PUBLISHERS' NOTE.

THE INTERNATIONAL CYCLOPEDIA contains a reprint in full of *Chambers's Encyclopædia* supplemented by some 20,000 copyright articles added by American editors, the whole arranged for consultation under a single alphabet. The total number of titles is now 49,646. The titles of articles from *Chambers's Encyclopædia* are in bold-faced type—**AMERICA**. The titles of the American articles, whether on new topics or enlargements of the old, are in plain capitals—AMERICA. The word *ante* refers the reader to an article from *Chambers's* reprinted in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that that article is an enlargement of one under the same title in *Chambers's Encyclopædia*, usually to be found immediately preceding.

An asterisk (*) prefixed to an article indicates that additional information will be found under the same title in a supplement at the end of the volume.

THE INTERNATIONAL CYCLOPEDIA.

OPERA-GLASS (Fr. *lorgnette*, Ger. *theater-perspectiv*). This is a double telescope, which is used for looking at objects that require to be clearly seen rather than greatly magnified, such as adjoining scenery and buildings, the performers of a theater or opera, etc. It is from its use at an opera that it derives its name. The opera-glass is short and light, and can be easily managed with one hand. Its small magnifying power (from 2 to 3 at the most), and the large amount of light admitted by the ample object-glass, enable it to present a bright and pleasing picture, so that the eye is not strained to make out details, as in telescopes of greater power, which generally show a highly magnified but faint picture. It allows the use of both eyes, which gives to the spectator the double advantage, not possessed by single telescopes, of not requiring to keep one eye shut, a somewhat unnatural way of looking, and of seeing things stand out stereoscopically as in ordinary vision. The opera-glass is in consequence the most popular of telescopes, and requires almost no art in its use.

The opera-glass is the same in principle as the telescope invented by Galileo. It consists of two lenses, an object-lens, and an eye-lens. The object-lens is convex, and the eye-lens concave. They are placed nearly at the distance of the difference of their focal lengths from one another. Fig. 1 represents the action of the telescope; o is the object-lens, and e the eye-lens, and ae is the axis of the instrument. The object-lens would

form an image, cab , of the object looked at, at or near its focus, but eye-lens intervening, converts the light converging to cab to light diverging apparently from an object in front, CAB . To show more clearly the changes which the light undergoes, the course of a pencil of rays proceeding from the top of an object is traced. The ray proceeding from the top of the object to the center of the lens, o , makes an angle, roA , with the axis. This is the same as the angle aob ; and either of these angles gives half the angle under which the object is seen to the unaided eye.

FIG. 1.

After passing through the object-lens, the three rays proceed to the point b , in the image which the object-lens would form at cab , if no eye-lens were there. This image, as shown in the figure, is inverted, and would be seen as such if the eye were placed about ten inches (the distance of distinct vision) behind it. The three rays in question do not reach the point b in consequence of the eye-lens intervening, and their course onwards to that point, after passing the eye-lens, is shown by dotted lines. The actual course, after passing the second lens, is shown again by the full lines, r, r, r , which to the eye placed immediately behind the eye-lens appear to proceed from the point B in front. As the light comes from B in the same direction as it comes from the actual point in the object, the image is erect. What holds for the point B , holds for every point in the image and object. To find the magnifying power, it is necessary to join Be and Ce , and produce the lines thus formed to b and c . As the eye is placed immediately behind the eye-lens, the angle under which the magnified object is seen is the angle BeC , which is equal to ceb . Now, the angle under which the object itself is seen at o or at e —for the slight difference has no effect at the distance at which objects require to be seen by a telescope—is twice the angle roA , or which is the same thing, the angle cob . The ratio of the angle ceb to the angle cob , which is the magnifying power, is easily seen to be the same as that of the line oa to the line ae . But oa is the focal length of the object-glass, and ae is the focal length of the eye-glass, so that the magnifying

power of the instrument is the number of times the focal length of the eye-glass is contained in that of the object-glass. The longer, therefore, the focal length of the object-lens, or the shorter the focal length of the eye-lens, the greater the magnifying power. This may be practically expressed thus: the flatter the object-lens, and the hollower the eye-lens, the more are objects magnified by the glass. The magnifying power may be found with sufficient accuracy by looking at an object with one eye through the tube and the other eye unaided, and so handling the glass that the magnified image seen by the one eye is superposed on the object seen by the naked eye, when a comparison of their relative sizes can be easily made. For great magnification, the instrument requires to be greatly lengthened—a condition inconsistent with its use as an opera-glass. In addition, a high magnifying power is attended with the disadvantage that the field of view, or amount of object or objects seen, becomes too limited. On screwing out the instrument, it will be seen that objects increase in size as the instrument is lengthened, but that the picture becomes more and more limited, showing that a large power and a large field are incompatible. The opera-glass need not be set to the same precise point as is necessary with ordinary terrestrial telescopes, as the lengthening or shortening of the instrument does not produce so decided an effect on the divergence of the light; the change of divergence, caused by screwing the opera-glass out or in, is so slight as not much to overstep the power of adjustment of the eye, so that an object does not lose all its distinctness at any point within the range of the instrument. There is, however, a particular point at which an object at a certain distance is best seen.

The two telescopes are identical in construction, and are placed parallel to each other. The blending of the two images is easily effected by the eyes, as in ordinary vision. Opera-glasses have now come into such demand, that they form an important article of manufacture, of which Paris is the great seat. So largely and cheaply are they produced in Paris that it has nearly a monopoly of the trade. They may be had from 2s. 6d. to £6 or £7. The cheapest opera-glasses consist of single lenses, those of the better class have compound achromatic lens. A very ordinary construction for a medium price is to have an achromatic object-lens, consisting of two lenses and a single eye-lens. In the finest class of opera-glasses, which are called *field-glasses*, both eye-lenses and object-lenses are achromatic. Plössl's celebrated field-glasses (Ger. *feldstecher*) have twelve lenses, each object-lens and eye-lens being composed of three separate lenses.

OPER' CULUM (Lat. a lid), a term used in botany chiefly to designate the lid or covering of the mouth of the urn or capsule (*theca*) which contains the spores of mosses. Before the ripening of the spores, the operculum is generally concealed by the *calyptra*; but after the calyptra has been thrown off, the operculum itself also generally falls off, leaving the peristome visible, and the mouth of the urn open. In some cases the operculum does not fall off, and the urn opens by valves.

In zoology, the term operculum is chiefly employed to denote the covering which many gasteropod mollusks form for the mouth of their shell. It is attached to the back of the foot of the mollusk. In some it is calcareous, forming a shelly plate; in some it is horny; whilst gasteropods very nearly allied to those which possess it, are destitute of it altogether. The operculum increases in various ways, so as to present in different genera great diversity of structure, concentric, spiral, unguiculate, etc.

OPHICEPH'ALUS, a genus of fishes, of the family *anabasidæ* (q. v.), sometimes regarded as constituting a distinct family *ophicephalidæ*, because there is a mere cavity for retaining water to supply the gills, and no pharyngeal laminae, and because of the long eel-like form and the flattened head, which is covered with large scales. Some of them are common in the fresh waters of the East Indies, are often found among wet grass, often travel from one pool to another, and are capable of subsisting for a long time in half-dried mud, descending into it when the pools dry up. The CORA-MOTA or GACHUA of India (*O. gachua*) is much used for food by the natives, although generally rejected by Europeans on account of its very snake-like appearance. It is very tenacious of life, and is not only brought to the Indian markets alive, but is cut to pieces whilst still living for the convenience of buyers.

OPHICLEIDE (Gr. *ophis*, serpent, and *kleis*, key), a musical wind-instrument of brass or copper, invented to supersede the serpent (q. v.) in the orchestra and military bands. It consists of a conical tube, terminating in a bell like that of the horn, with a mouth-piece similar to that of the serpent, and ten ventages or holes, all stopped by keys like those of the basson, but of larger size. Ophicleides are of two kinds, the bass and the alto. The bass ophicleide offers great resources for maintaining the low part of masses of harmony. Music for it is written in the bass clef, and the compass of the instrument is from B, the third space below the bass staff to C, the fifth added space above it, including all the intervening chromatic intervals. The alto ophicleide is an instrument of very inferior quality, and less used. Its compass is also three octaves and one note. The music for it is written in the treble cleff, and an octave higher than it is played. Double bass or monster ophicleides have sometimes been used in large orchestras, but the amount of breath which is required to play them has prevented their coming into general use.

OPHIDIA See SERPENTS.

OPHIOSLOSSEÆ, a suborder of *filices* or *feras* (q.v.), consisting of a few rather elegant little plants with an erect or pendulous stem, which has a cavity instead of pith, leaves with netted veins, and the spore-cases (*thecæ*) collected into a spike formed at the edges of an altered leaf, two-valved, and without any trace of an elastic ring. They are found in warm and temperate countries, but abound most of all in the islands of tropical Asia. Several species are European, and two are British, the *botrychium* (q.v.) *lunaria*, or moonwort, and the common adder's tongue (*ophioglossum vulgatum*), which was at one time supposed to possess magical virtues, and was also used as a vulnerary, although it seems to possess only a mucilaginous quality; on account of which some of the other species have been employed in broths. It is a very common plant in England, its abundance in some places much injuring pastures.

O'PHIR, a region frequently mentioned in the Old Testament, and from which the ships of Solomon, fitted out in the harbors of Edom, brought gold, precious stones, sandal-wood, etc. The voyage occupied three years. Where Ophir was situated has been a much, in fact, a superfluously disputed question. It was probably either on the e. coast of Africa about Sofala, or in Arabia, or in India, but in which of the three countries is doubtful. Huet, Bruce (the traveler), the historian Robertson, M. Quatremère, etc., are in favor of Africa; Michaelis, Niebühr (the traveler), Gosellin, Vincent, Winer, Fürst, Knobel, Forster, Crawford, and Kalisch, of Arabia; Vitranga, Reland, Lassen, Ritter, Bertheau, and Ewald, of India. Josephus, however, it should be said, placed Ophir in the peninsula of Malacca, and his very respectable opinion has been adopted by sir J. Emerson Tennent in his work on Ceylon. For a complete discussion of the point, see Karl Ritter's *Erdkunde* (vol. xiv. 1848), 80 octavo pages of which are devoted to Ophir. According to Ritter, who accepts the view of Lassen, Ophir was situated at the mouth of the Indus.

O'PHIR, called by the Malays, Gunong Pasaman, a volcanic mountain in the highlands of Padang, island of Sumatra, lies in $0^{\circ} 4' 58''$ n. lat., and $99^{\circ} 55'$ e. long.; the eastern peak, called Telaman, attains the height of 9,939 ft. above the sea. The western peak is called Pasaman. The numerous inhabitants have cleared off forest and brought under cultivation large tracts of land on the slopes of Ophir, and its base is studded with villages. The Ophir districts are most beautiful, and the lofty waterfalls, contrasting with the bright-green foliage of the mountain, highly picturesque.

OPHISU'RUS. See SNAKE-EEL.

O'PHITES (Gr. *ophitai*, "serpent-brethren," from *ophis*, a serpent), a sect of gnostics (q.v.), who while they shared the general belief of dualism, the conflict of matter and spirit, the emanations, the demiurgos, and other notions common to the many subdivisions of this extraordinary school, were distinguished from all by their peculiar doctrine and worship connected with their *ophis* or serpent. The ophites, like most other gnostics, regarded the demiurgos, or the Jehovah of the Old Testament, with great abhorrence, but they pursued this notion into a very curious development. Regarding the emancipation of man from the power and control of the demiurgos as a most important end, they considered the serpent who tempted Eve, and introduced into the world "knowledge" and revolt against Jehovah, to have been the great benefactor of the human race. Hence their worship of the serpent. Some of the details of their system were very strange. We may instance their singular attempt to engraft "ophism" on Christianity; their seeking, as it were, to impart to the Christian eucharist an ophite character, by causing the bread designed for the eucharistic sacrifice to be licked by a serpent, which was kept in a cave for the purpose, and which the communicants kissed after receiving the eucharist (*Epiph. Hor.* 37, s. 5). Our information, however, regarding them is very meager, and comes chiefly from antagonistic sources. The ophites originated in Egypt, probably from some relation to the Egyptian serpent-worship, and spread thence into Syria and Asia Minor. Offshoots of this sect are the Cainites. See CAIN and SETHITES: SERPENT WORSHIP.

OPHIU'RANS. See STAR-FISH, *ante*.

OPHRYDEÆ. See page 881.

OPHTHAL'MIA (derived from the Greek word *ophthalmos*, the eye) was originally and still is sometimes used to denote inflammation of the eye generally, but it is at the present time usually restricted to designate inflammatory affections of the mucous coat of the eye, termed the *conjunctiva*.

There are several important and distinct varieties of ophthalmia (in the restricted sense of the word) which require special notice.

Catarrhal Ophthalmia.—Its leading symptoms are redness of the surface of the eye (the redness being superficial, of a bright scarlet color, and usually diffused in patches), sensations of uneasiness, stiffness and dryness, with slight pain, especially when the eye is exposed to the light; an increased discharge, not of tears, except at the beginning of the attack, but of mucus, which at first is thin, but soon becomes opaque, yellow, and thicker; pus (or matter, as it is popularly termed) being seen at the corner of the eye, or between the eyelashes along the edges of the lids, which it glues together during the night. The disease results in most cases from exposure to cold and damp, and is very apt to be excited by exposure to a draught of air, especially during sleep. It is popu-

larly known as a *cold* or a *blight* in the eye. With regard to treatment, the patient should remain in rooms of a uniform temperature, and should at once take about five grains of calomel, followed by a black draught. The eye should be frequently bathed with poppy decoction, lukewarm or cold as the patient prefers. If the affection does not readily yield to these measures, a drop of a solution of nitrate of silver (four grains of the nitrate to an ounce of distilled water) should be let fall into the eye twice or thrice a day. It usually causes a smarting sensation for about ten minutes, after which the eye feels much easier than it did before the drop was applied. The adhesion of the eyelids in the morning may be avoided by smearing their edges at bedtime with a little spermaceti ointment.

Purulent ophthalmia differs from catarrhal ophthalmia in the severity of its symptoms, and in its exciting causes. It is a violent form of inflammation of the conjunctiva; is accompanied with a thick purulent discharge on the first or second day of its commencement, and is very apt to occasion loss of vision. There are three remarkable varieties of this affection, called respectively (1) purulent ophthalmia of adults, or Egyptian ophthalmia, or contagious ophthalmia; (2) gonorrhoeal ophthalmia; and (3) purulent ophthalmia of newly-born children. (1) *Purulent ophthalmia of adults* begins with the same symptoms as catarrhal ophthalmia, but in a very exaggerated form. The conjunctiva rapidly becomes intensely red, and soon appears raised from the sclerotic by the effusion of serum between them, projecting around the cornea, which remains buried, as it were, in a pit. Similar effusion takes place beneath the mucous membrane lining the eyelids, causing them to project forwards in large livid convex masses, which often entirely conceal the globe of the eye. These symptoms are accompanied by severe burning pain, great headache, fever, and prostration. When the disease is unchecked, it is liable to produce ulceration or sloughing of the cornea, with the escape of the aqueous humor and protrusion of the iris; and even when these results do not follow, vision is often destroyed by permanent opacity of the cornea. It is a common disease in India, Persia, and Egypt; and in consequence of its having been imported from the last named country into England by our troops in the beginning of the present century, it got the name of Egyptian ophthalmia. Some idea of its prevalence and of its danger may be formed from the facts (1) that two-thirds of the French army in Egypt were laboring under it at the same time, and (2) that in the military hospitals at Chelsea and Kilmatham there were, in Dec., 1810, no fewer than 2,317 soldiers who had lost the sight of both eyes from this disease. Until after the war in Egypt, the disease was unknown in Europe. Since that time it has not unfrequently broken out in this country—not only among troops, but in schools, asylums, etc. The disease is unquestionably contagious, but there are good reasons for believing that it often arises, independently of contagion, from severe catarrhal ophthalmia under unfavorable atmospheric and other conditions; and that having so originated, it possesses contagious properties. *Gonorrhoeal ophthalmia* arises from the application of gonorrhoeal discharge or matter to the surface of the eye; and hence is most common in persons suffering from the disease from which this variety obtains its specific name. It is, moreover, not unfrequently occasioned by the common but disgusting practice adopted by the poorer classes, of bathing the eyes in human urine, under the idea that by this procedure they strengthen the sight. In its symptoms, it is almost identical with ordinary purulent ophthalmia. The *purulent ophthalmia of children* usually begins to appear about the third day after birth. It is a very common affection, and its importance is apt to be overlooked until it has made considerable progress. If the edges of the lids appear red and glued together, and if the eye, when the lids are separated, shows redness and swelling of the conjunctiva, there is no doubt of the nature of the disease, which, if not checked, progresses in much the same way as in adults. It is, however, much more amenable to treatment, and with proper care the sense of sight is seldom impaired, provided the disease has not extended to the cornea before medical aid is sought. Of the treatment of purulent ophthalmia in these various forms, we shall say nothing more than that it must be left exclusively to the medical practitioner, whose advice should be sought as soon as there is the slightest suspicion of the nature of the case.

There is one more form of this disease which is of very common occurrence, and has received the various names of *strumous* (or *scrofulous*), *pustular*, and *phlyctenular ophthalmia*. It is intimately connected with the scrofulous constitution, and is most prevalent in children from 4 to 10 or twelve years of age. The most prominent symptom is extreme intolerance of light, the lids being kept spasmodically closed. When they are forcibly separated, a slight vascularity, usually stopping at the edge of the cornea, is observed, and at or about the line of separation between the cornea and sclerotic small opaque pimples or pustules appear. The treatment consists (1) in improving the general health by due attention to the secretions, and the subsequent administration of tonics (such as quinia and cod-liver oil), and change of air; and (2) in local applications, such as solution of nitrate of silver, or wine of opium, dropped into the eye, or stimulating ointments (such as dilute citrine ointment) smeared over the edges of the lids at bedtime. This form of disease, being dependent on constitutional causes, is often very obstinate, and is always liable to recur. It is not unfrequently attended with the annoying complication of a skin disease, known as *crusta lactea*, on the cheeks, in consequence of the irritation caused by the flow of scalding tears. The crusts or scabs are easily removed

by a poultice or warm water dressing after which the part must be bathed by a lotion, consisting of a dram of oxide of zinc in four ounces of either pump or rose water.

OPHTHALMIC GANGLION, one of the four cephalic ganglia of the great sympathetic nerve. It is about the size of a pin's head, and situated at the back part of the orbit, between the optic nerve and the external rectus muscle. It lies in a quantity of loose fat which makes its dissection somewhat difficult. It has three branches of communication which enter its posterior border. The long branch is derived from the nasal branch of the ophthalmic nerve (first division of the 5th nerve). The second branch, or root, is derived from a branch of the third nerve supplying the inferior oblique muscle of the eyeball. The third branch, or root, is a slender filament from the cavernous plexus of the sympathetic. According to Tiedemann this ganglion receives a filament of communication from Meckel's ganglion (q.v.). Its branches of distribution are the short ciliary nerves. These are 10 or 12 delicate filaments arising from the fore-part of the ganglion in two bundles. They run forward with the ciliary arteries, pierce the sclerotic coat at the back part of the globe, pass forward in delicate grooves on its inner surface, and are distributed to the ciliary muscle and the iris. It is therefore seen that the ophthalmic ganglion is one of the most important nerve centers in the whole body, although no larger than a pin's head. The ciliary muscle is the muscle of accommodation of the eye, causing variation in the form of the aqueous humor and the crystalline lens so as to accommodate the focal length of the eye to the distance of objects. Its supply of nerve force to the muscular fibers of the iris is also intimately connected with the focal length of the eye-apparatus, and its connections with this part of the eye are of marvelously beautiful character.

OPHTHALMOL'OGY. See **EYE; EYE, DISEASES OF THE**, *ante*.

OPHTHALMOSCOPE, THE, is an instrument recently invented for the purpose of examining the deep-seated structures of the eye, and for detecting disease in them. In its simplest form, it is merely a concave circular mirror, of about 10 in. focus, made of silvered glass or polished steel, and having a hole in the center; and with it there is supplied, as a separate piece of apparatus, a convex lens an inch and a half in diameter, with a focal length of about two and a half inches, set in a common eye-glass frame, with a handle 3 in. long. The patient (his pupil having been previously dilated by the application of a drop of solution of atropine) is made to sit by a table in a dark room, with a sliding argand lamp placed by the side of his head, with the flame on a level with the eye, from which it is screened by a little flat plate of metal attached to the burner. The following description of the mode of using the instrument, and of the parts brought into view by it, is borrowed from the article on this subject contributed by Mr. Haynes Walton to the last edition of Druitt's *Surgeon's Vade Mecum*: "The operator sits directly in front, and holding the instrument close to his eye, and a little obliquely to catch the light from the lamp, he commences, at the distance of about 18 in. from the patient, to direct the reflection on the eye. When this is got, the convex lens must be held at a distance of two and a half inches from the eye, and the focusing commenced by moving it slowly backwards and forwards. When the light fairly enters the eye a reddish glare appears; and as it is focused, an orange-red or orange-yellow is seen; then the blood-vessels of the retina come into view. The retina itself presents a whitish aspect, through which the choroid is more or less discernible. The entrance of the optic nerve should now be sought. The way to discern it is to make the patient look inward. It appears as a white circular spot, in the center of which are the central vein and artery of the retina, giving off six or eight branches." This optic disc is the most important part to be observed; but a thorough ophthalmoscopic examination will reveal structural differences, not only in it, but in the retina, choroid, and vitreous humor, and will reveal cataract in its early stage. In short, the ophthalmoscope is now as essential in the diagnosis of diseases of the deep-seated parts of the eye as the stethoscope is in the diagnosis of thoracic diseases.

OPIE, AMELIA (ALDERSON), 1769-1853, b. England; second wife of John Opie, the painter, whom she married in 1798. She had already written much, but had published but one novel. After her husband's death, she lived at her father's house in Norwich. She wrote but little after becoming a member of the society of friends in 1825. Among her works are *Father and Daughter*, 1801; *Poems*, 1802; *Adeline Mowbray*, 1804; *The Warrior's Return and Other Poems*, 1808; *Detraction Displayed*, 1828; and *Lays for the Dead*, 1833.

OPIE, JOHN, A. R., was b. at the village of St. Agnes, 7 m. from Truro, Cornwall, in May, 1761. His father, a master carpenter, wished him to follow the same trade, but his bias for art was strong; and his attempts at portrait-painting having attracted the notice of Dr. Wolcot, afterward celebrated as Peter Pindar, he had the advantage of his advice in the practice of the art, and his exertions in procuring him employment. And at length, in 1780, he was taken to London by Dr. Wolcot; and immediately came to be acknowledged by the fashionable world as the "Cornish Wonder." This tide of good fortune soon ebbed, but not before Opie had realized a moderate competency. The loss of popular favor, however, only served to bring out more strongly those points in Opie's character on which his reputation mainly rests, viz., manly independence and strong

love of art. He stooped to no device to retain fashionable patronage, but calmly and unremittingly entered on that department of painting which, according to the notions of his time, was the only style of high art, viz., historical or scriptural subjects, executed on a large scale. His pencil was employed by Boydell in his well-meant and magnificent scheme to elevate British art; he also painted a number of works in the illustration of Bowyer's "English History," Macklin's "Poets," and "Biblical Gallery," and other similar undertakings. His pictures of the "Murder of James I. of Scotland," the "Slaughter of Rizzio," "Jephthah's Vow," "Presentation in the Temple," "Arthur and Hubert," "Belisarius and Juliet in the Garden," are his most noted works. Opie was elected an associate of the royal academy in 1786, and academician in the following year. He devoted part of his time to various literary efforts tending to the illustration of art: these were chiefly the "Life of Reynolds" in Dr. Wolcot's edition of Pilkington's *Dictionary of Painters*; a letter in the *North Briton*, recommending the formation of a national gallery, reprinted as *An Inquiry into the Requisite Cultivation of the Fine Arts in Britain*; lectures on art, delivered at the royal institution, which, though listened to with great attention by a select and fashionable audience, do not seem to have been satisfactory to himself, as he declined to continue them. When Fuseli, on being appointed keeper, resigned the professorship of painting, Opie was appointed to that office; and the four lectures which he delivered—he died before completing the course—bear the stamp of practical experience and shrewd observation. Opie was twice married. He obtained a divorce from his first wife; but his second, well known as one of the most popular novelists of the day, appreciated his high character, which she set forth, after his death, in a memoir published along with his lectures. He died somewhat suddenly in his house, St. Bernard street, Oxford street, April 9, 1807, and was buried in the crypt of St. Paul's, near the grave of Reynolds.

OPIN'ICUS, one of the fabulous creatures known in heraldry, with the head and neck of an eagle, the body of a lion, wings, and a short tail like that of a camel. Such a monster, with wings endorsed or, was the crest of the company of barber-surgeons of London.

OPINION OF COUNSEL, is the technical name for the advice given by a barrister or advocate. The attorney or solicitor writes a statement of facts, called "a case" in England, and "a memorial" in Scotland, which ends by asking certain queries, and the answer written by the counsel is his opinion. A counsel is not liable for any damages caused by his giving a wrong opinion though the result of gross ignorance, this being one of the privileges of counsel.

OPITZ, MARTIN, a famous German poet, was b. Dec. 23, 1597, at Bunzlau, in Silesia. He received an education of the highest kind; and after some time spent at the court of the duke of Liegnitz, he accepted, in 1622, an invitation by Bethlen Gabor, prince of Transylvania, to teach philosophy and the *Humaniora* at Weissenburg; but disliking the rudeness of the country, he soon returned to the court of the duke of Liegnitz. In 1624, his first poems were published, and in the same year his work *Von der deutschen Poeterei*, in which he laid the foundation of a system of German poetics. In 1625 he went to Vienna, where, on account of an elegy on the death of an archduke, he received a laurel crown from the hands of the emperor, Ferdinand II. In 1626 he became secretary, although a Protestant, to the burggraf Karl Hannibal of Dohna, a distinguished Roman Catholic and imperialist, and was employed in various transactions with foreign courts. In 1629 the emperor raised him to the rank of nobility. After the death of the burggraf of Dohna, in 1633, he returned to the courts of Liegnitz and Brieg. About this time he published *Vesuv*, a didactic poem, and his *Trostgedicht in Widerwärtigkeit des Kriegs*, the best of his poems, which were followed by an opera called *Judith*, a translation of the *Antigone* of Sophocles, and a translation of the Psalms. In 1638 he was appointed secretary and historiographer to Ladislaus IV. of Poland. But in the midst of his days, and when he had attained to fame and prosperity, he was cut off by the plague at Danzig, Aug. 20, 1639. Opitz was more honored by his contemporaries than almost any other poet ever was. German poetry, which had been neglected and despised, began again to be esteemed and cultivated. The popularity of Opitz and his relations with the chiefs of the Roman Catholic party, led to the adoption, throughout the whole of Germany, of the form given to the German language by Luther, which had previously obtained general acceptance only in the Protestant states. His poetry is characterized by careful attention to language and meter, and by reflection rather than by brilliant fancy or deep feeling. There are several editions of his works, but none is quite complete (3 vols., Breslau, 1690; 3 vols., Amst. 1646; and 3 vols. Frankfort and Leipsic, 1724.)

O'PIUM, one of the most valuable of medicines, is the dried juice of the unripe capsules of a species of poppy (q. v.), *papaver somniferum*, sometimes called the common poppy, and sometimes the white poppy, although the latter name is really appropriate only to one of its varieties. The plant is probably a native of some of the warmer parts of Asia, although it is now common in cultivated and waste grounds throughout all the s. and middle of Europe, and is occasionally found in Britain. It is an annual, varying in height from 1 to 6 ft., erect, branched, of a glaucous green color, with ovate-oblong sessile leaves, the stem and leaves generally smooth, the branches terminated by large

flowers on long stalks, the capsules globose or roundish-ovate and smooth. There are two principal varieties cultivated for the opium which they yield, which have been regarded by some botanists as distinct species; the one (*papaver somniferum*) having generally red or violet-colored flowers, numerous flower-stalks rising together, globose capsules opening by a circle of pores under the persistent stigma, and black seeds; the other (*P. officinale*) having white flowers, solitary flower-stalks, the capsules somewhat ovate, the circle of pores almost wanting, the seeds white. The former variety is generally cultivated in the mountainous parts of the n. of India, the latter in the plain of Bengal, where the poppy-fields are described by Dr. Hooker as resembling green lakes studded with white water-lilies. The cultivation of the poppy for the sake of opium is carried on in many parts of India, although the chief opium district is a large tract on the Ganges, about 600 m. in length and 200 m. in breadth, which was divided by the east India company into two *agencies*, that of Behar and that of Benares, the central factory of the former being at Patna, and that of the latter at Ghazeepore. The poppy is also extensively cultivated for opium in the Asiatic provinces of Turkey, in Egypt, and in Persia. Opium of very good quality is also produced, although not to any considerable amount, in some parts of Europe, and even in Britain. It is sometimes alleged that a much warmer climate than that of Britain is requisite for the profitable production of opium, but the chief fault of the climate seems rather to be the frequency of wet weather. Very fine specimens of opium have been produced, and the produce per acre has been found amply remunerative; but a great difficulty is experienced in obtaining labor at a moderate rate for a few days only at a time, and when the experiment is conducted on a small scale, only for a few hours daily. This difficulty was much felt in an experiment, otherwise most successful, which was made at Edinburgh, by Mr. Young, a surgeon, who, about the year 1830, obtained 56 lbs. of opium from one acre of poppies, and sold it at 36s. a lb. It was of excellent quality. His mode of cultivation was similar to that usual in India, The seed being sown in spring on a rich soil, the plants were kept clear of weeds, and when they had flowered and produced capsules, incisions were made in the capsules, and the exuded juice collected as described below. The capsules vary from the size of a hen's egg to that of the fist. In India, the poppy flowers in the end of January and beginning of February.

The poppy requires for its profitable cultivation a rich soil, and in India is generally sown in the neighborhood of villages where manure can be easily obtained. The soil ought to be fine and loose when the seed is sown. The subsequent cultivation consists chiefly in thinning and weeding. Irrigation is practiced. Mild moist weather, with night-dews, is deemed most favorable during the time of the collection of the opium. Very dry weather diminishes the flow of the juice, and much rain is injurious.

The opium poppy is cultivated for other purposes besides the production of opium, concerning which see POPPY.

Opium, as a commercial article, is of great importance, exceeding indeed that of any other drug in use, and the cultivation of the opium poppy (*papaver somniferum*) in British India forms a most extensive branch of agriculture, and the collection and preparation of the drug itself employs a large number of persons in the Patna, Malwa, and Benares districts of Bengal. Indeed, during the whole existence of the East India Company, the production of this drug was of the first importance; its employment as a habitual narcotic, as well as a medicine amongst all the eastern nations, demands an enormous supply. The seed is sown in India in the beginning of November; it flowers in the end of January, or a little later; and in three or four weeks after, the capsules or poppy-heads are about the size of hens' eggs, and are ready for operating upon. When this is the case, the collectors each take a little iron instrument, called a *nushtur*; it is made of three or four small plates of iron, narrow at one end and wider at the other, which is also notched like a saw; with these instruments they wound each full-grown poppy-head as they make their way through the plants in the field. This is always done early in the morning, before the heat of the sun is felt; during the day the milky juice of the plant oozes out, and early on the following morning it is collected by scraping it off with a kind of scoop, called a *sittoooha*, and transferred to an earthen vessel called a *kurrace*, hanging at the side of the collector. When this is full, it is carried home and transferred to a shallow open brass dish, called a *thallee*, and left for a time tilted on its side, so that any watery fluid may drain out; this watery fluid is called *pusseewah*, and is very detrimental to the opium unless removed. It now requires daily attendance, and has to be turned frequently, so that the air may dry it equally, until it acquires a tolerable consistency, which requires three or four weeks; it is then packed in small earthen jars, and taken to the *godowns*, or factories; here the contents of each jar are turned out and carefully weighed, tested, valued, and credited to the cultivator. The opium is then thrown into vast vats, which hold the accumulations of whole districts, and the mass being kneaded, is again taken out and made into balls or cakes for the market.

This is a very important operation, and is conducted in long rooms, the workmen sitting in rows, closely watched by the overseers to insure the work being carefully performed. Before each workman is a tray, and within easy reach is placed the *tagar*, a tin vessel for holding as much opium as will make three or five balls. On the tray is another basin containing water, and a smaller tray; on this tray stands a brass cup, into which

the ball or cake is molded, also a supply of thin layers of poppy petals, formed by laying them out overlapping each other, and pressing them upon one another; these are prepared by women in the poppy-fields, and with these is a cup filled with a sticky fluid called *lewah*, made from opium of inferior quality. The operator begins his work by taking the brass cup and placing on its bottom one of the cakes of poppy petals, which he smears over with the *lewah*; then adds other cakes of petals to overlap and adhere to the first, until the cup is lined and a coat of petals is thus formed for the opium, of which he takes the exact quantity as near as he can guess, works it into a ball, and places it in the basin, so that the lining of petals encloses it and sticks to it, in consequence of the *lewah* smeared on the inner side of the thin cakes of petals. Other petals are put on the upper part of the ball, and the whole gathered round it, forming a case about as thick as a bank-note. Each man's work for the day is kept by itself, and after having been duly registered, is taken to a vast drying-room, where the balls are placed in tiers on lattice-work racks, and are continually turned and examined by boys, to keep them from insects and other injuries. After being fully dried, these balls are packed in chests for the market.

The manufacture of opium is carried on to the greatest extent in India, but large quantities are also made in Turkey, and this latter is considered the best in quality. It is also made at Trebizond in Persia, and in Egypt; occasionally it has been produced in Germany, France, and England. Of the Indian opium there are several qualities, as Bengal, Patna or Benares opium, Garden Patna, Malwa, fine Malwa, Cutch, and Kandesh opium.

The opium revenue for India in 1875-76 was given at £8,471,425. The number of chests sold was 49,695, at £139 per chest, or £26 higher than the previous year's average. The net profit was £90 per chest. The area under cultivation in Bengal and Bombay was 560,608 acres. In 1880-81, 92,190 chests of opium, valued at £13,600,148, were exported. Next to China, the largest consumption of Indian opium is by the Burmese and the natives of the Malacca straits, who take annually to the value of nearly a million sterling.

In Europe, with very slight exceptions, opium is used for medicinal purposes only, and large quantities of it undergo a still further stage of manufacture, in order to separate from it the active principles morphine, narcotine, etc. In Great Britain, the chief manufacture of these salts of opium is carried on in Edinburgh, where two firms, Messrs. T. and H. Smith, and J. F. Macfarlane & Co., have attained great reputation, and manufacture these products upon an immense scale, supplying probably a fifth of the whole quantity manufactured.

Chemical and Medicinal Properties.—The only variety recognized in the British pharmacopœia is the Turkey opium. The chemical composition of opium has been studied by various chemists, amongst whom must be especially mentioned prof. Mulder of Utrecht, and prof. Anderson of Glasgow. The following constituents occur in most kinds of opium:

Organic Bases or Alkaloids.	Meconic acid.....	3HO, C ₁₄ H ₁₁ O ₁₁ ,	from 4 to 8 per cent.
	Morphia.....	C ₃₄ H ₁₉ NO ₆ ,	from 4 to 12 “
	Codeia.....	C ₃₆ H ₂₁ NO ₆ ,	less than 1 “
	Thebaia.....	C ₃₈ H ₂₁ NO ₆ ,	“ “
	Papaverine.....	C ₄₀ H ₂₁ NO ₈ ,	“ “
	Narcotine.....	C ₄₆ H ₂₅ NO ₁₄ ,	from 6 to 10 “
	Narceia.....	C ₄₆ H ₂₉ NO ₁₈ ,	from 6 to 13 “
	Meconine.....	C ₂₀ H ₁₀ O ₈ ,	less than 1 “
	Resinous matter.....		from 2 to 4 “
	Caoutchouc.....		from 4 to 6 “
Mucilage, gum, and extractive matters.....		from 40 to 50 “	

In addition to the six alkaloids named in this table, a seventh, named opianine, has been found in Egyptian opium, but in no other varieties.

Some of the most important and characteristic of these constituents, as meconic acid, morphia, and narcotine, are noticed in special articles. The only isolated constituents of opium which are now used in medicine are *codeia* (so called from the Greek word *kōdeia*, a poppy-head), which has been asserted by Magendie and others to act in the same manner as, although less powerfully than, morphia, but which is now seldom prescribed, as it is not a pharmacopœial preparation; and *morphia*, which has already been described.

The only test given in the British pharmacopœia for the purity of opium is the determination of its percentage of morphia, which is a process requiring a considerable amount of chemical skill.

Following the arrangement adopted by Pereira (*Elements of Materia Medica*, 4th ed.), we have just quoted, we shall consider (1) the effects of one or a few doses of opium employed medicinally or as a poison; (2) the effects of the habitual employment of opium, either by chewing or smoking it; and (3) its good and bad effects on the different systems of organs.

1. In *small doses*, as from a quarter of a grain to a grain, it acts as an agreeable stimulant, this effect being followed by a desire to sleep, accompanied by dryness of the

mouth and throat, thirst, and slight constipation. When it is given in a *full medicinal dose* (as from two to four grains), the stage of excitement is soon followed by well-marked depression or torpor, both of the bodily and mental organs, and an almost irresistible sleepiness; these effects being usually succeeded by constipation, nausea, furred tongue, headache, and listlessness. When it is administered in a dangerous or poisonous dose, the symptoms, as summed up by Dr. Christison in his work *On Poisons*, begin with giddiness and stupor, generally without any previous stimulus. The stupor rapidly increasing, the person becomes motionless, and insensible to external impressions; he breathes very slowly, generally lies quite still, with his eyes shut and the pupils contracted; and the whole expression of the countenance is that of deep and perfect repose. As the poisoning advances, the features become ghastly, the pulse feeble and imperceptible, the muscles exceedingly relaxed, and, unless assistance is speedily procured, death ensues. If the person recovers, the insensibility is succeeded by prolonged sleep, which commonly ends in twenty-four or thirty-six hours, and is followed by nausea, vomiting, giddiness, and loathing of food.

2. The *habitual use of opium*, whether the drug be eaten or smoked, is undoubtedly in most cases injurious to the constitution, although probably not to the extent that some eastern travelers assert. Sir R. Christison, and other eminent physicians, have shown that in numerous cases very large quantities of this drug may be regularly taken with impunity; and Dr. Chapman (*Elements of Therapeutics*, vol. ii., p. 199) relates two remarkable cases of this kind—one in which a wineglassful of laudanum was taken several times in the twenty-four hours, and another (a case of cancer of the uterus) in which the quantity of laudanum was gradually increased to *three pints* daily, a considerable quantity of solid opium being also taken in the same period.

Opium-smoking is a habit that is chiefly confined to China and the islands of the Indian archipelago. An extract, called *chandoo*, is made into pills about the size of a pea. The following is the account given by Marsden, in his *History of Sumatra*, of the process employed: “One of these pills being put into the small tube that projects from the side of the opium pipe, that tube is applied to a lamp, and the pill being lighted is consumed at one whiff or inflation of the lungs, attended with a whistling noise. The smoke is never emitted by the mouth, but usually receives vent through the nostrils.” Although the immoderate practice of opium-smoking is most destructive to those who live in poverty and distress, yet from the evidence of Mr. Smith, a surgeon, resident at Pulo Penang, and of Dr. Eatwell, who passed three years in China, it does not appear that the Chinese in easy circumstances, and who have the comforts of life about them, are materially affected, in respect to longevity, by addiction to this habit.

3. As the discussion of the physiological action of opium on the different organs would, in its most condensed form, occupy too much space, we shall confine our remarks to the practical conclusions at which physiologists and physicians have arrived respecting the utility and the danger of prescribing this drug in various conditions of the principal vital organs.

a. Cerebro-spinal System.—Under proper regulations it is a remedy which may be used to stimulate the circulation within the cranium, to promote sleep, to diminish abnormal or increased sensibility, and to allay pain generally; while it is contra-indicated in apoplexy, cerebral inflammation, paralysis, and hysteria. Dr. Pereira relates a case in which *one grain* of opium, administered to an hysterical young woman, proved fatal.

b. Digestive System.—“Under proper regulations,” says Pereira, “opium is an admissible remedy for the following purposes: to diminish excessive hunger; to allay pain, when unaccompanied by inflammation; to diminish the sensibility of the digestive organs in cases of acrid poisoning, and in the passage of biliary calculi; to produce relaxation of the muscular fibers of the alimentary canal in colic, and of the gall-ducts in the passage of calculi, and to diminish excessive secretion from the intestinal canal in diarrhoea;” while it is contra-indicated “in diminished secretion from the gastro-intestinal membrane, in extreme thirst, in loss of appetite and weak digestion, in obstinate costiveness, and in diminished excretion of bile.”

c. Vascular System.—In vascular excitement with great diminution of power, as after hemorrhage, opium is often serviceable; but when the pulse is strong as well as quick, or when there is simultaneously a tendency to abnormal sleepiness, it is contra-indicated.

d. Respiratory System.—“Opium, under proper regulations, may be useful to diminish the contractility of the muscles of respiration, or of the muscular fibers of the air-tubes, as in spasmodic asthma; to diminish the sensibility of the bronchia in the second stage of catarrh, and thereby to allay cough by lessening the influence of the cold air; and, lastly, to counteract excessive bronchial secretion;” while it is contra-indicated in difficulty of breathing, arising from a deficient supply of nervous energy, as in apoplectic cases; in cases in which the venous is imperfectly converted into arterial blood; and in the first stage of catarrh and pneumonia, both from its checking secretion, and from its tendency to impede the due arterialization of the blood.

e. Urinary System.—Opium is a valuable remedy to allay the pain in the kidney and adjacent parts in cases of renal calculi, and also to produce relaxation of the ureters when the calculi are passing along these tubes; it is also of great service in certain forms of irritable bladder.

There can be no doubt that the essential and primary operation of opium is on the nervous system, the other effects being for the most part secondary.

Opium is undoubtedly the most valuable remedy of the whole materia medica. "For other medicines," says Dr. Pereira, "we have one or more substitutes; but for opium, none—at least in the large majority of cases in which its peculiar and beneficial influence is required." We not only exhibit it to mitigate pain, to allay spasm, to promote sleep, to relieve nervous restlessness, to produce perspiration, and to check profuse discharges from the bronchial tubes and intestinal canal; but we also find it capable of relieving some diseases in which none of the above indications can be always distinctly perceived. In combination with tartar emetic, it has been strongly recommended in fever with much cerebral disturbance; in association with calomel, it is the most trustworthy remedy in cases of inflammation of membranous parts; in insanity, its value cannot be overestimated; it is the remedy chiefly trusted to in delirium tremens; it is more serviceable than any other medicine in diabetes; and to conclude with a more common and less serious affection, its efficiency, when administered in small doses (as ten or fifteen drops of laudanum three times a day), in promoting the healing of ulcers in which granulation proceeds too slowly, is very marked.

In addition to the solution of muriat of morphia (q.v.) which, on the whole, is the best preparation of opium for internal use in the majority of cases, the British pharmacopœia contains an opium pill (containing one part of opium in five of the pill); a pill of lead and opium (chiefly used in pulmonary hemorrhage); an aromatic powder of chalk and opium (containing one part of opium in forty of the powder); powder of ipecacuan and opium (or Dover's powder [q.v.], containing one part of opium in ten of the powder); powder of kino and opium (containing one part of opium in twenty of the powder, and, like the aromatic powder, chiefly used in diarrhea); tincture (see LAUDANUM), and camphorated tincture of opium (commonly known as paragoric elixir, and much used in chronic cough—containing two grains of opium in the fluid ounce); in addition to an enema; a wine (used chiefly as a local application to the eye in cases of ophthalmia); an ointment of galls and opium (used as an external application to piles); and a liniment and a plaster, which are applied to remove local superficial pains.

In a case of poisoning by opium, the first and most essential point is the evacuation of the contents of the stomach. The stomach-pump, if it can be procured, should be employed, and strong coffee should then be pumped into the stomach after the removal of its contents. The next best remedy is an emetic of sulphate of zinc (about a scruple), and if this is not at hand, a dessert-spoonful of flour of mustard, stirred up in a tumbler of warm water, will usually produce the desired effect. The patient must, if possible, be prevented from falling asleep, and for this purpose he should be kept constantly walking between two strong men, while a third person in the rear should, at short intervals, flick him sharply with a rough wet towel, or (if procurable) a good birch rod. Cold water should also be occasionally dashed over the head and chest. In a few apparently hopeless cases, death has been averted by artificial respiration, and by the application of electro-magnetism.

OPOBALSAMUM. See BALSAM and GUM.

OPODELDOC is a popular synonym for *soap liniment* (q.v.). The origin of the term which was apparently applied by Paracelsus to various forms of liniments or local applications, is not known. The *opo* is the same as the *opo* of *opoponax*, *opobalsamum*, etc., and is doubtless derived from the Greek *ῥπος*, juice. It has been suggested by an eminent Anglo-Saxon scholar that the original word was *opodilla*, and that *doc* or *dock* was added merely as a gloss to *dilla*—a view that is confirmed by the fact, that in Ælfric's *Glossary*, *dill* (*dilla*) is Englished by *dock*.

OPOP'ONAX, a gum resin obtained by puncturing the roots of a species of parsnip (*Pastinaca Opoponax*). The chief interest in this material is the great importance which the ancient physicians attached to it as an antispasmodic medicine. It was employed by Hippocrates, Theophrastus, and Dioscorides, who have each left descriptions of it. The plant grows generally throughout southern Europe, and the gum is still collected, but is not much used.

OPOR'TO (Port. *O Porto*, the port), a city of Portugal, and, after Lisbon, the most important seaport of the country, in the province of Minho, on the right bank and two miles from the mouth of the Douro, in lat. 41° 9' n., long. 8° 37' w.; and is 495 m. n.n.e. of Lisbon. Though possessing few imposing edifices, the town, seen from a distance with its irregular outline marked with many towers, its whitewashed houses gleaming among trees and terraced gardens, has a fine picturesque effect. Its picturesqueness, however, has been secured at the cost to a great extent of comfort, as many of its streets are narrow, dirty, and so steep as to be impassable for carriages. Of the old walls that surrounded the ancient town, remains are still to be seen. The principal street is the *Rua Nova dos Ingleses*, a spacious, handsome, modern thoroughfare, from which a good view of the bishop's palace, which seems to be hung high in the air, is obtained. Here is situated one of the finest edifices in Oporto, the English factory house, a building of white granite with a beautiful façade, and comprising on a magnificent scale all the appurtenances of a club-house, as ball-room, library, refreshment-room, etc. The houses in the *Rua Nova de S. João*, the most regular street in the city, are lofty, and are

faced with gaily painted and gilt balconies. Of the 11 squares, the greatest is the *Praça de S. Ovidio*, on a height, the appearance of which is enhanced by beautiful buildings and a terrace, with a fine seaward view, planted with trees. On the high rocks, on the southern bank of the river, stands the convent of *da Serra*, which at one time was extraordinarily rich. The most beautiful of the convents was that of *S. Bento*, now converted into barracks. The cathedral, which must originally have been a noble edifice, but has been infamously modernized, stands near the bishop's palace. The *Torre dos Clerigos* (Tower of the Clergy), said to be the highest in Portugal, was built in 1748. Formerly, there were in all 80 convents and chapels in the city. Of existing institutions, there are four hospitals, and numerous educational and benevolent establishments. Oporto is the principal industrial seat in the country. It carries on manufactures of linen, silk, cotton, and woolen fabrics, cloth of gold, silk and cotton hosiery, lace, buttons, gold and silver wire, cutlery and hardware, excellent furniture, pottery, glass, leather, paper, hats, sails, and the articles required on shipboard. Royal tobacco and soap-works, two iron-foundries, and several sugar-refineries are also in operation. The entrance to the Douro is rendered highly dangerous by a shifting bar of sand; but yet the commercial traffic on the river is considerable. The exports of wine were larger in 1874 than in any former year, amounting to 301,310 hectoliters, of which seven-elevenths was shipped for England. O. has imported from England in a single year cotton goods to the value of £330,000, and woolen goods, £70,000. O. builds ships. In 1875 the port owned 137 ships of 38,540 tons. Pop. (1878) of O. 89,295; and with its four suburban districts, 108,346.

In ancient times the site of Oporto was occupied by the harbor-town *Portus Cale*, afterwards *Porto Cale*, from which has been derived the name of the kingdom Portugal. It was an important city during the supremacy of the Moors, was destroyed in 820 by Almansor of Cordova, but was restored and peopled by a colony of Gascons and French in 999. It was famous for the strength of its fortifications during the middle ages, its walls being 3,000 paces in circumference, 30 ft. in height, and flanked with towers. From the 17th to the present century Oporto has been the scene of an unusual number of popular insurrections. In 1808 it was taken by the French; but in the following year it was retaken by an Anglo-Portuguese force under Wellington. In 1832, Dom Pedro, the ex-emperor of Brazil, was unsuccessfully besieged for a year in this city by the forces of Dom Miguel.

OPOS'SUM, *Didelphis*, a genus of *marsupiata*, having ten cutting teeth in the upper jaw and eight in the lower, one canine tooth on each side in each jaw, three compressed premolars, and four sharply tuberculated molars on each side—50 teeth in all; the tongue bristly; the tail long, prehensile, and in part scaly; the feet plantigrade; five toes on each foot, their claws long and sharp; but the inner toe of the right foot converted into a thumb, destitute of a claw, and opposable to the other digits; the muzzle long and pointed, the mouth very wide, the ears large and destitute of hair. The unwebbed feet and non-aquatic habits distinguish this genus from *cheironectes* (q.v.), also belonging to the family *didelphidæ*. But the genus *didelphis* itself is divided by some naturalists into several genera; and there are differences not unimportant, particularly in the well-developed pouch of some species, and the merely rudimentary pouch or abdominal folds of others. All the existing species are American, but fossil species are found in other parts of the world. The opossums were the first marsupial animals known, and are noticed as very wonderful creatures by some of the earliest writers on America. Some of the smaller species much resemble rats and mice, except in their long and pointed muzzle; others greatly resemble shrews; the largest known species are scarcely equal in size to a large cat. It is in some of the smaller species that the pouch is rudimentary; all the larger species have a well-developed pouch in which the young are carried, and to which, even after beginning to venture forth from it, they retreat on the approach of danger. The young of the species which have a merely rudimentary pouch, also remain attached to the nipple of the mother for a time; and afterwards for a time are carried on her back, intertwining their prehensile tails with hers, and clinging to the fur of her back.—The VIRGINIAN OPOSSUM (*D. Virginiana*) is one of the largest species. It abounds in the warmer parts of North America, and its range extends considerably to the n. of Virginia. Its form is robust, its head very large, its color dull white; its fur long, fine, and woolly, thickly interspersed with longer coarse white hairs, except on the head and some of the upper parts, where the hair is short and close. The tail is not quite so long as the body. The Virginian opossum lives much in forests and among the branches of trees, to which it usually retreats to devour its prey, twining its tail around a branch for security. Its food consists of small quadrupeds and reptiles, birds' eggs, and insects; also in part of fruits and the juicy stalks of plants. It often visits poultry-yards, and displays much cunning in its stealthy quest of prey; although otherwise it seems, like the other *marsupiata*, to be very low in the scale of intelligence. It seeks to escape from enemies by running to the woods and ascending a tree; but if escape is impossible, it feigns death, and maintains the imposture in very trying circumstances, however it may be kicked and beaten; but the true state of the case may be ascertained by throwing it into water. The American word 'possuming makes a figurative application of this part of the natural history of the opossum. The female sometimes produces 16 young at a birth; the young when born are blind, naked, and shapeless, and weigh

scarcely more than a grain each; they do not begin to leave the pouch until they have attained about the size of a mouse. The female opossum shows a very strong attachment to her young. The opossum is very easily tamed, but its strong odor makes it an unpleasant pet. The flesh of the opossum is said to be good. The hair is woven into garters and girdles by the Indian women.—Other species of opossum are found in the more southern parts of America. Of these one of the largest is the CRAB-EATING OPOSSUM (*D. cancrivora*) of Guiana and Brazil, which is nearly as large as the Virginian opossum, lives chiefly in marshy places, and feeds much on crabs. The smaller species are numerous in the tropical parts of America.—The name opossum is often given in Australia to the phalangers (q. v.).

OPPELN, a t. of Prussian Silesia, capital of the government district of the same name, on the Oder, 51 m. s. e. of Breslau. Since 1816, when it was erected into an especial seat of government for upper Silesia, the town has been much beautified both with new edifices and with parks and gardens. It contains four churches—one of which, Adelbert's church, was founded in 995—an old castle on the island Pascheke in the channel of the Oder, a town-house, and theater. Pop. '80, 14,447, who carry on a considerable transit-trade in timber, zinc, lead, hardware, cattle, and wines; and manufacture ribbons, linen goods, leather, and pottery.

OPPENHEIM, a t. of the grand-duchy of Hesse-Darmstadt, in the province of Rhenish Hesse, on the left bank of the Rhine, 10 m. s. by e. from Mayence, and on the railway between Mayence and Spires. It stands on the steep slope of a hill abounding in vineyards, and carries on a pretty active trade in wine. Oppenheim occupies the site of the Roman castle of Bauconia, and was made a royal palatinate under the Carolingians. It afterwards became one of the most important free towns of the empire. It was taken in 1218 by archbishop Adalbert of Mayence, in 1620 by the Spaniards, in 1631 by the Swedes under Gustavus Adolphus, and in 1634 by the imperialists, suffering much upon all these occasions. In 1689 the French under Melac almost entirely destroyed it. The church of St. Catharine, a fine specimen of the German architecture of 1262-1317, lies yet in a ruinous condition, except the eastern part. In 1878 the German reichstag voted £2,500 for its restoration. Pop. '80, 3,300.

OPPERT, JULES, b. Hamburg, 1825; educated at Heidelberg, where he studied law, and at Bonn, where he devoted himself to Arabic and Sanskrit. His first work was a treatise on *The Phonetic System of the Old Persians*. Being a Jew, and prevented on religious grounds from obtaining a position at a German university, he removed to France in 1847. He was professor of German in the lyceums of Laval and Rheims successively, and accompanied the expedition to Mesopotamia equipped by the French government. He returned in 1854, and has since made a special study of the cuneiform inscriptions. In 1857 he was called to the chair of Sanskrit in the school of languages connected with the imperial library at Paris. He has published among other works: *The Inscriptions of the Achemenidæ*, 1852; *Assyrian Studies*; *The French Scientific Expedition to Mesopotamia*; *A Sanskrit Grammar*, 1859; *The Great Inscription of the Khorsabad Palace*, 1864; *History of the Chaldean and Assyrian Empires, according to the Monuments*, 1866; and *The Immortality of the Soul among the Chaldeans, followed by a translation of the Goddess Istar Astarte's Descent to Hell*, 1875. He published *The People and Language of the Medes*, 1879.

OPPIAN, b. Cilicia, 2nd c., in the reign of Marcus Aurelius, or according to others in the reign of Severus. His father Agèsilaus, was a man of rank, who had his son instructed in the fine arts, geometry, and music. When Septimius Severus, who had usurped the throne, came to Anazarba, Oppian's birthplace, Agèsilaus was so intent upon his philosophical studies that he failed to pay his respects to the new emperor, who in consequence banished him to the island of Melita, in the Adriatic. His son Oppian accompanied him, and during his residence on the island finished his *Cynegetics*, or treatise on hunting, and *Halieutics*, or treatise on fishing. He then went to Rome, and offered both these poems to Antoninus Caracalla, the son of Severus, who was so pleased with them that he invited their author to ask any reward he pleased. Oppian contented himself with asking that his father might be released, and allowed to return to Cilicia. The emperor, besides granting this request, is said to have given him a piece of gold for every verse. Oppian went back to Cilicia, and died of the plague, at the age of 30. The *Halieutics*, written in hexameters, contain five books treating of fishes and fishing. The poem shows some zoölogical knowledge, though with many absurdities. The *Cynegetics* are in four books of hexameters, so inferior to to the *Halieutics* as to give rise to the supposition that they were composed by different persons. There is an English translation of the *Halieutics* by Draper and Jones, Oxford, 1722, and an English translation of the first book of the *Cynegetics* by Mawer, London, 1786.

OPPOSITION, the party in either house of the British parliament who are opposed to the existing government, and who would probably come into power on its displacement. The existence of a fair and temperate opposition, keeping a watch over the acts of the ministry, is undeniably conducive to good government; while, on the other hand, the conduct of public affairs may be seriously embarrassed by an opposition whose proceedings are conducted in a factious or obstructive spirit. The name opposition is not gen-

erally applied to a party, merely because opposed to the existing administration, if there is no likelihood of their succeeding to power on a change of government.

OPTIC NERVE. See EYE.

OPTICAL ILLUSION. Of all the senses none is more deceptive than the sense of sight; it often deceives us as to the distance, size, shape, and color of objects; it frequently makes them appear as if in situations where their existence is impossible; and often makes us think them movable when they are not so, and *vice versâ*. An object appears to us as large or small, near or distant, according as the rays from its opposite borders meeting at the eye form a large or a small angle: when the angle is large, the object is either large or near; when small, the object must be small or distant. Practice alone enables us to decide whether an object of large apparent size is so on account of its real size, or of its proximity; and our decision is arrived at by a comparison of the object *in position*, with other common objects, such as trees, houses, etc., which may chance to be near it, and of which we have by experience come to form a correct idea. The same is, of course, true of apparently small objects. But when all means for comparison are removed, as when we see a distant object floating on an extensive sheet of water, or erect in an apparently boundless sandy plain, where no other object meets the eye, then our judgment is completely at fault. Imperfection in the acquired perceptions of sight, as it is called, produces many other illusions; it leads us to consider spherical solids at a distance as flat discs, and deceives us regarding the size of objects, by their color; the sun appears larger than he would if illumined by a fainter light, and a man in a white habit seems larger than he would if he wore a dark dress. Illusions are also produced by external causes; and instances of this sort are given under MIRAGE, REFLECTION, and REFRACTION.

The property which the eye possesses of retaining an impression for a very brief, though sensible period of time (about one-quarter of a second), after the object which produced the impression has been removed, produces a third class of illusions. Common examples of this are the illuminated circle formed by the rapid revolution of an ignited carbon point, piece of red-hot iron, or other luminous body, and the fiery curve produced by a red-hot shot projected from a cannon.

Another form of illusion is produced to a person who is seated in a vehicle in motion, and it is very deceptive when the motion is so equable as not to be felt by the person himself. The illusion is most complete when the attention is riveted on an object several yards off; this object then appears as a center round which all the other objects seem to revolve, those between the observer and the object moving backwards, and those beyond the object moving forwards. This illusion occurs on a large scale in the apparent motion of the heavenly bodies.

Other illusions arise from a disordered state of the organs of vision; such are the seeing of things double or movable (if they are not so), or of a color different from the true one; the appearance as of insects crawling over a body at which the eye is directed, etc.

OPTICS is the science whose object is the investigation of the laws that regulate the phenomena of light and vision. The nature of light will be found treated of under LIGHT, and its various properties under CHROMATICS, DIFFRACTION, INTERFERENCE, LENS, POLARIZATION, REFLECTION, REFRACTION, SPECTRUM, etc.; and we shall confine ourselves in this article to a historical sketch of the rise and progress of the science.

Optics, as a science, is entirely of modern growth, for though the Greeks and their disciples the Arabs had made some progress in mathematical optics, their knowledge was confined to the law of reflection and its more immediate consequences. Euclid, Aristotle, Archimedes, Hero, and Ptolemy were acquainted with the fact that light is transmitted in straight lines, but with the important exception of Aristotle, and some of his followers, the ancient philosophers believed that rays proceeded *from* the eye *to* the object, instead of in the contrary direction. Ptolemy was well acquainted with atmospheric refraction. Alhacen (1070) and Vitellio the Pole (1260) were almost the only cultivators of this science during the middle ages, and their additions to it were unimportant. The lens, though known from early antiquity, was not applied as an aid to defective eye-sight till after the time of Roger Bacon. Jansen, Metius, and Galilei separately invented the telescope about the beginning of the 17th c.; and the last-mentioned philosopher, by its means, made various important astronomical discoveries. Kepler, a short time after, gave the true theory of the telescope, explained the method of finding the focal length of lenses, and applied it to find the magnifying power of the telescope, besides pointing out the mode of constructing an instrument better adapted for astronomical purposes than that of Galileo; he also made some useful experiments on the nature of colors, and showed that images formed on the retina of the eye are inverted, a fact previously discovered by Maurolycus of Messina. From this period the science of optics steadily advanced, and its treasury of facts received numerous additions through the labors of De Dominis, Snell (the discoverer of the law of refraction in 1621), Descartes, Fermat, Barrow, Mariotte, and Boyle. Up to the time of Newton it was generally believed that color was *produced* by refraction, but that philosopher showed by a beautiful series of experiments that refraction only separates the colors already existing in white light. In his hands the theory and construction of the tele-

scope underwent many valuable improvements, and in 1672 the description of his *reflecting* telescope was submitted to the royal society. Gregory had constructed an instrument on similar principles some years before. About the same time, Grimaldi made his interesting series of experiments on the effects of diffraction, and noticed the remarkable fact of the interference of one pencil of light with the action of another. The complete theory of the rainbow, with an elegant analysis of the colors of thin plates, and the hypothesis concerning the nature and propagation of light, now known as the "corpuscular" theory, completed Newton's contributions to the science. The important services of the ingenious but eccentric Hooke cannot be easily stated in such a brief extract, as he discovered a little of everything, completed nothing, and occupied himself to a large extent in combating faulty points in the theories of his contemporaries. It must not, however, be forgotten that he has as much right as Huyghens to the credit of originating the undulatory theory, which is the favorite one at present. The double refraction of Iceland spar was discovered (1669) by Bartholin, and fully explained in 1690 by Huyghens, the propounder of the undulatory theory, who also aided the progress of mathematical optics to a considerable extent. The velocity of light was discovered by Römer (1675), and in 1720 the aberration of the fixed stars and its cause were made known by Bradley, who likewise determined with accuracy the amount of atmospheric refraction. Bouguer, Porterfield, Euler, and Lambert rendered essential service to physical optics; the same was done for the mathematical theory by Dollond (the inventor of the achromatic telescope), Clairaut, D'Alembert, Boscovich, etc.; while in later times the experiments of Delaval on the colors produced by reflection and refraction; the discussion of the phenomena arising from unusual reflection or refraction, carried on by Vince, Wollaston, Biot, Monge, and others; the discovery of polarization of light by Malus (1808), and its investigation by Brewster, Biot, and Seebeck; of depolarization by Arago (1811), and of the optical properties as connected with the axes of crystals (1818) by Brewster; and the explanation of these and other optical phenomena, in accordance with the undulatory hypothesis by Young—the discoverer of the *interference* (q.v.) of rays—and Fresnel, went far to give optics a width of scope and symmetry which is possessed by few other sciences. The development of the undulatory theory and of optical science generally has been carried on in the present century by Lloyd, Airy, Cauchy, and others; and more recently important discoveries in connection with the physical modifications and chemical properties of light have been made (the latter chiefly, as far as the spectrum is concerned, by Kirchhoff), for a notice of which, and other discoveries, see PHOTOGRAPHY, SPECTRUM, and other articles.

OPTIMATES AND POPULARES, in the politics of republican Rome, were the conservative or aristocratic, and the democratic or progressive parties respectively. The *populares* comprised the great body of the people, including not only the proletariat but many men of wealth, but without personal influence. The *optimates* were the aristocracy, the great official houses, and their followers. The two parties perpetuated the old contests between the patricians and plebians. The *populares* triumphed under the leadership of C. Gracchus, and were crushed by Sulla.

OPTIMISM (Lat. *optimus*, best) the name given to the doctrine of those philosophers and divines who hold that the existing order of things, whatever may be its seeming imperfections of detail, is nevertheless, as a whole, the most perfect or the best which could have been created, or which it is possible to conceive. Some of the advocates of optimism content themselves with maintaining the absolute position, that although God was not by any means bound to create the most perfect order of things, yet the existing order *is de facto* the best; others contend, in addition, that the perfection and wisdom of almighty God necessarily require that his creation should be the most perfect which it is possible to conceive. The philosophical discussions of which this controversy is the development are as old as philosophy itself, and form the groundwork of all the systems, physical as well as moral, whether of the Oriental or of the Greek philosophy; of Dualism, Parsism, and of the Christian Gnosticism and Manichæism in the east; and in the west, of the Ionian, the Eleatic, the Atomistic; no less than of the later and more familiar, Stoic, Peripatetic, and Platonistic schools. In the philosophical writings of the fathers, of Origen, Clement of Alexandria, and above all of Augustine, the problem of the seeming mixture of good and evil in the world is the great subject of inquiry, and through all the subtleties of the mediæval schools it continued to hold an important and prominent place. But the full development of the optimistic theory as a philosophical system was reserved for the celebrated Leibnitz (q.v.). It forms the subject of his most elaborate work, entitled *Theodicea*, the main thesis of which may be briefly stated to be—that among all the systems which presented themselves to the infinite intelligence of God, as possible, God selected and created, in the existing universe, the best and most perfect, physically as well as morally. The *Theodicea*, published in 1700, was designed to meet the sceptical theories of Bayle, by showing not only that the existence of evil, moral and physical, is not incompatible with the general perfection of the created universe, but that God, as all-wise, all-powerful, and all-perfect, has chosen out of all possible creation the best and most perfect; that had another more perfect creation been present to the divine intelligence, God's wisdom would have required of him to select it; and that if another, even equally perfect, had been possible, there would not have been

any sufficient determining motive for the creation of the present world. The details of the controversial part of the system would be out of place in this work. It will be enough to say that the existence of evil, both moral and physical, is explained as a necessary consequence of the finiteness of created beings; and it is contended that in the balance of good and evil in the existing constitution of things, the preponderance of the former is greater than in any other conceivable creation. The great argument of the optimists is the following: If the present universe be not the best that is possible, it must be either because God did not know of the (supposed) better universe, or because God was not able to create that better one, or was not willing to create it. Now every one of these hypotheses is irreconcilable with the attributes of God: the first, with his omniscience; the second, with his omnipotence; and the third, with his goodness. See Leibnitz, *Theodicea*; Baumeister's *Historia de Mundo Optimo*. The view of the universe diametrically opposed to optimism is pessimism (*pessimus*, worst), and has of late been frequently maintained: see Sully's *Pessimism* (1877). See PESSIMISM.

OPUNTIA. See PRICKLY PEAR.

O'PUS OPERAN'TIS (Lat. literally "the work of the worker"), a well-known theological phrase, intended to convey that the effect of a particular ministration or rite is primarily and directly due, not to the rite itself (*opus*), but to the dispositions of the recipient (*operans*). Thus, in the act of kissing or praying before a crucifix, of sprinkling one's self with holy water, of telling the prayers of the rosary upon blessed beads, the fervor and personal piety of the supplicant, and not the material object of the religious use, is held to be the efficient cause of the grace which is thereby imparted. The term is used chiefly by writers of the Roman-Catholic schools, in whose system, however, the sacramental rites are held to differ from all others in this respect. See OPUS OPERATUM.

O'PUS OPERA'TUM (Lat. literally "the work wrought") is the phrase employed in the Catholic theological schools to describe the manner of the supposed operation of the sacramental rites in the production of grace (q. v.). It is intended to imply that the ministration of the rite (*opus*) is in itself, through the institution of Christ, an efficient cause of grace, and that, although its operation is not infallible, but requires and presupposes certain dispositions on the part of the recipient, yet these dispositions are but *conditiones sine qua non*, and do not of themselves produce the grace; and hence, when the sacraments are administered to dying persons in a state of apparent insensibility, this is done in the hope and on the presumption that the dying person may, though seemingly unconscious, be nevertheless really disposed to receive the sacrament: but it is by no means held that if these dispositions be wanting, the sacrament will itself justify him. It is a mistake, therefore, to suppose, as is often done in popular controversy, that Catholics ascribe to the sacramental rites such magical or talismanic power that they can sanctify even an unrepentant sinner. Their efficacious operation *presupposes as conditions* the repentance and other moral dispositions of the recipient, although the grace which they give *is due not to these dispositions, but to the sacraments as received with the dispositions*.

OP'ZOOMER, CAROLUS WILHELMUS, b. Holland, 1821; educated at Leyden, where he attacked Christianity in his *Examination of the Dutch Annals of Theology*. He was called to the chair of philosophy at the university of Leyden in 1846. His best known philosophical work is his *Path of Knowledge*, 1851, in which he maintains rational empiricism. His chief journalistic work is *Elections Direct and Indirect*.

OR, in heraldry, the metal gold, represented in heraldic engravings by an unlimited number of dots.

ORACHE, *Atriplex*, a genus of plants of the natural order *chenopodiaceæ*, having male, female, and hermaphrodite flowers; the male and hermaphrodite flowers with a 3-5 partite calyx, and 3-5 stamens; the female flowers with a compressed and 2-lobed or 2-partite calyx. The species are numerous. Some of them are of frequent occurrence in waste places, and as weeds in gardens in Britain and throughout Europe. GARDEN ORACHE (*A. hortensis*), also called MOUNTAIN SPINACH, was formerly much cultivated in England, and is still cultivated in some parts of Europe as a substitute for spinach. It is a native of Tartary, an annual, with a stem about 3 ft. high, and cordate-triangular leaves, which are thick and glaucous, and have a slightly acid flavor. The leaves are sometimes greenish, sometimes reddish, which is the case also in other species, and the flowers resemble the leaves in color.—The leaves of the sea orache (*A. littoralis*), a native of the British coasts, are used in the same manner, and those of the common garden-weeds, *A. patula* and *A. angustifolia*, are excellent substitutes for spinach.—It is mentioned in Remy and Brenchley's *Journey to the Salt Lake City*, that an orache, with pale pink leaves and a salt taste, is cultivated by the Indians on the Humboldt river for its seed, which resembles that of Quinoa (q. v.), and is used like it for making porridge and bread.

ORACLE, the response delivered by a deity or supernatural being to a worshiper or inquirer; also the place where the response was delivered. These responses were supposed to be given by a certain divine afflatus, either through means of mankind, as in the orgasms of the Pythia, and the dreams of the worshipper in the temples; or by its effect on certain objects, as the tinkling of the caldron at Dodona, the rustling of the sacred

laurel, the murmuring of the streams; or by the actions of sacred animals, as exemplified in the Apis or sacred bull of Memphis, and the feeding of holy chickens of the Romans. This arose, in fact, from the idea that the deity signified his intentions to men by signs or inspirations, which, however, had always to be interpreted to the inquirer by the priesthood. Such responses were, however, closely allied to augury, which differed in this respect that auguries could be taken anywhere, while the oracular spots were defined and limited. Oracle dates from the highest antiquity, and flourished in the most remote ages, and gradually declined with the increasing knowledge of mankind. Among the Egyptians all the temples were probably oracular, although only a few are mentioned by Herodotus, as the oracle of Latona, in the city of Buto; those of Hercules, Mars, Thebes, and Meroe. In the hieroglyphic texts the gods speak constantly in an oracular manner, and their consultation by the Pharaohs is occasionally mentioned. In later days the most renowned of these oracles was that of Ammon, in the Oasis (q.v.), where oracular responses were rendered either by the shaking of the statue of the god, or by his appearance in a certain manner. Oracles were also used by the Hebrews, as in the consultation of the Urim and Thummim by the high priest, and the unlawful use of Teraphims, and consultations of the gods of Phenicia and Samaria. The Hebrew oracles were by word of mouth, as the speech of God to Moses, dreams, visions, and prophetic denunciations; besides which, there were oracles in Phenicia, as that of Belzebub and others of the Baalim. They were also in use throughout Babylonia and Chaldæa, where the responses were delivered by dreams given to the priestesses, who slept alone in the temples as concubines of the gods. So numerous were they in the ancient world, that 300 are said to have been in existence.

The most celebrated oracles of Asia Minor were those of Telmissus in Caria or Lycia, which gave responses by dreams, and that of Apollo at Patara; but the Grecian oracles enjoyed the highest reputation for truthfulness, and the most celebrated of these were the Dodonean, the Delphic, and that of Trophonius and Amphiaraus. The Dodonean (see DODONA) was the only oracle in Greece which was given by Jupiter; the others were either those of Apollo, or of certain soothsayers, to whom that god had imparted the gift of prophecy, or of other gods. The most renowned of all was the Delphic oracle (see DELPHI), and was Panhellenic, or open to all Greece, consulted for public purposes, and occupying a position resembling in some respects that of the papacy in the middle ages in Europe. The name of the first priestess who gave oracles was Phemonœ. The consultations were generally in the Delphic month, *Bysios* or April, and once a day on other months; and the precedence of consulting the oracle was determined by lot, but rich presents obtained for Cræsus and the Lydians the privilege of first consultation. Sacrifices were offered by the inquirers, who walked with laurel crowns on their heads, and delivered in sealed questions; the response was deemed infallible, and was usually dictated by justice, sound sense, and reason, till the growing political importance of the shrine rendered the guardians of it fearful to offend, when they framed the answers in ambiguous terms, or allowed the influence of gold and presents to corrupt the inspirations. The other oracles of Apollo were at Aba in Phocis; at Ptoon, where a man prophesied, which was destroyed in the days of Alexander the Great; and at Ismenus, s. of Thebes, Hysia, Tegyra, and Eutressis. In Asia Minor the most celebrated was that of Branchidæ, close to Miletus, celebrated in Egypt, Gryneum, and Delos. Besides that of Dodona, Zeus had another at Olympia; and those of various other deities existed elsewhere. A secondary class of oracles of heroic or prophetic persons existed in Greece, the two most celebrated of which were those of Amphiaraus and Trophonius. The first mentioned was one of the five great oracles in the days of Cræsus, and was situate at Oropus, in Attica, being the shrine of a deified magician, or interpreter of dreams, having a fountain close to it. Those who consulted it fasted a whole day, abstained from wine, sacrificed a ram to Amphiaraus, and slept on the skin in the temple, where their destiny was revealed by dreams. That of Trophonius was at Lebæa, in Bœotia, and owed its origin to a deified seer. It was given in a cave, into which the votary descended, bathed, and anointed, holding a honeyed cake. He obtained a knowledge of futurity by what he saw or heard, and returned dejected from the cavern. Then, seated upon the seat of Mnemosyne, he gave an account of what he had heard, and, conducted to the chapel of good fortune or good genius, recovered his usual composure. There were some other oracles of minor importance. Besides these oracles, written ones existed of the prophecies of celebrated seers, as Bacis and Musæus, which were collected by the Pisistratidæ, and kept in the acropolis of Athens. Those of the Euclus, Panolmus, and Lycus were also celebrated. Others of the Sibyls or prophetic women, daughters of Zeus and Lamia, were popular, and at a later period (see SIBYLS), Athenais and others, prophesied in the days of the Seleucidæ. Amongst the oriental nations, as the Arabs and others, divination was and is extensively practiced, but there are no set oracles. The Celtic Druids are said to have delivered responses, and the oracle of the Celtic god Belenus or Abelio, in the Isle de Sein, was celebrated. Herod. *Hist.* v. 89, viii. 82; Curtius, iv. 7; Hare, *Ancient Greeks*, (12mo, Lond. 1836, p. 141); Bos, *Antiquities of Greece* (1823, p. 31).

ORAN' (Arab. *Waran*), a thriving municipal t. and sea-port of Algeria, capital of the province of the same name, stands at the inner extremity of the gulf of Oran, 220 m.

w.s.w. of Algiers. The province of Oran, sometimes called the province of the west, from the fact of its forming the western frontier of the country, is bounded on the n. by the Mediterranean, on the e. by the province of Algiers, on the w. by the empire of Morocco, and on the s. by the desert. Area about 100,000 sq.m., of which 13,514 belong to the Tell (q.v.), and a large portion to the Sahara. Pop. '72, 513,492, four-fifths of whom were Arabs. The town of Oran is the seat of the government offices—the prefecture, the civil, criminal, commercial tribunals, etc. It also contains a college, primary and native schools, Protestant and other churches; synagogues; mosques; a branch of the bank of Algeria; exchequer, post, and telegraph offices; three great barracks, St. Philippe, le Château-Neuf, and le Château-Vieux; a military hospital, with accommodation for 1400 beds (an immense new building, which overtops all surrounding edifices), and various splendidly appointed magazines and government stores. The town, which is girt by walls, and defended by strongly armed forts, is seated at the foot of a high mountain, crowned by the forts Santa-Cruz and Saint-Gregoire. The port does not offer safe anchorage; although it has been much improved within recent years. Large vessels, however, have still to find shelter in the roadstead of Mers-el-Kebir, 3 m. distant. The streets and promenades of Oran are generally spacious, the houses elegant and airy. The principal edifices are the Château-Neuf, the residence of the general of division; the Hôtel de la Préfecture; the great mosque de la Rue Philippe; the Catholic church; and the barracks. Pop. of commune, comprising the three suburbs, Mers-el-Kebir, La Senia, and Aïn-el-Turk, '81, 59,377. The country in the vicinity is bare and arid, although the land is not sterile. To the s. of the town the country is uncultivated; but towards the s.e., highly cultivated lands are seen. In the vicinity there are a great many farms, cultivated with the greatest care, and most of them furnished with buildings necessary to their efficiency. Cattle are reared, and grain, tobacco, and cotton are grown. The vine already covers large tracts of land, and its cultivation is annually extending. It is cultivated with the most complete success, and the wines are of good quality.

Besides the commune of Oran, there are in the province the communes of Sidi-bel-Abbès (q.v.), of Mostaganem (pop. 11,950), of Mascara (pop. 8,629), and of Tlemcen (q.v.)

The town of Oran was built by the Moors. It was taken by the Spaniards in 1509, by the Turks in 1708, and again by the Spaniards in 1732. In 1791 it was destroyed by an earthquake, and shortly after it was altogether abandoned by the Spaniards. Oran was taken by the French in 1831, has since remained in their hands, and has by them been developed into a large and prosperous town. Vessels with an aggregate tonnage of 65,000 tons enter and clear the port yearly. The annual imports amount to about £1,307,700, and the exports to £260,990. A bishopric was established at Oran in the year 1867.

ORANG, or **ORANG-OUTANG**, *Simia satyrus*, or *Pithecus satyrus*, or *P. Abellii*, a species of ape found in the forests of Malacca, Cochin-China, and some of the islands of that part of the world. The name is sometimes extended in signification, so as to include all the species of the restricted genus *simia* or *pithecus*, a genus which exists only in the s.e. of Asia and the eastern archipelago; and was also till of late extended even to the African apes now forming the genus *troglydytes*, the species which is the subject of this article being distinctively called the **RED ORANG**, when it and the chimpanzee were the only *anthropoid* apes known. The name orang is Malayan, and signifies *man* or *rational being*; outang signifies *wild*, or *of the woods*. The genus *simia* or *pithecus* differs from *troglydytes* (the chimpanzee and gorilla) in the more lengthened muzzle—the lower part of the face projecting suddenly and remarkably; in the very large canine teeth; in the great breadth of the central incisors; and in the great length of the arms, which are so long that the fingers can touch the ground when the animal stands erect. The ears are also small, and lie close to the head. The eyes are close together; the nose is little elevated; the lips are scarcely visible when the mouth is shut. The apes of this genus are arboreal in their habits, and not gregarious. They are ill-adapted for walking on the ground, and in a wild state probably almost never assume an erect posture, and although they can be taught to do it in confinement, they maintain it with difficulty, and only when standing still; even then often seeking to adjust the balance of the body by raising the arms above and behind the head. In climbing and swinging among the branches of trees, the hands of the hinder extremities are used as readily as those of the anterior, and the great length of the arms is useful in enabling them to take hold of distant branches. The fingers of all the extremities are very long.

Some of the most important distinctions between the anatomy of the anthropoid apes and that of man, are noticed in the article **CHIMPANZEE**. The orang and its congeners are regarded as differing more widely from man in their anatomical characters than the chimpanzee and gorilla; although the number of ribs is the same as in man, and there are a few other particulars in which the orang more nearly resembles a human being than any of the African apes do. The projecting muzzle is much less notable in the young than in the adult orang, and the aspect of the adult males is further rendered hideous by great callosities on the cheeks. In the adult state, the ridges of the skull also greatly increase in thickness and prominence.

The species of this genus exhibit in a much greater degree than those of *troglydytes* an anatomical character common also to many other apes and monkeys, a pouch in the

Orange.

throat, opening from the windpipe, and capable of being dilated with air at the pleasure of the animal. In the orang, it branches into several subordinate pouches, which are situated among the muscles of the throat. The use of this organ is not known. It does not appear to have any connection with the voice; and has been supposed, not very probably, to be of some service in leaping, by diminishing the specific gravity of the animal.

There are at least two other species of the genus besides that best known as the orang, one of these being the great pongo (q.v.) of Borneo (*S.* or *P. Wormbii*), and the other (*S.* or *P. morio*), also a native of Borneo, of comparatively small size. The natural history of these apes has not been thoroughly investigated; and, until recently, it was supposed that the species first known might be identical with the great ape believed to exist in the woods, and that the differences of size and other characters might depend merely on age. The orang is about 3 ft. in length from the heel to the crown of the head. It is covered with brownish-red hair, which, on the back and arms, is 5 or 6 in. long, but very short on the backs of the hands and feet. There is little hair on the face, and none on the palms of the hands. When taken young, it is easily tamed, and becomes sufficiently familiar. It displays considerable sagacity, and some playfulness and love of mischief, but is not so frolicsome as many of the monkey tribe. Young specimens have sometimes been brought to Europe, but none have lived long. The temper is believed to change very much to the worse, when the animal reaches maturity.

ORANGE, the name of one or more species of *citrus* (q.v.), of which the fruit is much prized. Botanists generally regard all the oranges as of one species, *citrus aurantium*, but some follow Risso in making the sweet orange, the bitter orange, the bergamot orange, etc., distinct species. The wild state of the orange is not certainly known, although its characters may be pretty confidently inferred from the degeneration of cultivated varieties; and no cultivated plant shows a greater liability to degenerate, so that seedling oranges are almost always worthless. Nor is its native country more certain, although there is much reason to believe that all the kinds have spread over the world from the warmer central and eastern parts of Asia. It has been alleged that the orange is a native of North America, near the gulf of Mexico; but the probability rather seems to be that it has been introduced, and has become naturalized.

The **COMMON ORANGE**, or **SWEET ORANGE** (*citrus aurantium* of Rissio), is an evergreen tree of moderate size, with greenish-brown bark; the leaves oblong, acute, sometimes minutely serrated, the leaf-stalks more or less winged, the flowers white, the fruit roundish, the oil-cysts of the rind convex, the juice sweet and acid. It is cultivated in almost every part of the world of which the climate is warm enough, but succeeds best in the warmer temperate or sub-tropical climates, as in the s. of Europe, where it is very extensively cultivated, as far n. as the s. of France. The orange does not seem to have been known to the Greeks or Romans, but was probably brought to Europe by the Moors, and is supposed to have been introduced into Italy so recently as the 14th c., fully 1000 years after the citron. In the n. of Italy, oranges are sometimes grown in conservatories, but often in the open air, except during winter, when they are covered with temporary houses of boards. In the s. of England they are sometimes in like manner grown in the open air, with a shelter of boards or matting in winter, but trained against a south wall; attaining a large size, and yielding good fruit. The abundant importation of the fruit, however, renders the cultivation of the orange in Britain unnecessary; and, in general, only small plants are to be seen in green-houses or conservatories, as mere objects of interest. In former times, when the evergreen shrubs in cultivation were much fewer than now, orange trees were very commonly cultivated in pots, both in green-houses and in windows of apartments in Britain, as is still the case in the northern parts of Germany. The orange loves a rich soil, and succeeds well in a strong clay. There are many varieties in cultivation, which are perpetuated by grafting upon seedling orange stocks, and by layers.

Of the varieties of the sweet orange, perhaps the most deserving of notice are the **PORTUGAL** or **LISBON ORANGE**, the most common of all, having the fruit generally round or nearly so, and a thick rind; the **CHINA ORANGE**, said to have been brought by the Portuguese from China, and now much cultivated in the s. of Europe, having a smooth thin rind and very abundant juice; the **MALTESE** or **BLOOD ORANGE**, remarkable for the blood-red color of its pulp; the **EGG ORANGE**, having fruit of an oval shape; and the **TANGERINE ORANGE**, having a small flat fruit, with a pleasant odor and finely flavored pulp. The **ST. MICHAEL'S ORANGE** appears to be a sub-variety of the China orange. The **MAJORCA ORANGE** is seedless, resembling in this certain cultivated varieties of other fruits.

The **BITTER ORANGE**, **SEVILLE ORANGE**, or **BIGARADE** (*citrus vulgaris*, or *C. bigaradia*), is distinguished from the sweet orange by the more truly elliptical leaves, the acid and bitter juice of the fruit, and the concave oil-cysts of its rind. Its branches are also spiny, which is rarely the case with the sweet orange. The varieties in cultivation are numerous. The bitter orange was extensively cultivated by the Moors in Spain, probably for medicinal purposes. The rind is more bitter than that of the sweet orange, and is used as a stomachic and tonic. Its chief use, however, is for flavoring puddings, cakes, etc., and for making marmalade.

The **BERGAMOT ORANGE** (*C. bergamia*) is noticed in a separate article.

The MANDARIN ORANGE, or CLOVE ORANGE (*C. nobilis*), recently introduced from China, has fruit much broader than long, with a thick rind, very loosely attached to the flesh, so that there is often a space between them. The leaves are smaller than those of any other kind of orange.

Orange leaves are feebly bitter, and contain a fragrant volatile oil, which is obtained by distilling them with water, and is known in the shops as *essence de petit grain*. Orange flowers yield, when distilled with water, a fragrant volatile oil, called *oil of neroli*, which is used in making *eau de cologne*, and for other purposes of perfumery. The flowers both of the sweet orange and of the bitter orange yield it, but those of the bitter orange are preferred. Dried orange flowers, to be distilled for this oil, are an article of export from the s. of Europe. They are packed in barrels, and mixed with salt. The dried flowers have a yellowish color; the fresh flowers are white and very fragrant. The use of them as an ornament in the head-dress of brides is common throughout great part of the world. The small green oranges, from the size of a pea to the size of a cherry, which fall from the trees, both of the sweet orange and the bitter orange, when the crop is too great to be brought to maturity, are carefully gathered and dried, and are the *orange berries* of the shops. They are used in making curaçoa. They also yield a fragrant oil on distillation, the original *essence de petit grain*; and they are smoothed in a turning-lathe, and employed as *issue pease*; not readily acquiring a fetid odor, as pease do when employed for this purpose. The dried and candied rind of the ripe bitter orange, well known as *orange-peel*, is used as a stomachic, and very largely for flavoring puddings and articles of confectionery. The rind of the sweet orange is sometimes employed in the same way, but is inferior. A fragrant essential oil is obtained from the rind of the orange by distillation with water, and is sold by perfumers as *oil of sweet orange*, or *oil of bitter orange*, according as it is obtained from the one or the other, although the two kinds of oil are very similar. The rind of the orange is used in the preparation of a fine liquor called *orange rosoglio*, which is an article of export from some parts of Italy. Besides the use of the sweet orange as a dessert fruit, and as a refrigerant in cases of sickness, its juice is extensively used as a refrigerant beverage, and is particularly valuable in febrile and inflammatory complaints.

Orange trees are often extremely fruitful, so that a tree 20 ft. high, and occupying a space of little more than 12 ft. in diameter, sometimes yields from 3,000 to 4,000 oranges in a year. The orange tree attains an age of at least 100 to 150 years. Young trees are less productive than old ones, and the fruit is also less juicy, has a thicker rind, and more numerous seeds.

The wood of the orange tree is yellowish-white and close-grained. It is used for inlaying and for turnery.

The fruit of the orange tree is of great commercial importance, for not only is it one of the most delicious and wholesome of fruits, but fortunately it is also the most easily kept and carried from place to place. No fresh fruit possesses in the same degree as the orange, and its congeners, the lemon, citron, lime, etc., the property of being easily packed in boxes, when nearly ripe, and being in that state able to stand the close confinement of a ship's hold during a voyage of two or three weeks. The orange is much cultivated in the Azores, Malta, Sicily, Spain, and Portugal, and it is from these localities that Britain receives its supply. Those from St. Michael's, one of the Azores, and from Malta, are the best varieties in our markets; but the *mandarin orange* of China and the navel orange of South America are much superior. The latter occasionally reach this country in small quantities from Brazil; they are nearly double the size of the ordinary orange, and have a peculiar navel-like formation on the top of the fruit, which is somewhat oval in shape. The very small orange, now often seen in our shops, with an extremely aromatic rind, is the Tangerine orange, of which there are two varieties—the greater and lesser. The latter is hardly an inch in diameter, but the flesh is sweet, and the rind deliciously fragrant. The larger variety is about half the size of a common orange, and is the one generally seen.

The bitter orange is called the Seville orange in consequence of large plantations, which the Moors planted round the city of Seville, having for a long time furnished the chief part of those used in this country; but it also has several varieties, which are all remarkable for the bitterness of the rind, and the not very pleasant sharpness of the juice. Their chief use is for making the well-known confection called orange marmalade, and for this the true *large-fruited* variety is the best, but it is now somewhat scarce.

Oranges, when gathered for export, must not be quite ripe; those fully formed, and with the color just turning from green to yellow, are chosen. Each is wrapped in a piece of paper, or in the husk of Indian corn, and they are packed in boxes and half-boxes, chests and half-chests—the former are the Sicilian packages, the latter are St. Michael's, Spanish, and Portuguese. A box contains about 250, a chest about 1000 oranges; and the price ranges from 15s. to 30s. per box, and from 30s. to 50s. a chest. The crop begins to arrive early in November, and the ships continue to bring them until the spring. The quantity consumed in Great Britain alone is enormous; and since the duty was removed, has reached nearly two millions of bushels annually.

Orange-peel, or the rind of the orange, is used both in medicine and in confectionery—for the former purpose, it is merely cut into long strips, and dried; for the latter, it is carefully separated, either in halves or quarters, from the fruit, and after lying in salt

Orange.

water for a time, is washed in clear water, and then boiled in syrup of sugar, or candied, and is sold extensively as candied peel. The rinds of the citron and lemon are treated in the same manner.

ORANGE (*ante*), a fruit cultivated in Florida, Texas, Louisiana, southern California, and some other states. In Florida there are extensive groves of wild oranges, which are of use in budding other varieties, and the cultivation of the orange is an important industry. In Florida three methods of establishing an orange grove are in use. Either stocks are raised from seed, budded in a nursery, and set out when of proper size; or young wild trees are transplanted and budded; or a wild grove is cleared, and budded with sweet fruit.

ORANGE, a co. in central Florida, bounded on the n.e. by St. John's river; 2,500 sq.m.; pop. '80, 6,618—1023 colored. The surface is even, and much of it covered with swamp, lakes, and great forests of pine. The soil is sandy. Cattle-grazing is the principal pursuit, and large numbers of cattle are raised and exported. Corn, sweet potatoes, and cotton are cultivated to some extent. Co. seat, Orlando.

ORANGE, a co. in s. Indiana, drained by Lost creek and Patoka creek, on the Louisville, New Albany and Chicago railroad; 400 sq.m.; pop. '80, 14,363—14,315 of American birth. The surface is undulating, and in the s. hilly. The soil is fertile, and produces good crops of corn, wheat, oats, tobacco, and potatoes. There are flour and saw mills, and manufactories of whetstones and harnesses. Co. seat, Paoli.

ORANGE, a co. in s.e. New York, adjoining New Jersey, bounded e. by the Hudson and s.w. by the Delaware; drained by the Shawangunk, Wallkill, and Ramapo rivers; traversed by the Erie and New York, and the Oswego Midland railroads; 800 sq.m.; pop. '80, 88,217—75,812 of American birth. The surface is diversified, much of it occupied with the Hudson highlands, and contains iron, granite, and limestone. The soil is fertile, and produces good crops of corn, grass, oats, and potatoes. It is one of the best dairy-farming districts in the state, and produces immense quantities of milk and butter. West Point is in this county. Co. seat, Goshen.

ORANGE, a co. in n. central North Carolina, drained by New Hope creek and the Neuse, Flat, and Haw rivers, on the North Carolina railroad; about 600 sq.m.; pop. '80, 80,902—66,343 of American birth. The surface is undulating and heavily wooded, and the soil generally fertile. The great staple is tobacco. Corn, wheat, oats, potatoes, sweet potatoes, and cotton are also raised. Sandstone is abundant. Co. seat, Hillsborough.

ORANGE, a co. in e. Texas, adjoining Louisiana, bounded on the e. by the Sabine river, on the s. by Sabine lake, and on the w. by the Neches river; 400 sq.m.; pop. '80, 2,938. The surface is mostly even, well wooded in some portions. The soil is fertile, and adapted to agriculture or grazing. The principal productions are corn, sweet potatoes, and cotton. Rice grows well on the wet lands. Many cattle are raised. Co. seat, Orange.

ORANGE, a co. in e. Vermont, drained by the White river and Wait's river, on the Connecticut and Passumpsic River railroads; 680 sq.m.; pop. '80, 23,529—21,819 of American birth. The surface is diversified and hilly, and much of it heavily wooded with beech, maple, elm, and other trees. Copper and slate are found. The soil is fertile, and produces good crops of corn, oats, hay, and potatoes. The sugar maple abounds, and much maple sugar is made. Other staples are wool and butter. There are flour, saw, and woolen mills, and manufactories of carriages and agricultural tools. Co. seat, Chelsea.

ORANGE, a co. in n. central Virginia, s. of the Rapidan river, intersected by the North Anna; on the Potomac, Fredericksburg and Piedmont, and the Chesapeake and Ohio railroads; 280 sq.m.; pop. '80, 13,051—6,844 colored. The surface is uneven and heavily wooded. The soil is fertile, and the principal productions are corn, wheat, and oats. Co. seat, Orange Court-House.

ORANGE (the ancient *Arausio*), an ill-built, decaying, and dirty, but also an interesting town of France, in the department of Vaucluse, stands in a beautiful plain on the left bank of the Aigue, 16 m. by railway n. of Avignon. Its chief manufactures are silks, muslins, serges, etc.; and there are numerous oil-works, dye-works, and tanneries. It carries on a considerable trade in wine, spirits, oils, truffles, saffron, honey, madder, and essences. Pop. '76, 6,782.

Orange was the capital of a small independent principality of the same name (now comprised in the department of Vaucluse), which was ruled by its own sovereigns from the 11th to the 16th century. The last of these sovereigns, Philibert de Chalons, died in 1531 without issue. His sister, however, had married a count of Nassau, and to that house the estates and titles passed. The count of Nassau who obtained the principality of Orange was William, the father of William I., the stadtholder of the United Provinces (see WILLIAM, PRINCE OF ORANGE). William III., prince of Orange and king of England, having died in 1702 without issue, there began a long-continued controversy as to the succession between Frederick I. of Prussia (as grandson of one of the last princes of Orange), the representative of the older branch of the house of Nassau (q.v.), and the

head of the younger line. At the peace of Utrecht (1713) the king of Prussia took the settlement into his own hands; so far as the territory of Orange was concerned, by making it over, for certain equivalents, to the king of France. The title, prince of Orange, remained with the younger Nassau line, afterwards kings of the Netherlands, and is now borne by the heir-presumptive to the Dutch throne.

In the vicinity of Orange are several notable Roman remains. The triumphal arch, 60 ft. high, is celebrated for the beauty of its architecture, and for its richly sculptured *bassi-relievi*. Of the theater, the remains are sufficiently entire to give a good idea of the arrangements of this institution as it existed among the Romans.

ORANGE, a township in New Jersey, United States, four m. n.w. of Newark, containing three villages, Orange, North Orange, and South Orange. Orange mountain commands a noble view of New York city and bay, and its slope is laid out in beautiful parks, and ornamented with villas. It is the site of a Roman Catholic college and a water-cure establishment. Pop. '70, 9,348.

ORANGE (*ante*), a city in Essex co., N. J., primarily the name given in honor of the prince of Orange to a pleasant village w. of Newark, which, since its intersection by what is now the Morris and Essex division of the Delaware Lackawanna and Western railroad, has greatly increased in population and importance. A few years ago it was divided by legislative enactment into the city of Orange and the townships of East and West Orange. But, notwithstanding the separating influences that have been thus strengthened, a substantial unity binds the whole region together, which will probably constitute one large city at no distant day. It stands on ground rising from the city of Newark by successive ridges to the summit of the Orange mountain, which is 650 ft. in height. The streets and avenues are laid out mostly at right angles and have Telford road beds, which afford about 60 m. of admirable drives. Llewellyn park, extending from the base to the summit of the mountain, contains 750 acres, 50 of which form a ramble for the common use of the residents, who now include above 50 families. There are 10 m. of drives through the park, kept in order by an annual contribution from each family. Eagle rock, at one extremity, affords a fine view of New York and its environs. The whole region, including South Orange, contains about 30 churches, nearly as many school organizations, seven stations of the Delaware Lackawanna and Western railroad, besides several of the Watchung road, a line of horse cars running to Newark, one national and two savings banks, the Park and Mansion House hotels, with pleasant accommodations for boarders, several post-offices, an orphan asylum, hospital, Seton Hall (Roman Catholic college), and a large number of residences in various styles of architecture, many of them elegant and tasteful. The total population of the city and towns is about 30,000. Pop. of Orange, '80, 13,207.

ORANGEBURG, a co. in s.w. South Carolina, bounded on the n.e. by the Congaree and Santee rivers, and on the s.w. by the Edisto; on the South Carolina railroad; 900 sq.m.; pop. '80, 40,995—28,201 colored. The surface is diversified and the soil fertile. The principal productions are corn, wheat, rice, cotton, and sweet potatoes. Co. seat, Orangeburg Court-House.

ORANGE COLORS, for painters' use, are various shades of alteration produced on chrome yellow (see **YELLOW**), by acting on it either with diacetate of lead or a weak alkaline lye, both of which redden the otherwise pure yellow, and give it an orange tint.—For dyers, a beautiful orange red is obtained from safflower; and orange yellows are made by mixing, in proper proportions, any of the red with the yellow dyes.

ORANGE OIL, an essential oil obtained by distilling or pressing the rind of the orange. It is composed principally of the hydrocarbon *hesperidine*, $C_{10}H_{16}$. It changes rapidly on exposure to the air, acquiring a turpentine-like odor, the occurrence of which is prevented or retarded by the addition of 5 or more per cent of alcohol. It commences to boil at $347^{\circ}F.$, and 97.8 per cent goes over below 356° . The remainder is a soft, inodorous, yellow resin. *The oil of orange flowers, or oil of neroli*, is a volatile oil of a very agreeable odor, and much used in perfumery. It is usually obtained in the preparation of orange flower water, separating upon the surface in small quantities. It has a brownish color, a bitterish, aromatic taste, and a density of 0.889. It is neutral to test paper, and shows a bright violet fluorescence when mixed with alcohol. On being shaken with a concentrated solution of bisulphite of sodium it assumes an intense permanent crimson hue. It is a hydrocarbon having the same composition as hesperidine $C_{10}H_{16}$, and contains a small quantity of an inodorous crystallizable camphor. The commercial oil of neroli is generally yellowish or reddish yellow, and is frequently adulterated with oil of bergamot and orange leaves.

ORANGE RIVER. See **GARIEP**.

ORANGE RIVER FREE STATE. The Orange River Free State is the name assumed by the republic of Dutch boers, who, after retiring from Natal when declared a British colony, established themselves in the country lying between the two great branches of the Orange river, the Ky Gariep and the Gariep, known to the colonists as the Vaal and Orange rivers, and separated from the coast region by the great chain of the Quathlamba, Maluti, and Drachenberg mountains.

The Orange River Free State forms a sort of connecting link between the Cape Colony, the Transvaal Territory, and Natal. It consists chiefly of vast undulating plains, which slope down from the Maluti mountains to the Vaal river, dotted over here and there with rocky hills, locally called "Kopjies," although in the northern part hundreds of square miles are found with hardly a break on the horizon. It comprises an area of above 60,000 square miles.

When the emigrant Dutch boers took possession of this country, it was inhabited by different tribes of Betjouanas and Corannas, ail of whom have been dispersed, except the powerful Basuto tribe, under the late chief Moshesh. The country is very rich in minerals; precious stones occur; coal is found everywhere, and iron, tin, copper, and lead are plentiful; besides plumbago, alum, saltpetre, ochre, and useful earths.

All the rivers of this region are affluents of either of the branches of the Gariep; amongst them may be named the Modder, Valsch, Great and Little Vet, which run into the Ky Gariep or Vaal river, and the Caledon, a considerable stream, which joins the Orange river after draining the Basuto country.

This region is a vast plateau, rising from 3,000 to 5,000 ft. above the sea-level, with very little wood, except along the lines of the water-courses that traverse it. Travelers crossing this state from the Cape Colony to Natal arrive at the top of the passes leading to the latter colony without a mountain being in sight, and then find themselves suddenly on the edge of an immense mountain-chain, with the coast region several thousand feet below them, extending to the Indian ocean. Immense herds of the larger antelopes formerly tenanted these vast plains, and are vividly described by capt. Harris, Gordon Cumming, and others; they are now fast disappearing. The diamond-fields recently discovered lie in this state, partly in Griqualand West, now British territory.

The land in the Free State is very fertile. The difference of temperature in various parts of it renders it possible to raise tropical and sub-tropical products, coffee, sugar, rice, and cotton in some parts; while hemp, flax, and the vegetables of northern latitudes grow freely elsewhere. Tobacco and maize are largely cultivated, and fruits can be had all the year round. The climate of the state is very healthy, and that of the uplands, considering the latitude, is wonderfully cool. The houses of most of the inhabitants are little more than strongly built mud huts, very sparsely furnished. Total pop., 133,518.

The capital, Bloemfontein, is the only town of considerable size, and contained, 1881, 2,567 inhabitants. The other villages, or small towns, are on the increase. The Dutch Reformed church has about 20 congregations; the Anglican, Wesleyan, Lutheran, and Roman Catholic churches are also represented. There are 13 administrative districts in the state. The public income in 1883-4 was stated at £264,438; the expenditure at £268,671.

The history of the country forming the Free State may be summed up in a few words. Capt. Harris describes it, before 1836, as a howling wilderness, inhabited by wandering hordes of Bushmen and broken tribes of Betjouana and Zulu refugees from the armies of the great Zulu tyrants, Chaka, Dingaan, and Maselikutse. After the Kaffir war of 1835-36, a spirit of dissatisfaction arising in the minds of many of the frontier boers, an extensive emigration took place along the n.e. frontier of the Cape Colony; the majority of the emigrants, however, having Natal as their ultimate goal. However, after the British government had declared it an English colony in 1843, the boers again fell back on this region, and by degrees declaring their independence of the British crown, and forming a sort of Alsatia on our very borders, after some opposition, and one or two conflicts with our troops, the country was annexed by sir H. Smith to the British empire, under the name of the Orange River sovereignty; and continued so until 1854, when sir G. Clerk formally gave it up, and allowed the inhabitants to form a government according to their own wishes. The government is now in the hands of a president, freely elected by the landrost and heemraden in the several districts; while the volksraad, or peoples' council, exercise legislative functions. This state labors under the very serious disadvantage of being, like the kingdom of Bohemia, entirely inland, and has no port on the ocean at which customs dues can be collected; thus throwing the whole of the expense of government on local taxation.

About the year 1862 a large number of Griquas—a tribe of bastard Hottentots, who inhabited the south part of the state—sold their farms to the Free State government, and migrated in a body to the coast side of the mountains in Independent Kaffraria, occupying a large tract of country there known by the name of No Man's Land.

In 1866 a treaty was concluded with Moshesh, chief of the Basutos, by which a portion of the territory known as Basuto Land was ceded to the Orange River Free State. The boundaries agreed on by this treaty were, however, somewhat modified by the governor of Cape Colony in 1869—a significant fact.

The Dutch boers profess the Dutch Reformed faith, and speak a dialect of Dutch, corrupted with Hottentot and English words. They marry young, and keep up, to some extent, nomadic habits. The roads and internal communication are good. Lime and timber are rather scarce, but building-stone and thatch abundant. Woolled sheep have increased amazingly within the last few years; and farms that 10 years ago would hardly fetch £50, now sell at from £2,000 to £3,000. President of the Republic, Hon. Sir John Henry Brand, LL.D.

ORANGE, WILLIAM NICHOLAS ALEXANDER FREDERICK CHARLES HENRY, Prince of. See page 881.

OR'ANGEMAN, one of the unhappy party designations which contributed for nearly a century to create and keep alive religious and political divisions of the worst character throughout the British empire, but especially in Ireland. The Orange organization had its origin in the animosities which had subsisted between Protestants and Catholics in Ireland from the reformation downwards, but which reached their full development after the revolution of 1688, and the wholesale confiscations of Catholic property by which that event was followed. From that time, the Catholics of Ireland may be said legally to have lost all social, political, and religious status in Ireland. Some attempts which were made in the latter part of the 18th c. to ameliorate their condition, excited, especially in the n., the alarm of the Protestant party, who regarded the traditionary "Protestant ascendancy" as endangered. Acts of violence became of frequent occurrence, and, as commonly happens, combinations for aggressive and defensive purposes were formed, not alone by the Protestants, but also by their Catholic antagonists. The members of the Protestant associations appear at first to have been known by the name of "Peep-of-day Boys," from the time at which their violences were commonly perpetrated; the Catholics who associated together for self-defense being called "Defenders." Collisions between armed bodies of these parties became of frequent occurrence. In 1785 a pitched battle, attended with much bloodshed, was fought in the county of Armagh. The steps taken to repress these disorders were at once insufficient in themselves to prevent open violence, and had the effect of diverting the current into the still more dangerous channel of secret associations. The rude and illiterate mob of Peep-of-day boys made way for the rich and influential organization of the Orange society, which, having its first origin in the same obscure district which had so long been the scene of agrarian violence, by degrees extended its ramifications into every portion of the British empire, and into every grade of society from the hovel to the very steps of the throne. The name of the Orange association is taken from that of the prince of Orange, William III., and was assumed in honor of that prince, who, in Ireland, has been popularly identified with the establishment of that Protestant ascendancy which it was the object of the Orange association to sustain. The first "Orange lodge" was founded in the village of Loughgall, county Armagh, Sept. 21, 1795. The immediate occasion of the crisis was a series of outrages by which Catholics were forcibly ejected from their houses and farms, 12 or 14 houses being sometimes, according to a disinterested witness, wrecked in a single night; terminating, Sept., 1795, in an engagement, called from the place where it occurred, the Battle of the Diamond. The association which began among the ignorant peasantry soon worked its way upwards. The general disaffection towards English rule, which at that time pervaded Ireland, and in which the Catholics, as a natural consequence of their oppressed condition, largely participated, tended much to identify in the minds of Protestants the cause of disloyalty with that of popery; and the rebellion of 1798 inseparably combined the religious with the political antipathies. In November of that year, the Orange society had already reached the dignity of a grand lodge of Ireland, with a grand master, a grand secretary, and a formal establishment in the metropolis; and in the following years, the organization extended over the entire province of Ulster, and had its ramifications in all the centers of Protestantism in the other provinces of Ireland. In 1808 it extended to England. A grand lodge was founded at Manchester, from which warrants were issued for the entire kingdom. The seat of the grand lodge was transferred to London in 1821. The subject more than once was brought under the notice of parliament, especially in 1813; and, in consequence, the grand lodge of Ireland was dissolved; but its functions in issuing warrants, etc., were discharged vicariously through the English lodge. The most memorable crisis, however, in the history of the Orange society was the election of a royal duke (Cumberland) in 1827 as grand master for England; and on the re-establishment of the Irish grand lodge in 1828, as imperial grand master. The Catholic relief act of the following year stirred up all the slumbering antipathies of creed and race, and the Orange association was propagated more vigorously than ever. Emissaries were sent out for the purpose of organizing lodges, not alone in Wales and Scotland, but also in Canada, in the Mediterranean, and in the other colonies. But the most formidable part of this zealous propagandism was its introduction into the army. As early as 1824 traces of this are discoverable, and again in 1826. No fewer than 32 regiments were proved to have received warrants for holding lodges in Ireland, and the English grand lodge had issued 37 warrants for the same purpose.

The organization of this strange association was most complete and most extensive. Subject to the central grand lodge were three classes—county, district, and private lodges—each of which corresponded and made returns and contributions to its own immediate superior, by whom they were transmitted to the grand lodge. Each lodge had a master, deputy-master, secretary, committee, and chaplain. The only condition of membership was that the party should be Protestant, and 18 years of age. The election of members was by ballot, and each lodge also annually elected its own officers and committee. The general government of the association was vested in the grand lodge, which consisted of all the great dignitaries, the grand masters of counties, and the members of another body called the grand committee. This lodge met twice each year, in May and on Nov. 5—the day pregnant with associations calculated to keep alive the Protestant antipathies of the body. All the dignitaries of the society as well as its vari-

ous committees and executive bodies, were subject to annual re-election. In 1835 the association numbered 20 grand lodges, 80 district lodges, 1500 private lodges, and from 200,000 to 220,000 members. The worst result of the Orange association was the constant incentive it supplied to party animosities and deeds of violence. The spirit of fraternity which pervaded its members was a standing obstacle to the administration of the law; and all confidence in the local administration of justice by magistrates was destroyed. An alleged Orange conspiracy to alter the succession to the crown in favor of the duke of Cumberland led to a protracted parliamentary inquiry in 1835; and this inquiry as well as a shocking outrage perpetrated soon afterwards by an armed body of Orangemen, on occasion of a procession in Ireland, so discredited the association and awakened the public mind to a sense of its folly and wickedness, that its respectability has since that time gradually diminished. For several years the lord chancellor laid down a rule, by which no member of the Orange association was admitted to the commission of the peace; and the association became comparatively without influence, except among the very lowest classes in the north of Ireland. Of the colonial offshoots of the Orange association those of Canada have at all times been the most active, carrying with them all the bitterness of the domestic feud with the Roman Catholics. Outrages against Catholic churches and convents were of not unfrequent occurrence until recently; and on occasion of the visit of the prince of Wales to Canada, an attempt was made to force from his royal highness a recognition of the association, which was only defeated by his own firmness, and by the judicious and moderate counsels of his advisers. A few years ago the Orangemen of British America constituted above 1200 lodges, with about 150,000 members. The association has branches in the United States also.

The Orange association in Ireland, which had begun to fall into general disrepute, received an impulse among the working classes from a series of sanguinary conflicts with Roman Catholics on occasion of the anniversary celebrations of the society; and even still the peace of many districts in the north of Ireland is only preserved on such occasions by the presence of an overpowering force of military and constabulary. The repeal of the processions act has failed up to the present time to put an end to the traditional collisions of the parties.

ORA'NIENBAUM, a Russian t. on the gulf of Finland, 20 m. w. of St. Petersburg; pop. 4,043. It has a marine hospital and an imperial palace built by prince Menshikoff, and afterwards the favorite residence of Peter III. The palace is surrounded on all sides by orange trees (*oranienbäume*), whence it derives its name.

ORATORIO (Ital. *oratorio*, chapel or oratory, the place where these compositions were first performed), a kind of sacred musical composition, either purely dramatic or partaking both of the drama and the epic, in which the text is illustrative of some religious subject, sometimes taken directly from Scripture; and the music consists of recitatives, airs, duets, trios, quartets, choruses, accompanied by an orchestra, sometimes also by an organ, and introduced by an instrumental overture. The oratorio is not intended for scenic representation.

St. Filippo Neri, born in 1515, has been considered the founder of the oratorio. He engaged poets and composers to produce dialogues, on subjects from scriptural and legendary history, in verse, and set to music, which were performed in his chapel or oratory on Sundays and church festivals. The subjects were *Job and his Friends*; *The Prodigal Son*; *The Angel Gabriel with the Virgin*; and *The Mystery of the Incarnation*. Stradella composed various oratorios, of which *San Giovanni Battista*, produced in 1670, is praised by Dr. Burney. A number of oratorios, or *azioni sacre*, by Apostolo Zeno and Metastasio, were set to music by Caldara in the beginning of last century. Sebastian Bach's *Passions-Musik* was a species of oratorio, originally performed during the service of the church, the congregation joining in the chorales. Its form arose out of the practice prevalent in the Lutheran church, of having the gospels for the day repeated on Good Friday, and some other festivals, by different persons in a recitative and dialogue style. By far the greatest master of oratorio was Handel, who perfected that species of composition, and was the first to introduce it into England. At the age of 20, when on a visit to Italy, he produced his oratorio of *La Resurrezione* at Rome. *Esther*, the first oratorio written by him in England, was composed for the chapel of his patron, the duke of Chandos, in 1720, the words altered from Racine. It was performed privately at Caunons in the same year, but laid aside, and not produced in public till 1732. An oratorio was then so complete a novelty in England, that it was deemed necessary to give the following explanation in advertising it: "By His Majesty's command, at the King's theater in the Haymarket, on Tuesday the 2d May, will be performed the sacred Story of Esther, an oratorio in English, composed by Mr. Handel, and to be performed by a great number of voices and instruments.—*N.B.* There will be no acting on the stage, but the house will be fitted up in a decent manner for the audience." For many years after the appearance of *Esther*, no more oratorios were produced by Handel, who devoted himself to operas and other secular music; and it was only after the temporary failure of his health, that at the ripe age of 53 he resumed the composition of oratorios. The great oratorios which have made his name immortal were all produced in the decline of life, some of them after he was afflicted with blindness, and they were performed for the most part in the Old Haymarket theater. *Debo*

rah was first performed in 1733; *Athaliah*, in 1734; *Israel in Egypt*, in 1738; *The Messiah*, in 1741; *Samson*, in 1742; *Judas Maccabæus*, in 1746; *Joshua*, in 1747; *Solomon*, in 1749; and *Jephtha*, in 1751. The two crowning works were *Israel in Egypt* and *The Messiah*—the former ranks highest of all compositions of the oratorio class. *The Messiah*—which, in consequence of its text being taken entirely from Scripture, was called by Handel *The Sacred Oratorio*—ranks very near it in point of musical merit, and has attained an even more universal popularity; from the time when it was first brought out, down to the present day, it has been performed for the benefit of nearly every important charitable institution in Britain. *Judas Maccabæus* is perhaps best known from the flowing and martial grace of that unrivaled military march, “See the Conquering Hero Comes;” and *Saul* is associated in every one’s mind with the most solemn of all funeral marches. The orchestra was but imperfectly developed in Handel’s time, and his oratorios had therefore originally but meager instrumental accompaniments; they have since been generally performed with additional accompaniments written by Mozart. From Handel’s time downwards, it was the practice in London to have oratorios performed twice a week during Lent in the various theaters, which were only given up on the institution of the oratorio performances at Exeter Hall. Haydn composed three oratorios—*The Return of Tobias*, *The Seven Last Words*, and *The Creation*. *The Seven Last Words*, a work full of sweetness and of energy, hardly answers to the common conditions of an oratorio; it is rather a series of symphonies, intended to follow as many short sermons on the sentences uttered by our Lord on the cross, the text being a subsequent addition by the composer’s brother, Michael Haydn. *The Creation* originated in a visit of Haydn to London in 1791, when he heard for the first time some of the works of Handel, none of which were then known in Germany. Though less grand than the oratorios of Handel, it is full of fresh lovely songs, bright choruses, picturesque recitatives, and exquisite instrumentation. Beethoven’s sole oratorio, *The Mount of Olives*, is a pure drama, rather than the mixed composition generally known under the name. Spohr’s *Last Judgment*, produced in 1825, contains some grand music, particularly in the choruses. Costa’s *Eli* deserves mention among modern oratorios. But since the time of Handel no other writer of oratorios has approached Mendelssohn. The greatest works of that composer are his oratorios of *St. Paul* and *Elijah*; the former was first produced at Düsseldorf in 1836, the latter at Birmingham in 1846; and at the time of his death he was engaged in a third oratorio, called *Christus*, which he expected would be his greatest, and of which but a few fragments have been published. The oratorios of Mendelssohn have tended greatly to revive the popularity of this kind of composition in Britain. At Exeter Hall in London, and at the musical festivals throughout England, oratorios are performed on a large scale, and with a power, a precision, and a perfection unknown elsewhere. The choruses at the provincial festivals are, for the most part, supplied by Birmingham, Manchester, Leeds, and the other large towns. The greatest oratorio performances are now those of the Triennial Festivals at the Sydenham Crystal Palace. At the festival of 1880, the chorus amounted to over 2,900 voices, and there was an orchestra of 425 performers.

ORATORIUM (Lat. “oratory,” called in Greek, *eukterion* or *proseukterion*), as contrasted from *ecclesia*, “a church,” is the name given to an apartment or building designed for worship of a private or domestic character. From the earliest times, the use of oratorio is traceable in the history of the church; and before the regular organization of parishes, they had probably a considerable place in the common, although not in the public worship. At a later period, oratoria became a common appendage of the castles and residences of the nobility, and were of two kinds; the first, simply for private or family prayer and other devotion; the second, for the celebration of mass. The latter fell properly under the jurisdiction of the bishop or the parochial clergy, and many jealousies and disputes grew out of their establishment or direction. The council of Trent (Sess. xxii., *De Reformatione*) placed them under very stringent regulations, which have been enforced and developed by later popes, especially by Benedict XIV.

ORATORY. See ELOQUENCE; RHETORIC.

ORATORY, CONGREGATION OF THE. The origin of this learned congregation, and its early history, have been detailed under the head of St. Philip Neri (q.v.). It is remarkable, however, that this extraordinary man, unlike most other founders of religious bodies in the Roman Catholic church, had never committed to writing any definite body of rules for the government and direction of the brethren. Even his scattered papers, from which his plans and intentions might have been collected, had been burned by his orders a short time before his death. Soon after that event, the fathers, at the instance of Baronius, compiled from the existing practices and from memory a rule for the congregation, framed so as to embody the spirit of St. Philip. This rule was approved of by Paul V. on Feb. 21, 1612. The fathers of the congregation are a body of priests living in community, but without vows, and under a constitution of a highly democratical character. They are at liberty to withdraw at any time, and to resume possession of the property which they had brought with them at entrance; and even during their association, each member manages his own financial concerns, only contributing a fixed sum to the common expenses of the community. There is no superior-general, as in other orders. Each house is distinct and independent. In each, the

superior is elected only for three years, and his position does not give him any personal pre-eminence whatever. The members take their places according to seniority, not according to official rank, and the superior is compelled to take his turn in all the duties, even down to the semi-menial office of serving in the refectory. The main occupations of the fathers, beyond those of attending to the public service of the church, and the duties of the pulpit and the confessional, lie in the cultivation of theological and other sacred studies, of which "conferences" for the discussion, in common, of theological questions, form a principal feature. The congregation has produced many men of great eminence in sacred science, among whom have been already named the great church historian, cardinal Baronius, and his continuators. To these may be added the celebrated explorers of the Roman catacombs, Bosio, Severani, and Aringhi; and the no less eminent patristical scholar, Gallandi. The houses of the Oratory in Italy before the revolution were numerous, and in high repute. Few towns of any importance were without a house of the Oratory. The congregation was early established in France by the celebrated Pierre (afterwards cardinal) de Berulle, in common with two Italian fathers, and from France it extended to the Low Countries. One important difference, however, is noticeable between the French Oratory and the Roman original. In the former, all the houses of the country are subject to a single superior-general. In France, also, the Oratorians took charge of seminaries and of theological teaching. The French Oratory, as well as the Italian, reckons many illustrious members; but the fame and utility of the French congregation were much marred by the unhappy controversy about Jansenism. In the year 1847 this congregation was introduced into England by Dr. John Henry Newman (q.v.). Soon after his secession from Anglicanism, he established a house, the members of which were for the most part ex-Anglicans like himself, near, and finally at Birmingham; and soon afterwards, a second at London, which has since been transferred to Brompton.

ORBIGNY, ALCIDE DESSALINES D', 1802-57; b. France; educated at La Rochelle. In 1826 he went to South America on a scientific expedition, equipped by the French government. He remained eight years, exploring the country from Brazil to Patagonia, making extensive collections in natural history and botany. He also acquired a large number of historical manuscripts, and vocabularies of the native languages. He was lecturer on paleontology at the museum of natural history, 1836-53. Among his works are: *A Voyage in South America*, 1834-52; and *French Paleontology*, 14 vols., 1840-51.

ORBIS PICTUS (the *Pictured World*), the title of the first picture-book or illustrated manual of instruction for the young, by the celebrated educationist, Comenius, published at Nuremberg in 1657. It was long a great favorite with the youth of Germany, and continued to be reprinted, in various modified forms, down to recent times. Comenius, with the instinct of a great teacher, felt that to give words without things to the pupil was not simply to retard his progress, but to lay the foundation of vague and inaccurate conceptions. Hence his introduction of the pictures of things into the work above named, which, among other things, was intended for those beginning the study of Latin, the connecting of the word with the picture tending to give the pupil a firmer hold or a quicker perception of both word and thing. The great and distinguishing merit of Comenius's book is, that it brought distinctly into notice the necessity of giving children in the earliest stages of their education, not simply a word, but the form of the thing of which the word was the symbol. Further advance on this idea was made by Pestalozzi, who aimed at presenting to the eye of the child the thing itself, whenever it was practicable to do so; and he regarded this as essential to the right education of the human faculties in their infancy. From this, again, flowed the excellent custom of giving object lessons in infant schools.

ORBIT, in astronomy, is the path described in space by a heavenly body in its revolution round its primary.* The path so described is of an elliptic form, and would be accurately an ellipse were it not for the disturbing influence of the other heavenly bodies. See **PERTURBATIONS**. The complete determination of a planet's orbit is of the last importance to astronomers, as it enables them to predict the planet's place in the heavens at any period, and thus determine the exact date of eclipses of the sun and moon, of transits and occultations of the planets, and of the appearances and disappearances of comets. For the determination of a planet's orbit, it is necessary to know three things: 1. The situation of the *plane* of the orbit in space; 2. the position of the orbit in this plane; and 3. the situation at a given epoch, and rate of motion, of the planet in its orbit. Since the plane of the ecliptic is for convenience taken as the reference plane, the position of the plane of a planet's orbit is known when its inclination to the plane of the ecliptic (1), and the line of intersection of the two planes (2), are known. Since the sun, which is the focus of the planetary orbits, lies in this line of intersection, the orbit cannot lie wholly above or below the plane of the ecliptic, but must cut it in two points, called *Nodes* (q.v.), and the position of the line of intersection, or line of nodes, is generally given in terms of the longitude (or angular distance) of the ascending node, reckoning from the equinox. The situation of a planet's orbit in its plane is determined when we know its form (3), size (4), and the position of its major axis or line of

* The sun is the primary of the planets and comets, and each planet is the primary of its satellites (secondary planets).

aspides (5). The size and form of the orbit depend upon the length of its major and minor axes, but astronomers prefer to employ the major axis and eccentricity (see ELLIPSE); and the position of the major axis is known by determining the heliocentric longitude of its *perihelion* (i. e., the extremity of it which is nearest the sun). To complete our knowledge of a planet's motion, all we now require are the epoch of its appearance at some determinate point of its orbit, say at the perihelion (6), and the velocity of its motion in its orbit (7), for when this last is known, the law of areas, as given in Kepler's second law, enables us to determine the position of the planet in its orbit at any future period. These seven facts, the possession of which gives us a complete clue to a planet's motion, are called the seven "elements of a planet's orbit." What has been here stated concerning the planetary orbits, is equally true of the comets and satellites, though, in the case of the latter, the effect of disturbing forces is so great as to produce a considerable change of the elements in one revolution.

ORCA. See GRAMPUS, *ante*.

ORCA'GNA, ANDREA DI CIONE, 1325-85; b. Florence; studied art with his father, Cione, a famous goldsmith, and afterward with Andrea Pisano. In association with his brother Bernardo, he painted a number of works in the Florentine churches, and in the Campo Santo at Pisa, where he executed the *Triumph of Death* and the *Last Judgment*, and his brother the *Hell*. The *Hell* and *Last Judgment* were engraved by Lasinio in his *Pitture del Campo Santo di Pisa*. Orcagna reproduced them in the Santa Croce at Florence; he had already painted in the Strozzi chapel, in Santa Maria Novella, a *Hell* after Dante's *Inferno*, in which some of the portraits are those of personal enemies. His reputation as an architect was high, and he built the Loggia de' Lanzi in the Piazza Granduca at Florence, the church of Or' San Michele, and the famous tabernacle of the Virgin in that monastery; a white marble Gothic altar in pyramidal form, covered with figures and sculptures. The adoption of the semicircular arch in preference to the pointed has been attributed, but wrongly, to Orcagna. The semicircular arch had already been employed by Arnolfo di Lapo and others. Orcagna signed himself sculptor upon his paintings, and painter upon his sculptures.

ORCHARD (Goth. *aurtigards*, middle high Ger. *wurzgarte*, Ang.-Sax. *vyrtgeard*, *ortgeard*, a yard or garden for worts or vegetables), a piece of ground specially devoted to the growth of fruit trees, and in which these are planted as near to each other as their profitable cultivation will admit of, no space being left for culinary vegetables, as in the fruit-garden. The introduction of such crops to any considerable extent is injurious to the trees of an orchard, by exhausting the soil, and the vegetables produced are not good. In some orchards the soil is regularly digged, and manure pretty freely supplied, the trees being *dwarf standards*, trained to a low and bushy form, in rows about 12 ft. apart, with rows of gooseberries, currants, or raspberries between them. Such orchards are often very productive, and are not liable to suffer much from winds, whilst the trees also protect each other from frosts in spring. Other orchards are formed in old pastures, the turf being replaced when the trees are planted, or, if they are formed on land that has been under the plow, it is sown down with grass. In these, also, manure is occasionally given. In many cases the grass of orchards is employed for pasturing cattle or sheep, the trees being standards or half-standards, with stems so tall that their branches are beyond the reach of the animals, and in this way the grass produced by the soil is returned to it in the form of manure. In forming orchards of this kind, it is not unusual to plant the *stocks*, upon which the proper grafts or buds are afterward inserted. Great orchards of this kind exist in Devonshire, Herefordshire, and some other southern counties of England, devoted to the growth of apples for the production of cider, and to a smaller extent, of pears for the production of perry. Orchards are not so common in Scotland as in England, where they are not only frequent appendages of the manor-house, but even of the farm-house. Apples, pears, plums, and cherries, not of the finest kinds, are the fruits chiefly produced in British orchards, although some in England also yield walnuts, chestnuts, medlars, mulberries, quinces, etc., and there are even a few small fig-orchards in the most southern parts. Fig and peach orchards are very common in the more southern parts of Europe; and oranges, lemons, etc., on the shores of the Mediterranean.

An orchard requires a dry soil, which ought also to be free and open, not a stubborn clay. A gentle slope, exposing it to the sun, is preferable to perfectly level ground. Protection from prevalent winds, especially in Britain from the s.w. winds, which often blow strongly in autumn, is very necessary; but it is not less important that there should be a free circulation of air, in default of which the trees become covered with lichens and mosses, and cease to be productive. An orchard is often surrounded by a hawthorn-hedge, but a small orchard must not have a very high hedge. Forest trees are often planted as a screen, but must not be too near. Where walnut and chestnut trees will ripen their fruit, they are often planted, on the side most exposed to winds, for shelter.

In laying out the ground for an orchard, it is not unusual to form it into ridges, on the crown of which the trees are planted. But, however this may be, the trees are planted in rows running n. and s., so that the rays of sun may penetrate among them somewhat equally. In planting the trees, their roots are spread out as much as possible, as it is found desirable to encourage them to extend near the surface, rather than to penetrate

deep into the ground, particularly where no digging or cropping is intended. The remarks on soil and manures in the article FRUIT-GARDEN are applicable also to orchards.

The districts of Scotland most celebrated for their orchards are a portion of Clydesdale (Lanarkshire) and the Carse of Gowrie (Perthshire) in both of which the apple-orchards are of very considerable economical importance.

ORCHARD-HOUSE, a structure adapted to the cultivation of fruits, of finer kinds than can be produced in the open air, or in greater perfection, without the aid of artificial heat. It is the invention of Mr. Rivers of London, and is a "glass-roofed shed," the front of which is lower than the back, so that the roof slopes towards the sun. The merit of the invention, however, consist not so much in the structure itself, or in the protecting of fruit-trees and admitting of the sun's rays by glass, as in the mode of their treatment, by which a limited space can be made to produce a prodigious quantity of fine fruit. The trees are planted in pots, are never allowed to attain a considerable size, and are so trained and pruned as to have the greatest possible amount of fruitful wood within the smallest possible compass. The pots have a large hole in the bottom, through which the roots may pass; and are placed upon a border carefully prepared for them, of loose and open materials, such as cinders, lime-rubbish and broken bricks, enriched by manure. After the fruit is gathered, the roots are cut through at the bottom of the pot, and the trees are set aside to rest for the winter; and this treatment is repeated from year to year. The orchard-house is generally a very low structure, so that the foliage and fruit are very near the glass; its back being only 7 ft. high, and its front only $2\frac{1}{2}$ ft., for a width of 12 feet. A path is excavated as a trench of 2 ft. deep, and $2\frac{1}{2}$ ft. wide, through the middle of it. For details as to glazing, ventilation, etc., we refer to Mr. Rivers's pamphlet, *The Orchard-house*, and to Chambers's *Information for the People*, i. pp. 591-92 (new ed.). Plants for orchard-houses may now be purchased in nurseries. In the pamphlet of Mr. Rivers, instructions will be found as to the training and treatment of different kinds of trees.

ORCHESTRA (Gr. *orchēstra*, from *orcheomai*, I dance), in the Greek theaters, the place allotted to the chorus of dancers; in modern theaters, the part of the building assigned to the instrumentalists; and in the modern concert-room, the place occupied by the instrumental and vocal performers. The word orchestra is also used to denote the musicians collectively.

A complete orchestra consists of stringed and wind instruments, and instruments of percussion. The employment of stringed and wind instruments together was long deemed a barbarism. Glück was among the first composers who showed that they could be effectively combined, and his ideas were more fully developed by succeeding composers. The perfecting of the old instruments, and the introduction of new ones, formerly confined to military bands, have added immensely to the power and resources of the modern orchestra, whose capacities, however, have sometimes been misused.

The proper strength of an orchestra must depend on considerations connected with the locality. The stringed instruments should in all cases greatly outnumber the wind instruments; and those latter, the instruments of percussion. The stringed instruments in general use are the violin, viola, violoncello, and double-bass, and their force often amounts to as many as fifty, while even in a large orchestra there are seldom more flutes, hautboys, or bassoons than two of each. The horn trumpet, and ophicleide or serpent, the other wind instruments admitted into the orchestra, are used as sparingly; and of instruments of percussion, a pair of kettle-drums is often considered sufficient, though cymbals and triangles are occasionally added. In a small orchestra, trumpets, trombones, the serpent, and the kettle-drum should be avoided as being too noisy. By far the greatest part of the work falls to the share of the stringed instruments, the parts for which form a complete quartet for first violin, second violin, viola and violoncello, which should be perfect within itself, independently of the parts for the wind instruments. The object of the double-bass is to enforce the violoncello part. This full quartet is occasionally interrupted by harmony in two or three parts, or passages in unisons or octaves. The success of the combination of wind and stringed instruments depends on the skill and judgment of the composer. The bassoon, horn, or flute may double any given part of the stringed instrument quartet, so as to produce an effect of re-enforcement, or it may have its own distinctive melody. An occasional variety is produced by the entire cessation of stringed instruments for a short period, letting the wind instruments be heard alone.

The orchestra of a concert-room should be so arranged that the front is about five ft. above the level of the floor, and it should rise gradually in steps towards the end wall, whose angles ought to be rounded off so as to enable the whole body of sound to be reflected. Reverberation is essential to the proper effect of music. From the exigences of dramatic representation, a theatrical orchestra must necessarily be much inferior to a concert orchestra; the instrumentalists, brought together in the lowest part of a theater on a horizontal plane between the spectators and the stage, are deprived of most of the advantages arising from a proper arrangement.

ORCHHÁ, or **TEHRI**. See page 881.

ORCHIDEÆ, or **ORCHIDA'CEÆ**, often popularly called **ORCHIDS**, a natural order of endogenous plants, remarkable for the structure of their flowers, which are also of great beauty and exquisite fragrance. The perianth sometimes exhibits much variety of forms,

even in the same species; but is always irregular, its segments differing much from each other. There are unusually six segments, arranged in two rows (*calyx* and *corolla*); although some of the most extraordinary forms of orchideous flowers are produced by the combination of certain segments into one piece. Spurs and other appendages of some of the segments are also common. The inner segments are often beautifully colored. The inferior segment of the corolla is called the lip (*labellum*), and is often lobed, spurred, or furnished with curious appendages of different kinds. The stamens are united with the style into a single central column, the distinctive character of the Linnæan class *gynandria*, of which the orchideæ form the chief part. There is usually only one anther, with a tubercle on each side of it, the tubercles being abortive anthers; but sometimes the two lateral anthers are perfect, and the central one is abortive; and very rarely all the three anthers are perfect. The anthers are usually two-celled; the grains of pollen cohering in two or more masses. The ovary is inferior, one-celled; the stigma usually a mere hollow in front of the column. The fruit is usually a capsule, opening with six valves, three of which have placentæ; the seeds numerous and very small. In a few cases the fruit is fleshy. The orchideæ are generally herbaceous perennials; but some of those found in warm climates are shrubs, and some of these, as vanilla, are climbers. The root is usually composed of simple cylindrical fibers, which are often accompanied with one or two fleshy tubercles, a tubercle dying and a new one being produced annually. The leaves are always simple, alternate, often sheathing at the base, often leathery, sometimes arising, in tropical species, not directly from the stem, but from fleshy bulb-like excrescences of it. The species of orchideæ are very numerous, about 3,000 having been described. They are found in all parts of the world, except the coldest and the most arid regions; but are most numerous in the humid forests of the torrid zone, and particularly in America. Many of them are epiphytes, adorning the boughs of trees with splendid flowers. This is chiefly the case with tropical species, those of colder climates mostly growing on the ground. Only about thirty-eight species are reckoned in the British flora.—SALEP (q.v.), a delicate and nutritious article of food, is obtained from the root-tubercles of a number of species. The only other product of the order which is of any commercial importance is vanilla (q.v.). The fragrant faam (q.v.) leaves are the leaves of an orchid. Several species are known to possess tonic, stimulant, and antispasmodic properties, but none are of much importance in medicine.

Orchids have of late been much cultivated on account of their flowers, and many tropical species are amongst our most esteemed hot-house plants, houses being sometimes specially devoted to them. Many of the epiphytal kinds may be planted in pots filled with loose fibrous peat; the roots of others are placed in baskets, or are fastened to blocks of wood, with a little moss or some such thing around them, to keep them from becoming too dry, and are thus placed on the shelves, or suspended from the roof of the house. Careful attention to temperature is necessary, and also to ventilation; and although much heat and moisture are requisite, the atmosphere must not be constantly very hot and humid, but seasons of rest must be given to the plants, which in their native climates have generally a wet and a dry season, the latter being to them in many respects what the winter is to plants of temperate regions.

Lindley has particularly signalized himself in the study of this interesting order of plants.

ORCHIL AND ORCHELLA WEED. See ARCHIL.

ORCHIS is a genus of *Orchideæ*, to which, as now restricted, eleven of the British species are referred. Some of them are among the most common of British *Orchideæ*, adorning meadows and pastures with their flowers in summer. The roots of some of the species yield salep. The lip of the flower in this genus has a spur. The flowers of the early purple Orchis (*O. mascula*), one of the most common species, are sometimes fragrant; but those of the lizard Orchis (*O. hircina*), found in chalky districts in the south of England, are remarkable for their disagreeable goat-like or lizard-like smell.

ORCHOMENOS, a famous and very ancient city of Bœotia, the capital of the once independent kingdom of the Minyæ, and hence called Minyean Orchomenos, to distinguish it from another Orchomenos in Arcadia. It was situated northward from the lake Copaïs, on the left bank of the Cephissus, and extended from the marshy edges of the lake up the face of a steep rocky hill on which stood the acropolis. In the earliest times its dominions extended to the sea. In this city was situated the magnificent "treasury" admired by Pausanias and lately discovered by Schliemann. During the legendary era it became a member of the Bœotian confederacy. During the Persian war, like the other towns of Bœotia, it abandoned the national cause. Its government was thoroughly aristocratic, and after the Peloponnesian war, when Thebes became a democracy, Orchomenos took part with Sparta, and shared in its first triumph over Thebes; but the victory of Epaminondas at Leuctra (371 B.C.) placed Orchomenos at the mercy of the Thebans, who soon after destroyed it by fire, and sold its inhabitants as slaves. It was again rebuilt during the Phocian war, but a second time destroyed in the reign of Philip of Macedon, who, however, once more rebuilt it; but it never again became prominent in history. Orchomenos was famous for its great musical festival in honor of the Graces, when poets and musicians assembled from all quarters to compete for

prizes. The ruins of Orchomenos are still to be seen near the modern village of Skripú. See K. O. Müller's *Orchomenos und die Minyer*, Leake's *Northern Greece*, and Mure's *Tour in Greece*. The Arcadian O. is mentioned in the Homeric catalogue.

ORCIN AND ORCEIN are coloring matters obtained from lichens. Orcin ($C_{14}H_8O_4 + 2$ Aq) may be obtained by boiling certain species of *Rocella* or *Lecanora* with lime for some hours, removing the lime by a current of carbonic acid, evaporating and abstracting with boiling alcohol, from which the orcin separates in red crystals. With chloride of lime, it gives a purple red color, which quickly changes to a deep yellow. Orcin is the true color-producing substance or chromogen of these lichens. In the presence of ammonia, it absorbs oxygen, and is converted into *orcein* ($C_{14}H_7NO_6$), a nitrogenous compound of strong tinctorial power. When isolated, orcein forms a red flocculent powder, which is freely soluble in alcohol, forming a scarlet fluid. Potash and ammonia dissolve it readily, forming a splendid purple color, which is the basis of the ordinary arehil of commerce. With metallic salts, its alkaline solutions yield beautiful purple lakes.

ORD, EDWARD O. C., b. Md., 1818; son of James Ord, an officer of the war of 1812; graduated at the U. S. military academy at West Point in 1839. In July, 1839, he was appointed 2d lieut. of the 3d artillery. He served in the Florida war with the Seminole Indians 1839-42, and was then ordered to the frontier, taking part in many expeditions against the Indians. He was employed on the coast survey 1845-46. When the war broke out in 1861 he was on duty in California, whither he had twice before been sent; the first time to establish order and a respect for the law, in the performance of which duty he was forced to use very stringent measures, executing several notoriously desperate men; and again in 1855, having been made capt. Sept. 7, 1850. He was appointed brig.gen. of volunteers in Sept., 1861, and the following November was placed in command of a brigade of Pennsylvania reserves, under gen. McCall, and was raised to the rank of maj. of the 4th artillery in the regular army. He was in action at the battle of Dranesville, near the Potomac, Dec. 20, where he defeated the confederate cavalry under gen. Stuart. For this service he was brevetted maj.gen. of volunteers in May, 1862, and a month later was transferred to the west, where he participated in the engagements that made memorable the months of August and September, events in which the army of the Mississippi figured. He was placed in command of Corinth under gen. Grant, and subsequently of the 2d division of the district of w. Tennessee. For gallantry at Iuka, Sept. 19-20, he was brevetted col. At Hatchie, Oct. 5, he was in command, and was dangerously wounded, for his services he was brevetted brig.gen. During the siege of Vicksburg and capture of Jackson, he commanded the 13th army corps, and afterward the 8th corps in the middle department, July 9-21, 1864, and the 18th corps in operations before Richmond, July 21 to Sept. 30, 1864. He was again severely wounded in the assault and capture of fort Harrison, near Richmond, Sept. 29, 1864, and brevetted maj.gen. On Jan. 9, 1865, he superseded gen. Butler in command of the department of Virginia and North Carolina, and of the army of the James, which he commanded from Jan. to June, 1865, through the siege of Petersburg, and subsequent movements against the army of northern Virginia, under gen. Lee, to the surrender at Appomattox Court House, April 9, 1865. His rank at the close of the war was lieut.col. of the 1st artillery, dating from Dec. 11, 1865, in the regular army, and maj.gen. of volunteers, which latter he continued to hold, and was at the head of various departments until Sept., 1866, when, having been promoted to brig.gen. in the regular army the July previous, he was mustered out of the volunteer service. He was commander of the 4th military district of Mississippi and Arkansas, from April to Dec., 1867, and has been in command of the departments of California, the Platte, and Texas. He retired from the service Dec. 8, 1880.

ORDEAL (Anglo-Saxon, *ordaal*; from *or*, primitive, and *daal*, judgment; Ger. *urtheil*, judgment), a practice which has prevailed largely among various widely separated nations, of referring disputed questions, particularly such as relate to the guilt or innocence of an individual, to the judgment of God, determined either by lot, or by the success of certain experiments. Of its existence among the ancient Jews, we have an instance in Numbers v., where a Hebrew woman, accused of adultery, is required to drink the waters of jealousy as a test of innocence; a similar ordeal for incontinence is in use among the natives of the Gold Coast of Africa. Compurgation of accused persons by fire, as existing among the Greeks, is referred to in Sophocles's *Antigone*. Among the Hindus, the ordeal has been in use to be practiced in nine different ways—by the *balance*, by *fire*, by *water*, by *poison*, by the *cosha*, or drinking water, in which images of the sun and other deities had been washed, by *chewing-rice*, by *hot oil*, by *red-hot iron*, and by drawing two images out of a jar into which they have been thrown. (*Asiatic Researches*, vol. i., p. 389).

The ordeal seems to be prevalent throughout Africa. "When a man," says Dr. Livingstone, "suspects that any of his wives have bewitched him, he sends for the witch-doctor, and all the wives go forth into the field, and remain fasting till that person has made an infusion of the plant (called 'goho'). They all drink it, each one holding up her hand to heaven in attestation of her innocence. Those who vomit it are considered innocent, while those whom it purges are pronounced guilty, and put to death by

burning. The innocent return to their homes, and slaughter a cock as a thank-offering to their guardian spirits. The practice of ordeal is common among all the negro nations n. of the Zambesi." The women themselves eagerly desire the test on the slightest provocation; each is conscious of her own innocence, and has the fullest faith in the *muavi* (the ordeal) clearing all but the guilty. There are varieties of procedure among the different tribes. The Barotse pour the medicine down the throat of a cock or dog, and judge of the innocence or guilt of the person accused by the vomiting or purging of the animal.

Throughout Europe in the dark ages the ordeal existed under the sanction of law, and of the clergy. The most prevalent kinds of ordeal were those of *fire*, *water*, and the *wager of battle*. *Fire ordeal* was only allowed to persons of high rank. The accused had to carry a piece of red-hot iron for some distance in his hand, or to walk nine feet barefoot and blindfolded over red-hot plowshares. The hand or foot was bound up and inspected three days afterwards: if the accused had escaped unhurt, he was pronounced innocent; if otherwise, guilty. Under such a judicial system, there were probably few acquittals; but it is believed that in the severer kinds of ordeal, precautions were sometimes taken by the clergy to protect those whom they wished to clear from suspicion. Queen Emma, mother of Edward the confessor, when suspected of a criminal intrigue with Alwyn, bishop of Winchester, is said to have triumphantly vindicated her character by walking unhurt over red-hot plowshares. *Water ordeal* was the usual mode of trial allowed to bondsmen and rustics, and was of two kinds—the ordeal of *boiling water*, and of *cold water*. The ordeal of *boiling water*, according to the laws of Athelstane, consisted in taking a stone out of boiling water, where the hand had to be inserted as deep as the wrist; what was called the triple ordeal, deepened the water to the elbow. The person allowed the ordeal of *cold water* (the usual mode of trial for witchcraft) was flung into a river or pond; if he floated without any appearance of swimming, he was judged guilty—while if he sank, he was acquitted.

The *wager of battle* was a natural accompaniment of a state of society which allowed men to take the law into their own hands. The challenger faced the west, the challenged person the east; the defeated party, if he craved his life, was allowed to live as a "recreant;" that is, on retracting the perjury which he had sworn to. See BATTEL, TRIAL BY.

Other kinds of ordeal were practiced in particular circumstances in different parts of Europe. In the ordeal of the *bier*, a supposed murderer was required to touch the body of the murdered person, and pronounced guilty if the blood flowed from his wounds. The ordeal of the *eucharist* was in use among the clergy: the accused party took the sacrament in attestation of innocence, it being believed that, if guilty, he would be immediately visited with divine punishment for the sacrilege. A somewhat similar ordeal was that of the *corsned*, or consecrated bread and cheese: if the accused swallowed it freely, he was pronounced innocent; if it stuck in his throat, he was presumed to be guilty. Godwin earl of Kent, in the reign of Edward the confessor, when accused of the murder of the king's brother, is said to have appealed to the ordeal of the *corsned*, and been choked by it. An early form of ordeal, abolished by Louis le debonnaire in 816, was that of the *cross*: the accuser and accused stood upright before a cross, and he who first fell, or shifted his position, was pronounced guilty. It was done away with, as being irreverent towards the mystery of the cross. Besides these, there was the ordeal by *lot*, dependent on the throw of a pair of dice, one marked with a cross, the other plain.

Trial by ordeal at first carried with it the sanction of the priests, as well as of the civil power, though the clergy in the course of time came to discountenance it. In England it seems to have been continued till the middle of the thirteenth century. On the continent it was, generally speaking, abolished rather earlier, although as late as 1498 we find the truth of Savonarola's doctrine put to the test, by a challenge between one of his disciples and a Franciscan friar, to walk through a burning pile. In Scotland, in 1180, we find David I. enacting, in one of the assemblies of the frank tenantry of the kingdom, which were the germ of parliaments, that no one was to hold an ordinary court of justice, or a court of ordeal, whether of battle, iron, or water, except in presence of the sheriff or one of his sergeants; though if that official failed to attend after being duly summoned, the court might be held in his absence. The first step toward the abolition of this form of trial in Saxon and Celtic countries, seems to have been the substitution of compurgation by witnesses for compurgation by ordeal. The near relatives of an accused party were expected to come forward to swear to his innocence. The number of compurgators varied, according to the importance of the case; and judgment went against the party whose kin refused to come forward, or who failed to obtain the necessary number of compurgators. To repel an accusation, it was often held necessary to have double the number of compurgators who supported it, till at length the most numerous body of compurgators carried the day.

ORDER. In classic architecture, the order or ordonnance comprises the column with its base and capital and the entablature. There are five orders: (1) Tuscan, (2) Doric, (3) Ionic, (4) Corinthian, (5) Composite. The first and fifth are Roman orders, and are simply modifications of the others. The remaining three are the Greek orders. See COLUMN, GREEK ARCHITECTURE, ROMAN ARCHITECTURE.

ORDER, in natural history, a group constituted for the purpose of classification, inferior to *class* and *sub-class*, but superior to *family*, *tribe*, *genus*, etc. The term **NATURAL ORDER** is used in botany to designate an order belonging to the natural system of classification, in contradistinction to one of an artificial system devised for mere convenience of the student, and signifies that the limits of the order agree with the truth of nature, and that it thus exhibits affinities really existing. In all branches of natural history, classification now proceeds on this principle.

ORDER, in Natural History (*ante*). The use of the term order is not precisely the same in zoölogy as in botany. Zoölogy, from its greater scope and complexity, requires a more varied extension and application of all divisions or groupings; of kingdoms, sub-kingdoms, classes, sub-classes, orders, etc., but by common consent, orders in botany are frequently termed families, whilst what answers to *family* in zoölogy is called *tribe* in botany. Thus, it is common to speak of the order Ranunculaceæ as the *crowfoot family*. It is divided in five tribes, viz: clematideæ, anemoneæ, ranunculeæ, helleborineæ, and cemicifugeæ. These tribes are then divided into genera, as *clematis*, *anemone*, *ranunculus*, etc., and these genera, again, into species. In some cases a tribe in botany has much the same position as a sub-family in zoölogy, but its order has all the marked distinctions of an ordinal grouping, and never descends to the position of a family, although it may be so denominated. The use of the term order in zoölogy is illustrated in the article **INVERTEBRATE ANIMALS**.

ORDER. This word is applied to an aggregate of conventual communities comprehended under one rule, or to the societies, half military half religious, out of which the institution of knighthood sprang. Religious orders are generally classified as monastic, military, and mendicant.

The earliest comprehension of monastic societies under one rule was effected by St Basil, archbishop of Cæsarea, who united the hermits and cenobites in his diocese, and prescribed for them a uniform constitution, recommending at the same time a vow of celibacy. The Basilian rule subsists to the present day in the eastern church. Next in order of time was the Benedictine order, founded by St. Benedict of Nursia, who considered a mild discipline preferable to excessive austerity. The offshoots from the Benedictine order include some of the most important orders in ecclesiastical history, among others the Carthusians, Cistercians, and Præmonstrants. The order of Augustinians professed to draw their rule from the writings of St. Augustine; they were the first order who were not entirely composed of laymen, but of ordained priests, or persons destined to the clerical profession.

The military orders, of which the members united the military with the religious profession, arose from the necessity under which the monks lay of defending the possessions which they had accumulated, and the supposed duty of recovering Palestine from the Saracens, and retaining possession of it. The most famous orders of this kind were the Hospitallers or Knights of St John of Jerusalem, the Knights Templars, and the Teutonic order. Many other military orders existed, and not a few continue to exist, particularly in Spain and Portugal. The phraseology of the old military orders is preserved in the orders of knighthood of modern times, into which individuals are admitted in reward for merit of different kinds, military and civil.

The three mendicant orders of Franciscans, Dominicans, and Carmelites were instituted in the 13th century. Their principal purpose was to put down the opposition to the church, which had begun to show itself, and also to reform the church by example and precept. At a later period the order of the Jesuits was founded, with the object of increasing the power of the church, and putting down heresy.—Notices of the more important orders, monastic, military, and mendicant, will be found under separate articles. See also **KNIGHTS** and **MONACHISM**.

ORDERICUS, **VITALIS**, a mediæval historian, born at Atcham, near Shrewsbury, in 1075, was taken to France at the age of five, and educated for the monastic life in the abbey of Ouche, at Lisieux. He became a priest in 1107, and died, it is thought, about 1143. Ordericus is the author of a so-called church history (*Historiæ Ecclesiasticæ*), in 13 vols. It is a chronicle of events from the birth of Christ down to his own time. Books 3-6 give an account of the Norman wars in England, France, and Apulia down to the death of William the conqueror. The last half of the book is the most valuable, being a record of the history of the author's own times. The first edition of the *Historiæ Ecclesiasticæ* was published by Duchesne, in his *Hist. Norm. Scrip.* (1619). It has also been printed by the French historical society (2 vols. 1840), and was translated into French by Dubois (4 vols. 1825-27).

ORDERLIES are soldiers or sergeants appointed to wait upon general and other commanding officers, to communicate their orders, and to carry messages. The *orderly officer*, or officer of the day, is the officer of a corps or regiment, whose turn it is to superintend its interior economy, as cleanliness, the goodness of the food, etc. *Orderly non-commissioned officers* are the sergeants in each company who are "orderly," or on duty for the week. On the drum beating for orders, they proceed to the orderly room, take down the general or regimental orders affecting their respective companies, show them to the company officers, and warn the necessary men for any duties specified in those

ORDERS.—1. Polish Order. 2-4. Spanish orders. 5. Papal Order. 6. American Order of the Cincinnati. 7-13. Orders of the Middle Ages. 14. French Order of the Holy Spirit. 15. Star of the Legion of Honor. 16. Order of the Garter. 17. Golden fleece. 18. Bavarian Order of St. Michael. 19. Portuguese Order of Christ. 20. Russian Order of St. Andrew. 21. Order of Alexander-Newsky. 22. Swedish Order of the Seraphim. 23. Saxon Order. 24. Guelphic order (Hanover). 25. Order of the Black Eagle. 26. Order of the Red Eagle. 27. Iron Cross. 28. Turkish order. 29. Persian order.

orders. An *orderly book* is provided by the captain of each troop or company in a regiment for the insertion of general or regimental orders from time to time issued.

ORDERS, ARMY, are general, divisional, brigade, or regimental. General orders are issued by the commander-in-chief of an army, and affect the whole of his force. The others emanate from generals of division or brigade, or from officers commanding regiments, and severally affect their respective commands.

ORDERS, HOLY, an institution regarded in the Greek and Roman churches as a sacrament, by which ministers are specially set apart for the service of religion, and are regarded as receiving a certain religious consecration, or, at least, designation for their office. While some of the reformed churches altogether deny the distinction of ranks in the ministry, none of them admits more than three ranks, of bishop, priest, and deacon. But in the Roman and Greek churches a further classification exists. In the Roman church, a distinction is made between the major (or holy) orders and the minor orders. Of the major orders, three have been described in general terms, under the head hierarchy (q.v.), viz., the classes of bishops, priests, and deacons. A fourth rank of sub-deacons is generally regarded as one of the major orders, but its functions closely resemble in their nature and their degree those of the deacon. The minor orders in the Roman church are four in number—those of door-keeper, reader, exorcist, and acolyte. To none of these orders is any vow of celibacy annexed. Some of their functions had their origin in the peculiar religious condition of the early church. The duties of door-keeper arose chiefly out of the discipline in regard to the penitents and catechumens; but although these functions find no room in the modern discipline of the Roman church, the door-keeper of the modern church is held to succeed to other functions of his ancient prototype in relation to the catechetical instruction of children and of the poor and ignorant. Preparatory to the receiving of these orders, candidates are initiated in what is called the *tonsure*, which consists in the cutting off of the hair, as a symbol of separation from the world and its vanities—a rite which appears also as one of the ceremonies of the religious profession. Tonsure, however, is not reckoned as an order; it is but a distinguishing characteristic of a class. In the Roman church the sacrament of orders is held to produce an indelible character, and therefore to be incapable of being forfeited and of being validly repeated. This, however, applies only to the holy orders. The Greek church has the distinction of major and minor orders, in common with the Roman. But the Greeks commonly exclude sub-deaconship from the major orders, and all the functions of the four minor orders of the Roman church are united by the Greeks in one single order, that of reader (*anagnōstes*).

In the Anglican and other Reformed Episcopal churches the three higher orders of bishop, priest, and deacon are alone retained. An Anglican clergyman may be deprived of his benefice, or suspended by his bishop, for various ecclesiastical offenses; and the right of the court of arches to pronounce sentence of deprivation has also been recognized. But in the usual case of deprivation, the clergyman does not forfeit his status of priest or deacon, which can only be lost by deposition or *degradation*. Statute 23 Hen. VIII. c. 1. s. 6 reserves to the ordinary the power of degrading clerks convicted of treason, petit treason, murder, and certain other felonies, before judgment. A bishop may be deprived of his see by his metropolitan, with or without the co-operation of a synod of the bishops of the province, but it has been questioned whether he can be lawfully deprived of his orders as bishop. A clergyman of the church of England and Ireland cannot become a member of the house of commons. In the Presbyterian and other non-episcopal churches, the ceremony of ordination is not held to impart any indelible character. A minister found guilty of heresy or immorality is deprived of his office by *deposition*, by which his clerical status is forfeited. His removal from his charge, however, in any other way, does not affect his office as a minister; and a minister removed from one charge to another, or, after a time, inducted into a new charge, is not re-ordained. A minister having no charge or flock may yet dispense the sacraments if duly called upon. A minister deposed ceases altogether to be a minister, and is no more capable of any of the functions of the office than if he had never been ordained.

The ceremony of *imposition of hands* is used in almost all Protestant churches in the ordination of ministers, the ordaining bishop or presbyters placing the right hand on the head of the person ordained; and is always accompanied with prayer. It is deemed a proper and Scriptural form (1 Tim. iv. 14), but not essential.

In the church of Scotland and other Presbyterian churches, when an already ordained minister is inducted into a new charge, no imposition of hands takes place. In the Scottish and American Presbyterian churches, candidates for the ministry are *licensed to preach the gospel* before being called to any particular charge, and are then styled *licentiates* or *probationers*. They are licensed, according to an old phrase, "for trials of their gifts," but are not entitled to dispense the sacraments.

There is nothing to prevent a minister of the church of Scotland, or any Presbyterian or Independent church, from being a member of the British house of commons.

ORDERS IN COUNCIL, orders by the sovereign with the advice of the privy council. The privy council of Great Britain has no power to legislate, except so far as authorized to do so by parliament; but in periods of emergency it has nevertheless occasionally issued and enforced orders of a legislative kind; those who were concerned in passing,

promulgating, or enforcing the orders trusting to parliamentary protection, and taking on themselves the personal responsibility of the proceeding. In such cases an act of indemnity afterwards passed has relieved from liability those who advised the order or acted under it, and given compensation to all who suffered by its enforcement. This course was adopted in 1766 with regard to an embargo on the exportation of corn, issued in consequence of a deficient harvest and prospect of famine. An important constitutional question was raised by the famous orders in council issued by Great Britain in 1807 and 1809, in reprisal for Napoleon's Berlin and Milan decrees. The Berlin decree, issued on Nov. 21, 1806, declared the whole of the British islands to be in a state of blockade, and all vessels trading to them to be liable to capture by French ships. It also shut out all British vessels and produce both from France and from all the other countries which gave obedience to the French. A subsequent decree, issued soon afterwards, obliged all neutral vessels to carry letters or certificates of origin—that is, attestations by the French consuls of the ports from which they had sailed, that no part of the cargo was British. In retaliation for the Berlin decree, the British government issued, on Jan. 7, 1807, an order in council, subjecting to seizure all neutral vessels trading from one hostile port in Europe to another with property belonging to an enemy. This order was at first extensively evaded, while the French made vigorous efforts to enforce the Berlin decree; the result was that new orders were issued by the British government on the 11th and 21st of Nov., 1807, declaring France and all states subject to the French to be in a state of blockade, and all vessels liable to seizure which were found to have certificates of origin on board, or which should attempt to trade with any of the ports of the world thus blockaded. Neutral vessels intended for France, or any other hostile country, were ordered, in all cases, to touch first at some British port, and to pay custom-house dues there, after which they were in certain cases to be allowed to depart for their destination; and vessels clearing from a hostile country were similarly to touch at a British port before proceeding on their voyage. On Dec. 27, 1807, Napoleon's Milan decree was issued, which declared the whole British dominions to be in a state of blockade, and all countries were prohibited from trading with each other in any articles of British produce or manufacture. The Americans, and those of the public of Great Britain who were interested in the export trade, exclaimed loudly against the edicts of both powers, and the legality as well as the expediency of the orders in council were called in question in parliament. The result was that an inquiry was instituted into the effect of the orders, from which no direct result followed. But, in the mean-time, on April 26, 1808, a new order in council was issued, limiting the blockade to France, Holland, a part of Germany, and the north of Italy, and the order which condemned vessels which had certificates of origin on board was rescinded. Subsequent orders introduced a system of furnishing licenses to vessels to proceed to hostile ports after having first touched and paid custom-house dues at a British port; no fewer than 16,000 of these licenses are said to have been granted. The legality of these orders has been called in question on the ground that they were more of a legislative than an executive character, in so far as a fictitious blockade, where there is no blockading force present, is contrary to the law of nations; it has been defended on the ground that they were issued in execution of the royal prerogative of declaring and conducting war. They are generally believed to have added to the general distress, and the check on the progress of manufactures produced by Napoleon's decrees; but, on the other hand, it has been maintained that they were essential to the effective prosecution of the war.

There are various matters connected with trade and the revenue as to which orders in council have been authorized by statute; parliament, in fact, delegating its legislative authority to the queen in council. For example, the international copyright act, 7 and 8 Vict. c. 12, contains a provision for empowering the crown, by order in council, to extend the privileges of British copyright to works first published in any state which gives a like privilege to the productions of this country.

ORDINAL, the service used in Episcopal churches for the ordination of ministers. The English ordinal was drawn up by a commission appointed in the third year of Edward VI. (1550), and added to the *Book of Common Prayer*. It was slightly modified in the reign of Elizabeth, and was again revised by the convocation of 1661. The English ordinal, in its general structure, resembles the ancient services used for that purpose, but possesses much greater simplicity, and has some features—e.g., the numerous questions addressed to the candidates—peculiar to itself. There are separate services for the “making of deacons” and the “ordering of priests,” but these are practically joined in one, and used on the same day. The service for the consecration of bishops is altogether distinct.

The ordination takes place at one of the ember seasons, and during the public service, after morning prayer and a sermon on the subject, and begins with the presentation of the candidates by the archdeacon. The bishop inquires as to their fitness, and commends them to the prayers of the congregation. The litany is then said with special petitions for the candidates for each order, and the communion service commences with a special collect, epistle, and gospel. Between the epistle and gospel the oath of supremacy is administered, and the candidates for deacons' orders are questioned by the bishop and ordained. The gospel is read by one of the newly ordained deacons. The candi-

dates for priests' orders are then solemnly exhorted and interrogated, and the prayers of all present are asked for the divine blessing upon them. For this purpose a pause is made in the service for silent prayer. After this the hymn, *Veni Creator Spiritus* (Come, Holy Ghost, our souls inspire)—a composition of great antiquity, supposed to be as old as the 4th c.—is sung, and, the candidates kneeling before the bishop, he and the assistant presbyters lay their hands upon the head of each, with the words, "receive the Holy Ghost for the office and work of a priest in the church of God," etc.

The only other ceremony is the presentation of each candidate with the Bible in token of authority to preach; as the deacons had been before presented with the New Testament with authority to read the gospel. The service concludes with the administration of the sacrament of the Lord's-supper.

The consecration of bishops is performed by an archbishop, or some bishop appointed in his place, and two or more of his suffragans, and may take place on any Sunday or holy day. The service is very similar to that for the ordination of priests.

ORDINANCE OF 1787, an act of congress under the confederation in respect to the government of the territory of the United States n.w. of the Ohio river. The large states which, by their original charters from the English crown, included within their boundaries portions of the n.w. territory, were not willing at first to relinquish jurisdiction over their several parts, but smaller states like Maryland and New Jersey claimed that the territory ought to be surrendered as common property, inasmuch as it was the united effort of all the states that had secured independence. Accordingly, after considerable agitation, New York fixed a limit for its western boundary, and ceded a part of its lands for the states that became members of the confederation. Virginia soon followed, giving up the state's lands n.w. of the Ohio; and a law was passed for the temporary government of the territory, which provided for the organization of a state whenever its inhabitants numbered 20,000. No settlements of any consequence, however, were made during the following three or four years. The ordinance of 1787, three years later, has usually been attributed to Nathan Dane, a representative from Massachusetts in the congress of the confederation, although it has been claimed that a clergyman, the rev. Manasseh Cutler, originated it. The ordinance defined the rights of the citizens, prohibited slavery within the territory, and provided that the navigable waters leading into the Mississippi and St. Lawrence rivers, and the carrying-places between the same, should be common highways. It was passed at a very critical time in the formation of the union, and subsequent events have shown that it was of the greatest importance, as there was danger of the whole region becoming a slave territory.

ORDINARIES, or HONORABLE ORDINARIES, in heraldry, certain charges composed of straight lines, and in very common use, to which writers on heraldry had assigned abstruse symbolical meanings, but whose real chief peculiarity seems to be that they originally represented the wooden or metal fastenings of the shields in use in actual warfare. The ordinaries are usually accounted nine—the chief, pale, fess, bar, bend, bend sinister, cheveron, saltire, and cross. Heraldry vary a little in their enumeration, some taking in the pile in place of the bar. Each is noticed under a separate article.

ORDINARY, a term used in the British navy in two senses. First, as regards ships, vessels in ordinary are those out of actual use, commonly dismasted, and occasionally roofed over to protect them from the weather. They are congregated near the several dock-yards, where their masts and gear lie ready for their immediate fitting for sea when required. A few men have charge of each vessel; a certain number of vessels constitute a division, with a lieut. in command; and a line-of-battle ship, called a "guard-ship of ordinary," is responsible for the different divisions at each port. The ships are moored in safe places, as up the Medway, in the recesses of Portsmouth and Plymouth harbors, etc.

As regards men, an *ordinary seaman* is one capable of the commoner duties, but who has not served long enough at sea to be rated as an able seaman (q.v.). His pay is 11d. a day on entering, and 13d. a day on promotion to the first class, or 1s. and 1s. 3d. if engaged for continuous service.

ORDINARY (Lat. *ordinarius*) is the name commonly given to a person, who, in virtue of his office, and in his own consequent right, is competent to do certain acts or to decide certain causes. In this sense there are many functionaries who may be called by the name ordinary. But the word in canon law, when used without other additions, is understood to mean the bishop, who is the ordinary of his own diocese, and is competent of himself to do every act necessary for its government, and for the ordering of the spiritual concerns of his flock. The jurisdiction of the ordinary is called by that name, in contradistinction to "extra-ordinary jurisdiction," which arises from some abnormal circumstances, and from "delegated" jurisdiction, which is imparted by the ordinary to another person to be exercised vicariously.

In English law the ecclesiastical jurisdiction which was formerly vested in bishops and their officers relating to wills and marriages was recently abolished, and transferred to a new judge called the judge ordinary, who is entirely disconnected with the church. The bishops still retain their jurisdiction in matters of discipline as regards the clergy.—In Scotland the judge ordinary generally means the sheriff depute or substitute, who has

ordinary jurisdiction in the county. Lord ordinary is the name given to certain judges of the outer house in the court of session.

ORDINARY OF ARMS, in heraldry, an index or dictionary of armorial coats, arranged, not according to names, like an armory, but according to the leading charges in the respective shields, so as to enable any one conversant with heraldic language, on seeing a shield of arms, to tell to whom it belonged. A very imperfect ordinary for England is appended to Edmonson's *Heraldry*: a far more complete and elaborate work of the same kind, Papworth's *Ordinary of British Armorials*, partly edited by Alfred Morant, was published in 1874.

ORDINATION, the rite or ceremony by which ministers of the Christian church are dedicated to their sacred office. The use of a ceremonial for such purposes is traceable among the Jews (Exod. xxix. 24, Levit. xxi. 10, Num. iii. 3); and the New Testament contains frequent reference to the specific ceremonial of "imposition of hands" (Acts vi. 1-7, xiii. 1-4, xiv. 23; 1 Tim. iv. 14, v. 22; 2 Tim. i. 6). In the Roman, the Greek, and the other eastern churches this rite of ordination is held to be sacramental, and it is reserved, at least as regards the major orders (see **ORDERS, HOLY**), exclusively to bishops. In extraordinary cases it was permitted to cardinals and to certain abbots to confer the minor orders. Considerable controversy exists among Catholic writers as to what are essential portions (*materia sacramenti*) of the rite of ordination. Some place it in the "imposition of hands," some in the "presentation of the instruments" symbolical of each order. The controversy derives some importance from the diversity which exists between the Greek and Roman ceremonial; but on this head Roman Catholics maintain that the essential rites are contained alike in both ceremonials. As regards the *validity* of the rite of ordination, the mere fact of its being conferred by a bishop suffices; but there is not any part of the Roman discipline which is more jealously guarded by laws than the administration of orders. The candidate can only be *lawfully* ordained by "his own bishop" (*proprius episcopus*), or with the authority of his own bishop, which must be communicated to the ordaining bishop by what are called dimissorial letters. The candidate may be claimed by a bishop as by "his own bishop" under any of four titles—of birth, of domicile, of benefice, or of connection by personal service; and if an ordination be attempted without some one of these titles, heavy ecclesiastical penalties are incurred as well by the ordainer as by the ordained. On the part of the candidate himself, certain qualifications are required; and certain disqualifications created or propounded by the canon law, called *irregularities*, are held to render an ordination in some cases invalid, and in all unlawful.

In the church of England and other reformed Episcopal churches, the rules of the ancient canon-law are retained, by which no one could be ordained without previous examination of his fitness, or who was disqualified by bodily infirmity, illegitimacy, immorality, or simony, or who was unprovided with a title (i. e., an appointment to serve in some church), which should provide him with a maintenance; or who, being a candidate for deacon's orders, was under 20, and for priest's under 24 years of age; but the age for admission to deacon's orders is changed to 23. A college fellowship is admitted as a title. (For the ceremony of ordination see **ORDINAL**.) A person can only be ordained by the bishop in whose diocese he is to serve, except on *letters dimissory* from that bishop to another.

In other reformed churches ordination is performed by the presbytery, or by one or more ordinary ministers. Some small Protestant denominations have no ceremony of ordination whatever.

ORDINATION (*ante*), the Roman Catholic church, the Church of England, and the Protestant Episcopal church of the United States do not consider valid unless the officiating bishops are in the line of succession from the apostles. The former rejects ordination by the Greek and other eastern churches not as invalid, but as unlawful, because the officiating bishops are not in ecclesiastical connection with the pope. In common with the eastern churches, it places ordination among the seven sacraments, and teaches that it conveys to the candidate supernatural grace and fitness for his office, and imparts to him a permanent character which forever distinguishes him from the laity. Presbyterian churches believe that, in accordance with apostolic precedent, the power to ordain is vested in the ministers of a presbytery, all of whom are, in scriptural usage, identical with bishops. In Congregational churches (including the Baptist) the power of ordination rests with the local church, which is always expected in the interest of fellowship to call a council of churches to which they intrust the exercise of the power on behalf of the church; thus a congregation exercises the right of judgment concerning the qualifications of a candidate, and gives him a call to be its minister; after which it invites other churches in council to examine his credentials, character, and theological views. If the council be satisfied with him they ordain him with prayer and laying on of hands. In Wesleyan Methodist churches ordination is performed in the annual conference, with a bishop or president at its head, and without the laying on of hands. Among Calvinistic Methodists the sanction and assistance of their ministers alone is required. The society of Friends select their ministers according to their usual quiet methods of arriving at general consent, and dispense with all ceremonial in setting them apart to the work.

ORD'NANCE (*ordinance*, primarily, any disposition, arrangement, or equipment; and then applied incidentally to a particular part of the equipment or apparatus of war), a name applied to the guns and munitions of an army generally, and in particular to the great guns. Descriptions of the various sorts of ordnance will be found under **CANNON, FIREARMS, GUN, HOWITZER, MORTAR, RIFLED ARMS.**

ORDNANCE, BUREAU OF. See **UNITED STATES ARMY.**

ORDNANCE DEPARTMENT, one of the oldest departments under the crown, was abolished by an order in council of May 25, 1855, after an existence of at least 400 years. Its constitution, its important functions, and the causes which led to its dissolution, will be found under **BOARD OF ORDNANCE.** The early history of the department is lost in the middle ages; but it appears to have risen gradually under the Lancastrian kings. A master of the ordnance is mentioned in the time of Richard III.; but we read of John Louth being clerk of the ordnance as early as 1418. Henry VII. constituted the board, adding a lieutenant, a surveyor, and a storekeeper, to whom a clerk of the cheque was subsequently joined. With the exception of the last, whose office was abolished in the beginning of the present century, this organization was maintained until the abolition of the whole. In 1604 James I. dignified the master and lieutenant with the respective titles of master-gen. and lieut.gen. The history of the ordnance office is of importance in British history, as in all wars it has been responsible not only for the management of the *matériel* of the armies, but also for the direction of the *personnel* of the artillery and engineers. By an order in council of June 23, 1870, the department of ordnance in a very modified form was revived under the surveyor-general of the ordnance, as a section of the war office, responsible for all supplies and *matériel* of war.

ORDNANCE SELECT COMMITTEE was, until 1870, a committee composed of scientific officers, to advise the secretary of state for war on all inventions in war *matériel.* It had its offices at Woolwich, in the midst of the manufactories of the royal arsenal, and near the head-quarters of the royal artillery, by whom most of the designs had to be practically tested. The president of the committee was usually a general officer of artillery; and a captain in the royal navy served as vice-president. Since 1870 these functions have been fulfilled by officers of the department of the director of artillery and stores, who has his head-quarters at the war office.

ORD'NANCE SUR'VEY. By this term is understood the various operations undertaken by the ordnance department of the British government for preparing maps and plans of the whole kingdom and its parts. The idea of a general map of the country to be executed by the government was first proposed after the rebellion in 1745, when the want of any reliable map of the northern parts of Scotland was much felt by the officers in command of the royal troops. Its execution was intrusted to lieut.gen. Watson, the deputy quarter-master of North Britain; but it was mostly carried out by maj.gen. Roy, an officer of engineers. The drawing, on a scale of one inch and three-fourths to the mile, was completed in 1755; but in consequence of the war which broke out in that year, was never published. In 1763 it was proposed to extend the survey to the whole kingdom; but the first steps to effect this were taken only in 1784, when maj.gen. Roy commenced measuring a base-line on Hounslow heath, near London. This principal triangulation was designed partly for astronomical purposes, and partly as a basis for a map on a small scale. The base-line was remeasured with great care in 1791; and detail plans were commenced by officers of the royal engineers, partly for practising them in military drawing, and partly for the purpose of forming plans of some portions of Kent for the use of the ordnance. The principal object was, however, the instruction of a corps of military surveyors and draughtsmen, the plans themselves being regarded as of secondary importance. In 1794 the survey for the one-inch map was begun, and some sheets were published in 1796. As the series of principal triangles were extended westward towards the Land's End, it was thought right to measure another base, for verification, on Salisbury plain in 1794; and two other base-lines were subsequently measured—one in 1801 at Misterton Carr, and the other in 1806 on Ruddlan marsh. Though first intended chiefly as a military map, the publication of the survey soon created a desire on the part of the public for better maps, and surveyors were then hired to hasten its progress. This, however, was very slow, the map being at one time entirely suspended during the war in the beginning of this century, and even the parts which were executed, having been done by contract, were found very inaccurate. In this condition the survey of England continued during the first quarter of the present century, sometimes delayed by the government from motives of economy, at other times urged on by the county gentlemen, who wished the map either as a hunting-map or for local improvements.

In Scotland, the principal triangulation was begun in 1809, but was discontinued in the following year, to enable the persons who had been employed there to carry forward the subordinate triangulation required for constructing the detail maps in England. In 1813 it was resumed, and continued steadily up to 1819; a new base-line having been measured on Belhelvie Links, near Aberdeen, in 1817, and the great sector used at various stations, both on the mainland and in the islands. In 1820 it was again suspended, was resumed in 1821 and 1822, and anew broken off in 1823, the large theodolite being wanted in order to proceed with the principal triangulation in s. Britain. In 1824 the survey of Ireland was begun, and nothing more was done in Scotland till

1838, except that some detail surveying for a one-inch map was continued for a few years in the southern counties. The chief strength of the surveying corps was now transferred to Ireland. A map of that country was required for the purpose of making a valuation which should form the basis of certain fiscal arrangements and other improvements which the social evils and anomalies of Ireland urgently demanded. For this map a scale of 6 in. to the mile was adopted, as best suited for the purposes in view. On this scale the whole map was completed, and published in 1845, though the first portions were in an imperfect form, and needed revision, which was proceeded with in 1873.

In 1838 the triangulation of Scotland was resumed; and the survey of Ireland having been finished in 1840, surveys for a six-inch map were begun for the northern portions of England which had not been mapped on the one-inch scale. In connection with this map the base-line on Salisbury plain was remeasured with great accuracy in 1849, and its length found 36577.8581 feet. In 1841 some secondary operations for a map of Scotland, also on a six-inch scale, were begun; but proceeded so slowly, that in 1850 only the map of Wigtownshire and some parts of Lewis were completed. Much dissatisfaction having been expressed in Scotland by the press and public bodies, as to the slow progress of the map and the six-inch scale on which only it was published, a committee of the house of commons (lord Elcho's) recommended the six-inch maps to be stopped, and the one-inch map completed as speedily as possible. This change produced much discussion as to the relative value of the one-inch and six-inch scales then in use, and the expediency of adopting a still larger scale as more valuable to the public. Circulars were issued, asking the opinion of various public bodies, and of scientific and practical men, as to the proper scale for a great national survey. The great preponderance of opinion was in favor of a scale of 1-2500 of nature, or nearly one inch to the acre. This scale was therefore ordered by a treasury minute of May 18, 1855 (lord Palmerston's), and though subsequently stopped, in consequence of a motion by sir Denham Norreys in the house of commons in June 1857, was again recommended by a royal commission (Dec. 1857), and ordered to be resumed by another treasury minute (Sept. 11, 1858). In 1861 a select committee was again appointed, and reported that it is desirable that the cadastral survey on the scales directed by the treasury minute of May 8, 1855, be extended to those portions of the United Kingdom that have been surveyed on the scale of one-inch to the mile only. This recommendation has now been adopted by the government, and the survey is at present proceeding on the following scales: Towns having 4,000 or more inhabitants are surveyed on a scale of 1-500 of the linear measurement, which is equivalent to 126.72 in. to a mile, or $41\frac{2}{3}$ ft. to an inch; Parishes (in cultivated districts) 1-2500 of the linear measurement, equal to 25.344 in. to a mile, or one sq. inch to an acre; counties on a scale of 6 in. to a mile; kingdom, a general map one inch to a mile.

The sheets of the one-inch map join together, so as to form a complete map of the whole kingdom. This is true also of the sheets of each county on the six-inch scale, and of each parish on the 1-2500 scale, but the sheets of different counties and parishes are not connected. The 1-2500 scale also applies only to cultivated, populous, and mineral districts; the Highlands of Scotland, and other extensive moorland and uncultivated tracts, being only surveyed on the six-inch scale, and published on the one-inch scale.

The scale, originally one inch to a mile, was increased to six inches to a mile when the survey reached Yorkshire and Lancashire; these counties being done on that scale as well as on the one-inch scale. The remaining counties of England were done on the scale of twenty-five inches to a mile for cultivated districts, as well as on the six-inch and one-inch scales. When England was completed, a re-survey was begun on the twenty-five-inch scale of those counties which had only been surveyed on the one-inch scale. The sheets on the scale of twenty-five inches to a mile (called parish maps), are reduced by photography, and issued on the scale of six inches to a mile (county maps). Of some of the maps, two series are issued, one having the hill features, marked in the usual way, the other with contour lines only. The area that has been surveyed in England was, at the end of 1880, 34,696 sq. m. (of a total of about 58,000 sq. m.). The annual grant for the re-survey was officially stated in 1880 at £133,500. The survey of the whole of Scotland was completed in 1877, and the maps for a large proportion of the area have been published. In Ireland, as stated, the six-inch maps have been long published, and are now in process of revision. A one-inch map of the whole in outline has been published, and is being completed by the addition of hills. The engraving of hills in the remainder is also being proceeded with. In all the three kingdoms, plans of many of the towns on the 10 and 5 ft. scale are also published.

The sketch now given of the history of this great national undertaking will show that it has been conducted at different times on different scales and plans, and that the system now pursued was only adopted after much discussion both in parliament and out of doors. The map was originally begun as a military map, and the scale of one inch to the mile chosen, without considering whether some other scale would not offer greater advantages. Many now think that a scale a little larger, and an aliquot part of nature, such as 1-50,000, or about $1\frac{1}{4}$ inch to the mile, would have been preferable for the small map; in which case a scale of 1-10,000 of nature, or about $6\frac{1}{2}$ in., might have been chosen for the intermediate, instead of the six-inch scale selected at first for mere local purposes in Ireland. Be this as it may, the arguments in favor of the one-inch

map are, that it is the most convenient both as a general and traveling map. For general views of the structure of a country, the distribution and relations of its mountains, plains, valleys, and rivers, the one-inch is admitted to be superior to the six-inch, and thus better adapted in the first instance for laying roads, railways, or other extensive public works, or for the publication of a general geological survey. Such a map, on the other hand, is on too small a scale to admit of correct measurement of small distances; it is in some respects a generalized picture, and not a correct plan. The six-inch maps were at first selected in Ireland as the smallest size on which correct measurements of distances and areas could be made. On them every house and field, and almost every tree or bush, might be laid down. Hence they are superior for working out details, as in minute surveys of railways or roads, or the complex geological structure of rich mineral districts. On such sheets, too, a proprietor or farmer may find every field laid down, and the relative heights indicated by contour lines, and may therefore use them for drainage and other improvements. It has also been proposed to use these six-inch maps as a record of sales or encumbrances of land, thus lessening the cost and simplifying the transfer of property. On the other hand, their size unfits them for most of the purposes for which the one-inch map is useful, and the contour lines give a far less vivid and correct impression of the physical features of a country than the hill sketching of the one-inch map. Most of the purposes of the six-inch plans are attained in a still more perfect manner from the 25-inch plans or cadastral survey. This last name is taken from the French *cadastre* (a register of lands), and is defined (in the *Recueil des Lois*, etc.) as a plan from which the area of land may be computed, and from which its revenue may be valued. The purposes to which these large plans may be applied are, as estate plans, for managing, draining, and otherwise improving land, for facilitating its transfer by registering sales or encumbrances; and as public maps, according to which local or general taxes may be raised, and roads, railways, canals, and other public works, laid out and executed.

Nearly all the states of Europe have produced trigonometrical surveys, many of them of great excellence as scientific works. All of these have been published, or are in course of publication, on convenient scales; generally smaller than one inch to a statute mile. The most important of these are:

Austria and northern Italy, scale $\frac{1}{80000}$ or $\frac{4}{5}$ of an inch to a mile.

Bavaria, Baden, Wurtemberg, and the Hessen territories $\frac{1}{80000}$ or $\frac{4}{5}$ of an inch to a mile.

Belgium, $\frac{1}{80000}$ or $\frac{4}{5}$ of an inch to a mile.

Denmark, survey map in preparation.

————, Iceland, surveyed and published on different scales.

France, $\frac{1}{80000}$ or $\frac{4}{5}$ of an in. to a m.; and a reduction to $\frac{1}{320000}$ or 5 m. to an inch.

Great Britain, 1 in., 6 in., and, in the lowland districts, 25 in. to a m.; and the coast survey, general charts, $2\frac{1}{2}$ m. to an in.; harbors and bays, from 2 in. to 12 in. to a mile.

Hanover and e. Prussia, $\frac{1}{100000}$ or $\frac{7}{11}$ of an in. to a mile.

Italy (see Sardinia, Tuscany, etc.), survey maps of Naples, Rome, etc., in progress.

Greece (French survey) $\frac{1}{288000}$ or $4\frac{6}{11}$ m. to an inch.

Netherlands, $\frac{1}{80000}$ or $1\frac{3}{11}$ in. to a mile.

Prussia, $\frac{1}{100000}$ or $\frac{7}{11}$ of an in. to a m., and many smaller.

Russia, survey map in progress.

Sardinia, $\frac{1}{288000}$ or $\frac{1}{4}$ of an in. to a mile.

Saxony, $\frac{1}{87000}$ or $1\frac{1}{9}$ in. to a mile.

Switzerland, $\frac{1}{100000}$ or $\frac{7}{11}$ of an inch to a mile.

Spain and Portugal, surveys commenced.

Sweden and Norway, surveys in progress.

Tuscany, $\frac{1}{200000}$ or about 3 m. to an inch.

The great trigonometrical survey of India, which was begun more than 70 years ago, has been conducted with great ability. The only remaining gaps in the principal triangulation of all India were filled in in the year 1880–81. The maps are published on a scale of $\frac{1}{250000}$ or $\frac{1}{4}$ of an inch to a mile. In America, the coast survey of the United States, a map of great accuracy and minute detail, has been going on for many years. The general charts are published on a scale of $\frac{1}{80000}$ or $\frac{4}{5}$ of an inch to a mile; the harbors and ports $\frac{1}{20000}$ or $3\frac{1}{2}$ of an inch to a mile. The triangulation of the whole area of the republic has been recently begun. See COAST SURVEY.

No portion of South America has been trigonometrically surveyed, except the republics of Peru and Chili, which are in progress.

The geological survey, though under a different department of government (science and art), may be shortly noticed here. The English survey was begun in June, 1835, and has now been completed, with the exception of Cumberland, Yorkshire, Norfolk, and Cambridge. The Irish survey was begun in 1840, but was subsequently suspended till 1845. It is now completed in the counties of Dublin, Meath, Westmeath, Longford, Kildare, Queen's county, King's county, Carlow, Wicklow, Wexford, Kilkenny, Waterford, Cork, Tipperary, Kerry, Limerick, and Clare. In 1854 the survey was extended to Scotland, and now extends over the counties of Edinburgh, Haddington, Fife, Kin-

ross, Linlithgow, Peebles, Lanark, Ayr, Renfrew, Dumbarton, Stirling, Perth, Wigton, Kirkcudbright, Dumfries, Selkirk, Berwick, and Roxburgh. The surveys are made on the 6-inch maps in the parts of the country where these exist; but the results are published on the 1-inch scale only, except some of the coal-fields, which are issued also on the 6-inch scale. Besides the maps, sheets of sections, horizontal and vertical, with valuable memoirs, are also published.

ÖREBRO. See OCREBRO, *ante*.

OR'EGON, one of the United States of America, in lat. 42° to 46° n., long. 116° 40' to 124° 25' w.; bounded n. and e. by Washington territory, from which it is chiefly separated by Columbia river; e. by Idaho, the Lewis or Snake river intervening; s. by Nevada and California; and w. by the Pacific ocean; being 350 m. from e. to w., by 275 from n. to s., with an area of 95,274 sq. miles. The principal rivers are the Columbia and its branches—the Willamette, Fall river, Snake river, and the Owyhee. The Columbia is a large river, navigable 96 m. to the Cascade mountains, through which it passes; but the entrance is difficult. The Willamette drains a large and fertile valley between the mountains and the ocean. The Cascade mountains, which have extinct volcanic peaks of 4,000 to 10,000 ft. high, run n. and s., dividing the state into two unequal regions. The western third of the state, bordering the Pacific, has a mild, equable, and moist climate, with valleys of great fertility, where pines grow from 250 to 300 ft. high, and firs from 4 to 10 ft. in diameter. The rainfall at Astoria, mouth of the Columbia river, is 86 inches. East of the mountains the climate is dry and variable, and the soil less fertile. Gold and silver are found in the Cascade mountains, with copper, platinum, iridium, and osmium. Coal has been discovered on Coos bay. The chief agricultural productions are wheat, oats, potatoes, and apples. The great forests abound with the grizzly and black bear, panther, wild-cat, elk, deer, and antelope; among the birds are the California vulture, golden eagle, American swan, Canadian goose, etc.; while the rivers swarm with salmon. There were, in 1870, twenty-two organized counties. Most of the settlements are on the Columbia river and in the Willamette valley. The chief towns are Salem, the capital, on the Willamette river; pop. 4,000; Portland, 10,000; and Oregon City, about 2,000. Within the state are about 10,000 Indians and 2,000 Chinese. Four colleges have been founded, one medical school, numerous academies, common schools, daily and weekly papers, and churches of several denominations. Oregon was the name formerly given to the whole territory w. of the Rocky mountains claimed by the United States as far n. as lat. 50° 40' north. This claim was resisted by the British government, which asserted a right to the entire territory, and in 1818 a treaty was made, and renewed in 1827, giving joint occupation, which was terminated in 1846 by notice from the United States government, and the question seemed likely to involve the two countries in war, when a compromise was offered by lord Aberdeen, on the part of the British government, and accepted by that of the United States, by which the boundary was settled on the forty-ninth parallel. The northern portion is now Washington, and the eastern Idaho territory. The coast was discovered, and Columbia river entered, in 1792 by capt. Gray of Boston. It was explored in 1804 and 1805 by capt. Lewis and Clarke, U. S. army. In 1811 John Jacob Astor founded Astoria as a trading-depot of the American fur company, but sold out afterward to the Northwest fur company. In 1845 the gift of 320 acres of land to each married couple of settlers caused a large immigration. The territorial government was organized in 1848, and in 1859 it was admitted as a state. Pop. in 1860, 52,464; in 1870, 90,776.

OREGON (*ante*). The name Oregon originally applied to all the w. part of the United States possessions n. of the Spanish province of California. The Columbia river was once known as the Oregon. Bryant, in "Thanatopsis," alludes to it under that name in the line—

"Or lose thyself in the continuous woods where rolls the Oregon,"

etc. The Greek navigator De Fuca discovered its coast in 1592; the Spanish admiral Fonte, in 1640; and Spain, for a time, claimed it. She ceded her rights, such as they were, to England by treaty in 1790. The American capt. Robert Gray of Boston explored the great river in May, 1792, named it after his vessel, the Columbia, and by the attention called to it in a circumstantial report to the United States government gave the color of an original title to a claim by the United States to the valley of the river. France then held a shadowy claim to all the continent w. of the Mississippi and n. of the Spanish possessions, under the name of Louisiana. The United States acquired all of that by the purchase of Louisiana in 1803. The report of capt. Gray was made the basis for a continental exploring expedition ordered by Jefferson and made by captains Lewis and Clarke in 1804-6. Their really original surveys up and down the Columbia and its great tributaries gave the United States its best title to the country. In 1811 the American Pacific fur company, of which John Jacob Astor was the director, established a trading-post at the mouth of the Columbia, and called the place Astoria. In the war of 1812 its property was sold to the Northwest fur company (a British company, subsequently merged into the Hudson bay company) to prevent its seizure by British war-vessels. These companies maintained their fur depots at fort Vancouver, 60 m. above Astoria, up to 1860. In 1832 a few settlers came from the United States. Overland immigration from

PACIFIC STATES AND TERRITORIES.

the states commenced in 1833 on a very small scale; only made possible across the vast plains and numerous ranges of intervening mountains through the thorough knowledge of the country which had been acquired by the hunters and trappers employed by the Hudson bay company in all the country between the Mississippi and the Pacific. A missionary colony, headed by Dr. Marcus Whitman and rev. Mr. Spaulding, arrived in 1834. The first considerable immigration was caused by the gold excitement in California in 1849, which, by establishing the overland route, placed the rich valley of the Willamette within reach of exploring parties from California, as well as direct immigration down the Snake river. An organization for a territorial government had been effected by the few settlers in the state in 1843, and a territorial constitution adopted by their votes in 1845. A treaty with Great Britain, concluded in 1846, settled a disputed boundary question. Congress passed the act to organize the territory of Oregon Aug. 14, 1848. It then embraced all of the region claimed by the United States n. of the 42d parallel, and w. of the Rocky mountains. The territorial government was inaugurated March 3, 1849, on the arrival of the first appointed governor, Joseph Lane. Washington territory, organized Mar. 2, 1853, took from Oregon that part n. of the Columbia river and lat. 46°. A state constitution was framed and ratified in 1857, and Oregon was admitted into the union as a state Feb. 14, 1859, with its present boundaries. In 1850 congress passed the "donation law," giving 320 acres of public lands on the Pacific slope to any actual settler upon it, and 320 acres more to the wife, on all lands entered previous to December of that year; and from Dec. 1, 1850, to Dec. 1, 1853, the right in like manner to enter 160 acres each. Under that law 8,000 acres were registered in Oregon, including what is now Washington territory. It mostly fell into the hands of speculators. The following have been her governors, provisional, territorial, and state:

James Shields, provisional..	1848-49	John Whittaker, state.....	1859-62
Joseph Lane, territorial.....	1849-51	Addison C. Gibbs, state.....	1862-66
John P. Gaines, "	1851-53	George L. Woods, "	1866-70
Joseph Lane, "	1853-53	Lafayette S. Grover, "	1870-78
John W. Davis, "	1853-55	William M. Thayer, "	1878-82
John L. Curry, "	1855-59	Zenas F. Moody, " "	1882-87

In 1843 there were about 400 white colonists in Oregon, and as many more hunters and trappers.

The subsequent decennial censuses show population as follows: 1850, 13,294; 1860, 52,465; 1870, 90,923; 1880, 174,767. The proportion of males to females in 1850 was about two to one, and since that time as 3 to 2. The proportion of native to foreign population in 1880 was as 7 to 1, and nearly one-half of all the population even at that time had been born in the state. Oregon received emigrants from every state of the union, but in largest porportion from the northern states between the lakes and the Missouri river. Of the foreign-born population one-third were natives of the British isles, one-sixth of Germany, and about one-tenth from British North America. In 1880 there were 33,468 families, averaging 5.22 persons in each; 32,374 dwellings, averaging 5.40 persons in each. There were in 1880, 5,376 persons of 10 years of age and upward unable to read, and 7,423 unable to write, making a total percentage of 9.8. The Indians of Oregon in 1885 living on reservations, number about 4,255, located at five reserves, as follows: the coast Indians, at Siletz river, on the Pacific coast, 75 m. s. of the mouth of the Columbia; the Grand Rondes, near the coast, 60 m. s. of the Columbia; the Klamath Indians, just e. of the coast range, near the California line; the Warm Springs Indians, on the 45th parallel, forty m. s. of the Dalles; the Malheurs, in the e. part of the state, near the 44th parallel; and the Umatillas about 30 m. s.e. of Walla Walla. A small part of the Indians rove along the banks of the Columbia to fish, and a still smaller number have taken to farming among the settlers. In the reservations there are 6,000 sq. m., making 550 acres to each Indian. Of roving Indians the number is greater and more uncertain. The Modoc war of 1872 in the lava plains of the s. border of Oregon showed the power of a few Indians and white outlaws to make much trouble. In 1878 a more serious attack on white settlements was made in e. Oregon. A band of Bannacks, joined by Shoshones, Piutes, Snakes, and Malhes, ravaged a large district, killing stock and murdering settlers; but were followed so closely by the U. S. forces under gen. Howard that the panic caused by their unexpected show of strength and destructiveness rapidly subsided. It was the most matured and united movement by the Indians against the settlers ever made in the state, and resulted in widespread destruction to property, and considerable loss of life. Their quick defeat and the measures taken to force the Indians into reservations near military stations have since effected the clearance of the whole country from the same dangers.

Three ranges of mountains—or, rather, two ranges and one broad upheaval, with many ranges ramifying from it—divide the state into four widely different parts. Next to the sea is the Coast range, of an average height of 2,500 ft., maximum 5,000 ft., drained by deeply fissured streams running directly to the sea on the w., and into the Willamette valley eastward. Parallel with the coast, and from 40 to 70 m. e. of it, is the great Cascade range—the northerly continuation of the Sierras of California, and the loftiest mountains of the state. Between these two ranges flows the Willamette n. to the Columbia, and makes the most fertile and beautiful region of the state. The strip on

Oregon.

the coast slope, and the narrow valley of the Willamette, are but small parts of the state, but the richest by nature and by far the most settled. The Blue mountains are the third of the great divisions of Oregon, forming a vast irregular plateau, with spurs in every direction, and draining by streams n. to the Columbia, s. to the Humboldt and the Klamath rivers, and e. to the Snake. Their n.e. spurs are called Eagle mountains. These mountains have not so lofty peaks as those of the Cascade range, but, springing from a much more elevated and extensive upheaval, they form a more elevated mountain system than is generally supposed, ranging from 4,000 to 9,000 ft. above the sea. The peaks of the Cascade range, on the other hand, rising from the low level of the Willamette and Columbia river valleys, are seen in all their majesty. Mount Hood, the most northerly, is 11,225 ft. high, 30 m. from the Columbia, and 110 m. from the Pacific. Mount Jefferson, 50 m. further s., is 10,200 ft. high, and mounts Thielson, Scott, Pitt, and the Three Sisters are of about equal elevation. This great range is broken through in its southern part by the Willamette and Klamath rivers, which rise e. of it, but flow w. through great gaps, the former to the Columbia, and the latter through California to the Pacific. The peaks of the Cascades rise above the line of perpetual snow. The Cascade mountains are volcanic, and indicate that eruptions have taken place from them at no very remote period. The Indians have traditions that mount Hood has been seen in an active state. The valley of the Columbia, where it forms a part of middle Oregon, receives as tributaries from the Blue mountain range John Day's river, down the valley of which it is expected the Union Pacific railroad connection with Oregon will be made; and the Des Chutes river, which drains a great basin between the Cascade and the Blue mountains. The s. part of middle Oregon has many small lakes, some of them salt, some basins without outlets, and others which drain s. to the Humboldt and Klamath rivers. The principal lakes are the Klamath, Goose, Warner, and Harney. East Oregon is drained by short streams flowing n. into the Columbia, and by the following rivers flowing easterly into Snake river, viz.: Grande Ronde, Powder, Burnt, Malheur, and Owyhee rivers. The last two, in the s.e. part of the state, drain considerable valleys, mainly valuable for grazing.

The sea-shore of Oregon is 300 m. in length, and has many fine bays and good harbors. The most southerly is the mouth of Rogue river at Ellenburg. At Port Oxford, a few miles n., is a small bay furnishing partial protection from storms. The mouth of Coquille river is accessible to vessels of light draught. Coos bay, in lat. $43^{\circ} 20'$, is 10 m. long, 2 m. wide, with 18 to 24 ft. of water, and a changeable bar at its mouth that occasionally impedes entrance. Empire City and Marshallton are located upon it. The Umpqua mouth can be entered by vessels of light draught, and the river is navigated by small steamers to Roseburg, 90 miles. Yaquina bay at the mouth of Yaquina river, in lat. $44^{\circ} 40'$, is a wide estuary with 10 to 12 ft. of water on its bar. Tillamook bay, in lat. $45^{\circ} 34'$, has an area of upwards of 6 sq.m., with 24 to 50 ft. of water at the entrance and in the bay. Tillamook is its port. Nehalem river, in lat. $45^{\circ} 41' 30''$, forms a bay 4 m. long, 8 m. wide, with an entrance 200 to 400 ft. wide, and 18 ft. at high tide. False Tillamook bay, a few miles n., is a small, round, secure harbor. Next comes the mouth of the Columbia river. All the harbors named have a light-house or light-houses at their entrances. The Columbia river is the great harbor of that coast. It is 5 m. wide at its mouth, has 2 channels—the s. 2 m. wide with 24 ft. of water at low tide, and the n. 600 yds. wide with 21 ft. depth. Fogs and a shifting bar make some difficulties at its entrance at times. Cape Hancock, on the n. of the entrance, has a light-house, and on cape or point Adams, on the s., is fort Stevens and a light-house. There are many harbors on both sides of the Columbia, and ships ascend it 115 m. to the Cascades. The Willamette joins it 110 m. from the mouth, and is navigable by light steamers 126 m. above Portland, which is located on the w. bank 7 m. above the Columbia. Ships can ascend to Oregon City, 11 m. above Portland. A ship canal has been constructed around the falls of the Willamette at the former city at a cost of \$450,000, which provides for the steamboat navigation before mentioned. The U. S. government commenced the construction of a ship canal around Cascade falls on the Columbia in 1877, to be 7,200 ft. long, with two locks 300 ft. long, by 50 ft. wide each, overcoming a fall of 26 feet. Above the Cascades there are 296 m. of steamboat navigation on the Columbia, interrupted only by the rapids of the Dalles.

The Pacific slope of the state west of the Cascade mountains is tempered by the cool waters of the Pacific, so that its extremes of heat and cold are not great. Mists, frequent rains, and but little snow, characterize its winters. The summers are not excessively warm, but are often long without rain. Thunder-storms are rare, and hail-storms unknown. At Portland the average temperature for January was 30.30° ; the highest, 44.90° ; average for January is 39.5° ; February, 41° ; March, 45.5° ; April, 52.4° ; May, 46.8° ; June, 62° ; July, 68.6° ; August, 71° ; September, 62.6° ; October, 54.9° ; November, 44.9° ; December, 42.3° . The lowest temperature in January, 1875, was 3° ; the lowest in 1876, 20° , in January; and in 1874, 26° . The interior mountain county of the state east of the Cascade range is relatively hot and dry in summer, with deep snows and intense cold in winter. In the Columbia valley, at Dalles, the mercury sometimes falls to 8° below zero. The annual rainfall at Astoria is 60 in.; in Portland, 52.8 in.; in east Oregon, from 12 to 20 in., most on the high mountains and least in the valleys; in the upper valley of the Willamette, from 37 to 44 inches. Observations from 1820 to

1876 inclusive, at Eola, near Salem, show an average of $37\frac{1}{2}$ in. yearly, which is the same as at Cincinnati, Ohio. There are no diseases peculiar to the climate. In some places alluvial lands and narrow valleys are subject to malarial fever.

Eastern Oregon, like southern Idaho, exhibits evidence of volcanic action at no remote period. Clefts and cañons afford excellent studies of geologic structure. The geologic formations of Oregon are eozoic, volcanic, tertiary, and cretaceous. The coast range and the mountains of the n.e. part are eozoic, and the Cascade range and southern mountains generally volcanic. A narrow strip of tertiary is found on the Pacific border, the Willamette valley, the upper portion of the Umpqua valley in the s.w., and the northern part of the state e. of the Cascade range. On the upper valleys of the Des Chute, Crooked, and John Day rivers cretaceous formations are developed. Minerals of nearly all kinds have been found in Oregon. Gold is found in nearly all the valleys of the streams flowing into the Snake river, and in the sands of the sea-shore. It was found, in 1852, in the s.w. corner of the state, where mining is still carried on; but since 1861, when gold was discovered in nearly all the streams flowing into the Snake river, and in the upper part of John Day river, the eastern part of the state has been much the most productive. The easy diggings were mostly worked over in the ten years following, and railways have not yet furnished facilities for the machinery necessary to costly developments. Silver is said to occur in nearly all the quartz ledges in the state, but extensive mining in quartz is in its infancy. Baker co., on the e. border of the state, has the greatest show of gold and silver ores. There are about 200 gold mines in Oregon, the great majority being placer; over 20 hydraulic, and 20 quartz. The gold from these mines deposited at the various mints and assay offices, aggregated in value (1884) \$17,835,054. The amount produced in the calendar year 1883 was valued at \$660,000. The silver yield during this year amounted to \$20,000, and the aggregate sum deposited in the mints and assay offices was valued (1884) at \$51,166. Many of the mines were idle. Previous to 1870 nearly all the mining was for gold. Each succeeding census shows a great increase in the number and value of silver mines, and in the value of capital and machinery engaged on them. Copper is found in oxides and carbonates in many parts of the state, and natives in ledges principally in the eastern and south-western counties. Iron ore is found in nearly every part of the state, but is not yet extensively worked. Six m. s. of Portland there is a bed at Oswego, in which the ore is 54 per cent pure iron. Lignite coal is found in many places in the coast range, in the Umpqua and Willamette valleys, and e. of the Blue mountains. Considerable quantities are shipped from Coos bay. Limestone, marble, granite, sandstone, slate, and syenite suitable for building are found in abundance all over the state. Salt springs abound in the southern part of the state, and soapstone in the Klamath basin. Stones of chalcedony, agates, carnelian, and jasper are found along the banks of the Columbia river.

The native animals of Oregon differ little from those of all the north-western states. The grizzly, cinnamon, and black bears are probably as abundant in this state as in any other, but the former is seldom found of so great size as in California and Nevada. A large wolf, the cayote, the panther, and wild cat are the principal carnivora. Of the deer family are the black-tailed, elk, antelope, and big-horn mountain sheep. The latter are very shy and rare, and found only on the high mountains. The elk generally herd on high table-lands among the mountains. Their meat is the finest of all of the deer family. Bears are generally in the woods near to streams. Fur-bearing animals were formerly abundant. Among them are the silver foxes, beavers, otter, polecat, muskrat, martin, and weasel. Seals (not fur-bearing) frequent the Columbia up to the cascades.

Fish are the great river product of Oregon. The salmon and salmon-trout of the Columbia and its tributaries, in size, abundance, and high flavor, fresh or salted, are known throughout the world. All the small rivers that flow to the sea are also stocked with these fish. A large amount of capital is engaged in the catch and canning of salmon. The first cannery was established in 1868 by Mr. Hume, of Maine, who established a wide demand in the United States and in England for his canned goods. There were, in 1885, 40 large canneries upon the Columbia, a majority of which were at Astoria, but scattered also along the river to 15 m. above the cascades. The catch of salmon averages about 1,250,000 fish, averaging about 23 lbs. They are caught in nets, of which about 40 m. in length are set for them nights. At Astoria 500 to 600 boats sometimes leave in the afternoon at once to go to the fishing grounds on the bar below. Twelve thousand is about the highest daily catch at the Astoria grounds, and 100 lbs. the maximum size of the fish. The canneries are built over the river on piles, and the work in them is principally done by Chinamen, except that done with machinery, which is employed to the fullest practicable extent. The work must be pushed with the greatest possible celerity during the height of the catch, which lasts in all about 100 days, but has its great days that tax all the machine and hand power of the vast establishments night and day. Ten million cans were required in 1880 by the Astoria canneries, and put up in 539,000 cases containing 25,900,000 lbs. The capital of these canneries is estimated at \$1,500,000, and the value of the products at over \$3,000,000. Over 7,000 hands and 1,500 boats are employed. Only 4,000 cases of salmon were packed, 1866, the first year of the business. The fishermen earn five dollars a day during the height of the fish catch.

Oregon has become, more than any other state except Texas, the primary market for

live stock ; the great herders of Wyoming and Colorado doing much of their "stocking-up" by purchase of Oregon cattle, of which about 150,000 head pass east through Idaho every year. East Oregon furnishes the larger part of these. In 1880 the value of live stock in the state amounted to \$13,808,392. There were in 1880, 16,217 farms, which were valued at \$57,000,000. At the present time these values are probably increased. In 1870 there were 120,000 cattle in the state ; in 1875, 276,000 ; in 1880, 417,000. The number of hogs in 1870 was 119,455 ; in 1880, 156,222. Of milch cows there were in 1860, 53,170 ; in 1870, 48,325 ; in 1880, 59,549. The raising of horses is increasing considerably at the present time, but the climate of Oregon will not permit them to be reared so cheaply as in California.

The total wheat crop of Oregon in 1870 was 2,270,000 bush. ; in 1880, 7,480,010 bush. ; the latter believed to be an average of 19 bush. per acre. The oat crop of 1880 was 4,385,650 bush., averaging 35 bush. per acre. The wool clip increased from 1,750,600 lbs. in 1871 to 5,718,524 lbs. in 1880. The quality has improved as rapidly as the quantity, and Oregon wool commands the best prices in eastern markets. Its exhibit at the centennial fair in 1876 received medals and diplomas, according to the report of the commissioners, for "merino wool, very fine specimens of fiber, and good staple, very much resembling Australian wool, and giving evidence that Oregon can produce wool of very great value." Much wool is consumed by the cloth-mills of the state. Oregon has a climate particularly favorable to the potato, the quality of which commends it to states south, while for Indian-corn her summers are too short and moist.

The timber grown on the alluvial lands and in the mountain valleys of Oregon is unsurpassed in magnitude except by the "big trees of California." In the families *pinus abies* and *picea* the trees of Oregon and Washington territory are the best of their species in the world. The long-leaved Oregon pine is found in mountain valleys, where it grows to the height of 170 ft., in straight trunks, without waste for lumber seven-eighths of their height, with a diameter of from 4 to 6 feet. The redwood, which belongs to the cedar family, is found on the Coast range of enormous size, sometimes 15 ft. in diameter. Its lumber is admirable for building purposes, being strong, easily worked, light, not liable to quick decay, and noxious, by its odor, to insects. A spruce, known as red pine, red fir, and red spruce, resembles the Norway spruce, but is distinct, makes a valuable lumber, grows 150 ft. in height, and 3 to 6 ft. in diameter.

Public lands : There are five United States land-offices in the state, located respectively at Oregon City, Roseburg, the Dalles, La Grande, and Parkville. Under the pre-emption law a citizen may enter or pre-empt, on payment of a fee of \$2, the right to purchase 160 acres either within or without the limits of a railroad grant at the rate of \$2.50 per acre for the former, and \$1.25 for the latter. The grants to the Oregon and California, and Oregon Central railroad companies, comprise the odd numbered alternate sections within 20 m. on each side of the road to the extent of 12,800 acres per mile. The companies sell their lands at from \$1.25 to \$7 per acre, 10 per cent off for cash, or on 10 years' time with interest at 7 per cent, one-tenth of the principal to be paid yearly. The United States have made extensive surveys, so that there are vast tracts of good land for sale under the homestead and pre-emption laws. The state also has for sale a large quantity of desirable lands granted by the government. Its chief land office is at Salem.

The state has three customs districts and ports of entry ; for s.w. Oregon, at Coos bay ; for the Columbia river, at Astoria ; and for the Willamette, at Portland. The commercial importance of the water route is second only to the Mississippi. The Columbia river is navigable for 300 miles. The commerce upon the Columbia and Willamette rivers has assumed a great magnitude by regular lines of steamers connecting with railways and canals around the falls. Smaller boats and rafting contribute largely to swell its volume. In 1868 there were 9 steamers engaged in the carrying-trade on the river. In 1875 the Oregon Steam Navigation Co., Oregon Steamship Co., and Willamette Transportation Co. had together 32 steamers and barges, with an aggregate of 18,698 tons. Twelve small steamers owned by individuals represented 2,473 tons. In 1880 the number of steamers had increased to 89, with aggregate tonnage of 31,370, besides 38 sailing vessels of 7,041 tons. Previous to 1868 the export trade, except that to the Sandwich islands and Puget sound (about \$100,000), was to San Francisco, and aggregated to the latter port that year \$1,678,793, in 1875 it was \$4,105,025, and in 1878, \$6,134,491. Before 1868 gold dust and ores formed three-fourths of all the exports of Oregon. They are now but one-third of the value of salmon alone.

The railways of Oregon are the Oregon Pacific (in progress), from Yaquima bay to Boise city, Idaho, crossing the Cascade mountains ; the Oregon and California railway, from Portland up the Willamette to Fort Lane, 324 m., successors of the Oregon and Central Railroad Co., chartered by congress March 17, 1870, and owners of a land grant ; the Willamette Valley railroad, from Dayton to Dallas, 35 m., and the Oregon Railway and Navigation Co., consisting of eight divisions, with a total mileage of 481 in the state. The principal branches are the Western division, from Portland to Dallas, 85 m., the Columbia division, from Dallas to Wallula Junction, Washington, and Mountain division, from Umatilla to Neacham, Washington. This company commenced business July 1, 1879. It is a strong corporation, controlling the Oregon Steamship Co. and the Oregon Steam Navigation Co., including portage of the Columbia river (one in Washington territory around the lower cascade), and the Walla Walla and Columbia River railroad. It owns

many ocean and Puget sound steamers : total river lines, 667 m. The controlling managers of this company are in Boston, New York, and Chicago. A railroad is projected up the valley of John Day river toward the s.e. part of the state, to meet a branch of the Union Pacific, now under construction from Ogden through s. Idaho, and when these roads shall be completed, a transcontinental road eastward from Oregon will be formed. Total mileage of railroads in O., 1884, 950.

The number of manufacturing establishments given by the census of 1880 was 1,080, employing 3,476 hands, \$6,312,056 capital, paying \$1,667,046 for wages, consuming \$6,954,436 of raw material, and producing \$10,931,232 value of manufactures. Flouring mills produced of this \$3,475,531 ; lumber, \$1,452,000 ; woolen fabrics, \$51,000. In 1880 the exported part of the flour-mill products amounted to over \$4,000,000 ; the lumber and timber to \$4,000,000, and woolen goods to \$1,000,000. Iron foundries, machine-shops, rolling mills, quartz crushing mills and smelters, wool and paper mills, linen factories, extensive tanneries, and factories for making building lumber, agricultural implements, and wooden ware, indicate the direction of the manufacturing work of the state. The fish-canning factories have been referred to.

The constitution was adopted in 1857, and authorizes any male citizen of the United States 21 years old and six months a resident of the state to be a voter, and any like foreigner who shall declare his intention to become a citizen one year before an election, and have been a resident of the state for six months. The governor, secretary of state (who is auditor), and state treasurer are elected for four years, and ineligible four out of any period of 12 years. The legislature has a senate of not more than 30 members elected for 4 years; and a house of representatives of not more than 60 members elected for two years. They meet biennially. The judiciary consists of a supreme court of two or more judges, having appellate jurisdiction ; five circuit courts, presided over by one of the judges of the supreme court, having civil and criminal jurisdiction, and appellate jurisdiction from the county courts; and county courts with one judge, elected for four years, who is also judge of probate. An act was passed by the legislature in 1878 creating a separate supreme court of three judges. The circuit court judges are elected one-third every two years. One or more justices of the peace are elected in every township or mining district, and have jurisdiction in cases involving \$250 or less. Judges of the supreme court can be removed by the governor upon the joint resolution of two-thirds of the legislature. A state printer and superintendent of public instruction are elected every four years. General elections are held biennially on the first Monday of June of even years. To amend the constitution the amendment must pass two successive legislatures, and be approved by popular vote. The constitution prohibits the legislature from contracting any state debt exceeding \$50,000, or assuming the debt of any county, town, or corporation, and limits each county to \$5,000 of indebtedness except "to repel invasion or suppress insurrection." The salaries of governor, secretary of state, and superintendent of public instruction are \$1,500 each; treasurer, \$800; and members of each house \$3 per day, and \$3. for every 20 miles of travel, not making more than \$120 to any one member.

The board of education for the state consists of the governor, secretary of state, and superintendent of instruction. County superintendents and boards of district school officers are chosen at the biennial county elections. The foundation for the public schools of Oregon is exceptionally strong. An irreducible school fund of \$500,000 furnishes a part of it. A large body of swamp lands was donated to the state by the United States, and has been placed at the disposal of the board of school commissioners to be sold so as to make the most of their value. The number of children in the public schools in 1882 was 37,748 ; of school age, 65,216. The very sparse settlement of a large part of the state makes the maintenance of schools difficult in many places, so that the average duration of schools in 1882 was only 6 months. Value of school property the same year, \$684,298 ; number of school-houses, 1,061 ; number of teachers employed that year, 1,412 ; average salary of teachers, \$37 per month. The total receipts from all funds for public schools was \$338,307, an increase of \$15,000 in a single year. The total expenditures were \$346,961, an increase of \$28,630 in a single year. The permanent school fund amounts to \$832,522. The university of Oregon, established by the legislature in 1872, is under the control of nine directors, six of whom are appointed by the governor, and is endowed by the state at the start with \$50,000, called the university fund. The following colleges were in operation in 1885. The Pacific university and Tualatin academy at Forest Grove, not denominational, had 8 instructors, 124 students and 5,000 volumes in library; the Willamette university at Salem, Methodist Episcopal, 9 instructors, 322 students, 2,500 volumes; McMinnville college at McMinnville, Baptist, 6 instructors, 150 students; Christian college, at Monmouth, Christian Brothers, 9 instructors, 180 students; Philomath college at Philomath, United Brethren, 6 instructors, 134 students, and Corvallis college at Corvallis, Methodist Episcopal, 6 instructors and 134 students. The Pacific university, Philomath college, and Willamette university admit women. A medical department of the latter had 11 professors and 14 students. Ninety thousand acres of the congressional land grant for school purposes were given in 1872 to endow a state agricultural college which was grafted as a department on Corvallis college, where it has a farm, and receives an annual grant of \$5,000 from the state. Over 5,000 pupils were enrolled in private schools. Many of the institutions were well endowed. The United

States Indian Industrial Training School, at Forest Grove, has proved a successful undertaking, now numbering over 150 pupils. Nearly every settlement now has its public or parochial school.

The number of newspapers and periodicals in 1883 was 77; they were classified: 8 daily, 1 tri-weekly, 57 weekly, 1 semi-monthly, and 4 monthly. The aggregate circulation was over 46,000. The church organizations and relative strength are given below from the census of 1875: Organizations, 351; edifices, 242; clergymen, 320; value of property, \$654,000.

The leading denominations represented are the Baptists, Congregationalists, Episcopalians, Methodists, Presbyterians, and Roman Catholics. There are about 80 Baptist, 25 Roman Catholic, 30 Congregational, 35 Presbyterian, and 40 Episcopal churches. There are over 6,000 Methodists.

No public building for state charities had been erected up to 1875. A school is maintained for deaf mutes, an asylum for the insane, and another for the blind, under state control, in buildings leased for the purpose. In the deaf mute school in 1882 there were 42 pupils; in the blind asylum, 0; in the insane asylum, 195; of whom 140 were males and 55 females, and 124 natives of the United States and 71 of foreign countries. The penitentiary was erected in 1874, and has a farm and commodious yards connected with it. The convicts are employed at brick-making, or on the farm, or let out to contractors. In 1879 they numbered 200.

The decennial valuations of property for taxation have been as follows:

YEARS.	ASSESSED VALUE.			Estimate of Real Value.
	Real.	Personal.	Total.	
1850.....	\$5,063,474
1860.....	\$6,279,602	\$12,745,313	\$19,024,915	28,930,637
1870.....	17,674,202	14,124,308	31,798,570	51,558,932
1883.....	75,306,453	90,000,000

The amount raised by taxation in 1882 was \$258,000. The state receipts, 1880-2, amounted to \$519,848; the expenditures to \$545,196. The state debt, 1884, was \$110,000. The rate of the state tax is 5.67 mills on the dollar, or 56.7 cents on \$100. No poll-tax is levied on those over 50 years of age.

OREGON, a co. in s. Missouri adjoining Arkansas, watered by the Spring and Eleven Point rivers; 730 sq.m.; pop. '80, 5,739. The surface is uneven, broken with hills, heavily wooded; the soil is fertile. The principal productions are corn, wheat, and oats. Co. seat, Alton.

OREGON RIVER. See COLUMBIA RIVER, *ante*.

OREIDE, a new alloy lately introduced by the French as a substitute for ormolu, which it excels in its gold-like character. There are two formulas for composing it. In the first the ingredients are: copper, 100.0; tin, 17.0; magnesia, 6.0; sal ammoniac, 3.6; quicklime, 1.80; argols, or unrefined tartar, 9.0. In the second, zinc is substituted for the tin. The latter does not possess the same brilliancy as the former. The metals are first melted, and the other ingredients, after being thoroughly incorporated together by powdering and mixing, are slowly added, and the whole is kept in a state of fusion for about an hour, and the scum removed from time to time.

O'REILLY, ALEXANDER, Count, 1725-94, b. Ireland. He went to Spain at an early age, became a soldier in the Spanish army, and served in Italy in the war of the Austrian succession. He served for a short time in the armies of France and Austria, and then re-entered the Spanish service, where he was brig.gen. and afterwards inspector-gen., in which position he introduced many reforms in the discipline and tactics of the army. In 1768 O'Reilly was sent to Louisiana, which had been ceded to Spain in 1762. Here he put down the disaffection of the French, and in so doing committed many tyrannous and cruel acts. His system of court martials and executions was particularly unjust in view of the fact that up to the time of his arrival the Spanish authority had not been asserted in the colony. Upon his return to Spain he was given command of an expedition against Algiers, which proved a failure (1775). He d. while on his way to take command of the army of the eastern Pyrenees.

O'REILLY, JOHN BOYLE. See page 881.

O'REILLY, PATRICK T., D.D. See page 881.

O'REILLY, PRIVATE MILES, (*pseud.*) See HALPINE, CHARLES G.

OREL, a government in the s.w. of Central Russia, bounded on the w. by little Russia and the government of Smolensk. Area, 17,951 sq.m.; pop. '80, 1,826,169. The surface is flat, with rising grounds in the vicinity of the towns of Kromy and Malo-Archangelsk, from which the Oka and Sosna respectively take their rise. The government is drained by the Desna on the w., an affluent of the Dnieper; the Oka on the n., an affluent of the Volga; and the Sosna on the e., an affluent of the Don. The soil is fertile, and the climate mild. The western part of the government abounds in woods. In the district of Briansk, in the n.w., there are a number of iron mines. Agriculture and the cultivation and preparation of hemp are the chief employments of the people.

Corn is very extensively grown, and great quantities are sent to St. Petersburg, Riga, and the Black sea ports for export. The principal article of export is wheat, in grain and in flour. Sail-cloth, rope and hemp-yarn manufactures are carried on; glass and iron works are numerous. The hemp of Orel is reckoned the best in Russia; and the oil obtained from hemp-seed, and used in Russia as an article of food, is extracted at 2,000 mills. The rearing of cattle and horses is much attended to; almost all the considerable land-owners keep studs.

OREL, a thriving t. of Great Russia, capital of the government of the same name, stands on the Oka, as its confluence with the Orlik, 226 m. s.s.w. of Moscow, and 678 m. s.s.e. of St. Petersburg. It was founded in 1566, as a stronghold in defense of what was then the Russian frontier, against the inroads of the Tartar tribes of the Crimea. Its importance as a fortress ceased after the annexation of Little Russia, and it then became a commercial town. The town owes much to its advantageous position on a navigable river in the midst of the most fertile provinces of Russia. The railway from Moscow to Odessa, on the Black sea, passes through Orel, and the Vitebsk line affords it direct railway communication with the port of Riga, and thus its export trade has been greatly promoted. It is the seat of a bishop, and contains numerous churches; its houses are for the most part constructed of wood. There is an important ferry here over the Oka. The chief manufacturing establishments in the town, are yarn and rope factories. The principal articles of export are cereals and hemp. On June 7, 1848, Orel suffered severely from a great fire, which destroyed 1237 houses, four bridges, and a number of granaries. Pop. '80, 53,500.

ORELLÁNA, FRANCISCO, d. about 1550; b. Spain, went to Peru in 1531, in the expedition commanded by Francisco Pizarro, participated in the contest which conquered the country, and was the first European who crossed the continent of South America. He was of respectable family and went to America to better his fortunes. In 1540, with Gonzalez Pizarro (brother to Francisco), Orellána, as second in command of 350 Spaniards, 4,000 Indians, and 1000 dogs (for hunting natives), penetrated the forests and climbed the snow-clad Andes mts. between Quito and the country beyond, which was reported to abound in gold, silver, cinnamon, etc. Many hardships and misfortunes were met, and the explorers were shaken by earthquakes, overtaken by tempests, and drenched by floods, which cut off their means of communication, and reduced them to the greatest straits. After many trials of endurance they reached the province of Zumaco, and were cheered by the sight of the cinnamon tree growing in great abundance. They had been subsisting on roots and berries, while following the course of a river supposed to be the Napo, a branch of the Marañon for 200 leagues, and had nearly exhausted their supply, when Orellána was ordered down the river with the bark which they had built—large enough to hold their baggage—manned with 50 soldiers. They were warned to keep near the army which would follow by land, and after procuring provisions the orders were to return immediately, leaving the baggage where they loaded the provisions. He proceeded down the river till he came to the place where it joined the Amazon, made no discoveries of the means of subsistence, but was the first European to navigate that stream. He parted with his commander at this point and proceeded down the river, the voyage lasting 7 months, and his party were reduced to the extremity of hunger, eating their shoes and devouring their saddles. Many deaths occurred from skirmishes with the natives, and mutinies broke out among the crew, which only his firmness quelled. He reached the coast in August, 1541, having passed over 1000 leagues of the river. From its mouth he sailed to the island of Cubagua and thence to Spain carrying glowing accounts of the El Dorado, and embellishing his story with descriptions of the marvelous race called the Amazons, who were female warriors, and dwelt by the banks of the river which had no male population, and where gold was so plenty that the roofs of the temples were made of gold. He readily induced a company to join him, and the king of Spain granted him extensive possessions and a commission to colonize El Dorada. He set out with 4 ships and 400 men in 1549, but he lost one ship and 150 men before reaching Teneriffe. He arrived at the mouth of the Amazon near Montealegre, but every vessel in his fleet was wrecked, and he d. shortly after of malarial fever.

ORELLI, JOHANN KASPAR, an eminent philologist and critic, was b. at Zürich, Feb. 13, 1787. His father was long the *Landvogt* of Wädenschweil. He studied in the *Carolinum* at Zürich, and betook himself enthusiastically to the study both of the ancient and of modern languages and literature. In 1806 he was ordained as a clergyman. He spent some years as a tutor at Bergamo; and while there, published, in 1810, two parts of a work entitled *Beiträge zur Geschichte der Ital. Poesie*. In 1813 he became a teacher in the cantonal school at Chur; in 1819, professor of eloquence and hermeneutics in Zürich; and after the foundation of the Zürich high school, in which he took an active part, he was one of its chief ornaments. There never was a man more zealous in the course of education. It was during this latter and most distinguished period of his career that he produced most of his learned works, and trained to a correct knowledge of antiquity a numerous band of scholars. His political sympathies and opinions were not, however, confined to the ancient world; he took the liveliest interest in the struggles of Greece for freedom, and in the political reformation of his native country. He died Jan. 6, 1849. Orelli edited many classical authors with great learning, taste, and acute

discrimination; in particular, his editions of Horace (2 vols. Zür. 1837-38), Tacitus (2 vols. Zür. 1846-47), and Cicero (4 vols. Zür. (1826-31) deserve mention; also an *Onomasticon Tullianum* (3 vols. Zür. 1836-38), executed in association with Baiter, and an *Inscriptionum Latinarum Selectarum Collectio* (2 vols. Zür. 1828).

O'RENBURG, a Russian government in the Ural region, lies partly in Europe and partly in Asia, and extends between the governments of Tobolsk on the n.e. and Samara on the s.w. Area of the government, 73,600 sq.m.; pop. '80, 1,074,420. The government is divided into four districts — Orenburg, Verchne, Uralsk, Ovsik, and Troitsk and Tehelabinsk. Capital, Orenburg (q.v.). Till 1865, Orenburg comprised within its area the whole of what is now the distinct government of Ufa (q.v.); but in that year the part of Orenburg lying to the n.w. of the Ural mountain range was organized into the new government. The populations, the surface, soils, flora, and fauna of this extensive country are of the most various kinds. The government is one of the most elevated in the empire; but it also contains extensive low-lying tracts and steppes. It is traversed by numerous navigable rivers, by means of which and by canals it is in communication with the Caspian and Baltic seas, and with the Arctic ocean. The main streams are the Bielaia (running into the Kama, a tributary of the Volga), the Tobol, and the Ural. As many as 2,300 larger and smaller lakes lie within the frontiers. Of the whole area, about three-tenths are forest, a half is waste land, and only about a twentieth part is cultivated. The hill country has much pleasant scenery, but great tracts of the steppe regions are utterly barren and desolate. The inhabitants are made up of Russians, Bashkir, Tartar, and Kirghis tribes, Kalmucks and certain Finnish peoples, with a few Germans. The trade is chiefly with Bokhara, Khiva, Tashkend, and the Kirgheez; the exports are gold, silver, and other metals, corn, skins, and manufactured goods; the imports, cattle, cotton—the demand for and supply of which have greatly increased since the commencement of the American war—and the other articles of Asiatic trade. The imports are either disposed of to Russian merchants in the custom-house on the frontier, or are carried by Asiatic traders into Russia, and sold at the great national market of Nijni-Novgorod. There are in the province numerous iron and copper works, as well as valuable gold diggings, both belonging to the crown and to private individuals. The salt mines are valuable. There is a small-arms factory on a large scale, and a few other factories. Cattle-breeding is very extensively carried on. The number of horses in Orenburg is larger than in any other Russian government. The southern frontiers are defended, at intervals of 12 or 12 m., by fortified settlements, inhabited by Cossacks; those on a larger scale being surrounded by a bulwark and a moat. This line of forts extends over a frontier of 2,000 m. eastward to the boundaries of China; the series from the mouth of the Ural to the Tobol, occupied by upwards of 242,000 Ural and Orenburg Cossacks, being known as the Orenburg line. The region of which Orenburg forms part was originally called Bashkir-land, and became subject to the Czar of Moscow in 1556. Besides the towns giving name to the governmental districts, the only other place of consequence is Mijask.

ORENBURG, a t. on the eastern frontier of European Russia, in the government of the same name, on the river Ural, 1393 m. s.e. of St. Petersburg, lat. 51° 45' n., long. 88° 6' east. The foundation of the fortress and town were laid here in 1742. Pop. '80, 47,840. It is the centre of the governor-generalship of the government of the same name, has an excellent custom-house, and carries on an extensive trade with Kirgheez and other Asiatic tribes. It imports cotton, silk-stuffs, and shawls from Bokhara, Khiva, and Tashkend; tea (brought mostly on camels) from China; and sheep and cattle from the Cossacks and Khirghiz. The sheep are killed in autumn for the fat and skins, which are purchased by Russian merchants. Corn, skins, and metals are the principal exports. In the neighborhood is the very rich rock-salt mine of Iletsik. At Orenburg the Ural is frozen from Oct. till March.

ORENBURG GUM, an exudation of the larch tree, resinous and somewhat sweet in taste. It is gathered in quantities by the peasants of Siberia and Russia, and is an article of commerce, making a fair substitute for gum arabic.

ORENSE (anc. *Aquæ calidæ Ciliorum*, or *Aquæ Originis*), a city of Spain, the capital of the province of Orense, in Galicia, near the frontier of Portugal, on the left bank of the Minho. Orense contains a number of interesting ecclesiastical edifices. It is highly reputed for its hot sulphurous springs, called *Las Burgos*, which issue—three in number—almost boiling from a granite rock in the western part of the town. The baths of Orense were known to the Romans, and were in much repute among the Goths. Orense carries on manufactures of linen, leather, and chocolate. It has a large trade in hams, which are in great repute throughout Spain. Pop. 12,586.

ORENSE, JOSÉ MARIA D'ALBAIDA, Marquis, 1802-80; b. Spain; when a young man became imbued with republican principles and spent his life in endeavoring to establish a Spanish republic. He was many times arrested on charges of disaffection and conspiracy, and banished from the country. In 1868 he became a member of the cortes, and in 1870 was opposed to the enthronement of Amadeus. After the abdication of king Amadeus, 1873, he was again chosen a member of the cortes, but after a few months resigned his place.

OREODAPHNE, a genus of trees of the natural order *Lauraceæ*, sometimes called MOUNTAIN LAUREL. The fruit is succulent, partly immersed in a deep thick cup formed of the tube of the calyx. *Oreodaphne opifera* is a native of the countries on the lower part of the Amazon. A volatile oil obtained from the bark is used as a liniment, and when kept for a short time deposits a great quantity of camphor.—*Oreodaphne copularis* is a very large tree with strong-scented wood, the bark of which yields the cinnamon of Mauritius. It grows also in Bourbon and Madagascar.—*Oreodaphne fœtens*, a native of the Canaries, has wood (*Til-wood*) of a most disagreeable odor. *Oreodaphne bullata*, found at the cape of Good Hope, is also remarkable for the disagreeable odor of its wood, the *Stink-wood* of the colonists; but it is hard, durable, beautiful, takes an excellent polish, and is used in ship-building.

OREODONTIDÆ, a family of extinct ungulates found in the miocene and pliocene tertiary formations of North America. They are regarded as forming a link between swine and ruminants, but in outward appearance had but little resemblance to the former. The family has been divided into two sub-families, *oreodontinæ* and *agriochærinæ*. In *oreodontinæ* the orbits were closed behind and the lachrymal bones were contained in well marked depressions. This sub-family included the genera *merycoïdodon*, or *oreodon*, *eporeodon*, *merychochærus merychyus*, and *leptanchenia*. In *agriochærinæ* the orbits were incomplete, and the lachrymal bones were not contained in fossæ, but this sub-family is limited to one genus, *agriochærus*. *Oreodon* may roughly be taken as the type of the family. It was an even-toed ungulate, about the size of a sheep, having swine characteristics on one hand, and those of the deer on the other: feet tetradactylous; metacarpals and metatarsals not ankylosed. Dental formula $i \frac{3-3}{3-3}; c \frac{1-1}{1-1}; p m \frac{4-4}{4-4};$

$m \frac{3-3}{3-3} = 44$. The incisors were small, the canines large, three-sided, and worn like those of the hog. A diastema separated them from the premolars, and the latter, as well as the molars, were of the ruminant type. A remarkable characteristic was the existence, beneath each eye, of a sinus called "larimer," or lachrymal sinus, a sebaceous gland possessed by the deer family (*cervidæ*), and which secretes a peculiar, strong-smelling, waxy substance.

ORES. Any mineral or combination of minerals containing as much metal as to be profitably extracted, is reckoned by miners an ore. The proportion necessary for this purpose is, of course, very various, according to the value of the particular metal and the facility or difficulty of *reducing* the ore. A rock containing only 1 per cent. of iron is never called an ore; one containing the same proportion of gold is a very rich ore. Metals rarely exist in ores in a pure or native state; they are almost always chemically combined with oxygen, sulphur, or other elements.

Ores present themselves in a multiplicity of forms and positions in the solid crust of the earth. Sometimes they are sprinkled through the whole mass of the rocks in which they occur, as is often the case with gold, tin ore, and magnetic iron ore. Sometimes they are deposited in regular parallel beds between the strata of other rocks, as in the case of many iron-stones and of cupreous schist. At other times they occur in irregular lumps or concretions; or they fill up the fissures of other rocks, forming veins, particularly silver, copper, and lead ores; or lastly, they are found in detritus, gravel, sand, and other alluvial deposits. This last form is evidently the result of disturbance and transport from some of the other positions above specified. And as the metallic parts of the mineral masses or rocks so disturbed and transported are the heaviest, and are insoluble in water, they are more concentrated in these deposits than in their original position, and can therefore be extracted with greater advantage. Such deposits are called *washings*, from the metal being separated from the other débris by the process of washing. Gold and platinum are mostly got in this way in the Ural and Altai mountains, and gold in Guiana, California, and Australia. Tin ore is also found in alluvial deposits in Cornwall and India. The reduction of ores is treated of under METALLURGY and the names of the several metals.

ORES'TES, legendary hero of several Greek tragedies, as the *Iphigenia in Tauris* of Euripides and the *Electra* of Sophocles; son of Agamemnon and Clytemnestra, and after the murder of the former by his wife and her lover Ægisthus was saved by Electra, his sister. When grown to manhood he was sent to Mycenæ by direction of the Delphic oracle, to avenge his father's death. He slew Ægisthus and Clytemnestra with his own hand, and in punishment for the matricide was hunted from country to country by the Eumenides (furies). Again he resorted to the Delphic oracle, and was told that he could free himself from persecution only by carrying off the statue of Diana from Tauris. There he was seized, and with his friend Pylades was about to be sacrificed to the goddess, when Iphigenia, the priestess, discovered that Orestes was her brother, and by her connivance they escaped and carried off the statue. Orestes became king of Mycenæ, and married the daughter of Menelaus.

ORFA or **URFA**. See EDESSA, *ante*.

ORFORD, EARLS OF. See WALPOLE, *ante*.

ORFILA, MATEO JOSÉ BONAVENTURA, a celebrated physician and chemist, and the recognized founder of the science of toxicology, was b. at Mahon in Minorca, April 24, 1787. His father, who was a merchant, intended that his son should follow the same pursuit; but young Orfila showed so strong a predilection for the study of medicine, that all thoughts of a mercantile career for him were dismissed, and he was sent to the medical schools of Valencia and Barcelona. In the latter of these seminaries he so distinguished himself that the junta of the province resolved to defray the expense of his further education in Paris, on condition of his returning to Barcelona to fill one of the chairs in their medical school; and accordingly Orfila departed for Paris in 1807. The junta were prevented from fulfilling the agreement by the outbreak of war with France; but Orfila, who had now made many friends in Paris, was enabled to continue his studies. In Oct., 1811, he received the degree of doctor of medicine, and immediately commenced a private course of lectures on chemistry, botany, and anatomy, which was largely attended, and, along with his successful practice, soon rendered him famous. In 1813 appeared the first edition of his celebrated work on poisons, entitled *Traité des Poisons tirés des Règnes Mineral, Végétal, et Animal*, or *Toxicologie Générale* (Paris). The work was commended by the Institute, and rapidly passed through a number of editions. In 1816, on the occasion of a short visit to Minorca, he met with an enthusiastic reception; and on his return to Paris became court physician. In 1819 he was created a citizen of France, and became professor of jurisprudence; and in 1823 was transferred to the chair of chemistry, to which, in 1831, was added the deanship of the faculty. His prosperity was now at the full; his lectures were more popular than ever; his works were reckoned as masterpieces; and he himself, by the geniality of his disposition and his many accomplishments, was a universal favorite in society. In all cases of suspected poisoning he was a most important witness. From 1834 he was a member of the council of public instruction, and procured the passing of many useful measures, such as the creation of secondary medical schools and the multiplication of means of instruction and observation. He also organized the clinical hospital, founded a new botanic garden, and a museum of comparative anatomy, which is now known by his name. On the outbreak of the revolution of 1848 he was deprived of his place in the medical faculty on account of his conservative opinions, but retained his professorship. He died at Paris, Mar. 12, 1853. His great work on toxicology has gained for him undying fame; it is a vast mine of information, the result of the author's solitary indefatigable researches; and includes symptoms of poisoning of all kinds, the appearances in the body to which poisons give rise, their action, and the means for their detection. It is well written, and exhibits the accuracy of language equally with the sound judgment of its author. His other works are not nearly so famous, partaking more of the character of compilations; the chief of them are: *Éléments de Chimie appliqués à la Médecine* (Paris, 1817; 8th edition, 1851); *Traité de Médecine Légale* (1823-25; 4th edition, 1847); *Mémoires sur Plusieurs Questions Medico-légales* (Paris, 1839); and *Recherches sur l'empoisonnement par l'Acide Arsenieux*, etc. (Paris, 1841). He also contributed largely to various journals, dictionaries, encyclopædias, and other periodicals. He has left a number of memoirs, which have not yet been published.

ORGAN (Gr. *organon*, a contrivance requiring skill on the part of the user of it), a musical instrument played by finger-keys, and in general partly also by foot-keys, and consisting of a large number of pipes of metal and wood made to sound by a magazine of wind accumulated by bellows, and admitted at will by the player. The following description is necessarily restricted to the most fundamental arrangements of this very complicated instrument. As met with in cathedrals and large churches, the organ comprises four departments, each in most respects a separate instrument with its own mechanism, called respectively the *great-organ*, the *choir-organ*, the *swell-organ*, and the *pedal-organ*. Each has its own clavier or keyboard, but the different claviers are brought into juxtaposition, so as to be under the control of one performer. Claviers played by the hands are called *manuals*; by the feet, *pedals*. Three manuals, belonging to the choir, great, and swell organs respectively, rise above each other like steps in front of where the performer sits: while the pedal-board by which the pedal-organ is played is placed on a level with his feet. The condensed air supplied by the *bellows* is conveyed through wooden tubes or trunks to boxes, called *wind-chests*, one of which belongs to each department of the organ. Attached to the upper part of each wind-chest is a *sound-board*, an ingenious contrivance for conveying the wind at pleasure to any individual pipe or pipes, exclusively of the rest. It consists of two parts, an *upper board* and an *under board*. On the upper board rest the *pipes*, of which a number of different quality, ranged behind each other, belong to each note. In the under board is a row of parallel *grooves*, running horizontally backwards, corresponding each to one of the keys of the clavier. On any of the keys being pressed down, a valve is opened which supplies wind to the groove belonging to it. The various pipes of each key stand in a line directly above its groove, and the upper surface of the groove is perforated with holes bored upwards to them. Were this the whole mechanism of the sound-board, the wind, on entering any groove, would permeate all the pipes of that groove; there is, however, in the upper board another series of horizontal grooves at right angles to those of the lower board, supplied with *sliders*, which can, to a small extent, be drawn out or

pushed in at pleasure by a mechanism worked by the *draw-stops* placed within the player's reach. Each slider is perforated with holes, which, when it is drawn out, completes the communication between the wind-chest and the pipes: the communication with the pipes immediately above any slider being, on the other hand, closed up when the slider is pushed in. The pipes above each slider form a continuous set of one particular quality, and each set of pipes is called a *stop*. Each department of the organ is supplied with a number of stops, producing sounds of different quality. The *great-organ*, some of whose pipes appear as show-pipes in front of the instrument, contains the main body and force of the organ. Behind it stands the *choir-organ*, whose tones are less powerful and more fitted to accompany the voice. Above the choir-organ is the *swell-organ*, whose pipes are inclosed in a wooden box with a front of louvre-boards like Venetian blinds, which may be made to open and shut by a pedal, with a view of producing *crescendo* and *diminuendo* effects. The *pedal-organ* is sometimes placed in an entire state behind the choir-organ, and sometimes divided, and a part arranged on each side. The most usual compass of the manuals is from C on the second line below the bass staff to D on the third space above the treble staff; and the compass of the pedals is from the same C to the D between the bass and treble staves. The real compass of notes is, as will be seen, much greater.

Organ-pipes vary much in form and material, but belong to two great classes, known as *mouth-pipes*, (or *flute-pipes*) and *reed-pipes*. A section of one of the former is represented in the figure. Its essential parts are the *foot a*, the *body b*, and a flat plate *c*, called the *language*, extending nearly across the pipe at the point of junction of foot and body. There is an opening, *de*, in the pipe, at the spot where the language is discontinuous. The wind admitted into the foot rushes through the narrow slit at *d*, and, in impinging against *e*, imparts a vibratory motion to the column of air in the pipe, the result of which is a musical note, dependent for its pitch on the length of that column of air, and consequently on the length of the body of the pipe: by doubling the length of the pipe, we obtain a note of half the pitch, or lower by an octave. Such is the general principle of all mouth-pipes, whether of wood or of metal, subject to considerable diversities of detail. Metal pipes have generally a cylindrical section; wooden pipes a square or oblong section. A mouth-pipe may be stopped at the upper end by a plug called a *tompion*, the effect of which is to lower the pitch an octave, the vibrating column of air being doubled in length, as it has to traverse the pipe twice before making its exit.

Pipes are sometimes half-stopped, having a kind of chimney at the top. The *reed-pipe* consists of a reed placed inside a metallic, or occasionally a wooden pipe. This *reed* is a tube of metal, with the front part cut away, and a tongue or spring put in its place. The lower end of the spring is free, the upper end attached to the top of the reed; by the admission of air into the pipe, the spring is made to vibrate, and in striking either the edge of the reed or the air, produces a musical note, dependent for its pitch on the length of the spring, its quality being determined to a great extent by the length and form of the pipe or bell within which the reed is placed. When the vibrating spring does not strike the edge of the reed, but the air, we have what is called the *free reed*, similar to what is in use in the harmonium (q.v.). To describe the pitch of an organ-pipe, terms are used derived from the standard length of an open mouth-pipe of that pitch. The largest pipe in use is the 32-foot C, which is an octave below the lowest C. of the modern piano-forte, or two octaves below the lowest C on the manuals and pedal of the organ: any pipe producing this note is called a 32-foot C pipe, whatever its actual length may be. By a 32-foot or 16-foot stop, we mean that the pipe which speaks on the lowest C on which that stop appears, has a 32-foot or a 16-foot tone.

The *stops* of an organ do not always produce the note properly belonging to the key struck; sometimes they give a note an octave, or, in the pedal-organ, even two octaves lower, and sometimes one of the harmonics higher in pitch. *Compound* or *mixture stops* have several pipes to each key, corresponding to the different harmonics of the ground-tone. There is an endless variety in the number and kinds of stops in different organs; some are, and some are not continued through the whole range of manual or pedal. Some of the more important stops get the name of *open* or *stopped diapason* (a term which implies that they extend throughout the whole compass of the clavier); they are for the most part 16-feet, sometimes 32-feet stops; the *open diapason* chiefly of metal, the *close* chiefly of wood. The *dulciana* is an 8-foot manual stop, of small diameter, so called from the sweetness of its tone. Among the reed-stops are the *clavion*, *oboe*, *bassoon*, and *vox humana*, deriving their names from real or fancied resemblances to these instruments and to the human voice. Of the compound stops the most prevalent in Britain is the *sesquialtera*, consisting of four or five ranks of open metal pipes, often a 17th, 19th, 22d, 26th, and 29th from the ground-tone. The resources of the organ are further increased by appliances called *couplers*, by which a second clavier and its stops can be brought into play, or the same clavier can be united to itself in the octave below or above.

Organs are now generally tuned on the equal temperament. See TEMPERAMENT. The notation for the organ is the same as for the pianoforte, in two staves in the treble and bass clefs; but in old compositions the soprano, tenor, and alto clefs are used.

Instruments of a rude description, comprising more or less of the principle of the organ, seem to have existed early. Vitruvius makes mention of a hydraulic organ, but

his description is not very intelligible. The organ is said to have been first introduced into church music by pope Vitalian I. in 666. In 757 a great organ was sent as a present to Pepin by Byzantine emperor, Constantine Copronymus, and placed in the church of St. Corneille at Compiègne. Soon after Charlemagne's time, organs became common. In the 11th c. a monk named Theophilus wrote a curious treatise on organ-building. But it was not till the 15th c. that the organ began to be anything like the noble instrument which it now is. The family of the Antignati, in Brescia, had a great name as organ-builders in the 15th and 16th centuries. The organs of England were also in high repute, but the puritanism of the civil war doomed most of them to destruction; and when they had to be replaced after the restoration, it was found that there was no longer a sufficiency of builders in the country. Foreign organ-builders were therefore invited to settle in England, the most remarkable of whom were Bernhard Schmidt (generally called father Smith) and his nephews, and Renatus Harris. Christopher Schreider, Snetzler, and Byfield succeeded them; and at a later period Green and Avery, some of whose organs have never been surpassed in tone. The largest English organs are those of York cathedral, Birmingham town hall, Christ Church, London; and a gigantic and exceedingly perfect instrument, completed in 1876 for the hall Primrose Hill, London. The latter surpasses in size the famous Haarlem organ, long reckoned the largest in the world, which is 103 ft. high and 50 broad. The German organs are remarkable for preserving the balance of power well among the various masses, but in mechanical contrivances they are surpassed by those of England.

For a full account of the structure of the organ see Hopkins and Rimbault, *The Organ, its History and Construction* (Lond. 1855). Rink's *Praktische Orgelschule*, Leipzig, v. y., is the best work on organ playing. See also Dr. Stainer's *The Organ* (1877).

ORGAN (*ante*). The pipes are of wood or metal. Metal pipes consist of tin, pure or with some alloy of lead, a common proportion being one-third tin with two-thirds lead. Heavy bass pipes are made of zinc. The fused metal is poured into a large box, from which it is drawn through a wide, shallow gate to the surface of a casting table, which may be $2\frac{1}{2}$ ft. wide and 20 ft. long. If the metal have as much as 40 per cent of tin, when cooling the crystalizing tin forms spots upon its surface, and the spots vary in size with the quantity of tin present. The builder varies the quality of his metal to produce pipes of different sonorous qualities as his experience dictates. The material is then cut from the sheet, and formed into pipes on a mandril and very neatly soldered at the joint where the edges meet. For the sides and backs of wood pipes the builder chooses the clearest seasoned pine; for fronts he uses cherry, maple, apple, or pear. The inside is coated smoothly with glue, to fill the pores and give a more resonant surface. The stock must be thick enough to withstand the vibrations of the tone without producing a rolling effect. The speaking length of a pipe is the distance from the language to the end; the pipe is usually straight for convenience of manufacture, but may be bent in any direction or may even return upon itself, as is observed in the convolutions of tubes in cornets and horns.

Remembering that musical tones are caused by vibrations having a fixed and known rapidity, it is evident that a tone may exist in company with other tones whose rates of vibration are 2, 3, 4, 5 times as great, no fractional multipliers being used. The first tone of the series is called the fundamental tone, the others its harmonics. A trained ear will detect the presence of harmonics in all but the very simplest tones. A tone which is deficient in harmonics is thin and cutting; a succession of pure octaves has this quality; the addition of the intermediate tones gives fullness to the sound and binds all together into a more perfect compound. The tones emitted from both open and stopped diapasons are almost free from harmonics, and the defect is cured by opening at the same time other smaller pipes which yield the harmonics wanting in the larger pipes of stronger tone. The resulting tone has the same pitch as the fundamental, but richer in quality, in which the trained ear may also recognize the harmonics.

The tuning of metal pipes is effected by cutting a slit at the top of the pipe and rolling the metal down; the tone becoming sharper by this means. The tuner must not be rolled too low, for when rolled back cuts will be left at the sides, which will interfere with the voicing of the pipe. For tuning open wood pipes a sheet of metal is placed horizontally over the open edge covering a part of the orifice; if the end be more covered the tone is flatted, if uncovered the tone is made sharp. Stopped wooden pipes are tuned by a wooden plug, covered with leather, called a tampion: the tampion is depressed to sharpen, and withdrawn to flatten the tone. The scale of an organ pipe is the ratio of its diameter to its tone-length. A pipe of large diameter has a fuller tone than one of small scale. Open diapasons have largest scale, and string-toned stops have smallest scale. The length of the foot—the conical part below the mouth—does not affect the quality of the tone. The high cutting of the mouth gives a flute quality to a tone, and requires more wind, but if the mouth be cut too high the tone becomes unsteady; the mouth is said to be cut high when the vertical breadth of the opening is large. If the length of a pipe be doubled the tone is lowered an octave; hence, reckoning the semitones, the thirteenth pipe from a given letter has half, or double, the length, as the pipes are counted up or down the scale; but the seventeenth pipe will have half, or double, the diameter, and intermediate pipes diminish in the ratio of the diminution of their lengths.

The following table gives the peculiarities of most of the stops now in use:

Name.	Quality of Tone.	Tone Length.	Actual Length.	Dimensions of Largest Pipe.	Material.	Remarks.
Sub-Bourdon, or Manual Untersatz.....	Flute.	32	16	10 $\frac{1}{4}$ by 8.	Wood.	Used only in largest organs; rarely below tenor C ^o .
Double Open Diapason	Organ.	16	16	12 inches.	Metal.	French "Montre;" German "Principal."
Double Dulciana.....	Organ, Soft.	16	16	Metal.	Lower octave mounted in front; if not, often of stopped wood; trebles 50 per cent tin.
Contra-Gamba.....	String.	16	16	50 p. c. tin Zinc B.	Sometimes inverted cones, with bell mouth.
Æolina.....	Organ, Delicate.	16	16	Metal.	Generally placed in choir; lower octave stopped wood.
Double Melodia.....	Flute.	16	16	Wood.	Open, with inverted mouths; lower octave stopped wood.
Tibia Major.....	Flute.	16	16	Wood.	With round mouths. Effective in giving body to tone of full organ.
Double Mouthed Bourdon.....	Flute.	16	8	Wood.	Trebles of double depth, with two mouths, for greater volume of voice.
Bourdon Double Stopped Diapason.....	Flute.	13	8	Wood.	Useful in supporting a chorus or a congregation; adding dignity to other stops.
Quintaton.....	Flute.	16	8	Wood.	Low mouthed; sounds also the fifth.
Still Gedect.....	Flute.	16	8	Wood.	High mouthed; clear tone; choir O.
Double Trumpet Bombarde.....	Reed.	16	16	Zinc bodies.	Sub-octave trumpet; large organs.
Contra Fagotta.....	Reed.	16	16	Metal.	Sub-octave oboe; lower pipes bent to go in a swell box.
Euphone.....	Reed.	16	16	Free reeds.	Clarinet tone; smooth and pleasant.
Open Diapason Principal.....	Organ.	8	8	40 p. c. tin	Seventeen lower pipes usually in front of case.
Bell Diapason.....	Organ.	8	8	Metal.	With sliding bells for tuning. Rarely used. French "Flute à Pavillon."
Horn Diapason.....	Organ.	8	8	Metal.	Inverted cones; horn-like tone.
Gemshorn.....	Flute.	8	8	Metal.	Conical, top $\frac{1}{2}$ dia. of mouth; tone light, sympathetic.
Dulciana, or Dolce.....	Organ.	8	8	Metal.	Small dia.; tone very gentle.
Æoline.....	String.	8	8	Metal.	Tone softest in organ.
Dolcan.....	Flute.	8	8	Metal.	Inverted cones; pleasing tone.
Gamba.....	String.	8	8	Metal.	Slender; incisive quality.
Salicional.....	String.	8	8	Metal.	Softer than gamba. Swell O.
Bell Gamba.....	String.	8	8	Metal.	Conical, with bell; fuller tone than of gamba.
Viol d'Amour.....	String.	8	8	Metal.	Like bell G, but softer.
Keraulophon.....	String.	8	8	Metal.	Pipes like salicional, with holes near top.
Geigen Principal.....	String.	8	8	Metal.	Violin quality; choir O.
Rohr Gedect.....	Flute.	8	8	Metal.	Half stopped, with chimney.
Stopped Diapason.....	Flute.	8	4	Wood.	Mild flute tone.
Gedect.....	Flute.	8	4	Wood.	Mouths cut high; clear bell tone; smaller than stopped diapason.
Doppel Flute.....	Flute.	8	4	Wood.	Large scale, double depth, with mouths on front and back; full tone.
Quintadena.....	Flute.	8	4	Metal.	Low mouths; sounds also the fifth.
Melodia.....	Flute.	8	8	Wood.	Bass, often stopped wood; tone clear and horn-like.
Clarabella.....	Flute.	8	8	Wood.	More subdned than Melodia.
Portunal.....	Flute.	8	8	Wood.	Clarinet quality.
Hohl-Flute.....	Flute.	8	8	Metal.	Powerful hollow tone.
Philomela.....	Flute.	8	4	Wood.	Small scale; very sweet and delicate.
Voix Celestes, or Unda Maris.....	Flute.	8	8	Metal.	Two dulcianas to each note, one a little sharper than the other, producing a waving or tremulant effect
Bifra.....	Flute.	8 4	8 4	Metal.	Two pipes to each note, with tremolo.

Name.	Quality of Tone.	Tone Length.	Actual Length.	Dimensions of Largest Pipe.	Material.	Remarks.
Trumpet.....	Reed.	8	8	Metal.	Powerful; loud solo-stop. Large scale trumpet, voiced with heavier wind pressure: often flaring fan-like at top of case, and finished with bells like trumpets. Powerful trumpet in swell O. Small scale with bell-mouth; delicate wailing tone. With sliding bells; choir O. With tremolo and flutes; resembles a choir of voices. Pipes enlarged between mouth and top. Very delicate. Conical pipes; soft tone. Free reeds in flat boxes. The stop to which the organ is tuned.
Tuba Mirabilis.....	Reed.	8	8	Metal.	
Cornopean, or Horn...	Reed.	8	8	Metal.	
Oboe.....	Reed.	8	8	Metal.	
Clarinet.....	Reed.	8	8	Metal.	
Vox Humana.....	Reed.	8	8	Metal.	
Cor Anglais.....	Reed.	8	8	Metal.	
Vox Angelica.....	Reed.	8	8	{ Free reeds.	
Musette.....	Reed.	8	8	Metal.	
Physharmonica.....	Reed.	{ Free reeds.	
Octave, or Principal...	Organ.	4	4	Metal.	
Violin.....	String.	4	4	Metal.	
Celestina.....	Organ.	4	4	Metal.	
Flute Harmonique....	Flute.	4	8	Metal.	An octave dulciana. Perforated between mouth and top; overblown to speak an octave above their length; tone very full, flute-like. Maple tubes, polished, with round mouths. Clear tone.
Traverse Flute.....	Flute.	4	4	Wood.	
Flute Octavante.....	Flute.	4	4	Metal.	Large scale; horn-like tone. Delicate tone. Mouths inverted like melodia
Night Horn.....	Flute.	4	4	Metal.	
Flute d'Amour.....	Flute.	4	4	Metal.	Large scale, full wind, mouth inverted. Half stopped, with chimneys. Stronger than violin. Octave trumpets. Tuned a fifth above 8 ft. pitch.
Wald Flute.....	Flute.	4	4	Wood.	
Concert Flute.....	Flute.	4	4	Wood.	Tuned 12 diatonic tones above 8 ft. open diapason. Same pitch as twelfth, but more delicate. Two octaves above 8 ft. pitch. Same pitch as fifteenth; choir O. Same pitch as fifteenth; swell O. Made like flute harmonique.
Flute, à Chiminee.....	Flute.	4	4	Metal.	
Fagara.....	String.	4	4	Metal.	
Ciarion.....	Reed.	4	4	Metal.	
Quint.....	Flute.	5½	5½	{ Metal, Wood.	
Twelfth, Octave Quint, or Nasard.....	Flute.	2¾	2¾	Metal.	
Gemshorn Quint.....	Flute.	2¾	2¾	Metal.	
Fifteenth, Super-Octave, or Doublette.}	Organ.	2	2	Metal.	
Piccolo.....	Flute.	2	2	Metal.	
Flageolet.....	Flute.	2	2	Metal.	
Harmonic Piccolo.....	Flute.	2	2	Metal.	

PEDAL STOPS.

Double Open Diapason, or Untersatz.....	Organ.	32	32	{ 24 by 20, 30 inches. 15 by 12.	Wood or Metal.	When of metal, the pipes are placed in front of case.
Double Bourdon.....	Flute.	32	16		Wood.	
Bombarde.....	Reed.	32	32	{ Wood or Metal.	Used only in largest organs. Most effective of wood; the stop which gives majesty to organ-tone; causes building to tremble. Very valuable, as sub-bass for soft combinations, and in small organs strong enough for the full organ.
Open Diapason, or Principal.....	Organ.	16	16	14 by 12.	{ Wood or Metal.	
Bourdon, or Sub-Bass..	Flute.	16	8	8½ by 5.	Wood.	
Dulciana.....	Organ.	16	16	9 by 7.	{ Wood or Metal.	Deep, smooth, mellow tone. Small scale; effect of double bass viol. Conical tube, with bell top. Powerful. Slender scale; delicate tone. Tuned a fifth higher than the 16 ft. diapason. Sometimes wood.
Violone, or Contra-Bass	String.	16	16	Wood.	
Gamba.....	String.	16	16	Metal.	
Trombone.....	Reed.	16	16	{ Metal or Wood.	
Bassoon.....	Reed.	16	16	
Quint, or Quintaulophon.....	Flute.	10¾	5½	Wood.	
Violoncello.....	String.	8	8	Metal.	

PEDAL STOPS—CONTINUED.

Name.	Quality of Tone.	Tone Length.	Actual Length.	Dimensions of Largest Pipe.	Material.	Remarks.
Principal, or Octavo...	Organ.	8	8	Wood.	Octave higher than 16 ft. dia.
Flote.....	Flute.	8	8	Wood.	Like melodia.
Dolcissimo.....	Organ.	8	8	Metal.	Soft; like manual dulciana.
Tromba.....	Reed.	8	8	Metal.	
Super-Octave.....	Organ.	4	4	Loud stops, two octaves above 16 ft. dia.
Flauto.....	Flute.	4	4	Wood.	
Clarina.....	Organ.	2	2	Metal.	Loud tone; large scale, to give clearness to pedal organ.
Mixture, Acuta, Furniture, Sesquialtera, Cornet, Harmonies, Sharp, etc.....	Compounds in which two to five pipes are opened by the same key; used with other stops to give fullness to harmony.

Organ-building has been carried to a perfection in the United States rivaled only by England. One of the largest organs in this country was in the Boston Music Hall; it was built by Walcker in Saxony; it was removed in 1884. It has 4 manuals, 89 stops, and 4,000 pipes. There are many organs built by Americans containing from 2,500 to 4,000 pipes, and from 50 to 60 stops, which compare favorably with European organs of equal size. Among the most noteworthy are the following: Trinity church, New York, built by Henry Erben; Plymouth church, Brooklyn, by E. and G. G. Hook; St. George's, New York, by Jardine and Son; Tabernacle, Brooklyn, by Jardine and Son; St. Bartholomew's, New York, by J. H. and C. S. Odell; Temple Emanuel, New York, by Hall and Labagh; and Holy Trinity, New York, by H. L. Roosevelt. One of the largest organs in America is in the Roman Catholic cathedral at Montreal, and was built by R. S. Warren of the same city.

ORGAN, ORGANIC, ORGANISM. The word *organ* is derived from the Greek *organon*, an instrument, and is sometimes employed almost in its original sense. But it has received a signification more peculiarly its own, and with which alone the word *organism* is connected, as the designation of any of the parts or members of a living body, the *organism* being the living whole, animal or vegetable, which these organs compose. The idea of an organism or of organization is almost as much involved in obscurity and difficulty as that of *life*, with which it is so closely connected. But it is observable that a living body is entirely composed of organs, and these themselves of other organs, until we come to elementary cells; and also, that all the parts are mutually dependent on each other; and therefore an organism has been defined as a natural whole, in which all the parts are mutually to each other means and end. The juice which nourishes a plant is elaborated by the plant itself, although the supplies are drawn from without. The leaves of a plant are produced by the stem, but react upon the stem in promoting its growth. This mutual dependence of parts strongly distinguishes an organism from a *machine*, in which the parts concur for a common end, to which each contributes in its own way, but in which each does not contribute to the support of all or any of the rest. In organisms, moreover, besides this support and maintenance of the different parts or organs, there is a provision for the production of new organisms of the same kind, the reproduction or propagation of the species, to which there is nothing analogous beyond the sphere of organic life. Amongst organic beings, as we ascend in the scale from the lowest kinds of plants and animals to the highest, we observe an increasing number of organs and of functions of organs. In the animal kingdom organic life appears as possessed of sensation and spontaneous motion; whilst plants are limited to growth, assimilation, and propagation. The question as to the nature of organic processes connects itself with a most difficult question as to the relation of chemical processes with psychical functions, chemical processes being certainly carried on, but singularly modified or directed by the living powers of the organic being.—The term organic is frequently applied to those things in which an analogy is traced to living creatures, in the mutual dependence of parts. Such an analogy may be traced in social life and in political life; and the more perfectly this relation of mutual dependence or mutual usefulness is established the better is the state of things, social or political. It is also the highest praise of a work of art that it suggests this idea of an organic relation of its parts to each other and to the whole.—*Organic laws* are those which are fundamental or most essential to the system to which they belong.

ORGANIC ANALYSIS. When a complex organic substance is submitted to chemical examination the first point is to determine its *proximate* constituents, or, in other words,

the several definite compounds of which it is made up. Opium, for example, is thus found to have as its proximate constituents meconic acid, morphia, codeia, and some 10 or 12 other substances. The modes by which these proximate constituents are separated are various; the chief being the action of certain solvents, such as ether, alcohol, and water, which extract some of the materials and leave others undissolved. Thus ether is the special solvent of fatty and waxy matters, resins, and camphors; alcohol dissolves the same substances with less facility, but on the other hand takes up many substances which are insoluble in ether; while water, which scarcely acts upon the above-named matters, dissolves saccharine, gummy, and starchy matters, and salts of organic acids. The proximate constituents being thus determined, the next point is to determine their qualitative and quantitative (or ultimate) composition; and it is to these processes—especially the last—that the term *organic analysis* is for the most part restricted.

Qualitative Analysis.—It is shown in the article ORGANIC COMPOUNDS, that the ordinary ingredients for which we must seek are carbon, hydrogen, oxygen, nitrogen, and sulphur. *Carbon* and *hydrogen* may be simultaneously detected by burning the compound (which must be previously well dried) in a glass tube in contact with oxide of copper, which readily yields up its oxygen. The carbon is thus converted into carbonic acid, which, if passed into baryta water, forms a white precipitate of carbonate of baryta, and the hydrogen into water, which collects in drops in a small cooled receiver attached to the tube. Carbon may also be usually recognized by the black residue which almost always remains on burning an organic matter, especially in a narrow test-tube in which there is little air. The presence of *nitrogen* may in most cases be readily ascertained by heating a portion of the substance in a test-tube with an excess of hydrate of potash, when a distinct odor of ammonia is perceived. *Sulphur* is detected by igniting the compound with hydrate of potash and niter, whereby sulphuric acid is formed; and phosphorus and arsenic may be detected by the same means. The presence of *oxygen* cannot, as a general rule, be directly determined.

Quantitative Analysis.—The first attempts to determine the quantitative composition of organic bodies were made, more than half a century ago, by Gay Lussac and Thenard. The process originally proposed by them has been modified and improved by various chemists, especially by Berzelius, Prout, and Liebig, and it is mainly owing to the great simplifications introduced by the last-named chemist, and to the consequently increased facility of conducting an ultimate analysis, that our knowledge of the composition of organic bodies has so vastly enlarged during the last 20 years.

The operation is always effected by causing complete combustion of a known weight of the body to be analyzed, in such a manner that the carbonic acid and water which are formed in the process shall be collected, and their quantities determined, from which, of course, the carbon and hydrogen they respectively contain may be readily calculated. The apparatus required for the analysis of a compound containing carbon, hydrogen, and oxygen only, consists of (1) a *combustion tube*, composed of hard white Bohemian glass, having a diameter of half an inch or less, and a length of

a, b, the combustion tube; *c*, the central portion, in which the mixture to be analyzed is placed; *d*, the bulb-tube, containing chloride of calcium; *ee*, Liebig's potash apparatus; *f*, a moveable iron screen; *gg*, bricks supporting *hh*, the furnace.

from 14 to 18 inches. One end is drawn out in a point and closed, while the edges of the other (or open) end are made smooth by fusion in the blow-pipe flame. (2.) A thin sheet-iron furnace, in which the tube is placed and supported during combustion. (3.) A small light tube (which may be either a bulb-tube, as in the figure, or a U-tube, which is filled with fragments of spongy chloride of calcium to absorb the watery vapor that is driven through it; and (4) Liebig's bulb-apparatus, containing a solution of potash of specific gravity 1.27, for the purpose of absorbing the carbonic acid. The chloride-of-calcium tube is connected by a well-dried perforated cork to the open extremity of the combustion tube, and by a little tube of flexible caoutchouc, secured by silk cord, to the potash apparatus.

In performing an analysis a little freshly prepared oxide of copper is first introduced into the combustion tube, then a mixture of about 5 grains of the substance to be analyzed, with an excess of the oxide, while the tube is lastly filled to within an inch of its open mouth with the oxide alone. The tube is then placed in the furnace, which may be heated with charcoal or gas. (Hofman's gas furnace, in which is a peculiar form of burner called the *atmopyre*, is the best. It is described in vol. xi. of *The Journal of the Chemical Society*.) Red-hot charcoal is now placed round the anterior part of the tube, containing the pure oxide of copper; and when this is red-hot, the fire is slowly extended towards the further extremity by shifting the movable screen shown in the figure. When the tube has been completely heated from end to end, and no more gas is disengaged, the charcoal is gradually removed from the further extremity of the tube, and the point of the latter broken off; after which a little air is drawn through the whole apparatus, so as to secure any remaining carbonic acid and watery vapor. The parts are then

detached, and the increase of weight of the chloride-of-calcium tube and potash apparatus is determined by an accurate balance. The following account of an actual analysis of crystallized cane-sugar (borrowed from Fownes's *Chemistry*) will serve to illustrate the preceding remarks:

Quantity of sugar employed.....	Grains. 4.750
Potash apparatus, after experiment.....	781.13
“ “ before experiment.....	773.82
Carbonic acid.....	7.31
Chloride-of-calcium tube, after experiment.....	226.05
“ “ “ before experiment.....	223.30
Water.....	2.75

7.31 grains carbonic acid = 1.994 grains carbon, and 2.75 grains water = 0.3056 grains hydrogen: or in 100 parts of sugar, carbon, 41.98; hydrogen, 6.43; oxygen by difference, 51.59.

For the methods of determining other elements quantitatively, such as nitrogen, chlorine, sulphur, phosphorus, etc., we must refer to the various works that have been published on organic analysis, amongst which those of Liebig, Fresenius, and Rose deserve special mention.

ORGANIC BASES. The present remarks must be regarded as supplementary to the article ALKALOIDS. They refer (1) to the classification of organic bases and (2) to their formation.

(1) From the fact that nearly all artificial organic bases are (as will be afterward shown) actually constructed from ammonia, and that whether artificially or naturally formed, they exhibit the property of basicity, which is the leading characteristic of ammonia, chemists have been led to refer organic bases generally to the typical body ammonia, and have succeeded in demonstrating that they are constructed upon or derived from the simple type NH_3 . Berzelius believed that all the alkaloids actually contained ammonia as an ingredient of their composition, a view which is now untenable; and it is to Liebig that we are indebted for the idea that they are derivatives of ammonia, or, in other words, amidogen bases or ammonia in which an equivalent of hydrogen is replaced by an organic radical. The subject has been thoroughly worked out by Dr. Hofmann, who originally proposed to classify these bodies under the heads of *amidogen*, *imidogen*, *nitrile*, and *ammonium* bases; but afterwards adopted the terms *primary amines*, *secondary amines*, and *tertiary amines*, in preference to amidogen, imidogen, and nitrile bases—the word *amines* being applied to all organic bases that are derived from ammonia (NH_3). The amines may be (1) *monamines*, (2) *diamines*, (3) *triamines*, (4) *tetramines*, or (5) *pentamines*, according as they be constructed upon a single, double, treble, quadruple, or quintuple atom of NH_3 . We shall confine our illustrations of the meaning of these terms to the monamines, both because they form the most important group and because they are much more readily elucidated than the other groups; which are extremely complicated in their composition. *Monamines* are constructed upon the single atom of ammonia, H_3N . In *primary monamines* one of the atoms of hydrogen is replaced by an organic radical, R; and hence their general formula is RH_2N . Ethyl-amine or ethylia (C_2H_5) H_2N , or $\text{C}_2\text{H}_7\text{N}$, is an example. In *secondary monamines* two of the atoms of hydrogen are replaced by two atoms of either the same or different radicals. Hence their general formula is $\text{RR}'\text{HN}$, where R and R' may be the same or different radicals. Diethylia (C_2H_5) $_2\text{HN}$, or $\text{C}_4\text{H}_{11}\text{N}$, and methyl-ethyl-amine, or methyl-ethylia (C_2H_5)(C_2H_5) HN , or $\text{C}_4\text{H}_9\text{N}$, are examples. In *tertiary monamines* the three atoms of hydrogen are replaced by three atoms of the same or different radicals; their formula therefore is $\text{RR}'\text{R}''\text{N}$, when R, R', R'' may or may not differ from one another. Trimethylamine or trimethylia (C_2H_5) $_3\text{N}$, or $\text{C}_6\text{H}_{15}\text{N}$, and methyl-ethyl-phenyl-amine or methyl-ethyl-phenylia (C_2H_5)(C_2H_5)(C_6H_5) N , or $\text{C}_8\text{H}_{13}\text{N}$, afford examples of the radicals being all the same and of their being all different. This last example affords a good illustration of the fact, that although the modern nomenclature of organic chemistry includes long and apparently complex words, these words to a great degree represent the composition of the substance they are used to indicate; methyl (C_2H_5), ethyl (C_4H_9), and phenyl (C_6H_5), mainly contributing, to form methyl-ethyl-phenylia.

(2.) Although all attempts at forming in the laboratory those alkaloids that naturally exist in plants, such as morphia, quinia, and strychnia, have hitherto failed, a large number of organic bases have been prepared by artificial means, such as: *a.* By the destructive distillation of organic bodies containing nitrogen. Thus, in the preparation of coal-gas, four at least of these compounds are obtained, viz., aniline, picoline, leukol (or quinoline), and pyridine. *b.* By the distillation of certain nitrogenous compounds with caustic potash. In this way aniline is obtained from indigo. *c.* By the combination of ammonia with the aldehyds and with certain volatile oils which possess the properties of aldehyds. Thus acetic aldehyd yields dimethylia, and oil of mustard yields thiosin-

amine. *d.* By the substitution (by the action of strong nitric acid) of one atom of nitrous acid (NO_2) for one atom of hydrogen in certain hydrocarbons. *e.* By the processes of fermentation and putrefaction. Thus wheaten flour yields by putrefaction trimethylia, ethylia, and amylium.

ORGANIC COMPOUNDS. It was formerly believed that the compounds to which the term *organic* is applied could only be produced by a vital force acting in a more or less complex animal or vegetable organism. It is, however, now known that this view is altogether untenable, and that many substances which are products of animal or vegetable organisms may also be formed artificially in the laboratory. Thus urea, the chief and most characteristic organic constituent of urine, may be formed by the direct union of chlorine and carbonic acid (which form *phosgene gas*) with ammonia; and glucose or grape-sugar may be artificially produced from starch, woody fiber, paper, linen, etc. Although such cases as that of urea, in which a complex organic product ($\text{C}_2\text{H}_4\text{O}_2\text{N}_2$) is produced by the direct union of three inorganic substances (and many other cases of the same nature might be adduced), show that there is no definite line of demarkation between organic and inorganic products, it is useful, as a matter of convenience, to classify chemical compounds according to their natural origin.

The following are the leading characteristics of organic compounds: Those which occur naturally rarely consist of more than four elements—viz., carbon, hydrogen, nitrogen, and oxygen—although a few contain sulphur, and possibly (but this is doubtful) phosphorus. By artificial means, however, organic compounds can be formed containing chlorine, bromine, iodine, selenium, tellurium, and many of the metals. Carbon is universally present both in natural and artificial organic compounds. The number of equivalents entering into the composition of organic compounds is usually higher than in the case of inorganic compounds. There is no organic compound into which less than two equivalents of carbon enter, and, according to some chemists, both oxygen and sulphur only enter these compounds in double equivalents. Melissic acid, for example, one of the constituents of wax, is represented by $\text{C}_{60}\text{H}_{60}\text{O}_4$; that is to say, each equivalent of the acid is composed of 124 equivalents of the elements entering into its composition; and each equivalent of the solid fat, commonly known as stearine, contains 114 equivalents of carbon, 119 of hydrogen, and 12 of oxygen. No instance is known in which an organic compound has been formed by the direct union of its elements in a free state, as many sulphides, chlorides, and oxides (for example) are formed in inorganic chemistry. Their extreme readiness to decompose under the influence of heat, fermentation, putrefaction, etc., is another characteristic of organic compounds, although some artificially prepared inorganic compounds—as, for example, chloride of nitrogen—are also very unstable.

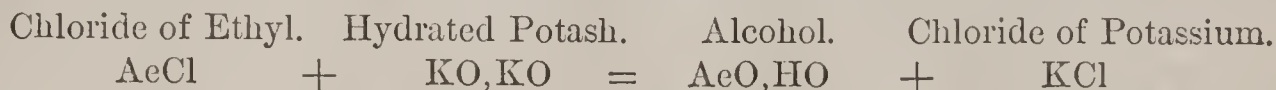

The following scheme may serve to elucidate the arrangement of the elements in organic compounds. Such compounds may be composed of carbon and oxygen, as carbonic oxide, C_2O_2 ; or of carbon and hydrogen, as oil of turpentine, $\text{C}_{20}\text{H}_{16}$; or of carbon and nitrogen, as cyanogen, C_2N ; or of carbon, hydrogen, and oxygen, as grape sugar, $\text{C}_{12}\text{H}_{12}\text{O}_{12}$; or of carbon, nitrogen, and oxygen, as anhydrous cyanic acid, C_2NO ; or of carbon, hydrogen, and nitrogen, as nicotine, $\text{C}_{20}\text{H}_{14}\text{N}_2$; or of carbon, hydrogen, and sulphur, as oil of garlic, $\text{C}_6\text{H}_5\text{S}$; or of carbon, hydrogen, nitrogen, and oxygen, as caffeine, $\text{C}_{16}\text{H}_{10}\text{N}_4\text{O}_4$; or of carbon, hydrogen, nitrogen, and sulphur, as oil of mustard, $\text{C}_8\text{H}_5\text{NS}_2$; or finally, of carbon, hydrogen, nitrogen, oxygen, and sulphur, as taurine, $\text{C}_4\text{H}_7\text{NO}_6\text{S}_2$. Hence organic compounds may be binary, ternary, quaternary, or quinary in their composition.

ORGANIC RADICALS. Under the term organic or compound radicals (or radicles, as some chemists write the word) are included a number of groups of elements, of which carbon is always one, which comport themselves chemically like simple elementary bodies. The careful study of organic compounds led chemists to perceive that many of these contained as a proximate constituent a more or less complex atomic group, which in its combining relations behaves precisely like the elementary substances, and which, like them, may be transferred from one compound to another; and hence the inference was drawn, that all organic compounds were combinations of organic radicals with oxygen, sulphur, hydrogen, or other elements, or of one organic radical with another. In accordance with this view, Liebig defined organic chemistry as *the chemistry of organic radicals*. In order to show how much the theory of organic radicals serves to elucidate the composition of organic compounds, and to reduce the laws of organic to those of inorganic chemistry, we will point out some of the chemical analogies between the radical *ethyl* (C_2H_5) and the metal potassium (K), and between the radical *cyanogen* (C_2N) and the halogen chlorine (Cl). Ae is the symbol for ethyl, Cy for cyanogen.

KO	= Oxide of potassium, or potash.	Ae	= Oxide of ethyl or ether.
KO,HO	= Hydrated potash.	AeO,HO	= Hydrated oxide of ethyl or alcohol.
KO,SO ₃	= Sulphate of potash.	AcO,SO ₃	= Sulphate of oxide of ethyl.

KCl	= Chloride of potassium.	AeCl	= Chloride of ethyl.
KS	= Sulphide of potassium.	AeS	= Sulphide of ethyl.
	&c. &c.		&c. &c.
HCl	= Hydrochloric acid.	HCy	= Hydrocyanic acid.
KCl	= Chloride of potassium.	KCy	= Cyanide of potassium.
NH ₄ Cl	= Chloride of ammonium.	NH ₄ Cy	= Cyanide of ammonium.
HgCl	= Chloride of mercury.	HgCy	= Cyanide of mercury.
	&c. &c.		&c. &c.

Again, if under certain conditions chloride of ethyl is brought into contact with hydrated potash, the reaction expressed in the following equation occurs:

which shows that the ethyl and the potassium may mutually replace one another in compounds; and the same might be similarly shown of cyanogen and chlorine.

Comparatively few organic radicals have been obtained in an isolated state; and in most cases the existence of any special radical is only inferred from the fact, that the group of atoms of which it is supposed to be composed can be transferred from one elementary substance to another, and can be made to enter into combination with other organic radicals. The existence of ethyl was thus inferred long before the substance itself was isolated, and the radical benzoyl, C₁₄H₅O₂ (symbol Bz), which exists in the oil of bitter almonds, and on which Liebig specially bases his whole theory of organic radicals, has never been isolated. The simplicity obtained by adopting the radical theory in place of using merely empirical formulas, is well shown in the two contrasted modes of symbolically representing the compounds which are obtained from this oil:

Empirical Formula.	Rational Formula (Bz=C ₁₄ H ₅ O ₂).
Oil of bitter almonds, C ₁₄ H ₅ O ₂	= BzH, Hydride of benzoyl.
Benzoic acid, C ₁₄ H ₅ O ₃ , HO	= BzO, HO, Hydrated oxide of benzoyl.
Chlorine-compound, C ₁₄ H ₅ O ₂ Cl	= BzCl, Chloride of benzoyl.
Sulphur-compound, C ₁₄ H ₅ O ₂ S	= BzS, Sulphide of benzoyl.
Cyanogen-compound, C ₁₆ H ₅ O ₂ N	= BzCy, Cyanide of benzoyl.

The organic radicals are either binary or ternary in their composition. Many of them—as, for example, ethyl—consist of carbon and hydrogen; others, as carbonyl (or carbonic oxide), of carbon and oxygen; others, as cyanogen, of carbon and nitrogen; and others again, like benzoyl, of carbon, hydrogen, and oxygen. Into a few radicals a metallic element enters; these are termed organo-metallic radicals; and cacodyl, which contains arsenic, and is represented by the formula As(C₂H₃)₂ is the best example of this class. All recent works on organic chemistry are based either on the theory of organic radicals or on the more complicated theory of types, which will be noticed in a special article.

ORGANISTA, the common name of a number of small South American birds, allied to wrens, and remarkable for the sweetness of their song. The Peruvian organista (*trogodytes leucophrys* of Tschudi) has a modest, cinnamon-brown plumage, with head and neck of dark olive. “The tender, melancholy strains, and the singular clearness of the innumerable modulations, charm the ear of the astonished traveler, who, as if arrested by an invisible power, stops to listen.”—Tschudi's *Travels*.

ORGANO-LYRICON, a musical instrument consisting of a piano-forte combined with twelve kinds of wind instruments—flutes, bassoon, horns, trumpet, and fife. It was invented in Paris by M. de Saint Pern in 1870, and was the first of a number of similar inventions, such as the orchestrion. There were two rows of finger-keys which were so arranged as to act independently or together, or with a partial effect. Pedals at the foot of the instrument called into play various tones, and the bellows was worked by clock wheels and weights.

ORGANO-METALLIC BODIES. Under this term are included a large number of chemical compounds in which organic radicals, such as methyl (C₂H₃), ethyl (C₄H₅), etc., are united to metals in the same way as chlorine is combined with zinc, forming chloride of zinc. If, for instance, in chloride of zinc (ZnCl) we replace the chlorine by ethyl, we produce one of the bodies belonging to this class, viz., zinc-ethyl, Zn(C₄H₅). This substance (which we take as a good example of the class) is obtained by digesting a mixture of equal volumes of iodide of ethyl and ether with granulated zinc, at a temperature of about 260°, for several hours. Subsequent distillation gives a mixture of zinc-ethyl and ether, from which the former may be obtained pure by rectification, in the form of a colorless, transparent, mobile liquid, which refracts light strongly, has a powerful but not disagreeable odor, and is rather heavier than water, its specific gravity being 1.182 at 64°. With the exception of cacodyl, As(C₂H₃)₂, these bodies are the creation of the last ten or twelve years, during which period numerous compounds of

organic radicals with zinc, cadmium, magnesium, antimony, arsenic, bismuth, mercury lead, sodium, and potassium have been discovered.

For further information on this subject the reader is referred to an article by Dr. Frankland (who has most successfully devoted his attention to this class of compounds) in the 13th vol. of *The Quarterly Journal of the Chemical Society*, and to an elaborate article on "Organo-Metallic Bodies" in Watts's *Dictionary of Chemistry*.

ORGAN-POINT, or **PEDAL-POINT**, in music, a bass note sustained through a series of chords, with only the first and last of which it is in harmony. The sustained note may be the dominant or tonic, and sometimes occupies an upper part instead of the bass.

ORGAN'ZINE, a name applied to silk which after having been first wound off from the cocoons into hanks is then placed on a winding machine, which reels off the hanks on to wooden reels. These are then placed on spindles, and the fibers of each are made to pass through a minute orifice and small brush, which together clean the thread and remove any knots or projections from it, throwing it at the same time into hanks again. Then the threads of two hanks are taken and again reeled off, this time on to one hank, being twisted together *to the left*; then two of these doubled reels are taken, and the ends being laid together, are twisted *to the right*. These operations, consisting of winding, cleaning, throwing, and twice twisting and doubling, constitute organzine silk. See **SILK**.

ORG'EAT, a kind of culinary preparation, which is both used as an agreeable syrup to mix in certain drinks, or medicinally as a mild demulcent. It is prepared by making an emulsion of almonds, which are blanched for the purpose, and beaten into a paste in a mortar, and then rubbed up with barley-water. The proportions are: 1 lb. of sweet and 1 oz. of bitter almonds to a quart of barley-water. To this emulsion are added 2 lbs. of powdered loaf-sugar, and a quarter of a pint of orange-flower water. There are other modes of making it, but this is the simplest and best. It is much used in France under the name of *sirop d'orgeat*.

ORGIES (probably from Gr. *erdo*, in the perfect, *eorga*, to sacrifice), or **MYSTERIES**, secret rites or customs connected with the worship of some of the pagan deities; as the secret worship of Ceres (q. v.), and the festival of Bacchus, which was accompanied with mystical customs and drunken revelry. The name is now applied to scenes of drunkenness and debauchery.

ORGUES are thick, long, wooden beams, pointed and shod with iron, hung vertically by separate ropes in the gateway of and over the entrance to a fortified place. They answer the purpose of a portcullis or door, and are dropped into position by cutting the ropes from which they hang. Their descent is inevitable, in which they possess an advantage over the portcullis, which may be held up by the enemy or blown in by petards, whereas petards have little effect on orgues, for if one beam be destroyed another can be dropped to fill up the gap.

O'RIA, a t. in Lecce, a province of Italy, 22 m. from Brindisi; pop. about 7,000. It is situated between two lakes, and the surrounding scenery is fine. There are cotton manufactories and other industries. Oria is a very ancient city, and the date of its origin is not known. It was twice destroyed by the Saracens in the 10th c., and later in the middle ages was a place of refuge for the Christians who were driven from Constantinople. It was afterwards sold by St. Charles Borromeo for 40,000 ducats, which were distributed among the poor in a single day.

O'RIEL COLLEGE. In 1324 Adam de Brom, almoner of Edward II., procured from the sovereign a charter of incorporation for a college, under the name of St. Mary's house, in Oxford. The origin of the name "Oriel college" is uncertain. It consisted originally of a provost and 10 fellows. The number of fellows was by subsequent benefactions raised to 18, and several exhibitions and scholarships were also founded at various times. By the commissioners under 17 and 18 Vict. c. 81, all the fellowships are thrown open, but two are in the mean time suspended for the purpose of increasing the number and value of the scholarships, and of augmenting the salary of the professor of modern history. By the same authority the scholars are placed on the foundation of the college, a position they did not before enjoy; the scholarships are made ten in number, tenable for five years, of value £80 per annum, with rooms free. This college was one of the first to throw open such of its fellowships as it could to competition, and hence the fellows of Oriel have long been among the most distinguished men in the university. For several years back, however, its undergraduates have done little in the schools. The fellows divide upwards of £200 a year, in addition to allowances; and the income of the provostship, to which is annexed a living in Essex and a canonry in Rochester cathedral, is estimated at £2,000 a year. There are thirteen benefices in the gift of this college.

ORIEL WINDOW, a projecting window having more sides than one, usually three, and commonly divided into bays by mullions. It is one of the most picturesque features in mediæval and Elizabethan domestic architecture, and adds much to the convenience of the interior. The word oriel (Med. Lat. *oriolum*, probably dim, from *os*, *oris*, as if a small opening or recess) formerly meant a chamber or apartment, and a window is so

called which makes a small apartment, as it were, off a large room. Oriels are also called bay or bow windows (q.v.).

ORIENT, THE THREE KINGS OF. See **KINGS OF ORIENT.**

ORIENTA'TION. As Christians from an early period turned their faces eastward when praying, so Christian churches for the most part were placed e. and w., in order that the worshipers, as they looked towards the altar, might also look towards the east. Modern observation, however, has found that few churches stand exactly e. and w., the great majority inclining a little either to the n. or to the south. Thus, of three ancient churches in Edinburgh, it was ascertained that one (St. Margaret's chapel in the castle) pointed e.s.e.; another (St. Giles's cathedral), e.-by-s. $\frac{1}{2}$ s.; a third (Trinity college church, now destroyed), e. $\frac{1}{2}$ s. This deviation from the true e. has received, among English ecclesiologists, the name of "orientation." Its origin or cause has not been satisfactorily explained. Some have supposed that the church was turned not to the true e., but to the point at which the sun rose on the morning of the feast of the patron saint. But, unfortunately for this theory, neighboring churches, dedicated in honor of the same saint, have different orientations. Thus, All Saints' at West Beckham, in Norfolk, points due e.; while All Saints' at Thwaite, also in Norfolk, is 8° to the n. of east. There are instances, too, in which different parts of the same church have different orientations; that is to say, the chancel and the nave have not been built in exactly the same line. This is the case in York minster and in Lichfield cathedral. Another theory is, that orientation "mystically represents the bowing of our Savior's head in death, which Catholic tradition asserts to have been to the right [or n.] side." But this theory is gainsaid by the fact, that the orientation is as often to the s. as to the north. Until some better explanation is offered, it may, perhaps, be allowed to hold, that orientation has had no graver origin than carelessness, ignorance, or indifference.

ORIFLAMME, or AURIFLAMME (Lat. *auri flamma*, flame of gold), a banner which originally belonged to the abbey of St. Denis, and was borne by the counts of Vexin, patrons of that church, but which, after the county of Vexin fell into the hands of the French crown, became the principal banner of the kingdom. It was charged with a saltire wavy or, with rays issuing from the center crossways. In later times the oriflamme became the insignia of the French infantry. The name seems also to have been given to other flags; according to sir N. H. Nicolas, the oriflamme borne at Agincourt was an oblong red flag split into five parts.

ORIGENES (ORIGEN), called *adamantinos* or *chalchentezos*—both epithets expressive of his firmness of purpose and iron assiduity—one of the most eminent of the early Christian writers, "the father of biblical criticism and exegesis in Christendom," was b. 185 A.D., at Alexandria, where his father, Leonidas, seems to have held some superior office in the church. Origenes received a most liberal education. While, on the one hand, he was initiated at an early age into Hellenic science and art, the teachings of Christianity were instilled into his mind by men like Pantænus and Clemens of Alexandria. During the persecutions against the Christians, instituted by Sept. Severus, his father died the death of a martyr, and Origenes, then 17 years of age, would have shared it of his own free will had not his mother, left unsupported with six children, prevented him. After a short time his zeal and erudition procured for him the office of catechist in the Alexandrian church; but no salary being affixed to it, he was fain to dispose of his much-loved collection of classical authors for a daily stipend of four oboli (2d.) for several years. His wants were extremely limited, and his asceticism led him even to self-mutilation (in accordance with the view he took of Matt. xix.(12): an act for which he afterwards expressed the deepest sorrow, and which became a dangerous weapon in the hands of his antagonists. Not a few of his hearers being masters of Greek (Neoplatonic) philosophy, Origenes, in order to ward off more successfully their attacks upon his doctrines, and to combat them on their own ground, applied himself particularly to this science, and Ammonius Saccas himself is said to have been his teacher. From this period also may be dated Origenes's transition from unconscious to conscious belief. He examined henceforth, with as little prejudice as possible, all the different systems of human speculations that came under his notice during the many journeys he undertook, proceeding on the principle "that we are not, under the pretense of piety, to pin our faith on that which is held by the multitude, and which therefore alone seems to stand on high authority, but on that which results through examination and logical conclusions from established and admitted truths." This liberality of his mind and doctrines could not fail, on the one hand, to bring about many conversions to the faith, as he taught it, both among "pagans" and "heretics," the latter chiefly of the gnostic sects; and on the other hand, to raise an outcry among less liberal professors and teachers of the faith, who had not been so successful in their labors. What gave the greatest offense in his teachings was his way of explaining, after the manner of the Midrash, known to him through the Jewish masters (from whom, at an advanced age, he had also learnt Hebrew) allegorically and symbolically that which in the Scripture warred with the common human understanding, or seemed repugnant in manner or matter. Furthermore, while upholding all the ethical portions of the Bible, he rejected a great deal of its supposed historical and legal contents for all purposes, save, perhaps, as starting-points for homiletics. "What edification," he says, "could we find in literally interpreting the story of Abraham's first telling Abimelech a lie, and then, with Sarah's consent, handing her

over to him and prostituting her?" As to the discrepancies in the different gospels respecting the life of Christ, he says: "One of two only is possible. Either these things are true in a *spiritual* sense only, or as long as the discrepancies are not satisfactorily explained away, we cannot believe in the gospels being dictated by the Holy Ghost, and redacted under the influence of his inspiration."

In 211 he went to Rome, but soon afterward, at the wish of bishop Demetrius, he returned to Alexandria, which, however, he was obliged to leave precipitately, and to seek refuge from certain popular tumults in Palestine. Here the bishops received him with great honors, and desired him to institute public lectures, in which they themselves became hearers. Recalled again by the Alexandrian bishop, he was sent to Achaia to combat certain heresies that had broken out there. The wrath that had silently been gathering against him found its first vent when, in 228, the bishops assembled in Cæsarea in Palestine consecrated him presbyter. The bishop of Alexandria took umbrage at this outrage, as he called it, on his authority. Two councils were convoked, and in 232, Origenes was deprived of his priestly office, and excommunicated, the principal heresy charged against him being his denial of eternal punishment. Yet the churches of the east remained faithful to him. Palestine, Arabia, Phenicia, and Achaia remained in constant communication with him; and men like Gregory Thaumaturgus (q.v.), Athenodoros, and others remained or became his faithful disciples ever after, while the bishop of Cæsarea allowed him openly to expound the Scripture in his church. The persecutions under Maximinus again forced him to seek refuge for two years in Cappadocia. Returning under Gordianus, he resumed his labors and journeys, until, when Decius ascended the throne, he was seized, imprisoned, and tortured for his faith. He did not survive his sufferings long, but died, in 254, at Tyre, where his tomb, near the high-altar of the cathedral, was shown for many centuries, until it was destroyed during the Crusades.

The number of his works is stated by Epiphanius and Rufinus to have exceeded 6,000, and although this is probably only meant as an exaggerated round number, yet the amount of writings that issued from his always busy brain and hands cannot but have been enormous. Seven secretaries and seven copyists, aided by an uncertain number of young girls, are by Eusebius reported to have been always at work for him. The great bulk of his works is lost; but among those that have survived, the most important by far are his two editions of the Old Testament, called respectively *Tetrapla* (fourfold) and *Hexapla* (sixfold). See HEXAPLA. The labor bestowed upon this work must have been immense, and no less than twenty-eight years is Origenes supposed to have been engaged upon it. On its importance for Biblical criticism it is needless to enlarge here. Fragments only have come down to us, the original having been lost during the siege and capture of Cæsarea by the Arabs; and the Greek as well as the Roman clergy having almost laid an interdict upon the copying of any of Origenes's much suspected writings. Montfaucon has collected and edited these fragments (*Hexaplorum Origenis quæ supersunt*, 2 vols. fol. Paris, 1714), which were re-edited by C. F. Bahrtdt (1769-70). Of his other partly extant, partly lost works, the chief are his books "On the Resurrection," "On Martyrdom," "Eight Books against Celsus," "On Prayer," besides Epistles, etc. He further revised and enlarged Philo's Lexicon of Hebrew Names (*Hebraicorum Nominum S. Scripturæ et Mensurarum Interpretatio*), whence it has often, together with many other spurious works, been ascribed to him exclusively. Little also has survived of his many exegetical writings, commentaries, brief notes, and homilies on both Testaments. The best editions of his collected works are by De la Rue (Rudens), (Paris, 1733-59, 4 vols. fol.); by Oberthür (Wurzburg, 1785-94, 15 vols.); and by Lommatszsch, which is critical and more complete (Berlin, 1831), etc.

ORIGINAL SIN. According to this theological tenet, when stated in its extremest form, men come into the world with the reason and will utterly corrupt. This corruption originated in the fall of Adam, and has been inherited equally by all his posterity, so that the natural man is not only incapable of knowing and loving God and goodness, but is inclined to contemn God and pursue evil; on which account the anger of God has subjected him to temporal death, and destined him to everlasting punishment in hell. The doctrine is founded on the account of the fall given in Genesis, and on some passages in Paul's epistle to the Galatians, and in that to the Romans; which passages, however, are held by others to contain no such doctrine; and indeed nearly every point in the history of the doctrine is the subject of as much controversy as the details of the doctrine itself. The early church, it is maintained by one school, was unacquainted with it; and the most orthodox admit that the doctrine had not at that time been fully developed. The Christian fathers; Justin Martyr, Clemens Alexandrinus, Irenæus, and others, ascribe to the natural man a certain ability to know God and choose the good, they are said to reject distinctly all propagation of sin and guilt, and even to refer human mortality not to Adam's sin, but solely to the constitution of the body. Origen, on the other hand, in opposition to the Gnostics and Manichees, who grounded the sinfulness of men on the connection of the soul with a material body, asserted that the sinfulness was in existence at birth, but ascribed the development of actual sins and their consequences not to propagation, but to the moral operation of precept and example. He accordingly found the cause of sin to be in the freedom of the will, the abuse of

which he explained partly by the operation of evil powers, partly by the predominance of the sensuous part of man's nature over the rational mind. The orthodox teachers of the Greek church, again, held that Adam, by the fall, rendered himself and all his posterity mortal, but, according to the less rigid schools, they looked for the origin of sin in the freedom of the will acted upon by the flesh, and by demoniacal influences, and ascribed to man the power of resisting every evil if he chose. These views, it is alleged, continued to be held, in substance, by the Christian teachers in the east, and were fully developed by Chrysostom; but Catholic writers maintain that in all this Chrysostom and the other Greek fathers are speaking not of the *natural* powers of the will, but of the will as assisted by divine grace.

The doctrine took another shape in the Latin church. Tertullian, following up his dogma of Traducianism, according to which the child derives not only its body but its soul from its parents, maintained that sinfulness had been propagated, along with mortality, from Adam to all mankind; he thus defended an *originis vitium*, without conceiving it as actual sin and denying all capacity for good in man. This view was followed by Cyprian, Ambrose, and even by Augustine in his earlier writings. It was only during his controversy with Pelagius and Cælestius that Augustine came to develop the doctrine of original sin into the full form given above. His great influence in the western churches procured the condemnation of his opponents, the Pelagians (q. v.), as heretics at the councils of Carthage (412, 416, 418), although the councils of Jerusalem and Diospolis (415) decided in their favor. Building upon the foundation of Traducianism, Augustine laid down that every natural man is in the power of the devil, and upheld the justice of this as a punishment for the share which the individual had in Adam's transgression; for as all men existed in the loins of Adam, all sinned with him. Pelagius, on the other hand, who rejected the Traducian theory, denied that sin is propagated physically, or that the fall of Adam has exercised any prejudicial influence on the moral constitution of the posterity; and maintained that all men are born in a state of innocence, possess the power of free-will, and may therefore live without sin. He and his followers objected to Augustine, that his doctrine was in direct contradiction to clear passages of Scripture, and that it made God the originator of evil and an unrighteous judge.

Great as was the respect for Augustine, the harshness of his doctrine was too shocking to the natural sentiments to meet with lasting acceptance. In the eastern church it never gained a footing, and even in the west it met with opposition. In Gaul, John Cassian, Faustus, Arnobius, and others, took up a view midway between the views of Augustine and Pelagius, from which they were called Semipelagians. They attributed to man a capacity for good which makes it possible for him, not indeed to merit the favor of God, but to make himself capable of receiving it; and maintained that it is only a certain inborn weakness that men inherit from the first pair. The Semipelagian doctrine found acceptance especially among the monks (in particular among the Franciscans), continued to prevail during the middle ages, and among the scholastics found partisans in the Scotists. Augustine's views also found advocates among the scholastic philosophers, who, however, added to it many limitations and explanations. Regarding the way in which original sin is propagated, many held by the Traducian theory, while others conceived it to be a sort of infection of the soul by the defiled body, or an imputation of guilt to all partakers of the human nature. Petrus Lombardus adhered to Augustine. Anselm of Canterbury conceived original sin to be a want of requisite righteousness, and thought that this want was imputed to all the posterity of Adam, although not in the same degree as if they had themselves sinned. Anselm's view was adopted by Duns Scotus, while Bonaventura and Thomas Aquinas sought to combine the opinions of Anselm and Augustine. Anselm had thought that his theory afforded a better explanation of the sinless birth of Christ; and about the 12th c. it began to be maintained that Mary also was conceived without sin.

The reformers of the 16th c. everywhere made original sin a leading doctrine, and thus were enabled to combat effectively the Roman Catholic doctrine of the merit of works; while the Catholic church, in the fifth session of the council of Trent, stamped what the Calvinist school would call Semipelagianism as the orthodox doctrine. The reformed churches agreed with the Lutheran on the point of original sin. In this they followed Calvin rather than Zwingli, who looked upon it as an evil or disease, and as becoming sin only when a commandment is transgressed. The Arminians and Socinians, on the other hand, denied the doctrine of hereditary sin in the ecclesiastical sense. The Mennonites spoke of a loss of the divine image in consequence of the fall of Adam, but still asserted the free-will of man. The Quakers rejected the name of original sin altogether; they held that there is a germ of sin in man, from which imputable sin springs, and that, however corrupt, he has still the susceptibility of being awakened to the inward light. The whole Protestant church held, besides, that Jesus alone was free from sin, both original and actual. The Roman Catholic church ascribed this attribute also to Mary, though no public and distinct declaration on the point was given by the council of Trent. See IMMACULATE CONCEPTION.

The harshness of the Augustinian dogma led, at time of the reformation, to keen controversies; Erasmus disputed the point with Luther, and would only admit a weakness of the free-will arising from original sin, and by no means a complete annihilation

of it. From that time the doctrine in Germany continued to be variously attacked and defended. It has been discussed by the schools of philosophy. Kant showed the moral signification of the dogma, and made out original sin to be a propensity to evil inherent in man. The Schelling-Hegel school, again, explained it as the finite nature with which the individual is born. In recent times, the theologians of the old Lutheran and strictly orthodox tendencies, such as Olshausen, Tholuck, Hengstenberg, and others, have come forward as adherents and defenders of the Augustinian doctrine; while the more liberal theologians modify it in various ways, not admitting any moral inborn corruption arising from the fall, but only a weakness in man's nature for the knowledge and performance of good. How far, and with what differences, the extreme Augustinian view is held by the churches of England and Scotland, will be seen from the following extracts from the *Thirty-nine Articles* and the *Westminster Confession of Faith*.

From Art. ix. of the *Thirty-nine Articles*: "Original sin standeth not in the following of Adam (as the Pelagians do vainly talk); but it is the fault and corruption of the nature of every man, that naturally is engendered of the offspring of Adam, *whereby man is very far gone from original righteousness*, and is of his own nature inclined to evil, so that the flesh lusteth always contrary to the spirit; and therefore in every person born into the world, it deserveth God's wrath and damnation."

From chap. vi. of the *Westminster Confession*: "By this sin" (i. e., the eating of the forbidden fruit), "they" (i. e., our first parents) "fell from their original righteousness and communion with God, and so *became dead in sin, and wholly defiled in all the faculties and parts of soul and body*. They being the root of all mankind, the guilt of this sin was imputed, and the same death in sin and corrupted nature conveyed to all their posterity, descending from them by ordinary generation. From this original corruption, *whereby we are utterly indisposed, disabled, and made opposite to all good, and wholly inclined to all evil*, do proceed all actual transgressions.

ORIHUE'LA, an ancient t. of Spain in the modern province of Alicante, and 36 m. s. w. of the city of that name, stands on the banks of the Segura, in a plain remarkable alike for its beauty and its fertility. It is long and straggling, while its palm-trees, square towers, and domes give it an oriental appearance. It contains a cathedral, numerous churches and convents, barracks, etc. The manufactures are linen goods and hats, and many corn and oil mills and tanneries are in operation. Olive oil is very extensively made. The vegetation here is gigantic; the oleanders are actual trees. Orihuela has been possessed by Carthaginians, Romans, Moors, and Spaniards in turn. Pop. 24,000.

ORI'LLON, in fortification, and especially in the earlier systems, is a semicircular projection at the shoulder of a bastion, intended to cover from the observation of the enemy the guns and defenders on the flank, which, with such a construction, is somewhat retired or thrown back. The flank thus protected is held by many distinguished engineers to be most valuable in the defense of the ditch, in clearing it from an attacking party, or from hostile miners. The retired flank is sometimes straight, at others curved. The orillon is as old as the bastion, and is found in the works of Pagan and Speckle.

ORINO'CO, a great river of South America, flows through Guiana and Venezuela, and reaches the Atlantic ocean s. of Trinidad, in lat. 8° 40' north. The country in which it takes its rise is inhabited by an aboriginal race called the Guaicas, who have hitherto prevented all access by foreigners to its sources; but it is known to rise in the Sierra Parime, one of the chief mountain chains of Guiana, near lat. 3° 40' n., long. 64° 30' west. It has been explored by Humboldt to the village of Esmeraldas (lat. 3° 8' n., long. 66° 5' w.), and by Schomburgk to within 30 m. of its source. After flowing w.s.w. 20 m. past Esmeraldas the river bifurcates, and the southern branch, the Cassiquiari (q. v.), flowing s.w., joins the Rio Negro, an affluent of the Amazon. From this point the Orinoco flows n.w. to its junction with the Guaviare, then n.e. to its junction with the Apure, after which it flows in an eastward direction to its mouth. Length of course 1960 miles. The head of uninterrupted navigation is at the confluence of the Orinoco, with the Apure, 777 m. from the mouth of the river. Above this point the course of the river is interrupted by "raudals" or cataracts, of which those of Maypures and Atures are the most celebrated. Its principal affluents from the left are the Guaviare, the Vichada, the Meta, and the Apure; from the right, the Ventuare, Caura, and Caroni. The Orinoco, which is joined by 436 rivers, and upwards of 2,000 streams, drains an area (usually stated at 250,000 sq. m.) which, according to Wappäu's *Republiken von Süd-Amerika*, may be estimated at 650,000 sq. miles. It begins to form its delta 130 m. from its mouth, by throwing off a branch which flows northward into the Atlantic. Several of the mouths are navigable, and the main stream, the Boca de Navios, is divided by a line of islands into two channels, each two m. in width. Bolivar, a town upwards of 250 m. from the mouth of the river, marks the head of tide-water, and here the river is 4 m. wide and 390 ft. deep. Below the junction of the Apure the character of the scenery seems to be uniform—forests on the right bank, and llanos on the left.

O'RIOLE (*Oriolus*), a genus of birds of the Thrush family (*Merulidæ* or *Turdidæ*) having an elongated conical beak, broad at the base; the upper mandible ridged above, and notched at the point; wings of moderate size. the first feather very short, the third the

longest; the tail of moderate length, and rounded; the tarsus not longer than the middle toe; the outer toe joined at its base to the middle toe; claws strong and curved. The species are numerous, all natives of the Old World, and chiefly of the warmer parts of it; the adult males generally of much brighter plumage than the females and young males, the prevalent color yellow. Only one species is found in Europe, the GOLDEN ORIOLE (*Oriole galbula*), pretty common in Italy and some other parts of Europe, but a rare summer visitant of England, and never seen in Scotland, although it occasionally breeds in the south of Sweden.—The name Oriole is still very commonly given to the Baltimore bird (q. v.) and other American birds of the Starling family, the chief resemblance of which to the true orioles is in color.

ORION, in Greek mythology, was a gigantic hunter, and reputed the handsomest man in the world. His parentage is differently given. According to the commonly received myth, he was the son of Hyrieus of Hyria, in Bœotia, and was called in his own country Kandaon. Another account makes him a son of Poseidon and Euryale, while some state that he was *Autochthonos*, or "earth-born." So immense was his size, that when he waded through the deepest seas he was still a head and shoulders above the water; and when he walked on dry land, his stature reached the clouds. Once on a time he came to Chios, in the Ægean sea, where he fell in love with Æro or Merope, daughter of Cœnopion. He cleared the isle of wild beasts, and brought their skins as presents to his sweetheart; but her father always put off their marriage; whereupon Orion, one day giving way to passion (when under the influence of wine), sought to take the maiden by force. Cœnopion now called upon Dionysus (Bacchus) for help, who put out the eyes of the inebriate lover. Orion, however, recovered his sight in Lemnos, by following the advice of an oracle, and returned to Chios to take vengeance on Cœnopion. Not finding him, he went to Crete, where he spent the rest of his life hunting in company with Artemis (Diana). The cause and manner of his death are differently related. Artemis, say some, slew him with an arrow, because Eos, inflamed by his beauty, had carried him off to Ortygia, and thereby offended the gods. Others aver that Artemis, virgin-goddess though she was, cherished an affection for him, that made her brother Apollo fiercely indignant. One day, pointing out to her at sea a black object floating in the water, he told her that he did not believe she could hit it. Artemis, not recognizing her favorite, drew her bow, and pierced him through the head; a third myth makes him find his death from the sting of a scorpion. Asklepios (Æsculapius) wished to restore him to life, but was slain by a bolt of Zeus. After his death, Orion was placed with his hound among the stars, where, to this day, the most splendid constellation in the heavens bears his name.

ORIS'SA, an ancient kingdom of Hindustan, the authentic history of which goes back to 473 A. D., extended from Bengal—a part of which it included—on the n., to the banks of the Godavari on the s., and from the coast on the e. to the river Gondwana on the west. From its remains of sculptures, inscriptions, etc., we may infer that its early civilization was high. The temple of the sun at Kanárek—erected about the 12th c.—exhibits carvings representing the planets, sculptured figures of animals, etc., which show that at that date the plastic and mechanical arts were in a more advanced state in Orissa than they were in England. It maintained its position as an independent monarchy till 1558, when, its royal line having become extinct, it became an outlying province of the empire of the great mogul. On the breaking up of this empire, the more valuable portions of Orissa were seized by the nizam of Hyderabad. The French, who had taken possession of a part of the country long known as the northern Circars, attempted to drive the English (who had also formed commercial settlements on the coast), out of India. The result of the contest for supremacy in India between the English and French is well known. The Mahrattas, who had seized a portion of Orissa in 1740, were forced to surrender it to the English in 1803. The soldiers of the East India company were marched into Orissa at the commencement of the present century, and an engagement was subsequently entered into between the company and the native chiefs and princes, by which the former bound themselves to perform certain services for the country (as maintaining the river-banks in good repair), while the latter engaged to pay a yearly tribute. Of the many principalities into which Orissa was divided, a large number got into arrears with the government, and the result was that numbers of the estates were sold, and the government, as a rule, became the purchaser. Much of the territory originally forming a portion of this kingdom thus fell into the hands of the British. The ancient Orissa, which existed as an independent monarchy for four centuries, and flourished as a principality of the mogul empire after 1558, is now hardly to be recognized in the British commissionership of Orissa, with an area of 23,901 sq. m., and a pop. of ('82) 5,000,000. This country was decimated by famine in 1868-69; and careful surveys of its coast were made in 1870. Orissa is traversed by a branch of the eastern Ghauts running parallel with the coast. The hill-districts, which nowhere present an elevation of more than 3,000 ft., are inhabited by the Gonds, the Koles, the Sourahs, and the Khonds. The Khonds occupied an area extending from n. of the Mahanaddi, s. to the banks of the Godavari. Their mountain-haunts are admirably suited for defense, as the districts which they inhabit are almost inaccessible; and although they do not yet appear to have adopted firearms, they manage their battle-axes and bows and arrows with an adroitness

and courage that make them formidable enemies. The Khonds are a totally distinct race from the inhabitants of the plains, and there is but little resemblance between them and the other hill-tribes, the Gonds and Sourahs. The chief peculiarities of the Khonds are, that their language, which is quite distinct from those of the neighboring tribes, is not in the least understood by the inhabitants of the plains; and that human sacrifice formed, till within the last few years, one of the distinguishing features of their religion. They do not barter or traffic, and all commercial transactions are managed for the Khonds by the Panus, Doms, etc., regarded by their employers as inferior races. There are, however, no caste prejudices among the Khonds such as generally prevail throughout the plains of India. Agriculture and war are the only employments. The revolting custom of human sacrifice prevailed among the Khonds from the earliest times, although it was not till 1836 that the attention of the government was specially called to the subject, at the conclusion of an insurrection, in the course of which British officers had been brought into contact with the hill tribes. The Khond victims, called Meriah, were always bought with a price, sometimes from families of their own tribes who had fallen into poverty, but generally kidnapped from the plains by miscreants of the Panu race. The Meriah victims were of both sexes, and of every age; though adults were held in the highest esteem, because, being the most costly, they were supposed to be more acceptable to the deity. The object of the sacrifice was to propitiate the earth-god; and abundant crops, security from calamity, and general prosperity were supposed to be insured to any one who had cut off a portion of the flesh of the human victim, and buried it in his farm.

The consummation of the Meriah sacrifice was often attended with circumstances of the most revolting and disgusting cruelty. In some cases the event was preceded by a month's feasting, intoxication, and dancing round the Meriah. On the day before the sacrifice, the priest thus addressed the victim: "We have bought you with a price, and did not seize you; now we sacrifice you according to custom, and no sin rests with us." On the following day the victim was made senseless from intoxication, and then suffocated; after which the officiating priest cut a portion of the flesh from the body, and buried it as an offering to the earth-god. The people, following his example, hewed the flesh from the bones, and carried the bloody trophy to their distant villages, where it was buried. In many cases the victim was not intoxicated before sacrifice; but the joints of his arms and legs were broken with a hatchet, in order to prevent the possibility of resistance. In 1837 gen. (then capt.) Campbell was appointed assistant-collector in Ganjam, the adjoining district in the plains, and with varied success devoted much of his time to endeavoring to suppress the rite. He was succeeded in 1841 by maj. (then lieut.) Macpherson, c.B. Encouraged by the success of his labors, the government in 1845 established, under Macpherson, a separate agency for the suppression of Meriah sacrifices in the hill tracts of Orissa, in which he was succeeded, in 1847, by maj.gen. Campbell, who carried on, with undiminished success, the good work commenced by Macpherson, pushing his inquiries and exerting his authority among the tribes unvisited by his predecessor; and reports have been sent in from all parts of the country, stating that for several years hardly any Meriah sacrifices have taken place in the great hill tract of Orissa. In the year 1852-53 all victims retained for sacrifice were demanded, and in only one instance had the demand to be followed up by force. The practice of female infanticide has now also become almost wholly suppressed. The irrigation of a large portion of Orissa is provided for by an extensive and costly system of canals taken over by the government in 1863.

See *Report by Lieut. M'Pherson, 1841; An Account of the Religion of the Khonds in Orissa, idem in the Trans. of Asiat. Societies, 1851; Campbell's Personal Narrative of Service Amongst the Wild Tribes of Khondistan, 1864; Calcutta Review, Nos. IX., XI., XV., and XX.; Kaye's History of the Administration of the E. I. Coy., 1853; Memoir: Administration of India During Last Thirty Years, 1858; Indian Records—History of the Rise and Progress of the Operations for the Suppression of Human Sacrifice and Female Infanticide in the Hill Tracts of Orissa (1854); and Orissa, by W. W. Hunter, director-general of the statistical survey of India (1872).*

ORISTA'NO, a t. and inferior river port on the w. coast of Sardinia, 56 m. n.w. of Cagliari. It stands in a fruitful, well-cultivated plain, about a mile from the left bank of the Tirso or Oristano, and 3 m. from its mouth in the gulf of Oristano, which is about 10 m. in length, with a breadth of 5 miles. It is surrounded by ancient walls flanked with towers; contains a cathedral with a great clock tower, the most conspicuous object in the town; an archbishop's palace, college, and several churches and convents. It carries on manufactures of ironware, cutlery, and agricultural implements, and a number of its inhabitants are engaged in the tunny fishery on the coast. Corn, salt fish, and the wine of Vernaccia are exported. In winter the town is busy and lively; but in summer it is unhealthy, and during that season all who can afford to do so, leave it. Pop. 2,500.

ORIZA'BA, a t. of Mexico, in the state of Vera Cruz, 70 m. w.s.w. of the town of that name, and 25 m. s. of the volcano of Orizaba. The vicinity is unusually fertile, and is covered with forests. The town contains numerous churches, a high school, and an

extensive cotton spinning factory. Coarse cloths and tobacco are largely manufactured, and there is much general industry. Pop. 16,600.

ORKNEY ISLANDS, which, with Shetland, form one county, separated from Caithness by the Pentland firth (q.v.), lie between $58^{\circ} 41' 24''$ and $59^{\circ} 23' 2''$ n. lat., and between $2^{\circ} 22' 2''$ and $3^{\circ} 25' 10''$ w. long.; and are 73 in number at low water, of which 28, besides Pomona, or the Mainland, are inhabited. The area of the Orkney islands is 610 sq.m., or 390,147 imperial acres. The surface is very irregular, and the land is indented by numerous arms of the sea. The highest hill is the Ward of Hoy, 1555 feet. The rocks are of the old red sandstone formation, except a small granite district near Stromness. Previous to the middle of last century, the agriculture of Orkney was, in more than an ordinary degree for the time, in a primitive state. There was little communication then with the mainland, and improvements were slowly adopted. The spinning-wheel, for instance, was not introduced there for half a century after it was in use elsewhere. Until toward the end of last century, little advance seems to have been made in the management of the land, the inhabitants deeming it more important and profitable to direct their attention to the manufacture of kelp. The people used to suffer periodically from bad seasons and violent storms, when less help could be afforded to them from without. In 1778 a great hurricane of four hours' duration drove the sea-spray over the islands. The grain crop was in consequence *sea-gusted*, and rendered almost worthless, and there required to be imported 18,000 bolls of meal and bere, besides other articles, costing £15,000, or nearly twice the gross rental of the county. Orkney was formerly divided into 32 parishes, having 8 parish ministers. It now contains 22 parishes, forming 3 presbyteries and 1 synod. There are also about 30 congregations belonging to the Free and United Presbyterian churches, besides 3 Independent, and one or two others.

The temperature of Orkney is comparatively mild, considering its northern latitude. This arises partly from its being surrounded by the sea, but chiefly from the neighborhood of the gulf stream to the western shores. For the 13 years ending 1869, the mean annual temperature was 46° ; the mean temperature of January and February, the coldest months, 39° ; and that of July, 55° . The annual rainfall varies from about 28 in. on the e. side of the isles to 37 in. on the west.

The carrying-trade and merchandise of Orkney have greatly increased of late years. The exports rose from £49,308 in 1848 to £181,483 in 1861. According to a carefully prepared return in connection with a piers' bill, the value of exports, in 1871, exceeded £250,000. The exports are chiefly of fish and agricultural produce, of which cattle are the principal. About 4,000 men are employed in the fisheries; 11,000 eggs were exported, 1880.

The total acreage in 1881 under all kinds of crops, bare fallow and grass, was 108,795; barley and bere, 5,910 acres; oats 32,373 acres; turnips, 13,952 acres; potatoes, 3,137 acres. The number of horses in 1881 was 6,181; cattle, 26,103; sheep, 29,064; swine, 3,769. The number of occupants of land was 3,147.

The chief towns are, Kirkwall (q.v.), the capital (situated in Pomona), and Stromness, in which there are 3 distilleries, producing upward of 20,000 gallons of whiskey annually; but Kirkwall is the only royal burgh in the shire. The valued rent of the Orkney islands in 1653 was £57,149 Scots, or £4,763 sterling. The valuation (exclusive of the burgh of Kirkwall) in 1878-9 was £65,061. In 1881, inhabited houses in the Orkney islands, 6,288; pop. 32,037. Parliamentary constituency in 1879-80, 1,333, returning one member conjointly with Shetland.

The Orkneys, under the name *Orcades* [whence the modern adjective, Orcadian], are mentioned by the ancient geographers, Pliny, Ptolemy, Mela, and by other classical writers, but of their inhabitants we know almost nothing till the dawn of the middle ages. They were most probably of the same stock as the British Celts. From an early period, however, the Norsemen resorted to these islands, as a convenient spot from which to make a descent on the Scotch and English coasts. In 876 Harald Haarfager conquered both them and the Hebrides. During the greater part of the 10th c. they were ruled by independent Scandinavian jarls (earls), but in 1098 they became formally subject to the Norwegian crown. Thus they remained till 1468, when they were given to James III. of Scotland as a security for the dowry of his wife, Margaret of Denmark. The islands were never redeemed from this pledge; and in 1590, on the marriage of James I. with the Danish princess Anne, Denmark formally resigned all pretensions to the sovereignty of the Orkneys. During their long connection, however, with Norway and Denmark, all traces of the primitive population disappeared. The present proprietors of land are chiefly of Scotch descent; and the inhabitants generally are a mixed race of Scandinavian and Scotch descent.

ORLE, in heraldry, one of the charges known under the name of sub-ordinaries, said to be the diminutive of a Bordure (q.v.), but differing from it in being detached from the sides of the shield. It may be the sole charge in a shield. Or, an orle gules was the coat borne by John Baliol. An orle of heraldic charges of any kind denotes a certain number (generally eight) of these charges placed in orle, as in the coat of the old Scottish family of Gladstones of that Ilk; argent, a savage's head coupé, distilling drops of blood proper, thereon a bonnet composed of bay and holly leaves all proper, within an orle of eight martlets sable.

ORLEANS, an island in the St. Lawrence river, belonging to Montgomery co., Quebec, Canada; 69 sq.m.; pop. '70, 4,924. The surface is undulating, and covered in some portions with extensive forests. The soil is rich, and in a high state of cultivation. There are a number of villages on the island.

ORLEANS, a parish in s.e. Louisiana, on the Mississippi river, bounded on the n. by lake Pontchartrain, on the s.e. by lake Borgne, and on the s. by the Mississippi; on the New Orleans, Mobile, and Texas railroad; 150 sq.m.; pop. '80, 216,140—174,965 of American birth—57,761 colored. The surface is low, and liable to inundation, and much of it is swampy. The soil along the Mississippi is fertile. The principal production is sugar. The city of New Orleans constitutes the greater part of the co., which is the most populous in the state. Capital, New Orleans.

ORLEANS, a co. in New York bounded on the n. by lake Ontario, drained by Oak Orchard creek; on the New York Central, and the Rome, Watertown, and Ogdensburg railroads, and the Erie canal; 380 sq.m.; pop. '80, 30,128—25,329 of American birth. The surface is rolling, and the soil fertile. The principal productions are corn, wheat, hay, oats, and fruits. Wool, flax, hops, and tobacco are also raised. There are flour and saw mills, cooper shops, manufactories of carriages, harnesses, etc. Co. seat, Albion.

ORLEANS, a co. in n. Vermont, watered by the Missiquoi, Clyde, Barton, and Black rivers; on the Connecticut and Passumpsic River railroad; 700 sq.m.; pop. '80, 22,082—18,102 of American birth. The surface is hilly, much of it heavily wooded with sugar maple, oak, hickory, and other trees. It contains a number of lakes, of which the largest is lake Memphremagog (q.v.). Iron ore and soapstone are found, and granite slate and other minerals. The soil is fertile, and the principal crops are potatoes, grass, corn, and oats. Maple sugar is made, and much lumber is exported. Co. seat, Irasburg.

ORLEANS, an important commercial t. of France, capital of the department of Loiret, and formerly capital of the old province of Orleannais, which now forms the greater part of the departments of Loiret, Eure-et-Loir, and Loir-et-Cher, is situated on the right bank of the Loire, here crossed by a bridge of 9 arches, and is 75½ m. s.s.w. of Paris by railway. Close to the city is the forest of Orleans, one of the largest in the country, consisting of 94,000 acres, planted with oak and other valuable trees. Orleans stands on the verge of a magnificent plain sloping toward the Loire, and watered by the Loire and Loiret, and is surrounded on the land-side by a wall and dry ditches, on either side of which there are pleasantly shaded boulevards. Around it are eight prosperous and populous suburbs. Among its principal buildings are the cathedral, with two lofty and elegant towers, one of the finest Gothic edifices in the country; the tower; bishop's residence; the houses of Joan of Arc, of Agnes Sorrel, of Diane de Poitiers, of François I., of Pothier; the churches and hospitals, which are numerous; the *musée*, the theater, etc. The town contains three statues of Joan of Arc, of which the equestrian one was inaugurated in 1855. The situation of the town has many commercial advantages, arising from its position on a navigable river, on lines of railway which connect it with Paris and the great trading towns in the s. of France, and on the canal which connects the Loire with the Seine. Hosiery, cotton and linen goods, refined sugar, vinegar, bleached wax, leather, etc., are manufactured; and the trade is chiefly in stockings, sheepskins, wine, brandy, corn, and sugar. Pop. 57,314.

Orleans, originally called *Genabum*, afterward *Aureliani* (probably from the emperor Aurelian), of which the modern name is only a corruption, was besieged by Attila in 451, but relieved by the Romans, who here defeated Attila. It afterwards passed into the hands of the Franks, was taken by the Northmen in 855, and again in 865. In 1428 it was besieged by the English under the duke of Bedford, but was delivered by Joan of Arc (q.v.), therefore named the Maid of Orleans. In the wars of the 16th c., Orleans suffered severely. It was taken by the Germans in 1870, and was their center of operations against the French army of the Loire.

ORLEANS, HOUSE OF. See BOURBON.

ORLEANS, JEAN BAPTISTE GASTON, Duc d', third son of Henry IV. of France and Marie de Medici; was b. at Fontainebleau, April 25, 1608. He possessed tolerable abilities, but his education was neglected. On his marriage with Marie of Bourbon, duchess of Montpensier, in 1626, he received the duchy of Orleans as appanage. His wife soon died, leaving one daughter, the celebrated Mademoiselle de Montpensier. His brother, Louis XIII., regarded him with dislike as heir-presumptive to the throne, the queen having no children; and the treatment which he received at the hands of the king and of Richelieu, led him to join with his mother in attempting the overthrow of that minister. He left the court with a number of other great nobles in Feb., 1631; sought the support of the duke of Lorraine, whose sister he married, and raised in the Spanish Netherlands a corps of 2,000 men, at the head of which he crossed the French frontier assuming the title of lieut.gen. of the kingdom; but was completely defeated by marshal Schomberg at Castelnaudary, and fled to the duke of Lorraine, whom he thereby involved in ruin. In 1634, however, he returned to the French court. Richelieu sought to have his marriage with Marguerite of Lorraine declared invalid, but after a long struggle, and much disputing among jurists and theologians, its validity was sustained. The duke was, however, again obliged to leave France in consequence of fresh

intrigues against Richelieu. After Richelieu's death, a reconciliation was effected between him and his brother, the king, by the ministers Mazarin and Chavigny; and Louis XIII. appointed him lieut. gen. of the kingdom during the minority of Louis XIV. Mazarin and the queen-mother, Anne of Austria, attempting to assume all power to themselves, the duke placed himself at the head of the Fronde (q.v.); but with his usual vacillating weakness and selfish sacrifice of his friends, soon made terms again with the court. Yet, when Mazarin returned from banishment in 1652, the duke again assembled troops for the prince of Condé, upon which account, after the disturbances were ended, he was confined to his castle of Blois, where he died Feb. 2, 1660. He left three daughters by his second marriage.

ORLEANS, LOUIS PHILIPPE JOSEPH, Duc d', b. April 13, 1747, was the great-grandson of the preceding. He possessed very good abilities; but early fell into the grossest debaucheries, in which he continued to the end of his career. Louis XVI. disliked him on account of his debased character, and the queen for his obtrusiveness. He became gradually estranged from the court, sought popularity and obtained it, and embraced the cause of American independence. In the assembly of notables in 1787 he declared against the ministerial proposals; and when the king sought to overcome the resistance of the parliament by a *Lit de justice*, he protested against the proceeding. On the assembly of the states-general, he took the popular side, and voted with the extreme left in the national assembly; seeking at the same time to please the populace by profuse expenditure, with the hope of being made lieut. gen. of the kingdom, or perhaps of opening for himself a way to the throne. When the insurrectionary movements began in Paris in 1789, he promoted them by secret agents and money. The court sent him on an ostensibly diplomatic mission to England, from which he returned after more than six months' absence, in July, 1790, and unscrupulously engaged in new intrigues hostile to the king. But he began to find that he himself was made the mere tool of a party, who availed themselves of his influence and wealth for their own purposes, and this discovery cooled his revolutionary fervor. He withdrew from the Jacobin club, was reconciled to the king, and appeared at court; but was treated with such disrespect by the courtiers, that he turned away, and from that time followed in blind rage the stream of the revolution. He joined Danton's party, was concerned in insurrections, disclaimed all pretensions to the throne, renounced his titles, assumed the name of Philippe Egalité, was addressed as citizen Egalité, and was returned by the department of Seine and Marne to the national convention, in which he took his place among the mountain party. He voted for the death of the king, being, it is said, himself threatened with death by the Jacobins if he should do otherwise, but alleging his sense of duty and his belief that every one who did anything contrary to the sovereignty of the people deserved death. The vote was received with a cry of disgust, and by no means increased the safety of his own position. The mountain party were dissatisfied with him, because he did not give up the whole of his immense wealth for party purposes. After the desertion of his son, the duke de Chartres (see **LOUIS PHILIPPE**), the decree for the imprisonment of all the Bourbons was applied to him. He was thrown into prison with his family in Marseille, and was brought before the tribunal of the department of Bouches de Rhône on a charge of high treason. He was acquitted, but the committee of public safety immediately brought him before the revolutionary tribunal in Paris; and on Nov. 6, 1793 he was condemned, and on the same day executed amidst the execrations of the multitude which had so often applauded him.

ORLEANS, PHILIPPE, Duc d', regent of France during the minority of Louis XV., was the son of Philippe, duc d'Orleans, and the grandson of Louis XIII., and was b. Aug. 4, 1674. He possessed excellent talents, and made unusual attainments both in science and belles lettres; but his tutor, cardinal Dubois (q.v.), did not scruple to minister to the strong passions of the young prince, and exercised a most pernicious influence over him. He gave himself up to debauchery. The king compelled him to marry Mademoiselle de Blois, his daughter by Mme. de Montespan. He astonished and alarmed the court by protesting against his exclusion by the testament of Charles II. from all right of succession to the throne of Spain, and by the attention which he immediately began to give to military and political affairs. His military talents, however, led to his employment in the wars in Italy and in Spain; but his presence in Madrid after his victories was regarded with apprehension both by Philip V. and by Louis XIV. He had, indeed, formed the design of taking possession of the Spanish throne for himself. In consequence of this, he lived for some years in complete exile from the court, and much dreaded by it; spending his time both in vicious excesses, and in the cultivation of the fine arts and the study of chemistry. This study afforded a pretext to Mme. de Maintenon and her party for accusing him of poisoning the dauphin and others of the royal family, who died suddenly, and in rapid succession, of malignant fever, in 1711. The king refused an investigation which the duke demanded. Louis, having legitimized his sons, the duke of Maine and the count of Toulouse, appointed the duke of Orleans only president of the regency and not regent, giving the guardianship of his youthful heir and the command of the household troops to the duke of Maine; but all this was set aside at his death, and the duke of Orleans became sole regent. He was popular, and his first measures increased his popularity; but the financial affairs of the

kingdom were perplexing, and the regent's adoption of the schemes of law (q.v.) led to disastrous results. Meanwhile, on Aug. 26, 1718, he held the celebrated *Lit de Justice*, in which he prohibited the parliament of Paris from meddling with financial or political affairs, and declared the legitimized sons of Louis XIV. incapable of succeeding to the throne. Dubois, who still possessed an unhappy influence over his former pupil, became prime-minister, and eventually ruler of France; the regent, who was really a man of far higher abilities, neglecting all duties, and pursuing a course of profligacy almost unequalled in the worst instances of antiquity. His eldest daughter, the duchess de Berry, followed his example, and brought herself to any early grave. Dubois, wishing to be made a cardinal, persuaded the regent to sacrifice the Jansenists, and to compel the parliament in 1722 to recognize the bull *Unigenitus* (q.v.). After the king's coronation, Feb. 15, 1723, and the death of Dubois in August, the duke of Orleans, although disliking public affairs, consented to become prime-minister; but died on December 2 of the same year, physically exhausted by his incessant debauchery. The influence of his religious and other opinions, and the example of his immoralities, powerfully tended to promote that state of things which eventually produced the horrors of the French revolution.

ORLEANS CLOTH, a kind of stuff made for ladies' dresses, in which the warp is of cotton and the weft of worsted. It is so called from having been first made at Orleans in France, but it is now extensively manufactured at Bradford in Yorkshire.

ORLEANS, MAID OF. See JOAN OF ARC, *ante*.

ORLEANS, NEW. See NEW ORLEANS.

ORLOFF, or **ORLOV**, a Russian family that first rose to eminence during the reign of Paul III., when one of its members, count Gregori Orloff, attracted the notice of the grand duchess Catherine, afterwards the empress Catherine II., and succeeded Poniatowski as her favorite. It was Gregori who planned the murder of Peter III., and his brother Alexis who committed the deed, and both received high honors and rich rewards for this and other services. The flourishing family of the counts Bobrinski resulted from Gregori's intercourse with the empress. The legitimate line of Orloff soon became extinct; but Feodor, a brother of Gregori and Alexei, left four illegitimate sons, one of whom, Mikail, distinguished himself in the campaign of 1814; and another was count Alexei Orloff, the celebrated diplomatist. Count Alexei was born in 1787, signalized himself by courage and military talents during the French wars, negotiated the treaties of Adrianople (1829) and Unkiar-Skelessi (1833), and represented Russia at the London conference of 1832 on the affairs of Belgium and Holland. In 1844 he was placed at the head of the secret police; and the ability and energy with which he directed its vast machinery, rendered him the most dreaded official in Russia. He was high in the favor of the emperor Nicholas, who employed him in the negotiations with Austria previous to the Crimean war. In 1856 he sat in the congress of Paris as a representative of Russia, and on his return was made president of the grand council of the empire. He died at St. Petersburg, May 20, 1861.

ORLOFF' (*ante*), the name of a distinguished Russian family of recent origin in European family annals. **IVAN** was noted, first, for having taken part in a mutiny in 1689 against the young czar Peter (the great). His coolness at the scaffold obtained him a pardon, and a commission in the army; and he adopted the name of Orloff. **II. GRIGORI GRÉGORIEWITCH**, grandson of the preceding, 1734-83; an intriguer, a protégé of Catherine II., who helped her dethrone her husband Peter III., and when Catherine became empress vainly sought to marry her. She became tired of him, sent him to Moscow when infected with the plague, where he so distinguished himself by energetic performance of humane duties in arresting the pestilence that he was re-instated in her favor, afterward sent to prison by her, and died a wanderer and insane. **III. ALEXEI**, 1737-1808; brother of the preceding, is said to have acquired the favor of the same Catherine by strangling her husband with his own hands. In 1768 was made admiral of the Russian fleet in the Grecian archipelago, achieved brilliant successes in battles with the Turks in 1770; was rewarded with honor, then exiled by czar Paul. **IV. FEDOR**, 1741-96; another brother, made general-in-chief of an army serving against the Turks, and the father of four illegitimate sons, by whom the family name has been continued. **V. ALEXEI**, 1787-1861; one of the above sons, was engaged in the campaign against the first Napoleon, aid-de-camp of Alexander I. His energy on the accession of Nicholas in 1825 aided to suppress the conspiracy on that occasion, for which he was promoted; fought against the Turks in 1828, negotiated the peace of Adrianople in 1829, and superintended the movements of the Russian army in Poland in 1830-31. He was suspected of poisoning the grand duke Constantine and marshal Diebitsch, but the charge was not sustained. In 1833 he was a party to the secret treaty with Turkey by which the Bosphorus and the Dardenelles were closed to all but Russian ships of war. In 1844 he was at the head of the police system of Russia, and after the death of Nicholas retained the favor of Alexander II. In 1856 he was Russia's chief representative at the congress of Paris, and on his return to Russia was made president of the grand council of Russia, and a prince. **VI. NIKOLAI** a son of the preceding, b. in 1827; minister at Brussels in 1859; ambassador to Paris in 1872; recipient of the grand cross of the legion of honor

from president MacMahon in 1875; and author of a work published in St. Petersburg in 1856, on the campaign in Prussia in 1806. He d. 1885.

ORLOP (Dutch, *overloop*, that which runs over, or covers), in ships of war, is the lowest deck, immediately above the hold. It contains the magazine, bread-room, and various store-rooms; and is used in time of action for the reception and treatment of the wounded, as, from being below the water-line, it is the safest part of the ship.

ORME, ROBERT, 1728-1801; b. Hindustan, of English parentage, son of Dr. Alexander Orme, physician and surgeon of the British army in Bombay; educated at Harrow, went back to India in 1742, as a writer in the employ of the East India company. He resided in Anjengo, a city of Travancore. In 1752 he went to England in company with capt. Clive, afterward lord Clive, baron of Plassey, his friend for many years. He returned again to India, and in 1754 became fourth member of the council at fort Saint George, Madras, and rose to be commissary and accountant-general 1757-58. In 1759 he went to England, having made a small fortune. He was influential in establishing the power of Great Britain in India, and active in the interest of his friend capt. Clive, whom he succeeded in having sent as military commander of that country. He returned to England finally in 1759, and became historiographer to the East India company, with a salary of £300 per annum, retiring to Ealing in 1792, where he passed the remainder of his life. In 1763 he published the first vol. of the *History of the Military Transactions of the British Nation in Hindustan*, and in 1775 the second vol., the 3 vols. appearing in 1780. In 1782 appeared *Historical Fragments of the Mogul Empire of the Mahrattas*, during the reign of Aurungzebe, to which was prefixed a life of the author. In reference to his history Macaulay says: "He is inferior to no English historian in style and power of painting, is minute even to tediousness." "In one volume he allots, on an average, a closely-printed quarto page to the events of every forty-eight hours." Robertson and Sterne were great admirers of his history, and Boswell, in his life of Johnson calls him "the able and eloquent historian of Hindustan, who expressed a great admiration of Johnson.... Johnson was much pleased with such praise from such a man as Orme."

ORME'S HEAD, GREAT, a headland in the n.e. of Caernarvonshire, North Wales, 5 m. n.n.w. of Conway, is an enormous mass of limestone rock, surmounted by a lighthouse, and forming the extreme point of the western shore of Orme's bay. Lat. 53° 20' n., long. 3° 51' w.—Little Orme's Head forms the eastern extremity of the same bay.

ORMISTON, WILLIAM, D.D., LL.D. See page 881.

OR'MOLU is a variety of brass, consisting of zinc 25 parts, and copper 75 parts, which has a nearer resemblance in color to gold than ordinary brass (q. v.). It is extensively used for castings of ornaments for furniture, candelabras, and such articles. When the casting is made, its color is brought out by a *pickle* of dilute sulphuric acid, after which the acid is removed by water, and a liquor varnish is put on to keep it from tarnishing.

ORMOND, JAMES BUTLER, Duke of, was the first of the ancient Anglo-Irish family of Butler on whom the ducal title was conferred. The family was of illustrious antiquity. Genealogical legend carried it back to the dukes of Normandy before the conquest, and it is certain that at the dawn of the 13th c., it held the hereditary office of royal cup-bearer or *butler*, whence the family name. The subject of the present article was b. in London in 1610. His father, the son of the celebrated Walter, earl of Ormond, was drowned in crossing the channel; and the old earl having incurred the displeasure of the king, James I., and being thrown into prison, James, who on his father's death became, as viscount Thurles, the heir of the title, was seized as a royal ward, and placed under the guardianship of the archbishop of Canterbury. On the restoration of his grandfather to liberty, he also was released; and in his 20th year he married his cousin, lady Elizabeth Preston, and in 1632 succeeded, upon his grandfather's death, to the earldom and estates of Ormond. During the Strafford administration in Ireland, Ormond distinguished himself so much, that on Strafford's recall he recommended Ormond to the king; and in the rebellion of 1640, Ormond was appointed to the chief command of the army. During the troubled times which followed, he conducted himself with undoubted ability, although, as a necessary consequence of the numberless divisions and subdivisions of party which then prevailed in Ireland, he failed to satisfy any one of the conflicting sections; and when, in 1643, he concluded an armistice, his policy was loudly condemned as well by the friends as by the enemies of the royalist party in England. During the long contest of Charles with the parliament, Ormond continued to uphold the royal interest in his Irish government; and when the last crisis of the king's fortunes came, he resigned his Irish command, and retired to France, from which country he again returned to Ireland with the all but desperate design of restoring the royal authority, and after a gallant but unequal struggle, was compelled, in 1650, to return once more to France. His services to the royal cause continued unremitting during his exile; and at the restoration he accompanied Charles II. on his return, and was rewarded for his fidelity by the ducal title of Ormond. His after-life was less eventful, although he twice again returned to the government of Ireland. It was in 1679 that the well-known attempt was made by the notorious col. Blood (q. v.) upon the life of Ormond. As he was returning from a civic festival, he was attacked by Blood and a party of ruffians, and was dragged from his coach with the intention of his being hanged at Tyburn.

The attempt drew additional interest from its being commonly supposed to have been instigated by the profligate duke of Buckingham, Ormond's inveterate foe. He escaped uninjured, and lived until the year 1688. His letters and other papers are full of deep historical interest. See Carte's *Life of Ormond*.

ORMSBY, a co. in w. Nevada, bounded on the w. by lake Tahoe, drained by Carson river; on the Virginia and Truckee railroad; about 170 sq. m.; pop. '80, 5,410—3,254 of American birth. The surface is mountainous, well wooded, and crossed in the w. by an offshoot of the Sierra Nevada range. The soil especially in the valley of the Carson is fertile, and produces wheat, corn, oats, and barley. There are mines of gold, silver, and iron. Large amounts of lumber are exported. There are quartz, saw, and planing mills. Co. seat, Carson city.

ORMSKIRK, a market t. of England, in Lancashire, in the center of a rich and populous agricultural district, 12 m. n. of Liverpool by the Lancashire and Yorkshire railway. The parish church has both a tower and spire. Its grammar school has an annual income from endowment of £150. Silk-weaving, rope-making, basket-making, and brewing are the principal branches of industry. There are large collieries in the vicinity. Pop. '81, 6,651.

ORMUZ, or **HORMUZ**, a small island in the straight of the same name, at the entrance of the Persian gulf, and within 10 m. of the Persian coast. It is about 12 m. in circumference, and belonged to the Imaum of Muscat till 1854. In the 16th c. it was taken by the Portuguese, and being made by them an entrepôt for goods from India, Persia, and Turkistan, it became important, and the town of the same name rose in population until it had 40,000 inhabitants. The town was demolished in 1622, by Shah Abbás, assisted by the English, and its trade was removed to Gombroon (q. v.).

ORMUZD (Ahurmazd, Auramazda, Hormazd, Ormazd), corrupted from Ahurô-Mazdaô, i. e., that Ahura (Vedic Asura), or "spiritual being," who is called Mazdaô (i. e., Vedic Medhâs) = "creator of all things;" the name of the supreme deity of the ancient Persians, and of their descendants the Guebres and Parsees. It was at first emphatically employed in this sense by Zoroaster, or Zarathustra Spitama. Ormuzd is, according to Zoroaster's original doctrine, the creator of the earthly and spiritual life, the lord of the whole universe, in whose hands are all creatures. He is the light and the source of light, the wisdom and the intellect, and is in the possession of all good things, such as "the good mind," "immortality," "wholesomeness," "the best truth," "abundance," etc.; which gifts he bestows upon the pure in thoughts, deeds, and words, while the wicked are punished by him according to their wickedness. ("For thou art through purity, the holy over the wicked, the ruler over all, the heavenly, the friend of both worlds, Mazda! Father of the pure creatures at the beginning, who hath created the way of the sun, of the stars, who causeth the moon to wax and to wane He holdeth the earth and the unsupported [heavenly bodies?], the waters and the trees, and giveth swiftness to the wind and the clouds The creator of the good mind, the working good, hath made light as well as darkness, sleep and waking, the morning dawns, the noons, the nights," etc.—*Yazna*, 43.) Sprung from Zarvan-Akarana (the boundless time), i. e., being from eternity, self-existing, neither born nor created, he unites within himself—as does man and everything else existing,—the two primeval principles of good and evil, the Çpento-mainyus, i. e., the white, holy spirit and the Angrô-mainyus (corrupted into Ahriman, = the dark spirit. This Zoroastrian conception of the two sides of the divine being—itsself one and indivisible—has, however, in the course of time, partly through misunderstandings and willfully false interpretations, undergone important changes. While the Zervan-Akarana was transformed by the Magi—in opposition to the Zendiks—into the Supreme Being itself, the philosophical notion of a duality in Ormuzd became the theological dogma of god and devil, jealous of each other's power, bent upon the destruction of each other's works, and consequently in constant war with each other, they and their armies. Both are—according to this corrupted view of later times, by means of which the genuine one has been forgotten up to our day—supreme rulers; both have their fixed number of councilors (sprung from an egg, *Plut. Isis and Osiris*), who are the actual governors of the whole universe, each in his special province; which councilors, however, are neither more nor less than certain abstract ideas of Zoroaster. One personal archangel alone is assumed by the latter, viz., Sraosha (Serosh, cf. Sansr. Shruti), i. e., hearing, tradition. He is vested with very high powers, and stands between Ormuzd and man; he is the teacher of good religion; he shows the way to heaven, and pronounces judgment over human actions after death. He is the personification of the whole divine worship and its outward manifestations, the symbols, prayers, sacrifices, rites, etc., and the chief combatant of the influence of the Devas; who stand symbolically for the Brahmanic religion. Ormuzd is represented as sitting upon a throne of light, as a venerable man, or seated upon a bull, etc.—For further particulars about the seasons and the manner of his worship, as well as the general relations between his and the Brahmanic religion (both the result of a prehistoric conflict between the Iranians and those Aryan brother-tribes who immigrated into Hindustan proper), we must refer to **PARSEES**, **PERSIA**, and **ZOROASTER**.

ORNAMENTATION, or **DECORATION**, in architecture, applies to something which is added to the simple constructive features, or to the form given to those features, for the

purpose of making them beautiful or elegant. Thus, the Doric shaft, while answering the constructive purposes of a simple square or round pier, is ornamented with fluting; and its capital, with its beautifully proportioned echinus and abacus, supports as a plain slab would do the weight of the entablature. The other classic orders illustrate this in a richer manner. Thus, the Corinthian column, with its fluted and elegant shaft, resting on an ornamented base, and crowned by an ornamented capital, takes the place of what might have been, had utility alone been consulted, a plain pier of rubble-work, with a rough stone to rest upon, and another on the top to receive the load.

In classic architecture, as in every good style, the same principle pervades all the ornamental features—viz., *that they are constructive features ornamented in a manner suitable to their use*; for instance, a column being a member for support, should be of such a form as to denote this; the constructive use of a cornice being to protect the top of the wall, and to shield the front of it from the rain and sun, it should be made of such a form as to do this, and also to *look* as if it did it—to express its purpose. In classic architecture, the cornice consists of several members, in which the constructive decoration is well seen; the mutules and modillions beautifully indicating in an ornamental manner their original use, while the leaf enrichments of the small moldings give life and animation to the building. In mediæval art the same principle prevails in a much greater degree, and over a more complex system of construction. The shafts, with their elegant and purpose-like bases and caps, are arranged so that each supports a separate member of the vaulting. The arch-moldings are divided so as to indicate the rings of their constructive formation. The buttresses, so elegant in outline, express the part they serve in supporting the vaulting; the pinnacles, with their ornamental finials, are the decorated dead-weights which steady the buttresses. The foliage and smaller ornament is also beautifully and suitably applied, as the growth and vigor of the supporting capitals and corbels, and the running foliage of the string-courses, arch-moldings, etc., fully illustrate.

There are, no doubt, many styles of art to which these remarks can hardly be said to apply; as, for example, the Assyrian, Egyptian, and Hindu styles, where we find many features applied in a manner meant to be ornamental, although actually contrary to their constructive use. In these styles (and also in Greek architecture) human figures, bulls, and other animals are placed as columns to carry the weight of a superincumbent mass. This is evidently wrong in principle, except when the figure is placed in an attitude to indicate that he is supporting a weight, as the Greek Atlantes do; but in the former cases religious notions seem to have overcome true artistic feeling. There are also many forms of ornament used in all styles, the origin of which is obscure, and their advantage doubtful; such are the zigzag, chevron, billet, etc., so common in early mediæval art, and the scrolls of Ionic and Indian art, and the complications of the interlacing work of the north in the middle ages. Such things may be admissible in colored decoration, such as the confused patterns of Saracenic art and the shell-patterns of Indian art; but where ornamental *form* is wanted, unless the requirements of the construction are carefully followed as the guide to the decoration, all principle is lost, and the ornament runs wild. This has frequently occurred in the history of art, and in no case more markedly than in the art of the renaissance.

The material in use must also have an influence on the form and style of the ornament. Thus, stone-carving and metal-work must evidently require different treatment. Fac-simile leaves might be formed in iron, but could not be so carved in stone. This constructive element should be carefully attended to in designing. All imitative art must be to some extent conventional. Natural objects, such as leaves, flowers, etc., cannot be copied absolutely literally; and in suiting the conventional treatment to the nature of the material used lies the great skill of the artist.

ORNE, a department of France formed out of the old provinces of Normandy and Perche, is separated on the n. from the English channel (La Manche) by the department of Calvados. Area, 2,350 sq.m., more than one-half of which is cultivable land; pop. '81, 376,126. A range of wooded hills, nowhere rising above 1370 feet, extends across the south of the department from east to west. North of this range the surface slopes toward the English channel; south of it, toward the Atlantic. The principal rivers are the Orne (which gives name to the department), the Rille, the Sarthe, and Huisne. The climate is damp, though in general temperate, and the winters are severe. The soil is fertile, but agriculture is not in an advanced state. The inhabitants consume one-third more grain produce than is grown on the land. There are several millions of apple and pear trees planted along the roads, etc., and cider is extensively made. Cattle, and horses of the purest Norman breed, are reared. Mining is an important branch of industry; the chief products are iron and copper; marble, granite, and other stones for building are quarried. The department is divided into four arrondissements, Alençon, Argentan, Domfront, and Mortagne; capital, Alençon.

ORNITHOLOGY (Gr. *ornis*, a bird, and *logos*, a discourse), that branch of zoology of which the subject is birds. By Aristotle, Pliny, and others of the ancients this study was prosecuted to some extent, along with other parts of natural history; but it is only in modern times that ornithology has assumed the rank of a distinct branch of science. The first modern author to attempt a scientific classification of birds seems to have been

Pierre Belon, noted also as an ichthyologist, whose *Historia Avium* was published about the middle of the 16th century. Some of his classes are very heterogeneous assemblages; but the first three, viz., birds of prey, web-footed birds, and *grallæ*, are so natural as to have been acknowledged, with some modification of their limits, in all subsequent systems. In the 17th c. much progress was made in the observation and description of species, not only of the birds of Europe, but of other parts of the world. In the latter part of the century attention began to be given to the anatomy of birds. An ornithological system, more perfect than that of Belon, was proposed by Willughby about 1676, and afterwards matured and improved by Ray. On this system that of Linné was founded. During the 18th c. the progress of ornithology was very rapid. The birds of many countries were described in works specially devoted to them, and the habits of birds began to be carefully observed; but the system of Linné, as framed by him before the middle of the century, continued to prevail almost unmodified till the publication of Cuvier's *Règne Animal* in 1817. Latham, Lacépède, Illiger, Temminck, and others had indeed previously proposed systems more or less different from it; and systems have since been proposed by others, particularly by Mr. Vigors and Mr. Swainson, who have endeavored to accommodate the classification to certain first principles which they supposed to pervade nature, but which other naturalists in general regard as fanciful. The system of Cuvier is now generally received by ornithologists, as that of Linné formerly was; not, however, without modifications, by which it has been sought to accommodate it to the progress of science, and some of the names introduced by other authors have obtained very general acceptance. The system of Linné divided birds into six orders—*accipitres*, *picæ*, *anseræ*, *grallæ*, *gallinæ*, and *passeræ*. That of Cuvier also divided them into six orders—*birds of prey* (the *accipitres* of Linné, now often called *raptores*), *passerine birds* (*passerinæ*, now more generally called *insessores*, or *perching birds*, including most of the Linnean *passeræ*, and part of *picæ*); *climbers* (*scansores*, part of the Linnean *picæ*, and often designated *zygodactyli* or *zygodactylous birds*), *gallinaceous birds* (now often called *rasores*, the Linnean *gallinæ*, but including also the pigeons or *columbidæ*, which Linné placed among *passeræ*), *stilt-birds*, often called *waders* (*grallatores*, the Linnean *grallæ*), and *web-footed birds* (*palmipedes*, now also known as *natatores* or *swimmers*). These orders are noticed in separate articles. Perhaps the most important modification of Cuvier's system which has been proposed is the separation of the *brevipennes* or *struthious birds* from *grallæ*, and their formation into a distinct order, sometimes called *cursores* or *runners*; and next to this may be mentioned the proposed separation of *columbidæ* from gallinaceous birds.—The progress of ornithology since the commencement of the 19th c. has been very rapid; every department of it has been assiduously cultivated, and many of the works published have been not only of great merit, but very sumptuous and beautiful. The works of Audubon and Gould perhaps merit particular notice.

ORNITHORHYNCHUS. See DUCK-BILL.

ORNITHOSAURIANS. See PTERODACTYL, *ante*.

OROBAN'CHEÆ, or OROBRANCHIA'CEÆ, a natural order of exogenous plants, all herbaceous, and destitute of true leaves, but having their stems covered with brown or colorless scales. They all grow parasitically upon the roots of other plants. The calyx is divided, persistent, inferior; the corolla monopetalous, hypogynous, and irregular. The stamens are four, two long and two short; the ovary 1-celled, seated in a fleshy disk, composed of two carpels, with one style. The fruit is capsular, inclosed within the withered corolla, 1-celled, 2-valved. The seeds are numerous, and very minute. There are about 120 known species, natives chiefly of temperate climates, and generally characterized by astringency and bitterness, upon account of which some of them have been used in medicine (see CANCER ROOT). Eleven species are natives of Britain, chiefly belonging to the genus *Orobanche*, or BROOM-RAPE; to some of which important medicinal virtues were once erroneously ascribed. The enlarged base or root-stock of a species of *Orobanche* is cooked or dried, and eaten by the Indians of the north-western parts of America.

O'ROBUS, a genus of plants of the natural order *Leguminosæ*, suborder *Papilionaceæ*, allied to Vetches, and sometimes called BITTER VETCH; the style linear, downy beneath the stigma; the calyx obtuse at the base and oblique at the mouth; its upper segments deeper and shorter; the pod 1-celled, 2-valved; the leaves pinnate, without tendrils. The species are perennial herbaceous plants, chiefly natives of Europe. They afford good food for cattle. Two are natives of Britain, of which the most common is *O. tuberosus*, whose racemes of purple flowers often adorn heaths and bushy places, especially in hilly districts. The stem is unbranched, erect, about a foot high, with narrow membranous wings; the leaflets in 2—4 pairs; the pods long, cylindrical, black; the root creeping and swelling out into tubers at irregular intervals. The tubers have a sweet taste, resembling that of liquorice, and are sought after by children; they are also bruised and steeped in water in some parts of the Highlands of Scotland to make a fermented liquor, and a kind of liquor is made by steeping them in whisky; they are well-flavored and nutritious when boiled or roasted, and are used in this way in the Highlands of Scotland, in Holland, Belgium, and other countries.

ORODUS, a genus of sharks whose remains are found in the carboniferous rocks. The crowns of the teeth present a series of blunt, but frequently ornamental cones or "hills," whence the name of the genus. See **PLAGIOSTOMI** and **SHARK**.

OROHIP'PUS. See **HORSE**, **Fossil**.

ORON'TES, the ancient name of a river in Syria, now called *Nahr-el-Asi*. It rises in the highest part of Cœle-Syria, near Baalbec, flows northward between the mountains of Libanus and Anti-Libanus, as far as the city of Antioch, and then westward to the Mediterranean sea, after a course of 240 m., passing by a cross valley, through the mountains of the Syrian coast. Its lower course is remarkably beautiful, surpassing everything else that can be seen in Syria. Its rocky banks are 300 ft. high, and the windings of the river show them off to the greatest advantage. Myrtle-bushes, laurels, figs, wild vines, arbutus, dwarf-oaks, and sycamores (*Acer pseudo-platanus*) are scattered about in picturesque confusion. Here and there the eye catches a glimpse of some cavern mouth or ivy-matted precipice, while from the abyss beneath ascends forever the roar of the impatient stream. The country through which it flows is of great fertility, and in many parts is richly cultivated.

OROOMIAH. See **URUMEYAH**, *ante*.

OROSHA'ZA, a t. of Hungary in the district of Békés, 27 m. s.w. of the town of Békés and 65 m. n.e. of Szegedin; pop. '80, 18,032. The chief occupations are cattle-raising and the cultivation of vineyards. The wine is noted for its excellence.

ORO'SIUS, **PAULUS**, a Spanish presbyter and historian, was born at Tarragona, and flourished in the early part of the 5th century. He went to Africa about 413 A.D., where he made the acquaintance of St. Augustine, and thence to Palestine, to study under St. Jerome, then living at Bethlehem. He finally settled down in Africa, but the date of his death is unknown. His chief work, the *Historiarum adversus Paganos Libri 7*, begins with the creation and goes down to 417 A.D. It is apologetic in design, being intended to refute the notion then current among the pagans, that the misfortunes of the Roman empire and the wretchedness of the great masses were owing to the anger of the gods at the abandonment of their worship, and the profanation of their altars. The work is a trivial, inaccurate, uncritical miscellany of facts, culled from such secondary authorities as Justin and Eutropius; the style is elegant, but also, as Bacon says, "watery." Yet it has obtained a place in literature from being a favorite text-book of universal history during the middle ages, and had the honor of being translated into Anglo-Saxon by our own Alfred. Some manuscripts bear the puzzling title of *Hormesta* or *Ormista*, conjectured by some to be a corruption of Or. M. ist.; that is, *Orsi Mundi Historia* (Orosius's History of the World). The *editio princeps* of the work appeared at Vienna in 1471; the best edition is that of Havercamp (Lug. Bat. 4to, 1738). Other writings of Orosius are *Liber Apologeticus de Arbitrii Libertate*, and anti-Pelagian treatise, *Commonitorum ad Augustinum*, an explanation of the state of religious parties in Spain in his time. See Mörner's *De Orosii Vita ejusque Historiarum Libris Septem adversus Paganos* (Berl. 1844).

OROSZHAZA (pronounced *Oroshása*), a thriving t. of Hungary, in the co. of Békés Csanad, 31 m. n.e. from Szegedin. Pop. '80, 12,586.

ORATA'VA, a t. on the n. coast of Teneriffe, one of the Canary islands, is situated below the peak, in one of the most fertile, pleasant, and healthy districts in the world. It contains several beautiful churches, the residence of the governor, and the citadel. Fishing is carried on to some extent, and there is a trade in wine. Pop. about 9,000.

ORPHAN HOUSE. See **MÜLLER**, **GEORGE**.

OR'PHEUS, (supposed to be the Vedic Ribhu or Arbhu, and epithet both of Indra and the Sun), a semi-mythic name of frequent occurrence in ancient Greek lore. The early legends call him a son of Apollo and the muse Calliope, or of Cægrus and Clio or Polymnia. His native country is Thracia, where many different localities were pointed out as his birth-place—such as the mounts of Olympus and Pangæus, the river Enipeus, the promontory of Serrhium, and several cities. Apollo bestows upon him a lyre, which Hermes invented, and by its aid Orpheus moves men and beasts, the birds in the air, the fishes in the deep, the trees, and the rocks. He accompanies the Argonauts in their expedition, and the power of his music wards off all mishaps and disasters, rocking monsters to sleep and stopping cliffs in their downward rush. His wife, Eurydice (?= Sanscr. Uru, Dawn), is bitten by a serpent (?=Night), and dies. Orpheus follows her into the infernal regions; and so powerful are his "golden tones," that even stern Pluto and Proserpina are moved to pity; while Tantalus forgets his thirst, Ixion's wheel ceases to revolve, and the Danaïdes stop in their wearisome task. He is allowed to take her back into the "light of heaven," but he must not look around while they ascend. Love or doubt, however, draws his eyes towards her, and she is lost to him forever (=first rays of the sun gleaming at the dawn make it disappear or melt into day). His death is sudden and violent. According to some accounts, it is the thunderbolt of Zeus that cuts him off, because he reveals the divine mysteries; according to others, it is Dionysius, who, angry at his refusing to worship him, causes the Menades to tear him to pieces, which pieces are collected and buried by the muses in tearful piety at Leibethra, at

the foot of Olympus, where a nightingale sings over his grave. Others, again, make the Thracian women divide his limbs between them, either from excessive madness of unrequited love, or from anger at his drawing their husbands away from them. Thus far, legend and art, in manifold hues and varieties and shapes, treat of Orpheus the fabulous. The faint glimmer of historical truth hidden beneath these myths becomes clearer in those records which speak of Orpheus as a divine bard or priest in the service of Zagreus, the Thracian Dionysius, and founder of the mysteries (q.v.); as the first musician, the first inaugurator of the rites of expiation and of the mantic art, the inventor of letters and the heroic meter; of everything, in fact, that was supposed to have contributed to the civilization and initiation into a more humane worship of the deity among the primitive inhabitants of Thracia and all Greece: a task to which Orpheus was supposed to have devoted his life after his return with the Argonauts. A kind of monastic order sprang up in later times, calling itself after him, which combined with a sort of enthusiastic creed about the migration of souls and other mystic doctrines a semi-ascetic life. Abstinence from meat (not from wine), frequent purifications and other expiatory rites, incantations, the wearing of white garments and similar things—not unlike some of the essenic manners and customs—were among their fundamental rules and ceremonies. But after a brief duration, the brotherhood, having first, during the last days of the Roman empire, passed through the stage of conscious and very profitable jugglery, sank into oblivion, together with their “orpheotelistic” formulas and sacrifices, and together with the joys of the upper and the never-ending punishments of the infernal regions which they held out to their rich dupes: according to the sums they grudged or bestowed upon them.

Orpheus has also given the name to a special literature called the Orphic, the real origin of which, however, is (according to Ottfried Müller), like Orpheus’s own history, “unquestionably the darkest point in the entire history of early Greek poetry.” Like Olen, Linus, Philammon, Eumolpus, Musæus, and other legendary singers of prehistoric Greece, Orpheus is supposed to have been “the pupil of Apollo and the Muses,” and to have first composed certain hymns and songs used in the worship of a Dionysius, dwelling in the infernal regions, and in the initiations into the Eleusinian mysteries. A mere “abstraction,” as it were, he was called the first poet of the heroic age, and though not mentioned before Ibycus, Pindar, Hellanicus, and the Athenian tragedians, he was yet placed anterior to both Homer and Hesiod. The fragments current under his name were first collected at the time of the Pisistratidæ, chiefly by Onomacritus, and these fragments grew under the hands of the Orphic brotherhood, aided by the Pythagoreans, to a vast literature of sacred mythological songs sung at the public games, chanted by the priests at their service, worked out for dramatic and pantomimic purposes by the dramatists, commented upon, philosophized upon, and “improved” by grammarians, philosophers, and theologians. Although authorities like Herodotus and Aristotle had already combated the supposed antiquity of the so-called Orphic myths and songs of their day, yet the entire enormous Orphic literature which had grown out of them retained its “ancient” authority, not only with both the Hellenists and the church fathers of the 3d and 4th centuries A.D. (who, for their individual, albeit opposite purposes, referred to it as the most authentic primitive source of Greek religion, from which Pythagoras, Heraclitus, Plato had drawn their theological philosophy), but down almost to the last generation, when it was irrefutably proved to be in its main bulk, as far as it has survived, the production of those very third and fourth centuries A.D., raised upon a few scanty, primitive snatches. The most remarkable part of the Orphic literature is its theogony, which is based mainly on that of Hesiod, with allegorizing and symbolizing tendencies, and with a desire to simplify the huge Olympic population by compressing several deities into a single one. See THEOGONY. Yet there is one figure which stands out here prominently—viz., Zagreus, the horned child of Zeus by his own daughter Persephone, who, killed by the Titans at the bidding of Here, is reborn by Semele as Dionysius.

Besides the fragments of the Theogony which have survived, imbedded chiefly in the writings of the Neoplatonists, are to be mentioned the *Argonautica*, a poem of the Byzantine period, consisting of 1384 hexameters; further, a collection of 87 or 88 liturgical hymns; a work on the virtues of stones, called *Lythica*, etc. Other poems belonging to the Orphic cycle, of which, however, only names have survived in most instances, are *Sacred Legends*, ascribed to Cercops; a poem on nature, called *Physica*, probably by Brontinus; *Bacchica*, supposed to be written by Avignota, the daughter of Pythagoras; *Minyas*, or Orpheus’s descent into the Hades; and other poetical productions by Zopyrus, Timoeles, Nicias, Persinus, Prodicus, etc. The best edition of the Orphic fragments is that of G. Herrmann (Leipzig, 1805). The hymns have repeatedly been translated into English by T. Taylor and others. See Lobeck’s *Aglaophamus* (1829); Gerhard, *Orpheus und die Orphiker* (1861); and Schuster, *De Theogoniæ Orphicæ Indoïe* (Leip. 1869).

ORPIMENT. See ARSENIC.

ORR, HUGH, 1717–98; b. Scotland; son of Robert of Lochwinnoch, Renfrewshire, came to the United States in 1740, and settled in June in Bridgewater, Mass., where he plied his trade of gunsmith and the manufacture of scythes and other agricultural implements. He is said to have made the first muskets ever made in this country, having a contract from the state, about 1748, to furnish 500. During the revolutionary war he made the cast-iron and brass cannons and cannon balls for the government. He invented

several machines, among them one to clean flax-seed by a new process, which he sent to Scotland, and one to be used in the manufacture of cotton. He represented his district in the state senate, and had a son, col. Robert Orr, who was a maker of arms at Springfield, Mass.

ORR, JAMES LAWRENCE, 1822-73; b. S. C.; educated at the university of Virginia, and read law, the practice of which he began at Anderson, S. C. He was a member of the state legislature 1844-45, and of congress 1848-59; and he was elected speaker of the 35th congress. He was a member of the South Carolina convention which resolved on secession in 1860, and the same year was a commissioner sent by that state to come to an arrangement with the national government in regard to the federal property in South Carolina. He was a member of the confederate senate from 1862 till the close of the war, when he accepted from the U. S. government the position of provisional governor of his native state. Adhering henceforth to the republican party, he was appointed a circuit judge in 1870, and minister to Russia in 1873. He died in St. Petersburg.

ORRERY, a machine constructed for the purpose of exhibiting the motions of the planets round the sun, and of the satellites round their primaries, which was in high repute during the 18th and beginning of the 19th centuries, though now regarded as a mere toy. It was a combination of the old *Planetarium* (q.v.), with other machines which showed the motions of the earth, moon, and planetary satellites. Though the construction of a machine which would exhibit accurately the motions, distances, and magnitudes of the planets is impossible, yet an orrery is in some degree useful as giving a general notion of the way in which the planetary motions are performed. As it was a favorite machine at one time, a description of it may not be uninteresting. A number of iron tubes equal in number to the planets, and of different dimensions, are placed one within the other; their lengths being arranged so that the innermost tube projects at both ends beyond the one next to it, that one similarly projects beyond the third, and so on. At one end of each tube a rod is fixed at right angles, and a ball or lamp attached to its end; the lengths of the rods being proportional (or at least supposed to be so) to the radii of the planetary orbits. The other ends of the tubes form the axes of toothed wheels, which are connected either directly, or by means of combinations of toothed wheels, with a winch. The several combinations of wheels are so adjusted that the velocity of revolution of the rods is proportional to the times of revolution of the planets. On turning the winch the whole apparatus is set in motion, and the balls or lamps (representing the planets) revolve round the center, which is a fixed lamp (representing the sun), at different distances, and with varying velocities. There are many nice arrangements, such as for producing elliptic motion, but these need not be described.

ORRIS ROOT (probably a corruption of *Iris* root), the rootstock (*rhizome*) of certain species of *Iris* (q.v.), natives of the s. of Europe, belonging to the division of the genus having bearded flowers, sword-shaped leaves, and scapes taller than the leaves; viz., *I. Florentina*, a species with white flowers; *I. pallida*, which has pale flowers; and *I. Germanica*, which has deep purple flowers. The flowers of all these species are fragrant. *I. Germanica* extends further north than the other species, and its root is sometimes said to be more aerid. Orris root was formerly used in many medicinal preparations as a stimulant, but is now almost entirely disused. It is sometimes chewed to sweeten an offensive breath. Its chief use is in perfumery. It has a pleasant smell of violets, which it acquires in drying. Hair and tooth powders, and oils, are often scented with it. A tincture of it is also used as a scent, and is often sold as *essence of violets*.

ORSAY, ALFRED GUILLAUME GABRIEL, Comte d'. See D'ORSAY.

ORSINI, an Italian family holding a conspicuous position among the nobility of Italy from the 12th c. to the present time. The first of note was Giordano, a soldier, who was made cardinal in 1145 and sent as papal legate to Germany; while Matteo, his nephew, was prefect at Rome. Later, the senators Orso and Matteo, called the great, and pope Celestine III. were members of the family. In 1277 Giovanni, son of Matteo, became pope as Nicholas III., and by his influence the rank and fortunes of the Orsini were greatly increased. They became rivals of the Colonnas, and in the contests of the Guelphs and Ghibellines sided with the former. The stronghold of the family was on lake Braeciano. Pope Alexandria VI. hated both the Orsini and Colonna, and by his order in 1505 Francis Orsini, duke of Gravina, and Paolo Orsini were seized and strangled at Sinigaglia by Cesare Borgia, while the cardinal was poisoned at Rome. The branches of the family have died out with the exception of the Neapolitan Orsini-Gravina branch. The old Orsini palace at Naples is built on the ruins of the ancient theater of Marcellus; and that belonging to the modern family at Naples is one of the finest buildings in the city. Pope Benedict III., 1724, was a member of this branch of the family. Prince Domenico Orsini, duke of Gravina, 1790-1874, was lieut.gen., senator of Rome, and assistant-prince of the holy see. His son, Filippo, duke of Roccagorsa, is the present representative of the family.

ORSINI, FELICE, an Italian revolutionist, who is destined to be remembered for his atrocious attempt on the life of the French emperor, Napoleon III., was b. at Meldola, in the states of the church, in 1819. The son of a conspirator, Orsini at an early age was initiated into secret societies, and before he had reached his twentieth year he was

thrown into prison, and condemned to the galleys for life. The amnesty of Pius IX. (1846) restored him to liberty, but he was soon after again imprisoned for participation in political plots. When the revolution of 1848 broke out Orsini was elected as a deputy to the Roman constituent assembly. He was invested with extraordinary powers, and sent to Ancona and Ascoli to suppress brigandage. He signalized himself by the violence with which he executed his commission. He also took part in the defense of Rome and Venice; agitated in Genoa and the duchy of Modena; and in 1853 was shipped for England by the Sardinian government, where he formed close relations with Mazzini. Furnished with money by the leaders of the revolutionary party, he appeared at Parma in 1854, and afterwards at Milan, Trieste, Vienna, everywhere agitating in the interest of insurrection; until at last he was arrested and confined in the fortress of Mantua. In 1856 he succeeded in making his escape, and found refuge in England, where he supported himself by public lecturing, and wrote a book entitled *The Austrian Dungeons in Italy* (Lond. 1856). Towards the end of 1857 he repaired to Paris, with the intention of assassinating Louis Napoleon, whom he reckoned the great obstacle to the progress of revolution in Italy. His associates in this diabolical design were persons named Pieri, Rubio, and Gomez. Providing themselves with bombs, they took up their station in a house close by the opera, and on the evening of Jan. 14, 1858, just as the carriage containing the emperor and empress was drawing up, they threw three of the deadly missiles under the carriage. An explosion took place, and several people were wounded, one or two mortally, but their majesties remained unhurt. The assassins were arrested, tried, and sentenced; Orsini, Pieri, and Rubio to capital punishment, Gomez to hard labor for life. Rubio's life was spared at the intercession of the empress, but Pieri and Orsini were beheaded on March 13.

ORSOVA, the name of two towns at the iron gate of the Danube (q.v.). **OLD ORSOVA**, a Hungarian place, is on an island, and is a station for the Danube steamers. Pop. 1200.—**NEW ORSOVA**, on the Servian side, is a fortified town of 3,000 inhabitants.

ORTELIUS, **ORTEL**, or **OERTEL**. See page 881.

ORTH, **GODLOVE S.**, b. Penn., 1817: a graduate of Pennsylvania college, Gettysburg; studied law, and commenced practice in Indiana in 1839. He represented his district in the state senate for 6 sessions, and was elected president of that body for one year. In the war of the rebellion he was capt. of a company on board the ram *Horner* in an engagement on the Ohio river in 1862. In 1863 he was elected member of congress from Indiana, serving 12 years, and resigned his seat to accept the mission to Austria. On May 24, 1876, he resigned his position abroad, and in August of the same year declined the nomination for governor of Indiana.

ORTHAGORISCUS, a genus of plectognathous fishes. See **SUN FISH**, *ante*.

ORTHEZ, a small t. of France in the department of Basses-Pyrénées, on the right bank of the Gave de Pau, 37 m. e. of Bayonne. Pop. '76, 4,727. The castle of Moncada, now reduced to a few ruined walls, overtopped by one stately tower, was built here in 1240 by Gaston de Foix. In the immediate vicinity of the town, the British under Wellington gained a grand and decisive victory over the French under Soult, Feb. 27, 1814.

ORTHIS (Gr. *straight*), a large genus of fossil brachiopodous mollusca, found in the Palæozoic rocks, most abundantly in the Silurian rocks, but ranging upward to the Permian series. The genus contains upwards of 100 species.

ORTHO'CERAS (Gr. *straight horn*), an extensive genus of cephalopodous mollusca, found in the Palæozoic rocks from the lower Silurian to the Trias. It is nearly allied to the nautilus, and is, indeed, in its simplest forms, nothing more than an unrolled and straightened nautilus. The shell is straight, the siphuncle central, and the body chamber small. The members of the genus are the most widely distributed, and the most abundant of any of the Palæozoic fossils. Nearly 200 species have been described, but a considerable number of these have been separated into sub-genera, characterized chiefly by the form and size of the siphuncle.

ORTHODOXY (Gr. *orthos*, right, and *doxa*, an opinion), a name given by theologians to religious opinions in agreement with Scripture, or rather with the view of Scripture entertained either by the church in general, or by the established church of any particular nation. Its antithesis is **HETERODOXY** (Gr. *heteros*, another, meaning "wrong," and *doxa*, opinion).

ORTHOEPY (Gr. *correctness or propriety of speech*), a branch of grammar that treats of the right pronunciation of the words of a language.

ORTHOGRAPHY (Gr. *correct writing*), a branch of grammar that treats of the elementary sounds of a language, the signs or letters by which they are represented in writing, and the combinations of these signs to represent words; it also includes the right dividing of words into syllables (as when a word has to be divided at the end of a line), and punctuation. In a more restricted sense, orthography is synonymous with the art of correct spelling. No part of grammar is less satisfactory than this. All alphabets were from the first both defective and redundant, and therefore inadequate to represent exactly the elementary sounds of the languages to which they were applied (see **ALPHA-**

BET, LETTERS, AND ARTICULATE SOUNDS). The first attempts, then, at writing any language must have exhibited great diversity of spelling. Wherever an extensive literature has sprung up among a people, and language been made a study of itself, there a greater or less uniformity of spelling has, by tacit convention or otherwise, become established for a time. Such was the case with Latin in the time of the Cæsars, with high German about the 12th and 13th centuries, and with English (Anglo-Saxon) in and for some time after the days of Alfred. But although language, as depicted to the eye, may be fixed for a time, the spoken tongue, being a living organism, cannot be thus petrified. A written literature may modify, and in some degree retard, but cannot altogether arrest that incessant change and evolution to which all spoken tongues are subject. The breaking up of the Anglo-Saxon in its transition into modern English brought necessarily a period of orthographic chaos. Never was the lawlessness greater than during one of the brightest periods of the literature, namely, the Elizabethan period. Then, and for a long time after, all perception of the real powers of the letters seems to have been lost, and nothing but caprice ruled. Not only were words spelled differently by different persons, but even among the best-educated classes the same person would spell the same word (even his or her own name) half-a-dozen ways in the same page. Among the classic writers of the Queen Anne period, some degree of uniformity began to establish itself, and this was afterwards further confirmed and fixed by the publication of Johnson's Dictionary, since which time the alterations have been comparatively trifling. The modern spelling thus established conformed itself only partially to the changes the spoken language had undergone. Of the letters that had become silent through the wearing away and collapse of the spoken words, some were omitted and others retained, with little attention to consistency, or to any principle now discernible. Hence, in the English language as now written and spoken, there is in general so imperfect a correspondence between the sound of a word and the sounds of the several letters that are written to represent it, that the spelling of each individual word has, in a manner, to be learned by itself. By no possible rules can a learner be taught when he sees the groups of letters *n-o-w*, *p-l-o-u-g-h*, *e-n-o-u-g-h*, to make out the sounds or spoken words that these groups actually represent; or, conversely, when he hears the words spoken, to find out what letters they are to be represented by. This circumstance presents great difficulty to foreigners in the acquisition of English; which, in other respects, is one of the simplest and most easily learned languages in the world. The orthography of English is only to be acquired by observation and practice. There are no *rules* in the proper sense of the word; the only effective assistance that can be given in this matter is to bring together, under some kind of classification, the words that are most frequently misspelled. See PHONETIC WRITING.

ORTHONYX. See page 881.

ORTHOP'TERA (Gr. straight-winged), an order of mandibulate insects, in many respects resembling the *coleoptera* (q.v.), but having the wing-covers softer and generally leathery and flexible. The wing-covers also often overlap on the back when at rest, or meet at an angle, like the roof of a house. The wings are broader than the wing-covers, and fold in a fan-like manner. A few species are wingless. The body is generally elongated. The antennæ are almost always filiform and many-jointed. The eyes are usually very large, and there are also in most species two or three stemmatic eyes. The mouth much resembles that of the *coleoptera*, but the maxillæ are terminated by a horny denticulated piece, and covered by a *galea*; and the interior of the mouth exhibits a distinct fleshy piece, which some regard as a kind of tongue. The orthoptera undergo only a semi-complete metamorphosis, the larva and pupa much resembling the perfect insect, except in the want of wings; which, however, begin to be developed in the pupa. The earwig family differs so much from the other orthoptera as to have been constituted by some entomologists into a distinct order. See EARWIG. The orthoptera are divided into two sections, *cursoria* and *saltatoria*; the first with legs adapted for running, as the mantis family, specter insects, walking-sticks, leaf insects, etc.; the second having the hinder legs very large and strong, generally adapted for leaping, as grasshoppers, locusts, crickets, etc.

OR'TOLAN, *Emberiza hortulana*, a species of bunting (q.v.), much resembling the yellow-hammer, and not quite equal to it in size. The adult male has the back reddish-brown, the wings dusky black and rufous brown; the tail dusky black, some of the outer tail-feathers with a patch of white on the broad inner web; the chin, throat, and upper part of the breast yellowish-green; the other under parts reddish buff-color. The plumage of the female is of less vivid hues. The ortolan occurs in great flocks in the south of Europe and north of Africa. Even in the south of Europe it is a summer bird of passage, but its migrations extend as far north as Lapland, although in Britain it is a very rare bird, and only of accidental occurrence. It has no song, but merely a monotonous chirping note. It frequents bushy places, but often makes its nest on the ground in corn-fields, particularly where the soil is sandy. No bird is so highly esteemed by epicures, and vast numbers are used for the table. It is taken chiefly by nets, with the aid of decoy-birds, and after being taken is fattened on millet and oats, in rooms dimly lighted by lamps. Thus treated, it becomes excessively fat, sometimes so as to die of obesity; and attains a weight of three ounces. Great numbers of ortolans, potted and pickled, are exported from Cyprus.

ORTON, JAMES, 1830-77, b. N. Y., graduated at Williams college, 1855, and then studied theology at the Andover seminary. In 1860 he returned from an extended trip through Europe and Palestine, and was ordained a Congregational minister. He became professor of natural sciences in Rochester university in 1866, and in the next year took charge of a scientific expedition across South America which found many fossils and specimens of value in the Amazon valley, and in 1873 made a second expedition to Lima and lake Titicaca. From 1869 to the time of his death prof. Orton was professor of natural history in Vassar college. He published *The Miner's Guide and Metallurgist's Directory* (1849); *The Proverbialist and Poet* (1852); *Andes and the Amazon* (1870); *Comparative Zoölogy* (1875.)

ORTO'NA, a town of s. Italy, on the Adriatic, in the province of Chieti, 14 m. e. of the town of that name, and 8 m. n. of Lanciano. It gives title to a bishop, and contains a cathedral and other religious edifices. Its port has ceased to exist, and vessels are now obliged to anchor about a mile from the town in unsheltered roads, where, however, the water is deep and the bottom good. Wine is extensively grown, and has a local reputation as the best in this part of Italy. Pop. about 7,000.

ORTY'GIA. See DELOS, *ante*.

O'RTYX. See VIRGINIAN QUAIL.

ORU'RO, a department in w. Bolivia, adjoining Peru, between the e. and w. ranges of the Andes, watered by the Desaguadero river; 21,600 sq.m; pop. about 110,000. The surface is undulating, consisting mostly of a great plain called the valley of the Desaguadero. The soil is fertile; the principal productions are quinine and potatoes. Vineyards flourish in the valleys, producing a good quality of wine. Cattle, sheep, llamas, alpacas, vicuñas, etc., are numerous. There are rich mines of tin and salt; and gold exists in some parts. Large quantities of silver are found, especially in the mines of Popó, Cerro de Oruro, and El Turco. The climate is even, though great storms occur in the wet season. The Desaguadero, which rises in lake Titicaca, empties into lake Aullaga's, which is without outlet.

ORU'RO, or, in the complete form of the name, *San Felipe de Asturia de Oruro*, a town of Bolivia, the capital of the department of Oruro. It is situated about 9 m. e. from Desaguadero, and 32 m. n. from the northern extremity of the salt lake of Desaguadero, on an affluent of the river of the same name which falls into that lake. It is 12,015 feet above the level of the sea, at the base of a very high mountain; but on the other side of the town is a large plain, often covered with saline efflorescences. The soil of the whole department is saline, and far from being fertile, but its mineral wealth is great. Gold, silver, copper, tin, iron, lead, and antimony are among its products. Oruro was founded in 1590, in consequence of the discovery of silver mines, which proved more productive than any in Bolivia, except those of Potosi. It soon became a wealthy and flourishing city with 70,000 inhabitants; but in consequence of the diminished productiveness of its mines, and of the anarchy prevailing in the country after the revolution, its population declined, and is now only 7,980. It has recently been made the seat of the Bolivian government, and the place of meeting of congress.

ORVIET'O, a city in the province of Umbria (Perugia), which was included in the former Papal States, but now forms part of the kingdom of Italy, stands on the right bank of the Paglia, 8 m. n.e. of Lake Bolsena, and 60 m n.n.w of Rome. It occupies a strong position on a steep hill, is well built, and is surrounded with walls. It has been the seat of a bishop since 509 A.D. The cathedral, a beautiful specimen of the Italian Gothic, and one of the most richly-decorated edifices in Italy, is built of black and white marble, was begun in 1290, and completed about the middle of the 14th century. The façade is unsurpassed in richness of material, and in the beauty of its mosaics, sculptures, and elaborate ornamentation. The interior is also magnificently decorated with sculptures and paintings. The other chief buildings are St. Patrick's Well, and several palaces. Pop. 8,626, who trade in corn, cattle, and silk, and a delicate white wine, which is highly esteemed at Rome.

Orvieto, called in the time of the Longobards *Urbs Vetus*—of which its present name is a corruption—has been the place of residence and retreat in turbulent times of upwards of 30 popes. The city is evidently of Etruscan origin, but of its early history nothing is known.

ORYCTEROP'IDÆ. See AARD-VARK.

O'RYX, the name given by the ancients to a species of antelope, a native of the n. of Africa. It is often represented on the monuments of Egypt, and as these representations are most always in profile, it is generally made to appear as having only one horn, thus probably contributing to the fable of the unicorn; and indeed, all the older figures of the unicorn exhibit a considerable resemblance to this kind of antelope. The name *Antilope oryx* was given by Pallas to the Gems-boc (q.v.), an antelope certainly much resembling the oryx, but found only in South Africa; and it is now generally believed that the true oryx of the ancients is a species also known as the ALGAZEL (*Antilope Gazella* or *Oryx bezoartica*), common in the n. of Africa.

OBY'ZA. See RICE.

OSACA, or **OZAKA**, a city of Japan, in n. lat. $35^{\circ} 5'$, about 20 m. from its sea-port of Hiogo, is situated on a large river on the s.e. coast of the main island, in the most central and populous part of the empire, and surrounded by the great tea districts. Osaca is one of the three imperial cities of Japan, and is a great centre of trade; especially since 1863, when it became possible for foreigners to settle. The town, clean and regularly built, is intersected by numerous streams, spanned by hundreds of wooden and iron bridges. Some of the public buildings are imposing structures, such as the municipal hall and the new mint. The latter is equipped with the finest obtainable apparatus; and of late much foreign machinery has been introduced into Osaca, to the great advancement of its manufactures. Besides very numerous Buddhist and other temples, there are in Osaca two Christian churches, a government college, an academy, and 72 public schools. The town is connected by railway with Hiogo and Kioto (see **MIAKO**), 27 m. further inland. Pop. '81, 291,000. The foreign imports are valued at near £100,000 annually; the exports at £200,000.

OSAGE, a co. in e. Kansas, drained by the Osage, and by Salt and Dragoon creeks; on the Atchinson, Topeka and Santa Fe railroad; 720 sq. m.; pop. '80, 19,643—16,536 of American birth. The surface is rolling, most of it prairie, and the rest covered with forests. The soil is fertile and produces good crops of corn, oats, wheat, hay, and potatoes. Many cattle are raised. Bituminous coal abounds in some parts. Co. seat, Lyndon.

OSAGE, a co. in e. central Missouri, bounded on the n. by the Missouri river, on the n.w. by the Osage river; drained by the Gasconade; on the Missouri Pacific railroad; 600 sq. m.; pop. '80, 11,824—9,848 of American birth. The surface is diversified and hilly, and the soil mostly fertile. The principal productions are corn, oats, wheat, tobacco, and hay. Co. seat, Linn.

OSAGE ORANGE, *Maclura aurantiaca*, a tree of the natural order *Moracæ*, a native of North America. It attains a height varying, according to soil and situation, from 20 to 60 feet. It is of the same genus with Fustic (q.v.), and its wood, which is bright yellow, might probably be used for dyeing. The wood is fine-grained and very elastic, and is much used by the North American Indians for making bows. The osage orange has been successfully introduced into Britain as a hedge plant. Its fruit is about the size of a large orange, has a tuberculated surface of a golden color, and is filled internally with radiating somewhat woody fibers, and with a yellow milky juice, the odor of which is generally disliked, so that the fruit, although not unwholesome, is seldom eaten.

OSAGE RIVER, rises in Wabaunsee co., Kansas, flows e. and s.e. into Missouri, passes through Bates, St. Clair, Benton, Camden, and Miller counties, and after a course of about 500 m., empties into the Missouri river 9 m. s. of Jefferson. That part of it which intersects Kansas and w. Missouri is often called the *Marais des Cygnes*. It is navigable for the lower 200 m. of its course.

OSAGES, a tribe of Dakota Indians, the most powerful and warlike of the eight tribes of southern Sioux, who in 1673 were found by Marquette on lands watered by the Missouri and its tributaries. They were confederates of the Illinois, but were forced to abandon their settlement in 1700, and settled in Arkansas. They fought with the French against the Foxes at Detroit in 1712, and the visit of some of their chiefs soon afterwards to France augmented their friendship, whereupon they became allies of the French against the Chickasaws, and against the English in their last battles. About 1800 they were at war with the Sacs and Foxes, but peace was established in 1804. At this time most of the Great Osages were living in the region of the Arkansas, their chief being Big Track, and the Little Osages had left the Missouri and settled on the Great Osage river, their total number at this time being 6,300. A treaty was made with the chief of the Big Osages and the chiefs of the Arkansas, and the Little Osages in 1808, in which they ceded a part of their land to the United States. The Osages afterwards disputed the authority of this treaty, and caused great disturbance by constant plundering. Their time was spent in warring with the neighboring tribes, and, in an encounter with the Cherokees in 1817, Clermont, chief of the Arkansas Osages, was killed, and his town laid waste. Other treaties ceding lands were made in 1815, 1818, 1822, and 1825. A mission which had been established among them by the American board was discontinued in 1845, and a Jesuit mission was begun a year later, but the attempts to introduce Christianity were futile. They have always been a thieving, plundering tribe, showing little inclination for agricultural pursuits. They were removed in 1870 to their reservation, comprising 1,760,000 acres, partly bounded on the s. and w. by the Arkansas river, and w. of long. 96° . It is mostly a hilly country, with little fertile land. About 2,000 acres are said to be under cultivation. A school has been established among them, but they are not desirous of education. They now number about 1,576.

OSBORN, **SHERARD**, 1822–75; b. England; entered the British navy in 1837, and soon rose to a captaincy. He commanded the *Pioneer*, which was sent in search of sir John Franklin, and took part in the Crimean war. He did efficient work in the Chinese waters, having been placed in command of a squadron by the emperor of China in 1862, to suppress piracy. He returned to England in 1864, and was placed in command of the armor-plated *Royal Sovereign*, in order to test the turrets which had been constructed

on a new principle by capt. Cole. In 1873 he became rear-admiral. He has written some interesting books entitled, *Stray Leaves from an Arctic Journal*; *A Cruise in Japanese Waters*; *The Career, Last Voyage, and Fate of Sir John Franklin*; *The Past and Future of British Relations in China*; and *Japanese Fragments*.

OSBORNE, a co. in n. Kansas, drained by Wolf and Salt creeks, and the North and South forks of the Solomon river; 900 sq. m.; pop. '80, 12,518—11,487 of American birth. The surface is undulating and mostly prairie, and the soil is fertile. Limestone abounds. Co. seat, Osborne.

OSBORNE, or ST. HELEN'S BEDS, are a series of strata of the middle eocene period, occurring in the isle of Wight. They have been divided into two groups: 1. The St. Helen's sands, consisting of layers of white, green, and yellow sands, interstratified with blue, white, and yellowish clays and marls, with a maximum thickness of 50 feet; and, 2, the Nettlestone grits, composed of yellow limestone and marl, and a shelly free-stone, which is much used for building, having a maximum thickness of 20 feet. The fossils of the Osborne beds are species of paludina and cypris, and the spirally sculptured spore-cases of chara. The group is of fresh and brackish water origin, and is very variable in mineral character and thickness.

OSBORNE, Lord SYDNEY GODOLPHIN, b. England, 1808; third son of the first lord Godolphin. He was educated at Oxford; was for a number of years rector of Stoke Pogis, and rector of Durweston 1841-75. He has published *Gleanings in the West of Ireland* (1850); *Lady Eva: Her Last Days* (1851); *Scutari and its Hospitals* (1855); *Hints to the Charitable, and Hints for the Amelioration of the Moral Condition of a Village* (1856); *Letters on the Education of Young Children* (1866); and numerous pamphlets on the means of improving the homes of the laboring classes.

OSBORNE, RALPH BERNAL. See page 882.

OSBORNE, THOMAS O., b. Ohio, 1832; a graduate of Ohio university, Athens, Ohio, class of 1854; went to Crawfordsville, Ind., studied law, was admitted to the bar, and in 1858 commenced practice in Chicago. In the war of the rebellion he was col. of the 39th Illinois volunteers, commissioned in Dec., 1861, and was in action at the battle of Winchester in 1862. In 1863 he participated in the operations in Charleston harbor, commanded by admiral Dupont, and in May, 1864, went up the James river with gen. Butler, on the Dutch gap expedition. At the battle of Drury's bluff he lost his right arm. He commanded the 1st brigade, 1st division, 24th corps, at the close of the siege of Petersburg, conducted by gen. Grant, and, on April 2, 1865, captured fort Gregg by a gallant charge, securing an important outpost of the fortifications raised around Petersburg and Richmond, cutting off the advance of the confederates on the Lynchburg road, which was the beginning of the capture of Lee's army. In acknowledgment of this service he was promoted to brig.gen., and was brevetted maj.gen. After the war he returned to the practice of law in Chicago.

OSCAN. See OSCI, *ante*.

OSCAR 1., JOSEPH-FRANCIS, king of Sweden and Norway, was b. at Paris, July 4, 1799, and was the only issue of the marriage of Charles XIV. (q.v.), formerly marshal Bernadotte, with Desirée Clary, the daughter of a Marseillais merchant, and sister of madame Joseph Bonaparte. After the election of his father as crown-prince of Sweden, Oscar received the title of duke of Sudermania, and was placed under the tutelage of the poet Atterbom, for the purpose of acquiring the Swedish language. In 1818 he entered the university of Upsala, where his education was completed. The effects of the thorough training he received were seen in his remarkable proficiency in science, literature, and especially the fine arts. For some time he gave himself up almost entirely to the study of music, and composed various pieces, including an opera, and several waltzes, marches, etc.; he is also the author of several songs and hymns, some of which are still popular. He also published memoirs on education and penal establishments. What is of more consequence, he became thoroughly imbued with the national sentiments, and after his admission to a share in the administration, opposed, though with becoming filial respect, the pro-Russian policy of his father. This course of conduct rendered him immensely popular, and on March 8, 1844, his accession to the throne was hailed with rapture by the great majority of his subjects. His rule was distinguished for its liberality and justice; and many liberal measures, such as those for the removal of Jewish disabilities, freedom of manufactures and commerce, and parliamentary reform (the last-mentioned being vigorously opposed by the nobility), were laid before the *riksdag* by his orders. He introduced these changes with caution and gentleness, and had the gratification of seeing, in most cases, his prudence crowned with success. His foreign policy was of an independent and anti-Russian character, and during the Crimean war he joined (Nov. 21, 1855) the king of Denmark in a declaration of armed neutrality, which gradually assumed a more hostile attitude to Russia, and would have inevitably led to war, had not the Paris treaty so rapidly succeeded. His attitude at this time gained him general favor and respect throughout Europe. On July 19, 1823, he married Josephine Beauharnais, the granddaughter of the empress Josephine, by whom he had five children, the eldest of whom, on account of his father's failing health, was appointed regent, Sept. 25, 1857, and succeeded to the throne as Charles XV. on

the death of Oscar, July 8, 1859. Charles XV. died Sept. 18, 1872, and was succeeded by his brother as Oscar II.

OSCAR II., King of Sweden and Norway, b. 1829; married, in 1857, princess Sophia, daughter of duke Wilhelm of Nassau, by whom he has four sons, of whom the eldest, Gustaf, duke of Göthland, was b. in 1858. King Oscar held the rank of lieut. gen. in the army when he ascended the throne in 1872, in succession to his brother, Charles XV. He was crowned in the cathedral at Drontheim in 1873. He has followed the liberal policy of his predecessor, enlarged the liberty of the press, and made many reforms. In 1878 he was elected a corresponding member of the Frankfort academy of sciences, on account of his Swedish translation of Goethe's *Faust*. He wrote *Memoir of Charles XII.*, '79.

OSCEO'LA (Seminole, *As-se-ho-lar*), a chief of the tribe of Seminole Indians in Florida, United States, was b. about 1803. He was the son of an English trader, named Powell, and the daughter of a Seminole chief. In 1835 the wife of Osceola, a chief's daughter, was claimed and seized as a slave by the owner of her mother. The outraged husband threatened revenge, and for his threats was imprisoned six days in irons by gen. Thompson. Lying in wait, a few days afterwards he killed the general and four others. This was the beginning of the second Seminole war. Laying an ambush soon after, he killed maj. Dale and a small detachment of soldiers; and, taking to the almost impenetrable Everglades, with two or three hundred followers, he fought for a year with great energy and skill the superior numbers sent against him. He was taken prisoner at last by gen. Jessup, while holding a conference under a flag of truce, an act of inexcusable treachery, though represented as one of retaliation, and confined in fort Moultrie until his death in Jan., 1838.

OSCEOLA, a co. in n.w. Iowa, having the state line of Minnesota for its n. boundary; 432 sq.m.; pop. '80, 2,219—1888 of American birth. It is drained by Little Sioux river, Otter creek, and Rock river, an affluent of the Big Sioux, and is intersected by the Sioux City and St. Paul railroad. Its surface is generally level, a large proportion fertile prairie land, at present furnishing excellent pasturage, and containing unbounded agricultural resources undeveloped. Co. seat, Sibley.

OSCEOLA, a co. in central Michigan, intersected by the Flint and Pere Marquette, and the Grand Rapids and Indiana railroads, forming a junction in the s.w. section; 576 sq.m.; pop. '80, 10,777—7,570 of American birth, 43 colored. It is drained by the Muskegon and Pine rivers, and other affluents of the Manistee river. Its surface is hilly, a large proportion covered with a dense growth of timber, and trade in lumber is active. Near the water-courses some sections are swampy, but the soil is generally fertile and adapted to grain, potatoes, and dairy products. Some attention is paid to the raising of stock. The manufacture of lumber is the leading industry; other manufactures are carriages and the product of iron-foundries and machine-shops. Co. seat, Hersey.

O'SCHERSLEBEN, or GROSS-OSCHERSLEBEN, a t. of Prussian Saxony, on the left bank of the Bode, a branch of the Saale, 22 m. w.s.w. from Magdeburg. Pop. '75, 7,927.

OSCO'DA, a co. in n. Michigan, intersected centrally by the Au Sable river; 576 sq.m.; pop. '80, 467—357 of American birth, 8 colored. Its surface is elevated table land, uneven and largely covered with timber. It is visited in the season by large numbers of sportsmen, the Au Sable being famous for good fishing, containing the grayling, a kind of salmon with a very small mouth, found in the streams of England, Sweden, Norway, and Lapland, considered delicious food. Its soil is fertile, easily cultivated, and adapted to the production of grain and potatoes. Lumber is the chief article in trade. Co. seat, Harmon.

OS'CI, originally OPSCI (rendered by Mommsen "laborers," from *opus*, a work), in Greek always ΟΠΙΚΟΙ, the name of an Italian people, who at an early period occupied Campania, and were either closely allied to or the same race as the Ausones. Subsequently (about 423 B.C.) Samnites from the hilly districts to the north overran the country, and amalgamated with the inhabitants whom they had subjugated. It is conjectured that the conquerors were few in numbers, as (like the Normans in English history) they adopted, in time, the language of the conquered, but whether they modified the original Oscan language, and, if so, to what extent, cannot now be ascertained. As it was these Samnitic Oscans or Campanians who formed that Samnitic people with whom both the Greeks of lower Italy and the Romans first came into contact, the names *Osci* and *Oscan language* were subsequently applied to all the other races and dialects whose origin was nearly or wholly the same. The Oscan language was not substantially different from the Latin, but only a ruder and more primitive form of the same central Italic tongue. The territory where it was spoken comprised the countries of the Samnites, Frentani, northern Apulians, Hirpini, Campani, Lucani, Bruttii, and Mamertini, whose dialects only slightly differed from each other; besides the entire Samnitic races, whence the language is sometimes called Samnitic or Saffinic. The races situated n. of the Silarus were purely Samnitic; those s. of it, and even of the region round the gulf of Naples, were Græco-Samnitic. The use of the national Samnitic alphabet was confined to the former. By the victories of the Romans over the Samnites, and the conferring of the *civitas* on all the Italians (88 B.C.), an end was put to the official use of the Oscan

tongue; nevertheless, in the time of Varro (1st c. B.C.) it was still used by the people, and as late as the destruction of Herculaneum and Pompeii was spoken by a few individuals. During its most flourishing period it was something more than a country *patois*; it is even possible that the Oscans had a literature and art of their own, which may not have been without influence on the early Calabrian poets Ennius and Pacuvius, and the Campanian Lucilius. At any rate, we certainly know of a poetic creation peculiar to the Campanians, a kind of unwritten, regular, probably improvised farce, with fixed parts and changing situations, which was transplanted to Rome about 304 B.C., but was imitated there not in Oscan but in Latin. See ATELLANÆ. Besides a considerable number of coins with Oscan legends, there are still extant a number of inscriptions in the Oscan tongue, among which the most important for linguistic purposes are: 1st, the *Tabula Bantina*, a bronze tablet found in the neighborhood of Bantia (on the borders of Lucania and Apulia), referring to the municipal affairs of that town; 2d, the *Cippus Abellanus*, or stone of Abella (in Campania); and, 3d, a bronze tablet found near Agnone, in northern Samnium. See Mommsen's *Oskische Studien* (Berlin, 1845), and *Die Unteritalischen Dialekte* (Leip. 1850); also Friedländer's *Die Oskischen Münzen* (Leip. 1850); Kirchhoff's *Das Stadtrecht von Bantia* (Berlin, 1853); and Donaldson's *Varronianus* (pp. 104-138).

OSCUATION, and **OS'CUATING CIRCLE** (Lat. *osculari*, to kiss). One curve is said to osculate another when several points are common to it with the other, and the degree of osculation is said to be high or low according as the number of points in contact are many or few. The number of possible points of contact is determined by the number of constants contained in the equation to the tangent curve (supposing the number of constants in the equation to the curve which is touched to be greater). The same is true of a straight line and a curve. The equation to a straight line being of the form $ax + b$, contains two constants, a and b , hence a straight line *can* coincide with a curve in *two* contiguous points, and the contact is said to be of the *first* order. This straight line is the tangent at the point of contact. When a straight line, not a tangent, meets a curve, there is no "contact" but "section," as in that case only one point is common to the straight line and the curve. The equation to a circle contains three constants, and therefore a circle *can* have *three* consecutive points in common with a curve, and the contact is then of the *second* order. This circle is known as the "circle of curvature," or the osculating circle, and has for its radius the radius of curvature of that portion of the curve with which the circle is in contact. No other circle can have so high a degree of contact with a curve at any point as the osculating circle at that point.

ÖSEL. See OESEL, *ante*.

OSGOOD, DAVID, D.D., 1747-1822; b. Mass. He worked until the age of 19 on his father's farm; graduated at Harvard in 1771; studied theology with the rev. Mr. Emerson of Hollis, and afterwards at Cambridge; was ordained in 1774; was settled as Congregational pastor at Medford for 50 years, and became a distinguished preacher. He was a zealous federalist, and in 1794 preached a sermon upon Genet's appeal to the people against the government, which attracted much attention, and passed through several editions. A volume of his *Sermons* was published in 1824.

OSGOOD, FRANCES SARGENT, 1811-50; b. Mass., and when but a girl contributed several poems to the *Juvenile Miscellany* of Lydia Maria Child. In 1835 she married Samuel Osgood, a portrait painter, and visited England, where she published a collection of poems called *A Wreath of Wild Flowers from New England* (1839); two tragedies, *Elfrida* and *The Happy Release; or, the Triumphs of Love*, and a number of contributions to periodicals. In 1840 she returned to New York and edited several illustrated gift-books, such as *The Floral Offering. A Memorial*, with an account of her life, by Dr. R. W. Griswold, was printed in 1851; and a complete illustrated edition of her poems was published in 1850.

OSGOOD, HELEN LOUISE (GILSON), 1835-68; b. Mass.; one of the original organizers of the soldiers' aid societies in the war of the rebellion; educated carefully under the supervision of F. B. Fay of Chelsea, her guardian after the loss of her parents in early childhood. In connection with her work for the soldiers, in field and hospital, she provided employment for their wives and daughters who were dependent on their own exertions. She went as nurse to the army of the Potomac in 1861 and served through the war, becoming a favorite with the sick and disabled, winning their esteem and gratitude by her kind attentions, the sweetness of her manner, and her appreciation of their needs. She established and conducted a hospital for colored soldiers, capable of accommodating 1000 cots. During the war she visited and comforted thousands of the sick, wounded, and dying. Her ceaseless labors undermined her health, and she died at her home in Newton Center, Mass.

OSGOOD, SAMUEL, 1748-1813; b. Mass.; graduated at Harvard college in 1770; studied theology, but his health failing, became a merchant, and was active in public affairs. In 1774 he was a delegate to the Essex co. convention; a member of the provincial congress, and on many important committees. In 1775 he was capt. at Lexington and Cambridge; aid to gen. Ward in 1776; member of the board of war, and in

1776 left the army with the rank of col. and assistant commissary. He was a member of the Massachusetts legislature; delegate to the old congress in 1780-84; first commissioner of the U. S. treasury, 1785-89; postmaster-general, 1789-91. Afterward he was a member of the New York legislature and speaker of the house; supervisor of New York in 1801-03; and from 1803 naval officer of the port of New York until his death. He published several volumes on religious topics, and a work on chronology. He had an extensive acquaintance with science and literature.

OSGOOD, SAMUEL, D.D., 1784-1862; b. Maine; graduated at Dartmouth college in 1805; was pastor of the first church (Congregational), Springfield, Mass., 1809-62. As a preacher he was earnest and direct; he had great force of character, and his abilities gained extensive recognition.

OSGOOD, SAMUEL, D.D., LL.D., 1812-80; b. Mass.; graduated at Harvard college in 1832, and at the Cambridge divinity school in 1835. In 1836-37 he edited the *Western Messenger* at Louisville, Ky. In 1837 he became pastor of the Unitarian church at Nashua, N. H., in 1841 of the Westminster church in Providence, R. I., and in 1849 of the church of the Messiah in New York. In 1850-54 he was editor of the *Christian Inquirer* in New York. In 1869, resigning his pastoral charge, he went to Europe for health and rest. On his return in 1870 he entered the Protestant Episcopal church, but took no pastoral charge. He received the degree of D.D. from Harvard college in 1857, and of LL.D. in 1872 from Hobart college. For several years he was domestic corresponding secretary of the New York historical society. He was the author of *Studies in Christian Biography; The Hearthstone; God with Men; Mile-Stones in our Life-Journey; Student Life; American Leaves*; translations from Olshausen's *The History of the Passion*, and DeWette's *Human Life*. His printed sermons, speeches, and orations, are numerous. He contributed largely to the *Christian Examiner*, and wrote also for the *North American Review*, *Bibliotheca Sacra*, and various monthly magazines.

OSGOOD, THADDEUS, 1775-1852; b. Mass.; graduated at Dartmouth in 1803; studied theology with Drs. Lothrop and Emmons; was ordained in 1806; was stated preacher to the Congregational church in Southbury, Conn. He organized the first church of Buffalo, now Presbyterian, and many others. He visited England several times, and collected a large amount for educational purposes. He founded a society in Canada to supply Bibles for seamen and emigrants, and was engaged for many years in organizing Sunday schools.

OSHIMA, a Japanese word meaning "big island," used in general to denote the larger of two neighboring islands, the smaller being called *Koshima*; more especially applied to Vries or Barneveld's island, situated near the entrance to the gulf of Yedo. This *Oshima* is 8 m. long and 5 m. wide, has a good harbor, and is remarkable for an active volcano about 2,500 ft. high, the flames from which can be seen at a great distance by sailors in the night. There are a number of villages upon the island.

OSH'KOSH, a t. in Wisconsin, on both sides of the Fox river, at its entrance to lake Winnebago, 90 m. n.e. of Madison. It has a large lumber trade, saw-mills, planing-mills, steamboats, etc. Pop. '70, 12,663.

OSH'KOSH (*ante*), co. seat of Winnebago co., on the Chicago and Northwestern, the Chicago, Milwaukee and St. Paul, and the Oshkosh and Mississippi railroads; pop. '80, 15,749. It is situated on both sides of the river, spanned by two bridges besides the railroad bridges, and occupies an area of about 8 sq. miles. The streets are handsomely laid out, and lined with shade trees. There are many fine business and private houses. The principal public buildings are the court-house, northern state lunatic asylum, state normal school, and high school. It contains about 20 churches, a number of private schools, an opera house, several public halls and good hotels. There are six newspapers, of which one is a daily, and one published in German. The city has a great trade and valuable manufacturing industries. Large amounts of lumber are exported. There are saw, planing, and grist mills, machine and boiler shops, ship yards, breweries, and manufactories of furniture, agricultural tools, sashes and doors, matches, shingles, etc. The city is lighted with gas. The government is vested in a mayor and a board of 18 aldermen, 3 from each ward. A French Canadian trading post was set up here in 1820. The first permanent settlement was begun in 1836, and the act of incorporation was passed in 1853. A great fire in 1875 destroyed some 200 residences and 100 stores.

OSIANDER, ANDREAS, one of the most learned and zealous of the German reformers, was born in 1498, at Gunzenhausen, near Nuremberg. His father was a blacksmith, called Hosemann, out of which name his son, after the fashion of his time, manufactured the classic-looking Osiander. Osiander was educated at Ingolstadt and Wittenberg, and after completing his course of study, became a preacher at Nuremberg, where he was conspicuously active in introducing the reformation (1522). He ardently advocated the views of Luther in his controversy with the Swiss reformer Zwingli, on the question of the Lord's-supper. He took part in the conference held at Marburg (1529), and was present at the diet of Augsburg (1530). In 1548 he was deprived of his office as preacher at Nuremberg, because he would not agree to the Augsburg interim; but was immediately afterwards invited by Albrecht, duke of Prussia, to become the head of the theological faculty in the newly established university of Königsberg. He was hardly settled here

when he became entangled in a theological strife that embittered his naturally imperious and arrogant temper. In a treatise, *De Lege et Evangelio* ("On the Law and the Gospel"), Osiander asserted that the righteousness by which sinners are justified, is not to be conceived as a mere justificatory or imputative act on the part of God, but as something inward and subjective, as the impartation of a real righteousness, springing in a mystical way from the union of Christ with man. The most notable of his opponents was Martin Chemnitz (q.v.). A seemingly amicable arrangement between the disputants was brought about by duke Albrecht in 1551; but the strife was soon recommenced, by Osiander publishing some new writings in which he attacked Melanchthon; nor did his death in the following year put a stop to the war of words. It was continued by his followers, called *Osiandrists*, who were finally extinguished by the *Corpus Doctrinae Prutenicum* (in 1567), which caused their banishment from all parts of Prussia. See Wilken, *Andr. Osiander's Leben, Lehre und Schriften* (Strals. 1844).

O'SIER (Fr. probably of Celtic origin), the popular name of those species of willow (q.v.), which are chiefly used for basket-making and other wicker-work. They are of low bushy growth, few of them ever becoming trees, their branches long and slender; and they are the more valuable in proportion to the length, slenderness, suppleness, and toughness of their branches. Their leaves are long and narrow, lanceolate, or nearly so, obscurely notched on the margin, almost always smooth on the upper side, but generally white and downy beneath. The COMMON OSIER (*salix viminalis*), a common native of wet alluvial grounds in Britain and many parts of Europe, is one of those which sometimes become trees, although when cultivated for basket-making, it is not permitted to do so. It has two distinct stamens in the flowers of the male catkins; and the stigmas of the female catkins are long and slender. It is often planted to prevent the banks of rivers from being washed away. Its branches are used for making hoops and coarse baskets. There are several varieties in cultivation, not easily distinguished except by a very practiced eye, but much more useful than the original or wild kind, which is apt to break, and therefore of little value. More suitable for the finer kinds of basket-making are *salix Forbyana*, sometimes called the FINE BASKET OSIER, and *S. rubra*, known near London as the GREEN-LEAVED OSIER or ORNARD; *S. triandra*, a triandrous species, known to English osier-cultivators and basket makers as the SPANIARD ROD; whilst *S. vitellina*, a pentandrous species, sometimes becoming a tree, is the GOLDEN OSIER or golden willow, remarkable for the bright-yellow color of its branches, as well as for their pliancy and toughness. There are other species, not natives of Britain, which are also valuable; but the osiers chiefly cultivated belong to those which have been named, or are very nearly allied to them.

Osiers are very extensively cultivated in Holland, Belgium, and France, on alluvial soils, especially near the mouths of rivers; and from these countries great quantities of "rods" are imported into Britain. They are cultivated also to a considerable extent in some parts of England, particularly on the banks of the Thames and the Severn, and in the level districts of Cambridgeshire, Huntingdonshire, etc. They are nowhere extensively cultivated in Scotland. Islets in the Thames and other rivers, entirely planted with osiers, are called *Osier holts*. Osiers grow particularly well on grounds flooded by the tide. Much depends on the closeness of planting of osier grounds; as when space is too abundant, the shoots of many of the kinds do not grow up so long, slender, and unbranched as is desirable. The French cultivators, when they wish osiers for the finest kinds of basket-work, cut branches into little bits with a bud or eye in each, and plant these pretty close together, so as to obtain weak but fine shoots; but generally cuttings of 15 or 16 in. in length are used, and of tolerably thick branches; and these are placed in rows, from 18 in. to 2 ft. apart, and at distances of 15 to 18 in. in the row. Osier plantations in light soils continue productive for 15 or 20 years, and much longer in rich alluvial soils. Osiers succeed best in rich soils, but not in clays. No cultivation is required after planting; but the shoots are cut once a year, at any time between the fall of the leaf and the rising of the sap in spring. After cutting, they are sorted; and those intended for brown baskets are carefully dried and stacked, care being taken that they do not *heat*, to which they are liable, like hay, and by which they would be rotted and rendered worthless. The stacks must be carefully protected from rain. The osiers intended for white baskets cannot at once be peeled; but after being sorted, they are placed upright in wide shallow trenches, in which there is water to the depth of about 4 in. or in rivulets, being kept secure in their upright position by posts and rails; and thus they remain till they begin to bud and blossom in spring, which they do as if they remained on the parent plant, sending forth small roots at the same time into the water. They are then, in ordinary seasons, easily peeled by drawing them through an instrument called a *break*, but in cold springs it is sometimes necessary to lay them for a while under a quantity of litter. After being peeled, they are stacked, preparatory to sale.

It is impossible to form an estimate of the quantity produced in Great Britain, but our imports amount annually to about 200,000 bundles; nearly one-half are from Holland, and the remainder from the Hanse towns, Belgium, and France.

OSI'MO (the ancient Auximum), a t. in the province of Ancona, Italy; 8 m. from Ancona on the road to Loretto; pop. about 7,000. It has a cathedral, an episcopal palace, a museum containing many statues and ancient inscriptions found near by, and

several churches containing noteworthy paintings. Auximum was made a Roman colony in B.C. 157, and in the wars of Pompey and Cæsar was occupied by both parties at different times.

OSIRIS, according to others, *Asiris*, or *Hysiris* ("Many-eyed"), a celebrated Egyptian deity, whose worship was universal throughout Egypt. This name appears in the hieroglyphic texts as early as the 4th dynasty, and is expressed by a throne and eye; at a later period, that of the 19th, a palanquin is substituted for a throne; and under the Romans, the pupil of the eye for the eye itself. Osiris does not indeed appear to have been universally honored till the time of the 11th and 12th dynasties, or about 1800 B.C., when Abydos, which was reputed to be his burial-place, rose into importance. In the monuments of this age he is called great god, eternal ruler, dwelling in the west, and lord of Abut or Abydos. Even at the most remote period, individuals after death were supposed to become an Osiris; and all the prayers and ceremonies performed or addressed to them were in this character, referring to their future life and resurrection. At the time of the 18th dynasty, this title of Osiris was prefixed to their names, and continued to be so till the time of the Romans and fall of paganism.

In the Ritual, and other inscriptions, Osiris is said to be the son of Seb or Saturn, and born of Nu or Rhea; to be the father of Horus by Isis, of Anubis, and of the four genii of the dead. Many mystic notions were connected with Osiris; he was sometimes thought to be the son of Ra, the sun, or of Atum, the setting sun, and the Bennu or Phenix; also to be uncreate, or self-engendered, and he is identified in some instances with the Sun or the creator, and the Pluto or judge of Hades. Osiris was born on the first of the Epagomenæ, or five additional days of the year. When born, Chronos or Saturn is said to have given him in charge to Pamytes; having become king of Egypt, he is stated to have civilized the Egyptians, and especially to have taught them agriculture, the culture of the vine, and the art of making beer; he afterwards traveled over the earth, and conquered the people everywhere by his persuasion. During his absence, his kingdom was confided to Isis, who guarded it strictly, and Set or Typhon, the brother of Osiris (who was born on the third of the Epagomenæ), was unable to revolt against him. Typhon had, however, persuaded 72 other persons, and Aso, the queen of Ethiopia, to join him in a conspiracy; and having taken the measure of Osiris, he had a chest made of the same dimensions, richly ornamented and carved, and produced it at a banquet, where he promised to give it to whomsoever it should fit; and when all had lain down and tried it, and it suited none, Osiris at last laid himself down in it, and was immediately covered over by the conspirators, who placed the lid upon it, and fastened it with nails and molten lead. The chest was then hurled into the Nile, and floated down the Tanaitic mouth into the sea. This happened on the 17th of the month Athyr, in the 28th year of the reign or age of Osiris. Khem or Pan, and his attendant deities, discovered the loss of the god; Isis immediately cut off a lock of hair and went into mourning, and proceeded in search of Anubis, the child of her sister Nephthys by Osiris, and having found him, brought him up. The chest having floated to Byblos, had lodged in a tamarisk, and became inclosed in the tree, which was cut down by the king, and the trunk, containing the chest and the body of the god, converted into a pillar to support the roof of the palace. The goddess proceeded to Byblos, and ingratiated herself with the queen's women by plaiting their hair and imparting to it an ambrosial smell, so that the monarch, whose name was Melcarthus, and his wife, Saosis or Nemianoun, invited her to court to take care of the royal child. She endeavored to confer immortality upon him by placing him on a fire, and changing herself into a swallow, flew round the pillar and bemoaned her fate. The queen became alarmed at the danger of her child; Isis revealed herself and asked for the pillar of tamarisk wood, which was given her. She then cut it open, and took out the chest, making great lamentations, and subsequently sailed for Egypt, with the eldest of the king's sons. The goddess, intending to visit Horus her son at Buto, deposited the chest in an unfrequented spot; but Typhon discovered it by the light of the moon, tore it into 14 pieces, and distributed each to a nome or district. Isis recovered all by passing the marshes in a boat of papyrus; all except the phallus, which had been eaten by the lepidotus, the phagrus, and oxyrhynchus fish. Subsequently, a battle took place between Horus and Typhon or Set, which lasted three days, and ended by Typhon having fetters placed upon him. Isis, however, liberated Typhon, which so enraged Horus that he tore off her diadem, but Teti or Thoth placed on her the head of a cow instead. Typhon finally accused Horus of illegitimacy; but the question was decided between them by Teti or Thoth and the gods. From Osiris, after his death, and Isis sprung Harpocrates. See HARPOCRATES. Osiris seems to have been finally revived, and to have become the judge of the Karneter or Hades, presiding at the final judgment of souls in the Hall of the two Truths, with the 42 demons who presided over the capital sins, and awarding to the soul its final destiny. Thoth or Hermes recorded the judgment, and justified the deceased against his accusers, as he had formerly done for Osiris.

Considerable diversity of opinion existed amongst the ancients themselves as to the meaning of the myth of Osiris. He represented, according to Plutarch, the inundation of the Nile; Isis, the irrigated land; Horus, the vapors; Buto, the marshes; Nephthys, the edge of the desert; Anubis, the barren soil; Typhon, was the sea; the conspirators,

the drought; the chest, the river's banks. The Tanaitic branch was the one which overflowed unprofitably; the 28 years, the number of cubits which the Nile rose at Elephantine; Harpocrates, the first shootings of the corn. Such are the naturalistic interpretations of Plutarch; but there appears in it the dualistic principle of good and evil, represented by Osiris and Set or Typhon, or again paralleled by the contest of Ra or the sun, and Apophis or darkness. The difficulty of interpretation increased from the form of Osiris having become blended or identified with that of other deities, especially Ptah-Socharis, the pigmy of Memphis, and the bull Hapis or Apis, the avatar of Ptah. Osiris was the head of a tetrad of deities, whose local worship was at Abydos, but who were the last repetition of the gods of the other nomes of Egypt, and who had assumed an heroic or mortal type. In form, Osiris is always represented swathed or mummied in allusion to his embalment; a net-work, suggestive of the net by which his remains were fished out of the Nile, covers this dress; on his head he wears the cap *atf*, having at each side the feather of truth, of which he was the lord. This is placed on the horns of a goat. His hands hold the crook and whip, to indicate his governing and directing power; and his feet are based on the cubit of truth; a panther's skin on a pole is often placed before him, and festoons of grapes hang over his shrine, connecting him with Dionysos. As "the good being," or Onnophris the meek-hearted, the celestial or king of heaven, he wears the white or upper crown. Another and rarer type of him represents him as the *Tut*, or emblem of stability, wearing the crown of the two Truths upon his head. His worship, at a later time, was extended over Asia Minor, Greece, and Rome, and at an early age had penetrated into Phenicia, traces of it being found on the coins of Malta and other places. He became introduced along with the Isiac worship into Rome, and had votaries under the Roman empire. But the attacks of the philosophers, and the rise of Christianity, overthrew these exotic deities, who were never popular with the more cultivated portion of the Roman world.

Herodotus, ii. 40-42; Plutarch, *De Iside*; Tibullus, i. 7; Diodorus, i. 25; Prichard, *Mythology*, p. 208; Wilkinson, *Man. and Cust.*, iv. 314; Bunsen, *Egypt's Place*, i. 414.

OSKALOO'SA, a city, county seat of Mahaska co., in s.e. Iowa, at the junction of the Central railroad of Iowa, the Chicago, Rock Island and Pacific, and the Keokuk and Des Moines railroads; pop. '80, 4,600. It is pleasantly situated in the divide between the Des Moines and South Skunk rivers, 140 ft. above the level of the river. It is 62 m. e. of Des Moines city, 24 m. n.w. of Ottumwa, and 24 m. n.e. of Albia. It is the seat of Oskaloosa college (Christian), having an extensive edifice of brick, and of Penn college, organized 1873, under the management of the society of Friends. The city is lighted by gas, is well drained, has 4 banks (1 national), and 2 weekly newspapers; also 2 monthly magazines. It is the place for the yearly meetings of the society of Friends of the state of Iowa. In the vicinity are inexhaustible deposits of coal and iron, extensively mined; other mineral products are fire-clay and limestone. It has 3 churches, excellent public schools, an artesian well 900 ft. deep, a grain elevator, 4 hotels, 2 woolen factories, a well-organized fire department, 3 foundries with machine shops, and a mattress factory. Other manufactures are flour and lumber, and it is the center of an active trade, being surrounded by a fertile agricultural district.

OSMAN. See OTHMAN, *ante*.

OSMAN DIGNÁ. See page 882.

OSMAZOME, a name given by Thenard to the spirit-extract of flesh, on which, as he supposed, its agreeable taste, when cooked, depended. The term is now abandoned by chemists.

OSMIUM (symb. Os; old equiv. 100; new eq. 200; spec. grav. 10) is one of the noble metals which occurs in association with platinum in the form of an alloy with iridium. It may be obtained in the metallic condition by several processes which yield it either in thin, dark-gray glistening scales, or as a dense iron-black mass. It is the least fusible of all the metals; the oxyhydrogen jet volatilizing but not fusing it.

Five oxides of osmium are known—viz., the *protoxide* (OsO), which is of a dark-green color, and forms green salts when dissolved in acids; the *sesquioxide* (Os₂O₃), which has not been isolated; the *binoxide* (OsO₂), which is black; the *teroxide* (OsO₃), which possesses the character of a weak acid, but has not been isolated; and *osmic acid* (OsO₄), which occurs in colorless, glistening, acicular crystals, freely soluble in water, and very volatile. At about 220°, this compound gives off an extremely irritating and irrespirable vapor; and hence the name of the metal (from the Greek word *osmē*, odor). It produces a permanent black stain upon the skin, and gives a blue precipitate with tincture of galls. Osmium also forms four chlorides, which correspond in composition to the first four oxides. This metal was discovered by Tennant in 1803.

OSMOSE; DIALYSIS. The earlier discoveries of Dutrochet and Graham have been briefly described in the article on Diffusion (q.v.). The subject has, however, been much extended recently, principally by the investigations of Graham; and as the whole phenomena are exceedingly interesting and important, since secretion, absorption, and various other organic processes are to a great extent dependent on them, some further detail, especially of these later facts, may here be given.

When two different liquids are separated by a bladder or other membrane, or a piece of calico coated with coagulated albumen, there is always a more or less rapid transfer-

once of the two liquids in opposite directions through the diaphragm. In certain cases, the explanation given in the article referred to is complete, but in others it appears to be insufficient. Graham has made an extensive series of experiments upon osmose, where distilled water was on one side of the diaphragm, and various liquids and solutions on the other, and has arrived at many general results, of which the following are the more important. The osmose is considered as *positive* when more of the water passes through the diaphragm than of the other liquid. Such substances as gum, gelatine, etc., produce scarcely any effect. Solutions of neutral salts, such as common salt, Epsom salts, etc., follow the ordinary law of diffusion, as if no diaphragm had been interposed. Acid salts in solution, and dilute acids, pass rapidly into the water—or the osmose is *negative*; while alkaline solutions give, in general, a strong *positive* effect.

In all the cases in which an osmotic action occurs which cannot be explained by capillary forces, there is chemical action on the diaphragm; and conversely, such osmose cannot be produced if the material of the diaphragm be not acted on by the liquids in contact with it.

But the most remarkable results of Graham's later investigations are those relating to dialysis—i.e., to the separation of the constituents of mixtures, and even the decomposition of chemical compounds, by osmose. The results of his earlier investigations, above given, show a remarkable difference between two classes of bodies; gum, gelatine, etc., which form viscous solutions, on the one hand; and salts, acids, and alkalies, on the other. The first class he has called *colloids*; the second, *crystalloids*. The former are extremely sluggish, the latter comparatively rapid in their action. Thus, of common salt and albumen, under precisely similar circumstances, there pass through the diaphragm in a given time quantities which are as 25 to 1 by weight. Hence, if a solution containing both classes of substances be opposed to pure water, the crystalloids will pass rapidly through the diaphragm, and the colloids slowly. This process promises to be of very great value in medical jurisprudence, as, without introducing any new substance (except the diaphragm and distilled water), we have the means of separating from the generally colloidal contents of animal viscera such poisonous crystalloids as white arsenic, vegetable alkaloids, etc., which by the old methods was in general attended with great difficulty, and often uncertainty. These methods are still in their infancy, but enough is already known to show how valuable they must soon become to the chemist and the toxicologist. One economical application has been proposed, and shown to be practicable. When a bladder is filled with the brine of salt beef, and suspended in fresh water, the salt after a time nearly all disappears, and there remains in the bladder a rich extract of meat fit for making soup.

For a brief notice of the speculations which Graham's researches have led him to form as to the nature of *matter*, we refer to the article on that subject.

OSMUN, THOMAS EMBLEY, M.D. See page 882.

OSMUN'DA, a genus of ferns, distinguished by spore-cases in branched, stalked masses. The OSMUND-ROYAL, ROYAL, or FLOWERING FERN (*O. regalis*), is the noblest and most striking of British ferns. It is very frequent in the districts of Scotland and Ireland most remarkable for the moisture of their climate, growing in boggy places and the wet margins of woods. It has bipinnate fronds, and paniced spore-cases upon altered fronds, which appear as stalks distinct from the fronds, and assimilate the general appearance to that of a phanerogamous plant. It sometimes rises to 11 ft. in height. It is found in many parts of Europe, and in North America. It possesses tonic and styptic properties, and its root-stocks were formerly employed in scrofula. The root-stocks abound in a mucilaginous substance, which, being extracted by boiling them in water, is used in the n. of Europe instead of starch.

OSNABRÜCK, or OSNABURG, a territory occupying the western portion of the Prussian province of Hanover, and embracing the principality of Osnabrück, the countships of Lingen and of Bentheim, and the duchy of Arensburg-Meppen and the lordship of Papenburg. Area, 2,408 sq.m.; pop. '80, 290,135.

OSNABRUCK, the chief t. of the territory, lies in the midst of the extended and fruitful valley of the Hase, 80 m. w.s.w. of Hanover by railway. It still ranks as one of the principal commercial cities of Hanover, although it cannot boast of the pre-eminence which it enjoyed before the establishment of the Zollverein. Pop. '80, 32,812. Osnabrück has thriving manufactories of cigars and tobacco, paper-hangings, and cotton and woolen goods, and extensive works for the preparation of mineral dyes and cement, besides iron, machinery, and carriage manufactories. According to the opinion of antiquarians, Osnabrück stands on the site of the ancient Wittekindsburg, which was raised to a bishopric in 783 by Charlemagne, some relics of whom, together with the pretended bones of the martyrs Crispinus and Crispinianus, are preserved in the cathedral—a fine specimen of the Byzantine style of architecture of the 12th century. The church of St. Mary, a noble Gothic building, was erected by the burghers of Osnabrück in the 14th c. during their contentions with their haughty ecclesiastical rulers, and contains the grave of Möser, in whose honor a statue was placed in the square of the cathedral in 1836. The signing of the peace of Westphalia in 1648, in an apartment of the town-hall, is commemorated by the preservation of the portraits of all the ambassadors who took part in the treaty. It was decreed in this treaty that the ancient bishopric of Osnabrück should thenceforth be occupied alternately by a Roman Catholic prelate and

a Protestant secular prince of the house of Brunswick-Luneburg; and after having been last held by Frederick, duke of York, the district of Osnabrück was ceded to Hanover in 1803, and the chapter finally dissolved.

OSORIO, GIERONYMO, 1506-80; b. Lisbon; studied languages, philosophy, and theology, at Salamanca, Paris, and Bologna respectively. On his return to Portugal he was appointed to various offices by the royal patronage, and finally became bishop of Sylves. He published, besides a number of biblical commentaries, treatises *De Nobilitate Civili et de Nobilitate Christiana; De Justitia Cœlesti; De Regis Institutione*, etc. His most noted works are *De Rebus Emmanuelis Regis Lusitanicæ, Virtute et Auspicio Gestis Libri XII.*, and his treatise *De Gloria*, written with so much elegance that D'Alembert asserted it was a work of Cicero of which Osorio claimed the credit. Many of his works have been translated into English, French, and Portuguese.

OSPHROMENUS, a genus of fishes, natives of southern and eastern Asia, of which the celebrated *gourami*, so highly prized for food, is the chief representative. They have recently been erected into a family, but their genera are not yet made out. See ANABASIDÆ, *ante*.

OSPREY, *Pandion*, a genus of *falconidæ*, of which only one species is known (*P. haliaëtus*), also called the FISHING HAWK or FISHING EAGLE, and sometimes the BALD BUZZARD. It is singular among the *falconidæ* in preying *exclusively* on fish; and to this its whole structure and habits are adapted. Its whole length is about 22 in.; it is of a dark-brown color, variegated with black, gray, and white. The under parts are white, except a light-brown band across the chest. The bill is short, strong, rounded, and broad. The tail is rather long, the wings are very long, extending beyond the tail; the under surface of the toes remarkably rough, covered with small pointed scales, suited for the securing of slippery prey; the claws not grooved beneath, as in most of the *falconidæ*. The feathers are destitute of the supplementary plume, which is considerably developed in most of the *falconidæ*. The intestine differs from that of the other *falconidæ* in being very slender and of great length.

The osprey is chiefly to be seen near the sea, lakes, and large rivers. No bird is more widely diffused; it is found in all quarters of the world; its geographical range including Europe, Asia, Africa, North and South America, and Australia, and both very warm and very cold climates. It is everywhere a bird of passage, retiring from high northern latitudes on the appearance of frost. It occurs on many parts of the British coasts, and is sometimes found in inland districts, but is nowhere abundant in Britain. In some places in Scotland it still breeds year after year, on the highest summit of a ruined building, or the top of an old tree. It is very plentiful in some parts of North America; and its return in the beginning of spring is hailed with joy by fishermen, as indicative of the appearance of fish. The nest is a huge structure of rotten sticks, in the outer interstices of which smaller birds sometimes make their nests; for the osprey never preys on birds, and is not dreaded by them. It is, indeed, of a pacific and timorous disposition, and readily abandons its prey to the white-headed eagle (or erne, q.v.). In the days of falconry, the osprey, being very docile, was sometimes trained and used for catching fish.

OSSA, the ancient name of a mountain on the e. side of Thessaly, near Pelion, and separated from Olympus by the vale of Tempe. It is now called Kissavo. The conical summit is covered with snow during the greater part of the year. The ancients placed the seat of the centaurs and giants in the neighborhood of Pelion and Ossa.

OSSEIN. This term is applied by chemists to the substance in the tissue of the bones which yields gluten. It is obtained by the prolonged action of dilute hydrochloric acid on bone, which dissolves all the earthy matter. The material thus procured retains the form of the bone without its hardness, and must be repeatedly washed with water, and treated with alcohol and ether to remove traces of salt, fat, etc. It is insoluble in water, but is converted into gluten (one of the forms of gelatine) by the action of boiling water—a transformation which is much facilitated if a little acid be present. The ossein yielded by different kinds of animals requires different times for its conversion into gluten; and that of young animals changes more rapidly than that of adults of the same species. It appears to exist in the bones in a state of freedom—that is to say, not in combination with any of the salts of lime. Fremy's analyses show that the amount of gluten is precisely the same as that of the ossein which yields it, and that the two substances are isomeric.

OSSIAN, POEMS OF. Ossian, or Oisín (a word which is interpreted the "little fawn"), a Celtic warrior-poet, is said to have lived in the 3d c., and to have been the son of Fingal or Fin MacCumhail. The poems which are ascribed to him in manuscripts of any antiquity are few and short, and of no remarkable merit. But in 1760-63, a Highland school-master, James Macpherson (q.v.), published two epics, *Fingal* and *Temora*, and several smaller pieces and fragments, which he affirmed to be translations into English prose of Gaelic poems written by Ossian and preserved by oral tradition in the Scottish Highlands. Their success was wonderful. They were received with admiration in almost every country of Europe, and were translated not only into French and Italian, but into Danish and Polish. But their authenticity was challenged almost as

soon as they saw the light, and a long and angry controversy followed. That they were what they claimed to be was maintained by Dr. Blair, lord Kames, the poet Gray, and sir John Sinclair. That they were more or less the fabrication of Macpherson himself was maintained by Dr. Johnson, David Hume, Malcolm Laing, and John Pinkerton. While this controversy still raged, another sprang up scarcely less angry or protracted. Macpherson made Ossian a Scotch Highlander, but the Irish claimed him as an Irishman. The fact is he was both: for in those early times the n.e. of Ireland and the w. coast of Scotland were practically one country; the people spoke one language, they were of one blood; and the narrow strip of sea that divided them served not as a wall of separation, but rather as an easy passage of communication by means of boats. As to the real authorship of the poems, as the original manuscripts which Macpherson used have never been produced, there will always remain doubts; one thing only we know, that he did use materials of the same nature as the Ossianic traditions that may be picked up from the mouth of the people in many parts of Ireland and the Highlands at the present day; but how far under Macpherson's hands they were remodeled remains a secret. The recent contribution to this question made by J. F. Campbell in his *Leabhar na Feinne*—a digest of all the Ossianic ballads either published by others or collected by Mr. Campbell himself—has not tended much to clear up the matter. No trace of Macpherson's two large poems has been recovered. On one point all Gaelic scholars seem agreed—that Macpherson did not, and could not have written the Gaelic. Poems ascribed to Ossian, committed to writing in the Highlands in the first half of the 16th c., are printed in the *Dean of Lismore's Book* (Edin. 1862), with translations into English and into modern Gaelic. The poems ascribed to Ossian, preserved in Ireland, were published by the Ossianic society in 6 volumes (Dublin, 1854-61). Students of the Ossianic poems will find much assistance from consulting the edition of the Gaelic with a new translation by Dr. Clark of Kilmallie (Edin. 1870). In 1876 the Ossian controversy was again agitated, but came to nothing.

OSSIFICATION, or the formation of bone, is a process to which physiologists have paid much attention, but regarding which there is still considerable difference of opinion. On one point, however, there is a general agreement—viz., that the bones are not in any instance a primary formation, but always result from the transformation and earthy impregnation of some pre-existing tissue, which is most commonly either cartilage or a membrane containing cell-nuclei. At a very early period of embryonic life, as soon, indeed, as any structural differences can be detected, the material from which the bones are to be formed becomes mapped out as a soft gelatinous substance, which may be distinguished from the other tissues by being rather less transparent, and soon becoming decidedly opaque. From this beginning the bones are formed in two ways; either the tissue just described becomes converted into cartilage, which is afterwards replaced by bone, or a germinal membrane is formed, in which the ossifying process takes place. The latter is the most simple and rapid mode of forming bone. When ossification commences, the membrane becomes more opaque, and exhibits a decided fibrous character, the fibers being arranged more or less in a reticulated manner. These fibers become more distinct and granular from impregnation with lime salts, and are converted into incipient bone, while the cells which are scattered among them shoot out into the bone corpuscles, from which the canaliculi are extended probably by resorption. The facial and cranial bones, with the exception of those at the base of the skull, are thus formed without the intervention of any cartilage.

The process of ossification in cartilage (q.v.) is too complex and difficult to follow in these pages. Some physiologists hold that when ossification is carried on in cartilage a complete molecular replacement of one substance by the other takes place; while others believe that more or less of the cartilaginous matrix remains, and becomes impregnated with earthy matter at the same time that gluten is substituted for chondrine (chondrine being the variety of gelatine that is yielded by ossein or bone-cartilage before ossification, while gluten is yielded after that process is established). All the bones of the body, excepting those of the head and face already mentioned, are at first formed, in part at all events, from cartilage.

The time at which ossification commences does not at all follow the order in which the primordial cartilage is laid down. Thus the cartilage of the vertebræ appears before there is any trace of that of the clavicle; yet at birth the ossification of the latter is almost complete, while that of the former is very imperfect for many years. We will briefly trace the process of ossification as it occurs in the human femur or thigh-bone. Ossification commences in the interior of the cartilage at determinate points, which are hence termed *points* or *centers of ossification*. From these points the process advances into the surrounding substance. In the second month of foetal life, one of these centers shows itself about the middle of the shaft, and from this point ossification rapidly extends upwards and downwards along the whole length of the shaft. The upper and lower ends remain cartilaginous, and it is not till the last month of foetal life that a second center appears at the lower end. The third center, from which the upper end of the bone is ossified, does not appear till about a year after birth. The bone now consists of two extremities, or *epiphyses*, with an intermediate shaft or *diaphysis*; and the superior epiphysis is not ossified to the shaft until about the 18th, and the inferior until after the 20th

year. At about the 5th year a fourth ossific center is developed in the earilage of the greater trochanter, and a fifth center appears in the lesser trochanter at about the 14th year. These osseous processes, thus developed from special ossific centers, are termed *apophyses*. Most of the long bones are developed in a corresponding way. It is a curious fact (which is of such general occurrence that it may be regarded as a law) that in the skeletons, both of man and of the lower animals, the union of the various apophyses to the epiphyses, and of the epiphyses to the diaphysis or shaft, takes place in the inverse order to that in which their ossification began. The advantages derived from this subdivision of the long bones into segments, with interposed cartilaginous plates, are obvious. Besides the greater facilities for growth thus afforded, the flexibility of the bony frame-work is thereby greatly increased, and its escape from injury during the many falls incidental to this period of life is in no small degree attributable to this cause. See Humphry *On the Human Skeleton*, pp. 33 to 45.

True ossification sometimes occurs as a morbid process; but in many cases, the term is incorrectly used (especially in the case of blood-vessels) to designate a hard calcareous deposit, in which the characteristic microscopic appearances of true bone are altogether absent.

In one sense, the osseous tissue that is formed in regeneration of destroyed or fractured bones may be regarded as due to a morbid, although a restorative action. Hypertrophy of bone is by no means rare, being sometimes local, forming a protuberance on the external surface, in which case it is termed an *exostosis*; and sometimes extending over the whole bone or over several bones, giving rise to the condition known as *hyperostosis*. Again, true osseous tissue occasionally occurs in parts in which, in the normal condition, no bone existed, as in the duramater, in the so-called permanent cartilages (as those of the larynx, ribs, etc.), in the tendons of certain muscles, and in certain tumors. The peculiar causes of the osseous formations which are unconnected with bone are not known.

Calcareous deposits or concretions not exhibiting the microscopic character of bone, but often falsely termed ossifications, are of no unfrequent occurrence. Analyses of such concretions occurring in pus, in the valves of the heart, in the muscles, and in the lungs, are given by Vogel in his *Pathological Anatomy of the Human Body*; and in some of these concretions the phosphate and carbonate of lime occur in nearly the same percentages as those in which they are found in bone. The diseased condition usually but incorrectly called ossification of the arteries, is of sufficient importance to require a brief notice. In consequence of the deposition of earthy or calcareous matter in the middle coat of the artery, the vessel loses all its elasticity, and becomes a rigid, unyielding tube. All parts of the arterial system are liable to this change; but it is more frequently met with in the ascending portion and arch of the aorta, than in any other part of that vessel, and is more common in the lower extremities than the upper. The affection is usually partial, but occasionally it appears to be almost universal. Thus, Dr. Adams has recorded a case, in the Dublin hospital reports, in which no pulsation could be felt in any part of the body, and even the heart offered no other sign of action than a slight undulating sound. Old age strongly predisposes to this diseased condition, and probably few very aged persons are altogether exempt from it. There is also reason to believe that gout and rheumatism favor these calcareous deposits. This condition of the arteries may give rise to aneurism, to gangrene of the extremities in aged persons, and to atrophy, and consequent feebleness of the brain and heart. (The coronary arteries, which supply the heart with the arterial blood necessary for its own nutrition, are very often, although not always, ossified in angina pectoris). Moreover, this condition of the vessels very materially increases the risk from severe accidents and surgical operations.

OSSOLI, MARGARET, Marchioness. See FULLER, *ante*.

OSSORY, THOMAS BUTLER, Earl of, 1634-80; b. Ireland; son of James, duke of Ormond. He fought on the royalist side in the English civil war, and after being imprisoned in the Tower for eight months, went to Holland. He came back with Charles II. at the restoration, and was appointed lieut.gen. of the Irish army. In 1666 he was made lord-butler of Moore park. The same year he participated in the naval fight with the Dutch. In 1673 he was raised to the rank of admiral; in 1677 he led the English contingent in the army of the prince of Orange; and in 1678 he had a brilliant part in the defeat of marshal Luxembourg at Mons.

OSTADÉ, ADRIAN VAN, a celebrated painter and engraver of the Dutch school, was born at Lübeck, in n. Germany, in 1610. His teachers were Franz Hals and Rembrandt. He followed his art at Haarlem, till the French army of Louis XIV. threatened Holland, when he removed to Amsterdam, where he spent the remainder of his life. He died in 1685. Country-danceing greens, farm-yards, stables, the interiors of rustic hovels and beer-shops, are the places which he loved to paint; and his persons are, for the most part, coarse peasant carls, drunken tobacco-smokers, or peasant women employed in country work. In everything he did there is a bright and vivid naturalness. Not equal to Teniers in originality and quiet humor, he surpasses him in the force and fineness of his execution, though he is not free from trivialty and repetitions, and inaccuracies in drawing. He was a prolific painter, and his works are to be found in all the museums and collections of the Netherlands, Germany, France, and England. They have been well

engraved by Vischer, Suyderoef, and himself.—ISAAC VAN OSTADÉ, brother of Adrian, also a painter, was born at Lübeck in 1612, and died at Amsterdam in 1671. He did not equal his brother, whose style he labored to imitate.

OSTASHKOFF', a manufacturing district t. of Great Russia, in the government of Tver, stands on the s.e. shore of lake Seliguer; lat. $57^{\circ} 10'$ n., long. $33^{\circ} 6'$ east. The first settlements on this site are said to have taken place in 1230. Pop. '80, 12,000. Skin-dressing, boot-making, and fishing in the neighboring lakes are the principal employments of the inhabitants. The woods in the vicinity furnish bark for tanning purposes, and charcoal for the blacksmiths' shops. There are in Ostashkoff 37 tan-yards, in which skins are dressed, and Russian leather prepared to the amount of £90,000 annually. The leather prepared at Savine's tanyard is known in England, Austria, Italy, and North America. Two hundred and eighty thousand pairs of boots are made annually, and 400 men and 1000 women are engaged in the manufacture. Manufactures of hatchets and scythes are also carried on. The commerce of Ostashkoff is small, however, owing to its remote distance from important lines of communication.

OSTEND', a strongly fortified t. of the Belgian province of w. Flanders, on the German ocean, at the opening of the Ostend and Bruges canal, and on the state railway. Pop. '76, 16,823. Notwithstanding its proximity to the sea, the shallowness of the harbor prevents large ships from entering the port except at high tide. It ranks, however, as the second sea-port of the kingdom, Antwerp being the first, and is fortified with walls and broad ditches. It has some good manufactories for linens, sail-cloths, and tobacco, and several sugar, salt, and candle-works. From its position as a station for the steamers plying daily between London, Dover, and the continent, and as the terminus of various branches of railway in connection with the great French and German lines, it is a lively and active place of transport traffic, and is resorted to in the summer as a bathing-place by 12,000 persons from all parts of the continent. It is, moreover, an important station for oyster, cod, and herring fishing; has a good naval school, some ship-yards, an efficient staff of pilots, and is the seat of a commercial tribunal, and a chamber of customs. The imports greatly exceed the exports. There is an active trade in soap, wool, and salt. The harbor is furnished with a light-house, and is provided with an admirably-constructed stone promenade for the accommodation of the public. Ostende is memorable for the protracted siege which it underwent from 1601 to 1604, terminating in the surrender of the Dutch and Flemish garrison to the Spanish commander, Spinola.

OSTEOCO'LA, a kind of size or glue made by removing the mineral matter from bones, and dissolving the gelatine. Its common name is bone glue.

OSTEOGLOS'SIDÆ, a family of fresh water teleost fishes, characterized by the peculiar form of the head. The body is covered with mosaic-like hard scales; gill apertures large; branchiostegal rays numerous; pectoral fins low on each side; vertebrae from 60 to 80. The family is divided into two sub-families, *osteoglossinæ*, represented in the Philippine islands and Australia; and *heterotinæ*, having one genus *heterotís*, peculiar to w. Africa, and another *arapaima*, particularly inhabiting the Rio Negro, a branch of the Amazon. See **ARAPAIMA** *ante*.

OSTEOLE'PIS (Gr. bone-scale), a genus of fossil ganoid fish peculiar to the Old Red Sandstone. It is separated from its allies by having the two anal and two dorsal fins alternating with each other. Seven species have been described.

OSTEOL'OGY (Gr. *ostea*, the bones) is that department of anatomy which treats of the chemical and physical properties of the osseous tissue, and of the shape, development, and growth, articulations, etc., of the various bones of which the skeleton is composed. See **BONE**, **OSSIFICATION**, **SKELETON**, etc.

OSTEO-MYELI'TIS, an inflammation of the medullary or lining membrane of the bony cavities. It usually occurs as a consequence of injuries which expose the medullary canal to the air as well as to mechanical injury. It therefore sometimes follows compound fracture and ill-performed amputations, or operations on bad subjects. Its presence may be suspected when, after an injury to, or an operation on a bone, the limb swells and becomes very tender, with formation of abscess and profuse suppuration of a dark and fetid character. It is a very dangerous disease, indeed usually proving fatal, passing into osteo-phlebitis, and then into pyemia (q.v.). It is of an erysipeloid character, and is generally septic, which adds to the fatality of severe injuries and the larger amputations. There is death of bone, and therefore a natural tendency to its separation from the living parts. If nature succeeds the *sequestrum*, or separated dead bone, may be removed, which is usually not a difficult operation, because the parts are generally exposed and easily reached with a pair of forceps. Sometimes portions may be wedged in between sound parts of bone, when a small portion of the latter may be removed with a pair of cutting forceps, or a small saw. The constitutional treatment consists in supporting the patient's strength with nourishing food, such as strong beef-tea, beef-steak, chops, eggs, milk-punch, wine, cinchona, etc., and perhaps the administration in some cases, of a ferruginous tonic. Great attention must be paid to cleanliness and careful ventilation.

OSTERHAUS, PETER J., b. Prussia; having served as an officer in the Prussian army came to the United States, settled in St. Louis, and entered the U. S. volunteer

army in the first year of the rebellion as maj. of the 2d Missouri regiment. He participated in the battle of Wilson's creek, Aug. 10, 1861, under gen. Lyon who was killed, retiring under command of col. Sigel. He was promoted to the colonelcy of the 12th Missouri, and commanded a brigade under gen. Fremont, and also in the expedition conducted by S. R. Curtis, maj.gen. commanding the army operating in s.w. Missouri, resulting in the battle of Pea Ridge or Elk Horn, March 6-8, 1862, between the confederates under gen. Van Dorn, and the Union forces under gen. Curtis, the latter gaining the victory. In this action he commanded a division. June 9, 1862, he received his commission as brig.gen., and in the following December was placed in command of a division of the 13th corps at Helena, Ark., with which he assisted in the capture of Arkansas post, under gen. McClernand and admiral Porter, Jan. 11, 1863; also in the Vicksburg campaign, resulting in the surrender on July 4, 1863. He commanded the 1st division, 15th corps at Chattanooga under gens. Rosecrans and Thomas, and at the battle of Missionary Ridge, the heights on the e. overlooking Chattanooga (Lookout mountain being on the w.), under gen. Sherman, Nov. 25-26, ending in the defeat of the confederates. In its results this was one of the most important of the war. On July 28d he was made maj.gen., and followed Sherman from Chattanooga to the occupation of Atlanta, Sept. 1, 1864, commanding the 15th corps "from Atlanta to the sea." He was chief of staff to Gen. Canby at the surrender of the confederate gen. Richard Taylor, May 4, 1865, and was mustered out Feb., 1866.

OSTERO'DE, a small t. of Hanover, in the principality of Grubenhagen, situated at the western base of the Harz mountains, on the Söse, an affluent of the Leine, 20 m. n.e. of Göttingen. It contains large grain stores, from which the miners of the neighborhood and their families are supplied with grain at a low and fixed rate. Cotton, woollen, and linen fabrics and hosiery are extensively manufactured, also lead and copper. Pop. '80, 6,087.

OSTIA, a city of Latium, at the mouth of the Tiber, about 16 m. from Rome. It is said to have been founded by Ancus Martius, and was regarded as the oldest Roman colony. It first acquired importance from its salt-works, the establishment of which is attributed to Ancus Martius, and afterwards as the port where the Sicilian, Sardinian, and African corn shipped for Rome was landed; yet its name first occurs during the second Punic war. It was long, too, the principal station of the Roman navy; but its harbor was exceedingly bad, and gradually the entrance became silted up with alluvial deposits, so that vessels could no longer approach it, but were compelled to ride at anchor in the open roadstead, and to disembark their cargoes there. At length the Emperor Claudius dug a new harbor or basin two m. n. of Ostia, and connected it with the Tiber by a canal. It was named the *Portus Augusti*, and around it soon sprung up a new town called *Portus Ostiensis*, *Portus Urbis*, *Portus Romæ*, and often simply *Portus*. Yet it was not till nearly the close of the Roman empire that the prosperity of Ostia as a city began to decline. Its decay, however, was rapid, and in the 8th c. it was a mere ruin. During the middle ages a village—the modern Ostia—was built about half a mile above the ancient one; but it has not more than 100 permanent inhabitants, who still carry on the manufacture of salt, established in the pre-historic times of ancient Rome. The ruins of Ostia extend for a mile and a half along the banks of the Tiber, and are nearly a mile in breadth. See Nibby's *Dintorni di Roma* (vol. ii).

OSTIAKS, or **OSTYAKS**. See page 882.

OSTRA'CION, a genus, and **OSTRACIONIDÆ**, a family of fishes of the order *Plectognathi*. They are remarkably distinguished by having the whole body covered with an inflexible tuberculated coat of mail, formed of six-sided bony scales or plates combined in a tessellated quincuncial manner, the fleshy lips, the fins, and the tail protruding through holes in the armor. The gill-opening appears in the armor as a mere slit, bordered with a skinny edge, but there is a true gill-cover within. There are no ventral fins. The vertebræ are generally coalescent. There is little muscular substance, and in some species it is reputed poisonous; but the liver is large, and yields much oil. Some of the species are known by the names of **TRUNK-FISH** and **COFFER-FISH**. They are mostly found in the Indian and American seas. None are British.

OSTRACISM, a right exercised by the people of Athens of banishing for a time any person whose services, rank, or wealth appeared to be dangerous to the liberty of his fellow-citizens, or inconsistent with their political equality. It was not a punishment for any particular crime, but rather, as has been observed, a precautionary measure to remove such leaders as were obviously exercising a dangerous ascendancy in the state. Ostracism was introduced by Cleisthenes about the beginning of the 6th c. B.C., after the expulsion of the Peisistratidæ. The people were annually asked by the Prytanes if they wished to exercise this right, and if they did, a public assembly was held, and each citizen had opportunity of depositing, in a place appointed for the purpose, a potsherd (*ostrakon*) or small earthen tablet, on which was written the name of the person for whose banishment he voted. Six thousand votes were necessary for the banishment of any person; but the greatest men of Athens—Miltiades, Themistocles, Cimon, Alcibiades, etc.—were subjected to this treatment. The banishment was at first for ten years, but the period was afterward restricted to five. Property and civil rights or honors remained unaffected by it. Alcibiades succeeded in obtaining the final abolition of ostracism.

OSTRICH, CASSOWARY, ETC.—1. Guinea fowl. 2. Heath-cock. 3. Hocco. 4. Skeleton of cassowary. 5. Head of cassowary. 6. Foot of cassowary. 7. Ostrich. 8. Head of ostrich. 9. Foot of ostrich. 10. Nandu. 11. Ibis. 12. Wood-snipe. 13. Head of moor-snipe. 14. Oyster-bird. 15. Head of peewit. 16. Water-hen. 17. Dwarf bustard. 18. Serieme.

of which, however, Plutarch and Aristotle speak as a necessary political expedient, and its utility has been very ably defended in modern times by Mr. Grote (*History of Greece*, vol. iv. pp. 200 *et seq.*).

OSTRÆIDÆ, a family of lamellibranchiate mollusks of which the common oyster (*ostrea*) is the type. It is sometimes made to include another group, the *pectinidæ*, comprising the scallops, and is sometimes named pectinidæ, instead of ostræidæ. The following are the chief characteristics of the *ostræidæ*: Shell inequivalve, slightly inequilateral, free or attached to the bottom or some object; hinge usually toothless, ligament internal; lobes of the mantle entirely separated; foot small or wanting; a single adductor muscle. In the genus *ostrea* the shell is irregular and attached by the left valve, which is convex, and has a well-marked beak. The upper valve is usually concave or flat, and is the smaller. The hinge is toothless, having a single ligamental pit. The lower valve is more plaited than the upper, and both valves are in some species thus ornamented, as in *ostrea Marshii* of the oolitic formation. In the genus *gryphæa* the lower valve is much the longer and very much curved, so that it points inwards, and at right angles to the plane of the upper valve, the whole animal having a general resemblance in profile to an ammonite, although belonging to an entirely different class of mollusks. They existed during the triassic and cretaceous epochs. In the genus *exogyra*, which existed in the later oolitic and cretaceous epochs, the beaks are reversed, or turned toward the posterior side of the shell. The genus *ostrea* commences in the carboniferous seas, abounds in the secondary and tertiary periods, and is very plentiful at the present day. A genus, *pernostra*, has been founded for Jurassic oysters, which differ from *ostrea* proper in having the ligament contained in from four to eight transverse grooves or pits. In a second section or sub-family, *anomiadæ*, of ostræidæ there are various forms of which *anomia* may be taken as the type. This latter genus comprises bivalves having a very thin, translucent shell, which is attached to some body by a plug which passes through a hole or notch in the right valve. It appears to have commenced its existence in the cretaceous period, but *limanomia* of Devonian, *anomianella* of the carboniferous, and *placunopsis* of the Jurassic are older forms of the same type. The genus *placuna*, commencing in the tertiary, is allied in many respects to *anomia*, but the shell is unattached. For the group pectinidæ see PECTEN, *ante*. A fourth group of ostræidæ, sometimes regarded as a distinct family (*limadæ*), is represented by the typical genus *lima*, the shell of which is equivalve and unattached, and the beaks separated from one another and eared. The surface is usually partially covered with radiating ribs or ridges, and there is a median cartilage pit and a triangular hinge area. The genus appears to have commenced in the carboniferous, was abundant in the triassic, Jurassic, cretaceous, and tertiary formations, and has representatives at the present day in smaller numbers. The *limoptera* of the Devonian is perhaps an early representative. A fifth group of ostræidæ, which is sometimes ranked as a separate family (*spondylidæ*) is represented by what are known as the thorny oysters, and forms the genus *spondylus*. It has an inequivalve shell, and is attached by the right valve to some other body. The beaks are separated from each other, and the shell is covered with spines or thorns, inclined in a direction from the beak. The genus commenced in the Jurassic, was plentiful in the cretaceous, and has present representatives. The *plicatulæ* resemble *spondylus* by having an inequivalve shell which is attached by the right valve, and by having two hinge teeth in each valve. But the shell is seldom eared, the hinge area is obscure, and the valves are not armed with spines. They extend in time from the trias to the present epoch, and were exceedingly abundant in the lower greensand. The anatomy of the oyster is given in the article under that title.

OSTRICH, *Struthio*, a genus of birds of the order *grallatores*, and tribe *brevipennes* (q.v.), in Cuvier's system—the order *cursores* (or runners) of some ornithologists. In this genus the bill is of moderate length, broad, flattened, rounded at the tip, the mandibles flexible; the head small; the neck long; the legs long (both tibia and tarsus) and very robust, the lower part of the tibia, as well as the tarsus, naked; the feet have only two toes, of which the inner is the largest, and has a short claw, the outer has no claw; the wings are too short to be used for flight, but are useful to aid in running; the plumage is lax and flexible; the wings and tail have long soft drooping plumes. Only one species is known (*S. camelus*), a native of the sandy deserts of Africa and Arabia: the South American ostriches, or nandus (q.v.), constituting a distinct genus. The ostrich is the largest of all birds now existing, being from 6 to 8 ft. in height to the top of its head, and an adult male weighing from 200 to 300 pounds. The male is rather larger than the female. The head and upper part of the neck are scantily covered with a thin down, through which the skin is visible. The young have the head and neck clothed with feathers. The general plumage is glossy black in the adult male, dark grey in the female and young, with a slight sprinkling of white feathers; the long plumes of the wings and tail are white, occasionally marked with black. On each wing are two plumeless shafts, not unlike porcupine's quills. The inner toe is very large, about 7 in. long, and its claw hoof-like. Whilst the sternum is destitute of a keel, and the muscles which move the wings are comparatively weak, those which move the legs are of prodigious strength, so that the ostrich is not only capable of running with great speed, but of striking such a blow with its foot as to make it too formidable for the

leopard and other large beasts of prey to assail it. It has been often known to rip open a dog by a single stroke, and a man is recorded to have suffered the same fate. The eyes of the ostrich are large, and the lids are furnished with lashes. Its sight is keen, so that it descries objects at a great distance in the open desert.

The ostrich shuns the presence of man, but is often to be seen in near proximity to herds of zebras, quaggas, giraffes, antelopes, and other quadrupeds. It is gregarious, although the flocks of ostriches are not generally very large. It is polygamous, one male usually appropriating to himself, when he can, from two to seven females, which seem to make their nest in common, scooping a mere hole in the sand for this purpose. Each female is supposed to lay about ten eggs. The eggs are all placed on end in the nest, which often contains a large number, whilst around it eggs are generally to be found scattered on the sand. Concerning these, it has been supposed that they are intended for the food of the young birds before they are able to go in quest of other food; an improbable notion, not supported by evidence. It seems at least as likely that these scattered eggs are laid by females waiting whilst the nest is occupied by another, and that they are lost to the ostriches and no more regarded. Contrary to a very generally received opinion, the ostrich does not leave her eggs to be hatched entirely by the heat of the sun; or, if this be the case in the warmest regions, it is otherwise in the more northern and southern countries in which this bird is found; and by a remarkable instinct, the ostrich sits upon the eggs by night, when the cold would be too great for them, and leaves them to the sun's heat during the day.

The ostrich feeds exclusively on vegetable substances, its food consisting in great part of grasses and their seeds; so that its visits are much dreaded by the cultivators of the soil in the vicinity of its haunts, a flock of ostriches soon making terrible devastation of a field of corn. The ostrich has a very large crop, a strong gizzard, and a pretty large *proventriculus* between the crop and the gizzard; the intestines are voluminous, and the cæca long, with a remarkable spiral valve. There is a receptacle in which the urine accumulates, as in a bladder, a thing very uncommon in birds.

The ostrich swallows large stones, as small birds swallow grains of sand, to aid the gizzard in the trituration of the food; and in confinement has often been known to swallow very indiscriminately whatever came in the way, pieces of iron, bricks, glass, old shoes, copper coins, etc. Its instincts do not suffice to prevent it from swallowing very unsuitable things; copper coins were fatal in one instance, and a piece of a parasol in another.

The ostrich is very patient of thirst, or is capable of subsisting for a long time without water. It often supplies the want of water by eating the gourds or melons of the desert, to which even the lion is said to resort on the same account.

The speed of the ostrich, when it first sets out, is supposed to be not less than 60 m. an hour; but it does not seem to be capable of keeping up this speed for a long time. It is successfully hunted by men on horseback, who take advantage of its habit of running in a curve, instead of a straight line, so that the hunter knows how to proceed in order to meet it and get within shot. It is often killed in South Africa by men who envelop themselves in ostrich skins, and admirably imitating the manners of the ostrich, approach it near enough for their purpose, without exciting its alarm, and sometimes kill one after another with their poisoned arrows.

The strength of the ostrich is such that it can easily carry two men on its back.

The voice of the ostrich is deep and hollow, not easily distinguished, except by a practiced ear, from the roar of the lion. It also more frequently makes a kind of cackling; and when enraged and striking violently at an adversary, hisses very loudly.

The flesh of the ostrich is not unpalatable when it is young, but rank and tough when old. It is generally believed to have been prohibited as unclean to the Jews (Lev. xi. 16), although the name is translated *owl* in the English Bible. There are frequent references to it in the Old Testament.

The eggs of the ostrich are much esteemed as an article of food by the rude natives of Africa, and are acceptable even to European travelers and colonists. Each egg weighs about three pounds, and is thus equal to about two dozen ordinary hen's eggs. The egg is usually dressed by being set upright on a fire, and stirred about with a forked stick, inserted through a hole in the upper end. The thick and strong shell is applied to many uses, but particularly is much employed by the s. African tribes for water-vessels. The reader will probably recollect the interesting plate in Livingstone's *Travels* of women filling ostrich shells with water. In taking ostrich eggs from the nest the s. African is careful not to touch any with the hand, but uses a long stick to draw them out, that the birds may not detect the smell of the intruder, in which case they would forsake the nest; whilst otherwise, they will return and lay more eggs.

The long plumes of the ostrich have been highly valued for ornamental purposes from very early times, and continue to be a considerable article of commerce, for the sake of which the ostrich is pursued in its native wilds. See OSTRICH-FARMING.

The ostrich is often to be seen in Britain in confinement, and readily becomes quite tame and familiar, although still apt to be violent towards strangers. Great numbers were exhibited in the public spectacles by some of the Roman emperors; and the brains of many ostriches were sometimes presented in a single dish, as at the table of Helio-gabalus.

OSTRICH-FARMING. Attempts are being made to increase the supply of ostrich feathers, or to facilitate the procuring of them by establishing farms—inclosures where the birds can grow and breed in tameness. In 1859 the bulletin of the société d'acclimatation contained a note from Dr. Vavasseur discussing the question whether the ostrich of South America, the nandu (q.v.) or *rhea*, can be acclimatized in France. When caught they are easily tamed; and this is the circumstance which has suggested the idea of naturalization. They must not be placed in cages, but must have free range to walk about, secured simply by a leg-guard. Dr. Vavasseur expressed an opinion "that the South American ostrich could live without difficulty in the n. of France; that there is no difficulty in domesticating it; and that it will feed on almost anything that is given to it, however coarse."

At a meeting of the cape agricultural society of Cape Town, in 1864, Mr. L. von Maltitz gave an account of his experience in ostrich-farming at Colesberg. Towards the end of 1863 he purchased 17 young ostriches of three or four months old, and placed them in an inclosure of 300 acres, over which they had free run. They subsisted wholly on the herbage of the inclosure, save a little grain given to them now and then. The opinion he formed from many months' observation was that 35 ostriches might find sufficient sustenance upon 300 acres of good grazing-ground. In April, 1864, he had the wings of the birds cut at the point where the well-known ostrich feathers grow; and they were fit again to cut six months later. The birds were so tame that they allowed themselves to be handled, and their plumage minutely examined. Having caused the birds and the feathers to be examined by experienced dealers, he found that the largest feathers, of which there are 24 on the wing of each male bird, were worth £25 per lb.; and that one plucking of his 17 birds would yield £10 each on an average. The birds cost him about £5 each. Since this experiment of Mr. von Maltitz, ostrich-farming has become a recognized form of industry at the cape. The price of a healthy bird a week old is £10; at six months, £30. The feathers may be plucked when the bird is a year old, and each crop is worth about £7 a bird. The price of the feathers ranges, according to quality, from a few shillings per lb. to £40 or £50. In 1875 there were 32,247 domesticated ostriches in Cape Colony. It is found that 600 acres of grass are required to feed 80 birds; and when the grass is poor the ostriches are fed on supplies of shrubs and occasionally on Indian corn. The adult birds require to be kept in separate paddocks, which are generally surrounded by wire-fencing. The egg of the ostrich, though coarse, is reasonably good food; but the naturalization of the bird derives most of its prospective importance from the feathers, for which there is at all times a large demand in the chief European countries.

OSTRICH FEATHERS are occasionally borne as a heraldic charge, and always represented drooping. Three white ostrich feathers are the well-known badge of the prince of Wales. According to common tradition they were assumed in consequence of Edward the black prince having plucked a plume of ostrich feathers from the casque of John of Luxemburg, king of Bohemia, who fell by his hand at Crecy. There is, however, no doubt that ostrich feathers were previous to that time a cognizance of the Plantagenets. Prince Henry, eldest son of James I., first established the present arrangement of the three ostrich feathers within a prince's coronet.

OSTRICH FERN, *Struthiopteris*, a genus of ferns whose fertile fronds have somewhat the appearance of an ostrich plume. There is but one species (*S. Germanica*) known in America, which is also a native of Europe. There is probably another species in Japan. The American species thrives best in northern latitudes in alluvial soil. The sterile fronds are often 5 ft. and more in height, pinnate, the pinnæ pinnatifid, all growing in a close, circular tuft from the thick and scaly matted rootstocks, forming a beautiful vase-like cluster. Within the circlet of rootstocks arise the fertile fronds, about two-thirds the length of the sterile ones, having the margins of their pinnæ rolled backwards so as to form a somewhat necklace-shaped or continuous hollow cylinder inclosing the fruit. There are from three to five pinnate free veinlets from each primary vein, each bearing on its middle a fruit dot. Sporangia borne on an elevated receptacle, which is half encircled at its base by a delicate semicircular indusium.

OSTROG', a small district t. of w. Russia, in the government of Vohhynia, 100 m. w. of Jitomir. Here, in the reign of Constantine of Ostrog, a school and typography were established, and the first Slavonic Bible printed in 1558. Pop. 7,700.

OSTROGOTHS. See **GOTHS.**

OSTROK', the name of a convent in Montenegro, near Herzegovina, noted from its occupying a large cave in the side of a precipice 400 ft. in height. In the various Montenegrin insurrections or wars it has often been made use of as a fortress or store-house for powder and ammunition.

OSTROLEN'KA, a t. in the Polish government of Lomza, 60 m. n.e. of Warsaw, and on the Narew river. It is noted as having been the scene of two battles, the first in 1807, when the Russian gen. Essen was defeated by the French under Savary, and the second in 1831, when the Polish insurgents under the lead of Skrzynecki were overwhelmed by the Russians. The present pop. of the town is about 3,500.

OSTROWS'KY MOUNTAINS, a central range of the Carpathian mountains, of volcanic formation. Sitna is the highest peak, 3,498 ft. high. The rivers Eipel, Sajo, and Gran flow at the base of its slopes and separate it from other portions of the main range.

OSTU'NI, a city of s. Italy, in the province of Lecce, 22 m. w.n.w. from Brindisi, on the railway between Ancona and Brindisi. It stands on a steep hill. A considerable trade is carried on, chiefly in the produce of the neighborhood, and the city is a flourishing one. Pop. '81, 15,199.

OSU'NA, a t. of Spain in the province of Seville, 48 m. e.s.e. of the city of that name, stands in a fertile plain, and on a triangular hill crowned by a castle and the collegiate church. It stands in the midst of a highly fertile plain, productive in grain, olives, almonds, etc. An extensive panoramic view is obtained from the castle. The collegiate church, in the mixed Gothic and cinque-cento style, was built in 1534. It was pillaged by Soult of 5 cwt. of ancient church plate, and was converted by him into a citadel and magazine. Pop. 17,500, who are engaged in agriculture and in the manufacture of linen goods, and iron and earthenware.

OSU'NA, PEDRO TELLEZ Y GIRON, Duke of, 1579-1624; b. Spain; married in 1598 a daughter of the duke of Alcalá, and took the title of duke of Osuna. He was several times expelled from court, but finally regained favor, and was appointed viceroy of Sicily in 1611 and of Naples in 1616. He opposed the establishment of the inquisition at Naples; resisted the attempts of Venice to control the commerce of the Mediterranean; and was recalled in 1620 on suspicion of usurping for himself the government of s. Italy. He was confined in Almedas castle, and died by poison.

OSWALD, SAINT, 605-642; king of Northumbria, son of king Ethelfrid. He spent some years an exile in Scotland, during which time he was converted to Christianity. He recovered his kingdom and ascended the throne in 634, having defeated in battle, and killed, Cadwalla, king of Wales. He married Cyneburg, a daughter of Cynegil, a West-Saxon king, and with her assistance introduced the Christian religion among the Anglo-Saxons. He was killed at Maserfield by the king of Mercia, Penda, a heathen, and was canonized by the Roman church. There are numerous legends concerning him, which at one time were very popular in Germany, and were published in book form in 1856 by Zingerle, entitled *Die Oswaldlegende und ihre Berichung zur deutschen Mythologie*.

OSWALD, ELEAZER, 1755-95; b. England; related to Richard Oswald of Auchencruive; he became interested in the American colonies, emigrated to America in 1770; and served as capt. under Arnold at Ticonderoga, also at Quebec in 1775, where he assumed command and distinguished himself, Arnold having been wounded. He was Arnold's secretary, and in 1777 was promoted to be lieut.col. in Lamb's artillery regiment, and was commended by gens. Lee and Knox for his brave conduct at Monmouth. He became a printer and publisher at Philadelphia; also public printer. In all political questions he was a bitter opponent of Hamilton and challenged him to fight a duel in 1789, but the affair was settled by friends without fighting. He commanded a regiment of artillery in the French army at the battle of Jamappes. Died of yellow-fever in New York.

OSWALD, RICHARD, 1705-84; b. Scotland; a London merchant, a representative of England at the signing of articles of peace at the close of the revolutionary war. He gave bail in the enormous sum of £50,000 for Henry Laurens. His wife, Mary Ramsey, was celebrated by Robert Burns in his songs.

OSWALDTWISTLE. See page 882.

OSWE'GO, a co. in n. central New York, bounded n. and e. by lake Ontario, s.w. by lake Oneida, and drained by the Oswego, Oneida, and Salmon rivers; intersected by the New York and Oswego Midland, the Oswego and Syracuse, and the Rome, Watertown and Ogdensburg railroads; 970 sq.m.; pop. '80, 77,915-66,739 of American birth. The surface is nearly level and adapted to grazing. Hay, oats, lumber, maple sugar, potatoes, and dairy products are the staples. There are several large flouring mills. Sandstone suitable for building purposes is found. Oswego and Pulaski are the semi-capitals. There are about forty towns and villages.

OSWE'GO, a city and port of entry in New York, is situated at the mouth of Oswego river, on lake Ontario, at the extremity of the Oswego canal, a branch of the Erie, and is a station on several railways. It is a handsome city, with streets 100 ft. wide, crossing at right angles, with costly government buildings, custom-house, court-house, post-office, city hall, hospital, orphan asylum, library, 16 churches, 2 daily and 2 weekly newspapers, excellent schools, etc. It has a large trade with the lake country and Canada, and exports about \$12,000,000 per annum. On the river are 14 flour-mills, making 600,000 barrels of flour a day, with 11 elevators for unloading vessels for 45,000 bushels an hour. Among the manufactures is that of 13,000,000 lbs. of what is known as Oswego flour, made from Indian corn. The lumber received in 1874 measured 210,814,573 ft., besides 47,605,053 shingles, 2,654,126 pieces of heading, etc. There are a fort and a navy-yard, and an excellent harbor recently constructed. Pop. '70, 20,910.

OSWEGO (*ante*), the capital of Oswego co., on the Delaware, Lackawanna and Western, the New York and Oswego Midland, the Rome, Watertown and Ogdensburg railroads; pop. '80, 21,117. It is connected by daily steamers with Montreal and the west. The river has a fall of 34 ft., distributed by 6 dams. Large shipments of lumber from and coal to Canada are made. The harbor is surrounded by breakwaters and jetties, has a width of 300 ft. at the entrance, and a depth of from 9 to 13 ft. at low water. There are machine shops, ship yards, iron foundries, etc. Oswego was incorporated as a village in 1828 and a city in 1848. A trading post was established there in 1720.

OSWEGO TEA, a name given to several species of *monarda*, particularly *M. purpurea*, *M. didyma*, and *M. kalmiana*, natives of North America, because of the occasional use of an infusion of the dried leaves as a beverage. They belong to the natural order *labiata*, somewhat resemble mints in appearance, and have an agreeable odor. The infusion is said to be useful in intermittents, and as a stomachic. Some other species of *monarda* are used in the same way.

OSWESTRY, a thriving market t. and municipal borough of England in the county of Salop, 18 m. n.w. of Shrewsbury. The stone pillars of its ancient gateways still stand in the streets. There are also scanty remains of a castle, said to have been the ancestral seat of Walter Fitzalan, progenitor of the royal house of Stuart, who, during the troubles of the reign of king Stephen, fled hence to Scotland, and became steward to David I., king of Scotland. Oswestry is the center of an extensive agricultural district; it has extensive market-places, and its weekly market for agricultural produce and cattle is very largely attended. There are corn-mills and coal-mines in the vicinity. Oswestry contains the offices and works of the Cambrian company, and is favorably situated as a railway center. Pop. '81, of municipal borough, 7,851. Oswestry is said to derive its name from Oswald, king of Northumbria, slain here in 642. Near the town is Oswald's well, a fine spring of water; and "Old Oswestra," an ancient encampment.

OSYMAN'DYAS, the name of a great king of Egypt, mentioned by Diodorus and Strabo, who reigned, according to these authors, as the 27th successor of Sesostris. He distinguished himself, according to these authors, by his victories, and invaded Asia with an army of 400,000 men and 20,000 cavalry, and conquered the Bactrians, who had been rendered tributary to Egypt by Sesostris. In honor of this exploit, he is said by Hecataeus to have erected a monument which was at once a palace and a tomb, and which, under the name of *Osymandeion*, was renowned for its size and splendor in later times. It was said to be situated in the necropolis of Thebes, or at Gournah, and close to the sepulchres of the concubines of the god Amen Ra. The *Osymandeion* is generally believed to be represented by the extant ruins of the palace of Rameses III. at Medinet Haboo, though great difficulty has been felt in reconciling the descriptions of its magnificence in ancient writers with the dimensions of the modern relic; and Letronne, in his *Tombeau d'Osymandyas* (Par. 1831), has even ventured to suppose that it was an imaginary edifice invented by the Greeks from their acquaintance with the great palaces of Thebes, but this skepticism is considered extreme. The name of *Osymandyas* is difficult to recognize amongst the Egyptian kings, the nearest approach to it being one of the Setis, either the 1st or 2d, called after death, Asiri-Meneptah. Others consider *Osymandyas* the *Ismendes* of Strabo, or the *Mendes* of Herodotus. The name of *Amenophis* may also lie concealed in his name, so much ambiguity pervades the subject.

Diodorus, i. 46-50; Strabo, xvii. p. 8, 11-16; Juvenal, xv. 38; Letronne, *Mem. de l'Inst.* ix. p. 321; Champollion, *Lettres Ecrites*, p. 260, 303; Champollion-Figeac, *L'Egypte*, 69, 291, 313-315.

OTA'GO, one of the most recent settlements, but, at the same time, the most prosperous, populous, and likely to become the most influential province of New Zealand (q.v.). Since the re-incorporation of Southland—a portion of its territory which, in 1861, was parted from Otago and raised into a small separate province, an experiment which failed in a short time—it is now the most southern province of South island (see **NEW ZEALAND**). Otago is bounded on the n. by the province of Canterbury, and on the w., e., and s. by the Pacific ocean; is in length 200 m., 160 m. in breadth, and possesses an invaluable line of coast which measures 400 miles. The entire area is about 15,500,000 acres—over 24,000 sq. miles. Pop. in 1871, 69,500; in 1881, estimated at 135,418. The chief rivers are the Waitaki, the Clutha, and the Mataura, all of which flow s.s.e., and are navigable to a greater or less extent. The western regions of Otago remain unsurveyed, but are known to be covered with high, and in many cases snow-capped mountains, stretching along the whole line of coast, and extending inland for upwards of 60 miles. East and n.e. from the Matura river to the shore the surface is well known, and consists of mountain-ranges alternating with valleys, and extending parallel to the sea and to each other as far inland as the valley of the Manuherikia, one of the first affluents of the Clutha. The climate of Otago is exceedingly healthy and invigorating; frost and snow are unknown except in the higher ranges, and rain, though sufficiently abundant to answer the demands of agriculture, does not interfere with outdoor occupations. All the English fruits and flowers, with some trifling exceptions, are grown here to perfection. The northern and interior districts of the province are eminently adapted, as regards both soil and climate, for agriculture as well as cattle-breeding. The western districts are rugged, and covered with forests; but in the eastern regions are many fertile and well-watered

tracts, admirably suited for the production of corn, and the rearing of cattle and sheep. In mineral wealth the province of Otago is remarkably rich. Coal, iron, copper, silver, lead, etc., have been found, and useful earths and clays are abundant. Gold has been found in small quantities in other provinces of New Zealand, as in Auckland and Nelson province; but by far the most important gold-fields of the colony are in the province of Otago. Gold was first discovered here by Mr. Gabriel Read in June, 1861, in a gully, since called Gabriel's gully, on the Tuapeka, an affluent of the Clutha, in a direct line 37 m. w. of Dunedin. Read placed his discovery in the hands of government, and was presented by the provincial council with £500 as a reward. In less than two months from the discovery of gold 3,000 people were at work in the Tuapeka valley, and were obtaining 6,000 oz. a week. From this time gold-mining became a staple employment. A "rush" was made from Australia; Dunedin, formerly the village-capital of the province, now rapidly increased in size and trade, new fields were discovered, and the immigration-lists were immensely swelled. From June, 1861, to June, 1863, 700,000 oz., worth nearly £3,000,000, were obtained. The most productive gold-field hitherto discovered is the Arrow river district, in the vicinity of lake Wakatiki. This district was made known in Nov., 1862, and from that time to the end of Oct., 1863, 237,655 oz.—value £955,620—were forwarded to Dunedin by escort. The value of the gold exported from Otago up to the end of 1880 was £15,818,948; in 1876 it was £487,632. In 1880 the imports amounted in value to £1,989,901; the exports to £1,988,101. Gold, wool, timber, and agricultural produce are the principal articles of export. In agriculture, the chief growths are wheat, oats, barley, potatoes, and hay. In 1880 the extent of land under cultivation, and the amount of these products of the farm, were reported to be as follows: wheat, 53,771 acres, supplying 1,930,000 bushels; oats, 143,165 acres, 6,000,000 bushels; barley, 10,114 acres, 340,000 bushels; potatoes, 5,290 acres, 25,000 tons; hay, 7,592 acres, 11,899 tons. The first band of settlers reached the shores of Otago in the spring of 1848. The capital is Dunedin (q.v.). The population of this city and its suburbs, Roslyn and Caversham, was, in 1881, 42,802. Otago was originally a class colony connected with the free church of Scotland; but the influx of immigrants consequent on the discovery of gold has obliterated its distinctive character.

OTAHEITE. See TAHITI.

OTAL'GIA (Gr. *ot*, the ear, and *algos*, pain) is neuralgia of the ear. It occurs in fits of excruciating pain, shooting over the head and face, but it is not accompanied by fever, nor usually by any sensation of throbbing. Its causes and treatment are those of neuralgia generally, but it is particularly caused by caries of the teeth, which should always be carefully examined by a dentist in these cases. When patients complain of *earache*, the pain is far more commonly due to *otitis*, or inflammation of the tympanic portion of the ear, a much more serious affection.

O'TARY, *Otaria*, a genus of the seal family (*Phocidae*), distinguished from the rest of the family by a projecting auricle or auditory conch (often popularly called "external ear"), and by a very remarkable character, a double cutting edge in the four middle upper incisors. The membrane which unites the toes of the hind-feet is prolonged into a flap beyond each toe. The fore-legs, as if intended exclusively for swimming, are placed further back in the body than in the true seals, giving the otaries the appearance of having a longer neck. The hind-legs are more like the fore-legs than in the true seals.—The SEA-LION (*O. jubata* or *O. Stelleri*) of the northern seas is about 15 ft. in length, and weighs about 16 cwt. It inhabits the eastern shores of Kamtchatka, the Kurile islands, etc., and is in some places extremely abundant. It is partially migratory, removing from its most northern quarters on the approach of winter. It is to be found chiefly on rocky coasts and islet rocks, on the ledges of which it climbs, and its roaring is sometimes useful in warning sailors of danger. It is much addicted to roaring, which, as much as the mane of the old males, has obtained for it the name of sea-lion. The head of this animal is large; the eyes very large; the eyebrows bushy; the hide thick; the hair coarse, and reddish; a heavy mass of stiff, curly, crisp hair on the neck and shoulders. The old males have a fierce aspect, yet they flee in great precipitation from man; but if driven to extremities, they fight furiously. Sea-lions are capable of being tamed, and become very familiar with man. They are polygamous, but a male generally appropriates to himself only two or three females. They feed on fish and the smaller seals.—The sea-lion of the southern seas, once supposed to be the same, is now generally believed to be a distinct species, and, indeed, more than one species are supposed to inhabit the southern seas.—The URSINE SEAL, URSINE OTARY, or SEA BEAR (*O. ursina*), is an inhabitant of the northern Pacific. It is scarcely 8 ft. long. The hinder limbs being better developed than in most of the seals, it can stand and walk almost like a land quadruped. The muzzle is prominent, the mouth small, the lips tumid, the whiskers long; the tip of the tongue is bifurcated, the eyes are large, the skin is thick, the hair long, erect, and thick, with a soft underclothing of wool. The food consists of sea-otters, small seals, and fish. The ursine seal is polygamous, a strong male appropriating to himself from eight to fifty females. It swims with great swiftness. It is fierce and courageous. Its skin is much prized for clothing in the regions in which it abounds. As in the case of the sea-lion, it is doubtful if the geographical range of the sea-bear extends to the southern seas, or if it is represented there by a similar species. Several

other species of otary are inhabitants of the Pacific and Southern oceans. The **FUR SEAL** (*O. falklandica*) is one of these. It is found on the Falkland islands, South Shetland, etc. It is of a long and slender form, with broad head, and clothed with a soft, compact, grayish-brown hair, amongst which is a very soft, brownish fur. It is gregarious and polygamous. When South Shetland was first visited, its seals had no apprehension of danger, and unsuspectingly remained whilst their fellows were slain and skinned; but they have since learned to be upon their guard. The skin of the fur seal is in great demand, chiefly for ladies' mantles, and was much used for making a kind of soft fur cap, which was very common thirty or forty years ago,

OTCHAKOV, a small t. and sea-port of South Russia, in the government of Kherson, surrounded on all sides by a barren steppe, stands at the western extremity, and on the n. shore, of the estuary of the Dnieper, 40 m. e.n.e. of Odessa. It traces its foundation to the very earliest times, and is supposed by some to be the spot where stood the Grecian colony Olbia; by others, to be Tomi, the scene of Ovid's banishment. At the end of the 15th c., the khan of the Crimea built here a strong fortress. Its present name occurs for the first time in 1557. During the Russian wars with Turkey in the 18th c., Otchakov was alternately the property of each, until it was taken by Potemkin in 1788, and definitively annexed to the Russian dominions. The vicinity of Odessa is fatal to the development of foreign commerce at its port. Pop. '77, 5,140, the greater part of whom are Jews, and are employed in salting fish for transport to Little Russia.

OTEY, JAMES HERVEY, D.D., 1800-63; b. Va.; a graduate of the university of North Carolina, Chapel Hill, class of 1820; ordained minister in the Protestant Episcopal church 1825, and the first minister of that faith settled in Tennessee. In 1834 he became bishop of Tennessee, and labored in Mississippi, Louisiana, and Alabama, with great success, among the white population and natives. Through the s. and s.w. he bore the title of "the good bishop." At the outset of the war of the rebellion he wrote a letter of remonstrance to the U. S. secretary of state concerning coercive measures on the part of the federal government, which he disapproved, and received a reply that materially changed his views, so that subsequently he acted with the north. He published a number of charges, sermons, speeches, and addresses; *The Unity of the Church*; *The Ministry*; *The Apostolical Succession*; and *Three Discourses*.

OTFRIED, a German poet, who was b. in the 9th century. He was a Frank by birth; studied at Fulda till 848; then lived many years in St. Gall, and finally became a monk in a Benedictine monastery at Weissenburg, Alsace. While there he wrote his *Liber evangeliorum*, a poetical paraphrase of the gospels, in four-lined rhymed stanzas. The aim of this poem was to replace the heathenish ballads of the newly converted Germans. It is the first rhymed poem we possess of the 9th c., and is chiefly valuable as a study of the German language of that time. The poem, which was probably written before 868, was first published by M. Flacius (Basle, 1571). A translation into modern German, by Kelle, appeared in 1870. For a historical sketch of this poem, and the poetry of his time, see *Otfried's Evangelienbuch und die übrige Althochdeutsche Poesie Krolingischer Zeit*, by Rechenberg (1862).

OTHMAN, OTHOMAN, or OSMAN I., surnamed *Al-ghazi* ("the conqueror") the founder of the Turkish power, was b. in Bithynia in 1259. His father, Orthogrul, the chief of a small tribe of Oguzian Turks, had entered the service of Alla-ed-din Kaikobad, the Seljuk sultan of Iconium, and had rendered important services to that monarch and his successors in their wars with the Byzantines and Mongols. Orthogrul dying in 1289, after a rule of more than half a century, his tribe chose his son Osman (i.e., the "young bastard,") as his successor. Othman trod in his father's footsteps; and on the destruction of the sultanate of Iconium in 1299 by the Mongols, succeeded in obtaining possession of a portion of Bithynia. He had previously subjugated many of the neighboring Oguzian chiefs, and this new accession of territory rendered him powerful enough to attack the Byzantines with success. In July, 1299, he forced the passes of Olympus, and took possession of the whole territory of Nicaea, with the sole exception of the town of that name, which resisted his efforts for five years longer. In 1301 he defeated the emperor Andronicus II. at Baphaeon; in 1307 he incorporated the province of Marmara in his dominions; and continued till his death, in 1326, steadily to pursue his plans of conquest. "Othman," says Knolles, "was wise, politic, valiant, and fortunate, but full of dissimulation, and ambitious above measure; not rash in his attempts, and yet very resolute; to all men he was bountiful and liberal, especially to his men of war and to the poor. Of a poor lordship, he left a great kingdom (Phrygia, Bythnia, and the neighboring districts), having subdued a great part of Asia Minor, and is worthily accounted the first founder of the Turks' great kingdom and empire." Othman assumed the title of sultan (though this is denied by many historians) on the extinction of the Iconian sultanate in 1299, held his court at Kara-Hissar, and struck money in his own name. From him are derived the terms Ottomans, Othomans, and Osmanli or Osmanlû, which are employed as synonymous with Turks. See **OTTOMAN EMPIRE**.

OTHMAN IBN AFFAN, third caliph of the Moslems, was b. about 574. He belonged to the family of the prophet, and was cousin-german of Abu Sofian. One of the early converts to Islam, he was one of its most zealous supporters, and linked himself still

more strongly to Mohammed by becoming his son-in-law and private secretary. He was elected to succeed Omar in the caliphate in Dec. 644, and a most unworthy successor he proved to be. The Moslem empire, however, continued to extend itself on all sides till the insane nepotism of Othman gave its progress a sudden check. The able and energetic leaders who had been appointed by Omar were superseded by members of his own family, and of that of Abu Sofian; and the consequences were what might have been expected. Egypt revolted, and the caliph was compelled to reinstate Amru in the government of that country, and several other rebellions were only quelled by a similar restoration of the previous governors. Zealous Moslems deeply deplored the folly of their chief, and were indignant at seeing the chair of the prophet occupied by Othmar, while Abu-bekr, and even Omar, were accustomed to seat themselves two steps below it. Emboldened by the knowledge of his vacillating and cowardly disposition, they showered upon him reproaches and menaces; but the bearer of their remonstrances having been bastinadoed by Othman's order, a general revolt ensued. Othman averted the crisis by unconditional submission; but having soon after attempted to put to death Mohammed, the son of the caliph Abu-bekr, the latter made his appearance at Medina at the head of a troop of malcontents, and forcing his way to the presence of Othman, stabbed him to the heart. Othman was of a mild and pacific disposition, but he was at the same time most ambitious of power, though after his accession to supreme authority, he showed himself to be, either from age or natural imbecility, deplorably deficient in those energetic virtues, without which the control of a warlike people and the management of a mighty empire such as that of the Moslems, were utterly impossible. Othman was the first to cause an authentic copy of the Koran to be composed.

OTHO, MARCUS SALVIUS, Roman emperor, was descended of an ancient Etruscan family, and was b. 32 A.D. He was a favorite companion of Nero, who appointed him governor of Lusitania, in which office he acquitted himself creditably. On the revolt of Galba against Nero, Otho joined himself to the former; but being disappointed in his hope of being proclaimed Galba's successor, he marched at the head of a small band of soldiers to the forum, where he was proclaimed emperor, and Galba was slain, 69 A.D. Otho was recognized as emperor over all the Roman possessions, with the exception of Germany, where a large army was stationed under Vitellius. The first few weeks of his reign were marked by an indulgence towards his personal enemies, and a devotion to business, which, though at total variance with his usual habits, excited in the minds of his subjects the most favorable hopes. But the tide of rebellion raised in Germany by Valens and Cæcina during the reign of Galba had by this time gathered strength, and these commanders having prevailed upon Vitellius, who had become a mere good-humored glutton, to join his forces to theirs, the combined army poured into Italy. Otho fortunately possessed several able generals, who repeatedly defeated the rebels; but the prudence of some among them in restraining the enthusiasm of their troops, who wished further to follow up their victories, was unfortunately considered as cowardice or treason, and produced dissensions in Otho's camp. This state of matters becoming known to the generals of Vitellius, encouraged them to unite their armies, and fall upon the forces of Otho. An obstinate engagement took place near the junction of the Adda and the Po, in which the army of Otho was completely routed, and the relics of it went over on the following day to the side of the victor. Otho, though by no means reduced to extremity, resolved to make no further resistance; settled his affairs with the utmost deliberation; and then stabbed himself, April 15, 69 A.D.

OTHO I., second son of Ludwig, king of Bavaria, was b. at Salzburg, June 1, 1815, and on the erection of Greece into a kingdom in 1832, was appointed by the protecting powers king of Greece. Till he attained his majority, the government was intrusted to a regency, which was unable to suppress internal disorder, or counteract the diplomatic intrigues of foreign powers. On assuming the government in 1835 Otho transferred the court from Nauplia to Athens, and passed into law several important measures, which afforded the most lively satisfaction to his subjects. During a visit to Germany in 1836, he married the princess Amalie of Oldenburg. A monetary crisis, provoked partly by false administrative measures, and partly by too prompt demands for repayment on the part of the protecting powers, threw the affairs of Greece into confusion, and materially weakened the king's popularity. A national reaction against the Germanizing tendencies of the court followed, and resulted in 1843 in a military revolution, which was suppressed. Otho now attempted to soothe the general discontent by taking the oath to the new constitution of Mar. 30, 1844, but his efforts were only partially successful. Though the Bavarian ministers were dismissed, the king and his Greek advisers showed the most reactionary tendencies, and attempted in various ways to curtail the privileges which the new constitution had conferred on the people. The equivocal position in which he was placed, in 1853, between the allied powers on the one hand, and his subjects, whose sympathies were strongly in favor of Russia, on the other, greatly increased the difficulties of his situation. The occupation of the Piræus by Anglo-French troops enabled him to restrain the enthusiasm of his subjects; but after their withdrawal in 1857, he was obliged to adopt severe measures against the frontier brigands. His council, too, was composed of men unable or unwilling to support him, and his position became year by year more and more difficult. The strong pro-Russianism of the queen rendered her

for some time a favorite; but the belief that Otho's absolute measures were due to her instigation, turned the tide of popular hatred so strongly against her, that attempts were made on her life. The general discontent at last found vent in insurrections at Nauplia and Syra in 1862, which were soon suppressed. A more formidable insurrection in the districts of Missolonghi, Acarnania, Elis, and Messenia, having for its object the expulsion of the reigning dynasty, broke out in October of the same year, and in a few days extended to the whole of Greece. Otho and his queen fled to Salamis, from which place he issued a proclamation declaring that he quitted Greece to avoid the effusion of blood, and a provincial government was then established. This government, in Feb., 1863, resigned its executive power to the national assembly, which confirmed its acts, and decreed that prince Alfred of England had been duly elected king of Greece. On the refusal of this prince to accept the throne, their choice fell on prince William of Schleswig-Holstein-Sonderburg-Glücksburg, the second son of Christian IX., king of Denmark, who under the title of George I., king of the Hellenes, in Sept., 1863, assumed the functions of royalty. Otho died July 26, 1867.

OTHO I., or the great, son of the emperor Henry I. of Germany, was b. in 912, and after having been early recognized as his successor, was, on the death of his father in 936, formally crowned king of the Germans. His reign was one succession of eventful and generally triumphant wars, in the course of which he brought many turbulent tribes under subjection, acquired and maintained almost supreme power in Italy, where he imposed laws with equal success on the kings of Lombardy and the popes at Rome, consolidated the disjointed power of the German emperors, and established Christianity at many different points in the Scandinavian and Slavonic lands, which lay beyond the circuit of his own jurisdiction. His earliest achievement was a successful war against the Bohemian duke Boleslas, whom he reduced to subjection, and forcibly converted to Christianity; next, the dukes of Bavaria and Franconia were compelled to succumb to his power; the former paying the penalty of his opposition to Otho by defeat and death in battle, and the latter by the confiscation of his territories, which, together with the other lapsed and recovered fiefs of the empire, were bestowed on near and devoted relatives of the conqueror. After subduing the Slavi of the Oder and Spree, for whose Christian regeneration he founded the bishoprics of Havelburg and Brandenburg, driving the Danes beyond the Eyder, compelling their defeated king to return to the Christian faith and do homage to himself; and after founding, at the suggestion of his mother's former chaplain, Adeldag, the bishoprics of Aarhus, Ribe, and Sleswick, which he decreed were forever to be free from all burdens and imposts, he turned his attention to the affairs of Italy. Here he presented himself as the champion of the beautiful Adelheid, the widow of the murdered king Lothaire; and having defeated her importunate suitor, Berengar II. (q. v.), married her, and assumed supreme power over the north of Italy in 951. The wars to which this measure gave rise obliged Otho frequently to cross the Alps; but at length after a great victory gained over the Huns in 955, and the defeat and capture of Berengar, Otho was acknowledged king of Italy by a diet held at Milan; and after being crowned with the iron crown of Lombardy, was, in 962, recognized by pope John XII. as the successor of Charlemagne, and crowned emperor of the west at Rome. Otho lost no time in asserting his imperial prerogatives; and having called a council, effected the deposition of John, whose licentiousness had become a burden to Italy and a scandal to Christendom, and caused Leo VIII. to be elected in his place. Fresh wars were the result of this step. Popes and antipopes distracted the peace of Rome; but through all these disorders Otho maintained the supremacy which he claimed as emperor of the west in regard to the election of popes and the temporal concerns of the Roman territories. His later years were disturbed by domestic differences; for his elder son, Ludolph, and his son-in-law, Konrad of Lorraine, having risen in rebellion against him, through jealousy of his younger son and intended successor, Otho, the empire was distracted by civil war. Although the war terminated in the defeat of the rebels, and the recognition of young Otho as king of the Germans, and his coronation at Rome, in 967, as joint emperor with his father, Otho's favorite scheme of uniting the richly-dowered Greek princess, Theophania, with the young prince met with such contempt from the Greek emperor that his outraged pride soon again plunged him into war. His inroads into Apulia and Calabria, however, proved convincing arguments in favor of the marriage, and Theophania became the wife of young Otho, with Calabria and Apulia for her dowry. Otho died at Minsleben, in Thuringia, in 973, and was buried at Magdeburg, leaving the character of a great and just ruler, who had extended the limits of the empire, and restored the prestige of the imperial power more nearly to the stand which it occupied under Charlemagne than any other emperor. He created the duchy of Carinthia, and the mark-grafdoms of east and north Saxony; appointed counts-palatine; founded cities and bishoprics; and did good service to the empire, in reorganizing the shaken foundations of its power in Europe. See Vehse's *Leben Kaiser Otho's des Grossen* (Dresd. 1827).

OTHO II., surnamed *Rufus*, "the red," son of Otho I., was b. in 955, and succeeded his father in 973. For a time Otho was content to rule under the regency of his mother, the empress Adelheid; but differences having arisen between them, through the headstrong and ambitious inclinations of the young monarch, his mother withdrew from all

share in the administration, and left him to the exercise of his own will, which soon brought him into collision with the great vassals of the crown. Civil war broke out under the leadership of Henry II. of Bavaria, who formed a secret alliance against the young emperor with Harold, king of Denmark, and Micislav of Poland, and for a time fortune inclined to the side of the rebels; but Otho's astuteness circumvented their designs, and after defeating Henry, and depriving him of his duchy, he marched against the Danish king, who had been making successful incursions into Saxony. Otho's first attack on the Dannevirke having proved of no avail, he retired, vowing that he would return before another year and force every Dane to forswear paganism. Otho kept his promise, returning to the attack the following year, when, according to the old chroniclers, acting by the advice of his ally, Olaf Trygvesen of Norway, he caused large quantities of trees, brush-wood, and stubble to be piled up against the Dannevirke, and set on fire, and this drove away the defenders, and destroyed their fortifications. The defeated Harold was soon overpowered by the superior numbers of the Germans, and compelled to receive baptism, as the badge of his defeat. The next scene of war was Lorraine, which the French king, Lothaire, had seized as a former appanage of his crown; but here, after a partial defeat, Otho succeeded in reasserting his power; and not content with this advantage, devastated Champagne, pursued and captured Lothaire and advanced upon Paris, one of the suburbs of which he burned. Scarcely was this war ended when the disturbed condition of Italy called Otho across the Alps. His presence put a stop to the insurrection at Milan and Rome, where he re-established order; and having advanced into lower Italy, he defeated the Saracens, drove back the Greeks, and having re-established his supremacy in Apulia and Calabria, which he claimed in right of his wife, Theophania, made himself master of Naples and Salerno, and finally of Tarentum, in 982. The Greek emperor, alarmed at the successful ambition of Otho, called the Saracens again into Italy, who gave him battle with overwhelming numbers. The result was the total defeat of the emperor, who only escaped from the hands of the victors by plunging with his horse into the sea, and swimming, at the risk of his life, to a ship. Unluckily it was a Greek ship, and Otho was virtually a prisoner; but as the vessel neared Rossano, a friendly port, he contrived to escape by a cunning stratagem. Otho now hastened to Verona, where a diet was held, which was numerously attended by the princes of Germany and Italy, and at which his infant son, Otho, was recognized as his successor. This diet is chiefly memorable for the confirmation by Otho of the franchises and privileges of the republic of Venice, and the enactment of many new laws, which were added to the celebrated Longobard code. Otho's death at Rome, at the close of the same year, 983, arrested the execution of the vast preparations against the Greeks and Saracens, which had been planned at the diet of Verona, and left the empire embroiled in wars and internal disturbances. See Giesebrecht's *Jahrbücher des Deutschen Reichs unter der Herrschaft, Kaiser Otho's II.* (Berl. 1840).

OTHO III., who was only three years old at his father's death, was at once crowned king of the Germans at Aix-la-Chapelle in 983, from which period till 996, when he received the imperial crown at Rome, the government was administered with extraordinary skill and discretion by three female relatives of the boy-king—viz., his mother, Theophania; his grandmother, Adelheid; and his aunt, Matilda, abbess of Quedlingburg, who, in conjunction with the learned Willegis, archbishop of Mainz, directed his education. The princes of the imperial family disputed the right of these royal ladies to the custody of the young king; and Henry of Bavaria, the nearest agnate, having seized the person of Otho, tried to usurp the supreme power; but opposed by the majority of the other princes of the empire, he was compelled to release him, in consideration of receiving back his forfeited duchy. Otho early showed that he had inherited the great qualities of his forefathers, and when scarcely 15 years of age, at the head of his army, defeated the troops of the patrician Crescentius, the self-styled consul of Rome, and thus restored order in the Roman territories. In 996 he was crowned emperor by his relative Gregory V.; and having settled the affairs of Italy returned to Germany, where he defeated the Slaves, who had long carried on war against the empire; and having forced Micislav, duke of Poland, to do him homage, he subsequently raised the Polish territories to the rank of a kingdom, in favor of Micislav's successor, Boleslas. The renewed rebellion of Crescentius, who drove Gregory from the papal throne, compelled Otho to return to Italy, where success, as usual, attended his measures. Crescentius, who had thrown himself into St. Angelo, was seized and beheaded, together with twelve of his chief adherents; the antipope, John XVI., imprisoned; Gregory restored; and on the speedy death of the latter, Otho's old tutor, Gherbert, archbishop of Ravenna, raised to the papacy under the title of Sylvester II. Otho elated with his success, took up his residence in Rome, where he organized the government, erected new buildings, and showed every disposition, notwithstanding the ill-concealed dissatisfaction of the Romans, to convert their city into the capital of the western empire. The near approach of the year 1000, to which so many alarming prophecies were then believed to point as the end of the world, induced Otho to undertake a pilgrimage to the Holy Land, where he founded an archbishopric. On his return, after visiting Charlemagne's grave at Aix-la-Chapelle, and removing the consecrated cross,

suspended from the emperor's neck, he again repaired to Rome, to consolidate his schemes of establishing a Roman empire. The insurrection of the Romans frustrated his plans, and escaping from Rome at the risk of his life, he withdrew to Ravenna, to await the arrival of powerful re-enforcements from Germany: but before they had crossed the Alps, Otho died in 1002, at the age of 22, apparently from poison, which was said to have been administered to him by the widow of Creseentius, who, it is said, had deliberately set herself to win his affections that she might have an opportunity of avenging the death of her husband; and with him the male branch of the Saxon imperial house became extinct. See Wilman's *Jahrbücher des Deutschen Reichs unter Kaiser Otto III.* (Berl. 1840).

OTHO IV., 1174-1218; b. Germany; son of Henry the lion, duke of Bavaria, and Matilda, sister of Richard Cœur-de-Lion. He was duke of Saxony in 1197, when the emperor Henry VI. died, leaving an infant heir, Frederick II. Otho was supported by the Guelphs as a candidate for the throne, while the Ghibellines supported Philip duke of Swabia. A civil war of eight years resulted, which ended by Otho's flight to England, where he took refuge with his uncle, king John of England. Philip remained on the throne till 1207, when he was assassinated, and Otho returned; his claims were recognized by Innocent III., who crowned him at Rome in 1209. Innocent had refused to perform the act of coronation, till Otho swore to give up to the church the right to the nomination to certain benefices. The emperor broke his oath, and was excommunicated by the pope. About the same time the German princes deposed Otho, in favor of the lawful heir, Frederick II., king of Sicily and Naples. After an unsuccessful struggle Otho withdrew to his estates in Brunswick, where he passed the last part of his life in penitential exercises.

OTIC GANGLION, one of the four cephalic sympathetic ganglia, the other three being Meekel's, the ophthalmic and the submaxillary (q.v.). The otic, or Arnold's ganglion, is a small oval, flattened mass of reddish-gray color situated immediately below the foramen ovale. See SKULL, *ante*. It is connected with the inferior maxillary nerve, by which it obtains its motor root, and with the auriculo-temporal nerve, from which it derives its sensory root. Its communication with the sympathetic is by a filament from a plexus which surrounds the middle meningeal artery. This ganglion also communicates with the glosso-pharyngeal and facial nerves. It distributes branches to the tensor muscle of the tympanum, and to the tensor muscle of the palate.

OTIDÆ, a group of birds, usually classed as a family, but in this work as a genus, *otis*, comprising the bustards (q.v.).

OTIS, GEORGE ALEXANDER, b. Mass., 1830; studied at Princeton, and at the university of Pennsylvania, after which he went to Paris and London to study surgery, remaining two years. In 1853 he published the *Virginia Medical Journal*, and in 1861 became a surgeon in the army; in 1864 he served under the surgeon-gen. at Washington. In 1867 he published an article on *Amputation of the Hip Joint*, and in 1869, *Excisions of the Head of the Femur for Injury*. In 1871 he collated a *Report of Surgical Cases Treated in the Army of the U. S.* from 1867 to 1871, and later was appointed curator of the army medical museum. His collections and reports have great value.

OTIS, HARRISON GRAY, 1765-1848; b. Boston; nephew of James. He was educated at Harvard college. admitted to the bar in 1786, and 10 years later represented Boston in the Massachusetts house of representatives. He entered congress in 1797 as the successor of Fisher Ames, and remained for two terms a recognized leader of the federal party. In 1801 he became U. S. district attorney for Massachusetts from 1803 to 1805; he was speaker of the state house of representatives, and president of the state senate 1805-11. In 1814, as chairman of a committee of the legislature, he made a report advising a general convention of the New England states, to devise some method of relief for the disaster brought upon them by the war with Great Britain. See HARTFORD CONVENTION. He took an active part in the proceedings of that convention, at its sessions in Hartford, and was one of the commissioners sent to Washington by Massachusetts to lay the case of the New England states before the federal authorities. In 1814 he became an associate justice of the state court of common pleas, resigning in 1818 to enter the U. S. senate. He was elected mayor of Boston in 1829. In the senate he opposed the further extension of slavery, distinguishing himself in the discussion of the Missouri compromise. He was as strongly opposed to abolition, and the antislavery agitation, as to the extension of slavery. He published, in 1824, *Letters in Defense of the Hartford Convention*. He left public life in 1832.

OTIS, JAMES, 1702-78; b. Mass.; son of judge John. He did not receive a college education, but studying law, rose to a high rank in his profession. He was prominent in the disputes between the colonies and the crown, and a warm advocate of the rights of the former. He was elected to the legislature in 1758, and was its speaker for the sessions of 1760 and 1761, when Bernard the royal governor, interposed his negative. Otis asked Bernard for the place of associate justice, on the death of chief-justice Sewall in 1760, but was refused. In 1763 Otis was made probate judge of Barnstable co., and the next year chief-justice of the common pleas; about the same time he was chosen a member of the council, and speaker of the house. Bernard refused to ratify

his election, and Otis was re-elected and negatived every year till 1770. Hutchinson, then lieut. gov., sanctioned the election in that year. During the first years of the revolutionary war Otis was senior member and president of the council.

OTIS, JAMES, 1725-83; b. Great Marshes, now West Barnstable, Mass.; graduated at Harvard college in 1743; studied law, and was admitted to the bar in 1748. He at first practiced at Plymouth, but settled in Boston in 1748. In 1761, when he was advocate general, the point came up for argument, whether persons engaged in carrying out the acts of trade were entitled to receive assistance from the executive departments of the colony. Otis was convinced of the illegality of the writs of assistance, and resigned rather than argue in their defense. He was immediately engaged to argue against them, which he did in an argument of great force and eloquence: the judges reserved their decision, but no more writs were enforced, though some were issued. The resignation of Otis, and his plea in behalf of the popular side of the writs-of-assistance controversy, gave him a high reputation for ability and eloquence, which he more than maintained in the legislature, to which he was elected next year. He soon came to be regarded the ablest leader of the popular party in Massachusetts. June 6, 1765, he made a motion which was carried, that a congress of representatives from the various colonies should be convened. In pursuance of this measure a circular letter was sent, inviting the colonies to join in a congress, and the stamp act congress, which met in New York, in the fall of 1765, was the result. Otis took part in the proceedings of this body, and served on the committee which framed an address to the house of commons. He was chosen speaker of the legislature in 1767, but the governor interposed his negative. In 1768, after the passage through parliament of Charles Townshend's bill for the taxation of the colonies, the Massachusetts house of representatives sent a second circular letter to the other colonies, calling on them to join in some common plan for protection. It was in answer to the message of Bernard, the royal governor, demanding that the circular be recalled, that Otis made a notable speech, condemned by the partisans of the crown, as "the most violent, insolent, abusive, and treasonable declaration that perhaps was ever delivered." Only 17 members voted to recall the circular. In 1769 the customs commissioners accused him in England, of treason. This coming to the notice of Otis, in the summer of 1769, he publicly denounced the commissioners, in the *Boston Gazette*. Meeting Robinson, one of the commissioners, in a coffee-room the next night, became involved in a dispute with him. An affray was the result, in which Otis was severely handled, and received a cut on the head, which is supposed to have been the cause of his subsequent insanity. He sued Robinson, and recovered £2,000 damages. He relinquished this sum, however, in consideration of a written apology from Robinson. After a short residence in the country for the benefit of his health, he returned to the legislature in 1771. He was insane for the greater part of his life subsequently, with the exception of a short interval, when he went back to Boston and resumed the practice of his profession. The last two years of his life were spent at Andover, and there he was killed by lightning, while standing at the door of his house. He published in 1760, a treatise on *The Rudiments of Latin Prosody; A Vindication of the Conduct of the House of Representatives*, 1762; *The Rights of the British Colonies Asserted*, 1764; and *Considerations on Behalf of the Colonists*, 1765.

OTIS, JOHN, 1657-1727; b. Mass.; represented the t. of Barnstable in the legislature for 20 years. He was chief justice of the common pleas, the first judge of probate for Barnstable co., and commander of the co. militia. He sat in the council from 1706 till his death.

OTITIS, or inflammation of the tympanic cavity of the ear, may be either acute or chronic, and it may come on during the course of certain febrile affections, especially scarlatina, or in consequence of a serofulous, rheumatic, or gouty constitution; or it may be excited by direct causes, as exposure to currents of cold air, violent syringing or probing, etc. The symptoms of the acute form are sudden and intense pain in the ear, increased by coughing, sneezing, or swallowing, *tinnitus aurium*, or singing or buzzing noises heard by the patient, and more or less deafness. If the disease goes on unchecked, suppuration takes place, and the membrane of the tympanum ulcerates, and allows of the discharge of pus, or inflammation of the dura mater, and abscesses in the brain may be established. In less severe cases there is usually a considerable amount of persistent damage, and an obstinate discharge of matter (*otorrhea*) is a frequent sequence of the disease.

The treatment of so serious an affection must be left solely in the hands of the medical practitioner.

The symptoms of the chronic and less acute varieties of otitis are unfortunately so slight, that they are often neglected, until the patient finds the sense of hearing in one or both ears almost completely gone. In these milder forms of otitis, the general indications of treatment are to combat the diathesis on which they frequently depend, and to improve the general health. Very small doses of mercury continued for a considerable time (such as one grain of gray powder night and morning), and small blisters occasionally applied to the nape of the neck or to the mastoid process, are often of service in very chronic cases. If there is any discharge, the ear should be gently syringed once or twice a day with warm water, after which a tepid solution of sulphate of zinc (one grain

to an ounce of water) may be dropped into the meatus, and allowed to remain there two or three minutes.

OT'LEY, a small market t. of England, in the West Riding of Yorkshire, on the right bank of the Wharfe, 29 m. w.s.w. of York. Its parish church was built in 1507. Extensive cattle and grain markets are held here. Worsted spinning and weaving, machine-making, and the manufacture of malt, bricks, and leather, are the main occupations. Pop. '81, 6,803.

O'TOE, a co. in s.e. Nebraska, adjoining Iowa, bounded on the e. by the Missouri river, watered by the Little Nemaha river and its branches, and traversed by the Nebraska railroad; about 650 sq. m., pop. '80, 15,760—12,846 of American birth. The surface is diversified, and heavily timbered. The soil is fertile. The principal productions are corn, wheat, oats, hay, and barley. Co. seat, Nebraska City.

OTOES, or **OTTOES**, one of the eight tribes of southern Sioux Indians, known first by the French, who called them Otontanta. They live upon the land watered by the Missouri river, and claim to have gone there with the Winnebagoes. For a long time they lived in the region of the Platte river, in a village of earth-covered huts. They made treaties with the whites in 1817 and 1825. They were originally a part of the Missouris, and for some years past they have been joined to them, both tribes living in the same village. The total number in the two tribes was less than 500 in 1885. The Otoes adhere to their original customs and dress, and the efforts of Christian missionaries have produced no special results.

OTO'LITHUS, a genus of fishes of the family *Sciænidae* (q.v.), having a perch-like form, a convex head, with cellular bones, feeble anal spines, no barbels, long curved teeth or *canines* among the other teeth. A valuable species of this genus is the **WEAK-FISH**, or **SQUETEAGUE** (*O. regalis*), which is common on the eastern coasts of North America, from the gulf of Mexico to the gulf of St. Lawrence, and attains a length of 2 feet. It coasts only in the warmer part of the year. It swims in shoals near the surface, takes bait greedily, and may be readily taken by any soft bait. It enters the mouths of rivers where the water is brackish. The flesh is pleasant, but soon gets soft. Excellent isinglass is made of the air-bladder.—A number of species of *Otolithus* are found in the East Indian seas, some of which are valuable for the isinglass which is made from their air-bladder, and some are much used as food, both fresh and dried.

OTOMIS, or **OTHOMIS**, the most widely scattered and oldest known of all Mexican tribes, inhabiting the states of Queretaro, Guanajuato, and Hidalgo, small bands of them also being found in Puebla, Vera Cruz, San Luis Potosi, and Michoagan. They occupied the valley of Mexico until the time of the incursion of the Toltecs, who vanquished them and forced them to the mountains; years later they recovered their possessions. They were afterwards driven out by the Aztecs, who were not able, however, to hold the territory acquired. Gen. Zarazo was sent to conquer them in 1686, but was defeated and killed in the Sierra Gorda. Ardelá reduced them to submission in 1715. They were a rude people, but learned something of civilization from their conquerors; and Conni, one of their chiefs and the founder of Queretaro, became a convert to Christianity. They have usually submitted to Spanish rule, and many of them are now numbered among the Mexican citizens and speak the Spanish language as well as their own, which is considered the harshest and most guttural of Indian dialects, and has been thought by many to be a kindred language to the Chinese.

OTORRHEA signifies a purulent or muco-purulent discharge from the external ear. It may be due to various causes, of which the most frequent is catarrhal inflammation of the lining membrane of the meatus, and the next in frequency is otitis (q.v.) in its various forms. If the discharge is very fetid, a weak solution of chloride of lime, or of Condy's disinfectant fluid, may be used in place of the solution of sulphate of zinc recommended in article **OTITIS**; and in obstinate cases of catarrhal inflammation of the lining membrane, the discharge may often be checked by penciling the whole interior of the meatus with a solution of five grains of nitrate of silver in an ounce of water.

OTRANTO (the ancient *Hydruntum*), a small town on the s.e. coast of the province of the same name, 24 m. s.e. of Lecce. During the latter period of the Roman empire, and all through the middle ages, it was the chief port of Italy on the Adriatic, whence passengers took ship for Greece—having in this respect supplanted the famous Brundisium of earlier times. In 1480 it was taken by the Turks, and at that time it was a flourishing city of 20,000 inhabitants; but it has long been in a decaying condition, principally on account of malaria. Otranto possesses a castle and a cathedral. Its harbor is unsafe. In clear weather the coast of Albania is visible from Otranto. Pop. about 2,000.

OTRANTO, DUKE OF. See **FOUCHÉ**, *ante*.

OTRANTO, TERRA DI, now called **LECCE**, the extreme south-eastern province of Italy, forming the heel of the Italian boot, is bounded on the n.w. by the provinces of Bari and Basilicata, and surrounded on all other sides by the sea. Area, 3,293 sq. m.; pop. '81, 554,418. It occupies the ancient Iapygian or Messapian peninsula, and is 102 m. in length, and from 25 to 35 m. in breadth. Three parts of its surface are covered with hills, offsets from the Apennines of Basilicata. All the rivers are short, many of

them being lost in the marshes of the interior; but abundant springs and heavy dews render the soil surprisingly fertile. Good pasture-lands and dense forests occur. The climate is pleasant and healthy, except along the shores, both on the e. and w. coasts, and in the vicinity of the marshes, which in summer generate malaria. An abundance of best wine, with corn and olive-oil, are produced; tobacco (the best grown in Italy), cotton, and figs, almonds, oranges, etc., are also produced. The capital is Lecce (q.v.).

OTSEGO, a co. in the n. part of the s. peninsula of Michigan; drained by the Cheboygan and Au Sable rivers, both of which rise in small lakes of the co.; traversed by the Jackson, Lansing and Saginaw railroad; 540 sq. miles. The surface is rolling and fairly fertile, but not well developed. Co. seat, Otsego. Pop. '80, 1,974.

OTSEGO, a co. in s.e. central New York; drained by the Unadilla river, its n. boundary, the Susquehanna, which takes its rise in lake Otsego, and several less important streams; traversed by the Cooperstown and Susquehanna, and Albany and Susquehanna railroads; 960 sq. m.; pop. '80, 51,398—48,753 of American birth. The surface is uneven. Large forests of oak, beech, elm, sugar-maple, and other trees cover about one-fourth of its extent. Hops, oats, potatoes, and dairy products are the staples. The Onondaga building limestone is found in abundance. Co. seat, Cooperstown.

OTSEGO LAKE, in Otsego co., N. Y., abounding in fish, $7\frac{1}{2}$ m. long, $1\frac{1}{2}$ m. wide; 1193 ft. above the level of the sea. High hills surround the greater portion of the lake; the waters are clear, and the scenery is picturesque. It empties into a fork of the Susquehanna river, which rises near. Cooperstown is at the s. end of the lake near its outlet.

OTTAWA, one of the largest rivers of British North America, rises in lat. $48^{\circ} 30'$ n., long. 75° w., in the watershed on the opposite side of which rise the St. Maurice and Saguenay. After a course of above 600 m., it falls into the St. Lawrence by two mouths, which form the island of Montreal; and the entire region drained by it and its tributaries measures about 80,000 sq. m. (*Geol. Rep.* for 1845-46, p. 13). During its course, it widens into numerous lakes of considerable size, and is fed by many important tributaries, such as the Mattawa, Mississippi, Madawasca, and Rideau on the right, the Gatineau and the rivières du Moine and du Lièvre on the left side. These, with the Ottawa itself, form the means of transit for perhaps the largest lumber-trade in the world, while the clearances of the lumber have opened the country for several thriving agricultural settlements. The navigation has been greatly improved, especially for timber, by the construction of dams and slides, to facilitate its passage over falls and rapids. The Ottawa is already connected with lake Ontario at Kingston by the Rideau canal; and there is every prospect of its becoming, before many years, the great highway from the north-western states to the ocean by being connected with the Georgian bay in lake Huron through the French river, lake Nipissing, and the Mattawa. This great engineering achievement, for which capital will undoubtedly be soon forthcoming, would place the western lake ports by water 760 m. nearer to Liverpool by Montreal than by New York through the Erie canal, and would save nearly a week in time, while it would lessen considerably insurance and freight charges.—The Ottawa possesses one of the few literary associations of Canada. At St. Ann's, a few miles above its mouth, the house is pointed out where Moore wrote the Canadian boat-song.

OTTAWA, a co. in n. central Kansas, drained by the Solomon and Saline rivers; 720 sq. m.; pop. '80, 10,388—9,202 of American birth. The surface is rolling, and the soil fertile. The principal productions are corn, potatoes, wheat, oats, and hay. Co. seat, Minneapolis.

OTTAWA, a co. in w. Michigan, adjoining lake Michigan, watered by Grand, Black, and Pigeon rivers, on the Chicago and West Michigan, Detroit, Grand Haven and Milwaukee, and Lake Shore railroads; 550 sq. m.; pop. '80, 33,126. The surface is rolling and well wooded, and the soil fertile. The principal productions are corn, wheat, oats, potatoes, maple sugar, and wool. There are flour and saw mills, and manufactories of carriages, leather, etc. Co. seat, Grand Haven.

OTTAWA, a co. in n.w. Ohio, bordering on lake Erie and Sandusky bay, traversed by the Lake Shore and Michigan Southern railroad, and drained by the Portage river; 350 sq. m.; pop. '80, 19,762. The soil is fertile and the surface slightly hilly, with extensive forests of hickory, beech, ash, elm, and oak trees. Several of the islands in lake Erie are included in the county, and produce large quantities of grapes used in wine manufacture. Wheat, corn, wool, wine, and lumber are leading products; raising cattle and butter-making are among the business interests. Silurian limestone is found here and exported. There are carriage and harness manufactories, flour mills, and 22 saw mills. Co. seat, Port Clinton.

OTTAWA, a co. in n.w. Quebec, having the Ottawa river for its s. boundary, separating it from Ontario; 5,705 sq. m.; pop. 49,432. It is drained by Grand and White Fish lakes, other smaller lakes, and the Petit Nation, Lievre, Gatineau, and numerous smaller rivers. It is intersected by the Northern Colonization railway. The rivers furnish extensive water-power, which is utilized to some extent, and trade is rapidly increasing. It contains iron mines, and mines of graphite are worked in the vicinity of Buck-

Ingham. The Ottawa river at Hull is spanned by a suspension bridge over Chaudière falls, connecting it with the city of Ottawa, and steamers running on the upper Ottawa start from Aylmer. It has axe factories, carding and woolen mills, and manufactures of lumber, matches, pails, and wooden-ware. Co. seat, Hull.

OTTAWA, a city and co. seat of La Salle co., Ill., near the junction of the Illinois and Fox rivers, 84 m. s.w. of Chicago; on the Chicago and Rock Island, and the Chicago, Burlington and Quincy railroads; pop. '80, 7,834. Water-power is furnished by the Fox river, and there are 4 flouring mills and manufactories of agricultural tools, glass, and starch; also several large grain elevators. The shipping facilities are excellent, and grain to the value of several millions leaves this port yearly. Coal is found in the vicinity.

OTTAWA, a city and co. seat of Franklin co., Kan., on the Osage river and 53 m. s.w. of Kansas City, on the Leavenworth Lawrence and Galveston railroad; pop. '80, 4,032. The river is crossed at the city by a railroad bridge and a suspension bridge. The principal public buildings are a court-house, the Ottawa university, a high school, and two banks. There are two large flouring mills, machine shops, manufactories of soap and castor oil, carriages and furniture. Coal is found in the vicinity.

OTTAWA, the capital of the dominion of Canada, is situated 87 m. above the confluence of the river Ottawa with the St. Lawrence, 126 m. from Montreal, 95 from Kingston, and 450 from New York. Originally called Bytown, after col. By, who in 1827 was commissioned to construct the Rideau canal; it was incorporated as a city, and received the name which it now bears in 1854. At the w. end of the city, the Ottawa rushes over the magnificent cataract known as the Chaudière falls; and at the n.e. end there are two other cataracts, over which the Rideau tumbles into the Ottawa. The scenery around Ottawa also is scarcely surpassed by any in Canada. The immense water-power at the city is made use of in several saw-mills, which give Ottawa its principal trade, and issue almost incalculable quantities of sawed timber. A suspension bridge hangs over the Chaudière falls, connecting upper and lower Canada. The city is in communication by steamer on the Ottawa with Montreal; on the Rideau canal with lake Ontario at Kingston; and with the principal points of the province by means of the St. Lawrence and Ottawa and the Canada Central lines. In the year ending June 30, 1883, the imports amounted to \$1,562,344, and the exports to \$2,444,723. In 1858 the queen selected Ottawa as the seat of government of the then province of Canada; and in 1860 was commenced the erection of magnificent parliamentary offices, of which the prince of Wales laid the foundation in September the same year. They are among the finest architectural structures on the American continent. Pop. '81, 27,412. Ottawa returns two members to the house of commons, and one to the provincial parliament.

OTTAWAS, an Algonquin tribe who, when first visited by the French explorers, lived in n.w. Michigan, and on the Manitoulin islands. The tribe then consisted of the Keinouehes, Kiskakons, and Sinagos. They were worshipers of the water-god Mirabichi, and of the creator Michabou, "the great hare." On the fall of the Hurons in 1649, that portion of the Ottawas living in the Manitoulin islands, and at Saginaw, crossed the Mississippi, and reached the Sioux territory, from which they soon withdrew, after a war with the Sioux, to Mackinaw. Soon after the foundation of Detroit, a part of the tribe took up lands near that point, while the Mackinaw Ottawas went to Arbre Croche. The tribe had always been friendly to the French, and, at the close of the last French war, the Detroit Ottawas joined the conspiracy against the English, which was planned by their chief Pontiac. The whole tribe then counted 1500 persons. They adhered to the English in the revolutionary war, after the close of which they were parties to the treaties of fort MacIntosh in 1785, and fort Harmar in 1789. After allying themselves with the Miamis in a short war against the Americans, they made a final treaty of peace in 1795. They soon united with the Ojibways and the Pottawattamies, and in successive treaties ceded large tracts of land to the United States, reserving for themselves a tract on the Miami, with an area of about 1200 sq. miles. A treaty of 1833 ceded the Michigan lands to the United States in exchange for a tract s. of the Missouri river. In 1836, the Ottawas at Maumee, Ohio, ceded 49,000 acres of their Ohio lands. The same year the Michigan Ottawas gave up all their lands outside of the reservations. Part of the Maumee Ottawas settled in 1836 upon a tract of 34,000 acres s. of the Osage river. There they founded a prosperous farming community, and had schools and a Baptist mission. In 1862 each family was allotted 160 acres, and 20,000 acres were reserved for schools; and in 1867 they were made citizens of the United States. In 1870 they removed to a reservation of nearly 25,000 acres in the Indian territory, n. of the Shawnees. They number about 130. The Michigan Ottawas live among the Chippewas along the shores of lake Superior. The number of both tribes is between 4,000 and 5,000. There is another branch of the Ottawas in Canada.

*OTTENDORFER, OSWALD, b. Zwittau, Moravia, 1826; law student at Prague and Vienna; became a resident of New York in 1850, and an editor of the *New Yorker Staats-Zeitung* until the death of Mr. Uhl, the proprietor, when he became manager, under his supervision this paper has become the leading German-American daily: it was for some years an advocate of the democratic party, but since 1871 has been inde-

pendent in politics. Mr. Ottendorfer, as president of the German reform association, labored zealously in exposing the corruption then existing in the city government. He served as alderman, 1872-74, when he was nominated as independent candidate for mayor, and defeated. See Supp., page 882.

OTTER, *Lutra*, a genus of quadrupeds of the weasel family (*mustelidæ*), differing widely from the rest of the family in their aquatic habits, and in a conformation adapted to these habits, and in some respects approaching to that of seals. The body, which is long and flexible, as in the other *mustelidæ*, is considerably flattened; the head is broad and flat; the eyes are small, and furnished with a *nictitating membrane*; the ears are very small; the legs are short and powerful; the feet, which have each five toes, are completely webbed; the claws are not retractile; the tail is stout and muscular at its base, long, tapering, and horizontally flattened; the dentition is very similar to that of weasels; six incisors and two canine teeth in each jaw, with five molars on each side in the upper, and five or six in the lower jaw; the teeth are very strong, and the tubercles of the molars very pointed, an evident adaptation for seizing and holding slippery prey. The tongue is rough, but not so much so as in the weasels. The fur is very smooth, and consists of two kinds of hair—an inner fur very dense and soft, intermixed with longer, coarser, and glossy hair. The species are numerous, and are found both in warm and cold climates. The COMMON OTTER (*L. vulgaris*) is a well-known British animal, rarer than it once was in most districts, but still found in almost every part of the British islands, and common also throughout the continent of Europe, and in some parts of Asia. It often attains a weight of 20 to 24 lbs. Its length is fully 2 ft., exclusive of the tail, which is about 16 in. long. The color is a bright rich brown on the upper parts and the outside of the legs, being the color of the tips of the long hairs, which are gray at the base; the tips of the hairs in the soft inner fur are also brown, the base whitish-gray; the throat, cheeks, breast, belly, and inner parts of the legs are brownish-gray, sometimes whitish, and individuals sometimes, but rarely, occur with whitish spots over the whole body; the whiskers are very thick and strong; the eyes are black. The otter frequents rivers and lakes, inhabiting some hole in their banks, generally choosing one which already exists, and seldom, if ever, burrowing for itself. It also inhabits the sea-shore in many places, and swims to a considerable distance from the shore in pursuit of prey. Its movements in the water are extremely graceful; it swims with great rapidity in a nearly horizontal position, and turns and dives with wonderful agility. Its prey consists chiefly of fish, and, like the other *mustelidæ*, it seems to take pleasure in pursuing and killing far more than it can eat; and in this case it daintily feeds on the choicest part, beginning behind the head of the fish, and leaving the head and often much of the tail part. The otter, however, when fish cannot readily be obtained, satisfies the cravings of hunger with other food, even snails and worms, and attacks small animals of any kind, sometimes making depredations in places far from any considerable stream. The otter produces from two to five young ones at a birth. The flesh of the otter has a rank fishy taste, on which account, perhaps, it is sometimes used in the Roman Catholic church, as *fish*, by those whose rules forbid them the use of flesh.—Otter-hunting has long been practiced in Britain, although now chiefly confined to Wales and Scotland. Hounds of a particular breed—otter hounds—are preferred for it. The otter defends itself with great vigor against assailants. The otter can be easily domesticated, and trained to catch fish for its master. In India, tame otters—probably, however, of another species to be afterwards noticed—are not unfrequently used both for catching fish, which they bring ashore in their teeth, and for driving shoals of fish into nets.—The fur of the otter is in some request, but more on the continent of Europe than in Britain.—The AMERICAN OTTER or CANADA OTTER (*L. Canadensis*) is very like the common otter, but considerably larger. The tail is also shorter, and the fur of the belly is almost of the same shining brown color with that of the back. The species is plentiful in the northern parts of North America. Its skin is a considerable article of commerce, and, after being imported into England, is often exported again to the continent of Europe. It is usually taken by a steel-trap, placed at the mouth of its burrow. Its habits are very similar to those of the otter of Europe.—The INDIAN OTTER (*L. Nair*) has a deep chestnut-colored fur, and yellowish-white spots above the eyes.—The BRAZILIAN OTTER (*L. Braziliensis*) is said to be gregarious.—Somewhat different from the true otter is the SEA OTTER or KALAN (*L. marina*, or *enhydra lutris*), an animal twice the size of the common otter, a native of Behring's straits and the neighboring regions, frequenting sea-washed rocks. There are, at least in the adult, only four incisors in the lower jaw, and the ears are set lower in the head than in the true otters, below, not above, the eyes. The tail is also much shorter. The under teeth are broad, and well adapted for breaking the shells of mollusks and crustaceans. The hind-feet have a membrane skirting the outside of the exterior toes. The sea otter is much valued for its fur, the general hue of which is a rich black, tinged with brown above, and passing into lighter colors below. The head is sometimes almost white. The skins of sea otters were formerly in very great request in China, so that a price of from £35 to £50 could be obtained for each; but the attention of European traders and hunters having been directed to them—in consequence chiefly of a passage in *Cook's Voyages*—they were carried to China in such numbers as greatly to reduce the price.

OTTER : a magisterial dist., Bedford co., Va. Pop. '80, 4,236.

OTTERBEIN, PHILIP WILLIAM, 1726–1813; b. in Germany; studied theology, and was ordained in the Reformed church at Herborn, 1749. He was sent to the United States as a missionary in 1752 by the Holland synod, and settled at Lancaster, Penn., and after acting as pastor in several other places went to Baltimore in 1774. Here he remained until his death, and the church which he founded was the first of the denomination known as the United Brethren in Christ, which now numbers about 100,000 members. Mr. Otterbein was a man of great learning, and very liberal in his associations with Christians of other sects than his own, frequently co-operating with the Methodists in open-air meetings and itinerant tours.

OTTERBURN, BATTLE OF. See CHEVY CHASE.

OTTER TAIL, a co. in w. central Minnesota, drained by the Red River of the North and Leaf and Pelican rivers, and containing several lakes, the largest, Otter Tail lake, being about 12 m. long; others are Pelican, Pine, Battle, and Rush lakes; traversed by the Northern Pacific railroad; 2,016 sq. m.; pop. '80, 18,675—11,246 of American birth. The surface part prairie and part woodland. Oats, wheat, hay, and potatoes are the staples. Co. seat, Fergus Falls.

OTTO: a tp. in M'Kean co., Penn. Pop. '80, 4,277.

OTTO, LOUIS WILLIAM, 1754–1817; Count of Mosloy; b. in Baden, Germany; educated at Strasbourg; entered diplomatic service, and was an *attaché* of the chevalier Luzerne in the French mission to the United States in 1779, first as secretary, and afterward as *charge d'affaires* until 1792; married a daughter of the Livingston family; was employed by the committee of public safety in Paris in 1793 as a friend of the Girondists, and when they fell was imprisoned until released by the overthrow of Robespierre; was afterward in diplomatic positions at Berlin, London, and Vienna, and negotiated the marriage of Napoleon I. with Maria Louisa in 1809. He died in Paris.

OTTO (or **ATTAR**) OF **ROSES** is the volatile oil or otto (see **PERFUMERY**) of the petals of some species of rose, obtained by distillation, and highly prized as a perfume. It is a nearly colorless or light yellow crystalline solid at temperatures below 80° F., liquefying a little above that temperature. It is imported from the e., where in Syria, Persia, India, and Turkey, roses are cultivated to a considerable extent for its sake. It is probable that the oriental otto is the produce of more than one species of rose; and it is uncertain what species is cultivated in some of the localities most celebrated for it; but *rosa Damascena* is known to be so employed in the n. of India, and a kind of otto is sometimes obtained by the makers of rose-water from *rosa centifolia* in England. See **ROSE**. Ghazipore, near Benares, is celebrated for its rose gardens, which surround the town, and are in reality fields occupied by rows of low rose-bushes, which in the flowering season are red with blossoms in the morning, but the blossoms are all gathered before midday. Cashmere is noted for its extensive manufacture of otto, as are also the neighborhoods of Shiraz and Damascus. To procure the otto, the rose petals are usually distilled with about twice their weight of water, and the produce exposed to the cool night-air in open vessels, from which the thin film of otto is skimmed with a feather in the morning. Twenty thousand flowers are required to yield otto equal to the weight of one rupee, which even in India is worth about 100 rupees, or £10 sterling. Otto is said to have been first procured by what may be called an accidental distillation of rose-petals exposed with water to the heat of the sun, and to have been found floating on the surface of the water; and it is still sometimes obtained in India by such a process. It is said to be also obtained by dry distillation of rose-petals at a low temperature. During the distillation of rose-petals, a small quantity of a solid volatile oil comes over (solid oil of roses, see below), which crystallizes and floats on the water in the receiver, and which is sometimes called *English oil of roses*. Otto of roses is not unfrequently adulterated with sandal-wood oil, oil of rhodium, etc. It is much used for making hair-oil, a drop of it being enough to impart a pleasant odor to a considerable quantity. It is also used in making lavender-water and other perfumes. The odor of otto itself is too powerful to be altogether pleasant. Another method of obtaining the *scent* of roses is described in the article **PERFUMERY**. Otto of roses is a mixture of two volatile or essential oils; the one solid at ordinary temperatures, and the other liquid. The solid oil of roses (rose camphor, stéaroptène of oil of roses) exists separately in crystalline plates, melts or fuses at 203° F., and boils at about 592°. It possesses of itself very little odor, is insoluble in alcohol, but soluble in ether. It is composed of carbon and hydrogen. The liquid oil of roses (eléoptène of oil of roses) is a very fragrant liquid, to which the otto of roses is indebted for its delicious perfume, and appears to consist of carbon, hydrogen, and oxygen; though its composition and properties have not been attentively studied. The otto of roses may be regarded as a solution of one part of the solid oil in two parts of the liquid. To separate these oils, the otto is frozen at a temperature below 80° F., and the congealed mass pressed between folds of blotting-paper, which absorbs the liquid oil of roses, and leaves the solid. Another process which may be resorted to is to treat the frozen otto with alcohol, which dissolves the liquid oil, and leaves behind the solid. The otto of roses has a specific gravity of 832, water being 1000; it is combustible; and when its vapor is diffused through oxygen, and set fire to, a violent explosion takes place: 1000 parts of alcohol dissolve 7 parts of the otto in the cold, and 33 parts when slightly heated. The principal use to which otto of roses is put is as a perfume. Milk of roses and lavender-water owe their fragrance to the presence

of the otto. A good receipt for oil for the hair is olive oil, colored by alkanet, and scented by a few drops of otto, and this is very generally sold under the name of otto of roses. Medicines are occasionally perfumed by otto of roses, and it is sometimes added to unguents and spirit-washes.

OTTOCAR II., King of Bohemia, 1230-78; son of Wenceslas I., against whom, when a young man, he led a revolt of the Bohemian nobility; but his father defeated and imprisoned him. He was soon released, and at the age of 23 married Margaret, the widowed duchess of Austria, aged 46, who brought him Austria and Styria as her dower. He came to the Bohemian throne on the death of his father, and the next year organized a crusade against the heathen Prussians, whom he defeated; and he founded Königsberg in their territory. In 1260 he gained a victory over the Hungarians on the Marchfeld, and annexed some of their dominions. He procured a divorce from Margaret, and married princess Cunigunda of Hungary in 1261. The duchies of Carniola and Carinthia fell to him in 1269, and his kingdom then comprised the territory between the Baltic and the Adriatic, and between the Inn and the Raab. Upon the death of Richard of Cornwall, he became a candidate for the imperial throne in 1273; but both he and Alfonso of Castile, who had also offered himself for the vacancy, were passed over in favor of Rudolph of Hapsburg. Ottocar refused to recognize the latter, and in the war that ensued was defeated; and Rudolph, before the walls of Vienna, 1276, forced from him the renunciation of Carniola, Carinthia, Austria, Styria, and the Windish territory. Soon afterward Ottocar, again attacking Rudolph, was killed at the battle of Jedespeng. He founded schools, promoted commerce and agriculture, and sought to weaken the power of the feudal nobility.

OT'TOMAN EMPIRE, or "Empire of the Osmanlis," comprehends all the countries which are more or less under the authority of the Turkish sultan, and includes, besides Turkey in Asia, and that part of Turkey in Europe which is under his immediate sovereignty, the vassal principalities of Moldavia and Wallachia (i.e., Roumania), Servia, and Montenegro, in Europe; Egypt with Nubia, Tripoli, and Tunis, in Africa; and a part of Arabia, including the holy cities of Mecca and Medina, in Asia. The special description, topography, history, etc., of these countries will be found under their own heads, and this article will consist solely of a brief sketch of the origin, growth, and present state of the Ottoman empire.

The Ottomans, or Osmanlis, to whom the generic epithet of *Turks* is by common usage now confined, are the descendants of the Ogūzian Turks, a tribe of the great Turkish nation, which in the 13th c. inhabited the steppes e. of the Caspian sea. The tide of Mongol invasion which was then setting in from the n.e., swept the Oguzes before it, and they, to the number of 50,000, under their chief, Suliman, fled westward to the mountainous region of Armenia. After the chief's death, the majority of the tribe became scattered over Mesopotamia; but a few thousands under Orthoguel, his youngest son, marched westward to aid the Seljuk sultan of Konieh against the Khaurezmians and Mongols, and received from the grateful monarch a grant of land in Phrygia.—His son, OTHMAN (q.v.) (1289-1326), laid the foundation of the independent power of the Turks; and Othman's son and successor, ORKHAN (1326-59), continued the same aggressive policy, and gained a footing in Europe by the taking of Gallipoli, Koiridicastron, and other fortresses on the coast. The Greeks, with the usual contempt of civilization for barbarism, made light of these losses, saying that the Turks had only taken from them a "hogs' sty" and a "pottle of wine," in allusion to the magazines and cellars built by Justinian at Gallipoli; but, as the historian Knolles quaintly remarks, "by taking of such hog-stys and pottles of wine, the Turks had gone so far into Thracia that Amurath, a few years later, placed his royal seat at Adrianople." Sultan Orkhan, perceiving the advantage of possessing a force trained exclusively for war, organized the body of troops known as Janizaries (q.v.), and to these his successor added the Spahis (q.v.) and the Zanis.—AMURATH I. (1359-90), the successor of Orkhan, rapidly reduced the Byzantine empire within the limits of Constantinople and some neighboring districts in Thrace and Bulgaria. A formidable confederacy of the Slavonian tribes of the upper Danube was formed against him, and, supported by multitudes of warriors from Hungary and Italy, they advanced into Servia to give him battle; but their army, amounting, it is said, to 500,000 men, was defeated with dreadful slaughter at Kossova (1390); and though the sultan was assassinated on the eve of the battle, his son, BAJAZET I. (q.v.) (1390-1402), followed up this victory by ravaging Servia and Wallachia. Moldavia was also overrun, and a second crusading army, under the king of Hungary, totally routed at Nicopolis (1396); but the defeat and capture of the sultan by Timur (q.v.), gave Constantinople a respite for half a century, by raising up numerous claimants for the Turkish throne; and it was not till 1413 that Bajazet's youngest son, MOHAMMED I. (1413-22), established his claim to the scepter. A war which broke out with the Venetian republic at this time produced the most disastrous consequences to the mercantile and maritime interests of the Turks, and internal disorders prevented any aggressions on their neighbors.—AMURATH II. (1422-50), a prince of considerable ability, completed the conquest of the Greek empire by reducing Macedonia and Greece proper; and finding that the Hungarians had concluded a secret treaty of offense and defense with the Turkish sultan of Caramania against him, he attacked the former, but was defeated by Hunyady (q.v.),

and compelled to retreat. Disheartened at his ill success, he resigned the throne; but on receiving news of a formidable invasion by the army of the papal crusade, resumed the direction of affairs, and totally defeated the invaders, with whom were Hunyady (q.v.) and Scanderbeg (q.v.), at Varna (1444).—MOHAMMED II (q.v.) (1450–81), the sworn foe of Christianity, greatly enlarged the Turkish territories. It was he who stormed Constantinople in 1453, and destroyed the last relic of the empire of the Cæsars.—His son, BAJAZET II. (1481–1512), extended his dominions to the present limits of the Turkish empire in Asia and Europe, including, however, also the country to the n. of the Black sea, as far e. as the mouth of the Don, portions of Dalmatia, and Otranto in Italy. Bajazet was the first to feel the evil effects of the military organization of sultan Orkhan, but all his attempts to get rid of his formidable soldiery were unsuccessful. He attempted the invasion of Egypt, but was totally defeated by the Mameluke sultan at Arbela (1493).—His successors, SELIM I. (q.v.) (1512–20) and SOLYMAN I. (q.v.) (1520–66), raised the Ottoman empire to the height of its power and splendor. During their reigns no ship belonging to a nation hostile to the Turks dared then navigate the Mediterranean, so completely did their fleets command that sea.—SELIM II (1566–74), a pacific prince, put an end to a war with Austria, which had been commenced in the previous reign, by a peace in which it was stipulated that the Emperor Maximilian II. should pay a tribute of 30,000 ducats annually for the possession of Hungary, and that each nation should retain its conquests. During his reign occurred the first collision of the Turks with the Russians. It had occurred to Selim that the connection of the Don and Volga by a canal would, by allowing the passage of ships from the Black sea into the Caspian, be a valuable aid to both military and commercial enterprise, and accordingly he sent 5,000 workmen to cut the canal, and an army of 80,000 men to aid and protect them. But, unluckily, the possession of Astrakhan formed part of the programme, and the attack of this town brought down on the Turks the vengeance of the Russians, a people till then unknown in southern Europe, and the projected canal-scheme was nipped in the bud. The rest of this sultan's reign was occupied in petty wars with Venice, Spain, and his rebellious feudatory of Moldavia.—His son, AMURATH III. (1574–95), such was then the prestige of the Turks, dictated to the Poles that they should choose as their king Stephen Bathory, Woiwode of Transylvania; and received the first English embassy to Turkey in 1589, the object of the embassy being to conclude an alliance against Philip II. of Spain. To this the sultan agreed; but the destruction of the Spanish armada soon after rendered his interference unnecessary.

After an exhausting, though successful, war with Persia, succeeded a long contest with Austria, in which the Turks at first obtained the most brilliant success, penetrating to within 40 m. of Vienna, but afterward suffered such terrible reverses that they were compelled to evacuate all Hungary and Transylvania (hitherto a feudatory), and were only saved from destruction by the Poles, who entered Moldavia, and drove out the Transylvanians and Hungarians, thus affording the Turks an opportunity of rallying, and even recovering some of their losses. The latter part of this war happened during the reign of MOHAMMED III. (1595–1604), and afforded unmistakable symptoms of the decline of Turkish prowess; and a rebellion of the pasha of Caramania, in Asia, which was quelled not as a Mohammed II. or a Bajazet I. would have quelled it, but by yielding to the pasha's demands, afforded an equally convincing proof of the growing weakness of the central administration, and set an example to all ambitious subjects in future. During the reigns of ACHMET I. (1604–17), MUSTAFA (1617–17, 1622–23), OTHMAN II. (1617–22), and AMURATH IV. (1623–40), Turkey was convulsed by internal dissensions, nevertheless, a successful war was waged with Austria for the possession of Hungary; but this success was more than counterbalanced in the e., where shah Abbas the great conquered Mesopotamia, Kurdistan, and Armenia; and in the n., where the Poles took possession of some of the frontier fortresses. While Amurath was recovering his lost provinces in the e., the khan of the Crimea, countenanced by the Poles, and Russians, threw off his allegiance. Mustafa, the grand vizier, a man of great ability and integrity, continued to direct the helm of government under IBRAHIM (1640–48); took from the Poles their conquests; and in a war with the Venetians (1645) obtained Candia and almost all the Venetian strongholds in the Ægean sea, though with the loss of some towns in Dalmatia.—MOHAMMED IV. (1648–87) commenced his reign under the most unfavorable auspices; he was only seven years of age, and the whole power was vested in the janizaries and their partisans, who used it to accomplish their own ends; but luckily for Turkey, an individual of obscure birth, named Mohammed Köprili, supposed to be of French descent, was, when over 70 years of age, appointed vizier; and the extraordinary talents of this man proved to be the salvation of Turkey at this critical juncture. He was succeeded (1661) in office by his son Achmet, a man of equal ability, and under his guidance the central administration recovered its control over even the most distant provinces; a formidable war with Germany, though unsuccessfully carried on (1663), was concluded by a peace advantageous to the Turks; Crete was wholly subdued, and Podolia wrested from the Poles; though, shortly afterwards, much of this last acquisition was reconquered by John Sobieski (q.v.). Achmet's successor overran the Austrian territories, and laid siege to Vienna; but the siege was raised, and his army defeated by a combined army under the duke Charles of Lorraine, and John Sobieski, king of Poland. The Austrians followed up this victory by repossessing themselves of Hungary,

inflicting upon the Turks a bloody defeat at Mohacz (1687); but the fortunate appointment of a third Köprili as grand vizier by SOLYMAN II. (1687-91) was the means of restoring glory and fortune to the Turkish arms.—The reigns of ACHMET II. (1691-95), and MUSTAFA II. (1695-1702), were occupied with wars against Austria; but with the death of Köprili (1691) fortune deserted the Turks, and the peace of Carlowitz (1699) forever put an end to Turkish domination in Hungary.—ACHMET III. (1702-30) was forced by the intrigues of Charles XII. (q. v.) of Sweden, while residing at Bender, into a war with Russia; a step which was immediately followed by an invasion of Moldavia by the czar Peter. The czar, imprudently relying on the aid of the woiwode of Moldavia, found himself in great straits, from which he was rescued by the genius of his queen, afterward Catharine I. The recovery of the Morea from the Venetians, and the loss of Belgrade and parts of Servia and Wallachia, which were, however, recovered during the subsequent reign of MAHMUD I. (1730-54), and the commencement of a long war with Persia (see NADIR SHAH), were the other prominent occurrences of Achmet's reign. In 1736 the career of Russian aggression commenced with the seizing of Azof, Oczakof, and other important fortresses; but a scheme for the partition of Turkey between Austria and Russia was foiled by the continued series of disgraceful defeats inflicted upon the Austrian armies by the Turks: the Russians, on the other hand, were uniformly successful; but the czarina, becoming very desirous of peace, resigned her conquests in Moldavia, and concluded a treaty at Belgrade. Among the benefits conferred by sultan Mahmud on his subjects, not the least was the introduction of the art of printing.—His successor, OTHMAN III. (1754-57), soon gave place to MUSTAFA III. (1757-74), under whom the empire enjoyed profound tranquillity; but after his death, the Russians, in violation of the treaty of Belgrade, invaded Moldavia.—The war with Russia continued during the succeeding reign of ABDUL-HAMID (1774-89); the fortresses on the Danube fell; and the main army of the Turks was totally defeated at Shumla. The campaign was ended July 10, 1774, by the celebrated treaty of Kutshouk-Kainardji. In defiance of its provisions, the czarina took possession of the Crimea and the whole country eastward to the Caspian. The sultan was compelled, by his indignant subjects, to take up arms in 1787. In 1788 Austria made another foolish attempt to arrange with Russia a partition of Turkey; but, as before, the Austrian forces were completely routed. The Russians, however, with their usual success, had overrun the northern provinces, taken all the principal fortresses, and captured or destroyed the Turkish fleet.—The accession of SELIM III. (q. v.) (1789-1807) was inaugurated by renewed vigor in the prosecution of the war; but the Austrians had again joined the Russians. Belgrade surrendered to the Austrians, while the Russians took Bucharest, Bender, Akerman, and Ismail (see SUVOROF); but the critical aspect of affairs in western Europe made it advisable for Russia to terminate the war, and a treaty of peace was accordingly signed at Jassy, Jan. 9, 1792. By this treaty the provisions of that of Kainardji were confirmed; the Dniester was made the boundary-line, the cession of the Crimea and the Kuban was confirmed, and Belgrade was restored to the sultan.

Numberless reforms were now projected for the better administration of the empire. The people were, however, hardly prepared for so many changes, and the sultan's projects cost him his throne and life. The occupation of Egypt by the French brought on a war between them and the Turks, in which the latter, by the aid of the British, were successful in regaining their lost territories. In revenge for the defeat of his Egyptian expedition, Napoleon contrived to entrap the sultan into a war with Russia and Britain, which was confined to a struggle in Egypt, in which the British were worsted.—After the ephemeral reign of MUSTAFA IV. (1807-8), the able and energetic Mahmud II. (q. v.) (1808-39) ascended the throne; and though his dominions were curtailed by the loss of Greece, which established its independence, and of the country between the Dniester and the Pruth, which, by the treaty of Bucharest in 1812, was surrendered to Russia, the reformation he effected in all departments of the administration checked the decline of the Ottoman empire. Egypt, during his reign, attempted unsuccessfully to throw off the authority of the sultan (see MEHEMET ALI, IBRAHIM PASHA).—His son, ABDUL-MEDJID (1839-61), continued the reforms commenced in the previous reign; but the czar, thinking that the dissolution of the Ottoman empire was at hand, constantly tried to wring from the sultan some acknowledgment of a right of interference with the internal affairs of the country. It was an attempt of this sort to obtain the exclusive protectorate of the members of the Greek church in Turkey that brought on the "Crimean war" of 1853-55, in which the Turks were effectively supported by England, France, and Sardinia. The treaty of Paris (1856) restored to Turkey the command of both sides of the lower Danube, excluded the czar from his assumed protectorate over the Danubian principalities, and closed the Black sea against all ships of war. The porte, apparently adopted into the family of European nations, made proclamation of equal civil rights to all the races and creeds of the Turkish dominions. But a massacre of Christians in Lebanon and at Damascus provoked western intervention in 1860. Abdul-Medjid, whose last years were disgraced by irrational profuseness of expenditure, was succeeded by his brother ABDUL-AZIZ in 1861. Meanwhile the nominally subject peoples of Moldavia and Wallachia ventured to unite themselves into the one state of Roumania; and in 1866 the empire, becoming more and more enfeebled through its corrupt administration, had to look on while the Roumanians expelled their ruler, and, in

the hope of securing western support, chose prince Charles of Hohenzollern to be hereditary prince (*domnu*) of the united principalities. The rebellion of Crete in 1866 threatened a severe blow to the integrity of the empire, but was ultimately suppressed in 1868—in spite of active help from Greece. Servia, already autonomous within her own frontiers, demanded the removal of the Turkish garrisons still maintained in certain Servian fortresses; and in 1867 Turkey saw herself compelled to make this concession. In the same year the sultan distinguished the vali of Egypt by granting to him the unique title of khedive (q. v.). The vassal king drew down the wrath of his suzerain in 1870 by negotiating directly with foreign courts, and was compelled to give formal tokens of vassalage. But later concessions have made the khedive virtually an independent sovereign. The Russian government took the opportunity of war between Germany and France to declare, in 1871, that it felt itself no longer bound by that provision of the Paris treaty which forbade Russia to have a fleet in the Black sea; and a London conference sanctioned this stroke of Russian diplomacy. Between 1854 and 1871 the Turkish debt had increased by more than £116,000,000; and in 1875 the porte was driven to partial repudiation of its debts. An insurrection in Herzegovina in the latter part of 1874 marked the beginning of a very eventful and critical period in the history of the Ottoman empire. The insurrection smoldered on through 1875 and part of 1876, and excited all the neighboring Slavonic peoples. A threatened revolt in Bulgaria in May, 1875, was repressed with much bloodshed; and the merciless cruelty displayed by the bashi-bazouks or Turkish irregulars alienated foreign sympathy from the government. In May Abdul-Aziz was deposed; and his nephew, MURAD V., son of Abdul-Medjid, who succeeded him, was destined in turn to make way for his brother, ABDUL-HAMID II., in August of the same year. In June Servia declared war, and Montenegro followed her example. Before the end of the year the Servians were utterly defeated, in spite of the help of many Russian volunteers; but the state of affairs in the Turkish provinces seemed to call for a conference of the great powers at Constantinople. The proposals then made for the better government of the Christian subjects of Turkey were rejected by the Turkish authorities, who had, during the conference, taken the extraordinary step of bestowing a parliamentary constitution on the Ottoman empire. Russia took upon herself to enforce on Turkey the suggestions of the conference, and on April 24, 1877, declared war. Both in Armenia and Bulgaria the opening of the campaign was favorable to Russian arms, but later the Turks rallied and seriously checked the hitherto triumphant progress of the invaders. Even after the Russian forces had been greatly augmented, the Turks resisted energetically. Kars, besieged for several months, resisted till the middle of November; Erzeroum did not surrender until after the armistice had been concluded. Osman Pasha, who established himself in Plevna early in July, repelled with brilliant success repeated and determined assaults from a besieging army of Russians and Roumanians; and he had so strengthened the fortifications as to be able to hold out until Dec. 10, when he surrendered. Desperate fighting in the Shipka pass had failed to expel the Russians from their position in the Balkans; and within a month of the fall of Plevna the Russians captured the whole Turkish army that was guarding the Shipka pass, and then easily overran Roumelia. The victorious Muscovites occupied Adrianople in Jan., 1878; on the last day of that month an armistice was concluded; and in March the "preliminary treaty" of San Stefano was signed. After grave diplomatic difficulties, owing chiefly to the apparent incompatibility of English and Russian interests, a congress of the powers met at Berlin, and ultimately agreed to that solution of the "eastern question," discussed under the article TURKEY, which has so seriously affected the area and standing of the Ottoman empire.

OTTUMWA, a city and co. seat of Wapello co., Iowa; situated on the Des Moines river, 86 m. s.e. of Des Moines; it is a station of 4 railroads: the Burlington and Missouri river; the Central Iowa; the St. Louis, Kansas City and Northern, and the Keokuk and Des Moines; pop. '80, 9,004. Ample water-power is furnished by the river, which is crossed by a bridge at the city, and there are factories making carriages, tools, furniture, and woolen goods. The city is the center of a large trade with the surrounding country. There is a daily paper, several weeklies, two banks, a high school, and 8 or 10 churches.

OTWAY, THOMAS, an English dramatist, was b. Mar. 3, 1651, at Trotton, near Medhurst, Sussex. He left Oxford without taking a degree, and went to London in search of fortune in 1671. He appeared on the stage, but made a signal failure; and next he applied himself to dramatic composition. In 1675 *Alcibiades*, his first tragedy, was printed; and in the following year he produced *Don Carlos*, a play which was extremely popular, and "got more money than any preceding modern tragedy." His first comedy, *Friendship in Fashion*, appeared in 1678, and, being sufficiently immoral to please the taste of the age, met with general appreciation. In 1677 Otway received a cornet's commission in a regiment, which, however, was disbanded in 1678, and Otway, resuming his former occupation, produced the tragedy of *Caius Marius* in 1680. In the same year *The Orphan* met with an extraordinary, and, in some respects, a deserved measure of success. In 1681 *The Soldier of Fortune*, and in the following year the finest of all his plays, *Venice Preserved*, were produced. From this time till his death, the poet had much to endure from poverty and neglect. Debts accumulating upon him, he retired to

an obscure public-house on Tower-hill, for the purpose of avoiding his creditors, and here, at the premature age of 34, he died, April 14, 1685. Although Otway achieved a brilliant reputation during his lifetime, although he is described by Dryden as possessing a power of moving the passions which he himself did not possess, and later by sir Walter Scott as being Shakespeare's equal, if not his superior, in depicting the power of affection; yet his plots are artificial, and his language is without fancy, melody, or polish.

OUACHITA', a co. in s. Arkansas; drained by the Ouchita river and by the Little Missouri, which bounds it on the n.; 730 sq.m.; pop. '80, 11,757—11,675 of American birth, 6,254 colored. The surface is in great part covered with forests of white, red, and Spanish oaks; pine, beech, and hickory. Indian corn, cotton, and pork are the chief products. Co. seat, Camden.

OUACHITA', a parish in n. Louisiana, intersected by the Ouachita river and drained by the bayou D'Arbonne; traversed by the North Louisiana and Texas railroad; about 600 sq.m.; pop. 14,682—14,443 of American birth, 10,080 colored. The surface is hilly, and there is much woodland. The soil is rich; cotton, Indian corn, and pork are the staples. Chief town, Monroe.

OUDE, or **AUDH**, a province of British India, separated on the n. from Nepaul by the lower ranges of the Himalaya, whence it gradually slopes to the Ganges, which forms its boundary on the s. and s.w. Extreme length from n.w. to s.e. 270 m., breadth, 160; area, 23,992 sq. miles. Pop. '81, 11,427,625, or 476 to the sq. mile. Oude is one great plain, the slope of which from n.w. to s.e. indicates also the direction of the principal rivers. These are the Gumti, the Ghagra (Ghogra), and the Rapti, which swarm with alligators. The northern part, on the edge of the Himalaya, is not very well known. It forms a portion of the Terai, a vast unhealthy tract stretching along the borders of Nepaul, and covered with impassable forests. The climate of Oude is cool and pleasant from November to March; during the next four months it is hot and sultry, after which follows the long rainy season, but in general it is considered the healthiest along the whole valley of the Ganges. The soil is light, and except small nodules of chalk and oolite called *kankars*, there is hardly a loose stone to be seen. Oude was formerly more copiously watered than it is now, the clearing of the jungles having greatly decreased the moisture of the land. The chief crops are wheat, barley, gram, masure, mustard, rice (of the finest quality), millet, maize, joar, bajra, various kinds of pulse and oil-seeds, sugar-cane, tobacco, indigo, hemp, and cotton. The manufacturing industry of Oude is not important; soda, saltpeter, and salt are the only articles of which more is produced than is requisite for home consumption. Gunpowder, and all kinds of military weapons, guns, swords, spears, shields, and bows of bamboo, or Lucknow steel, are, however, also made, besides some woolen goods, papers, etc. Bridges are few, if any, and the roads in general bad. The principal is the famous military road from Cawnpore to Lucknow, which runs in a north-easterly direction.

The people are of a decidedly warlike disposition. The bulk of the inhabitants are Hindus, though the dominant race for centuries has been Mohammedan. The Brahmans are the most numerous class, but there are 29 different Rajput tribes. It is these two classes that mainly supplied the famous (or infamous) sepoy's of the Bengal army. The language spoken is Hindustani.

The most characteristic feature in the social economy of Oude is its *village-system*, for a description of which see INDIA. The *ryots*, or cultivators of the soil, cling to the land which their fathers have tilled for ages with extraordinary affection, and thoroughly believe that they have a right of property in it; and, in general, we believe they are *actually* the owners of their farms, but in many cases they have been dispossessed by a class of tax-gatherers (resembling the Roman *publicani*) called *talukdars*, who farmed from the Mogul, and afterwards from the king of Oude, the revenues of a collection of villages called a *talukah*, and by their extortions so impoverished the ryots or peasant-proprietors, that the latter were often forced to execute deeds transferring their property to the talukdars. Many of the more spirited would not submit to become *tenants*, and taking to the jungles waged war on the new occupants of their ancestral lands, until gradually they sank into *dacoits*, or professional robbers. The extortions of the talukdars continued till the annexation of the country in 1856, and the country suffered severely from the retaliatory raids of the dispossessed ryots. The East India company reinstated the ryots in their property, where the talukdars could not show undisputed possession for 12 years—a proceeding which gave great offense to the latter, who, in consequence, assumed a coldly hostile attitude to the British during the great mutiny of the following year.

The principal towns are Lucknow (q.v.), Fyzabad, Oude, or Ayodha, Roy Bareilly, and Shahabad.

Oude is believed by Sanskrit scholars to be the ancient *Kosala*, the oldest seat of civilization in India. The country was conquered by a Mohammedan army in 1195, and made a province of the Mogul empire. In 1753 the vizier of Oude, Sa'fidar Jung, rebelled against his imperial master, Ahmed Shah, and forced the latter to make the governorship hereditary in his family. His son, Sujah-ud-Dowlah, became entirely independent, and founded a dynasty which ruled the country, generally in a most deplorable manner, until, in the interests of the wretched inhabitants, the East India company was

forced to adopt the extreme measure of annexation, Feb. 7, 1856. The necessity for this high-handed but most beneficent act will be better understood if we read the statistics of crime in Oude during the last years of its independence: one item will suffice—from 1848 to 1854 there were, on an average, no fewer than 78 villages burned and plundered every year, while murders, robberies, abductions, and extortions were every-day occurrences. A feeble king, a blackguard soldiery, and a lawless peasantry had brought about a most helpless and ruinous anarchy. When the mutiny of 1857 broke out, Oude became one of the great centers of rebellion. Upon this, the confiscation of all the estates of the talukdars was proclaimed by lord Canning; but when the country was subdued by force of British arms, the estates of all such as laid down their arms and swore fealty to the British government were restored. The forts of the petty chiefs, however, were dismantled, and the inhabitants disarmed. The province is now administered by a chief commissioner. The chief feature of the present condition of affairs in Oude is the preservation in their integrity of the estates of the talukdars. The amount of government revenue paid by the talukdars is about £1,000,000.

OUDE, or **AWADH**, one of the principal towns of the province Oude (q.v.), stands amid ruins on a hilly site on the right bank of the Sarayû or Goggra river, 80 m. e. of Lucknow. It is also called *Hanumangâ'dhi*, on account of a temple erected there in honor of Hanumat (q.v.), the fabled monkey-ally of Râma, an incarnation of the god Vish'nu. The name Oude is a corruption of the Sanskrit *Ayodhyâ* (from *a*, not, and *yodhya*, conquerable, hence "the invincible" city); but the ancient city of that name was situated opposite the modern Oude, where its ruins may still be seen. *Ayodhyâ* was one of the oldest seats of civilization in India; it was the residence of the solar dynasty, or one of the two oldest dynasties of India, deriving its descent from the sun, but it obtained special renown through Râma, the son of Das'aratha, a king of that dynasty. Its great beauty and immense size are dwelt upon in several of the Purânas and modern poems, but more especially in the *Râmâyan'a* (q.v.), the first and last books of which contain a description of it. According to some Purânas (q.v.) *Ayodhyâ* was one of the seven sacred cities, the living at which was supposed to free a man from all sin, and the dying at which, to secure eternal bliss. It was also called *Sâketa*, *Kos'alâ*, and *Uttara-kos'alâ*. See Goldstücker's *Sanskrit Dictionary*, under **AYODHYÂ**.

UDENARDE, a t. in the province of east Flanders, Belgium, is situated chiefly on the e. bank of the Scheldt, 16 m. s. by e. from Ghent. It has a pop. of 8,000, and possesses a fine Gothic council-house, important manufactures of linen and cotton fabrics, and many extensive tanneries. The town was taken by the French, aided by an English force in 1658; it was again besieged in 1674, by the stadtholder, William (III. of England) of Orange; and in 1706 it was taken by Marlborough. An attempt made by the French to retake it brought on the famous battle of Oudenarde, one of Marlborough's most celebrated victories, which was gained on July 11, 1708, with the aid of prince Eugene, over a French army under the duke of Burgundy and marshal Villars. After this battle the French king made offers of peace, which were not accepted.

UDINOT, CHARLES NICOLAS, Duke of Reggio, and Marshal of France, was b. at Bar-le-Duc, in the department of Meuse, France, April 25, 1767. At the age of 17, he entered the army but returned home after three years' service. Having distinguished himself in 1790 by suppressing a popular insurrection in his native district, he was, after some volunteer service, Nov. 1793, raised to the rank of chief of brigade, in the fourth regiment of the line, and distinguished himself in various actions with the Prussians and Austrians. He was wounded and taken prisoner before Mannheim, by the Austrians, but was soon exchanged and served in the armies of the Rhine under Moreau, and in that of Switzerland under Massena. He was promoted to be general of division (April 12, 1799), and for a daring capture of a battery at Pozzola, was presented by the first consul with a saber of honor and the cannon which he had taken. In 1805 he received the grand cross of the Legion of Honor, and about the same time received the command of ten battalions of the reserve, afterwards known as the "grenadiers Oudinot." At the head of this corps he did good service in the Austrian campaign. He was present at Austerlitz and Jena, and gained the battle of Ostrolinka (Feb. 16, 1807), for which he was rewarded with the title of count, and a large sum of money. He greatly contributed to the success of the French at Friedland, and was presented by Napoleon to the Czar Alexander as the "Bayard of the French army, the knight *sans peur et sans reproche*." He sustained his now brilliant reputation in the second Austrian campaign of 1809, and on July 12 was created marshal of France, and on Aug. 15, duke of Reggio. In 1810 he was charged with the occupation of Holland, and by his unswerving probity and attractive personal qualities, drew the esteem of all classes. He was engaged in the disastrous Russian campaign, and subsequently took part in the various battles of 1813 between the French and the Russians and Austrians. He was one of the last to abandon Napoleon, but he did so forever, and spent the period known as the "hundred days" on his own estates. At the second restoration he became a minister of state, commander-in-chief of the royal guard and of the national guard, and was created a peer of France, grand cross or St. Louis, etc. In 1823 he commanded the first division of the army of Spain, and was for some time governor of Madrid. After the revolution of July 1830, Oudinot retired to his estates, and only at rare intervals presented himself in the cham-

ber of peers. He became grand chancellor of the Legion of Honor in May, 1839, succeeded marshal Moncey as governor of the Invalides in Oct. 1842, and died at Paris Sept. 13, 1847. A statue was erected in his honor at Bar, Sept. 29, 1850.—His son, CHARLES NICOLAS-VICTOR OUDINOT, duke of Reggio (born Nov. 3, 1791), was a general in the French army. He first distinguished himself in Algeria, and in the revolution of 1848—having previously distinguished himself as a deputy (1842–46) by his admirable talent for dealing with questions affecting the comfort and discipline of the soldiery—he was chosen commander-in-chief of the army of the Alps. In April 1849, he was appointed general of the French expedition against Rome, and forced the city to surrender unconditionally on July 1, in spite of the heroic resistance of the republican triumvirs—Garibaldi, Mazzini, and Saffi. He was, however, not a Napoleonist, and at the *coup d'état*, Dec. 2, 1851, shared the fate of every eminent general who would not violate his oath to obey the constitution—i. e., he was arrested and imprisoned. He was soon set at liberty and lived in retirement until his death in 1863. Oudinot wrote several books on military matters.

OUGRÉE, a t. of Belgium, in the province of Liège, 3 m. s.s.w. from Liège, on the right bank of the Mense. It has iron-works, a cannon-foundry, and oil and flour mills. The neighborhood produces coal. Pop '70, 6,200.

OUISTITI. See MARMOSSET.

OULACHAN. See CANDLE-FISH, *ante*.

OUNCE. The Latin *uncia* (derived by Varro from *unus*) was the name of the twelfth part of the *as* or *libra* (pound), and also was applied to the twelfth part of any magnitude, whether of length, surface, or capacity. Hence *inch*, the twelfth part of a foot. The modern ounce is a division of the pound-weight. See POUND.

OUNCE, *Felis Uncia* or *Leopardus Uncia*, a large feline animal, nearly resembling the leopard, but having much rougher and longer hair, a longer and much more bushy tail; the general color is also paler, the rosette-like spots are less sharply defined and there is a black spot behind the ears. Little is known of the ounce; it is described by Buffon, but naturalists were for some time generally inclined to regard it as identical with the leopard, and its name has been transferred in South America to the jaguar. It is a native of Asia, and probably of mountainous districts.

OU'RARI. See CURARI.

OURAY, co. Col. See page 882.

OURAY, CHIEF. See page 882.

OUREBI, *Scopophorus Ourebi*, an antelope found in great numbers in s. Africa, on the open plains. It is called the pale buck (*bleek boe*) by the Dutch from its light brown or yellow color. It is much hunted and flees with immense rapidity.

OU'RO PRE'TO (black gold), a city of Brazil, capital of the province of Minas Geraes, stands among barren mountains, 4,000 ft. above sea-level, and 200 m. n.n.w. of Rio Janeiro. It contains the governor's residence and a college, and consists mainly of narrow and irregular streets. Although the neighboring mountains are very auriferous, and although the mines were once the richest in the kingdom, the mining is now reduced to comparatively unprofitable washings. A good trade in coffee, etc., is carried on with Rio Janeiro, but is retarded by the want of good roads. The journey from Ouro Preto to the capital of the empire is performed by horses and mules only, and ordinarily requires 15 days. Pop. about 4,000.

OUSE, called also, for the sake of distinction, the **NORTHERN** or **YORKSHIRE OUSE**, a river of England, is formed by the union of the Swale and the Ure in the immediate vicinity of the village of Boroughbridge, and flows s.e. past York, Selby, and Goole. About eight m. below the last town, it joins the Trent, and forms the estuary of the Humber. The length of its course from Boroughbridge is 60 m., for the last 45 of which (from the city of York) it is navigable for large vessels. Its principal affluents are the Wharf and the Aire from the w., and the Derwent from the n.e. The basin of the Ouse, or the Vale of York, commences from the northern boundary of the county, near the river Tees, from whose basin it is separated by a low ridge of hills, and extends southward, including almost the whole of the county. See YORKSHIRE.

OUSE, GREAT, a river of England, rises close to the town of Brackley, in the s. of Northamptonshire, and flows n.e. through the counties of Buckingham, Bedford, Huntingdon, Cambridge, and Norfolk, and falls into the Wash $2\frac{1}{2}$ m. below King's Lynn. It is 160 m. in entire length, and is navigable for about 50 miles. It receives from the e. and s. the Ivel, Cam, Lark, and Little Ouse.

OUSEL. See OUZEL, *ante*.

OUSELEY, Sir FREDERICK ARTHUR GORE, b. London, 1825; educated at Oxford. Taking holy orders he became a curate in London, was made precentor of Hereford cathedral, in 1855, and incumbent of St. Michael's, Tenbury, in 1856. He was one of the founders, and is now warden of St. Michael's college, Tenbury, an institution for the instruction of boys in classics and choral singing. He took the degree of doctor of music at Oxford, in 1854; and the next year, became professor of music there. He has published a number of musical collections, *A Treatise on Harmony*, 1869; and *A Treatise on Counterpoint and Fugue*, 1869. He is also the author of a number of anthems, and has edited, with Dr. Monk, *Anglican Psalter Chants*, 1872.

OUSELEY, GIDEON, 1762–1839; b. Ireland; of a family distinguished in English history. He was designed for the government service, and received a liberal education. In his youth he was reckless, but in 1789 became religious under the influence of some Wesleyan soldiers stationed at Dunmore, his native place. He soon became an evangelist, exciting the wonder of the people by his fervor and boldness, preaching in the streets and churchyards, fairs and markets and at the wake-houses. Without dismounting from his horse he preached from three to five times a day. After preaching thus for 7 years he was received into the Wesleyan conference, and in 1799 appointed a missionary to Ireland. He was often roughly treated by the Irish, but being a master of the Irish language, and thoroughly acquainted with the Irish character he succeeded in converting thousands. At the age of 74, after 50 years of devoted labor, he was still as active as ever on the high-ways and in the market-places, preaching fourteen, sixteen, and sometimes twenty, sermons a week. "Gideon Ouseley," says Stevens, "will be forever recognized as the Protestant apostle of Ireland." He was the author of several polemical publications, of which the most important is *Old Christianity and Papal Novelties*. So conclusive were his arguments that many Roman Catholic laymen, schoolmasters, and candidates for the priesthood, were converted, some of the latter becoming preachers of the Wesleyan body or of the established church.

OUSELEY, Sir WILLIAM, LL.D., 1771–1842; appointed cornet of dragoons in 1788, but left the army in 1794, and began the study of the oriental languages at the university of Leyden. He was secretary to his brother sir Gore, ambassador to Persia, 1810–12. He gave an account of his residence in Persia, under the title of *Travels in Persia*, 1819–23. Among his works are *Persian Miscellanies*, 1795; *Oriental Collections*, 1797; *Observations on some Medals and Gems bearing Inscriptions in the Pahlavi or Ancient Persian Character*, 1801; and *Anecdotes from Oriental Bibliography*, 1827.

OUSELEY, Sir WILLIAM GORE, D.C.L., 1797–1866, b. London; entered the diplomatic service. He was attached to the British legation at Stockholm in 1817, and at Washington in 1825. He held various diplomatic positions at Rio Janeiro, Buenos Ayres, Montevideo and Asuncion, 1832–51. He was afterward employed on special missions, to Central America and the United States. Among his works are *Remarks on the Statistics and Political Institutions of the United States*, 1832; *Notes on the Slave Trade*, 1850; and *Views of South America*, 1852.

OUSTER, in law. See **EJECTMENT, ACTION OF**, *ante*.

OUTAGAMIE', a co. in e. central Wisconsin, drained by the Fox, Wolf, and Embarras rivers; traversed by the Chicago and Northwestern, and Green Bay and Minnesota railroads; 625 sq.m.; pop. '80, 28,716—19,649 of American birth. The surface is level and in great part woodland. The soil is moderately fertile. wheat, oats, hay, lumber and dairy products are the staples. Co. seat, Appleton.

OUTAGAMIES. See **SACS AND FOXES**.

OUTCROP, a term applied in geology to the edge of an inclined bed at the place where it rises to the surface. The line of the outcrop is called the strike, which is always at right angles to the dip.

OUTER HOUSE. See **COURT OF SESSION**.

OUTFIT ALLOWANCE, in the British army, is a sum of £150 for the cavalry, and £100 for the infantry, granted to non-commissioned officers promoted to commissions, to enable them to meet the heavy charges for uniform and equipments. The larger sum is given in the cavalry because the newly commissioned officer has to purchase his charger.

OUTLAWRY, in English law, means putting one out of the protection of the law, for contempt in willfully avoiding execution of legal process. Formerly, in the common law courts, if the defender would not enter an appearance, certain proceedings were taken to outlaw him, so as to allow the action to go on without his appearance. These proceedings, however, are now abolished, and, in the majority of cases, it is immaterial as regards the action whether the defendant appear or not, provided he was properly served with the original writ of summons. After judgment he may still be outlawed, as a preliminary to seizing and selling his property. In criminal proceedings, outlawry still exists as part of the ordinary practice to compel a person against whom a bill of indictment for felony or misdemeanor has been found, but who will not come forward to take his trial, and who has not been arrested. In such a case, process of outlawry against him is awarded, which is a kind of temporary judgment; and while this process exists he is out of the protection of the law, and forfeits all his property. The courts will not listen to any complaint or attend to his suit till he reverse the outlawry, which is generally done as a matter of course.—In Scotland outlawry or fugitation is a similar process, and the defender must first be reponed against the sentence of outlawry before his trial can take place.

OUTLAWRY (*ante*). In the United States the process of outlawry in civil cases does not exist; never having been practiced in most of the states, and having long since been abolished in the others. It is possible that it may have been used here in criminal cases, but the instances, if any exist, were of very rare occurrence.

OUTPOSTS are bodies, commonly small, of troops stationed at a greater or less distance beyond the limits of a camp or main army, for the purpose of preventing an enemy approaching without notice, and also to offer opposition to his progress, while the main force prepares for resistance. Outguards march off to their position silently, and pay no compliments of any kind to officers or others. As soon as the officer commanding an outpost arrives on his ground, he proceeds to carefully examine the environs, noting all heights within rifle-range, roads and paths by which an enemy may approach, etc. He also takes such impromptu means of strengthening his position as occur to him—felling a tree here, cutting brushwood there, blocking a path in another place, and resorting to any expedient which may serve to delay the foe at point-blank range—an object of importance, as a stoppage at such a point is known to act as a great discouragement to advancing troops.

OUTRAM, Sir JAMES, Lieut. Gen., G.C.B., Indian soldier and statesman, was b. 1803, at Butterley hall, Derbyshire, the residence of his father, Mr. Benjamin Outram, a civil-engineer of note. His mother, the daughter of James Anderson of Mounie, Aberdeenshire, was descended from sir W. Seton, lord Pitmedden. Outram was educated at Udney, Aberdeenshire, under the rev. Dr. Bisset, and afterwards went to Marischal college, Aberdeen. He was sent to India as a cadet in 1819, and was made lieut. and adjutant of the 23d Bombay native infantry. He then took command of and disciplined the wild Bheels of Candeish, and successfully led them against the Daung tribes. From 1825 to 1838 he was engaged in re-establishing order in the Mahi Kânta. He went with the invading army under lord Keane into Afghanistan as aid-de-camp; and his ride from Khelat, through the dangers of the Bolan pass, will long be famous in Indian annals. He became political agent at Guzerat, and commissioner in Sinde, where he made a bold and earnest defense of the ameers against the aggressive policy of gen. sir Charles James Napier. He was afterwards resident at Sattara and Baroda, and upon the annexation of Oude, was made resident and commissioner by lord Dalhousie. His health failing, he returned to England in 1856; but when the war with Persia broke out, and it became necessary to send an expedition to the Persian gulf, Outram accompanied the forces, with diplomatic powers as commissioner. He conducted several brilliant and successful operations; the campaign was short and decisive; and the objects of the expedition having been triumphantly attained, he returned to India. Landing at Bombay in July, 1857, he went to Calcutta to receive lord Canning's instructions, and was commissioned to take charge of the forces advancing to the relief of Lucknow. He chivalrously waived the command in favor of his old lieut., Havelock (q.v.), who had fought 8 victorious battles with the rebels, and, taking up only his civil appointment, as chief-commissioner of Oude, tendered his military services to Havelock as a volunteer. Lucknow was relieved, and Outram took the command, but only to be in turn besieged. He held the Alumbagh against almost overwhelming forces, until lord Clyde advanced to his relief. He then made a skillful movement up the left bank of the Gumti, which led to a final and complete victory over the insurgents. He was made chief-commissioner of Oude; and though he had strongly opposed its annexation, he was the man who did most to restore British rule, and attach the people to it. For his eminent services he was appointed to the rank of lieut. gen. in 1858, and received the thanks of parliament in 1860. He took his seat as a member of the supreme council of India, in Calcutta, but sank under the climate, and returned to England in 1860, already stricken by the hand of death. The communities of India voted him a statue at Calcutta, founded an institution to his honor, and presented him with commemorative gifts. A banquet was given to him and his chief and companion-in-arms, lord Clyde, by the city of London. His English admirers determined to erect a statue to his honor in London, and gave him a valuable desert-service in silver. He spent the winter of 1861-62 in Egypt; and after a short residence in the s. of France, expired at Paris, Mar. 11, 1863. Outram was styled by sir Charles Napier the "Bayard of India." Than his, there is no more gallant name in the whole list of distinguished Indian soldiers. His services in the east as a soldier and a diplomatist extended over the period of 40 years. He was ever the generous protector of the dark-skinned races among whom his lot was thrown, and set a bright example to all future administrators of moderation, conciliation, humanity, and practical Christianity in all his dealings with the natives of India. See the *Biography* by Sir F. Goldsmid (1880).

OUT'RIGGER, in its proper sense, is a beam or spar fastened horizontally to the cross-trees or otherwise, for the purpose of extending further from the mast or topmast, the backstay or other rope by which that mast or topmast is supported. The power of the stay is thus increased. The term is also used improperly—because no "rigging" is in question—to denote the apparatus for increasing the leverage of an oar, by removing the resistance, as represented by the side of the boat (see OAR), further from the power represented by the rower's hand. This is effected by fixing an iron bracket to the boat's side, the row-loek being at the bracket's extremity. The necessary leverage is thus obtained without adding to the width of the boat itself.

OUTWORKS, in fortification, are minor defenses constructed beyond the main body of a work, for the purpose of keeping the enemy at a distance, or commanding certain salient points which it is undesirable that he should occupy. Such works are ravelins, lunettes, hornworks, crownworks, demi-lunes, tenailles, etc. They occur in certain

necessary order, as a ravelin before the curtain and tenaille, a hornwork before a ravelin, and so on.

OUVRARD, GABRIEL JULIEN, 1770-1846. On leaving college he was placed in a provision house, of which he soon became head, when the revolution of 1789 began. Perceiving that the freedom of the press would cause a rise in paper he made contracts with the principal manufacturers for all their products for two years, which enabled him quickly to realize 300,000 francs on the enforced advance. Entering into larger speculations which were enormously profitable, in 1793 he was denounced by Carrier to the committee of public safety as a monopolizer, and would probably have felt the guillotine had he not entered the army in a manner that suspended arrest, and enabled him to return to Paris the bearer of flags taken from the enemy. While there he successfully interceded for 132 imprisoned citizens of Nantes, and after the fall of Robespierre made friends with the new government, secured immense contracts, and in 1797 made 15,000,000 francs out of one contract with the Spanish government. In 1798 he loaned 10,000,000 francs to the French directory, and submitted a plan for the reorganization of the treasury department. The directory accepted the money but not the plan. In 1799 Bonaparte desired to borrow 12,000,000 more, but Ouvrard objected, and the former found excuse to arrest and imprison him in 1800. Ouvrard did not cede the loan, and Bonaparte, after failing to find evidence of dishonest practices, was obliged to give him freedom, when his commercial speculations then assumed still larger proportions. In 1802 he loaned the state 20,000,000 francs, and when the camp at Boulogne for the English invasion was preparing, his advances rose to 68,000,000 francs. Bonaparte, pleased to think he had drawn so much out of him, instructed his finance minister to pay back nothing. But Ouvrard's resources were greater than imagined, and in 1804 he advanced 200,000,000 more, and agreed to provide the state with all the money needed for Bonaparte's gigantic operations. In 1806 Bonaparte again endeavored to embarrass him, on the supposition that he was exhausted, and by a decree made him responsible for a debt of Spain. In 1809 another decree ordered his arrest and the sequestration of his estates. This stretch of unbridled power was suspended over him rather than executed. About 1810 he was in communication with Fouché, when the fall of that police minister brought his re-arrest and incarceration in the Abbaye, the donjon of Vincennes, and Sainte-Pélagie where he remained until the fall of Napoleon in 1813. On the return of the Bourbons, Ouvrard again presented his plan of national finance to the chambers. It was not adopted. On the return of Napoleon from Elba, overlooking his brutal treatment, Ouvrard lent his aid in the sum of 2,000,000 a day to the cost of the hundred days' campaign. Louis XVIII. refused to permit the acknowledgement of the debt; but it was already so distributed among third parties that a part only was finally repudiated. In 1817 Ouvrard's plan for the reorganization of the French treasury and its loan system was adopted, and proved a great and permanent advantage to France. In 1820 he addressed a memoir to the government demanding that cases pending between citizens and the state should be tried in ordinary courts like other cases, and not by special appointees of the crown. Accused in 1824 of dishonesty in connection with supplies for the French army in Spain, he was tried and fully acquitted; but was subsequently convicted of some improper procedure in the Bourse, and sentenced to a punishment, which was avoided by going to England, where he thenceforward lived an inconspicuous life.

OUZEL, or OUSEL (Old Fr. *oysel*, bird), an old name of the blackbird, as is evident from the descriptive lines of Bottom's song in *Midsummer Night's Dream*:

The ouzel cock, so black of hue,
With orange tawny bill.

It is also applied to other birds, chiefly of the thrush family. Thus, one British thrush is called the ring ouzel. The dipper (q v.) is very generally known as the water ouzel; and the rose-colored pastor is also called the rose-colored ouzel.

OVAL, the name given to the figure presented by a longitudinal section of an egg through its center. The oval has a general resemblance to the ellipse; unlike the latter, however, it is not symmetrical, but is thicker at one end than the other, and at the thin end narrows almost to a point. The term "oval" is also used indiscriminately with "nodus," "loop," to denote the figure formed by a curve which either returns upon itself, as the lemniscata, etc., or the loops of the cubical and semi-cubical parabolas and other curves. In scientific language it is specially distinguished from the term "elliptical," with which, in common parlance, it is usually confounded.

OVAM'POS AND OVAMPOLAND. The Ovampos or Otjiherero are a tribe, seemingly a connecting link between the Kaffir and Negro races, who inhabit the region n. of Great Namaqualand, in South Africa, extending n. to the Cuanene river, and s. to the parallel of 23° s. latitude. The Ovampo tribes are described by Andersson as of a very dark complexion, tall and robust, but remarkably ugly. He found them, however, honest, industrious, and hospitable. They are not entirely pastoral, but cultivate much corn. Living in the same country are the Cattle Damaras, with still more of the negro type, a stout, athletic people, very dirty in their habits, and generally armed with the

bow and arrow. They live in a state of constant warfare with the Ghondannup, or Hill Damaras, a nearly pure negro race, on the one hand, and the Namaqua Hottentots, who live s. of them, on the other.

Ovampoland is a more fertile region than Namaqualand, from which it is separated by a wide belt of densely-bushed country. It has but few rivers, and these not of a perennial nature. About 50 m. from the coast the country rises to a table-land about 6,000 ft. above the sea-level, and then declines to the s. and e. into the deserts of the Kalihari and the region of lake Ngami. Many strong indications of copper-ore are found in various places. The principal rivers, or rather water-courses, are the Swakop, Kusip, and their branches, which enter the Atlantic a few miles n. of Walfish bay. The other rivers in the interior seem to lose themselves in the sands. The climate is healthy except near the coast, where fever in some seasons prevails. It seldom rains in the coast region, which is a very desolate one, and almost devoid of water. Thunder storms are very violent in the summer season. All the large mammalia are found, more or less plentiful, according as water may be found at the different drinking-places. Elephants, rhinoceroses, elands, and other large animals driven from the s. by the march of civilization, take refuge in the desert region lying e. of Ovampoland, where sportsmen like Green and Andersson have been known to kill as many as 12 elephants in a day. The country was first described by sir J. Alexander, who visited its s. border. Mr. Galton afterward penetrated much further north; and Mr. C. J. Andersson has since fully explored it nearly as far n. as the Cuanene. Large numbers of horned cattle are annually collected by traders from the cape in these regions, and whales abound on the coast. The trade in ostrich feathers and ivory is of increasing importance, and several trading stations are established for the collection of native products. Some elementary works have been printed in the Otjiherero dialect by the German missionaries; two appear in sir G. Grey's catalogue.

O'VAR, a t. of Portugal, in the province of Beira, 17 m. n. from Aveiro, at the mouth of the small river Ovar, and at the head of one of the branches of the curious lagoon or bay called Ria d'Aveiro. See **AVEIRO**. It is a prosperous and rapidly increasing town, and carries on an extensive fishery and a considerable trade. Pop. '78, 10,447.

O'VARIES are organs peculiar to the female, and are analogous to the testes in the male. They are two oblong flattened bodies (about an inch and a half in length, three-quarters of an inch in width, and nearly half an inch thick in the human subject), situated on either side of the uterus, to which they are connected by ligaments and by the Fallopian tube. On making sections of an ovary, numerous vesicles are seen. These are the ovisacs of the future ova or germs, and are termed the *Graafian vesicles*. Before impregnation they vary in number from 10 to 20, and from the size of a pin's head to that of a pea; but microscopic examination reveals the presence of young vesicles in large numbers. At each monthly period a ripe Graafian vesicle bursts, and the ovum contained in it makes its way by ciliary motion along the Fallopian tube to the uterus, where, if it is not impregnated, it is disintegrated and absorbed.

Solid tumors or cysts, containing hair and teeth, are developed in these organs, but their principal disease is that to which the name of *ovarian tumor* is applied. This tumor may be described as consisting of an enormous enlargement of one or more of the Graafian vesicles into a mass which may weigh 80 or 100 lbs., or even more; and it may be either simple (that is to say, composed of natural structures much hypertrophied) or cancerous. The walls of the cysts (or enlarged Graafian vesicles) may be thin and flexible, or thick and cartilaginous; and the fluid they contain may be clear and limpid, or thick and ropy, or grumous and opaque. The only disease with which it can be confounded is ordinary abdominal dropsy, or *ascites*, and when its nature is clearly determined, three modes of treatment are open for adoption: these are (1) tapping, (2) various surgical and medical means of producing atrophy of the tumor, and (3) extirpation of the organ, or ovariectomy.

1. Tapping is the simplest mode of relieving the patient; but the cyst soon refills, and the operation must be often repeated. "Cases are extant in one of which the patient lived to be tapped 66 times at intervals of about a month, and in another, 128 times at intervals of six weeks; but, taken as a general rule, it may be affirmed that few patients survive more than four years after the first tapping, a period passed in the greatest misery and suffering."—Druet's *Surgeon's Vade-Mecum*, p. 498.

2. Under this head are included both numerous operations for causing the tumor to waste, and its internal walls to adhere, and the internal administration of absorbent medicines, with the view of producing atrophy and absorption of the tumor. The injection of tincture of iodine into the previously emptied cyst, is sometimes followed with good results, as in the case of hydrocele (q.v.).

3. Ovariectomy, or total extirpation of the morbid mass, is an operation regarding which there has of late years been much discussion. Its opponents urge (1) the difficulty of diagnosis; (2) the frequency of adhesion of the tumor to adjacent parts—a point which can often not be ascertained till the abdomen has been opened; and (3) the great mortality that follows it: while in favor of the operation it is urged (1) that the mortality is not greater than from some other surgical operations which are regarded as justifiable; (2) that no other plan of treatment can effect a radical cure; (3) that if the surgeon, in order

to complete his diagnosis, first makes a small incision to enable him to ascertain the existence of adhesions, and closes it again with suture, if he finds this to be the case, no great harm is likely to result; and (4) that considering the miserable lives these patients lead during a course of tapping, etc., it is the most merciful course to adopt in patients who are young and otherwise healthy. For a description of the mode of performing the operation, and of the cautions to be observed, we may refer to a series of papers on ovariectomy by Mr. Spencer Wells in *The Medical Times and Gazette* for 1858 and 1859.

OVARY, in botany. See **GERMEN**.

OVA'TION. See **TRIUMPH**.

OVEN, **FIELD OR BARRACK**, is a necessary apparatus in military economy to preserve the health of troops, by enabling them, at a comparatively small expenditure of fuel, to cook many rations together. In the British army little attention was paid to such subjects, until, in 1858, the inquiries of Mr. Sidney Herbert (afterwards lord Herbert) brought to light the excessive mortality among soldiers, which was partly—and, as the event has shown, justly—attributed to the bad cookery of their food. Capt. Grant has bestowed much attention to army cookery, and has invented ovens for barrack use and for the field. While great improvements on the system—or want of system—which preceded them, these ovens are still admitted to be far from perfect in their arrangements. For boiling meat, etc., in the field, he employs detached cylinders, which, when empty, he proposes to join and floor over for use as pontoons; when in use they are united cross-wise, one in the middle serving for a chimney. One or more empty barrels can be attached for steaming potatoes, and the roasting of coffee is performed, though not altogether successfully, in another cylinder made to revolve over the chimney. Up to the present time other systems have been partially resorted to; but none has as yet been definitively adopted to the exclusion of others.

OVEN-BIRD, *Furnarius*, a genus of birds of the family *Certhiadae* (q.v.), natives of the southern parts of South America, interesting on account of the remarkable nests which they construct. They are small birds, with short wings and feeble power of flight. One species, *F. albogularis*, or *F. rufus*, is found near Buenos Ayres; another *F. fuliginosus*, inhabits the Malouine islands. It is a fearless little bird, regarding the presence of man so little that it may be easily struck down with a switch. Both sexes take part in the construction of the nest, which is generally in an exposed situation, remarkably large, and of the shape of a dome, with a small entrance on one side, so as to have much resemblance to a rude oven. It is made of clay, grass, etc., well plastered together, and becomes quite firm as the clay dries in the sun. Internally, it is divided into two chambers by a partition reaching nearly to the roof, the eggs being placed in the inner chamber on a bed of soft grass and feathers. The outer chamber seems to be intended for the male.

OVER DAR'WEN is a very flourishing t. of Lancashire, situated amid moorland hills, $3\frac{1}{2}$ m. s. of Blackburn, and $19\frac{1}{2}$ m. n.w. of Manchester, with which towns it is connected by the Lancashire and Yorkshire railway. It has risen into wealth principally by a trade with India and China in calicoes. At present, there are about 250,000 spindles and 15,000 looms, contained in upward of 40 mills and manufactories, at work in it. The "India mill," erected to contain 100,000 spindles, is in every respect one of the finest in the country. It is a first-class stone building in the Italian style, with engine-house, chimney etc., highly ornamented, is 100 ft. high, and covers an area of 31,000 sq. feet. The town also contains the most extensive paper-staining works in England, 5 paper manufactories, 1 calico-printing establishment, as well as works for the manufacture of fire-bricks, tiles, and sanitary tubes, iron and brass founding, bleaching, machine and reed making. Coal-mines and stone quarries also find employment for a considerable number of the inhabitants. The places of worship are—4 churches, 3 independent chapels; a Baptist, Wesleyan, Primitive, Methodist free church, and Roman Catholic chapel. There are large and commodious schools for elementary education. The town possesses a covered market, public baths, and a valuable free library. The central stores of the industrial co-operative society, erected in 1867, at a cost of £10,000, contain a public hall to accommodate 1500 people. This society, which soon had over 2,000 members, has several thriving branches. It maintains science classes, and possesses an extensive library, and well supplied news-rooms, free to members and their families. Pop. '51, 11,702; '61, 16,492; '71, 21,278; and at the close of '80, the estimate was given at above 29,747.

OVERBECK, **FRIEDRICH**, b. at Lubeck; July 3, 1789, a distinguished painter, to whom is justly awarded a large share of the merit of the movement in the early part of this c., from which arose the modern German school of art. He commenced his studies as an artist at Vienna in 1806; but having adopted, and continued to persist in carrying out certain notions on art, and the mode of studying it, essentially different from those inculcated in the academy, he was expelled along with certain other students who entertained the same views, and in 1809 set out for Rome. Here he was soon afterward joined by Cornelius and Schadow; and these three, animated with similar ideas, and mutually

encouraging one another, laid the foundation of a school that now holds a high rank, and has in no small degree influenced the taste for art in Europe at the present time. A picture of the Madonna, which Overbeck painted at Rome in 1811, brought him into marked notice. He was next employed along with Cornelius and others, by the Prussian consul, gen. Bartholdi, to execute certain frescoes illustrating the history of Joseph, the "Selling of Joseph" and the "Seven Lean Years" being the subjects assigned to him. After completing these, he painted in fresco, in the villa of the marchese Massimi, five large compositions from Tasso's *Jerusalem Delivered*. In 1814, along with some of his artistic brethren, he abjured Lutheranism, and embraced the Roman Catholic religion. Overbeck's chief work is a fresco at Assisi, "The Miracle of Roses of St. Francis." His oil pictures are inferior to his frescoes, being dry and weak in color. His great picture, "The Influence of Religion on Art," preserved in the Stadel institute at Frankfurt, and well known from the engraving, is an admirable composition, and is indeed the most favorable specimen of his powers as a painter in oil colors. He executed a great many drawings remarkable for high feeling, most of which have been engraved. One of his last undertakings, a series of designs from the Evangelists, delicately engraved in the line manner, is a work of high excellence. Overbeck adhered closely to those ideas of art which he started with—namely, entire devotion to the style of the Italian artists prior to the period of the renaissance, particularly Fra Angelico (b. 1387—d. 1455), and a strong impression that form or drawing in the style of Greek or classic art is inadmissible in works embodying religious subjects; although many of his compatriots—Cornelius, for instance—have modified, or perhaps enlarged these ideas, and study the works of Michael Angelo and those of Raphael's later style executed under the influence of classic art. Overbeck resided in Rome from the time he went there as a student. He died November 1869.

OVERBURY, Sir THOMAS, an English author and courtier, whose mysterious death has given a peculiar interest to his history, was the son of Nicholas Overbury, a Gloucestershire squire, and was b. at Compton Scorfen, Warwickshire, the residence of his maternal grandfather in 1581. At the age of 14 he entered Queen's college, Oxford, where he highly distinguished himself in logic and philosophy, and where he took the degree of B.A. in 1598. He then joined the middle temple, but soon after set out for the continent, from which he returned with the reputation of being a finished gentleman. While on a visit to Scotland in 1601, he met for the first time with his future murderer, Robert Carr (properly Ker), then a page in the service of the earl of Dunbar. An intimacy unfortunately sprung up between the two, and Carr—a handsome ignoramus, sensual and unprincipled—followed his scholarly friend to London. On the accession of James to the English throne (1603), Carr rose rapidly into royal favor, and was created viscount Rochester. Through his influence, Overbury was knighted in 1608, and his father appointed a judge for Wales. In return, Overbury gave his patron the benefit of his wit and judgment, both of which were singularly excellent; and, according to Hume, it was owing to Overbury that Carr enjoyed for a time the highest favor of the prince without being hated by the people. The circumstances that led to a rupture of their intimacy, and turned the earl into Overbury's secret and relentless enemy, form one of the most flagrant scandals in the history of the English court. A brief outline of these circumstances is all that can be given here.

At the age of 13, Frances Howard, daughter of the earl of Suffolk, was married (1606) to the earl of Essex, himself only a year older. On account of their youth, it was reckoned advisable by their friends that they should not live together for some time. The boy-husband went away on his travels, and the wedded girl to her mother. After the lapse of nearly 5 years, Essex came home, and found his wife, now a splendid beauty of 18, the idol of all the court gallants. But there was not a touch of virtue or goodness in her whole soul. She had the disposition of a Messalina (q.v.) or a Brinvilliers (q.v.). For her husband she showed the greatest aversion, and only consented to live in his house at the command of the king. It was well known that she had had intrigues with more than one lover, but in particular with Rochester, for whom she now cherished a fierce passion. Overbury had been instrumental in bringing about their guilty intercourse, and was now to reap the reward due to a pander. Rochester having told him that he purposed to get lady Essex divorced from her husband, and then to marry her, Overbury strongly deprecated the idea, and declared that it would be disgraceful to form a union with so depraved a creature—she might do for a mistress, but not for a wife! The earl told lady Essex what Overbury had said of her; she became furious for revenge, and offered sir David Wood (between whom and Overbury there was a standing quarrel) £1000 to assassinate him, which that canny Scot declined to do. Rochester himself was now persuaded by his mistress to join privately in a plot against Overbury, who on a most trivial and illegal pretext was thrown into the Tower, April 21, 1613. It was some time before he could bring himself to believe that his friend and patron was the cause of his imprisonment; but when he had assured himself of Rochester's treachery, he threatened to divulge certain secrets in his possession, whereupon it was determined by the earl and his mistress that he should be poisoned. This, after several trials, was successfully accomplished, and Overbury expired on Sept. 15th. Rochester (now created earl of Somerset), and his paramour were married on Dec. 26th with great pomp, the brazen-

facéd beauty wearing her hair "as a virgin," and the whole affair was soon to appear forgotten; but after George Villiers had supplanted the earl in the royal favor, an inquiry was instituted; Somerset and his wife were tried and found guilty of poisoning, but were, by an amazing and infamous stretch of the royal prerogative, pardoned. The motive for James's extraordinary clemency has never been ascertained; but the prevailing opinion is, that it was to prevent the disclosure of some discreditable, if not criminal, incidents in the private life of that monarch.

Overbury wrote several works, all of which were posthumously published. The principal are, *The Wife* (1614), a didactic poem; *Characters* (1614), the wit, ingenuity, precision, and force of which have long been admitted; *Crumms Fallen from King James's Table* (1715). The latest edition of Overbury's works is that by E. F. Rimbault with life (1856).

OVERCOMERS. See page 882.

OVERLAND ROUTE to India, the route generally chosen by those to whom time is a more important consideration than expense. The management of the route is in the hands of the Peninsula and Oriental steam company, who present the traveller with a choice of lines of route to Alexandria. He may sail from London (formerly Southampton) *viâ* Gibraltar and Malta, reaching Alexandria in 13 days, a very convenient route for those who have much luggage, as no shifting is required till Alexandria is reached; or he may travel overland by railway and steamer to Marseilles or Trieste. The shortest route from London to the former is *viâ* Dover, Calais and Paris, Alexandria being reached in 11 days (including necessary stoppages); and to the latter *viâ* Dover, Calais, Paris, Turin, and Venice. The shortest route to India at present, after reaching Paris, is *viâ* Lyon, the Mount Cenis tunnel, Modena, to Brindisi; from that Adriatic port by steamer to Port Said, thence through the Suez canal and the Red Sea to Bombay, the time occupied being from 20 to 21 days. Passengers may still go from Alexandria by rail to Suez, where they again embark on the P. and O. steamers. The time occupied in travelling from Alexandria to Bombay is 13 days, to Madras, 19 days, and to Calcutta, 23 days. Thus a traveller can reach Calcutta from London in 34 days, and at a cost of £68. He may now further shorten his route by going from Bombay to Madras by rail (775 miles), and to Calcutta (1,401 miles). The long sea-route round by the Cape of Good Hope cannot be accomplished by steamer in less than 94 days, and by sailing vessels it takes more than four months.

OVERSEER, ASSISTANT. An assistant overseer is a paid officer, whose services have generally been found necessary in the larger parishes, in order to relieve the annual overseers of their burdensome office to some extent. Accordingly, the ratepayers, in vestry assembled, appoint a person as assistant overseer with a salary, who performs most of the same duties as the overseers. In many cases, however, a collector of poor-rates has been appointed, who is also paid by salary, and in such a case he discharges like duties. Both the assistant overseer and the collector of poor-rates are bound to find security for the faithful discharge of their duties, and for duly accounting for moneys in their hands.

OVERSEERS are officers appointed annually in all the parishes in England and Wales, whose primary duty it is to rate the inhabitants to the poor-rate, collect the same, and apply it towards giving relief to the poor. These officers occupy an important position in all English parishes. They were first ordered to be appointed in each parish by the statute of 43 Eliz. c. 2, the leading poor-law act, which directed four, three, or two substantial householders in the parish to be nominated yearly, and a later statute fixed the time of nomination to be March 25, or a fortnight thereafter. The courts have held that not more than four, nor less than two, can be appointed, the object being, probably, that so much responsibility should not be thrown on any one individual. Though it is usual for the vestry of the parish to nominate two persons to be overseers, still those who really appoint them are the justices of the peace, who are not bound to regard the wishes of the vestry in this respect. It is only householders in the parish who are qualified for the office, and though it is not necessary that they should actually reside in the parish, still they must occupy or rent a house there. Several classes of persons are exempt from serving the office, such as peers, members of parliament, clergymen, dissenting ministers, barristers, attorneys, doctors, officers of the army and navy, etc. But all who are not specially exempted by some statute are liable to serve the office, and even women may be appointed, though they scarcely ever are so in practice. The office is compulsory, and entirely gratuitous; and so necessary is it that some one shall fill the office, that it is an indictable misdemeanor to refuse, without cause, to serve when duly appointed. Though overseers are the proper managers of the poor for each parish, yet some parishes, especially in large overgrown towns, have been regulated by local acts, and guardians of the poor provided; and other parishes are under what is called a select vestry. In such cases the overseers, though still appointed, are only allowed to give relief to paupers in certain urgent and exceptional cases, the ordinary regulation of poor-law affairs being confided to the guardians or the select vestry. The primary duty of the overseers consists in making, collecting, and applying the poor-rate for the relief of the poor of the parish, but, as will be seen, advantage has been taken by the legislature of the existence of these officers always representing the parish, to throw upon

them various miscellaneous duties which are not directly connected with poor-law affairs.

1. Of the duties connected with the management of the poor: The overseers, along with the churchwardens, are to make a rate once or twice a year; i.e., a list of all the occupiers of lands and houses in the parish, specifying their names and the property occupied by each, and the ratable value and amount due by each. The next thing to be done is to go before two justices of the peace and get the rate allowed—i.e., signed by them—and then it is published on the church door on the following Sunday. The overseers must collect the rate also; but in all large parishes there is a collector of poor-rates who is specially appointed and paid for the purpose of collecting it. If a party refuses to pay the rate, the overseers must take proceedings before justices to compel payment, which is done by distraining the goods of the party, or, if there are no sufficient goods, by getting a warrant to imprison him. The party may, however, appeal against the rate to the court of quarter sessions. When the money is collected, the overseers have to apply it towards the relief of the poor, and many other purposes of a kindred nature. Relief must be given to all the poor in the parish who are in a destitute state; but it is the duty of the overseers, when the pauper has not a settlement in the parish, to obtain an order of removal, i.e.; to get an order of justices, under which the pauper is taken by force and sent to the parish where he has a settlement. See REMOVAL OF THE POOR. Relief is given, in general, only in the workhouse, and according to certain rules and conditions. Where the parish is included in a poor-law union, as is now generally the case, then the duty of overseers in giving relief is entirely confined to certain urgent cases; for the guardians of the union administer the ordinary business of the workhouse, and of relief generally. Another duty incident to overseers of a parish in a union is the duty of making out valuation lists—i.e., a new valuation of the property in the parish—which list is ordered by the guardians with a view to produce some uniformity in assessing the burdens on the various occupiers. Formerly the mode of valuing property for the purposes of the poor-rate was not subject to any uniform rule, and in some parishes the valuers made a larger deduction from the actual value than in others; but in 1862 a statute passed, called the union assessment act, the object of which was to enable new valuations to be made on a uniform plan, till the occupiers in all the parishes are treated alike. At the end of the year of office, the accounts of the overseers of parishes in unions are audited by a poor-law auditor, who is a paid officer, and who examines the vouchers, and sees that no illegal payments have been made.

2. The miscellaneous duties now imposed by statute on overseers, over and above their original duty of relieving the poor, are numerous. The most prominent, perhaps, is that of making out the list of voters for members of parliament. This duty is done in obedience to certain precepts issued by the clerk of the peace each year, who gives the overseers full instructions how to make out the lists, and what claims and objections to receive, and how to deal with them. The overseers must also attend the court of the revising barrister, when he revises the lists, and disposes of legal objections. Another duty of the overseers is to make out the list of persons in the parish qualified to serve as jurors. So they must make out the burgess lists when the parish is situated within a borough. They must also make out the list of persons qualified to serve as parish constables. They are also bound to appoint persons to enforce the vaccination acts; they must give notice to justices of all lunatics within the parish, and pauper lunatics are removed to the county asylum. They must also collect and enforce payments of the rates levied to pay the expenses of school-boards. The overseers must also perform certain duties as to the election of guardians for the union. They must also bury the dead bodies of persons cast on shore, and of all paupers who die in the parish. They also are the proper parties to protect village greens from nuisances; and in general, where there is no local board of health, the overseers are the parties bound to act in carrying out the nuisances removal acts (see NUISANCE) within the parish, which of itself is an onerous duty. In general, whenever overseers are bound to do miscellaneous duties of this kind, they are authorized to pay the necessary expenses and disbursements out of the poor-rate; but, as already stated, their services are gratuitous. The duties which in England are performed by overseers, devolve, in Scotland, upon the parochial board, the sheriff-clerk of the county, session-clerk, and others.

OVERSTONE, SAMUEL JONES LOYD, Lord, one of the most skillful political economists, and the ablest writer on banking and financial subjects that England ever has produced. He was born in 1796, being the only son of Mr. Lewis Loyd, descended from a respectable Welsh family, and a leading partner in the eminent banking house of Jones, Loyd & Co. of London and Manchester. Having gone through a regular course of instruction at Eton, young Loyd was sent to Trinity college, Cambridge, where he had Dr. Blomfield, late bishop of London, for tutor, and where he acquired a very extensive acquaintance with classical literature, and with the history and literature of his own country and of Europe generally. On leaving Cambridge, Loyd entered the banking-house as a partner along with his father, and on the retirement of the latter, he became its head. He distinguished himself highly in his capacity of banker. He had a profound knowledge of the principles of banking, and these he applied on all occasions in

conducting the business in which he was engaged. Far-sighted and sagacious, he was seldom deceived by appearances or pretensions, however specious. Perhaps, if anything, he was too cautious; but he was neither timid nor irresolute. He was eminently successful in the employment of the very large deposits at his command, and while he eschewed hazardous transactions, he did not shrink from engaging in very extensive operations when he believed they could be undertaken with a due regard to that safety which should always be the first consideration in the estimation of a banker.

Loyd entered parliament in 1819 as member for Hythe, which he continued to represent till 1826. He made several good speeches in the house; and was one of a small minority that voted for the proposal to make bankers issuing notes give security for their payment. Though opposed to all changes of a dangerous or revolutionary character, Loyd had been always a consistent liberal. Having either withdrawn, or being on the eve of withdrawing from business, Loyd was raised to the peerage in 1850, by the title of baron Overstone and Fotheringhay, county Northampton; and if great wealth, consummate intelligence in regard to matters of great public importance, and the highest degree of integrity and independence, be qualified for a seat in the lords, few peers had had a better title to be enrolled in that august assembly.

The first of lord Overstone's famous tracts on the management of the bank of England and the state of the currency was published in 1837, and was followed by others between that period and 1857. The proposal for making a complete separation between the banking and issue departments of the bank of England, introduced by sir Robert Peel into the act of 1844, was first brought forward in these tracts, and its adoption has been the greatest improvement hitherto effected in our banking system. Having been collected, these tracts were published in 1857, with extracts from evidence given by lord Overstone before committees of the lords and commons. And it would not be easy to exaggerate the value of this volume. Lord Overstone has also reprinted, at his own expense, four volumes of scarce and valuable tracts on metallic and paper money, commerce, the funding system, etc., which were extensively distributed.

An inquiry took place before a committee of the house of commons in 1857 into the practical working of the act of 1844, and lord Overstone was the principal witness who came forward in defense of the act; but several leading members of the committee being hostile to it, exerted themselves to overthrow his lordship's theories and opinions, and subjected him to a severe cross-examination; which gave lord Overstone the opportunity of successfully vindicating the principles and practical working of the act. This evidence was published in a separate volume in 1857.

Lord Overstone did not often speak in the house of lords. His speech on the commercial treaty with France is probably the best of his parliamentary appearances. He was invariably a zealous opponent of the principle of limited liability. He was a leading member of the commission appointed to inquire into the proposal for the introduction of a decimal system of arithmetic, and powerfully advocated the opinion that it would be injurious rather than beneficial.

All who had the privilege of knowing lord Overstone regard him as one of the most honorable, high-minded, and upright man in the empire. But his rigid adherence to principle in his writings, his dealings, and his conversation, and his undisguised contempt for twaddle and pretensions of all sorts, have made him be generally looked upon as austere and without sympathy. Such, however, was not the fact. When proper cases for the display of sympathetic and generous feelings were brought before him none evinced them more strongly. We may add that his conversational talents were of the highest order. He d. 1883.

OVERTON, a co. in n. central Tennessee, bordering on Kentucky; drained by Ovie's river and the West fork; 470 sq.m.; pop. '80, 12,153—12,146 of American birth, 341 colored. The surface is broken, but the soil fertile. The chief products are maize, wheat, oats, cattle, and pork. There are extensive forests of ash, oak, hickory, tulip, and maple. Coal is found. Co. seat, Livingston.

OVERTURE. See page 882.

OVERTURE (from Fr. *ouverture*, opening), a musical composition for a full instrumental band, introductory to an opera, oratorio, cantata, or ballet. It originated in France, and received its settled form at the hands of Lulli. Being of the nature of a prologue, it ought to be in keeping with the piece which it ushers in, so as to prepare the audience for the sort of emotions which the author wishes to excite. Such is to a great extent the character of the beautiful overtures by Mozart to *Zauberflöte* and *Don Giovanni*, by Weber to *Freischütz*, and by Mendelssohn to his *Midsummer Night's Dream*, which are enriched by snatches of the more prominent airs in these operas. In the end of last century overtures were written by Haydn, Pleyel, and other composers, as independent pieces to be played in the concert room; this sort of overture being, in fact, the early form of what was afterwards developed into the symphony (q.v.). The overture, as well as the symphony, is designated by the name *sinfonia* in Italian.

OVERWEG, ADOLF, 1822—52; b. Hamburg. He studied geology at the universities of Bonn and Berlin, and in 1850 joined Barth and Richardson in their explorations of central Africa. He reached Lake Tchad with a boat which had been brought overland from Tripoli; and devoted five weeks to exploring that lake, being the first European who had ever sailed upon its waters. He then tried to penetrate the Fellatah kingdom.

of Yakoba, n.w. of the Benoowe, but his health was shattered and he returned to Kuka, near which place he died Sept. 27, 1852. He made a number of discoveries, among which was the fact that the desert of Sahara is an elevated plateau, and not a depressed plain. His reports appeared in Vol. VIII. and IX. of *Monatsberichte der Gesellschaft für Erdkunde*; and Vol. I. of Petermann's *Zeitschrift für Allgemeine Erdkunde*.

OVERYS'SEL, a province of the Netherlands, is bounded on the n. by Friesland and Drenthe; e. by Hanover and Westphalia; s. and s.w. by Gelderland; and w. by the Zuyder Zee. It has an area of 1,274 sq.m.; and (1880) a pop. of 276,246. The soil is sandy, with clay lands by the Yssel, rich pastures along the Zuyder Zee and rivers, tracts of peat-land in various parts, and extensive heaths which are gradually being brought into cultivation. From south to north the province is intersected by an unbroken chain of sand-hills. The chief cities are Zwolle, Deventer, and Kampen; important manufacturing towns of less note being Almelo, Avereest, Dalfsen, Haaksbergen, Hardenberg, Hellendorn, Lonneker, Losser, Raalte, Staphorst, Steenwykerswold, Tubbergen, Weerselo, Wierden, Zwollerkerspel, etc. The principal employments are: agriculture, manufactures of various kinds, fishing, making peat, shipping, and merchandise. There are very many cotton mills and bleaching establishments in the district of Twenthe: Yssel has brick and tile manufactures; while mats and besoms are made by the people of the coast. There is extensive cattle-raising; and potatoes, buckwheat, oats, barley, wheat, rye, beans, flax, etc., are grown in abundance.

At Zwolle, Deventer, Kampen, Almelo, and Steenwyk, besides the ground produce, 3,008,000 lbs. of butter were put in the market in a single year. In Overyssel thousands of acres are still waste.

Carpets are manufactured at Deventer and Kampen, leather at Blokzyl, calicoes and other cotton fabrics at Kampen, Almelo, Dalfsen, Ommen, and many other towns. There are extensive brick-works at Ryssen, Zwollerkerspel, Markelo, and Diepenveen, producing a yearly aggregate of 43,760,000. Ship-building is carried on at Zwartsluis, Vollenhove, Steenwykerswold, Avereest, etc. There were in 1875, 181,863 Protestants and 76,891 Roman Catholics, and a few churches belonging to smaller Protestant sects. There were at the same time 4,018 Jews. 14 communes (including Wolle, the chief city) numbered in 1879 more than 2,000 inhabitants. Commerce has been increased by the opening of several large canals.

The principal rivers are the Yssel, into which the Schipbeek runs, and the Overysseche Vecht, which falls into the Black Water. Other important water-ways are the Dedems-Vaart and the Willems-Vaart canals. There are more than 100 m. of railways in the province. The island of Schokland, in the Zuyder Zee, belongs to Overyssel.

OVIBOS. See MUSK-Ox, *ante*.

O'VID (PUBLIUS OVIDIUS NASO), the descendant of an old equestrian family, was b. on Mar. 20, 43 B.C., at Sulmo, in the country of the Peligni. He was educated for the bar, and under his masters, Arellius Fuscus and Porcius Latro, he became highly proficient in the art of declamation. His genius, however, was essentially that of the poet, and the writing of verses began to absorb the time that should have been spent in the study of jurisprudence. His father, having but a scanty patrimony to divide between two sons, discouraged this tendency in the younger, but in vain. By the death of his elder brother, Ovid inherited all his father's property, and went, for the completion of his education, to Athens, where he acquired a perfect mastery of the Greek language. He afterwards made a tour in Asia and Sicily along with the poet Macer. It is uncertain whether, on his return to Rome, he ever practiced as advocate. Although by birth entitled to aspire to the dignity, he never entered the senate; his weakness of body and indolence of habit prevented him from ever rising higher than from the position of triumvir capitalis to that of a decemvir, who convened and presided over the court of the centumviri. While his public life was unimportant, his private was that of a gay and licentious man of letters. The restraint of the matrimonial tie was always distasteful to him; twice married in early life, he soon divorced each of his wives; while he carried on an intrigue with a lady whom he celebrated as Corinna, and who is believed to have been no other than Julia, the accomplished daughter of Augustus. Before his thirtieth year, he married a third time, and became the father of Perilla, of whom he was tenderly fond. Up till his fiftieth year, he resided chiefly at Rome, in a house near the capitol, and occasionally visited his Pelignan estate. His society was much courted, and his large circle of distinguished friends included Augustus and the imperial family. By an edict of the emperor, however, he was, in 9 A.D., commanded to leave Rome for Tomi, a town near the delta of the Danube, and on the very limit of the empire. The sentence did not condemn him to an *exsilium*, but to a *relegatio*—or, in other words, he did not lose his citizenship, nor was he cut off from all hope of return. The cause of this sudden banishment has long divided the opinion of scholars, since the one mentioned in the edict—the publication of his *Ars Amatoria*—was a mere pretext, the poem having been in circulation for ten years before. His intrigue with Julia, or with Julia's daughter, and the consequent displeasure of Augustus or of Livia, have been adduced with various degrees of plausibility, as the cause of a sentence to which Ovid himself only mysteriously refers. The misery of his life on the inhospitable and barbarous shore of the Euxine is commemorated by the poems in the composition of which he found his solace. He became

a favorite with the Tomitæ, whose language he learned, and before whom he publicly recited some poems in honor of Augustus. But his devotion to the emperor, and the entreaties addressed to the imperial court by himself and his friends, failed to shorten the term, or to change the scene of his banishment; so he died, an honored citizen of Tomi, 18 A.D., in his sixtieth year. His works which have come down to us, either in whole or in part, appeared in the following order: 1. *Amorum Libri III.*, a revised and abridged edition of an early series. 2. Twenty-one *Epistolæ Heroidum*. 3. The *Ars Amatoria*. 4. *Remedia Amoris*. 5. *Nux*, the remonstrance of a nut-tree against the ill-treatment it receives from the wayfarer, and even from its owner. 6. *Metamorphoseon Libri XV.* This is deservedly Ovid's best-known work. It seems to have been written between the poet's fortieth and fiftieth years, and consists of all the transformations recorded in legend from the creation down to the time of Julius Cæsar, whose change into a star forms the last of the series. 7. *Fastorum Libri XII.*, the first six of which are all that remain. The poem is a Roman calendar versified, and describes the appropriate festivals and mythic legends from materials supplied by the old annalists. 8. *Tristium Libri V.*, written in elegiac meter, during the first four years of the poet's banishment. They are mainly descriptive of his miserable fate, and are full of appeals to the clemency of Augustus. 9. *Epistolarum ex Ponto Libri IV.*, also written in elegiac meter, and similar in substance to the *Tristia*. 10. *Ibis*, a short satire against some traducer of the poet's. 11. *Consolatio ad Liviam Augustam*, held spurious by some critics. 12. *Medicamina Faciei* and *Halieuticon*, dubiously genuine, and of which we possess but fragments. Several of his works are entirely lost, the one best known to antiquity being *Medea*, a tragedy.

The poetical genius of Ovid has always been admired. A masterly facility of composition, a fancy vigorous and rarely at fault, a fine eye for color, and a versification very musical in its flow, are the merits which have made him a favorite of poets from Milton downwards, in spite of his occasional slovenliness and falsity of thought. The best editions of Ovid's entire works are Burmann's (Amsterdam, 1727), and the recent one of Merkel; while excellent commentaries on one or other of his poems have been published by Haupt, Ramsay, and Paley. A good translation of his *Metamorphoses* is that edited by Garth, with the assistance of Dryden, Addison, Congreve, and others; while special passages of the same poem have been admirably rendered by Mr. D'Arcy Thompson.

OVIE'DO, a pleasant and healthy city of Spain, capital of the modern province of the same name (the ancient Asturias, q.v.), stands on a plain between the rivers Nalon and Nora, 61 m. n.n.w. of Leon, and 22 m. s.s.w. of Gijon, on the bay of Biscay. In the center of the city is a handsome square, from which four principal streets terminating in alamedas or promenades, branch off toward the n., s., e., and w., respectively. These main streets are connected by others, and all are clean and well-paved. Pure water is abundantly supplied by means of a long aqueduct, and is delivered in the city by eleven public fountains. The cathedral, a beautiful cruciform specimen of Gothic, the ornamentation of which is as rich as it is elegant, contains (in the chapel of the Virgin) the remains of many of the early kings and princes of Asturias, and has a fine old library. Some curious, but eminently questionable relics, are to be found in the church of *San Miguel*, which is the second oldest Christian building after the Moorish invasion. In the immediate vicinity of the city there are other churches in the early Saxon style, which are among the oldest churches in the peninsula. The convent of San Vincente, founded in 1281, has been secularized, and is now occupied by government offices, etc. Linens, woolens, hats, and fire-arms are manufactured. Pop. 25,460.

Oviedo was known during the middle ages as *Civitas Episcoporum*, because many of the Spanish prelates who had been dispossessed of their sees by the Moors, took refuge here. This city, which is the see of a bishop, was twice plundered of its ecclesiastical and other treasures during the war of independence; first by Soult, and subsequently by Bonnet.

OVIEDO Y VALDES, GONZALO FER. DE, a Spanish chronicler, b. at Madrid in 1478, was sent by Ferdinand to St. Domingo, in the West Indies, in 1514, as intendant and inspector-general of the trade of the new world. During his long residence in St. Domingo, he spent his leisure in acquiring an extensive knowledge of the West Indies; and after his return to Spain published at Toledo, in 1526, a *Summario de la Historia General y Natural de las Indias Occidentales*, which he dedicated to Charles V. He afterwards made some additions to the work, which was republished at Seville in 1535, in 21 vols., under the title of *La Historia General y Natural de las Indias Occidentales*. He left other 29 books in manuscript. A complete edition is now being prepared at Madrid. Oviedo died at Valladolid in 1557. Besides his *History of the West Indies*, he wrote *Las Quinquagenas*, a valuable, gossiping, and anecdotal account of all the principal personages of Spain in his time, which still remains in MS. in the royal library at Madrid; and chronicles of Ferdinand, Isabella, and Charles V. A life of cardinal Ximenes is also attributed to him.

OVIP'AROUS, a term applied to animals in which reproduction takes place by eggs (*ova*). Except the mammalia, all animals are either oviparous or ovoviviparous (q.v.); the latter mode—which is not essentially different from the former—being comparatively

rare. Even those invertebrate animals which multiply by gemmation and division have also a true reproduction by *ova*. See EGG and REPRODUCTION.

O'VOLO, a convex moulding much used in classic architecture. See MOULDING. In Roman architecture, the ovolo is an exact quarter of a circle; in Greek architecture, the curve is sharper at the top and quirked. It is sometimes used in *decorated Gothic*.

OVOVIVIP'AROUS, a term applied to animals of which the egg is hatched within the body of the mother, so that the young is excluded alive, although the fetus has been inclosed in an egg almost to the time of parturition. It is probable that the egg is often broken in parturition itself. Some fishes are ovoviviparous, and some reptiles; also the *monotremata*. The common lizard and the viviparous lizard, both natives of Britain, are illustrations of the near resemblance which may subsist between oviparous and ovoviviparous animals. The distinction is much less important than might be supposed.

O'VULE (Lat. a little egg), in botany, the rudimentary seed. The germen (q.v.) or ovary sometimes contains only one ovule, sometimes a small *definite* number, sometimes a large *indefinite* number. Ovules are to be regarded as metamorphosed buds. "The single ovule contained in the ovaries of compositæ and grasses may be called a terminal bud, surrounded by a whorl of adhering leaves or carpels, in the axil of one of which it is produced."—Balfour, *Manual of Botany*. The ovule is not always contained in an ovary. In gymnogens (q.v.) it is wanting, and the ovule is *naked*; but the plants possessing this character are comparatively few. The ovule is attached to the *placenta* (q.v.), and by it to the carpel (q.v.), from which it is developed. The attachment to the placenta is either immediate, when the ovule is said to be *sessile*, or by means of an umbilical cord (*funiculus*), which sometimes elongates very much after fecundation. The ovule is, in general, essentially formed of a cellular *nucleus* inclosed by two membranes, the outer of which is called the *primine*, and the inner the *secundine*. At one end of the nucleus there is an opening of both membranes—the *foramen*—through which the access of the pollen in fecundation (q.v.) takes place. The *chalaza* (q.v.) unites the nucleus and these membranes at the base. When the ovule is so developed that the chalaza is at the base, and the foramen at the apex, it is said to be *orthotropal* (Gr. *orthos*, straight, *tropos*, a mode). When the ovule is bent, so that the foramen is brought near to the base, it is called *campylotropal* (Gr. *kampylos*, curved). When by increasing on one side more rapidly than on the other, the ovule has its foramen close to the base, the chalaza being carried round to the opposite extremity, the ovule is *anatropal* (Gr. *anatrepo*, to turn upside down). Anatropal ovules are very common. When the ovule is attached to the placenta, so that the foramen and chalaza are at opposite ends, the base being in the middle, it is called *amphitropal* (Gr. *amphi*, around).—When the ovule arises from the base of the germen, it is said to be *erect*; when it hangs from the apex of the cavity of the germen, it is *pendulous*; when it arises from the side of the germen above the base, it is *ascending*; when it hangs from the side of the germen below the apex, it is *suspended*. When two or more ovules are found, not only in the same ovary, but in the same cell, they generally exhibit different modes of attachment. See CHALAZA, EMBRYO, FECUNDATION, GERMEN, PLACENTA, SEED.

OWARI, a province in central Japan, bordering on a bay of the same name, into which the Kiso river, noted for its lumber booms, empties. The chief city is Nagoya. Owari contains the oldest potteries in Japan, and the famous Owari blue and painted ware is exported in large quantities. The "seto" ware or common blue-and-white crockery of Japan was first made at Seto village in Owari in 1237, by Kato Shirozayemon, who learned the art in China. Owari-ware in its decoration follows closely that of Kyoto faience. Owari is the seat of much literary activity, and was long noted for its collections of books on natural history.

OWASCO LAKE, in s.e. central Cayuga co., N. Y., 11 m. long, and from $\frac{1}{3}$ m. to $1\frac{1}{2}$ m. in width; 758 ft. above the sea level. It lies in the midst of picturesque scenery and the neighborhood is a favorite summer resort. Its waters are discharged by an outlet leading into Seneca river.

OWOSSO, a city in Shiawassee co., Mich., on the Shiawassee river, 27 m. n.e. of Lansing, on the Detroit and Milwaukee, and the Jackson, Lansing, and Saginaw rail roads; pop. '80, of township, 1,217; of city, 2,501. The city lies on both sides of the river, which furnishes excellent water power, and there are flouring, planing, plaster, and woolen mills, machine shops, brewery, tannery, and a marble mill. There are 2 weekly papers, 2 banks, 7 hotels, 7 churches, and 5 schools.

OWEGO, a t. and village, the co. seat of Tioga co., N. Y., on the Susquehanna river at the junction of Owego creek; 240 m. from New York city, on the New York and Erie railroad; pop. '80, township, 9,884; village, 5,525. There are flouring, planing, plaster, and woolen mills, foundries and machine shops; lumber is the chief article of export. The public buildings are a country court-house, library, academy, 3 banks, several hotels, 6 churches, and 4 schools. The village is beautifully laid out and is a popular summer resort.

OWEN, a co. in w. central Indiana; drained by White river, Mill creek, and Eel river, and intersected by the Indianapolis and Vincennes railroad; 400 sq. m.; pop. '80, 15,901—15,598 of American birth. The surface is rolling, and there are extensive forests.

Indian corn, wheat, oats, pork, and maple sugar are the chief products. Block coal, a variety of bituminous coal, abounds. Co. seat, Spencer.

OWEN, a co. in n.w. Kentucky, drained by the Kentucky river, which forms the n. boundary, and by Eagle creek; 300 sq. m.; pop. '80, 17,401—17,285 of American birth, 1,501 colored. The soil is rich and produces tobacco, Indian corn, wheat, and oats. Of tobacco nearly 1,000,000 lbs. are raised annually. Co. seat, Owentown.

OWEN, DAVID DALE, 1807-60; b. in Scotland, and the second son of Robert Owen; educated at North Lanark and in Switzerland. He came to this country in 1825, took a degree from the Ohio medical college and for some years studied his profession and scientific branches in Europe. In 1833 he returned to the United States, and was soon appointed state geologist of Indiana. Under the direction of the legislature he made a geological survey of the state, and in 1839 was employed by the U. S. government to make a survey of the mineral lands of Iowa, and in 1848 made similar surveys in Minnesota and adjoining territories. The results of his work were published by order of congress at an expense of \$40,000 in an elegant quarto volume with many illustrations. He was employed in surveys of the same nature in Kentucky, 1852-57, and in 1857 was appointed state surveyor of Arkansas. Reports of the results of his work in both states were printed.

OWEN, Dr. JOHN, an eminent nonconformist divine, descended from an ancient Welsh family, was the son of the rev. Henry Owen, vicar of Stadham, in Oxfordshire, and was born at the vicarage in 1616. In his 12th year he was entered of Queens' college, Oxford, where he worked with amazing diligence; for years taking no more than four hours sleep a night. In 1635 he "commenced" M.A. At this period (if his own statement does not exaggerate) his great ambition was to acquire celebrity either in church or state, he didn't particularly care which; and he affirms the irreligiousness and worldliness of his motives with entire frankness. Yet he appears, for all that, to have been agitated, even during his student-life, by the *questiones vexatæ* of ecclesiastical politics, and made himself so conspicuous by his anti-Laudianism that he was forced to leave Oxford. In fact, his Puritanism had become so decided that most of his former friends had abandoned his society. The next five or six years of his life were spent, speaking generally, in a state of anxious and melancholy introspection. When the civil war finally broke out, Owen was living as chaplain with lord Lovelace of Hurley, in Berkshire. His lordship was a royalist, and went to join the king's army, whither Owen, who had warmly espoused the cause of the parliament, could not accompany him. About the same time his uncle, a gentleman of property in Wales, who, having no children of his own, meant to have made Owen his heir, indignant at the zealous Puritanism of his nephew, settled his estate upon another, and died without leaving him a farthing. The almost friendless scholar now removed to London, where a casual sermon, preached by a stranger in Calamy's church, had the effect of imparting to his soul the peace he so ardently desired. In 1642 he published his *Display of Arminianism*, a work that proved very acceptable to the Puritan party, and drew upon him the favorable regards of the house of commons. Soon after, the "committee for purging the church of scandalous ministers" presented him with the living of Fordham, in Essex. His ministrations were exceedingly popular, people coming from great distances to hear him preach. While residing at Fordham he married a lady named Rooke, by whom he had several children. Not long after he removed to Coggeshall, where his views of church government underwent a modification. Up to this point he had been a Presbyterian, but he now became a moderate independent or Congregationalist. It is almost superfluous to add that the Presbyterian ministers—intolerant, dogmatical, and acrimonious to a degree that is scarcely credible—fell upon him at once for his apostacy, but failed to perturb his sober temper. At Coggeshall he wrote his *Salus Electorum, Sanguis Jesu* ("The Blood of Jesus, the Salvation of the Elect"), a work the result of seven years study, and of which he himself said that "he did not believe he should live to see a solid answer given to it." His fame still increasing, he was sent for in 1646 to preach before the parliament. To his discourse, entitled *A Vision of Free Mercy*, he added an appendix, in which he pleads for liberty of conscience in matters of religion. He was again chosen to preach before the house of commons the day after the execution of king Charles I. (Jan. 31, 1649), but discreetly avoided a vindication of the act. About this time Cromwell made his acquaintance, and thought so highly both of his preaching and character that he insisted on Owen accompanying him to Ireland, where the latter remained about half a year. In 1650 he went with Cromwell to Scotland, and resided in Edinburgh for several months; in 1651 the house of commons appointed him dean of Christ church, Oxford; and in 1652, when only in his 36th year, he was admitted vice-chancellor of the university. The manner in which he discharged his duties reflects the highest credit on the impartiality of his disposition. Though himself an Independent, and owing his honors directly to the Independent party, Owen never showed himself a partisan. Most of the vacant livings in his patronage were bestowed on Presbyterians; and Episcopalians were allowed to celebrate divine worship in their own way, nor could the vice-chancellor ever be induced to offer them the slightest molestation. While at Oxford, the "Atlas of Independency," as Wood grandiloquently dubs Owen, wrote his *Diatriba de Divina Justitia*, his *Doctrine of the Saints' Perseverance*, his *Vindiciæ Evangelicæ*—against Biddle (q. v.)

and the Socinians—and his *Mortification of Sin in Believers*. He was one of the well-known “tryers” appointed to “purge” the church of “scandaious” (i. e., royalist) “ministers,” and in this capacity signalized himself by his friendly offices on behalf of men of learning and merit, among whom may be mentioned the celebrated Dr. Edward Pocke, professor of Arabic. A coldness now appears to have sprung up between him and Cromwell. Owen is said to have been opposed to what many people call the “ambitious” designs of the protector, and in 1657 he was succeeded as vice-chancellor of the university by Dr. Conant. The year after Cromwell’s death he was ejected from his deanery, and retired to Stadham, in Oxfordshire, where he had purchased an estate, and where he formed a congregation, to which he ministered until his removal to London shortly after the restoration. The writings belonging to this period of retirement, if we may so call it, are, *Communion with God; On the Divine Original, Authority, Self-Evidencing Light and Power of the Scriptures; Theologoumena, or De Natura, Ortu, Progressu, et Studio veræ, Theologiæ*; and an uncritical irreflective, and unscholarly diatribe against Walton’s *Polyglott*, in which the different readings of scripture were learnedly set forth. In 1662 he published *Animadversions to Fiat Lux*, a treatise written by a Franciscan friar in the interest of Roman Catholicism. It was followed by works on *Indwelling Sin*, on the 130th Psalm, and on “The Epistle to the Hebrews,” the last of which began to appear in 1668, and is usually reckoned Owen’s *Magnum Opus*. In 1669 he published *Truth and Innocence Vindicated*, a reply to Samuel (afterwards bishop) Parker’s *Discourse on Ecclesiastical Policy*, and in 1673 became pastor of a large congregation in Leadenhall street. His last publications of importance were a *Discourse Concerning the Holy Spirit* (1674); *Doctrine of Justification by Faith* (1677), a treatise still much admired by many; and *Christologia, or Glorious Mystery of the Person of Christ*.

Owen in his later years was held in the highest esteem by many of the most influential personages in the land, such as the earl of Orrery, the earl of Anglesea, lord Willoughby, lord Berkley, sir John Trevor. When drinking the waters at Tunbridge, even the duke of York and Charles II. paid him particular attention, and had long conversations with him on the subject of nonconformity. Owen died at Ealing, Aug. 24, 1683, and was buried in Bunhill Fields. His funeral was attended by no less than sixty noblemen. Owen was the most voluminous, but by no means the most powerful writer among the Puritan divines. His prolix and passionless disquisitions, his dull, tedious, and exhausting argumentations, his lack of subtle spiritual perception, his ponderous and lumbering style, make his writings the reverse of interesting; and one can almost pardon the irreverent criticism of Robert Hall, who is said to have pronounced them “a continent of mud.” Yet Owen deserves respect for his learning and moderation. The best edition of his works was published at Edinburgh (1856, *et seq.*).

OWEN, JOHN JASON, D.D., L.L.D.; 1803-69; b. Conn. In his youth amid unfavorable circumstances he devoted himself with great earnestness to study with the special design to acquire the ancient languages. Without aid, he overcame the greatest difficulties by indomitable perseverance. After a course of study with the Rev. Dr. Yale of Kingsborough, N. Y., he entered Middlebury college, graduating in 1828, and at the Andover theological seminary in 1831. The same year he was ordained a minister of the Presbyterian church. Though not a settled pastor, he preached often in the churches of New York. Under his instruction, private and public, many young men were fitted for the ministry of different denominations. In 1836 he was appointed principal of the Cornelius institute in New York. While there he edited Xenophon’s *Anabasis* with English notes, the first Greek text-book thus prepared in the United States. This was followed by a *Greek Reader*, Xenophon’s *Cyropædia*, the *Odyssey* and *Iliad* of Homer, and *Thucydides*. These books were well received. He then published the *Acts of the Apostles* with a lexicon, and finally *A Commentary, Critical, Expository, and Practical on the Gospels of Matthew, Mark, and the Acts*, 3 vols., as excellent a work for popular use as this country has produced. In 1848 Dr. Owen became professor of the Latin and Greek languages and literature in the New York free academy, of which in 1853 he became vice-principal. In 1866, when the name of the institution was changed to that of college of the city of New York, he became vice-president. Dr. Owen’s eminence as a scholar was recognized by the learned men of England, Scotland, and America. He was an earnest preacher, a faithful instructor, and a genial friend.

OWEN, RICHARD, was b. at Lancaster, July 20, 1804. Having received his elementary education at the grammar-school of that town, he became, at the age of 20, a student in the Edinburgh university. Under the guidance of the third Monro, Alison, Jameson, and Hope in the university, and of Barclay in the outdoor school, his natural talents early developed themselves. He was an active student, and with others of kindred spirit, formed the Hunterian society, of which he was chosen president in 1825. In 1826, he removed to London, joining the medical school of St. Bartholomew’s hospital; and to the Medical society of this institution he communicated his earliest published paper: “An Account of the Dissection of the Parts concerned in the Aneurism, for the Cure of which Dr. Steven’s tied the Internal Iliac Artery,” which appeared in the *Medico-Chirurgical Transactions* for 1830. It was doubted whether so deep-seated an artery could have been reached, but he showed that the ligature had been applied to the internal iliac, and the aneurism had in this way been obliterated.

It had been his intention to enter the navy; but when he finished his education, he accepted an appointment as assistant to Mr. Clift, the curator of the museum of the royal college of surgeons, and helped him in the preparation of his catalogues of "Pathological Specimens" (1830), "Monsters and Malformations" (1831), but chiefly of the "Specimens of Natural History in Spirits" (1830). He had, about this time, the fortune to obtain a specimen of *nautilus pompilius*, an animal almost unknown, and of great importance not only in itself, but also and chiefly because of its numerous fossil allies. The results of his careful dissection of this specimen were published in an elaborate memoir, which at once gave him a high position amongst naturalists, for the advanced views on structure and affinities it contained.

The continued examination of Hunter's extensive collections in the college of surgeons' museum was his great work. This resulted in the enlargement and arrangement of the collections, and in the publication of his *Descriptive and Illustrated Catalogue of the Physiological Series of Comparative Anatomy*, which was issued in sections during 1833-40; of his *Paleontological Catalogue*, of which the Mammals and Birds were published in 1845, and the Reptiles and Fishes in 1854; and of his *Catalogue of Recent Osteology* (1854), in which he describes 5,906 specimens. The collections, which in 1828 were contained in one small badly-lighted room, in 1856, when Owen's connection with them terminated, filled 10 times the original space—three large galleries having been specially erected to contain them.

Owen's position as curator of the Hunterian museum, to which he succeeded on the death of Clift, awakened in him a special interest in its famous founder. In 1837, he published a new edition of Hunter's *Animal Economy*, adding to it all the known published papers of its author; and giving in the preface, for the first time, a descriptive narrative of Hunter's real discoveries. He afterward edited two volumes of *Essays and Observations on Natural History, Anatomy, etc., by John Hunter* (1861), which had been saved from Home's unprincipled and barbarous destruction of Hunter's manuscripts, by having been transcribed by Clift, who was the last articulated apprentice of Hunter. In the preface to these volumes, Owen showed the advanced views which Hunter entertained in geology and paleontology.

The first appointment of Owen as public lecturer was to the chair of comparative anatomy in St. Bartholomew's hospital in 1834. Two years afterwards, he succeeded sir Charles Bell as professor of anatomy and physiology in the college of surgeons, and was in the same year appointed by the college as first "Hunterian professor." For 20 years he continued to illustrate the recent and fossil treasures of the museum, until, in 1856, he was appointed superintendent of the natural history department of the British museum, when his connection with the college of surgeons ceased.

We have not space to record even the principal of Owen's numerous published papers. His earliest communications to the royal society were papers on the generation of the ornithorhynchus and of the kangaroo. In numerous memoirs between 1835 and 1862, he expounded the structure and affinities of the higher quadrumana; and in these and other papers, he proposed the use of the brain-structure, as an important element in classification. It has been objected, that the particular parts to which he referred in characterizing his highest class, are found in the lower classes; but the objectors forget that he does not use the existence of the parts as his characters, but only their remarkable development. A similar objection may be urged against every system of classification, for no decided line can be drawn around any group, the whole animal world being united by a graduation of structure.

His exposition of the recent and fossil birds of New Zealand is well known. He first published two elaborate papers on the anatomy of the apteryx, and then followed at intervals 7 or 8 monographs on the gigantic struthious birds which once existed in these distant islands. His descriptions and restorations of extinct animals are perhaps the most important of all his labors. He has published a monograph of the British fossil mammalia and birds, and 6 parts of an elaborate systematic history of British fossil reptiles. In describing the fragmentary fossil relics brought home by Darwin from South America, he established many remarkable forms from very scanty materials, and showed that there existed in America, during the Tertiary period, a mammalian fauna, the individuals of which were, for the most part, of gigantic size, yet similar in type to the existing animals of that continent. Subsequently, he clearly expounded the various genera of huge sloths from the same region, whose remains were previously confounded or misunderstood. A series of fossils from Australia revealed to him a remarkable group of gigantic marsupials, resembling in type the present tenants of that island-continent. He was the first to expound the structure and affinities of the singular long-tailed bird from Solenhofen. See his well-known *Paleontology* (1861). Amongst his more recent works in this field are *The Fossil Reptilia of South Africa* (1876); *On the Fossil Mammals of Australia, and on the Extinct Marsupials of England* (1877); and *On the Extinct Wingless Birds of New Zealand* (1879).

His great work on the microscopic structure of the teeth must be named. The *Odontography*, published in 1849-45, contains descriptions and exquisite drawings of the minute structure of a very extensive series of the teeth of every class of animals, and forms an immense store-house of information alike to the anatomist and the geologist.

He has published original papers on every branch of the animal kingdom, living and

fossil; and it has been justly said of him, that "from the sponge to man, he has thrown light over every subject he has touched." Some idea of the magnitude of his labors may be formed from the fact, that his published productions amount to more than 300 different papers and works, many of them being of the most voluminous and laborious character.

Owen, in 1835, married the only daughter of Clift, his colleague at the college of surgeons. In 1858, he resumed his position as Fullerian professor of physiology in the royal institution of Britain, which, some 20 years before, he had filled for two sessions; and in the following year he was appointed Reader lecturer by the university of Cambridge, but has now resigned these offices. He is a fellow and active member of most of the metropolitan scientific societies, one of the 8 foreign associates of the institute of France, and an honorary member of many foreign societies. From France he also received the order of the legion of honor; from Prussia, the order pour le Mérite; and from Italy, the order of St. Maurice and St. Lazare. He was made a companion of the bath in 1873.

OWEN, ROBERT, a social theorist and schemer, was b. May 14, 1771, at Newton, in Montgomeryshire. He does not appear to have had any more than a merely commercial education to fit him for common business. The point from which his peculiar destiny in life may be said to have started, was his marriage in 1799 to the daughter of David Dale, the owner of the celebrated cotton mills at New Lanark, on the Clyde. This establishment was very successful as a money speculation, and it is curious that Jeremy Bentham made a small fortune by investing in it. Mr. Dale was known to be a thorough man of business, but whether Owen, by his peculiar faculties for organization, contributed to the prosperity of the establishment in its early stages, is a doubtful question. It is certain that as his larger schemes developed themselves, he was felt to be a dangerous partner in a good business, and he was gradually elbowed out of any voice in the management, and he finally disposed of his share in the property.

It should be remembered, however, of a man, whose life will go down to posterity as one long absurdity, that in his connection with the New Lanark mills he did real practical good on a scale by no means limited. He was naturally active and interfering, and being a humane man, it struck him that much degradation, vice, and suffering arose from the disorganized manner in which the progress of machinery and manufactures was huddling the manufacturing population together. He introduced into the New Lanark community education, sanitary reform, and various civilizing agencies, which philanthropists at the present day are but imperfectly accomplishing, in the great manufacturing districts. The mills became a center of attraction. They were daily visited by every illustrious traveler in Britain, from crowned heads downward, and it was delightful not only to see the decency and order of everything, but to hear the bland persuasive eloquence of the garrulous and benevolent organizer.

A factory was, however, far too limited a sphere for his ambition. He wanted to organize the world; and that there might be no want of an excuse for his intervention, he set about proving that it was in all its institutions—the prevailing religion included—in as wretched a condition as any dirty demoralized manufacturing village. Such was the scheme with which he came out on the astonished world in 1816, in his *New Views of Society, or Essays on the Formation of the Human Character*; and he continued, in books, pamphlets, lectures and other available forms, to keep up the stream of excitation till it was stopped by his death. He had at least three grand opportunities of setting up limited communities on his own principles—one at Romney, in America; a second at Orbiston, in Lanarkshire; the third at Harmony hall, in Hampshire, so lately as the year 1844. They were, of course, all failures, and Owen attributed their failure to their not being sufficiently perfected on his principles. His life was a remarkable phenomenon, from the preternatural sanguineness of temperament which, in the face of failures, and a world ever growing more hostile, made him believe to the last that all his projects were just on the eve of success. In the revolution of 1848 he went to Paris, with hopes of course on the highest stretch; but his voice was not loud enough to be heard in that great turmoil. He appeared at the meeting of the social science association at Liverpool in the autumn of 1858, with all his schemes as fresh as ever. He died a few weeks afterward, on Nov. 17, 1858. A life of Owen by A. J. Booth appeared in 1869 (Trübner).

OWEN, ROBERT DALE, 1801–77; b. in Glasgow, Scotland; son of Robert Owen (q.v.); educated at New Lanark and in Switzerland. He accompanied his father to the United States, and after the failure of the New Harmony experiment, came to New York, and in 1828 began the issue of the *Free Inquirer*, a continuation of the *New Harmony Gazette*, the publication continuing until 1834. He then returned to New Harmony, and was for three years (1835–38), a member of the Indiana legislature; in 1843 he was elected member of congress as a democrat, served two terms, and was specially active in organizing the Smithsonian institute, of which he was made a regent. He was chairman of the revision committee having charge of the amendment of the Indiana constitution, 1849–50, and was active in securing the passage of laws giving independent property rights to women. He represented our government as chargé d'affaires and minister, 1853–58, at Naples. During the rebellion, Mr. Owen published a number of papers expressing his views in favor of freeing the slaves and maintaining the union. Some of his pamphlets

were extensively circulated by the New York Union League club and other organizations. For the greater part of his life, Owen was a firm believer in the so called spiritual phenomena, and on this subject were written *The Debatable Land between this World and the Next* (1872), and *Footfalls on the Boundary of Another World* (1860). He wrote several other books, among which were *Beyond the Breakers* (1870), a novel; *Moral Physiology* (1831); and *Threading my Way* (1874), an autobiographical sketch.

OWEN, WILLIAM, 1769-1825; b. in Shropshire, Eng.; son of a bookseller. He received an ordinary education at Ludlow, and when about 17 years old began to study art under the painter Catton, and afterwards under Sir Joshua Reynolds. His first portrait was exhibited in 1792, and at once established his reputation. Among his most noted sitters were William Pitt, Sir Walter Scott, the marquis of Stafford, and the bishop of Durham. Owen also executed a number of fancy sketches of great merit, such as "Peasants Resting by the Roadside," and "The Fortune Teller and the Lady." In 1806 he was made a member of the royal academy.

OWEN MEREDITH (*pseud.*). See BULWER-LYTTON, EDWARD ROBERT, BARON.

OWENS COLLEGE, Eng. See page 882.

OWENS, JOHN E.; b. England, 1823; made his first appearance on the stage at Philadelphia in 1846. *Solon Shingle* is his best known part.

OWENSBOROUGH, a city and co. seat of Daviess co., Ky., 160 m. below Louisville, on the s. bank of the Ohio river; terminus of the Owensborough and Nashville railroad; pop. '80, 6,231. The chief industry is the stemming and manufacture of tobacco, for which there are 18 factories; there are also furniture and chair manufactories and machine-shops. Coal is found in the vicinity. Wheat, rye, tobacco, and whisky, are the articles of export.

OWEN SOUND, a t., the co. seat of Grey co. Ontario, Canada, at the mouth of Sydenham river, on Owen sound; on a branch of the Toronto, Grey, and Bruce railroad; pop. '81, 4,426. The harbor is the best in lake Huron, 12 m. long, and 5 m. wide at its widest point. The town is built on a plain inclosed on 3 sides by heights. It has a court-house, town-hall, churches, and 2 weekly newspapers. It is an exporting point for lumber and grain, the largest vessels used on the lakes entering the harbor without difficulty. There is abundant water-power. There are grain elevators, flour and saw mills, and manufactories of woolen goods, leather, machinery, agricultural tools, engines, etc.

OWL, a numerous and extremely well-defined group of birds, constituting the Linnæan genus *Strix*, now the family *Strigidae*, the whole of the *nocturnal* section of birds of prey. The aspect of the owls at once distinguishes them from all other birds, being rendered very peculiar by the large size of their heads, and by their great eyes, directed forwards, and surrounded with more or less perfect disks of feathers radiating outwards, whilst the small hooked bill is half concealed by the feathers of these disks, and by bristly feathers which grow at its base. The bill is curved almost from its base; the upper mandible not notched, but much hooked at the tip. The claws are sharp and curved, but, like the bill, less powerful than in the *Falconidae*. The outer toe is generally reversible at pleasure, so that the toes can be opposed two and two, to give greater security of grasp. The wings, although generally long, are less adapted for rapid and sustained flight than those of the diurnal birds of prey, and the bony frame-work by which they are supported, and the muscles which move them, are less powerful; the owls in general taking their prey, not by pursuit, but by surprise, to which there is a beautiful adaptation in the softness of their plumage, and their consequently noiseless flight; the feathers even of the wings being downy, and not offering a firm resisting surface to the air, as in falcons. The soft and loose plumage adds much to the apparent size of the body, and also of the head; but the head owes its really large size to large cavities in the skull between its outer and inner tables or bony layers, which cavities communicate with the ear, and are supposed to add to the acuteness of the sense of hearing. This sense is certainly very acute, and the ear is, in many of the species, very large. It is furnished with an external cone, which is found in no other birds. It is, however, concealed by the feathers, being situated on the outside of the disk which surrounds the eye; but the feathers immediately surrounding the ear are arranged in a kind of cone, serving a purpose like that of an ear-trumpet. In some species the ear is furnished with a remarkable lid or operculum, which the bird has the power of opening and shutting at pleasure. The disk which surrounds the eye serves to collect rays of light and throw them on the pupil; and owls can see well in twilight or moonlight, but are generally incapable of sustaining the glare of day, many of them becoming quite bewildered when exposed to it, and evidently suffering pain, which they instinctively seek to relieve by frequent motion of the third eyelid or nictitating membrane of the eye. The legs and feet of owls are feathered to the toes, and in many species even to the claws.

The digestive organs much resemble those of the *falconidae*, but there is no crop, and the stomach is more muscular. The gullet is very wide throughout, and owls swallow their prey either entire or in very large morsels. The largest species feed on hares, fawns, the largest gallinaceous birds, etc.; others on small mammalia, reptiles, birds, and sometimes fishes; some feed partly or chiefly on large insects.

The owl has from early times been deemed a bird of evil omen, and has been an object of dislike and dread to the superstitious. This is perhaps partly to be ascribed to

the manner with which it is often seen suddenly and unexpectedly to flit by when the twilight is deepening into night; partly to the fact that some of the best-known species frequent ruined buildings, while others haunt the deepest solitudes of woods; but, no doubt, chiefly to the cry of some of the species, hollow and lugubrious, but loud and startling, heard during the hours of darkness, and often by the lonely wanderer. It is evidently from this cry that the name owl is derived, as well as many of its synonyms in other languages, and of the names appropriated in different countries to particular species, in most of which the sound *oo* or *ow* is predominant, with great variety of accompanying consonants. Many of the owls have also another and very different cry, which has gained for one of them the appellation screech owl, and to which, probably, the Latin name *strix* and some other names are to be referred.

Some of the owls have the disks of the face imperfect above the eyes, the whole aspect somewhat approaching to that of falcons; the cochles of the ears small, and the habits less nocturnal than the rest of this family. These constitute one of the three generally received divisions in which the species are arranged. Another division, with more perfect disks around the eyes, is characterized by the presence of two feathery tufts on the head, popularly called horns, or ears, and sometimes egrets or aigrettes. The third division is destitute of these tufts, the disks of the face are perfect, and the ears are very large. On these distinctions, and on the feathered or unfeathered toes, and other points not of great importance, are founded the genera into which the Linnæan genus *strix* has been broken down by recent ornithologists. See, for example, the characters of *Bubo* in the article EAGLE OWL.

Owls are found in all parts of the world, and in all climates. Ten species are reckoned as natives of the British islands, some of which, however, are very rare, and about fifteen are natives of Europe. Some of the species have a very wide geographical range. One of the most plentiful British species is the WHITE OWL, or BARN OWL, or SCREECH OWL (*Strix flammea*), one of those having perfect disks around the eyes, and no aigrettes. It is about 14 in. in its whole length. The tail is, as in most of the owls, rather short and rounded; the wings reach rather beyond the tail. The toes are not feathered. The head and upper parts are of a pale orange color, marked by a multitude of small, scattered chestnut-colored spots, and gray and brown zig-zag lines; the face and throat white. This owl very generally frequents old buildings and out-houses. It destroys great numbers of rats and mice, and deserves the protection of the farmer. The voracity of owls is wonderful, and they kill, if possible, more than they need, storing it up for future use. The barn owl is easily tamed if taken young. When irritated, it has, like some others—perhaps all—owls, a habit of hissing and snapping its mandibles together. It almost never leaves its retreat by day, unless driven out; and when this is the case, all the little birds of the neighborhood congregate about it as an enemy which may then be safely annoyed, and the grimaces of the poor owl, blinded by the too strong light, are very grotesque and amusing. This species has been said to be an inhabitant of almost all parts of the world, but there is reason to think that similar species have been confounded. The TAWNY OWL, BROWN OWL, or IVY OWL (*Strix*, or *Syrnium*, *stridula* or *aluco*) is another of the most common British owls, a species about the size of the barn owl, or rather larger, with rather longer tail, and comparatively short wings, the feet feathered to the claws; the upper parts mostly ash-gray mottled with brown, the under parts grayish-white and mottled. The LONG-EARED OWL (*Strix otus*, or *Otus vulgaris*) and the SHORT-EARED OWL (*S.* or *O. brachyotos*), species with aigrettes, are not unfrequent British birds. The EAGLE OWL (q.v.) occurs, but is rare. Of the species with imperfect disks around the eyes and more falcon-like aspect, the most interesting in the British fauna is the SNOWY OWL (*Strix*, or *Surnia*, *nyctea*), the *Harfang* of the Swedes, a species occasionally seen in the Shetland islands, and very rarely in more southern regions in winter, but well known in all the very northern parts of the world. It is from 22 to 27 in. in length, feeds on every kind of animal food which it can obtain, and has white plumage spotted and barred with brown, the legs densely feathered to the claws. Of owls not natives of Britain one of the most interesting is the BURROWING OWL (*Strix*, or *Athene*, *cunicularia*), a North American species, which, when necessary, excavates a burrow for itself, but prefers to take possession of those of the marmot, called the prairie dog (q.v.). It is not the only species of owl which inhabits holes in the ground. The BOOBOOK or BOOKBOOK of Australia (*Strix*, or *Noctua*, *Boobook*) is a species of owl, which frequently repeats during the night the cry represented by its name, as if it were a nocturnal cuckoo. Some of the species of owl are small birds; among the rarer British species are one of 8½ in., and one scarcely more than 7 in. long. Some owls are at least partially birds of passage, of which, among British species, the short-eared owl is an example.

OWLGLASS (Ger. *Eulenspiegel*), TYLL, the prototype of all the knavish “fools” of later time, is said to have been b. in the village of Kneittingen, in Brunswick. His father was called Klaus Eulenspiegel, and his mother Anna Wortbeck. In youth, we are told, he wandered out into the world and played all manner of tricks on the people whom he met with. His tomb is shown at Mölln, about four leagues from Lübeck, where tradition makes him die about 1350; but the inhabitants of Damme, in Belgium, also boast of having his bones in their church-yard, and place his death in 1301, so that several critics

regard Eulenspiegel as an altogether imaginary person, a mere *nominis umbra* affixed to a cycle of mediæval tricks and adventures. The opinion, however, considered most probable is that Eulenspiegel is not a myth, but that there were two historical individuals of that name, father and son, of whom the former died at Damme, and the latter at Mölln. The stories that circulate in Germany under Eulenspiegel's name were not collected, as the book containing them itself informs us, till after Eulenspiegel's death, and without doubt were originally written in the low German tongue; from low German they were translated into high German by the Franciscan Thom. Murner, and this translation was followed in all the old high German editions of the work. At a later period it underwent considerable alterations at the hands of both Protestants and Catholics, who made it a vehicle for the expression of their own likings and dislikings. The oldest known edition is that printed at Strasburg in 1519. The verdict of modern times has been unfavorable, not only to the æsthetic, but to the moral value of the book; yet although indecencies may be found abundantly in it, they may perhaps in large measure be attributed to the age in which Eulenspiegel, or the author of Eulenspiegel lived. For centuries it has been a favorite people's book, not only in Germany, but in many other countries. Translations of it exist in Bohemian, Polish, Italian, English (as a *Miracle Play*), Dutch, Danish, French, and Latin; it has been frequently imitated, and reprinted times without number down to the most recent years. Max Müller, in his *Lectures on the Science of Language*, points out that Eulenspiegel is the origin of the French word *espiègle*, waggish. When the stories about Eulenspiegel were translated into French, he was called Ulespiègle, "which name contracted afterward into *Espiègle*, became a general name for every wag."

OWL-PARROT, *Strigops habroptilus*, a species of cockatoo found in New Zealand, the *kakapo* or night-parrot of the natives. It is about two and a half ft. in length, and has a dirty green color with black transverse bands and brownish-yellow spots. It has the nocturnal habits and noiseless flight of the owls, and lives in holes at the roots of trees. It feeds on the roots of ferns and New Zealand flax. It breeds in February, laying two or three eggs. In the winter these birds congregate in caves. Their flesh is white and palatable.

OWNERSHIP is not a legal term, though it is used frequently in law to denote the highest degree or kind of property which one can have in anything. Owner is often used in this sense as contradistinguished from an occupier, who has only a temporary interest in the property. Thus a freeholder, or one who holds a freehold estate in land, is an owner; though, in common parlance, it is not unusual also to describe as owner any one who has a long lease of the property. When a person is owner in fee of land, he has certain rights more or less absolute as incidental thereto, for example, he may build on his land as high as he pleases, subject only to doing no direct injury to his neighbor, such as darkening his windows; and he may dig as deep as he pleases, or, as it is said, to the center of the earth. There are certain things which are said to be incapable of ownership, such as the air, the sea, and the water of navigable rivers, as to each of which every individual member of the public has the right merely of using it, but no one has the ownership—i.e., the exclusive right of property as well as possession thereof. As to things wild, such as birds, beasts, fishes, the rule is that he who first catches the animal becomes the owner thereof, and acquires such a property in it that any one who takes it from him against his will commits larceny. But though the person who first catches a wild animal is entitled to it, penalties are sometimes imposed upon the person catching it, as to which see **GAME**, **POACHING**. In regard to lost property—i.e., property which had once been appropriated and possessed by some one, but who has casually lost or abandoned it—the rule is that he who finds it is entitled to keep it, provided at the time of finding it he had no means of ascertaining the owner. But the true owner, if he discover and can identify the property, can always in general reclaim it from the finder. See **LOST PROPERTY**.

OWOSSO, Michigan. See **OWASSO**.

OWSLEY, a co. in e. Kentucky, drained by the s. fork of the Kentucky river and many small creeks; 460 sq.m.; pop. '80, 4,942—4,940 of American birth, 89 colored. The surface is hilly, and but moderately productive. Indian corn, wheat, and pork are the chief products. Iron and coal are found in considerable quantities. Co. seat, Boonville.

OWY'HEE, a co. in extreme s.w. Idaho, bordering on Utah and Nevada to the s. and Oregon to the w.; drained by Snake river, which forms the n. boundary, and by the Bruneau and other small streams; 13,600 sq.m.; pop. '80, 1420. The Owyhee mountains traverse the surface, which is in most part timber land, and in the valleys is well adapted to grazing cattle. Gold and silver abound. In 1870, 14 mines were in operation and the product was reported at \$852,835. Co. seat, Silver City.

OX, *Bos taurus*, a ruminant quadruped of the family *bovidæ* (q.v.), the most useful to man of all domesticated animals. The species is distinguished by a flat forehead, longer than broad; and by smooth and round tapering horns, rising from the extremities of the frontal ridge. But among the many varieties or breeds which exist, there are great diversities in the length and curvature of the horns, and some are hornless. It is

probable that the ox is a native of both Asia and of Europe, perhaps also of Africa; and not improbable that it may have been domesticated at different times and in different countries. It cannot be confidently asserted that it now exists anywhere in a truly wild state; wild oxen are nowhere so abundant as on the pampas or great grassy plains of South America, where it is certain that they are not indigenous; and it is not impossible that the wild oxen still existing in the parks of a few noblemen in Britain may be also descended from domesticated animals. Whether or not the *Urus*, described by ancient authors as an inhabitant of central Europe, was the original of the domestic ox will be considered in the article *URUS*. The very early domestication of the ox is attested by the mention made of it in the writings of Moses, and by the worship of it in Egypt, which the Israelites imitated in making their golden calf at mount Sinai. Yet oxen do not appear to have formed any part of the wealth of the patriarchs. The ox was probably used as a beast of burden or draught before it was valued for its milk. It is mentioned by Cæsar as a principal part of the wealth of the Britons at the time of the Roman invasion.

The ox is more frequently employed as a beast of burden and of draught in some parts of the continent of Europe than in Britain. From the earliest historic times the horse has been more generally thus employed in Britain, and has now almost entirely superseded the ox. The gait of the ox is slow and plodding, but its strength enables it to perform a great amount of work, and it is not easily exhausted. It needs, however, intervals of rest inconvenient for the farmer; and it is not capable of exertion at all equal to that of the horse on any occasion of emergency. The ox is chiefly valuable for its flesh and its milk; but almost every part of the animal is useful—the fat, skin, hair, horns, intestines.

The period of gestation of the ox is nine months, or 270 days. It rarely produces more than one calf at a birth. It attains maturity in two or three years, becomes evidently aged at ten, and seldom lives more than 14. Cows are seldom kept for the dairy after they are seven or eight years old, as after that age they yield less milk and of inferior quality. Modern husbandry has also found means to fatten cattle for the market at an earlier age than was formerly usual; and although the beef is not quite so good in quality, the profit is great, both to the farmer and to the community, through the increased productiveness of the land.

The ox is gregarious, and where circumstances permit, as in the South American plains, associates in very large herds. Herds of oxen defend themselves with great vigor against the large feline animals and other assailants, the younger and weaker animals being placed in the middle, whilst the bulls in the outer rank confront the adversary with their horns.

The varieties or breeds differ very much in size. Among those which occur in the British islands, the Shetland breed is not much larger than a calf of some of the others. Some of the breeds of the torrid zone are also very small; but the fatty hump on the back may probably be regarded as indicating a connection with the Indian ox or zebu (q.v.), which, although it has been generally regarded as a variety of the common ox, is perhaps a distinct species.—The “wild ox,” now existing only in a few parks, as at Chillingham and Hamilton, seems, whatever its origin, to have been formerly an inhabitant of many forest districts in Britain, particularly in the n. of England and s. of Scotland. The Chillingham wild oxen are of a creamy white color, much smaller than many of the domestic breeds, of a graceful form, with sharp horns, which are not very long, and not very much curved. The uniform white color is to be ascribed to the care taken to destroy every calf which is not perfect in this respect. The habits of these wild oxen are very similar to those of the domestic races.—The *West Highland* breed, or *Kyloe*, differs very little from the Chillingham or Hamilton wild ox, except in being generally black. It has short muscular limbs, a wide and deep chest, well-arched ribs, and a straight back; the horns are often somewhat long; the muzzle is short but not broad; the skin is closely covered with shaggy hair. The milk is very rich, but the quantity is so small that this breed is very unsuitable for dairy farming. The beef, however, is of the finest quality; and great numbers of cattle, reared in the Highlands and Hebrides, are annually conveyed to other parts of the country, to be fattened on rich pastures. The breed is a very hardy one, and peculiarly suited to the region in which it prevails.—The *Galloway* breed is very like the preceding, but larger and destitute of horns; and many cattle reared in the hilly parts of Galloway are fattened on English pastures for the London market.—The *Pembroke* and other Welsh breeds are not unlike the West Highland; but the cows yield milk more abundantly.—The diminutive *Shetland* breed is very hardy, and is celebrated for the fine quality of its beef. The Shetland ox is easily fattened, even on scanty pasturage. The milk which the cows yield is also remarkably abundant in proportion to their small size.—The *Ayrshire* breed is particularly celebrated for the abundance and excellence of its milk, but the beef is of inferior quality, and the animal is not easily fattened. Great care has been bestowed on this breed in Ayrshire and neighboring counties, where dairy farming is much practiced. The horns are smaller than those of the West Highland breed, the hair much smoother, and the color chiefly brownish-red, with large patches of white.—The *Alderney* breed much resembles the Ayrshire, but the milk is comparatively small in quantity, and remarkable for the richness of the cream, on which account Alderney cows are often

THE OX.—1. Berne thoroughbred. 2. Swiss thoroughbred. 3. Cow's head. 4. Head of Algau thoroughbred steer. 5. Dutch thoroughbred steer's head. 6. Cow of same. 7. Cow's head. 8. Podolian thoroughbred. 9. Durham short-horn. 10. Scotch hornless thoroughbred. 11. Indian zebu. 12. African zebu. 13. Yak.

kept for the supply of private dairies. The milk of an Alderney cow, mixed with that of a dozen other cows, will sensibly improve the quality of the butter. But this breed is worthless for the purposes of the grazier.—The *Suffolk Dun* is a *polled* or hornless breed, of clumsy form, and of little value to the grazier, but yielding a very large quantity of milk, on which account Suffolk has long been celebrated for its dairy produce.—The *North Devon* is a pretty large breed, with rather short horns, very muscular and powerful, and also very gentle and docile, so that it is particularly adapted for draught; and much agricultural labor is still performed in Devonshire by teams of oxen of this breed. The North Devon breed, however, is surpassed by others, both for the purposes of the dairy farmer and of the grazier.—The *Hereford* breed, of stouter form than the Ayrshire, but in some respects not unlike it, has long been in great repute both for its beef and its milk; but in the districts where it once prevailed, it is now giving place to the *Short-horn* breed, one of the new breeds which are the result of care and attention. The short-horn breed, so called because the horns are shorter than in almost any other, originated about the beginning of the 19th c. on the banks of the Tees, and has spread very widely both in England and in Scotland, in the districts of richest pasturage. The color varies from pure white to bright red; the head is short and very broad; the chest is wide, deep, and projecting; the fore-legs are short, the back straight, and not very long, the “barrel” full. The ease with which oxen of this breed are fattened is one of its great recommendations. The beef is also of excellent quality. For dairy purposes the short-horn is surpassed by some other breeds; but a cross between a short-horn bull and an Ayrshire cow is found useful both for beef and milk. The short-horn breed is now cherished in Britain with peculiar care; genealogies are registered, and prodigious prices are given for first-rate animals. It is also in great esteem in many parts of the continent of Europe, and in America.—The *Long-horn* breed, long prevalent in the midland counties of England, and still prevalent in Ireland, was brought to great perfection by Bakewell, one of the first to show what could be done in the improvement of cattle; but is rapidly giving place to the short-horn, by which it is much excelled. The length of the horns in this breed is very remarkable.

Of foreign races of oxen, one of the most notable, on account of its large size, is that in possession of the Kalmuck Tartars; another is that prevalent in the Roman states, generally of a bluish-ash color, with remarkably large and spreading horns. A large white breed was long kept in Egypt; and a similar breed, without the hump characteristic of the Indian ox, is found in South Africa, where, however, it has become partially intermixed with European breeds. Oxen are much employed by the Kaffers as beasts of burden; they were also formerly trained by the Hottentots to aid them in battle. Peter Kolben, in his account of the cape of Good Hope, written in 1705, gives an interesting description of these trained fighting oxen, which, he says, are called *Backeleyers*. “In the wars of the Hottentots with one another,” he says, “these backeleyers make very terrible impressions. They gore, and kick, and trample to death with incredible fury.” He ascribes to them also great docility, and states that they know every inhabitant of the kraal, and are perfectly inoffensive towards them, but ready to run with fury at strangers. The readiness with which the draught oxen of South Africa observe the words of the driver, is said to be almost, if not quite, equal to that of the dog. In the training of them, however, severe measures are often requisite, and particularly by a hooked stick inserted through the cartilage which separates the nostrils, as bulls are *ringed* when sent to exhibitions of cattle in Britain. Trained oxen are also employed in the training of their younger fellows. In some parts of Africa the ox is used for riding as well as for draught. The horns, which are very long, are split into ribbons, or curved in various directions to prevent their points from coming in contact, by any accident, with the person of the rider. The pace of the ox scarcely exceeds four or five miles an hour.

A very remarkable conformation of skull occurs in some of the herds of South American oxen, the bones of the nose and the jaw-bones being very much shortened; yet there is no question that this is a mere accidental variation, which has become perpetuated as one of race. Importance has been attached to it in the discussions regarding *species*.

The cow has been for ages tended by man on account of the agreeable and highly nutritious fluid which is obtained from it. Milk is manufactured into cheese and butter, which are capable of being preserved for a considerable time. The processes by which these are obtained are described under the article DAIRY. Cows, under our modern systems of agriculture, are selected either for their properties of giving large quantities of milk, or for raising stock which are well suited for grazing and fattening. For milking properties, the Ayrshire breed stands undoubtedly at the head of the list. In comparison with some of the other breeds, the Ayrshire is rather deficient in size, with the flesh spread thinly over its body. In the male animals these characteristics are all the more prominent, and for this reason the breed is not much liked by graziers. It is capable, however, of thriving on secondary or even inferior pastures. Wherever, therefore, it is found most profitable to follow dairy husbandry in Scotland, the Ayrshire cow is preferred. A considerable variety of breeds are cultivated both for milking and grazing in the western parts of England, the principal of which are the Herefords and Devons. In the eastern counties, again, where arable culture and the rearing and feed-

ing of cattle are chiefly followed, the Ayrshire gives place to the Aberdeen, the Angus, and the Teeswater. The cow is there selected for its massive and square-built frame, soft skin, and meat-producing qualities. For more than a century vast care has been bestowed on the improvement of the short-horns. In this breed the pedigrees of the sire and the dam are traced back for many generations, and purity of blood is quite essential in herds of any pretensions. The large sums which particular cows and bulls of this breed realize, attest the value which modern breeders set upon animals which are considered to approach perfection in their form and style. In no department of British agriculture are the results of care and attention more strongly marked than in the noble figure of the short-horned cow or bull.

The rearing and fattening of the ox is one of the most important branches of agriculture. Since the prices of butcher-meat have become so much higher relatively to corn in this country, the breeding and feeding of cattle have received a great impetus. Fifty years ago, many of our old breeds of cattle were kept till they were four or five years old before they were sent fat to the butcher. The demand for meat was so limited then in the n., that most of the cattle were sent s. lean, to be fattened on the pastures and turnips of the eastern counties of England. The introduction of steam-shipping, followed by railways, has given the Scotch breeder and feeder great facilities for disposing of fatted cattle, and now there are no lean cattle sent to the south. Indeed, the extension of green crops in Scotland has been so great that large numbers of lean cattle are imported from England, as well as Ireland, to be fed in the stalls and courts during winter. This applies to the arable districts, where the land does not remain more than one year in grass. In Aberdeenshire, where the land rests from three to four years in grass, more cattle are bred and turned out fat, which is by far the most profitable system, seeing the breeder often gets a larger share of the profits than the feeder. The short-horned blood is in great request to cross with the native breeds, rendering the progeny much easier fattened, as well as causing them to grow to a larger size. It is now the most approved method to feed the calf from the time it is dropped till it is sent to the butcher. Oil-cake is generally considered the best and most healthy auxiliary food for stock, whether old or young. In the pastoral districts of England, where little of the land is cultivated, the rearing of cattle to be sent into the arable districts is carried out. The young animals are fed with hay in winter instead of straw and turnips. Large numbers of cattle are fattened on turnips and mangold in winter in Norfolk and eastern counties. Large allowances of cake and corn are there given in addition to the roots.

OXALATES. See OXALIC ACID, *ante*.

OXALIC ACID ($C_4O_6, 2HO + 4Aq$) occurs in colorless, transparent, oblique, rhombic prisms, which have an intensely sour taste, and are soluble in nine parts of cold water, and much more freely in boiling water. When heated to 212° , the crystals lose their four equivalents (or 28.5 per cent) of water, and the residue, consisting of the hydrated acid ($C_4O_6, 2HO$), becomes opaque; these two equivalents of water contained in the hydrated acid, cannot be expelled by mere heat, although they can be displaced by an equivalent amount of a metallic oxide. When the crystallized acid is rapidly heated to about 300° , it is decomposed into a final mixture of carbonic acid, carbonic oxide, and water; formic acid being produced and again decomposed in the process.

and formic acid when heated yields $2HO + 2CO$. When warmed with strong sulphuric acid, it is decomposed into equal volumes of carbonic acid and carbonic oxide gases, and into water; according to the equation:

This reaction affords one of the best means of obtaining carbonic oxide for use in the laboratory. Oxidizing agents, such as binocide of manganese, peroxide of lead, nitric acid, etc., convert oxalic into carbonic acid, and on this property is based a good method of determining the commercial value of the black oxide of manganese.

Oxalic acid is one of the most powerful of the organic acids, and expels carbonic acid and many other acids from their salts. The acid itself, and its soluble salts, are poisonous. This acid is very widely diffused throughout the vegetable kingdom. Sometimes it occurs in a free state (as in *Boletus sulphureus*), but much more frequently as a salt, either of potash, as in the different species of *oxalis* (from which genus the acid was originally obtained and derives its name), and of *rumex*; or of soda, as in various species of *salicornia* and *salsola*; or of lime, as in rhubarb and many lichens. In the animal kingdom, it never occurs except in minute quantity and in combination with lime.

Oxalate of lime is found in a crystalline shape, both in healthy and morbid urine. In the latter, it constitutes the leading symptom of the affection termed oxaluria (q. v.), while in the former it occurs after the use of wines and beer containing much carbonic acid, of sorrel, rhubarb-stalks, etc., and after the administration of the alkaline bicarbonates. It is the constituent of the urinary calculus, known from its rough exterior as the mulberry calculus. Crystals of oxalate of lime have also been found in the mucus of the gall-bladder, on the mucous membrane of the impregnated uterus, and in morbid blood. They have likewise been detected in the biliary vessels and excrements of caterpillars. In the mineral kingdom these crystals have been detected in association with crystals of calcareous spar.

Oxalic acid is produced by the action of either hydrate of potash or of nitric acid upon most organic compounds of natural occurrence. Its most common mode of preparation is by the oxidation of starch or sugar by nitric acid. The organic compound and the nitric acid are heated in a flask till all effervescence has ceased, after which the solution is evaporated, and the oxalic acid separates in crystals on cooling.

This acid forms three series of salts, viz.: neutral, acid, and super-acid, which, if M represents the metal entering into the salt, may be represented by the formulæ:

the last being a compound of the acid salt and the acid. Oxalate of lime ($2\text{CaO}, \text{C}_4\text{O}_6 + 4\text{Aq}$) and ordinary (neutral) oxalate of ammonia ($2\text{NH}_4\text{O}, \text{C}_4\text{O}_6 + 2\text{Aq}$) are examples of the first; binoxalate of potash, or salt of sorrel ($\text{KO}, \text{HO}, \text{C}_4\text{O}_6 + 2\text{Aq}$), is an example of the second; while the salt usually termed quadroxalate of potash ($\text{KO}, 3\text{HO}, 2\text{C}_4\text{O}_6 + 4\text{Aq}$) is an example of the third class. Of the numerous oxalates, the most important are the oxalate of lime (in consequence of its physiological and pathological relations); the neutral oxalate of ammonia, which is the best test for the detection of lime in solution (in consequence of the extreme insolubility of the resulting oxalate of lime); and the acid oxalate of potash, which is contained in the juices of *oxalis* and *rumex*, and is employed in various manufacturing processes.

The best test for this acid is the production of a white precipitate (of oxalate of lime), on the addition of any soluble salt of calcium. The precipitate is insoluble in water, in solution of potash, and in acetic acid, but dissolves in the mineral acids. A solution of nitrate of silver also gives a white precipitate of oxalate of silver, which explodes when heated.

In consequence of its employment in cotton printing, bleaching straw, etc., oxalic acid is more accessible to the general public than many other poisons, and on this account instances of suicide from the swallowing of this acid are by no means uncommon. Cases of accidental poisoning, moreover, sometimes occur by its being sold by mistake for Epsom salts. Large doses destroy life very rapidly. Dr. A. Taylor mentions a case in which a man died in 20 minutes after taking 2 oz. of the acid. Dr. Christison records a case in which an ounce killed a girl in 30 minutes, and another case in which the same quantity destroyed life in ten minutes; and, as a general rule (liable to exceptions), when the dose is half an ounce or upward, death commonly takes place within the hour. The symptoms are a hot or burning acid taste, with a sense of constriction or suffocation; vomiting, great pain in the region of the stomach, convulsions, cold perspirations and general collapse speedily follow; and respiration shortly before death becomes slow and spasmodic. With the view of converting the free acid in the stomach into an insoluble and inert salt, chalk, whiting, or lime-water, with full draughts of milk, should be administered with the least possible delay. Salt of sorrel is almost as poisonous as the pure acid.

OXALIDÆÆ, or **OXALIDA'CEÆ**, a natural order of exogenous plants, allied to *geraniaceæ*; including herbaceous plants, shrubs, and trees; with generally compound alternate leaves; calyx of five equal persistent sepals; corolla of five equal unguiculate petals, spirally twisted in bud; ten stamens, usually more or less united by the filaments, in two rows; the ovary usually 5-celled, with five styles; the fruit a capsule opening by as many or twice as many valves as it has cells, or more rarely a berry; the seeds few, attached to the axis. There are upwards of 300 known species, natives of warm and temperate climates. They are particularly abundant in North America and at the cape of Good Hope. The flora of Britain includes only two small species of *oxalis*. An acid juice is very characteristic of this order. Some of the tropical species produce agreeable acid fruits, as the carambola (q. v.).—The genus *oxalis* has a capsular fruit, and the seeds have an elastic integument, which at last bursts open and projects the seed to a distance. The species are mostly herbaceous plants with ternate or digitate—rarely simple or pinnate—leaves; a few are shrubs. The stems and leaves generally contain a notable quantity of *binoxalate of potash*, and have therefore a sour taste.—The COMMON WOOD-SORREL (*O. acetosella*), very abundant in shady woods and groves in Britain and most parts of Europe, a native also of North America, is a beautiful little plant, often covering the ground with its green leaves, amidst which the white or slightly roseate flowers appear. Its leaves all grow from the root, a long leaf-stalk bearing three obovate leaflets; the scape bears a single flower. There is a subterranean scaly root-stock. On

account of their grateful acid taste the leaves are used in salads and sauces. The plant is extremely abundant in Lapland, and is much used by the Laplanders. It is antiscorbutic and refrigerant, and an infusion of it is a grateful drink in fevers. *Binoxalate of potash* is obtained from the leaves by expressing the juice and crystallizing; and is sold not only under the name of *salt of sorrel*, but also of *essential salt of lemons*, and is used for extracting spots, and particularly iron-marks, from linen and for other purposes. Much of it is now, however, obtained from a very different source. See OXALIC ACID.—*O. corniculata*, rare in Britain, and almost confined to the south of England, but a plant of very extensive distribution, being found in Europe, North America, India, Japan, and some of the African islands, has a branched stem, with decumbent branches, leaves very similar to those of the common wood-sorrel and yellow flowers. Its properties agree with those of the common wood-sorrel. Many other species resemble these in their general appearance and properties. Some of the species exhibit an irritability like that of the sensitive plant; generally, as in the two British species, in a slight degree, and notably only in hot sunshine, but *O. sensitiva*, an East Indian species, with pinnate leaves, possesses this property in a high degree. Some species of *oxalis*, as *O. cernua*, a native of South Africa, are remarkable for producing large bulbils in the axils of the lower leaves. Several species have tuberous roots, and are cultivated on account of their tubers; as *O. crenata* and *O. tuberosa*, natives of Peru and Bolivia, where they are much esteemed, and both receive the name OCA. The tubers when cooked become mealy like potatoes. They have a slightly acid taste. *O. crenata* has been cultivated in gardens in Britain for about 30 years, but continues to be almost exclusively an object of curiosity, being too tender for the climate, and its produce very inconsiderable in quantity. Its tubers are yellow, in size and shape like small potatoes. The succulent stalks of the leaves abound in a pleasant acid juice, and make excellent tarts and preserves. *O. tuberosa* produces numerous small tubers. The Bolivians often expose them for a long time to the sun, by which they lose acidity, become saccharine, and acquire a taste and consistence like dried figs. *O. Deppèi* is a Mexican species, with a root somewhat like a small parsnip, quite free of acidity. It is much cultivated in its native country, and succeeds well in the southern parts of England. *O. tetraphylla* and *O. crassicaulis*, natives of Mexico, and *O. enneaphylla*, a native of the Falkland islands, also have eatable roots. Many species of *oxalis* are much esteemed as ornaments of gardens and green-houses.

OXALIS. See OXALIDÆ, *ante*.

OXAL'URIA, or THE OXAL'IC ACID DIATH'ESIS, is a morbid condition of the system, in which one of the most prominent symptoms is the persistent occurrence of crystals of oxalate of lime in the urine. These crystals most commonly occur as very minute transparent octohedra, but sometimes in the form of dumb-bells; in order to detect them the urine, which usually in these cases presents a mucous cloud, should be allowed to stand for some hours in a conical glass, and after the crystals have gradually subsided, the greater part of the fluid should be poured away, and the drops remaining at the bottom examined with a power of not less than 200 diameters. These crystals, which are insoluble in acetic acid, may occur either in acid or in alkaline urine. Persons who secrete this form of urine are usually dyspeptic, hypochondriacal, and liable to attacks of boils, cutaneous eruptions, and neuralgia. The oxalic acid in these cases is not introduced into the system with the food, but is a product of the disintegration of the tissues, and is due to the imperfect oxidation of compounds, which should normally have been converted into carbonic acid. (Anhydrous oxalic acid, C_4O_6 , obviously requires 2 equivalents of oxygen to be converted into carbonic acid, C_4O_8 , or $4CO_2$. Hence, if these two equivalents of oxygen are wanting in the system, in consequence of imperfect oxygenation of the blood, oxalic acid, in combination with lime, appears as a final excretion in place of carbonic acid.) The occurrence of oxalic acid as a persistent sediment in the urine is not only an indication of an existing morbid condition of the system, but may give rise to two perfectly distinct dangerous complications; (1) a concretion of oxalate of lime (mulberry calculus) may be formed either in the kidney or the bladder; and (2) bad consequences may arise from the poisonous action of the oxalic acid on the digestive organs, on the heart, and on the nervous system.

The treatment is simple. Care must be taken that the patient should avoid articles of diet containing oxalic acid (such as sorrel, rhubarb, tomatoes, etc.), or readily converted into it (such as sugar), and all drinks containing much carbonic acid; while he should take plenty of exercise in the open air without fatiguing himself; should use the shower-bath, unless he feels chilled and depressed after its application, in which case he should rub the body all over daily with a horse-hair glove; and should employ as a tonic medicine either a little nitro-muriatic acid in a bitter infusion (20 minims of the acid in an ounce and a half of infusion of chyretta), or five grains of citrate of iron and quinine three times daily. Under this treatment the oxalates usually almost entirely disappear from the urine in two or three weeks.

OXENBRIDGE, JOHN, 1609-74; b. Daventry, Eng.; educated at Oxford and Cambridge, taking his degree at the latter university in 1631; was tutor of Magdalen hall, Oxford; but deprived of the position in 1634 for persuading the students to subscribe certain religious articles prepared by himself; was ordained a minister of the

church of England, and spent the next few years as a missionary in the Bermuda islanas. In 1642 he was chosen fellow of Eton college, and in 1644 installed pastor of a church in Beverly. He was afterwards settled at Berwick-on-Tweed, and in 1662 was silenced for noneonformity by the Bartholomew act. He then went as a missionary to Surinam, Guiana, where he labored for some time. In 1667 he visited Barbadoes, and in 1669 came to Boston, where he was installed in 1670 as colleague of the rev. James Allen over the First church of that city, remaining there until his death. Though much engaged in religious controversy he was a popular and useful preacher. His publications are, *A Double Watchword; Election Sermon; Seasonable Seeking of God; A Proposition for Propagating the Gospel by Christian Colonies in the Continent of New Guiana.*

OXENDEN, ASHTON, D.D.; b. at Broome park, near Canterbury, Eng., 1808; educated at the University college, London; for many years rector of Pluckly-with-Pevington, in Kent. In 1864 he became honorary canon of Canterbury cathedral, and in 1869 was chosen bishop of Montreal, and private and metropolitan of Canada. His jurisdiction includes 8 bishopries, viz.: Quebec, Toronto, Ontario, Huron, Nova Scotia, Fredericton, Newfoundland, and Rupert's Land. Among his numerous publications are, *Plain History of the Christian Church; Barham Tracts; The Pastoral Office; Baptism and the Lord's Supper simply explained; Lectures on the Gospels.* He resigned his bishoprie, 1878.

OXENSTIERNA, AXEL, Count, an illustrious Swedish statesman, was b. at Fanö, in Upland, June 16, 1583. He was originally educated for the church, and studied theology as well as jurisprudence at Rostock, Jena, and Wittenberg, in the last of which universities he took his degrees. Although he afterwards devoted himself to public affairs, he continued all his life to take a deep personal interest in religious questions, and labored zealously for the extension of the Protestant doctrines. After leaving the university, he visited most of the German courts, but returned to Sweden in 1603, and soon afterwards entered the service of Charles IX., who, in 1606, dispatched him as ambassador to the court of Meeklenburg. He became a senator in 1608—a dignity which had been enjoyed by thirteen of his predecessors in uninterrupted succession. Having displayed great prudence and wisdom in the settlement of certain disputes between the Livonian nobles and the town of Reval, he was appointed by Charles—now infirm from age—guardian of the royal family, and head of the regency. On the accession of Gustavus Adolphus (q. v.), in 1611, Oxenstierna was made chancellor; and in 1613, acted as minister-plenipotentiary in the negotiations for peace between Sweden and Denmark. In the following year he accompanied his sovereign to Poland, and by the peace of Stolbova, in 1617, terminated hostilities between Sweden and Russia. His political sagacity was not less conspicuously shown in his successful efforts to prevent Gustavus from marrying Ebba Brahe, a Swedish beauty, and in bringing about a match between his master and the princess Maria-Eleonora of Brandenburg. In 1621, on the departure of the king for the Polish war, he was charged with the administration of affairs at home, which he conducted with his invariable felicity; subsequently he was appointed governor-general of the conquered districts; and in 1629 concluded peace with the Poles on highly favorable conditions. For a while Oxenstierna strongly opposed the desire of Gustavus to take part in the “thirty years’ war;” his hope being to see the latter arbiter of the n. of Europe; but when he found that the Protestant sympathies of the king were irrepressible, he set about collecting money and troops for the perilous enterprise, with all the quiet but wonderful activity and persistency that so remarkably characterized him. After Gustavus had fairly entered on the bloody struggle, Oxenstierna joined him, and conducted most of the extensive and complicated diplomacy which the course of events entailed on Sweden. The death of Gustavus for a moment paralyzed him, but he instantly recovered, and heroically resolved to continue the contest with the imperialists, in spite of the visible disaffection of many of the German Protestant princes, among others, of the elector of Saxony. The will of the dead monarch was sent to Stockholm; according to its conditions, the government—during the minority of Christina (q. v.)—was intrusted to five nobles, who empowered the chancellor to prosecute the war. His difficulties were enormous, yet by indefatigable efforts he managed partly to allay the discontents, jealousies, and rivalries of the Protestant leaders. The disastrous defeat of the Swedes at Nordlingen in 1634, and the perplexities which followed it, would have stupified most men in the position of Oxenstierna, but it only called out more energetically his splendid diplomatic genius. Transferring the leadership of the Protestant forces to duke Bernhard (q. v.) of Weimar, he proceeded, in 1635, to France and Holland, and formed alliances with these countries. Returning to Germany, he assisted in quelling a mutiny among the Swedish troops at Magdeburg; put Pomerania in a state of defense, to resist the mediated attack of the elector of Brandenburg; renewed the treaty with Poland; and leaving Baner in command of the Swedes, returned to Stockholm in 1636, where he was received with the liveliest enthusiasm. He still continued, however, to direct ably the policy of the Protestants in Germany, till the peace of Westphalia, in 1648, put an end to the war. Oxenstierna's son was one of the Swedish envoys who signed the treaty, and it is in a letter to him that the famous sentence of the statesman occurs, *Nescis mi fili, quantilla prudentia homines regantur*—(“You do not yet know, my son, with how little wisdom men are governed.”) Christina, who had been declared of age in 1644, did not show a proper

respect for the advice of Oxenstierna; and after she had—through mere feminine wilfulness—abdicated, in spite of all his protestations, he withdrew from public life, and died Aug. 28, 1654, shortly after she had left Sweden. He entertained a genuine affection for the daughter of his noble master, and in his last moments her name was upon his lips. Some treatises and historical fragments are attributed to him, and his “journal” has been published in the *Stockholm Magazine*. See Lundblad’s *Svensk Flutarch* (2 vols. Stock. 1824); Fryxell’s *History of Gustavus Adolphus*; and Geijer’s *History of Sweden*.

OX-EYE. See CHRYSANTHEMUM.

OXFORD, a co. in s.w. Maine, bordering on New Hampshire, drained by the Saco and Androscoggin rivers; containing several large lakes, among which are Molechunke-munk, Parmachena, and Mooselucmaguntic; traversed by the Portland and Oxford, and Grand Trunk railroads; 1,700 sq.m.; pop. '80, 32,625—32,025 of American birth. The surface is mountainous but in the valleys fairly fertile. The staples are wheat, buckwheat, corn, dairy products, maple sugar, and hay. There are over 80 factories of various kinds in the county. Capital, Paris.

OXFORD, a co. of Canada in s.w. Ontario, drained by the Thames and smaller rivers, and traversed by the Canada Southern and the Great Western railroads; 760 sq.m.; pop. '81, 50,093—18,813 of English and 12,943 of Scotch descent, the rest being of Irish and German origin. Capital, Woodstock.

OXFORD, an ancient and famous city and seat of learning in England, the chief town of the co. of Oxford, is situated on the n.e. bank of the Isis, a tributary of the Thames, a little above the point where it is met by the Cherwell. Both streams are crossed by numerous bridges, of which the finest are Folly bridge over the Isis, and Magdalen bridge over the Cherwell. Lat. of the city, 51° 45' 55" n., long. 1° 15' 29" west. Distance from London, 55 m. w.n.w. Pop. '81, 40,862. Oxford occupies an undulating site, is surrounded by rich and wooded meadows, and presents to the eye of the approaching visitor a scene of unequaled architectural magnificence—spires, and towers, and domes rising as thickly as chimney-stalks in the manufacturing towns of Lancashire or Yorkshire. The four main streets of Oxford meet at right angles near the center of the town, at a place still called Carfax, a corruption of *Quatre voies*, and which appears in Agas’s map (*temp.* Elizabeth) as *Cater voys*. These are—Cornmarkèt street, leading into St. Giles’s, and running due n.; Queen street, leading to the railway stations, and running w.; St. Aldate’s street, leading to the Isis, and running due s.; and High street, which is the chief street of the city, gracefully curving in an easterly direction, and conducting to the river Cherwell, a smaller river joining the Isis soon after it has passed Oxford.

The western half of the town is the most uninteresting; and it is a misfortune that the railway stations are placed here, as travelers, on arriving, are introduced to the meanest parts of the city first. The county courts and jail, and the remains of the castle, from which the empress Maud escaped while it was besieged by king Stephen, will be observed in passing. There is one good street in this part, viz.: Beaumont street, built on the site of the ancient Beaumont palace, in which Richard I. was born. At the end of this street is Worcester college. Passing to the n. from Carfax, along the Cornmarket, the old tower of St. Michael’s church is seen, against which stood formerly the n. gate of the city; next St. Mary Magdalen church; then the martyr’s memorial, with the Taylor buildings and Randolph Hold on the left, and part of Balliol college and St. John’s college on the right. St. Giles’s church is at the n. end of this street, which is very wide, and has a row of elm trees on each side, forming a picturesque avenue like a foreign *boulevard*. Beyond this, to the n., is the Radcliffe observatory and infirmary. The High street is about 1000 yds. in length; it is reckoned one of the noblest streets—architecturally considered—in Europe, and contains, among other edifices, part of the buildings of Magdalen college, Queen’s college, All-Soul’s college, University college, and St. Mary’s and All-Saints’ churches. Parallel to it is Broad street, in which are situated Balliol, Trinity, and Exeter colleges, the Ashmolean museum, the Clarendon rooms, the Sheldonian theater, and close by are the Academical schools, the Bodleian library, and the picture gallery. In St. Aldate’s street, which forms the southern part of the series of streets already mentioned as forming one line, and running n. and s. is Christ Church college (the entrance tower of which contains the great bell “Tom of Oxford,” weighing upwards of 17,000 lbs.) and St. Aldate’s church. The other colleges and important buildings connected with the university of Oxford lie back from the principal streets. To attempt particularizing the architectural characteristics of each of these edifices is impossible within our limits. It may suffice to say, that though there is nothing extraordinarily fine about the architecture of the colleges, regarded individually, yet the vast number of the structures and variety of styles present a *tout-ensemble* that is altogether sublime. The effect is wonderfully heightened by the interspersion of gardens, meadows, and venerable trees—old as the buildings that tower above them. Christ church is celebrated for its magnificent hall, picture gallery, and library, as well as for its extensive grounds; its chapel, the cathedral church of Oxford, is Norman in style, but is inferior, both in size and beauty, to most English cathedrals. Merton college is situated a little to the s. of the High street, and still retains the original chapel

and part of the other buildings erected by Walter de Merton in the 13th century. Magdalen college retains its celebrated cloister and tower of the 15th c., and the buildings here are the most complete of any college in Oxford. Oriel college, a comparatively modern structure, is very picturesque, but far from chaste in its design; New college ranks among the noblest buildings in the city—"the chapel, the hall, the cloisters, the groined gateways, and even some original doors and windows remain, in their exterior at least, as they came from the hand of their master architect," William of Wykeham, 500 years ago; Queen's college is built in the Grecian style of architecture, with a spacious and handsome chapel and a fine library; so is Trinity college; University college is a not unpleasing mixture of Gothic and Italian; Exeter college has a splendid frontage on the w., and its chapel (built 1857-58), in the Gothic style, is the finest modern building in the city; it has also an excellent hall, and a beautiful library; Balliol college has a remarkably fine chapel, built only a few years ago. Among the other churches in Oxford, besides the cathedral church and the college chapels, are—St. Mary's, which is attended by the members of the university; St. Martin's, the church of the corporation of Oxford; St. Peter's-in-the-East, with a Norman crypt; St. Michael's, with a Saxon tower; and St. Aldate's. The chief buildings connected with the university, besides the Bodleian and the Ashmolean museum already mentioned, are the Radcliffe library, a circular structure, adorned with Corinthian columns and surmounted by a dome; the Radcliffe observatory, crowned by an octagonal tower, in imitation of the temple of the Winds at Athens; the University printing-office, and the Taylor institution, founded "for the teaching the European languages"—an exceedingly handsome and extensive range of buildings. The botanic gardens are situated not far from the Cherwell, and nearly opposite Magdalen college. Other notable buildings, not connected with the university, are—the town hall, the Radcliffe infirmary, the co. jail, and one or two dissenting places of worship, such as the Wesleyan chapel in New Inn Hall lane, and the Independent chapel in George lane.—The city of Oxford is a mart for the disposal of the agricultural produce of the neighboring country, but has little trade of its own, and is dependent for its prosperity chiefly on the university. It is a municipal and parliamentary borough, and governed by a mayor, nine aldermen, and thirty councilors, whose jurisdiction, however, does not embrace the university. Both the city and the university send two members to parliament. (The city was disfranchised, 1883-90.)

Oxford, by the Saxons called Oxnaford, and in the *Domesday Book*, Oxeneford (probably from its having been originally a ford for the passage of oxen), is a place of great antiquity. The date of its origin is unknown, but as early as the 8th c. there was a nunnery established here; and in 802 an act of confirmation by pope Martin II. describes it as an ancient seat of learning. It is said to have been a residence of king Alfred, and also of Canute, who held several parliaments within its walls. The townsmen closed their gates against William the conqueror, who stormed the town in 1067, and gave it to one of his followers, Robert d'Oyley, who built a castle here to overawe the disaffected Saxons, some ruins of which are still to be seen. The pacton that terminated the strife between Stephen and Henry II. was drawn up at Oxford. In the reign of Edward III. the preaching of Wyckliffe excited great commotion among the students, and threatened well-nigh the dissolution of the university. In the reign of the "Bloody Mary" it witnessed the martyrdoms of Ridley, Latimer, and Cranmer; and during the great civil war of the 17th c. it was for a while the head-quarters of the royalist forces, and was conspicuous for its adherence to Charles I. Ever since that period the city—or, at any rate, the university—has been in general characterized by an extreme devotion to the "church" and the "king."

OXFORD, N. J. See page 883.

OXFORD, EARL OF. See HARLEY, ROBERT, *ante*.

OXFORD BLUES. See HORSE GUARDS, ROYAL.

OXFORD CLAY, the principal member of the middle oolite series, is a bed of stiff dark-blue or blackish clay, sometimes reaching a thickness of 600 feet. There occur in its lower portion in some places layers of tough calcareous sandstone, called Kelloway rock, from a place in Wiltshire, where it is quarried. The Oxford clay lies beneath the plain on which Oxford is built, and extends s.w. and n.e. from the shore at Weymouth to the fen lands s. of the Wash, thence it may be traced through Lincoln into Yorkshire, until it disappears under the sea at Scarborough. The close packing of the fossils in the fine compact clay has caused them to be beautifully preserved; the shells frequently retain their iridescence, and even the softer parts of the cephalopods have sometimes left with tolerably clear definition their form in the clay. The fossils are, however, often filled with iron pyrites, which, on exposure to the atmosphere, readily decomposes and destroys all traces of the beautiful organism. The remains of chambered shells of the genera belemnites and ammonites are very abundant, and with them are associated other shells, interesting crustacea, and the species of fishes and reptiles which are characteristic of the oolite.

OXFORDSHIRE, an inland county of England, bounded on the s. by the river Thames, on the e. by Bucks, and on the w. by Gloucestershire. Area, 472,717 acres. Pop. '81, 179,650. The surface, where it is not level, is undulating. In the n.w. the hills rise in Broom hill to 836 ft. above sea level, and in the s.e. of the county are the Chiltern hills (q.v.), rising near Nutfield to 820 ft. in height. It is watered along its

southern border by the Thames, and the other chief rivers are the Windrush, Evenlode, Cherwell, and Thame, affluents of the Thames. By means of the Oxford canal, which joins the Thames at Oxford, the towns and districts lower down the river (Abingdon, Wallingford, etc.) are supplied with coal from the Leicestershire coal-fields. The soil is fertile; the state of agriculture is advanced, 414,663 acres being under crops, fallow, or grass in 1876; and the county may be considered one of the most productive in the country. Three members are returned to the house of commons for the county.

OXFORD TRACTS. See TRACTARIANISM, *ante*.

OXFORD UNIVERSITY is said to have been founded by king Alfred. Without claiming for it an origin quite so ancient, it is certain that from very early times students resorted to Oxford in order to attend lectures there delivered by learned men, and that they lived in the houses of the towns-people. In some cases they combined together, so as to secure the service of a common teacher, with whom they lived in a large tenement called an inn, hostel, or hall. For a long time, however, the great majority of the students lodged in rooms hired from the citizens; and as late as the year 1512, regulations were made for the governance of such students. As their numbers increased, the halls were multiplied. Anthony Wood states that he could show the names and places of more than a hundred. A great diminution in the numbers of the students took place about the middle of the 15th century. This, among other causes, led to the gradual disappearance of the halls, which were bought up by the wealthier colleges. Only five of the halls now exist, which differ from the colleges only in that they are unincorporated, and have little or no endowments. Residence in private lodgings had also fallen into disuse; and by the time of queen Elizabeth it had become a compulsory rule that all undergraduates should reside in some college or hall, at least for the first twelve terms of residence. Now, however, undergraduates may in most colleges live in lodgings from the beginning of their course.

The colleges were founded at various periods from the end of the 13th c. to the beginning of the 18th. Fourteen out of the 20 were founded before the reformation. Their object originally was to support limited societies of students, who were to devote their lives to study—by no means, as at present, to educate large classes of the community. Students, other than those on the foundation, seem not to have been regarded by the founders as an essential part of the college. The colleges arose, as has been already said, partly instead of the old halls, and were partly at first connected with the monasteries, it being by means of these institutions that benevolent persons were enabled to give permanent support to poor secular scholars. University and Balliol, which now rank as the oldest colleges, were in point of fact halls supported by endowments held in trust for the maintenance of their students. The originator of the collegiate system, in anything like its present form, was Walter de Merton, who, besides having founded Merton college, is entitled to the honor of having mainly contributed to fix the university in its present site. All those on the foundation of the colleges before the reformation were called clerici. The great majority of the fellows were required to take priest's orders within a certain period after their election. This requirement of course involved celibacy, which, besides, was expressly imposed in some colleges; and practically, in old times as now, was enforced by the rule of life and the obligation of residence. Within the last few years in some of the colleges the restriction of celibacy has been, under certain conditions, remitted in the case of fellows engaged on college work.

Under a statute passed in 1868 any person may now become a member of the university without becoming a member of a college or hall, provided he satisfies certain disciplinary requirements. For such purposes these unattached students are under the control of a board of delegates; but no special provision is made for their instruction. In 1871 the new foundation of Keble college, built in memory of John Keble, was admitted to enjoy the same privileges (save as regards the academical status of its head) as are possessed by the existing colleges and halls.

Previous to the statute 17 and 18 Vict. c. 81 the constitution of the university was as follows: 1. The hebdomadal board, or weekly meeting, consisting of the heads of houses and the two proctors, which body exercised the chief share of the administration of the university, and possessed the exclusive power of initiating legislation; 2. Congregation, consisting of certain university dignitaries, which met merely for the purpose of conferring degrees; 3. Convocation, consisting of all masters of arts, a body whose consent was necessary before any of the measures proposed by the hebdomadal board could become law, which elected the chancellor, the two representatives of the university in parliament, several of the professors, and dispensed the ecclesiastical patronage of the university. The statute referred to introduced important changes. The hebdomadal board has been changed into the hebdomadal council, consisting of the chancellor, the vice-chancellor, the proctors, six heads of houses, six professors, and six members of convocation of not less than five years' standing—such heads, professors, and members of convocation being elected by congregation, and holding office for six years. Congregation, again, now consists of all the great officers of the university, the professors, the public examiners, and all resident masters; and on this body is now bestowed the power of accepting or rejecting, and of amending any statute framed by the hebdomadal council. The composition and powers of convocation remain unchanged. The students

not on the foundation are for the most part commoners. In Worcester college and the halls there is still a class of fellow-commoners, who pay large fees, and enjoy certain privileges. They mainly consist of men above the ordinary age of undergraduates, who wish to have the intellectual advantages of the university without being subjected to the common routine of discipline. All other formal distinctions due to wealth or poverty are almost entirely abolished, such as the special privileges of peers, and the regard had to the poverty of candidates in the case of certain scholarships. It is very difficult to ascertain the actual number of students at any one time in Oxford, but now it is probably seldom above 1800.

There are four terms in each year—viz., Michaelmas term, which begins on Oct. 10, and ends on Dec. 17; Hilary term, which begins on Jan. 14, and ends the day before Palm Sunday; Easter term, which begins on the Wednesday in Easter-week, and ends on the Friday before Whitsunday; Trinity term, which begins on the Saturday before Whitsunday and ends on the Saturday after the first Tuesday in July. Full term, as it is called, does not begin till the first day of the week, after the first congregation is held. By undergraduates, Michaelmas and Hilary terms are kept by six weeks' residence, and Easter and Trinity terms by three weeks each; but more than this is required by most of the colleges. Twenty-six weeks may be taken as the ordinary *length of the academic year*. Twelve terms of residence are required for the degree of B.A. from all. The degree of M.A. is obtainable in the twenty-seventh term after matriculation. By a statute passed in 1850, the following examinations were made necessary for a degree in arts; but their nature has been considerably changed by the new statutes which came into effect 1873-74: 1. Responsions, called "little go" or "smalls" in the familiar language of undergraduates, are obligatory upon all. The university does not, as to this or any other pass examination, fix a limit of time within which they must be passed; but most colleges require their members to pass responsions, at least within their first year of study. Subjects: one Latin and one Greek author—or portions of them, as five books of Homer, five of Virgil, two Greek plays, etc.—with a paper of grammatical questions; a piece of English to be translated into Latin; two books of Euclid, or algebra up to simple equations inclusive; and arithmetic. 2. The first public examination, or moderations, is also obligatory upon all. Candidates must have entered upon their fourth term. Subjects: the four gospels in Greek (except in the case of persons not members of the church of England, when some one Greek author is to be substituted); one Greek and one Latin author, not the same as those offered for responsions, and one must be a poet, the other an orator; a piece of English into Latin, and a paper of grammatical questions; logic, or Euclid III. and IV., 1-9, and algebra. Honors are awarded at this examination both in classics and pure mathematics. Candidates are recommended to take up especially poets and orators. Verses, as well as Greek and Latin prose-writing, and a paper of grammatical and philological questions, are set. In the mathematical school, which in this examination exists as a separate school for honors only, candidates are examined in pure mathematics up to the integral calculus and the calculus of finite differences inclusive. 3. The second public examination held twice a year, to be *passed* not earlier than the 12th term, and for honors not later than the 16th term of standing; unless the candidate has been classed in some other school of the second public examination, in which case he may be admitted up to the 20th term inclusive. This examination consists of three parts: (1.) an examination in the rudiments of faith and religion, or in the case of those who (or whose guardians) object to such examination, certain substituted books or subjects; (2.) an examination of those who do not seek honors; and (3.) an examination for those who do seek honors. In this last there are, in Oxford phraseology, six schools: literæ humaniores, mathematics, natural science jurisprudence, modern history, theology. Candidates are entitled to a degree of B.A. who having passed the two previous examinations, also passed the examination appointed for those who do not seek honors, or who obtain honors in any one of the six honor schools. But every candidate, except he has obtained honors in the theology school, must have satisfied in the rudiments of faith and religion or the substitute. By these rudiments are understood the Old and New Testaments (gospels and acts of the apostles in the original Greek); and the 39 articles. The pass examination embraces subjects chosen from at least two out of the three following groups: (a) Greek and Roman history and philosophy; (b) English, modern languages, political economy and law; (c) geometry, mechanics, chemistry, and physics. Out of these the candidates must select three subjects, one of which must be either (1) ancient philosophy and history (in the original Greek, or Greek and Latin); or (2) a modern language (French or German). The classical books must be other than those offered for responsions and moderations. Candidates for honors may select any one, or more than one of the six schools. The most popular and influential of these is the school of literæ humaniores. The examination in this school includes (1) the Greek and Latin languages; (2) the histories of ancient Greece and Rome; (3) logic, and the outlines of moral and political philosophy. Candidates may also offer certain special subjects in any of these three departments. The republic of Plato and the ethics of Aristotle form the basis for philosophical study, though they are every year more largely supplemented by modern philosophy. Next in the numbers of its candidates is the school of modern history, which includes (1) the continuous history of England; (2) general history during some period, selected

by the candidate, from periods to be named from time to time by the board of studies: (3) a special portion of history, or a special historical subject, carefully studied with reference to original authorities. The school of jurisprudence includes (1) general jurisprudence; (2) the history of English law; (3) some department of Roman, and it may be, of English law; (4) international law, or a specified department of it. The school of mathematics embraces pure and mixed mathematics (algebra, trigonometry, calculus, mechanics, optics, astronomy). The school of natural science has a double examination for honors—a preliminary and a final. The preliminary examination, incumbent upon all, is restricted to the elementary parts of mechanics, physics, and chemistry. In the final examination, the candidate may offer himself for examination in one or more of the three general subjects of physics, chemistry, and biology. The examination in the honor school of theology includes the Holy Scriptures, dogmatic and symbolic theology, ecclesiastical history and the fathers, the evidences of religion, liturgies, sacred criticism, and the archæology of the Old and New Testaments. A knowledge of Hebrew will have weight in the distribution of honors. The organization of these schools is at present the main function of the university, as distinct from the colleges. Professorial teaching on its own account only exists to a very limited extent. In the main, the teaching power of the colleges is devoted to preparing their undergraduate members for these various examinations.

Examinations also take place for degrees in law, medicine, divinity, and music; but these are in great measure formal. The examinations for degrees in arts are the proper work of the university.

Besides these honors, various distinctions are conferred by the university. There are several university scholarships, more particularly the Vinerian law fellowships and scholarships; the Eldon law scholarship; one Sanscrit and two Hebrew scholarships yearly; two mathematical scholarships; the Hertford scholarship, for the encouragement of the study of Latin, and the Ireland and Craven scholarships, for the encouragement of the study of classics. There is also the Newdigate prize for the best composition in English verse; and the three chancellor's prizes for the best compositions in Latin verse, Latin prose, and English prose; the Gaisford prizes for Greek composition; and the Arnold, Stanhope, and marquis of Lothian's prizes for the best essays on an historical subject. But the great prizes are the scholarships and the fellowships. By the commissioners under 17 and 18 Vict. c. 81, these have been for the most part thrown open, and are now awarded after examination without restriction as to kin or place of birth. At All-Souls, and also at St. John's college, since the labors of the commissioners, an attempt has been made to keep up the former exclusiveness. The scholarships, which are so numerous as to be within the reach of any young man of ability, range from £60 to £80 a year, with rooms free, which would go a considerable way toward defraying the expense of a university education. At the close of this education come the fellowships; and it has been calculated that when the arrangements of the commissioners are complete, there will be between 20 and 30 fellowships, mostly about £300 per annum, open yearly to competition.

Oxford is, of course, chiefly fed from the great English schools. A close connection subsists, by the terms of the foundation, between Winchester and New college, between Westminster and Christ Church, and between Merchant Taylors' and St. John's. For the nature of this connection, see under these colleges. A student desirous of going to Oxford, must apply to the head of the college to which he wishes to belong. Application in former times had to be made early, as all the good colleges were filled up for several years in advance. But now that undergraduates are allowed by most colleges to live in lodgings from the first, a candidate can have no difficulty in securing admission even to a distinguished college at short notice. There is no *university* examination at matriculation; but all the good colleges have such an examination before they receive any one—the standard of the examination, of course, varying with the college. After being received into the college, the undergraduate is sometimes assigned to a college tutor, who exercises a special control over his reading; but he also attends the instruction of the other college tutors or lecturers, as the course of his studies may require. The cost of tuition varies at different colleges, but an average of £65 may be given as paid by the undergraduate during his whole career. This payment is at some colleges distributed over three, at others over four years. Besides this, almost every undergraduate finds it necessary, at some period before taking his degree, to read with a private tutor, whom he chooses for himself. Private tuition has grown to be quite an institution in Oxford, though not formally recognized. Many of the ablest young men, after taking their degree, remain in Oxford for a year or two, taking private pupils. In this way an undergraduate, even of a badly-taught college, could secure the advantages of the best tuition. But during the last few years, the lecturers in different colleges have more and more combined and systematized their work; and thus to a slight extent obviated the need of private tuition. Much discussion has taken place on the merits and faults of this system; but, on the whole, it must be allowed to be useful for the tutor, as clearing up and concentrating his knowledge, while, at least to undergraduates who read for honors (with a few rare exceptions), it may be considered as absolutely necessary. Private tutors usually charge £10 a term for three hours a week. Previous to 1852, the professoriate of Oxford was strictly ornamental. A great effort was then made to stir

it into life, which has been partially successful. New professorships were created, and the endowments of old ones were increased by the commissioners, under 17 and 18 Vict. c. 81. But the former of these measures, at least, whatever it may have done for the interests of science, has produced but little effect on the undergraduates. They still limit their range of studies by the requirements of the examinations of the schools, and it were hard to expect them to do otherwise. But professorial teaching has undoubtedly become more popular in the ordinary branches of study. Lectures by the professors of law and modern history, of moral philosophy, logic, Greek, and Latin, are felt to be useful, and are therefore well attended. With regard to the expenses of Oxford, it is difficult to say anything very definite. They vary at different colleges, not only indirectly from the tone of the society, but even directly from the charges made for necessities. A man should be exceedingly comfortable at Oxford with £200 a year; on £150, he can manage with economy. Many young men could not with prudence, be exposed to the difficulties of living in Oxford on less than the latter sum. There have indeed been instances of men passing creditably through the university course on £100 a year. The *necessary* expenses do not exceed that sum; the habits of the young men themselves cause a great part of the expenses. Returns procured by the delegates for unattached students show that some students cover their board, lodging, and tuition for about £45 a year. Discipline inside the college is maintained by the head of the house and the tutors; in the town and its neighborhood, by the proctors, who are university officers with great authority. As a rule, this authority is well exercised. According to the *Universities Commission Report* (1874), the revenue of the colleges and university in 1871 was £413,000.

The following is a list of the colleges and halls as they rank in the university; an account of each will be found in its alphabetical place; University, Balliol, Merton, Exeter, Oriel, Queen's, New College, Lincoln, All-Souls, Magdalen, Brasenose, Corpus Christi, Christ Church, Trinity, St. John's, Jesus, Wadham, Pembroke, Worcester, Keble, St. Mary hall, Magdalen hall, New Inn hall, St. Alban hall, St. Edmund hall. To these may be added Charsley's hall, being a private hall under the mastership of W. H. Charsley, in virtue of a statute passed in 1854, empowering any M.A. of a certain standing to open a private hall on his obtaining a license from the vice-chancellor. The unattached students now number upward of 100; but the present system of university teaching is not very favorable either to their increase or progress.

Among the books which may be consulted with regard to Oxford are—Ayliffe's *History of Oxford*, Wood's *Annals*, the *University Calendar*, and above all, the *Report of the Royal Commissioners for 1852* and the *Student's Handbook to the Univ. of Oxford*.

OX-GALL, the bile of the ox, greenish-yellow in color. It has several uses in arts and manufactures. It is reduced to the form of an extract for preservation, and when used dissolved in alkaline water. The chief use is in mixing colors, the effect being to give them tenacity and fluidity. It is also an ingredient in varnish, and is a substitute for Indian ink, and is used in painting on ivory.

OXIDATION is the term applied to the union of any body with oxygen, the body being then said to be *oxidized*, and the resulting compound being termed an *oxide*. Many bodies possess the property of entering into several distinct combinations with oxygen. For example, manganese (Mn) forms no less than six such compounds—viz., MnO, Mn₂O₃, Mn₃O₄, MnO₂, MnO₃, Mn₂O₇, which represent different stages of oxidation.

OXIDES, METALLIC, are the most important of all the compounds of the metals, and in many cases occur naturally as abundant and valuable ores. They are divided by chemists into three classes—viz., (1) basic oxides or bases, (2) saline or indifferent oxides, and (3) acid oxides or metallic acids. The different oxides of the same metal usually afford illustrations of two, and not unfrequently of all three of these classes. Thus (to take the case of manganese referred to in the last article) the protoxide (MnO) is a powerful base, the red oxide (Mn₃O₄) is a saline or indifferent oxide, showing little tendency to combine either with acids or alkalies, while permanganic acid (Mn₂O₇) presents all the properties of an acid. "As a general rule, the greater the number of atoms of oxygen which an oxide contains, the less is it disposed to unite with the acids; on the contrary, it frequently possesses acid properties, and then unites with bases to form salts. Protoxides generally are strong salifiable bases; they require one equivalent of a monobasic acid to form neutral salts. Sesquioxides are weaker bases; their salts are usually unstable; they require three atoms or equivalents of a monobasic acid to form a salt which is neutral in composition, though it may not be neutral to test-paper; and in general, all oxides require as many equivalents of acid as they contain atoms of oxygen in their composition. Some of the metallic acids, like the stannic and titanous, contain two atoms of oxygen to one atom of metal, but most of them contain three atoms of oxygen—such, for example, as the manganic, ferric, chromic, tungstic, molybdic, and vanadic acids; whilst in a few cases, such as the arsenic, antimonous, and permanganic, the proportion of oxygen is still higher."—Miller's *Inorganic Chemistry*, 2d edit. p. 314. Of the basic oxides, which form by far the most important class, it may be observed that they are devoid of all metallic appearance, and present the characters of earthy matters, and that six only of them are soluble in water to any considerable extent—viz., the three alkalies and baryta, strontia, and lime. All the oxides are solid at ordinary

temperatures, and as a general rule, the addition of oxygen to a metal renders it much less fusible and soluble; the protoxide of iron, the sesquioxide of chromium, and molybdic acid being the only oxides that melt more readily than the metal.

OXLEYA, a genus of trees of the natural order *cedrelaceæ*, of which one species, *O. xanthoxyla*, the YELLOW WOOD of Eastern Australia, is a very large tree, 100 feet high, valuable for its timber.

OXLIP. See PRIMROSE, *ante*.

OXPECKER. See BEEF-EATER, *ante*.

OXUS, the ancient name of a great river in Central Asia, which is called by the Turks and Persians *Jihûn*, and *Amû* or *Amû-DARIA* by the natives of the country through which it flows. The Oxus rises in lake Sari-kol, in the elevated plateau which separates Eastern and Western Turkestan. It flows through Buddakshan, Bokhara, and Khiva, and empties itself by several mouths into the sea of Aral. In the first part of its course its volume is increased by numerous affluents, but it receives no tributaries after entering Khiva, from which point its course is wholly through a dry sandy desert. Its total length is about 1150 miles. The value of the Oxus for the purpose of water communication, is said by recent Russian geographers to have been much overrated in Europe; and they add that, in summer, vessels of even slight draught could only be got upon the stream by shutting off the irrigation canals, and risking the desolation of the country dependent on them for its crops. The true value of the Oxus lies in the means it will supply of irrigating the sterile alluvial wastes through which it runs. Before the Christian era, it is believed that the Oxus flowed into the Caspian, and that since 600 A.D. it has twice changed its course (see *ARAL*). A great part of the old bed of the Oxus has recently been explored by M. Stebnutzki (*Bulletin de la Soc. de Géogr. de Paris*, April, 1871), who has ascertained that it has a fall towards the Caspian, from which he infers that its course was not changed by an upheaval of the Turcoman desert, but by the simple accidents of fluvial action on an alluvial soil. In his address to the London geographical society in May, 1872, sir Henry Rawlinson said the restoration of the Oxus to its old bed was then under the serious consideration of the Russian government, that it was a work of no engineering difficulty whatever, and would assuredly be accomplished as soon as the neutrality of Khiva was secured.—See *A Journey to the Source of the Oxus*, by John Wood, with Essay of the Geography of the Oxus Valley by col. Yale, 1873; also *The Road to Merv*, by sir H. Rawlinson, in the proceedings of the geog. society, 1879; and a *Monograph on the Oxus*, in *Jour. Roy. Geog. Soc.*, XLII.

OXYACIDS. When Lavoisier, in 1789, gave the name of oxygen to the *dephlogisticated air* discovered, in 1774, by Priestley, he believed that the presence of that body was essential to the existence of an acid, and this view was supported by the composition of the principal acids which were then known, such as sulphuric, nitric, carbonic, and phosphoric acids. But, by degrees, acids were discovered into which no oxygen entered, but which always contained hydrogen, and hence acids were divided into two great classes, the *oxyacids* and the *hydracids*; oxygen being supposed to be the acidifying principle in the former, and hydrogen in the latter. At the present day scientific chemists usually restrict the term *acid* to compounds into which hydrogen enters, and the acids are regarded as salts of the last-named element; thus, sulphuric acid (HO, SO_3) and nitric acid (HO, NO_5) are the sulphate and nitrate of oxide of hydrogen; hydrochloric acid (HCl) is chloride of hydrogen, etc.

OXYCHLORIDES, chemical compounds containing both chlorine and oxygen in combination with some other element or radical. Chloride of lime (CaOCl), chloride of potash (KOCl), oxychloride of lead or Turner's yellow belong to this class.

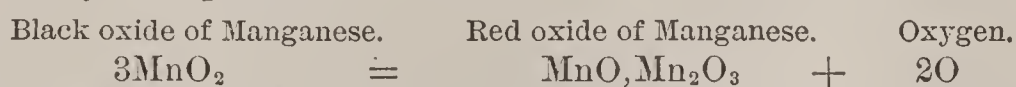

OXYGEN (symb. O, equiv. 8; new system, 16; sp. gr. 1.1056) is a colorless, inodorous, tasteless gas, long regarded as a "permanent" gas, but liquefied by Pictet of Geneva for the first time in 1877. Its chemical affinities for other elementary substances are very powerful; with most of them it is found in combination, or may be made to combine, in more than one proportion; with several in 4, 5, or 6 proportions; and there is only one element (fluorine) with which it does not enter into any combination. Owing to the intensity with which many of these combinations take place, this gas has the power of supporting combustion (q.v.) in an eminent degree. Of all known substances, it exerts the smallest refracting power on the rays of light. It possesses weak but decided magnetic properties, like those of iron, and like this substance, its susceptibility to magnetization is diminished or even suspended by a certain elevation of temperature. It is only slightly soluble in water; 100 cubic inches of that liquid dissolving 4.11 cubic inches of gas at 32° , and only 2.99 inches at 59° .

Oxygen gas is not only respirable, but is essential to the support of animal life; and hence it was termed *vital air* by some of the older chemists. A small animal placed in a bell-glass containing pure oxygen will not be suffocated so soon as if it were placed in the same glass filled with atmospheric air. For further details on this property of oxygen, the reader is referred to the article *RESPIRATION*.

Oxygen is the most abundant and the most widely distributed of all the elements. In its free state (*mixed* but not *combined* with nitrogen), it constitutes about a fifth of the bulk, and considerably more than a fifth of the weight, of the atmosphere. In combina-

tion with hydrogen, it forms eight-ninths of all the water on the globe; and in combination with silicon, calcium, aluminium, etc., it enters largely into all the solid constituents of the earth's crust; silica in its various forms of sand, common quartz, flint, etc.—chalk, limestone, and marble—and all the varieties of clay, containing about half their weight of oxygen. It is, moreover, found in the tissues and fluids of all forms of animal and vegetable life, none of which can support existence independently of this element.

There are various modes of obtaining oxygen, the simplest of which consists in the exposure of certain metallic oxides to a high temperature. It was originally obtained by its discoverer, Dr. Priestley, from the red oxide of mercury, which, when heated to about 750°, resolves itself into metallic mercury and oxygen gas. It may be similarly obtained from red oxide and peroxide of lead, the resulting products in these cases being protoxide of lead and oxygen. The following are the chief methods now employed: (1.) The black oxide (or binoxide) of manganese (MnO_2) is much employed as a source of this gas. The mineral is reduced to small pieces of about the size of a pea, and introduced into an iron bottle, with a pipe through which the gas may escape. When the bottle is placed in a furnace, and attains a red heat, the mineral parts with one-third of its oxygen, and the red oxide of manganese ($\text{MnO}, \text{Mn}_2\text{O}_3$) remains behind; the reaction being explained by the equation:

(2.) A very pure and abundant supply of oxygen may be obtained by heating chlorate of potash (KClO_3), which yields up all its oxygen (amounting to 39.16 per cent), and leaves a residue of chloride of potassium. One ounce of this salt yields nearly two gallons of oxygen gas. It is found by experiment, that if the chlorate of potash is mixed with about a fourth of its weight of black oxide of copper, or of binoxide of manganese, the evolution of the gas is greatly facilitated, although the oxides do not seem to undergo any change during the process. (3.) Oxygen is readily obtained by heating strong sulphuric acid with about half its weight of powdered black oxide of manganese, or chlorate of potash, in a glass retort; the reaction in the former case being expressed by the equation:

and in the latter case, being of a more complicated character. (4.) Various processes have been proposed for obtaining the gas on a large scale, of which the following, recommended by St. Claire Deville and Debray, is perhaps the best: The vapor of hydrated sulphuric acid is passed over red-hot platinum, by which it is decomposed into oxygen and sulphurous acid, the latter of which may easily be separated (and made available for the formation of sulphites) by its solubility in water or alkaline solutions. It has been calculated that a cubic meter (35.375 cubic ft.) of oxygen costs 8s. 4d. when obtained from chlorate of potash; nearly 4s. 1d. when obtained from manganese; and only 10d. when obtained from sulphuric acid.

Of the compounds of oxygen, it is unnecessary to speak here, as they are described in the articles on the other chemical elements.

Oxygen was discovered almost simultaneously, in the year 1774, by Priestley and by Scheele, the English chemist having the precedence by a few weeks. Priestley gave it the name of *dephlogisticated air*; Scheele termed it *empyreal air*; Condorcet shortly afterward suggested *vital air*, as its most appropriate designation; and in 1789, Lavoisier, who, by a series of carefully conducted and very ingenious experiments, proved that the combustion of bodies in the air consisted essentially in their chemical combination with oxygen, and thus overthrew the *phlogiston* (q.v.) theory, gave it the name which it now retains, in consequence of his (erroneously) believing that it possessed a certain property which is described in the article OXYACIDS.

OXYGEN, in medicine. Ever since the discovery of oxygen, its use in medicine has been attempted, principally with the idea that it would be an invigorating purifier of the blood. It has been used in consumption; in diabetes for assisting in the consumption of sugar in the blood; and in hydrophobia; and although the use has been claimed to be sometimes beneficial, this cannot be said of most cases. Indeed, it has been pointed out by Drs. A. H. Smith and B. W. Richardson that, as a general rule, only a certain proportion of oxygen, such as exists in the atmosphere, can be absorbed by the lungs. Their opinions have been supported by the experiments of Bucheim, who concludes "that henceforth we must abandon the notion that the course of diseases can be modified by increasing the amount of oxygen in the blood." It is believed, however, that in some cases of chronic bronchitis, and other pulmonary affections attended with symptoms of asphyxia, the inhalation of oxygen has prolonged life. In some cases of laryngitis in which the opening of the glottis has been very much reduced, the inhalation of oxygen has been the means of saving life. Cases of poisoning by charcoal fumes have been successfully treated. It should be administered in the same manner as laughing gas.

OXYHYDROGEN BLOW-PIPE, an instrument for the purpose of burning oxygen and hydrogen gases in their equivalent proportions, so as to get the greatest heat from the combination. Two volumes of hydrogen and one of oxygen form an exceedingly powerful explosive mixture, in consequence of their instantaneous union upon the application of sufficient heat, as the electric spark or a taper, the result being the formation of water. It was, therefore, early known to be dangerous to experiment with the mixed gases. In some instances, when the gases were contained in separate reservoirs and connected by tubes at their extremities, they have become mingled in one of the reservoirs in consequence of a backward flow of the mixture, and serious accidents have resulted. This led to the early use of concentric tubes for the delivery of the gases, the hydrogen tip usually surrounding the one discharging the oxygen. By properly regulating the pressure in the gas-holders the two gases may be mingled without danger, near the end of the tubes, at the entrance of the burner. Hemming's safety jet is used for burning the gases mixed in the same reservoir; but it is not thought safe to have this of metal, but of a membrane. The ordinary burner, which mingles the two gases for some inches before their exit, is all that is sufficient to produce thorough admixture previous to ignition, and will furnish as "solid" a flame as may be desired. The chief uses of the oxyhydrogen blow-pipe are to fuse metals, and to render lime incandescent in the Drummond light.

OXYHYDROGEN MICROSCOPE. See SOLAR MICROSCOPE.

OXYRHYNCHUS, the name of a celebrated Egyptian fish, said to be revered throughout Egypt, and sacred to the goddess Athor. Its name in Egyptian is *kha*, and the fish in the hieroglyphs was used for this syllable, and particularly expressed the idea of the body. In the ritual, the deceased particularly stated that he had not caught this fish. The name appears to have comprised the genus *mormorus*, distinguished by its pointed nose and long dorsal fin. The fish was worshiped in one of the nomes, which was called after it, and the inhabitants held it in such reverence that they would not touch any fish captured by a hook. When the portions of the body of Osiris were flung into the Nile, this fish alone ate one portion of his body. The oxyrhynchus was not eaten in Egypt, except by the natives of the Cynopolites Nomos. Its modern name is *mizeleh*, which seems retained in the Coptic Penge, the name of the city of Oxyrhynchus. It is represented both in the sculptures and on the coins of the nome, and was anciently embalmed.—The city of Oxyrhynchus is the modern Behnesch, lying on the w. bank of the Nile, in lower Egypt, near the Bahr-el-Jusuf.

OXYURIS VERMICULARIS is the name now assigned by most zoologists to the intestinal worm described as *ascaris* (q.v.) *vermicularis*, yet it is the original and true *ascaris*. For the mode of recognizing the presence of this worm, and treating patients suffering from its presence, the reader is referred to the articles VERMIFUGES and WORMS.

O'YER (law French, a hearing, from Lat. *audire*, to hear). When a party to an action supports his claim or defense by a deed, he is obliged to make profert of the deed, i.e., make averment in his plea that he produces in court the deed alleged. The other party may then demand oyer of the deed, i.e., hear it read. Under the old system of oral pleadings, the deed was actually brought into court and read by the party pleading it upon demand by the other party. Under the system of written pleadings the deed is not actually brought into court, unless the other party serves a written notice that he demands oyer. The party pleading the deed must then allow his opponent to see the deed, or give him a copy. The formula for making profert was as follows: "One part of which said indenture, etc., sealed with the seal of the said plaintiff [or defendant], the said plaintiff [or defendant] now brings into court." The object of oyer is to spread the deed upon the record, and give the opposite party an opportunity of knowing its contents, and availing of them in pleadings. Under the common-law rules of pleading, the party setting forth a deed need not allege the whole of it, but only such parts as were material to his defense or claim. It was often of great importance to the opposite party to have oyer of an instrument whose terms he might be unable to learn in any other way. If a party whose duty it is to make profert cannot bring in the deed, he must excuse his failure to do so in his plea; but he must not make profert, for, if he do, oyer may be demanded and judgment given against the party failing to make oyer. Oyer could be granted only where profert was necessary; and if profert were unnecessarily made, or not made when necessary, oyer would not be granted. Oyer is not necessary except in the case of instruments under seal; though an executor or administrator, instituting a suit, must make profert of his letters testamentary or of administration. Oyer was abolished in England in 1852, and the production of instruments is obtained in most of the American states in other ways, as by an order of a judge to a party calling upon him to allow the opposite party to inspect the instrument, etc.

O'YER AND TERMINER (Fr. *ouïr*, to hear; *terminer*, to determine). A commission of oyer and terminer is granted by the crown to the judges and others to hear and determine all treasons, felonies, and trespasses; and it is by virtue of this commission that the judges on circuit dispose of criminal cases in the various circuits. Sometimes a special commission of the same kind is issued, authorizing the judges to go and try prisoners at other than the ordinary times.

OYER AND TERMINER (*ante*) is applied in England to courts trying criminal causes by special commission; but, in this country, courts with that name try criminal causes by authority of statute. In New York the court of oyer and terminer is the highest criminal court of original jurisdiction. In Pennsylvania it is also a court of criminal jurisdiction, held at the same time with and generally by the same judges as the court of quarter sessions.

*OYSTER, *Ostrea*, a genus of lamellibranchiate mollusks, of the section with a single adductor muscle. See LAMELLIBRANCHIATA. The shell consists of two unequal and somewhat irregularly shaped valves, of laminated and coarsely foliated structure; and the hinge is without tooth or ridge, the valves being held together by a ligament lodged in a little cavity in each. The animal is, in its organization, among the lowest and simplest of lamellibranchiate mollusks. It has no *foot*; and, except when very young, no power of locomotion, or organ of any kind adapted to that purpose. Its food consists of animalcules, and also of minute vegetable particles, brought to it by the water, a continual current of which is directed toward the mouth by the action of the gills. The gills are seen in four rows when the valves of the shell are separated, a little within the fringed edge of the mantle. In the most central part is the adductor muscle; toward the hinge is the liver, which is large; and between the adductor muscle and the liver is the heart, which may be recognized by the brown color of its auricle. The mouth—for, as in the other lamellibranchiate, there is no head—is situated beneath a kind of hood, formed by the union of the two edges of the mantle near the hinge. It is jawless and toothless. The ovaries are very large during the season of reproduction, which extends over certain months in summer, when oysters are out of season for the table. Oysters are hermaphrodite. They produce vast numbers of young. Leeuwenhoek calculated that from 3,000 to 4,000 exist within an oyster at once when “siek,” “milky,” or full of spawn; and, according to Poli, one oyster produces about 1,200,000 eggs. The eggs are hatched within the shell and mantle of the parent, and the young are to be seen swimming slowly in a whitish and mucous or creamy fluid surrounding the gills, which becomes darker and of a muddy appearance when they are about to be expelled. Each young oyster is then about $\frac{1}{120}$ of an inch in length, and about two millions are capable of being closely packed in the space of a cubic inch. When the parent oyster expels the young, and this is done simultaneously by multitudes on an oyster-bank, the water becomes filled as with a thick cloud, and the spawn—called *spat* by fishermen—is wafted away by currents; the greater part, of course, to be generally lost, by being driven to unsuitable situations, as exposed rocks, muddy ground, or sand to which it cannot adhere, or to be devoured by fishes and other marine animals, but some to find an object to which it can attach itself for life. The young come forth furnished with a temporary organ for swimming, ciliated, and provided with powerful muscles for extending it beyond the valves and withdrawing it at pleasure; and when the oyster has become fixed in its permanent place of abode, this organ, being no longer of any use, has been supposed to drop off, or gradually to dwindle away and disappear. But Dr. F. Buckland has recently expressed the opinion that the swimming organ of the young oyster is the “lungs,” and remains as the “lungs” in the mature oyster. In very favorable situations, oysters grow rapidly, so that the common oyster is ready for the table in a year and a half or two years; but in other places, a longer time is required, often about five years.

The species of oyster are numerous, and are found in the seas of all warm and temperate climates. None have been found in the coldest parts of the world. The COMMON OYSTER (*O. edulis*) is the only British species. Like it, the other species are generally found where the water is of no great depth; and some of them, also like it, are very abundant in estuaries, where the water is not very salt. The mangrove swamps of warm climates often abound in oysters of excellent flavor (*O. parasitica*, etc.), adhering to the roots and branches of the trees, within the reach of the tide. Some of the species differ from the common oyster not a little in form, as the LONG-HINGED OYSTER (*O. Canadensis*) of North America, which is very elongated; and some of them far exceed it in size. Sir J. E. Tennent states that he measured the shell of an edible oyster in Ceylon, and found it a little more than 11 in. in length by half as many in breadth; “thus unexpectedly attesting the correctness of one of the stories related by the historians of Alexander’s expedition, that in India they had found oysters a foot long.” Some species of oyster have the valves plaited with strong longitudinal plaits.—For the illustrations here given we are indebted to the kindness of the editor of the *Field*.

Young oysters readily attach themselves to the shells of old ones, and thus, in favorable circumstances, oyster-banks increase rapidly, so as to fill up shallow parts of the sea, and to form walls which effectually resist the waves and tide. This is very remarkably the case on the alluvial shores of Georgia and some other parts of North America, where these banks are called *Raccoon Banks*, because the racoon, among other animals, visits them to feed upon the oysters. Marshy land extends inwards from 12 to 18 m. from the sea, with tidal rivers meandering through it, and these rivers are kept pretty constant to their channels by the walls of living oysters on both sides. Large bunches of oysters may even be found among the long grass. It is not unusual for the inhabitants of the neighborhood to light a fire and roast a bunch of oysters on the spot. So abundant are the oysters in many places that a vessel of 100 tons might be loaded within three times

her own length. American oysters, which are of excellent flavor, are an important article of commerce in America, and have begun to be imported (alive) into Britain.

Notwithstanding the prodigious fecundity of the oyster, however, the beds or banks which yield it for the markets of Britain and other European countries are not sufficiently productive to satisfy the demand, and it is not so much an article of ordinary food for all classes as a luxury of the wealthy. The usual mode of taking oysters by dredging is destructive, although, for oyster-beds, which are at all states of the tide covered with a considerable depth of water, nothing better has been devised, and the anxiety of fishermen to make the most of the present opportunity has caused many beds to be almost ruined by over-dredging. But the artificial formation of oyster-beds has been resorted to with great promise of success. It is indeed no novelty, having been practiced by the Romans. Pliny says that "the first person who formed artificial oyster-beds was Sergius Orata, who established them at Baiæ. . . . This was done by him, not for the gratification of gluttony, but for the sake of gain, as he contrived to make a large income by the exercise of his ingenuity." Sergius Orata lived in the time of Augustus. Among the *vivaria* of later emperors and other wealthy Romans were *ostrearia*, specially devoted to oysters; and oyster-culture has never ceased to be practiced in Italy, although to an inconsiderable extent, and particularly in lake Fusaro, the Acheron of Virgil, a muddy salt-water pond, nowhere more than two yards deep. In Britain it has also long been practiced to some extent, particularly on the coasts of Kent and Essex, for the supply of the London market.

In 1864 an act of parliament was passed giving exclusive rights to a company, called the "Herne bay, Hampton, and Reculver oyster fishing company," over a certain portion of the shore at Herne bay, extending about 6 m. in length by $1\frac{1}{2}$ in breadth. The oyster-beds fished by the public had, till then, yielded a very small supply; and it was urged that this supply could be largely increased by a well-managed company. In order that the public should not be injured by this legislation it was declared by one of the clauses of the act that "if the company fail to maintain and cultivate the beds, or to produce well-fed oysters fit for the public market in such quantities as to be of public advantage, all the privileges conferred on the company would be withdrawn, and the dredging of the beds, as formerly, thrown open to the public to fish."

In 1869 the board of trade commissioned Mr. Pinwell, inspector of oyster fisheries, to visit the oyster-culture grounds of France, in order to ascertain whether we could gather any useful hints therefrom. In his report he explained that the English plan, as conducted at Herne bay, Reculver, Whitstable, Langston harbor, the Isle of Wight, and other localities, depends on the provision of salt-water tanks or ponds, in which the oysters are kept for a certain time. In France the system is much more elaborate. He found that the coast is parted off into divisions or districts, each of which is placed under a maritime prefect. Each district is divided and subdivided into smaller portions, managed by commissioners, inspectors, syndics, and watchmen. The determination of "close-time," when oyster-fishing is totally prohibited, the decision how much to fish up, and how much to reserve for restocking; the discrimination between public oyster-beds and those which are made over to individuals by "concessions;" the control of the fore-shore; the maintenance of oyster-breeding farms; the prevention of poaching by fishers not belonging to the respective districts—occupy quite an army of officials. Mr. Pinwell recommended the adoption of some matters of detail from the French system, but not an imitation of the elaborate official machinery.

In 1872 the enhanced price of oysters in France attracted much public attention. Close observers arrived at an opinion that it was due to three causes—the impoverishment of some of the beds by injudicious dredging; a greatly increased demand for the supply of Germany and Russia; and a private understanding between many of the French companies, leading to something very like a monopoly. The *Economiste Français* drew a comparison between various dates, in regard to the number of oysters consumed in Paris, and the price per 100. Considering price alone, we find that it was 1.20 francs per 100 in 1840, 2.83 francs in 1856, 4.58 francs in 1860, 7.20 francs in 1868, and no less than 11.20 francs in 1872. Of course, the price charged to foreign consumers augmented in somewhat the same proportions.

In 1874 the free fishers and the public of Herne bay complained that the oyster company in that locality, above adverted to, had not fulfilled the required conditions. The company, on the other hand, declared that they had spent £100,000 in ten years, and were fairly attending to their engagement. The board of trade thereupon sent down Mr. Spencer Walpole, an inspector of fisheries, to hold a court of inquiry at Herne bay. He decided on a compromise, by which a certain portion of the ground was to be retransferred to the public or free fishers; the remainder being left in the possession of the company, who would hold the exclusive right of fishing thereon as long as they continued to maintain and foster the beds.—It is gratifying to find that oyster-culture is receiving much attention in Australia. Oyster-farms were established both in New South Wales and in Victoria in 1872.

Oysters live equally well in situations where they are constantly under water, and in those which are left dry by the retiring tide. In the latter kind of situations they instinctively keep their valves closed when the water deserts them. It is in such situations that oyster-culture can be most easily and profitably carried on. Our space will

not admit of details, which we would gladly give. Various methods are adopted of preparing the artificial oyster-bed by providing suitable solid objects for the oysters to attach themselves to. Stones are piled together, and in such a way that there are many open spaces among them; stakes are driven into the mud or sand; bundles of small sticks are fastened to stones or stakes; floors of planks are formed, at a little height above the bottom, with alleys between them, the under surface of the planks being roughened by the adze; and tiles are arranged in various ways, so as to turn to account the whole space at the disposal of the oyster-cultivator as high as the ordinary tides reach. The method must be varied in accordance with the situation and the probable violence of winds and waves; but sheltered situations are best in all respects; and experience in France seems to prove that tiles covered with cement are preferable to everything that has yet been tried, as convenient for the cultivator, presenting a surface to which oysters readily attach themselves, and from which they can easily be removed, whilst the larger seaweeds do not grow on it so readily as on stones or wood. By the use of tiles covered with cement the cultivator is also able easily to remove young oysters from breeding-grounds to feeding-grounds; the best breeding-grounds being by no means those in which the oyster most rapidly attains its greatest size and that greenish tinge which Parisian epicures so much desire to see, and which is owing to the abundant confervæ and green monads of quiet muddy waters.—It has been long known that the oysters of particular localities are finer than those produced elsewhere. Nowhere, perhaps, are finer oysters produced than on some parts of the British coasts. Those of Rutupiceæ, now Richborough, in Kent, were highly esteemed by the Romans, whose epicurism in oysters exceeded that of modern nations.

Of the culinary uses of oysters it is unnecessary to say anything. Raw oysters, however, are generally believed to be more nutritious and more easily digested, as to many they are more delicious, than oysters cooked in any way; and it does not appear that any such evil consequences ever ensue from eating them as are known to ensue from eating other kinds of uncooked food. Probably no parasite capable of developing into any form injurious to the human being exists in the oyster.

The genus *ostrea* gives its name in some zoological systems to a family—*ostreadæ*. The fossil species are more numerous than the recent.

The name oyster is popularly extended to many mollusks not included among the *ostreadæ*, as the pearl-oyster (q.v.).

Oysters raised in artificial beds are called “natives,” and are considered very superior to those which are dredged from the natural beds; although to these last the name of “native” would seem more appropriate than to the other. Some years ago it was estimated that 500,000,000 oysters were consumed annually in London alone, at a cost of £100,000; but the supply has since lessened, and the price per 100 greatly increased. A large trade in oysters has sprung up in the United States; that of New York alone being estimated at \$25,000,000 annually.

Fossil Oysters.—A single species occurs in the carboniferous limestone, and as we rise in the crust of the earth the genus becomes more and more common, no less than 200 species have been recorded, many of them scarcely distinguishable from the living species. The subgenus *gryphaea* was a free shell, with a large thick left valve and small concave right valve. Thirty species have been found in beds of the oolite and chalk periods. In the same beds there occurs another form of *ostrea* with subspiral reversed umbones, to which the subgeneric name *exogyra* has been given. Forty species of this form have been described.

OYSTER BAY, a favorite watering place on the n. coast of Long Island, N. Y., on a deep sheltered bay, opening into Long Island sound, 25 m. n.e. of New York city. It abounds in handsome residences and fine scenery, and offers facilities for fishing, bathing, etc. Pop. '80, 11,923.

OYSTER-CATCHER, *Hematopus*, a genus of birds of the family *charadriadæ* (q.v.), chiefly inhabiting sea-coasts, where they feed on mollusks, crustaceans, annelids, and other marine animals—sometimes even on small fishes. Their legs are of moderate length, like those of the plovers, and, like them, they have no hind-toe. The most remarkable generic distinction is found in the bill, which is long, strong, straight, much compressed and wedge-like towards the point. They are generally said to make use of the bill for opening the shells of oysters and other mollusks; but the late Mr. James Wilson expresses a very reasonable doubt on this point. The habits of the British species (*H. ostralegus*), so far as they have been accurately observed, agree with those of the American. It is the only European species, and is common on all parts of the British coasts, on those of continental Europe, the n. of Africa, and of the n. of Asia. Its whole length is about 16 inches. Its finely contrasted black and white colors have gained it the name of SEA PIE. It is most abundant on the sea-coast, but often visits inland regions, and sometimes breeds in them. It does not make a nest, but lays its eggs—usually four—on the shingly beach or bare ground. On some of the sandy flat coasts of Lincolnshire the oyster-catcher is so abundant that a bushel of the eggs have been collected in a morning by a single fisherman. The American oyster-catcher is a bird of passage, deserting the northern regions in winter. It is rather larger than the European species, and differs from it in colors, and in greater length and slenderness of bill.

OYSTER GREEN, marine algæ of the genus *ulva*, sometimes called sea-lettuce. The *ulvas* are chlorospermous sea-weeds, having green spores and generally green fronds. The most abundant on the shores of the United States are *U. latissima* and *U. lactuca*, common on oyster beds, being also used by oystermen to cover heaps of oysters. The leaf is from 3 to 12 in. wide, and from 4 to 24 in. long. It is the most valuable of the sea-weeds for a salt-water aquarium, because of its ability to thrive in still water. The sea-lettuce is often eaten in Europe as "greens," under the impression that it is a good blood purifier and antiscorbutic, and it probably has medicinal properties.

OYSTER PLANT. See SALSIFY, *ante*.

*OYSTERS, LAW AS TO. The rule is that he who has the right of property in the soil or sea-shore is entitled to catch or keep and breed oysters there. But the shore below the medium line of the tides belongs to the crown, and not to any individual; and it is only by virtue of some grant from the crown that an individual or a corporation can establish an exclusive title to the sea-shore, and in such a case is exclusively entitled to any oyster-beds there. It is thus always by virtue of a grant from the crown that oyster-fisheries are claimed as the property of an individual or of a corporation. The act 31 and 32 Vict. c. 45, however, now enables the board of trade to grant parts of the sea-shore of Great Britain to individuals for breeding oysters and mussels, and has given new remedies for the protection of this property. The general law is as follows: Whoever steals oysters or oyster-brood from an oyster-bed which is private property is guilty of felony; and whoever unlawfully or willfully uses any dredge net or instrument within the limits of a private oyster-bed, for the purpose of taking oysters, though none are actually taken, is guilty of a misdemeanor, and is liable to be imprisoned for three months. But persons are not prevented from fishing for floating fish within the limits of an oyster-fishery, if they use nets adapted for floating fish. Certain statutes as old as the time of Richard II. were passed to protect oyster-brood, but these were recently repealed by the sea fisheries act, 1868 (Paterson's *Fishery Laws of the United Kingdom*). Under the convention between England and France, confirmed by the statute 31 and 32 Vict. c. 45, a close season is prescribed for oyster-fishing in the seas between England and France, from June 15 to Sept. 1, during which time oyster-fishing boats may be boarded by officers of the coast-guard or navy; and oysters illegally caught may be seized and destroyed, and the master is liable to a penalty. In 1877 an act was passed appointing June 15 to Aug. 4 as a close time for fishing deep-sea oysters, and from May 14 to Aug. 4 for other kinds in the British seas; it also grants power to prohibit the fishing in any locality for not more than a year. The law as to oysters in Scotland is substantially the same as in England. As to Ireland, the Irish fishery acts give power to the Irish fishery inspectors to grant a license to individuals, as is now done in England, to appropriate a certain tract of the shore for the purpose of forming oyster-beds, and thereupon the beds become private property (Paterson's *Fishery Laws*, p. 257). There is also a close season in Ireland for oysters, like what is established under the convention with France. See Supp., page 883.

OZA'KA. See OSAKA, *ante*.

OZAN: a tp. of Hempstead co., Ark. Pop. '80, 4,021.

OZANAM, ANTOINE FRÉDÉRIC, 1813-53. At 18 Ozanam was a student of law in Paris, where his religious mind drew him into close relations with the eminent men of the Catholic church, and with Montalembert and Lacordaire. In 1833, with seven other students, he aided to found the society of St. Vincent de Paul, which grew with great rapidity. In 1836 he delivered a memorable essay on Catholic philosophy in the time of Dante; in 1839-40 was professor of commercial law at Lyons; and in 1841 became professor of foreign literature at Sorbonne. On the accession of pope Pius IX., in 1846, he hailed with joy the marriage of liberalism with Catholicism. After the revolution of 1848, studied mediæval history to the ruin of his health, and has left erudite contributions to the history of the time of Dante and the influence of that poet: *Dante et la Philosophie Catholique au XIII. Siècle* and *Études Germaniques pour Servir à l'Histoire des Francs*, are notable among the long list of his works, mostly religious.

OZARK', a co. in s. Missouri, bordering on Arkansas; drained by branches of White river; 700 sq.m.; pop., '80, 5,618-5,602 of American birth, 14 colored. The surface is broken and in great part covered with forests of pine and other trees, but there is fertile soil in the valleys; the staples are Indian corn, tobacco, and wheat. Sheep breeding is carried on to some extent. Co. seat, Gainesville.

OZARK MOUNTAINS, a range of mountains running from the Missouri river, in Missouri, between the Osage and Gasconade rivers, s.w. through n.w. Arkansas and the Indian territory, to the Red river. They are a succession of hills, not over 2,000 ft. in height. The Black Hills and Washita range in Arkansas are offshoots of this range.

OZAU'KEE, a co. in s.e. Wisconsin, bordering on Lake Michigan; drained by Milwaukee river and its branches and intersected by the Milwaukee, Lake Shore and Western railroad; 290 sq.m.; pop. '80, 15,462-10,063 of American birth. The surface is undulating and there are extensive forests. The staples are oats, wheat, barley, corn, potatoes, rye, wool, and hay. The amount of butter produced annually is more than 500,000 lbs. Machinery and woolen goods are manufactured and there are 7 flour mills and 6 breweries. Co. seat, Ozaukee.

OZE'NA (from the Gr. *ozo*, I smell) signifies a discharge of foetid, purulent, or sanious matter from the nostrils. It is a symptom rather than a disease, and may arise from ulceration of the membrane lining the nostrils, or from caries of the adjacent bones, and may accompany syphilitic, scorbutic, scrofulous, or cancerous affections of these or adjacent parts. A slighter form of ozena sometime follows chronic coryza or (cold in the head), malignant scarlatina, and erysipelas of the face. The discharge is seldom accompanied by acute pain, unless when caused by cancer; sometimes, however, an aching is complained of. The prognosis must depend upon the nature of the disease, of which the discharge is a symptom. The treatment may be divided into the general or constitutional, and the local. The *general treatment* should consist of tonics combined with alteratives, as the preparations of bark with the alkalies, or with the mineral acids; a dry, bracing air, or a temporary removal to the sea-side, is also usually of service. If the discharge arises from syphilis or scurvy, the treatment suitable to those diseases should be prescribed. The *local treatment* consists in the inhalation, once or twice a day, of the steam of boiling water, to which a little creosote or carbolic acid has been added; and in more severe cases, in the thorough syringing of the nostrils, so as to wash away all collections of matter with a copious stream of warm water, to which a little chloride of zinc has been added (about 30 minims of Burnett's solution to a half a pint of water).

OZIE'RI, a t. of the island of Sardinia, in the province of Sassari, 26 m. e.s.e. from Sassari, amongst the mountains which occupy the center of the island. It stands in a deep valley, open only to the n., and is therefore peculiarly exposed to cold winds. Pop. '71, 7,965.

O'ZONE (Gr. *ozo*, I smell). It was remarked long ago that a peculiar odor was produced by the working of an electrical machine. Van-Marum found that, when electric sparks were passed through a tube containing oxygen, the gas became powerfully impregnated with this odor—which he therefore called the “smell of electricity.” Subsequent writers attributed the phenomenon to the formation of nitric acid due to a trace of nitrogen mixed with the oxygen; especially as the gas was found to act energetically upon mercury. Thus supposed to be explained, these curious results were soon forgotten. But in 1840 Schönbein (q.v.), with remarkable acuteness, made a closer investigation of the question, and arrived at many most curious results, all of which have not even yet been satisfactorily accounted for. The problem remains, in fact, one of the most perplexing, as well as interesting, questions imperfectly resolved in chemistry.

The earlier results of Schönbein were as follows: (1.) When water is decomposed by the voltaic current, the electrodes being of gold or platinum, the oxygen (which appears at the positive pole) possesses in a high degree the smell and the oxidizing power developed by Van-Marum by means of friction-electricity. (2.) When the positive electrode is formed of an oxidizable metal, these results are not observed, but the electrode is rapidly oxidized. (3.) The oxygen collected at a platinum electrode retains these properties for an indefinite period, if kept in a closed vessel; but loses them by heating, by the contact of an oxidizable substance, and even by contact with such bodies as charcoal and oxide of manganese. To the substance, whatever it may be, which possesses such powerful chemical affinities, Schönbein gave the name ozone, from its peculiar smell.

In 1845 he showed that the same substance can be produced by the action of phosphorus on moist air; and suggested that it might be a higher oxide of hydrogen.

De la Rive and Marignac shortly afterwards, repeating the experiments of Van-Marum, showed that electric sparks produce ozone even in *pure* and *dry* oxygen; and came to the conclusion that ozone is oxygen in an *allotropic* state, as diamond is a form of coke or charcoal.

Baumert, in 1853, endeavored to show that there are two kinds of ozone—one formed from pure oxygen by electric sparks, which he allowed to be allotropic oxygen; the other formed in the voltaic decomposition of water, which he endeavored to prove to be a *teroxide* of hydrogen (HO_3). But Andrews, in 1856, completely refuted this view, by showing that no such oxide of hydrogen (at least in a gaseous form) is produced in the electrolysis of water; and that ozone, from whatever source obtained, is the same body; and is not a compound, but an allotropic form of oxygen.

In 1860 Andrews and Tait published the results of a series of *volumetric* experiments on this subject, which led to some remarkable conclusions—among which are the following: When the electric discharge is passed through pure oxygen, it *contracts*. If ozone be oxygen in an allotropic form, it must therefore be denser than oxygen. It was found also that a much greater amount of contraction, and a correspondingly greater quantity of ozone, were produced by a silent discharge of electricity between fine points than by a brilliant series of sparks. The contraction due to the formation of the ozone is entirely removed by the destruction of the ozone by heat; and this process can be repeated indefinitely on the same portion of oxygen.

In attempting to determine the density of ozone, they used various bodies to take up the ozone from the oxygen containing it; and met with many very curious results. Thus, if mercury be introduced, it is immediately attacked and oxidized, and yet the oxygen *increases* in volume. If iodine be employed, it is immediately oxidized, and *no*

change of volume was observed, though the apparatus would have at once rendered visible a change to the amount of $\frac{1}{50000}$ th of the bulk of the oxygen. By measuring the contraction produced by electricity in the oxygen, then the effect of introducing a solution of iodide of potassium, and determining the amount of oxygen taken up from the quantity of iodine set free, Andrews and Tait showed that the density of ozone, if it be allotropic oxygen, must be practically *infinite*—i. e., that ozone must have the density of a *liquid* or a *solid* at least, although existing in the gaseous form. This conclusion is, they say, inevitable, unless we make the very improbable assumption, that when iodine, etc., are exposed to ozone, one portion of the ozone (of volume, as oxygen, equal to the the volume of the whole ozone) combines with the iodine, and the other portion is restored to the form of oxygen. The paper from whose statements we have quoted concludes with the suggestion that it is *possible* that, in the formation of ozone, oxygen may be decomposed. This is, of course, contrary to all the received notions of chemistry—but such a supposition would at once reconcile all the apparently contradictory facts connected with this singular body. Soret and Von Babo have recently repeated and verified a few of these results, and the former, by using turpentine as an absorbing substance, and also by measuring its diffusion rate, has endeavored to show that the density of ozone is 50 per cent greater than that of oxygen—a result on the whole consistent with the recent experiments of Brodie. Andrews has lately shown that ozone is rapidly destroyed when shaken up with dry fragments of glass, etc. He has also proved that the effect which is (almost invariably, and sometimes in fine weather powerfully) produced by the air on what are called ozone-test papers—papers steeped in iodide of potassium (and generally spoiled by the addition of starch) which are rendered brown (or blue) by the liberation of iodine—is really due to ozone. He did so by showing that it acts upon mercury as ozone does, and that it is destroyed by heat at the same temperature. *Nature* reported in 1880 that ozone had been liquefied, as the so-called permanent gases had been a year or two before; other experiments seem to prove that it is explosive.

P

P, THE sixteenth letter of the English alphabet, was in Hebrew called *Pe*, i. e., mouth, most probably from its original form. P is the thin letter of the labial series (*p, b, f, v*), and is interchangeable with the other letters of the series. P, in Sanskrit, Greek, and Latin, is replaced by *f* in the Teutonic tongues. See F. Words beginning with *p* in English, and its kindred Teutonic tongues, are almost all of foreign origin (Slavic, Celtic, Latin), as *pain* (Fr. *peine*, Lat. *pœna*), *plough* (Pol. *plug*), *pit* (Lat. *puteus*, a well). The Greek prep. *apo* (Sans. *apa*) became in Lat. *ab*; Gr. *hupo*, Lat. *sub*; Sans. *upa*, Lat. *ob*; but before sharp letters, as *t* and *s*, the original *p* was retained in pronunciation, as is shown by inscriptions (*apstulit, optinui*). There are remarkable interchanges of *p* with the sharp guttural *k* or *q*. Thus, for Lat. *quis, quod, quam*, the Oscan dialect had *pis, pod, pam*; Lat. *equus, coquo*, corresponded to Gr. *hippos* (Æol. *hikkos*), *pepo*; similarly, Gaelic *mac* (son), *ceathair* (Lat. *quatuor*, four), *coig* (Lat. *quinque*, five), correspond to Welsh *map, pedwar* (Gr. *pettores*), *pump* (Gr. *pente* or *pempe*). In Gr. *p* is sometimes replaced by *t*, as *tis, tessares*, for *pis, pettores*. In such words as *redemption, consumption*, *p* has been introduced as an intermediary between the incompatible sounds *m* and *t*. The initial *p* of Latin words has for the most part passed into French unaltered; in other positions, *p* has become *v*; thus, Fr. *évêque, cheveu, décevoir, pauvre*, from Lat. *episcopus, capillus, decipere, pauper*.

PA'CA, *Coelogenys*, a genus of rodent quadrupeds, allied to the agoutis, cavies, and capybara, and inhabiting Brazil, Guiana, and some of the West India islands. The dentition very nearly resembles that of the agoutis. The cheek-bones are prodigiously developed, in a way of which no example exists in any other mammalian animal, so that the zygomatic arches inclose a large hollow space, whilst the bone also descends to an unusual depth from the arch, even below the lower jaw-bone. Within this structure, which gives an extraordinary breadth and peculiar aspect to the face, is a sac in each cheek, opening in front, and lined with a fold of the skin of the face. The whole of this seems to be intended to preserve the true cheek-pouches from external shocks. The cheek-pouches open from the mouth in the usual way, and are capable of very great distention. The lip is cloven; the ears are small; the eyes are large and full; the neck is short; the tail is a mere tubercle; the feet have each five toes; the legs are thick; the back is rounded. The form and gait are clumsy, yet the paca (*C. paca*) is very quick and active. It lives in moist grounds, burrowing like the rabbit, but not so deeply, its burrow, however, is always provided with three openings. It feeds on vegetable substances, and often does great damage to plantations of sugar-cane. It is one of the largest rodents, being about two ft. long. It is generally of a dark brown color, with four rows of white spots along the sides, the throat and belly white. A lighter-colored species has been described, but is perhaps a mere variety. The flesh of the paca is much esteemed, and is very fat.

PACA, WILLIAM, 1740–99, b. Md.; educated in Philadelphia, and after graduating, 1759, studied law and was admitted to practice in 1764. He opened an office in Annap-

olis, became a successful lawyer, and in 1771 was a delegate to the provincial legislature. From 1774 to 1777 inclusive he represented his state in the colonial and continental congress. He was a state senator for two years, and in 1778 was made chief judge of the superior court, and two years later became judge of the admiralty court of appeals. He was elected governor of Maryland in 1782, and again in 1786, and in the latter year was also a member of congress. For the ten years preceding his death he was a judge of the U. S. district court for the state of Maryland.

PACAY, *Prosopis dulcis*, a tree of the natural order *leguminosæ*, suborder *mimoseæ*; a native of Peru, of rather large size, with a broad head; producing pods from 20 in. to 2 ft. long, which contain black seeds imbedded in a sweet flaky substance as white as snow. This flaky substance is used as an article of food and much relished by the Peruvians.

PACCHIONIAN BODIES, or **GLANDULÆ PACCHIONI**, numerous small, whitish granular looking bodies, collected together in clusters of varying size, found upon the human meninges, or cerebral membranes, principally in the following localities: 1. Upon the *outer* surface of the dura mater, in the superior longitudinal sinus, being received into little depressions, called Pacchionian depressions on the inner surface of the skull. 2. Upon the *inner* surface of the dura mater. 3. In the superior longitudinal sinus (a large venous canal, or vein, attached to the inner surface of the skull, running from before backward). 4. Upon the pia mater, near the margin of the hemispheres. The Pacchionian bodies are not glandular in structure, but are composed of a fibro-cellular matrix originally developed from the pia mater. Their growth and consequent pressure produces absorption of the dura mater through which they pass to the inner surface of the skull as well as into the superior longitudinal sinus. These bodies do not occur in infancy, and very seldom before the third year; usually after the seventh, increasing after this as age advances. Sometimes they are wanting. What purpose they may serve is not known.

PACE (Lat. *passus*), in its modern acceptation, is the distance, when the legs are extended in walking, between the heel of one foot and that of the other. Among disciplined men the pace becomes of constant length, and as such is of the utmost value in determining military movements, the relative distances of corps and men being fixed by the number of paces marched, and so on. The pace in the British army is $2\frac{1}{2}$ ft. for ordinary marching, and 3 ft. for "double quick" or running time.—With the Romans, the pace had a different signification, and it is important to bear the distinction in mind, when reading of distances in Latin works; the single extension of the legs was not with them a pace (*passus*), but a step (*gradus*); their pace (*passus*) being the interval between the mark of a heel and the next mark of the *same* heel, or a double step. This pace was equivalent to 4.84 English ft. The pace was the Roman unit in itinerary measure; the mile being 1000 paces, or 5,000 Roman ft. equal to .917 of an English mile. See **MILE**. Whether measurements were effected by actually counting the paces, or by the time occupied is not clear; but either method would, with disciplined troops give a safe result.

In the middle ages, writers confuse accounts of distances by allusion to a geometrical pace, a measure which varied with different authors.

PACHA. See **PASHA**, *ante*.

PACHACAMAC, RUINS OF, the environment of a village of the same name, the remains of an ancient city in Peru, 18 m. s.e. of Lima, not far from the modern town of Lurin. It was dedicated to Pachacamac by the Yuneas whose capital was at Gron Chimu near Trujillo in n. Peru. It contained a gorgeous temple, the walls of which were thickly studded with corals, and precious stones. Francisco Pizarro in his explorations and depredations is said to have taken immense treasure from the temple, and to have given its keys, valued at 4,000 marks, to his pilot Quintero. There was an oracle at Lima, which was then called the City of Kings, 6 m. from the mouth of river Rimac.

PACHECO, FRANCISCO, 1571–1654; b. Seville, Spain. His first lessons in painting were received from Luis Fernandez. Some stray prints of Raphael that he met he took as models. His first engagements were in decorative painting. In 1594–1600 he executed work for convents, palaces, and monuments. In 1611 he visited Toledo, Madrid, and the Escorial, where he made a thorough study of Titian and other great Italian and Spanish painters, and, returning to Seville, he opened a large academy of the arts, where he had numerous pupils. In 1618 he was appointed to the office of inquisitor of art, and with the duty of preventing the sale of pictures of nude figures. He received now more commissions than he could execute. In 1623 he accompanied his pupil and son-in-law, Velasquez, to Madrid, where, for two years, he mingled with artists and men of letters. On his return to Seville, his house was the resort of men of art and taste. His masterpiece was "The Last Judgment," an immense altar-piece finished in 1612 for the nuns of the convent of St. Isabel. Other works are "The Archangel Michael expelling Satan from Paradise," "Ignatius Loyola," and "The Baptism of Christ." In 1649 he published a treatise on *The Art of Painting*, containing much curious information and received as authority on the history of Spanish art.

PACHECO, ROMNALDO. See page 883.

PACHOMIUS, an Egyptian monk of the 4th c., is held in high estimation by the Roman Catholic church, as being the first to substitute for the free asceticism of the

solitary recluse, a regular cenobitic system. He was born toward the close of the 3d c., was brought up as a pagan, but converted to Christianity by the kindness of certain Christians whom he encountered at Thebes. About 340 A.D., at Tabenna, an island in the Nile, he founded the first monastic institution. The members agreed to follow certain rules of life and conduct drawn up by Pachomius, and to subject themselves to his control and visitation. He also established the first convent for nuns, which was under the presidency of his sister, and labored with so much diligence and zeal, that at his death, according to Palladius, not fewer than 7,000 monks and nuns were under his inspection. The various writings extant under the name of Pachomius are: *Regule Monasticæ* (of doubtful genuineness), *Monita, SS. PP. Pachomii et Theodori, Epistolæ et Verba Mystica* (a farrago of unintelligible allegory), and *Præcepta S. Pachomii*. See *Acta Sanctorum*, vol. iii.

PACHYDERMATA (Gr. thick-skins), in the system of Cuvier, an order of mammalia, including part of the *bruta* (rhinoceros, elephant), and all the *belluce* (horse, hippopotamus, tapir, hog, etc.) of Linnæus, besides one genus (*hyrax* or daman) of the Linnæan *glivres*. It has been often described as less natural than any other of Cuvier's mammalian orders, as it consists of animals among which there are wide diversities, and the associating characters are rather negative than positive; but it is now universally received by naturalists as indicating a real, though not a close affinity; and when we extend our view from existing to fossil species, numerous connecting links present themselves. As defined by Cuvier, the order consists of those hoofed mammalia (*ungulata*) which are not ruminants; all of which possess, as a more positive character, a remarkable thickness of skin. This order he divides into three sections: (1) *Proboscidea*, having a prolonged snout or proboscis, through which the nostrils pass as elongated tubes, a powerful organ of prehension, and a delicate organ of touch, and having also five toes on each foot, inclosed in a very firm horny skin; (2) *ordinaria*, destitute of proboscis, although in some (tapirs) there is such an elongation of the upper lip and nostrils as approximates to it; and the nose is employed by hogs, etc., in seeking their food, not only as an organ of smell, but as an instrument for turning up the ground, and as an organ of touch; the number of toes varies, four, three, or two on each foot; those with an even number of toes having in the cleft foot a resemblance to the *ruminantia*; and (3) *solidungula*, in which the foot has but one apparent toe, inclosed in a hoof. Some naturalists have thought it better to separate the *solidungula* or *equidæ* (q.v.) from the pachydermata, as a distinct order; whilst others have enlarged instead of restricting the limits of the order, by adding, as a fourth section, the *herbivorous cetacea*.

Those pachydermata which have a number of toes differ completely from the mammalia having claws (*unguiculata*) in their inability to bend their toes in order to seize any object. Some of the *edentata* have very large hoof-like claws, but this difference still subsists. The fore-limbs of the pachydermata are also incapable of any rotatory motion, serving for support and locomotion only, not at all for prehension; the metatarsal and metacarpal bones being consolidated as in the *ruminantia*, and they have no clavicles.

The largest terrestrial mammalia belong to this order. Most of the pachydermata are of large size, although the damans are a remarkable exception, and some of the hog family are also comparatively small. Most of them have a clumsy form, with a slow and awkward gait; but they are capable of activity beyond what might be supposed, and sometimes move at a pretty rapid pace. Gracefulness and fleetness are characteristics of the otherwise exceptional *solidungula*. The *P. ordinaria* have generally great strength, and the larger ones push their way through the entangled thickets of tropical forests, bending or breaking the lianas, small trees, and branches which oppose their progress, their thick hides resisting the spines and broken branches by which the skins of other animals would be pierced. The horse and other *solidungula* are not inhabitants of forests and jungles, but generally of grassy plains, and their hides are much less thick and hard than those of most of the pachydermata.

The physiognomy of the pachydermata in general is rather dull and unexpressive, the eyes being small, and having that character of which a familiar example is found in the common hog. When enraged, however, they manifest their fierceness in their eyes; and although, in general, mild and gentle, they are capable of being aroused to great fury.

The skeleton of the *P. ordinaria* and *proboscidea* is strong and massive; the neck short, the processes of its vertebræ strongly developed; the skull affording a large surface for the muscles which support and move it.

The pachydermata generally feed on vegetable substances. Some are omnivorous. The digestive organs are more simple than in the *ruminantia*, but exhibit considerable diversity. The stomach is simple in some, and in others is more or less completely divided into sacks, approaching to one of the most remarkable characters of the *ruminantia*. The intestines are generally longer than in the *ruminantia*. The dentition exhibits considerable diversity; the adaptation to vegetable food being the most prevalent character. The most important peculiarities of the dentition and digestive organs are noticed in the articles on particular families and genera.

PACIFIC, a co. in s.w. Washington territory, has the Columbia river for its s. boundary; the Pacific ocean on the w., and Shoalwater bay on the n.w., an estuary of the Pacific; 750 sq. m.; pop. '80, 1645—1122 of American birth, 369 colored. Cape Hancock (formerly

cape Disappointment) is in the extreme s.w. section. It is drained by the Willopah river, emptying into Shoalwater bay, and other small streams flowing into the ocean. A large proportion of the surface is covered with timber, and is hilly. The soil in the Willopah valley is fertile, and adapted to stock-raising and the cultivation of grain. Its mineral products are Columbia cement-rock and silver. Lumber and wool are the chief commodities, and fishing and the oyster trade are the principal industries. Co. seat, Oyster-ville.

PACIFIC OCEAN, the largest of the five great oceans (see OCEAN), lies between America on the e., and Asia, Malaisia, and Australasia on the west. The name "Pacific," given to it by Magellan, the first European navigator who traversed its wide expanse, is doubtless very appropriate to certain portions of this ocean; but as a whole, its special claims to the epithet are at the least doubtful, though the name has by long usage become too well established to be easily supplanted by any other.

The greatest length of the Pacific ocean from the Arctic (at Behring's strait) to the Antarctic circles is 9,200 m., and its greatest breadth, along the parallel of lat. 5° n., about 10,300 m.; while its area may be roughly estimated at 80,000,000 English sq.m., or about two-fifths of the whole surface of the earth. Its form is rhomboidal, with one corner incomplete (at the s.), and its surface is studded with numberless islands, either scattered or in groups; these, however, are chiefly confined to the western side. Along the whole eastern side there is a belt of sea of varying width, which, with a very few exceptions, is wholly free from islands. The deepest sounding yet found (in n. lat. $11^{\circ} 24'$, e. long. $143^{\circ} 16'$) in the Pacific ocean is 26,850 ft., or above 5 m.—nearly equal to the height of the highest mountain on the globe.

The coasts of the Pacific ocean present a general resemblance to those of the Atlantic, and the similarity in the outline of the western coasts of each is even striking, especially n. of the equator; but the shores of the former, unlike those of the latter, are sinuous, and, excepting the n.e. coast of Asia, little indented with inlets. The shore on the American side is bold and rocky, while that of Asia varies much in character.

Though the Pacific ocean is by far the largest of the five great oceans, being about equal to the other four in extent, the proportion of land drained into it is comparatively insignificant. Its basin includes only the narrow strip of the American continent to the w. of the Andes and Rocky mountains; Melanesia (with the exception of almost the whole of Australia), which contains few rivers, and none of them of large size; the Indo-Chinese states, China proper, with the e. part of Mongolia, and Manchuria in the Asiatic continent.

Winds.—The trade-winds of the Pacific have certain peculiarities, which have only lately been discovered. In general, they are not found to preserve their peculiar characteristics except within certain limits, thus, the s.e. trades are found to blow steadily only between 92° and 140° of w. long.; while the n.e. trades are similarly fluctuating, except between long. 115° w. and 214° w. Beyond these limits, their action is in whole or in part neutralized by the monsoons and other periodical winds peculiar to the tropical regions of the Pacific. In Polynesia, especially near the New Hebrides group, hurricanes are of frequent occurrence from November to April, but they exhibit few of the terrible characteristics which distinguish the hurricanes of the West Indies and Indian ocean. North and s. of the tropical zone the winds exhibit little periodicity, being found to blow from all parts of the compass at any given season of the year, though a general westerly direction is most frequent among them. On the coast of Patagonia and at cape Horn, w. winds prevail during the greater part of the year, while in the sea of Okhotsk they are of rare occurrence. The frightful typhoon (q.v.) is the terror of mariners in the Chinese seas, and may occur at all seasons of the year. There are many other winds and storms, such as white squalls, cyclones, "tempestades," etc., which are confined to particular localities, and will be found noticed under other heads, and also under STORMS.

Currents.—The currents of the Pacific ocean, though less marked in character and effects than those of the Atlantic, are yet of sufficient importance to require a brief notice. The *Southern Pacific current* takes its rise s. of Van Diemen's Land, and flows eastward at the rate of half a mile per hour, dividing into two branches about long. 98° w., the northern branch, or *current of Mentor*, turning northward, and gradually losing itself in the counter equatorial current; the southern branch continuing its eastward course until it is subdivided by the opposition of cape Horn into two branches, one of which, *the cold current of Peru*, or *Humboldt's current*, advances northward along the w. coast of South America, becoming finally absorbed in the equatorial current; the other washing the coast of Brazil, and becoming an Atlantic current. The Pacific ocean, like the Atlantic, also possesses its equatorial current, separated into a northern and southern current by the equatorial counter-current. It sweeps across the whole ocean from e. to west. Two subdivisions of the southern current, called respectively the "current of Rossel" and the "warm current of Australia," flow, the one through the Polynesian archipelago to New Guinea, and the other along the e. coast of Australia. The northern equatorial current, after reaching the coast of Asia, turns n.e., washing the shores of China and Japan, under the name of the *black* or *Japan current*; it then sends off a branch along the coast of Kamtchatka, and advances eastward till it becomes

lost on the n.w. coast of North America. There are other minor currents, the most remarkable of which is Fleurieu, which describes a kind of irregular circle with a radius of about 240 miles. It is situated in lat 25° to 40° n., and long. 133° to 155° west. All these currents have their corresponding counter-currents.

There are two "sargassos" or weedy seas of considerable extent in the Pacific ocean, one lying 15° e.s.e. of New Zealand; the other, and by far the larger, about 15° w. of San Francisco in California. There is also a large region lying nearly half-way between cape Horn and New Zealand, which seems to correspond to the deserts on land, as mariners report it almost wholly destitute of any signs of life either in sea or air.

History.—The existence of this ocean first became known to Europeans through Columbus, who had received accounts of it from some of the natives of America, though it was first seen by Balboa, Sept. 29, 1513, and first traversed by Magellan 8 years afterwards; but its size, limits, and the number and position of its islands, etc., were little known till long afterwards. Capt. Cook deserves the first place among the investigators of the Pacific ocean; and after him come Anson, the two Bougainvilles, La Perouse, Carteret, Vancouver, Kruzenstern, Kotzebue, etc. But the most thoroughly scientific examination of its physical condition is that accomplished by the *Challenger* expedition of 1873-76.

PACINIAN CORPUSCLES are very remarkable structures appended to the nerves. In the human subject they are found in great numbers in connection with the nerves of the hand and foot, and sparingly on other spinal nerves, and on the plexuses of the sympathetic, but never on nerves of motion. They always present a *proximal end*, attached to the nerves by a stalk of fibrous tissue prolonged from the neurilemma, and occasionally one-tenth of an inch long; and a *distal end*, lying free in the connective or areolar tissue. In the human subject the corpuscles vary in length from one-twentieth to one-tenth of an inch. They are usually seen very readily in the mesentery of the cat, appearing as pellucid oval grains, rather smaller than hemp-seed. The microscopic examination of these bodies discloses an internal structure of a very remarkable kind. They consist, first, of a series of membranous capsules, from 30 to 60 or more in number, inclosed one within the other; and secondly, of a single nervous fiber, of the tubular kind, inclosed in the stalk, and advancing to the central capsule, which it traverses from beginning to end, and where it finally terminates in a fixed swollen extremity. The 10 or 15 innermost capsules are in contact with one another, while the rest are separated by a clear space containing fluid, which is so abundant as to constitute far the largest portion of the bulk of the entire corpuscle. Such are the views of Pacini (as given in his *Nuovi Organi Scoperte nel Corpo Umano*, 1840), who is usually regarded as their discoverer, although they had been noticed and roughly described nearly a century before by Vater, of Henle, and of Todd and Bowman; but later observations made by Huxley, Leydig, Kölliker, and others, show that the question of their true nature is still an open one. Huxley asserts that their central portion is solid, and not hollow; that in birds, and in the human hand, there is no fluid between the laminae—and indeed, that the laminae themselves have no real existence—the Pacinian corpuscle being merely a solid mass of connective tissue (a thickened process of the neurilemma of the nerve to which it is attached), whose *apparent lamination* depends on the regular disposition of its elastic elements. If Pacini's views of these structures be correct, there is probably some general analogy between the electric organs of the torpedo and those corpuscles; at present we know nothing with certainty regarding their office.

PACKARD, ALPHEUS SPRING, D.D., b. Chelmsford, Mass., 1799; a graduate of Bowdoin college, Maine, class of 1816; was college tutor for 5 years afterwards, and became a Congregational minister. In 1824 he was called to fill the chair of professor of Latin and Greek languages and literature at Bowdoin college, which he now holds. In 1864 he became Collins professor of natural and revealed religion, and librarian in 1869. He married the daughter of Jesse Appleton, D.D., president of Bowdoin college 1807-19, and in 1837 published Appleton's works, in 2 vols., embracing lectures on theology, addresses, and sermons, with a memoir prefixed. His wife's sister married president Franklin Pierce. Among other works by his pen there appeared, in 1839, *Xenophon's Memorabilia of Socrates*, edited with English notes, later edition 1843; in 1853 *History of the Bunker Hill Monument Association*. He has been a contributor to the *North American Review* and other periodicals.

PACKARD, ALPHEUS SPRING, JR., b. Brunswick, Me., 1839; son of the Rev. Dr. Alpheus Spring; graduated at Bowdoin college, Maine, class of '61; studied natural history at the museum of comparative zoology connected with Harvard university, attending mainly to the department of entomology. In 1864 the Maine medical school at Brunswick conferred upon him the degree of M.D. He has made several excursions in the interest of his profession in Maine and elsewhere, lectured for several years on entomology at Bowdoin college, was curator of the Peabody academy of sciences at Salem, Mass., and one of the editors of the *American Naturalist* published by that institution. In 1868 he established the *Annual Record of Entomology*, which he has since edited. He published in 1867, *Observations on the Glacial Phenomena of Labrador and Maine, with a view of the Recent Invertebrate Fauna of Labrador*; in 1868-69, *A Guide to the Study of Insects*, of which later editions have been issued; and a treatise on those insects injuri-

ous and beneficial to crops, for the use of colleges, farm-schools, and agriculturists. In 1875 he published *Half Hours with Insects*; later publications are *Outlines of Comparative Embryology*, and *Zoology*, both illustrated. He is at present (1885) connected with Brown university, Providence, R. I.

PACKARD, FREDERICK ADOLPHUS, LL.D.; 1794–1867; b. Mass.; graduated at Harvard college, 1814; studied law at Northampton, Mass., and practiced at Springfield, Mass., 1817–29, editing also the *Federalist* newspaper; was editor of the publications of the American Sunday-school union, Philadelphia, 1829–67, also of its periodicals for a large part of that time; declined the presidency of Girard college at Philadelphia, 1849; published the *Union Bible Dictionary*, *The Teacher Taught*, *Life of Robert Owen*, etc.

PACKARD, STEPHEN B. See page 883.

PACKER, ASA. See page 833.

PACKER COLLEGIATE INSTITUTE, Brooklyn, N. Y. See page 884.

PACKER, WILLIAM FISHER; 1807–70; b. Penn.; received a common-school education, learned the printer's trade, and studied law, but was never in active practice. From 1827 to 1836 he was proprietor and editor of the *Lycoming Gazette*, became interested in politics and local improvements, and held the offices of canal commissioner and state auditor, three years each. In 1845 he was elected state senator, and at the close of his term was made president of the Susquehanna railroad company. When that corporation consolidated with the Northern Central, he became a director of the joint company, and continued so until 1858, when he was elected gov. of Pennsylvania by the republican party and served until 1861.

PACKFONG, or **PETONG'**, a Chinese alloy or white metal, consisting of arsenic and copper. It is formed by putting two parts of arsenic in a crucible with five parts of copper turnings, or finely divided copper; the arsenic and copper require to be placed in alternate layers, and the whole is covered with a layer of common salt, and pressed down. When melted, the alloy contains nearly the whole of the arsenic, and is yellowish-white in color when in the rough state, but takes a fine white polish resembling silver. It is not very ductile, and cannot be fused without decomposition, as the arsenic is easily dissipated. It was formerly much used in this country, as well as China and India, for making the pans of small scales, dial-plates, and a variety of other articles requiring nicety of make, such as graduated scales for philosophical instruments. It is probably never imported now, the nickel alloys of Europe having quite superseded its use; in China, however, it is still extensively employed.

PACK-HORSE, a horse employed in the carriage of goods, which are either fastened on its back in bundles, or, if weighty, are placed in panniers, slung one on each side across the horse's back. The saddle to which the bundles were fastened consisted of two pieces of wood, curved so as to fit the horse's back, and joined together at the ends by other two straight pieces. This frame was well padded underneath, to prevent injury to the horse's back, and was firmly fastened by a girth. To each side of the saddle a strong hook was attached, for the purpose of carrying packages, panniers, etc. Panniers were sometimes simply slung across the horse's back with a pad under the band. The panniers were wicker baskets, and of various shapes, according to the nature of their usual contents, being sometimes long and narrow, but most generally having a length of three feet or upwards, a depth of about two-thirds of the length, and a width of from one to two feet. The pack-horse with panniers was at one time in general use for carrying merchandise, and for those agricultural operations for which the horse and cart are now employed; and in the mountainous regions of Spain and Austria, and in other parts of the world, it still forms the sole medium for transport; though the mule has, especially in Europe, been substituted for the horse.

An army requires to be accompanied by several thousand pack-animals, sometimes horses, but preferably mules; and in Asia, commonly camels, or even elephants. Pack-saddles are variously fitted, according to the objects to be carried; some for provisions or ammunition; others for carrying wounded men, tents, and in mountain-warfare, even small cannon. In battle, the immediate reserves of small-arm ammunition are borne in the rear of divisions by pack-animals; the heavy reserves being in wagons between the army and its base of operations.

PACOURY-UVA, a sweet and delicious Brazilian fruit, a large berry, produced by the *Platonia insignis*, a tree of the natural order *Clusiaceæ*. The seeds have the taste of almonds.

PACTO'LUS, anciently the name of a small brook of Lydia, in Asia Minor, which rises on the northern slope of Mount Tmolus (modern *Buz Dagh*), flows north past Sardis (*Sart*), and empties itself into the Hermus (*Kodus*). It is never more than 10 ft. broad, and 1 ft. deep. The sands or mud of Pactolus were long famous in antiquity for the particles of gold dust which they contained, and which are supposed to have been carried down by its waters from the bosom of Tmolus—a hill rich in metals. The collection of these particles, according to legend, was the source of Cræsus's vast wealth. But as early even as the time of Strabo, Pactolus had ceased to yield any of the precious dust. The brook is now called *Sarabat*.

PACTUM ILLICITUM is, in the law of Scotland, a contract or agreement for some illegal purpose, i.e., a purpose either expressly prohibited by statute, or by the general policy of the law. Thus, an immoral contract between a man and woman would be held

void on the ground, that the law discountenances practices *contra bonos mores*. A contract between a client and agent, called a *pactum de quota litis*, whereby a share of the property which is the subject of litigation is given to the agent instead of his usual fees, is void in most cases; though it is often difficult to determine what contracts fall within this rule. The courts, however, have construed very jealously every contract which tends to corrupt the administration of the law, and hence an agreement between a town and country agent to divide the profits has been held a *pactum illicitum*. So agreements by a client to give an excessive sum to his law-agent as a gift have been often set aside. In England, similar doctrines prevail, though the phrase *pactum illicitum*, which was borrowed from the Roman law, is not used, contracts of this description being technically described as illegal contracts.

PACUVIUS, MARCUS, b. at Brundisium about B.C. 219, d. about B.C. 129. Repairing to Rome he soon acquired fame by his skill in poetry and painting. One of his pictures was hung in the temple of Hercules in the Forum Boarium at Rome. But his finest works were his tragedies, which showed eloquence and refinement. The fragments of Pacuvius have been printed in Stephen's *Fragmenta Veterorum Poetarum*, and in Bothe's *Poetarum Latii Scenicorum Fragmenta*.

PADANG, the capital of the Dutch government of the w. coast of Sumatra, is situated in $0^{\circ} 59' 30''$ s. lat., and $100^{\circ} 20' 30''$ e. long., and has about 12,000 inhabitants. The Padang flows through the town, but is only navigable for small vessels, the larger requiring to anchor in the roadstead, about 3 m. distant. On the left bank, stand the houses of the natives, unsightly bamboo erections, elevated about 8 ft. from the ground by posts of the cocoa-nut tree, and covered with leaves. The government buildings, houses of the Europeans and Chinese, etc., are on the right, and mostly built of wood or stone, and roofed with tile. Padang is picturesquely inclosed by a semicircle of mountains, behind which rises a loftier chain, two being volcanoes. There are a Protestant church, a Roman Catholic church, flourishing schools, a fort, military hospital, government workshops, large warehouses, etc. An agent of the Netherlands Trading company (q.v.) resides at Padang. Being the center of the exports and imports of Sumatra's w. coast, Padang has a lively trade, not only with Java, the other islands of the eastern archipelago and Europe, but also with the interior of the island.

The climate is considered healthy, although the heat is great. Colonel Nahuys found the thermometer range from 70° to 80° at 6 A.M., from 82° to 88° at noon, 84° to 90° at 2 P.M., 78° to 84° at 6 P.M., and from 72° to 80° at 10 in the evening.

The governor resides at a country-house about $2\frac{1}{2}$ m. above Padang, and rules over a territory stretching from the residency of Bencoolen (which has a population of 112,000 souls, and stands immediately under the government at Batavia), n.w. over 7° of latitude. It is divided into the residencies of lower Padang, upper Padang, and Tapanoeli (Tapanuli); the population in 1870 being 1,600,730 natives, 2,178 Europeans, and nearly 3,000 Chinese.

Lower Padang was the first district of the w. coast of Sumatra which submitted to the Dutch, who had formed a settlement at Padang as early as 1660, and by repeated wars gradually extended their territory.

Upper Padang lies to the n.w. of the lower province, from which it is separated by a chain of lofty mountains, some of which, as the Singalang, Merapie, and Sago, attain to nearly 10,000 ft. in height; Merapie being an active volcano, the last eruptions of which were in 1845 and 1855, though it sent forth volumes of smoke in 1861. This residency possesses the most lovely districts of the island, or of any tropic land, the mountain slopes being studded with villages, rice-fields, cocoa-nut and coffee-trees, of which last it is calculated that there are 32,000,000 in upper Padang. In addition to the coffee-culture, gambier, cassia, pepper, rattans, indigo, caoutchouc, etc., are largely produced, and gold, iron, copper, lead, and quicksilver are found. In the district of Tanah Datar is the town of Paggeroejong, formerly the capital of the powerful kingdom of Menangkabo, and the residence of the king.

Tapanoeli, the remaining residency under the government of Sumatra's w. coast, lies n.w. from upper Padang. The independent spirit of the inland natives has caused the Netherlanders much trouble, but each fresh outbreak only extends their territory and power further into the interior, and towards the n.w. of the island.

PADDLE, probably the precursor of the oar (q.v.), and still its substitute among barbarous nations, is a wooden implement, consisting of a wide flat blade with a short handle, by means of which the operator spoons the water towards him. In canoes for only one sitter, a double paddle is generally used, which is dipped alternately on either side: the inhabitants of Greenland are especially skillful in this operation. The action of the paddle is the same as that of the oar. The paddle has, however, one advantage—viz., that the rower faces the bow of his boat, and therefore sees what is before him. In threading narrow streams, etc., this is an appreciable gain.

PADDLE-FISH, *Polyodon folium*, a fish inhabiting the Mississippi river and its tributaries. It is about 5 ft. long, without scales, and has a long, bony snout of about the length of the body, with which it plows or digs up the mud of the bottom in search of food. It has a dark bluish back and a whitish belly.

PADDLE-WHEEL—one of the appliances in steam-vessels by which the power of the engine is made to act upon the water and produce locomotion—is a skeleton wheel of iron, on the outer portion of whose radii flat boards, called floats or paddles, are fixed, which beat upon the water, and produce, continuously, the same effect as is given, in an intermittent manner, by the blades of oars. The use of paddle-wheels in conjunction with steam as a motive-power dates from about the commencement of the present century, but the employment of the paddle-wheel itself is as ancient as the time of the Egyptians. A specimen is also known to have been tried in Spain in the 16th century.

The Fig. shows the usual form of paddle-wheel, that called the radial, in which the floats are fixed. It will be seen that a certain loss of power is involved, as the full force of the engine on the water is only experienced when the float is vertical, and as on entering and leaving the water the power is mainly employed in depressing or lifting the particles of water. This objection has great force at the moment of

starting, or when progress is very slow, as is illustrated by the small power a paddle-steamer evinces when trying to tug a stranded vessel off a sandbank; but when in full progress, the action is less impeded by this circumstance, the water in front of the wheel being depressed, and that abaft being thrown into the form of a wave. The extent of the immersion much influences the economy of power, as will be readily understood if the consequences of immersion up to the center of the wheel be imagined. An immersion somewhat over the top of the lowest float is about the most advantageous, and in order that the floats may be as nearly as possible vertical when they strike the water, it is advisable to give the wheel as large a diameter as possible, and to place the axis at the highest available point in the vessel.

To overcome the drawbacks to the radial wheel, Elijah Galloway patented, in 1829, the *feathering paddle-wheel*, in which the floats are mounted on axes, and are connected by rods with a common center, which revolves upon a pin placed eccentrically to the axis of the paddle-wheel. By this method the floats are kept, while immersed, at right angles to the surface of the water. So long as the water is smooth the gain is great, consequently feathered floats are much used in river-steamers; but for ocean-steamers the liability to derangement, perhaps at a critical period, is a great objection to their use.

The paddle-wheel, in revolving, imparts both a forward velocity to the vessel and a backward velocity to the water. The latter is called the *slip*, and sometimes bears a very large and wasteful proportion to the former. The absolute velocity of the paddle floats is equal to the sum of the slip and the forward motion of the ship, so that the wheel always revolves faster than the ship makes way.

PADDOCK, ALGERNON S. See page 884.

PADDOCK, BENJAMIN HENRY, D.D., b. Conn.; graduated at Trinity college in 1848, and at the Episcopal general theological seminary, New York, in 1852; was assistant at Epiphany church, New York, 1852-53; rector of Trinity church, Norwich, Conn., 1853-60; of Christ church, Detroit, Mich., in 1860-69, and of Grace church, Brooklyn, 1869-73. He was consecrated bishop of Massachusetts, Sept. 17, 1873.

PADDOCK, JOHN ADAMS, D.D. See page 884.

PADDY, or **PADDIE**, the name commonly applied in India to rice in the husk. It is the Tamul and the Malay name. See **RICE**.

PADEL'LA (Ital. a frying-pan; plur. *padelle*), a shallow vessel of metal or earthenware used in illuminations. The illumination of St. Peter's at Rome, and other large buildings in Italy, is effected by the tasteful arrangement of large numbers of these little pans, which are converted into lamps by partly filling them with tallow or other grease, and placing a wick in the center. This mode of illumination was first adopted on a large scale in Great Britain on the occasion of the marriage of the prince of Wales with the princess Alexandra, when the inhabitants of Edinburgh produced by this means a most magnificent illumination of their city.

PADERBORN, the chief t. of a district in the Prussian province of Westphalia, situated in 51° 43' n. lat., and 8° 45' e. long., in a pleasant and fruitful district, is built at the source of the Pader, which bursts forth from below the cathedral with sufficient force to drive mills within 20 paces of its point of exit. Pop. '80, 14,689. Paderborn has narrow, dark, old-fashioned streets, presenting no special attractions, although it has some interesting buildings, as, for instance, the fine old cathedral, completed in 1143, with its two magnificent façades, and containing the silver coffin in which are deposited the remains of St. Liborius. It is the seat of a bishop and chapter, and of an administrative court. The manufactures of Paderborn, which are not very considerable, include tobacco, starch, hats, and wax-cloths, and there are several breweries, distilleries and sugar-refineries in the town, which carries on a considerable trade in cattle, corn, and oils. Paderborn is

one of the important stations on the Great Westphalia railway. Paderborn, which ranked till 1803 as a free imperial bishopric, owes its foundation to Charlemagne, who nominated the first bishop in 795. Several diets were held during the middle ages at Paderborn, which at that period ranked as one of the most flourishing of the Hanseatic cities, while it was also numbered among the free imperial cities. In 1604 it was forcibly deprived by the prince-bishop, Theodore of Fürstenburg, of many of the special rights and prerogatives which it had enjoyed since its foundation, and compelled to acknowledge the Roman Catholic as the predominant church, in the place of Protestantism, which had been established during the time of Luther. In 1803 Paderborn was attached as an hereditary principality to Prussia, and, after being for a time incorporated in the kingdom of Westphalia, was restored to Prussia in 1813, and incorporated in the Westphalian circle of Minden.

PADIHAM, a large chapelry and township, in the higher division of the hundred of Blackburn, seated on an eminence springing from the n. bank of the Calder, and reached by the Rose Grove station of the Lancashire and Yorkshire railway, and also by the Leeds and Liverpool canal. It is about 9 m. n. e. of Blackburn. The cotton trade employs a great proportion of the population—(1881) 8,983—but coal mines and extensive quarries also add to industrial activity and the prosperity of Padiham; which has been greatly improved in appearance recently by several new streets.

PADILLA, JUAN DE, one of the most popular heroes in Spanish history, was a scion of a Toledan family, and was appointed by the emperor Charles V. military commandant of Saragossa. While he was so employed a formidable rebellion, caused by the excessive taxes which the emperor imposed on the Spaniards, to defray the cost of his various wars in Italy, Germany, and the Low Countries, broke out among the towns (*comunidades*) of Castile, and the rebels, who were known as *comuneros*, called upon Padilla to put himself at their head. The introduction of the religious element into the quarrel tended greatly to strengthen the insurgents, and for an instant Padilla was the ruler of Spain, and formed a new junta to carry on the government. He was successful in a number of enterprises undertaken against the royalist party; but on April 23, 1521, was completely beaten by the royalists at Villallos. This conflict decided the fate of the rebellion, and of Padilla himself, who was taken prisoner, and next day beheaded.

His wife, DONA MARIA DE PACHECO, rallied the wrecks of the rebel army, and for a long time held Toledo against the royalist besieging army, and after its fall, retired to Portugal, where she died soon afterwards. With Padilla and his wife expired the last remnant of the ancient freedom of Spain. Numerous poems and dramas celebrated their deeds.

PADISH'AH, in Turkish PADISHAG (Persian *padi*, protector or throne, *shah*, prince), one of the titles of the sultan of the Ottoman empire, and of the shah of Persia. Formerly this title was accorded only to the kings of France among European monarchs, the others being called *kral*, king. It was subsequently allowed to the emperor of Austria, and still later, by a special article in the treaty of Kutshuk-Kainardji (Jan. 10, 1775), to the autocrat of all the Russias. Of late it has been accorded to the monarchs of all the great European nations, and even to those of secondary states.

PADRON', a very ancient t. of Spain, in the province of Coruña, 15 m. s.w. of Santiago, on the Sar, a few miles from the coast. Padron being the place at which the body of Santiago is said to have landed itself, was formerly an important place of pilgrimage. Pop. 8,424.

PADUA, a province of Italy, in Venetia, called by the Italians Padora, having on the n. Treviso, on the e. Venice, on the s. Rovigo and the river Adige, on the w. Vicenza and Verona, on the s.e. the Adriatic sea or gulf of Venice; 805 sq.m.; pop. '72, 864,430. It is about 40 m. in length from n. to s., its greatest breadth 30 m., its narrowest portion 15 miles. Its surface is generally level, rising in the s.w. into the volcanic district of the Euganean hills, which extend from the vicinity of Padua to Este, and are separated from the Alps by the Paduan plain. Near these hills are mineral springs of great value. It is drained by the rivers Brenta, Gorgone, Bacchiglione, and other small streams flowing down the incline of the plain toward the lagoons of Venice. Its soil is very fertile, producing wheat, corn, pulse, olive oil, wine, flax, hemp, chestnuts, honey, wool, and silk of superior quality, potatoes and the nutritious grass that furnishes excellent pasturage. Cattle, sheep, and poultry are raised, and grapes are cultivated. Very little care is taken of the vines which with the attention paid to their culture in some countries, would yield a crop equal to any. The temperature is equable, there is sufficiency of moisture through the nights, plenty of direct rays of the sun during the month of August, everything favorable to the ripening of grapes that make sweet and highly flavored wine. It is considered the most fertile and the most densely populated of the Venetian provinces. It is intersected by several railroads, and by irrigating and navigable canals, and is divided into the districts of Padua, Camposanpiero, Piore, Citadella, Monselice, Este, Montagna, and Conselve. The leading industries are the manufacture of leather, silk, woolen goods, and hats. The principal towns are Este, pop. 8,000, which gave its name to an illustrious family; Montagnana, pop. 8,000, containing tanneries and hat factories; Abano, pop. 3,000, noted for its medicinal springs; Battaglia, also visited for its mineral waters, near which city is the village of Arquà, where Petrarch died. Capital, Padua.

PADUA (Ital. *Padova*), capital of the province of the same name in n. Italy, stands on a beautiful plain on the Bacchiglione, 23 m. by railway w.s.w. of Venice. It is surrounded by walls and ditches, and is fortified by bastions. Its houses are lofty, supported for the most part on long rows of arches, generally pointed, and most of its streets, especially in the older quarters, are narrow, dark, dirty, and ill-paved. There are, however, several handsome gates, as those of San Giovanni, Savonarolo, and Falconetto; a number of fine squares, of which the Prato della Valle is the largest and the finest, and is surrounded by a stream, and planted with trees; and several magnificent buildings. Of these the café Pedrocchi is esteemed the finest edifice of the kind in Italy. Portions of a Roman edifice were discovered while the foundations of this building were being made, and the marbles found now adorn the pavement, etc., of the *salone*. The Palazzo della Municipalità, built 1172–1219, is the most peculiar and the most national in the city. It is an immense building, forming one side of the market-place, rests wholly on arches, and is surrounded by a loggia (q.v.). Its e. end is covered with shields and armorial bearings, and its roof is said to be the largest unsupported by pillars in the world. Its hall is 267½ ft. long, and 89 ft. wide, is covered with mystical and metaphorical paintings, and contains a monument of Livy, the Roman historian, and a bust of Belzoni, the traveler, both natives of this city. The other chief edifices are the cathedral, the church of Sant' Antonio, a beautiful building in the pointed style, with several Byzantine features, and remarkably rich and splendid in its internal decorations; and the churches of San Giorgio and Santa Giustina; all of them richly decorated with paintings, sculptures, etc. The university of Padua, the most famous establishment in the city, was celebrated as early as the year 1221. It embraces 61 professors and other teachers, and is attended by about 1000 students. Connected with the university are an anatomical theater and a botanic garden, both dating from the 16th c., and each the first of its kind in Europe. There is also a museum of natural history, an observatory, a chemical laboratory, and a library of 120,000 volumes and 1500 manuscripts. There are also numerous palaces, theaters, and hospitals. Pop. '81, 72,174.

Padua, the Roman *Patavium*, is one of the most ancient towns of Italy. According to a wide-spread belief of antiquity, alluded to by Virgil, it was founded by the Trojan chief Antenor, but we really know nothing of its history until it became a Roman town. During the first centuries of the empire, it was the most flourishing city in the north of Italy, on account of its great woolen manufactures, and could return to the census more persons wealthy enough to be ranked as *equites* than any other place except Rome. But in 452 Attila utterly razed it to the ground. It was, however, rebuilt by Narses, again destroyed by the Lombards, but once again rose from its ashes, and became a very famous city in the middle ages. It fell into the hands of the Carrara family in 1318, and in 1405 it was conquered by Venice, the fortunes of which it has since shared.

PADUCAH, a city of Kentucky, on the s. bank of the Ohio river, just below the mouth of the Tennessee river, 322 m. below Louisville. It is the entrepôt of a fertile country, and has a large trade by the rivers, the Louisville, Paducah and South-western, and the Paducah and Memphis railways. It contains county buildings, 4 banks, 3 ship-yards, steam saw-mills, extensive manufacturing establishments, and 15 churches. Pop. '80, 8,036.

PADULA, a t. of s. Italy, in the province of Salerno, 52 m. s.e. of the town of Salerno, in a mountainous district. Below Padula are the ruins of the once famous and magnificent monastery, *La Certosa di S. Lorenzo*, despoiled by the French during their occupation of Calabria. Pop. '71, 8,556.

PADUS. See Po, *ante*.

PÆAN (of doubtful etymology), the name given by the ancient Greeks to a kind of lyric poetry originally connected with the worship of Apollo. The oldest pæans, as we learn from Homer, appear to have been either hymns, addressed to that deity for the purpose of appeasing his wrath (*Iliad*, i. 473), or thanksgiving odes, sung after danger was over and glory won (*Iliad*, xxiii. 391). Nevertheless, at a later period, they were addressed to other deities also. Thus, according to Xenophon, the Lacedæmonians sung a pæan to Poseidon after an earthquake, and the Greek army in Asia one to Zeus.

PÆDO-BAPTISM. See BAPTISM, INFANT.

PAËR', FERDINANDO, 1771–1839; b. Italy; chapel-master at Dresden, imperial composer to Napoleon, and director of the Italian opera at Paris 1818–25. Besides a number of operas, such as *Griselda*, *Leonora*, *Camilla*, *Dido*, etc., he composed overtures and cantatas of merit.

PAEZ', JOSE' ANTONIO, 1790–1873; b. Venezuela; raised a force of revolutionists in 1810, and defeated the Spanish troops under Lopez in 1815. He inflicted another defeat upon the royalists in 1816, and was appointed brig.gen. in command of the revolutionary army. He again defeated Lopez, and secured control of the province of Apure. In 1817 he recognized the authority of Bolivar, and two years later he became gen. of division, and worsted gen. Morillo in several engagements. The victory which he won at Carabobo in 1821 effected the independence of Colombia. Upon the erection of the new state, he became one of the representatives of Venezuela in the senate. An attempt was made in the house of representatives in 1826 to impeach him, whereupon he organ

ized a revolt, which continued till Bolivar recognized him as the commander in Venezuela. In 1830, and again in 1839, he was elected president of Venezuela. Monagas, who succeeded him in 1846, attempted to make himself dictator and was opposed by Pæz, who was defeated and captured. Released, but banished, he spent the years 1850-58 in New York. On the overthrow of Monagas in 1858 he returned to Venezuela. He was Venezuelan minister at Washington 1860-61, when he resigned, and, returning to Venezuela, was appointed dictator. Failing to restore order he returned to New York in 1864. He subsequently lived in Peru and the Argentine Republic.

PÆSTUM, anciently a Greek city of Lucania, in s. Italy, in the present province of Salerno, on the *Sinus Pæstanus*, now the gulf of Salerno, and not far from mount Alburnus. It was founded by the Trœzenians and the Sybarites, some time between 650 and 610 B.C., and was originally called Poseidonia (of which *Pæstum* is believed to be a Latin corruption), in honor of Poseidon (Neptune). It was subdued by the Samnites of Lucania, and slowly declined in prosperity after it fell into the hands of the Romans, who established a colony here about 273 B.C. The Latin poets celebrate the beauty and fragrance of its flowers, and particularly of its roses, which bloomed twice a year. Wild roses, it is said, still grow among its ruins, which retain their ancient property, and flower regularly both in May and November. Pæstum was burned by the Saracens in the 10th c., and there is now only a small village called Pesto, in a marshy, unhealthy, and desolate district; but the ancient greatness of the city is indicated by the ruins of temples and other buildings. These appear to have been first noticed in the early part of the 18th c., by a certain count Gazola, in the service of the king of Naples; they were next described by Antonini, in a work on the topography of Lucania (1745), and have since been visited by travelers from all parts of Europe.

PAEZ, PEDRO. See page 884.

PAGA'NI, an uninteresting t. of s. Italy, province of Salerno. In the church of St. Michele, is the tomb of Alfonso de' Liguori, founder of the order of the redemptionists, who died here, 1787. The body is preserved in a glass case. Pop. about 12,000.

PAGANINI, NICOLO, a famous violinist, son of a commission-broker at Genoa, where he was born in 1784. His musical talent showed itself in his childhood; in his ninth year he had instructions from Costa at Genoa, and afterward from Rolla at Parma, and from Ghiretti. In 1801 he began his professional tours in Italy; in 1828 he created a great sensation on appearing for the first time in the principal towns of Germany; and in 1831 his violin-playing created an equal *furor* in Paris and London. His mastery over the violin has never been equaled, but he was too much addicted to using it in mere feats of musical legerdemain, such as his celebrated performance on a single string. His execution on the guitar was also very remarkable; for four years he made that instrument his constant study. Paganini died at Nice in 1840, leaving a large fortune.

PA'GANISM, another name for heathenism or polytheism. The word is derived from the Latin *paganus*, a designation of the inhabitants of the country (*pagus*), in contradistinction to the inhabitants of towns, the more educated and civilized inhabitants of towns having been the first generally to embrace Christianity, whilst the old polytheism lingered more in remote rural districts.

PAGE (derivation variously assigned to Gr. *pais*, a boy, and Lat. *pagus*, a village), a youth employed in the service of a royal or noble personage. The practice of employing youths of noble birth in personal attendance on the sovereign, existed in early times among the Persians, and was revived in the middle ages under feudal and chivalric usages. The young nobleman passed in courts and castles through the degree of page, preparatory to being admitted to the further degrees of esquire and knight. The practice of educating the higher nobility as pages at court, began to decline after the 15th c., till pages became what they are now, mere relics of feudal usages. Four pages of honor, who are personal attendants of the sovereign, form part of the state of the British court. They receive a salary of £200 a year each, and on attaining a suitable age, receive from her majesty a commission in the foot guards.

PAGE, a co. in s.w. Iowa, having the state line of Missouri for its s. boundary; 600 sq.m.; pop '80, 19,667—17,673 of American birth, 246 colored. It is intersected in the n.w. by the Brownsville and Nodaway division of the Burlington and Missouri River railroad, terminating at its co. seat. It is drained by the Nodaway, Takio, and e. Nishnabotona rivers, affluents of the Missouri. Its surface is mostly hilly, equally divided into prairie and woodland. The soil of the valleys which follow the water courses is fertile, and is adapted to the production of grain and the raising of stock. Co. seat, Clarinda.

PAGE, a co. in n. Virginia, having a range of the Blue Ridge for its e. boundary, the Massanuttar mts. on the west; 280 sq.m.; pop., '80, 9,965—9,934 of American birth, 1115 colored. It is drained by the south fork of the Shenandoah river intersecting it centrally. Its surface consists of a valley at the base of the Blue Ridge. Timber grows on the uplands, which also furnish excellent pasturage. Its soil is calcareous and very productive, adapted to the production of grain and tobacco, and the raising of live stock. Its mineral products are copper, iron, and marble. It has blomaries and blast furnaces for the manufacture of iron; other industries are the manufacture of woolen goods, and distilled liquors. At Luray an immense cave has been discovered. Co. seat, Luray.

PAGE, JOHN, 1743-1808; b. Rosewell, Va., a graduate of William and Mary college, Williamsburg, Va., class of 1763; represented the college in the house of burgesses, and became a member of the colonial council. During the revolutionary war he was an ardent supporter of the cause of the colonists, contributing of his private means for its support, and was a leader of his party in his native state, of which he was elected lieutenant-governor, and held other offices in the gift of the people. He was a member of the convention which framed the constitution of Virginia, at one time was colonel of a militia regiment, was appointed one of the first councilors, and member of the committee of public safety. He was contemporary with Thomas Jefferson, with whom he sustained very friendly relations. He was member of congress 1789-97, and presidential elector in 1800. In 1802 he was elected governor of Virginia and filled the office three years. In 1796-99 he published *Addresses to the People*. He had a son, Octavius Augustus, first lieutenant of the frigate *Chesapeake*, who died in 1813.

PAGE, WILLIAM, b. Albany, N. Y., 1811; at the age of eight years went to New York with his parents, studied drawing, and three years afterward received a premium from the American institute for a drawing in India ink. In 1825 he commenced the study of law in the office of Fredrick De Peyster, but left it to learn the art of portrait painting of Herring, with whom he remained a year, and afterward entered the studio of Samuel F. B. Morse, artist, sculptor, inventor of the telegraph, and author of a portrait of Lafayette in the New York city hall, who, in connection with other artists, organized a drawing-school which resulted in the establishment, in 1826, of the national academy of design. By the influence of Mr. Morse he was admitted as a student at the academy, and for his drawings from the antique was awarded a large silver medal. In 1828 he joined the Presbyterian church, and removing to Andover, Mass., began the study of theology, and went from there to Amherst, in that state, intending to fit himself for the ministry, but returned to his artist life in 1830. He passed a year in Albany painting portraits, and was considered a painter of great promise, excelling in brilliancy of color and accuracy of drawing. Returning to New York he was admitted as a member of the national academy. Among his most valued works are a portrait of gov. Marcy in the New York city hall, that of John Quincy Adams in Faneuil hall, Boston: "The Holy Family" in the Boston athenæum, "The Wife's Last Visit to her Condemned Husband," and "The Infancy of Henri IV." In 1844 he established himself in Boston and industriously followed his profession. In 1847-49 he resided in New York, and in the latter year went abroad, living 11 years in Italy studying in Rome and Florence. He is said to have made such literal copies of Titian that they were mistaken for the originals even by the residents of Florence. While in Italy he painted the portraits of several distinguished Englishmen and American tourists and residents abroad, and among his productions of that period are his two Venuses, "Moses and Aaron on Mount Horeb," "The Flight into Egypt," and "The Infant Bacchus." In 1860 he returned to the United States and took up his residence in Eagleswood, near Perth Amboy, N. J., after a time building a house on Staten Island, and painting in his studio in New York. He has delivered several courses of lectures on art, and in 1870 painted a portrait of Christ, which was placed on exhibition, and was the subject of considerable critical controversy. He was president of the academy of design in 1871-73. From photographs of the Kesselstadt mask of Shakespeare, preserved in Germany, he has produced a bust of the poet, making the journey to that country for the purpose, and has painted portraits from it. Among recent portraits are those of Henry Ward Beecher, Charles A. Dana, Parke Godwin, Wendell Phillips, and, about 1876, a full length representation of "Farragut at the Battle of Mobile," which was presented to the late emperor of Russia by a committee who purchased it. He published in 1860, *A New Geometrical Method of Measuring the Human Figure*, based upon the models of the antique, and is distinguished as a colorist, for which department of the art of painting he has advanced original theories, and as an accurate draughtsman.

PAGET, FAMILY OF. This noble family, though said to be of Norman extraction, do not trace their descent further back than the reign of Henry VII., in whose time one William Paget held the office of one of the sergeants-at-mace of the city of London. His son William, who was educated at St. Paul's school, and at Cambridge, was introduced into public life by Stephen Gardiner, bishop of Winchester, early in the reign of Henry VIII., who sent him abroad to obtain the opinions of foreign doctors as to his contemplated divorce from Catharine of Aragon. From this time forth his rise was rapid, and he was constantly employed in diplomatic missions until the death of the king, who appointed him one of his executors. He now adhered to the party of the protector Somerset, and was raised to the peerage in 1552, as lord Paget of Beaudesert. He shared in the power, and also in the fall, of the protector, and was heavily fined by the star chamber, who also deprived him of the insignia of the order of the garter. His disgrace, however, was not of long continuance, and a change taking place in the councils of his opponents, he soon obtained his pardon. On the accession of queen Mary, he was sworn a member of the privy council, and obtained several large grants of lands. He retired from public life on the accession of Elizabeth, who regarded him with much favor, though he was a strict Roman Catholic. The representative of the family adhered to the cause of Mary queen of Scots, and suffered, in consequence, the confiscation of his property. The fifth lord Paget so far departed from the traditionary policy of the family as

to accept from the parliament the lord-lieutenancy of Buckinghamshire; but he returned to his allegiance shortly afterward, and held the command of a regiment under the royal standard at the battle of Edgehill. His grandson was advanced to the earldom of Uxbridge, but this title becoming extinct, the representation of the family devolved on a female, who carried the barony of Paget by marriage into the house of Bayly. The son of this marriage, however, having assumed the name of Paget, obtained a renewal of the earldom of Uxbridge, and the second earl, for his gallantry at Waterloo, was advanced to the marquise of Anglesey. Of late years, the Paget family have usually held three or four seats in every parliament, and they have constantly supported the liberal party.

PAGET, Sir JAMES, D.C.L., b. England, 1814; became a member of the royal college of surgeons in 1836, and an honorary fellow in 1843. He is a member of the senate of the university of London, and of the council of the college of surgeons. He was made a baronet in 1871, and elected president of the college of surgeons in 1875. He is consulting surgeon to St. Bartholomew's hospital, and surgeon to the prince of Wales and the queen. He has published *Pathological Catalogue of the Museum of the College of Surgeons*, *Report on the Results of the Use of the Microscope*, and *Lectures on Surgical Pathology*.

PAGET, VIOLET. See page 884.

PAGING-MACHINE. Several machines have been made for paging books and numbering bank-notes, checks, railway tickets, and other similar papers. The great object of these machines is to prevent the chance of error or fraud by making it impossible that a page, check, etc., can be abstracted or lost without detection. Messrs. Waterlow & Sons of London, perfected an ingenious machine, by which pages of books, such as ledgers and other commercial books, and bank-notes, etc., are numbered in regular succession. The numbers are engraved on metal rowels, usually of steel or brass. A series of these rowels are so arranged, that when the machine is worked, the numbers must be impressed on the paper in regular succession from 1 to 99,999; and it is impossible to produce a duplicate number until the whole series has been printed. The instrument is made to supply ink to the types, so that it may be locked in such a manner as to admit of being worked without the chance of its being tampered with.

An extremely ingenious modification of this machine has been perfected by M. Auguste Trouillet, of Paris, under the name of *Numérateur Mécanique*, which is not only more simple, but admits of wider application; for it not only pages books and numbers notes, tickets, etc., but can also be used for numbering bales and other packages of merchandise. The instrument has six rowels, on each of which is a set of engraved numbers, so arranged, that their revolutions produce in regular succession the required numbers, by the action of a lever which moves horizontally, and supplies the type with ink as it moves backward and forward.

PAGO, an island belonging to the Austrian crownland of Dalmatia, separated from Croatia by the Morlacca canal, a channel from two to three miles in width. It is long and narrow, runs parallel to the Croatian coast, and has an area of 108 sq.m. Pop. 5,150, who are most industrious, and support themselves by vine-culture, the manufacture of salt and fishing.

PAGO'DA (according to some, a corruption of the Sanskrit word *bhāgarata*, from *bhagarat*, sacred; but according to others a corruption of *put-gada*, from the Persian *put*, idol, and *gada*, house) is the name of certain Hindu temples which are amongst the most remarkable monuments of Hindu architecture. Though the word itself designates but the temple where the deity—especially S'iva and his consort Durgâ, or Pârvatî—was worshiped, a pagoda is in reality an aggregate of various monuments, which, in their totality, constitute the holy place sacred to the god. Sanctuaries, porches, colonnades, gateways, walls, tanks, etc., are generally combined for this purpose, according to a plan which is more or less uniform. Several series of walls form an inclosure; between them are alleys, habitations for the priests, etc., and the interior is occupied by the temple itself, with buildings for the pilgrims, tanks, porticoes, and open colonnades. The walls have, at their openings, *gopuras*, or large pyramidal gateways, higher than themselves, and so constructed that the gopura of the outer wall is always higher than that of the succeeding inner wall, the pagoda itself being smaller than the smallest gopura. The extent of the inclosing walls is generally considerable; in most instances they consist of hewn stones of colossal dimensions, placed upon one another without mortar or cement, but with such admirable accuracy that their joints are scarcely visible. The gateways are pyramidal buildings of the most elaborate workmanship; they consist of several, sometimes as many as fifteen stories. The pagodas themselves, too, are of a pyramidal shape, various layers of stones having been piled upon one another in successive recession; in some pagodas, however, the pyramidal form begins only with the higher stories, the broad basis extending to about a third of the height of the whole building. The sides of the different terraces are vertical, but the transition from one to the other is effected by a vault surmounted by a series of small cupolas, which hide the vault itself. A single cupola, hewn out of the stone, and surmounted by a globe, generally crowns the whole structure; but sometimes the latter also ends in fantastical spires of a fanlike shape or concave roofs. The pagodas are covered all over with the richest ornamentation. The pilasters and columns, which take a prominent rank in the ornamental portion of these temples, show the greatest variety of forms; some pagodas are

also overlaid with strips of copper, having the appearance of gold. The most celebrated pagodas on the main-land of India are those of Mathura, Trichinopoli, Chalambrou, Konjeveram, Juggernaut, and Deogur, near Ellora.—That of Mathura consists of four stories, and is about 63 ft. high; its base comprises about 40 sq. feet. Its first story is made of hewn stones, copper, and covered with gilt; the others of brick. A great number of figures, especially representing deities, tigers, and elephants, cover the building.—The pagoda of Tanjore is the most beautiful monument of this kind in the s. of India; its height is 200 ft., and the width of its basis is equal to two-thirds of its height.—The pagoda of Trichinopoli is erected on a hill, elevated about 300 ft. over the plain; it differs in style from other pagodas dedicated to Brahmanical worship, and exhibits great similarity with the Buddhistic monuments of Thibet.—The great pagoda of Chalambrou, in Tanjore, is one of the most celebrated and one of the most sacred of India. It is dedicated to S'iva and Pârvatî, and filled with representations belonging to the mythical history of these gods. The buildings of which this pagoda is composed cover an oblong square 360 ft. long and 210 ft. wide.—At Konjeveram there are two pagodas—the one dedicated to S'iva and the other to Pârvatî.—The pagodas of Juggernaut, on the n. end of the coast of Coromandel, are three; they are erected likewise in honor of S'iva, and are surrounded by a wall of black stones—whence they are called by Europeans the Black Pagodas—measuring 1122 ft. in length, 696 ft. in width, and 24 ft. in height. The height of the principal of these three pagodas is said to be 344 ft.; according to some, however, it does not exceed 120 to 123 feet.—The pagoda of Deogur, near Ellora, consists also of three pagodas, sacred to S'iva; they have no sculptures, however, except a trident, the weapon of S'iva, which is visible on the top of one of these temples.—The monuments of Mavalipura, on the coast of Coromandel, are generally called the Seven Pagodas; but as these monuments—which are rather a whole city than merely temples—are buildings cut out of the living rock, they belong more properly to the rock-cut monuments of India than to the special class of Indian architecture comprised under the term pagoda.

The term pagoda is, in a loose way, also applied to those Chinese buildings of a tower form which consist of several stories, each story containing a single room, and being surrounded by a gallery covered with a protruding roof. These buildings, however, differ materially from the Hindu pagodas, not only so far as their style and exterior appearance are concerned, but inasmuch as they are buildings intended for other than religious purposes. The Chinese call them *ta*, and they are generally erected in commemoration of a celebrated personage or some remarkable event; and for this reason, too, on some elevated spot, where they may be conspicuous, and add to the charms of the scenery. Some of these buildings have a height of 160 ft.; the finest known specimen of them is the famous Porcelain Tower of Nankin (q.v.). The application of the name pagoda to a Chinese temple should be discountenanced, for, as a rule, a Chinese temple is an insignificant building, seldom more than two stories high, and built of wood; the exceptions are rare, and where they occur, as at Pekin, such temples, however magnificent, have no architectural affinity with a Hindu pagoda.

PAGODA (*ante*). A word of Persian origin, applied to religious and monumental edifices of a peculiar order of architecture. They are generally the accompaniments of temples, but sometimes commemorate persons or events. In Burmah, India, and China they are often of stone, in the shape of terraced pyramids. In China, at Pekin, one built of massive masonry, and a superb tower of bricks coated with porcelain enamel, are famous among a vast number of smaller pagodas. In Japan they are always of wood, painted crimson, and, having from five to nine stories, are surmounted by a plume or spindle having copper rings. Those at Asakusa, in Tokio, and in Ozaka and Kioto are the most famous.

PAGU'RUS AND PAGU'RIDÆ. See HERMIT CRAB.

PAHLANPUR', a t. of India, capital of the state of the same name, 260 m. e.s.e. of Hyderabad. It is a walled t., is the seat of extensive trade and of several manufactures. Pop. estimated at 30,000, many of whom are artificers and shop-keepers. The state of which Pahlapur is capital lies between lat. 23° 57' and 24° 41' n., and long. 71° 51' and 72° 45' east. One-seventh of the population are Moslem and the remainder Hindus. The state, whose revenue, 1870–71, was £37,593, pays an annual tribute of £5,000 to the guicowar, and £600 per annum for the maintenance of a British political agent. The exact area of the state is not known; the state, however, contains 300 villages; pop. 216,000. The products are wheat, rice, sugar-cane, and cotton. In the n. and w. the soil yields only one crop annually, but in the s. and e. three crops are obtained in the year.

PAHLAVI. See PEHLEVI.

PAH UTE, a co. in n.w. Arizona, bordering on Utah and Nevada, separated from the latter by the Colorado river, which runs through it in deep cañons; 4,360 sq. miles. The soil is sterile and barren. Co. seat, St. Thomas.

PAIGE, ELBRIDGE GERRY, 1813–59; b. N. Y.; for some time the editor and proprietor of the N. Y. *Sunday Mercury*, in which he published a series of papers called *Short Patent Sermons*, by Lorenzo Dow, republished in 1854 in 3 vols. He was an unsuccessful business man. In 1849 he became one of the early California emigrants, and there died in great poverty.

PAILA is, according to the Purân'as (q.v.), one of the disciples of Vyâsa (q.v.), the reputed arranger of the Vedas (q.v.); he was taught by the latter the R'igveda, and, on his part, communicated this knowledge to Bâshkali and Indrapramati. This tradition, therefore, implies that Paila was one of the earliest compilers of the R'igveda.

PAIN is an undefinable sensation, of the nature of which all persons are conscious. It resides exclusively in the nervous system, but may originate from various sources. Irritation, or excessive excitement of the nervous system may produce it; it frequently precedes and accompanies inflammation; while it sometimes occurs in, and seems to be favored by a state of positive depression, as is seen in the intense pain which is often experienced in a limb benumbed with cold, in the pain which not unfrequently accompanies palsy, and in the well-known fact, that neuralgia is a common result of general debility. Hence, pain must on no account be regarded as a certain indication of inflammation, although it rarely happens that pain is not felt at some period or other in inflammatory diseases. Moreover, the pain that belongs to inflammation differs very much, according to the organ or tissue affected; the pain, for example, in inflammation of the lungs, differs altogether in character from that which occurs in inflammation of the bowels, and both these pains from that occurring in inflammation of the kidneys.

Pain differs not only in its character, which may be dull, sharp, aching, tearing, gnawing, stabbing, etc., but in its mode of occurrence; for example, it may be flying or persistent, intermittent, remittent, or continued. It is not always that the pain is felt in the spot where the cause of it exists. Thus, inflammation of the liver or diaphragm may cause pain in the right shoulder, the irritation caused by stone in the bladder produces pain at the outlet of the urinary passage; disease of the hip-joint occasions pain in the knee, disease of the heart is often accompanied with pain in the left arm, and irritation of the stomach often gives rise to headache. Pain is differently felt by persons of different constitutions and temperaments, some persons being little sensitive to painful impressions of any kind, while others suffer greatly from slight causes. There even seem to be national differences in this respect; and before the introduction of chloroform it was a matter of common observation that Irishmen were always more troublesome subjects for surgical operations than either Englishmen or Scotchmen; and the negro is probably less sensitive to pain than any of the white races.

Although in most cases we are to regard pain merely as a symptom to be removed only by means which remove the lesion which occasions it, there are cases in which, although it is only a symptom, it constitutes a chief element of disease, and one against which remedies must be specially directed. As examples of these cases, may be mentioned neuralgia, gastralgia, colic, dysmenorrhœa, and perforation of the intestines; and in a less degree, the stich of pleurisy, which, if not relieved, impedes the respiration, and the pain of tenesmus, which often causes such efforts to empty the lower bowel, as seriously to disturb the functions of the intestine, and to exhaust the strength.

For the methods of relieving pain, the reader is referred to the articles on the different diseases in which it specially occurs (as COLIC, NEURALGIA, PLEURISY, etc.), and to those on CHLOROFORM, ETHER, INDIAN HEMP, MORPHIA, NARCOTICS, OPIUM, etc.

PAINE, CHARLES, 1799-1853; b. Vt.; son of Dr. Elijah; graduated at Harvard college, 1820. He became engaged in various manufacturing enterprises, acquired considerable wealth, and became noted for his liberal assistance to the Vermont state university and Northfield academy. In the construction of the railroads of the state he was prominent, and at the time of his death was interested in the scheme of a Southern Pacific railroad. He was governor of Vermont, 1841-43.

PAINE, ELIJAH, LL.D., 1757-1842; b. Vt.; graduated at Harvard college, studied law and was admitted to practice in 1784. He was a member of the state legislature, 1787-91; judge of the state supreme court, 1791-95; was then elected U. S. senator, and at the close of his term of office, 1801, was appointed U. S. district judge for Vermont, a position which he held until his death. In 1782 he delivered the first Phi Beta Kappa oration at Harvard, and in 1789 was made president of that society. He was noted not only as a scholar, lawyer, and publicist, but also for his benevolence and his liberality to educational institutions. He was one of the first to undertake the manufacture of American cloth.

PAINE, HALBERT E.; b. Ohio, 1826; graduated in 1845 at Western Reserve college; in 1848 was admitted to the bar at Cleveland, and in 1857 removed to Milwaukee, Wis. He joined the union army, was col. of the 4th Wis. vols., 1861-63, and became brig.-gen. 1863. He assisted in defending Washington during Early's raid; served in the Vicksburg campaign, in command of a division; and in the last assault on Port Hudson lost a leg. In 1865 was brevetted maj. gen. In 1866 he was a delegate to the Philadelphia loyalist convention, and in 1865-71 a Republican member of congress.

PAINE, MARTYN, LL.D., 1794-1877; b. Vt.; after graduating at Harvard in 1813, studied medicine with Dr. John Warren, of Boston. In 1816 he began practice in Montreal, and in 1822 removed to New York, where he soon gained extensive practice. In 1841 he was prominent in establishing the N. Y. university medical school, and became professor of medicine and materia medica and afterwards of materia medica and therapeutics. In 1854 he, with others, procured the repeal of a state statute forbidding dissection of the human body. He published, besides many contributions to medical periodicals, a treatise

tise on the cholera epidemic of 1834; *Medical and Physiological Commentaries*, 1840-44; *Materia Medica and Therapeutics*, 1842; *Institutes of Medicine*, 1847; *The Soul and Instinct Distinguished from Materialism*, 1848; and *Theoretical Geology*, 1856.

PAINE, ROBERT, D.D.; b. N. C. in 1799; removed to Tennessee in 1813; in 1819 joined the Tennessee conference of the Methodist Episcopal church; president of Lagrange college, Ala., 1830-46; and was then elected bishop. He was chairman of the committee of nine appointed to prepare a plan for the division of the church; was a prominent member of the Louisville convention in 1845, which organized the Methodist Episcopal church south. Dr. P. was distinguished as a preacher and as presiding officer in the conference. He is the author of a work on *Hopkinsianism*, and the *Life and Times of Bishop McKendree*. He d. 1882.

PAINE, ROBERT TREAT, 1731-1814; b. Boston; son of Thomas, minister at Weymouth. He graduated at Harvard college in 1749, and after teaching school and making a tour in Europe, studied for the ministry. He was chaplain of the provincial troops in the north in 1755, and afterward studied law, and was admitted to the bar in 1759. He practiced law in Taunton for a number of years. In 1768 he was a delegate from that town to a convention called by prominent citizens after the legislature had been dissolved by gov. Bernard for refusing to take back its circular letter to the other colonies. In 1770 he managed in the absence of the attorney-general the prosecution of capt. Preston and his troops for the Boston massacre. In 1773-74 he was a member of the Massachusetts legislature. He was a representative of that state in the continental congress, 1774-78, and a signer of the declaration of independence. In 1776 he was a congressional commissioner from congress to Schuyler's army. He was speaker of the Massachusetts house of representatives in 1777, and was the first attorney-general of that state under the new constitution, which he had himself helped to frame. He continued to hold the office of attorney-general till 1790, when he accepted an appointment as an associate justice of the state supreme court. He resigned in 1804 on account of deafness. His last public office was that of councilor. He was an able lawyer, and a sound judge.

PAINE, ROBERT TREAT, jr., 1773-1811; son of Robert T. His name was originally Thomas, but was changed in 1801 to that of his father. Paine remarked upon the occasion of the change, and in allusion to the more famous Thomas Paine, that he now for the first time had a "Christian" name. He graduated at Harvard in 1792, and went into business. But he soon abandoned mercantile life, and began a bi-weekly literary paper called *The Federal Orrery*. About the same time he began to write theatrical criticisms. He wrote for the *Orrery* the *Lyars* and *The Jacobiniad*, which were full of personalities, and made him many enemies, and he was several times assaulted. In 1795 he married Miss Baker, an actress. The same year, upon taking the degree of A.M., he read a poem upon *The Invention of Letters*, for which he was paid \$1500, and Washington wrote him a letter expressing a high opinion of its merit. He sold his newspaper in 1796, and the same year read a poem on *The Ruling Passion*, before the Harvard Phi Beta Kappa society; this poem he disposed of for \$1200. In 1798 he composed the song called *Adams and Liberty*, for which he received \$750.

PAINE, THOMAS, an author famous for his connection with the American and French revolutions, and for his advocacy of infidel opinions, was b. Jan. 29, 1737, at Thetford, in the county of Norfolk in England. He was trained to the business of his father, who was a staymaker, but afterward obtained a situation in the customs, and the management of a tobacco-manufactory. His income, however, was small, and he fell into debt, and was dismissed in 1774, upon which he went to America; was favorably received by a book-seller in Philadelphia, and in 1776 published a pamphlet entitled *Common Sense*, written in a popular style, in which he maintained the cause of the colonies against the mother-country. The success and influence of this publication were extraordinary, and it won him the friendship of Washington, Franklin, and other distinguished American leaders. He was rewarded by congress with the appointment of secretary to the committee of foreign affairs; visited France in the summer of 1787, where he made the acquaintance of Buffon, Malesherbes, La Rochefoucauld, and other eminent men; and in the autumn following went to England, where, in 1791, he published *The Rights of Man*, the most famous of all the replies to Burke's *Reflections upon the French Revolution*. The work has gone through innumerable editions, and has been translated into almost all the languages of Europe. His defense of the principles of the French revolution against the magnificent assault of Burke and the outcry of the English aristocracy is vigorous, and by no means unsuccessful. But the value or at least the popularity of the work has been injured by its advocacy of extreme liberal opinions. His assaults on the British constitution exposed him to a government prosecution, and he fled to France, where he was admitted to citizenship; and in 1792 the department of Pas-de-Calais elected him a deputy to the national convention, where he voted with the Girondists. At the trial of Louis XVI., says Madame de Staël, "Thomas Paine alone proposed what would have done honor to France if it had been accepted—the offer to the king of an asylum in America;" by which he offended the mountain party; and in 1793 Robespierre caused him to be ejected from the convention, on the ground of his being a foreigner, and thrown into prison. During his imprisonment he wrote *The Age of Reason*, against

Atheism, and against Christianity, and in favor of Deism. After an imprisonment of 14 months he was released on the intercession of the American government, and restored to his seat in the convention. He was chosen by Napoleon to introduce a popular form of government into Britain, after *he* should have invaded and conquered the island. But as Napoleon did not carry out his design, Paine was deprived of an opportunity of playing the part of legislator for his conquered countrymen. He then retired into private life, and occupied himself with the study of finance. In 1802 he returned to the United States, and died June 8, 1809. The most complete edition of his works is that by J. P. Mendum (Bost. 1856); the most noted of his numerous biographers is William Cobbett (1796).

PAINESVILLE, a t., the co. seat of Lake co., Ohio, on the w. bank of Grand river, the Lake Shore and the Michigan Southern, and Painesville and Youngstown railroads; pop. '80, 3,841. It has churches, schools, a female seminary, banks, 3 weekly newspapers, foundries, flour mills, and machine-shops, etc. A viaduct 800 ft. long crosses the Grand river at this point.

PAINS AND PENALTIES. When a person has committed some crime of peculiar enormity, and for which no adequate punishment is provided by the ordinary law, the mode of proceeding is by introducing a bill of pains and penalties, the object of which, therefore, is to inflict a punishment of an extraordinary and anomalous kind. These bills are now seldom resorted to, and the last instance of an attempt to revive such a form of punishment was by the ministers of George IV. against queen Caroline, an attempt which was signally defeated. When a bill of this kind is resolved upon, it is introduced, and passes through all the stages like any other bill in parliament, except that the party proceeded against is allowed to defend himself or herself by counsel and witnesses. The proceeding is substantially an indictment, though in form a bill.

PAINT, ASBESTOS. See page 884.

PAINT, LUMINOUS. See page 884.

PAINTER, in naval matters, is the rope by which a boat is fastened to a ship or pier.

PAINTER, GAMALIEL, 1773-1819; b. New Haven, Conn.; received his education at the public schools; the pioneer settler of Middlebury, Vt., erecting the first house in the town. He was also the founder of Middlebury college in that place, bequeathing \$10,000 for that purpose. In the revolutionary war he served as capt. of a company, and as quartermaster. In 1777 he was chosen delegate to the convention which declared the independence of the state of Vermont, and was representative from his district to the Vermont legislature in its earliest sessions. In 1793 he was a member of the constitutional convention of Vermont; held the office of judge of the county court, and was councilor in 1813-14.

PAINTER'S COLIC. See **LEAD POISONING**, *ante*.

PAINTER'S CREAM, a composition used by artists to cover oil-paintings in progress, when they leave off their work; it prevents drying, and the consequent showing of lines where new work is begun. It consists of 6 parts of fine nut oil, and 1 part of gum-mastic. The mastic is dissolved in the oil, and then is added a quarter part of acetate, or sugar of lead, finely triturated with a few drops of the oil. When well incorporated with the dissolved mastic, water must be added, and thoroughly mixed, until the whole has the consistency of cream. It is applied with a soft brush, and can easily be removed with water and a sponge.

PAINTING, the art of representing objects to the eye on a flat surface by means of lines and color, with a view to convey ideas and awaken emotions. See **ART**. As one of the fine arts, painting occupies a prominent place; some claim for it the first place, as combining the chief elements—namely, form, light and shade, and color. As compared, however, with music and poetry, it lacks the important element of movement, the representation being confined, in a great measure, to one aspect and one instant of time. In its ruder and more elementary forms, in which the primary design was to communicate ideas, painting is perhaps the oldest of the arts, older, at all events, than writing (see **ALPHABET**, **HIEROGLYPHICS**); and, as a vehicle of knowledge, it possesses this advantage over writing—that no *description*, however minute, can convey so accurate and distinct an idea of an object as a pictorial representation, much less make so vivid an impression. Besides this, it is not limited, as writing is, by differences of language, but speaks alike to all nations and all ages.

The great antiquity of painting is proved by remains discovered in Egypt, and by reference to it in ancient writings. It has been ascertained that as early as the 19th c. B.C., the walls and temples of Thebes were decorated by painting and sculpture. Ezekiel, who prophesied about 598 years B.C., refers to paintings in Jerusalem after the manner of the Babylonians and Chaldeans. Though no specimens have come down to us, it is evident that paintings of the highest excellence were executed in Greece. This is proved by what is recorded of them, for the subjects of many of those mentioned required the putting forth in a high degree of all the qualities requisite for the production of the greatest historical works, such as form, grouping, expression, fore-shortening. From the immense sums given for paintings, the care with which they were preserved in temples and other public buildings, and from the fact of the high state of sculpture at contemporary periods, as proved by well-known works now extant, it may be deduced that painting, which, like sculpture, is based on design or drawing, must have occupied

an equally high position. Even the imperfect specimens of painting discovered in Pompeii, where the style and influence of Greek art may be traced to some extent, lead to conclusions highly favorable to the high position of painting in classic times. The chief schools of painting in Greece were those of Sicyon, Corinth, Athens and Rhodes. The first great artist of whose works there is any authentic description, and from details of which an idea may be formed of his attainments, is Polygnotus of Thasos (flor. 420 B.C.), who painted, among other works, those in the Pœcile, a celebrated portico at Athens, and the Lesche, or public hall at Delphi.

The works of Apollodorus of Athens (flor. 408 B.C.) are described and highly praised by Pliny. Zeuxis, the pupil of Apollodorus, Eupompus, Androcides, Parrhasius (q.v.) the Ephesian, and Timanthes of Sicyon, prosecuted painting with distinguished success, and by them it was carried down to the time of Philip, the father of Alexander. Of the same period was Pamphilus, celebrated not only for his works, but as the master of the artist universally acknowledged as the greatest of the ancient painters, Apelles (q.v.), who was born probably at Colophon, and flourished in the latter half of the 4th c. B.C. He was highly esteemed by Alexander the great, and executed many important works for that monarch. Protogenes of Rhodes was a contemporary, and may be styled the rival of Apelles, who greatly admired his works. His picture of Ialysus the hunter and the nymph Rhodes was preserved for many years in the temple of Peace at Rome. Art in Greece had now reached its highest point; its course afterwards was downwards.

In Italy art was followed at a very early period by the Etruscans, and, according to Pliny, painting, as well as sculpture, was successfully practiced in Ardea and Lanuvium, cities of Latium, perhaps more ancient than Rome. The finest specimens of Etruscan art, however—as the paintings on tombs, and the remains of armor and fictile ware ornamented with figures, evince unmistakably the influence of, or rather are identical with Greek art. According to Pliny it was introduced from Corinth about 650 B.C. No great national school of painting ever flourished in Rome, for though the names of Romans who were painters are cited, the principal works of art that adorned the temples and palaces of Rome were obtained from Greece, and it is probable that many of the paintings executed there were by Greek artists. When the seat of empire was transferred to the east, such art as then remained was carried with it, and in a new phase was afterwards recognized as Byzantine art—a conventional style, in which certain typical forms were adopted and continually repeated. This mode has been preserved, and is practiced in church-painting in Russia at this present time.

Much discussion has arisen in modern times as to the supposed technical modes or processes of painting employed by the ancients. It seems established that painting in fresco was much practiced; but many of the most valuable pictures we read of were removable, and there are accounts of some carried from Greece to Rome. “The Greeks preferred movable pictures, which could be taken away in case of fire” (*Wilkinson on Egyptian and Greek Paintings*), and Pliny says Apelles never painted on walls; therefore, there can be no doubt that the ancients painted on boards; indeed, the name *tabula* or *tabula picta* proves this, and it seems to be now generally acknowledged that these were executed in tempore—that is, with size, and probably fixed or protected by some kind of varnish, in the preparation of which oil was used; or in encaustic, a process in which wax was employed to fix and give brilliancy and depth to the colors, heat being applied in working with it.

Painting was revived in Europe in the 13th c.; previous to that period, Byzantine artists chiefly were employed. On the conquest of Constantinople by the Latins in 1204, the Byzantine school was broken up, and many Greek artists were transplanted to Italy, where art was now destined to flourish, so the works of the Italians who profited by their instructions, were necessarily, at the commencement, composed in the Byzantine style. The first Italian whose name is associated with the revival of Italian art is Guido of Sienna; a work by him, a large Madonna, inscribed with his name and the date 1221, is still preserved in that city. The next is Giunta da Pisa (1236). But Giovanni Cimabue (q.v.), 1240–1300, is commonly styled the founder of the Italian school. Several works of considerable importance are ascribed to him; and though he followed the Byzantine arrangement, he ventured occasionally out of the path, introduced the study of nature in his drawing, and imparted a greater degree of softness to his painting than the Byzantine artists. The influence of Byzantine art was not confined to Italy: it operated in Germany, Bohemia, and France; but there also art began to assume a national character early in the 13th c., and paintings are still preserved at Cologne, dated 1224. The Italian school of painting, or that style in which so many of the highest qualities of art have been so successfully carried out, received its chief impetus from Giotto (q.v.), the son of Bordone, born in 1276 at Vespignano, near Florence, where he died in 1336. It is said that he was originally a shepherd-boy, and being discovered by Cimabue drawing a sheep on a slate, was instructed by him in painting. His style is distinguished from that of earlier painters by the introduction of natural incidents and impressions, by greater richness and variety of composition, by the dramatic interest of his groups, and by total disregard of the typical forms and conventional style of his predecessors. His influence was not confined to Florence, but extended over the whole of Italy: and works by this artist may be traced from Padua to Naples. Giotto followed pope Clement V. to Avignon, and is said to have executed many important pictures there, and in other cities

in France. The most celebrated of his frescoes now extant are those at Assisi; some noted works by him in that class also remain at Padua, Florence, and Naples. Most of the small easel-pictures ascribed to him are of doubtful authenticity, but some preserved in the gallery at Florence are acknowledged to be genuine. His high powers as a sculptor and architect are also exemplified by works in that city. Giotto had numerous scholars and imitators, and several of these have left works which show that while they profited by his instruction or example, they were also gifted with original talent. Among these may be noticed Taddeo Gaddi, the favorite pupil of Giotto (born 1300, living in 1352); Simone Memmi (1284-1344); and Andrea Orcagna (1329-89), one of the artists employed in the decoration of the celebrated Campo Santo at Pisa. Painting in Italy continued to be impressed with the feeling and style of Giotto for upwards of a hundred years; but early in the 15th c. the frescoes executed by Masaccio (1401-43) in the Brancacci chapel in the Carmelite church at Florence, clearly prove that it had entered on a new phase, and had come forth strengthened by an important element in which it formerly was deficient, viz., correct delineation of form, guided by the study of nature. These celebrated frescoes, twelve in number, were at one time all ascribed to Masaccio; but it seems now to be acknowledged by judges of art that two of these are by Masolino da Panicale (1378-1415), the master of Masaccio; and three, or probably four, and a small portion of one, by Filippino Lippi (1460-1505). The frescoes by Masaccio, however, are superior to those by Masolino and Lippi, and, indeed, for many of the highest qualities in art, have, as compositions, only been surpassed by Raphael in his celebrated cartoons. In about a century from Masaccio's time, painting in Italy attained its highest development; but before referring to those artists who are acknowledged as having carried painting to the highest elevation it has attained since the period of the middle ages, it is right to note the names of some of the painters who aided in raising it to that position. The works of Fra Giovanni da Fiesole (1387-1455) are highly valued and esteemed by many critics as the purest in point of style and feeling, and so the best fitted for devotional purposes. Confining his efforts to simple and graceful action, and sweet and tender expression, he adhered to the traditional types, and ventured on none of the bold innovations which were introduced in his time, and carried so far by Masaccio. His example, as regards feeling and expression, influenced many succeeding artists, particularly Pietro Perugino, the master of Raphael (1446-1524), and Francesco Francia of Bologna (1450 or 1453-1517), by both of whom these qualities, united to greatly improved technical power, were brought to high excellence. Giovanni Bellini, the founder of the early Venetian school (1422-1512), has left many admirable works; he had numerous scholars, among them Titian and Giorgione. Domenico Corradi or Ghirlandajo, under whom Michael Angelo studied, successfully followed out that direction given to art by Masaccio, which involved individuality of character and expression, in the figures. Andrea Mantegna, of the school of Padua (1430-1506), along with strong expression, gave an impetus to form, modeled on Greek or classic art. Luca Signorelli of Cortona (about 1440-1521), successfully exemplified powerful action and bold foreshortening, particularly in his frescoes at Orvieto, which, with his other works, are supposed to have strongly influenced the style of Michael Angelo. Antonello da Messina (1447-96) is said to have been a pupil of Jan Van Eyck, who imparted to him his secret in the preparation and use of oil-colors, the knowledge of which he spread among the Venetians. The above statement, however, as to the exact period at which oil-painting was first introduced, is one attended with much doubt. Painting with colors mixed in oil is mentioned by Italian writers before the period of Van Eyck; painting in tempera, or size, was continued in Italy, particularly in the Florentine and Roman schools, to the time of Raphael; and the transition from the one method to the other has been so gradual, that many judges of art have expressed inability to determine whether the pictures of Perugino, Francia, and Raphael are in oil or tempera, or in both. The practice of painting on canvas, in place of wooden boards or panels, was introduced and carried on for a considerable time in Venice before it was adopted in other parts of Italy, and canvas is the material best suited for pictures in oil-colors when they are not of small dimensions; so, on the whole, the conclusion seems to be, that though oil-painting was not unknown in Florence and the south of Italy, painting in tempera was longer practiced there than in Venice. At the time when the painters above referred to flourished, there were many able artists in Germany, whose works are deservedly very highly prized. Among these, Jan Van Eyck (q.v.), (about 1390-1441), deserves special notice. To him is generally given the credit of being the first painter who used oil in place of size in his colors. His works are remarkable for brilliant and transparent coloring and high finish. He had numerous scholars; among these, Justus of Ghent (flor. 1451), Hugo Vander Goes (died 1480)—supposed to be the painter of the celebrated wings of an altar-piece, now at Holyrood palace, containing portraits of James III. and his queen—Roger of Bruges (1365-1418), Hans Hemling or Memling (died 1489), the best scholar of the Van Eyck school; Quintin Matsys (1450-1529), Jan Van Mabuse (1470-1532), Albert Dürer (q.v.), (1471-1528), Lucas Van Leyden (q.v.), (1494-1533). The career of the two last-named extended to the best period of art, and for many high qualities their works strongly compete with those of the ablest of the Italians; while portraits by Hans Holbein (q.v.), (1497-1554), and Antonio More (1512-88) rank with those of any school or period. The leading qualities in German art are invention, individuality of character, clearness of coloring, and high finish; but they are

inferior to the Italians in embodying beauty; their representation of the nude is angular in form and deficient in the elegance and grace attained by the painters of Italy; and in their draperies they do not attain the simplicity and grandeur so remarkable in the works of their southern competitors.

Anything like an account of the artists by whom painting was carried to its highest pitch, of sufficient comprehensiveness to exhibit their peculiar æsthetic qualities, cannot be attempted in so short a notice as this; but that deficiency is in some degree supplied by, and reference is made to, the biographical notices of distinguished painters given in this work under their names. Keeping this reference in view, therefore, the next step is to note the relative positions generally assigned to the most distinguished painters of that period, with reference to the estimation in which their works are now held. Leonardo da Vinci (q.v.), (1452-1519), Michael Angelo Buonarrotti (1474-1563), and Raphael or Raffaello Sanzio of Urbino (1483-1520), are universally acknowledged as the three greatest among the Italian artists; but two other names may be added as worthy to be put in an equally high place—those of Titian (q.v.), (1477-1576), and Antonio Allegri, surnamed Correggio (q.v.), (1594-34). These five painters exhibit in their works, some of them the whole, others the greater portion of the various elements—which in the earlier periods of art had existed apart, and composed distinct styles—united, and more highly developed; while each of them has taken up one of these elements, and carried it not only further than his predecessors had done, but further than it was by his contemporaries, or by any subsequent artist. Thus we see in Leonardo's celebrated picture of the "Last Supper," that though he has adopted the traditional style of composition handed down from Giotto's time, and carried out the religious feeling and dignified expression aimed at by the older masters, the whole is deepened and elevated by the manner in which it is worked out—namely, by a mind and hand possessing mastery over all the elements that are combined in the production of the highest works of art. Michael Angelo was a proficient in all the qualities that constitute a painter, but he carried several of them—viz., grandeur of design, anatomical knowledge, and power of drawing—far beyond all other artists of his own or of later times. Titian and Correggio, again, with great power over every art-element, have each carried one quality further than all other artists—the former, color; the latter, light and shade. Raphael is generally allowed the first place among painters, for, though each of the four artists just referred to carried one, or perhaps two, of the qualities of painting further than he did, he excelled them in every other element but the one for which each was particularly distinguished, and in several of the highest qualities of art he attained to greater excellence than any other artist; the expression of dignity of movement by broad masses and grand lines aimed at in the works of Masaccio, is successfully realized in the cartoons at Hampton court; and the pictures in which Perugino and Francia so earnestly and successfully embodied female beauty, maternal affection, and infantine purity, are as much inferior to pictures of similar subjects by Raphael as they are above those executed during the decadence of Italian art. Besides the five leading masters just referred to, there were many other Italian artists of great talent, who may be ranged in three classes: 1. the contemporaries of those artists; 2, those influenced by their style; 3, their scholars. Among their contemporaries, the works of Fra Bartolommeo (1469-1517) and Andrea Vanucchi, called Andrea del Sarto (1488-1530), both Florentines, deservedly rank very high. Giorgio Barbarelli, called Giorgione (1478-1511), was, under Bellini, a fellow-pupil of, and is generally styled the rival of Titian; and his works, which are of great excellence, prove that he was worthy of that name. In class 2, Correggio himself may rank as being influenced by Leonardo's style, but the great prominence of his other qualities makes his style original and independent. On Bernardino Luini (about 1460, living in 1530), Leonardo's influence is direct; and as he was an able painter, his pictures are very valuable for embodying many of those qualities in art which Leonardo had so much improved. Sebastiano del Piombo, a Venetian (1485-1547), studied under Giovanni Bellini and Giorgione; and after settling in Rome, became intimate with Michael Angelo, who employed him to paint some of his designs, with a view of benefiting by his admirable coloring. His pictures are greatly esteemed, as uniting rich color to grandeur of design. Class 3. All the five leading artists above referred to had pupils or scholars, particularly such of them as, like Raphael, were much engaged in extensive works in fresco, in the execution of which assistants are generally employed. A complete list of these, however, would occupy too much space here. Among the scholars of Michael Angelo, Daniele da Volterra (1509-66) was the best; and among Raphael's scholars, the first place is generally accorded to Giulio Pippi or Romano (q.v.), (1492-1546). After the first quarter of the 16th c., painting in Italy, except in the Venetian school, showed symptoms of rapid decline; that school, however, continued its vitality longer than any other in Italy, having flourished with all the life of originality during the whole 16th century. This is attested by the productions of many able Venetian painters; but among those, the works of Jacopo Robusti, or Tintoretto (q.v.), 1512-94, and Paolo Caliari, or Veronese (q.v.), 1528-88, are by far the most important. The pictures of the former exhibit great vigor in composition, and much richness of color—the former quality evincing the influence of Michael Angelo; the latter, that of Titian. Veronese ranks before even Tintoretto; his compositions are animated and full, and as a colorist he is a powerful rival to Titian, not aiming at the rich glow of that master's

tints, but excelling every artist in producing the brilliancy and sparkling effect of mid-daylight on figures gorgeously attired, and seen against backgrounds enriched with landscape and architecture. The other great schools of Italy, however, as already said, had less vitality than the Venetian, and showed symptoms of decay at the end of the first quarter of the 16th century. Raphael left numerous scholars and assistants; many of these, after his death in 1520, quitted Rome. The pillage of that city by the French under Bourbon in 1527 had also the effect of dispersing them, and this naturally led to the style of Raphael, so far as they could acquire it, being transplanted into other parts of Italy; but Raphael's style was founded on his own peculiar feeling for the beautiful, and on his own peculiar grace; and all that his scholars had acquired or could convey was a mere imitation of his external forms, without the spirit and pure feeling of which these forms are the expression. The imitation of Michael Angelo became the great object with the Florentines; but his scholars and imitators being unable to comprehend his powerful spirit, and not possessing his technical powers and theoretical knowledge, their pictures are merely exaggerated compositions of academic figures. Nor were Correggio's scholars more successful in following his walk, for they exaggerated the peculiarities of his style, which in their hands became affected and insipid. Leonardo's scholars repeated his distinguishing qualities, modified by their own individual peculiarities, and avoided that academic ostentation displayed by the followers of the masters just named. Their reputation therefore stands higher.

The German painters who succeeded Dürer, Van Leyden, and the other celebrated artists of their period, before referred to, endeavored to improve their national style by the study of Italian art, at first attempting to combine the two styles, and afterwards, to the close of the 16th c., devoting themselves exclusively to the study or imitation of the Italian painters. The works of these artists, the worst productions of any school, form a connecting link between those of the famous old German masters and the vigorous, varied, and attractive works of the painters of the Netherlands in the 17th century.

Towards the end of the 16th, and during the first half of the 17th c., a revival of art in Italy was attempted. This was sought for in two ways by two classes of artists; the larger body were known by the name of eclectics, from their having endeavored to select and unite the best qualities of each of the great masters, combined with the study of nature; the other class were distinguished by the name of naturalisti, and they aimed at forming an independent style, distinct from that of the earlier masters, based on the indiscriminate imitation of common life, treated in a bold and lively manner. In their development, both classes exercised an influence on each other, particularly the naturalisti on the eclectics. Eclectic schools arose in various parts of Italy, but the most celebrated was that at Bologna, founded by Lodovico Carracci (q.v.), (1555-1619), assisted by his two nephews, Agostino Carracci (1558-1602) and Annibale Carracci (1560-1609), the most eminent of the three. Many painters of mark were reared in this school; among those, Domenico Zampieri, called Domenichino (q.v.), (1581-1641), and Guido Reni (q.v.), (1575-1642), were by far the most eminent. The art of the eclectics has been greatly overrated. Till recently, the leaders of that school were always placed on an equality with the best masters of the early part of the 16th c., and far above any of the painters of the 15th century. These notions have recently undergone a complete change; it is now acknowledged that the attempt of the eclectics to combine the excellences of various great masters, involves misapprehension with regard to the conception and practice of art, for the greatness of the earlier masters was brought out in their individual and peculiar qualities, the uniting of which implies a contradiction. Michael Angelo Amerighi da Caravaggio (q.v.), (1569-1609) was the founder of the naturalisti school; he resided principally at Rome, but at a later period went to Naples, Malta, and Sicily. The naturalisti were in their greatest strength at Naples, where they perseveringly opposed the followers of the Carracci, their leader being Giuseppi Ribera (q.v.), a Spaniard, hence called Spagnoletto (1593-1656). With much of the force of Caravaggio, he united more delicacy and greater vivacity of color. The historical or scriptural subjects of Salvator Rosa (q.v.), (1615-73) are in the style of the school of the naturalisti; but on account of his *genre* pieces and landscapes, Salvator is entitled to occupy the place of the originator of a style noted for certain qualities of poetic feeling. The influence of the school of the naturalisti had more important results than that of the eclectics, for it affected to some extent the leading masters of the Spanish school. At Rome, contemporaneously with Domenichino, Guido, and other leading masters of the schools of the eclectics and naturalisti, the three following artists elevated landscape-painting to a high position—Nicholas Poussin (q.v.), a Frenchman (1594-1665); Claude Lorraine, also a native of France (1600-82), called Claude Lorraine (q.v.); and Gaspre Duchet, named Gaspar Poussin (q.v.), born in Rome, but the son of a Frenchman (1613-75). Among the great masters who occasionally practiced landscape-painting as a distinct branch of art, the earliest were Titian and Giorgione; the Carracci (particularly Annibale) carried out their style with considerable success; the landscapes of Domenichino are esteemed, and other scholars of the Carracci turned their attention in that direction. The reputation of N. Poussin is principally based on his figure-pictures, the subjects of which were mythological and scriptural. Into these pictures, he endeavored, with considerable success, to infuse the classical style; but his compositions were generally arranged with a large space of landscape background, which was in many cases not the least important

portion of the picture; and these, and the pictures he painted falling strictly under the class of landscapes, are distinguished for largeness of style and poetic feeling. Claude and Gaspar directed all their efforts to landscape, and attained to high eminence in that department of art.

The earlier specimens of painting in Spain resemble in style the works of the old German painters, who seemed to have disposed of many of the pictures in that country, while Spanish art of the 16th c. was modeled on that of Italy, Titian and Raphael being the masters studied; but when works of the Spanish school are spoken of, those executed in the 17th c. are always understood to be referred to, as it was then that Spanish art became entirely national in feeling and style, and that is the period in which the best works of the school were produced. The two most distinguished Spanish painters are Don Diego Velasquez (q.v.), (1599-1660), and Bartholomé Esteban Murillo (q.v.), (1618-82). The portraits of the former are characterized by truthful and dignified expression, great breadth and vigorous handling, and rank with the best works of that class of any school; while the Scripture subjects of the latter, which are noted for tender expression, rich color, and powerful light and shade, may be classed with similar works by Rubens and Van Dyck. Spagnoletto, a Spanish painter, has already been referred to as a leading artist of the school of the naturalisti at Naples. Alonzo Cano (1601-67), Francisco Zurbaran (1598-1662), and Claudio Coello (b. between 1630 and 1640, d. 1693), have a high reputation. No name of a Spanish painter of eminence occurs after the close of the 17th century.

Very soon after the period when the eclectic and naturalistic schools arose in Italy, a revival of art also occurred in the Netherlands. This was very different in its effects from the revival in Italy, the only results from which were academical imitation of the older masters, and coarse naturalism, either separately or combined in varied proportions; while the works of the artists of the Netherlands executed about the same period, though they do not exhibit the high qualities found in the compositions of the Italian masters of the best period, possess many new and attractive features—freedom, originality of treatment, attention to the peculiar character of individual life, and the daily intercourse of men with each other in all its variety, and the study of nature, brought out with truth and delicacy of execution. Two important schools of art were established by this movement—the Flemish and the Dutch. The Flemish school flourished in Brabant, where the Roman Catholic faith—then making strenuous efforts to oppose the reformed religion—still retained and actively employed art in its service. The Dutch school flourished in Protestant and republican Holland, where the artist, having to trust to private encouragement, painted, for the most part, familiar subjects from everyday life; and in place of altar-pieces for churches, and large historical and allegorical pictures for palaces, produced the subjects then in demand—portraits, *genre* pictures, or works in which life and manners are depicted in various phases—landscapes with and without figures, sea-pieces, battle-pieces, compositions representing hunting, animals, game, etc. The catalogue of the names of the able artists of these two schools is long; in the Flemish school, those who stand highest are Peter Paul Rubens (q.v.), (1577-1640), Anthony Van Dyck (q.v.), (1599-1641), David Teniers (q.v.) the younger (1610-90), F. Snyders (1579-1657). The following are the most eminent in the long list of artists of the Dutch school: Rembrandt (q.v.), (1608-69), Vanderhelst (1613-70), Albert Cuyp (q.v.), (1605-91), Terburgh (1608-81), A. V. Ostade (1610-85), J. Ruysdael (q.v.), (1630 or 1636-81), Hobbima (1629-70), P. Potter (1625-54), K. du Jarden (1635-78), Jan Steen (q.v.), (1636-89), G. Metz (1615-58), F. Mieris (1635-81), W. Van de Velde (1633-1707), A. Van der Neer (1613-84), P. Wouvermans (q.v.), (1620-68).

Painting has been practiced for a very long period in France; but there, as in Spain and in Britain, the marked preference shown in early times by the sovereigns of the country for the works of foreign artists, their undervaluing native talent, and their directing it into a channel supplied from a foreign source, had the effect of neutralizing it as the exponent of national feeling. Francis I. is acknowledged to have been a patron of art; he had a desire to possess fine works, and he liberally rewarded able artists, but his patronage was almost entirely confined to foreigners. Louis XIV. did what he could to place French art above that of every other nation; but he had no knowledge of it himself; he did not comprehend its nature and true intention, and imagined that pictures if painted by Frenchmen must necessarily be national. Nevertheless, his influence was, on the whole, highly beneficial to French national art. He always showed himself desirous to employ native rather than foreign talent, and he encouraged and enlarged the academy of fine arts, which had been founded at the commencement of his reign, under the direction of Lebrun. Although in many respects the principles and the regulations of the academy tended rather to the perpetuation of debased Italian, than to the development of genuine French art; yet the bringing together of a body of influential French artists, was the measure most likely to foster the feeling of nationality and to lead to the foundation of a national school of art. In the 16th c., François Clouet was distinguished as a portrait painter; and Jean Cousin as a painter, sculptor, and architect. In the 17th c., among many names, those chiefly deserving notice are Simon Vouet, the brothers Le Nain, N. Poussin, Claude Lorraine, Mignard, S. Bourdon, Le Sueur, J. Courtois (called Borgognone), and Coypel. Among these, the works of the brothers Le Nain alone possess national feeling and character, and they are held in very

considerable estimation; those of the others were executed under the influence of foreign art; and excepting Claude's splendid landscapes, Poussin's learned compositions, and some of Borgognone's battle-pieces, hold a low position. The works of Anthony Watteau (1684-1721) are truly national, excellent in execution, and very highly valued. This artist may be classed as at the head of the school of the 18th c.—the period in which art in France became really national. Not only did most of the painters of his school—which lasted till the end of the century, when classic art ruled for a time—form their style upon the works of Watteau, but his influence also affected the British school, which arose soon after that of France was developed. Lancret (1690-1742) was the most successful imitator of Watteau; Pater (1696-1736) followed in the same course; Chardin (1699-1779), though influenced by him, had an original style of his own, and his works now stand high. The pictures of Boucher (1704-70) exhibit the defects of the French school of the 18th c., unredeemed by the delicacy and grace, and high technical execution and truth of Watteau, Chardin, and Greuze (1725-1805), the last of whom sustained the character of French national art, and carried it into the 19th c., when it was re-established, after the classic school of David, founded at the revolution, and patronized under the empire of the first Napoleon, had in its turn been laid aside. David (q.v.), (1748-1825), the leader of this school, carried his admiration of classic art to the length of substituting the study of statues, the works by which the art of the ancients is chiefly known, for that of nature. He had numerous able pupils, several of whom, tired with this constant repetition of conventional form, recurred to nature, extended their range of subjects, and infused new vigor into the French school. Among many distinguished artists that have maintained the fame of the French school during the present century the following names may be mentioned: Géricault, Prud'hon, Leopold Robert, Delaroche (q.v.), Horace Vernet (q.v.), Ary Scheffer (q.v.), Eugène Delacroix (q.v.), and Ingres (q.v.). A number of artists, chiefly pupils of the above, now sustain the high position of French art in every department; while in that of landscape illustrative of French scenery, a branch of art never much studied in past times, great progress has been made, and the rise of this flourishing branch of French art is acknowledged by the French themselves to be due to the works of the English painter Constable, exhibited in Paris in 1824.

The English school was the latest national school that arose in Europe, for although the modern schools of Germany and Belgium are of still later date, having arisen in the present century, still they can scarcely be classed as new schools, but rather as revivals of former national schools. In England, as in France, foreign artists chiefly were in early times employed by the court and the nobles. Henry VIII. competed with Francis I. for the services of the greatest of the Italian artists, and permanently secured those of Hans Holbein, one of the most distinguished of those of Germany. Charles I. liberally patronized Rubens and Van Dyck; and if he had reigned longer, would in all probability, like Louis XIV., have founded a national school. But referring to the separate notices in this work of the foreign artists under their names respectively who were employed in this country, and to the article *MINIATURE PAINTING* for notice of several eminent native artists in that branch of art, it is only necessary here to touch on the subject of painting in this country from the time it acquired a truly national character. At the beginning of the 18th c., art in Britain was at the lowest ebb; the career of sir Godfrey Kneller (q.v.) (1648-1725 or 1726), the last of the foreigners, was drawing to a close; sir James Thornhill (1676-1734), an Englishman, followed out the decorative kind of art on which Verrio, La Guerre, and others were so much employed; but after his death, that debased style finally went down. The time had now arrived for native artists, if there were any entitled to the name, to assert their independence; and accordingly, in 1734-35, as many as from thirty to forty artists combined together in London, and instituted an academy for studying the human figure. About the same time a similar movement was going on in Edinburgh; the contract or indenture for establishing a school of art, dated Oct. 18, 1729, and signed by 17 artists, besides amateurs, is in the possession of the royal Scottish academy. The effort above referred to, of artists combining to found a life academy, was mainly due to William Hogarth (1697-1764), who, on this account, and from his first having developed, in a very high degree of excellence in his works, the leading characteristics of the English school, is justly entitled to be considered its founder. This combination led to these important results—it showed the artists their strength, and enabled them, after a probation of 34 years, to found the royal academy, an institution managed by artists, and intended to support and encourage a national school of art. The means by which the royal academy proposed to attain its purpose were the following: 1, by founding a school where artists may learn their profession; and 2, by instituting an exhibition where, independently of private patronage and support, artists may bring their works directly before the public. Hogarth died four years before the royal academy was organized; but he powerfully contributed to its establishment by his exertions in bringing the artists together in 1734, by supporting the modern exhibitions at Spring gardens, and by ridiculing by his pencil and pen the passion of the cognoscenti of the day for crying up as superior to the modern the doubtful specimens of old art which were largely imported and disposed of at great prices in numerous salerooms established for the purpose in London. As regards technical execution, and indeed in style generally, the English artists were at first indebted to the

French school, which, in the commencement of the 18th c., was in great vigor. Hogarth himself, in these respects, looked closely at the works of Watteau, engravings from which were well known in this country in his time; indeed, Watteau's pictures were so greatly admired here that he came over and spent the year 1720 painting in London. But Hogarth, though alive to the qualities in art produced by others, ranks among painters as one of the most original, for he greatly extended the dramatic element in painting, and imparted an originality and vigor to it never before attained; and his example has led to that element being one of the leading features of the English school, as is exemplified in the works of Wilkie (q.v.), Leslie (q.v.), Stuart Newton, Bonington, and others; and those of many distinguished artists of the present day. In the department of portrait-painting, many of the works of the British school rank with those of Titian, Van Dyck, and Velasquez, such, for instance, as Reynolds's portraits of Nelly O'Brien and lady Hamilton, Gainsborough's Mrs. Graham and Mrs. Siddons, and some of Raeburn's heads, etc. While in that of landscape, the position of the English school is acknowledged to be very high, its influence now strongly affecting the French school—this is proved by the works of R. Wilson, Gainsborough (q.v.), and Turner (q.v.), the last of whom, for wide range of subject, and rendering of atmospheric effect, stands alone; Constable, whose powerful grasp of nature has excited the emulation of the French artists; Calcott (q.v.), Collins (q.v.), Nasmyth, J. Thomson, Muller, and others; and their successors, the artists of the day, who ably represent the English school. Animal-painting has also been elevated to a high position. And an important department, that of painting in water-colors, originated in England, and has there attained far higher excellence than in any other country.

Painting is cultivated with success and receives much encouragement in America, but there the features that mark a national school have not yet had time for development. From the close connection between Britain and America, the art of the latter country was naturally influenced by and became assimilated to that of the former. America may, however, justly take credit for having contributed in no small degree to strengthen the British school of art, as several very able members of the royal academy were Americans. Benjamin West (1738–1820) was one of the original members, and elected president of the royal academy in 1806. J. S. Copeley (1737–1815), elected R.A. in 1799; his "Death of Chatham," and "Defense of St. Heliers, Jersey, against the French, and Death of Major Pierson at the moment of Victory," are excellent works, and as such were conserved in the national gallery, London. C. R. Leslie (1794–1859) was born in London of American parents; but in 1799 went to Philadelphia, where he was educated. Returning to London in 1811, he entered the schools of the royal academy; was elected academician in 1826, and professor of painting in 1848. G. S. Newton (1794–1835)—he was admitted a student of the royal academy in 1821, and elected academician in 1832. Washington Allston (1780–1843) was elected an associate in 1818; but afterwards returned to America, where he died. With the exception of the last named, the feeling evinced in the works of all these artists, influenced by study and continued residence, was essentially English; indeed few have equaled Leslie and Newton in their power of embodying the various incidents made national by English poets; and in none of their works can anything be set down as contributing in any degree to the foundation of a national American school. There is every reason to think, however, that such a school is being gradually evolved, and will soon be developed. Already something like originality of a national kind is exhibited in landscape painting, in which some American artists are endeavoring to embody scenes embracing a vast extent of country, or of extraordinary magnitude—such as those met with in the Andes, at Niagara, or exhibited by floating icebergs; and American literature, having now assumed imposing proportions, and great historical events having recently taken place, illustrations of American poetry and pictures of stirring national events will be called forth; and able American artists will doubtless be found to embody them and create a school truly national.

A general survey of painting at the present time exhibits the following aspect and arrangement: 1. A school in Germany, which arose during the present century, ostensibly a revival of the old national, but truly modeled on the early Italian school, the religious element being prominent. Its principal works are mural, of large dimension, and mostly executed in fresco, or on a kind of fresco lately invented, called silica or water-glass painting, from a vehicle of that kind being used. Invention, composition, grouping, and powerful and correct drawing, characterize the modern German works; but being of necessity executed from cartoons, they are deficient in that amount of individual expression, and natural color and effect, that can only be attained by a direct and continued reference to the object represented. 2. A Belgian school, which arose in the present century, and is also a revival of the earlier national schools. Some of the Belgian artists lean to the manner of the very early Flemish school, others to that of which Rubens was the head. The greater portion of the Belgian works are easel-pictures, and many of them rank high for individual expression, color, and technical execution. 3. A French school, exhibiting in active operation the various styles that have at different periods prevailed in that country, sometimes modified or adapted to the taste and feeling of the times. The works of the French school of the 18th c. were utterly condemned by French artists at the close of that and commencement of the present

century. They would tolerate nothing but what they called classic art. *L'Ecole classique*, as it was styled, was in its turn supplanted by *l'Ecole romantique*. Now, however, all styles are tolerated, even those of foreign schools—for instance, the English school of landscape—and there can be no doubt that, by the extensive range of subject, invention, drawing, and other high qualities the French artists display in their works, they have now raised that school to a very high position. 4. A British school, which has been in existence as a national school nearly as long as that of France, undisturbed by the convulsions that affected it. Vitality in art is maintained by close reference to nature, and this has all along been the leading characteristic of the English school; while the tendency of the artists at present is, taking advantage of the aid of science, which has lately discovered photography, to study nature with still greater earnestness and care. The high claims of the British school, long denied abroad, are now fully admitted. Formerly, foreigners never classed a British school among those of Europe, but now this is invariably done. One of the most popular writers on art in France, Théophile Gautier, in his work, *Les Beaux-Arts en Europe*, divides the art of the world into four strongly-defined zones—viz., Great Britain, Belgium, Germany, and France—Britain being distinguished by “individuality,” a potent element in art; Belgium, by “skill”; Germany, by “ideality”; and France, by “eclecticism,” or a selection and combination of the qualities of all other schools.

Regarding technical modes or processes of painting, reference is made to the separate notices under FRESKO, ENCAUSTIC, MINIATURE PAINTING. The period when the method of mixing up colors with oil was introduced, and the artists to whom the invention is attributed, have been already alluded to. It is necessary, however, to enter on some details touching the mechanical processes in oil-painting, the branch of the art that occupies the most prominent position; and the practice of cleaning and restoring pictures.

The implements used by a painter in oil are charcoal, chalk, or lead pencils, for drawing the outline; hair-pencils or brushes of various sizes, made of hog's bristles or finer hair, such as sable; a knife or spatula to mix the colors, and a palette or small table of thin wood, to be held in the left hand, on which the colors and tints are placed and mixed; an easel or stand for supporting the picture is also required, and a light rod for steadying or resting the hand on. Large pictures are always executed on canvas, stretched tightly on a frame, and primed or coated with paint. Small pictures are often painted on boards or panels, generally of hardwood, such as oak or mahogany, and similarly primed or prepared; but canvas, even for small works, seems at present to be generally preferred. Panels are apt to twist, or warp, or split, and in the event of the surface of a picture chipping or breaking off from the ground, the damage can be more easily remedied, and its progress stopped, when the picture is on canvas, by re-lining. The color of the ground of the canvas or panel has been the subject of much diversity of opinion among artists in different countries and at various periods; and it is certainly a matter of great importance, as it affects the general color of the work, or makes it necessary for the artist to adopt a peculiar style of working. The color of the ground used by the early masters was white, or nearly purely white. This arose from tempera or size being the medium first used in painting, and a pure white ground prepared with size was necessary for that kind of work. This practice, except as regards the Venetian school, continued till the decline of Italian art. Dull red was the universal color adopted in the eclectic, naturalistic, and late Italian schools, and this is one of the causes of the works of these schools being characterized by blackness and heaviness; at the same time, it is certain that red grounds were also used by many of the best Venetian painters, in whose works these defects are never found, probably from having used an impasto or body of color sufficiently powerful to bear out on the ground. A dark ground affords a facility for working expeditiously, and that, probably, was the principal cause for its being adopted. The Dutch and Flemish painters generally used light grounds; some of them light-brown, nearly the color of oak. Van Dyck occasionally used gray, and sometimes, when he painted in Italy, dull-red grounds. In the British school, light grounds are preferred. Some artists use smooth canvas, others prefer it rough, and avail themselves of the texture to increase the richness of the surface of their work. All these varieties in the materials are called for in consequence of the numerous styles or modes adopted by painters in oil colors. Every artist has his peculiar way of working, and in bringing out the color or effect, or special quality in his picture, by which the feeling or idea of the subject he conceives is expressed. No two artists—imitators and copiers are not referred to—produce their tints by mixing colors in the same proportions, nor, indeed, by using the same colors; and it is difficult to lay down general rules for the execution of works, seeing that depends very much on individual feeling and appreciation. The design or drawing is first outlined on the canvas, if it is light, with charcoal, or with white chalk when it is dark, and these lines are easily dusted off or rubbed out when corrections are made. It is then put in with black chalk or a lead pencil. Not many years ago it was the practice of painters, particularly landscape-painters—Nasmyth, for instance—to rub in the design with some brown color, such as a tint composed of burned sienna and black; but this practice is not much adopted now. Some artists make but a slight outline, and paint—or, as it is called technically, rub—in the subject in a bold, rough manner, afterwards gradually finishing it up; others draw the design very care-

fully, and work the picture up in portions, finishing or nearly finishing one portion before commencing another. In arranging the colors, or as it is called, setting the palette, many artists use a great variety of colors, others produce rich tones with few colors; some mix up tints in various gradations, others place the colors on the palette, commencing at the outer edge with white, followed by yellows and burned sienna (a reddish brown), then reds, including lakes, such as pink, madder, next blue, and lastly black, and merely mix up the tint on the center of the palette with their brush, as they proceed. In laying the colors on the canvas, the painter with his brush mixes or dilutes them with what is called a vehicle or medium. Here, again, the practice of artists is very varied; and this is a matter of importance, as the tone and quality of the picture, as regards texture or surface and transparency, is much affected by the medium employed, and the manner of using it. The durability of the work also depends very much on the medium and the artist's management of it. A medium composed of mastic varnish and drying or boiled linseed oil, named magilp, is that most generally used. This mixture coagulates or forms a jelly, and has the advantage, when placed on the palette, of not running off it, or mixing with the colors when the palette is not held level. Some painters prefer using raw linseed oil mixed with a dryer, such as litharge, or drying oil mixed with turpentine, or copal varnish and turpentine, or copal varnish and oil, with mastic varnish added, to make it coagulate. Other ingredients are often mixed with the medium to give a thick consistency to the paint, such as fat or thickened nut oil, paste, etc.; and various preparations sold by artists' colormen are much used; for instance, Roberson's medium, and Siccatif de Harlem, a preparation imported from Paris. The mode of using the medium is of great consequence; some apply it very sparingly, others, particularly those who prefer magilp, or a medium that coagulates, employ it lavishly. By the first method, firmness and decision of touch may be exhibited, by the latter, richness and brilliancy of tone; the excess tends to produce, in the one case, a hard and dry surface, and the want of the protection that varnish mixed with the color gives against atmospheric action; the other induces a surface having a horny appearance, and a tendency to darken, or crack, or open up.

Arresting the decay of pictures, and repairing, or, as it is styled, restoring them, after they have suffered from age or bad usage are matters which engage much attention. There can be no doubt that many paintings of vast importance have been saved by the care and skill of those who have earnestly devoted themselves to that kind of work; but picture-cleaning is now a trade followed in numerous instances by ignorant pretenders and quacks, who hold out that they possess some means by which they can freshen a picture, and restore it to the state it was in when originally executed. Generally speaking, the great extent to which this business is carried on is owing to the credulity of those who dabble in collecting old pictures, one great incentive to which being the hope of picking up, or discovering, some picture of great value concealed under the dirt and discoloration acquired in a long course of years; but, nevertheless, there can be no doubt that many proprietors of works of art who collect from far higher motives are remarkably prone to call in the picture-cleaner when his services are anything but necessary or beneficial. The late sir Edwin Landseer, R.A., when examined by the select committee of the house of commons appointed to inquire into allegations of damage by cleaning, sustained by the pictures in the National gallery in London (report and evidence ordered to be printed, 1858), stated in the following terms, his idea of this rage for picture-cleaning, or rather picture-destroying: "The first thing, whenever a picture is sold, I think, is, that it goes to a picture-restorer, or a picture-liner, or a picture-cleaner, no matter what its condition is. It is exactly the same thing as when you buy a horse; your groom says he will be all right when he has a dose of physic through him, whether he wants it or not." The mania for picture-cleaning is not confined to this country; it is extensively carried on with even more ruinous consequences abroad, particularly in Italy, where there is a large traffic in old, and few commissions for modern works, and where in many of the public galleries one or more picture-cleaners, for whom work must be found, are attached as permanent officers.

The process of picture-cleaning, or the removal of the old varnishes or other incrustations by which a painting may be obscured, is effected either by mechanical or chemical means. The first method is accomplished when the varnish on the surface is mastic, by rubbing with the fingers the surface of varnish when in a dry state, by which action it is brought off in a fine white powder; or by scraping or erasing the surface with sharp steel instruments when the surface of the picture is tolerably smooth. The first of these processes is the best that can be employed; but when the surface is rough or unequal, the prominent portions are apt to be over-rubbed; erasing or scraping is often practiced in Italy, but rarely in this country. The chemical means consist in the application of solvents, chiefly alkali, or alcohol, to dissolve the old varnish. The danger here is, that the action of these solvents is not always stopped with sufficient promptness and dexterity, and part of the surface of the picture is taken off; consequently it is by this latter process that most destruction is caused. For the various methods employed in picture-cleaning, the report and minutes of evidence, already referred to, may be consulted, and the *Guide Théorique et Pratique de l'Amateur de Tableaux, par Théodore Lejeune* (Paris, 1864), in which are stated all the most approved methods of cleaning and restoring pictures.

Works on painting and painters: Vasari (Florence, 1568); Borghini (Florence, 1584); Rodolphi (Venice, 1648); Zanetti (Venice, 1771); Lanzi (1792), Bohn's edition of Roscoe's translation; Von Rumohr (Berlin, 1827); Kugler's *Hand-book of Painting, Italian Schools* (ed. by Eastlake, 1855), *German, Flemish, and Dutch Schools* (1846); *Spanish and French Schools* (1848); *History of Painting in Italy*, by Crowe and Cavalcaselle (1876); *Hand-book for Young Painters*; by C. R. Leslie, R.A. (1855); Ruskin's *Modern Painters* (1843-60); *History of Painting: Ancient, Early Christian and Medieval*, 1880.

PAINTING (*ante*) in the United States had slow development until a comparatively recent date. The colonial period and the first half century of the republic were not conducive to the culture of art, although even then America had already produced artists of merit, recognized both here and in Europe—notably Benjamin West (1738-1820), who was not only honored by the academies of Florence, Parma, and Bologna, but made president of the royal academy of England: of his numerous works, estimated at 3,000, most are in that country, but his "Lear," "Hamlet and Ophelia," "Christ Healing the Sick," and "Rejected Christ," are in this country. Copley (1737-1815) also ranks very high as a portrait painter, whose works were valued for both truthfulness and coloring. His historical paintings, likewise, were much admired, and three are in the national gallery. It is said that the first American flag hoisted in England appeared in a portrait by him, Dec. 5, 1782, the day on which the king formally recognized the United States. Leslie (1794-1859), also, was honored in England, and valued for the high class of *genre* subjects which he painted; but though he was appointed professor of painting in the royal academy, and published *A Hand-book for Young Painters*, he excelled least in coloring. Allston (1779-1843), although named last, is really the first American artist who rose superior to the English traditional style, which more or less characterized the productions of the former. His "Spalatro" or "The Vision of the Bloody Hand" he esteemed the best of his pictures. Mr. Page said of it: "In color it is not as good as the best of Titian's, yet few pictures of Titian's, of that size, are so good in color. In composition and chiaro-oscuro it is one of the great pictures." His was a genius of no common order; the versatility of his conceptions, and the lofty purity of his spirit shining in them, entitle him to a place in the front rank of the best painters of the period. "The beauty of 'Beatrice' and 'Rosalie,' the prophetic sternness of 'Jeremiah,' the grace of 'Miriam,' the moonlight effects, the forests and mountains of his landscapes, the horror of 'Spalatro,' and the impressive mysteriousness of 'The Reviving Dead Man,' display a wonderful scope of thought, and a surprising power of execution" (Clement, *Handbook etc.*).

A distinctly accentuated American school of painting had no existence before 1825 when Thomas Cole (1801-1848) originated what has been called the American school of landscape painting. His experiments were views of the Hudson, for which he found a ready market. When some of his autumnal pieces, reflecting the glories of American sunshine, were exhibited in England, they were thought the invention of an extravagant Yankee. Although his allegorical pictures are most celebrated, they are artistically inferior to his landscapes, which are lovely and loving reproductions of nature. He painted nature in England, Sicily, and Italy, but he loved her nowhere so intensely as in America, and performed with his brush the same service for our scenery, as has been said, which Bryant performed with his pen. He wrote from Italy, "Neither the Alps, nor the Apennines, nor even Etna itself, have dimmed in my eyes the beauty of our own Catskills." Among his numerous followers in that department of painting, and among the earliest American artists who interpreted with truth and feeling our autumnal season, Thomas Doughty deserves to be named. The first American painter who attempted *genre*, with rather doubtful success, was Henry Inman; his pictures are quite numerous; some of his portraits are in the Boston athenæum, Independence hall, Phila., City hall, N. Y., and the capitol at Albany; his *genre* pictures are in private collections, and among them are the "Boyhood of Washington," the "Newsboy," "Awaking of Rip Van Winkle," etc. Rembrandt Peale (1787-1830), the son of Charles Wilson Peale, who painted 14 different pictures of Washington, and established a museum in Philadelphia, is said to have produced the best portrait of Washington; he painted two historical subjects, but both he and his father were portrait painters. Since then there are few departments of painting in which American artists have not labored, and often with marked success; the limits of this article preclude even passing notices of the best of their works. The fields of history and *genre* give us the names of Rothermel, Page (a fine colorist), Eastman Johnson, Winslow Homer, Leutze, Weir, May, Powell, Darley, Lambdin, Hennessey, Hall, Brown, Terry, Coleman, Freeman, Perry, Vedder, and Wood. Marine subjects, those of Bradford, Dana, DeHaas, Dix, Haseltine, Moran, and others. Animals are treated by J. H. and W. H. Beard, Butler, P. Moran, Tait, Hay, and Hinkley. Portraiture is cultivated by Ames, Baker, LeClear, Flagg, Gray, Hicks, Hunt, Staigg, Stone, and many more. Landscape furnishes the names of Church, Bierstadt, Kensett, Inness, James M. and William Hart, Cropsey, Casilear, the Giffords, Brown, Bristol, Cranch, Griswold, Gignoux, Wyant, Fitch, and many besides.

Landscape is probably the true field for the growth of a pure and noble American school of painting, where leaning on foreign schools might be, and ultimately will be, avoided. It is not the departed classicism of the older masters, nor the fashionable

adaptation of French coloring and ideal lines, nor the realistic and utterly unpoetic prosiness of so many English landscapes that is required, but an honest, persistent study of American scenery, which needs no foreign aid to be truly and enthusiastically portrayed. It is difficult to indicate the horizon of the ideal; ideality pertains as much to poetry and music as to painting; it may be said to be its very soul; but an ideal painting is not necessarily an exaggerated one of impossible mountains, gigantic foliage, and garish illumination.

In the domain of historical paintings, likewise, the drift is an escape from such barren literalness as is often found crowded into walls of canvas; it is not size, or the multiplication of figures about as life-like as the ordinary photograph, but spirit, the true and feeling poetry of the motive, that are wanted, and here also there is a manifest tendency to idealize. In portrait painting it is not the minute delineation of secondary accessories, but expression, that now rivets attention, and in that field lies the amplest scope for the application of true artistic skill. In a photograph there may be resemblance; in a portrait, if it be a portrait, there must be speaking likeness, life-like, or better still, living expression of character, mood, and carriage; here also the drift is in the direction of the poetic or ideal. The same drift seems to characterize genuine American *genre*, e.g., George Fuller's "And She was a Witch" plainly shows that motives may be found on native soil admitting of poetic and ideal treatment. Anything more unpleasantly bare than the "Coming Man," by Frank Duvenek, and painfully realistic than Muhrman's "Bather," could not easily be conceived. Realistic or exaggerated literalness should have no place in American *genre*. As the number of French pictures, and of the Düsseldorf and Munich schools, in the United States, is much greater than that of others, a certain leaning on their styles is more or less perceptible in not a few of the recent productions of our native painters, as a leaning on the English style characterized the works of our earlier artists. With the growth of art in the country, and the growth of an art *clientèle*, the tendency to draw artistic excellency, and to rise to higher standards, American art, with her illimitable resources and possibilities, has a bright future before it; and the time will come when writers like Lübke will, in 8vo volumes of 900 pages, find a little more to say of art in America than in the six lines which dispatch it by the juxtaposition of the names of Leutze, Winslow Homer, Thomson, Bierstadt, Whittridge, Coleman, and Gifford. The Preraphaelite movement of English origin, and by no means limited to England, has obtained of late a certain vogue here, but its grotesqueness will prevent it from ever being permanently national among us.

Attention is directed to the superior art-illustrations which of late years have been introduced in American publications, and they very often, and very felicitously, bring matter purely American in conception, motive, and force.

PAINTING (HOUSE) is one of the useful arts, combining much that is artistic with much that is absolutely necessary. The primary object of painting houses, or parts of them, either internally or externally, is to preserve them from decay—to cover the parts liable to suffer from exposure with a durable composition. That now used is made of ground white-lead mixed with linseed oil. This produces white paint, which forms the basis of all others. The various colors given to it are produced by the grinding of pigments (or *stainers*) along with the white-lead. The commonest of these are ochres (yellow and red earths), lampblack, Venetian red, umber, Prussian blue, chrome, vermillion, etc. Substances called driers are also mixed with the paint, such as spirits of turpentine, boiled oil, litharge, and sugar of lead ground in oil. Paint may be laid on any material—stone, wood, iron, and plaster being the most usual in buildings. It has the effect of preserving these by filling up the pores in them and forming a coating on which the moisture of the atmosphere does not act. The paint is laid on in several *coats* or layers, each being allowed to dry before the next is applied. The usual number of coats for new wood or plaster varies from three to six. Five coats form a good and lasting protection from the weather. Plain painting is generally finished with a coat prepared with a mixture of oil of turpentine, which takes off the gloss from the paint, and leaves the surface quite *mat* or dead. This is called *flattening*. A very common form of decoration in all ages has been to imitate the veins or colors of marbles, and the *grains* or marks of growth of various woods. In modern times these arts form a separate branch of house-painting, some men being *grainers*, others *marblers*, etc. The mode in which these imitations are produced is by forming a *grounding* of several coats of plain paint—usually four—and applying the coloring coat over this. In marbling the coloring matter is marked and veined with *feathers*, in place of brushes; and in graining steel combs are used. When the surface is dry it is protected with one or more coats of copal varnish.

Besides painting, the decorator uses paper-hangings for adorning the walls of houses. These are applied to the walls with paste. Size-coloring is also used, the coloring matter in this case being mixed with strong size (q.v.) in place of oil; but this has the disadvantage of being easily acted on by moisture. It is often used for the ceilings of common rooms, and for the walls of kitchens and servants' apartments, being much cheaper than oil-paint. In ancient times, in Greece and Rome, wax was used in mixing the colors with; but although there are many very fine specimens of Roman paintings still preserved on the walls of the houses of Pompeii, the mode in which these decorations were applied is not known.

PAINTS, PAINTERS' COLORS, or PIGMENTS. These names are applied to the prepared or unprepared compositions by which wood, stone, and other materials are coated with a preservative surface of oil, mixed with an earthy matter to give it color and consistency; also to the materials used by artists to produce the colored surfaces of their pictures. The art of painting in its primitive state consisted merely in applying such natural, mineral, and vegetable colors as were spontaneously yielded, without any vehicle to render them permanent, consequently they had to be renewed as often as they were rubbed or washed off from the surfaces to which they were applied. The paints now in use are nearly all mixed with a liquid vehicle, and are applied in the liquid state. The mixing materials are varied according to the requirements of the work. Thus for some kinds of decorative work, and for water-color drawings, gum, glue, size, or other adhesive materials dissolved in water, are employed; whilst for the painting of buildings, etc., and for oil-paintings, oils of various kinds are used for mixing and thinning the colors. Thus, for painted work exposed to the weather, it is found that linseed oil, boiled with the sulphates of lead (litharge) or zinc, or with acetate of lead (sugar of lead), is the best. The preparation of boiled oil is one requiring particular care, as it is desirable to have it bright and clear. Hence the proportions of the metallic salts are much varied by different manufacturers, and by some various other ingredients are added. The time of boiling and the method of filtering are also much varied. For indoor work, plain linseed oil and oil (spirit) of turpentine are used; if a *glossy surface* is wished, the linseed oil must be in excess; if a *dull or flattened surface*, then the quantity of turpentine, or *turps*, as it is often technically called, must be increased; and it is usual to add a small quantity of ground litharge and sugar of lead, which are prepared for this purpose, and sold under the name of *driers*. For artists' colors, very fine linseed or nut oil is used, unboiled, and in small quantity, and turpentine is employed to dilute them. Paints for very rough purposes, such as ship-work, stone walls, etc., are often mixed with whale oil boiled with white vitriol (acetate of zinc), litharge, and vinegar, and they are diluted with common linseed oil and turpentine.

Most of the paints used for ordinary purposes are composed first of the coloring matter, then of a quantity of white-lead, with which and the oil they are worked into a paste of the shade required, and afterwards thinned down with oil and turpentine when used. The white-lead which thus forms the basis of most paints, and by itself a color, is a carbonate and oxide of the metal, produced by exposing pieces of lead to the action of the steam of acetic acid in beds of fermenting tan. It is the principal white paint used, but is liable to discoloration from the gases contained in impure atmospheres. Other white pigments are prepared from the oxide of zinc, and the carbonate and sulphate of barytes. Pale yellow is made with chromate of strontian, orange-yellow with sulphuret of cadmium, whilst several varieties of this color are produced by chromate of lead, sulphuret of arsenic, or king's yellow, and various native earths in which silica and alumina are combined with oxide of iron. Amongst these are yellow ochre, Oxford, Roman, stone, orange, Indian, and American ochres. *Reds* are either purely mineral, or they are *lakes*, i.e., organic colors precipitated on alumina bases. Of the latter there are madder-lakes, prepared from madder-roots, and carmine-lakes, prepared from cochineal, of the former, vermilion (bisulphuret of mercury), Indian red (a native oxide of iron), Venetian red (also an oxide of iron), red lead (red oxide of lead or *minium*). A very beautiful red is used by artists called palladium red; it is formed of ammonio-perchloride of palladium. *Blues* consist of the artificial ultramarine, and for artists' purposes of the real ultramarine, also the silicate of cobalt, and for water-colors, indigo and Prussian blue. *Greens* are either produced by mixtures of *yellows* and *blues*, or they are made directly from the phosphates, carbonates, acetates, and arsenites of copper, also from the sesquioxide of chromium and from *terre verte*, a native mineral, consisting of iron, silica, potassa, and magnesia. The last two are the best for artists. *Browns* are numerous, and various in their composition. Decomposed peat, burned madder, burned Prussian blue, burned terre verte, asphalt, manganese brown, catechu, umber (which is an oxide of iron with manganese), and mummy, or the asphalt mixed with other matters taken from Egyptian mummies, are amongst the best known and most used. *Blacks* are made of lampblack and bone-black (q. v.), peroxide of manganese, and blue-black, which is made of the charcoal of burned vine twigs.

In all cases the coloring materials of paints require to be very finely ground, and as many are very poisonous, great care is required in their preparation, and several forms of mill have been invented for the purpose. The principle upon which all are made is to secure the operator from the poisonous dust and exhalations, and to reduce the coloring material, if ground dry, to an impalpable powder, or, if mixed with the oil, to a perfectly smooth paste.

PAIXHANS, HENRI JOSEPH, 1783-1854; b. France; educated at the polytechnic school, and appointed to the artillery, in which he rose to be gen. He made valuable improvements in heavy ordnance, in gun-carriages and projectiles, and the methods of working guns. The Paixhans gun, intended for ships of war or coast fortresses, and adapted to throwing shells and hollow shot, was adopted in France about 1824, and afterwards in England. It was used by the Russian fleet which destroyed the Turkish forts and ships in the harbor of Sinope. Paixhans recommended cylindro-conical pro-

jectiles as going more directly and striking more powerfully than round balls, and exposed to less resistance from the air. He believed in smaller ships carrying heavier guns for firing shell and hollow shot. The original Paixhans gun was 9 ft. 4 in. long, with a bore of $8\frac{3}{8}$ in., and a weight of about 7,400 lbs. The charge was between $10\frac{1}{2}$ and 18 lbs. of powder. It would bear hollow shot of 60 lbs., or solid shot of 86 to 88 lbs. He wrote several works on naval artillery.

PAISIELLO, GIOVANNI, an eminent musician, son of a veterinary surgeon at Taranto, was b. in 1741, and received his musical education in the conservatorio St. Onofrio at Naples. Of his earlier operas produced at Naples, the most celebrated was *Dal Finto al Vero*, composed in 1777. Some of his best works, particularly *Il Barbiere de Seviglia*, were written during an 8 years residence at St. Petersburg. At Vienna, he composed 12 symphonies for a large orchestra, and the opera buffa, *Il re Teodoro*. Between 1785 and 1799, he produced a number of operas for the Neapolitan theater, and was appointed by Ferdinand IV. his *maestro di capella*. In consequence of having accepted under the revolutionary government the office of national director of music, he was suspended from his functions for two years after the restoration of royalty, but eventually restored to them. In 1802, he went to Paris to direct the music of the consular chapel; but the indifferent reception shortly after given to his opera *Proserpine*, led him to return to Naples, where he died in 1816. His compositions are characterized by sweetness and gracefulness of melody, and simplicity of structure. Besides no fewer than 90 operas, Paisiello composed masses, requiems, cantatas, an oratoric, instrumental quartets, harpsichord sonatas, concertos, and a highly praised funeral march in honor of gen. Hoche.

PAISLEY, a municipal and parliamentary burgh, and an important manufacturing t. of Scotland, in the co. of Renfrew, on both banks of the White Cart, 3 m. above its junction with the Clyde, and 7 m. w.s.w. of Glasgow by railway. The progress of the town has been much hindered by the fact that it was bankrupt for nearly 30 years. A bill was passed in 1872, by which a settlement was effected, and the town property restored to the corporation. Since then, extensive improvements have been made. An abundant supply of water is brought from the Gleniffer hills, and more recently from Rowbank.

By far the most interesting edifice is the abbey. It was founded by Walter, the high steward of Scotland, about 1163, for a prior and 13 monks of the Cluniac order of reformed Benedictines, and was dedicated to St. James, St. Mirren, and St. Milburga. It was the burying-place of the Stewarts before the accession of that family to the throne, and was occasionally used by them afterward as a place of sepulture. It was raised to the rank of an abbey in 1245. What remains of the building is the nave, of 6 bays, chiefly in the first pointed style. In 1862 a thorough restoration of the abbey (at a cost of £4,000) was made, the happiest feature of which was the removal of the unsightly galleries. The eastern gable window represents the ascension. It is of Munich manufacture. Another window has been inserted by the St. Andrew's society of Glasgow, in memory of sir William Wallace, who, if he was born at Ellerslie, was a native of the abbey parish. Extensive improvements in the surroundings of the abbey have also been made.

Among the other edifices, the principal are the county buildings, a quadrangular pile in the castellated style; the Neilson educational institution, a noble bequest, built in the form of a Greek cross, and surmounted by a fine dome; the infirmary; the school of design; and the grammar-school. This last institution was founded by king James VI., and the present building was completed in June, 1864. In 1870 a free public library and museum was presented to the town, and is maintained by the community under the free libraries act; and by a similar act of liberality, its amenity was increased by a pleasure-ground named the fountain gardens. In 1873 a native of Paisley bequeathed £20,000 for the erection of a town hall. Paisiello possesses a trust for the education of boys born in the burgh and abbey parish, the revenue of which amounts to £500, and is spent on educational bursaries.

In the beginning of the last century the principal manufactures were coarse linens and checkered cloths. About the middle of that century the weaving of linen and of silk gauze became the staple manufactures. In 1784 silk gauze was manufactured to the value of £350,000, and employed 5,000 looms. Shawls, which used to be a principal and are still an important article of manufacture, began to be made here in the beginning of the present century. Within recent years the annual value of the shawl trade of Paisiello was estimated at about £1,000,000 sterling, but it has now greatly declined. Cotton thread is manufactured on a most extensive scale; indeed Paisiello may be considered the seat of the thread manufacture for the home and American markets. Different varieties of tartan cloths, handkerchiefs, carpets, etc. are made; soap, starch, and corn flour are largely manufactured; dyeing is carried on by several firms on an extensive scale; and power-loom factories, print-works, machine shops, bleach-fields, ship-building yards, etc., are in operation in the town and vicinity. At the St. James' day fair, horse-races, originated by act of the bailies of the burgh in 1608, are held. Pop. '81, 55,642.

PAJOU, AUGUSTIN, 1730-1809; b. Paris; pupil in sculpture of the eminent Lemoine; obtained the grand prize for sculpture in the French academy in 1748, with the privilege of going to Rome to complete his studies. On his return after 12 years he was elected a member of the academy. In 1767 he became a professor. Louis XVI. employed him to adorn with sculptures the façade of the Palais Royal, and to execute statues of Pascal, Turenne, Bossuet, Buffon and Decartes. He executed also the sculptures of the Salle del' Opera at Versailles; the ornaments of the Palais Bourbon, and of the cathedral of Orleans. Gabet says he was the sculptor of about 200 works in bronze, marble, stone, wood, and even paper or pasteboard. He received a handsome fortune from his works, but lost it by the revolution, and for the rest of his days was in comparative poverty.

PA'KENHAM, Sir EDWARD MICHAEL, 1779-1815, b. Ireland, made maj. of dragoons 1794, lieut. 1799, col. 1809, and maj.gen. 1812. He was quartermaster under Wellington in the peninsular campaign. In 1814 he commanded the expedition against New Orleans, and was killed at the battle of New Orleans, Jan. 8, 1815.

PAKS, a market t. of Hungary, in the co. of Tolna, 60 m. s.s.e. of Pesth, on the Danube. The river is here very winding, and the eastern bank a desert and useless morass. The town is frequently subject to inundations. Pop. 11,110.

PALACE, this title is applied, with few exceptions, in Great Britain to houses occupied by royal personages only. In Italy the name is given to all fine dwellings.

PALACKY, FRANTISEK, a Bohemian philologist, critic, and historian, was b. June 14, 1798, at Hodslavitz, in Moravia, and studied at Presburg and Vienna, confining his attention chiefly to philological and historical investigations. In 1831 he was appointed by the states of Bohemia historiographer to that country, and was intrusted with the compilation of a general history of Bohemia. In furtherance of this work, he ransacked all the libraries and archives in Bohemia, and made long visits to Germany and Italy in search of materials. He took in the political agitation of 1848, and was the leader of the Slav or national party as opposed to the German at the diet of Kremsier, after the dissolution of which he returned to his literary labors. His great and justly celebrated work, *History of Bohemia* (in German and Bohemian, Prague, 1836-67, 5 vols.), was received with enthusiasm by the whole Bohemian nation. Besides an early treatise on æsthetics, Palacky published many volumes of documents pertaining to Bohemian history, and a series of monographs on the same subject; a work on the most ancient monuments of the Czech tongue; an account of a literary tour to Italy in 1837; and in 1872 his *Political Testament*. "Father Palacky," as he was fondly called by his Czech fellow-countrymen, was beloved by them as the first to give access to the real history of Bohemia; and, though himself a Protestant, was regarded by Catholics with perfect confidence. Throughout life a zealous contender for the crown rights of Bohemia, he persistently but vainly opposed the reconstruction of Austria on a German-Hungarian basis; and when in 1861 he was elected into the Austrian house of lords, he declined to attend. He died in May, 1876.

PALADIN, a term originally derived from the counts Palatine, or of the palace (see **PALATINE**), who were the highest dignitaries in the Byzantine court, and thence used generally for a lord or chieftain, and by the Italian romantic poets for a knight-errant.

PALAFIX Y MELZI, DON JOSÉ DE, Duke of Saragossa, a Spanish patriot, was b. in 1780 of a distinguished Aragonese family, and received an excellent education. He accompanied Ferdinand VII. to Bayonne, and on seeing him made a prisoner there fled to Saragossa, where he exerted himself to prevent the invasion of Aragon by the French. His defense of Saragossa (q.v.), July 27, 1808—Feb. 21, 1809, which only yielded to the French after a second investment, is one of the most brilliant and heroic incidents in modern history, and has conferred lasting glory on Palafox and the whole city. The ancient fame of the Spaniards for obstinate valor in the defense of walled cities was rivaled, if not surpassed, and Saragossa could proudly claim to vie with Numantia. Palafox, sick and exhausted, was taken prisoner and conveyed by the ungenerous French to the dungeons of Vincennes, where he was treated with great hardship. Released in 1813, he returned to Spain, and was appointed in the following year capt.-gen. of Aragon. Palafox was no great politician, but he loved liberty and hated anarchy, and on more than one occasion he supported the former and crushed the latter. After being created duke of Saragossa, and grandee of Spain of the first class in 1836, he kept himself apart from politics. He died at Madrid, Feb. 16, 1847.

PALAI'A, a t. in n. Italy, province of Pisa, 19 m. from the city of Pisa; pop. '74, 10,119. It was once a fortified town, and is situated on elevated land, with the river Chiecinella flowing at its base.

PALAIS ROYAL, a heterogeneous mass of buildings on the eastern side of the rue Richelieu in Paris, composed of a palace, theaters, public gardens, bazaars, shops, cafés, and restaurants. The old palace was built between 1624 and 1636 on the site of the hôtel Rambouillet by cardinal Richelieu, who at his death bequeathed it to Louis XIII. Henrietta of France, widow of Charles I., and Anne of Austria, the queen mother, afterwards lived in it for a time with her young son, Louis XIV. It subsequently became the town residence of the Orleans branch of the Bourbons, and during the minority of Louis XV. it acquired a scandalous notoriety as the scene of the wild orgies in which

the regent, duke of Orleans, and his dissolute partisans were wont to indulge; while in the time of his son, Philippe Egalité, it became the focus of revolutionary intrigue, and the rendezvous for political demagogues of every shade of opinion. This prince, partly to repair his impoverished fortune and partly to persuade the sans-culottes of Paris of the sincerity of his professed sympathy with their striving for equality, converted part of his gardens into a place of public resort, and the pavilions of the great court into bazaars, which were divided into shops and stalls. On the downfall of Egalité the palais royal was taken possession of by the republican government, and used for the sittings of the tribunes during the reign of terror. On the restoration of the Bourbons, it reverted to the Orleans family, and was occupied by Louis Philippe till his election to the throne of France in 1830, when it was incorporated in the general domains of the state, and ceased to be an appanage of the house of Orleans. The palace was sacked by the mob during the revolution of 1848, when many of its best paintings and most precious works of art were destroyed. After having been temporarily appropriated to various public purposes, it was thoroughly repaired and magnificently furnished, and given by the late emperor, in 1855, to his uncle, Jerome Bonaparte, whose son, prince Napoleon, resided there until 1871. The main entrance, with its elegant façade, is in the rue St. Honoré; and on passing through the first court, the second or cour royale is reached, to the left of which stands the Théâtre Français, while immediately facing it is the celebrated Galerie Vitrée, or glass gallery, which contains on the ground floor some of the most brilliant shops of Paris, while the upper stories are chiefly occupied by cafés and restaurants. The garden, which is surrounded by this and other galleries, measures 700 ft. by 300. The red republicans set fire to the palace in Mar., 1871 (see PARIS), when all the apartments occupied by prince Napoleon were destroyed. The firemen and those who aided them, while forming into line to pass buckets of water, were fired upon by the insurgents, but kept to their work, and succeeded in checking the flames before they spread to the galleries and shops, which may almost be said to have remained intact. In the autumn of 1873 that part of the palace injured by the insurgents was restored. The garden, with its avenues and parterres, fountains, and grass plots, still constitutes one of the liveliest and most frequented spots in the whole city; and although much of their glory has faded, its cafés still maintain, in great measure, the world-wide reputation they long ago acquired.

PALAME'DES, a Grecian hero, son of Nauplius and Clymene. He was the prince whom the Greeks deputed to induce Ulysses to join in the war against Troy, but his stratagem, by which he exposed the pretended insanity of Ulysses, produced an irreconcilable enmity between them. He was for a time commander-in-chief in place of Agamemnon. His death is attributed to Ulysses, in revenge, who accused him of treason: as to its modes, there are various traditions.

PALAMEDIDÆ, a family of birds, somewhat resembling the ducks (*anatidæ*), and also the rails (*raillidæ*). Feet very large, neck short, head small, bill short, nostrils large; wings large and armed at the shoulder with two strong spurs; tail small, legs large and covered with hexagonal scales; toes long, three before and one behind; the anterior toes connected by slight, scaly webs. Family includes two genera, *palamedea*, with one species, and *chaunæ*, with two species. They are natives of South America, inhabiting marshy grounds and borders of lakes and rivers.

PALAMPUR, India. See page 884.

PALANQUIN, or **PALKI**, the vehicle commonly used in Hindustan by travelers, is a wooden box, about 8 ft. long, 4 ft. wide, and 4 ft. high, with wooden shutters which can be opened or shut at pleasure, and constructed like Venetian blinds for the purpose of admitting fresh air, while at the same time they exclude the scorching rays of the sun, and the heavy showers of rain so common in that country. The furniture of the interior consists of a cocoa mattress, well stuffed and covered with morocco leather, on which the traveler reclines; two small bolsters are placed under his head, and one under his thighs, to render his position as comfortable as possible. At the upper end is a shelf and drawer and at the sides are nettings of larger dimensions than the ordinary pockets in carriages, for containing those articles which may be necessary to the traveler during his journey. At each end of the palanquin, on the outside, two iron rings are fixed, and the *hammals*, or palanquin-bearers, of whom there are four, two at each end, support the palanquin by a pole passing through these rings. Traveling in this mode is continued both by day and night. (See DAWK.) The palanquin is also used at the present day in Brazil, with the prominent exception of Rio Janeiro.

Similar modes of traveling have been at various times in use in western Europe, but only for short distances. The Roman "litter," the French "chaise à porteurs," and the "sedan-chair" were the forms of vehicle most in use, and the two latter were in general use in towns till they were superseded by hackney coaches. The Roman "litter" was one of the criteria of its owner's wealth, the rich man generally exhibiting the prosperous condition of his affairs by the multitude of the bearers and other attendants accompanying him.

PALAPTERYX (Gr. an. apteryx), a genus of fossil birds whose remains are found in the river-silt deposits of New Zealand, associated with the gigantic dinornis, and which, like it, resembled in the form of the sternum, and the structure of the pelvis and legs, the living wingless apteryx. Two species have been described.

PALATE, THE, forms the roof of the mouth, and consists of two portions, the hard palate in front and the soft palate behind. The framework of the *hard palate* is formed by the palate process of the superior maxillary bone, and by the horizontal process of the palate bone, and is bounded in front and at the sides by the alveolar arches and gums, and posteriorly it is continuous with the soft palate. It is covered by a dense structure formed by the periosteum and mucous membrane of the mouth, which are closely adherent. Along the middle line is a linear ridge or raphe, on either side of which the mucous membrane is thick, pale, and corrugated, while behind it is thin, of a darker tint, and smooth. This membrane is covered with scaly epithelium, and is furnished with numerous follicles (the palatal glands). The *soft palate* is a movable fold of mucous membrane inclosing muscular fibers, and suspended from the posterior border of the hard palate so as to form an incomplete septum between the mouth and the pharynx; its sides being blended with the pharynx, while its lower border is free. When occupying its usual position (that is to say, when the muscular fibers contained in it are relaxed), its anterior surface is concave; and when its muscles are called into action, as in swallowing a morsel of food, it is raised and made tense, and the food is thus prevented from passing into the posterior nares, and is at the same time directed obliquely backwards and downwards into the pharynx.

Hanging from the middle of its lower border is a small conical pendulous process, the *uvula*; and passing outwards from the uvula on each side are two curved folds of mucous membrane containing muscular fibers, and called the *arches* or *pillars of the soft palate*. The *anterior pillar* is continued downwards to the side of the base of the tongue, and is formed by the projection of the palato-glossus muscle. The *posterior pillar* is larger than the anterior, and runs downwards and backwards to the side of the pharynx. The anterior and posterior pillars are closely united above, but are separated below by an angular interval, in which the *tonsil* of either side is lodged. The tonsils (*amygdalæ*) are glandular organs of a rounded form, which vary considerably in size in different individuals. They are composed of an assemblage of mucous follicles, which secrete a thick, grayish matter, and open on the surface of the gland by numerous (12 to 15) orifices.

The space left between the arches of the palate on the two sides is called the *isthmus of the fauces*. It is bounded above by the free margin of the palate, below by the tongue, and on each side by the pillars of the soft palate and tonsils.

As the upper lip may be fissured through imperfect development (in which case it presents the condition known as the hare-lip), so also may there be more or less decided fissure of the palate. In the slightest form of this affection, the uvula merely is fissured, while in extreme cases the cleft extends through both the soft and hard palate as far forward as the lips, and is then often combined with hare-lip. When the fissure is considerable, it materially interferes with the acts of sucking and swallowing, and the infant runs a great risk of being starved; and if the child grows up, its articulation is painfully indistinct. When the fissure is confined to the soft palate, repeated cauterization of the angle of the fissure has been found sufficient to effect a cure by means of the contraction that follows each burn. As a general rule, however, the child is allowed to reach the age of puberty when the operation of *staphyloraphy* (or suture of the soft parts) is performed—an operation always difficult, and not always successful. For the method of performing it, the reader is referred to the *Practical Surgery* of Mr. Fergusson, who has introduced several most important modifications into the old operation.

Acute inflammation of the tonsils, popularly known as **QUINSY**, is treated of in a separate article.

Chronic enlargement of the tonsils is very frequent in scrofulous children, and is not rare in scrofulous persons of more advanced age, and may give rise to very considerable inconvenience and distress. It may occasion difficulty in swallowing, confused and inarticulate speech, deafness in various degrees from closure of the eustachian tubes (now often termed *throat deafness*), and noisy and laborious respiration, especially during sleep; and it may even cause death by suffocation, induced by the entanglement of viscid mucus between the enlarged glands. Iodide of iron (especially in the form of Blencard's pills) and cod-liver oil are the medicines upon whose action most reliance should be placed in these cases, while a strong solution of nitrate of silver (a scruple of the salt to an ounce of distilled water), or some preparation of iodine, should be applied once a day to the affected parts. If these measures fail, the tonsils must be more or less removed by the surgeon, either by the knife or scissors, or by a small *guillotine* specially invented for the purpose.

Enlargement or relaxation of the uvula is not uncommon, and gives rise to a constant tickling cough, and to expectoration, by the irritation of the larynx which it occasions. If it will not yield to astringent or stimulating gargles, or to the stronger local applications directed for enlarged tonsils, its extremity must be seized with the forceps, and it must be divided through the middle with a pair of long scissors.

PALATINATE, a name applied to two German states, which were united previously to the year 1620. They were distinguished as the Upper and Lower Palatinate. The Upper or Bavarian Palatinate, now forming a circle of the kingdom of Bavaria, was a duchy, and was bounded by Baireuth, Bohemia, Neuburg, Bavaria, and the district of

Nürnberg. Area, 2,830 sq.m.; pop. 1807, 283,800. Amberg was the chief city, and the seat of government. The Lower Palatinate or the Palatinate on the Rhine, embraced an area of from 3,045 to 3,150 sq.m.; and consisted of the electoral Palatinate, the principality of Simmern, the duchy of Zweibrücken, the half of the county of Sponheim, and the principalities of Beldenz and Lautern. For the area and population of the modern provinces of the Upper and Lower Palatinate, see article BAVARIA.

The counts of the electoral or Rhenish Palatinate were established in the hereditary possession of the territory of that name, and of the lands attached to it, as early as the 11th century. After the death of Herman III., the emperor Friedrich I. assigned the Palatinate to Conrad of Swabia. After Conrad's death, his son-in-law, duke Henry of Brunswick, came, in 1196, into the possession of these lands, but he, having been outlawed in 1215 by Friedrich II., was succeeded by his son, Otto III., duke of Bavaria. Ludwig II., or the Strong, succeeded the preceding in the Palatinate in 1253, and was in turn succeeded in 1294 by Rudolf I., who, however, was banished by his brother, the emperor Ludwig, because he had taken part with Friedrich of Austria. The country was ruled by his three sons. Ruprecht III., who died in 1410, was a German emperor. Of his four sons, Ludwig III. received the electoral or Rhenish Palatinate, Johann, the Upper Palatinate; Stephan, Zweibrücken; and Otto, Mosbach. The second and fourth lines soon died out, as well as also that of Ludwig III., which came to a close in 1559, upon which the possessions of that prince, together with the electorate, passed to Friedrich III. of the Simmern line. He was succeeded by Ludwig IV. in 1576, by Friedrich IV. in 1583, and by Friedrich V. in 1610, who, after he accepted the Bohemian crown, was driven from his possessions by the emperor in 1619, and his office of elector was transferred to Maximilian, duke of Bavaria. Karl Ludwig, son of Friedrich V.; received the Lower Palatinate at the peace of Westphalia, and in his favor a new or eighth electorship was created. With his son Karl, the Simmern line terminated in 1685, upon which the Palatinate fell into the hands of Philipp Wilhelm, count palatine of Neuburg.

The house of Neuburg was descended from Ludwig the Black, count palatine in Zweibrücken, second son of Stephan, count palatine in Simmern. Wolfgang, a descendant of Ludwig's, was the founder of all the other lines of counts palatine. Of his three sons, Johann founded the line of Neu-Zweibrücken, Karl the Birkenfeld line, Philipp Ludwig the Neuburg line. Philipp Ludwig had three sons, Wolfgang Wilhelm, August, and Johann Friedrich. The first founded the Neuburg line, the second the Sulzbach line, the third died childless. The son of Wolfgang Wilhelm died in 1690. His son, Johann Wilhelm, became heir to the Beldenz line in 1694. He was succeeded by his brother, Karl Phillip, who in turn was succeeded in 1742 by Karl Theodor, from the Sulzbach line, who united the Bavarian territories with the Palatinate. Duke Maximilian of Zweibrücken next succeeded in 1799, who at the peace of Luneville (1801) was compelled to cede a portion of the Rhenish Palatinate to France, a part to Baden, a part to Hesse-Darmstadt, and a part to Nassau. Treaties of Paris of 1814 and 1815 re-assigned the Palatinate lands beyond the Rhine to Germany, Bavaria receiving the largest share, and the remainder being divided between Hesse-Darmstadt and Prussia.

PALATINE (from Lat. *palatium*, a palace). A *Comes Palatinus*, or count Palatine, was under the Merovingian kings of France, a high judicial officer, who had supreme authority in all causes that came under the immediate cognizance of the sovereign. After the time of Charlemagne a similar title was given to any powerful feudal lord, to whom a province, generally near the frontier, was made over with *jura regalia*, or judicial powers, similar to what the counts palatine had received in the palace, and the district so governed was called a *palatinate* or *county palatine*. There were three counties palatine in England—Lancaster, Chester, and Durham—which were, no doubt, made separate regalities on account of their respective proximity to the frontier of Wales and to that turbulent Northumbrian province which could neither be accounted a portion of England nor of Scotland. In virtue of their regal rights, the counts palatine had their courts of law, appointed their judges and law officers, and could pardon treasons, murders, and felonies; all writs and judicial process proceeded in their names, and the king's writs were of no avail within the bounds of the palatinate. Lancaster seems to have been made a county palatine by Edward III. Henry, first duke, and John, second duke of Lancaster, were both invested by him with the dignity of count palatine. Henry VI. was hereditarily duke and count palatine of Lancaster, and on his attainder, soon after Edward IV.'s accession, the duchy and county were forfeited to the crown, and confirmed on Edward IV.—afterward on Henry VII, and his heirs forever. The queen is now duchess and countess palatine of Lancaster. There is still a chancellor of the duchy and county palatine, whose duties are few and unimportant, but the administration of justice has gradually been assimilated to that of the rest of England. See LANCASTER. Chester is supposed to have become a county palatine when made over with regal jurisdiction by William the Conqueror to Hugues d'Hvranches. In the reign of Henry III. it was annexed to the crown by letters patent, and since that time the earldom palatine of Chester has been vested in the eldest son of the sovereign, or in the crown, whenever there is no Prince of Wales. Durham seems to have first become a palatinate when William the Conqueror constituted bishop Walcher, bishop and duke of Durham, with power (according to William of Malmesbury) to restrain the rebellious people with the sword, and

reform their morals with his eloquence. The palatinate jurisdiction continued united with the bishopric till 1836, when it was separated by act of parliament, and vested in William IV. and his successors as a franchise distinct from the crown, together with all forfeitures, mines, and *jura regalia*. It has since been more completely incorporated with the crown. Pembroke was at one time a county palatine, but ceased to be so in Henry VIII.'s time. The archbishop of York also exercised the powers of a palatine in the county of Hexham in Northumberland, of which he was deprived in the reign of Elizabeth. In very early times there were a number of similar privileges in Scotland, the most important of which was that of the earls palatine of Strathern. In Germany, the *Pfalzgraf*, or count palatine, exercised a jurisdiction much more extensive than the simple *Graf* or count. A considerable district in Germany was long under the jurisdiction of a count palatine, who was one of the electors of the empire. See PALATINATE.

PALATINE, a township of Montgomery co., N. Y.; pop. '80, 2,786. It consists of three villages, Palatine Bridge, Palatine Church, and Stone Arabia. Of these the largest is Palatine Bridge on the n. bank of the Mohawk river, and a station on the New York Central railroad. There is a manufactory of thrashing machines, a foundry, an academy, and (in the township) 5 churches.

PALATINE HILL, *Mons Palatinus*, the central hill of the famous seven on which ancient Rome was built, and, according to tradition, the seat of the earliest Roman settlements. In point of historical interest, it ranks next to the capitol and the forum. Its summit is about 160 ft. above the sea. The form of the hill is irregularly quadrangular. Its north-western slope, towards the Capitoline hill and the Tiber, was called *Germalus* or *Cermalus*. The origin of the name is uncertain, although several derivations are given connecting it with legendary stories. Romulus is said to have founded the city upon this hill, and on Germalus grew the sacred fig-tree (near to the Lupercal) under which he and his brother, Remus, were found sucking the she-wolf. Upon the Palatine hill were the temple of Jupiter *Stator*, the temple of Cybele, the sacred square inclosure called *Roma quadrata*, and other sacred places and edifices, besides many of the finest houses in Rome. Augustus and Tiberius had their residences here, whence Tacitus termed it *ipsa imperii arx* (the very citadel of government); and at last Nero included it entirely within the precincts of his *aurea domus*, which Vespasian subsequently restricted to the hill. From the time of Alexander Severus it ceased to be the residence of the emperors, but the name *palace* (*palatium*), derived from it, was given to the abodes of sovereigns and great princes, and has been adopted into modern languages. Recent excavations have brought to light numerous remains of the palatial and other structures with which the Palatine hill was once covered; and these are now among the most interesting sights of the Eternal City.

PALAWAN, or PARAGOA, one of the Philippine islands (q.v.).

PALAY, *Cryptostegia grandiflora*, a climbing plant of the natural order *asclepiadaceæ* (q.v.), common in many parts of India, particularly on the eastern coast of Hindustan. It yields a very fine strong white fiber, resembling flax, and which can be spun into the finest yarn. The fiber is obtained from the stalk; the milky juice contains caoutchouc. Palay is one of the most interesting plants which have recently been recommended to notice in India.

PALAZ'ZOLO ACREI'DE, a t. of Sicily, in the province of Syracuse, 29 m. s.s.w. of Catania, is situated on the brow of a hill, just where it overhangs a deep valley. Near Palazzola Acreide are the remains of the ancient *Acræ*, founded by a colony from Syracuse, on the site of a Phœnician settlement, 664 B.C. The most curious remains are to be found in some low cliffs beneath the town to the s., where is a series of arched niches, containing figures carved in high relief in the rock. The style of art appears to be archaic Greek, with somewhat of an Egyptian character. Pop. 9,954.

PALE, in heraldry, one of the figures known as ordinaries, consisting of a perpendicular band in the middle of the shield, of which it is said to occupy one-third. Several charges of any kind are said to be "in pale" when they stand over each other perpendicularly, as do the three lions of England. A shield divided through the middle by a perpendicular line is said to be "parted per pale." The pallet is the diminutive of the pale, and is most generally not borne singly. Or three pallets gules were the arms of Raymond, count of Provence. When the field is divided into an even number of parts by perpendicular lines, it is called "paly of" so many pieces. Paly of six argent and gules, the arms of the family of Ruthven. When divided by lines perpendicular and bendways crossing, it is called paly bendy. An indorse is a further diminutive of the pallet, and a pale placed between two indorses is said to be indorsed.

PALE, in Irish history (see IRELAND, HISTORY), means that portion of the kingdom over which the English rule and English law was acknowledged. There is so much vagueness in the meaning of the term that a few words of explanation appear necessary. The vagueness arises from the great fluctuations which the English authority underwent in Ireland at various periods, and from the consequent fluctuation of the actual territorial limits of the pale. The designation dates from the reign of John, who distributed the portion of Ireland then nominally subject to England into twelve counties palatine, Dublin, Meath, Kildare, Louth, Carlow, Kilkenny, Wexford, Waterford, Cork, Kerry,

Tipperary, and Limerick. To this entire district, in a general way, was afterwards given the designation of the Pale. But, as it may be said that the term is commonly applied by the writers of each age to the actual English territory of the period, and as this varied very much, care must be taken to allude to the age of which the name Pale is used. Thus, very soon after the important date of the statute of Kilkenny, at the close of the reign of Edward III., the English law extended only to the four counties of Dublin, Carlow, Meath, and Louth. In the reign of Henry VI. the limits were still further restricted. In a general way, however, the Pale may be considered as comprising the counties of Dublin, Meath, Carlow, Kilkenny, and Louth. This, although not quite exact, will be sufficient for most purposes.

PA'LEA (Lat. chaff), a term employed in botany to designate the bracts of the *florets* in grasses (q. v.), called *corolla* by the older botanists; also to designate the small bracts or scales which are attached to the receptacle of the head of flowers in many of the *compositæ* (q. v.). Any part of a plant covered with chaffy scales is described as *paleaceous*.

PALEAS'TER (Gr. ancient star-fish), a genus of star-fish peculiar to the Silurian period, which in general appearance resemble the living brittle stars, but when more minutely examined present so many anomalies that they cannot be referred to any existing family. Five or six species have been described.

PALEFITS. See LAKE DWELLINGS.

PALEMBANG', formerly an independent kingdom on the e. coast of Sumatra; now a Netherlands residency, is bounded on the n. by Djambi, n.w. by Bencoolen, s. by the Lampong districts, and s.e. by the strait of Banca, has an area of 61,900 sq. m.; and a population amounting, in 1873, to 577,085 souls. Much of the land is low-lying swamp, covered with a wilderness of impenetrable bush; but in the s. it rises into mountains, of which Ocloe Moesi (Ulu Musi) is 6,180 feet. Gold-dust, iron-ore, sulphur with arsenic, lignite, and common coal are found; also clays suited for making coarse pottery, etc. Springs of pure oil occur near the coal-fields of Bali Boekit (Bukit), and of mineral water in various places. Rice, cotton, sugar, pepper, tobacco, and, in the interior, cocoanuts, are grown; the forests producing gutta-percha, gum-elastic, rattans, wax, benzoin, satin-wood, etc. The rivers abound with fish; and the elephant, rhinoceros, tiger, panther, and leopard roam the woods, as well as the deer, wild swine, and goats, with many varieties of the monkey.

In the dry season the thermometer ranges from 80° to 92° F., and in the rainy season 76° to 80°. The climate is not unhealthy, except in the neighborhood of the swamps. The natives are descended from Javanese, who in the 16th c., or earlier, settled in Palembang, and ruled over the whole land. The race, however, has become mixed with other Malays, and the language has lost its purity. In the n.w. interior is a tribe called the Koeboes (Kūbūs), of whose origin nothing is known, but who are probably the remainder of the aborigines. They do not follow after agriculture, go about almost naked, and live chiefly by fishing and hunting. No idea of a supreme being seems to be possessed by them, though they believe in existence after death.

PALEMBANG, the capital of the kingdom and residency, is 52 m. from the Soensang (Sunsang), or principal mouth of the river Moesi (Musi), in 2° 59' s. lat., and 104° 44' e. longitude. The city is built on both banks of the Moesi, and other streams which fall into it, and is 5 m. in length by ½ m. in breadth. The river is upwards of 1,000 ft. broad, and from 40 to 50 ft. in depth, so that the largest vessels can sail up to the harbor. The native houses are raised on posts and neatly constructed of planks or bamboos; the Chinese, Arabians, and Europeans, chiefly living in floating houses called rakits, of which there are upwards of 500, and holding communication with one another and with the natives by boats. The fort is built on the left bank of the river, and behind it are an institution for the blind and a splendid mosque. There is a school, where 30 European children are educated, a government elementary school for natives, and several good Chinese schools. Many of the natives can read and write, and in 1856 a native printing press was erected by Kemas Mohammed Asahel.

Palembang is visited annually by upwards of 30,000 boats of various sizes, bringing produce from the interior, consisting chiefly of rice, benzoin, gum-elastic, gutta-percha, raw cotton, rattans, tobacco, pepper, wax, dragon's blood, resin; and gold-dust from the boundaries of the kingdom of Djambi, now included in the residency. These are obtained chiefly in exchange for salt, cotton manufactures, earthenware, iron and copper wares, and provisions. The foreign trade is large, and chiefly carried on with Java, Banca, Singapore, China, and Siam. The colonial report of the Dutch government, published in 1875, gives the exports from Palembang for 1872 at £227,825, and the imports at £278,693. The natives of Palembang are good ivory carvers, gold and silver smiths, jewelers, cutlers, japanners, painters, boat-builders, bookbinders, etc., and expert at all the ordinary handicrafts. The women, in addition to cotton fabrics, spinning, and dyeing, weave silk stuffs embroidered with gold. Pop. 44,000, of whom 100 are Europeans, 3,000 Chinese, and 2,000 Arabians.

PALENCIA, a province in n.w. Spain, bounded on the n. by Santander, on the e. by Burgos, on the s. by Valladolid, and on the w. by Burgos; 328 sq. m.; pop. 184,668. The surface is level, except in the n. where it is mountainous. There are few trees. It

is watered by the Pisuerga, Carrion, Camera, and other rivers. The soil is fertile and produces wheat, hemp, and flax. Other staples are fruit and linseed oil. Minerals abound, but only coal is mined to any extent. Grain is exported on the canal of Castile which passes through the province from n. to south. The principal manufacture is flour; blankets, baize, and serge also are made. There is a good system of elementary schools. Capital, Palencia.

PALENCIA (the ancient *Pallantia*), a city of Spain, in Old Castile, capital of the modern province of the same name, stands in a treeless, but well-watered and fruitful plain, on the Carrion, 39 m. n.e. of Valladolid. It is a bishop's see, and is surrounded by old walls, 36 ft. high and 9 ft. thick, around which are pleasant promenades. The cathedral, a light and elegant Gothic edifice, was built 1321-1504. The first university founded in Castile was built here in the 10th c., but was removed to Salamanca in 1239. Nearly one-third of the population is employed in the manufacture of blankets and coarse woolen cloths. The position of the town on the Carrion, and on the Castilian canal, is favorable to the development of commerce. The vine is cultivated, and there is a good trade in wool. Pop. (1877) 14,505.

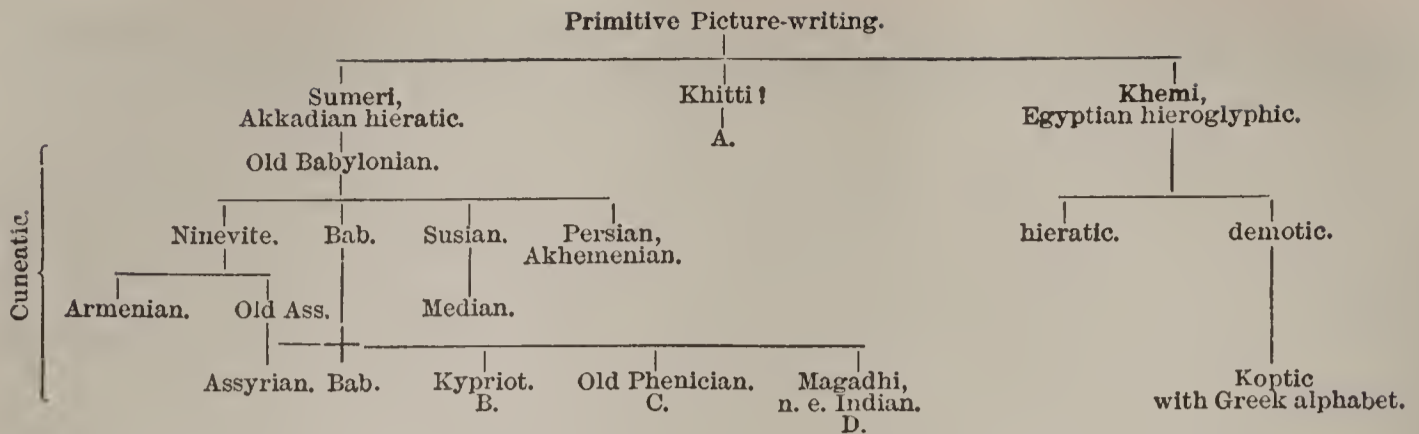

PALENQUÉ, RUINS OF, are on the Rio Chacamas, a branch of the river Usumasinta, in the state of Chiapas, Mexico, 8 m. s.e. of the village of Santo Domingo de Palenque, lat. 17° 30' n., long. 92° 26' west. The ruins extend over a large area, covered with a dense tropical forest, and are of difficult exploration. They consist of vast artificial terraces, or terraced truncated pyramids, of cut stone, surmounted by edifices of peculiar and solid architecture, also of cut stone, covered with figures in relief, or figures and hieroglyphics in stucco, with remains of brilliant colors. Most of the buildings are of one story, but a few are two, three, and some may have been four stories. The principal structure, known as the palace, is 228 ft. long, 180 ft. deep, and 25 ft. high, standing on a terraced truncated pyramid of corresponding dimensions. It was faced with cut stone, cemented with mortar of lime and sand, and the front covered with stucco and painted. A corridor runs around the building, opening into four interior courts, which open into many smaller rooms. On slabs of stone are carved numerous colossal figures, and the remains of statues more resemble Grecian than Egyptian or Hindu art. Other spacious and elaborately ornamented buildings appear to have been temples of religion. These ruins were in the same condition when Cortez conquered Mexico, as now, overgrown with a forest, and their site forgotten. They were only discovered in 1750. Three explorations were made by the Spanish government, but they were little known until visited by Messrs. J. L. Stephens and F. Catherwood, and their account published with plans and drawings. See Stephens's *Incidents of Travel in Central America*, etc., and Catherwood's *Views of Ancient Monuments of Central America*, etc. There are in Mexico dim traditions of the existence, at a remote period, of the capital of a theocratic state, the center of a long since extinguished civilization, of which the only traces are these wonderful ruins and unexplained hieroglyphics.

PALEOGRAPHY (Gr. *palaios*, old, and *graphé*, writing), the science of ancient writings. It comprehends not merely the art of reading them, but such a critical knowledge of all their circumstances as will serve to determine their age, if they happen to be undated, and their genuineness, in the absence of any formal authentication. For these purposes, the paleographer needs to be acquainted with the various substances, such as bark, leaves, skins, paper, etc., which have been used for writing; with the various manners of writing which have prevailed, and the changes which they have undergone; with the various forms of authenticating writings, such as seals, signets, cachets, signatures, superscriptions, subscriptions, attestations, etc., which have been employed at different times; with the various phases through which the grammar, vocabulary, and orthography of the language of the writing with which he is dealing, has passed; and with more or less, as the case may be, of the history, laws, institutions, literature, and art of the age and country to which the writing professes to belong.

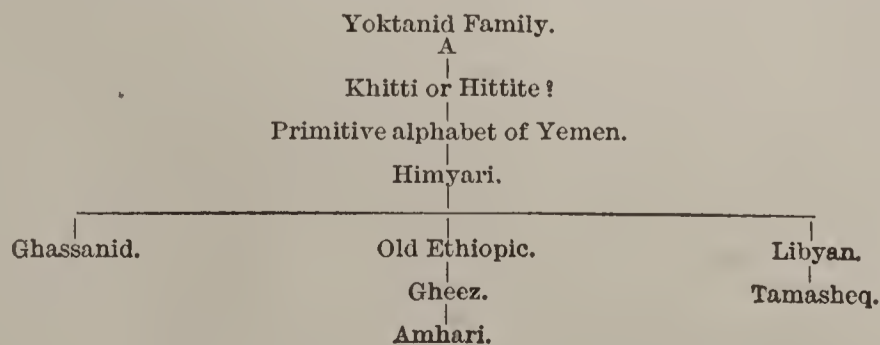

Paleography may be said to have been founded by the learned French Benedictine, Jean Mabillon, whose *De Re Diplomatica*, first published in 1681 in 1 vol. fol., reprinted in 1709, and again in 1789, in 2 vols. fol., is still, perhaps, the most masterly work on the subject. Along with the *Nouveau Traité de Diplomatique* (Par. 1750-65, 6 vols. 4to) of the Benedictines of St. Maur, and the *Eléments de Paléographie* (Par. 1838, 2 vols. 4to) by M. Natalis de Wailly, it is the great authority for French paleography. English paleography is perhaps less favorably represented in Astle's *Origin and Progress of Writing* (Lond. 1803) than Scottish paleography in Anderson's and Ruddiman's *Diplomata Scotiæ* (Edin. 1739). Muratori treats of Italian paleography in the third volume of his great work, the *Antiquitates Italicae Medii Ævi*; and among later works on the same subject may be mentioned the *Diplomatica Pontificia* (Rome, 1841) of Marino Marini. The paleography of Greece is illustrated in the *Paleographia Græca* (Par. 1708) of Montfaucon. Spanish palæography may be studied in the *Bibliotheca de la Polygraphia Espanola* (Mad. 1738) of Don C. Rodriguez. Of works on German paleography, it may be enough to name Eckard's *Introductio in Rem Diplomaticam* (Jen. 1742), Heumann's *Commentarii de Re Diplomatica* (Norimb. 1745), Walther's *Lexicon Diplomaticum* (Gott. 1745), and Kopp's *Palæographia Critica* (Manh. 1817). Hebrew paleography has been elaborated by Gesenius in his *Geschichte der Hebräischen Sprache und Schrift*, and

other works. The great work on paleography generally—one of the most sumptuous works of its class ever published—is the *Paléographie Universelle* (Par. 1839–45, in 5 vols. fol.) of M. J. B. Silvestre. See BLACK LETTER, CONTRACTIONS, PALIMPSEST, POPYRI.

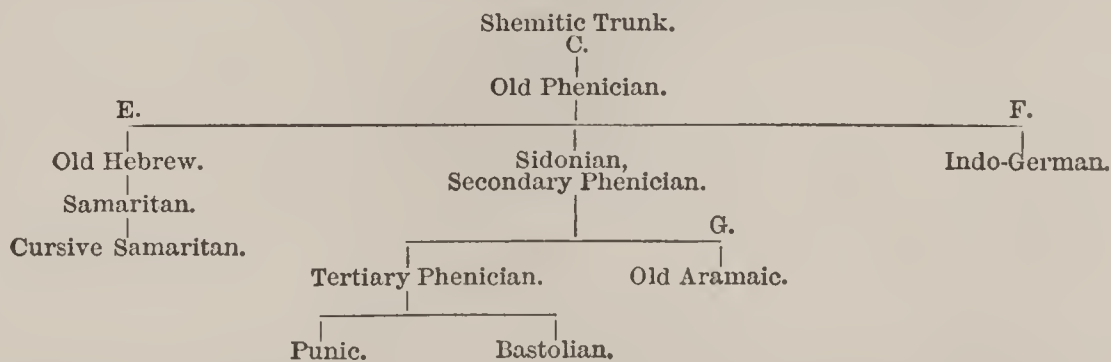

PALEOGRAPHY (*ante*). Modern paleography, since the simultaneous reading of the euneatic Persian by Rawlinson, Lassen, and Burnouf, in 1836, lies at the bottom of all that exact and laborious criticism which in thirty years enabled the entire history of antiquity to be rewritten from a linguistic and archæological point of view. The whole subject turns on an intimate acquaintance with the most minute points in the history of whatever people may be under discussion. Back of all is the real living feeling of that people, as shown in their remains—that is, their inscriptions. Having a series of inscriptions, granted in an unknown alphabet, the first thing is to verify the copies, an exceedingly difficult operation, since every scholar knows it is impossible to correctly copy writing not understood. Recourse should be had, when reachable, to rubbing with heel-ball, to squeezes in paper or clay, to casts, and to photography. The approximate date of each should then be ascertained, the place of its “find,” the date of the find, and a *proces-verbal* of its exact location, most especially with regard to ground-level or later constructions. No duplicates or comparative collations should be made without these, and they should always be affixed to the original and printed in essays. The Kypriot texts of Moritz Schmitt are almost useless from neglect of these evident rules, which apply with equal force to MSS., where the experienced eye notices a hundred details all tending to approximate the date of fabrication. Next comes the correction of the text. No man can correct an inscription until he understands the grammar of its language, and the grammar of a language is tabulated only from a thousand examples. A whole generation of German scholars battered their brains over the reading of the Malperg glosses, and utter failure resulted even to Grimm from neglect of the ordinary processes of analysis. The mistakes in a text usually arise from three causes: from dialect; from literal resemblances; from ignorant copyists. There is an enormous mass of pedantic analysis wasted on old English and old German spelling, which, on correction by three known systems—Saxon, Norse, and Gothic—shows differences neither abnormal nor arbitrary. A letter, like every creation in form, depends upon three things: the intention, the capacity, and the material. Letters may be successively analyzed as: *a*, imitative—a picture of the thing thought of; *b*, conventional—a change in shape for quickness or convenience which recalls little or not at all the original picture; *c*, symbolical—they become signs, and subject, as puns, metaphors, or similes, to all the turns of human wit or wisdom. It follows that they get a double meaning to one sound, or a double sound to one meaning; or, new sounds being evolved, new characters are created as, *d*, explanatory—generally abbreviations of other characters, or a change, by altering shape or affixing marks; lastly they become, *e*, traditional—in which case the original generation is forgotten and the character is arbitrarily connected with a given object. They decrease from signs of words to signs of syllables, to sounds of syllables, to sounds of letters merely, to silent indications of an extinct letter. The actual form of a sign, in one of these successive states, depends on the other original two conditions—the material and the tool in use. If in a hard stone they will be chiseled square; if in a soft, rounded, usually sunk, but occasionally in relief or intaglio-relief. This must have been preceded by scratching on stone, carving in wood, stamping or picking in clay, and painting or steneiling on a surface. Many eastern alphabets are written across the fiber of dry, hard leaves, and are usually minute and crumpled. Characters in soft clay or wax are legible and rounded. The invention of ink involves a brush, which gives a peculiar flowing look, or a reed pen, or a quill, whether for square or cursive characters, or the abomination of the artist—a steel-pen, with all the thick and thin lines of modern script. Stamped letters, for embossing or gilding, naturally led to block type, and they to separate type. The kinds of type in use in ornamental English printing are almost 100, yet each has a history and a reason. In regard to the method of writing, letters may go from left to right, direct; or right to left, reverse; or back and forth, woven; or from top to bottom, in columns. Some few occasionally go above or below another letter, and many abbreviate by contractions or monograms. The letters may occur in a syllabary, or in a vowellic syllabary, where each letter adds for a different vowel a hook or a tail; or they may be alphabetic, with vowels expressed, *scriptio plena*, or with vowels understood, *scriptio defectiva*. The letters may be all capitals, uncial, or with small letters (almost always different), minuscles; they may be connected by a bar at top, bottom, or middle, or with each other, cursive. Finally, they may be accented, pointed; or with hooks attached, apieces. Words are not always separated, and letters often vary in shape when occurring as initial, medial, or final. The earliest efforts at signs are tallies, still found in the Egyptian and Chinese numbers; the origin of the Chinese and several American systems is unknown to us; there are two or three systems known to be self-invented in modern times, and one or two, like the Lepcha or Ron of the Himalayas, and the running runes of the Danes and Celts (ogham), cannot be distinctly connected with a known alphabet. With these exceptions all systems known are traceable to one common center, but so lately has it been possible to assert this that Lenormant's *Spread of the Phenecian Alphabet*, first edition in 1868, and the best authority for the central Asiatic paleography, must be rewritten.

At a time so remote as to antedate all remains of Egyptian civilization, a writing of the true pictorial type seems to have suggested the systems of three different races—Egyptians, who may have been African and Indo-German; the men of the center of Arabia—Shemites; and the men of the Tigris valley, apparently Uraltaic. The identity of origin, necessarily difficult to prove where the deductions result very differently, and where the sign has a different meaning in four languages, is inferred from the choice of the same thing to represent the same metaphor, and from the identity of secondary forms throughout. The accepted derivation of Phenician from XVIII. dynasty hieratic is wrongly based on a necessary resemblance; both are the conventional representations of the same thing, but by far-separated routes. For latest collations of cuneatic and Shemitic, see Deecke, Z.M.G. The hieroglyphs are true word-pictures, and the language being one-syllabled they change into alphabetic. The writing is chiseled, direct or columnar, with always a determinative sign. The hieratic or priests' system, modified about the time of the Hyksos, is a graphic variety of the same, reversed, written with a brush on linen or papyrus. The demotic, in another dialect, direct, quickly formed, finally becomes cursive. The hieroglyphs were still read in Trajan's time, and a bastard demotic was written long after the Arab conquest. The Greeks of Alexandria introduced a beautiful graphic variety of the Greek alphabet, and, written direct, with 6 demotic signs added, it served as the vehicle of a living dialect of Egyptian till modern times. The third race, that best known to us as Accadian, leaves its first records of the 20 c. B.C. (?) in a few names of kings on bricks, on stone, on seals. Very quickly the character, a singular series of outline pictures, syllabic, direct, with determinative signs, appears accompanied by an east Shemitic idiom, the Babylonian; and the signs are composed of many lines each in shape of an arrow or wedge, whence the name, cuneiform, or better cuneatic, for all such inscriptions. Now follow a northern dialect, that of Nineveh, with fewer lines to the signs and a growing syllabary; the Babylonian continues; the mountaineers to the north-east, not Shemites nor Aryans, borrowed a distorted copy, the Susian; and lastly, the Persian or, as we now know it, the Bactrian, makes an alphabet of forty curtailed and legible characters, with almost no determinative signs—an alphabet thereafter to record the glories of the conquerors of Greece. From the Ninevite comes the rude and scanty Armenian of Van, hardly yet enough deciphered to be classified as to language; the old Assyrian commences, the fine clear-cut language of the old inscriptions and gems; the Babylonian soon falls under its power, but still continues for local use; and from the Susian, apparently, but with traces of all, is generated still a new system, that of the Uraltaic Medes. All thus far are cuneatic, all are direct, and all divide their words. The Assyrian, first in glory and spread in the 10th c. B.C., is the first of all Shemitic languages to generate a regular syllabary of twenty-two letters; but this itself bears traces of a late arrangement, and only thirteen of them appear in full form. After the fall of the Assyrian empire, the Babylonian character, debased and with more or less Assyrian influence, continues to be written until the Sassanian era, changing also in dialect to Aramaic. But from the true standard cuneatic syllabary are gendered, at some date probably long preceding the 10th c. B.C., a new series of systems no longer cuneatic, but more or less approaching to the type of our own letter. One of these, B, the Kypriot, only lately deciphered, has a syllabary of four vowels in combination with ten consonants, occurs as an antiquated Greek dialect in connection with pure Greek and Phenician inscriptions, principally in Cyprus, and supposedly as late as the times of Alexander. It remains to speak of the third or center variety of the three early types, the

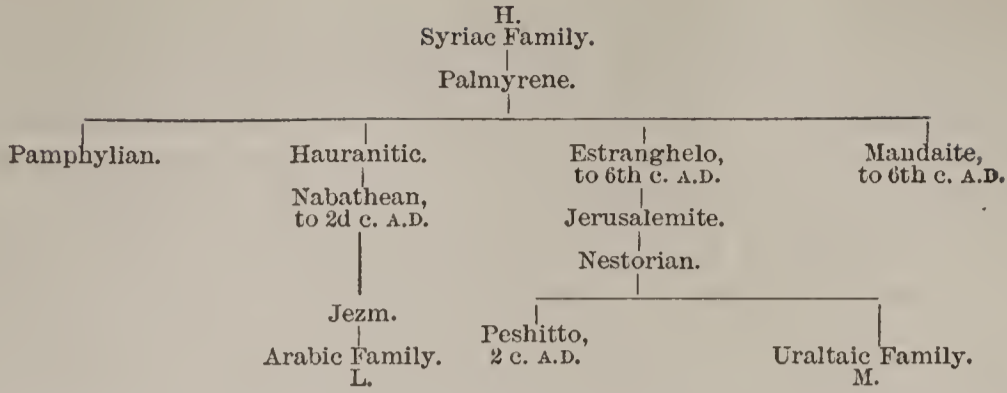

The original inhabitants of the center of Arabia—in Hebrew, B'nai Yuktan; in Arabic Beni Kahtan—have long spread from the n.w., touching Palestine as far s. as Nubia, and w. to Barbary. We have called them doubtfully Khittim or Hittites, though the Bible name would indicate Cyprus as one of their colonies, and identification is hindered by our not knowing who the Hittites were, nor what language they spoke. At any rate, Ramses II. found them in Palestine, and they then had scribes. The curious inscribed stones of Hamath appear to belong to the center or Himyari variety of letter; and the western, the Ghassani, has been found mixed with late Moabite legends. The Himyari, the Musnad of Arabic writers, was supplanted in the s. of Arabia by the modern Arabic. It adds 6 letters to the Phenician, and is a curious humped kind of alphabet, written reversed or woven. The Gheez, extinct in the 4th c. A.D., is an enormous syllabary of 33 letters, combined by differentiation with 6 vowels and with additional diphthongs. The other divisions are the old and the new systems of the Barbary tribes. The peculiar vowel treatment of Ethiopic—its fullness, its direct writing, and an identity of signs, all pointing to an Indian rather than a Shemitic relation—led Lenormant to derive the old Indian or Magadhi from a supposed primitive alphabet of Yemen. We follow an apparently conclusive German authority in referring the Indian D to the cuneatic. But the systems of this whole A family are very unlike, and there may be a supposition possible. The Libyan may represent a true Arabic alphabet, rudely formed from the hieratic syllabary, and of which the Himyari would be an enlargement under outside influence. The Hittites may have been, as often argued, a foreign race, who made a complicated and flexible syllabary out of the cuneatic as a basis, and from them the Indians may have obtained their own rich alphabet, and the forms which vary almost beyond recognition.

The archaic Phenician, of 22 letters, is the parent of all the alphabets, properly so named from their first letters. It is found in connection with cuneatic in the 10th c. B.C.; descends by a regular process of greater and greater curtailment through all the colonies of that sea-faring race; mixed with Libyan it formed the script of the rivals of Rome; and, still further debased, passed over to the Turditani and the mixed race of Bastulopoeni near cape Trafalgar. It is distinguished by its abominable execution. Seldom chiseled, usually scratched, often merely smeared or painted, the letters finally become almost indecipherable, and we see for the first time the quick and careless workmanship of a race of traders and clerks. Let it be understood that all inscriptions down to the fall of Babylon are never Aramaic, or of the northern Shemitic branch; they are all of the central band—either western, Kenzani or Yehudith, or eastern, Athmith or Babli. The Hebrew branch, E, must never then be confounded with the Chaldee jargon of the later prophets, so often understood by that term; it differs, in company with Moabite, from the Phenician, only in its being better executed and having a scriptio plenior. After the captivity the Samaritans retained the old alphabet, which passed through transition down to the present Samaritan type-letters and the late manuscript. The Hebrew letters were used on the coins of the Maccabees, and again, during the last flicker of independence, during the revolt of Bar Kokhabas. G, the Aramaic family, like all true Shemitic alphabets, is written reversed, and in modern times pointed for vowels and precessed letters.

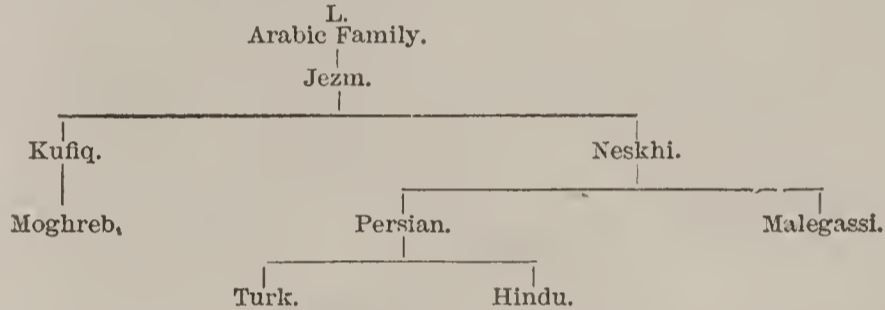

It varies from a type evidently influenced, by the local cuneatic found on the Babylonian tablets, to a coarse running style on the demotic papyri. It supplanted all the old alphabets in western Asia by the time of the last Achemenians, and results in

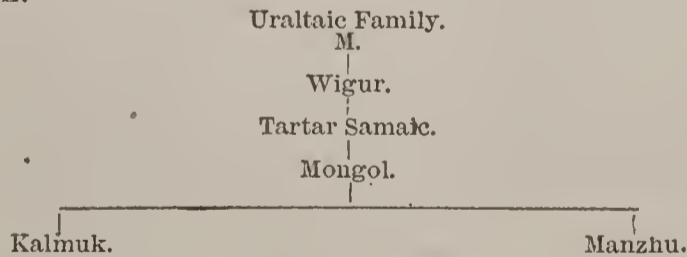

The Mandaite differentiates for vowels; but most Syrian letters are cursive, or bound by a bottom line. Final letters are the rule, and the best differentiate for place in the word. The Syrians of Malabar have a slightly changed Nestorian alphabet.

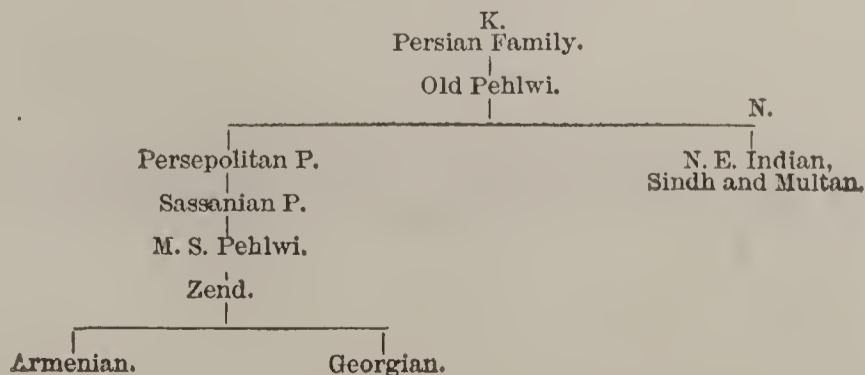

Earliest monuments known are not earlier than the 1st c. B.C. The Rabbinical is a current handwriting in use till the 12th c. A.D.; now superseded by the Spanish, the German, and the beautiful Raschi text. There are several forms of debased modern manuscript. It should be noticed that there are no Jewish manuscripts older than the 3d c. A.D., and that no vowels were pointed before the 5th century.

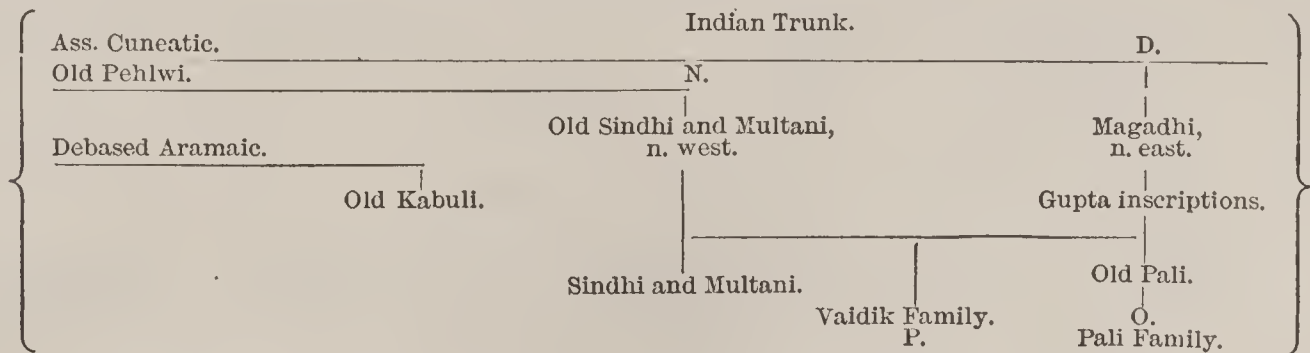

The modern Neskh appears on the tomb at Khartoom, in Nubia, of the second generation after the prophet. The Cufic, the beautiful characters erected upon a long straight bar, and used in ornamental inscriptions, had originally only the 22 letters of the Phenician, but they early added six precessed letters; yet not in the same order in the Barbary or Mograb alphabet. The Neskh turned the letters into a new order, easily memorized by a mnemonic verse, but based really on their forms, those alike being brought together. It is current, with some exceptions, reversed, differentiated for four places, and pointed for vowels. The Cufic is handsomer for inscriptions, but, as illuminated with a reed pen, it may be questioned whether so graceful an alphabet has ever been invented. Like all systems of which the letters differ widely in shape, it is not, except when in too fine a type, tiresome to the eye. There are various forms of more or less cursive shape, known by different names. The Persian Tazalik reduces the short twists to one long waving stroke. All foreign nations—and Arabic is the English of the East—make needed letters by pointing those nearest in Arabic. Such alphabets are the Malay, the Turk, the Indian, and the Afghan.

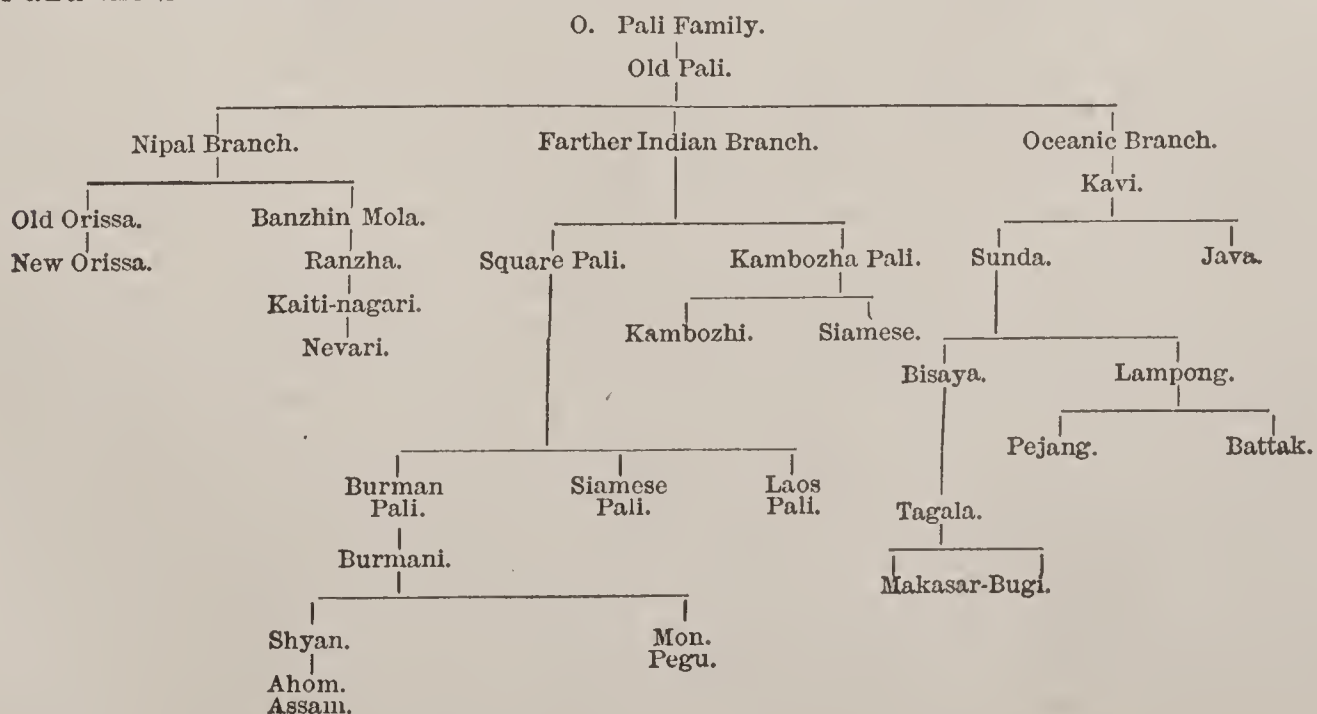

Wigur in 7th c. A.D., Manzhu in the 16th. Some differentiate for place, and connect; all write in column from above, down, which also appears to have been once true of the Estranghelo, from which they come. Kalmuk has 7 vowels and 18 consonants, the arrangement, as in all these alphabets, being arbitrary.

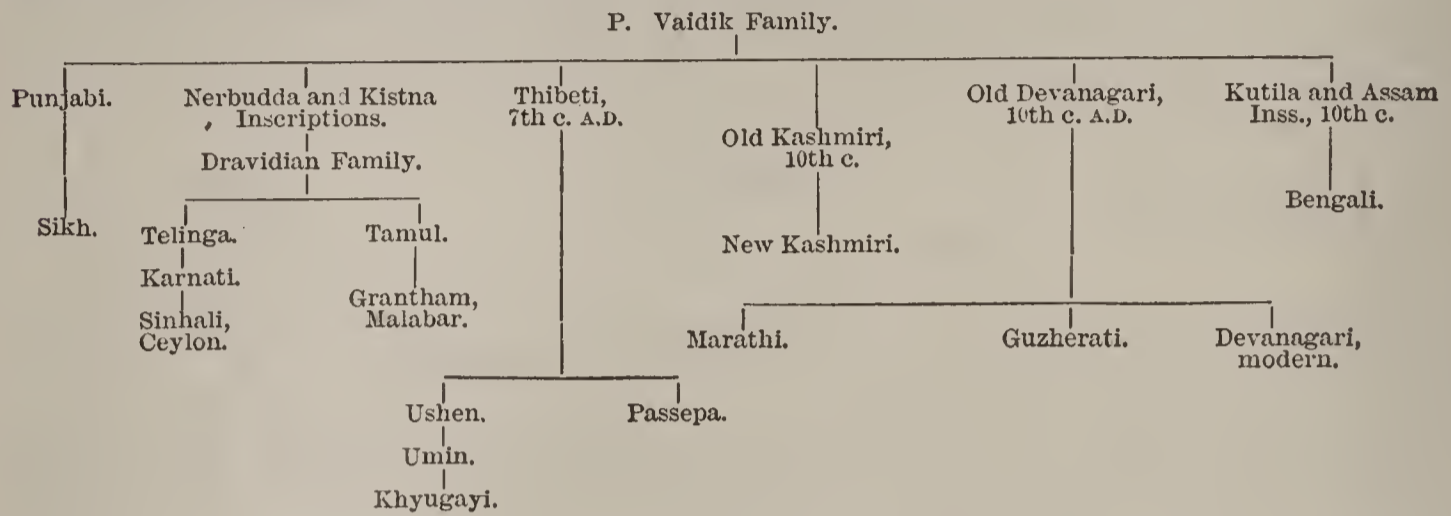

Eastern Aramaic of the Achemenian empire gradually changes, as may be traced on monuments, until it appears on the Sassanian coins. The MS. is exceedingly hard to read, the 4 vowels and 19 consonants being exceedingly alike, and ligatures and contractions numerous. The language is a conventional one, containing both Indo-German and Shemitic, and exceedingly difficult to understand: writing reversed, and words separated by a point. Zend is the language of the Avestas, and there may be distinguished an older and a newer form. An alphabet of 51 signs, which, like the last, have the flowing look of Arabic Neskhi, but many of the tails of the letters turn against the grain: writing disconnected, reversed, with ligatures. The Armenian began in the 5th c. A.D., till when they used Sassanian or Greek. They have large and small letters, both in type and cursive. The Georgian is of two types, older and newer. Both have 41 letters; and the Armenian, though undoubtedly Indo-German, appears to have been influenced to assume many strong explosives and double letters.

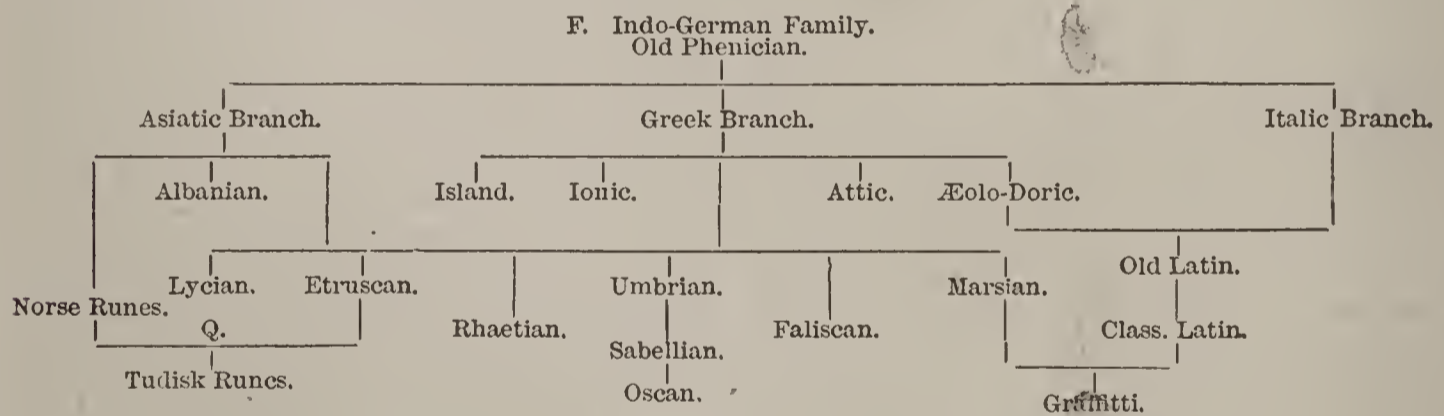

On old coins of Cabul of about 150-22 B.C. are found letters and numerals of an alphabet, evidently debased Aramaic, but more of a Syrian than of a Pehlwi type. It has neither mother nor daughter that we at present know, and has not been attached to the Aramaic branch, where it properly belongs, for that reason. The whole of Indian paleography is unsettled, and for a reason which always causes confusion; the relative antiquity of its alphabets and cultivation being elosely bound up with religion, all native observations on the subject are puerile or deceptive, nor is the student fitted for researches which belong to the sphere of the archæologist. Late discoveries of inscriptions on copper, on stone, and in caves, enable us to correct many extravagant claims for Indian antiquity, yet there still remain uncertainties and illusions which only critical research can dispel. It must be remembered that northern India, Brahmani till the 5th c. B.C., became Buddhi from the 3d c. B.C. to the 6th c. A.D., the wave spreading from the town of Bihar, then Magadha. The Magadhi alphabet is without the band-line above the letters, but each consonant implies the *a* vowel, since when several follow without a vowel they go each below the other. We have inscriptions of king Açoka, 3d c. B.C.; from Guzerat, 2d c. B.C.; from Allahabad. 5th c. A.D., and several probably slightly older than any. The difference is hardly so much as might be expected in so long a time, and all the Sanskrit letters are present, at least in the latest. Pali, its descendant, easily known by its wanting the band-line, coming into use in Buddhism just before its final expulsion from hither India, naturally became finally identified with that religion, and furnished the alphabets for the languages influenced by its missionary exile. There seems to have been a n.w. center, necessarily Brahmani, which, thrown into the background by Buddhism, contributed, after the downfall of the latter, to the formation of a new character, the ancestor of the modern hither Indian alphabets, and which, as it was used in committing to writing the sacred Brahmanical books, we may call the Vaidik. Such a supposed type, a floating mixture of old n.e. and n.w. types, must have existed, for a reciprocal influence is evident between modern Devanagari and the Sindhi and Multani.

The Nipal branch is particularly interesting as showing a gradual change to a type almost identical with Devanagari. The square Pali of Burmah is probably the nearest to the old Pali of any. The Burman itself being written with a heavy, slightly rounded character, painted with a brush, and a round, semicircular type for writing with a point, which may be taken as the distinctive appearance of most of the transgangetic alphabets. The Cambodian is contorted and intricate, and the Javanese crumpled. The Buddhists arrived in Pegu at the beginning of the 5th c. A.D. There is a kind of scrawl used in Malabar which can hardly be placed, and in several instances the arrangement of Lenormant has been curtailed or altered. The best authority on Pali is the work of Burnouf and Lassen, corrected by latest essays. From Siam spreads north-east the great family of toned or musical languages, culminating in Chinese.

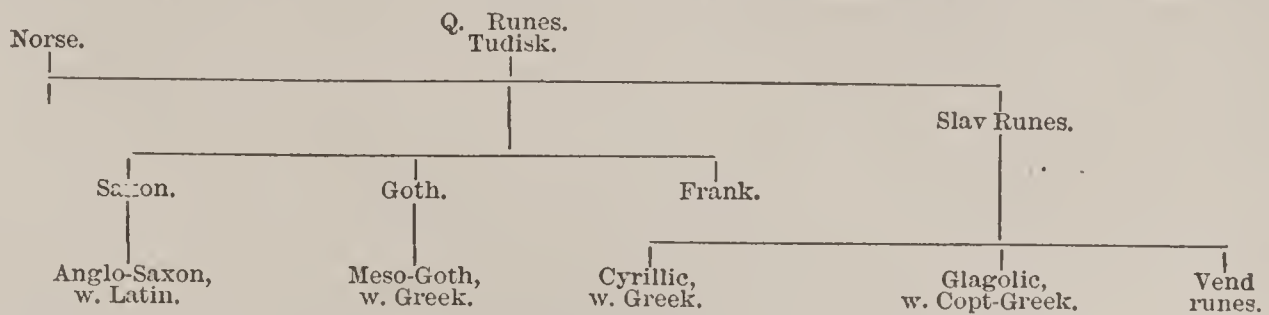

Buddhism made its way to Ceylon in the 3d c. B.C., and it is yet a question whether the last examples of the Dravidian family are really based on Pali or old Devanagari; they are certainly of that round type which is characteristic of the farther Indian alphabets. The modern Devanagari deserves notice from its full alphabet, from its being the exponent of a whole horde of dialects, and from its expression of the farthest developed of all the Indo-German languages. It is the only language which still connects (except certain interrupting letters) a whole sentence, and accents and inwardly changes it as one concrete expression. But the question for all scholars is, Are there any texts whatever, old in date (before the 10th c. A.D.), or, if old in date, without palpable interpolations, glosses, or subsequent precessions?

The oldest Greek inscriptions, of Melos and Thera, date from about 620 B.C. The old alphabets, besides this group of 23 letters, divide into another of 26, of two marked types—Æolian, or of Korkyra, and Doric. In many parts of Greece the Ionic, which may possibly show a derivation from secondary or Sidonian Phenician, replaced these older types, and the Athenians, adopting the characters for *ê* and *ô* about 400 B.C., make that variety the representative alphabet of classical Greek. The Italian alphabets have all an evident primitive air, and they differ from the Greek branch in that, like the Asiatic, they do not distinguish *v* from *o*. The dates of relics are about—Faliscan, middle of 4th c. B.C., Oscan the end, Sabellian the middle, Etruscan the first half of the 5th century. That the Etruscan does not belong with the Italic family is an inference which can hardly yet be considered proved, all this subject being made more difficult by the perfectly evident borrowing of all these types, one from another, and the perplexing way in which, while striving to make up signs not in the original Shemitic, each different dialect sets a different value on the very limited stock of new signs common to all. Everything points to the presence of the Kypriot syllabary on the islands long before any alphabet through the Phenician arrived there, but no vestiges of any such alphabet are left; and the resemblances between that syllabary and earlier alphabets are explainable exactly as were those of Phenician and Egyptian. The Lycian alphabet, as we now have it, is very late, of the time of the satraps at the earliest; and it, like all the others, is distinctly Phenician. It may be believed that some 13 to 16 letter alphabet once existed; the universal tradition of antiquity was to that effect; and the incomplete alphabet of early Assyrian points out what the letters and signs would naturally be;

but to find such an one we have to come down to the Norse runes, nearly 2,000 years later. The Asiatic systems are direct, but the others were at first reversed, then woven, only the survivals running direct like Greek and Latin. The late history of the two learned alphabets belongs rather to the subject of manuscript. It will be sufficient here to remind the reader that there was a cursive Greek as early as Alexandrian cultivation, and that Latin, already as much disfigured as Phœnician in the careless scrawls on the walls of Pompeii, had also a distinct cursive as early as the 2d c. A.D. It is a mistake to speak of an Irish, Saxon, or Norse mediæval alphabet. They are simply a beautiful variety of the usual early Lombardic letters; but the influence of the Greek scribes is evident in them, and they did not merge into the far uglier, angular, black-letter.

The earliest rune futhark (like the word alpha-bet) is probably of about A.D. 300; it and all others show acquaintance with the Latin alphabet; but just as evidently, they are, on close inspection, not derived from that alone. The letters on the bracteate of Sconen are 23 (is there one lost?) in number, and correspond closely enough with the names preserved by Ulfilas in his Meso-Gothic; they are, in fact, just the same as the Markoman alphabet, and the old part of the Anglo-Saxon futhark. The old Norse futhark, on the contrary, though it does not appear until the 8th c., is much more primitive, and originally had 15 characters (staves). These were pointed to represent the needed sounds in the beginning of the 13th c. by king Waldemar, and then give way before Christianity and its prejudice in favor of the Latin alphabet. While we see the west, or Teutonic system of runes, thus disappearing before an alphabet wholly inadequate to express the sounds of its dialects, the eastern or Slavonic took advantage of the (comparatively) brilliant ingenuity and learning of the Greek church, and, using as a basis a series of runes which unfortunately we do not possess entire, evolved the Moravian, or Cyrillic bukiviza (equals alphabet) in the 9th c., the Glagolitic, or southern Slavic, in the 13th century. The last is of, probably, 31 letters, and their forms are usually traced to a Coptic debasement of hieratic signs which equal their meaning in the original Slav. This is far-fetched. It would suffice that the Dalmatian monk Hieronymus, who invented them, had been a Copt by birth. The Cyrillic, parent of the modern Slav systems, shows the influence of the usual rounded Greek Byzantine character. It is necessary to say a few words of Russian, because it, with Devanagari and Persian Neskhi, shows a distinct attempt at a phonetic system. It is the only system that ever succeeded in spelling for Europeans the harsh and convoluted sounds of the Caucasus; it is evident what small additions would perfect the system, and the additions, generated as they might be from the original shapes of the runes, would come in well with the present letters. See ARYAN RACE : CUNEIFORM : PHILOLOGY.

PALEOLOGUS, the name of an illustrious Byzantine family, which first appears in history about the 11th c., and attained to imperial dignity in the person of Michael VIII. in 1260. This emperor successfully undertook many expeditions to Greece and the Archipelago, and used his utmost endeavors to heal the schism between the Roman and Greek churches, though with exceedingly little success. His successor on the throne was his son Andronicus II. (1282-1329), under whose reign the Turks commenced in earnest a series of assaults on the Byzantine dominions. Andronicus attempted to oppose them with a force composed of mercenaries, but his success was very doubtful, as these troops, with perfect impartiality, attacked both his enemies and his subjects. To pay them he was compelled to levy such imposts as went far to destroy Byzantine commerce. He associated his son, Michael IX., with himself in the government, and was dethroned by his grandson, Andronicus III. (1328-41), an able warrior and wise ruler, who repeatedly defeated the Bulgarians, Tartars of the Golden Horde, and the Servians, and diminished the oppressive imposts of the previous reign. He was, however, unsuccessful against the Catalans in Greece, and the Turks during his reign ravaged Thrace as far as the Balkan. He was greatly esteemed by his subjects, and well merited the title of "father of his country," which they bestowed upon him. His son, John VI. (1355-91), a weak and voluptuous prince, attempted in vain, both by force and bribery, to stop the progress of the Turks; at last the pope, moved by his urgent entreaties, which were backed by a promise to submit the Greek church to his (the pope's) supremacy, urged the Hungarians and Servians to arm in defense of the Greek emperor, but the result was only an additional triumph to Sultan Amurath. The imbecile emperor was several times deposed, and on his final reinstatement by the sultan, acknowledged himself as his vassal for the capital and a small tract along the Propontis and Black sea. Indeed, so degraded had the Byzantines become that they obeyed the sultan Bajazet's summons to aid him in reducing Philadelphia, the last Greek stronghold in Asia Minor. His son, Andronicus IV.

(1355-73), who had been associated with him in the government, died in exile. Manuel II. (1391-1425) pursued the same tactics as his father John VI., and with the same result. The allied army of the Hungarians, Germans, and French, which he had summoned to his aid against the Turks, was totally routed at Nicopolis by Bajazet, and Constantinople itself closely besieged. The invasion of Asia Minor by Timûr, however, compelled the sultan to withdraw his whole force, and his subsequent defeat and capture at Angora in 1402, and the contests among his sons for the supremacy, gave the Greek empire a breathing-space. Having aided Mohammed I. in his contests with his brothers, Manuel was, by the grateful sultan, presented with some districts in Greece, Thessalonica, and on the Euxine. John VII. (1425-49), on being pressed by the Turks, again held out to the pope the old bait of the union of the Greek and western churches under his sway, and even presented himself at the council of Florence, where, in July, 1439, the union of the churches was agreed to. But on his return to Constantinople, the opposition of the Greek ecclesiastics to the union, supported by the people, rendered the agreement of Florence a dead letter. The pope, however, saw that it was for his interest to fulfill his part of the agreement, and accordingly stirred up Wladislas of Hungary to attack the Turks (see JAGELLONS), but this act only hastened the downfall of the Paleologi. John's brother, Constantine XIII. (1449-53), a heroic scion of a degenerate race, accepted the crown after much hesitation, knowing his total inability to withstand the Turks, and even then took the precaution of obtaining the sultan's consent before he exercised the imperial authority; but some rebellions in Caramania which now occurred, baffling sultan Mohammed II.'s efforts to quell them, the emperor was willingly persuaded by his rash advisers that the time had now arrived for rendering himself independent of the Turks. The attempt, however, only brought swifter destruction on the wretched remnant of the Byzantine empire, for Mohammed invested the capital by sea and land, and after a siege, which lasted from April 6 to May 29, 1453, Constantinople was taken by storm, and the last of the Paleologi fell fighting bravely in the breach. A branch of this family ruled Montferrat, in Italy, from 1306, but became extinct in 1533. The Paleologi were connected by marriage with the ruling families of Hungary, Servia, and the last of the family married Ivan, czar of Russia—a fact which the czars of Russia have persisted till lately in bringing forward as a claim in favor of their pretensions to the possession of European Turkey. It is said that direct descendants of the Paleologi exist to the present day in France. (For further information see the separate articles on some of the emperors, and BYZANTINE EMPIRE.)

PALEONTOLOGY (Gr. science of fossil animals) is that division of geology (q. v.) whose province it is to inquire into the evidence of organic life on the globe during the different bygone geological periods, whether this evidence arises from the actual remains of the different plants and animals, or from recognizable records of their existence, such as footprints, coprolites (q. v.), etc.

The metamorphic action which has so remarkably altered the oldest sedimentary rocks, is sufficient to have obliterated all traces of organic remains contained in them. Fossils are consequently extremely rare in these older paleozoic strata, and indeed it is only after long search, and within a recent time, that undoubted remains have been found in the Laurentian rocks. We were unable to record their existence in the article LAURENTIAN SYSTEM; but in the article LIMESTONE, we referred to the existence of beds of limestone as requiring the presence of animal life for their production. It is true that in 1852 an organic form resembling a coral was found in the limestone of the Ottawa, but much doubt was always entertained regarding this solitary discovery. In 1863, however, there was detected an organism in the serpentine limestone of Grenville, of true Laurentian age, which Dr. Dawson describes as that of a foraminifer, growing in large sessile patches, after the manner of *carpentaria*, but of much greater dimensions, and presenting minute points, which reveal a structure resembling that of other foraminiferal forms, as, for example, *calcarina* and *nummulina*. Large portions of the limestone appear to be made up of these organisms, mixed with other fragments, which suggest comparisons with crinoids and other calcareous fossils, but which have not yet been distinctly determined. Some of the limestones are more or less colored by carbonaceous matter, exhibiting evidences of organic structure, probably vegetable. In this single foraminifer, and the supposed coral, we have all that is positively known of the earliest inhabitants of our globe, with which we are yet acquainted. That these are but the smallest fraction of the fauna of the period in which they lived, is evident from the undetermined fragments associated with them, as well as from the extensive deposits of limestone of the same age. And that contemporaneous with them, there existed equally numerous representatives of the vegetable kingdom, cannot be doubted, when it is remembered that the animal can obtain its food only through the vegetable, and not directly from inorganic materials. Besides, their remains apparently exist in the limestone at Grenville, a rock which, from its very nature, rarely contains vegetable fossils.

The Cambrian rocks, though of immense thickness, have hitherto yielded indications of only a very few animals, but these have a special interest, as they are the oldest fossil remains yet detected in Britain. They consist of an impression which Salter considers to be portion of a trilobite, named by him *paleopyge*, of the burrows and tracks of sea-worms, and of two species of radiated zoophytes called *oldhamia*—animals which in this case also can be nothing more than the most fragmentary representations of the fauna of

the period. No indications of vegetable life have yet been noticed in the Cambrian rocks, for we cannot consider the superficial markings on some of these strata as having anything to do with fuci.

Undoubted representations of the four invertebrate sub-kingdoms early make their appearance in the Silurian strata, and the occurrence before the close of the period of several fish, adds to them the remaining sub-kingdom—the vertebrata. If we except the silicious frustules of diatomaceæ which are said to have been detected in these rocks, no satisfactory traces of plants have yet been observed, although extensive layers of anthracitic shales are common. Of the lower forms of the animal kingdom, some sponge-like bodies have been found, and corals are remarkably abundant, chiefly belonging to the order *rugosa*, a paleozoic type, the members of which have horizontal tabulæ, and vertical plates or septa, either four in number, or a multiple of four. Graptolites, another family of zoophytes, flourished in the dark mud of the Silurian seas, and did not survive the period. All the great divisions of the mollusca are represented by numerous genera, several of which are not very different from some living forms. A few true star-fishes have left their records on the rocks, but the most striking feature in the echinodermata of the period is the cystideans, or armless sea-lilies, which, like the Graptolites, did not pass beyond the Silurian seas. Tubes, tracks, and burrows of annelids have been observed; and numerous crustacea, belonging, with the exception of one or two shrimp-like species, to the characteristic paleozoic trilobite, of which the number of individuals is as remarkable as the variety of species and genera. It is only in the upper portion of the group (the Ludlow beds) that the fish remains have been found. These have been referred to six different genera, and are chiefly loricated ganoids, of which *cephalaspis* is the best known.

The rocks of the old red sandstone period supply the earliest satisfactory remains of plants. The ferns, sigillariæ, lycopodites, and calamites, so abundant in the coal measures, make their appearance among the newer of these beds, and even fragments of dicotyledonous wood have been observed. The various sections of the invertebrata are well represented, but the remarkable characteristic in the animal life of the period is the abundance of strange forms of heterocercal-tailed fish, whose buckler-shields, hard scales, or bony spines occur in the greatest abundance in some beds. The reptiles and reptile tracks in the red sandstone of Moray, originally referred here, are now universally considered as belonging to the new red measures.

The striking feature in the rocks of the carboniferous period is the great abundance of plants, the remains of which occur throughout the whole series, the coal-beds being composed entirely of them, the shales being largely charged with them, the sandstones containing a few, and even the limestones not being entirely without them. These plants were specially fitted for preservation, the bulk of them being vascular cryptogams, a class which Lindley and Hutton have shown by experiment to be capable of long preservation under water. They are chiefly ferns; some are supposed to have been arborescent lycopods, while others (*sigillaria*, *calamites*, and *asterophyllites*) are so different from anything now known, that their position cannot be definitely determined, though it is most probably among the higher cryptogams. Several genera of conifers have been established from fossilized fragments of wood; and some singular impressions, which look like the flowering stems of dicotyledonous plants, have been found. The limestones are chiefly composed of crinoids, corals, and brachiopodous shells. The corals attain a great size, and the crinoids are extremely abundant, their remains making sometimes beds of limestone 1000 ft. thick, and hundreds of square miles in extent. Many new genera of shells make their appearance. The trilobites, which were so abundant in the earlier rocks, are reduced to one or two genera, and finally disappear with this period. Fish with polished bony scales are found; and others, like the Port Jackson shark, with pavements of flat teeth over their mouth and gullet, fitting them to crush and grind the shell-protected animals on which they fed. Strange fish-like reptiles existed in the seas, and air-breathing species have been found on the continent and in America. The wing-cases, and parts of the bodies of insects, have also been found.

The permian period is remarkable for the paucity of its organic remains, but this may arise from our comparative ignorance of its strata. The plants and animals are on the whole similar to those found in the carboniferous measures, and a great proportion of them belong to the same genera. Many ancient forms do not pass this period, as the *sigillaria* among plants, and the *producta* among animals.

The red sandstones of the triassic period are remarkably destitute of organic remains—the iron, which has given to them this color, seems to have been fatal to animal life. In beds, however, on the continent, in which the iron is absent, fossils abound. These fossils present a singular contrast to those met with in the older rocks. The paleozoic forms had been gradually dying out, and the few that were still found in the permian strata do not survive that period, while in their place there appear in the trias many genera which approach more nearly to the living forms. Between the organisms of the permian and triassic periods there exists a more striking difference than is to be found between those of any previous periods. Looking at this life-character, the rocks from the permian downwards have been grouped together under the title paleozoic; while from the trias upwards the whole of the strata have received the name of neozoic.

The extensive genera of ammonites and belemnites make their first appearance in the trias. Several new forms of cestraciont fish occur, and the reptiles increase in number and variety; among them is the huge batrachian labyrinthodon, and the singular fresh-water tortoise, dicynodon. The bird-tracks on the sandstones of Connecticut are by some referred to this age. Small teeth of mammalia, believed to be those of an insectivorous animal, like the myrmecobius of Australia, have been found in the keuper beds of Germany and Somerset.

In the oolitic series we have an abundance of organic remains, in striking contrast to the scanty traces in the permian and triassic periods. Many new genera of ferns take the place of the paleozoic forms, and a considerable variety of conifers make their appearance, some of which have close affinities with living species, one, indeed, being referred to a still existing genus. The same approximation to living types is to be found in the animal kingdom. Several of the foraminifers are referred to living genera. Among the corals, the representatives of two living families make their appearance. No new genera are found among the brachiopoda; but the conchifera and gasteropoda show a great addition of new genera, some of which are still represented by living species, while not many new genera were added to the cephalopoda, though they were individually very abundant. In some places the lias shale consists of extensive pavements of belemnites and ammonites. The crinoids give place to the increasing variety of sea-urchins and star-fishes. Numbers of insects have been found. The cestracionts continue to be represented in the oolitic seas, but with them are associated several true sharks and rays; and the homocercal-tailed fish become numerous. Labyrinthodont reptiles abound: the huge megalosaur and its companions occupied the land; while the seas were tenanted with the remarkable ichthyosaur and plesiosaur, and the air with the immense bat-like pterodactyl. Seven genera of mammalia have been found, all believed to be small carnivorous or insectivorous marsupials except the stereognathus, which Owen considers to have been a placental mammal, probably hoofed and herbivorous.

In the cretaceous beds, which are chiefly deep sea deposits, the remains of plants and land animals are comparatively rare. The wealden beds, however, which had a fresh-water origin, contain the remains of several small marsupials, some huge carnivorous and herbivorous reptiles, a few fresh-water shells, and some fragments of drift-wood. The true chalk is remarkably abundant in the remains of foraminifers—indeed, in some places, it is composed almost entirely of the shells of these minute creatures. Of the mollusca, the brachiopoda are in some beds very abundant; the conchifera introduce several new forms, the most striking of which is the genus hippurites, which with its allies did not survive this period; the cephalopodous genera which appeared in the oolite continue to abound in the chalk, many new forms being introduced; while others disappear with the period, like the belemnites and ammonites. Sea-urchins become still more numerous. In some beds the remains of fish are abundant, and while cartilaginous species still exist, the bony fishes become more numerous; and among them the family to which the salmon and cod belong makes its appearance. Reptiles are common in the wealden, and the flying pterodactyls attained a greater size, and were probably more numerous than in the former period. The remains of a single bird has been obtained from the greensand, but with this exception, birds as well as mammals have left no traces that have yet been found in the cretaceous beds, though doubtless they existed.

In the tertiary strata, the genera are either those still living, or forms very closely allied to them, which can be separated only by the careful examination of the accurate scientific observer. The plants of the eocene beds are represented by dicotyledonous leaves, and palm and other fruits. Foraminifers are remarkably abundant, whole mountain masses being formed of the large genus nummulites. Brachiopoda are rare, but conchifera, gasteropoda, and cephalopoda increase in number; the new forms being generically almost identical with those now living. The principal living orders of fish, reptiles, and birds are represented in the eocene strata. A considerable variety of pachydermatous mammals, suited apparently to live on marshy grounds and the borders of lakes, have been found in France and England, and associated with them are some carnivorous animals, whose remains are, however, much rarer. An opossum has been found at Colchester. The fragments belonging to the supposed monkey are portions of a small pachyderm, *hyracotherium* (q.v.).

Little need be said of the invertebrata of the miocene period, beyond remarking their growing identity in genera with the living forms. Among the mammals, the quadrumana make their first appearance. The true elephant and the allied mastodon are represented by several species; a huge carnivorous whale has been discovered, and several carnivora and deer, with a huge edentate animal, have been described. Owen thus speaks of these animals: "Our knowledge of the progression of mammalian life during the miocene period, teaches us that one or two of the generic forms most frequent in the older tertiary strata still lingered on the earth, but that the rest of the eocene mammalia had been superseded by new forms, some of which present characters intermediate between those of eocene and those of pliocene genera."

In passing upwards through the tertiary strata, the organic remains become more and more identical with living forms, so that when we reach the pliocene and pleistocene periods, the great proportion of the invertebrata are the same species which are found occupying the present seas. Among the higher orders of animals the life of a species is

much shorter than in the lower, and consequently, though the vertebrata approach so nearly to existing forms as for the most part to be placed in the same genera, yet the species differ from any of the living representatives of the different genera.

The Suffolk "erags," which are the only British representatives of the pliocene period, contain the relics of a marine testacea, that differs little from the present tenants of the European seas, between 60 and 70 per cent being the same species. The ear-bones of one or more species of cetacea have been found, and at Antwerp, the remains of a dolphin have been discovered in beds of this age.

The various local deposits which together form the pleistocene strata, the latest of the geological periods, contain a great variety of organic remains. In the submarine forests and in beds of peat, the stumps of trees are associated with the remains of underwood and herbaceous plants of species still living. Nearly all the mollusea and other marine invertebrata still survive. It is among the vertebrata that the most remarkable forms appear—forms which in the main differ little from the existing race of animals except in their enormous size. Elephants and rhinoceroses, fitted for a cold climate by their covering of long coarse hair and wool, roamed over the northern regions of both the old and the new world, and were associated with animals belonging to genera which still exist in the same region, as bears, deer, wolves, foxes, badgers, otters, wolverines, weasels, and beavers, besides others whose representatives are now found further south, as the hippopotamus, tapir, and hyena. Contemporary with these, there lived in South America a group of animals which were types in everything but in size of the peculiar existing fauna of that continent. Among these were gigantic sloth-like animals, fitted to root up and push down the trees, instead of climbing to strip them of their foliage, like the sloth. The armadillo was represented by the huge glyptodon, whose body was protected by a strong tessellated coat of mail. The species of fossil tapirs and peccaries are more numerous than their living representatives. The llamas were preceded by the large macrauchenia, and the opossums and platyrrhine monkeys were also prefigured by related species. Besides these, there have been found the remains of two mastodons and a horse, none of which are represented by any indigenous living animal in South America. The peculiar group of animals confined to Australia were prefigured by huge marsupials, some having close analogies to the living kangaroos and wombats, while others were related to the carnivorous native tiger. The gigantic wingless birds of New Zealand correspond in type with the anomalous apteryx, now existing only on these islands.

Associated with the remains of elephants, mastodons, cave-bears, and cave-hyenas, there have been found in England and France, numerous specimens of flint implements, which are undoubtedly the result of human workmanship, and show at least that man was contemporaneous with these extinct animals. If more certain evidence were needed of this, it has been obtained in the discovery of flint implements, bone implements fashioned and carved by means of the flint knives, the horns of a reindeer, two kinds of extinct deer, *bos primigenius*, and other animals, associated with numerous bones of man, included in the breccia of the cave of Bruniquel in France. Owen considers the evidence of the contemporaneity of the various remains as conclusive. The several human skulls which have been obtained show, according to the same authority, no characters whatever indicative of an inferior or transitional type. There are no certain data to give probability to the guesses which have been made as to the number of years which have elapsed since these deposits in which the relics of man occur were formed. The whole inquiry, moreover, is so recent, and the accumulation of facts is almost every day going on, that it would be premature to speak dogmatically on the subject.

PALEONISCUS (Gr. ancient sea-fish), a genus of ganoid fish, with a fusiform body, covered with rhomboid scales, a heterocercal tail, and moderately-sized fins, each furnished with an anterior spine. The single dorsal fin is opposite to the interval between the anal and ventral fins. Twenty-eight species have been described from the carboniferous and permian measures.

PALEOPYGE (Gr. ancient ramp), a genus of fossil crustacea, founded on a single impression from the surface of a bed in the Longmynd, of Cambrian age. Salter believes it to be the cephalic shield of a trilobite, but it may be only an accidental marking. If it be the impression of an organism, it is so distorted and imperfect that little can be made of it; its peculiar interest arises from its being associated with the earliest forms of life that have been observed on the globe.

PALEOSAURUS (Gr. ancient lizard), a genus of fossil saurian reptiles peculiar to the permian period. The remains of two species occur in the dolomitic conglomerate at Redland, near Bristol. The teeth were more or less compressed, and were furnished with serrated cutting margins. The vertebræ were biconcave, and had a remarkable depression in the center of each vertebra, into which the spinal canal was sunk. The leg-bones show that the paleosaurs were fitted for moving on the land. Owen thus exhibits their affinities: "In their thecodont type of dentition, biconcave vertebræ, double-jointed ribs, and proportionate size of the bones of the extremities, they are allied to the teleosaurus, but with these they combine a dinosaurian femur, a lacertian form of tooth, and a crocodilian structure of pectoral and probably pelvic arch."

PALEOTHE'RIUM (Gr. ancient wild beast), a genus of pachydermatous mammalia whose remains occur in the eocene beds of England and the continent. At least ten species have been described, ranging in size from that of a sheep to that of a horse. The upper eocene gypseous quarries of Montmartre supplied the first scanty materials, which Cuvier, by a series of careful and instructive inductions, built up into an animal, whose fidelity to nature was afterwards verified by the discovery of a complete series of fossils. In general appearance the paleotherium resembled the modern tapir, and especially in having the snout terminating in a short proboscis. It had three toes on each foot, each terminated by a hoof.—The formula of the teeth is the same as that of the hyracothere, viz.,

$$i. \frac{3-3}{3-3}, c. \frac{1-1}{1-1}, p. m. \frac{4-4}{4-4}, m. \frac{3-3}{3-3} = 44;$$

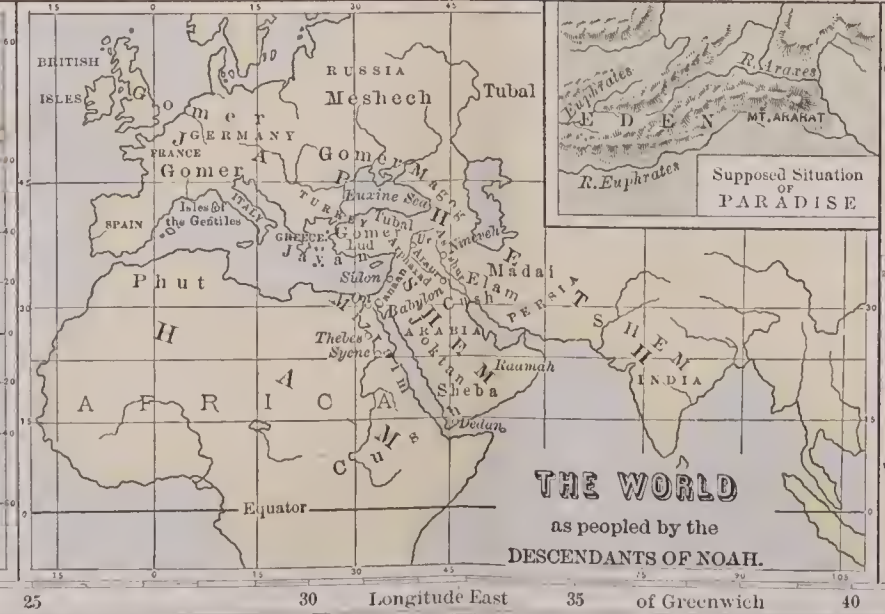

but the structure of the molars approaches nearer to the molars of the rhinoceros. It is supposed that animals of this genus dwelt on the margins of lakes and rivers, and that their habits were similar to those of the tapir.

PALEOZO'IC (Gr. ancient life), the name given to the lowest division of the fossiliferous rocks, because they contain the earliest forms of life. They were formerly, and are still generally, known as the primary rocks. The strata included under these titles are the laurentian, cambrian, silurian, old red sandstone, carboniferous, and permian systems. Phillips, for the sake of uniformity, introduced mesozoic as equivalent to secondary, and neozoic to tertiary rocks.

PALERMO, an archiepiscopal city, important seaport, and the capital of the island of Sicily; capital also of the province of the same name, and along with Naples, Rome, Milan, and Turin, one of the five most populous cities in the kingdom of Italy, is situated on the n. coast of the island, 135 m. by water w. of Messina; lat. 38° 6' n., long. 13° 20' east. It stands in a highly-cultivated and fertile plain called *La Conca d'Oro* (The Golden Shell), commands a beautiful view of the gulf of Palermo on which it stands, and is backed toward the interior by ridges of mountains. In shape the town is an oblong parallelogram, the direction of its length being from s.w. to n.e. It is divided into four quadrangular parts by two great streets, the beautiful *Via Vittorio Emanuele*, formerly the *Via Toledo* or *Cassaro*, and the *Strada Nuova* or *Macqueda*, which cross each other at right angles in the middle of the city. It is upward of four m. in circumference, is surrounded by walls pierced with 12 gates and flanked with bastions, and is defended by several batteries. The houses are balconied, flat-roofed, and have glass doors instead of windows. The streets, besides the two main thoroughfares already mentioned, are generally well laid out, and there are several fine promenades, of which the famous *Marina*, extending along the shore, on the line of the ancient fortifications, and bordered by the palaces of the nobles, is the most magnificent. Palermo contains 60 parish churches; 8 abbeys; 71 monasteries and convents, to which belong from 20,000 to 30,000 monks and nuns; and, besides these, 19 oratories. Under the churches is counted the cathedral—the church of St. Rosalia. At the intersection of the two principal streets there is a large octagonal space or *piazza*, lined with palaces, and adorned with statues and marble fountains. The royal palace is a huge pile of buildings, with a splendid chapel, built in 1129, and contains many pillars of rare workmanship and rich mosaics with Arabic inscriptions. The cathedral is a fine edifice, originally Gothic, but to which incongruous Greek additions have been made, is adorned with marble columns and statues, and contains monuments of the emperor Frederick II. and of king Roger, the founder of the Norman monarchy in Sicily. Among the principal public institutions of Palermo are the university, an academy of arts and sciences, a medical academy, an institution for arts and antiquities, a beautiful and extensive public garden, public libraries, theaters, etc. Palermo is an archbishop's see, the residence of the governor of the island, and the seat of the supreme courts. Manufactures of silks, cottons, oil-cloth, leather, gloves, etc., are carried on. The harbor is formed by a mole, 1300 ft. in length, on which there is a light-house and battery. Vessels of 700,000 tons enter and clear the port annually, and the imports amount in value to near £1,000,000, and the exports to about the same sum. Pop. '71 of Palermo with suburbs, 186,406; of comune, 219,838. Pop. '81, 205,712.

The environs of Palermo are interesting as well as picturesque, and embrace many pleasant villas and noble mansions. North-west of the city is Monte Pellegrino, the Eirete of the ancients, an abrupt rocky mass, in which there is a grotto or cave, in which Santa Rosalia, a young Norman princess, lived a life of religious retirement. In Palermo, Santa Rosalia is esteemed more highly than even Santa Maria; the festival in her honor lasts from the 9th to the 13th of July, and is the most important festival held on the island. During its celebration the city is illuminated, the streets are gay and brilliant, and there is an immense influx of strangers from the vicinity. But the chief feature of the festival is the procession to the cave. An immense silver image of the saint is borne thither on a wagon, 70 ft. long, 30 ft. broad, and 80 ft. high. Its form resembles that of a Roman galley, with seats for a choir. The wagon is drawn by 56 mules, covered with the gayest trappings, and driven by 28 postilions.

Palermo, the ancient *Panormus*, was originally a Phœnician colony, but had become

a dependency of Carthage before the name occurs in history. With the exception of a short time about 276 B.C., when it fell into the hands of the Greeks, it continued to be the headquarters of the Carthaginian power in Sicily, until it was taken by the Romans during the first Punic war (254 B.C.), when it became one of the principal naval stations of the Romans. The name Panormus is derived from the excellent anchorage (Gr. *hor-mos*) in the bay; but the Phœnician name found on coins is *Machanath*, meaning "a camp." The Vandals, and afterwards the Arabs, made it the capital of the island, and after the Norman conquest it continued to be the seat of the king of Sicily. It still remained the royal residence under the Aragonese kings; but the court was removed after Sicily became united to the then kingdom of Naples. See SICILY.

PA'LES, in Roman mythology the goddess who presided over flocks and shepherds, and was worshiped with great pomp. Her festival, called *Palilia*, was celebrated April 21, the anniversary, according to tradition, of the founding of Rome by Romulus. On this day the shepherds purified their flocks by making them pass round a large fire made of laurel, pine, and olive branches, sprinkled with sulphur. Milk, wine, and millet, were then placed on the altar of the goddess, who was entreated to bless the earth and the cattle with fecundity, and avert injury from both. These ceremonies were followed by feasting and rejoicing.

PALESTINE (*Palæstina*, *Philistia*), or the HOLY LAND, a country of south-western Asia, comprising the southern portion of Syria, and bounded on the w. by the Mediterranean, e. by the valley of the Jordan, n. by the mountain-ranges of the Lebanon and the glen of the Litâny (Leontes), and s. by the desert of Sinai; lat. 31° 15' to 33° 20' n., long. 34° 30' to 35° 30' east. Within these narrow limits, not more than 145 m. in length by 45 in average breadth—an area less than that of the principality of Wales—is comprised the "Land of Israel" or "Canaan," the arena of the greatest events in the world's history. The principal physical features of Palestine are, (1) a central plateau or table-land, with a mean height of 1600 ft., covered with an agglomeration of hills, which extend from the roots of the Lebanon to the southern extremity of the country; (2) the Jordan valley and its lakes; and (3) the maritime plain, and the plains of Esdraëlon and Jericho. On the e., the descent from the central plateau is steep and rugged, from lake Huleh to the Dead sea. On the w. it is more gentle, but still well marked, towards the plains of Philistia and Sharon. The ascertained altitudes on this plateau, proceeding from s. to n., are Hebron, 3,029; Jerusalem, 2,610; mount of Olives, 2,724; mount Gerizim, 2,700; mount Tabor, 1900; Safed, 2,775 ft. above the sea. Nearly on the parallel of the sea of Galilee, the range of Carmel extends from the central plateau n.w. to the Mediterranean, where it terminates abruptly in a promontory surmounted by a convent. It rises from 600 ft. in the w., to 1600 ft. in the e., and is composed of a soft white limestone, with many caverns. Beyond the boundary of Palestine on the n., but visible from the greater part of the country, mount Hermon rises to 9,381 ft., and is always snow-clad. From the formation of the central plateau, the drainage is nearly always e. and w., to the Jordan and the Mediterranean. The streams of the plateau are insignificant, and generally dry in summer.

The geological formation of the country consists of jurassic and cretaceous limestone, often covered with chalk, and rich in flints, with occasional interruptions of tertiary, basaltic, and trappean deposits. The upper strata consist of limestone of a white or pale-brown color, containing few fossils, but abounding in caverns, which form one of the peculiarities of the country. The general features of the landscape exhibit soft rounded hills, separated by narrow glens or valleys of denudation; the strata are occasionally level, but more frequently, violently contorted, as seen on the route from Jerusalem to Jericho, where the fissures are often 1000 ft. deep, and only 30 or 40 ft. wide. Iron stone occurs in small quantities; rock-salt, asphaltum, and sulphur abound near the Dead sea, where, as also near the sea of Galilee, there are many hot springs. Volcanic agency is evident in the obtruded lava of former ages, and in frequent earthquakes of modern times. The vast crevasse through which the Jordan flows, and which cleaves the land from n. to s., is one of the most remarkable fissures on the surface of the globe; it is from 5 to 12 m. wide, and of the extraordinary depth of 2,630 ft. at the bottom of the Dead sea. Through this the river descends at the rate of 11 ft. in a mile, with a course so tortuous that it travels 132 m. in a direct distance of 64, between the sea of Galilee and the Dead sea. It is the only perennial river of Palestine, except the Kishon, which is permanent only in its lower course, and the Litâny on its northern border. See JORDAN. The only lakes of Palestine are in the valley of the Jordan. See GENNESARET, SEA OF, and DEAD SEA.

The plain of Philistia extends from the coast to the first rising ground of Judah, about 15 m. in average width; the soil is a rich brown loam, almost without a stone. It is in many parts perfectly level; in others undulating, with mounds or hillocks. The towns of Gaza and Ashdod, near the sea, are surrounded by groves of olives, sycamores, and palms. This plain is still, as it always was, a vast corn-field, an ocean of wheat, without a break or fence; its marvelous fertility has produced the same succession of crops, year after year, for forty centuries without artificial aid. The plain of Sharon is about 10 m. wide in the s., narrowing towards the n., till it is terminated by the buttress of Carmel. Its undulating surface is crossed by several streams; the soil is rich,

and capable of producing enormous crops; but only a small portion of it near Jaffa is cultivated, and it is rapidly being encroached on by the sea sand, which, between Jaffa and Cæsarea, extends to a width of 3 m. and a height of 300 feet. The famous ancient cities of this region, Cæsarea, Diospolis, and Antipatris, have vanished. Jaffa (Joppa) alone remains, supported by travelers and pilgrims from the w. on the way to Jerusalem. The great plain of Esdraëlon, or Jezreel, extends across the center of the country, from the Mediterranean to the Jordan, separating the mountain-ranges of Carmel and Samaria from those of Galilee. Its surface is drained by the Kishon, which flows w. to the Mediterranean at Haifa. The plain is surrounded by the hills of Gilboa and Little Hermon; the isolated Mount Tabor rises on its n.e. side. It is extremely fertile in grain where cultivated, and covered with gigantic thistles where neglected. It is richest in the central part, which slopes e. to the Jordan—the battle-field where Gideon triumphed, and Saul and Jonathan were overthrown. It is the home of wandering Bedouins, who camp in its fields, and gallop over its green-sward in search of plunder. Many places of deep historical interest are connected with this plain. Shunem, Nain, Endor, Jezreel, Gilboa, Bethshan, Nazareth, and Tabor are all in its vicinity. The plain of Jericho is a vast level expanse, covered with the richest soil, now quite neglected. Around the site of Jericho, “the city of palm-trees,” there is not now a single palm; but a recent experiment proved its capability of producing in abundance all the crops for which it was formerly famous. The climate of Palestine is very varied; January is the coldest and July the hottest month. The mean annual temperature of the year at Jerusalem is 65° Fahr., resembling that of Madeira, the Bermudas, and California. The extreme heat of the summer months is modified by sea-breezes from the n.w. In the plain of Jericho and the Jordan valley it is extremely hot and relaxing. The *sirocco*, a s.e. wind, is often oppressive in early summer. Snow falls in the uplands in January and February, and thin ice is often found at Jerusalem, where the annual rainfall is 61 inches. Heavy dews fall in summer, and the nights are cold. Violent thunder-storms occur in winter. In the s., Judah and part of Benjamin, is a dry, parched land; the bare limestone rock is covered here and there with a scanty soil, and the vast remains of terraces show how assiduously it must have been cultivated in ancient times to support the teeming population indicated by the ruins of cities with which every eminence is crowned. To the n. of Judea the country is more open, the plains are wider, the soil richer, and the produce more varied, till at Nablous the running streams and exuberant vegetation recall to the traveler the scenery of the Tyrol. Even in its desolation, Palestine is a land flowing with milk and honey. There is no evidence of its climate having changed or deteriorated, nor any reason to suppose that it would fail to support as great a population as ever it did, provided the same means as formerly were used for its cultivation. It has the same bright sun and unclouded sky, as well as the early and latter rain, which, however, is diminished in quantity, owing to the destruction of trees.

The botany of Palestine is rich and varied, resembling that of Asia Minor. Among its trees are the pine, oak, elder, and hawthorn in the northern and higher districts, and the olive, fig, carob, and sycamore elsewhere. The cultivated fruits are the vine, apple, pear, apricot, quince, plum, orange, lime, banana, almond, and prickly pear. Wheat, barley, peas, potatoes, and European vegetables, cotton, millet, rice, maize, and sugarcane are among its products. The date now ripens its fruit only in the s. and on the sea-board. The brilliant flowers which in spring enamel the surface and tinge the entire landscape, comprise the adonis, ranunculus, mallow, poppy, pink, anemone, and geranium. In the Jordan valley, 900 or 1000 ft. below the sea-level, the vegetation is tropical in its character, resembling that of Arabia; the nubk (*spina christi*), the oleander, and the small yellow “apples of Sodom” are conspicuous. The most valuable products of the vegetable kingdom are derived from the vine, fig, olive, and mulberry trees. Wine for home use is made in all the central and southern districts; the best is made at Hebron from the grapes of Eshcol. Olive-oil is a valuable export.

The wild animals of Palestine comprise the Syrian bear in Lebanon, the panther, jackal, fox, hyena, wolf, wild boar, gazelle, and fallow-deer; the lion is now unknown. The domestic animals are the Arabian camel, ass, mule, horse, buffalo, ox, and broad-tailed sheep. Among the birds are the eagle, vulture, kite, owl, nightingale, jay, and kingfisher—the latter of brilliant plumage—the cuckoo, heron, stork, crow, partridge, and sparrow. Fish swarm in the sea of Galilee, and bats and lizards abound.

The divisions of Palestine in Old Testament times were into 9½ tribes in the w., and 2½ tribes in the e. of the Jordan. In New Testament times, on the w. of the Jordan, the provinces of Galilee in the n., Samaria in the middle, and Judea in the s.; on the e. of the Jordan, Perea and Decapolis. The boundaries of the tribes and provinces are very uncertain. Its modern divisions have changed with every new race and dynasty of conquerors. Under Turkish rule, Palestine is comprised in the vilayet of Syria, and contains the two subpashalics of Acre and Jerusalem. The present population is near 700,000, and consists mainly of a race of mixed descent, sprung from Syrians, Arabs, and Greeks. The Jews are all foreigners, almost exclusively inhabiting the four holy cities—Jerusalem, Hebron, Tiberius, and Safed; their whole number was, in 1871, estimated at only 10,000. The country is oppressed by Turkish avarice, and overrun by the predatory Arabs. The Palestine exploration has done good work in the identification of Biblical and classical sites, etc. See SYRIA.

PALES'TRA, a building for gymnastic sports.

PALESTRINA (the ancient *Præneste*), an episcopal city of the present kingdom of Italy, in the province and 22 m. e.s.e. of the city of Rome, occupies a strong position on the s.w. slope of a high hill, an offset of the Apennines. Besides several interesting churches, the town contains a castle, once the chief stronghold of the Colonna, to whom the town belonged; and the palace and garden of the Barberini family. The view across the Campagna and toward the Alban hills is magnificent. Pop. 6,000, who manufacture coarse woollen goods.

Palestrina is built almost entirely upon the site and the gigantic substructions of the Temple of Fortune, one of the great edifices of the former city of Præneste. This city was one of the most ancient as well as powerful and important cities of Latium. It covered the hill (2,400 ft. above sea-level) on the slope of which the modern town stands, and was overlooked by a citadel of great strength. The site of this citadel on the summit of the hill is now occupied by a castle of the middle ages, called *Castel S. Pietro*; but remains of the ancient walls are still visible. We first hear of Præneste as a member of the Latin League; but in 499 B.C. it quitted the confederacy, and joined the cause of the Romans. In 380 B.C., the Prænestines, having rejoined their ancient allies, opened a war with Rome; but were completely routed on the banks of the Allia by T. Quintius Cincinnatus, and beaten back to their own gates. They took a prominent part in the famous Latin war, 340 B.C. Having given shelter to the younger Marius in the year 82 B.C., this city was besieged by the forces of Sulla, and on its being taken all the inhabitants were put to the sword. A military colony was then established in their place, and soon the city began to flourish anew. Its elevated and healthy situation, at no great distance from the capital, made it a favorite place of resort of the Romans during summer. Augustus frequented it; Horace often found this city a pleasant retreat; and here Hadrian built an extensive villa. The Temple of Fortune is described by Cicero as an edifice of great antiquity as well as splendor, and its oracle was much consulted. The town became the stronghold of the family of Colonna in the middle ages; but was given to the Barberini family by Urban VIII.

PALESTRINA, GIOVANNI PIERLUIGI DA, a distinguished musical composer of the 16th century. He derived his surname from the town of Palestrina, in the Roman states, where he was born in 1524. At the age of sixteen, he went to Rome, and studied music under Claude Goudimel, afterwards one of the victims of the St. Bartholomew massacre. In 1551 he was made *maestro di cappella* of the Julian chapel, and in 1554 he published a collection of masses, so highly approved of by pope Julius III., to whom they were dedicated, that he appointed their author one of the singers of the pontifical chapel. Being a married man, he lost that office on the accession to the pontificate of Paul IV., in whose eyes celibacy was a necessary qualification for its duties. In 1555 he was made choir-master of St. Maria Maggiore, and held that position till 1571, when he was restored to his office at St. Peter's. In 1563, the council of Trent having undertaken to reform the music of the church, and condemned the profane words and music introduced into masses, some compositions of Palestrina were pointed to as models, and their author was intrusted with the task of remodeling this part of religious worship. He composed three masses on the reformed plan; one of them, known as the mass of pope Marcellus (to whose memory it is dedicated), may be considered to have saved music to the church by establishing a type infinitely beyond anything that had preceded it, and, amid all the changes which music has since gone through, continues to attract admiration. During the remaining years of his life, the number and the quality of the works of Palestrina are equally remarkable. His published works consists of 13 books of masses, 6 books of motets, 1 book of lamentations, 1 book of hymns, 1 book of offertories, 1 book of magnificats, 1 book of litanies, 1 book of spiritual madrigals, and 3 books of madrigals. Palestrina must be considered the first musician who reconciled musical science with musical art, and his works form a most important epoch in the history of music. Equally estimable in private life, and talented as a musician, Palestrina struggled through a life of poverty during eight pontificates; his appointments were meager, and his publications unremunerative. He died in 1594. A memoir of his life and writings has been written by the abbé Baini.

PALES'TRO, a village of Piedmont, 8 m. s.e. of Vercelli, famous as the scene of a battle between the Sardinians and Austrians in May, 1859. On the 30th of that month the Piedmontese drove the Austrians from this village, and on the 31st defended it with great bravery against an Austrian attack. The Piedmontese, in the battle of the 31st, were assisted by 3,000 French zouaves, and on that occasion the Austrians lost 2,100 men killed and wounded, 950 prisoners, and 6 pieces of cannon. On June 1st the allies entered Novara.

PALETTE. See PAINTING.

PALEY, FREDERICK APTHORP, b. England, 1816; educated at Shrewsbury, and Cambridge. He left the university on account of his conversion to the Roman Catholic faith. He returned to Cambridge, subsequently, and lived there till 1874, when he was called to the chair of classical literature at the Roman Catholic university college at Kensington. He has been classical examiner at the university of London, and a member

of the civil service commission. He has done much to promote the restoration of churches and the advancement of church architecture; and, in this connection, has written *The Ecclesiologist's Guide to Churches*; *The Church Restorers—a Tale*; *Remarks on the Architecture of Peterborough's Cathedral*, etc. He has edited Æschylus, Euripides, the *Iliad*, Theocritus, Propertius, etc., and has translated into English, Æschylus, and the *Odes* of Pindar, and, in verse, the 5th book of Propertius. He has also translated Schömann's book on the assemblies of the Athenians, and has written a number of pamphlets and articles on classical subjects.

PALEY, Dr. WILLIAM, a celebrated English divine, was born at Peterborough in 1743. His father was a Yorkshireman, and not long after Paley was born returned to his native parish of Giggleswick, one of the wildest and most sequestered districts in the West Riding, to become a master of the grammar-school there. Young Paley was brought up among the shrewd, hard-headed peasantry of Yorkshire; and it is probable that he either naturally possessed, or insensibly acquired their moral and mental characteristics. At all events, he soon became conspicuous in the family for his good sense; and when he left to enter Christ's college, Cambridge, as a sizar, in his 16th year, his father said: "He has by far the clearest head I ever met with." At Cambridge, Paley led for the first two years, a gay, idle, and dissipated life, but thereafter became a severe student, and took his bachelor degree in 1763 with highest honors. He then taught for three years in an academy at Greenwich. In 1765 he obtained the first prize for a prose Latin dissertation—the subject being, "A Comparison between the Stoic and Epicurean Philosophy with respect to the Influence of each on the Morals of a People," in which he characteristically argued in favor of the latter. Next year he was elected a fellow and tutor of Christ's, and also took the degree of M.A. In 1767 he was ordained a priest. His career as a college tutor, which lasted about ten years, was eminently successful; and it appears to have been during this period that he systematized his principles in moral and political philosophy. In 1776 Paley married, and was of course obliged to give up his fellowship, but was compensated by a presentation to the livings of Mosgrove and Appleby in Westmoreland, and of Dalston in Cumberland. Four years later he was collated to a prebendal stall in the cathedral church of Carlisle; in 1782 he became archdeacon, and in 1785 chancellor of the diocese. The last of these years witnessed the publication of his *Elements of Moral and Political Philosophy*. In this work he propounds his ethical theory, which is commonly called utilitarianism, but is really a mixture of utility and theology. He begins by renouncing the favorite doctrine of the moral sense, against which he adduces a series of strong objections. He then takes up the question of the source of obligation, and resolves it into the will of God, enforced by future punishment, admitting candidly that virtue is prudence directed to the next world. The will of God, in so far as it is not rendered explicit by revelation, is to be interpreted by the tendency of actions to promote human happiness; the benevolence of the Deity being supposed. Objection has frequently been taken to the principles on which Paley rests his system, but the lucidity and appositeness of his illustrations are beyond all praise. If his treatise cannot be regarded as a profoundly philosophical work, it is at any rate one of the clearest and most sensible ever written, even by an Englishman; and if it failed to sound the depths of "moral obligation," it at least brushed off into oblivion the shallow and muddy mysticism that had long enveloped the philosophy of politics. Paley's plain, sarcastic view of the "divine right of kings," which he puts on a level with the "divine right of constables," gave extreme offense to George III., but was nevertheless much admired by not a few of his majesty's subjects, and is now held by everybody to be beyond question. In 1790 appeared his most original and valuable work—the *Horæ Paulinæ, or the Truth of the Scripture History of St. Paul evinced by a Comparison of the Epistles which bear his name with the Acts of the Apostles, and with one another*. The aim of this admirable work is to prove, by a great variety of "undesigned coincidences," the improbability, if not impossibility, of the usual infidel hypothesis of his time—viz., that the New Testament is a "cunningly-devised fable." It was dedicated to his friend John Law, then bishop of Killala, in Ireland, to whose favor he had been indebted for most of his preferments. Paley's next important work was entitled *A View of the Evidences of Christianity*, published in 1794. It is not equal in originality to its predecessor, but the use which the author has made of the labors of such eminent scholars as Lardner and bishop Douglas is generally reckoned most dexterous and effective. Later and keener criticism is indeed anything but satisfied with Paley's "evidences;" but in Paley's own day he was held to have achieved a splendid triumph over skeptics, and was handsomely rewarded. The bishop of London appointed him a prebend of St. Pancras; shortly after, he was promoted to the subdeanery of Lincoln (worth £700 per annum); Cambridge conferred on him the degree of D.D.; and the bishop of Durham the rich rectory of bishop Wearmouth (worth £1200 per annum), in consequence of which he honorably resigned his livings in the diocese of Carlisle. After 1800 he became subject to a painful disease of the kidneys; but, notwithstanding, he continued to write, and in 1802 published perhaps the most widely popular of all his works, *Natural Theology, or Evidences of the Existence and Attributes of the Deity*, which, however, is based, and to a large extent borrowed from the *Religious Philosopher*, the work of a Dutch philosopher named Nieuwentyt, an English translation of which appeared in 1718-19. The plagiarisms are most palpable, but have

been accounted for on the supposition that the *Natural Theology* was "made up" from his loose papers and notes written when Paley was a college tutor, and that he had forgotten the sources from which he derived them. It is also but fair to state that he has taken nothing which he has not greatly improved; *nihil tetigit, quod non ornavit*. A somewhat noted edition of this work, enriched, or at least expanded by annotations and dissertations, is that by lord Brougham and sir Charles Bell (1836-39). Paley died May 25, 1805. He had a family of four sons and three daughters. A complete edition of his works was published in 1838 by one of his sons—the rev. Edmund Paley. The best biography is that by Meadley (1809).

PALFREY, JOHN GORHAM, D.D., LL.D; b. Boston, 1796; graduated at Harvard in 1815, and studied for the ministry. In 1818 he was called to the pulpit of the Brattle square church (Congregational-Unitarian), Boston, and in 1831, to the chair of sacred literature at the Harvard divinity school, where he remained till 1839. He was editor of the *North American Review*, 1839-42, and in the latter year gave a course of lectures before the Lowell institute, Boston, on *The Evidences of Christianity*, which appeared in book form the next year. He was elected to the Massachusetts legislature in 1842, and secretary of the commonwealth in 1844. He entered congress as a whig in 1846. He had already opposed the extension of slavery in a series of articles called *The Progress of the Slave Power*; and in Dec., 1847, he declined to vote for Robert C. Winthrop, the whig candidate for speaker. This step, with his well-known anti-slavery principles, cost him his seat at the election of 1848, after a close contest. He soon joined the free-soil party, was one of the editors of the *Commonwealth*, the Massachusetts organ of that party, and their candidate for governor. He acted with the republican party after its formation; but he did not again hold office, except from 1861-66, when he was postmaster of Boston. He has published *Lectures on the Jewish Scriptures and Antiquities*, 1838-52; *Harmony of the Gospels*, 1831; *Sermons*, 1834; *Academical Lectures*; *Remarks on the Proposed Constitutional Amendments*; and *The Relation Between Judaism and the History of New England*, 4 vols., 1858-78. The latter work is perhaps the best history ever written by an American, so far as original investigation of sources and impartiality are concerned; but is not brilliant in style. An abridgment of this history appeared in 1866, with the title *A History of New England from the Discovery by Europeans to the Revolution of the Seventeenth Century*, 4 vols. He died April, 1881.

PALGRAVE, Sir FRANCIS, a distinguished antiquary and historian, was b. in London in July, 1788, of Jewish parentage, being the son of Mr. Meyer Cohen, a member of the stock exchange. He was educated at home under a Dr. Montucci, and even when a child showed extraordinary genius. When only eight years old, he made a translation into French of the *Battle of the Frogs and Mice* from the Latin version of Beauclerc, which was printed by his father in 1797. In 1803 he was articled as a clerk to a legal firm, and at the expiration of his articles, continued with the same firm as managing clerk until 1822, when he took chambers in the Temple, and was employed under the record commission. He had previously made himself known as a literary antiquarian, by the publication, in 1818, of some Anglo-Norman chansons, which he edited with much care. On the occasion of his marriage in 1823, he changed his name of Cohen to Palgrave, that being the maiden name of his wife's mother. He was called to the bar in 1827, and had considerable practice for some years in pedigree cases before the house of lords. In 1831 he published a *History of England*, which formed a part of the *Family Library*; and in 1832 appeared his *Rise and Progress of the English Commonwealth*; also *Observations on the Principles, etc., of New Municipal Corporations*. In that year he received the honor of knighthood, and was subsequently one of the municipal corporation commissioners. In 1835 the commissioners issued their report, which was signed, however, by only 16 of the members—sir Francis Palgrave being one of the four dissentients. In the same year he published a "Protest" against the commissioners' report, in which he called in question several of its statements, views, and arguments. In 1838, on the reconstruction of the record service, sir Francis Palgrave was appointed deputy-keeper of her majesty's records, and held that office during the rest of his life. Besides the works already mentioned, sir Francis Palgrave edited for the government the following: *Calendars of the Treasury of the Exchequer*, *Parliamentary Writs*, *Curia Regis Records*, and *Documents Illustrative of the History of Scotland*. In his private capacity he produced the *Merchant and the Friar*, an imaginary history of Marco Polo and Friar Bacon; also a *Hand-book for Travelers in Northern Italy*, and a *History of England and Normandy*. Of this last work a volume appeared in 1851, and a second in 1857; and the third and fourth volumes were published within three years after their author's death. Sir Francis Palgrave also wrote numerous articles for the *Edinburgh* and *Quarterly Reviews*, principally of an antiquarian character, but some of them purely literary or artistic. His great merit, in his historic writings, consists in the extensive use made by him of original documents, by aid of which he not only himself very much enlarged our acquaintance with the history and social aspects of the middle ages, but pointed out to others the advantage to be derived from a careful study of the original sources of information now known to abound among our public records. Sir Francis Palgrave died at Hampstead, on July 6, 1861.

PALGRAVE, FRANCIS TURNER, b. England, 1824; son of sir Francis Palgrave. He was educated at the Charterhouse and at Oxford; was for 5 years vice-principal of the training college for schoolmasters at Kneller hall, and afterward held a position in the educational department of the privy council. He was for a number of years private secretary to earl Granville. He has published *Idylls and Songs*, 1854; *The Golden Treasury of English Songs*, 1861; *Art Catalogue of the Great Exhibition of 1862*; *Essays on Art*, 1866; *Hymns*, 1867; *Lyrical Poems*, 1871; and *Chrysomela, a Selection from the Lyrical Poems of Robert Herrick*, 1877.

PALGRAVE, WILLIAM GIFFORD, b. England, 1826; son of sir Francis Palgrave, an English author, educated at the Charterhouse, obtained a scholarship at Trinity college, Oxford. He served in the Indian army, and in 1847 was commissioned 2d lieut. in the 8th Bombay native infantry. In 1853 he resigned his commission, and joined the society of Jesus connected with the Roman Catholic church, and went to the Jesuit seminary at Laval to study theology, residing most of his time in s. India during his engagement with that society, and stayed in Rome two years. He was ordained priest, resided several years in and near Damascus, acquired a complete mastery of the Arabic language and Mohammedan theology, and went voluntarily to join the mission at Syria and Palestine, for which, on account of his knowledge of Arabic, he was peculiarly fitted. In 1861 he delivered in Ireland a course of lectures on the massacres of the Christians in Syria. In 1862 he set out on an expedition from Maan on the w. border of the Sherarat desert, and traveled through the Wahabite kingdoms of central Arabia, disguised as a physician, and subsequently visited the provinces adjacent to the Persian gulf and Indian ocean. He was shipwrecked on the coast of Oman, returning to Europe through Bagdad and Aleppo in 1863. In 1864 he abandoned the order of Jesuits at Berlin. He had become so familiar with the Arabs and their language that he was looked upon by them as one of their own leaders and *sheikhs*, and he took part on several occasions in their religious services. In 1865-66 he was in Egypt on government business; and returning, was appointed to various consulates. In 1864 he published *A Personal Narrative of a Year's Journey Through Central and Eastern Arabia*, and was presented with the gold medal of the French geographical society. The book awakened some curiosity, as the precise object of his wanderings was not made public. In 1872 his *Essays on Eastern Questions* appeared, and *Hermann Agha, an Eastern Narrative*, a novel in 2 vols. In 1875 *Alkamah's Cave, a Story of Nejd*, was published; in 1876, *Dutch Guiana*, an account of a fortnight's stay there. He has contributed valuable papers to the *Contemporary Review*, is a fellow of the royal geographical and the royal Asiatic societies, and an honorary member of a number of scientific institutions in foreign lands.

PALI (a corruption of the Sanskrit *Prâkrit*, q.v.) is the name of the sacred language of the Buddhists. Its origin must be sought for in one or several of the popular dialects of ancient India, which are comprised under the general name of Prâkrit, and stand in a similar relation to Sanskrit as the Romance languages, in their earlier period, to Latin. It has been formerly assumed that Pâli arose from the special Prâkrit dialect called Mâgadhî, or the language spoken in Magadha; but, according to the view expressed by Lassen in his *Indische Alterthumskunde*, an hypothesis of this kind is not tenable, since the peculiarities of this dialect are not compatible with those of the Pâli language. The same distinguished scholar holds that the Prâkrit dialects, called the S'aurasenî and Mâhârâshtrî, have a closer relation to the Pâli than any other, and that the origin of the latter must therefore be traced to the country of western Hindustan, between the Jumna river and the Vindhya mountain; though he observes, at the same time, that the Pâli is older than these dialects, and that the latter are therefore more remote from Sanskrit than the former. Whether the oldest works of the Buddhist religion were written in Pâli may be matter of doubt. It is more probable, on the contrary, that the language in which the founder of the Buddhist religion conveyed his doctrine to the people was not yet that special language, but a mixture of classical and popular Sanskrit, such as it still appears in the Buddhistic Sûtras. At a later period, however, Pâli became the classical language in which the Buddhists wrote their sacred, metaphysical, and profane works. The most important historical work written in this language is the *Mahâvans'a* (q.v.); other Pâli works, which have lately become known in Europe, and deserve especial mention, are the *Dhammapada*, on the Buddhist doctrine; and five *Jâtakas*, containing a fairy tale, a comical story, and three fables—both works edited and translated by V. Fausböll (Copen. 1855 and 1861). Pâli ceased to be a living language of India when Buddhism was rooted out of it; it was carried by the fugitive Buddhists to other countries, especially Ceylon, Burmah, and Siam, but in these countries, too, it had to give way before the native towns, in which the later Buddhist literature was composed.

PALIA'NO, a walled t. of the papal states in the province of Frösino, 32 m. s.w. of Rome; pop. 5,100. It has a large baronial castle which for a long time was the residence of the powerful Colonna family, descendants from Pierre Colonna, a vassal of the pope in the 11th c., among whose members were pope Martin V. and many prelates and generals.

PALICI, LAKE OF, or NASSIA, near Catania in Sicily; emitting large quantities of carbonic gas. It was formerly used as an ordeal for persons accused of crime, who were pronounced innocent, if they escaped the mephitic vapor.

PALIKAO, CHARLES GUILLAUME MARIE APPOLLINAIRE ANTOINE COUSIN-MONTAUBAN, Comte de, 1796-1878; b. France. In 1860 he was made supreme in command of the French and English forces sent to China to "conquer a peace" and with relatively insignificant force captured forts, gained battles, and entered Peking on Oct. 12 of that year. The Chinese government succumbed to the power of his small army and accepted the terms proposed. On his return to France in 1861 Napoleon presented him with the grand cross of the legion of honor, and gave him the title of count of Palikao; that being the name of the place where the decisive battle with the Chinese was fought. In 1870 he succeeded M. Ollivier as premier, and acting war-minister at the beginning of the German war; and was associated with the misfortunes that followed the French army. He published a defense of his administration in 1871. Died in Paris.

PAL'IMPSEST (Gr. *palimpsestos*, "rubbed a second time"), the name given to parchment, papyrus, or other writing material, from which, after it had been written upon, the first writing was wholly or in part removed for the purpose of the page being written upon a second time. When the MS. had been written with one species of ink employed by the ancients, which was merely a fatty pigment, composed chiefly of lampblack, and only coloring the surface, but not producing a chemical change, there was little difficulty in obliterating the writing. It was accomplished by the use of a sponge, and if necessary, of a scraper and polishing tool; and, where proper pains were taken, the erasure of the first writing was complete. But when the ink was mineral, its effect reached beyond the surface. In that case a scraping-tool or pumice-stone was indispensable; if these were hastily or insufficiently applied, the erasure was necessarily imperfect; and thus it often happens in ancient MSS. that, from the want of proper care on the part of the copyist in preparing the parchment for re-writing, the original writing may still be read without the slightest difficulty.

The practice of re-preparing used parchment for second use existed among the Romans. The material thus re-prepared was of course reserved for the meaner uses. We

boggest quia
 et omnes christiani membrasunt christi
 mensura christi quid cantant, amant
 desiderant cantant. Aliquando
 christi cantant.

meet frequent allusions in the classical writers, as Plutarch, Cicero (*Ad Familiares*, vii. 18), Catullus (xxii. 115), and others, to the palimpsest, in the sense of a blotter or first draft-book, on which the rough outline or first copy of a document was written, preparatory to the accurate transcript which was intended for actual use; and it appears equally certain that in many cases whole books were written upon re-prepared parchment or papyrus, not only among the Greeks and Romans, but also among the ancient Egyptians.

Of palimpsests of the classic period, however, it is hardly necessary to say no specimen has ever been discovered. It is to the necessities of the mediæval period that literature owes the unquestionably important advantages which have arisen from the revival of the ancient practice of re-preparing already used material for writing. Under the early emperors, the intercourse with Egypt and the east secured a tolerably cheap and abundant supply of papyrus (q.v.), which rendered it unnecessary to recur to the expedient of the palimpsest; and this became still more the case in the 5th and 6th centuries, when the tax on papyrus was abolished. But after the separation of the e. and w., and still more after the Mohammedan conquest of Egypt, the supply of papyrus almost completely ceased; and from the 7th c. in the west, and the 10th or 11th in the east, the palimpsest is found in comparatively frequent use; and its frequency in the 15th c. may be estimated from the fact that some of the earliest books were printed on palimpsest. Some writers have ascribed the prevalence of its use to the indifference, and even to the hostility of the monks and clergy to classical literature, and have attributed to their reckless destruction of classic MSS., in order to provide material for their own service-books and legendaries, the deficiencies in the remains of ancient learning which scholars have now to deplore. That some part of the loss may have so arisen it is impossible to doubt, although it is equally certain that we owe to the mediæval monks and clergy whatever of ancient literature has been preserved to our day. But the condition in which the existing palimpsests are uniformly found—for the most part mere fragments of the ancient

writers whose works they originally contained—goes far in itself to show that the MSS. which were broken up by the mediæval copyists, for the purpose of being re-written, were almost always already imperfect, or otherwise damaged; nor is there anything in the condition of any single palimpsest which has reached our day to justify the belief, that when it was taken up for the purpose of rescription, the original work which it contained was in a state at all approaching to completeness. Fortunately, however, there are many of the relics of ancient learning of which even the mutilated members have an independent value; and this is especially true of biblical MSS., particularly under the critical aspect, and in a still broader sense of all the remains of the ancient historians.

It will easily be understood, therefore, that the chief, if not the sole interest of palimpsests MSS. lies in the ancient writing which they had contained, and that their value to literature mainly depends on the degree of legibility which the ancient writing still retains. It is difficult to make this fully intelligible to the reader without an actual inspection, but the facsimile on the previous page will furnish a sufficient idea. The particular passage selected for the illustration is from page 62 of the Vatican MS., from which Mai deciphered the fragments of the *De Republica*. The darker letters are those of the modern MS.; the faint lines are, as may be supposed, those of the original codex. Although so much more faint than the modern writing, they can be read with facility on account of their greater size. We shall transcribe both texts in ordinary characters. The original was as follows:

EST
IGITUR INQUIT
AFRICANUS RESP.
(The ordinary contraction for *Respublica*.)

The corresponding lines of the modern MS., which is from St. Augustine's commentary on the psalms, are:

homo est quia
et omnes Χριστι (Christiani) membra sunt Χρι. (Christi)
membra Χρι. quid cantant. Amant
Desiderando cantant. Aliquando.

In this specimen, as very commonly occurs, the original writing is much larger than the modern; the modern lines and letters do not cover those of the old MS., but they follow the same order. In other specimens the new writing is transverse; in some, the old page is turned upside down. Sometimes, where the old page is divided into columns, the new writing is carried over them all in a single line; sometimes the old page is doubled, so as to form two pages in the new MS. Sometimes it is cut into two or even three pages. The most perplexing case of all for the decipherer is that in which the new letters are of the same size, and are written upon the same lines with those of the original MS. Examples of this are rare, and even when they occur, the difference between the form of the ancient characters, which are ordinarily uncial, and that of the modern, is in itself a great aid to the decipherer. Some variety, also, is found in the language of the palimpsests. In those which are found in the western libraries, the new writing is almost invariably Latin, while the original is sometimes Greek, and sometimes Latin. In the palimpsests discovered in the east the original is commonly Greek, the new writing being sometimes Greek, sometimes Syriac, sometimes Armenian; and one palimpsest, the material of which is papyrus, is found in which the original was the enchorial Egyptian language, while the modern writing is Greek.

The possibility of turning palimpsest MSS. to account as a means of extending our store of ancient literature was suggested as far back as the days of Montfaucon; but the idea was not turned to practical account till the latter part of the 18th century. The first palimpsest editor was a German scholar, Dr. Paul Bruns, who having discovered that one of the Vatican MSS. was a palimpsest, the effaced matter of which was a fragment of the 91st book of Livy's *Roman History*, printed it at Hamburg in 1773. In the field of discovery thus opened by Bruns but little progress was made until the following century, when Dr. Barrett of Trinity college, Dublin, published his palimpsest fragments of St. Matthew, and when palimpsest literature at once rose into interest and importance in the hands of the celebrated Angelo Mai (q.v.). A detailed account of Mai's successes will be given hereafter, when we shall enumerate the principal publications in this curious department of letters; and under his own name will be found the history of his personal labors. The great historian Niebuhr about the same time applied himself to the subject, and was followed by Blume, Pertz, Gaupp, and other German scholars, whose labors, however, were for the most part confined to the department of ancient Roman law. More recently, the discoveries of Dr. Tischendorf in biblical literature, and those of Dr. Cureton as well in sacred as in profane literature, have contributed still more to add importance to the palimpsest MSS. which have been supposed to exist in the monasteries of the Levant. Herr Mone has had similar success in the department of liturgical literature, and Dr. Frederick Augustus Pertz, son of the scholar already mentioned, may be said to have carried to its highest point the interest which attaches to these curious researches, by editing from a *thrice-written palimpsest* a very considerable series of fragments of the Roman annalist, Gaius Granius Licinianus.

It remains to enumerate briefly the most important palimpsest publications which have hitherto appeared, distributed according to the language of the effaced original.

I. GREEK PALIMPSESTS.—Among these, the first place of course belongs to the Greek biblical palimpsests, the earliest of which was (1) *Fragments of the Gospel of St. Matthew*, in facsimile as well as in *ordinary* type, printed from a palimpsest MS. of Trinity college, Dublin, by the rev. I. Barrett, D.D. (4to, Dublin, 1801). The original writing appears to be of the 6th century. Dr. Barrett's transcript of the text has not proved in all respects correct, but the original has since been carefully re-examined, and the ancient writing fully brought out. It is chiefly, however, to a collection of Syriac MSS. brought from the east that we are indebted for the more recent palimpsest restorations of the ancient biblical readings. In this line the chief discoverer has been Dr. Constantine Tischendorf. From his pen we have (2) the celebrated *Codex Ephremi* or *Codex Regius* of the royal library at Paris. This MS. had been early observed to be palimpsest, and the original Greek text was collated in part by Wetstein and by Küster. It was still more carefully examined by M. Hase in 1835; and finally, in 1840, by Dr. Tischendorf, by whom the New Testament was printed in 1843, and the fragments of the Old in 1845. The modern writing of this palimpsest consisted of the works of St. Ephrem the Syrian. (3.) *Fragmenta Sacra Palimpsesta* (4to, Leipsic, 1855), containing fragments of the books of Numbers, Deuteronomy, Joshua, Judges, Kings, Isaiah, together with 48 pages of fragments of the New Testament, the Gospels, the Acts, and the Epistles of St. Paul to the Corinthians and to Titus. The modern writing of these palimpsests was partly Greek, partly Armenian, and Arabic. (4.) *Fragmenta Evangelii Lucae et Libri Genesis* (4to, Leipsic, 1857). The fragments of St. Luke's gospel amount to 95 pages. The volume also contains fragments of St. John's gospel and of Ezekiel and the Third Book of Kings. The modern writing is partly Syriac, partly Coptic. Along with these biblical palimpsests (5) may be classed another, the original of which, however, contains not only some Greek fragments, but also portions of the ancient Gothic version of the Bible by Ulphilas. The MS. from which this is taken is known from its place in the Wolfenbüttel library as the *Codex Guelpherbytanus*. It was first noticed in 1755 by Knittle, by whom a portion of the Gothic version was published in 1762. These fragments were reprinted in 1772, and again in 1805. The modern writing of the MS. consisted of the *Origenes* of Isidorus Hispalensis. A large addition to the text of Ulphilas was made in 1817 by Mai and Castiglione, from palimpsests discovered in the Ambrosian library at Milan; and the whole have since been combined into one edition by Dr. Gabelentz, and finally by Dr. Massmann (4to, Stuttgart, 1855). We may also mention under the same head some interesting Greek liturgical remains edited by F. I. Mone (Frankfort, 1850), from a palimpsest discovered at Carlsruhe.

In Greek classical literature, also, we owe something to the labors of palimpsest editors. From one of the Syriac MSS. already referred to, Dr. Cureton has edited large fragments of the *Iliad* of Homer, amounting in all to nearly 4,000 lines; and although all these, it need hardly be said, were known before, yet the text is of the utmost value as a source of criticism, being certainly of much greater antiquity than the very earliest known MSS. of the *Iliad*. A still larger and more original contribution to Greek classical literature was made by Mai in the 5th volume of his *Scriptorum Veterum Nova Collectio* (Rome, 1831-38). From a very large palimpsest discovered in the Vatican library he has printed in this volume copious fragments of almost all the Greek writers on Roman history—from the lost books of Polybius no less than 100 4to pages; 130 pages of Diodorus Siculus; 64 of Dionysius of Halicarnassus; 100 of Dion Cassius; together with considerable fragments of Appian, Iamblichus, Dexippus, Eunapius, and others. This is, perhaps, after the *De Republica* of Cicero, the most important accession to the existing store of classic learning which the palimpsests have hitherto supplied.

II. LATIN PALIMPSESTS.—(1.) The earliest fragment of Latin literature, printed from a palimpsest original, is the portion of the 91st book of *Livy* already referred to, published at Hamburg and also at Rome in 1773. It was re-edited in a more complete form by Niebuhr in 1820. (2.) Of the Latin palimpsests edited by Mai, the earliest was some fragments of lost orations of Cicero from two different palimpsests in the Ambrosian library at Milan, in the latter of which, the second writing consisted of the acts of the council of Chalcedon. These orations were published in two successive volumes in 1814. (3.) Eight orations of Symmachus (1815). (4.) The comedies of Plautus, including a fragment of the lost play entitled *Vidularia* (1815). (5.) The works of M. Corn. Fronto, together with the epistles of Antoninus Pius, Lucius Verus, M. Aurelius, and others (1815). (6.) The celebrated dialogue of Cicero, *De Republica*, from a palimpsest of the Vatican, the modern writing of which is the commentary of St. Augustine on the Psalms. There is none of Mai's publications which presents his critical abilities in so favorable a light as this precious volume, which appeared at Rome in 1821. (7.) Soon after the *De Republica* he published another volume from palimpsest sources, the most important of whose contents were some fragments of ancient Roman law, which prepared the way for the more distinguished success of Niebuhr; who, in a palimpsest of the library of Verona, recognized a portion of (8) the *Institutiones* of Gaius, and procured an accurate transcript for the press, which was printed at Berlin in 1820. The latest considerable Latin publication in this department is (9) *Gaii Granii Liciniani Annalium quae supersunt* (Berlin, 1857), edited from a palimpsest of the British museum by the younger

Pertz. This palimpsest, as was already stated, is a thrice written codex, the earliest and original contents being the *Annales* of Gaius Granius. The second writing was also in Latin, and the work is a grammatical treatise, of which the chapters *De Verbo* and *De Adverbio* are still legible. The most modern writing is Syriac, written in the cursive character. Gaius Granius is a writer named by Macrobius, of whom nothing else is known.

It will be gathered from the above that the ancient works recovered by means of palimpsest MSS. are all fragmentary, and one is naturally led to rate at a low value the result thereby obtained. But it must be remembered that in some of the departments to which these fragments belong, every scrap, no matter how trifling, has an independent value. So it is, for example, in biblical remains—a single text may present a valuable reading, the merest fragment may throw light on an important critical question. In history, in like manner, a small fragment may disclose an interesting fact, or supply a significant commentary upon facts otherwise ascertained. And as regards critical uses especially, it must not be forgotten that the obliterated text of the palimpsest MSS. for the most part, far exceeds in antiquity the very oldest known codices which we possess, and is, probably, second only in age to the papyri of Herculaneum.

The method of treating palimpsest MSS., with a view to deciphering their contents, has been fully described by different editors. Mai, after having washed the palimpsest with an infusion of galls, exposed it to the light and air, and, generally speaking, found this sufficient for his purpose. Peyron washed the parchment in water, afterwards in dilute muriatic acid, and finally in prussiate of potash. A mixture, compounded on this principle, is called from its inventor, M. Gioberti, *tinctura Giobertina*. Sometimes the same treatment does not succeed equally well on both sides of the parchment; the inner surface, from its softer texture, sometimes requiring a more active preparation. When the ink contained animal substances, as milk, or the blood of the cuttle-fish, Dr. Mone plunged the parchment in a close vessel filled with oil, which he heated to a temperature of 400° R. In the prefaces of Mai's volumes will be found many amusing and interesting facts illustrating the difficulties which attend this curious branch of literary labor.

PALINDROME (Gr. *palin*, backwards, and *dromos*, a running), the name given to a kind of verse very common in Latin, the peculiarity of which is that it may be read the same backwards as forwards. A few examples will suffice.

*Si bene te tua laus taxat sua lautè tenebis.
Et neceat eger amor non Roma rege tacente,
Roma reges una non anus eger amor.*

A Roman lawyer gets the credit of the following:

Si nummi immunis,

which Camden translates:

Give me my fee, and I warrant you free.

It is said that in the reign of queen Elizabeth a certain lady of rank, having been compelled to retire from the court on account of some *fama*, the truth of which she denied, took for her motto:

*Ablata at alba.
Retired but pure.*

The English language has few palindromes, but one at least is inimitable. It represents our first parent politely introducing himself to Eve in these words:

Madam, I'm Adam.

Compare Henry B. Wheatley's book on *Anagrams* (1862).

PALINGENE'SIA (Gr. *palin*, again, and *genesis*, birth) is a term that appears to have originated among the Stoics, who employed it to denote the act of the demiurgus, or creator, by which, having absorbed all being into himself, he reproduced it in a new creation. The occurrence of the word in the New Testament (Titus, iii. 5, where it is used to denote regeneration) has given it a place in Christian theology, and divines have variously used it to express the resurrection of men, the new birth of the individual soul, and the restoration of the world to that perfect state that it lost by the fall—"the new heavens and the new earth wherein dwelleth righteousness." Savans have also applied the term to designate both the great geological changes which the earth has undergone and the transformations in the insect kingdom, such as of caterpillars into butterflies, etc

PALINODE, in the law of Scotland, is a peculiar practice by which, in actions for damages on account of slander or defamation raised in the commissary court, and even in the sheriff court, the pursuer may conclude not only for damages but for palinode, i.e., a solemn recantation. On a recent case, the question arose whether this ancient practice still existed as part of the law of Scotland, and it was held that it did. In actions, however, in the court of session, damages only are given as the remedy.

PALINU'RUM or **CAPO PALINURO**, a promontory of Italy, on the coast of Lucania in the Tyrrhæan sea, n.w. of the entrance to the gulf of Policastro; also called capo Spartimento. It was named in honor of Palinurus, the pilot of Æneas, said to have been buried here, where some ruined walls bear the name of the tomb of Paliurus. During the first Punic war, B.C. 253, a large Roman fleet was wrecked on this point, and 150 vessels lost; and, B.C. 36, a portion of the fleet of Octavius came to wreck by running on the rocks.

PALISADE, a paling of strong timber, used in fortification. For the mode in which the palisade is employed see **FORTIFICATION**, under the head *Stockade*.

PALISANDER WOOD, the continental name for rosewood (q.v.). By some of the French cabinet-makers the name *bois de Palisandre* is also applied to violet wood and to a kind of striped ebony.

PALISOT, **AMBROISE MARIE FRANÇOIS JOSEPH BEAVOIS DE**, 1752-1820; b. France; educated for the practice of law; receiver-general of the forests and domains of Picardy, Flanders, and Artois, and in 1781 made a correspondent of the academy of sciences for essays on cryptogamous and sarmentose plants. In 1786 he went to Africa with a returning negro prince, penetrated to the kingdoms of Oware and Benin, and made a great collection of strange plants and insects, which were captured and destroyed by the British. He went thence to San Domingo, became a member of the colonial government, and in 1791 was sent to Philadelphia to seek aid against the negroes who were in revolt. On his return he was arrested by them, freed by a negress who had been freed by him, escaped to the United States, where he taught for a living, and afterwards traveled as a botanist, and returned to France in 1798, where he was subsequently a member of the institute and of the council of the university. His works, illustrated, are: *Flore d'Oware et de Benin*, 2 vols., Paris, 1804-21; *Insects recueillies en Afrique et en Amérique*, 1805-21, and *Muscologie, ou traité sur les mousses*, 1822.

PALISSY, **BERNARD**, a French potter, famous for his glass paintings and beautiful figured pottery, was b. near Agen, now in the department of Lot et Garonne, France, about 1510, and at an early age was apprenticed to a potter. He devoted himself to chemical researches for the improvement of his art, and made many journeys through France and Germany for the same purpose; at the same time carrying on the business of a land-surveyor. An enameled cup of "Faience," which he saw by chance, inspired him with the resolution to discover the mode of producing white enamel. Neglecting all other labors, he devoted himself to investigations and experiments for the long period of 16 years. He had by this time exhausted all his resources, and for want of money to buy fuel was reduced to the necessity of burning his household furniture piece by piece; his neighbors laughed at him, his wife overwhelmed him with reproaches, and his starving family surrounded him crying for food; but in spite of all these discouragements he persisted in the search, and was in the end rewarded by success. A few vessels adorned with figures of animals, colored to represent nature, sold for high prices, and enabled him to complete his investigations, after which he became famous; and though a Huguenot, was protected and encouraged by the king and the nobility, who employed him to embellish their mansions with specimens of his art. He was lodged in or near the Tuileries, and was specially exempted by queen Catherine from the massacre of St. Bartholomew, more from a regard to her own benefit than from kindness. In March, 1575, he commenced a course of lectures on natural history and physics, and was the first in France to substitute positive facts and rigorous demonstrations for the fanciful interpretations of philosophers. In the course of these lectures, he gave (1584) the first right notions of the origin of springs, and the formation of stones and fossil shells, and strongly advocated the importance of marl as a fertilizing agent. These, along with his theories regarding the best means of purifying water, have been fully supported by recent discovery and investigation. In 1588 he was arrested and thrown into the Bastille as a heretic, but died in 1590 before his sentence was pronounced.

Palissy left a collection of objects of natural history, the first that had been formed in France. His works are at the present day almost beyond price, and his ornaments and arabesques are amongst the most beautiful of the "renaissance." As a sincere, earnest, and courageous man, he was no less eminent than as an artist. See Morley's *P. the Potter*.

PALIURUS, a genus of trees and shrubs of the natural order *rhamnaceæ*, nearly allied to *zizyphus* (see **JUJUBE**), but very different in the fruit, which is dry, orbicular, and girded with a broad membranous wing. *P. aculeatus* is often called **CHRIST'S THORN**, and by the Germans, **JEW'S THORN** (*Judendorn*), from an imagination that it supplied the crown of thorns with which our Savior was crowned. It is a deciduous shrub or low tree, with slender, pliant branches, and ovate 3-nerved leaves, each of which has two sharp spines at the base, one straight and the other re-curved. It is a native of the countries around the Mediterranean, of India, and many parts of Asia. It is often used for hedges in Italy and other countries; its sharp spines and pliant branches admirably adapting it for this purpose. The fruit has a singular appearance, being flat and thin, attached by the middle to the foot-stalk, the middle being raised like the crown of a hat, whilst the expansion resembles the brim. The seeds are sold by the druggists of the east, and are used medicinally, but their qualities are doubtful. This shrub is not

uncommon in shrubberies in England, being very ornamental when in flower, but the fruit does not ripen.

PALK STRAIT, or **PALK'S PASSAGE**, the northern portion of the passage between the s. coast of Hindustan and the island of Ceylon. This passage is continued southward by the gulf of Manaar (q.v.). It is from 40 to 80 m. in width, and is 80 m. in length. It is so shallow—in some places being no more than two fathoms in depth—that it cannot be navigated in safety by large vessels. In Palk strait there are several pearl fisheries.

PALL (Lat. *pallium*, also *palla*, a cloak), the name given in English to two very different portions of the vesture employed in the religious use of the Roman and some other churches. One of these is the *funeral pall*, an ample covering of black velvet or other stuff, which is cast over the coffin while being borne to burial. The ends of the pall are held during the funeral procession by the most distinguished among the friends of the deceased, generally selected from among those unconnected by blood. In its second and most strictly liturgical use, the word pall is applied to one of the coverings used at the altar in the celebration of the mass. Primitively, as appears from Optatus and other early writers, the altar was covered with a large linen cloth—called by the Latins *pallium*, and by the Greeks *eiletou*—the extremities of which were folded back so as to cover the bread and wine prepared for the celebration of the eucharist. In later times a separate covering was employed for the sacramental chalice, to which latter the name pall is now reserved in the use of the Roman church. The modern Roman pall is a square piece of linen cloth—sometimes limber, sometimes made stiff by inserting pasteboard—sufficiently large to cover the mouth of the chalice. The upper surface is often of silk embroidered, or of cloth of gold. The surface in contact with the chalice must always be of linen.

PALL, in heraldry, the upper part of a saltire conjoined to the lower part of a pale. It appears much in the arms of ecclesiastical sees.

PALLADIO, **ANDREA**, a famous Italian architect, was born at Vicenza, Nov. 30, 1518. After having studied with the greatest care the writings of Vitruvius, and the monuments of antiquity at Rome, he settled in his native city, and first acquired a reputation by his restoration of the basilica of Vicenza. Pope Paul III. then invited him to Rome, designing to intrust him with the execution of the works then going on at St. Peter's, but, his holiness dying before the arrival of Palladio, the latter had to return home. He was employed for many years in the construction of numerous buildings in Vicenza and the neighborhood, in all of which he displayed the most exquisite taste combined with the most ingenious and imaginative ornamentation. His style, known as the Palladian, is a composite, and is characterized by great splendor of execution and justness of proportion, and it exercised an immense influence on the architecture of Northern Italy. His principal works are the Rotonda Capra, outside Vicenza; the palazzo Chiericato and the palazzo Tiene, in the city; the palazzo Barbara, at Maser in the Trevigiano, the Teatro Olimpico at Vicenza (his last work), the palazzo at Montagnana for Francesco Pisana; the churches of San Giorgio Maggiore and Il Santissimo Redemptore at Venice, the atrium and cloister at the convent Della Carità, and the façade of San Francesco della Vigna in the same city. Palladio died at Vicenza, Aug. 6, 1580. He wrote a work on architecture, which is highly prized. The best edition is that published at Vicenza in 4 vols., 1776.

PALLADIUM (symb. Pd, eq. 53—new system, 106—spe. grav. 11.8) is one of the so-called noble metals, which in its color and ductility closely resembles platinum. It is not fusible in an ordinary wind-furnace, but melts at a somewhat lower temperature than the last-named metal, and when heated beyond its fusing point, it volatilizes in the form of a green vapor. It undergoes no change in the open air at ordinary temperatures; but at a low red heat it becomes covered with a purple film, owing to superficial oxidation. It is soluble in nitric and iodic acids, and in aqua regia. It combines readily with gold, which it has the property of rendering brittle and white. (When it forms 20 per cent of the mass, the alloy is perfectly white.) When alloyed with twice its weight of silver, it forms a ductile compound, which has been employed for the construction of small weights; but for this purpose aluminium is superior. Professor Miller states that it "has been applied in a few cases to the construction of graduated scales for astronomical instruments, for which, by its whiteness, hardness, and unalterability in the air, it is well adapted;" its scarcity must, however, prevent its general use for this purpose.

It was discovered in 1803 by Wollaston in the ore of platinum, of which it seldom forms so much as 1 per cent. Another source of this metal is the native alloy which it forms with gold in certain mines in Brazil, and which is termed *ouro poudre*; and it is from this alloy that the metal is chiefly obtained.

Palladium forms with oxygen a protoxide, PdO, which is the base of the salts of the metal; a binoxide, PdO₂; and according to some chemist, a suboxide, Pd₂O. On exposure to sufficient heat, these compounds give off their oxygen, and yield the metal. The salts of the protoxide are of a brown or red color.

PALLADIUM, among the ancient Greeks and Romans, an image of Pallas, who was generally identified with Athene, upon the careful keeping of which in a sanctuary the public welfare was believed to depend. The Palladium of Troy is particularly cele-

brated. According to the current myth, it was thrown down from heaven by Zeus, and fell on the plain of Troy, where it was picked up by Ilus, the founder of that city, as a favorable omen. In the course of time, the belief spread that the loss of it would be followed by the fall of the city; it was therefore stolen by Odysseus and Diomedes. Several cities afterwards boasted of possessing it, particularly Argos and Athens. Other accounts, however, affirm that it was not stolen by the Greek chiefs, but carried to Italy by Æneas; and the Romans said that it was preserved in the temple of Vesta, but so secretly that even the pontifex maximus might not behold it. All images of this name were somewhat coarsely hewn out of wood.

PALLA'DIUS, one of the early Christian fathers, born, as is supposed, in Galatia about 367. He was distinguished by an intense admiration of asceticism, and, assuming the garb of a monk, he started on foot at the age of 20 to visit the cells of the most famous monks in different parts of the Roman empire. In 400 he was appointed bishop of Helenopolis in Bithynia. Here he recorded what he had seen and heard among the monks, and in 420 the book appeared, addressed to Lausus, a chamberlain at the imperial court, and hence named the *Lausiaca History*. During the latter part of his life, he was bishop of Aspona in Galatia. The date of his death is unknown. The *Lausiaca History* in the original Greek, and in an old Latin version, is contained in the *Bibliotheca Patrum*. He was an adherent of Origen and an enemy of Jerome.

PALLADIUS (SOPHISTA), a Greek medical writer who lived at some time between the 3d and 9th centuries. The only record of him is that he was the author of three Greek treatises extant: the first, *Scholia in Librum Hippocratis, "De Fracturis;"* the second, *In Sextum (Hippocratis) "Epidemiorum" Librum Commentarius;* the third, *De Febribus Concisa Synopsis*.

PALLA'DIUS, RUTILIUS TAURUS ÆMILIANUS, a Roman author, who probably lived in the 4th c. A.D., under Valentinian and Theodosius. He wrote a work, *De Re Rustica* (On Agriculture), in 14 books, the last of which is a poem of 85 elegiac couplets. It is, from a literary and grammatical point of view, full of faults; but as it was a complete calendar of Roman agriculture, it was very useful for its time, and was much read and followed during the middle ages. Palladius has borrowed largely from his predecessors. The best edition is that by J. G. Schneider in his *Scriptores Rei Rusticæ Veteres Latini* (4 vols., Leip. 1794).

PALLAH, *Æpyceros melampus*, a species of antelope found in s. Africa, having long, branching, and ringed horns. It is of a dark-red color, and by the Dutch is called *roöde bok*. Its flesh, though not very palatable, is eaten by the natives.

PALLANZA, a t. in the province of Novarra, Italy, on a headland in Lago Maggiore, nearly opposite the Borromeo islands; 32 m. n. of Novarra; pop. 3,534. The town is well built, has an ancient massive tower used as a belfry, two convents, a town-house surrounded by arcades resting on pilasters, and a well-arranged prison. It is quite a resort for travelers on account of its fine climate and picturesque beauty. The finest granite quarries in Italy are found in the province; also a fine quality of white marble.

PALLAS. See MINERVA.

PALLAS, PETER SIMON, an eminent traveler and naturalist, was born Sept. 22, 1741, at Berlin, where his father was a physician. He studied medicine, natural history, and other branches of science at the universities of Berlin, Göttingen, and Leyden, and was employed in classifying many valuable collections of objects of natural history, both in Holland and England. He gained a high reputation by the publication of his *Elenchus Zoophytorum* (Hague, 1766), a work still much valued; *Miscellanea Zoologica* (Hague, 1766), and *Spicilegia Zoologica* (2 vols., Berlin, 1767-1804). The empress Catharine invited him, in 1768, to St. Petersburg, where he was well received, and had honors conferred on him, and he was subsequently appointed naturalist to a scientific expedition bound for Siberia, there to observe the transit of Venus. Pallas spent six years on this journey (1768-74), exploring in succession the Ural mountains, the Kirghis steppes, great part of the Altaian range, and the country around lake Baikal as far as Kiachta, great part of Siberia, and the steppes of the Volga, returning to St. Petersburg in 1774, with an extraordinary treasure of specimens in natural history, which form the nucleus of the museum of the academy of St. Petersburg. His travels (*Reisen durch verschiedene Provinzen des Russ. Reichs*) were published at St. Petersburg (1771-76), in 3 vols., and were followed by his *Sammlung historischer Nachrichten über die Mongol. Völkerschaften* (2 vols., St. Petersburg. 1776-1802), and his *Neue nordische Beiträge zur physikalischen und geographischen Erd- und Völkerbeschreibung, Naturgeschichte und Oekonomie* (6 vols., St. Petersburg. 1781-93). Without positively neglecting any branch of natural history, he now devoted himself more particularly to botany; and his magnificent *Flora Rossica* (St. Petersburg. 1784-88), a work which, however, he was not able to complete, and his *Species Astragalorum* (14 parts, Leip. 1800-4), were among the results of his studies. He published also *Icones Insectorum præcipue Rossicæ Sibiricæque Peculiarium* (Erlangen, 1781, 1783, and 1806); and contributed to a glossary of all the languages of the Russian empire, which was published at St. Petersburg. As he wished to live in the Crimea, the empress Catharine presented him with an estate in the finest part of that peninsula, where he resided generally from 1796. His *Travels in the South of Russia* were published in 1799 (2 vols., Leip., with

volume of plates). After the death of his wife, he went to Berlin, where he died Sept. 8, 1811. A large and valuable work of his, on the fauna of Russia, has not yet been published.

PALLAVICINO, FERRANTE, an Italian, b. at Piacenza about 1618. He was well educated, entered the monastery of the Augustinian friars at Milan, and joined the house of his order at Venice. For a few years he bore a high character for piety and learning, but a love affair led him to desert the monastery, and he gave himself up to a course of licentiousness, supporting himself for a time by writing obscene books. He wrote a collection of satirical letters called *The Courier Robbed of his Mail*, in which he inveighed bitterly against the Spaniards, but the secretary of the republic declined giving it his *imprimatur*. He afterwards went to Germany as chaplain to the duke of Amalfi, and on his return resolved vengeance on all who had prevented the publication of his MSS. Recasting and enlarging his *Courier*, he induced his bookseller to print it secretly. But a pretended friend, acting as a spy, informed the pope's nuncio, and the author was cast into prison. Having obtained his liberty, he wrote a piece called *La Buccinata overo Butarella per le api Barbarini*, satirizing severely his enemies, the Barberini, with a dedication expressing great contempt to the nuncio Vitelli. The nuncio, in revenge, bribed a Frenchman to decoy the poet into the hands of a gang of *sbirri*. He was taken to the papal territory of Avignon and imprisoned. There was a mock trial, he was condemned for apostasy and treason, and beheaded Mar. 5, 1644, at the age of 26. He wrote a number of small pieces characterized by the grace and genius which appear in his larger works. His *Opere Permesse*, edited by Brusoni, with a life of the author, was published in 4 vols. in 1665.

PALLAVICINO, PIETRO SFORZA, an Italian historian, son of the marquis Alessandro Pallavicino of Parma, was b. at Rome, Nov. 20, 1607. Much to the disgust of his father, he took priest's orders, and held several important ecclesiastical appointments during the pontificate of Urban VIII. In 1637 he became a member of the Jesuit society, and was created a cardinal in 1657 by pope Alexander VII. He died at Rome, June 5, 1667. Pallavicino was a fine scholar, and often presided in the famous Roman academy of the *Umoristi*. The best known of all his writings is his *Istoria del Concilio de Trento* (Rome, 1656-57), intended as a reply to the still more celebrated and liberal, although, by Catholics, deeply suspected, work of Paul Sarpi. Among his other works may be mentioned *Vindicationes Soc. Jes.* (Rome, 1649); *Arte della Perfezione Cristiana—I Fasti Sacri* (the unpublished MS. is in the library of Parma); *Ermengilda*, a tragedy (Rome, 1644); *Gli Avvertimenti Grammaticali* (Rome, 1661); *Trattato dello Stilo e del Dialogo* (Rome, 1662), and *Lettere* (Rome, 1668).

PALLI, a t. of Rajputana, in Judpore, stands on the right bank of a branch of the Luni river, in lat. 25° 48' n., long. 73° 24' east. It is an entrepôt for the opium sent from Malwa to Bombay, and is the seat of extensive commerce. It imports European manufactured goods extensively, and is estimated to contain about 50,000 inhabitants.

PALLIOBRANCHIA'TA. See BRANCHIOPODA.

PALLISER, JOHN, b. Ireland, 1817; son of lieut.col. Wray Palliser; came to Canada in early life, passing a number of years among the Indians of the n.w., exploring that region to the Pacific ocean. In 1857-60 he was commissioner for the British, to determine the boundary line between the United States and the Hudson's bay lands w. of lake Superior, from that lake across the main chain of the Rocky mountains, thence to the sea coast or Cascade range. The parliamentary papers reporting the progress of the explorations were published 1859, and a detailed account of the geography, agricultural resources, etc., appeared in 1861. He published also *The Solitary Hunter, or Sporting Adventures in the Prairies*, 1853. He returned to Ireland and has served as high sheriff of the co. of Waterford.

PALLISER, Sir WILLIAM, 1830-82: b. Dublin, educated at Rugby, Trinity college, Dublin, Trinity Hall, Cambridge, and the Staff college, Sandhurst. He entered the rifle brigade as ensign in 1855, and was transferred to the hussars in 1858. He retired from the service in 1871, and was knighted in 1873. He has introduced a number of inventions, among which are the "Palliser projectiles," used to pierce armor-plated ships, and of far greater efficiency than steel shell and shot; improved rifling in the heavy wrought iron cannon used in iron-clads, and the sea-front of forts; screw bolts for fastening the armor to the iron-plated defenses of harbors and dock-yards; the rifled compound guns known as "Palliser guns," into which the old smooth-bore cast-iron guns are converted.

PALLIUM, the name given in the Roman Catholic church to one of the ecclesiastical ornaments worn by the pope, by patriarchs, and by archbishops. Its use is held by Roman Catholics to descend from a very early period. It is worn by the pope at all times, as a symbol of his reputed universal and abiding jurisdiction. By archbishops it cannot be worn until it has been solemnly asked for and granted by the pope, and even then only during the solemn service of the great church festivals, and on occasions of the ordination of bishops or of priests, and other similar acts of the archiepiscopal order. The pallium is a narrow annular band of white woolen web, about 3 in. wide, upon which black crosses are embroidered, which encircles the neck of the archbishop, and from which two narrow bands of the same material depend, one falling over the breast, the

other over the back of the wearer. Its material is the subject of much care and ceremonial. It is made wholly or in part from the wool of two lambs, which are blessed annually on the festival, and in the church of St. Agnes. During the night of the vigil of the feast of St. Peter and St. Paul, the *pallia* made of this wool are placed on the altar above the tomb of these apostles, and on the feast of St. Peter and St. Paul, are delivered by the pope to the subdeacon, whose duty it is to keep them in charge. Within three months of his consecration, every new archbishop is obliged to apply to the pope, in person or by proxy, for the pallium; nor is it lawful for him, until he shall have received it, to exercise any act of what is properly archiepiscopal, as contradistinguished from episcopal, jurisdiction. Thus, he cannot, for example, call a *provincial* synod. The pallium cannot be transferred from one archbishop to another, but must be received direct from the pope. On the archbishop's death, his pallium is interred with him. Its use is held to symbolize the office of the "good shepherd" bearing the lost sheep on his shoulders, and is connected by some writers with the vesture of the Jewish high-priest in Exod. xxviii. 4. In the mediæval church, the granting of the pallium to archbishops was one of the chief occasions of the tribute which was paid by the national churches to the support of the great central office and dignity of the papacy. In some sees, as, for instance, those of the great prince-bishops of the Rhine, the tribute was as much as 20,000 florins. Roman Catholics, however, maintain that this tribute was not a *payment* for the pallium, but an *offering* to the holy see, made on occasion of the grant of that emblem of jurisdiction.

PALL-MALL. See MALL.

PALM, a measure of length, originally taken from the width of the hand, measured across the joints of the four fingers. In Greece, it was known as *palaistē*, and was reckoned at 3 in., or $\frac{1}{6}$ of a cubit, which was their standard unit. The Romans adopted two measures of this name—the one was the Greek *palaistē*, and was called *palmus minor*; the other, which was not introduced till later times, was called *palmus major*, or *palma*, and was taken from the *length* of the hand, being therefore usually estimated at three times the length of the other. At the present day, this measure varies in a most arbitrary manner, being different in each country, and occasionally varying in the same. The English palm, when used at all, which is seldom, is considered to be the fourth part of an English foot or 3 inches. The following is a list of the most common measures to which the name palm is given:

	Value in Eng. inches.
Greek <i>palaistē</i>	= 3.03375
Roman <i>palmus</i> , or lesser palm.....	= 2.9124
“ <i>palma</i> , or greater palm.....	= 8.7372
English palm ($\frac{1}{4}$ of a foot).....	= 3.0000
Hamburg palm ($\frac{1}{3}$ of a foot).....	= 3.7633
Amsterdam “round” palm.....	= 4.1200
“ “diameter” palm.....	= 11.9687
Belgian palm } properly the <i>decimètre</i>	= 3.9371
Lombard palm }	
Spanish palm, or <i>palmo major</i>	= 8.3450
“ “ or <i>palmo minor</i>	= 2.7817
Portuguese palm, or <i>palmo de Craveira</i>	= 8.6616

In Germany and the low countries the palm is generally confined to wood-measurement, while in Portugal it used to be the standard of linear measure.

PALM, JOHANN PHILIPP, a book-seller of Nuremberg, who has acquired an historic celebrity as a victim of Napoleonic justice in Germany. He was born at Schorndorf in 1766, and succeeded his father-in-law, Stein, as a book-seller in Nuremberg, the old name of the firm being retained. In the spring of 1806, a pamphlet, entitled *Deutschland in seiner tiefsten Erniedrigung* (Germany in its deepest humiliation), which contained some bitter truths concerning Napoleon, and concerning the conduct of the French troops in Bavaria, was sent by this firm to a book-seller in Augsburg in the ordinary course of trade, and, as Palm to the last moment of his life averred, without any regard, on his part, to its contents. Napoleon's police traced it to the shop in Nuremberg, and an investigation was ordered, from which nothing resulted. Palm was in Munich, and perhaps escaped imprisonment there because his name was not the same with that of the firm; but supposing all safe, he returned to Nuremberg, and was there taken prisoner, and examined before marshal Bernadotte, whose adjutant represented his arrestment as the consequence of direct orders from Paris. An extraordinary court-martial, held at Brunau, to which he was removed, condemned him to death, without any advocate being heard in his defense. All intercession on his behalf was in vain. Gen. St. Hilaire declared that the orders of the emperor were positive; and the sentence was executed at two o'clock on the same day on which it was pronounced. Subscriptions were raised for the family at St. Petersburg, to which the emperor and empress of Russia personally contributed; in England, and in several German towns, as Berlin, Leipsic, Dresden, and Hamburg. Some French writers have endeavored to throw the blame of this murder on marshal Berthier, instead of Napoleon.

PALMA. See CANARIES.

PALMA, the capital of the island of Majorca (q. v.) and of the province of Baleares, is situated on the s. w. coast of the island, on the gulf of Palma, which, between capes Figuera and Blanco, is 18 m. long, and sweeps 12 m. inland. The city is surrounded by orange plantations, and is walled and fortified. The houses, some of which are built of marble, are mostly in the Moorish style of architecture, and a number of the streets are wide and regular. It is the see of a bishop, and contains a Gothic cathedral, simple but beautiful in style, and with a spire which, from the delicate and airy character of its construction, is called the Angel's tower. Besides other ecclesiastical edifices, the town contains an exchange—a beautiful and ornate structure in Germano-Gothic—the governor's palace, an academy of medicine and surgery, and a large number of excellent educational institutions, including three *colegios*. In the port, a mole, 500 yds. in length, runs out from the bastions facing the s.; and on each side of it are ship-building yards, for the construction of the swift lateen vessels so well known in the Mediterranean. The port is small. The first railway in Majorca was opened from Palma to Inca in 1875. Wool, silk, and the cordage for the Spanish navy are manufactured. Though one of the chief marts of Europe in the 13th c., Palma now carries on but little commerce. Pop. 50,000.

PALMA, or **PALMA DI MONTECHIARO**, a t. of Sicily, in the province of Girgenti, 14 m. s. e. of the t. of Girgenti, near the s. w. coast. It is entirely a modern town, its foundation dating only from 1637. There is a trade in almonds, dried fruits, soda, wine, and sulphur. Pop. '81, 11,702.

PALMA, JACOPO, the elder, an eminent Italian painter, was b. near Bergamo about the beginning of the 16th century. Imitating the grace of Titian, and the clear expression and lively coloring of Giorgione, he is distinguished by elaborate refinement and a harmony of tints. Among other great pictures he painted "Santa Barbara Formosa" at Venice, and a "Madonna" for San Stefano di Vicenza. He is also the supposed artist of a portrait which Vasari eulogizes as "a performance of astonishing perfection and singular beauty." His pictures are found in the galleries of Dresden, Vicenza, Venice, Vienna, and other European towns.

PALMA CHRISTI. See CASTOR-OIL PLANT.

PALMARO'LI, PIETRO, 1750–1828; b. Italy; the first to transfer frescos from the wall to canvas. The first work which he transferred in this manner was the "Descent from the Cross," by Daniele da Volterra, in the church of Trinitá de' Monti in Rome. This was in 1811, and the work still remains, though not in the chapel where it was painted. This transfer created great interest throughout Italy. Palmaroli afterwards transferred a number of famous works in Rome and Dresden.

PALMAS, CAPE. See CAPE PALMAS.

PALMBLAD, VILHELM FREDRICK, a Swedish writer of considerable merit, and one of the most earliest and most zealous promoters of the literature of his native country, was b. in 1788 at Liljested, in East Gotland, where his father held a post under the government. While still a student at Upsala, Palmblad purchased, in 1810, the university printing-press, and immediately entered upon the publication of several literary and scientific periodicals, which, being the first of the kind that had ever appeared in the Swedish language, attracted considerable notice, and by their intrinsic merit, contributed materially to the diffusion of general information and the creation of a taste for learning among the general Swedish public. The earliest of these were the *Phosphorus*, a mixed literary journal; the *Poetisk Kalender*, an annual; and the *Svensk Litteratur Tidning*, a literary review, which lasted till 1824. The Swedish writers Atterbom and Hammarskjöld were associated with Palmblad in the management of these journals, and, like him, directed all their efforts to supplant the pseudo-classical school of literature, in favor of the romantic style, and to counteract the false French taste of that period, which, under Gustavus III., had been universally followed in Swedish literature and art. Palmblad successively occupied the chairs of history and geography and of Greek literature in the university of Upsala; and at his death in 1852 he left the character of having been of the most industrious and influential Swedish writers of his day. His principal works are—*Minnestafla ofner Sveriges Regenter* (1831); *Lärobok i nyare Historien* (Ups. 1832); *Handbok i fysiska og politiska Geographien* (1837); *Lärobok i Geographien* (Orebro, 1847); *Grekkisk Formkunskab* (Ups. 1845); and in addition to these purely instructive works, among his various novels we may instance his *Familjen Falkensvärd* (Oreb. 1844); *Aurora Köningsmark* (Oreb. 1846), which rank among the best of their class in Swedish literature. Palmblad was the editor of the great Swedish biography, *Namnkunnige Svenska Män* (Stock. 1835–52); and besides being an active coadjutor in the direction of the Swedish literary society, for which he wrote numerous papers, he was an active contributor to various German works of celebrity, as Ersch and Grüber's *Allgemeine Encyklopädie*, the *Conversations-Lexicon*, etc.

PALME, or **PALMI**, a royal city of South Italy, in the province of Reggio-Calabria, 20 m. n. e. of Reggio, on the coast of the bay of Gioja. The town, by means of its port, carries on an active trade. Pop. 13,500.

PALMELLA'CEÆ, a family or group of *Algæ*, of the order or sub-order *Confervaceæ*. In organization, they are among the lowest of plants; they are, however, universally regarded as vegetable, and do not, like the *Diatomaceæ*, occupy a somewhat doubtful position between the animal and vegetable kingdoms. The palmellaceæ all grow on damp surfaces, but some under the influence of fresh water, and some of salt. Some appear as a mere powdery layer, the granules of which have little adherence to each other, as red snow (q.v.); some of them assume the form of a slimy film or gelatinous mass, as gory dew (q.v.); and some are more firm and membranous, so as to have something of the character of a frond. The palmellaceæ bear so great a resemblance to the early stages of plants higher in organization, that doubts are entertained of their right to a distinct place in the botanical system, particularly as their mode of reproduction is not yet well understood. Conjugation has been observed in some of them. They propagate with great rapidity by gemmation, or something like it, some of them sending forth tubular filaments from their cells, the extremities of which dilate into new cells, after which the connecting tube closes, and ceases to exist; whilst in others the multiplication of cells takes place by division or segmentation (see MONAD), and the young plants exhibit remarkable powers of motion for a short time, like zoospores, being furnished with vibratile cilia, by which their motion is produced. Ere long, however, their motion ceases, and the process of segmentation is ready to begin anew. The motile organs and powers of some of the palmellaceæ, in the earlier part of their existence, have led to their being mistaken for animalcules.

PALMER (Lat. *palmifer*, a palm-bearer), the name of one of those numerous classes of PILGRIMS (q.v.), whose origin and history form one of the most interesting studies in the social life of mediæval Europe. The Palmer, properly so called, was a pilgrim who *had performed* the pilgrimage to the HOLY SEPULCHER (q.v.), and had returned, or was returning home after the fulfillment of his vow. The Palmers were so called from their carrying branches of the oriental palm, in token of their accomplished expedition. On arriving at their home they repaired to the church to return thanks to God, and offered the palm to the priest, to be placed upon the altar. The palms so offered were frequently used in the procession of palm Sunday. Even after the time of his return, the religious character of the Palmer still continued; and although his office might be supposed to have ceased with the fulfillment of his vow, many Palmers continued their religious peregrinations even in their native country. They were thus a class of itinerant monks, without a fixed residence, professing voluntary poverty, observing celibacy, and visiting at stated times the most remarkable SANCTUARIES (q.v.) of the several countries of the west. Their costume was commonly the same as that of the ordinary PILGRIM (q.v.), although modified in different countries.

PALMER, a t. in Hampden co., Mass., on the Chicopee river, at the junction of the New London, Northern, and the Boston and Albany railroads, and at the southern terminus of the Athol and Enfield and Ware River railroads, 15 m. e. of Springfield; pop. '80, 5,505. It has carpet, carriage, and straw-hat manufactories; an iron foundry and machine-shops, and several churches.

PALMER, ANTHONY, d. 1749; came from the West Indies to Pennsylvania in 1708. He was acting governor of that state 1747-48

PALMER, CHRISTIAN VON, 1811-75; b. at Winnenden, near Stuttgart, Würtemberg; educated at Tübingen, attending the lectures of Steudel, Baur, and Schmidt; became dean of the Tübingen diocese and minister at Tübingen in 1851; in 1852 was appointed professor in the university, and lectured on liturgy, the history of ecclesiastical music, and New Testament exegesis. The same year he was ennobled by his sovereign. In 1869 he was elected vice-president of the synod, and in 1870, by the city of Tübingen, its representative in the diet. His theology was evangelical and favored progress. His works, which have been widely circulated, are: *Evangelische Homiletik*; *Evangelische Katechetik*; *Evangelische Pädagogik*; *Evangelische Pastoraltheologie*; *Die Moral des Christenthums*; *Evangelische Casualreden*; *Evangelische Hymnologie*; *Predigten aus neuerer Zeit*. He wrote several essays and articles for the *Jahrbücher für Deutsche Theologie*, of which review he had been one of the editors from 1856, and for Herzog's *Real-Encyclopädie*.

***PALMER, EDWARD HENRY**, b. Cambridge, Eng., 1840; graduated at the university of Cambridge in 1867; accompanied the Sinai survey expedition of 1868-69, and explored the land of Moab and other regions of the east in 1869-70 in behalf of the Palestine exploration society; became professor of Arabic at Cambridge in 1871. He is the author of *The Negah or South Country of Scripture, and the Desert of El-Tih*; *The Desert of the Exodus*; of a *Persian-English and English-Persian Dictionary*; and some translations from and into Persian. See Supp., page 884

PALMER, ERASTUS DOW, b. N. Y., 1817; early manifested a talent for carving, learned the trade of a joiner, removed to Albany and commenced cameo-cutting 1846, and in 1852 devoted himself to the art of sculpture, producing first an ideal bust of the infant "Ceres." Other works are: "An Indian Girl contemplating a Crucifix," "The White Captive," "The Sleeping Peri," and "The Landing of the Pilgrims," containing 15 statues, and intended for the capitol at Washington. His works in busts and bas-

reliefs number over 100, some of them illustrative of American history and social life, many of them interesting classical subjects—groups of allegorical and mythological figures carefully and poetically treated. He has produced portrait-busts of Erastus Corning, com. M. C. Perry, gov. E. D. Morgan, Alex. Hamilton, Washington Irving, etc. In 1873 he went to Paris and modeled a statue of Robert R. Livingston for the state of New York, cast in bronze in Paris, and placed in position in 1875 in the old hall of representatives at Washington.

PALMER, INNIS N., b. Buffalo, N. Y., about 1825; graduate of West Point, 1846; entered the mounted rifles; served in the Mexican war and on the frontier; brevetted 1st lieut. and brevetted capt. for bravery at Contreras, Churubusco, and Chapultepec; was wounded at the latter place. He was made 1st lieut., 1853; capt. 2d cavalry, Mar. 3, 1855. In the war of the rebellion he was appointed maj. 5th cavalry, Aug. 3, 1861; brig.gen. of vols. in the September following; transferred to North Carolina, Dec., 1862. He was promoted to lieut.col. 2d cavalry, Sept. 23, 1863. He was made brig.gen. of vols., Sept. 23, 1861; was in the peninsular campaign commanding a brigade in the 4th corps; commanded a division in the 4th corps in North Carolina; commanded defenses at New Berne, 1863-64; commanded the district of North Carolina, 1864-65. He participated in the movements of gen. Sherman; was brevetted brig.gen., 1865. In June, 1868, he attained the rank of col. of the 2d cavalry, and served on the frontier after the war.

PALMER, JAMES S., 1810-67; b. N. J.; entered the U. S. navy as midshipman at the age of 15; made lieut. in 1836, and two years later served on the *Columbia* in the Sumatra battles of Quallah Battoo and Mushie. He also took part in the Mexican war, commanding the blockade schooner *Flirt*, and was promoted to the rank of commander. 1855. On the outbreak of the rebellion he was in command of the *Iroquois*, then in the Mediterranean squadron, but was at once recalled and attached to admiral Dupont's blockading fleet. In 1862 he was made a capt., and distinguished himself in the passage of the Vicksburg batteries and in the fight with the *Arkansas*, a confederate ram. He was Farragut's flag capt. at Mobile and New Orleans, and displayed great personal gallantry and skill in handling his ship. He was appointed rear-admiral in 1866, and was in command of the North Atlantic squadron from 1865 till his death from yellow-fever in St. Thomas, W. I.

PALMER, JOHN McCauley, b. Ky., 1817; received an ordinary education; removed to Illinois in 1832, and in 1840 was admitted to the bar. He was successful in practice, was prominent in political life, and in 1852 was elected state senator; was a delegate to the first republican national convention at Philadelphia in 1856, and to the peace convention at Washington, Feb., 1861. At the beginning of the rebellion he was given command of the 11th Ill. vol., took part in gen. Fremont's Springfield expedition, and soon afterward was made brig.gen. He was present at the battles of New Madrid, Island No. 10, and Farmington, and at Stone river commanded the 1st brigade, 1st division, of the army of the Mississippi. In Nov., 1862, he was made a maj.gen., and in Sherman's campaign of 1864 in Georgia had command of the 14th corps. Later he was in command of the military department of Kentucky, resigning in 1866. In 1868 he was elected governor of Illinois by the republican party and served two terms. He took part in the "liberal republican" movement which resulted in the nomination of Horace Greley at Cincinnati, and has since that time acted with the democratic party. His name was prominently mentioned in connection with the democratic nomination for the presidency in 1880.

PALMER, JOSEPH, 1718-88; b. Mass.; represented his district in the provincial congress of Massachusetts, 1774-75; a member of the committee of safety. In the revolutionary war he was col. of a militia regiment on duty near the coast 1775-76, and served in the Rhode Island campaign 1777, having attained the rank of brig.gen.

PALMER, RAY, D.D., b. R. I., 1808; graduated at Yale college in 1830; studied theology at New Haven; after teaching in New Haven became pastor of the Congregational churches at Bath, Me., in 1835, and at Albany in 1850, and secretary of the American Congregational union in 1866. He has published *Memoirs and Select Remains of Charles Pond*; *How to Live, or Memoirs of Mrs. C. L. Watson*; *Doctrinal Text-Book*; *Spiritual Improvement*; *Hints on the Formation of Religious Opinions*; *Remember Me, or The Holy Communion*; *Hymns and Sacred Pieces*; *Reminiscences of Our Work for Fifteen Years*; *Home, or the Unlost Paradise*; *Hymns of My Holy Hours*; also many discourses and addresses, and papers in reviews. Of his hymns and sacred poems the best known and most widely used, though not equal to some others of his hymns, is "My Faith Looks up to Thee." A complete edition of his poetical works was published in 1880.

PALMER, ROUNDELL, Lord SELBORNE, D.C.L., b. Eng., 1812; educated at Rugby and Winchester schools, and at Oxford, where he gained the prize for Latin and for English verse. He was called to the bar in 1837, and soon attained a large practice in chancery. In 1849 he was made a queen's counsel, and elected a bencher of Lincoln's inn. In 1847 he was returned to parliament for Plymouth, where he acted as a liberal conservative, opposing the endowment of the Roman Catholic clergy, and favoring the extension of free trade. He was defeated in the election of 1852, was returned in 1853, and held his seat till 1857. In 1861 he became solicitor-general in lord Palmerston's

administration, and was soon afterward knighted, and made M.P. for Richmond. In 1863, on the death of sir William Atherton, he was appointed attorney-general. He went out of office with lord John Russell's second administration in 1866. When Mr. Gladstone formed a cabinet in 1868, sir Roundell Palmer was offered the chancellorship, but refused it on account of the divergence of his views on the Irish church question from those of the administration. He agreed with the cabinet as to the disestablishment of the Irish church, but disagreed with them on the question of the disendowment. He supported Mr. Gladstone's government, however, on most other public questions. In 1871 he acted as counsel of the British government before the arbitration commission at Geneva. The next year he succeeded lord Hatherly as lord chancellor, and was raised to the peerage as baron Selborne, of Selborne, Hants. He went out of office in 1874, and returned in 1880. His attitude on the Irish land question was not entirely in accordance with that of other members of the Gladstone cabinet then in power. He was chosen lord rector of the university of St. Andrews in 1877. He edited in 1862 the *Book of Praise, from the best English Hymn Writers*, and published in 1878 *Notes on Some Passages in the Liturgical History of the Reformed English Church*. He has made a critical and historical study of hymns.

PALMER, SAMUEL. See page 885.

PALMER, THOMAS WITHERELL. See page 885.

PALMER, WILLIAM, b. Eng., 1811; brother of lord Selborne. He was educated at Rugby and Oxford, took holy orders, and traveled in the east, where he attempted to bring about a closer connection of the English and oriental churches. He has published *Harmony of Anglican Doctrine with that of the Churches of the East*, 1844; *The Patriarch and the Tsar*, translated from the Russian, 1871; and a *Commentary on the Book of Daniel*, 1873.

PALMERSTON, Viscount, HENRY JOHN TEMPLE, an English politician, was born at the family mansion, Broadlands, near Romsey, Hants, Oct. 20, 1784. The Temples are of Saxon origin, and the family claim descent from Edwyn, who was deprived of the earldom of Mercia by the Conqueror, and lost his life in defending himself against the Normans in 1071. Sir W. Temple, the diplomatist and patron of Swift, was a member of this family, which removed to Ireland in the time of Elizabeth. The family was ennobled 1722, when Henry Temple was created a peer of Ireland with the dignities of baron Temple and viscount Palmerston. His grandson, the second viscount, father of the present peer, superintended his son's education at Broadlands, and then sent him to Harrow. Palmerston afterwards went to the university of Edinburgh, where he attended the prelections of Dugald Stewart and other professors. He next matriculated at St. John's college, Cambridge, whence he was summoned to attend the deathbed of his father, on whose decease, in 1805, Palmerston succeeded to the title. His eminent abilities were early recognized, for he was scarcely of age when the Tory party in the university selected him (1806) as their candidate to succeed Mr. Pitt in the representation. The late marquis of Lansdowne was the Whig candidate; and lord Byron, then at Cambridge, in his *Hours of Idleness*, evinces the interest he took in the election. Palmerston was unsuccessful, and again in 1807. He entered parliament, however, in the same year for the borough of Newport, his colleague being Arthur Wellesley, then chief secretary of Ireland. In 1811, he exchanged Newport for the university of Cambridge, enjoyed the distinction of representing his *alma mater* for 20 years, and only lost his seat when he became a member of the Grey administration, and supported the reform bill. For the last two years of the unreformed parliament, he sat for the now extinct borough of Bletchingly. At the first election after the reform act he was returned for South Hampshire, but lost his seat at the general election of 1835. He immediately afterwards found a seat for the borough of Tiverton, which he promised never to leave as long as the electors would permit him to represent them. Having traced his representative, we now turn to his official career. Palmerston entered life as a member of the Tory party, and accepted the office of secretary at war in the duke of Portland's administration in 1809. This office he held during the successive governments of Mr. Perceval, the earl of Liverpool, Mr. Canning, lord Goderich, and the duke of Wellington—a period extending from 1809 to 1828. There was ample scope at the war-office for Palmerston's administrative talents and activity. Our military system swarmed with abuses, and the labor thrown upon the secretary at war during the peninsular campaign was prodigious. In 1817, an attempt was made to assassinate Palmerston by an insane army-lieutenant, named Davis, who fired a pistol at him as he was entering the Horse guards, the bullet, however, only inflicting a slight wound. Palmerston early attached himself to the Canning section of the Liverpool administration, and he accepted a seat in the cabinet of Mr. Canning. His official connection with the Tory party ceased in 1828, when the "great duke" insisted on accepting Mr. Huskisson's resignation, which was followed by Palmerston's retirement. The duke's government was swept away in the reform flood of 1830; and earl Grey, who became prime minister, offered the seals of the foreign office to Palmerston. The European horizon was so disturbed at this crisis that a great political authority declared that if an angel from heaven were in the foreign office, he could not preserve peace for three months. Palmerston falsified the prediction. Louis Philippe then filled the throne of France; and for the first time on record, England and France acted in concert, and without jealousy, under Palmerston's foreign ministry. He took a leading part in effecting the independence of Belgium, and in establishing the

thrones of queen Isabella of Spain and queen Maria of Portugal on a constitutional basis. In 1841 Palmerston went out of office with the Whigs on the question of free trade in corn; but on their return in 1846, he resumed the seals of the foreign office. His second foreign administration furnished various subjects of hostile party criticism, among which may be mentioned the civil war in Switzerland, the Spanish marriages, the European revolutions in 1848, the rupture of diplomatic relations between Spain and Great Britain, and, finally, the affair of Don Pacifico and the quarrel with Greece. A vote of censure on the foreign policy of the government was, in 1850, carried in the house of lords on the motion of lord Stanley (afterwards earl of Derby). A counter-resolution, approving the foreign policy of the government, was thereupon moved by Mr. Roebuck in the lower house. The debate lasted four nights. In a speech of five hours' duration—"that speech," said sir Robert Peel, "which made us all so proud of him"—Palmerston entered upon a manly and dignified vindication of his foreign policy; and Mr. Roebuck's motion was carried by a majority of 46. In December, 1851, the public were startled at the news that Palmerston was no longer a member of the Russell cabinet. He had expressed his approbation of the *coup d'état* of Louis Napoleon, without consulting either the premier or the queen; and, as explanations were refused, her majesty exercised her right of dismissing her minister. Palmerston avenged himself, as soon as parliament met, by shattering the Russell administration to pieces on a comparatively trifling question regarding the militia. He refused an offer from the earl of Derby to join the government which he was commissioned to form, but accepted the post of home secretary in the coalition administration of the earl of Aberdeen in 1852. The fall of this government, on Mr. Roebuck's motion for a Sebastopol committee, placed Palmerston in his 71st year in the position of prime minister, to which he was unanimously called by the voice of the nation. He vigorously prosecuted the Russian war until Sebastopol was taken, and peace was made. His government was defeated in March, 1857, on Mr. Cobden's motion, condemnatory of the Chinese war. Parliament was dissolved, and Palmerston met the house of commons with a large majority. But his administration fell in Feb., 1858, upon the conspiracy bill, intended to protect the French emperor against the machinations of plotting refugees. A short conservative administration followed; but in June, 1859, Palmerston was again called to the post of first lord of the treasury, which he continued to fill up to his death. It was his ambition to be considered the minister of a nation rather than the minister of a political party; and his opponents have been constrained to admit that he held office with more general acceptance than any English minister since the time of the great lord Chatham. As an orator, he was usually homely and unpretending, but always sensible and practical. He was a dexterous tactician, and a ready, witty, and often brilliant debater. He was popular as a minister, because he was thoroughly English in his ends and aims. Even his robust health, manly bearing, and physical vigor were elements of his popularity, because they were regarded as a glorification of the English sports, which he was never ashamed to patronize. He desired nothing so ardently as to promote the wealth and grandeur of Great Britain, and his national character and national spirit were thoroughly appreciated by his countrymen. He married, in 1839, the widow of the fifth earl of Cowper, daughter of the first viscount Melbourne. As he died without issue, and his only brother died unmarried, the title became extinct on Palmerston's decease, Oct. 18, 1865. See *Life of Palmerston* by sir Henry Lytton Bulwer (Lord Dalling), continued by Evelyn Ashley.

PALMER-WORM, a name given to many large kinds of grub, the larvæ of coleopterous insects, destructive to vegetable substances of various kinds. It is used in the English version of the Old Testament as the translation of the Hebrew *gazam*, rendered *kampe* by the Septuagint, which modern Hebrew writers and others very generally regard as a kind of locust, although more probably it is either the grub of a coleopterous or the caterpillar of a lepidopterous insect.—See Kitto in *Pictorial Bible*, on Joel i. 4.

Palmer-flies are much used by anglers on the English streams, and are at certain seasons excellent lures for trout, etc.

PALMET'TO, *Sabal palmetto* or *Chamærops palmetto*, a species of palm, a native of maritime parts of North America, as far n. as lat. 35°, which is further n. than any other American species of palm is found. It attains a height of 40 to 50 ft., and has a crown of large palmated leaves, the blade from one foot to 5 ft. in length and breadth, and the footstalk long. The flowers are small, greenish, and in long racemes; the fruit black, about as long as a pea-pod, and uneatable. The leaves are made into hats. The terminal bud or *cabbage* is eaten. The wood is extremely porous; but is preferred to every other kind of wood in North America for wharfs, as it is very durable, and not liable to be attacked by worms.—The *chamærops* (q.v.) *humilis* of the s. of Europe is also called palmetto.

PALMETTO-LEAVES, the leaves of the palmyra (q.v.) palm, *borassus flabelliformis*, which grows extensively in India and Polynesia. The leaves have great value as a material for the manufacture of hats, mats, etc., and for this purpose are frequently imported into Europe. In their native country, they are used as thatch, and for a great variety of other useful applications.

PALMIP'EDES, or **WEB-FOOTED BIRDS**, also called **NATATORES**, or **SWIMMERS**, an order of birds, the *anseræ* of Linnæus, very natural and universally recognized by ornithologists, having the feet specially formed for swimming, and the toes *webbed*, i. e., connected by a membrane, at least those which are directed forwards. In swimming, the feet are contracted when drawn forwards, the toes being brought together, and expanded to their utmost extent in the backward stroke. In accordance with their aquatic habits, the palmipedes are further characterized by a boat-like form, calculated to move through the water with little resistance; and by a dense and polished plumage, oiled by a secretion from certain glands near the tail, very impervious to water; whilst warmth is further secured by a clothing of down, more or less abundant, beneath the feathers. They are remarkable for the length of the breast-bone (*sternum*), and the neck is often longer than the legs, a thing very unusual in birds, so that they can plunge the head far down in search of food. The length of the wings differs very much in different sections of the order, and with it the power of flying; as does also the power of diving, which some possess in a high degree, and others, even of the same family, in a very inferior degree. To this order belong geese, swans, ducks, divers, auks, guillemots, puffins, penguins, petrels, albatrosses, gulls, terns, shearwaters, noddies, pelicans, cormorants, frigate-birds, gannets, darters, tropic-birds, etc.

PALMISTRY. See **CHIROMANCY**.

PALMITIC ACID ($\text{HO}, \text{C}_{32}\text{H}_{31}\text{O}_3$) is one of the most important of the *fatty acids*, represented by the general formula $\text{HO}, \text{C}_n\text{H}_{n-1}\text{O}_2$ (see **OILS AND FATS**). In a pure state, when crystallized from alcohol, it occurs in the form of beautifully white acicular crystals arranged in tuft-like groups. These crystals are devoid of odor or taste, communicate a fatty feeling to the finger, fuse at 143.6° , and solidify on cooling in the form of crystalline scales. This acid is lighter than water, in which it is perfectly insoluble; but it dissolves freely in boiling alcohol and in ether, and the solutions have a distinctly acid reaction. In small quantities it may be distilled without decomposing, if the heat be carefully regulated. The neutral palmitates of the alkalis constitute soaps, and are soluble in water; if, however, their solutions are largely diluted with additional water, they are decomposed, an insoluble acid salt being precipitated, while a portion of the base remains in solution. The addition of chloride of sodium (common salt) to a solution of an alkaline palmitate produces a similar effect. The other most important compounds of palmitic acid are those which it forms with glycerine and with cetylic ether. With glycerine this acid forms three compounds, viz., a triglyceride or tripalmitate (constituting the ordinary **PALMITINE** of chemists), a diglyceride, and a monoglyceride. In addition to its existence in the form of palmitine, palmitic acid is found in a free state in old palm oil. In combination with cetylic ether, or of oxide of cetyl, whose composition is represented by the formula $\text{C}_{32}\text{H}_{33}\text{O}$, it is the main constituent of spermaceti (q. v.), which is in fact essentially a palmitate of oxide of cetyl ($\text{C}_{32}\text{H}_{33}\text{O}, \text{C}_{32}\text{H}_{31}\text{O}_3$); and as a palmitate of oxide of melissyl—a substance which will be noticed in the article **WAX**—it is the chief ingredient of bees-wax.

PALMITINE is a white fat, usually occurring, when crystallized from ether, in the form of a mass of small scaly crystals. According to Duffy, it occurs like the allied fat stearine in three modifications, each of which has a different melting-point—viz., 114.8° , 143° , and 145° . On cooling, it solidifies into a wax-like mass, of lower specific gravity than water, and insoluble in that fluid, but readily soluble in ether and in boiling alcohol. It is a constituent of almost every kind of fat, and is the preponderating ingredient in those of a semi-solid consistence, and in many oils. It receives its name from the abundance in which it occurs in palm oil, and it may readily be obtained from this source by removing the liquid portion (the oleine) by pressure, and purifying the remaining palmitine by crystallization from ether, or a mixture of ether and alcohol. It has been stated in the article on glycerine (q. v.) that the composition of that substance may be represented by the formula $\text{C}_6\text{H}_5\text{O}_3, 3\text{HO}$. When palmitic acid unites with it to form a triglyceride (or the substance usually recognized as palmitine), three atoms of the anhydrous acid expel and replace the three atoms of water in the glycerine, and the resulting compound, palmitine, is consequently represented by the formula $\text{C}_6\text{H}_5\text{O}_3 + 3(\text{C}_{32}\text{H}_{31}\text{O}_3)$, or $\text{C}_{102}\text{H}_{98}\text{O}_{12}$.

PALM OIL. See **OIL PALM**.

PALMS, *Palmæ* or *Palmaceæ*, a natural order of endogenous plants, not excelled in importance by any order in the vegetable kingdom except grasses. They are generally tall and slender trees, often of gigantic height, without a branch, and bearing at the summit a magnificent and graceful crown of very large leaves. The stem is sometimes, however, of humble growth, and more rarely it is thick in proportion to its height; sometimes, but rarely, it is branched, as in the doom (q. v.) palm; and sometimes, as in rattans (q. v.), it is flexible, and seeks support from trees and bushes, over which it climbs in jungles and dense forests, clinging to them by means of hooked spines. Some of the species with flexible stem attain a prodigious length, ascending to the tops of the highest trees, and falling down again. Rumphius asserts that they are sometimes 1200, or even 1800 ft. long. Whatever the form or magnitude of the stem of a palm, it is always woody, and the root is always fibrous. It is only towards its circumference, however, that the stem is hard, and there in many species it is extremely hard; but the center is soft, often containing, when young, a great quantity of starch (sago), and sometimes

filled, when old, with a mass of fibers which can be separated without difficulty. Concerning the structure of the stem, see ENDOGENOUS PLANTS. The stem is generally marked externally with rings or scars, where former leaves have been attached; sometimes it is rough with the remaining bases of the leaves, and part of it is sometimes covered with their fibrous appendages. No other plants have leaves so large as many of the palms; the largest of all are those of some of the fan-leaved palms, but there are palms with pinnate leaves 50 ft. long and 8 ft. broad, and undivided leaves are to be seen 30 ft. long by 4 or 5 ft. broad. There are, however, also small palms, and palms with flexible stems, which have small leaves. The number of the large leaves which form the crown of even the most magnificent palm is never great. Whatever the size or form of the leaves, they are always stalked, the stalk being often in dimensions equal to a large bough of a great oak or other such tree. The leaves are commonly pinnated, the number of pinnules or leaflets being often very great; but about one-sixth of the whole number of known species of palms have fan-shaped leaves, and a few species have undivided leaves. The leaves are in all cases persistent, only falling off in succession as the palm advances in growth, and new ones are formed at the summit. The flowers are sometimes hermaphrodite, sometimes unisexual; the same tree having sometimes male, female, and hermaphrodite flowers, whilst other species are monœcious and others diœcious. The perianth has six divisions, three outer and three inner; there are generally six, rarely three stamens; the ovary is composed of three carpels, distinct or united, each with one cell containing one ovule. The flowers are small, but are often produced in dense masses of very striking appearance. Humboldt reckons the number of flowers on a single palm (*Alfonsia amygdalina*) as about 600,000, and every bunch of the Seje palm of the Orinoco consists of about 8,000 fruits. The flowers are produced on scaly spadices, often much branched, and inclosed, before expanding, in leathery or woody spathes, often very large, and sometimes opening by bursting with a loud explosion. The flowers of some palms emit a very powerful odor, which attracts multitudes of insects. The fruit is sometimes a kind of berry, sometimes a drupe, either with a fleshy or fibrous covering; and sometimes contains a very hard and bony nut. The fruit is sometimes only of the size of a pea or a cherry; sometimes, notwithstanding the smallness of the flowers, it is of very large size, of which the cocoa-nut is a familiar example.

Palms are mostly natives of tropical countries, being found almost everywhere within the tropics, and forming, perhaps, the most striking characteristic of tropical vegetation. The tropical parts of America, however, particularly abound in them, producing a far greater number of species than any other part of the world. A few species are found in temperate regions; one species only, *chamærops humilis*, being a native of Europe, and extending as far n. as lat. 44°, whilst the northern limit of palms in Asia is about lat. 34°, and in North America, lat. 35°. In South America, the southern limit of palms is lat. 36°; in Australia, it is lat. 35°; in Africa, no native species is found further s. than lat. 30°; but in New Zealand, one species extends as far s. as lat. 38° 22'. Some of the species, however, which are found in tropical America grow in mountain regions bordering upon the limits of perpetual snow. Some palms have very narrow geographical limits; the cocoa-nut palm is by far the most extensively distributed species. Some, like the cocoa-nut, grow in maritime, others in inland districts. Some grow on dry and sandy ground, others in the richest alluvial soil, and some in swampy situations; some in open districts, others in dense forests. Some species are generally found singly, some in groups; some even cover tracts of country in which no other tree appears.

The uses of palm are many and various; there is almost no species which is not capable of being applied to some use. Tribes in the lowest grade of civilization depend almost entirely on particular species of palm, as the cocoa-nut palm, for the supply of all their wants. The fruit of some species is eaten; sometimes the fleshy part of the fruit, sometimes the kernel of the nut. The importance of the date and the cocoa-nut needs only to be alluded to; but in this respect they far excel the fruits of all other palms. A grateful beverage is made from the fruit of some palms (see ASSAI), consisting simply of a mixture of the pulp with water; but a kind of wine can be obtained also by fermentation (see DATE). A kind of beverage more generally used is the sap of palm-trees, either fresh or fermented (*palm-wine* or *toddy*), from which also a kind of spirits called arrack (q.v.) is obtained by distillation; whilst from the fresh sap, boiled down, sugar is obtained—the *jaggery* of the East Indies. The sap of various species of palm is collected and used for these purposes, and that of many others is probably not less suitable. The pulp of the fruit of some species, and the kernel of others, yield bland, fixed oil, useful for various purposes. See OIL PALM and COCOA-NUT. The soft and starchy center of the stem of some palm affords a very important and abundant article of food. See SAGO. The terminal bud, or *cabbage*, of some species is boiled for the table; and although the taking of the bud is death to the tree, this is little regarded where vegetation goes on with a rapidity and luxuriance unknown in the colder parts of the world. The young sprouts arising from the seeds of palm, when they have begun to vegetate, are another esculent of tropical countries. From the stems of some species of palm, as the wax palm (q.v.) of the Andes, and from the leaves of some, as the Carnahuba palm (q.v.), wax is obtained, which is used for the same purposes as beeswax. The wood of palm is used in house-building, and for many other purposes; some affording very hard and beautiful wood for ornamental work, whilst others are suitable only

PALMS, ETC.—1. *Pandanus litoralis*. 2. *Phytelphas macrocarpa*. 3. *Chamædorea Schiedeana*. 4. *Metroxylon Rumphii*. 5. Coconut palm (*Cocos nucifera*). 6. *Elaeis melanococca*. 7. *Corypha umbraculifera*. 8. *Mauritia vinifera*. 9. *Borassus flabelliformis*. 10. *Copernicia cerifera*. 11. *Calamus equestris*. 12 *a*. Fruit of the *Areca triandra*; *b*, the same, cut. 13. Fruit of the *Metroxylon Rumphii*. 14. Fruit of the *Borassus flabelliformis*. 15. Fruit of the *Pandanus litoralis*. 16. Fruit of the *Phytelphas Ruizii*.

for coarse purposes. The great leaf-stalks are also used for some of the purposes of timber. The stems of the most slender species are used for walking-sticks, etc., and, split or unsplit, for wicker-work. See RATTAN. The leaves of many palms are used for thatching houses. The spathes of some species are used as vessels or bags. The fibers of the leaf, the fibers connected with the leaf-stalk, the fibers of the rind of the fruit, and the fibers of the stem of different kinds of palm are used for making cordage, mats, nets, cloth, etc. The most important of these fibers are Coir (q.v.), or cocoa-nut fiber, Gomuto (q.v.), or Ejoo fiber, and piassaba (q.v.). The coarsest fibers are employed as bristles for making brushes, etc. Stripes of the delicate epidermis of the young unopened leaves of some South American palm are twisted, and so used for making a kind of thread; hammocks made of which are highly valued. See ASTROCARYUM. The leaves of the Palmyra palm and Talipot palm are used in some parts of the e. for writing upon, an iron style being employed instead of a pen. One of the kinds of the resinous substance called *Dragon's Blood* is obtained from the fruit of a palm. The Betel (q.v.) nut, abounding in catechu, is the fruit of a palm. The fruit of many palms is very acrid. The ashes of the fruits of some American species are used by the Indians as a substitute for salt, probably on account of potash, or some salt of potash, which they contain; and much potash may be obtained from the stems and leaves of palms. Vegetable ivory (q.v.) is the kernel of the fruit of a palm; and somewhat similar to it in quality is the coquilla-nut (q.v.). But a complete enumeration of the uses to which Palm and their products are applied is almost impossible.

Some of the more important species of palm are noticed in separate articles.

About 500 species are known; but it is probable that many are still undescribed. The most complete work on palm is the monograph by Martius, *Genera et Species Palmarum* (3 vols. large folio, Munich, 1823-45), a magnificent work, with 219 colored plates; but many new species have been discovered since its publication.

The cultivation of palm in hot-houses is attended with great expense. Separate houses are devoted to them in a few gardens, of which the greatest is that at Kew. A very fine palm-house has been erected in the botanic garden of Edinburgh. Palms are cultivated in hot-houses merely as objects of interest, and for the gratification of a refined taste, never for the sake of their fruit or any other product.

PALM SUNDAY (Lat. *Dominica Palmarum*, or *Dom. in Palmis*), the last Sunday of Lent, is so called from the custom of blessing branches of the palm tree, or of other trees substituted in those countries in which palm cannot be procured, and of carrying the blessed branches in procession, in commemoration of the triumphal entry of our Lord into Jerusalem (John xii.). The date of the origin of this custom is uncertain. The first writer in the west who expressly refers to it is Venerable Bede. The usage certainly existed in the 7th century. A special service is found in the Roman missal, and also in the Greek euchologies, for the blessing of "branches of palms and olives;" but in many countries, other trees, as in England, the yew or the willow, and in Brittany, the box, are blessed instead. A procession is formed, the members of which issue from the church carrying branches in their hands, and singing a hymn suited to the occasion, of very ancient origin. In the Greek church, the book of the gospels is borne in front. In some of the Catholic countries of the west, a priest, or, occasionally a lay figure, was led at the head, mounted upon an ass, in commemoration of our Lord's entry into the city—a usage which still exists in Spain and in Spanish America. Before their return to the church, the doors have been closed, and certain strophes of the hymn are sung alternately by a choir within the church, and by the procession without, when, on the sub-deacon's knocking at the door, it is again thrown open, and the procession re-enters. During the singing of the passion in the solemn mass which ensues, the congregation hold the palm branch in their hands, and at the conclusion of the service it is carried home to their respective houses, where it is preserved during the year. At Rome, the procession of the palms, in which the pope is carried, is among the most striking of the picturesque ceremonies of the holy week. In England, Palm Sunday anciently was celebrated with much ceremonial; but the blessing and procession of the palms was discontinued in the Church of England, together with the other ceremonies abolished in the reign of Edward VI.

PALM-WINE, a beverage made of the juice which flows from the wounded spathes of the cocoa-nut tree, and some other species of the palm, in India, where it is called *toddy*. It is obtained also from the oil-palm. Palm-wine is extensively used in India and Chili, and is almost the only fermented liquor made in Africa.

PALMY'RA, the name given by the Greeks to a great and splendid city of upper Syria. Its original Hebrew name was *Tadmor*, which, like the Greek word, means "city of palms." It was built according to the writers of Kings (Book I. chap. ix. verse 18) and Chronicles (Book II. chapter viii. verse 4), by Solomon in the 10th c. B.C.; but it is more probable that he only enlarged it. It occupied a fertile oasis, well watered, and abounding in palm trees. Barren and naked mountains overlook it from the w., and to the e. and s. stretches the illimitable sandy desert. Palmyra was, in the Solomonic age, a bulwark of the Hebrew kingdom against the wandering hordes of Bedouins; but its early history is obscure and insignificant. After the fall of Selucia, it became a great center of commercial intercourse between the e. and the w. of Asia. Its commercial

importance, wealth and magnificence greatly increased after the time of Trajan, who subjected the whole country to the Roman empire. In the 3d c., Odenathus, a Syrian, founded here an empire, which, after his murder, rose to great prosperity under his wife, Zenobia (q.v.), and included both Syria and Mesopotamia; but this was not of long duration, for the Roman emperor Aurelian conquered it in the year 275, and the city was soon after almost entirely destroyed in revenge for the slaughter of a Roman garrison. It never recovered from this blow, although Justinian fortified it anew. The Saracens destroyed it in 744. A village called Tedmor, inhabited by a few Arab families, now occupies the site. The ruins of the ancient city, white and dazzling in the Syrian sun, excite, at a little distance, the admiration of all beholders; but when examined in detail, they are said to be far from imposing, though in regard to this latter point opinions differ. They were visited by English merchants resident at Aleppo in 1691, and again by Messrs. Wood and Dawkins in 1751, and since then by a vast number of travelers. The ruins of a temple of Baal, the sun god, are, however, confessedly magnificent. The language of ancient Palmyrene appears, from inscriptions which remain, to have been an Aramaic language. See Murray's or Baedeker's *Handbook for Syria and Palestine*; Vogüé's *Syrie Centrale*.

PALMYRA, the seat of justice of Marion co., Mo., on the Hannibal and St. Joseph railroad, 6 m. e. of the Mississippi river, and 15 m. n.w. of Hannibal. Pop. '80, 2,479. It has a court-house, a national bank, a savings bank, and St. Paul's college (Prot. E.) organized in 1848; flour mills, and wagon and farming-tool manufactories. Agricultural interests are prominent.

PALMYRA PALM, *Borassus flabelliformis*, a species of palm with a magnificent crown of fan-shaped leaves, a native of the East Indies. The stem attains a height of 25-40, or even 60 ft., and tapers slightly upward. The leaves are about four feet long, with stalks of about the same length, the stalks spiny at the edges; each leaf having 70-80 rays. The fruit is somewhat triangular, about the size of a child's head: having a thick, fibrous, and rather succulent yellowish-brown or glossy black rind, and containing three seeds each as large as a goose's egg. The Palmyra palm is the most common palm of India, growing spontaneously in many districts, cultivated in others, and reaching as far n. as lat. 30°. It is of slow growth; and the wood near the circumference of the stem in old trees is very hard, black, heavy, durable, susceptible of a high polish, and valuable, easily divided in a longitudinal direction, but very difficult to cut across. The Palmyra palm abounds greatly in the n. of Ceylon, forming extensive forests; and the timber is exported to the opposite coast of India, being of superior quality to that which is produced there. It is much used in house building. The stalks of the leaves are used for making fences, etc. The leaves are used for thatching houses; for making baskets, mats, hats umbrellas, and large fans; and for writing upon. Their fibers are employed for making twine and small rope; they are about two feet long, and very wiry. A fine down found at the base of the leaf stalks is used for straining liquids, and for stanching wounds. The Palmyra palm yields palm-wine, and of course also arrack and sugar (*jaggery*). It furnishes great part of the palm-wine, sugar, and arrack of India. See **ARRACK**. The fruit is cooked in a great variety of ways, and used for food. The seeds are jelly-like, and palatable when young. A bland fixed oil is extracted from the fruit. The young plants, when a few inches high, are esteemed as a culinary vegetable, being boiled and eaten generally with a little of the kernel of the cocoa-nut; and sometimes they are dried and pounded into a kind of meal. Multitudes of the inhabitants of the n. of Ceylon depend almost entirely on the Palmyra palm for the supply of all their wants. In the "Palmyra regions" of the southern Dekkan vast numbers of the people subsist chiefly on the fruit of this palm.

The Deleb palm (q.v.), so important to the inhabitants of central Africa, is believed to be nearly allied to the Palmyra palm.

PALMYRA WOOD. Properly this name applies only to the wood of the Palmyra palm (*Borassus flabelliformis*), but it is generally used for all kinds of palm-tree wood imported into this country, amongst which very much is the wood of the cocoa-nut palm (*cocos nucifera*), and the allied species *C. plumosa*. These woods are also called *speckled wood* and *porcupine wood* by the dealers—the former name being applied to those veneers cut transversely, and showing the ends of numerous black fibers mixed with the lighter colored portions; and the latter to longitudinal sections, in which the mixed black and white fibers much resemble porcupines' quills.

PALO ALTO, a co. in n. Iowa; drained by a branch of the Des Moines river, and containing several small lakes; 576 sq.m.; pop. '80, 4,131—3,113 of American birth. The surface is mostly prairie and the soil very rich; oats, wheat, and hay, are the chief products. Co. seat, Emmettsburg.

PALO ALTO, BATTLE OF, in s. Texas, between point Isabel and Matamoras, about 9 m. from the latter place. On May 8, 1846, the Americans numbering 2,300, under gen. Taylor, defeated 6,000 Mexicans under gen. Arista; American loss, 4 killed, 40 wounded; Mexican loss, 100 killed. On May 1st gen. Taylor set out on the march from fort Brown, near Matamoras, leaving maj. Brown, 7th inf., in charge, to point Isabel to save some stores which were in danger of being taken by the Mexicans. He arrived safely, and having attended to the commissaries, started back to relieve maj. Brown

whom he was advised had been attacked at fort Texas. The enemy made an attempt to cut him off from fort Brown. The engagement commenced with an artillery fire and a cavalry charge from the Mexicans, which was met and forced back by the Americans, who steadily advanced and caused the retreat of the Mexicans after 5 hours' fighting.

PALO BLANCO, *Flotovia dicanthoides*, a large tree, a native of Chili, the wood of which is white, and very useful and durable. It is remarkable as one of the few large trees belonging to the natural order *Compositæ*.

PALO'LO, or **BALOLO**, *Palolo viridis*, a dorsi-branchiate annelid, allied to the lug-worm, extremely abundant at certain seasons in the sea above and near the coral reefs which surround many of the South Sea islands, as the Samoa islands and the Fiji islands. The body is cylindrical, slightly tapering at both ends, divided into nearly equal joints, each joint with a small tuft of gills on each side. In thickness, the palolo resembles a very fine straw; it is about three inches long, generally of a greenish color, with a row of round black spots; but the color varies to red, brown, and white. These annelids make their appearance in great multitudes, apparently rising out of the coral reefs, and with a periodical regularity which is very remarkable. They are eagerly sought after by the islanders, who are on the watch for their appearance, and go out in canoes early in the morning to take them by means of nets; but they often occur in such numbers that the water seems to be full of them, and they may be grasped by handfuls. They are a delicacy of which the South Sea islanders are very fond. To prepare them for use, they are wrapped in bread-fruit leaves, and cooked for twelve or eighteen hours in an oven.

PALO PINTO, a co. in n.w. Texas, drained by the Brazos and Palo Pinto rivers; 960 sq. m.; pop. '80, 5,885—5,676 of American birth. The surface is in part woodland and in part prairie, and well adapted for cattle raising, which is the main industry. Predatory bands of Indians are found. Co. seat, Palo Pinto.

PALOS, a t. in the province of Huelva, Spain, on the Rio Tinto, near the Atlantic; pop. 1145. Columbus sailed from the bay of Palos, on his first voyage, Aug. 3, 1492, and returned to it Mar. 15, 1493, after the discovery of America. Near by is the convent where he asked for alms, and the prior of which, Juan Perez de Marehena, used his influence at court to further the undertaking of the voyage.

PAL'PI (from the Lat. *palpo*, I touch) are organs occurring in insects, crustaceans, and arachnidans. In insects, one or two pair of jointed appendages bearing this name are attached to the maxillæ, while one pair is attached to the labium; and in the higher crustaceans, similar appendages are attached to the mandibles and foot-jaws. In both these classes, the palpi probably serve, through the sense of touch, to take cognizance of the qualities of the substances which are employed as food. In the arachnidans, the palpi are attached to the maxillæ only; and vary exceedingly in form and functions. In the scorpions, for instance, they are extremely developed, and terminate in pincers which resemble the chelæ (or pincers) of crabs and lobsters; while in the spiders, they terminate in a single movable claw in the female, and in the male the last joint is dilated, and acts as an accessory generative organ.

PALPITATION is the term used to signify inordinately forcible pulsations of the heart, so as to make themselves felt, and frequently to give rise to a most troublesome and disagreeable sensation. It may be either functional or a symptom of organic disease of the heart. Here we shall merely consider it as a functional disorder. Although it may be persistent, it far more frequently comes on in paroxysms, which usually terminate within half an hour, recurring afterward quite irregularly, sometimes daily or several times a day, and sometimes not till after a long interval. The attack often comes on under some mental or physical excitement, but sometimes when the patient is quite composed, or even asleep. If the paroxysm is a severe one, the heart feels as if bounding upward into the throat; and there is a sensation of oppression over the cardiac region, with hurried or even difficult respiration. Excluding organic diseases, the causes of this affection are either (1) an abnormally excitable condition of the nerves of the heart, or (2) an unhealthy condition of the blood.

1. Amongst the causes of disturbed innervation may be especially noticed the abuse of tea (especially green tea), coffee, spirits, and tobacco. Any irritation of the stomach and intestinal canal may be reflected to the heart; and hence palpitation may frequently be traced to flatulence, undue acidity, and intestinal worms, especially tape-worms. Everything that causes pressure on the heart, such as tight-lacing, abdominal dropsy, or an enlarged uterus, is also liable to occasion this affection.

2. If the blood is abnormally rich and stimulating it may give rise to palpitation, as in plethora (q.v.); but the opposite condition, known as anæmia (q.v.), is a much more common cause of this affection. In anæmia the blood is watery and deficient in fibrine, and (far more) in red corpuscles; and being thus in an unnatural state, it acts as an unnatural stimulant, and induces frequent, although not usually strong pulsations. In cases of this kind, singular murmurs (not unlike those which are heard when we apply certain shells to the ear) are heard on applying the stethoscope to the neck over the course of the great jugular veins.

The age at which palpitation most usually comes on is from 15 to 25 years; and the

affection—especially if it arise from anæmia—is very much more common in the female than in the male sex.

The treatment of palpitation must entirely depend upon its cause. The use of all nervous stimulants (tea, coffee, alcohol, and tobacco) should be suspended or abandoned. If the patient is clearly plethoric, with a full strong pulse, he should take saline cathartics, and live upon comparatively low diet (including little animal food) until this condition is removed. When, on the other hand, the palpitation is due to an anæmic condition, the remedies are preparations of iron, aloetic purgatives, an abundance of animal food, bitter ale, the cold shower bath, and exercise, short of producing positive fatigue, in a pure bracing air. In the paroxysms, relief will often be afforded by the administration of a diffusible stimulant, such as ammoniated tincture of valerian, aromatic spirit of ammonia, etc.

PALSY. See PARALYSIS.

PALY. See PALE.

PAMIERS, a t. of France, department of Ariège, capital of the arrondissement of Pamiers on the right bank of the Ariège, 11 m. n. of Foix; pop. 10,000. It is in a beautiful district, rich in corn, fruit, and pasturage. It contains a cathedral surmounted by an ancient gothic brick tower, several other churches, a convent, bishop's palace, a college, seminary for the education of the clergy, several schools, a court-house, and a large hospital. It has manufactures of hardware and woollens, paper, flour and saw-mills, and a thriving trade in corn. There is a chalybeate spring in the neighborhood.

PAMLICO, a co. in e. North Carolina, bordering on Pamlico sound; drained by the Neuse; about 300 sq. m.; pop. '80, 6,324—6,315 of American birth, 2,116 colored. The surface is swampy and covered with forests of cypress, pine, and other trees. Indian corn and pork are the chief products. Co. seat, Stonewall.

PAMLICO RIVER. See TAR RIVER.

PAMLICO SOUND, a large bay on the coast of North Carolina, separated from the ocean by long, narrow islands of sand, an angle of the largest forming cape Hatteras, and connected with the ocean by narrow passages, the chief of which is Ocracoke inlet, and on the n. with Albemarle sound; it is 80 m. long, and from 10 to 30 m. wide, and receives the Neuse and Pamlico rivers.

PAM'PAS (in the Quichua tongue, a "valley" or "plain"), is a term employed in a general sense as a designation of southern American plains, in contradistinction to the "prairies" of North America, and in this sense it is frequently employed by geographers. It is also used in Peru as a general designation of tracts of level land either on the coast or among the mountains, and in this sense occurs as a component of many proper names, being then transformed into *bamba*. The chief pampas in Peru are those of the Sacramento. But in its more special and proper signification, the word pampas is given to the immense and partly undulating plains bounded by the Rio Negro of Patagonia, the La Plata and Paraguay, and the base of the Cordilleras. These plains during the wet season afford abundant pastures to the many herds of wild oxen and horses which roam over them, but they become rapidly parched under the burning heat of the sun, except in the low-lying tracts, or along the banks of rivers. The most fertile of the pampas lie westwards towards the Cordilleras. From the rapid alternation of vigorous growth with parching drought, the growth of trees is impossible, and their place is accordingly supplied by sparse groups of stunted shrubs. The soil, which is in general poor, is a diluvium composed of sandy clay, and abounds in the bones of extinct mammals. Strips of waterless desert, known as *travesias*, stretch across the pampas, these *travesias* are destitute of all vegetation with the exception of a few bushes, and are markedly distinct in geological character. The soil of the pampas is more or less impregnated with salt, and saltpeter abounds in many places. The wild animals of the pampas are horses, oxen (both introduced by the Spaniards), nandous, and guanacos. The skins of the horses and oxen, and the flesh of the latter, form a most important item in the trade of this region. The half-white inhabitants of the pampas are called Guachos (q.v.). The whole area of the pampas has been estimated at about 1,500,000 sq. miles.

PAMPAS GRASS, *Gynerium argenteum*, a grass which covers the *pampas* in the s. of Brazil and more southern parts of South America, and has been introduced into Britain as an ornamental plant. It is quite hardy, and its tufts have a splendid appearance. The leaves are 6 or 8 ft. long, the ends hanging gracefully over; the flowering stems 10 to 14 ft. high; the panicles of flowers silvery white, and from 18 in. to 2 ft. long. The herbage is too coarse to be of any agricultural value. The male and female flowers are on separate plants; in panicles; the spikelets 2-flowered, one floret stalked, and the other sessile; the paleæ of the female florets elongated, awn-shaped, and woolly.—Another species of the same genus, *G. saccharoides*, also a Brazilian grass, yields a considerable quantity of sugar.

PAMPELU'NA, or PAMPLO'NA, a fortified city of Spain, capital of Navarre, of which it is the key, occupies an eminence not commanded by any neighboring height, on the left bank of the Arga, a tributary of the Ebro, 111 m. n.n.w. of Saragossa by railway, and 200 m. n.n.e. of Madrid. The citadel, overlooking the river and commanding the plain, is

a regular pentagon, each side being 1000 ft. in extent, and is connected with the city by an esplanade or glacis. Magnificent views of the Pyrenees on the n. are obtained from the citadel, and there are several very pleasant promenades. The *cuenca* (plain) of Pampeluna is about 30 m. in circumference; and although the climate is somewhat chilly and damp, the gardens are fruitful and the meadows verdant. The city is well built and clean; water is brought from hills about 9 m. distant, by means of an aqueduct built after the solid Roman style by Ventura Rodriguez, and a portion of which, 2,300 ft. in length, is supported on 97 arches, 35 ft. in span and 65 ft. in height. The town contains a number of squares with fountains, a theater, and the regular *plaza de toros*—bull arena—capable, it is said, of containing 10,000 people. Agriculture, the wine trade, and the manufacture of linens and leather are the only noteworthy branches of industry. Pop., before the ruinous Carlist blockade in 1874, about 23,000.

Pampeluna was called by the ancient *Pompeiopolis*, from the circumstance of its having been rebuilt by the sons of Pompey in 68 B.C. It was taken by the Goths in 466, by the Franks under Childebert in 542, and again under Charlemagne in 778. It was subsequently for a time in possession of the Moors, who corrupted the name Pompeiopolis into *Bambilonah*, whence the modern Pamplona. In later times it was seized by the French in 1808, and held by them till 1813, when it fell into the hands of the allies under the duke of Wellington.

PAM'PHILUS, b. at Amphipolis in the 4th c. B.C., and studied painting at Sicyon, under Eupompus, whom he succeeded as the head of the Sicyonian school. The characteristics of this school were a stricter attention to dramatic truth of composition, and also the acquisition of all sciences relating directly or indirectly to painting. The length of the course was extended over 10 years, and the art of delineation was made fundamental in the education of all who were free-born. This school was the most famous of all the schools of ancient painting. The fee of admission was a talent, or about £216. Among the pupils at this school were Apelles and Melanthius. We have an account of only four of the pictures of Pamphilus, "The Heraclidæ"; "The Battle of Phlius"; "Ulysses on the Raft," and "Cognatio, or Relationship."

PAM'PHILUS, a Christian writer said to have been b. at Berytus in the latter half of the 3d c.; studied under Pierius of Alexandria, and spent most of his life as a presbyter at Cesaræa in Palestine. He founded a theological school, and established a valuable ecclesiastical library, which became celebrated. He multiplied copies of the Scriptures, and supplied them to the poor. He welcomed any also to his library or his school. He was the author of an *Apology for Origen* in five books, continued by his pupil and admirer, Eusebius. He prepared, in conjunction with Eusebius, an edition of the *Septuagint* from the text in Origen's *Hexapla*, which was generally used in the eastern church. During the persecution of the Christians by Diocletian he suffered martyrdom in 309 for refusing to sacrifice to the gods.

PAMPHLET (variously derived from Spanish *papaleta*, slip of paper on which anything is written, and *pagina filata*, threaded page), a small book consisting of a sheet of paper, or a few sheets stitched together, but not bound. It generally contains a short treatise on some subject, political or otherwise, which is exciting public attention at the time of its appearance. The word is of considerable antiquity, as it is to be met with in Chaucer; but it was not till about the middle of the 16th c. that pamphlets began to be of common use in political and religious controversy in England and France. Under the second French empire, political pamphlets appeared from time to time which were generally believed to be written under imperial dictation, and either to speak the sentiments of the emperor, or to be feelers of public opinion.

PAMPHYLIA, anciently a country on the s. coast of Asia Minor, with Cilicia on the e. and Lycia on the w. It was originally bounded on the inland or northern side by mount Taurus, but afterward enlarged so as to reach the confines of Phrygia. Pamphylia is mountainous, was formerly well wooded, and had numerous maritime cities. The inhabitants—a mixed race of aborigines, Cilicians, and Greek colonists—spoke a language the basis of which was probably Greek, but which was disfigured and corrupted by the infusion of barbaric elements. Their coins show that they had adopted to some extent the religion, arts, and games of the Hellenic race. Its political history is unimportant. Along with Phrygia and Lycia it fell to the share of Antigonus on the partition of the Macedonian empire. It afterwards passed successively into the hands of the Græco-Syrian princes, the kings of Pergamus, and the Romans.

PAN, among the Greeks, the chief god of pastures, forests, and flocks. The later rationalizing mythologists, misconceiving the meaning of his name, which they confounded with *to pan*, "the whole," or "the universe," whereas it is more probably connected with *paō* (Lat. *pasco*), "to feed," "to pasture," represented him as a personification of the universe, but there is absolutely nothing in the myth to warrant such a notion. Pan, neither in his genius nor his history, figures as one of the great principal deities, and his worship became general only at a comparatively late period. He was, according to the most common belief, a son of Hermes (Mercury) by the daughter of Dryops; or by Penelope, the wife of Ulysses; while other accounts make Penelope the mother, but Ulysses himself the father—though the paternity of the god is also ascribed to the num-

erous wooers of Penelope in common. The original seat of his worship was the wild hilly and wooded solitudes of Arcadia, whence it gradually spread over the rest of Greece, but was not introduced into Athens until after the battle of Marathon. Homer does not mention him. From his very birth his appearance was peculiar. He came into the world with horns, a goat's beard, a crooked nose, pointed ears, a tail, and goat's feet; and so frightened his mother that she ran off for fear, but his father, Hermes, carried him to Olympus, where all the gods, especially Dionysus (Bacchus), were charmed with the little monster. When he grew up he had a grim shaggy aspect, and a terrible voice, which bursting abruptly on the ear of the traveler in solitary places—for Pan was fond of making a great noise—inspired him with a sudden fear (whence the word *panic*). It is even related that the alarm excited by his blowing upon a shell decided the victory of the gods over the Titans. He was the patron of all persons occupied in the care of cattle and of bees, in hunting and in fishing. During the heat of the day he used to take a nap in the deep woods or on the lonely hillsides, and was exceedingly wroth if his slumber was disturbed by the halloo of the hunters. He is also represented as fond of music, and of dancing with the forest nymphs, and as the inventor of the syrinx or shepherd's flute, also called Pan's pipe. Cows, goats, lambs, milk, honey, and new wine were offered to him. The fir-tree was sacred to him, and he had sanctuaries and temples in various parts of Arcadia, at Troezene, at Sicyon, at Athens, etc. The Romans identified the Greek Pan with their own Italian god Inuus, and sometimes also with Faunus. See FAUN.

When, after the establishment of Christianity, the heathen deities were degraded by the church into fallen angels, the characteristics of Pan—viz., the horns, the goat's beard, the pointed ears, the crooked nose, the tail, and the goat's feet—were transferred to the devil himself, and thus the "auld hornie" of popular superstition is simply Pan in disguise.

PANA, a t. in Christian co., Ill.; about 40 m. s.e. of Springfield; the junction of the Indianapolis and St. Louis, the Ohio and Mississippi (Springfield branch), and the Illinois Central railroads; pop, '80, 3,009. There are 3 grain elevators, several machine-shops and foundries, 2 banks, and 2 weekly newspapers.

PANAMA', a city and sea-port of the republic of Colombia, in South America, capital of the "state" of the same name, at the head of the bay of Panama, on the southern shore of the isthmus of the same name, in lat. 8° 56' n., long. 79° 31' west. It occupies a tongue of land which extends some distance out to sea in shallow waters. The harbor is safe, but vessels of more than 80 tons burden cannot approach within 2 m. of the shore. Large vessels anchor at a distance of 3 m., near the island of Perico. The important edifices of the city include a beautiful cathedral, a college, and several convents, all of which, however, are falling into decay. There is considerable trade with Europe in pearls, mother-of-pearl, shells, and gold-dust, obtained in the vicinity. Panama is chiefly important, however, as the Pacific terminus of the Panama railway. This railway was completed in 1855, is about 48 m. in length, and connects Panama on the Pacific with Aspinwall colony on the Atlantic. By means of it the route to California was much shortened, and mails were carried over it till the completion of the Pacific railway. Pop. '70, 18,378. The former city of Panama, the seat of the Spanish colonial government established in 1518, stood 6 m. n.e. of Panama, and is now a heap of ruins.

PANAMA CANAL. See INTEROCEANIC SHIP CANAL.

PANAMA, ISTHMUS OF, is that portion of the narrow ridge of mountainous country connecting Central and South America which is bounded on the w. by the frontier of Costa Rica, and on the e. by the surveyed interoceanic route from the bay of Caledonia on the n. to the gulf of San Miguel on the s. or Pacific side. It extends in long. from 77° to 83° west. The "state" of Panama, one of those which form the United States of Colombia, is co-extensive with the isthmus of the same name. Area, 29,756. Pop. '70, 220,542. Panama contains the provinces of Panama, Azuero, Chiriqui, and Veraguas. The isthmus is traversed throughout by a chain of mountains, forming the barrier between the Atlantic and Pacific oceans, and of which the highest peak is that of Picacho (7,200 ft.) in the west. Numerous streams, the largest of which is the Tuira (162 m. long, and navigable for 102 m.), fall into both oceans. On the Pacific shores are numerous beautiful islands, among which Las Perlas, so called from their pearl fisheries, and the island of Coiba, are the chief. On the n. coast the principal harbors are the Chiriqui lagoon, San Blas, and Caledonia; on the s. shore, Damas in the island of Coiba, the bay of San Miguel, and Golfo Dulce. Gold, which in ancient times was obtained here in great quantities, is still found, and mines of salt, copper, iron, coal, etc., are worked. The climate is unhealthy, except in the interior and on the flanks of the mountains. Almost all the plants of the torrid zone may be raised here, but maize, rice, plantains, etc. (grown for the purpose of supplying the transit), are the chief crops. The imports amount annually to about £500,000, and the exports to the same value. The latter consisted of cotton, india-rubber, cloth and grass hammocks, grass (Panama) hats, matting, etc. Commerce is the chief employment.

In 1855 a railway across the isthmus, from Aspinwall city on the Atlantic to Panama on the Pacific, was opened. The summit of the railway is 250 ft. above the level of the sea; and the average value of the goods that annually pass over it is estimated at £11,000,000. The isthmus has frequently been surveyed with the object of finding a

SOUTH AMERICA

Railways shown thus

SOUTH GEORGIA (British)

route for an interoceanic canal. The name isthmus of Panama is generally used as interchangeable with the isthmus of Darien (q. v.).

PANATHENÆ'A, the most famous festival of Attica, celebrated at Athens in honor of Athene, patron goddess of the city, and intended to remind the people of Attica of their union into one community by the mythical Theseus. Before the time of Theseus, or—to speak more critically—before the formation of the Attic confederacy, this festival was only for the citizens of Athens, and was called simply *Athenæa*. According to tradition, the Athenæa owed its origin to king Erichthonius about 1506 or 1521 B.C. The later Panathenæa appears to have been a double festival. All writers who mention it speak of a lesser and greater Panathenæa, the former held annually, the latter every fourth year. Both took place in the month *Hecatombæon* (July), and lasted several days. The lesser Panathenæa was celebrated with gymnastic games, musical competitions, declamations, and a torch race in the evening, the whole concluding with the sacrifice of an ox. The prize of the victors was a vessel filled with oil from the sacred tree on the Acropolis. The greater Panathenæa only differed from the lesser in being more solemn and magnificent. Rhapsodists sang the Homeric poems: dramatic representations were given; and a splendid procession took place to the temple of Athene Polias on the last day of the festival, to present the goddess with a *peplus* or embroidered robe, of crocus color, woven by the maidens (*ergastinai*) of the city. Not alone the Athenians, but the whole population of Attica poured forth on this occasion. The procession is grandly sculptured on the frieze of the Parthenon by Phidias and his disciples.

PANAX. See GINSENG.

PANAY. See PHILIPPINE ISLANDS, *ante*.

PANCAKE. This article of food is prepared by pouring a rich batter of flour, eggs, and milk into a frying-pan, so as to cover it about half an inch in thickness; the pan having been previously heated and well supplied with butter, lard, or olive oil. A quick fire is necessary to cook it well, and when the under side is done, a dexterous cook by jerking the frying-pan manages to reverse the cake, so as to bring the upper side downward to be cooked in its turn. It is now a common practice to make pancakes rather smaller than the bottom of the pan, and frequently to add minced apples and other materials to vary and flavor them; these are, however, better known under the name of fritters.

This dish is particularly associated with Shrove Tuesday, but the origin of the connection is by no means clear. Perhaps it is the relic of a heathen custom. The Saxons called February *Solmonath*, "which," says a writer in *Notes and Queries* (first series, vol. v. p. 491), "Dr. Frank Sayers, in his *Disquisitions*, says is explained by Bede, *Mensis Placentarum*, and rendered by Spelman, in an inedited MS., 'pancake month,' because, in the course of it pancakes were offered by the pagan Saxons to the sun."

PÁNCH, MAHÁL. See page 885

PANCHATANTRA (literally, the five books) is the name of the celebrated Sanskrit fable-book of the Hindus, whence the *Hitopades'a* (q. v.) was compiled and enlarged. Its authorship is ascribed to a Brahman of the name of Vishn'us'arman, who, as its introduction in a later recension relates, had undertaken to instruct, within six months, the unruly sons of Amaras'akti, a king of Mahilâropya or Mihilâropya, in all branches of knowledge required by a king, and for this purpose composed this work. If the latter part of this story be true, it is more probable, however, as prof. Benfey assumes, that Vishn'us'arman was merely the teacher of the princes, and that the existing work itself was composed by some other personage; for an older recension of the work does not speak of his having brought his tales into the shape of a work. The arrangement of the Panchatantra is quite similar to that of the *Hitopades'a*. The fables are narrated in prose, and the morals drawn from or connected with them are interwoven with the narrative in verse; many such verses, if not all, being quotations from older works.—On the history of the Panchatantra and its relation to the fable-books and fables of other nations, see the excellent work of prof. Theodor Benfey, *Panchatantra: fünf Bücher Indischer Fabeln, Märchen und Erzählungen* (2 vols. Leip. 1859), the first volume containing his historical and critical researches on, and the latter his literal translation into German of, the *Panchatantra*.

PANCKOUCKE, CHARLES JOSEPH, 1736-98; b. in Lisle, France; son of a noted publisher of French Protestant works; died in Paris. He continued the business and became eminent as an editor as well as publisher. He edited Buffon's works, published *Le Grand Vocabulaire Français; Le Répertoire de Jurisprudence;* and *Le Voyageur Français;* in all about 100 vols. Voltaire named him to edit his works, but the work fell upon Beaumarchais. The *Encyclopédie Méthodique*, in 47 vols. illustrated, was his great work. He was one of the editors of the *Mercure Français*, and joint founder with La Harpe, Andrieux, and Regnier, of the *Moniteur*.

PANCKOUCKE, CHARLES LOUIS FLEURY, 1780-1844; b. in Paris; son of Charles Joseph, publisher and editor; educated to the law, but became associate and successor in the publishing business of his father. Among his issues are the *Dictionnaire des Sciences Médicales*, 60 vols., 1812; *Biographie Médicale;* and *Flore Médicale;* the latter illustrated by his wife; besides a great number of works on general subjects. He wrote a few small works, among which is the *Budget Statistique d'un Editor*, 1837. His wife was an artist of skill, and the translator of a prose edition in French of the poems of Goethe. The

Bibliothèque Latine-Française in 174 volumes, 1828, was from this house, which has since maintained its reputation under the direction of Ernest Panckoucke, son, b. 1806, and long a director of the *Moniteur*.

PANCOAST JOSEPH, b. N.J., 1805; educated at the university of Pennsylvania, where he took his degree in medicine, 1828. In 1831 he became instructor of surgery and anatomy; and in 1834 was chosen physician-in-chief of the Philadelphia and Children's hospitals. In 1861 he was made professor of anatomy in the Jefferson medical college, where for many years previous he had given instruction in surgery. From 1838 to 1845 he was visiting surgeon of the Philadelphia hospital. He has made many contributions to the medical and scientific periodicals, has edited Wistar's *Anatomy* and other text books, and is the author of a work on *Operative Surgery*.

PANCREAS (from the Gr. *pan*, all, and *kreas*, flesh) is a conglomerate gland, lying transversely across the posterior wall of the abdomen, varying in length from six to eight in., having a breadth of about an inch and a half, and a thickness of from half an inch to an inch. Its usual weight is about three ounces. The head of the pancreas lies in the concavity of the duodenum.

The secretion of this gland, or the pancreatic fluid, is conveyed from its various parts by means of the pancreatic duct to the duodenum. This gland is found in all mammals, birds, reptiles, amphibians, and osseous fishes, and in some cartilaginous fishes.

The physical and chemical characters of the pancreatic fluid, and its uses in the animal economy, are sufficiently noticed in the article DIGESTION.

The diseases of the pancreas are few, and do not signify their existence by any very marked symptoms. The presence of undigested fat in the stools has been frequently observed in cases in which after death the pancreas has been found to be diseased; and if Bernard's views regarding the saponifying power of the pancreatic juice on fatty matters (described in the article already referred to) be correct, the reason why the fat should appear in the evacuations in these cases is sufficiently obvious. The most common form of disease is cancerous deposit in the head of the gland, which frequently induces jaundice by obstructing the common biliary duct near its opening. An accurate diagnosis of disease of this organ is extremely difficult, but fortunately is of comparatively little importance, as it cannot lead to efficient treatment; all that can be done in these cases being to palliate the most distressing symptoms.

The pancreas of ruminating animals is a favorite article of food under the name of sweetbread. That of the calf is most highly esteemed, but that of the lamb is often substituted for it. Dr. Edward Smith questions whether the very high price often paid for calf's sweetbread is warranted by its nutritive qualities, or even by its flavor; although he allows that the flavor is perhaps the most delicate of any meat we are acquainted with. It is either boiled or fried. The thyroid and sublingual glands are also used as sweetbread.

PANCREATINE, a proteid substance forming the active principle of the pancreatic juice. This secretion as obtained from healthy animals is a viscid, slightly opaline fluid having an alkaline reaction and a very slight peculiar animal odor and taste. Bernard found its specific gravity in a good specimen taken from a dog to be 1.040. It contains a large amount of organic matter, and completely solidifies on the application of heat, this property distinguishing the normal fluid from that which has undergone change. The following is the composition of the pancreatic juice of a dog, according to Bernard. Water 900 to 920; organic matter (pancreatine) precipitable by alcohol, and always containing a little lime 73.6 to 90; chloride of sodium, chloride of potassium, carbonate of soda, and phosphate of lime, in all, 6.4 to 10 in 1000 parts. The chemical properties of the organic principle of the pancreatic juice are characteristic. Like albumen, it is coagulated by heat, mineral acids, and alcohol, but its dried alcoholic precipitate will redissolve in water and retain all its physiological properties, while the precipitated albumen will not redissolve. Bernard further ascertained that pancreatine is coagulated by an excess of sulphate of magnesia, which will also coagulate casein, but not albumen. This is an important distinction, as it is necessary sometimes to be able to distinguish between a fatty emulsion made with pancreatic secretion or with albumen, each having the property of forming emulsions with fats. Pancreatic juice, although normally alkaline, does not lose its peculiar digestive properties when rendered acid, as it usually is when the partly digested contents of the stomach are emptied into the duodenum. There are, apparently, no distinctive properties given it by its inorganic accompaniments, and Bernard has shown that the organic principle, or pancreatine alone, when extracted from the secretion and dissolved in water is capable of performing the same physiological work as the natural secretion. See PANCREAS, DIGESTION, *ante*.

PANCSOVA, an active trading t. of Hungary, in the Servian military frontier, 70 m. s.s.w. of Temesvar, and close to the mouth of the Temes in the Danube, which is here a mile wide. It is a military station, contains several churches, a high school, and a quarantine establishment. Silk-spinning, brandy-distilling, and an active trade in cattle, pigs, and corn are carried on. Pop. '80, 17,127.

PANDA, *Ailurus fulgens*, a quadruped of the family *ursidæ* (see BEAR), a native of the Himalayas, the only known species of its genus, which has a very short muzzle, small rounded ears, a moderately long tail, covered with long hair, semi-retractile

claws. The panda is about the size of a large cat. It dwells chiefly in trees, preying much on birds, but it also eats small quadrupeds and large insects. It has a thick, fine, woolly covering, adapting it to a cold climate, concealed by long, soft glistening, and richly colored hair, mostly chestnut brown, which passes into black on the sides and legs, and into white on the head. The panda is said to excel all other animals in the brilliancy of its fur, which, however, has not yet acquired any commercial value. The soles of the feet are thickly covered with woolly hair. The panda is also called *wah* and *chit-wa*, from a peculiar cry which it utters.

PANDANACEÆ, a natural order of endogenous plants, constituting a remarkable feature in the scenery of many tropical countries, but unknown in the colder regions of the globe. They are trees or bushes, often sending down adventitious roots, sometimes weak and decumbent, or climbing. There are two sections of the order, one (*pandaneæ*) including the genera *pandanus*, *freycinetia*, etc., having long, simple, imbricated leaves, usually spiny on the back and margin, their base embracing the stem, their spiral arrangement often notably visible; the other (*cyclantheæ*) containing the genera *cyclanthus*, *nipa* (q.v.), *carludovica*, *phytelephas*, etc., having pinnate or fan-shaped leaves, and in general appearance much resembling palms, with which they have been often ranked. The two sections, however, are very similar in their flowers and fruit, in which they not a little resemble the humbler *araceæ* and *typhaceæ*. The flowers are mostly unisexual, naked, or with only a few scales, arranged on a spadix, and wholly covering it. The stamens are numerous; the ovaries usually clustered, one-celled, each crowned with a stigma; the fruit consists of fibrous, one-seeded drupes, collected or almost combined, or of berries with many seeds.—There are not quite 100 known species. Some are valuable for the fiber of their leaves, some for their edible fruit, etc. See SCREW PINE, KIEKIE, and NIPA. The unexpanded leaves of *Carludovica palmata* furnish the material of which *Panama hats* are made. The tree which yields vegetable ivory (q.v.) is another of the palm-like section of this order.

PAN'D'AVAS, or the descendants of Pân'd'u (q.v.), is the name of the five princes whose contest for regal supremacy with their cousins, the Kurus, the sons of Dhr'itarâsh't'ra, forms the foundation of the narrative of the great epic poem, the *Mahâbhârata* (q.v.). Their names are *Yudhisht'hira*, *Bhîma*, *Arjuna*, *Nakula*, and *Sahadeva*—the former three being the sons of Pân'd'u, by one of his wives, Pr'ithâ; and the latter two by his other wife, Mâdrî. But though Pân'd'u is thus the recognized father of these princes, the legend of the *Mahâbhârata* looks upon him, in truth, merely as their father by courtesy; for it relates that Yudhisht'hira was the son of Dharma, the god of justice; Bhîma, of Vâyu, the god of wind; Arjuna, of Indra, the god of the firmament; and Nakula and Sahadeva, of the As'wins, the twin-sons of the sun.

PANDECTS (Gr. *Pandecton*, all-receiving; from *pan*, all, and *dechomai*, I receive), one of the celebrated legislative works of the emperor Justinian (q.v.), called also by the name *Digestum*, or *Digest*. It was an attempt to form a complete system of law from the authoritative commentaries of the jurists upon the laws of Rome. The compilation of the pandect was undertaken after that great collection of the laws themselves which is known as the *Codex Justinianus*. It was intrusted to the celebrated Tribonianus, who had already distinguished himself in the preparation of the *Codex*. Tribonianus formed a commission consisting of 17 members, who were occupied from the year 529 till 533 in examining, selecting, compressing, and systematizing the authorities, consisting of upwards of 2,000 treatises, whose interpretation of the ancient laws of Rome was from that time forward to be adopted with the authority of law. A period of 10 years had been allowed them for the completion of their work; but so diligently did they prosecute it that it was completed in less than one-third of the allotted time; and some idea of its extent may be formed from the fact that it contains upward of 9,000 separate extracts, selected according to subjects from the 2,000 treatises referred to above.

The Pandects are divided into 50 books, and also into 7 parts, which correspond respectively with books 1-4, 5-11, 12-19, 20-27, 28-35, 36-44, and 45-50. Of these divisions, however, the latter (into parts) is seldom attended to in citations. Each book is subdivided into titles, under which are arranged the extracts from the various jurists, who are 39 in number, and are by some called the classical jurists, although other writers on Roman law confine that appellation to five of the number, Papinian, Paulus, Ulpian, Gaius (q.v.), and Modestinus. The extracts from these indeed constitute the bulk of the collection; those from Ulpian alone making one-third of the whole work, those from Paulus one-sixth, and those from Papinian one-twelfth. Other writers beside these 39 are cited, but only indirectly, i.e., when cited by the jurists whose works form the basis of the collection. The principle upon which the internal arrangement of the extracts from individual writers was made had long been a subject of controversy. The question seems now to be satisfactorily solved; but the details of the discussion would carry us beyond the prescribed limits. Of the execution of the work it may be said that although not free from repetition (the same extracts occurring under different heads), and from occasional inaptness of citation, and other inconsistencies, yet it deserves the very highest commendation. In its relations to the history and literature of ancient Rome it is invaluable; and taken along with its necessary complement, the *Codex*, it may justly be

regarded (having been the basis of all the mediæval legislation) as of the utmost value to the study of the principles not alone of Roman, but of all European law.

PANDERPOOR', a t. in British India, in the presidency of Bombay, on the river Bima; pop. 20,000. It has a celebrated temple of Vishnu.

PAN'OLA, a co. in n.w. Mississippi, intersected centrally by the Mississippi and Tennessee railroad, crossing the Tallahatchee river at Panola in the center of the county; 720 sq.m.; pop. '80, 28,353—28,238 of American birth, 18,834 colored. It is drained by the Tallahatchee and its branches, one of which forms its s.e. boundary. Its surface is diversified by small lakes, groves of cypress, magnolia, and elm, and forests of good building timber. Its soil is fertile, and adapted to the raising of live stock and the production of grain, cotton, tobacco, and sweet potatoes. Its principal manufactures are leather and flour. Co. seat, Sardis.

PAN'OLA, a co. in e. Texas, having the state line of Louisiana for its e. boundary, drained by the headwaters of the Sabine river; 750 sq.m.; pop. '80, 12,218—12,205 of American birth, 4,034 colored. Its surface is generally level, a large proportion covered with dense forests of pine, oak, and hickory, ash, and walnut trees. Its soil is fertile, adapted to stock-raising, and the production of grain, cotton, sweet potatoes, fruit, and dairy products. Co. seat, Carthage.

PANDORA (i.e., the "All-endowed"), according to Grecian myth, was the first woman on the earth. When Prometheus had stolen fire from Jupiter, Zeus instigated Hephæstus to make woman out of earth to bring vexation upon man by her graces. The gods endowed her with every gift necessary for this purpose, beauty, boldness, cunning, etc.; and Zeus sent her to Epimetheus, the brother of Prometheus, who forgot his brother's warning against receiving any gift from Zeus. A later form of the myth represents Pandōra as possessing a vessel or box filled with winged blessings, which mankind would have continued to enjoy if curiosity had not prompted her to open it, when all the blessings flew out, except hope.

PANDOURS, a people of Servian origin who lived scattered among the mountains of Hungary, near the village of Pandour in the county of Sohl. The name used to be applied to that portion of the light-armed infantry in the Austrian service which is raised in the Slavonian districts on the Turkish frontier. The Pandours originally fought under the orders of their own proper chief, who was called Harûn-Basha, and rendered essential service to the Austrians during the Spanish war of succession, and afterward in the Seven Years' war. They originally fought after the fashion of the "free lances," and were a terror to the enemy whom they annoyed incessantly. Their appearance was exceedingly picturesque, being somewhat oriental in character, and their arms consisted of a musket, pistols, a Hungarian saber, and two Turkish poniards. Their habits of brigandage and cruelty rendered them, however, as much a terror to the people they defended as to the enemy. Since 1750 they have been gradually put under a stricter discipline, and are now incorporated with the Austrian frontier regiments. The name is now obsolete.

PAN'DU, literally, "white," is the name of the father of the Pân'd'avas (q.v.), and the brother of Dhr'itarâsht'ra. Although the elder of the two princes, he was rendered by his "pallor"—implying, perhaps, a kind of disease—incapable of succession, and therefore obliged to relinquish his claim to his brother. He retired to the Himalaya mountains, where his sons were born, and where he died. His renunciation of the throne became thus the cause of contest between the Pân'd'avas, his sons, and the Kurus, or the sons of Dhr'itarâsht'ra.

PANEL (through Fr. from Lat. *pannus*, a piece of cloth, a patch), a space or compartment of a wall, ceiling, woodwork, etc., inclosed by beams, moldings, framing, and so forth. It is generally sunk under the plane of the surrounding styles. In woodwork, panels are thinner parts used to fill in strong framing, as in doors, shutters, etc. These are sometimes highly ornamented with tracery, shields, etc. In late Gothic architecture, the panel is very often carved into the "linen pattern." Paneling is a style of ornament greatly used in Elizabethan architecture. The ceilings and walls are covered with it, and every piece of furniture is cut up into panels of every variety of form. Panels are said to be "fielded" when the center of the panel is raised with moldings, etc.

PANEL (properly the slip or "pane" of parchment on which the names of the jurors are written) is, in the practice of the English law, used to denote the body or set of jurors, consisting of 12 men, who try a cause, civil or criminal. In Scotch criminal law the prisoner is usually called the panel.

PANGÉ LINGUA (Lat. "Proclaim, O Tongue"), one of the most remarkable of the hymns of the Roman breviary, and like its kindred hymn, *Lauda Sion*, a most characteristic example as well of the mediæval Latin versification as of that union of theology with asceticism, which a large class of these hymns present. The Pange Lingua is a hymn in honor of the eucharist, and belongs to the service of the festival of Corpus Christi. It is from the pen of the great angelic doctor, Thomas Aquinas (q.v.), and consists of six strophes of verses in alternate rhyme. Besides its place in the office of the breviary, this hymn forms part of the service called benediction with the blessed sacra-

ment, and is sung on all occasions of the exposition, procession, and other public acts of eucharistic worship.

PANGOLIN, or **PENGOLIN**, a name sometimes extended to all the species of *manis* (q.v.), but originally belonging to *M. pentadactyla*, also called **SHORT-TAILED MANIS**, and in some parts of India **BAJJEKKEIT**; this species being a native of most parts of the East Indies, and pangolin, its Malayan name, derived from a word which signifies to roll up; the animal having the habit of rolling itself up, on apprehension of danger, into a compact ball, the head in the center, and its muscular mail-covered tail enfolding all. The food of the pangolin consists chiefly of ants, and like the rest of the genus, it is entirely destitute of teeth, and has a round, extensile tongue. Its claws are long and strong; it doubles them up like the American ant-eaters when it walks. It resides in burrows, which it excavates to the depth of 7 or 8 ft. in the ground. It is capable of climbing trees, and the tail is prehensile. The whole length of the animal, including the tail, is almost 5 ft., the tail being not quite half the length of the body. It is a gentle animal, easily tamed, and of an affectionate disposition.

PANIC is where fear, whether arising from an adequate or inadequate cause, obtains the mastery over every other consideration and motive, and urges to dastard extravagance, or hurries into danger or death. An inexplicable sound causes a rush from a church, a vague report in the market-place causes a run on a bank, and precipitate the very events that are dreaded. This emotion either differs from natural apprehension, or presents so intense and uncontrollable a form of the feeling, that it is propagable from one person to another, and involves alike the educated and ignorant—those who act from judgment as well as those who act from impulse. There are, besides this feature, several grounds for believing that such manifestations of involuntary terror are of morbid origin, and should be regarded as moral epidemics. They have generally arisen during, or have followed, seasons of scarcity and physical want and disease, the ravages of war, or periods of great religious fervor and superstition. The dancing mania, the retreat of the French army from Moscow, and recent and familiar commercial panics afford illustrations of certain of these relations. The most notable instance of universal panic, and that which demonstrates most aptly the connection here indicated, is the dread of the approaching end of the world which pervaded all minds, and almost broke up human society in the 10th century. The empire of Charlemagne had fallen to pieces; public misfortune and civil discord merged into misery and famine so extreme that cannibalism prevailed even in Paris; superstitious and vague predictions became formalized into a prophecy of the end of all things and universal doom in the year 1000. This expectation suspended even vengeance and war. The “truce of God” was proclaimed. Enormous riches were placed upon the altars. Worship and praise never ceased. The fields were left uncultivated; serfs were set free; four kings and thousands of nobles retired to the cloister; and all men, according to their tendencies, prepared to die.

It is worthy of note that during all pestilences there have arisen epidemic terrors, not so much of the devastations of disease, as of plots and poisonings directed by the rich against the poor. Even where these epidemic terrors are legitimately traceable to local and physical causes, as in the case of the singular affection *timoria*, which occurs in the marshy and unhealthy districts in Sardinia, the tremor and trepidation, and other phenomena, are ascribed to the magical influence of enemies. For the origin of the name, see **PAN**.

PANICLE, in botany, a mode of inflorescence (q.v.) in which the floral axis is not only divided, but also subdivided more or less frequently. The panicle may thus be regarded as a raceme (q.v.), of which the branches (or flower-stalks) are branched. The panicle is a very common kind of inflorescence. Most of the grasses exhibit it, and many other plants, both endogenous and exogenous. The common lilac affords a good example of it. The panicle, variously modified as to its form, and the arrangement and relative lengths of its branches and branchlets, becomes a cyme (q.v.), Thyrsus (q.v.), etc.

PANICUM. See **MILLET**.

PANINI, the greatest known grammarian of ancient India, whose work on the Sanskrit language has up to the present day remained the standard of Sanskrit grammar. Its merits are so great that Panini was ranked among the Rishis (q.v.) or inspired seers, and at a later period of Sanskrit literature, was supposed to have received the fundamental rules of his work from the god Siva himself. Of the personal history of Panini nothing positive is known, except that he was a native of the village Salâtura, situated n.w. of Attock, on the Indus—whence he is also surnamed Sâlâturiya—and that his mother was called Dâkshî, wherefore, on his mother's side, he must have been a descendant of the celebrated family of Daksha. A tale-book, the *Kathâsaritsâgara* (i. e., the ocean for the rivers of tales), gives, indeed, some circumstantial account of the life and death of Panini; but its narrative is so absurd, and the work itself of so modern a date—it was written in Cashmere, at the beginning of the 12th c.—that no credit whatever can be attached to the facts related by it, or to the inferences which modern scholars have drawn from them. According to the views expressed by Goldstücker (*Pânini, his Place in Sanskrit Literature*: London, 1861), it is probable that Panini lived before Sâkyamuni, the founder of the Buddhist religion, whose death took place about 543 B.C., but that a more

definite date of the great grammarian has but little chance of ascertainment in the actual condition of Sanskrit philology. The grammar of Panini consists of eight Adhyâyas, or books, each book comprising four pâdas, or chapters, and each chapter a number of Sûtras (q.v.), or aphoristical rules. The latter amount in the whole to 3,996; but three, perhaps four, of them did not originally belong to the work of Panini. The arrangement of these rules differs completely from what a European would expect in a grammatical work, for it is based on the principle of tracing linguistic *phenomena*, and not concerned in the classification of the linguistic *material*, according to the so-called parts of speech. A chapter, for instance, treating of a prolongation of vowels, will deal with such a fact wherever it occurs, be it in the formation of bases, or in conjugation, declension, composition, etc. The rules of conjugation, declension, etc., are, for the same reason, not to be met with in the same chapter or in the same order in which European grammars would teach them; nor would any single book or chapter, however apparently more systematically arranged—from a European point of view—such as the chapters on affixes or composition, suffice by itself to convey the full linguistic material concerned in it, apart from the rest of the work. In a general manner, Panini's work may therefore be called a natural history of the Sanskrit language, in the sense that it has the strict tendency of giving an accurate description of facts, instead of making such a description subservient to the theories according to which the linguistic material is usually distributed by European grammarians. Whatever objections may be raised against such an arrangement, the very fact of its differing from that in our grammars makes it peculiarly instructive to the European student, as it accustoms his mind to survey language from another point of view than that usually presented to him, and as it must induce him, too, to question the soundness of many linguistic theories now looked upon as axiomatic truths. As the method of Panini requires in a student the power of combining many rules scattered all over the work, and of combining, also, many inferences to be drawn from these rules, it exercises, moreover, on the mind of the student an effect analogous to that which is supposed to be the peculiar advantage of the study of mathematics. The rules of Panini were criticised and completed by Kâtâyâna (q.v.), who, according to all probability, was the teacher, and therefore the contemporary, of Patanjali; and he, in his turn, was criticised by Patanjali (q.v.), who sides frequently with Panini. These three authors are the canonical triad of the grammarians of India; and their works are, in truth, so remarkable in their own department, that they exceed in literary merits nearly all, if not all, grammatical productions of other nations, so far as the two classes are comparable. The rules of Panini were commented on by many authors. The best existing commentary on them is that called the *Kâsikâvrtti*, by Vâmana Jayâditya, which follows these rules in their original order. At a later period, attempts were made to arrange the rules of Panini in a manner which approaches more to the European method; the chief work of this category is the *Siddhânta-Kaumudî*, by Bhattoji-dîkshita. Panini mentions, in his Sûtras, several grammarians who preceded him, among others Sâkatâyana. Manuscripts of a grammar ascribed to a grammarian of this name exist in the library of the India office in London, and in the library of the board of examiners at Madras. On the ground of a few pages only of the latter an attempt has been very recently made to prove that this grammar is the one referred to by Panini, and therefore older than the work of the latter. But the facts adduced in proof of this hypothesis are so ludicrously weak, and the reasoning upon them so feeble and inconclusive, whereas the evidence in favor of the comparatively recent date of this work is so strong, that no value whatever can be attached to this hasty hypothesis. For the present, therefore, Panini's work still remains the oldest existing grammatical work of India, and probably of the human race. The Sûtras of Panini, with a modern commentary by two native pandits, and with extracts from the *Vârttikas* of Kâtâyâna and the *Mahâbhâshya* of Patanjali, were edited at Calcutta in 1809. This edition, together with the modern commentary, but with garbled extracts from the extracts mentioned, was reprinted at Bonn in 1839–1840 by Dr. O. Boehtlingk, who added to it remarks of his own and some indices. For the literature connected with Panini, see Colebrooke's preface to his *Grammar of the Sanskrit Language* (Calc. 1805), and Goldstûcker's *Panini*, etc., as mentioned above.

PANIPUT', the chief t. of the district Kurnal, in the division of Dehi, Punjab, is situated 54 m. (by road 78 m.) n. by w. from Delhi, in a fertile tract, the resources of which are largely developed by artificial irrigation. Pop. '81, 25,276. Being a station on the great military road between Afghanistan and the Punjab, and to some extent an outpost of Delhi, it has been at various times the scene of strife between the inhabitants of India and invaders. The *first* great battle of Paniput was fought in 1526, and gained by Mirza Baber, the ex-ruler of Ferghana, at the head of 12,000 Mongols, over Ibrahim the emperor of Delhi, whose unwarlike array numbered 100,000 men, with 1000 elephants. This victory seated Baber on the throne of Hindustan as the first of the "Great Mogul" dynasty. The *second* great battle was fought in 1556, by the Mongols under Akbar, grandson of Baber, and third of the Mogul emperors, against Hemu, an Indian prince who had usurped the throne of Delhi. Hemu's army was defeated with great slaughter, and himself slain. The *third* battle was fought on Jan. 14, 1761, between Ahmed Abdalli, ruler of Afghanistan, and the till then invincible Mahrattas. The Jats, who had been forced to join the Mahrattas, deserted to the

Afghans at a time when victory seemed to be declaring for the former; and this act of treachery, together with the loss of their leaders, threw the Mahrattas into confusion, and in spite of their most resolute valor they suffered a total defeat. They left 50,000 slain on the field of battle, including all their leaders except Holkar, and 30,000 men were killed in the pursuit, which was continued for four days. The Mahrattas never recovered this crushing blow. It was at Kurnaul, a town a little to the n. of Paniput, that Nadir Shah of Persia, in 1739, won the celebrated battle over the Mogul emperor, which placed n.w. India at his feet.

PANIZZI, Sir ANTONIO, principal librarian of the British museum from 1856 to 1866, b. Sept. 16, 1797, at Brescello, in the *ci-devant* duchy of Modena. For his education he was sent first to the public school of Reggio, and afterwards to the university of Padua, where, in 1818, he took the degree of doctor of laws, with a view to practicing at the bar. Early in life his sympathies were enlisted on behalf of the friends of Italy, as opposed to domestic tyranny and foreign intrusion, and when, in 1821, the popular revolution broke out in Piedmont, the young advocate became one of its leaders. The attempt, however, failed; and Panizzi, who had been denounced by a pretended friend, was arrested at Cremona. Having by some means contrived to escape, he took refuge in Lugano, and from thence in a short time found his way to Geneva. Meanwhile, during his absence, he was tried at home *per contumaciam*, as it is called, and sentenced to death, with confiscation of property. Nor was he allowed to remain at Geneva. The governments of Austria and Sardinia demanded from the Swiss confederation the expulsion of all concerned in the recent outbreak, and among these Panizzi was obliged to depart. Forbidden to pass through France, he reached England by way of Germany and the Netherlands. He now resided for about a month in London, whence he proceeded to Liverpool, with an introduction from Ugo Foscolo to Roscoe the historian, who received him with the utmost hospitality. At Liverpool, where he was introduced into the best circles by Mr. Roscoe, he taught Italian, and continued to reside in that town until 1828, when he came to London again, and was chosen professor of Italian in the university of London, just then opened for students. In 1831, through the instrumentality of lord Brougham, he was appointed one of the assistant-librarians in the British museum; and upon the retirement of the rev. Mr. Baber, in 1837, from the office of keeper of the printed books, Panizzi was appointed his successor. In the previous year there had been a parliamentary committee on the state of the British museum, before which Panizzi gave valuable evidence, and likewise urged the adoption of measures for the improvement and augmentation of the library, which, upon becoming keeper, he was in a still better position to advocate. In 1838 he superintended the removal of the printed books from the old suite of rooms in Montague House to the new library; and in the same year, in conjunction with some of his assistants, he drew up the well-known 91 rules for the formation of a new catalogue of the library. These rules were approved by the trustees, and the first volume of a catalogue framed after them was printed and published in 1841. No other volume has been since published, and Panizzi, before a royal commission of inquiry into the museum in 1847, justified the suspension of the printing until the whole catalogue should be finished. In 1845, Panizzi drew up an elaborate report of the deficiencies existing in the library, in consequence of which the trustees applied to the lords of the treasury for "an annual grant of £10,000 for some years to come, for the purchase of books of all descriptions." This grant having been obtained, the library rapidly increased in numbers, to such a degree that in 1849 the books amounted to 435,000, as compared with 235,000, the ascertained number in 1838. The number of volumes is now estimated at considerably over 1,000,000. Upon the resignation of sir H. Ellis, in 1856, Panizzi was appointed to the post of principal librarian of the British museum, an office he held ten years. In a literary capacity, Panizzi is known by an edition of the *Orlando Innamorato di Boiardo, and Orlando Furioso di Ariosto: with an Essay on the Romantic Narrative Poetry of the Italians, Memoirs and Notes, by A. Panizzi* (9 vols. Lond. 1830-34). Panizzi also edited the *Sonetti e Canzone* of Boiardo (Lond. 1835), and a collection of reprints of the first four editions of the *Divina Commedia*, printed at the expense of lord Vernon (Lond. 1858). He was also the author of a privately printed pamphlet, *Chi era Francesco da Bologna*, tending to prove the identity of the type-founder employed by Aldus, and the inventor of the well-known Aldine or Italic type, with the painter Francesco Francia. Panizzi is also understood to have written articles for some of the quarterly reviews. Panizzi retired on a pension in 1866. In 1869 he received the order of K.C.B. He d. 1879.

PANJIM. See GOA.

PANNAH, or PUNNAH, a decayed t. of India, in the district of Bundelcund, stands on the north-eastern slope of a plateau, 115 m. s.w. of Allahabad. It was formerly a large, thriving, and well-built town; but whole streets are now desolate, or are tenanted only by monkeys, which, posted on the roof or at the windows, view the towns-people without alarm. The palace of the rajah is a beautiful building, surmounted by elegant kiosks, but is in many places ruinous. The source of the former prosperity of Pannah was its rich diamond mines. Owing to the diminished value of the gem, however, and the increased tax upon the produce of the mines, this branch of industry has much fallen off. The diamonds are generally tinted with color; very few of them being of first-water, or

completely colorless. This town is the chief place of a territory of the same name, which is bounded on the n. by the British district of Banda, and on the s. by the British district of Nerbudda. See BUNDELCUND.

PANNELS, in artillery, are the carriages upon which mortars and their beds are conveyed on a march.

PANNO'NIA, a province of the ancient Roman empire, bounded on the n. and e. by the Danube, on the w. by the mountains of Noricum, and on the s. reaching a little way across the Save; and thus including part of modern Hungary, Slavonia, parts of Bosnia, of Croatia, and of Carniola, Styria, and lower Austria. It received its name from the Pannonians, a race of doubtful origin, but who at first dwelt in the country between the Dalmatian mountains and the Save, in modern Bosnia, and afterward more to the s.e. in Moesia. The Roman arms were first turned against them and their neighbors, the Iapydes, by Augustus in 35 B.C., and after the conquest of Segestica or Siseia (Siszek) he subdued them. An insurrection took place in 12 B.C., which Tiberius crushed after a long struggle; and a more formidable one of the Dalmatians and Pannonians together in 6 A.D., which was suppressed by Tiberius and Germanicus, but not till 8 A.D. Fifteen legions had to be assembled against the Pannonians, who mustered 200,000 warriors. Hereupon the Pannonians settled in the more northern countries, which received their name, and of which the former inhabitants, the Celtic Boii, had been in great part destroyed in Cæsar's time. The country was now formed into a Roman province, which was secured against the inroads of the Mareomanni and Quadi by the Danube, and on its other frontiers had a line of fortresses. Military roads were constructed by the conquerors, who also planted in the country many colonies and municipia, and thus gave it a rough coating of civilization. Great numbers of the Pannonian youth were drafted into the Roman legions, and proved, when disciplined, among the bravest and most effective soldiers in the imperial army. Pannalia was subsequently divided into upper (or western) and lower (or eastern) Pannonia, and under Galerius and Constantine underwent other changes. Upper Pannonia was the scene of the Mareomannic war in the 2d century. In the 5th c. it was transferred from the western to the eastern empire, and afterward given up to the Huns. After Attila's death, in 453, the Ostrogoths obtained possession of it. The Longobards under Alboin made themselves masters of it in 527, and relinquished it to the Avari upon commencing their expedition to Italy. Slavonian tribes also settled in the south. Charlemagne brought it under his scepter. In the reigns of his successors, the Slavonians spread northward, and the country became a part of the great Moravian kingdom, till the Magyars or Hungarians took it in the end of the 9th century. In the time of the Romans, Siseia (Siszek), Vindobona (Vienna), Carnuntum (near Hainburg), and Arrabo (Raab), were among its principal towns.

PANORAMA (Gr. *pan*, all, *orama*, a view), a pictorial representation of the whole surrounding landscape as seen from one point. The invention of the panorama is claimed by the Germans for prof. Breisig of Dantzic, but it does not appear that he ever constructed one. The real inventor was Mr. Barker, an ingenious artist of Edinburgh, to whom the idea occurred while taking a sketch of the city from the top of Arthur seat. After surmounting numerous difficulties—one of which was the invention of a new kind of perspective for the horizontal lines—he succeeded in producing an effective panoramic view of Edinburgh, which was exhibited in that city in 1788, and in London in the following year. The next panorama executed by Barker was a view of London from the top of the Albion mills. A large building was now erected in Leicester square for the exhibition of such views. On Mr. Barker's death in 1806, he was succeeded by his son, in partnership with a pupil, Mr. Burford, the painter of the chief modern panoramas. The first step in the construction of a panorama is to obtain sketches of the entire region to be represented; each sketch is a representation of a portion of the landscape in the form of a sector of a circle, with the sketched position as a center, and the horizon for circumference. The canvas to which the sketches are to be transferred is hung round the sides of a circular room, and forms the surface of a cylinder, on the inside of which the panorama is painted. The canvas, brushes, etc., are of the finest description manufactured, and the painting and coloring are elaborated in the most careful manner, in order to render the optical illusion—which every one who has seen a good panorama must have experienced—as complete as possible. The stage from which the picture is viewed is placed in the center of the room, about 30 ft. on every side from the picture; the picture itself is fastened above to a strong circular hoop, and, hanging down, has its lower edge fastened to a similar hoop, which is heavily weighted to keep the picture steady. The light is admitted by an aperture in the roof, which is concealed by an awning from the spectators on the stage. Notwithstanding important defects in the panorama, one of which is that the light more strongly illumines the upper than the lower parts of the picture—thus throwing the foreground comparatively into shade—many cases are on record of spectators being for the time completely under the influence of mental illusion. One of the best instances of this occurred during the exhibition of the third panorama in London. Part of the view consisted of a representation of the wreck of a ship's boat, with sailors struggling in the waves; and at sight of this, a dog belonging to one of the spectators at once leaped over the handrail to the rescue of the sup-

posed drowning men. Panoramas, though frequently exhibited in France, Germany, and other European countries, have met with little success out of Great Britain. The most popular panorama ever executed was that of the battle of Waterloo, the exhibition of which brought in £10,000. There are many modifications of the panorama, but that above described is the most important.

PANORMUS. See PALERMO, *ante*.

PANSLAVISM. This term is applied to the movement lately set on foot, and generally ascribed to Russian influence, for the amalgamation of all races of Slavonic descent into one body, having one language, one literature, and one social polity. The writings of Adam Gurowski and Kollar, and the anonymous pamphlet which appeared at Leipsic in 1837, under the title of *Die Europäische Pentarchie*, have exercised a very widespread influence in this direction among all the Slavonic people of the German states; and although the other nations of Europe have hitherto had no reason to anticipate any practical results from a movement towards Panslavism, the Slavonians of the Austrian empire have always taken occasion to show that they regarded themselves as standing apart from German interests in times of public disturbance. Thus, in 1848, instead of taking part with their fellow-citizens in the election of representatives to the German parliament at Frankfort, the leading promoters of Panslavism summoned a Slavonic congress at Prague, which was attended by Slavonians from Bohemia, Moravia, and Silesia, and by Slavonic Poles, Croats, Servians, and Dalmatians, who appeared in their national costumes. The impracticability of the grand schemes promulgated in the manifestoes of the conclave had been sufficiently shown ere the congress was interrupted by a democratic rebellion, which was suppressed with much bloodshed. Since 1860, when questions of nationality began to come more into the foreground, Panslavism has exercised some direct influence on Austrian affairs: both northern and southern Slavs tending toward united action in opposition to the centralistic and dualistic aims of Germans and Magyars respectively. In 1867 a great Slavonic congress was held at Moscow without result. Panslavistic tendencies contributed to the great changes that took place in 1877-78 in the Balkan peninsula. P. was favored by the late Gen. Skobelev.

PANSY. See VIOLET.

PANTÆNUS. See page 885.

PANT'AGRAPH (Gr. *panta*, all, *graphein*, to delineate), an instrument by the aid of which any engraving may be copied on paper, though its use is in practice restricted to the copying of maps and plans. The copy can be drawn to any scale. The instrument consists of four rods, AB, AC, DF, and EF, jointed together, as in the figure: the points D and E are so taken that AD is equal to EF, and AE to DF, and consequently ADEF is always a parallelogram. If C be a determinate point near the end of the rod AE, and any line, CHB, be drawn cutting the other three rods, the triangles BAC and BDH are similar; so that when the point B is fixed, the points C and H, which can, from the structure of the instrument, move in any direction, will describe similar figures different in size; that described by C being to that described by H in the proportion of CB to HB. The practical working of the instrument is as follows: The points H and B are determined by the ratio BH to BC, which is the proportion the scale of the copy bears to that of the original; a socket, which slides along the arm, is fastened exactly at B on the under side; below this is placed a heavy weight, with a stalk fitting into the socket, thus rendering B the center of motion of the instrument, if the weight be heavy enough. A pencil is fitted into another socket at H, and a rod of metal with a sharp point, called the *tracer*, is fastened at C, and the instrument is fitted with castors at various points underneath, to allow of its being moved freely. The operator then passes the tracer over the outline to be copied, and simultaneously the pencil at H makes the copy on the required scale. If a copy on a scale nearly as large as the original be required, the fulcrum must be placed in DF, and the pencil in DB; while, if a magnified copy be required, the pencil and tracer must exchange the positions assigned them in the first case. The defects of this instrument are its weight and the difficulty of rendering it perfectly mobile, both of which prevent that steady motion of the tracer which is necessary for making an accurate copy.

To remedy these defects, the pantagraph has been constructed in a variety of forms, all of which, however, like the one described, depend upon the principle that the two triangles which have for their angular points, the fulcrum the pencil-point and a joint, and the fulcrum the tracer-point and a joint, must always preserve their similarity.

PANTELLA'RIA, a volcanic island in the Mediterranean, 36 m. in circumference, and lying 60 m. s.w. of the Sicilian coast. The chief products are wine, oil, cotton, and fruit.

PANTHAYS, a Mohammedan community occupying the province of Yun-nan in the s.w. of China, who asserted their independence in 1855. In 1859 they captured Talifoo, the second city of the province, and in 1858, the capital. Their leader Wen-soai (king Suleiman) established his authority over about 4,000,000 of people, of whom not above a tenth were Mohammedans. In 1866 the Chinese government recognized the independence of the Panthays, and in 1872 their king sent his son Hassan on a mission to Europe. Meanwhile the Chinese again attacked the Panthays, defeated them utterly, and finally suppressed their empire. Panthays is an anglicized form of *Pan-si*, the name by which the Mohammedans called themselves.

PANTHEISM (Gr. *pan*, all, and *theos*, God), the name given to that system of speculations which in its spiritual form, identifies the universe with God (*akosmism*), and, in its more material form, God with the universe. It is only the latter kind of pantheism that is logically open to the accusation of atheism (q.v.); the former has often been the expression of a profound religiosity. The antiquity of pantheism is undoubtedly great, for it is prevalent in the oldest known civilization in the world—the Hindu. Yet it is a later development of thought than polytheism (q.v.), the natural instinctive creed of primitive races, and most probably originated in the attempt to divest the popular system of its grosser features, and to give it a form that would satisfy the requirements of philosophical speculation. Hindu pantheism, as *akosmism*, is taught, especially by the Upanishads (q.v.), the Vedânta (q.v.), and Yoga (q.v.) philosophies, and by those poetical works which embody the doctrines of these systems; for instance, the Bhagavagîtâ, which follows the Yoga doctrine. It is poetical and religious, rather than scientific, at least in its phraseology; but it is substantially similar to the more logical forms developed in Europe. The Hindu thinker regards man as born into a world of illusions and entanglements, from which his great aim should be to deliver himself. Neither sense, nor reason, however, is capable of helping him; only through long-continued, rigorous, and holy contemplation of the supreme unity (Brahma) can he become emancipated from the deceptive influence of phenomena, and fit to apprehend that he and they are alike but evanescent modes of existence assumed by that infinite, eternal, and unchangeable spirit who is all in all. Hindu pantheism is thus purely spiritual in its character; matter and (finite) mind are both alike absorbed in the fathomless abyss of illimitable and absolute being.

Greek pantheism, though it doubtless originated in the same way as that of India, is at once more varied in its form, and more ratiocinative in its method of exposition. The philosophy of Anaximander (q.v.), the Milesian, may almost, with equal accuracy, be described as a system of atheistic physics or of materialistic pantheism. Its leading idea is, that from the infinite or indeterminate (*to apeiron*), which is "one yet all," proceed the entire phenomena of the universe, and to it they return. Xenophanes (q.v.), however, the founder of the Eleatic school, and author of the famous metaphysical *mot*, *Ex nihilo, nihil fit*, is the first classical thinker who promulgated the higher or idealistic form of pantheism. Denying the possibility of creation, he argued that there exists only an eternal, infinite one or all, of which individual objects and existences are merely illusory modes of representation; but as Aristotle finely expresses it—and it is this last conception which gives to the pantheism of Xenophanes its distinctive character—"casting his eyes wistfully upon the whole heaven, he pronounced that unity to be *God*." Heraclitus (q.v.), who flourished a century later, reverted to the material pantheism of the Ionic school, and appears to have held that the "all" first arrives at consciousness in man, whereas Xenophanes attributed to the same universal entity, intelligence, and self-existence, denying it only personality. But it is often extremely difficult, if not impossible, to draw or to see the distinction between the pantheism of the earlier Greek philosophers and sheer atheism. In general, however, we may affirm that the pantheism of the Eleatic school was penetrated by a religious sentiment, and tended to absorb the world in God, while that of the Ionic school was thoroughly materialistic, tended to absorb God in the world, and differed from atheism rather in name than in fact. But the most decided and the most spiritual representatives of this philosophy among the Greeks were the so-called "Alexandrian" *Neoplatonists* (q.v.), in whom we see clearly, for the first time, the influence of the east upon Greek thought. The doctrines of emanation, of ecstasy, expounded by Plotinus (q.v.), and Proclus (q.v.), no less than the fantastic Dæmonism of Iamblichus (q.v.) point to Persia and India as their birthplace, and in fact differ from the mystic teaching of the Vedânta only by being presented in a more logical and intelligible form, and divested of the peculiar mythological allusions in which the philosophy of the latter is sometimes dressed up.

During the middle ages, speculation was, for the most part, held in with tight reins by the church, and in consequence we hear little of pantheism. Almost the only philosopher who advocated, or who even seems to have thought about it, is John Scotus Erigena (see ERIGENA), who was probably led to it by his study of the Alexandrians, but his speculations do not appear to have been thought by him incompatible with a Christian faith; and in point of fact there are several profoundly mystical expressions

employed in the New Testament, especially in the epistles of John, in which the soaring spiritualism of Christianity culminates in language that has at least a pantheistic form; e.g., "God is love; and he that dwelleth in love dwelleth in God, and God in him." Erigena is regarded as the link that unites ancient and modern pantheism. We find him now a reflection of the east and of Greece, and now a foreshadowing of the doctrines of Schelling and Hegel. His opinions were, with some scholastic modifications, introduced, in the 12th and 13th centuries, into theology by Amalric or Amaury de Chartres (a disciple also of Abelard), and his pupil David de Dinant, who were condemned as heretics by a council held at Paris.

Modern pantheism first shows itself in Giordano Bruno (q. v.), burned at Rome for his opinions in 1600. In Bruno reappear the speculations of the Eleatics and of the Neoplatonists, but with a still more definite recognition than we meet with in them of an absolutely perfect supreme spirit. The universe, in the eyes of the unfortunate Italian, is not, properly speaking, a creation, but only an emanation of the infinite mind—the eternal expression of its infinite activity; and hence the infinite mind penetrates and fills, with different degrees of consciousness, all the heights and depths of the universe. To see God everywhere, to realize that he alone is, and that all else is but a perishable phenomenon or passing illusion—that there is but *one* intelligence in God, man, beast, and what we call matter—this should be the aim of all true philosophy. Spinoza (q. v.) comes next among pantheists in the order of time, but he is perhaps the greatest, certainly the most rigorous and precise, of the whole class that either the ancient or the modern world has seen. His system is based, like the geometry of Euclid, on certain definitions and axioms, and he claims to have given it as conclusive and mathematical a demonstration as the latter. None will deny the keenness and cogency of his ratiocination. But human beings will not be forced into pantheistic convictions by any mere logical goad, however sharp; and the system, impregnable as it seems, has never had a formal adherent. The principal result at which, after a long, firm-linked chain of reasoning, Spinoza arrives, is, that there is but one substance, infinite, self-existent, eternal, necessary, simple, and indivisible, of which all else are but the modes. This substance is the self-existent God. To call Spinoza an atheist is ridiculous. The extravagant phrase of Schleiermacher, "a God-intoxicated man" (*ein Gott-trunkener mann*), would be greatly nearer the truth, for no human system of philosophy whatever exhibits such an all-controlling and even overwhelming sense of the omnipresent God. Many critics have said that he was far more of an old Hebrew in his system than he dreamed. Although he had no direct followers, he exercised great influence on the development of metaphysical speculation in Germany, where, with the exception of Kant (q. v.), the three greatest philosophers of recent times—Fichte (q. v.), Schelling (q. v.), and Hegel (q. v.)—have all promulgated systems of a thoroughly pantheistic and ideal character. Neither England, France, nor America has produced a single great pantheistic philosopher (unless Mr. Emerson be regarded as such); but there is an immense amount of pantheistic sentiment floating about in the poetry, criticism, theology, and even in the speculative thinking, in these and all European countries in the present age. This is attributable to the ravages made by biblical criticism, and the progress of the physical sciences in the region of religious beliefs. Multitudes of men are puzzled what to think and what to believe. They do not like to face the fact that they have actually lost faith in revelation, and are no longer relying for help and guidance on the spirit of God, but on the laws of nature; so they take refuge from the abhorred aspect of the naked truth, that they are "atheists," in a cloud of rose-colored poetical phrases, which, if they mean anything, mean pantheism.

PANTHEON, a Greek or Roman temple dedicated to all the gods. The "pantheon" of Rome, now the church of Santa Maria Rotonda, is the only ancient edifice in Rome that has been perfectly preserved. The pantheon is lighted through one aperture in the center of its magnificent dome. It was erected by Agrippa, son-in-law of Augustus, 27 B. C.

PANTHER, *Felis pardus*, one of the largest *felidæ*, now supposed to be identical with the leopard (q. v.), or a mere variety of it, differing only in its larger size and deeper color. Cuvier distinguishes the panther from the leopard, but without stating any characters other than those of color. The name panther (vulg. "painter") is given to the puma (q. v.) in America.

PANTHER, in heraldry, is borne gardant, and incensed, i. e., with fire issuing from his mouth and ears.

PANTICAPÆUM. See KERTCH, *ante*.

PANTOMIME, among the ancient Romans, denoted not a spectacle but a person. The pantomimes were a class of actors who (as the name implies) acted not by speaking, but wholly by mimicry—gesture, movements, and posturings—corresponding therefore pretty closely to the modern ballet-dancers. When they first made their appearance in Rome cannot be ascertained; probably the *histriones* (Etrusc. *hister*, a dancer) brought from Etruria to Rome 364 B. C. were pantomimes; but the name does not once occur during the republic, though it is common enough from the very dawn of the empire. Augustus showed great favor to this class of performers, and is consequently supposed

by some writers to have been himself the inventor of the art of dumb acting. The most celebrated pantomimes of the Augustan age were Bathyllus (a freedman of Mæcenas), Pylades, and Hylas. The class soon spread over all Italy and the provinces, and became so popular with the Roman nobles and knights (who used to invite male and female performers to their houses to entertain their guests), that Tiberius reckoned it necessary to administer a check to their vanity, by issuing a decree forbidding the aristocracy to frequent their houses, or to be seen walking with them in the streets. Under Caligula they were again received into the imperial favor; and Nero, who carried every unworthy weakness and vice to the extremity of caricature, himself acted as a pantomime. From this period they enjoyed uninterrupted popularity as long as paganism held sway in the empire.

As the pantomimes wore masks, no facial mimicry was possible; everything depended on the movements of the body. It was the hands and fingers chiefly that spoke; hence the expressions, *manus loquacissimæ*, *digiti clamosi*, etc. To such perfection was this art carried, that it is said the pantomimes could give a finer and more precise expression to passion and action than the poets themselves. The subjects thus represented in dumb show were always mythological, and consequently pretty well known to the spectators. The dress of the actors was made to reveal, and not to conceal, the beauties of their person; and as, after the 2d c., women began to appear in public as pantomimes, the effect, as may easily be supposed, of the æsthetical costume was injurious to morality. Sometimes these pantomimic actresses even appeared quite naked before an audience—a thing which could never have happened had the Roman communities not become thoroughly base, sensual, and impure. It was quite natural, therefore, that pantomimic exhibitions should have been denounced by the early Christian writers, as they even were by pagan moralists like Juvenal.

Under HARLEQUIN is described the character of the modern pantomimes, which word denotes not the performers, but the pieces performed. A few additional facts are here given to complete that notice. The Christmas pantomime, or harlequinade, is, in its present shape, essentially a British entertainment, and was first introduced into this country by a dancing-master of Shrewsbury named Weaver, in 1702. One of his pantomimes, entitled *The Loves of Mars and Venus*, met with great success. The arrival, in the year 1717, in London of a troupe of French pantomimists with performing dogs gave an impetus to this kind of drama, which was further developed in 1758 by the arrival of the Grimaldi family, the head of which was a posture-master and dentist. Under the auspices of this family, the art of producing pantomimes was greatly cultivated, and the entertainment much relished. Joseph Grimaldi, the son of the dentist, was clever at inventing tricks and devising machinery, and *Mother Goose*, and others of his harlequinades, had an extended run. At that time the wit of the clown was the great feature; but by and by, as good clowns became scarce, other adjuncts were supplied, such as panoramas or dioramic views; and now the chief reliance of the manager is on scenic effects, large sums of money being lavished on the *mise en scene*. This is particularly the case as regards the transformation scene—i.e., the scene where the characters are changed into clown, harlequin, etc.—as much as £1000 being frequently spent on this one effort. In London alone, a sum of about £40,000 is annually expended at Christmas time on pantomimes. The *King of the Peacocks*, a pantomime produced at the London Lyceum theater during the management of Mme. Vestris, cost upwards of £3,000. Even provincial theaters, such as those of Manchester or Edinburgh, consider it right to go to considerable expense in the production of their Christmas pantomime.

PA'OLI, PASCAL, a famous Corsican patriot, was born in 1726 at Morosaglia, in Corsica. His father, having taken a leading part in the unsuccessful insurrection of the islanders against the Genoese and their French allies, was obliged to return to Naples in 1739, taking his son with him. Here Paoli received an excellent education. In July, 1755, he was summoned by the supreme magistracy to Corsica, and was elected capt.gen. of the island, and the chief of a democratic government, possessing all the power of a king, but without the title. He energetically and successfully applied himself to the reformation of the barbarous laws and customs of the island, and at the same time to the expulsion of the Genoese, who, notwithstanding the aid they received from an influential section of the islanders, were deprived of nearly all their strongholds, their fleet was defeated, and they were finally obliged to seek help from France. After the withdrawal of the French troops, they were again speedily deprived of the places they had recaptured, and in 1768 they ceded the island to France. Paoli refused all the advantageous offers by which the French government sought to bribe him, as he had before refused those of the Genoese, and continued to struggle for the independence of his country, but he was signally defeated by the comte de Vaux, at the head of the French troops, and the French became masters of the island. After one year's struggle, Paoli was compelled to take refuge on board of a British frigate, in which he sailed for England, where he was treated with general sympathy. Twenty years afterwards, the French revolution of 1789 recalled him to Corsica, and as a zealous republican he entered into the schemes of the revolutionary party; but during the anarchy of France in 1792–93 he conceived a scheme for making Corsica an independent republic. Until this time he had been on the best terms with the Bonaparte family, but they now joined the Jacobin party whilst he allied himself with Britain, favored the landing of 2,000 British troops

in the island in 1794, and joined them in driving out the French. He then surrendered the island to George III., but becoming dissatisfied with the government, he quarreled with the British viceroy, whilst many of his countrymen were displeased with the course he had adopted in allying himself with the British. He therefore retired from the island in 1796, and spent the remainder of his life in the neighborhood of London. Paoli died near London, Feb. 5, 1807.

PAOLO, FRA, or PAOLI SARPI. See SARPI, *ante*.

PAOLO, VERONESE. See CAGLIARI PAOLO, *ante*.

PA'PA, a large market t. in the w. of Hungary, stands in a beautiful district on the Tapolcza, an affluent of the Marczal, 60 m. s.s.e. of Presburg. It contains a stately castle, with a beautiful garden, handsome Catholic and Lutheran churches, a Catholic gymnasium, reformed college, and a hospital. Stoneware, cloth, and pipes are manufactured, and a trade in wine is carried on. Pop. '80, 14,223.

PAPA, the Latin form of the title now, in the western church, given exclusively to the bishop of Rome. Originally, however, meaning simply "father," it was given indiscriminately to all bishops. Tertullian (*De Pudicitia*, cxiii.) so employs it. Dionysius, a priest of Alexandria, calls his bishop papa Heraclias. St. Cyprian, in the letters of his clergy, is addressed *beatissimo papæ Cypriano*. The same form is employed towards him by the clergy of Rome itself. Even Arius so addresses his own bishop Alexander. In the next century, St. Jerome addresses the same title to Athanasius, to Epiphanius, and most of all to Augustine. Indeed it would appear certain that down to the time of Gregory of Tours it was used not uncommonly of bishops in the western church. And there are evidences of its being occasionally applied to the inferior clergy, for whom, however, some adjunct was employed, in order to distinguish them from bishops. Thus we sometimes read of *papæ pisinni*, minor popes; and the tonsure was called by the name of *papa letra*. In the Greek church, as is well known, whether in Greece proper or in Russia, papa is the common appellation of the clergy. The circumstance of its having been originally of general application is acknowledged by all learned Roman Catholic controversialists and historians.

PA'PACY. See POPES.

PAPACY, THE. See ROMAN CATHOLIC CHURCH, *ante*.

PAPAGOS, an Indian tribe of the Pima family living in Arizona, where they occupy a reservation of 70,000 acres on the Santa Cruz river, allotted them in 1874. In the early history of the country they were friendly to the Spaniards, who established missions among them, at first under the control of the Jesuits, and, on the suppression of that order, under that of the Franciscans. They expelled the Spanish in 1694, but peace was soon made between them, and the tribe has remained Roman Catholic. They were long at war with the Apaches, with whom they made peace only a few years ago; and they suffered much from their attacks about 1820. When Arizona was annexed to the United States they were actually citizens of Mexico; but their rights were not recognized, and settlements were made upon their land without any attempt to secure a cession by treaty. They continued, however, upon good terms with the whites. Finally, an agency was organized among them under the care of the Roman Catholic church. They cultivate small farms, own a considerable number of cattle, and are fairly prosperous. They have good schools under the care of the sisters of St. Joseph. Their present number is about 5,000. Their own name for the tribe is Papapootam.

PAPAL INFALLIBILITY. See INFALLIBILITY, *ante*.

PAPAL STATES (Italian, STATI DELLA CHIESA, or STATI PONTIFICI), a territory, or rather group of states in central Italy, formerly united into one sovereignty, with the pope for its head. It was of an irregular form, resembling the letter Z, the upper portion lying to the e. of the Apennines, the lower to the w. of that range, these two being connected by a third strip, which crossed the peninsula from e. to west. The papal states were bounded on the n. by the Po, on the s. by Naples, on the e. by the gulf of Venice and Naples, and on the w. by Modena, Tuscany, and the Tyrrhenian sea. Detached portions, as Benevento and Pontecorvo, lay within the Neapolitan territory. The country is traversed by the Apennines, which attain their highest elevation in the monte della Sibilla, which is about 7,402 ft. above sea-level. Owing to this range, which traverses the peninsula in the direction of its length, lying so much nearer the e. than the w. coast, the streams to the e. of it have a short course and little volume, being, in fact, mere mountain torrents; while on the w. side a few of the rivers are of considerable size. Of the latter the Tiber (q.v.) is the largest. The eastern coast is bold and rugged, and destitute of proper harbors, that of Ancona alone excepted; towards the n., at the mouth of the Po, it gradually subsides into a low, level, marshy tract, with numerous lagoons. The country w. of the Apennines is traversed by ranges of hills parallel to them, and gradually decreasing in elevation as they approach the sea. The coast itself is almost wholly flat, sandy, or marshy, with no deep bays and few good harbors besides Civita Vecchia. There are numerous small lakes, principally in the northern portion of the country, the chief of which are lake Bolsena, lake Perugia, and lake Bracciano, the last an old crater, situated almost 1000 ft. above sea-level.

The country was divided for administrative purposes into 20 districts, as follows: 1

Comarca, including Rome and the Argo Romano; 6 legations, Bologna, Ferrara, Forli, Ravenna, Urbino, Velletri; and 13 delegations, Ancona, Ascoli, Benevento, Camerino, Civita Vecchia, Fermo, Frosinone, Macerata, Orvieto, Perugia, Spoleto, Rieti, Viterbo; with a total area of 15,774 English sq.m., and a population of above 3,000,000. The legations of Bologna, Ferrara, Forli, and Ravenna constituted the *Romagna*; Spoleto and Perugia were known as *Umbria*; and Ancona, Fermo, Macerata, and Ascoli constituted the *March of Ancona*. The inhabitants, with the exception of 16,000 Jews, were of Italian race, and of the Roman Catholic religion. The only provinces which latterly remained under the papal rule were, Rome with the Comarca, the legation of Velletri, and the delegations of Civita Vecchia, Frosinone (excepting Pontecorvo), and Viterbo, with a total area of 4,493 English sq.m., and a population of about 700,000. The chief cities and towns in the territory were, Rome (the capital), Viterbo, Velletri, Alatri, and Civita Vecchia.

Climate and Products.—The climate of the papal states is one of the finest in the world, and the heat of summer is tempered by the mild and cooling sea breezes; but in the flats s. of the Po and in the campagna of Rome, the noxious atmosphere produced by the exhalations from the marshes is most destructive of human life. Fever and ague are very prevalent among the inhabitants of the neighboring districts, and notwithstanding the attempts to remedy the deadly influence of the marshes by drainage and cultivation, it has hitherto been undiminished (see MAREMMA). Violent siroccos are occasionally experienced on the w. coast. The northern portion, from its elevation, is exposed to severe cold during winter. The soil of the papal states is in general extremely fertile; but the higher mountain districts are either quite barren, or only adapted for pasture; and not more than one-third of the whole surface is under cultivation. The practice of agriculture is in its most primitive state, notwithstanding the fact that agriculture, as a science, originated here, and was practiced for many centuries before it was introduced into the other countries of Europe; but the many political changes and revolutions which have convulsed the country, have acted as a bar to all enterprise. It must, however, be mentioned, that the present pope has, by salutary enactments, and by the establishment of agricultural societies, done much for the improvement of this branch of industry. The products are similar to those of the rest of Italy. The manufactures are comparatively unimportant—silks, woolens, and leather are the chief; but plate-glass, rope, sail-cloth, cotton goods, paper, artificial flowers, wax-candles, soap, stoneware, etc., are also manufactured in various places. The fisheries are important. The chief minerals are alum, vitriol, saltpeter, sulphur, coal, rock-salt, marble, and alabaster.

Many of the manufactured goods, and wine, olive oil, wool, hemp, tobacco, bread-stuffs, catgut, etc., were exported, the total exports amounting to about £2,600,000, while the imports reached nearly £14,000,000. The statistics were latterly very unreliable, but the fact that the papal states are now no more, renders details of trade under pontifical rule a matter of little importance. Indeed, no information on such topics was issued under the latest years of the political power of the pope.

Government.—The pope possessed absolute and unlimited power, but the members of the college of cardinals, who elected him, generally kept the chief offices of state in their own hands, and assisted the pope in the government of his states, as well as in the affairs of the church. The secretary of state was at the head of political affairs, and was nominated by the pope. He presided over both the ministerial council and the council of state. The former council, which consisted of five or more ministers, heads of departments, selected by the pope, had a voice in legislation, and also the right of authoritative interpretation of the laws; the latter, which consisted of 13 members, also nominated by the pope, had, in matters of legislation and finance, only the right of giving advice; but it settled any question of competency that might arise between the various branches of the administration. After 1850 there was also a separate *finanz-consulta* for the regulation of financial affairs. The Comarca, which was more directly under the central government, was ruled by a cardinal-president; the legation was ruled by a cardinal-legate, aided by a provincial chamber of deputies. There were civil and criminal courts in all the provinces, minor courts in the communes, with courts of appeal in all the chief cities, and a central tribunal at Rome. All the proceedings of these courts were public, except trials for political offenses.

The papal army, which formerly amounted to 20,000 men, in June, 1863, numbered only 8,513 men, infantry, cavalry, artillery, etc., included, and a considerable portion of the papal territory was garrisoned by French troops, without whose aid the pope's power could not have been maintained.

The income and expenditure for 1859, the last year of the entirety of the papal states, were respectively 14,453,325 scudi (£3,126,028), and 15,019,346 scudi (£3,248,038); but the three succeeding years showed a widely different result, the expenses being largely increased by the cost of the war, while from the rebellious provinces scarcely any taxes were collected. The income and expenditure for these three years were nearly as follows:

	Expenditure.	Income.
1860.....	£4,720,809	£1,716,658
1861.....	4,291,644	1,716,658
1862.....	2,145,822	1,072,911

The finances continued in the same deplorable condition, and the national debt amounted to about £17,000,000. The tax known as "Peter's pence," which was collected from all the Roman Catholic countries, had produced at the beginning of 1863 about £1,080,000.

History.—During the rule of the Goths and Lombards in Italy, the inhabitants of Rome and all who desired to live free from the barbarian yoke, feeling that the Greek empire was incapable of protecting them, and at the same time observing the pertinacity and energy with which the pope asserted the importance and dignity of Rome, naturally looked up to him as in some sort a protector; and it is to the gradual growth and spread of this feeling that the important position subsequently taken by the popes as authorities in temporal matters is chiefly due. About 720 A.D., Gregory III., having quarreled with the emperor Leo the Isaurian, declared the independence of Rome. In 726 Pepin le bref compelled the Lombard king to hand over Ravenna, Rimini, Pesaro, Fano, Cesena, Urbino, Forli, Comacchio, and 15 other towns, to the pope, who now assumed the state of a temporal sovereign. Pepin's example was followed by his son Charlemagne; but, notwithstanding, the pope's sovereignty was more nominal than real, as the towns were not in his possession, and he only obtained a small share of their revenues. In the 11th c. the Normans greatly aided to increase the papal temporal authority, and in 1053 the duchy of Benevento was annexed. In 1102 the countess Matilda of Tuscany left to the pope her fiefs of Parma, Mantua, Modena, and Tuscany, but these were immediately seized by the German emperor, and of this magnificent bequest only a few estates came into the pope's hands. Between this period and the end of the 13th c. the popes succeeded, often by unscrupulous means, in obtaining from many of the free towns of Italy an acknowledgment of the superiority of the Roman see over them; and in 1278 the emperor Rudolf I. confirmed the popes in the acquisitions thus obtained, defined authoritatively the boundaries of the papal states, and acknowledged the pope's exclusive authority over them by absolving their inhabitants from their oath of allegiance to the empire. The papal states at this time included Perugia, Bologna, Bertinoro, the duchy of Spoleto, the exarchy of Ravenna, and the march of Ancona; but many of the towns were either republics or hereditary principalities, and in none did the pope possess real authority. Sixtus IV., in the end of the 15th c., managed to annex the Romagna to his dominions; in effecting which he is accused of having employed intrigue, perjury, and murder. His successors, Alexander VI. and Julius II., increased the papal states by the addition of Pesaro, Rimini, Faenza, Parma, Placentia, and Reggio. By the victory of the French at Marignan (1515), the very existence of the papal power was threatened; but the able policy of Leo X. averted the threatened danger. In 1545 Paul III. alienated Parma and Placentia, and erected them into a duchy for his son, Pietro Luigi Farnese; but this loss was partly made up by the acquisitions of Gregory XIII. In 1598 the possessions of the house of Este, viz., Ferrara, Comacchio, and a part of the Romagna, were seized by pope Clement VIII.; and the papal states received their final additions in Urbino (1623), Ronciglione, and the duchy of Castro (1650). The Romagna was seized by Napoleon in 1797, and incorporated in the Cisalpine republic; and in the following year Rome was taken by the French, and the papal states erected into the *Roman republic*. Pius VII., in 1800, obtained possession of his states, but they were almost immediately retaken by the French, and finally (1809) incorporated with France, Rome being reckoned the second city of the empire. In 1814 the pope returned to his dominions, and was formally reinstated by the treaty of Vienna, mainly through the exertions of the *non-Roman Catholic* powers, Russia, Prussia, and Britain; but the clerical misgovernment contrasted so strongly with the liberal administration of France that in 1830 the people of Ancona and Bologna rose in rebellion. They were put down by the aid of an Austrian army, but the abuses in the administration were so flagrant that even Austria urged the necessity for reform. Her remonstrances, however, were not attended to, and the Bolognese again rebelled. This second revolt supplied Austria with a pretext for occupying the northern legations, and the French at the same time garrisoned Ancona. Occasional risings took place from time to time up to 1846, when the present pope, Pius IX., assumed the tiara, and burst upon the astonished world in the new character of a reforming pope. His projects were of a most liberal character, and were put in force with great energy, despite the opposition of Austria; but, alarmed at the spread of revolution in Europe during 1848, he halted in his career, just at the critical moment when to halt was to be lost. The people rose, and Pius IX. fled to Gaeta, whilst Rome was proclaimed a republic. He was restored, and his subjects reduced to submission by the arms of France, Austria, Naples, and Spain. The Austrians held the legations in subjection to the pope's authority till 1859; and the French occupied Rome in his behalf for 10 years more. In July, 1859, the four northern legations (the Romagna), taking advantage of the withdrawal of the Austrian troops, quietly threw off the papal authority, and proclaimed their annexation to Sardinia, which was formally acknowledged by Victor Emmanuel in Mar., 1860. The pope now raised a large body of troops, appointing Lamoricière, an eminent French gen., to command them, for the purpose of resisting any further encroachments on his dominions; but the news of Garibaldi's success in Sicily and Naples produced revolt in the legation of Urbino and in the marches, the people proclaiming Victor Emmanuel. The Sardinians accordingly marched into the papal states, defeated Lamoricière in two encounters, and finally compelled him to retire into Ancona, where, after a siege of seven days, he

was compelled to surrender with his whole army. The revolted provinces of Umbria, Urbino, and the marches were immediately annexed to Sardinia; and the isolated provinces of Benevento and Pontecorvo (a part of Frosinone), which were situated within the kingdom of Naples, shared the same fate. In Oct., 1870, the French having withdrawn, the remnant of the papal states voted for annexation to the kingdom of Italy.

PAPAVERA'CEÆ, a natural order of exogenous plants, herbaceous or half shrubby, usually with a milky or colored juice. The leaves are alternate, without stipules; the flowers on long one-flowered stalks. The fruit is pod-shaped or capsular; the seeds numerous. The order is distinguished for narcotic properties. Opium (q. v.) is its most important product. The juice of Celandine (q. v.) is very acrid. A number of species are used in their native countries for medicinal purposes. The seeds yield fixed oil, which, with the exception of that obtained from *Argemone Mexicana*, is quite bland. See POPPY. The flowers of many species are large and showy, most frequently white or yellow, sometimes red. Several kinds of poppy and eschscholtzia are frequent in our gardens. There are in all about 130 known species, natives of all quarters of the world, and of tropical and temperate climates, but they abound most of all in Europe.

PAPAW', *Carica Papaya*, a South American tree of the natural order *Papayaceæ*—of which order about 30 species are known—which has now been introduced into many tropical and subtropical countries. It grows to the height of 15—30 ft., with leaves only at the top, where also the fruit grows close to the stem. The leaves are 20—30 in. long. The fruit is of a green color, very similar in appearance to a small melon, and with a somewhat similar flavor. It is eaten either raw or boiled. The seeds are round and black, and when chewed, have in a high degree the pungency of cresses. The powdered seeds and the juice of the unripe fruit are most powerful anthelmintics. A constituent of this juice is *fibrine*, otherwise unknown in the vegetable kingdom, except in the fungi. The milky juice of the tree is very acrid. The leaves are used by negroes instead of soap to wash linen. The juice of the fruit and the sap of the tree have the singular property of rendering the toughest meat tender in a short time. Even the exhalations from the tree have this property; and joints of meat, fowls, etc., are hung among its branches to prepare them for the table. It is a tree of extremely rapid growth, bears fruit all the year, and is exceedingly prolific. The fruit is often cooked in various ways. The *Chamburu* (*C. digitata*), another species of the same genus, a native of Brazil, is remarkable for the extremely acrid and poisonous character of its juice, and the disgusting stereoraceous odor of its flowers. In the middle and southern states of America the name papaw is given to the *Uvaria* (or *Asimina*) *triloba*, a small tree of the natural order *Anonaceæ*, the fruit of which, a large oval berry, 3 in. long, is eaten by negroes, but not generally relished by others. All parts of the plant have a rank smell.

PAPENBURG, a small t. of Hanover, in the bailiwick of Osnabriek, on a canal navigable for sea-going vessels, 27 m. s.s.e. of Emden, on Dollart bay, by the Emden and Hanover railway. It originated in a small colony which sprung up here, and was supported principally by peat-cutting, an employment for which the fens and moors of the vicinity afford abundant facilities. The town is cleanly built, after the Dutch model; its houses stretch along the banks of the canal. It possessed, in '74, 185 ships, and carries on manufactures of sail-cloth and ropes. Its commerce is considerable. Pop. '80, 6,736.

***PAPER.** This well-known fabric is usually composed of vegetable fibers minutely divided and recombined in thin sheets, either by simple drying in contact, or with the addition of size or some other adhesive material. Probably the earliest use of paper was for the purpose of writing upon, and its earliest form was the papyrus (q. v.) of the Egyptians. The stems of the papyrus plant, which are often 8 or 10 ft. long, are soft and green, externally like the common rush; and the interior consists of a compact cellular tissue or pith. At the bottom of each stem the portion immersed in the mud and water is whiter and more compact; and under the outer skin a number of thin pellicles lie one above the other. These were removed, and laid side by side with their edges overlapping each other, and crosswise upon these was placed one or more similar layers, until the sheet was sufficiently thick; pressure was then applied for a time, and afterwards the sheet was dried in the sun. The width of such sheets, of course, depended upon the length of the portion of papyrus stems taken; but they could be made any length by joining a number of the squares end to end by glue or any other adhesive material. The *scapus*, or roll, usually consisted of about 20 of them.

Owing to the fact that the various layers of the papyrus decrease in thickness as they are nearer to the center of the stem, the makers were enabled to produce papers of different qualities, and in the time of the Romans many varieties were known, which differed as to the quality of the material, and the size of the pieces of which the sheets were composed. The finest quality was made from the innermost layer of membrane, and was called *hieratica*, or paper of the priests. This was made for the Egyptian priests, who interdicted its sale until covered with sacred writing. In this state it was, however, an article of trade, and the Romans found a means of removing the writing, and sold the palimpsest sheets in Rome under the name of *Augustus* paper, used as a Latin equivalent for its former Greek name of *hieratica*. It was, however, supposed by

many that it was named after the emperor Augustus, and in consequence a second quality was called after his wife, *Livinia*; and the original name of the first quality came in time to be applied to the third quality. The next quality was called *Amphitheatrica*, it is supposed, from its having been made in the vicinity of the Alexandrian amphitheater. This last, when imported to Rome, was partly remanufactured by Q. Remmius Fannius Palæmon, the schoolmaster and paper-maker, who, by a peculiar process of his own, reduced its thickness, and rendered it equal to the first quality, when it was sold under the name of *Fanniana*. There were other inferior qualities, of which one called *Emporetica* was used as shop paper.

Pliny, from whom we get these very interesting particulars, tells us that all these kinds were manufactured in Egypt, and required the Nile water for their formation. He says, that "when it is in a muddy state it has the peculiar qualities of glue, and the various kinds of paper are made on a table where they are moistened with this water. The leaves or sheets of membrane are laid upon it lengthwise, as long indeed as the papyrus will admit of, the jagged edges being cut off at either end; after which a cross layer is placed over; the same way, in fact, that hurdles are made. When this is done, the leaves are pressed together, and dried in the sun." The idea of the adhesive quality of the Nile water is erroneous, but it is very probable the Egyptian manufacturers encouraged the error. It is obvious the whole merit consisted in using the membranes fresh, whilst their own natural gum was in proper condition to make them adhere together.

In India and China, the art of writing with a style or sharp point upon dried palm and other leaves, and also some kinds of bark, is common even at the present day, especially in Ceylon, where we find it common to employ the leaves of the talipot and other palms as paper. Perhaps it was from the employment of these materials, or it is even possible from watching the operations of the paper-making wasps and other insects, that the manufacture of larger pieces, by pulping the materials and spreading them out to a greater extent, was suggested. Whatever was the true origin of the art, it is now lost in the vista of time.

It is known that the Chinese were acquainted with the art of making paper from pulp artificially prepared as early as the commencement of the Christian era; and it is thought that they used the bark of various trees, the soft parts of bamboo stems, and cotton. In the 7th c., the Arabians learned the art of making it of cotton from the Chinese, and the first manufactory was established, about 706 A.D., at Samarcand. From thence it was transplanted to Spain, where, under the Moors, paper was made not only of cotton, but it is thought also of hemp and flax. The exact time of the introduction of paper made of linen rags is very uncertain; but the best evidence is offered by the Arabian physician Abdollatiph, who writes, in an account of his visit to Egypt in the year 1200, "that the cloth found in the catacombs, and used to envelop mummies, was made into garments, or sold to the scribes to make paper for shopkeepers;" and as there is no doubt that these mummy-cloths were linen, it proves that the use of this material is of no mean antiquity. Of the use of linen rags in Europe, the earliest proof is in the celebrated document found by Ichwandner in the monastery of Goss, in Upper Styria, which purports to be a mandate of Frederiek II., emperor of the Romans, and is dated 1242. It is written on paper which has been proved to be made of linen. The practice of making a distinctive watermark on the paper, by means of an impression on the fine sieve of threads or wires upon which the floating pulp is received (fig. 4), was also of very early date, as MMS. as old as the 13th c. bear it. But there is really no satisfactory information respecting the exact time or place of the introduction of paper-making into Europe; by some it is supposed that Spain was the first to receive the art, and that thence it spread to France and Holland, and afterwards to England. It is quite certain that England was a long time behind these countries. As a proof of this, we find that the first patent for paper-making was taken out in 1665, by one Charles Hildeverd, but it was for "The way and art of making blew paper used by sugar-bakers and others." The second was in 1675, by Eustace Barneby, for "The art and skill of making all sorts of white paper for the use of writing and printing, being a new manufacture, and never practiced in any way in any of our kingdoms or dominions." This, then, was the first commencement of the making of writing and printing paper; but that it did not equal the manufactures of other countries is shown by the specification of another patent, taken out by John Briscoe in the year 1685, which is thus expressed: "The true art and way for making English paper for writing, printing, and other uses, both as good and as serviceable in all respects, and especially as white as any French or Dutch paper." As a general rule, it was the custom of paper-makers to employ linen rags for fine papers, but a great variety of other materials have been in use from its first introduction; for, as early as 1680, Nathaniel Bladen took out a patent for "An engine method and mill, whereby hemp, flax, linnen, cotton, cordage, silke, woolen, and all sorts of materials" might be made into paper and paste board; and from that time innumerable efforts have been made to prepare other materials than cotton and linen rags for the manufacture of paper. The following is a summary of the patents which have been taken out in Britain for making paper from various materials, with the dates, which will show to those engaged in this investigation in what directions the inquiry has been previously conducted. The arrangement is alphabetical, and consequently not in the order of dates:

Paper.

MATERIALS.	NAMES OF INVENTORS AND DATES OF PATENTS.
Aloe Fiber.....	Berry, 1838; D'Harcourt, 1838; Small, 1838; May, 1852; Burke, 1855.
Asbestos.....	Maniere, 1853.
Bagging or Sacking.....	Stiff, 1853; Wheeler & Co., 1854; Rossiter & Co., 1854; Smith & Co., 1855.
Banana Fiber.....	Berry, 1838; Lilly, 1854; Jullion, 1855; Burke, 1855; Hook, 1857.
Barks of various kinds.....	Koops, 1800; Balmano, 1838; Nerot, 1846; Coupier, 1852; Johnson, 1855; Kelk, 1855; Lotteri, 1855; Niven, 1856; Broad, 1857; Hope & Co., 1857.
Bass or Bast.....	Ruck & Touche, 1856; Touche, 1857.
Bean-stalks, etc.....	D'Harcourt, 1838; Brooman, 1855.
Cane (Sugar).....	Berry, 1838; Coupier, 1852; Johnson, 1855; Jullion, 1855; Ruck & Touche, 1856; Hook, 1857.
Cocoa-nut Fiber.....	Newton, 1852; Holt & Forster, 1854.
Cocoa-nut Kernel.....	Diaper, 1854.
Clover.....	Coupland, 1854; Holt & Fraser, 1854; Plunkett, 1857.
Cotton.....	Bladen, 1682; Williams, 1833; Coupier, 1852; Crossley, 1854; Siblet, 1857.
Dung.....	Jones, 1805; Zander, 1839; Lloyd, 1852; Hill, 1854.
Esparto or Alfa.....	Routledge, 1856.
Flax.....	Bladen, 1682; Koops, 1800; Jones, 1805; Ball, 1817; Berry, 1838; Gibbs, 1833; De la Garde, 1825; Coupier, 1852; Collins, 1853; Pownal, 1852; Coupland, 1854; Broad, 1857.
Flax, New Zealand.....	Berry, 1838; Gibbs, 1833 and 1857; Gillman, 1854.
Fresh-water Weeds.....	Archer, 1855.
Fur.....	Williams, 1833.
Grasses.....	Stiff, 1853; Evans, 1854; Clift, 1854; Coupland, 1854; Jeyes, 1854; Crossley, 1854; Jackson, 1854; Johnson, 1855; Fraser, 1855; Gilbee, 1855; Holt & Fraser, 1854; Pariset, 1856.
Gutta-percha.....	Hancock, 1846.
Hair.....	Williams, 1833.
Hay ..	Koops, 1800; Castelain, 1854; Pariset, 1856.
Heath.....	Crossley, 1854.
Hemp.....	Bladen, 1682; Hooper, 1790; Koops, 1800; De la Garde, 1825; Gibbs, 1832; Coupier, 1852; Collins, 1853; Bargnano, 1853; Jackson, 1854; Helin, 1854; Broad, 1857; Ball, 1817.
Hops and Hop-lines.....	De la Garde, 1825; D'Harcourt, 1838; Balmano, 1838; McGuaran, 1839; Sheldon, 1843; Barling, 1854; Crossley, 1854; Holt & Fraser, 1854; Taylor, 1854; Broad, 1857.
Husks of Grain.....	Wilkinson, 1852.
Jute.....	Calvert, 1846; Nerot, 1846; Coupier, 1852; Helin, 1854; Jackson, 1854; Smith & Hollingworth, 1855.
Leather.....	Hooper, 1790; Trappes, 1854; Ocks, 1856; Van den Hout, 1856; Lichtenstadt, 1857.
Leaves.....	Balmano, 1838; Warner, 1853; Vivien, 1853; Johnson, 1855; Moll, 1855; Ruck & Touche, 1857.
Maize, Husk, and Stems.....	D'Harcourt, 1838; Balmano, 1838; Ruck & Touche, 1857.
Manilla Hemp or Plantain Fiber..	Newton, 1852.
Moss.....	Nesbitt, 1824; Bellford, 1854; Johnson, 1855.
Nettles.....	Jones, 1805; De la Garde, 1825; Clift, 1854.
Old Writing-Paper.....	Koops, 1800.
Pea-stalk.....	D'Harcourt, 1838.
Peat or Turf.....	Ley, 1852; Clarke, 1853; Lallemande, 1853; Crossley, 1854; Hemming, 1857; Westerman, 1852.
Roots of various kinds.....	Balmano, 1838; De la Bertoche, 1855; Johnson, 1855; Ackland, 1854; Barling, 1855; Dubus, 1857.
Sawdust.....	Wilkinson, 1852; Johnson, 1855.
Seaweeds.....	Martenoli de Martonoi, 1855; Archer, 1855.
Silk.....	Bladen, 1682; Bull, 1817; Williams, 1833.
Straw.....	Koops, 1800; Lambert, 1824; Zander, 1839; Coupier, 1852; Stiff, 1853; Poole, 1853; Helin, 1854; Fraser, 1855; Chanchard, 1856; Castelain, 1854; Broad, 1857; Wheeler, 1857.
Tan (Spent Bark).....	Crossley, 1854; Jeyes, 1854; Holt & Forster, 1854; Horton, 1855; Rossiter & Bishop, 1854.
Thistle-down.....	Bellford, 1854.
Thistles.....	Koops, 1800; Lord Berridale, 1854; Lilie, 1854.
Tobacco-stalks.....	Adcock, 1854.
Wood.....	Koops, 1801; Desgrand, 1838; Brooman, 1853; Swindells, 1854; Newton, 1852; Johnson, 1855; Kelk, 1855; Martin, 1855; Predeal, 1855; De Frontur, 1855; Chanchard, 1856; Amyot, 1856; Newton (Voelter), 1857; Poisat, 1857; Coupier, 1852.
Wool.....	Bladen, 1682; Williams, 1833; Dickenson, 1807; Crossley, 1854.
Wrack Grass or Zostera.....	Spooner, 1857.

But whatever the material employed, the process for nearly all is the same. The rags, bark, fibers, or other substance, have to be reduced with water into a fine smooth pulp. This, in the early stages of the manufacture, was accomplished by macerating and boiling the material, until, in the case of bark, fibers, or other raw material, the fibers could be drawn out from the cellulose matter, after which it was beaten with mallets, or with pestles in mortars, or stampers moved by some power. Water is generally used, but in Holland wind-mills do this work. The beating is continued until the material is reduced to a very smooth pulp. The pulping, in our machine paper-mills, is much more rapidly accomplished by boiling the linen or cotton rags, or other material, in a strong lye of caustic alkali. This effectually cleans the rags, and other vegetable fibers are softened and separated in a remarkable manner by it; they are then put into a machine called the washing-machine which washes out dirt and everything but the pure vegetable fiber. This machine is a large cast-iron vessel, usually about 10 ft. in length, 4½ ft. in width, and 2½ ft. in depth. In the middle, occupying about two-thirds of its length, is a partition, always cast with it, called the mid-feather, to support the axle or driving-

shaft. This turns the cylinder which has a large number of teeth or ridges running across it, which grip and tear the rags, or other materials, as they are drawn under it by the current formed by its revolutions. In order to facilitate this, a peculiar form is given to the bottom of the part in which the cylinder works, as seen in fig. 1. The rise, *a*, is called the the backfall, and the materials are drawn up to, and through the narrow space at *b*, by the current; then, as they pass over the ridged surface, *c*, they come in contact with the ridged surface of the cylinder, and are thus violently ground and drawn through the stream carrying them round and round until they are thoroughly washed and partly pulped; or, as it is technically called, *broken in*. The washing-machine is supplied with a continued flow of clean water, and the soiled water as regularly escapes through a fine gauze screen, in the ends of the cylinders, in which is an

Fig. 1.

ingenious arrangement for raising it and carrying it away through the axis, which is hollow. The contents of the washing-machine are then allowed to flow through a large valve, opening downwards into the draining-chest. Here the water is drained away, and the *stuff* is then placed in the bleaching vats, which are made of stone, and each calculated to contain a hundred weight of stuff, which is here submitted to the action of a strong solution of chloride of lime for about 24 hours, and frequently agitated; after which it is transferred to a hydraulic press, and pressed so as to remove the greater portion of the liquid and chloride of lime. It is then placed in another washing-engine, and for an hour is submitted to the same process as in the first; by which all vestiges of the bleaching materials are removed, and the stuff so much more broken down as to be called *half-stuff*. From this engine it is let out by a valve, and finds its way into the *beating-engine*, which is placed at a lower level so as to receive it. Here the arrangement is nearly the same as in the washing and intermediate engines; but the ridges on the bars below the cylinder, and on the cylinder itself, are much sharper, and the disintegration of the fibers is carried on with great rapidity until they are quite separated; and the flow of the water in a rapid current, as it passes the cylinder, draws them out and arranges them in the water in much the same way as wool or cotton is laid on the carding-cylinders of a carding-machine. This operation takes about five hours, at the end of which time the materials have been worked up with the water into an almost impalpable pulp. This is then let out into the pulp vat, where it is kept continually agitated by a wooden wheel revolving in it, called a *hog*, and from this the hand-workman or machine is supplied.

We will now suppose the pulp formed and ready for use in the vat, and will first describe the process of hand-making, as formerly practiced in all countries, and still in use, more or less, in all paper-making countries. The workman or vatman takes an implement called a *mold*, which consists of a sheet of very fine network, attached to a frame. In Europe, this network was always made of very fine wire; but in India, China, and Japan, it is usually made of fine fibers of bamboo, which the workmen of these countries split and weave with remarkable skill. There are usually two kinds of molds employed. In one the wires are woven across each other, forming a very fine gauze, and paper made with them is known as *wove*. In the other, there are several cross-bars in the frame, and straight wires are laid from side to side, and about four or five to each half sheet are laid across them lengthwise, to keep them in position; the transverse wires are about twenty to the inch; the longitudinal ones are a little more than an inch apart. Paper made on such molds is called *laid*, and is easily known by the impression of the wires upon it. Whichever kind of mold is used, another implement called the *deckle* is required. It is a thin frame, which exactly corresponds to the frame of the mold, and the workman first places the deckle on the mold, and then dips them into the pulp; the deckle forms a ridge which retains just enough of the liquid pulp for the sheet of paper. The water of the pulp speedily drains through the wire gauze, and after it has stood in an inclined position for a few minutes, another workman, called the *coucher*, applies the face of the sheet of pulp to a piece of felt or flannel cloth stretched on a board, called the *couch*, and the sheet thus pressed, leaves the mold, and is left on the *couch*. Every successive sheet is similarly treated, and they are piled one on another, with a sheet of felt between each, until from four to eight quires, or a *post*, as it is called, is formed. Each post is put in a press, and under pressure parts with nearly all the moisture in the sheets of paper. The felts are then removed, and after several pressings, and other minor operations, the paper is hung on hair ropes, called *tribbles*, in the drying-loft; and when dried, resembles blotting-paper, and cannot be written upon. This is remedied by dipping it in a weak solution of hot size, sometimes tinged with color, after which it is pressed, dried, folded, and made up into quires. Hot pressing and glazing are done by passing the sheets through hot and polished iron rollers.

In Britain very little paper is now made by hand, the paper-machine having changed the character of the manufacture. It is usually stated that Louis Robert, a Frenchman, invented the paper-machine, and that it was brought to this country by Didot of Paris

Fig. 2.

in an imperfect state, but received improvements from Fourdrinier. But it must not be overlooked that Bramah took out a patent in 1805, rather more than a year before Fourdrinier, for very similar improvements to those described in Fourdrinier's specification. The object of all was to cause an equal supply of the pulp to flow upon an endless wire-gauze apron, which would revolve and carry on the paper until it is received on an endless sheet of felt, passing around and between large couching cylinders. These machines have now been brought to such perfection, that paper can be made in one continuous web of any length; and, before leaving the machine, is sized, dried, calendered, hot-pressed, and cut into sheets. Different engineers have contrived variations of constructions in the paper-machine, but the general principles of all are the same. We therefore select for illustration the machine which was exhibited by Mr. George Bertram of Edinburgh, and which was universally acknowledged to be by far the most complete and perfect which was presented in the international exhibition of 1862. Since then no very important improvements have been made in the main part of the machine, but the drying portion has been greatly extended.

Fig. 2 is a side view of the machine. The principle of the machine is very simple; it contains a pulp vat, A, with a hog or wheel inside to agitate the pulp and an arrangement for pouring the pulp over the wire-gauze mold, B, B, B, B, which instead of being in single squares, as in the hand process, is an endless sheet moving round two rollers, a, b, which keep it stretched out and revolving when in operation. Under the part which receives the pulp there is a series of small brass rollers, d, these, being nearly close together, keep it perfectly level, which is a most necessary condition; besides which, there is a shallow trough, ee, called the *save all*, which catches and retains the water, which always escapes with some pulp in suspension; and an arrangement of suction boxes and tubes, f, f, f, worked by air-pumps, which draw much of the water out as the pulp passes over them. The pulp is kept from running over the sides by straps called the *deckles*, which are also endless bands, usually of vulcanized India-rubber, carried round moving rollers, so that they travel with the wire-gauze, and therefore offer no resistance to it. In addition to all this, the frame-work on which the surface of the wire-gauze rests has a shogging motion, or side-shake, which has an important effect in working the fibers together before the pulp finally settles down. When it reaches the *couching rolls*, which press out most of the remaining moisture, and carry it forward to the first and second series of press-rolls by means of an endless web of felt which passes round them, the speed of these rollers and the traveling sheet of felt, CC, is nicely calculated, so as to prevent a strain upon the still very tender web of paper. Sometimes the upper rollers of these two series are filled with steam, in order to commence drying the web. The paper is now trusted to itself, and passes on, as indicated by the arrows, from the second press-rolls to the first set of *drying cylinders*, D, where it again meets with a felt sheet, which keeps it in close contact with the drying cylinders, which are of large size, and filled with steam. Around these it passes, drying as it goes; is then received between the two *smoothing rolls*, or damp calenders, which press both surfaces, and remove the marks of the wire and felt, which are until then visible on the paper. This is necessarily done before the drying is quite completed; and from the smoothing-rolls it passes to the second series of drying cylinders, E, where the drying is finished, and thence to the calenders, which are polished rollers of hard cast-iron, so adjusted as to give a considerable pressure to the paper, and at the same time a glossiness of surface. For writing papers, the paper passes through a shallow trough of size after leaving the drying cylinders, and then passes over another

series of skeleton cylinders, with fans moving inside, by which it is again dried without heat, and afterwards passes through the calenders. Printing and other papers are usually sized by mixing the size in the pulp, in which stage the coloring materials—such as ultramarine for the blue tint of foolscap—are also introduced. Still following the paper web in the drawing, it is seen to pass from the calenders to another machine, F; this slits the web into widths, which are again cross cut into sheets, the size of which is regulated at will. The water-mark is impressed on machine-made paper by means of a fine light-wire cylinder with a wire-woven pattern: this is placed over the wire-gauze sheet upon which the pulp is spread, but near the other end of it, so that the light impression of the marker may act upon the paper just when it ceases to be pulp, and this remains all through its course. There are many other interesting points about the paper-machine, but their introduction here would rather tend to confuse the reader. Its productive power is very great; it moves at a rate of from 30 to 70 ft. per minute, spreading pulp, couching, drying, and calendering as it goes, so that the stream of pulp flowing in at one end is in 2 minutes passing out finished paper at the other. It has been computed that an ordinary machine, making webs of paper 54 in. wide, will turn out 4 miles a day, and that the total production of all the mills in Britain is not less than 6,000,000 of yards, or 3,400 miles daily.

For very obvious reasons, the manufacture of paper has been localized on the banks of streams that afford an abundant supply of pure water for washing and pulping. Kent is celebrated for its paper-mills and for the fine quality of its paper, and is the chief county in this respect. Next follow Hertfordshire (where it was first commenced in England in 1490 by John Tate of Stevenage, of whom it is said in a book printed by Caxton,

Which late hathe in England doo make thya paper thynne,
That now in our Englyssh thys booke is printed inne;

and the same John Tate is mentioned in Henry VII.'s household book, under dates May 25, 1498 and 1499, "for a rewarde geven at the paper-mylne," and "geven in rewarde to Tate of the mylne, 6s. 8d."), Buckinghamshire, Oxfordshire, and Lancashire. It was introduced into Scotland in the year 1695, when a company was formed for carrying it on under "articles" signed at a general meeting held in Edinburgh, which articles are now in the library of the British museum. It has become a very important branch of manufacture; and not only is paper of a very fine quality made from rags and the new material, esparto, alfa, or Spanish grass (the *lygerum sparteum* of botanists), but also the manufacture of paper-machines is carried on most successfully both for foreign and home use. Both of these manufactures are carried on in the immediate neighborhood of Edinburgh. Since the introduction of the penny postage, penny papers, and other economical measures, especially the abolition of the excise-duty, an enormous impetus has been given to this branch of our home-manufacture, and considerable difficulty has been found in supplying the makers with raw material: this difficulty has been much increased by the export duties laid by other countries upon the export of rags. The greatest relief has been experienced by improved methods for preparing paper pulp from straw, and from the introduction of the esparto, which yields half its weight of paper. Of this material our imports have risen to 140,000 tons per annum, which represents 75,000 tons of paper. The imports of rags, notwithstanding the foreign impediments, are also very large. During the five years ending in 1875, they were as follows: 1871, 26,868 tons; 1872, 23,254 tons; 1873, 16,151 tons; 1874, 17,232 tons; 1875, 15,879 tons. In 1877 the 17,130 tons imported were valued at £256,489. Judging from good data, this manufacture has more than trebled since the abolition of the paper-duty, at which time it was very nearly 100,000 tons, a quantity so vast, that it will remove all surprise at the difficulty of supplying the raw materials.

The following are the principal varieties of ordinary paper, and the sizes of the sheets given in inches:

1. *Writing and Printing Papers*.—Pot (so named from its original water-mark, a tankard), 12½ by 15; double pot, 15 by 25. Foolscap, 16½ by 13½; sheet-and-third do., 22½ by 13½; sheet-and-half do., 22½ by 13½; double do., 27 by 17. Post (so called from its use in letter-writing; one of its original water-marks was a postman's horn), 18¾ by 15¼; large do., 20¾ by 16½; medium do., 18 by 22½; double do., 30½ by 19. Copy, 20 by 16½. Double crown, 20 by 30. Demy, 20 by 15; printing do., 22½ by 17¾; medium do., 22 by 17½; medium printing do., 23 by 18½. Royal, 24 by 19; printing do., 25 by 20; super-royal, 27 by 19; super-royal printing, 21 by 27. Imperial, 30 by 22. Atlas, 34 by 26. Columbian, 34½ by 23½. Elephant, 28 by 23; double do., 26¾ by 40. Antiquarian, 53 by 31: this is generally, if not always, hand-made.

These sizes are somewhat lessened by plowing and finishing off the edges previous to sale.

2. *Coarse Papers for wrapping and other purposes*.—Kent cap, 21 by 18; bag-cap, 19½ by 24; havon-cap, 21 by 16; imperial cap, 22½ by 29. Double 2-lb., 17 by 24; double 4-lb., 21 by 31; double 6-lb., 19 by 28. Cartridge, casing, and middle-hand, etc., 21 by 16. Lumber-hand, 19½ by 22½; royal-hand, 20 by 25; double small-hand, 19 by 29.

Purple papers of a soft texture, unsized, are used in very large quantities by sugar-refiners, of the following sizes: Copy-loaf, 16¾ by 21¾; powder-loaf, 18 by 26; double-

loaf, $16\frac{1}{2}$ by 23; single-loaf, $21\frac{1}{2}$ by 27; lump, 23 by 33; hambro', $16\frac{1}{2}$ by 23; titler, 29 by 35; Prussian, or double-lump, 32 by 42.

Blotting and Filtering Paper.—This is unsized paper, made of good quality, and usually colored pink or red; and of the same size as demy.

Besides these, which are well-known trade definitions, there are very many others, amounting, if we include paste and mill boards, to at least 12 or 15 hundred, so that even paper-manufacturers require the aid of a treatise upon the subject of the sizes, qualities, etc., and such a treatise is in common use.

Even as regards materials, varieties are endless. In an old German book by Jacob Christian Schäffers, published at Regensburg in 1772, there are no less than 81 samples of different kinds of paper bound up and forming part of the book, and innumerable others have been made since.

Rice paper is a beautiful material imported from China, about which numberless errors have been written. It is now known to be formed of thin slices of the pith of the plant called *aralia papyrifera*. This pith can be obtained from the stems in beautiful cylinders, from 1 to 2 in. in diameter, and several inches in length. The Chinese workmen apply the blade of a sharp, straight knife to these cylinders of pith, and, turning them round dexterously, pare them from the circumference to the center, making a rolled layer of equal thickness throughout. This is unrolled, and weights are placed upon it until it is rendered perfectly smooth and flat. Sometimes a number are joined together to increase the size of the sheets. It will be seen that this more nearly resembles the ancient papyrus than modern paper; but it is more beautiful than the former, being a very pure pearly white, and admirably adapted to the peculiar style of painting of the Chinese.

The ordinary papers of the Chinese, Japanese, and East Indians have much resemblance to each other, which arises from the manufacture and material being similar; the bark of the paper mulberry (*broussonetia papyrifera*) being chiefly used. The Chinese and Japanese are the most skillful paper-makers in the world, and some of the East Indian papers surpass the European manufactures completely.

Some useful kinds of paper are the result of manipulations subsequent to the paper-maker's work. Thus:

Lithographic Paper is prepared from good printing-paper by laying on one side of the sheets a preparation consisting of six parts of starch, 1 of alum, and 2 of gum-arabic dissolved in warm water, and applied whilst hot with a proper brush. Generally a little gamboge is added, to give it a slight yellow color.

Copying Paper, for manifold writers, is made by applying a composition of lard and black-lead to one side or both of sheets of writing-paper; and after leaving it on for a day or so, it is carefully and smoothly scraped off and wiped with a soft cloth.

Tracing Paper is good printing-paper rendered transparent by brushing it over with a mixture of Canada balsam and oil of turpentine, or nut oil and turpentine. In either case it must be carefully dried before using.

There are two distinct classes of colored papers. In one, the color is introduced into the pulp, and is consequently in the body of the paper; in the other, the colors are mixed with size, and applied to the surface. There have been many ingenious and tasteful inventions for decorating the surface of paper, such as by giving it a marbled and even a beautiful iridescent appearance, but they are too numerous for the limits of this article.

Paper is subject to much adulteration. China-clay and gypsum are generally used for the white sorts, and the heavy ferruginous ochers for the coarse and brown kinds. See Supp., page 885.

PAPER (*ante*). The manufacture of paper in the American colonies was not undertaken until 1609, about 50 years after the introduction of printing. The first mill was established in the vicinity of Philadelphia by William Rittenhausen, a native of Germany; and among the others that came into existence during the next 80 years was one established in the town of Milton, near Boston, in 1730, by Daniel Henchman and Peter Faneuil; one in Norwich, Conn., in 1768, by Christopher Leffingwell; and others here and there in New Jersey, Delaware, and Pennsylvania. In 1810 the number of mills in the United States was estimated to be 185, of which 7 were in N. H., 38 in Mass., 4 in R. I., 17 in Conn., 9 in Vt., 28 in N. Y., 60 in Penn., 4 in Del., 3 in Md., 4 in Va., 1 in S. C., 6 in Ky., and 4 in Tenn. The Fourdrinier machine was the one chiefly in use and the bulk of the manufacture was from white rags. The mills produced at that date about 50,000 reams of newspaper annually; 70,000 reams of book paper; 111,000 reams of writing paper; and 100,000 reams of wrapping paper, together valued at about \$800,000. After 20 years the business had increased so extensively that the manufacturers began to import rags in large quantities from Italy and Austria; and in 1852 the consumption of paper in the United States was equal to that of England and France together. By the census of 1880 there were in the United States, exclusive of paper-hanging manufactories, 692 establishments, principally manufacturing printing, writing, and wrapping paper, with a capital of \$46,241,202, and producing paper annually valued at \$55,109,914. Of these manufactories 168 in N. Y. produced \$8,524,279; 96 in Mass., \$15,188,198; 78 in Penn., \$5,355,912; 60 in Ohio, \$5,108,194; and 65 in Conn., \$4,337,550.

PAPER-BOOK, in English law, is the name given to the pleadings on both sides in an action at law, when the issue is one, not of fact, but of law.

PAPER-HANGINGS. This name is applied to the webs of paper, *papiers peints* of the French, usually decorated, with which interior walls are often covered. Previous to the invention of the paper-machine, sheets of paper of the size called *elephant*, 22 by 32 inches, were pasted together, to make 12-yard lengths, before the pattern was imprinted; but this is now rendered unnecessary by the facility of making webs of any length. Upon the paper it is usual first to spread a ground-color, with proper brushes, taking care to produce a perfectly smooth surface. The colors employed are opaque, and are mixed with size, and sometimes also with starch, and most of the ordinary pigments are used. In the early stages of the art, it was usual to have the patterns stenciled (see **STENCILING**) on the ground-color. The stenciling plates were usually pieces of paste-board, one being required for every differently colored portion of the pattern. Afterwards, wooden blocks were adopted, similar to those used in calico-printing, made of pear or poplar wood, generally the width of the paper, forming, indeed, huge woodcuts, on which the pattern is in high relief. As many blocks are required as there are colors in the pattern, each bearing only so much of the pattern as is represented by the color to which it is assigned. Of course, the whole beauty of the work depends upon the nice adjustment of one portion of the pattern to another; and this is determined by guide-pins in the blocks, which are so managed as not to disfigure the surface with their points. The pattern-block, being coated with its particular color from the color-tub, is laid on the paper, which is stretched out for the purpose on a table, and a lever is brought to bear upon it with sufficient pressure to make the whole of the block bear equally upon the paper. When one block has been printed the whole length of the paper by a succession of impressions, the piece is taken to the drying-room, and dried, previous to receiving the next color; and it often happens that the same operations have to be repeated a dozen different times before the pattern is completed. This process is now being rapidly superseded by the cylinder printing-machines, which are of the same kind as are used in printing textile fabrics. In these machines, the pattern is engraved on a series of copper cylinders, and each part or color has a separate cylinder, and an arrangement for keeping it constantly supplied with color when working. The cylinders are so arranged as, by the sum of their revolutions, to make the pattern complete; so that as the web of paper passes the first, it receives the color for one portion of the pattern, and reaches the second in exact time to have the next color applied in the right places. In this way the entire piece only occupies a few seconds in receiving the complete decoration.

The polished or glazed papers have the ground prepared with gypsum or plaster of Paris, and the surface dusted with finely-powdered steatite, or French chalk. When perfectly dry, this is rubbed hard with a burnishing-brush, until the whole is evenly polished. This is generally done before the pattern is printed, but in some cases pattern and ground are both polished. In making the *flock-papers*, the printing is done in the same way as in the block-printing, only, instead of colored material, a composition called *encaustic* is printed on. It consists of linseed-oil, boiled with litharge, and ground up with white lead; sufficient litharge is used to make it dry quickly, as it is very adhesive. The flock is prepared from the shearings of woollen cloths from the cloth-mills, by washing and dyeing the shearings to the various colors, then stove-drying and grinding them in a peculiar mill, which, in their brittle state, after leaving the stove, breaks them short. After this they are sifted, to obtain various degrees of fineness. By nice management, the prepared flock is so sprinkled over the whole of the printed surface as to coat the encaustic, and adhere evenly and firmly to it. The same adhesive material is used for printing in gold and other metals. The pattern being printed with the encaustic, gold or other metallic leaf is applied, and when it is properly fixed, the loose metal is brushed away with a hare's foot or other soft brush. Some of the finest French papers have much of the pattern actually painted in by hand, a process which, of course, renders them very costly.

PAPER, IMPRESSION. See page 885.

PAPER MULBERRY. See **MULBERRY**.

PAPER NAUTILUS. See **ARGONAUT**.

PAPHLAGONIA, anciently a province of Asia Minor, extending along the southern shores of the Black sea, from the Halys on the e., to the Parthenius on the w. (which separates it from Bithynia), an island on the s. to Galatia. Its limits, however, were somewhat different at different times. The Paphlagonian mountains were covered with forests, and the inhabitants were famous as hunters. Cræsus made Paphlagonia a part of the kingdom of Lydia, and Cyrus united it to Persia; it subsequently became part of the empire of Alexander the Great, and afterwards of the kingdom of Pontus, was included in the Roman province of Galatia, and in the 4th c. of the Christian era was made a separate province by Constantine. Its capital was Sinope. The Paphlagonians are supposed to have been of Syrian, or at least of Semitic origin, like the Cappadocians. They were proverbially rude, coarse, and deficient in understanding, but this probably refers only to the country-people in the interior.

PA'PHOS, anciently the name of two cities in the isle of Cyprus. The older city, sometimes called *Palaipaphos* (now *Kuklos* or *Konuklia*), was situated in the western part of the island, about $1\frac{1}{4}$ m. from the coast. It was probably founded by the Phenicians, and was famous, even before Homer's time, for a temple of Venus, who was said to have

here risen from the sea close by, whence her epithet *Aphrodite*, "foam-sprung," and who was designated the Paphian goddess. This was her chief residence, and hither crowds of pilgrims used to come in ancient times. The other Paphos, called *Neopaphos* (now *Baffa*), was on the sea-coast, about 7 or 8 m. n.w. of the older city, and was the place in which the apostle Paul proclaimed the gospel before the proconsul Sergius.

PAPIAS, bishop of Hierapolis in Phrygia, was a Christian writer, who flourished in the 2d century. According to Irenæus, he was a disciple of the apostle John; but Eusebius, who quotes (*Historia Ecclesiastica*, chap. 39) the words of Irenæus, immediately subjoins a passage from Papias himself, in which the latter distinctly states that he did not receive his doctrines from any of the apostles, but from the "living voice" of such followers of theirs as "are still surviving." He was, however, an "associate" of Polycarp, a bishop in the same province of proconsular Asia; and as the latter was a disciple of the apostle John, it is probable that Irenæus—a somewhat hasty writer—inferred that his companion must have been the same. The *Paschal or Alexandrian Chronicle* states that he suffered martyrdom at Pergamus, 163 A.D. Eusebius describes Papias as "well skilled in all manner of learning, and well acquainted with the Scriptures;" but a little further on he speaks of him as a man "of limited understanding" (*smikròs òn tòn noûn*), and a very credulous chronicler of "unwritten tradition," who had collected "certain strange parables of our Lord and of his doctrine, and some other matters rather too fabulous." The work in which these were contained was entitled *Logiòn Kuriakòn, Exegèseòs Biblia E'*. (Five books of commentaries on the sayings of our Lord). It is now lost, but certain fragments of it have been preserved by Irenæus, Eusebius, Maximus Confessor, and other writers. These fragments are extremely interesting, because of the light which they throw on the origin of the New Testament Scriptures, and their importance may be estimated from the fact, that they contain the earliest information which we possess on the subject. It is Papias who is our authority for the statement, that the evangelist Matthew drew up a collection of our Lord's sayings and doings (*ta logia*) in the Hebrew (probably Syro-Chaldaic or Aramaic) dialect, and that every one translated it as he was able. There can be no doubt that this is a perplexing statement, suggesting as it does the delicate question: "If Papias is correct, who wrote our present Matthew, which is in Greek, and not in Hebrew?" (For a consideration of this point, see MATTHEW.) Papias also tells us, either on the authority of John the presbyter, or more probably on that of one of his followers, that the evangelist Mark was the interpreter (Hermeneutes) of Peter, and wrote "whatsoever he [Peter] recorded with great accuracy." But the passage is far from implying that Mark was a mere amanuensis of Peter, as some have asserted, but only, as Valesius has shown, that Mark listened attentively to Peter's preaching, culled from it such things as most strictly concerned Christ, and so drew up his gospel. Papias, it remains to be said, was an extreme millenarian. See MILLENNIUM.

PAPIER-MACHE (Fr. mashed or pulped paper). This manufacture has certainly been in use for more than a century in Europe; but it is not improbable that it was first suggested by some of the beautiful productions of Sindh and other parts of India, where it is employed in making boxes, trays, etc., as well as in China and Japan. Its first application, as far as we know, was to the manufacture of snuff-boxes by a German named Martin, in 1740, who learned it of a Frenchman named Lefevre; but the French say that he learned the art in England. Properly speaking, paper-maché is paper-pulp molded into shape, and it has been used, not only to make small articles, such as boxes, trays, etc., but in the interior decoration of houses for cornices, ceilings, etc. The ceilings in Chesterfield house, and some other fine Elizabethan structures, are made of this material, which at one time, owing to a combination of the stucco-workers to raise the price of their labor, took the place almost entirely of stucco in house ornamentation. At present a combination of both stucco and paper is similarly employed under the name of *Carton-pierre*. From the extension of the applications of papier-maché to the manufacture of a number of light and useful articles, modifications have taken place in its composition, and it is now of three kinds—1st, the true kind, made of paper-pulp; 2d, sheets of paper pasted together after the manner of pasteboard, but submitted to far greater pressure; and 3d, sheets of thick millboard cast from the pulp are also heavily pressed. The term papier-maché is in trade held to apply rather to the articles made of the pulp than to the pulp itself; and a vast manufacture has sprung up during the present century, particularly in Birmingham, in which a great variety of articles of use and ornament are made of this material. They are coated with successive layers of asphalt varnish, which is acted upon by heat in ovens until its volatile parts are dissipated, and it becomes hard, and capable of receiving a high polish. Mother-of-pearl is much used in their decoration, for which purpose, when several layers of the varnish still remain to be applied, thin flakes of the shell of the form of the pattern are placed on the varnish, and are covered by the succeeding layers, giving rise to elevations where they are hidden by the coats of varnish. The surface is then ground down smooth and polished, and the grinding down brings to light the pieces of mother-of-pearl shell, which thus present the appearance of inlaid patterns. The fine surface which can be given to the asphalt varnish also permits of burnished gilding and other decorative applications with excellent effect.

PAPILIO. See BUTTERFLY.

PAPILIONACEÆ, a suborder of the natural order of plants generally called *leguminosæ* (q. v.).—The plants of this suborder are the only plants known which have flowers of the peculiar structure called *papilionaceous*, and of which the pea and bean afford familiar examples. The name is derived from Lat. *papilio*, a butterfly. Papilionaceous flowers have five petals, imbricated in estivation (bud), one of which, called the *vexillum*, or *standard*, is superior, turned next to the axis, and in estivation folded over the rest; two, called the *alæ*, or *wings*, are lateral; and two are inferior, which are often united by their lower margins, forming the *carina*, or *keel*. The number of the papilionaceæ is very great, about 4,800 species being known. They are found in all parts of the world, abounding in the tropics. Many have superb and beautiful flowers; many are plants of beautiful form and foliage, trees, shrubs, or herbaceous plants; many possess valuable medicinal properties; and many are of great importance as furnishing food for man and for domestic animals, others as furnishing dyes, fiber, timber, etc. See BROOM, LABURNUM, CLOVER, BEAN, PEA, LUCERNE, LIQUORICE, INDIGO, SANDAL-WOOD, etc.

PAPILLÆ. This term is applied by anatomists to minute, elongated, conical processes, projecting from the surface of the true skin into the epidermis, highly vascular and nervous in their character, and taking an active part in the sense of touch. Their form and structure are described in the article SKIN. The mucous membrane of the tongue also contains three varieties of papillæ, which are described in the article TASTE, ORGAN, AND SENSE OF.

PAPIN, DENIS, a celebrated French physicist, was b. at Blois, Aug. 22, 1647, and studied medicine, where, after receiving his degree, he practiced for some time as a physician. He now became acquainted with Huygens, an incident which strengthened in him an original predilection for physical science; and from this time he devoted himself almost exclusively to his favorite study. Before Papin's time, the intense force which can be generated in water, air, etc., under the action of heat, was well known, but he was one of the first to indicate the principal features of a machine by which this property could be made of practical utility. He soon acquired a wide reputation, and on visiting England was received with open arms by the philosophers of that country, and became a member of the royal society in 1681. While in England, Papin and Boyle (q. v.) together repeated their experiments on the properties of air, etc.; but in 1687 Papin was called to the chair of mathematics in the university of Marburg in Hesse-Cassel, the duties of which office he discharged with zeal and success for many years. He died at Marburg about 1714. The French academy of sciences, withholding from Papin the honor of "associate," enrolled him among its "correspondents"—a proceeding on the part of the academy which has, with reason, excited the astonishment of F. Arago. To Papin undoubtedly belongs the high honor of having first applied steam to produce motion by raising a piston; he combined with this the simplest means of producing a vacuum beneath the raised piston, viz., by condensation of aqueous vapor; he is also the inventor of the "safety-valve," an essential part of his "digester" (q. v.). By this latter machine Papin showed that liquids in a vacuum can be put in a state of ebullition at a much lower temperature than when freely exposed to the air. Papin's sagacity led him to many other discoveries; he discovered the principle of action of the siphon, improved the pneumatic machine of Otto de Guericke (q. v.), and took part against Leibnitz in the discussion containing "living" and "dead" forces. Unfortunately for science, Papin's numerous writings have not yet been collected, but many of them will be found in the *Philosophical Transactions*, *Acta Eruditorum*, and the *Recueil de Diverses Pièces*. He published two works, one being an explanation of the construction and uses of his "digester" (Lond. 1681), afterwards (1682) translated into French, and his experiments entitled *Nouvelles Expériences du Vide* (Paris, 1674). It was not till nearly a century after that the great value of Papin's work was perceived. See his *Life*, by Gerland.

PAPINIA'NUS, ÆMILIUS PAULLUS, the most celebrated of Roman jurists, was b. towards the middle of the 2d c.; and during the reign of the emperor Severus (q. v.), whom he succeeded as *advocatus fisci*, and whose second wife is said to have been Papinianus's relative, he held the office of *libellorum magister*, and afterwards that of *præfectus prætorio*. After the death of Severus, his son and successor, Caracalia, dismissed Papinianus from his office, and soon afterwards caused him to be put to death on various pretexts, the real reason, however, appearing to be that the emperor was afraid the influence of a man so able and upright would be dangerous to his power. Papinianus's works consist chiefly of 37 books of *Quæstiones*, 19 of *Responsa*, 2 of *Definitiones*, two works, *De Adulteriis*, and a Greek fragment; and from these works there are in all 595 excerpts in the digest (q. v.). The pupils of Papinianus include the most famous names in Roman jurisprudence, such as Ulpian, Paullus, Pomponius, Africanus, Florentinus, and Modestinus, but the master stands superior to them all. The high reputation he enjoyed among his contemporaries and successors may be gathered from the epithets *prudentissimus*, *consultissimus*, *disertissimus*, bestowed upon him by various emperors, and from the first book of the Codex Theodosii, *De Responsis Prudentum*, in which, after declaring the works of Papinianus, Paullus, Caius, Ulpian, Modestinus, and four others, to be authority for a judge's decision, it is declared that should these jurists be equally divided in opinion, that opinion which was maintained by Papinianus was to be considered right; while his commentator, the celebrated Cujacius (q. v.), goes so far as to declare "that

Papinianus was the first of all lawyers who have been, or are to be," and that "no one ever will equal him." His high reputation as a jurist was much enhanced by the strong moral feeling and stern unbending honesty which were equally characteristic of him, and which have stamped his works with an ineffaceable impress. Papinianus's works were studied both before and after Justinian's time by Roman legal students of the third year, who were for this reason denominated Papinianistæ. The fragments of Papinianus's works which now remain are somewhat obscure, and the excerpts from them in the digest are in general so brief that the aid of a commentator is required.

PAPINEAU, LOUIS JOSEPH, 1789-1871; b. Montreal, educated at the seminary of Quebec, studied law, was repeatedly elected member of the Canadian parliament, was speaker of the lower house and leader of the radical party, and appointed by lord Dalhousie one of the executive council. In 1827, when he was again member of parliament, he was elected speaker, but lord Dalhousie adjourned parliament to prevent his taking his seat until the following year. He prepared the list of demands and grievances known as the 92 resolutions. He did not countenance the rebellion of 1837, advocating peaceful resistance, and refused to join in any attempts at redress by force of arms. He was nevertheless suspected of complicity and accused of high treason, but escaped to the United States, and went to France in 1839, living in Paris 8 years. He returned in 1847, under the general amnesty of 1840, and was once more elected to parliament. In 1854 he retired to private life.

PAPIST (Lat. *papista*, an adherent of the pope) is a name applied, generally with some admixture of contempt, to members of the Roman church. Of itself, it implies nothing more than that they are adherents of the pope; but in its popular use it includes all the distinctive doctrines of Roman Catholics, and especially those which are supposed to be peculiarly cherished by the supporters of the papal authority. It is therefore in many cases held to be synonymous with the profession of the extremest opinions permitted in the church of Rome, and even those which are popularly regarded as superstitious. Understood literally, no consistent Roman Catholic would disclaim it; but in the imputed signification explained above, it is held to be offensive.

PAPPENHEIM, GOTTFRIED HEINRICH, Count von, an imperial gen. of great note in the thirty years' war, was b. at Pappenheim, in middle Franconia, Bavaria, May 29, 1594, of a very ancient Swabian family, in which the dignity of marshal of the empire became hereditary about the 13th or 14th c., and many of whose members had greatly distinguished themselves in the wars of the middle ages. When about 20 years of age, Pappenheim went over to the Roman Catholic church, and thenceforth signalized himself by his fiery zeal in its cause. After serving under the king of Poland in his wars with the Russians and Turks, Pappenheim joined the army of the Catholic league, and in the battle of Prague (1620) stayed the flight of the Austrian cavalry, and by a well-timed and furious charge turned the tide of battle against the Bohemians. In 1623 he received from the emperor the command of a cavalry regiment of the famous "Pappenheimer dragoons;" and in 1625 became gen. of the Spanish horse in Lombardy; but in 1626 re-entered the Austrian service, and after suppressing a dangerous revolt of the peasants of Upper Austria, in which 40,000 of the peasants perished, he joined the army which was opposed to the Protestant league, and, in association with Tilly, carried on many campaigns against the Danes, Swedes, and Saxons. It was Pappenheim who urged and induced Tilly to take Magdeburg by assault, and himself led and directed the attack. Moreover, it is he, rather than Tilly, who was to blame for the ferocious massacres which followed. His reckless bravery involved Tilly, against his will, in the disastrous battle of Breitenfeld; but to some extent he retrieved his character by his strenuous efforts to remedy the loss, and protect the retreat of the army. After Tilly's death, he was associated with Wallenstein, who detached him with eight regiments to protect Cologne, but on hearing of the advance of Gustavus, sent an urgent order for his return. Pappenheim arrived at Lützen at the moment when Wallenstein's army was on the point of being completely routed, and at the head of his cuirassiers, charged the left wing of the Swedes, throwing it into confusion, and almost changing the fortune of the battle by his extraordinary bravery. He was mortally wounded in the last charge, and died a few hours afterwards at Leipsic, Nov. 7, 1632, with a smile on his countenance, after learning that Gustavus Adolphus had died before him. "God be praised!" he said; "I can go in peace, now that that mortal enemy of the Catholic faith has had to die before me."

PAP'PUS, in botany, an appendage of the fruit of plants belonging to certain natural orders, of which the great natural order *compositæ* is the chief. It consists either of simple or feathery hairs, sessile or stalked, arising from the summit of the fruit, and is produced by a development of the tube and limb of the persistent calyx. Its object appears to be to waft the ripened seed to the new situation in which it is to grow. *Thistle-down* is the pappus of the thistle.—The pappus is sometimes represented by mere teeth or scales.

PAPPUS of Alexandria, one of the later Greek geometers, of whose history nothing is known; he is said by Suidas to have lived during the reign of Theodosius the great, emperor of the east (379-395). Some writers are of opinion that he lived two centuries

PAPUA AND CAROLINE ISLANDS.—1. Village on south-west coast of New Guinea. 2. Village at Humboldt Bay, New Guinea. 3. Village temple. 4. Native of Dorei in festival dress. 5. Dorei idol. 6, 13. Dorei shields. 7. Dorei bow. 8. South-west coast bow. 9. Dorei comb. 10. Arrow-head. 11. Calabash. 12. Carved boat ornament, Humboldt Bay. 14. Head-rest, Humboldt Bay. 15. Dorei drum (Tifa). 16. Dirk made of human bone. 17. Dorei ear-ring. 18. Arjakis. 19. Natives of Humboldt Bay. *Caroline Islands*: 20. Vessel at Lugunor. 21. Ruins at Tinian and Rota (Marianne Isles). 22. Meeting-house at Lugunor. 23. House at Ualan.

earlier, but the former is much the more probable opinion. The chief work of Pappus is his *Mathematical Collections*, of which the last six, out of eight books, are extant. The *Collections*, as their name implies, are an assemblage into one book of scattered problems and theorems, the work of Apollonius, Archimedes, Euclid, Theodosius, etc., to which he has joined his own discoveries. The first two books are supposed (on insufficient grounds) to have treated of arithmetic and arithmetical problems, but only a small fragment of the second book is extant: the third book is a collection of problems, mostly of solid geometry: the fourth treats of curves other than the circle, according to the method of pure geometry; the fifth contains problems of maxima and minima: the sixth treats of the geometry of the sphere; the seventh, which is by far the most important to modern geometers, as it is almost the sole authority we possess on the subject of the history and methods of the Greek geometrical analysis, treats principally of analysis; it also contains the proposition now known as "Guldinus's theorem," which was plagiarized from Pappus by father Guldin; the eighth and last book treats of machines. Pappus was the author of several other works which are lost, excepting only a fragment of his *Commentary on Four Books of Ptolemy's Syntaxis*. Pappus, as an independent investigator, enjoys a high reputation, and is considered by Descartes as one of the most excellent geometers of antiquity. Some of his problems have been looked upon with high interest by all succeeding geometers. The *Mathematical Collections* have been published in whole or part, at various periods, but the only complete editions are the two Latin versions, the first by Commandine (Pisa, 1588), and the second by Manolesius (Bologna, 1660), and the Greek edition of H. J. Eisenmann (Paris, 1824). The portion of the Greek text of the second book, which was wanting in Commandine's MS., was published (1688) in London by Dr. Wallis.

***PAPUA**, or **NEW GUINEA**, is, with the exception of Australia, the largest island on the globe. It lies in lat. $0^{\circ} 30'$ to $10^{\circ} 40'$ s., and long. 131° to $150^{\circ} 30'$ e., and is about 1300 m. in length. In outline the island is very irregular, the western part being nearly insulated by Geelvink bay, on the n., and M'Clure's inlet from the west. The head of Geelvink bay is separated from the s. coast by an isthmus only 35 m. in breadth. Eastward from this, the island increases in breadth from 200 to 360 m., and terminates in the s.e., in a long and narrow peninsula of lofty mountains.

There is probably no region of the globe so little known as Papua; the coast has not even been visited in some parts, and the maps published to this day show unsurveyed portions. It is not known with certainty who discovered Papua. It is attributed to a Spaniard, Alvaro de Saavadra. To him the first detailed notice of the island is due, and it was he who first noticed the resemblance of the inhabitants to African negroes, and for that reason gave the country the name of New Guinea. In 1606 the Spanish frigate *La Almiranta*, capt. Luiz Vaes de Torres, made the island, and sailed along the southern shore to the strait that bears his name. In 1676 the Dutch captains, Schouten and Le Maire, landed on the island to obtain fresh water. They were unexpectedly attacked by the natives, who killed 18 of their men. M. De Bougainville, in 1768, also made the south coast of the island, and worked to windward along it. The English navigators, Cook in 1770, and Forrest in 1774, Edwards in 1791, and the following year capt. Bligh, of *Bounty* notoriety, saw portions of the south coast. Flinders, in 1799, visited the island, and added a few facts to our scanty information. In the course of the voyage of the French ship *Astrolabe*, under the command of J. Dumont d'Urville, the distinguished naturalists, Quoi and Gaymard, studied the natural history of the island, and more especially its zoology. A Dutch expedition in 1828 added to the information of the western coast. In 1845 capt. Blackwood and Owen Stanley, of her majesty's ships *Fly* and *Bramble*, surveyed part of the southern coast; and, between 1846 and 1850, the last-named officer surveyed the southern shores of the eastern peninsula. In 1858 the Dutch government sent a surveying expedition in the steamer *Etna* to the north and n.w. coasts. In 1869 attention was called to our lack of information on Papua, and to the fact that so little had been done to explore this great and fertile island, which lay almost within sight of Australia, and might be looked on as belonging to that continent. Sir Charles Nicholson especially directed the attention of our Australian colonists to the importance of their becoming acquainted with the island, lying as it does, on the highway to India and China, and believed to be rich in minerals and commercial products. The importance of exploring the island was generally admitted. In 1871 the Russian steam corvette, the *Vitiaz*, left on the n.e. shores the naturalist, Miklouka Maclay, who undertook to penetrate westward into the Dutch territory. The Italian travelers, Messrs. Beccari and D'Albertis, and the Italian corvette *Vittor Pisani*, also visited the island. Early in 1873 H.M.S. *Basilisk*, capt. Moresby, was sent to suppress the system of kidnapping natives in the neighborhood of Torres strait; and this being accomplished, capt. Moresby employed his time in continuing the survey of the eastern coasts commenced by capt. Owen Stanley. He found the eastern part of the island different in form from the representations as given on our maps, inasmuch as a considerable portion of the eastern promontory consisted of islands with deep channels between, instead of being a continuous line of coast. But little is known of the geography of the island beyond the coast. The northern side is hilly and densely covered with wood, while such portions of the southern coasts as have been visited are low, and

apparently swampy, but still densely wooded. A range of mountains, the Charles Louis mountains, commences on the south coast near Geelvink bay, and extends due east, rising gradually to a height of nearly 17,000 ft., where it is lost sight of at a distance of 100 m. from the coast; but it is not improbable that this range continues through, and subdivides the island until it joins the high land of the eastern peninsula, where a succession of mountains, from 14,000 to 5,000 ft. high, continue to the eastern extreme. A large island, Frederick Henry island, 100 m. long by about 50 broad, on the s.w. coast, was supposed to be part of the mainland until lieut. Kool, of the Dutch navy, passed through the strait that separated it. The London missionary society's agents, in their steamer the *Ellangowan*, have also lately found that what was considered the south cape of Papua is detached from the mainland, and have called it Stacey island. The Fly river has been ascended 160 miles by the same parties. The whole of the south-eastern coast to the eastern extreme of the island, and continuing to the Louisiade archipelago beyond, is fringed with dangerous coral reefs, and, as during the monsoons the currents acquire great velocity, the danger of navigating is considerable. Capt. Moresby has discovered a new passage at the s.e. point of the main island, China strait, which is navigable for large ships, and apparently free from dangers; it is considered that this discovery will lead to more rapid communication between China and Australia. The tides, however, at springs, run at the rate of 5 or 6 knots, but more careful and elaborate surveys will doubtless render navigation more safe and expeditious in these waters.

There cannot be a doubt that in an island of such vast extent as Papua, not only does the character of the human family greatly diverge, but there may possibly exist several distinct races. With our little knowledge, two distinct races are admitted, viz., the Papuans, so called from the Malayan "frizzled hair," and the Haraforas. The Papuans are said to resemble the Australian aborigines, but, as a rule, are stouter. The Haraforas are distinguishable from the Papuans by lighter color and straighter hair; they also exhibit greater activity of body.

Except in the swampy districts, the climate is not unhealthy, though the temperature varies greatly, the thermometer sometimes indicating 95° Fahr. by day, and falling to 75° by night. On the s.w. coast, the east monsoon or rainy season begins about the middle of April, and ends in September; the dry season is from September to April, and on the n. coast they are just reversed.

The island is everywhere clothed with the most luxuriant vegetation, cocoa-nut, betel, sago, banana, bread-fruit, orange, lemon, and other fruit-trees lining the shores; while in the interior are abundance of fine timber trees, as the iron-wood, ebony, canary-wood, the wild nutmeg, and the massoi, the fragrant bark of which is a leading article of export from the s.w. coast. In the districts of the Arfak and Amberbakin mountains the sugar-cane, tobacco, and rice are cultivated.

The natural history of the western part of Papua has been recently examined by Mr. Wallace. This naturalist established the fact that a deep channel in the bed of the ocean, running w. of Celebes, and e. of the great islands of Java and Borneo, now known as Wallace's line, separates two regions, in which the islands rise from shallow waters, and which are totally unlike each other in their botany and zoology. The islands on either side of this line he supposes to be the relics of submerged continents. Those on the west, or the Great Malay islands, belong to the continent of Asia, and have its plants and animals. Those to the east of the line, on the other hand, including Papua, have a flora and fauna resembling those of Australia. The latter island has a dry climate and stunted vegetation. Papua, on the contrary, has a warm and moist climate, pre-eminently fitted to produce a varied, luxuriant vegetation; and it is clothed from end to end with magnificent forests. Insect life is, as might be expected, abundant and varied; the Papuan species being remarkable for fine forms and beautiful colors. Still more interesting to the naturalist is the variety of birds, of which 120 species are singers, 30 parrots, and 28 pigeons. Those of land species which have been examined belong to 108 genera, 29 of which are found exclusively in Papua. The beautiful birds of paradise are peculiar to the island, and distinguish it from all other regions. In contrast to this variety of birds is the small number of mammals. The great pachyderms and quadrumana of the Malay islands are wanting, and the mammals are 2 bats, 1 pig, 10 marsupials, 1 cetacea, and 1 carnivora. There is one true kangaroo similar to those of Australia. The climbing kangaroos take the place of the monkeys of the Asiatic area. It is believed that Wallace's line, or one nearly coincident with it, separates two varieties of the human race, the Malay's and the Papuans, or rather areas in which one of these races predominates.

Mr. Alfred Wallace, in his *Malay Archipelago*, says of the Papuans: "There has been much difference of opinion about the races of the Oceanic region, but it is generally admitted that they belong to four different types—those of (1) the Malays; (2) the Negritos or Papuans; (3) the Polynesians; (4) the Australians. The most distinguished of recent ethnologists class the Malays with the Mongols; the Negritos or Papuans, and the Polynesians, with the negroes of Africa; and distinguish widely the Australians from both. They do not recognize any fundamental distinction between the dark Papuans and the light-complexioned Polynesians. The western parts of the island are inhabited by the former, the eastern parts by the latter. 'The Papuans are well made, have regular features, intelligent black eyes, small white teeth, curly hair, thick lips,

and large mouth; the nose is sharp, but flat beneath, the nostrils large, and the skin dark brown. They are," Mr. Wallace says, "superior in stature to average Europeans, but have long and thin legs, and the splay foot of the negro." He thinks the Papuans superior to the Malays in intelligence. In the western parts, they are divided into small distinct tribes, frequently at war with each other. The men build the houses, hollow the trunks of trees into canoes, hunt and fish; while the women do all the heaviest work, cultivating the fields, making mats, pots, and cutting wood. Their food consists of maize, sago, rice, fish, birds, the flesh of wild pigs, and fruits, etc. "They are copper colored, of a light active build, often with very good features, which they paint; but the men's teeth and mouths are much disfigured by constant use of betel-nut. The hair is usually worn frizzled out into a huge mop. The women's hair is always cut short. Their weapons appear to be spears, swords, clubs, and stone hatchets, but no bows and arrows were seen amongst them. Occasionally human jaw and spinal bones are worn as bracelets and ornaments. They appeared to take pleasure in making us understand that they had eaten the original owners of the bones; but these bones, as well as the few skulls exhibited in their villages, appeared to be of an ancient date. The houses are built after the Malay fashion, on poles raised 5 or 6 ft. above the ground, and consist of one large apartment." The natives of Humboldt's bay have a temple in every village, though nothing is known of their religion.

In the eastern part of the island, the negro type of the inhabitants passes into that of the Polynesians. Captain Moresby says of them, that they have the light complexion and in all respects the appearance of the Polynesians, typically represented by the New Zealanders, that they are a friendly and intelligent people, and gladly received the English seamen at their villages, where they mixed freely with them. They practice several useful arts, such as pottery, and possess extensive, well-fenced plantations. In the north-eastern part of the island, their villages are terraced and cultivated to a great height, in a manner which a Chinaman might envy. Captain Moresby believes them to be a fine, promising race, and thinks that, with the aid of civilizing influences, a prosperous future is in store for them.

The Dutch scientific expedition of 1858 appended to their report a vocabulary of the Myfore language, of about 1,200 words, collected by Ottow and Geisler, missionaries at Doreh, on the w. of Geelvink bay. It is, however, known to differ greatly from languages spoken in other parts; and natives of the South Sea islands have a facility in communicating with the Papuans on the Torres Strait. The London missionary society has therefore begun to Christianize them through Samoan teachers directed by British missionaries. The first chapel, on Murray Island, was opened in 1875.

The population of Papua and the immediately adjacent islands has been estimated at 800,000, but no correct estimate of the numbers can be formed. The exports are masooi bark, trepang or bêche-demer, tortoise-shell, pearls, nutmegs, birds of paradise, crown-pigeons, ebony, resin, slaves, etc.

The inhabitants seem to be divided into a great number of petty tribes, quite independent of each other. No native government is known to extend over a great part of the island. The Dutch acquired the rights of their tributary, the sultan of Tidore, and it was partly to assert them that an expedition was undertaken in 1828. At this time, the Dutch built a fort called Du Bus, in Triton bay, 3° 46' s. lat., and 134° e. long., and declared the whole island w. of a line running from cape Bonpland in the n., along 141° e. long., to Torres Strait, to belong to the Netherlands, but the settlement was abandoned. In 1858 the Dutch made another attempt to establish a colony. The *Etna* was fitted out for that purpose. The expedition visited a great part of the north-western coast. Recent attempts of parties of miners to tap the metallic treasures of Papua have not as yet met with success.

That a great future is open to this vast territory is undoubted. Rich in natural products and mineral wealth to an extent of which we can have no conception, situated in such close contiguity to one of our largest possessions, and between it and China, Japan, and India, it is of immediate consequence to England; the western part may be regarded as under the Dutch power. In 1883 the government of Queensland annexed the eastern portion of P. in the name of the Queen of Great Britain and Ireland; but its action was not sanctioned by the Imperial government, greatly to the dissatisfaction of Queensland and the other Australian colonies. (The name P., commonly called *Pa'pua*, should be pronounced *Papoo'a*.)

PAP'ULÆ AND PAPULAR DISEASES. Papulæ, or pimples, constitute one of the eight orders of Bateman and Willan's classification of cutaneous diseases. They occur as little elevations of the cuticle, of a red color, containing neither pus nor any other fluid, and ending usually in a scurf. They are generally supposed to denote inflammation of the papillæ of the skin; but Erasmus Wilson believes that they represent an

inflammatory condition of the secretory orifices, whether sudoriferous or sebaceous. The diseases regarded as papular are strophulus, lichen, and prurigo; but there are other diseases in which the first external symptom is a papular eruption, as, for example, small-pox, in which the papula speedily develops itself into a pustule.

PAPYRI. Rolls made of the paper of the papyrus plant are commonly known as *papyri*, corresponding to the Greek *biblia*. These rolls are of a very remote antiquity, some of the still remaining Egyptian papyri being certainly as old as the sixth dynasty, and others as old as the twelfth, or from about 2,000 B.C. This is owing to their mode of preservation, and to the peculiarly dry character of Egypt. These rolls have been found deposited in different ways, those of a religious nature being placed upon the bodies of mummies, at the feet, arms, or even in the hands, sometimes, indeed, packed or laid between the bandages, or even spread over the whole bandages, like a shroud. At the time of the nineteenth and twentieth dynasties (1320–1200 B.C.), they were often deposited in hollow wooden figures of the god Ptah Socharis Osiris, or of the god Osiris, which were placed near the mummies. Papyri of a civil nature were deposited in jars or boxes, which were placed near the mummies, or have been found in the remains of ancient libraries. The following are the principal kinds of Egyptian papyri: I. Hieroglyphical papyri, always accompanied by pictures or vignettes, and consisting of three classes: 1. Solar litanies or texts, and pictures relating to and describing the sun's passage through the hours of the night, when that luminary was supposed to enter the Egyptian hades or hell. 2. Books of the empyreal gate, or heaven, with vignettes of deities, and other representations referring to the genesis of the cosmos or universe. 3. The so-called ritual, consisting of a series of sacred or hermetic books, some of a very remote antiquity, accompanied with rubrical titles and directions as to their efficacy and employment, and comprising various formulas ordered to be placed on the coffins, amulets, and other furniture of the dead, for the better preservation of the souls of the dead and of the mummies in the future state. In this book, chapters giving an account of the future judgment, of the *makhenu*, or boat of the dead, of the Elysian Fields, and of the halls through which the dead had to pass are also found. The work was considered by the Egyptians themselves mystic, and parts were supposed to be written by the god Thoth himself. A copy more or less complete, according to the wealth of the deceased, was deposited with all the principal mummies; and from the blank spaces left for the name, which were afterwards filled up, it is evident that they were kept ready made.—II. Hieratic papyri, written in the hieratic or cursive Egyptian hand, comprising a more extensive literature than the hieroglyphic papyri. This handwriting being used for civil as well as religious purposes, the papyri found in it differ considerably from one another, and comprise rituals of the class already mentioned, principally in use about the 26th dynasty, or the 6th c. B.C., but found also on some few papyri of a remote period; a book called the *Lamentations of Isis*; magical papyri, containing directions for the preparation of charms and amulets, and the adjuration of deities for their protection; civil documents, consisting of the examination of persons charged with criminal offenses, the most remarkable of which are that of an offender charged with the practice of magic in the 19th dynasty, another of a criminal charged with various crimes in the reign of Sethos I., the examination of a conspiracy in the palace of Rameses II., and the *procès-verbal* of an offender charged with violating the sepulchers of the kings in the reign of Rameses IX. Besides these, there are several letters of various scribes upon subjects connected with the administration of the country and private affairs; laudatory poems of Egyptian monarchs, one describing the campaign of Rameses II. against the Khita or Hittites; historical documents, the journeys in foreign parts; the endowment of temples by Rameses III.; works of fiction, one of the adventures of two brothers, the death of the younger, owing to the false accusation of the wife of the elder, his revival and transformation into a bull and a Persea tree; another, the story of a doomed prince, and the adventures of different persons. Works on plants and medical subjects, books of proverbs, lists of kings, historical accounts, are amongst these documents.—III. The last class of Egyptian papyri, those written in the demotic or enchorial character, consist of rituals, contracts for the sale of mummies and lands, accounts and letters, and miscellaneous documents. These papyri are often bilingual, sometimes accompanied with hieratic or Greek versions. Many of these papyri have been translated by de Rougé, Chabas, Heath, Goodwin, Birch, and others. Many Greek papyri have been found belonging to the archives of the Serapeion, referring to the administration of that temple, the orations of Hypereides, and some of the books of Homer. At all times in the history of Egypt, libraries of papyri seem to have existed, and, under the Ptolemies, are said to have contained as many as 700,000 rolls.

Another class of ancient papyri, those of Pompeii and Herculaneum, are of considerable interest, as showing the condition and arrangement of a Roman library. The papyri of Herculaneum are from $8\frac{1}{2}$ to $12\frac{1}{4}$ in. wide, and are rolled up in a cylindrical roll, *volumen*, upon a stick or inner roll, *bacillus*, *umbilicus*, having a stud at the end, *cornu*. They had their titles written on a strip, *lorum*, in red letters, and the writing was either on blind lines, or else on lines ruled with lead. About 1800 papyri were discovered at Herculaneum in 1753, in the library of a small house, charred to a cinder, and some of these, by the greatest skill and care, have been unrolled by a very laborious

process at Naples. Unfortunately, they have not answered the literary expectations formed of them, consisting of the works of philosophers of the Epicurean school, which the proprietor of the library seems to have collected. Some of the papyri were in Latin, and more difficult to unroll. Many of them have been published. They are only written on one side. When a small number were required, they were placed in a cylindrical bronze chest (*cista*), packed tightly in a perpendicular position, and were taken out single, and read by unrolling from one end. These papyri were of various prices; old ones, like old books, being of immense value, but those containing the works of contemporary authors were not dearer, perhaps, than modern books. Many extensive private and public libraries existed in Greece and Rome, but all have perished except those exhumed from Hereulaneum.

Contemp.* xxvii. p. 389; Devena, *Papyrus Judicione de Turin* (1868); *Trans. Soc. Bibl. Arch.* (1874).

PAPYRUS, a genus of plants of the natural order *cyperaceæ*, of which there are several species, the most important being the EGYPTIAN PAPYRUS or *papyrus* of the ancients (*P. antiquorum*, *cyperus papyrus* of Linnæus); a kind of sedge, 8 to 10 ft. high; with a very strong, woody, aromatic, creeping root; long, sharp-keeled leaves; and naked, leafless, triangular, soft, and cellular stems, as thick as a man's arm at the lower part, and at their upper extremity bearing a compound umbel of extremely numerous drooping spikelets, with a general involucre of 8 long filiform leaves, each spikelet containing 6-13 florets. By the ancient Egyptians it was called *papu*, from which the Greek *papyrus* is derived, although it was also called by them *byblos* or *deltos*. The Hebrews called it *gomé*, a word resembling the Coptic *gom*, or volume; its modern Arabic name is *berdi*. So rare is the plant in the present day in Egypt, that it is supposed to have been introduced either from Syria or Abyssinia; but it has been seen till lately in the vicinity of the lake Menzaleh, and specimens sent to England; and, as it formerly was considered the emblem of northern Egypt, or the Delta, and only grown there if introduced, it must have come from some country lying to the north of Egypt. It has been found in modern times in the neighborhood of Jaffa, on the banks of the Anapus, in the pools of the Liane, near Syracuse, and in the vicinity of lake Thrasymenus. It is represented on the oldest Egyptian monuments, and as reaching the height of about 10 ft. It was grown in pools of still water, growing 10 ft. above the water, and 2 beneath it, and restricted to the districts of Sais and Sebennytus. The papyrus was used for many purposes both ornamental and useful, such as crowns for the head, sandals, boxes, boats, and cordage, but principally for a kind of paper called by its name. Its pith was boiled and eaten, and its root dried for fuel. The papyrus or paper of the Egyptians was of the greatest reputation in antiquity, and it appears on the earliest monuments in the shape of long rectangular sheets, which were rolled up at one end, and on which the scribe wrote with a reed called *kash*, with red or black ink made of an animal carbon. The process of making paper from the papyrus is described in the article PAPER. When newly prepared, it was white or brownish white and lissom; but in the process of time, those papyri which have reached the present day have become of a light or dark brown color, and exceedingly brittle, breaking to the touch. While papyrus was commonly used in Egypt for the purposes of writing, and was, in fact, the paper of the period, although mentioned by early Greek authors, it does not appear to have come into general use among the Greeks till after the time of Alexander the great, when it was extensively exported from the Egyptian ports under the Ptolemies. Fragments, indeed, have been found to have been used by the Greeks centuries before. It was, however, always an expensive article to the Greeks, and a sheet cost more than the value of a dollar. Among the Romans, it does not appear to have been in use at an early period, although the Sibylline books are said to have been written on it, and it was cultivated in Calabria, Apulia, and the marshes of the Tiber. But the staple was no doubt imported from Alexandria, and improved or adapted by the Roman manufacturers. So extensive was the Alexandrian manufactory that Hadrian, in his visit to that city, was struck by its extent; and later in the empire, an Egyptian usurper (Firmus, 272 A.D.) is said to have boasted that he could support an army off his materials. It continued to be employed in the eastern and western empire till the 12th c., and was used amongst the Arabs in the 8th; but after that period it was quite superseded by parchment. At the later periods it was no longer employed in the shape of rolls, but cut up into square pages, and bound like modern books.

As a matter of scientific interest, experiments on the manufacture of paper from the papyrus have been made in recent times by Landolina, Seyffarth, and others.—Another species of papyrus (*P. corymbosus* or *P. Pangorei*) is much used in India for making mats. See INDIAN-GRASS MATTING.

PAR, or **PARR**, a small fish, also called BRANDLING and FINGERLING in different parts of Britain, inhabiting rivers and streams, and at one time believed to be a distinct species of the genus *salmo*, but now almost universally regarded as the young of the salmon. The question will be noticed in the article SALMON. It may here, however, be

mentioned, that it is difficult to discriminate the young of different species of this genus. The par rises with extraordinary readiness to the artificial fly; and until it began to receive protection as the fry of the salmon vast numbers were killed both by youthful and adult anglers.

PARA', the name of the s. arm of the Amazon, forming an outlet for that river into the Atlantic; on the southern side of the island of Marajo (q.v.). It is 200 m. in length, is 20 m. broad opposite the city of Para, and is 40 m. broad at its mouth. Its most important affluent, and the source whence it draws, perhaps, the great mass of its volume of waters, is the Tocantins. Formerly, the name Para, which is said to signify "father of waters," was applied in a general way to the river Amazon. At the time of the spring-tides, the *bore* rushes up the river with enormous force, forming a wave 15 ft. high.

PARA', an important province of the empire of Brazil, in the extreme n. of the country, is bounded on the n. by Guiana and the Atlantic, on the e. by Maranhao and Goyaz, on the s. by Matto Grosso, and on the w. by Amazonas. Area, 460,000 sq.m.; pop. '72, 280,000. It is one of the largest provinces of Brazil—having an area nearly twice the extent of Austria—is watered by the Amazon and its great affluents the Tapajos, Xingu, and Tocantins; and forms a portion of a district—the Amazon valley—which has been described by the most thorough explorer of this region as unequalled for richness of vegetable production and fertility of soil. The surface of the country is level, and consists of great plains, intersected by rivers, and covered with primeval forests, and in some cases with rich pasture. The climate, though warm, is not unhealthy. The precious metals, with diamonds, iron, and coal, are found, but are not worked. The timber is valuable, and the chief crops raised upon the very limited area as yet brought under cultivation are coffee, rice, millet, and cotton.

PARA', or BELE'M, a thriving city and seaport of Brazil, capital of the province of the same name, stands on the e. bank of the river Para, 80 m. from its mouth. Lat. 1° 28' s., long. 48° 28' west. The harbor is formed by an abrupt curve or inlet of the channel of the river, which is here 20 m. broad. Vessels of the largest size are admitted; the anchorage is roomy, safe, and easy of access. The streets are paved and macadamized; the houses, like those of most Brazilian towns, have whitened walls and red-tiled roofs. Among the principal buildings are the palace of the president, the cathedral and the churches, all ample in size, and imposing in structure. There are also numerous public squares, a college, and a beautiful botanic garden. The city is supplied with water by water-carts that perambulate the streets. The "Amazon navigation company," a Brazilian association, has erected large workshops, coal depôts, and wharfs; and steam navigation is rapidly extending. The imports have an annual value of about \$5,000,000; the annual exports reach nearly \$8,000,000, of which about \$6,000,000 are for india-rubber. Nearly \$5,000,000 were paid to the custom house in duties in 1882. Trade with the U. S. is extensive. The imports are principally cotton manufactures, wheat and flour, cutlery and hardware, wool, gold and silver wares, coins, and wine. The exports are india-rubber, coffee, sugar, raw cotton, hides, tobacco, diamonds, and cocoa. Pop. 40,000. Para is the mart through which passes the whole commerce of the Amazon and its affluents. The city was the seat of revolution during the whole of the year 1835, when a great number of lives were lost and houses destroyed, and grass grew in streets that previously had been the center of business. It is only since the year 1848 that the city can be said to have fairly entered upon the path of orderly commercial progress; and since that period, its advance has been continuous and rapid.

PARA', a coin of copper, silver, or mixed metal, though most generally of copper, in use in Turkey and Egypt; it is the 40th part of a piaster, is divided into 3 aspers, and varies much in value, owing to the debased and complicated condition of the Turkish coinage. Pieces of 5 paras are also in use. The para is equal to about $\frac{1}{18}$ th of a penny sterling in Turkey, and $\frac{1}{16}$ th of a penny sterling in Egypt. See **PIASTER**.

PARABLE, (Gr. *parabolé*, a comparison) was originally the name given by the Greek rhetoricians to an illustration avowedly introduced as such. In Hellenistic and New Testament Greek, it came to signify an independent fictitious narrative, employed for the illustration of a moral rule or principle. This kind of illustration is of eastern origin, and admirable examples are to be found in the Old and New Testaments, particularly in the discourses of our Lord. It is no less interesting than curious to learn that many of Christ's parables, or at least much of his parabolic imagery, are to be found in the writings of Hillel, Shammai, and other great rabbis, as, for example, the parables of the Pearl of Great Price, the Laborers, the Lost Piece of Money, the Wise and Foolish Virgins, etc. Among modern writers, the German divine Krummacher (q.v.) has greatly distinguished himself in this species of composition. The parable differs from the fable (q.v.) in the probability or verisimilitude of the story itself, and agrees with it in the essential requisites of simplicity and brevity. In the course of time, the word parable came to lose its significance of figurative speech, and to mean speech generally. From the *parabola* of the Latin Vulgate, came the mediæval Latin *parabolare*, whence the modern French *parler* and *parole*. An excellent work on the parables of the New Testament—probably the best in the English language—is that by archbishop Trench.

PARAB'OLA, one of the conic sections, is produced by a plane not passing through the vertex, which cuts the cone in a direction parallel to that of a plane touching the convex surface of the cone. A little consideration will show that a section so produced cannot be a closed curve, but its two branches, though continually widening out from each other, do not diverge so rapidly as in the hyperbola (q.v.). The nearer the cutting plane is to that which touches the cone, the less do the two branches diverge; and when the two planes coincide, the branches also coincide, forming a straight line, which is therefore the limit of the parabola. It may otherwise be considered as a curve, every point of which is equally distant from a fixed straight line and a given point; the fixed straight line is called the *directrix*, and the given point the *focus*. Thus (see fig.) PAP is a parabola, any point P in which is equally distant from the focus S and the directrix CB, or $PS = PD$. If, from S, a perpendicular, SE, be drawn to the directrix, and produced backward, this line, AO, is the *axis* or *principal diameter* of the parabola, and the curve is symmetrical on both sides of it. As A is a point in the parabola, $AS = AE$, or the *vertex* of a parabola bisects the perpendicular from the focus to the directrix. All lines in a parabola which are parallel to the axis cut the curve in only one point, and are called *diameters*. All lines, such as PP', which cut the curve in two points, are ordinates, and the diameter to which they are ordinates, is that one which bisects them; the portion of this diameter which is intercepted between the ordinate and the curve, is the corresponding abscissa. From the property of the parabola that $PS = PD$, the equation to the curve may be at once deduced; for $PS = PD = EN$, therefore PS^2 (which $= PN^2 + NS^2$) $= EN^2$; hence $PN^2 = EN^2 - NS^2 = (ES + SN)^2 - NS^2 = ES^2 + 2ES.SN = (since ES = 2AS) 4AS^2 + 4AS.SN = 4AS(AS + SN) = 4AS.AN$; and calling PN, the semiordinate, y ; AN, the abscissa, x ; and AS, a ; the equation to the parabola becomes $y^2 = 4ax$, where a (the distance of the vertex from the focus) remains the same for all points in the same curve. It is evident from the equation, as well as from the geometrical derivation of the parabola, that it must have two, and only two branches, and that the further it is extended the nearer its branches approach to the condition of straight lines parallel to the axis, though they never actually become so. The parabola has no asymptotes, like the hyperbola, but it possesses many properties which are common to it with that curve and the ellipse. In fact, the parabola is nothing more than an ellipse, whose major axis is infinitely long.

If parallel rays of light or heat fall upon the concave surface of a paraboloidal (see PARABOLOID) mirror, they are reflected to the focus, and conversely, if a light be placed in the focus of a paraboloidal reflector, its rays will be reflected in parallel directions, and would appear equally bright at all distances did light move without deviation, and unabsorbed. Also, if a body be projected in a direction not vertical, but inclined to the direction of gravity, it would, if undisturbed by the resisting force of the atmosphere, describe accurately a parabola whose axis is vertical, and whose vertex is the highest point reached by the body (see PROJECTILES).

The term parabola is used in analysis in a general sense, to denote that class of curves in which some power of the ordinate is proportional to a lower power of the abscissa. Thus, the curve we have just described, and which is distinguished as the *common* or *Apollonian* parabola, has the square of its ordinate proportional to its abscissa; the *cubic* parabola has the cube of its ordinate proportional to its abscissa; and the *semicubic* parabola has the cube of its ordinate proportional to the square of its abscissa.

PARABOLA'NI (Gr. *parabolos*, a desperate person), a class of functionaries in the early church, by some writers reckoned as members of the clergy, and included in the ranks of the minor orders, but more probably religious associations, whose duty it was to assist the clergy, especially in the more laborious and the menial offices of religion or of charity. The etymology of the name is somewhat curious, being derived or applied from that of those desperate adventurers of the arena who hired themselves for the wild-beast fights of the amphitheater. The chief duty of the parabolani was the tending of the sick, whether in ordinary diseases or in times of pestilence. By some, the association is believed to have originated at Alexandria, and perhaps to have been peculiar to that church; but although the parabolani were certainly very numerous at Alexandria, amounting to some 500 or 600, it is beyond all question that they were also enrolled in other churches. We find them at Ephesus, at the time of the council in 449. They held the same place in regard of ministrations to the living, that the *fossores* of Rome or the *kopiatai* of the Greeks did in relation to the burial of the dead. The parabolani are made the subject of formal legislation by Theodosius the younger. At first they were subject to the præfectus Augustalis, but a later decree placed them directly under the authority of the bishop.

The name *parabolani* must not be confounded with the epithet *parabolarius*, which the pagans applied to the Christian martyrs, from the recklessness with which they gave their lives for their faith.

PARABOLOID, a solid figure traced out by a parabola (q.v.) revolving round its principal axis. Sections of this solid parallel to the principal axis are parabolas, and those perpendicular to it, circles. The term "paraboloidal," for which "parabolic" is frequently but improperly substituted, is applied either to bodies having the form of a paraboloid, or to concave surfaces which seem to have taken their peculiar hollow shape from the impress of a paraboloidal body.

PARACEL'SUS. About the end of the 15th c. there lived in the small town of Marien-Einsiedeln, near Zurich in Switzerland, William Bombast von Hohenheim, a physician and chemist; he was married to the lady-superintendent of the hospital attached to the convent of Einsiedeln; they had an only son, Philip Aureolus Theophrastus, born, it is thought, about 1493. The name Paracelsus, by which he is now known, is a rude rendering into Greek and Latin of his patronymic. It seems doubtful if he ever attended any regular school, but he received from his father the rudiments of Latin and whatever else he could teach. He soon took to roaming, and even pursued his travels into Asia and Africa. How he maintained himself during his pilgrimage is unknown; probably by necromancy and quack cures—that is, proclaiming he had certain specifics, and bargaining for the amount he was to receive if he performed a cure. He was a diligent chemist, investigating the processes of the preparation of metals, and making experiments as to their medicinal virtues; also to discover the philosopher's stone. As a chemist he lived with Sigismund Fugger, one of a family celebrated for its patronage of art and science. His cures, real or pretended, became noised abroad, and he was called to prescribe for all the great men of his day. When he was thirty-three, he boasted of having cured thirteen princes, whose cases had been declared hopeless. He was then at his zenith and at the recommendation of Ecolampadius was appointed professor of physic and surgery at Basel. He commenced his academic career by publicly burning Galen's works, exclaiming Galen did not know as much as *his* shoe-latchets. "Reading never made a physician," he said; "countries are the leaves of nature's code of laws—patients his only books." His class-room at first was full to overflowing, but was soon deserted, and he fell into habits of excessive intemperance; indeed his secretary asserts he was drunk every day; never undressed, and went to bed with his famous sword by his side, which he would draw, and flourish about the room. The reason of his departure from Basel was, that a certain dignitary, suffering from gout, in his agony sent for Paracelsus, and promised to give him 100 florins if he cured him. Paracelsus gave him three *laudanum* pills; the canon felt comfortable, and the doctor claimed his fee, but the churchman refused to pay. Paracelsus took him into court, but the judge decided against the professor, who lost his temper, and abused the legal functionary in such a manner that the matter was taken up by the town council, and ended in the expulsion of Paracelsus. He recommenced his wanderings. Wherever he went he excited the regular faculty to a state of violent hatred, not wholly undeserved. At Salzburg he had given offense in the usual way, and the result was, "he was pitched out of the window at an inn by the doctor's servants, and had his neck broken by the fall." This took place in 1541.

That a man whose life was such an incoherent medley should exert an influence for centuries after his death, may well be a matter of surprise, but he and the age were fitted for each other. He struck the weak point of the prevailing system of medicine; he appealed to the public as to whether it were not a false system that could only lead to failure, and he proposed a system of his own, which, though shrouded in absurdity and obscurity, inaugurated a new era of medicine. The prominent idea of his system is, that disease does not depend upon an excess or deficiency of bile, phlegm, or blood, but that it is an actual existence, a blight upon the body subject to its own laws, and to be opposed by some specific medicine. See the works of Paracelsus; also of Schulz (1831); Lessing (1839); Mook (Würzb. 1876); and Russell (*History and Heroes of Medicine*, 1861).

PARACHUTE (Fr. *chute*, a fall), a machine invented for the purpose of retarding the velocity of descent of any body through the air, and employed by aëronauts as a means of descending from balloons. It is a gigantic umbrella, strongly made, and having the outer extremities of the rods, on which the canvas is stretched, firmly connected by ropes or stays to the lower part of the handle. The handle of the parachute is a hollow iron tube, through which passes a rope connecting the balloon above with the car (in which are the aëronauts and their apparatus) beneath, but so fastened, that when the balloon is cut loose, the car and parachute still remain connected. When the balloon ascends, the parachute collapses like an umbrella; but when the balloon rope is severed, and the car begins to descend, the parachute is extended by the action of the air, and prevents the car from acquiring a dangerous velocity of descent; the final velocity in those cases where the machine is of a size proportioned to the weight it has to support, being no more than would be acquired by a person leaping from a height of between two and three feet. But the slightest derangement of the parachute's equilibrium, such as might be caused by a breath of wind, or the smallest deviation from perfect symmetry in the parachute itself, immediately produces an oscillatory motion of the car, hav-

ing the apex of the parachute as a center, and the oscillations becoming gradually greater and more rapid, the occupants of the car are in most cases either pitched out or are along with it dashed on the ground with frightful force. This defect in the parachute has been attempted to be remedied in various ways, but hitherto without success. The first successful experiment with the parachute was made by Blanchard at Strasburg in 1787, and the experiment has been often repeated by Garnerin and others; very frequently, however, with fatal results.

The parachute was employed by capt. Boxer, R.N., as an essential part of his patent light-ball, for discovering the movements of an enemy at night, and was so arranged as to open up when the lighted ball had attained its greatest elevation, so as to keep it for a considerable period almost suspended in the air.

PARADE (from *parare*) signified in its original sense a prepared ground, and was applied to the courtyard of a castle, or to any inclosed and level plain. From the practice of reviewing troops at such a spot, the review itself has acquired the name of parade. In its modern military acceptance, a *parade* is the turning out of the garrison, or of a regiment in full equipment, for inspection or evolutions before some superior officer. It is the boast of British troops that their line and discipline are as perfect under an enemy's fire as on the parade ground.

PARADISE. See EDEN.

PARADISE, BIRD OF. See BIRD OF PARADISE.

PARADISIDÆ, a family of birds very closely allied to the crow family (*corvidæ*). These birds are particularly numerous in the island of New Guinea, but also inhabit other islands of the eastern archipelago. They are by common reputation the most beautiful of all birds, especially in regard to their plumage. Fiction has had much to do with them. Among other traditions is one which credits them with passing their entire existence floating about in the air, "gay creatures of the element" in which they were supposed to raise their young. Their food was said to be the dews and vapors, a sort of heavenly ambrosia and nectar. They were supposed never to touch the earth till the moment of their death, except that sometimes they suspended themselves from the branches of trees by the two elongated and gracefully curved feathers which are appended to the tails of some of the species. This delusion was kept up by the Papuans, who sold the skins, but in preparing them removed all traces of the feet or lower parts of the legs, and in most instances the wings also. Their skins were not only valued for their gorgeous beauty, but eastern princes prized them for turbans, believing that they conferred a charmed life on the wearer. The earliest European navigators who sailed to the Molucca islands for spices, obtained the dried skins of the birds of paradise which were called by the natives *manuk dewata*, or God's birds. John van Linschoten in 1598 wrote that no one had seen the birds alive, "for they lived in the air, always turning towards the sun, and never alighting till their death," saying, moreover, that they have neither feet or wings. It was a long time before the assertions of sensible observers and naturalists would be credited that birds of paradise had legs. Johnston, in 1657, writes of them: "It is peculiar to them all to be without feet, although Aristotle asserts that no bird is without feet, and Pigafetta assigns to them feet a hand breadth in length." This was written after Clusius had exposed the popular absurdity, and after the skins or the birds had been brought to Holland with their feet on, and after the publication of Tradescant's catalogue, wherein are mentioned among the *whole birds* of his museum "Birds of Paradise, or Manucodiata, whereof are divers sorts, some with, some without leggs." Johnston, however, discredits the stories about their never alighting, and living on dew, and that their eggs are hatched in a cavity on the back of the male. "Of a verity," says he, "they must necessarily require rest, and are with ease suspended to the branches of trees by those threads in their tails." Formerly, many artificial "birds of paradise" were made up by the Chinese, from parrots and other birds of brilliant plumage and palmed off on Europeans as genuine, and such imitations have been figured in books of natural history. The great bird of paradise (*paradisea apoda* of Linnæus) is the largest species, and measures 17 or 18 in. from the beak to the tip of the tail. Its body, wings, and tail are of a rich coffee brown, deepening on the breast to a very dark violet purple. The plumage of the head and neck is of the most beautiful and delicate straw color, the feathers so short and close as to resemble velvet. The lower part of the throat is of a metallic emerald, and lines extend up to the eyes and across the forehead of a deeper color. The beak is of a delicate leaden blue, and the feet, which are strong and finely formed, are of a delicate ash pink, approaching a mauve. A tuft of long, gorgeous, glossy, orange-colored plumes, often 2 ft. long, arises from each side of the body under the wings. The bird has the power of erecting these tufts of plumage so as to conceal its entire body. These ornaments are generally possessed only by the males, the female being soberly clad in a suit of unchangeable coffee brown; neither has she the slender thread-like tail plumes, nor the yellow and green feathers about the head. During the first year the young males resemble the females. The first approach to decoration is in the appearance on the head and neck of the yellow and green plumage; then the two middle tail feathers commence to grow longer than the rest, and lastly the

gorgeous, golden, orange-colored side-plumage is developed. This wonderful evolution is accomplished during three successive moltings. The great bird of paradise is described by Mr. Wallace as very active and vigorous, being all day in constant motion. They are also very abundant, and broods of young birds with their mothers are constantly met with. The full-plumed males are also quite numerous, and their cry, *wauk, wauk*, which may be regarded as the inverted cry of the common crow, *caw, caw*, is perhaps the most familiar sound in the Aru islands. The natives told Mr. Wallace that they had never seen the egg, and their accounts of the nests were rather unsatisfactory. On one occasion a Dutch official offered a high reward for an egg, but did not succeed in obtaining one. The birds molt in January and February; and in May, when they have received their full plumage the males assemble for the annual dance, or *sácaleti*. They congregate in trees with large spreading branches, but with scattered leaves to allow room for the play of their plumage. A dozen or more assemble in one tree and perform in an excited manner the most varied evolutions, stretching their necks, vibrating their wings and all the feathers of the body. They also fly from one branch to another, filling the air with reflections of the most gorgeous rainbow colors. It is during this season that the natives take the opportunity of shooting them with the bow and arrow, the head of the arrow being blunt so as only to stun the bird and not to injure its skin or plumage. The lesser bird of paradise is smaller, of a lighter brown color, and is not purple on the breast. The yellow color extends over part of the back and upon the wings, and the side plumes are of a much paler yellow than those of the great bird, the ends tipped with white. The curled tail feathers are also shorter. The female is entirely white on the under surface of the body, and is a more showy bird than the female of the great bird species. The red bird of paradise is about 14 in. long from beak to tip of tail. Its side plumes are a splendid crimson, the ends reaching but about 4 in. beyond the tail, curving downward and inward, and tipped with white. The two middle tail feathers are in the form of stiff black ribbons a quarter of an inch in width, resembling half-cylinders of whalebone. They are about 22 in. long and have a spiral, graceful curve as they hang downward in their natural position. A splendid metallic green line passes from the throat along the side of the neck, meeting and forming a longitudinal line on the back of the head, passing forward to just behind the eyes, and forming a double crest upon the forehead. The bill is a rich yellow, and the iris blackish olive. The body of the female is of a nearly uniform coffee brown, with a nearly black head and yellow neck and shoulders. The red bird of paradise is entirely confined to the small island of Waigiou, on the n.w. coast of New Guinea. The three birds thus far described are distinguished from the others by their larger size, and by their being each confined to its own region; that is, each of the three keep separate from the other two. To these strictly belong, according to Mr. Wallace, the generic title *paradisea*, or true bird of paradise. The king bird of paradise (the *paradisea regia* of Linnæus), differs considerably from the three true birds of paradise, and has been called *cicinnurus regius*. The Malays call it *burong rajah*, or king bird, and the Aru islanders, *goby-goby*. It is only about 6½ in. long, owing much to the short tail, which does not reach far beyond the wings. The whole head, throat, and back, are of the most splendid crimson color, shading to orange crimson on the forehead, from which the feathers extend more than half way down the beak. The breast and belly are of a pure white, separated from the crimson throat by a broad band of the richest metallic green; while above each eye there is a small spot of the same color. The side plumes are about an inch and a half long, of an ashy hue, tipped with emerald, and bordered with a narrow line of buff. These tufts are ordinarily covered by the wings, but at will can be spread out so as to form a beautiful semi circular fan over each shoulder. The most singular ornaments, however, belonging to this bird are the two central tail feathers which are nearly 6 in. long, thread-like, and bearing a coiled disk at their extremities of an emerald green. The bill is orange yellow, and the legs a beautiful cobalt blue. The female is so plain that it would not be regarded as belonging to the same species, unless its habits were watched. The "magnificent bird of paradise," the *diphyllodes* of prince Bonaparte, so named from the double mantle which clothes the back, is one of the rare birds. From the nape a dense mass of feathers, about 1½ in. long, and of a beautiful straw color, rises to form a mantle over the upper part of the back. This species is only found on the mainland of New Guinea and on the island of Mysol. The "superb bird of paradise," first described by Buffon, and named by Broddaert, *paradisea atra*, has very dark plumage, and is one of the rarest and most brilliant, only known by the mutilated skins sold by the natives. The ground color of the plumage is of an intense black, but the various bronze and other metallic reflections over various parts of the neck and body are especially superb. The whole head is covered with feathers of a brilliant metallic green and blue. It has a mantle similar to that of the "magnificent," only broader and more wing-like, of a velvety black, resplendent with bronze and purple. On the breast there is also a similar shield, but inverted in position, of a bluish green, and satin gloss. It inhabits the interior of northern New Guinea only. Mr. Wallace gives a list of 18 species, 8 of which are confined to the island of New Guinea, and the scarcely separated island of Salwatty. See BIRD OF PARADISE, *ante*.

PARADOS—another name for traverse—is an intercepting mound, erected in various parts of a fortification for the purpose of protecting the defenders from a rear or ricochet fire. See FORTIFICATION.

PARADOX (Gr. *para*, beside, or beyond, and *doxa*, an opinion), a term applied to whatever is contrary to the received belief. Cicero, in his book on paradoxes, states that the Stoics called by this name all those unusual opinions which contradict the notions of the vulgar. It follows from this that a paradox is not necessarily an opinion contrary to truth. There have been bold and happy paradoxes whose fortune it has been to overthrow accredited errors, and in the course of time to become universally accepted as truths. It is, perhaps, even one of the prerogatives of genius to bring such into the world, and thereby to alter the character of an art, a science, or a legislation; but this, the highest form of paradox, which is only another name for originality of thought, or for novelty of scientific discovery, is rare. The paradox which springs from a passion for distinction, and which, in its efforts to achieve it, despises good sense and the lessons of experience, is far more frequent. It may not be at bottom a positive error in thought, but it is so exaggerated in expression, that if taken literally it actually does mislead. This is the besetting sin of the brilliant and epigrammatic class of writers, abundant examples of which are to be found in modern French literature.

PARADOXURUS, a genus of carnivorous animals allied to the civet and genet, and confounded by Buffon with the latter animal. These genera with others belong to the family *viveridæ* (q.v.).

PAR'AFFINE is the name given to several closely allied substances, which are composed of mixtures of polymeric hydrocarbons, of the olefiant gas series (that is to say, of the formula $C_{2n}H_{2n}$), and are obtained from the dry distillation of wood, peat, bituminous coal, wax, etc. Paraffine is particularly abundant in beech tar, but, according to Reichenbach, to whom its name (which is formed from *parum affinis*, "little allied," in consequence of its resisting the action of the strongest acids and alkalies) is due, and who may be regarded as its discoverer; it is also found in the tar of both animal and vegetable substances. At ordinary temperatures paraffine is a hard, white, crystalline substance, devoid of taste or odor, and resembling spermaceti, both to the touch and in appearance. The paraffine obtained from wood fuses at about 111° , but the varieties obtained from other substances have considerably higher boiling-points. When carefully heated, it sublimes unchanged at a little below 700° . It dissolves freely in hot olive-oil, in oil of turpentine, in benzol, and in ether, but it is only slightly soluble in boiling alcohol, and is quite insoluble in water. It does not burn readily in the air, unless with the addition of a wick, when it evolves so brilliant and smokeless a flame that it has been applied to the manufacture of candles, which rival those made of the finest wax. The main supply of the paraffine of commerce is obtained in this country, from the Boghead cannel-coal, and from the bituminous shale of West Calder. See NAPHTHA. A bituminous shale near Bonn supplies much of the continental demand.

PARAFFINE OIL is the term applied to the oily matter which is given off in large quantity in the distillation of Boghead cannel coal. By rectification it may be separated into three portions, one of which remains liquid at very low temperatures, boils at about 420° , and is much used under a variety of names for illuminating purposes, while a mixture of the two less volatile portions (which may be regarded as composed of paraffine dissolved in a mixture of hydrocarbons of nearly the same composition as paraffine) is largely employed for the purpose of lubricating machinery, for which it is admirably adapted by its power of resisting the oxidizing action of the atmosphere, and by its very slow evaporation. See NAPHTHA.

PARA GRASS. See PIASSABA.

PARAGUAY, an important river of South America, an affluent of the Parana (q.v.), rises in the Brazilian province of Matto Grosso, on a plateau of red sandstone, in lat. $13^{\circ} 30'$ s., long. about $55^{\circ} 50'$ w., 9,535 ft. above sea-level. The sources of the river are a number of deep lakes, and 8 m. from its source the stream already has considerable volume. Pursuing a s.w. course, and, after flowing through a level country covered with thick forests, the Paraguay is joined from the w. by the Jauru, in lat. $16^{\circ} 30'$ south. It then continues to flow s. through the Marsh of Xarayes, which, during the season when the stream rises, is an expansive waste of waters, stretching far on each side of the stream, and extending from n. to s. over about 200 miles. The river still pursues a circuitous but generally southward course, forming from 20° to 22° s. the boundary-line between Brazil and Bolivia, thence flowing s.s.w. through the territories of Paraguay to its junction with the Parana, in lat. $27^{\circ} 17'$ s., a few m. above the town of Corrientes. Its chief affluents are the Cuyaba, Tacoary, Mondego, and Apa on the left, and the Jauru, Pilcomayo, and Vermejo on the right. Except in the marshy districts, the country on both banks of the river is rich and fertile, and abounds in excellent timber. The entire length of the river is estimated at 1800 miles; it is on an average about half a m. in width, and is navigable for steamers to the mouth of the Cuyaba, 100 m. above the town of Corumba. The waters of the Paraguay, which are quite free from obstructions, were declared open to all nations in 1852; and now Brazilian mail-steamers ply monthly between Monte Video and Cuyaba, on the river of the same name, one of the head-waters of the Paraguay; and there are several lines of steamers between Buenos Ayres and Asuncion.

PARAGUAY, a republic of South America. Its frontiers, previous to the war of 1865-70, were not well defined, but on its conclusion were fixed by treaty. Paraguay now extends from 22° to 27° 30' s. lat., and from 54° 32' to 58° 40' w. long., forming the peninsula between the rivers Paraguay and Parana. It is bounded n. and n.e. by Brazil, s.e., s., and s.w. by the Argentine confederation, and n.w. by Bolivia. Its area previous to the war was about 103,148 sq.m., and is now variously estimated at from 57,000 to 90,000 sq. miles. Before the war, the pop. was variously estimated at from 450,000 to 1,300,000, consisting of whites of Spanish descent, native Indians, negroes, and a mixture of these several races. In 1873 it had fallen to 221,079; in 1876 it was 293,844. A mountain-chain called Sierra Amambay, running in the general direction of from n. to s., and bifurcating to the e. and w. towards the southern extremity, under the name of Sierra Maraeayu, divides the tributaries of the Parana from those of the Paraguay, none of which are very considerable, although they are liable to frequent and destructive overflows. The northern portion of Paraguay is in general undulating, covered by low, gently-swelling ridges, separated by large grass plains, dotted with palms. There are mountains in the n.e. and n.w. corners. The southern portion is one of the most fertile districts of South America, consisting of hills and gentle slopes richly wooded, of wide savannas, which afford excellent pasture-ground, and of rich alluvial plains, some of which, indeed, are marshy, or covered with shallow pools of water (only one lake, that of Ypao, deserving special notice), but a large proportion are of extraordinary fertility and highly cultivated. The banks of the rivers Parana and Paraguay are occasionally belted with forest; but, in general, the low lands are destitute of trees. The climate, for a tropical country, is temperate, the temperature occasionally rising to 100° in summer, but in winter being usually about 45°. In geological structure, the southern part belongs generally to the tertiary formation; the n. and e. presenting greywacke rocks in some districts. The natural productions are very varied, although they do not include the precious metals or other minerals common in South America. Much valuable timber is found in the forests, and the wooded districts situated upon the rivers possess a ready means of transport. Among the trees are several species of dye-wood, several trees which yield valuable juices, as the India rubber and its cognate trees; and an especially valuable shrub, called the *Maté* (q.v.), or Paraguay tea-tree, which forms one of the chief articles of commerce, being in general use throughout La Plata, Chili, Peru, and other parts of South America. The tree grows wild in the north-eastern districts, and the gathering of its leaves gives employment in the season to a large number of the native population. Many trees also yield valuable gums. Wax and honey are collected in abundance, as is also cochineal, and the medicinal plants are very numerous. The chief cultivated crops are maize, rice, coffee, cocoa, indigo, mandioe, tobacco, sugar-cane, and cotton. Nearly three-fourths of the land is national property, consisting partly of the lands formerly held by the Jesuit missions, partly of lands never assigned to individuals, partly of lands confiscated in the course of the revolutionary ordeal through which the country has passed. The national estates have, for the most part, been let out in small tenements, at moderate rents. Under the dictator Francia, 1814-40, agriculture made considerable progress, and the breed of cattle and horses was much improved, and the stock increased. The few manufactures are sugar, rum, cotton and woolen cloths, and leather. The commerce of the country is chiefly in the hands of the government, which holds a monopoly of the export of Paraguay tea. In 1883 the total value of the exports amounted to £385,709, and the imports to £190,415. The chief exports were maté, tobacco, hides, and bark for tanning; imports, cotton goods, haberdashery, groceries, etc. Up till the war of 1865-70, Paraguay had no national debt, but the terrible losses then incurred compelled it in 1871-72 to contract obligations amounting to upwards of \$47,000,000. Three millions were contracted in England on the security of the public lands of Paraguay, estimated at upwards of £19,000,000; but the foreign loans committee, 1875, reports that payment of interest and sinking fund has ceased since 1874. The military force, which, during the five years' war, was raised to 60,000 men, has now been reduced to 550. The established religion is the Roman Catholic, the ecclesiastical head of which is the bishop of Asuncion. Education is very widely diffused; and it is said that there are but few of the people who are not able to read and write.

The history of Paraguay is highly interesting. It was discovered by Sebastian Cabot in 1526, but the first colony was settled in 1535 by Pedro de Mendoza, who founded the city of Asuncion, and established Paraguay as a province of the viceroyalty of Peru. The warlike native tribe of the Guaranis, however, a people who possessed a certain degree of civilization, and professed a dualistic religion, long successfully resisted the Spanish arms, and refused to receive either the religion or the social usages of the invaders. In the latter half of the 16th c. the Jesuit missionaries were sent to the aid of the first preachers of Christianity in Paraguay; but for a long time they were almost entirely unsuccessful, the effect of their preaching being in a great degree marred by the profligate and cruel conduct of the Spanish adventurers, who formed the staple of the early colonial population. In the 17th c. the home government consented to place in their hands the entire administration, civil as well as religious, of the province; which, from its not possessing any of the precious metals, was of little value as a source of revenue; and in order to guard the natives against the evil influences of the bad example

of European Christians, gave to the Jesuits the right to exclude all other Europeans from the colony. From this time forward the progress of civilization as well as of Christianity was rapid. The legislation, the administration, and the social organization of the settlement were shaped according to the model of a primitive Christian community, or rather of many communities under one administration; and the accounts which have been preserved of its condition, appear to present a realization of the ideal of a Christian Utopia. On the expulsion of the Jesuits from Paraguay in 1768, the history of which is involved in much controversy, the province was again made subject to the Spanish viceroys. For a time the fruits of the older civilization maintained themselves; but as the ancient organization fell to the ground, much of the work of so many years was undone; the communities lapsed into disorganization, and by degrees much of the old barbarism returned. In 1776 Paraguay was transferred to the newly-formed viceroyalty of Rio de la Plata; and in 1810 it joined with the other states in declaring its independence of the mother kingdom of Spain, which, owing to its isolated position, it was the earliest of them all to establish completely. In 1814 Dr. Francia (q.v.), originally a lawyer, and the secretary of the first revolutionary junta, was proclaimed dictator for three years; and in 1817 his term of the office was made perpetual. He continued to hold it till his death, in 1840, when anarchy ensued for two years; but, in 1842, a national congress elected two nephews of the dictator, don Alonzo and don Carlos Antonio Lopez, joint consuls of the republic. In 1844 a new constitution was proclaimed, and don Carlos was elected sole president, with dictatorial power, which he exercised till his death in 1862, when he was succeeded by his son, don Francisco Solano Lopez, whose name has become notorious in connection with the tragic struggle of 1865-70, in which the Paraguayans made a heroic but unavailing fight against the combined forces of Brazil, the Argentine confederation, and Uruguay. The war was brought to a close by the defeat and death of Lopez at the battle of Aquidaban, Mar. 1, 1870. In June, 1870, a congress voted a new constitution, which was proclaimed on Nov. 25. It is modeled on that of the Argentine confederation, the legislative authority being vested in a congress of 2 houses, and the executive in a president, elected for 6 years. Paraguay was till 1876 partially occupied by Brazilian troops, and was virtually a Brazilian province.

The central department, in which the capital, Asuncion, is situated, contains nearly one-third of the whole inhabitants; and the capital itself 10,000 to 20,000. Asuncion is connected by railway with Paraguari. The inhabitants of the towns consist chiefly of whites, or half-breeds, speaking Spanish. The native population of the provinces are chiefly Guaranis, speaking the Guarani language.

PARAGUAY TEA. See MÂTÉ.

PARAHÍBA, one of the most eastern maritime provinces of Brazil, bounded on the n. by Rio Grande do Norte, on the s. by Pernambuco, on the w. by Ceara, and on the e. by the Atlantic. Area, 31,500 sq.m.; pop. '72, 376,226. It is traversed by a river of the same name, by a number of smaller streams, and by mountainous ridges, between which are valleys, the soils of which are, for the most part, dry and sandy. Cotton of excellent quality, mandioc, and tobacco are grown; and cotton, sugar, and timber are exported. Capital, Parahiba (q.v.).

PARAHIBA, a sea-port of Brazil, capital of the province, and situated on the river of the same name, about 10 m. from the sea. Besides the cathedral, it contains a number of religious houses, 2 colleges, and other educational institutions. In 1874 106 vessels, of 34,683 tons, entered and cleared the port. Pop. 15,000.

PARALEPID'IDÆ, a family of fishes, allied to the *salmonidæ* and *scopelidæ*. There are two genera, *paralepis* and *sudis*, the first represented in the Mediterranean, off the shores of Madeira, and Greenland; the latter also in the Mediterranean. The form resembles that of the pike; it is covered with deciduous scales; lateral line straight; teeth on the jaws as well as palate; branchial apertures very large; branchiostegal rays, seven; dorsal fin short and far behind; pectorals well developed; ventrals small, inserted in front of the dorsal.

PARALLAX is the apparent displacement of an object caused by a change of place in the observer. When an object at M is looked at from P, it appears in line with some object, S; but after the observer has moved to E, M has apparently retrograded to a position in line with S'; this apparent retrogression is denominated *parallax*. The angle PME is called the "angle of parallax," or the "parallactic angle," and is the measure of the amount of parallax. To astronomers the determination of the parallax of the heavenly bodies is of the utmost importance, for two reasons—first, from the necessity of referring all observations to the earth's center, i.e., so modifying them as to make it appear as if they had been actually made at the earth's center; and secondly, because parallax is our only means of determining

Fig. 1.

the magnitude and distance of the heavenly bodies. The *geocentric* or *daily* parallax—as the apparent displacement of a heavenly body, due to its being observed from a point

Fig. 2.

on the surface of the earth instead of from its center, is called—is determined as follows: Let P and P' be two stations on the surface of the earth (fig. 2), E its center, M the object to be observed, and Z and Z' the zeniths respectively of the observers at P and P' (points which, if possible, should be on the same meridian exactly); then at P and P' let the *zenith distances*, ZPM and Z'P'M, be observed simultaneously, and since the latitudes of P and P', and consequently their difference of latitude, or the angle PEP', is known, from these three the angle PMP' (the sum of the parallaxes at P and P') is at once found; and then, by a trigonometrical process, the separate angles or parallaxes PME and P'ME. When the parallax of M, as observed from P, is known, its distance from E, the center of the earth, can be at once

found. When the heavenly body is on the horizon, as at O, its parallax is at a maximum, and is known as the *horizontal* parallax. The geocentric parallax is of use only in determining the distances of those heavenly bodies at which the earth's radius subtends a considerable angle; and as the moon and Mars (when in opposition) are the only such bodies, the parallax of the other celestial bodies must be determined in a different manner. The parallax of the sun (q.v.) is found by observation of the *transit* of Venus across his disk, a much more accurate method than that above described. The parallaxes of the other planets are easily determined from that of Mars.

In the case of the fixed stars, at which the earth's radius subtends an infinitesimal angle, it becomes necessary to make use of a much larger base-line than the earth's radius, and, as the largest we can employ is the radius of the earth's orbit, it accordingly is made use of, and the displacement of a star, when observed from a point in the earth's orbit instead of from its center, the sun, is called the *annual* or *heliocentric* parallax. Here the base-line instead, as in the former case, of being 4,000 m., is about 92,000,000 m., and the two observations necessary to determine the parallactic angle are made from two points on opposite sides of the earth's orbit, at an interval as nearly as possible of half a year. Yet, notwithstanding the enormous length of the base-line, it bears so small a proportion to the distances of the stars, that only in three or four cases have they been found to exhibit any parallactic motion whatever, and in no case does the angle of parallax amount to 1" (see STARS). The geocentric horizontal parallax of the moon is about 57' 4.2"; that of the sun, about 8.6"; and of the double star, 61 *cygni*, the heliocentric parallax has been determined by Bessel to be .348", equivalent to about 15 millionths of a second of geocentric horizontal parallax. Parallax affects every observation of angular measurement in the heavens, and all observations must be corrected for parallax, or in astronomical phrase, referred to the earth's center before they can be made use of in calculation. The position of a body, when noted from the surface of the earth, is called its *apparent* position; and when referred to the center, its *real* position.

PARALLEL FORCES are those forces which act upon a body in directions parallel to each other. Every body, being an assemblage of separate particles, each of which is acted on by gravity, may thus be considered as impressed upon by a system of parallel forces. The following demonstration will exhibit the mode in which the amount and

Fig. 1.

position of the resultant force are found: Let P and Q be two parallel forces acting at the points A and B respectively, either in the same (fig. 1), or in opposite (fig. 2) directions; join AB, and in this line, at the points A and B, apply the equal and opposite forces S and S, which counterbalance each other, and therefore do not affect the system. Find M and N (see COMPOSITION AND RESOLUTION OF FORCES), the resultants of P and S, and Q and S respectively, and produce their directions till they meet in D, at which point let the resultants be resolved parallel to their original directions; then there are two equal forces, S and S, acting parallel to AB, but in opposite directions, and thus, as they counterbalance each other, they may be removed. Then there remain two forces, P and

Q, acting at D, in the line DC, parallel to their original directions, and their sum (fig. 1) or difference (fig. 2), represented by R, is accordingly the resultant of the original forces at A and B. To find the position of C, the point in AB, or AB produced, through which the resultant passes, it is necessary to make use of the well-known property denominated the *triangle of forces* (q.v.), according to which the three forces S, M, and P are proportional to the lengths of AC, AD, DC, the sides of the triangle ADC; then $S : P :: AC : CD$, similarly $Q : S :: DC : CB$, therefore $Q : P :: AC : BC$, and $Q \pm P$ or $R : P :: AC \pm BC$ or $AB : BC$, from which proportions we derive the principle of the lever,

$P \times AC = Q \times BC$, and also that $R \times BC = P \times AB$, whence $BC = \frac{P}{R} \times AB$, and the point C is found. The failing case of this proposition is when P and Q acting in opposite parallel directions at different points are equal, in which case the resultant $R = Q - P = Q - Q = 0$. In all other cases there is a progressive motion, such as would be caused by the action of a single force $R (= Q \pm P)$ acting at the point C in the direction CR; but in the failing case, since $R = 0$, there is no progressive motion, but a rotatory movement round the center of AB. See COUPLE. It is of no consequence whether A and B be the true points of application of the forces P and Q, provided their directions when produced pass through these points, and the point of application of the resultant need not be in the line joining the points of application of the component forces, but its direction must, when produced, pass through C. If there be more than two parallel forces, the resultant of the whole is found by compounding the resultant of the first two with the third in the way given above, thus obtaining a new resultant, which is similarly combined with the fourth force; and so on till the final resultant is found. The center of gravity is only a special name for the point of application of the final resultant of a number of parallel forces.

Fig. 2.

PARALLELOGRAM, in mathematics, is a quadrilateral rectilinear figure which has its opposite sides parallel; the opposite sides are therefore equal, and so are the opposite angles. If one angle of a parallelogram be a right angle, all its angles are right angles, and the figure is then called a *rectangular parallelogram*, or shortly, a *rectangle*; and if at the same time all the sides are equal, the figure is a *square*; otherwise, it is an *oblong*. If the angles are not right angles, but all the sides are equal, it is called a *rhombus*; and if the opposite sides only are equal, a *rhomboid*. The two lines which connect the opposite corners of a parallelogram are called its *diagonals*; each bisects the parallelogram, and they bisect each other; the sum of their squares also is equal to the sum of the squares of the sides of the parallelogram.

All parallelograms which have equal bases and equal altitudes are equal in area, whether they be similar in shape or not, and the area of a parallelogram is found by multiplying its base by the height.

PARALLELOGRAM OF FORCES. See COMPOSITION OF FORCES.

PARALLELOPIPED (Gr.), frequently, but improperly written *parallelepiped*, is a solid figure having six faces, the faces being invariably parallelograms, and any two opposite faces equal, similar, and parallel. If the faces are all squares, and consequently equal, the parallelopiped becomes a cube. The volume of a parallelopiped is found by multiplying the area of one face by its distance from the opposite one.

PARALLELS, in military language, are trenches cut in the ground before a fortress, roughly parallel to its defenses, for the purpose of giving cover to the besiegers from the guns of the place. The parallels are usually three, with zigzag trenches leading from one to another. The old rule used to be to dig the first at 600 yards distance; but the improvements in artillery have rendered a greater distance necessary; and at Sevastopol, the allies made their first trench 2,000 yards from the walls. The third trench is very near to the besieged works, and from it saps and zigzag approaches are directed to the covertway.—The bearing of parallels in the general conduct of a SIEGE will be found described under that head.

PARALLELS or **CIRCLES OF LATITUDE** are circles drawn round the surface of the earth parallel to the equator. They may be supposed to be the intersections with the earth's surface of planes which cut the earth at right angles to its axis. The greatest of these circles is the equator, which has the center of the earth for its center, the radius for its radius, and is equally distant at all points from each pole. It is evident that of the others, those next the equator are greater than those more remote, and that they become less and less till at the poles they vanish altogether. The radius of any one circle is evidently equal to the earth's radius multiplied into the cosine of its latitude or distance from the equator. The rotary velocity of the earth's surface, which is about $17\frac{1}{2}$ m. per minute at the equator, is only $8\frac{2}{3}$ m. in lat. 60° ; in lat. $82\frac{1}{2}^\circ$ (the most northerly point yet reached), is only $2\frac{1}{4}$ m.; and in lat. $89\frac{1}{2}^\circ$ (within 35 m. of the pole) is not more than 267 yards per minute.

The most important parallels of latitude are the *tropics of Cancer* ($23^\circ 28'$ n. lat.) and *Capricorn* ($23^\circ 28'$ s. lat.), and the *Arctic* ($66^\circ 32'$ n. lat.) and *Antarctic circles* ($66^\circ 32'$ s. latitude.)

PARALYSIS (Gr., a loosing or relaxing), or **PALSY**, is a loss, more or less complete, of the power of motion; but by some writers the term is employed to express also loss of sensation. When the upper and lower extremities on both sides, and more or less of the trunk, are involved, the affection is termed *general paralysis*. Very frequently only one-

Paralysis.

half of the body laterally is affected, the other side remaining sound; to this condition the term *hemiplegia* is given. When the palsy is confined to all the parts below an imaginary transverse line drawn through the body, or to the two lower extremities, the condition is termed *paraplegia*. When one part of the body, as a limb, one side of the face, etc., is exclusively attacked, the affection is known as *local palsy*. In some cases the loss of sensation and the power of motion in the paralyzed part is entire, while in others it is not so. In the former the paralysis is said to be *complete*, in the latter *partial*. In most cases, but not invariably, sensibility and motion are simultaneously lost or impaired. When motion is lost, but sensation remains unimpaired, the affection has received the name of *akinesia* (Gr. *a*, not, and *kinēsis*, motion). More rarely, there is a loss of sensibility while the power of motion is retained; and to such cases the term *anesthesia* (Gr. *a*, not, and *aisthesis*, sensation) is applied. This affection occurs most frequently in the organs of sense; as in the tongue, for example, in which the sense of taste may be lost, without any defect of movement.

Paralysis is in most cases a mere symptom of disease existing in some other part than that apparently affected; as, for example, in the brain or spinal cord, or in the conducting nerves between either of these organs and the palsied organ. Sometimes, however, it is a purely local affection, depending upon a morbid condition of the terminal extremities of the nerves. The varieties in the condition of the brain and spinal cord which occasion paralysis are somewhat numerous; as, for example, congestion, hemorrhagic and serous effusion, softening, fatty degeneration, fibrinous exudation, suppuration, hydatids, various morbid growths, depressed bone from external violence, etc. It is highly probable, also, that palsy may sometimes result from mere functional disorder of the nervous centers—a view which is confirmed by the fact that a post-mortem examination of a patient who has suffered from this affection sometimes fails to detect any apparent lesion. Paralysis may originate in a nervous trunk, if it is compressed by a tumor, or otherwise mechanically affected, or if it is the seat of morbid action tending in any way to disorganize it; or it may be due to an abnormal condition of the terminations of the nerves, which may be rendered unfit for receiving impressions either from the external world or from the brain by prolonged disuse, by continuous or severe pressure, by exposure to cold, by disorganization of their own tissue, or by the depressing action of various metallic poisons, especially lead.

We shall briefly notice the symptoms and causes of the most important forms of paralysis, before offering any remarks on the general principles of treatment. *Hemiplegia* (Gr. *hemi*, half, *plēssō*, I strike) affects one *lateral half* of the body, and is that form of palsy to which the term *paralytic stroke* is commonly applied. The parts generally affected are the upper and lower extremities, the muscles of mastication, and the muscles of the tongue on one side. In a well-marked case the patient when seized falls to the ground, all power of motion in the affected arm and leg being lost. The palsy of the face which accompanies hemiplegia is usually quite distinct from the affection known as *facial palsy*, which is an affection of the facial nerve or *portio dura*. See NERVOUS SYSTEM. It is the motor branches of the fifth or trifacial nerve going to the muscles of mastication which are generally involved in hemiplegia, and consequently the cheek is flaccid and hangs down, and the angle of the mouth is depressed on the affected side. The tongue when protruded points towards the paralyzed side, and there is often imperfect articulation, in consequence of the lesion commonly affecting the hypoglossal nerve. Hemiplegia may arise from lesions of various kinds, as, for example, (1) from hemorrhage, or some other morbid change in the brain, in which case the palsy is on the side of the body opposite to the lesion, in consequence of the decussation or crossing over of nervous fibers from one side to the other that occurs at the upper part of the spinal cord (q.v.); (2) from spinal disease below the point of decussation just noticed; in this case the palsy, and the lesion causing it, are on the same side of the body. It is also sometimes associated with hysteria, epilepsy, and chorea, but in these cases it usually disappears in a few hours.

Paraplegia (Gr.) is usually confined to the two lower extremities, but the muscles of the lower part of the trunk and of the bladder and rectum are sometimes affected. There are at least two distinct forms of paraplegia, viz., (1) paraplegia dependent on primary disease of the spinal cord or its membranes, and especially on myelitis (q.v.); and (2) reflex paraplegia, i.e., paraplegia consequent on disease of the kidneys, bladder, urethra, prostate, womb, etc. These two forms of paraplegia differ in many of their phenomena, and the most important of these points of difference have been arranged in a tabular form by Dr. Brown Sequard in his *Lectures on Paralysis of the Lower Extremities*, to which we must refer for the best information on this form of palsy. Paraplegia usually comes on slowly, with a gradual increase of its symptoms. The reflex form is, of course, by far the most favorable, as it usually abates spontaneously on the subsidence of the primary disease.

Facial palsy, although locally affecting only a small part of the body, is a disorder of sufficient importance to require a definite notice. In this affection there is a more or less perfect loss of power over all the muscles supplied by the *portio dura*, or facial nerve. The following graphic account of the appearance of the patient is condensed from Dr. Watson's *Lectures on the Practice of Physic*. From one-half of the countenance all power of expression is gone; the features are blank, still, and unmeaning; the

eyelids apart and motionless. The other half retains its natural cast, except that, in some cases, the angle of the mouth on that side seems drawn a little awry, in consequence of the want of counterpoise from the corresponding muscular fibers of the palsied side. The patient cannot laugh, or weep, or frown, or express any feeling or emotion with one side of his face, while the features of the other may be in full play, nor can he spit or whistle properly. One-half of the aspect, with its unwinking eye, its fixed and solemn stare, might be that of a dead person; the other half is alive and merry. To those who do not comprehend the possible extent of the misfortune, the whimsical appearance of the patient is a matter of mirth and laughter; while, on the other hand, his friends imagine that he has had a stroke, and that he is in a very dangerous state. The nerve may be unable to discharge its duties in consequence of disease within the cavity of the skull, and in that case there is very serious danger; but in the great majority of cases the nervous function is interrupted in that part of the *portio dura* which lies encased in the temporal bone, or in the more exposed part which issues in front of the ear; and hence this form of palsy is generally unattended with any danger to life. It may arise from various causes. Sometimes it is the consequence of mechanical violence, sometimes of tumors pressing on it in the region of the parotid gland, and it very frequently arises from the mere exposure of the side of the face for some time to a stream of cold air.

It yet remains to notice certain kinds of paralysis which differ either in their characters, or in their causes, from those which have been already described—viz., *shaking palsy*, or *paralysis agitans*; and the palsies induced by various poisons. *Shaking palsy* has been defined as “involuntary tremulous motion, with lessened muscular power in parts not in action, and even when supported; with a propensity to bend the trunk forwards, and to pass from a walking to a running pace; the senses and intellect being uninjured.” It is chiefly an affection of old age, and often goes no further than to cause an unceasing nodding and wagging of the head in all directions. Somewhat analogous to this form of palsy is that peculiar kind of trembling which is often noticed in persons who are much exposed to the vapor of mercury; *mercurial tremor*, as it is termed by the physicians, and *the trembles*, as the patient usually calls it. It consists in a convulsive agitation of the voluntary muscles, especially when an attempt is made to cause them to act under the influence of the will; a patient with this affection walks with uncertain steps, his limbs trembling and dancing as if they had been hung upon wires. When sitting down he exhibits little or no indication of his disease, but on rising he cannot hold his legs steady, nor direct them with precision; and in severe cases he falls to the ground if not supported. The arms are similarly agitated, and the tongue is usually so tremulous as to render the articulation hurried and unnatural. The disease is especially common in artisans employed in the gilding of metals, and particularly of silver, by means of heat; it is also frequent among the workers of quicksilver mines, in which the crude metal is purified by heat. The time required for the production of the disease varies extremely in different cases (according to Dr. Watson, from two years to five-and-twenty). The duration of the complaint is considerable; it may last two or three months, or longer, but it is seldom fatal.

The palsy arising from the absorption of lead has been already noticed in the article LEAD-POISONING.

A specific form of paralysis of the lower extremities, consequent on the use of flour from the beans of the *lathyrus sativus*, is common in certain parts of India and in Thibet. The ripe bean is an ordinary article of food when made into flour, but it is generally used with wheat or barley flour; it is only when it exceeds one-twelfth part that it is at all injurious, and when it exceeds one-third that the paralysis sets in. Other species of *lathyrus* have been known occasionally to induce similar symptoms in European countries.

We shall enter into no details regarding the treatment of hemiplegia and paraplegia, as the management of these serious affections should be exclusively restricted to the physician. When a patient has an attack of hemiplegia (or a *paralytic stroke*) all that should be done before the physician arrives is to place him in a horizontal position, with the head slightly raised, and to remove any impediments presented by the dress to the free circulation of the blood. Should the physician not arrive in an hour or two, it may be expedient to give the patient a sharp purge (half a scruple of calomel, followed in a few hours by a black draught, if he can swallow; and two drops of croton oil, mixed with a little melted butter, and placed on the back of his tongue, if the power of deglutition is lost), and without waiting for its action, to administer an injection (or clyster) consisting of half an ounce of oil of turpentine suspended (by rubbing it with the yolk of an egg) in half a pint of thin gruel; and cold lotions may be applied to the head, especially if its surface be hot. The question of blood-letting—the universal treatment a quarter of a century ago—must be left solely to the physician. It should, however, be generally known, that if the patient be cold and collapsed; if the heart's action be feeble and intermittent; if there be an anæmic state; if the patient be of advanced age; if there is evidence of extensive disease of the heart or arterial system; or lastly, if there is reason, from the symptoms, to believe that a large amount of hemorrhage has already taken place in the brain; these singly, and *a fortiori* conjointly, are reasons why blood should not be abstracted.

Facial palsy, unless the seat of the disease be within the cavity of the cranium, will usually yield in the course of a few weeks to cupping and blistering behind the ear of the affected side, purgatives, and small doses of corrosive sublimate (one-twelfth of a grain three times a day, combined with a little of the compound tincture of bark), which must be stopped as soon as the gums are at all affected. Exposure to cold air must be carefully avoided during treatment.

Little or nothing can be done to cure *paralysis agitans*. In the treatment of *mercurial tremor*, the first step is to remove the patient from the further operation of the poison, while the second is to remove the poison already absorbed into the system, which is effected by the administration of iodide of potassium. This salt combines with the metallic poison in the system, and forms a soluble salt (a double iodide of mercury and potassium), which is eliminated through the kidneys. Good food and tonics (steel or quinia, or the two combined) should be at the same time freely given.

The writer of this article has no personal knowledge of the treatment that should be recommended in the paralysis produced by the use of *lathyrus sativus*, but cases are reported which seem to have been benefited by good diet, tonics, strychnia, and the application of blisters to the loins.

PARAMAR'IBO, the capital of Dutch Guiana, is situated on the western bank of the river Surinam, about 10 m. from its mouth, in $5^{\circ} 45'$ n. lat., and $55^{\circ} 15'$ w. long. It forms a rectangle of nearly a mile and a half in length by three-quarters in breadth. The streets are broad, covered with shell-sand, and planted on both sides with orange, lemon, tamarind, and other trees. Near the river, the houses, which are chiefly of wood, stand somewhat closely together, but in the remoter parts each is surrounded by its own garden. The rooms are wainscoted with the choicest woods, and elegantly furnished.

In approaching Paramaribo from the sea fort Zeelandia is first reached; then the bureau of finance and court of justice on the government plain, which is surrounded by stately cabbage-palms; the governor's house, with shady double avenue of tamarind trees; and lastly, the business streets stretching along the river side. There are a Dutch Reformed, a Lutheran, Moravian, two Roman Catholic churches, and two synagogues. Fort Zeelandia has a large and beautiful barrack, with several roomy houses for the officers. Paramaribo has a neat, pleasant, and picturesque appearance, the white painted houses, with bright-green doors and windows, peeping out from the shady trees, and the river being thronged with the tent-boats and canoes which are constantly arriving and departing. The Moravians have extensive missions among the bush negroes.

On Jan. 1, 1878, the population amounted to 21,755. By royal decree of Feb. 6, 1851, the flogging of slaves in the Netherlands West Indies was forbidden, except through officers appointed for the purpose, and the number of lashes was limited. This check, however, was frequently evaded, and the greatest barbarities practiced, so that the feeling in favor of emancipation increased in the Netherlands, and a bill was passed, Aug. 8, 1862, for emancipating the slaves on July 1, 1863.

Paramaribo being the only port, except Nickerie Point, at the mouth of the Corentyn, enjoys a considerable trade. In 1870-1880 the arrivals in Dutch Guiana were 200 ships a year, of 25,000 tons, with an equal number of clearances. By far the largest number were British. About a fourth part cleared at Nickerie, a very productive portion of the colony, in which sugar, molasses, and rum are manufactured in large quantities.

The climate of Dutch Guiana is not healthy. From this and other causes the deaths annually exceed the births. In 1874 there were 1548 births and 3,364 deaths. Of the births 1198 were not in wedlock. In Curaçao, Aruba, St. Martin, St. Eustatius, and Saba, there were 1439 births and 658 deaths. Of the births 1058 were illegitimate. During that year 1405 coolies arrived in the colony, of whom 1384 were from British India. Among these laborers the average death-rate was 13.85 per cent, and on three plantations 47.70; while that of the creoles averaged 5.70. Elephantiasis arabum and lepra are fearfully prevalent among the black population of Paramaribo and neighborhood.

The maximum fall of rain is in May, the minimum in September and October. By observations made at five different points during eight successive years, it was found that the quantity varies much, being smallest at Nickerie, in the w., and largest at Montbyou in the e. of the colony. The averages of the eight years, from 1847 to 1854, were: Nickerie, 66.70 in.; Groningen, on the river Saramacca, 90.50; Paramaribo, 99.85; Gelderland, on the river Surinam, 108.25; and Montbyou, 127.75. In Georgetown, British Guiana, the average fall is 100.50 inches.

The coast of Dutch Guiana is an alluvial deposit formed by the rivers and equatorial stream which flows eastwards. Further inland the soil is diluvial loam, bearing the finest timber trees; and s. of this line are extensive savannas of white sand, stretching towards the hills and mountains of the interior, which are chiefly of gneiss and granite.

The bank of Surinam has its headquarters at Paramaribo. It has a capital of \$400,000. About 25,000,000 lbs. of sugar are exported annually.

PARAMAT'TA is a light worsted twilled fabric for female dress. It was invented at Bradford, in Yorkshire, and has become an important manufacture of that place. The weft consists of combed merino wool, and the warp of cotton. It resembles in texture the Coburg and Orleans cloths.

PARAMATTA, a pleasantly situated t. of New South Wales, stands near the w. extremity of port Jackson, on a small river of the same name, and is 15 m. by land w.n.w. of Sydney, with which it is connected both by steamer and railway. The houses are mostly detached, and the streets are wide and regular, the principal one being about a mile in length. The institutions comprise churches, schools, an orphan and a lunatic asylum, and a prison. There was formerly an observatory here, but it was removed to Sydney in 1858. "Colonial tweeds," "Paramatta cloths," and salt are manufactured. Pop. '81, 8,433.

The town of Paramatta, formerly called Rosehill, is, with the exception of Sydney, the oldest in the colony. The first grain raised in the colony was grown here, and the first grants of land made.

PARAM'ETER, or **LATUS RECTUM**, a term used in conic sections, denotes, in the case of the parabola, a third proportional to the abscissa of any diameter and its corresponding ordinate; in the ellipse and hyperbola, a third proportional to a diameter and its conjugate. The parameter of any diameter is, in the case of the parabola, the same as the double ordinate of that diameter which passes through the focus, and is four times as long as the distance between the diameter's vertex and the directrix. The term parameter was also at one time used to denote *any* straight line about a curve, upon which its form could be made to depend, or any constant in its equation, the value of which determined the individual curve; but its employment in this sense is now discontinued, except in the theory of homogenous differential equations, where the constants, for the purpose of aiding the solution, are supposed to vary; and the method is consequently denominated the "variation of the parameters." In the application of this method to determine the orbital motions of the planets, the "seven necessary data" (see **ORBIT**) were called parameters, but for this the term "elements" is now substituted.

PARANA', an important river of Brazil, rises in the province of Minas Geraes, about 100 m. n.w. of Rio de Janeiro. It flows w. for upwards of 500 m., through the provinces of Minas Geraes and Sao Paulo. In the latter it is joined by the Parnahiba, after which its course alters, and it flows s.s.w. to Candelaria. Passing this town, it flows w. for 200 m. to its confluence with the Paraguay (q.v.), and then bending southward passes Santa Fe, below which its channel frequently divides and incloses numerous islands. After passing Santa Fe, it rolls onward in a s.e. direction and unites with the Uruguay in forming the Rio de la Plata. Entire length about 2,400 miles. It draws a number of considerable tributaries from the province of Parana (q.v.); and of the others the chief are the Paraguay, Uruguay, Pardo, Tiete, and Parnahiba. For vessels drawing 16 ft. it is navigable to Corrientes, upwards of 600 m. from its mouth.

PARANA', a province in the s. of Brazil, is bounded on the n. by the province of Sao Paulo; on the e. by the Atlantic; s.e. by Santa Catharina; s. by Rio Grande do Sul; w. by Paraguay and Matto Grosso. Area stated at 72,000 sq. miles. Pop. '72, 126,722, one-sixth of whom are slaves. The capital is Curitiba, and previously to 1852 this province formed a territory called the Comarca of Curitiba, included in the province of Sao Paulo. It fully commenced its provincial career in 1853. The sea-coast is indented by several bays, but the chief and almost the only port as yet is Paranagua. A line of mountains runs parallel to the coast at a distance of about 80 m. inland, and throws out spurs and branches westward. The streams flowing e. from this water-shed, though numerous, are inconsiderable; while the rivers flowing westward, into the Parana (q.v.), which forms the western boundary of the province, are all about or upwards of 400 m. in length. The principal are the Paranapanema, Ivay, Piquery, and Yguassu. The climate is unusually healthy; the soil is fertile; and agriculture, rearing cattle and swine, and gathering *mâté*, or Paraguay tea, are the chief employments. The capital, Curitiba, has manufactures of coarse woollens, and with its agricultural surroundings has a pop. of 12,000.—The chief port, Paranagua, on a bay of the same name, is about 400 m. s.w. of Rio de Janeiro. It contains about 3,000 inhabitants, and exports *mâté* to the value of \$1,000,000 annually.

PARAPET (Ital. *para-petto*, from *parare*, to protect, and *petto*, the breast), a wall raised higher than the gutter of a roof for protection; in military works, for defense against missiles from without (see **FORTIFICATION**); in domestic buildings, churches, etc., to prevent accident by falling from the roof. Parapets are of very ancient date. The Israelites were commanded to build "a battlement" round their flat roofs. In classic architecture balustrades were used as parapets. In Gothic architecture parapets of all kinds are used. In early work they are generally plain, but in later buildings they are pierced and ornamented with tracery, which is frequently of elaborate design, especially in French flamboyant work. Shields and little arcades are also used as ornaments to parapets; and the battlements of castles are imitated in the parapets of religious and domestic buildings.

PARAPH (Gr. *para*, beside, and *hapto*, to touch), an addition to the signature formed by a flourish of the pen, which, during the middle ages, constituted some sort of provision against forgery. Its use is not altogether extinct in diplomacy, and in Spain the paraph is still a usual part of a signature.

***PARAPHERNALIA** (Gr. *para*, beside or beyond; *pherne*, dower) is a term borrowed from the Roman law to denote certain articles of personal adornment and apparel belonging to a married woman. According to the usual rule in the law of England, all the personal property of a woman becomes the property of her husband when the marriage takes place, unless there is a marriage settlement; but there is an exception as regards the trinkets and dress of the wife so far as suitable to her rank in life, and which she continues to use during the marriage. In such a case the property in these articles does not vest absolutely in the husband. He cannot bequeath them by his will to a third person, but if he gave them to the wife, he may pawn, or sell, or give them away, and they can be seized in execution to pay his debts, except so far as they constitute necessary clothing. And if he were to die insolvent, they may, except that part which is necessary clothing, be taken by the husband's creditors. If the paraphernalia were given, not by the husband but by a third party before or during marriage, then they are presumed to be given for the wife's separate use, and the husband or his creditors cannot in any way interfere with them. In the law of Scotland the paraphernalia of a married woman include not merely personal clothing and trinkets, but articles of furniture, such as a chest of drawers. The husband there can neither pawn, nor pledge, nor give away the paraphernalia, nor can his creditors attach them either during his life or after his death. See Supp., page 885.

PARAPHRASE (Gr. *para*, beside, and *phrazein*, to speak) is the name given to a verbal expansion of the meaning either of a whole book, or of a separate passage in it. A paraphrase consequently differs from metaphrase, or strictly literal translation, in this, that it aims to make the sense of the text clearer by a lucid circumlocution, without actually passing into commentary. The versified passages of Scripture, forming part of the psalmody of the Scottish church, are popularly known as "the paraphrases."

PARAPLE'GIA. See PARALYSIS.

PAR'ASANG, a lineal measure still used by the Persians, and often alluded to by the Greeks. The estimate of its length given by Herodotus, Suidas, Hesychius, and Xenophon, and concurred with by modern travelers, is equivalent to about 30 Greek *stadia*, or $3\frac{1}{2}$ English miles. The word is thought to be derived from *seng* (Persian, a stone), and *para* (Sanskrit, end), in allusion to milestones. Byzantine writers reckoned it at 21 *stadia*; Strabo reckoned it at 30, 40, and even 60 *stadia*. Persian authorities are divided.

PARAS'ARA is the name of several celebrated personages of ancient India, met with in the *Mahâbhârata* (q.v.), the *Purân'as* (q.v.), and other works. Of one personage of this name, the *Mahâbhârata* relates that he was the son of S'akti, who was the son of the patriarch Vasisht'ha. King Kalmâshapâda once meeting with S'akti in a narrow path in a thicket, desired him to stand out of the way. The sage refused, on which the râja beat him with his whip, and S'akti cursed him to become a râkshasa, or demon. The râja, in this transformation, killed and ate S'akti, together with the other sons of Vasisht'ha. S'akti, however, had left his wife, Adris'yanti, pregnant, and she gave birth to Parâ'sara, who was brought up by his grandfather. When he grew up, and was informed of his father's death, he instituted a sacrifice for the destruction of all the Râkshasas, but was dissuaded from its completion by Vasisht'ha and other sages. The same legend is referred to by the *Vishn'u-Purâna*, where Parasara is introduced as relating, himself, part of this story, and adding, that the saint Pulastya, one of the mind-born sons of Brahma, in reward of the clemency he had shown even toward such beings as the Râkshasas, bestowed on him the boon of becoming the author of a compendium, or rather the compiler, of the *Purân'as*, and of the *Vishn'u-Purâna* in particular. "This tradition," prof. Wilson observes (*Vishn'u-Purâna*, ed. Hall, vol. i., p. 10), "is incompatible with the general attribution of all the *Purân'as* to Vyâsa;" but it may perhaps point to a later recension when, to the native mind, Vyâsa would still remain the reputed author of the older *Purân'as*, although, of course, even this assumption has little claim to historical truth. A Parasara, probably different from the one named, is the author of a celebrated code of laws; he is mentioned by Yâjnavalkya in his standard work, and often quoted by the commentaries.—A probably third Parasara is the reputed author of a Tantra (q.v.): and a fourth the author of an astronomical work.—Parâs'aras (in the plural) designates the whole family to which the different Parâs'aras belong.

PARASI'TA, or ANOPLU'RA, an order of insects, to all of which the name louse is popularly given. All live as parasites on quadrupeds and birds. The characters of the order are noticed in the article LOUSE. It remains, however, to be added that the order is divided into two sections: in the first of which, *pediculidea*, the mouth is small and quite suctorial; whilst in the second, *nirmidea*, it is furnished with mandibles and hooked maxillæ. The species of the first section are found only on man and mammals; those of the second section, almost exclusively on birds, although one infests the dog. The *nirmidea* show much greater activity than the *pediculidea*. When a bird dies, the bird-lice congregate near the beak, and seem disquieted, apparently anxious to change their abode.

PARASITE (Gr. from *para*, beside; *sitos*, food; one who eats with another; hence one who eats at the expense of another), a common character in the Greek comedies; a low fellow, who is ready to submit to any indignity, that he may be permitted to partake of a banquet, and who lives as much as possible at the expense of others.

PARASITIC ANIMALS are numerous. Some of them are entozoa, and some are epizoa. See these heads. They belong to different classes, and even to different divisions of the animal kingdom; all, however, are invertebrate. Many are of the division *articulata*, and many of the division *radiata*. Besides *worms* of various kinds, there are among parasites not a few crustaceans, as the leucans, etc., and not a few insects, as the louse. These insects constitute the order *parasita* or *anoplura*. Some of the cirrhopods which live in the skin of large marine animals, as whales, can scarcely be regarded as parasitic animals, but rather bear to them a relation such as *epiphytes* do to parasitical plants, not deriving their food from the animal on which they live. Tapeworms, ascarides, and other intestinal worms, do not directly draw sustenance from the animal in which they live, by extracting its juices, but they live at its expense, by consuming its food, after the food has undergone, in great part, the process of digestion.

PARASITIC DISEASES constitute one of the recognized orders of disease in Dr. Farr's classification. See NOSOLOGY. In these diseases, certain morbid conditions are induced by the presence of animals or vegetables which have found a place of subsistence within some tissue or organ, or upon some surface of the body of man or of other animals. Even plants are not exempt from disorders of this nature (see PARASITIC PLANTS). The forms of animal life giving rise to parasitic diseases are described in articles ASCARIDES, CESTOID-WORMS, ENTOZOA, EPIZOA, GUINEA-WORM, ITCH-INSECT, LOUSE, NEMATELMIA, STRONGYLUS, TAPEWORMS, TRICHINA, etc. With the vegetable structures which give rise to special diseases we are less accurately acquainted, in consequence of the limited knowledge of cryptogamic botany possessed by many writers who have recorded their experience of these cases. These parasites are either *fungi* or *algæ*, and are composed of simple sporules, germs, or cells, or of cells arranged in rows, or groups, which are so minute as to require the microscope for their recognition. Fungi are the most numerous of all plants in regard to genera and species, and their growth is associated with serious injury both to animal and vegetable life. It is not, however, always easy to determine whether they are the direct cause of disease, or whether the diseased tissue has merely afforded a suitable nidus for their development. "It is certain," says Dr. Aitken, who has entered more fully into this subject than any other English writer on the practice of medicine, "that wherever the normal chemical processes of nutrition are impaired, and the incessant changes between solids and fluids slacken, then, if the part can furnish a proper soil, the cryptogamic parasites will appear. The soil they select is, for the most part, composed of epithelium or cuticle, acid mucus or exudation. Acidity, however, though favorable to their growth, is not indispensable, since some of the vegetable parasites grow upon alkaline or neutral ground, as on ulcerations of the trachea, or in fluid in the ventricles of the brain. Certain atmospheric conditions seem favorable to the occurrence of these vegetable parasites. For example, *tinea tonsurans* may be quite absent for years in places such as work-houses, where it commonly exists, and then for several months every second or third child in the place gets the disease."

There is undoubted evidence from the observations and experiments of Devergie, Von Bärensprung, and others, that these parasitic diseases may be transmitted by contagion from horses, oxen, and other animals to man; while conversely, Dr. Fox mentions an instance of a white cat which contracted the *mange* from *tinea tonsurans* (ringworm of the scalp), which affected the children of the family to which it belonged—the fungus of the mange in the cat being the same fungus as that of *tinea* in the human subject, viz., the *trichophyton* (Gr. *tric* (tric), of a hair, and *phyton*, a plant).

The principal vegetable parasites associated in man with special morbid states are arranged by Aitken (*The Science and Practice of Medicine*, 1863, 2d edit., vol. ii., p. 171) as follows: 1. The *trichophyton tonsurans*, which is present in the three varieties of *tinea tonsurans*—viz., *T. circinatus* (ringworm of the body), *T. tonsurans* (ringworm of the scalp), and *T. sycosis menti* (ringworm of the beard). 2. The *trichophyton sporuloides*, which, together with the above, is present in the disease known as *plica polonica*. 3. The *achorion schönleinii* and *puccinia favi*, which are present in *T. favosa*, known also as *favus* (q.v.), and *porrigo scutulata* (the honeycomb ringworm). 4. The *microsporon mentagrophyta*, which is present in *mentagra*. 5. The *microsporon furfur*, which occurs in *pityriasis versicolor*. 6. The *microsporon audouini*, which is present in *porrigo decalvans*. 7. The *mycetoma* or *chionyphe carteri*, which gives rise to the disease known as the "fungus foot of India," etc. 8. The *oidium albicans* of diphtheria and aphtha. 9. The *cryptococcus cerevisiæ*, or *yeast plant*, occurring in the urine and contents of the stomach, if there is saccharine fermentation. 10. The *sarcina goodserii*, or *merispadia ventriculi* (of Robin), found in vomited matters and in the urine. There are strong grounds, based partly on botanical and partly on clinical observation, for believing that the various fungi already described are mere varieties of two or more species in various phases of development.

We shall conclude this article with a brief notice of the most dangerous of all the parasitic diseases—the *fungus foot* or *fungous disease of India*. It occurs in many parts of India, and the n.e. shores of the Persian gulf. It is a disease which occurs among natives only, so far as has been yet observed, and is undoubtedly due to the presence of a fungus which eats its way into the bones of the foot and the lower ends of the tibia and fibula, penetrating by numerous fistulous canals through the tissue of the entire foot, and tending to cause death by exhaustion, unless amputation is performed in due time. Dr. Carter has described three forms of this disease, in which both the symptoms and the fungoid material differ considerably from each other. A few remarks on the first of these forms will suffice as an illustration of parasitic disease. In this form the bones of the foot and the lower ends of the leg-bones are perforated in every direction with roundish cavities, varying in size from that of a pea to that of a pistol-bullet, the cavities being filled with the fungoid matter. The surrounding muscles, and subsequently the tendinous and fatty structures, are converted into a gelatiniform mass, in consequence of which the foot presents a peculiar turgid appearance. Examined under the microscope, the fungoid mass is found to consist of short, beaded, tawny threads or filaments, arising from a common center, and having at their tips large spore-like cells. For further information regarding this remarkable form of disease, the reader is referred to Dr. Carter's paper in the fifth volume (new series) of the *Transactions of the Medical and Physical Society of Bombay*, and to the rev. M. J. Berkeley's account of his examination of the fungus, in the second volume of *The Intellectual Observer*, p. 248.

Further notice of the parasitic diseases of the skin will be found in the articles PITYRIASIS (var. *versicolor*), RINGWORM, SCALD-HEAD, etc.

PARASITIC PLANTS are plants which grow on other plants, and derive subsistence from their juices; the plants which live parasitically on animal tissues being generally called entophytes (q. v.), although the distinction between these terms is not always preserved. Epiphytes (q. v.) differ from parasitical plants in not subsisting on the juices of the plant which supports them but merely on decayed portions of its bark, etc., or drawing all their nourishment from the air. Parasitical plants are numerous and very various; the greater number, however, and the most important, being small fungi, as rust, brand, bunt, smut, etc., the minute spores of which are supposed, in some cases, to circulate through the juices of the plants which they attack. Concerning some minute fungi, as the mildews, it is doubted if they are truly parasitical, or if their attacks are not always preceded by some measure of decay. But among parasitic plants are not a few phanerogamous plants, some of which have green leaves; and some are even shrubby, as the mistletoe, loranthus, etc.; whilst the greater number have brown scales instead of leaves; as dodder, broom-rape, lathræa, etc., and the whole of that remarkable order or class of plants called *rhizanthææ* or *rhizogens*, of which the genus *rafflesia* is distinguished above all other plants for the magnitude of its flowers. Some parasitic plants, as the species of dodder, begin their existence by independent growth from the ground; but when they have found suitable plants to take hold of and prey on, the connection with the ground ceases. Not a few, as broom-rape and lathræa, are root-parasites, generally attaching themselves to the roots of trees or shrubs; whilst some, as the eyebright (*euphrasia officinalis*), yellow rattle (*rhinanthus crista galli*), cow-wheat (*melampyrum arvense*), etc., are parasitical only occasionally and partially, and are chiefly found on neglected grass lands. Root-parasites generally attach themselves by means of little tubercles, which bury themselves under the bark.

PARATY', a sea-port t. of Brazil, in the province of Rio de Janeiro, on the w. coast of the bay of Angra, 90 m. s.w. of Rio de Janeiro city. It has extensive commerce, and numerous distilleries. Pop. said to be 10,000.

PARAY-LE-MONIAL, a t. of Burgundy, department of Saône-et-Loire, celebrated for its Benedictine abbey, founded in 973, which contains the tomb of Mary Margaret Alocque, the center of recent pilgrimages by the confraternities of the Sacred Heart (q. v.). Pop. of town and commune (1876), 3,627; of town alone, 2,895.

PARBUCKLE is a mode of drawing up or lowering down an inclined plane any cylindrical object, as a barrel or a heavy gun, without the aid of a crane or tackle. It consists in passing a stout rope round a post or some suitable object at the top of the incline, and then doubling the ends under and over the object to be moved. This converts the cask or gun into a pulley in its own behalf, and limits the pressure at each end of the rope to one-fourth the weight of the object moved, as felt on the incline. By hauling in the ends equally, the cask ascends, or *vica versâ*.

PAR'CÆ (from the root *pars*, a part), the name given by the Romans to the goddesses of fate or destiny, who assigned to every one his "part" or lot. The Greek name, *moiræ*, has the same meaning (from *meros*, a share). They are only once mentioned by Homer, who in every other instance—speak of Fate (Moiræ) in the singular, and whose Fate was not a deity but a mere personification, the destinies of men being made by him to depend upon the will of the gods; whilst, according to the later Greeks and the Romans, the gods themselves were subject to the control of the *parcæ* or *moiræ*. Hesiod, however, who is almost contemporary with Homer, speaks of three fates, whom he calls daughters of Night—Clotho, the spinner of the thread of life: Lachesis, who determines the lot of

life; and Atropos, the inevitable. They were usually represented as young women of serious aspect; Clotho with a spindle, Lachesis pointing with a staff to the horoscope of man on a globe, and Atropos with a pair of scales, or sun-dial, or an instrument to cut the thread of life. In the oldest representations of them, however, they appear as matrons, with staffs or scepters. They had places consecrated to them throughout all Greece, at Corinth, Sparta, Thebes, Olympia, etc.

PARCELS, in the law of England, is the technical word for the article in a conveyance describing the lands, etc., conveyed.

PAR'CENER. See COPARCENARY.

PARCHIM, a t. of the grand-duchy of Mecklenburg-Schwerin, stands on the Elde, which is here divided into two arms, 23 m. s.e. of Schwerin. It is very old, is irregularly built, surrounded by beautiful gardens, and has a gymnasium and two churches. Pop. '80, 9,063. employed in agriculture, in the manufacture of tobacco, cloth, leather, and brandy, and in weaving.

PARCHMENT, one of the oldest inventions of writing materials, was known at least as early as 500 years B.C. Herodotus speaks of books written upon skins in his time. Pliny, without good grounds, places the invention as late as 196 B.C., stating that it was made at Pergamum (hence the name *Pergamena*, corrupted into Eng. parchment) in the reign of Eumenius II. in consequence of Ptolemy of Egypt having prohibited the exportation of papyrus. Possibly the Pergamian invention was an improvement in the preparation of skins, which had certainly been used centuries before. The manufacture rose to great importance in Rome about a century B.C., and soon became the chief material for writing on; and its use spread all over Europe, and retained its pre-eminence until the invention of paper from rags, which from its great durability proved a fortunate circumstance for literature.

There are several kinds of parchment, prepared from the skins of different animals, according to their intended uses. The ordinary writing parchment is made from those of the sheep and of the she-goat; the finer kind, known as *vellum*, is made from those of very young calves, kids, and lambs; the thick common kinds, for drums, tamborines, battledores, etc., from those of old he-goats and she-goats, and in northern Europe from wolves; and a peculiar kind is made from asses' skins, the surface of which is enameled. It is used for tablets, as black-lead writing can be readily removed from it by moisture. The method of making parchment is at first the same as in dressing skins for leather. The skins are limed in the lime-pit until the hair is easily removed. They are then stretched tightly and equally, and the flesh side is dressed as in currying, until a perfectly smooth surface is obtained. It is next *ground* by rubbing over it a flat piece of pumice-stone, previously dressing the flesh side only with powdered chalk, and slaked lime sprinkled over it. It is next allowed to dry, still tightly stretched on the frame. The drying process is an important one and must be rather slowly carried on, for which purpose it must be in the shade. Sometimes these operations have to be repeated several times, in order to insure an excellent quality, and much depends upon the skill with which the pumice-stone is used, and also upon the fineness of the pumice itself. When quite dried the lime and chalk are removed by rubbing with a soft lambskin with the wool on.

PARCHMENT, VEGETABLE. This remarkable substance was made known by Mr. W. E. Gaine in 1854, and again by the rev. J. Barlow in 1857. It resembles animal parchment so closely that it is not easy to distinguish the difference. It is made from the water-leaf, or unsized paper, by immersing it only for a few seconds in a bath of oil of vitriol, diluted with one-half its volume of water. The exactness of this dilution is of the greatest importance to the success of the results. The dilute acid must not be used immediately after mixing, but must be suffered to cool to the ordinary temperature; without attention to these apparently trifling points, the operator will not succeed.

The alteration which takes place in the paper is of a very remarkable kind. No chemical change is effected, nor is the weight increased; but it appears that a molecular change takes place, and the material is placed in a transition state between the cellulose of woody fiber and dextrine. Vegetable parchment is in some respects preferable to the old kind, for insects attack it less, and it can be made so thin as to be used for tracing-paper, and bears wet without injury. Messrs. de la Rue have the credit of giving practical effect to the invention.

PARDESSUS, JEAN MARIE, 1772-1853; b. France; educated to the law, and early distinguished by his facility of expression. He was made associate judge in his native city at 30, and a few years later a member of the French legislative assembly. His *Traité des Servitudes*, published in 1806, established his reputation as a student of equity in law, and a writer of clearness of diction. It quickly reached 8 editions. In 1809 he published *Traité du Contrat et des Lettres de Change*, subsequently published under the title of *Cours de Droit Commercial*, which was considered the masterpiece of its time. A professorship of commercial law was created for him in the law department of the college of France, where his lectures were notable for their brilliancy and the simplicity with which he urged equity as the end of law. Thoroughly royalist in his sympathies,

and yet thoroughly progressive, he occupied a peculiar position in the chamber of deputies under Louis XVIII., being "a republican among royalists and a royalist among republicans." His fame rests on his works upon the history and practice of law.

PARDOE, JULIA, 1808-62; b. Yorkshire, England; daughter of maj. Thomas Pardoe of the Royal Wagon train, wrote verses at 13 years of age, a romance at 15, visited Portugal, and in 1833 published *Traits and Traditions of Portugal*, 2 vols.; went to Constantinople in 1835; and in 1836 published *The City of the Sultan*, 3 vols. In 1839 she brought out *The Romance of the Harem*, 3 vols. She traveled in Hungary, and in 1840 *The City of the Magyar* appeared; in 1855 *Reginald Lyle*, and *The Jealous Wife*. She was the author of several meritorious historical works; among them *Episodes of French History during the Consulate and the Empire*, 2 vols, 1859; the same year she received a civil list pension of £100 from the British crown.

PARDON, in law, an act of grace emanating from that power in the state intrusted with the execution of the laws, and exempting the individual on whom it is bestowed from the punishment to which he has been legally sentenced after conviction of crime, or to which he is by law liable for an offense on which he has not been tried and convicted. This is substantially the definition given by Marshall (7 Pet. 160); and it is to be observed that the act is one of clemency not of justice, that it presupposes guilt, and that conviction need not precede the granting of the pardon. But though theoretically the pardon is an act of grace only, practically, in its more judicious use, it is a means of repairing wrong or hardship committed under, and irremediable, by the ordinary legal procedure. The pardoning power is an executive one, belongs primarily to the people, and is usually intrusted to the executive head of the state by constitutional provision. In England the pardon may be granted either by the crown through the home secretary or by act of parliament. The U. S. constitution gives to the president power "to grant reprieves and pardons for offenses against the United States, except in case of impeachment," (art. II., sec. 2). This power is held to extend to the remission of fines and penalties, and cannot be interfered with by legislation of congress. The same rule as to legislation applies in those states where the pardoning power has been conferred absolutely on the governor by state constitution; no limitation is possible except by amendment. In many of the states, however, the constitution provides that the power shall be exercised by the governor and legislature jointly, or by a board of pardons either alone or in conjunction with the executive. The pardon must be accepted or else is of no effect. The bestowal of the pardon carries with it the removal of such disabilities as incapacity to hold office or to vote, but does not restore the recipient to an office forfeited, or invalidate vested rights acquired by a third party in consequence of his conviction. Where property was confiscated by the United States in the war of the rebellion, as having been used for insurrectionary purposes, and the owner subsequently received the president's pardon, it was held that the owner was thereby exempted from the forfeiture in so far as the rights accruing to the government were concerned. The exercise of the pardoning power is purely discretionary, and, though principles may be laid down as to its proper use, the executive cannot be held responsible for its abuse. The pardon may be absolute, or may be coupled with a condition precedent, as the taking of an oath of allegiance. In the latter case proof of performance of the prescribed condition must be presented by the claimant. A general pardon includes all offenders of the same class, and may be implied, as where a penal statute is repealed. Where the pardon is general it is not necessary to set it forth in the pleadings in a subsequent action, but if it be special, *profert* must be made, and the grant produced in court and properly verified. For a discussion of the subject see the works on criminal law of Russell, Wharton, Chitty, and Starkie.

PARDUBITZ, a t. of Austria, in Bohemia, 61 m. e. of Prague. It has copper, iron, and paper manufactures. Pardubitz was the headquarters of the king of Prussia, June 7, 1866. Pop. '80, 10,010.

PARE, AMBROISE, a renowned French surgeon, and the father of modern surgery, was b. about the beginning of the 16th c., at Laval, department of Mayenne, France. His father, who was a trunk-maker, was unable to afford him a literary education, and apprenticed him to a barber and surgeon. Paré, after a brief term of service, acquired such a fondness for surgery and anatomy, that, abandoning his master, he went to Paris to prosecute his studies. His means for doing so were very limited; he could afford to obtain instruction from only the more obscure teachers; few books were within his reach, yet by dint of perseverance and the exercise of a rare discrimination, combined with the valuable practice in the Hôtel de Dieu of Paris, he laid a solid foundation for future eminence. In 1536 Paré was received as a master barber-surgeon, and joined in this capacity the army of Marshal René de Monte-Jean, which was on the point of starting for Italy. During this campaign he improved the mode of treatment of gunshot wounds, which had up to this time been of this most barbarous kind—namely, cauterization with boiling oil. His reputation as well as his skill were greatly heightened during this campaign, and as he himself says: "If four persons were seriously wounded I had always to attend three of them; and if it were a case of broken arm or leg, fractured skull, or fracture with dislocation, I was invariably summoned." In 1539 he returned to Paris, whither his high renown had preceded him, and was received with

distinction by the royal college of chirurgery, of which he was subsequently appointed president. On the war being renewed, he was again attached to the army, under the vicomte de Rohan, afterwards under Antoine de Bourbon, duke of Vendôme. It was during this campaign that he cured Francois, the second duke of Guise, of the wound which conferred upon him the sobriquet of *Balafre*, and that he substituted ligature of the arteries for cauterization with a red-hot iron after amputation. The idea of this mode of repressing hemorrhage had long been in existence, but he was the first to show that it could safely be applied to practice. Many other important improvements in surgery were introduced by him at this time. In Sept., 1552, he was appointed surgeon to king Henry II., and in the following year was taken prisoner at Hesden; he was, however, released, in consideration of his having cured col. de Vaudeville, after rejecting the brilliant offers made him by the duke of Savoy to remain in his service. Returning to Paris, honors were showered upon him; and though he was ignorant of Latin, the *conditio sine qua non* of a liberal education at that time, no hesitation was shown in conferring upon him learned titles and degrees. He attended Francis II. on his death-bed, and continued to hold the office of king's surgeon to his successors, Charles IX. and Henry III. The former of these monarchs, whose life had been gravely threatened by an injury inflicted by his physician Portail, and who had been preserved by Paré, testified for him the greatest esteem, and saved him during the massacre of St. Bartholomew by locking him up in his own chamber. During the latter part of Paré's life he was much employed in the publication of his various writings, and suffered considerable annoyance from the envious spirit displayed towards him by his professional brethren, who showered obloquy upon him for having, as they said, "dishonored science by writing in the vulgar tongue." Paré died at Paris, Dec. 22, 1590. His writings have exercised a great influence on the practice of surgery in all countries to which they have penetrated, and are held of the highest authority on the subject of gun-shot wounds. The first complete edition of them appeared at Lyons in 1562, and the last, edited by M. Malgaigne, at Paris (1840-41, 3 vols.). Besides these are 8 Latin editions, and more than 15 translations into English, Dutch, German, etc. As an instance of his great popularity in the army, it may be mentioned that the soldiers of the garrison of Metz, of their own accord, gave him a triumphal reception on his entering that town.

PAREGOR'IC, or PAREGORIC ELIXIR (from the Gr. *parēgoricos*, soothing), the compound tincture of camphor of the London, and the camphorated tincture of opium of the British pharmacopœia, consists of an alcoholic solution of opium, benzoic acid, camphor, and oil of anise, every fluid ounce containing two grains each of opium and benzoic acid, and a grain and a half of camphor. This preparation is much used both by the profession and the public. In doses of from one to three drams, it is an excellent remedy for the chronic winter-cough of old people, the opium diminishing the bronchial secretion and the sensibility of the pulmonary mucous membrane, while the benzoic acid and oil of anise act as stimulating expectorants. It has also been found useful in chronic rheumatism.

PAREI'RABRA'VA. See CISSAMPELOS.

PAREIRA BRAVA (*ante*), the root of the *chondodendron tomentosum*. It has for a century been supposed that the root known as *pareira brava* was that of *cissampelos pareira*, but its true origin was established by Hanbury in 1873. *Chondodendron tomentosum* is a tall, woody, climbing plant, a native of Brazil and Peru, belonging to the order *menispermaceæ*. It has large ovate-cordate, fine-nerved leaves, very small unisexual flowers, and purplish-black, ovoid one-seeded drupaceous fruits, resembling grapes. As it comes to market the root is in pieces from three to six inches long, or more, and from one to three inches in diameter, of a dark-brown color externally with transverse ridges and fissures, and irregular longitudinal furrows. When cut it presents a palish brown color and a waxy luster, and when broken, a fibrous fracture. It is nearly inodorous and has a bitter taste. The stem is sometimes found mixed with the root, which it much resembles, but may be distinguished by the pith. Several roots of menispermous plants have been sold for *pareira brava*, and recently a *yellow pareira brava* has been imported from Brazil. It comes in the form of flat, twisted stems which have been thought to be obtained from *abuta amura*. It may be detected by the eccentric arrangement of its woody zones, which in the genuine are symmetrically concentric. *Pareira brava* contains a yellow, bitter principle, which has been called *cissampelina* (after the plant for which it has been mistaken), soluble in alcohol and ether; a soft resin soluble in alcohol; and a brown extract soluble in alcohol and water. It appears to have therapeutic properties similar to those of *uva ursi*. It has been used with benefit in chronic pyelitis and cystitis in the form of an infusion, decoction, or fluid-extract. The solid extract is said to be less active.

PAREJA, JUAN DE, 1610-70; b. West Indies; son of a Spanish father and an Indian mother. He was at first a slave of the painter Velasquez, for whom he ground colors. He passed his nights in drawing, copying the manner of his master. He had noticed that Philip IV., who was in the habit of visiting the studio of Velasquez, always directed any painting which was placed with its face to the wall to be turned. Pareja

put one of his own pictures in that position, and the king, as he expected, ordered it to be turned, and admired it. Velasquez disowned it, and Pareja confessed that it was his, and was immediately emancipated at the instance of the king. He did not, however, leave Velasquez, but remained in his house in the double capacity of a servant and a pupil. After the death of Velasquez he continued to serve his master's daughter, with whom he remained till her death. He was particularly successful in portrait painting, and his works in coloring and treatment closely resemble those of his master. His best picture is "The Calling of St. Matthew," in the Spanish royal gallery.

PAREL'LA (Fr. *parelle* or *perelle*), a name often given to some of those crustaceous lichens which are used to produce archil, cudbear, and litmus; but which more strictly belongs to one species *Lecanora parella*, resembling the cudbear lichen, but with somewhat plaited warty crust, and shields (*apothecia*) having a concave disk of the same color as the thick tumid even border. Like the cudbear lichen—to which it is far superior in the quality of the dye-stuff obtained from it—it grows on rocks in mountainous districts both in Britain and on the continent of Europe, being particularly abundant in Auvergne and other parts of France.

PAREN'CHYMA. See CELLULAR TISSUE.

PARENT AND CHILD. The legal relation between parent and child is one of the incidents or consequences of the relation of husband and wife, and flows out of the contract of marriage. The legal is to be distinguished from the natural relation, for two persons may be by the law of nature parent and child, while they are not legally or legitimately so. Hence a radical distinction exists between natural, or illegitimate, and legitimate children, and their legal rights as against their parents respectively are very different. Legitimate children are the children of two parents who are recognized as married according to the laws of the country in which they are domiciled at the time of the birth; and according to the law of England, if a child is illegitimate at the time of the birth, nothing that can happen afterwards will ever make it legitimate, the maxim being "once illegitimate always illegitimate"—a maxim which, as will be stated, has some exceptions in Scotland. In treating of the laws affecting the mutual relation of parent and child, the laws of England and Ireland, which differ from the law of Scotland in material respects, will first be stated.

1. *As to Legitimate Children.*—These laws relate first to the liability of the parent to maintain the child, and the rights of the child in the event of the parent's death. As regards the maintenance of the child, it is somewhat singular that, according to the law of England, there is no duty whatever on the parent to support the child, and consequently no mode of enforcing such maintenance. The law of nature was probably considered sufficient to supply the motives which urge a parent to support the child, but the municipal law of England has not made this duty compulsory. This defect was to some extent remedied when what is called the poor-law was created by statute in the reign of Elizabeth by which law parents and children are compellable to a certain small extent, but only when having the pecuniary means to do so, to support each other, or rather to help the parish authorities to do so. But apart from the poor-law statutes, there is no legal obligation on the parent to support the child, nor on the child to support the parent. Hence it follows, that if the child is found in a destitute state, and is taken up, fed, clothed, and saved from starvation by a stranger, such stranger cannot sue the parent for the expense, or any part of it, however necessary to the child's existence. In order to make the father liable for maintenance, there must in all cases be made out against him some contract, express or implied, by which he undertook to pay for such expense; in other words, the mere relationship between the parent and child is not of itself a ground of liability. But when the child is living in the father's house, it is always held by a jury or court that slight evidence is sufficient of, at least, an implied promise by the father to pay for such expenses. As, for example, if the child orders clothes or provisions, and the father see these in use or in process of consumption, it will be taken that he assented to and adopted the contract, and so will be bound to pay for them. So if a parent put a child to a boarding-school, very slight evidence of a contract will be held sufficient to fix him with liability. Nevertheless, in strictness of law, it is as necessary to prove a contract or agreement on the part of the parent to pay for these expenses as it is to fix him with liability in respect of any other matter. When it is said that a parent is not compellable by the common law to maintain his child, it must, at the same time, be observed that if a child is put under the care and dominion of an adult person, and the latter willfully neglect or refuse to feed or maintain such child, whereby the child dies or is injured, such adult will incur the penalties of misdemeanor; but this offense does not result from the relationship of parent and child, and may arise between an adult and child in any circumstances, as where a child is an apprentice or servant. The change as to the liability of parents to maintain their children created by the poor-laws amounts merely to this, that if a person is chargeable to the parish, that is, not able to work as well as destitute, and if the overseers or guardians are bound to support him or her, then the parish authorities may reimburse themselves this outlay, or part of it, by obtaining from justices of the peace an order commanding the parent or child of such pauper to pay a certain sum per week towards the relief. This is, however, only competent when the relative is able to pay such sum, and in all cases the sum is of necessity

very small. Not only parents, but grand-parents, are liable under the poor-law act to the extent mentioned. Another provision in the poor-law and other kindred acts is, that if a parent runs away and deserts his children, leaving them destitute and a burden on the parish, the overseers are entitled to seize and sell his goods, if any, for the benefit and maintenance of such children; and if the parent, so deserting the children, is able by work or other means to support them, such parent may be committed to prison as a rogue and vagabond. Not only, therefore, is a parent during life not bound to maintain his or her child (with the above exceptions), but also after the parent's death the executors or other representatives of the parent, though in possession of funds, are not bound. It is true that if the parent die intestate, both the real and personal property will go to the children; but the parent is entitled, if he choose, to disinherit the children, and give away all his property to strangers, provided he execute his will in due form, which he may competently do on death-bed if in possession of his faculties.

Another important point of law, affecting the mutual relation of parent and child, is the right of the parent to the custody of the child. At common law it is the father who has the right to the custody of the child until majority at least, as against third parties, and no court will deprive him of such custody except on strong grounds. Whenever the child is entitled to property, the court of chancery so far controls his parental right, that if the father is shown to act with cruelty, or to be guilty of immorality, a guardian will be appointed. A court of common law also has often to decide in cases of children brought before it by *habeas corpus*, when parties have had the custody against the father's will. In such cases, if the child is under fourteen, called the age of nurture, and the father is not shown to be cruel or immoral, the court will order the child to be delivered up to him; but if the child is above fourteen, or, as some say, above sixteen, the court will allow the child to choose where to go. So the father is entitled by his will to appoint a guardian to his children while they are under age. The mother had at common law no right as against the father to the custody of the children, however young; but under a statute of 36 and 37 Vict. c. 12, she is entitled to the custody of the child while under sixteen years of age, or rather she is entitled to apply to the court of chancery for leave to keep the children while under that age, provided she is unobjectionable in point of character; and access may be allowed to the father or guardian. If the parents separate by agreement, no stipulation will be enforced which is prejudicial to the child. In case of divorce or judicial separation, the court of divorce has power to direct who is to have the custody of the children.

2. *Illegitimate Children*.—It has been already stated that, at common law, the parent of a legitimate child is not bound to maintain it, and this is equally true of an illegitimate child—i.e., a child not born in wedlock. In strictness of law an illegitimate child has no father, which means practically that in case of the death of the father without making a will, the law will not treat such child as entitled to the ordinary legal rights of a legitimate child—i. e., to a share of the father's property. The child is not legally related to the father in this sense. With regard to the mother, she also is not bound to maintain her child according to the common law; but the poor-law acts have made an important qualification of her rights and duties. As between the father and mother of the child, the law is this: The father is not bound even by the poor-laws to maintain the child, and the parish officers cannot now institute any proceeding whatever against him for this purpose; but the mother can, to a certain extent, enforce against him a contribution toward the child's maintenance and education, or the guardians may do so. It is entirely discretionary on the mother to take any proceeding against the father, but if she chooses she can do so; and the first step is to go before a justice of the peace, and obtain a summons of affiliation. The father is thus cited before the magistrate, and if the mother swears that he is the father of the child, and is corroborated in some material part of this statement by a third party, the magistrate may make an order against the father to pay the expenses of lying-in, and a weekly sum not exceeding five shillings till the child attains the age of sixteen. The mother may make this application either a few months before the birth, or within twelve months after the birth; and even after that time, provided she can prove that the putative father paid her some money on account of the child within such twelve months. The putative father, in these cases, is a competent and compellable witness. The utmost, therefore, that the father can be made to contribute toward the child's maintenance is only a portion of the whole, the chief burden being thrown on the mother, who is assumed to be the more blamable party. Though she is not bound by the common law to maintain her child, yet the poor-laws make her liable to maintain the child till it attains sixteen; and not only is she bound, but any man who marries her is also by statute bound to support all her illegitimate (and also legitimate) children till they attain sixteen. The result is, that illegitimate children under sixteen are better provided for by the present state of the law than legitimate children, inasmuch as the mother is positively bound to support her illegitimate child, and only to a less extent her legitimate child. As regards the custody of illegitimate children, the mother is the party exclusively entitled, for the father is not deemed, in point of law, to be related to such child. Yet if the father has, in point of fact, obtained the custody of such child, and the child is taken away by fraud, the courts will restore the child to his custody, so as to put him in the same position as before. Though illegitimate children will not succeed to the father's property in the event of his dying with-

out a will, there is nothing to prevent him making his will in their favor, provided he expressly name and identify them, and not leave it to them by the description of "his children," which in point of law they are not.

Scotland.—The law of parent and child in Scotland differs materially from the law of England and Ireland. In Scotland a child may be born a bastard, and yet if the parents afterward marry this will legitimize the child, and give the child the right to succeed to the father's property. A difficulty sometimes arises where, before the father and mother of a bastard marry, the father has had a legitimate family by another woman, in which case it is held that the bastard, though oldest in point of age, does not take precedence of the legitimate children. The law of Scotland also differs from that of England as regards the obligation of parent and child to maintain each other. There is a legal obligation on both parties to maintain each other if able to do so, and either may sue the other for aliment at common law; but this obligation extends only to what may be called subsistence money, and does not vary according to the rank of the party. Thus an earl is bound to pay no more for the aliment of his son than any other father. As regards all maintenance beyond mere subsistence, the law does not materially differ from that of England, and a contract must be proved against the father before he can be held liable to pay. The legal liability as between parent and child is qualified in this way by the common law, that if a person has both a father and a child living and able to support him, then the child is primarily liable, and next the grandchild, after whom comes the father, and next the grandfather. Not only are parent and child liable to support each other while the party supporting is alive, but if he die, his executors are also liable; and this liability is not limited by the age of majority, but continues during the life of the party supported. Such being the common law of Scotland, it was scarcely necessary, as in England, for the poor-law to supply any defect; but the Scotch poor-law supplements the common law, by imposing a penalty on a father or mother (though not *vice versa*) who neglects to support a child. Another advantage which a Scotch child has over an English child is, that the father cannot disinherit it—at least so far as concerns his movable property; and even in case of heritable property, the rights of the child were so protected, that unless the father made away with his heritable property sixty days before his death, or while in sound health, it was too late to prejudice his heir-at-law; this rule was, however, abolished in 1870 by 34 and 35 Vict. c. 81. This was called the law of death-bed (q.v.); but as regards the father's movable property, he cannot by any will he can make at any time of his life deprive the children of one-third, or, if their mother is dead, of one-half of such property. This is called the children's right to legitim (q.v.), a right which they can vindicate, whatever may be their age when the father dies. With regard to the custody of children in Scotland, the rule is, that the father is entitled to the custody as between him and the mother; but the court of session has power to regulate the custody in case the children are entitled to property, and the father is of an immoral or cruel character; and the court will also interfere to allow to the mother access to the children at certain times and seasons. Another important difference between a Scotch and English child is this, that whereas in England the father or guardian, or the court of chancery, has power to control the custody of the person of the child to a certain extent, until the child attains the age of 21, in Scotland such power entirely ceases when the child attains the age of 14 or 12, according as such child is male or female. At the age of 14, a boy, and at 12, a girl, in Scotland, is entire master or mistress of his or her movements, and can live where he or she pleases, regardless of any parent or court. They can marry at that age at their own uncontrolled discretion, and act in all respects with the same freedom as adults. As regards the disposition of their property there are some restrictions, but as regards the disposal of their persons there are none, after the ages of 14 and 12 respectively.

2. *Illegitimate Children.*—The law of Scotland as to illegitimate children also differs in some respects from that of England. Both the father and mother of a bastard are bound by law to support such child, and the obligation transmits to the personal representatives of the father or mother. Moreover, by the poor-law statute both are liable to a penalty for neglecting to support the child. The mother of illegitimate children is entitled to their custody till the age of ten, if daughters, and if sons, till the age of seven; but the limit is not clearly defined. If the father support the child after the above age, he is entitled to the custody. The mother does not apply to a magistrate for a summons of affiliation in order to fix the paternity; but she may bring an action of filiation and aliment, in which the question of paternity is settled. The father may be judicially examined, and is a competent witness; and it is usual for the court to decree an aliment, varying from £4 per annum against laborers, up to £10 against persons in better circumstances. In Scotland, as in England, the father of a bastard child is not deemed related, in point of law, to such child; and if he desires to provide for such child, it must be done by deed or will, in which the child is identified, and not merely described under the general designation of "child," which he is not.

PARENT AND CHILD (*ante*). In the United States it is generally held that the rights of protection and support due from a parent to a child are dependent not upon statutory provisions (though these exist in most states), but on general principles of the

common law, as well as of morality. As the protector of his child, a parent may lawfully do any act which he might do in self-defense, and hence may even take the life of an assailant. It has been said that though protection and education are the child's right, yet maintenance and support is the only obligation which can be enforced by the law; if a father fail to supply such necessaries for the support of his minor child as are suitable to its rank and condition, a third person may do so, and can recover the amount from the father, acting, however, at his own risk in determining whether the facts justify his interference. No evidence of a contract is required as in the English courts (see *ante*). The reciprocal rights of parent and child cease when the latter has attained his legal majority, but may be revived on either side. Thus if the adult child become a pauper, the parent would again be liable for its support; and, on the other hand, if the parent become a burden to the community, the adult child is responsible. The right of a parent to leave his property away from his children is undisputed at common law, but is in some cases restrained by statute; and if a child be left destitute without very strong reason, it will go far to prove the exertion of undue influence. The right to the custody of the child belongs to both parents. When the custody is disputed between the father and mother, the question may be brought before an equity court on petition, or before a court of common law by writ of *habeas corpus*. In the latter case, the child's preference is consulted if he be 14 years old or over, and if not, the court may use its discretion. In the English courts the superior right of a father to custody has been strongly upheld, and only the most flagrant conduct on his part has been thought to justify its restraint. In this country the courts are less restricted by this rule, but, *ceteris paribus*, will prefer the father to the mother (see DIVORCE). The parent has also the right to obedience and service on the part of his child, and may compel obedience by a reasonable exercise of force, as may also school-teachers or any persons standing *in loco parentis*. The father may collect his child's earnings, and may sue for damages caused by the loss of services from injuries inflicted by the defendant. This action is entirely distinct from that which may be brought in the child's name for his personal damage, pain, expenses, etc. The right of a father to sue for damages the seducer of his daughter is also based on the loss of service, but the jury are allowed to take into consideration the loss of reputation, etc., in fixing the amount of damages. See MEASURE OF DAMAGES. If the girl were a lawful apprentice, or had reached her majority, the actual relation of master and servant must exist to justify the action. Under the statutes of most states, an action may be brought by the child when the parent is killed through the negligence of a third party, a right which did not exist at common law. See NEGLIGENCE. The obligations due from a parent to an illegitimate child are those of support only. For this both the mother and the putative father are liable; and the liability may be enforced against the latter on suit either of the mother or of the local authorities in form and manner as by statute provided.

PARENTHESIS, a term originally Greek, and signifying *insertion* or *intercalation*, is in composition a clause, or part of a sentence or argument, not absolutely essential to the sense, but generally serving either for explanation or confirmation, sometimes chiefly for rhetorical effect. A parenthesis is usually included between the marks (), instead of which the *dash* (—) at the beginning and end of the parenthesis is frequently but improperly employed.

PARET, WILLIAM, D.D. See page 886.

PARGA, a t. in European Turkey, in Albania, on a rocky peninsula, on the shore of the Mediterranean, opposite the island of Paxo, and distant from it 12 miles. It is on a steep cliff, on the summit of which is a small but almost impregnable citadel, and from which is a fine view of the adjacent country. It has a harbor defended by a small island, and carries on a thriving export trade in oil, wine, fruit, and tobacco. Parga was founded in the last days of the Roman empire, and has had importance in history since the beginning of the 15th century. It was independent, and under the protection of Venice from this period until the overthrow of the Venetian power by Napoleon in 1797, when it was for a short time governed by the French. In 1814 Ali Pasha, governor of Albania, besieged it, and the French refusing to defend it, the people applied to the English for aid, who took possession of the fortress. In 1819 Parga was given up to Turkey by the treaty of 1817, under the condition that those who chose to emigrate should have an asylum in the Ionian islands, and that their immovable property should be valued and paid for by the porte before embarkation. The payment was delayed for two years through the intrigues of the Turkish commissioner and Ali Pasha, but in 1819 the whole population of Parga having received the money, amounting to £150,000, embarked in English vessels and settled at Paxo and Corfu, having previously dug up and burned the bones of their ancestors.

PARHELIA. See HALOS, *ante*.

PA'RIAHS is the name given to the lowest class of the population of India—to that class which, not belonging to any of the castes of the Brahmanical system, is shunned even by the lowest Hindu professing the Brahmanical religion, as touching a Pariah would render him impure. The Pariahs seem to belong to a negro race, as it appears from their

short woolly hair, flat nose, and thick lips; they are, besides, of short stature, and their propensities are of the coarsest kind. Despised by the Hindus, and ill used by the conquerors of India, they have, in some parts of India, gradually sunk so low that, to judge from the description which is given of their mode of living by different writers, it is scarcely possible to imagine a more degraded position than that which is occupied by these miserable beings.

PARIMA SIERRA, an irregular cluster of mountains sometimes called the Highlands of Guiana, in the n.e. of Venezuela, lat. 4° to 6° 30' n., long. 64° to 67° w., and connected on the s.e. with the Sierra Pacaraima, thus forming a part of the great mountain system of South America, which consists of lofty ranges, generally bleak and barren, and of elevated plateau-like valleys, which afford pasturage, or are covered with forests; the valleys being about 2,000 ft. above the level of the sea, and sometimes 60 m. wide. These mountains in no part border on the sea, being separated by wide belts of lowland. Maravaca, 10,000 ft. high, and Duida, about 8,000 ft. high, are the highest points. The Essequibo, the Rio Branco, a branch of the Rio Negro, and the Orinoco rise among these mountains.

PARING AND BURNING consists in cutting off the surface of the soil in thin slices, which are then dried and burned. This is the most effectual way of reclaiming peat and other waste land, the surface of which is matted with coarse plants, difficult of decay. It is also applied advantageously to cold clay soils, apt to produce rank weeds and coarse grasses, which are to be broken up after lying for some time in grass. The ashes of the plants, consisting of potash and other salts, act as a powerful manure; while the clay, being reduced to the state of brick-dust, both improves the texture of the soil and acts as an absorbent for retaining moisture and nutritive gases, and giving them out to the roots of growing plants. On thin light soils the operation is rarely advisable, for much of the scanty volatile vegetable matter is dissipated; however, if care is taken to make the turfs merely smolder without flame, so that the plants are rather charred than burned, it is doubtful whether more dissipation takes place than if the plants were plowed down and allowed slowly to decay. The plot to be reclaimed should, if necessary, be dried by stone or tile drains: and all large stones grubbed up and carted or conveyed off upon sledges. The paring is to be done, if possible, in the months of April and May, in order to have the most favorable part of the year for drying the parings well before burning. There are plows specially made for paring, with a very flat share; but the best method is to employ the *breast-plow* or *paring spade*, as the surface is in most cases very irregular, and it is desirable to have the slices very thin. The parings should be burned directly they are sufficiently dry, as, after lying a month or six weeks, they begin to unite with the ground, and imbibe moisture from the young grass vegetating beneath them. Sometimes they can be burned as they lie, without being collected into heaps; and in this way the fire, in consuming the liny side, which is undermost, chars the surface of the soil at the same time. If burned in heaps the heaps should be very small, in order to secure a good black ash, instead of the hard lumps of red ash produced by large fires. The weeds or refuse organic matters are thus only charred, instead of being entirely burned away; whilst the mineral matters are left in a soluble state instead of being reduced, as is too apt to be the case where the operation is carelessly conducted, into an insoluble semi-vitrified slag. To attain these desirable results a smoldering fire must be maintained, by keeping the outside layer of sods so close as to prevent the fire from kindling into flame. The ashes should be spread, care being taken to clear the bottoms of the heaps well out, so that the first crop may be free from patches. The cost of thus paring, burning, and spreading is about £1 per acre.

PARINI, GIUSEPPE, 1729-99; b. in Bosisio, near Milan. He was of humble parentage, but cultivating his poetical faculty he soon became celebrated. In 1752 he published a volume of anacreontic poems, showing remarkable lyric talent. In 1763 he published the first part of his *Giorno*, a dramatic and didactic satire, which raised him to a high rank as a moral poet. By his success he obtained several important offices at Milan, occupied the chair of belles-lettres in the palatine schools, and that of eloquence in the college of Brera. He was appointed magistrate by Bonaparte. His works were published in 6 volumes in 1801-4.

PA'RIS, a genus of plants of the small endogenous or dietyogenous natural order *trilliaceæ*, of which one species, *P. quadrifolia*, called **HERB PARIS**, is not uncommon in moist shady woods in some parts of Britain. It is rarely more than a foot high, with one whorl of generally four leaves, and a solitary flower on the top of the stem, followed by a berry. The berry is reputed narcotic and poisonous, but its juice has been employed to cure inflammation of the eyes. The root has been used as an emetic.

PARIS, also called **ALEXANDER**, was, according to Homer, the second son of Priam and Hecabe, sovereigns of Troy. His mother dreamed during her pregnancy that she gave birth to a fire-brand, which set the whole city on fire, a dream interpreted by Æsacus or Cassandra to signify that Paris should originate a war which should end in the destruction of his native city. To prevent its realization Priam caused the infant to be exposed upon mount Ida by a shepherd named Agelaus, who found him, five days after, alive and well, a she-bear having given him suck. Agelaus brought him up as his own son, and he became a shepherd on mount Ida, distinguishing himself by his valor in protecting the other shepherds from their enemies—whence his name, Alexander, “the defender of men.” An accident having revealed his parentage, old Priam became reconciled to his son, who married Cēnone, daughter of the river-god Cebren. But his mother’s dream was to come true for all that. He was appealed to, as umpire, in a strife which had arisen among the three goddesses, Hera (Juno), Athene (Minerva), and Aphrodite (Venus), as to which of them was the most beautiful, the goddess Eris (strife) having revengefully flung among them, at a feast to which she had not been invited, a golden apple (of discord) inscribed *To the Most Beautiful*. Each of the three endeavored to bribe him. Hera promised him dominion over Asia and wealth; Athene, military renown and wisdom; Aphrodite, the fairest of women for his wife—to wit, Helen, the wife of the Lacedæmonian king, Menelaus. Paris decided in favor of Aphrodite, hence the animosity which the other two goddesses displayed against the Trojans in the war that followed. Paris now proceeded to seek Helen, whom he carried away from Lacedæmon in her husband’s absence. “The rape of Helen” is the legendary cause of the Trojan war, on account of which Paris incurred the hatred of his countrymen. He deceitfully slew Achilles in the temple of Apollo. He was himself wounded by a poisoned arrow, and went to mount Ida to be cured by Cēnone, who possessed great powers of healing; but she avenged herself for his unfaithfulness to her by refusing to assist him, and he returned to Troy and died. He was often represented in ancient works of art, generally as a beardless youth, of somewhat effeminate beauty.

PARIS, the seat of justice of Edgar co., Illinois; the southern terminus of the Paris and Danville railroad, and the junction of the Illinois Midland with the Indianapolis and St. Louis railroad; pop. '80, 4,373. It contains a number of churches, a normal academy, national banks, and a court-house. It has a good trade and some manufacturing interests.

PARIS, seat of justice in Bourbon co., Ky., on Stoner creek, a branch of Licking river, on the Kentucky Central railroad, at the junction of Maysville and Paris railroad; 19 m. n.c. of Lexington; pop. '80, 3,204. It contains a court-house, a military institute, two colleges for girls, banks, flour-mills, and a rope factory. It is one of the chief cattle markets in the state, and the principal place for the manufacture of Bourbon whisky. The town is lighted with gas.

PARIS (the ancient *Lutetia Parisiorum*), the metropolis of France, is situated in 48° 50' n. lat., and 2° 20' e. long., on the Seine, about 110 m. from its mouth. The population of the city was, in 1869, 1,875,000; in 1872, 1,799,250; and at the end of 1884, 2,239,928. Its circumference is upwards of 25 miles. It lies in a hollow, about 200 ft. above the level of the sea, and is surrounded by low hills, which in their highest ranges to the n. only attain an elevation of 290 or 300 ft., as at Montmartre and Belleville. These hills, which are separated by narrow valleys or plateaus, as those of St. Denis to the n., Ivry to the e., Montrouge to the s., and Grenelle to the s.w., are encircled at a distance of from two to five miles by an outer range of heights, including Villejuif, Meudon, St. Cloud, and Mont-Valérien, the highest point in the immediate vicinity of the city. The Seine, which enters Paris in the s.e. at Bercy, and leaves it at Passy in the w., divides the city into two parts, and forms the two islands of La Cité and St. Louis, which are both covered with buildings.

The earliest notice of Paris occurs in Julius Cæsar’s *Commentaries*, in which it is described under the name of Lutetia, as a collection of mud huts, composing the chief settlement of the Parisii, a Gallic tribe conquered by the Romans. The ruins of the Palatium Thermarum (Palais des Thermes), and of ancient altars, aqueducts, and other buildings, show that even in Roman times the town extended to both banks of the Seine. Lutetia began in the 4th c. to be known as Parisia, or Paris, from the Celtic tribe of the Parisii, to whom it belonged. In the 6th c. Paris was chosen by Clovis as the seat of government; and after having fallen into decay under the Carlovingian kings, in whose time it suffered severely from frequent invasions of the Northmen, it finally became in the 10th c. the residence of Hugh Capet, the founder of the Capetian dynasty, and the capital of the Frankish monarchy. From this period Paris continued rapidly to increase, and in two centuries it had doubled in size and population. In the middle ages Paris was divided into three distinct parts—La Cité, on the islands; the Ville, on the right bank; and the quartier Latin, or university, on the left bank of the river. Louis XI. did much to enlarge Paris, and to efface the disastrous results of its hostile occupation by the English during the wars under Henry V. and Henry VI. of England; but its progress was again checked during the wars of the last of the Valois, when the city had to sustain several sieges. On the accession of Henri IV. of Navarre in 1589, a new era was opened to Paris. The improvements commenced under his reign were continued under

the minority of his son, Louis XIII. Louis XIV. converted the old ramparts into public walks or *boulevards*, organized a regular system of police, established drainage and sewerage works, founded hospitals, almshouses, public schools, scientific societies, and a library, and thus gave to Paris a claim to be regarded as the focus of European civilization. The terrible days of the revolution caused a temporary reaction. The improvement of Paris was recommenced on a new and grander scale under the first Napoleon, when new quays, bridges, markets, streets, squares, and public gardens were created. All the treasures of art and science which conquest placed in his power were applied to the embellishment of Paris, in the restoration of which he spent more than £4,000,000 sterling in twelve years. His downfall again arrested progress, and in many respects Paris fell behind other European cities.

Renovation of various sorts was recommenced under Louis-Philippe; but as lately as 1834, much of the old style of things remained; the gutters ran down the middle of the streets, there was little underground drainage from the houses, oil lamps were suspended on cords over the middle of the thoroughfares, and, except in one or two streets, there were no side-pavements. It was reserved for Napoleon III. to render Paris the most commodious, splendid, and beautiful of modern cities. When he commenced his improvements, Paris still consisted, in the main, of a labyrinth of narrow, dark, and ill-ventilated streets. He resolved to pierce broad and straight thoroughfares through the midst of these, to preserve and connect all the finest existing squares and boulevards; and in lieu of the old houses pulled down in the heart of the town, to construct, in a ring outside of it, a new city in the most approved style of modern architecture. With the assistance of baron Haussman, the prefect of the Seine, his schemes were carried out with rare energy and good taste. Two straight and wide thoroughfares, parallel to and near each other, crossed the whole width of Paris from n. to s. through the Cité; a still greater thoroughfare was made to run the whole length of the town, n. of the Seine, from e. to west. The old boulevards were completed so as to form outer and inner circles of spacious streets—the former chiefly lying along the outskirts of the old city, the latter passing through and connecting a long line of distant suburbs. In the year 1867, when the international exhibition was opened, Paris had become in all respects the most splendid city in Europe; and in that year it was visited by upwards of a million and a half of foreigners. Many further improvements were then contemplated. New botanical and zoological gardens were to be formed; the museums and class-rooms of the Jardin des Plantes were to be rebuilt; an underground railway was to be formed, crossing Paris from e. to w.; Montmartre was to be leveled, and the Seine was to be deepened up to Grenelle, the point where it leaves the town; and there a harbor was to be formed for sea-going ships, which was to convert Paris into a *port de mer*. Financial and political difficulties were, however, at hand (see FRANCE), and these great schemes had to be postponed. The siege of Paris by the Germans, which lasted from Sept. 19, 1870, to Jan. 28, 1871, caused much less injury to the city than might have been expected—it was reserved for a section of the Parisian population to commit an act of vandalism without a parallel in modern times. On Mar. 18, the red republicans, who had risen against the government, took possession of Paris. On Mar. 27, the commune was declared the only lawful government. Acts of pillage and wanton destruction followed. On May 15, the column erected to the memory of Napoleon and the great army, in the place Vendôme, one of the principal squares of Paris, was solemnly pulled down as “a monument of tyranny.” The government troops under marshal MacMahon attacked the insurgents, and kept them from doing further mischief. The former succeeded in entering Paris on May 20, and next day the communists began systematically to set fire with petroleum to a great number of the chief buildings of Paris, public and private. The fire for a time threatened to destroy the whole city. It raged with the greatest fury on the 24th, and was not checked until property had been lost to the value of many millions sterling, and historical monuments were destroyed which never can be replaced. The horror inspired by the commune for a time drove the wealthy classes from Paris, and it was feared that it would lose its prestige as a European capital. This, however, has not proved to be the case. In the autumn of 1873, all the private houses burnt had been rebuilt—the monuments only partially injured had been restored, and the streets and public places were as splendid and gay as in the best days of the empire. There remained, however, to recall the commune, the blackened ruins of the Tuileries, the hôtel de Ville, and two or three other buildings to which we are about to refer.

The Seine, in passing through Paris, is spanned by 28 bridges. The most celebrated and ancient are the pont Notre-Dame, erected in 1500, and the pont Neuf, begun in 1578, completed by Henri IV. in 1604, and thoroughly renovated in 1852. This bridge, which crosses the Seine at the n. of the Ile-de-la-Cité, is built on 12 arches, and abuts near the middle on a small peninsula, jutting out into the river, and planted with trees, which form a background to the statue of Henri IV. on horseback, which stands in the central open space on the bridge. Among the other bridges, the handsomest are the Pont de la Concorde, 160 yards long, built in 1787–90; the pont du Carrousel, pont d'Austerlitz, and the pont d'Jéna, both of the time of the first empire; and the pont des Invalides, pont de l'Alma, and pont de Solférino—all handsome structures, adorned with military and naval trophies, commemorative of events and victories connected with the second empire. These bridges all communicate directly with the spacious quays, planted with

trees, which line both banks of the Seine, and which, together with the boulevards, give special characteristic beauty to the city. Although the most ancient quays—as those des Augustins and de la Mégisserie—date from the 14th c., the greater part of these magnificent embankments, measuring 12 m. in extent, is due to the first Napoleon and the late emperor.

Before speaking in detail of the streets, boulevards, and places or squares of Paris, it is proper to mention that the private houses as well as the public buildings are built of a light-colored kind of limestone, easily wrought and carved ornamentally. With this material they are reared in huge blocks, rising to a height of six or seven stories, each floor constituting a distinct dwelling; access to all the floors in a tenement being gained by a common stair, which is usually placed under the charge of a porter at the entrance. Very frequently the tenements surround an open quadrangle, to which there is a spacious entry, the gate of which is kept by a porter for the whole inhabitants of the several stairs. In these respects, therefore, Paris differs entirely from London; for instead of extending rows of small brick buildings of a temporary kind over vast spaces, the plan consists of piling durable houses on the top of each other, and confining the population to a comparatively limited area. In the great new streets which were formed in the time of the late emperor, this general plan has been adhered to, but with this difference, that instead of being narrow and crooked, they are wide and straight. Among the finest of them are the rue de Rivoli, 2 m. in length, the rue de la Paix, the rue du Faubourg St. Honoré, and the rue Royale. The boulevards, which extend in a semicircular line on the right side of the Seine, between the nucleus of the city and its surrounding quarters, present the most striking feature of Paris life. In all the better parts of the city they are lined with trees, seats, and little towers called *Vespasiennes*, covered with advertisements. Restaurants, cafés, shops, and various places of amusement succeed one another for miles, their character varying from the height of luxury and elegance in the western boulevard des Italiens, to the homely simplicity of the eastern boulevards Beaumarchais and St. Denis. Among the public squares or *places*, the most noteworthy is the place de la Concorde, which connects the gardens of the Tuileries with the Champs Elysées, and embraces a magnificent view of some of the finest buildings and gardens of Paris. In the center is the famous obelisk of Luxor, covered over its entire height of 73 ft. with hieroglyphics. It was brought from Egypt to France, and in 1836 placed where it now stands. On the site of this obelisk stood the revolutionary guillotine, at which perished Louis XVI., Marie Antoinette, Philippe Egalité, Danton, Robespierre, and a host of other victims. Of the other squares, the following are some of the most handsome: The place du Carrousel, between the Tuileries and Louvre; the place Vendôme, already referred to, with Napoleon's column of victory; the place de la Bastille, where once stood that famous prison and fortress; the place Royale, with its two fountains and a statue of Louis XIII.; the place de l'Hôtel de Ville, formerly place de la Grève, for many ages the scene of public executions, and the spot at which some of the bloodiest deeds of the revolution were perpetrated. The porte St. Martin and porte St. Denis, which were erected by Louis XIV. to commemorate his victories in the Low Countries, and are adorned with bas-reliefs representing events of these campaigns, mark the ancient limits of the most turbulent quarters of the Paris of the past; while the Arc de l'Etoile, begun by Napoleon in 1806, and completed in 1836 at a cost of more than £400,000, may be said to form the extreme western boundary of the aristocratic quarters. This arch, which bounds the Champs Elysées, has a total height of 152 ft., and a breadth of 137. It is profusely adorned with bas-reliefs and alto-reliefs, representing victories of Napoleon, which were injured during the bombardment of Paris, but which have since undergone a complete restoration. The great streets which radiate from the Arc de Triomphe were among the most magnificent of those constructed during the recent improvements, and they still form the finest quarter of Paris. A great avenue runs e. from it to the palace of the Tuileries, in the heart of the city.

The palace of the Tuileries (q.v.) was begun in 1566 by Catherine de' Medici, and enlarged by successive monarchs, while used as a royal residence, until it formed a structure nearly a quarter of a mile in length, running at right angles to the Seine. To the e. of the Tuileries, at a distance of more than a quarter of a mile, was erected the palace of the Louvre, forming a square of 576 ft. by 538 ft., remarkable, especially the eastern façade, for its architectural beauty. The Louvre long since ceased to be a royal residence, and has been converted into a public museum of antiquities. It was connected with the Tuileries by a great picture gallery overlooking the Seine, and 1456 ft. in length. N. of the picture gallery, and between the two palaces, lay the place du Carrousel, into the northern side of which, at the accession of Napoleon III., there intruded a mass of poor and narrow streets. One of the emperor's earliest improvements was to remove these buildings, and connect the Tuileries and Louvre on the northern side, throwing them into one vast building, forming the most magnificent palatial structure in the world. The Tuileries continued to be occupied as the residence of the imperial family; but the Louvre proper formed a series of great galleries filled with pictures, sculptures, and collections of Egyptian, Greek, and Roman antiquities. The communists attempted to burn the whole pile, but fortunately only succeeded in destroying the Tuileries (now being restored) and the north-western corner of the Louvre. The library of the Louvre, with its contents, was burned, but the rest of the building and its priceless treasures were

saved. A large sum was voted by the government for the restoration of the Louvre, and this work was at once undertaken and carried forward with the utmost dispatch. N. of the injured part of the Louvre is the palais Royale (q.v.), the most valuable part of which, fronting the rue St. Honoré, was set fire to by order of the commune in 1871. The palace of the Luxembourg, on the s. side of the Seine, was built by Marie de' Medici in the Florentine style. It contains many magnificent rooms, some of which have been employed as picture galleries for the works of modern artists. The Luxembourg was formerly the house of the peers, but since 1871 it has been used as the hôtel de Ville. On the n. bank of the Seine, opposite the island of the Cité, is the site of the hôtel de Ville, which, before its destruction by the commune, was one of the most magnificent buildings in Paris. It was the residence of the prefect of the Seine, who held a sort of court there, and included all the offices for the transaction of the municipal business of Paris. It was commenced under Francis I., but had been trebled in extent by recent additions. The statues and rich ornaments with which it was decorated have been almost entirely destroyed, but the building has been again carefully rebuilt in the style of its predecessor. Not far from the hôtel de Ville, on the northern bank of the Cité, stands the palais de Justice, a vast building, also set fire to by the commune; some parts of it date from the 14th c., and others are modern. It is the seat of some of the courts of law, as the court of cassation, the imperial court, the tribunals of the first appeal and of police. The old palace was not much injured by the fire; but the new portion which was constructed during the reign of Napoleon III., and much admired for its architecture, was left in ruins. Within the precincts of this palace are the Sainte Chapelle, and the noted old prison of the Conciergerie, in which Marie Antoinette, Danton, and Robespierre were successively confined.

The Conciergerie, just mentioned, in which prisoners are lodged pending their trial, constitutes one of the eight prisons of Paris, of which the principal is La Force. The Nouveau Bicêtre is designed for convicts sentenced to penal servitude for life; St. Pélagie receives political offenders, St. Lazare is exclusively for women, the Madelonnettes for juvenile criminals, and Clichy for debtors.

The number of the institutions of benevolence is enormous. The largest of the numerous hospices or almshouses is La Salpêtrière, probably the largest asylum in the world, extending over 78 acres of land, and appropriated solely to old women, 1300 of its 4,500 inmates being insane patients; Bicêtre, with nearly 3,600 beds, receives only men. The hospice des Enfants Trouvés, or foundling hospital, provides for the infants brought to it till they reach the age of maturity, and only demands payment in the event of a child being reclaimed. The Crèches, or public nurseries, first established in 1844, of which there are now 18, receive the infants of poor women for the day at the cost of 20 centimes. Besides institutions for the blind, deaf and dumb, convalescents, sick children, etc., Paris has 17 general and special hospitals. Of these the oldest and most noted are the hôtel Dieu, receiving annually 13,000 patients; La Charité; and La Pitié

The chief institutions connected with the university of France, and with education generally, are still situated in the Quartier Latin. The Sorbonne (q.v.), a large building erected by cardinal Richelieu for the faculties of the old university of Paris, contains lecture halls and class-rooms, and an extensive library open to the public. There degrees are granted by the university of France in the faculties of science, letters, and theology, and gratuitous public lectures are delivered, which are attended by a large number of students. Near the Sorbonne is the collège de France, where gratuitous public lectures are also delivered by eminent scholars and men of letters. The Ecole Polytechnique, the school of medicine and the school of law, the observatory, and the Jardin des plantes, with its great museum of natural history, lecture-rooms, and botanical and zoological gardens, are situated in the same quarter of Paris. The principal of the public libraries are those of the rue Richelieu, now called the bibliothèque nationale, which contains more than 2,000,000 volumes, 190,000 manuscripts, 5,000 portfolios of engravings, and a great collection of coins and medals (see LIBRARIES), which originated in a small collection of books placed by Louis XI. in the Louvre. No city on this side of the Alps is richer than Paris in fine-art collections, and among these the museums at the Louvre stand pre-eminent. The palais des Beaux-arts is used as an exhibition of art, manufactures, and architectural models. The hôtel Cluny, connected under-ground with the palais des Thermes, in addition to its being in itself a most interesting monument of mediæval art, contains curious relics of the arts and usages of the French people, from the earliest ages of their history to the renaissance period. The mint deserves notice for the perfection of its machinery. The Gobelins, or tapestry manufactory, may be included under the fine arts, as the productions of its looms are all manual, and demand great artistic skill. The conservatoire des arts et Métiers, in the Rue St. Martin, contains a great collection of models of machinery, and class-rooms for the instruction of workmen in all departments of applied science. The palace of industry, built in 1854 for the universal exhibition, now forms a permanent exhibition. The spacious building in which the exhibition of 1878 took place was named palace of the Trocadéro.

Among the parish churches of Paris (upwards of 60 in number), the grandest and most interesting, in an historic point of view, is the cathedral of Notre Dame, which stands on a site successively occupied by a Pagan temple and a Christian basilica of the time of

the Merovingian kings. The present building was constructed between the 12th and 15th centuries; and in its present state of restored magnificence it may rank as one of the noblest specimens of Gothic architecture. St. Germain-des-Prés, which is probably the most ancient church in Paris, was completed in 1163; St. Etienne du Mont and St. Germain l'Auxerrois, both ancient, are interesting—the former for its picturesque and quaint decorations, and for containing the tomb of St. Geneviève, the patron saint of Paris; and the latter for its rich decorations and the frescoed portal, restored at the wish of Margaret of Valois. The Sainte Chapelle, built by St. Louis in 1245–48, for the reception of the various relics which he had brought from the Holy Land, is one of the most remarkable buildings in Paris, profusely decorated in all parts with brilliantly colored materials. Its present beauty is entirely due to the restorations completed by the late emperor at a cost of £50,000. It was threatened by the commune, but saved. Among modern churches are the Madeleine, built in imitation of a Greek temple, and gorgeous with gildings, frescos, carvings, marbles, and statues; and the Pantheon, which was begun as a church, but converted by the constituent assembly of republican France into a temple dedicated to the great men of the nation—it was restored to the church by the late emperor, and rededicated to St. Geneviève; Notre Dame de Lorette, erected in 1823, a flagrant specimen of the meretricious taste of the day; and St. Vincent de Paul, completed in 1844, somewhat less gaudy and more imposing in style, etc. Among the few Protestant churches, l'Oratoire is the largest and the best known.

Paris abounds in theaters and places of amusement suited to the tastes and means of every class. The leading houses, as the opéra, théâtre Français—chiefly devoted to classical French drama—Odéon, théâtre Italien, etc., receive a subvention from government, and all are under strict police supervision. The new opera-house, completed in 1875, is a wonderfully magnificent building, costing, exclusive of the site, £1,120,000. Cheap concerts, equestrian performances, and public balls, held in the open air in summer, supply a constant round of gayety to the burgher and working classes at a moderate cost, and form a characteristic feature of Paris life; while, in addition to the noble gardens of the various imperial palaces, the most densely crowded parts of the city have public gardens, shaded by trees, and adorned with fountains and statues, which afford the means of health and recreation to the poor. Beyond the fortifications at the w. of Paris is the Bois de Boulogne, converted by the late emperor from a wood covered with stunted trees into one of the most beautiful gardens in Europe. That part of it which skirted the fortifications was cut up and destroyed during the siege, but since then it has been replanted, and is now as attractive to visitors as it has ever been.

Paris has three large and twelve lesser cemeteries, of which the principal one is Père-la-Chaise, extending over 200 acres, and filled in every part with monuments erected to the memory of the countless number of celebrated persons who have been buried here. The morgue is a building in which the bodies of unknown persons who have met with a violent death are placed, and which, if not claimed within three days, are buried at the public expense. The southern parts of the city are built over beds of limestone, rich in fossils, which have been so extensively quarried as to have become a mere net-work of vast caverns, which in some cases scarcely afford sufficient support to the houses above. These quarries were first converted in 1784 into catacombs, in which are deposited the bones of the dead, collected from the ancient cemeteries of Paris.

Paris was surrounded, under Louis Philippe, with fortifications extending 30 miles round, and costing £5,500,000 sterling, and, in addition to these, 16 detached forts have been erected at definite distances from one another. The Champ-de-Mars is a vast sandy plain near the Quai d'Orsay, on which reviews and other military displays and national festivals are held. Close to it stands the Ecole militaire, founded in 1752, and used as barracks for infantry and cavalry, of which it can accommodate 10,000 men, with space for 800 horses. The hôtel des invalides, founded in 1670 for disabled soldiers, is situated on the left bank of the river. The crypt of the church contains the sarcophagus, hewn from a huge block of Russian granite, in which lie the remains of Napoleon, deposited there in 1840.

Paris is divided into 20 arrondissements. The prefect of the Seine is the chief of the municipal government, and is appointed by the government. There is a large municipal council, chosen by popular election. Each arrondissement has a maire and two assistant councilors. The prefect of police is at the head of the civic guard or gensdarmes, the fire brigade, and the sergents de ville, or city police, who are armed with a sword. The cleaning, sewerage, and water supplies of Paris are under the charge of the prefect. Paris is now abundantly supplied with pure and wholesome water; since 1854 the length of vaulted sewers has been doubled, and now amounts to upwards of 250 miles. The same may be said in regard to the paving of the city, and the street-lighting is now adequately effected by means of some 15,000 gas-lights. In 1818 public slaughter-houses, or abattoirs, were established at different suburbs, where alone animals are allowed to be slaughtered. Large cattle markets are held near the licensed *abattoirs* (q. v.). There are in the heart of the city numerous *halles*, or wholesale, and *marchés*, or retail markets. The principal of these is the halles centrales, near the church of St. Eustache, covering nearly 20 acres. Among the older markets, the halle aux vins, in which 500,000 casks of wine can be stowed, and the marché aux fleurs, are perhaps the most interesting.

For an account of Paris, see *Le Nouveau Paris*, by Labedolière; *Paris Illustré en*

1870, by Ad. Joanne (Paris. 1870 and 1871); and Moriac's *Paris sous la Commune* (Paris, 1871). A great work, which was to include all the principal documents connected with the history of Paris, was commenced during the late empire, under the supervision of M. Haussman. Seven large quarto volumes had appeared when the work was interrupted by the events of 1871.

PARIS, JOHN AYRTON, 1785-1856; b. England; educated at Cambridge, where he took a medical degree after a course of medical study at Edinburgh. He began the practice of his profession in London, and in his 23d year was made physician to Westminster hospital. Soon afterwards he settled in Cornwall, where he obtained a large practice. He pursued the study of natural history, founded the royal geological society of Cornwall, and wrote a *Guide to Mount's Bay and Land's End*, describing the geology of that part of Cornwall. He also wrote, while in Cornwall, *Memoirs of the Life and Scientific Labors of the late Rev. W. Gregor*. Returning to London, he lectured on the materia medica at the Windmill-street school of medicine, and on the philosophy of medicine at the royal college of physicians. He worked over the substance of these lectures into the introduction of his *Pharmacologia*, which passed through many editions, and still ranks as a valuable text-book on the materia medica. He also wrote a *Treatise on Diet*; a *Life of Sir Humphrey Davy*; and anonymously *Philosophy in Sport made Science in Earnest*. He became a censor of the college of physicians in 1817, delivered the Harveian oration before it in 1843, and the next year succeeded sir Henry Hallford in its presidency; retaining that office till his death. He received the degree of D.C.L. from Oxford, and was a member of the royal society.

PARIS, LOUIS PHILIPPE D'ORLÉANS, Comte de, b. in Paris, 1838; son of Louis Philippe, king of France; educated, after the abdication of his father, in Germany and England. After a journey to Syria with his brother, the duc de Chartres, in 1859, he published a journal of the voyage entitled *Damas et le Liban*. Early in 1861 he became interested in the American war against the rebellion, offered his services, with his brother's, to the union cause, and Sept. 28 was made aid-de-camp to gen. McClellan, with the rank of capt. He remained in active and efficient service in all the disastrous battles of that campaign, and retired from the service when the attitude of France towards Mexico gave cause of offense to the United States. He returned to England in the summer of 1862, and in Feb., 1863, published in the *Revue des Deux-Mondes* an article entitled *La Semaine de Noel dans la Laucas hire* over the signature of Eugène Forcade. In 1867-68 he published in the same magazine, under the *nom de plume* of *d'x-Raymond*, a letter on new Germany, and a study of the state church and the free church in Ireland. In 1869 he published a book entitled *Les Associations Ouvrières en Angleterre* (Trades Unions), which went through many editions in Paris, and has been translated into several languages. During the misfortunes of the German war the count and his brother offered their services in the French army in whatever place they might be assigned; but were refused by the legislative assembly. In 1873 he made a formal resignation of the claims of his family to the throne of France, by a visit to the comte de Chambord at Frohsdorff. In 1874-75 *Une Histoire de la Guerre Civile en Amérique*, volumes I. and II., appeared, which is to be completed in 8 vols. He married May 30, 1864, Marie Isabel, daughter of the duc de Montpensier, by whom he has a son and daughter.

PARIS, MATTHEW, the best Latin chronicler of the 13th c., was b. about 1195, and in 1217 entered the Benedictine monastery of St. Albans. After the departure of Roger of Wendover, in 1235, Paris was chosen to succeed him as annalist of the monastery. He discharged his functions with veracity and boldness, in consequence of which he greatly displeased some of his contemporaries. The principal external incident of his life was his voyage to Norway, whither he was invited by king Hakon, to repair the financial disorders in the Benedictine monastery of Holm. Paris landed at Bergen, July 10, 1248, was courteously received by the Norwegian monarch, and settled the business about which he came in a satisfactory manner. After his return to England he stood high in the favor of Henry III., who used to converse with him in the most familiar manner, and from whose lips he derived not a little of the information that makes his *Chronicle* so valuable. He had also a wide circle of influential friends and acquaintances among the clergy, from whom he obtained materials for his work. His death occurred in 1259. Paris had a great reputation in his day for his virtues and abilities. He was considered a universal scholar, and is said by his laudatory biographers to have been versed in mathematics, poetry, oratory, divinity, history, painting, and architecture. One thing about him long kept his memory green in the hearts of his countrymen—he was a patriotic Englishman, and though a sincere Catholic (like all good men of his age), yet he loved his country better than the pope, and wrote so fiercely against the encroachments of the court of Rome in ecclesiastical matters that his *Chronicle* became, in after times, a great favorite with the reformers. Paris's principal work is his *Historia Major*, which begins with the Norman conquest, and extends to the year of the author's death. It was continued by William Rishanger, also a monk of St. Albans, till the death of Henry III. in 1272. The first edition was published at London by archbishop Parker in 1571, and was reproduced at Zürich in 1606; later and more complete editions are those of London in 1640-41, and in 1684. The only portion of the *Historia Major*, how-

ever, which is properly the work of Paris is that extending from 1235 to 1259; the previous part being nearly a transcription from the *Flores Historiarum*, attributed to Roger of Wendover, whence some critics have supposed that Paris is really the author of that work too. But this opinion is strenuously contested by the most recent editor of the *Flores Historiarum*, the rev. H. O. Coxe (4 vols. 1841-42). Translations both of Paris's *Chronicle* and that of Roger of Wendover have been published by Bohn in his Antiquarian library. The British museum, and the library of Corpus Christi college at Cambridge, contain manuscript abridgments of the *Historia Major*, made by Paris himself, and entitled *Chronica Majora Sancte Albani*; a second abridgment is known as the *Historia Minor*. Other works of Paris's are *Duorum Offarum Merciorum Regum Vitæ*; *Viginti trium Abbatum, S. Albani Vitæ*; and *Additamenta*, being explanatory additions to his *Historia Major*.

PARIS BASIN, the collective name of the beds of eocene age, which rest in a hollow of the chalk in the district around Paris, where they occupy an oblong area measuring 180 m. in greatest length from n. to s., and 90 m. in breadth from e. to west. The different sections into which the series has been divided are given under eocene (q.v.). The beds are chiefly remarkable for the rich harvest of organic remains which they supplied to Cuvier, and which led to the foundation of the modern science of palæontology. The strata from which these were principally obtained consist of a series of white and green marls with subordinate beds of gypsum; they are largely developed at Montmartre, where the gypsum has been extensively quarried for the manufacture of plaster of Paris. The fossils consist of land and fluviatile shells, fresh-water fish and crocodiles, and the bones of birds and quadrupeds, besides a few land-plants, among which are some palms. The mammals, of which about 50 species have been described, belong to the order pachydermata. The Paris basin has for some time almost ceased to supply the remains of vertebrate animals.

PARIS GREEN. See ARSENIOUS ACID, *ante*.

PARISH (Gr. *paroikia*, habitation, from *para*, near, and *oikeomai*, I dwell; Lat. *parochia*), the district assigned to a particular church, where the inhabitants of the district may attend at public worship, and receive the sacramental or other ministrations of the clergy. The name originally seems to have been interchangeable with *diæcesis*, "diocese," and to have been applied to the district subject to the spiritual jurisdiction of a bishop; and, on the other hand, at a later period, *diæcesis* was sometimes used to signify a parochial church or district. The distribution into parishes appears to be comparatively modern. Originally, all the clergy were (in the opinion of the Episcopalian churches) but coadjutors of the bishop, and served in his church, at which all the faithful assembled. At Alexandria, and afterwards at Rome, a number of minor churches were opened (called at Rome *tituli*), which were served by clergy originally not permanently attached to them, but sent from the principal or bishop's church, but in progress of time fixed permanently in the charge. This, however, was not common; and we find churches, with clergy permanently attached, much earlier in rural districts than in cities. The institution does not appear to have become general till the 9th or 10th century. In England, the first legislation on the subject occurs in the laws of Edgar, about 970. The parochial division of districts seems in great measure to have followed the civil distribution into manors, or other feudal divisions of territory; and it is probable that it is to the same state of things we owe the practice of lay patronage, the priest officiating in a manorial church being chosen, with the bishop's consent, by the lord of the manor. The parochial revenue, however, by no means followed the same rules which now prevail. At first, all ecclesiastical income, from whatever district, was carried into a common fund, which was placed at the disposal of the bishop, and was generally divided into four parts—for the bishop, for the clergy, for the poor, and for the church. By degrees, however, beginning first with the rural parishes, and ultimately extending to those of the cities, the parochial revenues were placed at the disposal of the parish clergy (subject to the same general threefold division, for the clergy, for the poor, and for the church), and in some places an abusive claim, which was early reprobated, arose upon the part of the lord of the manor to a portion of the revenue. Properly, a parish has but one church; but when the district is extensive, one or more minor (*succursal*) churches, sometimes called "chapels of ease," are permitted.

In the law of England, a parish is an important subdivision of the country, for purposes of local self-government, most of the local rates and taxes being confined within that area, and to a certain extent self-imposed by the parties who pay them. The origin of the division of England into parishes is not very clearly ascertained by the authorities. Some have asserted that the division had an ecclesiastical origin, and that a parish was merely a district sufficient for one priest to attend to. But others have asserted that parishes had a civil origin long anterior to ecclesiastical distinctions, advantage being merely taken to ingraft these on so convenient an existing subdivision of the country; and that a parish was a subdivision of the ancient hundred, known as a vill or town, and through its machinery the public taxes were anciently collected. Hobart fixes the date of the institution of civil parishes in 1179, and his account has been generally followed. Much difficulty has occasionally arisen in fixing the boundaries of parishes. Blackstone says the boundaries of parishes were originally ascertained by those of manors, and that

it very seldom happened that a manor extended itself over more parishes than one, though there were often many manors in one parish. Nevertheless, the boundaries of parishes are often intermixed, which Blackstone accounts for by the practice of the lords of adjoining manors obliging their tenants to appropriate their tithes towards the officiating minister of the church, which was built for the whole. Even in the present day, these boundaries often give rise to litigation, and the courts have always decided the question according to the proof of custom. This custom is chiefly established by the ancient practice of perambulating the parish in Rogation-week in each year. See PERAMBULATION. There are some places as to which it is uncertain whether they are parishes or not, and hence it has been usual to call them reputed parishes. There are also places called extra-parochial places, which do not belong to any parish, such as forest and abbey lands. In these cases the persons inhabiting were not subject to the usual parochial rates and taxes, and other incidents of parochial life. But in 1857 a statute was passed which put extra-parochial places upon a similar footing to parishes, by giving power to justices, and in some cases to the poor-law board, to annex them to adjoining parishes, after which they are dealt with in much the same way as other places. One of the chief characteristics of a parish is that there is a parish church, and an incumbent and churchwardens attached to it, and by this machinery the spiritual wants of the parishioners are attended to. These several parish churches, and the endowments connected therewith, belong in a certain sense to the nation, and the incumbents are members of the established church of England, and amenable to the discipline of the bishops and the spiritual courts. The private patronage, or right of presenting a clergyman to an incumbency, is technically called an advowson, and is generally held by an individual as a salable property, having a market value. The patron has an absolute right (quite irrespective of the wishes of the parishioners) to present a clerk or ordained priest of the church of England to a vacant benefice, and it is for the bishop to see to his qualifications. The bishop is the sole judge of these qualifications, and if he approves of them, the clerk or priest is instituted and inducted into the benefice, which ceremony completes his legal title to the fruits of the benefice. The incumbents of parish churches are called rectors, or vicars, or perpetual curates, the distinction being chiefly founded on the state of the tithes. When the benefice is full, then the freehold of the church vests in the rector or parson, and so does the church-yard; but he holds these only as a trustee for the use of the parishioners. There are certain duties which the incumbent of the parish church is bound by law to perform for the benefit of the parishioners. He is bound, as a general rule, to reside in the parish, so as to be ready to administer the rites of the church to them. See NON-RESIDENCE. The first duty of the incumbent is to perform public worship in the parish church every Sunday, according to the form prescribed by the Book of Common Prayer, which is part of the statute-law of England. He must adhere strictly to the forms and ceremonies, and even to the dress prescribed by the Book of Common Prayer and Canons. The incumbent is also bound to baptize the children of all the parishioners, and to administer the rite of the Lord's-supper to the parishioners not less than three times each year. The incumbent is also bound to allow the parishioners to be buried in the church-yard of the parish, if there is accommodation, and to read the burial service at each interment. He is also bound to marry the parishioners on their tendering themselves, and complying with the marriage acts, within the parish church and during canonical hours, and it is said he is liable to an action of damages if he refuse. In respect of burials and marriages, certain fees are frequently payable by custom; but unless such a custom exists, no fee is exigible for performance of these duties. In many cases, where one church had become insufficient for the increased population, the old parish has been subdivided under the church building acts, the first of which was passed in 1818, into two or more ecclesiastical districts or parishes, for each of which a new church was built, and an incumbent appointed. The incumbents in these ecclesiastical parishes have generally been provided for by the incumbent of the mother-parish or by voluntary benefactors, and by the aid of pew-rents. But these ecclesiastical parishes, so far as the poor and other secular purposes are concerned, make no change on the old law. Another incident of the parish church is that there must be churchwardens appointed annually, who are accordingly leading parochial officers, and whose duty is partly ecclesiastical and partly civil. Their civil duties consist chiefly in this, that they must join the overseers in many of the duties arising out of the management of the poor, and incidental duties imposed by statute. But their primary duty is to attend to the repair and good order of the fabric of the church. The common law requires that there should be two churchwardens, one of whom is appointed by the incumbent, and the other is chosen by the parishioners in vestry assembled, but sometimes this rule is varied by a local custom. This appointment and election takes place in Easter-week of each year. In electing the people's churchwarden, there is often much local excitement, and it is common to poll the parish, all those who pay poor-rates being entitled to vote, the number of votes varying according to the rent, but no person having more than six votes. See CHURCHWARDENS; CHURCH RATES.

The next most important business connected with the parish is that which concerns the poor, the leading principle being, that each union is bound to pay the expense of relieving its own poor. See OVERSEERS; GUARDIAN; POOR.

Another important feature of the parish is, that all the highways within the parish

must be kept in repair by the parish, i. e., by the inhabitants who are rated to the poor. For this purpose, the inhabitants of each parish, in vestry assembled, appoint each year a surveyor of highways, whose duty it is to see that the highways are kept in good repair; and he is authorized, by the general highway act, to levy a rate on all the property within the parish. The office of a surveyor of highways is, like those of churchwarden, overseer, and guardian, a compulsory and gratuitous office. When a highway is out of repair, the mode of enforcing the repair is by summoning the surveyor of highways before justices, to show cause why he has not repaired the road; and if the facts are not disputed, the justices either fine him, or order an indictment to be laid against the inhabitants of the parish. This indictment is tried, and the expense of it is defrayed out of the highway-rate, which is subsequently made. The highways of each parish being thus exclusively under the control of the ratepayers and their officers, it happened that great inequality prevailed in the standard of repairs which each parish set up for itself. This led to the late highway district acts, first passed in 1862, the object of which is to enable the justices of the peace of the district to combine several parishes into one district, and thus secure more uniformity in the repairs of the highways. A way-warden is now appointed to represent each parish at the highway board, instead of the old highway surveyor; but the expenses of maintaining the highways are still ultimately paid by the parish in which they are situated, the only change being, that the expenses are ordered to be incurred by the highway board, instead of the parochial officer.

The above duties in reference to the parish church, the poor, and the highways, are the leading duties attaching to the parish as a parish; but over and above these, many miscellaneous duties have been imposed on the parish officers, particularly on the overseers and churchwardens, which will be found specified under the head of OVERSEERS. In nearly all cases where the parish, as a parish, is required to act, the mode in which it does so is by the machinery of a vestry. A vestry is a meeting of all the inhabitant householders rated to the poor. It is called by the churchwardens, and all questions are put to the vote. Any ratepayer who thinks the majority of those present do not represent the majority of the whole parishioners, is entitled to demand a poll. At these meetings, great excitement often prevails, especially when there existed church-rates. Whenever a parish improvement is found to be desirable, the vestry may meet and decide whether it is to be proceeded with, in which case they have powers of rating themselves for the expense. Such is the case as to the establishment of baths and wash-houses, watching, and lighting. Returns are made of all parish and local rates to parliament every year. The parish property, except the goods of the parish church, which are vested in the churchwardens, is vested in the overseers, who hold and manage the same, requiring the consent of the poor-law board in order to sell it. Of late, a statute has authorized benefactors to dedicate greens or playgrounds to the inhabitants of parishes, through the intervention of trustees.

In Scotland the division into parishes has existed from the most ancient times, and is recognized for certain civil purposes relative to taxation and otherwise, as well as for purposes purely ecclesiastical. The court of session, acting as the commission of teinds, may unite two or more parishes into one; or may divide a parish, or disjoin part of it, with consent of the heritors (or landholders) of a major part of the valuation; or apart from their consent, if it be shown that there is within the disjoined part a sufficient place of worship, and if the titulars of teinds (q.v.), or others who have to pay no less than three-fourths of the additional stipend, do not object. By act 7 and 8 Viet. c. 44, any district where there is an endowed church may be erected into a parish *quoad sacra*, for such purposes as are purely ecclesiastical. Endowed Gaelic congregations in the large towns of the Lowlands may similarly be erected into parishes *quoad sacra*.

The principal application of the parochial division for civil purposes relates to the administration of the poor-law. Under the old system the administrators of the poor-law were the kirk-session in county parishes, and the magistrates, or certain managers selected by them, in burghal parishes. The act 8 and 9 Viet. c. 83, which remodeled the poor-law of Scotland, retained the old administrative body so long as there was no assessment; but, on a parish being assessed, substituted for it a new one, consisting in rural parishes of the owners of heritable property of £20 yearly value, of the magistrates of any royal burgh within the bounds, of the kirk-session, a certain number of members chosen by the persons assessed; and in burghal parishes of members, not exceeding 30, chosen by the persons assessed, four members named by the magistrates, and not above four by the kirk-session or sessions. The board of supervision may unite two or more parishes into a combination for poor-law purposes. There is not the same extensive machinery for parochial self-government that exists in England. The burden of supporting the fabric of the church falls on the heritors, and there are no churchwardens. Highways are not repairable by the parish, and there are no elections of surveyors or way-wardens. The meeting of the inhabitants in vestry, which so often takes place in England, is unknown in Scotland, and hence the ratepayers do not interest themselves so much in local affairs. Many of the duties which in England are discharged by parochial officers, are in Scotland discharged by the sheriff-clerk, a county-officer. The system of having a parish school (q.v.) in every parish (a system extended by the education act of 1872) has long prevailed in Scotland, though unknown in England till the year 1870

PARISH (*ante*) has in this country a usage different from that in England; and its usage is not the same in all the states. In Louisiana it is synonymous with county in the other states. The legal significance of the English parish arises from the right of the rector to receive tithes of the agricultural products of the parish. In America no such right ever existed. But from the first settlement of the country, associations were formed or corporations organized for religious worship; and parish denoted the territorial limit of a church. In New England, where the connection between church and state was originally very close, and where at one time only church members were qualified to vote, the parish was the town; that is, the whole body of qualified citizens, acting as the town in civil matters, constituted and acted as the parish in ecclesiastical matters. The same town-meeting, for instance, would vote an appropriation for the roads of the town, and another appropriation for the salary of the pastor of the town church. There was originally but one church and one parish in each town; but as population increased new parishes were set off, still remaining territorial divisions for ecclesiastical purposes. Finally, as Congregationalism ceased to be the sole form of religion in New England, and new denominations sprang up, and new churches were organized, the theocratic idea died, and it was recognized that all denominations should be on an equality. The state and the town as such ceased to provide for the support of religious worship, and parish henceforth denoted a voluntary association of persons with the same religious worship, without reference to locality or residence.

PARISH, ELIJAH, D.D., 1762–1825; b. Conn.; graduated at Dartmouth 1785; studied theology with the rev. Ephraim Judson of Taunton, Mass., and in 1787 was settled as pastor of the Congregational church at Byfield, Mass.; remaining there till his death. His theological views were those of Dr. Hopkins. He was greatly interested in politics, and in the annual election sermon which he preached in 1810 he censured so severely the policy of the government that the legislature refused to publish it. It had however a wide circulation. He published with Dr. Morse, *A Gazetteer of the Eastern and Western Continent*; also *A History of New England*; *System of Modern Geography*; *Memoir of Dr. Eleazar Wheelock*, first president of Dartmouth college; *Sacred Geography, or Gazetteer of the Bible*. In 1826 a volume of his *Sermons* was published with a memoir.

PARISH CLERK, in England, is an officer of the parish of some importance, his duty being to lead the responses during the reading of the service in the parish church. He is appointed by the parson, unless some other custom of a peculiar kind exists in the parish. He must be 20 years of age, and has his office for life, but is removable by the parson for sufficient cause. By the statute 7 and 8 Vict. c. 59, a person in holy orders may be elected a parish clerk. Under some of the church-building acts governing the new churches built in populous parishes, he is annually appointed by the minister. The salary of the parish clerk is paid out of the church-rate.

PARISH SCHOOL. In England, prior to the recent education act, there was no such thing as a parish school—that is, a school existing for the benefit of the parishioners, endowed by the state, or supported by taxes on the parishioners. Every school beyond charity schools was more or less voluntary in its character, and endowed, if at all, by private benefactors. In Scotland, however, it was essential that in every parish there should be a parish school, for a statute of 1696 made it compulsory on the heritors—i.e., the chief proprietors—to provide a school-house, and to fix a salary for the teacher. If the heritors neglected to supply a school-house, the presbytery was empowered to order one at the expense of the heritors. The schoolmaster's salary was fixed according to a certain proportion, half of the rate or cess being paid by the landlord, and half by the tenant. In 1803 a statute was passed to regulate the salaries, and to give a right to the schoolmaster to have a house and garden. The office was further regulated by a later act, 24 and 25 Vict. c. 107. The salary was fixed to be from £35 to £70 per annum, to be varied and fixed by the heritors and minister of the parish, in the case of future vacancies. The qualification of the schoolmaster consisted in passing an examination conducted by the examiners of parochial schoolmasters, who were professors of the universities, who made regulations as to the time and mode of examination. For this purpose, Scotland was divided into 4 districts, each in connection with one of the Scotch universities. When examined, the person obtained a certificate of fitness from these examiners. The schoolmaster, who had formerly, before admission to office, been required to sign the confession of faith and the formula of the church of Scotland, and to profess that he would submit to its government and discipline, had by this act merely to make a declaration that he would not, in his office, endeavor, directly or indirectly, to teach or inculcate opinions opposed to the divine authority of the holy Scriptures, or to the doctrines contained in the shorter catechism, agreed upon by the assembly of divines at Westminster, and approved by the general assembly of the church of Scotland, and that he would not exercise the functions of his office to the prejudice or subversion of the church of Scotland as by law established. In case of misconduct, the presbytery might complain to the secretary of state, who would institute a commission to inquire and report, and to censure, suspend, or deprive such schoolmaster accordingly. The sheriff of the county was made the sole judge of charges of immorality, or cruel or improper treatment of the scholars, offenses formerly cognizable by the presbytery; and the heritors and minister might permit or require him to resign, and allow him a retiring

allowance. Notwithstanding all these improvements, however, it continued to be apparent that the system of parish schools, however well adapted to Scotland at the revolution, had fallen behind the requirements of the country when the population had tripled, and large manufacturing villages and towns had sprung up in rural districts. But for denominational and other schools, vast numbers of children would have been left without the rudiments of education. By the education (Scotland) act, 35 and 37 Vict. c. 62 (1872), the parish schools were placed under the management of the school board of each parish, the jurisdiction of heritors, ministers, and church courts was abolished, and every school under the management of the school board was declared to be equally a parish school. Teachers in office before the act are not to be prejudiced by its provisions; those whom the school boards appoint are to have such salaries assigned them as the boards think fit, and to hold office at pleasure of the board.

PARIS, PLASTER OF. See GYPSUM, *ante*.

PARK (Fr. *parc*), a term still employed in some parts of Britain, in its original sense, to denote a field or inclosure, but more generally applied to the inclosed grounds around a mansion, designated in Scotland by another term of French origin, *policy*. The park, in this sense, includes not only the lawn, but all that is devoted to the growth of timber, pasturage for deer, sheep, cattle, etc., in connection with the mansion, wherever pleasure-walks or drives extend, or the purpose of enjoyment prevails over that of economical use. *Public parks* are those in the vicinity of towns and cities, open to the public, and intended for their benefit. An increase of public parks is a pleasing feature of the present age, and not a few towns enjoy parks recently bestowed by wealthy persons somehow connected with them.

PARK (*ante*), ground used for purposes of pleasure and recreation, and possessing some characteristics of woodland and grassy ground. It need not necessarily be a large area. The original French word *parc* signified first an inclosure for game, and afterward one for domestic animals. A decorated half-acre of trees and flowers in Montreal is called a park, with the same propriety as the deer park of hundreds of acres; and with more correctness than when those vast extents of natural meadows flecked with trees in Colorado are called parks. The evident needlessness of shutting people out of the enjoyment of nature's beauties which their use will not harm, has long made the great parks of England and the continent almost as free to the people as recognized "commons." A grassy expanse, large or small, stocked with shade trees, and used for rest and recreation, is a park; whether it be as formal as Versailles, as wild and picturesque as Fontainebleau, or as trim as an old Dutch garden. Even grass may be omitted, and yet the park remain. The park of the Tuileries in Paris is so swarmed with people that no grass could be maintained under the trees without limiting to an intolerable degree its use. The entire surface among its trees not occupied by pavements, groups of shrubs, or parterres of flowers, is covered with loose gravel, through which water percolates to the tree roots, and over which there is no restraint of popular use. The beauty of the park is lessened, but its value greatly increased for the use intended—viz., the recreation of the greatest number of people. The distinction between a park and a pleasure garden is this: the decorated garden where no crop is grown is cultivated to exhibit a growth of grass, trees, shrubs, or flowers with reference to the special beauty of each, as well as the beauty of harmonious arrangement. The perfectness of development of each part of a pleasure garden is the object aimed at. The garden becomes a park whenever freely used for recreation by persons not interested in its special growth. It is the tendency of our modern suburban home gardening to make playgrounds of their grassy surroundings, where croquet and all out-door family sports may be freely indulged. Thus they become our little parks, rather than gardens. Frederick Law Olmsted, the highest American authority on parks, suggests that little open spaces in cities, designed for public use, should be called *places*, when not large enough to have grass and trees; and *place-parks* when barely large enough to have grass plats and a few trees; that thoroughfares planted with trees for special adaptation to promenades or as avenues to parks, should be called *park-ways*; and public forests without roads simply *woods*. The Spanish have a word to designate long walks under avenues of trees which are neither thoroughfares nor park-ways, and yet admirably adapted to small cities, viz., *alameda*. The main streets of many old American towns arched with elms or maples, are some of the finest examples of *alamedas*, or park-ways, if the country beyond them might be considered park.

Public parks in the United States on a small scale are as old as their cities. A sea-side walk was originally the most common. The Battery in New York, and the Bay-side in Charleston, S. C. are familiar examples. The city hall park in New York was originally its men's and boy's playground or common. It was but little improved until the city hall was built, when it was offensively fenced in. Boston common was specifically dedicated to public use by the founders of the city, and has more perfectly fulfilled its use than any other equal area in the country. Public squares in nearly all the cities, notably around Yale college in New Haven, have shown the noble expression that may be given to a very limited park by avenues of full grown native trees. The period of land speculation from 1830 to 1837, when great numbers of western cities were platted, was peculiarly unfortunate in the failure to dedicate ground liberally either in

park-places, public squares, or larger grounds. The beginning of the era of public parks for large cities, commensurate with their size, was when the city of New York felt the lack of park provision for her people and secured special legislation to create the Central park. Though inferior in many respects to older parks, especially if its recent growth of trees be compared with noble old park forests, and its limited ranges of lawn with the great expanses of the finest English parks, yet it has this merit in a remarkable degree: that, in proportion to the ground which it covers, the loss of space by the great reservoir being considered as well as its proportions and topography, it has developed more beauties and interest for public use than any other. The property was secured in 1857, and the plans for its laying out submitted by Frederick Law Olmsted and Calvert Vaux were adopted and put in their charge to be executed. Work was begun at once. In 1858 4,000 men were engaged on it. The orderly manner in which the people thronged to enjoy its first opening beauties was a pleasing refutation of the fear that had been expressed that a quiet enjoyment of a park could not be maintained in an American city. The ground as purchased was a region of ledgy granite hills and swampy hollows, embracing a few small farms and old mansions. The transformation within five years was marvelous, and an enduring monument of the genius of the designers, their executive ability, and the energetic spirit of the park commissioners. The ground occupied is $2\frac{1}{2}$ m. long n. and s. and a half-mile wide e. and w. The city reservoirs within it occupy 142 acres, forming a lake the elevation of which does not permit it to be given the air of a natural piece of water, but which nevertheless is a pleasing feature in the warm months. Besides this water there are six beautifully managed artificial lakes, containing in all 43 acres. Exclusive of the reservoirs and building sites, the park contains 683 acres. About 110 acres are in lawn, little broken by rocks and only bordered by trees, and the remainder mostly broken ground, in glades and young forests, or covered with copses and shrubbery, but nearly all in a condition to have a surface of lawn. There are $9\frac{1}{2}$ m. of carriage roads of admirable construction, $5\frac{1}{2}$ m. devoted to saddle-horse use; and 28 m. of walks. The average breadth of the drives is 50 ft., of walks 13 ft.; and the entire area occupied by roads and walks is 100 acres. There are 8 bridges over water and 38 for roads and walks that intersect at different levels; forming altogether the most varied study of single-arched bridge designs to be found within the limits of a single park. In the originality of the forms employed in these bridges (no two of them being alike or even similar) in the grace of their lines, their adaptation to abutting grounds, the happy use of all sorts of materials, of cut stones, and rustic, of mixed stone and brick, of iron and wood in their construction, in the perfectness of the mechanical work and the delicate taste of their details they are monuments of the genius and taste of Mr. Calvert Vaux the architect, unsurpassed, if equaled, anywhere. The grand terrace, also by Mr. Vaux, is the first great work of park architecture executed in the United States. It is an admirable study. The visitors to the park frequently exceed 100,000 a day. A magnificent system of parks and drives has been projected for the part of the island above Central park. Prospect park, Brooklyn, is an outgrowth of the enthusiasm developed by the creation of the Central park. It contains 550 acres all of which is available for park use. Well-grown trees already on a part of it, and larger stretches of grassy ground, gave a nobler immediate effect in sylvan features than was possible in Central park. Its architectural features, though on a grand scale, are not so interesting as those of Central park, except at the entrance which is finer. The park was designed by the same gentlemen who created Central park, with masterly skill in producing the finest results with the means at hand. The heights command a fine view of New York bay and the ocean. Artificial lakes covering 50 acres of its surface are supplied with water by steam-power. It has 6 m. of carriage drives, 4 m. of saddle-horse roads, and 20 m. of walks. New York and Brooklyn together have about 1600 acres appropriated to parks.

Philadelphia in addition to her generous original squares for park use—as Franklin, Washington, Independence, Logan, and Rittenhouse—has followed and outdone New York in the purchase and improvement of 2,740 acres in one body—Fairmount park. Its extent, varied surface, fine old trees, broad expanses of turf, the Schuylkill river at its side, and the stream of the Wissahickon, flowing through a picturesque rocky valley clothed with the trees, shrubs and wild vines of virgin nature, through dark dells, broken by numerous waterfalls, altogether give it a different character from that of most other parks of the United States. In artificial improvements it has had less expended upon it than the New York and Brooklyn parks. Baltimore has the honor of the noblest forest park of the United States, Druid Hill—an old forest of 600 acres acquired in 1860, previously the private park of an old estate.

Boston's common contains 48 acres of pleasantly varied surface with trees as old as the city. The "old elm" was represented on a map published in 1722. English elms forming a part of its exterior avenues are the finest of their kind in the United States. The "public garden" is an extension n.w. of the common containing $21\frac{1}{4}$ acres, separated from it by a street. It is kept in gardenesque style as an arboretum and botanical garden, and contains a small lake, a conservatory, and many fine statues. The city has 23 smaller parks. Commonwealth avenue, leading n.w. from the public garden, is a grand park-way, $1\frac{1}{2}$ m. long, 240 ft. wide, in the center of which are double avenues of trees, and walks through grass-plots, shrubbery, and flowers.

The park system of Chicago, devised after 1864, was extensive and thorough as a plan, and though as yet but partially carried out, already fulfills an important mission of pleasure and comfort to its citizens. The plan embraces 1900 acres divided between 6 parks of 250 acres each and the broad parkways which connect them, and form a circumvallation of the city from lake Michigan n. round to the lake south. The parks by the lake-shore will have some features suggested by peculiarities of Venice, and in the hot summer months will be delightful. The parks on the flat prairies west of the city will be slow to develop the beauty that can come only from a growth of trees to shade their lawns and walks. The park-ways are 20 m. in length, 200 to 250 ft. wide.

St. Louis has 2,100 acres devoted to park use, of which 100 acres are small place-parks, already in use in the city. Tower Grove park, containing 277 acres, has been handsomely improved, and is connected with the city by a park-way 120 ft. wide, which is a part of 12 m. of such avenue embraced in its park system. Cincinnati has over 400 acres of park. Eden park containing 207 acres lies on the bluffs of the Ohio river e. of the city, and has a pleasing variety of vale and hill beautifully kept. Burnett-wood contains 168 acres mostly forest. Buffalo has one of the best park systems in the United States, consisting of a park of 300 acres of a rural character, with fine trees, a lake of 46 acres approached from the city by a noble avenue with park-ways 200 ft. wide, and a promenade along its shore on one side, and a parade-ground and garden on the opposite side. The park and park-ways together cover 530 acres. San Francisco has made an interesting essay in park-making by the conversion of some of the shifting sand dunes w. of the city into parks, by a careful system of watering and seeding; so that places where the sweep of winds from the Pacific made and unmade new sand hills or materially changed all their surfaces every year, have become well-established lawns, planted with trees, and in a fair way to become beautiful parks. The work has not been so systematically followed up as was intended, but whenever it is, then gardening skill, seconded by the peculiarly moist and equable climate of that coast, may be relied upon to cover the parks with interesting forms of semi-tropical vegetation. Winds are the sole enemy to these park formations; 1000 acres have been devoted to this experiment in the Golden Gate park, and broad park-ways along the sea entrance to the bay lead to it. Smaller cities throughout the United States and Canada have of late years followed the lead of the great ones. In many of them, comparatively small areas near the centers of population serve better than larger ones remote from it. It is a misfortune in many American cities that the late awakening to the need of more pleasure-grounds has forced the purchase of lands too remote to be most useful to the body of poor people who have most need of their pure air and priceless recreation; and it is too much the fashion of modern park-making to provide for those who can drive or ride to them, rather than for those who, like women and children, will use them only when near. In this respect European cities are generally much more favored. There nearly every town formerly had its wall and surrounding ditches and reserve of open ground outside kept clear for military defense, all belonging to the state. These walls and adjacent grounds, before as well as after the fortifications were razed, were the promenades of the people, and in modern times have been converted into parks and boulevards. Towns which have grown greatly have had several successive circles of inclosing fortifications, thus providing, as in Paris and Vienna, several successive circles of public promenades, boulevards, and commons. Parks could not be devised more convenient to the people than these enviroing grounds nearly equi-distant to all the population.

The area of parks in London, England, is proportioned to the immensity of the city. Only a small part of them are broken by carriage roads; nearly their whole extent being dedicated to the exclusive use of pedestrians. Its seven great parks are: Hyde, containing about 400 acres, intersected by walks and carriage roads, (including the famous saddle-horse drive called Rotten Row) clothed with old forests, and graced by the lake called Serpentine; Kensington gardens, an adjoining royal park of about the same size, further from the city; Green, a smaller pedestrian park, by which Hyde park may be approached; Regent's, nearly circular, with 450 acres, and having zoological and botanic gardens; Victoria park, with 290 acres, Battersea park, 320 acres, Kensington park, 20 acres, are almost exclusively for pedestrians; as well as the great Botanic gardens of Kew outside of London. Paris is more noted for the elegance and great number of its place-parks and avenues for promenades than for real parks. The latter have become numerous of late years, and are even more recent than the Central park of New York. The Bois de Boulogne, an ancient wood belonging to the crown, was given to the public about 1852. It contains 2,250 acres, not particularly interesting by nature, with no noble trees, but treated with all the graces of art possible to cover its natural deficiencies. Carriage drives and promenades traverse it in every part, and four artificial lakes are its most interesting feature. The most striking new park in the city is the *Buttes Chaumont* in the n.e. quarter, occupying the site of extensive old stone quarries. It embraces 62 acres, and is picturesque to a degree that renders it peculiarly charming and surprising in the midst of the city on the unsightly place of the exhausted quarry. It is probably the highest triumph of modern taste and skill in park creation. The park Monceaux is a smaller example of similar skill. The old gardens of the Tuileries already alluded to, and the somewhat similar gardens of the Luxembourg, though more like gardens than parks in their treatment, are so completely

used by the public that they fulfill all the uses of parks. Paris is provided with park resorts outside of the city to a greater extent than any other city. All the old chateau forests and hunting grounds of successive kings of France are now the property of the state, and furnish attractions in every direction out of the city. St. Cloud, Versailles, Vincennes, Fontainebleau, the latter one of the most picturesque and extensive of old royal hunting forests, are the most noted. Smaller cities in France and throughout Europe abound in beautiful small parks contiguous to their population, most of which have been improvements of the last 30 years, made possible by the possession by municipalities of suitable ground previously used by the public, but not specially improved for their enjoyment.

Private parks of much extent are everywhere decreasing rather than increasing, especially in the United States. The ambition for family land estates after the manner of the English was once general among the wealthy. The inheritors of estates under colonial grants, like the Livingstons and Van Rensselaers on the Hudson, formerly maintained private parks of great beauty. But the care and expense of maintaining a large and hospitable establishment, the loneliness of the mansion occupants without such tax for hospitality, and the weight of taxes concentrated on lands, have tended of late years to the abandonment of the park establishments and the sale and subdivision of such properties. In short, it is the tendency of civilization to make public parks instead of private ones.

PARK, a co. in central Colorado, drained by branches of the Platte river, which has its sources in the co.; 2,000 sq. m.; pop. '80, 3,970—2,946 of American birth. The surface is mostly table-land, bounded on the n. and w. by the Park range of the Rocky mountains. The scenery is remarkable for its beauty and sublimity. The soil is good grazing land, and oats, potatoes, and barley are the chief products. Gold, silver, copper, and lead abound. Co. seat, Fair Play.

*PARK, EDWARDS AMASA, D.D., LL.D., b. Providence, R. I., 1808; graduated at Brown university, 1826; and at Andover theological seminary, 1831; ordained the same year pastor of the Congregational church in Braintree, Mass.; elected in 1835 professor of moral and intellectual philosophy in Amherst college; in 1836 became Bartlett professor of sacred rhetoric in Andover theological seminary; and in 1847 Abbot professor of Christian theology in the same institution, which position he still holds. He has contributed largely to periodicals, and has been one of the editors of the *Bibliotheca Sacra* from the beginning. With prof. B. B. Edwards he translated a volume of *German Selections*; edited the *Writings of Rev. William Bradford Homer*, with a memoir; a volume on homiletics, the *Preacher and Pastor*, with an introductory essay; *The Writings of Prof. B. B. Edwards*, with a memoir, 2 vols.; and jointly with Drs. Austin Phelps and Lowell Mason, the *Sabbath Hymn and Tune Book*. In 1859 he assisted in the preparation of a volume of *Discourses and Treatises on the Atonement*, and wrote an introductory treatise on *The Rise of the Edwardean Theory of the Atonement*. With Dr. Phelps and the rev. D. L. Furber he published in 1861 a volume entitled *Hymns and Choirs*. He has written memoirs of Drs. Hopkins and Emmons for the editions of their works. He has published several sermons, one of which, a "convention sermon," on *The Theology of the Intellect and the Feelings*, occasioned a theological controversy between him and prof. Hodge of Princeton. He has long been considered one of the leading pulpit orators of the country, as regards both the matter of his discourse and the combined vigor and finish of his delivery. His use of words is exceedingly accurate and felicitous, and his illustrations are singularly apt. For many years he has been the foremost expounder of what is known as the New England theology, a strongly evangelical scheme of Christian doctrine, which has doubtless had a modifying power on the intenser forms of Calvinism, long prevalent in the middle and southern states. As editor of a leading theological quarterly, high in repute on both sides of the Atlantic, Dr. Park has had wide influence. But as a lecturer to consecutive classes of students for the ministry he has exerted an intellectual force keen, profound, vital, and formative, whose range and value can scarcely be overestimated. He has closely devoted himself to this work, visiting Europe for study and for indispensable rest, but seldom leaving his classes for any more public sphere of work. From his lecture-room, through his multitude of pupils, a stimulus has gone forth through the land and to distant parts of the earth. See Supp., page 886.

PARK, MUNGO, a celebrated African traveler, was the son of a Scottish farmer, and was b. Sept. 10, 1771, at Fowlshiels, near Selkirk. He studied medicine in Edinburgh, and afterward went to London, where he obtained the situation of assistant-surgeon in a vessel bound for the East Indies. When he returned, in 1793, the *African Association* of London had received intelligence of the death of maj. Houghton, who had undertaken a journey to Africa at their expense. Park offered himself for a similar undertaking, was accepted, and sailed from England May 22, 1795. He spent some months at the English factory of Pisania, on the Gambia, in making preparations for his further travels, and in learning the Mandingo language. Leaving Pisania on Dec. 2, he traveled eastward; but when he had nearly reached the place where Houghton lost his life, he fell into the hands of a Moorish king, who imprisoned him, and treated him so roughly that Park seized an opportunity of escaping (July 1, 1796). In the third week of his flight he reached the Niger, the great object of his search, at Sego (in the kingdom of Bambarra), and followed

its course downward as far as Silla; but meeting with hindrances that compelled him to retrace his steps, he pursued his way westward along its banks to Bammakoe, and then crossed a mountainous country till he came to Kamalia, in the kingdom of Mandingo (Sept. 14), where he was taken ill, and lay for seven months. A slave-trader at last conveyed him again to the English factory on the Gambia, where he arrived June 10, 1797, after an absence of nineteen months. He published an account of his travels, after his return to Britain, under the title of *Travels in the Interior of Africa* (Lond. 1799), a work which at once acquired a high popularity. He now married and settled as a surgeon at Peebles, where, however, he did not acquire an extensive practice; so that, in 1805, he undertook another journey to Africa at the expense of the government. When he started from Pisania, he had a company of 45, of whom 36 were European soldiers; but, when he reached the Niger, in August, his attendants were reduced to 7, so fatal is the rainy season in those regions to Europeans. From Sansanding, on the Niger, in the kingdom of Bambarra, he sent back his journals and letters in Nov., 1805, to Gambia; and built a boat, in which he embarked with four European companions, and reached the kingdom of Houssa, where he and they are believed to have been murdered by the natives, or drowned as they attempted to sail through a narrow channel of the river. The fragments of information and other evidence picked up among the natives by Clapperton and Lander (q.v.), strongly confirm this view of the fate of Park and his companions. An account of Park's second journey was published at London in 1815. Park's narratives are of no inconsiderable value, particularly for the light which they throw upon the social and domestic life of the negroes, and on the botany and meteorology of the regions through which he passed; but he was unfortunately cut off before he had determined the grand object of his explorations—the discovery of the course of the Niger.

PARK, ROSWELL, D.D., 1807–1869; b. Conn.; graduated at Union college, and at West Point in 1831, and was lieut. of engineers at the latter place until 1836; was professor of natural philosophy and chemistry in the university of Pennsylvania, 1836–42; ordained a minister in the Protestant Episcopal church in 1843; was principal of Christ Church hall, Conn., 1846–52; president of Racine college, Wis., 1852–59; chancellor of the college, 1859–63. In 1863 he founded at Chicago a literary and scientific school, Immanuel hall, of which he was rector and proprietor till his death. He is the author of *Selections of Juvenile and Miscellaneous Poems*; *Pantology, or Systematic Survey of Human Knowledge*; *Sketch of the History of West Point*; *Hand-book for American Travelers in Europe*; *Jerusalem and other Poems*; and some lectures and addresses.

PARK OF ARTILLERY is the whole train of great guns with equipment, ammunition, horses, and gunners for an army in the field. It is placed in a situation whence rapid access can be had to the line of the army in any part; and at the same time where the divisions of the force can easily mass for its protection. The horses of the park are picketed in lines in its rear.

PARKA, the name given by Fleming to a fossil from the old red sandstone, about which there has been considerable difference of opinion. The quarrymen call them "berries," from their resemblance to a compressed raspberry. They were compared by Fleming to the panicles of a *Juncus*, or the globose head of a sparganium. Lyell thinks they resemble the egg-cases of a natica, while Mantell suggested that they were the eggs of a batrachian. The opinion now most generally entertained is that they are the eggs of the pterygotus.

PARKE, a co. in w. Indiana, having the Wabash river for its w. boundary, intersected by the Logansport, Crawfordsville and South-western railroad, the Evansville, Terre Haute and Chicago crossing the extreme s.w. section; 450 sq.m.; pop. '80. 19,460—19,054 of American birth, 290 colored. It is drained by Sugar and Raccoon creeks, branches of the Wabash. Its surface is generally level, elevated in some portions, and largely covered with forests of hardwood timber, interspersed with groves of sugar maple and ash. Its soil is fertile, producing wheat, corn, dairy products, and vegetables. Cattle, sheep, and swine are raised. A mineral product is bituminous coal, called block coal. Its leading industries are the manufacture of carriages and wagons, saddlery and harness, woolen goods, and cooperage. Co. seat, Rockville.

PARKE, JOHN, b. Del., 1750; a student at the university of Pennsylvania in 1768. At the beginning of the revolution he was assistant quartermaster-gen., and, as some of his poems are dated in camp at Valley Forge and near Boston, it is probable that he was in Washington's division. At the close of the war he went to Philadelphia, and in 1786 published *The Lyric Works of Horace, translated into English Verse, to which are added a number of Original Poems by a Native of America*.

PARKE, JOHN G., b. Penn., 1827; after graduating at West Point in 1849, he was commissioned 2d lieut. in the topographical engineers, and became 1st lieut. in 1856. From 1857 till the rebellion he acted as chief surveyor and astronomer in locating the n.w. boundary. In 1861 he received the rank of brig.gen. of volunteers, and in Burnside's North Carolina expedition commanded a brigade at Roanoke island and New Berne, and was first in command at the capture of fort Macon. For his services in these engagements he was promoted to the rank of maj.gen., and at Antietam and South Mountain was chief of staff of the 9th corps. When gen. Burnside assumed

command of the army of the Potomac, gen. Parke was appointed his chief of staff, and was present at the battle of Fredericksburg and the siege of Vicksburg. At Jackson he commanded Sherman's left wing, and subsequently took part in the siege of Petersburg and the Richmond campaign. He showed great gallantry in the defense of Knoxville and at fort Steadman. At the close of the war he was a maj. in the engineer corps, and has since had charge of a division of that department.

PARKER, a co. in n. Texas, intersected in the s.e. by the Brazos river; 900 sq.m.; pop. '80, 15,871—15,248 of American birth, 620 colored. Its surface is rolling, composed of broad prairies, well timbered for that section of the country. It is drained by rivulets from the Brazos river, and has a fertile soil adapted to the production of cotton, corn, fruit, and vegetables. Live stock is raised to some extent, and coal is found. Co. seat, Weatherford.

PARKER, a family of distinction in the annals of the British navy. The founder of the family was sir HUGH PARKER, an alderman of London, who received a baronetcy in 1681.—His grand-nephew, sir HYDE PARKER, commanded the British fleet in the action off the Dogger bank, Aug. 5, 1781, in which three Dutch ships were destroyed, and the rest of the Dutch fleet compelled to retreat into harbor. In 1783 he was appointed to the command of the British fleet in the East Indies; but the ship in which he sailed thither was lost, with all on board.—His second son, sir HYDE PARKER, distinguished himself in the American war; blockaded the Dutch harbors with a small squadron in 1782; commanded the British fleet in the West Indies in 1795; and in 1801 was appointed to the chief command of the fleet which was sent to the Baltic to act against the armed coalition of the three northern states of Russia, Sweden, and Denmark. He had no share in the battle of Copenhagen, in which Nelson engaged contrary to his orders; but by his appearance before Carlscrona, he compelled the neutrality of Sweden; and he was on the point of sailing for Cronstadt when the news of Paul's death put an end to hostilities.—His kinsman, sir WILLIAM PARKER, was also a British admiral of high repute for his skill and bravery, and contributed to some of the great victories of the close of last century.—Sir PETER PARKER, who was born in 1716, and died in 1811, with the rank of admiral of the fleet, served with distinction during the seven years' and the American wars; and in 1782 brought the French admiral, De Grasse, a prisoner to England, for which he received a baronetcy.—Sir WILLIAM PARKER, born in 1781, commanded the frigate *Amazon* in 1806, and took, after a hard battle, the French frigate *La Belle Poule*, belonging to the squadron of admiral Linois; and in 1809 captured the citadel of Ferrol. In 1841 he succeeded to admiral Elliot in the command of the fleet in the Chinese seas during the first Chinese war. He took possession of Chusan, Ningpo, and Shapu; forced the entrance of the Yang-tse-kiang; and arrived under the walls of Nankin, where the treaty of peace was agreed upon. For these services he received a baronetcy in 1844. He was afterwards appointed to the command of the fleet in the Mediterranean, and exerted himself, although in vain, to mediate between the Neapolitan government and the insurgent Sicilians. In autumn, 1849, he sailed to the Dardanelles, at the request of sir Stratford Canning (now lord Stratford de Redcliffe), to support the Porte against the threatening demands of Austria and Russia concerning political fugitives; and in Jan., 1850, he compelled the Greek government, by a blockade of their ports, to comply with the demands of Britain. Named in 1851 admiral of the blue, he resigned the command of the Mediterranean fleet to admiral Dundas, was created admiral of the white in 1853, admiral of the red in 1858, and rear-admiral of the United Kingdom in 1862. He died in 1866.

PARKER, AMASA J., LL.D., b. Conn., 1807; graduated at Union college in 1825. He was principal of the Hudson academy in 1823, studied law, and was admitted to the bar in 1828, when he entered into partnership with a relative at Delhi, N. Y. He was elected to the state legislature in 1833, and two years later was made a regent of the state university. In 1837 he was elected a member of congress, became a circuit judge, and vice-chancellor of the court of equity in 1844; and a supreme court judge shortly afterwards. In 1859 he was U. S. district-attorney for New York. He compiled *Reports of Criminal Cases*, 6 vols. 8vo, 1855-69; and with Wolfert and Wade, *The Revised Statutes of New York*, 3 vols. 8vo, 1859.

PARKER, CORTLANDT. See page 886.

PARKER, EDWIN POND, b. Me., 1836; graduated at Bowdoin college in 1856; became pastor of the South Congregational church, Hartford, Conn., in 1860, where he remains. He has fine poetic taste and musical culture, and has done excellent work in compiling books of hymns and tunes for church service. He is known as a clear, original, and independent evangelical thinker and preacher, both claiming and conceding liberty in theological investigation; and in the pulpit, spiritually impressive.

PARKER, ELY S., b. N. Y., 1825; a Seneca Indian; b. on the S. reservation at Tonawanda; educated at Rochester, and adopted the profession of a civil engineer. He participated in the war of the rebellion as a member of gen. Grant's staff, and attained the rank of brevet brig.gen. He was afterwards a secretary to gen. Grant, and from 1869 to 1872 commissioner of Indian affairs.

PARKER, FOXHALL A., 1821-79; b. N. Y.; son of capt. F. A. Parker, U. S. navy; educated at the naval academy, and received his appointment as midshipman in 1843.

He served in the Indian campaigns in Florida, was commissioned lieut. in 1850, and during the rebellion commanded the gun-boat *Mahaska*, had charge of the naval battery on Morris island, which reduced fort Sumter to a mass of ruins, and in 1864 had command of the Potomac flotilla. The rank of commander was bestowed on him in 1862, and that of capt. in 1866. He was the author of several magazine articles and of two books, *Squadron Tactics under Steam*; and *Naval Howitzer Ashore and Afloat*. In 1873 he was appointed chief signal officer of the navy. He contributed numerous articles to Johnson's *Encyclopædia*.

PARKER, JOEL, LL.D., 1795-1875; b. N. H.; graduated at Dartmouth college in 1811. He was admitted to the bar, and began to practice at Keene. He soon attained a considerable practice, which he gave up in 1833, to become an associate justice of the supreme court of New Hampshire; and he was appointed chief-justice in 1838. He was chairman of the committee appointed in 1840 to revise the statutes of New Hampshire. In 1847 he was called to a chair in the Harvard law school. He was prominent in the proceedings of the Massachusetts constitutional convention of 1853. In politics he was a conservative, and opposed, during the civil war, to the exercise of what he deemed unconstitutional powers by the president. He published *Non-Extension of Slavery*, 1856; *Personal Liberty Laws*, and *The Right of Secession*, 1861; *Constitutional Law*, 1862; *War Powers of Congress and the President*, 1863; *Revolution and Reconstruction*, 1866; and *Conflict of Decisions*, 1871.

PARKER, JOEL, D.D., 1799-1873; b. Vt.; graduated at Hamilton college 1824; ordained to the ministry in the Presbyterian church 1826, and became prominent as an earnest and successful preacher in revivals of religion; was pastor at Rochester, N. Y., 1826-30; of Dey street church, New York, 1830-33; at New Orleans, 1833-38; of the Broadway tabernacle, New York, 1838-40; president and professor of sacred rhetoric in Union theological seminary, New York, 1840-42; pastor of Clinton street church, Philadelphia, 1842-52; of Bleecker street church, New York, which afterward became the Fourth avenue church, 1852-63; and of Park church, Newark, N. J., from 1863 until failing health compelled him, a short time before his death, to resign.

PARKER, JOEL, LL.D., b. N. J., 1816; educated at the college of New Jersey, and admitted to the bar in 1842. He was a member of the legislature in 1847, and afterward county attorney. He received a commission as maj.gen. of volunteers in 1861. He was governor of New Jersey, 1862-65, and again, 1871. He was a candidate for the democratic nomination for president in the convention at St. Louis in 1876, but failed to receive a large vote.

PARKER, JOHN HENRY. See page 886.

PARKER, LINUS, D.D. See page 886.

PARKER, MATTHEW, the second Protestant archbishop of Canterbury, was born at Norwich, Aug. 6, 1504, studied at Corpus Christi college, Cambridge, and was ordained a priest in 1527. At the university he was a distinguished student, especially of the Scriptures and of the history of the church, even to antiquarian minuteness; yet, in spite of his strong leaning to the past, he was from an early period favorably disposed toward the doctrines of the Reformation, and lived in close intimacy with some of the more ardent reformers. In 1533 he was appointed chaplain to queen Anne Boleyn, who thought very highly of him, and not long before her death exhorted her daughter Elizabeth to avail herself of Parker's wise and pious counsel. In 1535 he obtained the deanery of the monastic college of Stoke-Clare in Suffolk—*Roman Catholicism*, it must not be forgotten, being still the professed religion of the land, for Henry had not yet formally broken with the pope—and here the studious clerk continued his pursuit of classical and ecclesiastical literature, and at the same time set himself to correct the prevailing decay of morals and learning in the church, by founding a school in the locality for the purpose of instructing the youth in the study of grammar and humanity. Here, too, he appears for the first time to have definitely sided with the reforming party in the church and state, the sermons which he preached containing bold attacks on different Catholic tenets and practices. In 1538 Parker took the degree of D.D.; and in 1544, after some minor changes, became master of Corpus Christi college, Cambridge, which he ruled admirably. Three years later he married Margaret Harlstone, the daughter of a Norfolkshire gentleman. It was probably about this time that he drew up his defense of the marriage of priests, entitled *De Conjugio Sacerdotum*. In 1552 he was presented by king Edward VI. to the canonry and prebend of Covingham, in the church of Lincoln. On the accession of queen Mary he refused to conform to the re-established order of things, and was (like many others of the new school of divines) deprived of his preferments, and even obliged to conceal himself. It does not appear, however, that he was eagerly sought after by the emissaries of Mary; for he was no fanatic or iconoclast, but, on the contrary, though sincerely attached to the common Protestant doctrines, very unwilling to disturb the framework of the church. Parker spent at least some portion of his compulsory seclusion from public life in the enlargement of his *De Conjugio Sacerdotum*, and in translating the Psalms into English meter. The death of Mary, and the accession of Elizabeth, called him from that learned retirement of which he seems to have been sincerely fond. Sir Nicholas Bacon, now lord-keeper of the great seal, and sir William Cecil, secretary of state, both old Cambridge friends, knew what a solid and sure judgment, what a moderate and equable spirit, and above all, what a thorough faculty for business, ecclesiastical and secular, Parker had, and by their recommendation he was appointed, by the queen,

archbishop of Canterbury. The consecration took place in Lambeth chapel, Dec. 17, 1559.

“The subsequent history of archbishop Parker,” it has been justly remarked, “is that of the church of England.” The difficulties that beset him were very great. Elizabeth herself was much addicted to various “popish” practices, such as the idolatrous use of images, and was strongly, we might even say violently, in favor of the celibacy of the clergy. She went so far as to insult Parker’s wife on one occasion. But his greatest anxiety was in regard to the spirit of sectarian dissension within the bosom of the church itself. Already the germs of *puritanism* were beginning to spring up, and there can be no doubt that their growth was fostered by the despotic caprices of the queen, Parker himself was manifestly convinced that if ever Protestantism was to be firmly established in the land at all, some definite ecclesiastical forms and methods must be sanctioned to secure the triumph of order over anarchy, and so he vigorously set about the repression of what he thought a mutinous individualism incompatible with a Catholic spirit. That he always acted wisely or well, cannot be affirmed; he was forced, by virtue of his very attitude, into intolerant and inquisitorial courses, and as he grew older he grew harsher, the conservative spirit increasing with his years. To forbid “prophesyings,” or meetings for religious discourse, was something very like persecution, though probably enough something very like treason to the church was talked in these pious conventicles. Fuller (who must have his pun, however bad) says of him: “He was a Parker indeed, careful to keep the fences.” Yet it must not be forgotten that it is to Parker we owe the *Bishop’s Bible*, undertaken at his request, carried on under his inspection, and published at his expense in 1568. He had also the principal share in drawing up the *Book of Common Prayer*, for which his skill in ancient liturgies peculiarly fitted him, and which strikingly bears the impress of his broad, moderate, and unsectarian intellect. It was under his presidency, too, that the *Thirty-nine Articles* were finally reviewed and subscribed by the clergy (1562). Parker died May 17, 1575.

Among other literary performances, Parker published an old *Saxon Homily on the Sacrament*, by Ælfric of St. Albans, to prove that transubstantiation was not the doctrine of the ancient English church; edited the histories of Matthew of Westminster and Matthew Paris (q.v.); and superintended the publication of a most valuable work, *De Antiquitate Britannicæ Ecclesiæ*, probably printed at Lambeth in 1572, where the archbishop, we are told, had an establishment of printers, engravers, and illuminators. He also founded the “society of antiquaries,” and was its first president; endowed the university of Cambridge, and particularly his own college, with many fellowships and scholarships, and with a magnificent collection of MSS. relating to the civil and ecclesiastical condition of England, and belonging to nine different centuries (from the 8th to the 16th). Of this collection Fuller said that it was “the sun of English antiquity before it was eclipsed by that of sir Robert Cotton.”

PARKER, PETER, b. Mass., 1804; graduated at Yale college in 1831; studied theology and medicine at New Haven; was ordained and went to China as a missionary in 1834. He established a hospital at Canton, principally for eye-diseases, but soon for other diseases. The first year over 2,000 patients were treated. Dr. Parker wrought wonderful surgical cures, and his fame spread rapidly. He made it a point to preach to the inmates, and trained several Chinese students in surgery and medicine. In 1837 he visited the Loo-Choo islands and Japan. War breaking out in 1840 between England and China, the hospital was closed, and Dr. Parker returned to America. In 1842 he went back to China and reopened the hospital, which was soon crowded as before. In 1845 he resigned his connection with the American board, and became secretary to the U. S. legation and interpreter of the new embassy, still having charge of the hospital. In the absence of the minister he acted as *chargé d'affaires*. In 1855, his health having failed, he again visited this country, but by request of the government he returned the same year to China as commissioner with full power to revise the treaty of 1844. This position he held until a change of administration in 1857, when, his health again failing, he returned to the United States, and has resided in Washington. He has been a regent of the Smithsonian institution, and filled other scientific positions. He has published *A Statement Respecting Hospitals in China*, and an account of his visit to the Loo-Choo islands and Japan.

PARKER, THEODORE, an American clergyman and scholar, was born at Lexington, Massachusetts, Aug. 24, 1810. His grandfather was capt. of a militia company at the battle of Lexington, his father a farmer and mechanic, and his own boyhood was spent at the district school, on the farm, and in the workshop. At the age of 17 he taught a school, and earned money to enter Harvard college in 1830. During his collegiate course, he supported himself by teaching private classes and schools, and studied metaphysics, theology, Anglo-Saxon, Syriac, Arabic, Danish, Swedish, German, French, Spanish, and modern Greek. Entering the divinity class, at the end of his collegiate course, he commenced to preach in 1836, was an editor of the *Scriptural Interpreter*, and settled as Unitarian minister at West Roxbury in 1837. The naturalistic or rationalistic views which separated him from the more conservative portion of the Unitarians, first attracted wide notice, in consequence of an ordination sermon, in 1841, on *The Transient and Permanent in Christianity*. The contest which arose on the anti-supernaturalism of this discourse, led him to further develop his theological views in five lectures, delivered

in Boston, and published (1841) under the title of *A Discourse of Matters Pertaining to Religion*, which was followed by *Sermons for the Times*. Failing health induced him to make an extended tour in Europe. In 1845 he returned to Boston, preached to large audiences at the Melodeon, and wrote for the *Dial*, *Christian Register*, *Christian Examiner*, and *Massachusetts Quarterly*. He became also a popular lecturer, and was active and earnest in opposition to slavery, the Mexican war, and the fugitive slave law, for resisting which, by more than words, he was indicted. In the midst of his work, he was attacked, in 1859, with bleeding from the lungs, and made a voyage to Mexico, where he wrote his *Experience as a Minister*, whence he sailed to Italy, where he died at Florence, May 10, 1860. His works, consisting chiefly of miscellanies, lectures, and sermons, have been collected and published in America and England, in which his peculiar views in theology and politics are sustained with great force of logic and felicity of illustration. His learning was equal to his energy and philanthropy, and his influence was also great. His library of 13,000 volumes he bequeathed to the Boston free library. See Parker's *Life and Correspondence*, by Weiss (1864).

PARKER, THOMAS, 1595-1677; b. England; studied at Oxford, in Ireland under Dr. Usher, and at Leyden in 1617. He taught and preached in Newbury, England; came to New England in 1634; was colleague with the rev. Mr. Ward at Ipswich, Mass., and then settled at Newbury in 1635. His church was divided by a long controversy on church government, but he remained its pastor till his death. His publications are: *The Prophecies of Daniel Expounded*; *Methodus Gratiae Divinae*; *Theses de Traditione Peccatoris ad Vitane*. He published also a letter to a member of the Westminster assembly on church government, and edited the works of the Puritan Dr. Ames.

PARKER, WILLARD, LL.D., b. N. H., 1800; graduated at Harvard 1826, and began the study of medicine with John C. Warren, professor of surgery in the medical department of Harvard university; graduated in 1830, when he was appointed professor of anatomy in the Vermont medical college. During the same year he was also appointed professor of anatomy in the Berkshire medical college, in which latter institution he became professor of surgery in 1833. In 1836 he accepted the chair of surgery in the Cincinnati medical college. The following year he visited Europe and spent considerable time in the hospitals of Paris and London. After his return, in 1839, he was appointed professor of surgery in the college of physicians and surgeons of New York, a position he held for thirty years. He then resigned and was appointed professor of clinical surgery, lecturing once a week at the *cliniques*. In 1865 he was made president of the New York state inebriate asylum at Binghamton; '67, member metropolitan board of health. He made many contributions to the science of surgery, among which are the performance of the operation of cystotomy for the treatment of some cases of chronic cystitis, and the establishment of a system of rational treatment in cases of abscess of the *appendix vermiciformis*. He was also the first to point out the fact that nerve branches became the subject of concussion, as well as the nerve centers, a condition which had previously been confounded with inflammation or congestion. Dr. P. was also a successful operator in many important cases of ligaturing. See LIGATURE. He d. 1884.

PARKERSBURG, a city in West Virginia, incorporated 1860, on the e. bank of the Ohio river at the mouth of the Little Kanawha; pop. 1880, 6,582. It is the capital of Wood county, 92 m. below Wheeling, 65 m. n. of Charleston and 12 m. below Marietta, Ohio. It is regularly laid out in squares, with streets 60 ft. wide; on a plateau 100 ft. above the river, the ascent being a gradual rise from the water's edge, and the limits of the city extending for 1 m. on the Ohio river, and 2 m. on the Little Kanawha. In the background is an elevation called Prospect hill. A railroad bridge spans the Ohio at this point, erected in 1869-71 at a cost of \$1,000,000; 1½ m. long, 6 spans over the river. It is the w. terminus of the Baltimore and Ohio railroad, connecting here with the Marietta and Cincinnati railroad. It has regular lines of steamers to Wheeling, Charleston, and Cincinnati, the Little Kanawha being navigable 38 m. above this place. It is favorably located, the center of a fertile agricultural region, and of an active and constantly increasing trade. It contains 4 medicinal springs 6½ m. from the city, and petroleum wells of great value. Salt is among its mineral products. It has 7 establishments for refining petroleum, producing about 200,000 barrels of illuminating and 100,000 barrels of lubricating oil annually; annual value of oil shipments \$3,000,000. Among its manufactories are barrel factories, a chemical laboratory, a boat-building yard, lumber mills, iron foundries, machine shops, and chemical works. Its public buildings are of a substantial character, consisting of a county court-house, a fine building for holding the U. S. court, a custom house, a market, and fine post-office, and 3 national banks, with an aggregate capital of \$450,000. Three weekly newspapers and two monthly magazines are published here. It contains 10 churches and several academies.

PARKES, Sir HARRY SMITH, b. in England about 1812. After receiving a good education he went out to China, in the British civil service, at the time of the opium war in 1840. Rapidly rising, by reason of his energy and knowledge of the Chinese language, he was appointed British consul at Canton. The Chinese constabulary force seized the British lorcha *Arrow*, Oct. 8, 1856, and took therefrom 12 Chinese sailors. The action of Mr. Parkes in demanding from mandarin Yeh their return to the British consulate, and his speedy notification of the act to the British naval commander, led to the bom-

bardment of Canton and the capture of the forts and city, Dec. 28, 1857. In July, 1860, he left Canton to join lord Elgin in the n. of China, where the large naval forces of England and France were assembling off the Pei-ho. After the capture of Tientsin, Aug. 24, and while the allied forces were moving on to Peking, a conference with the Chinese was attempted at Tungchow. Consul Parkes, with 25 men, were sent forward with a flag of truce, but were seized by the Chinese, and kept prisoners in cages. Thirteen were barbarously murdered, and the remainder tortured and nearly starved. While a prisoner in a cage, Parkes sent word to lord Elgin not to delay or in any way compromise on his account. The treatment of Parkes and his companions left the allies no course but to proceed to Peking, before which they arrived Oct. 6. Parkes and the survivors of his party were delivered to the British forces Oct. 9, but in retaliation for the cruelties and murders inflicted the imperial summer palace was destroyed and pillaged. For his courage and skill, Parkes was rewarded with the title K.C.B., and appointed minister to Japan, arriving at Yokohama June 30, 1865. With characteristic insight, he soon learned the truth that the mikado and not the "tycoon" was the sovereign of Japan. He was the first foreign diplomat to recognize the new government of Japan as it rose out of the revolution of 1868. He negotiated treaties between J. and 13 European nations; was made minister to China, 1882. He d. 1884.

PAR'KESINE, the name given to a substance introduced for manufacturing purposes by Mr. Parkes of Birmingham. In that town, where so many kinds of small objects are made in countless thousands daily, it is of great importance to get hold of a cheap material which will in some measure partake of the properties of ivory, bone, horn, tortoise-shell, hard wood, india-rubber, or other natural substances. There are a number of artificial compositions which to some extent do this, and Parkesine is one of these. It is said to be a mixture of pyroxyline (gun-cotton) and oil, hardened with chloride of sulphur. The pyroxyline is made from any vegetable fiber, as cotton and flax waste, or rags. According to another account, it is composed of castor oil, collodion, and wood spirit. For large and cheap objects other materials and solvents can be used, to which saw-dust, cork-dust, or pigments may be largely added.

In a paper read before the society of arts on the subject of Parkesine, and in a discussion which followed the reading, it was stated that this substance is not affected by seawater; it does not soften, like gutta-percha, by heat; it is a good insulator of electricity, even at a temperature of 212° F.; it may be made either opaque or transparent, plain or colored; it will make a very strong joint after fracture; it will resist most of the common acids; its tensile strength is greater than that of india-rubber or gutta-percha. In its hard form, the surface can be so treated as to imitate marble, tortoise-shell, amber, or malachite. It may be molded, pressed, turned, sawn, planed, carved, rolled, engraved, inlaid, or polished, according to the consistency given to it in the course of manufacture; or it may be made thin enough to use, when melted, as a varnish or protective coating or water-proofing. Among the many articles into which it may be fashioned, are included spinners' rolls and bosses, knife-handles, combs, brush-backs, shoe-soles, umbrella and parasol handles, buttons, book-binding, tubes, galvanic-battery cells, water-proof fabrics, surgical implements, and telegraphic insulators.—It is probable that the eventual success of compositions such as this will mainly depend on the price at which the material can be supplied per pound, compared with the prices of gutta-percha and india-rubber, the two substances which it is mainly intended to imitate or supersede; and the supply of these is necessarily exhaustible. Parkesine appears to have been first made on a large scale in 1862, but the manufacture of it has declined. There are, however, other materials in use which resemble it as respects composition.

PARKHURST, CHARLES H., D.D. See page 886.

PARKHURST, JOHN, an English biblical scholar, the second son of John Parkhurst, esq., of Catesby, in Northamptonshire, was b. in June, 1728, educated at Rugby and at Clare hall, Cambridge, where he took his degree of M.A. in 1752, and in 1753 published *A Serious and Friendly Address to the Rev. John Wesley, in Relation to a Principal Doctrine advanced and maintained by him and his Assistants*. The doctrine assailed in Parkhurst's pamphlet was the favorite Wesleyan doctrine of "Assurance." In 1762 appeared his principal work—indeed the only thing that has preserved his name—*A Hebrew and English Lexicon, without Points, adapted to the Use of Learners*. Parkhurst kept mending this Hebrew lexicon all his life. It was a very creditable performance for its time, and long continued to be the standard work on the subject among biblical students in this country; but it is disfigured by its fanciful etymologies, partly the result of his having (like many other divines of his time) adopted the irrational and presumptuous theories of Hutchison (q.v.), and is now entirely superseded by the works of Gesenius, Ewald, and other critical scholars. Parkhurst also wrote a treatise (1787) against Dr. Priestley, to prove the divinity and pre-existence of Jesus Christ. He died at Epsom, in Surrey, Mar. 21, 1797.

PARKINSO'NIA, a genus of plants of the natural order *leguminosæ*, sub-order *cæsalpiniæ*.—*P. aculeata* is a West Indian shrub or small tree, which, when in flower, is one of the most splendid objects in the vegetable kingdom. It has pinnated leaves, with winged leaf-stalk, and large yellow flowers spotted with red. It is furnished with strong spines, and is often used for hedges, whence it is called the Barbadoes flower fence. It is now

common in India. The bark yields a beautiful white fiber, which, however is not very strong; but it has been suggested that it might be found suitable for paper-making.

PARKMAN, FRANCIS, D.D., 1788-1852; b. Boston; graduated at Harvard in 1807, and prepared for the ministry under Channing and at Edinburgh. In 1813 he was settled over the new North (Unitarian) church, where he continued to be pastor till 1849. He published, in 1829, *The Offering of Sympathy*. The Parkman professorship of pulpit eloquence in the Harvard divinity school is his foundation.

PARKMAN, FRANCIS, JR., b. Boston, 1823; graduated at Harvard in 1843, and began the study of the law. He gave up the law in 1846, and made a journey to the Rocky mountains, living for a time among the Dakota Indians, and suffering hardships which seriously impaired his health. He embodied his western experiences in his *Prairie and Rocky Mountain Life*, better known under its later title of *California and the Oregon Trail*. In 1856 he published a novel called *Vassall Morton*. For the last 30 years he has studied the history of the French power in America, and his works on various branches of that subject are of the first authority. The first of his series of works on this topic was *The Conspiracy of Pontiac*, which appeared in 1857. It was followed by the *Pioneers of France in the New World* (1865); *The Jesuits in North America* (1867); *The Discovery of the Great West* (1869); and *The Old Régime in Canada* (1874). He has made two visits to France for the purpose of examining authorities, and consulting the French archives. Like Prescott, his sight is so impaired as to make it impossible for him to read or write. In spite of this disadvantage, his historical works show accurate investigation, and are distinguished for impartiality and candor, no less than for grace of style. He has also given much attention to horticulture, published in 1866 *The Book of Roses*, and was professor of horticulture in the Bussey institution connected with Harvard university, 1871-72. For critical estimates of P.'s writings, see articles in *Appleton's Journal*, No. 3; *Atlantic Monthly*, No. 34 (W. D. Howells); and *International Review*, No. 3.

PARLEY, in military language, is an oral conference with the enemy. It takes place under a flag of truce, and usually at some spot—for the time neutral—between the lines of the two armies.

PARLIAMENT (Fr. *parlement*, from *parler*, to talk), the supreme legislature of the United Kingdom of Great Britain and Ireland. The word was first applied, according to Blackstone, to general assemblies of the states under Louis VII., in France, about the middle of the 12th c.; but in that country it came eventually to be the designation of a body which performed certain administrative functions, but whose principal duties were those of a court of justice.

The origin of the parliament of England has been traced to the Saxon great councils of the nation, called "Wittena-gemote," or meeting of wise men. These had, however, little in common with the parliaments of a later date: among other points of difference, they had a right to assemble when they pleased without royal warrant. Even under the Norman kings, the great council formed a judicial and ministerial as well as a legislative body, and it was only gradually that the judicial functions were transferred to courts of justice, and the ministerial to the privy council—a remnant of the judicial powers of parliament being still preserved in the appellate jurisdiction of the house of lords. Under the Norman kings, the council of the sovereign consisted of the tenants-in-chief of the crown, who held their lands *per baroniam*, lay and ecclesiastic. It was the principle of the feudal system that every tenant should attend the court of his immediate superior; and he who held *per baroniam*, having no superior but the crown, was bound to attend his sovereign in the great council or parliament. In the charter of king John, we for the first time trace the germ of a distinction between the peerage and the lesser nobility, the archbishops, bishops, abbots, earls, and greater barons being required to attend by a writ addressed to each, and the other tenants-in-chief by a general summons by the sheriffs and bailiffs. Baronial tenure originally made a man a baron or lord of parliament. When the offices or titles of earl, marquis, or duke were bestowed on a baron, they were conferred by royal writ or patent, and at length barony came also to be conferred by writ instead of by tenure. During the 13th c., the smaller barons were allowed, instead of personally attending the national council, to appear by representatives; but the principle of representation seems first to have been reduced to a system when permission was also given to the municipalities, which, as corporations, were chief tenants of the crown, to appear by representatives. It is not quite clear when the division of parliament into two houses took place; but when the representatives of the minor barons were joined by those of the municipalities, the term commons was applied to both. The lower house was early allowed to deal exclusively with questions of supply; and seems, in the reign of Richard II., to have established the right to assign the supplies to their proper uses. As the commons became more powerful, they came to insist on the crown redressing their grievances before they would vote the supplies. The influence of parliament was on the increase during the Tudor period, while the reign of the Stewarts was characterized by a struggle for supremacy between the parliament and the crown, each striving to acquire the control of the military force of the country. The powers of the different estates came to be more sharply defined at the revolution of 1688. Nineteen years later, on the union of Scotland, the parliament of England was merged into that of Great Britain.

In its early history, prior to the war of independence, the parliament of Scotland had probably not been very unlike that of England; it assembled without warrant, and consisted of bishops, earls, priors, abbots, and barons. At the close of the 13th c., the constitutional history of Scotland diverges from that of England. The addition of the burghs to the national council seems to date from the beginning of the 14th c., but it was not till much later that the lesser barons began to be exempted from attendance. The first act excusing them belongs to the reign of James I., and allows them to choose representatives called speakers, two for each county, excepting some small counties, which were to have but one, the expenses of the representatives being defrayed by the constituency. The Scottish parliament was never, like the English, divided into two houses; all sat in one hall, and though it consisted of three estates, a general numerical majority of members was considered sufficient to carry a measure. The greater part of the business was transacted by the lords of the articles, a committee named by the parliament at the beginning of each session, to consider what measures should be passed; and whatever they recommended was generally passed without discussion. It was never held indispensable that the parliament should be summoned by the crown, and it has even been thought that the royal assent to the measures carried was not absolutely essential. The parliament which carried the reformation had no royal sanction. The union was adjusted by commissioners for each country selected by the crown, and passed first, after strong and protracted opposition, in Scotland, and afterward more easily in England.

By the act of union with Ireland in 1800 (Act 39 and 40 Geo. III. c. 67), the Irish parliament was united with that of Great Britain as the parliament of the United Kingdom of Great Britain and Ireland. The parliament of Ireland had been originally formed on the model of that of England about the close of the 13th c., but it was merely the very small portion of Ireland occupied by the English settlers that was represented, which, as late as the time of Henry VII., hardly extended beyond the counties of Dublin, Louth, Kildare, and Meath, and constituted what was called the Pale. It was only for the last few years of its existence that the Irish parliament was a supreme legislature; the English parliament having down to 1783, had power to legislate for Ireland. By one of the provisions of Poyning's Act, passed in 1495, no legislative proposals could be made to the Irish parliament until they had received the sanction of the king and council in England. Act 23 Geo. III. c. 28 gave the Irish parliament exclusive authority to legislate for Ireland, and the abuse of this power so obstructed the machinery of government, as to render the union of 1800 matter of necessity.

The power of parliament is according to sir Edward Coke, so transcendent and absolute, that it cannot be confined either for persons or causes within any bounds. All remedies which transcend the ordinary courts of law are within its reach. It can alter the succession to the throne, the constitution of the kingdom, and the constitution of parliament itself. It has its own law, to be learned from the rolls and records of parliament, and by precedents and experience. One of the most thoroughly established maxims of this law is, that whatever question arises concerning either house of parliament ought to be discussed and adjudged there, and not elsewhere. The house of lords will not allow the commons to interfere in a question regarding an election of a Scotch or Irish peer; the commons will not allow the lords to judge of the validity of the election of a member of their house, nor will either house permit courts of law to examine such cases. The authority of parliament extends to British colonies and foreign possessions. In the ordinary course of government, however, parliament does not make laws for the colonies. For some the queen in council legislates; others have legislatures of their own, which propound laws for their internal government, subject to the approbation of the queen in council; but these may be repealed and amended by parliament.

The constituent parts of parliament are the sovereign, the house of lords, and the house of commons. In the sovereign is vested the whole executive power; the crown is also the fountain of justice, from whence the whole judicial authority flows. To the crown is intrusted the permanent duty of government, to be fulfilled in accordance with the law of the realm, and by the advice of ministers responsible to parliament. The sovereign is also invested with the character of the representation of the majesty of the state. The sovereign's share in the legislature includes the summoning, proroguing, and dissolving of parliament. Parliament can only assemble by act of the sovereign; in but two instances have the lords and commons met of their own authority—viz., previously to the restoration of Charles II., and at the convention parliament summoned at the revolution of 1688; and in both instances it was considered necessary afterward to pass an act declaring the parliament to be a legal one. Though the queen may determine the period for assembling parliament, her prerogative is restrained within certain limits. She is bound by statute (16 Chas. II. c. 1; and 6 and 7 Will. and Mary c. 2) to issue writs within three years after the determination of a parliament; and the practice of voting money for the public service by annual enactments, renders it compulsory for the sovereign to meet parliament every year. Act 43 Geo. III. c. 90 provides that the sovereign shall assemble parliament within fourteen days, whenever the militia shall be drawn out and embodied in case of apprehended invasion and rebellion; and a similar proviso is inserted in Act 15 and 16 Vict. c. 50, in case the present militia force should be raised to 120,000 men, and embodied. The royal assent is necessary before any

measure can pass into law. The crown, as the executive power, is charged with the management of the revenues of the state, and with all payments for the public service; it is therefore the crown that makes known to the commons the pecuniary necessities of the government, without which no supplies can be granted. The sovereign's prerogative also includes the sending and receiving of ambassadors, entering into treaty with foreign powers, and declaring war or peace. All the kings and queens since the revolution have taken an oath at their coronation "to govern according to the statutes in parliament agreed on, and the laws and customs of the same." The sovereign is further bound to an adherence to the Protestant faith, and the maintenance of the Protestant religion as established by law. By the bill of rights (1 Will. and Mary c. 2, s. 6), and the Act of Settlement (12 and 13 Will. III. c. 2, s. 2) a person professing the popish religion, or marrying a papist, is incapable of inheriting the crown, and the people are absolved from their allegiance. This exclusion is further confirmed by the act of union with Scotland; and in addition to the coronation oath, every king or queen is required to take the declaration against the doctrines of the Roman Catholic church prescribed by 30 Chas. II. c. 2, either on the throne in the house of lords in the presence of both houses, at the first meeting of the first parliament after the accession, or at the coronation whichever event shall first happen. The sovereign is bound by similar sanctions to maintain the Protestant religion and Presbyterian church government in Scotland.

The province of the houses of parliament is to legislate with the crown, to provide supplies, to exercise a supervision over the ministers of the crown and all other functionaries, and to advise the sovereign on matters of public moment. The upper house, from its hereditary and aristocratic character, is a check on the popular branch of the legislature and on hasty legislation.

The house of lords may originate legislative measures of all kinds, except money-bills. Acts of grace and bills affecting the rights of peers must originate in this house. In its judicial capacity, defined by the appellate jurisdiction act, 1876, it forms a court of final appeal from her majesty's court of appeal in England, from the court of session, Scotland, and the superior courts of law and equity of Ireland. It has a judicature in claims of peerage and offices of honor under reference from the crown. Since the union with Scotland and Ireland, it has had the power of deciding disputed elections of representative peers. It tries offenders impeached by the house of commons, and members of its own body on indictment found by a grand jury. The house of lords is composed of lords spiritual and temporal. According to a declaration of the house in 1672, the lords spiritual are only lords of parliament and not peers, a distinction which seems not to have been known in ancient times. They consist of 2 archbishops and 24 bishops for England, who are said to have seats in virtue of their temporal baronies. (By the act of 1869, the Irish church, which formerly sent 4 bishops, is no longer represented.) The bishop of Sodor and Man has no seat in parliament, and on Manchester being made a see in 1847, it was arranged that one other bishop should be in the same position, according to a rotation not including the bishops of London, Durham, and Winchester, so as not to increase the number of the lords spiritual. The lords temporal consist of: 1. The peers of England, of Great Britain, and of the United Kingdom, of whom there were, in 1876, 5 princes of the royal blood, 21 dukes, 17 marquises, 109 earls, 24 viscounts, and 232 barons. The number of the peers of the United Kingdom may be increased without limit by new creations at the pleasure of the sovereign. 2. Sixteen representatives chosen from their own body by the peers of Scotland for each parliament. As no provision was made at the union for any subsequent creation of Scottish peers, the peerage of Scotland consists exclusively of the descendants of peers existing before the union. By order of the house of lords, an authentic list of the Scottish peers was entered on the roll of peers on Feb. 12, 1708, to which all claims since established have been added; and in order to prevent the assumption of dormant and extinct peerages by persons not having right to them, statute 10 and 11 Vict. c. 52, provides that no title standing in the roll, in right of which no vote has been given since 1800, shall be called over at an election without an order of the house of lords. 3. Twenty-eight representatives of the Irish peerage, elected for life. Most peerages are still hereditary. Life peerages were in early times not unknown to the constitution; but in 1856, her majesty having created lord Wensleydale a peer for life, the house of lords decided he could not sit and vote. But in 1876, peers to sit as members of the house while they held the office of lords of appeal in ordinary—i.e., for judicial business, but on ceasing to act as judges to be peers no longer—were created by statute. The house has also power to call to its assistance in legal and constitutional questions the judges of the supreme court of judicature of all the four divisions, who advise what should be done. The house has power also to sit for judicial business during the prorogation of parliament. The votes of spiritual and temporal lords are intermixed, and the joint majority determine every question; but they sit apart on separate benches—the place assigned to the lords spiritual being the upper part of the house on the right hand of the throne. A lord may, by license from the sovereign, appoint another lord as his proxy to vote for him in his absence; but a lord spiritual can only be proxy for a lord spiritual, and a lord temporal for a lord temporal, and no member of the house can hold more than two proxies at the same time. Proxies cannot vote in judicial questions or in committees of the whole house. There are other rules and restrictions incident to the right of vote by proxy; a lords' committee

in 1867 reported that the practice of using proxies should be discontinued, but no alteration in the rules was agreed to. Peerages are lost by attainder for high treason. Neither the issue of the body of the person attainted, nor, on their failure, the descendants of the person first called to the dignity, will be admitted to it without a removal of the attainder. But where the attainted person is tenant in tail-male, with a remainder in tail-male to another, the dignity becomes vested in the remainder man on failure of the issue of the person attainted. A peerage, whether by patent or writ, is forfeited by attainder for high treason; attainder for felony forfeits a peerage by writ, not one by patent. An attainted peerage cannot be restored by the crown, only by an act of parliament.

The house of commons, besides its general power to introduce legislative measures, has the sole right to originate bills levying taxes, or affecting the public income and expenditure, and to examine into the validity of elections to its own body. The question whether it has any control over the rights of electors was the subject of a memorable contest between the lords and commons in 1704, in the cases of Ashby and White, and of the "Aylesbury men" (*Hatsell's Precedents*, vol. iii.), a contest ended by the queen proroguing parliament. When inquiring into the conflicting claims of candidates for seats in parliament, the commons have an undoubted power to determine whether electors have the right to vote. The house of commons has the right to expel or commit to prison its own members, and to commit other persons who offend by breach of its privileges, contempt of its authority, disobedience of its orders, or invasion of its rights; but this power is limited to the duration of the session. Expulsion does not, however, create any disability to serve again in parliament. The house of commons has also the power of impeaching offenders, who, however, are tried at the bar of the house of lords.

The number of members of the house of commons has varied greatly at different times. In the reign of Edward I., it seems to have been 275; in that of Edward III., 250; and of Henry VI., 300. In the reign of Henry VIII., 27 members were added for Wales, and 4 for the county and city of Chester; 4 were added for the county and city of Durham in the reign of Charles II. Between the reign of Henry VIII. and that of Charles II., 180 new members were added by the granting of royal charters to boroughs which had not previously returned representatives. Forty-five members were assigned as her proportion to Scotland at the union, and 100 to Ireland, making the whole number of members of the house of commons of the United Kingdom 658. The reform acts of 1832, 2 Will. IV. c. 45 for England, 2 and 3 Will. IV. c. 65 (amended by 4 and 5 Will. IV. c. 88, and 5 and 6 Will. IV. c. 78) for Scotland, and 2 and 3 Will. IV. c. 88 for Ireland, while leaving unaltered the whole number of members of the house of commons, made great changes in the distribution of their seats. Fifty-six boroughs in England and Wales were entirely disfranchised; 30 which had previously returned two members were restricted to one; while 42 new boroughs were created, of which 22 were each to return two members, and 20 a single member. Several small boroughs in Wales were assigned to the city of London, 2 to each of the universities of Oxford and Cambridge, and one to 133 cities and boroughs. The number of members for Scotland was increased from 45 to 53, 30 being county and 23 borough members, some of the latter representing several combined boroughs. The number of members for Ireland was increased from 100 to 105, 64 representing counties, 24 cities and boroughs, and 2 the university of Dublin. Further extensive changes in the distribution of seats were made by the recent reform acts of 1867 and 1868, 30 and 31 Vict. c. 102 for England, and 31 and 32 Vict. c. 48 for Scotland. The English act deprived of its second member each borough of less than 10,000 inhabitants, and altogether disfranchised 7 boroughs, giving 45 seats for redistribution, of which 25 were given to the larger counties, 11 to new boroughs, 8 to boroughs already represented, and 1 to the university of London. The Scotch act united the counties of Selkirk and Peebles into one constituency; gave a member to the universities of Edinburgh and St. Andrews, and another to the universities of Glasgow and Aberdeen, a second member to each of the counties of Lanark, Ayr, and Aberdeen, and to the town of Dundee, and a third member to Glasgow; and constituted Hawick, Galashiels, and Selkirk into a new district of boroughs; the 7 new seats required being provided for by a further disfranchisement of small English boroughs. The Irish reform act, 31 and 32 Vict. c. 49, made no change in the distribution of seats. The whole number of 658 seats was thus left unaltered, but the disfranchisement of two English and two-Irish boroughs for bribery has since reduced the number to 652, which are thus distributed:

	Counties.	Boroughs.	Universities.	Total.
England and Wales.....	187	295	5	487
Scotland.....	32	26	2	60
Ireland.....	64	39	2	105
	<hr/>	<hr/>	<hr/>	<hr/>
	283	360	9	652

In English counties, prior to the act of 1832, the electoral qualification was founded on the holding of freehold property of the yearly value of 40s. : by that act every person who at the date was seized for his own life and that of another, or for any lives whatever, of a 40s. freehold, or who might be seized subsequently to the act if in occupation,

or who might come into such freehold estate by marriage, marriage-settlement, devicc, or promotion to any benefice or office, could still vote as a freeholder; but a person not included in these classes, acquiring a freehold subsequently to the act, had only the franchise when it was of the clear yearly value of £10, which value was reduced to £5 by the act of 1867. Copyholders holding an estate of £10 a year, leaseholders of that value whose leases were originally granted for 60 years, leaseholders of £50 with 20 years' leases, and tenants at will occupying lands or tenements paying a rent of £50, had the franchise under the act of 1832; and the act of 1867 reduced the franchise of copyholders and leaseholders from £10 to £5, and the occupation franchise from £50 to £12. In boroughs, the old qualification varied according to local usage, and some of the ancient rights, as that of freemen, were retained in 1832, when the franchise was bestowed on all occupiers of houses of £10 yearly value. The act of 1867 extended the borough franchise to all occupiers of dwelling-houses who have resided for 12 months on July 31, in any year, and have been rated to the poor-rates as ordinary occupiers, and have, on or before July 20, paid such rates up to the preceding Jan. 5, and to lodgers who have occupied for the same period lodgings of the annual value, unfurnished, of £12. In Scotland, the old county qualification consisted in being infeft in lands or superiorities holding directly of the crown of 40s. old extent (see VALUATION), or £400 Scots valued rent; and the Scotch act of 1832 reserved the rights of persons then on the roll of freeholders, or entitled to be put on it, and extended the franchise to all owners of property of the clear yearly value of £10, and to certain classes of leaseholders. By the act of 1868, the county franchise was further extended to proprietors of lands of £5 yearly value, and occupiers of the ratable value of £20. The Scottish burghal franchise had, prior to 1832, been vested in the town-councils: the act of 1832 substituted a £10 household franchise, and that of 1868 conferred the franchise on all occupiers of houses paying rates.

By the Irish reform act of 1832, various classes of freeholders were invested with the county franchise, to whom were added, by 13 and 14 Vict. c. 69, occupiers of land rated for the poor-rate at a net annual value of £12, and persons entitled to estates in fee, or in tail, or for life, of the rated value of £5. The Irish borough qualification was nearly the same as the English, but the above-mentioned statute of Victoria added to the constituency the occupiers of lands and premises rated at £8. The act of 1868 made no change in the county qualification, but gave the borough franchise to occupiers of houses rated at £4, and of lodgings of the annual value of £10 unfurnished. Certain disqualifications exist from exercising the franchise on the grounds of infamy, alienage, conviction of felony, and the holding of government offices. Peers cannot vote. In the universities of Cambridge and Oxford the constituency consists of the doctors and masters of arts; in Dublin, of the fellows, scholars and graduates of Trinity college. In London university the graduates form the constituency; in the Scotch universities the chancellor, the members of the university court, the professors, and the members of general council. Under the acts of 1867-8, in London, where four members are returned, each elector has only three votes; and in Glasgow, which returns three members, each elector has but two votes.

The reform acts of 1832 introduced a system of registration of voters for the three divisions of the United Kingdom. In England lists of voters are prepared by the overseers of each parish, and on certain days courts are held by barristers appointed by the chief-justice and the senior judge of each summer circuit to revise these lists, when claims may be made for persons omitted, and objections offered to names standing on the list. If an objection be sustained, the name is struck off the list, there being an appeal from the decision of the revising barrister to the court of Common Pleas. In Scotland a register of persons entitled to vote is made up annually in counties and boroughs in terms of the registration of voters (Scotland) act, 24 and 25 Vict. c. 23, which register is printed, and may be had for a small price. Voters are thus put on the roll without trouble to themselves, and, in point of fact, without their consent. Enrollment, however, may be challenged, in which case objections are heard and determined by the sheriffs, subject (under the act of 1868) to appeal to a tribunal composed of three judges of the court of session. The registration system of Ireland introduced by the reform act resembles that of England; and by 16 and 17 Vict. c. 58, provision is made for the annual revision of the list of voters for the city of Dublin.

A property qualification of £600 a year in candidates for counties and £300 in candidates for boroughs, which had previously existed in England and Ireland, was left untouched in 1831, but has been abolished by 21 and 22 Vict. c. 26. Scotch peers, though not representative peers, are disqualified from sitting in the house of commons. Irish peers may represent any constituency in Great Britain, but not in Ireland. A disqualification is also attached to judges (except the master of the rolls), clergymen of the established church of any of the three kingdoms, Roman Catholic priests, revenue officers, persons convicted of treason and felony, and aliens, even when naturalized, unless the right has been conceded in express terms. Sheriffs cannot sit for their own counties, and government contractors are disqualified, a disqualification which does not extend to contractors for government loans. A member becoming bankrupt is incapacitated from sitting or voting.

When a new parliament has to be assembled, the lord chancellor, by order of the

sovereign, directs the clerk of the crown to prepare and issue, under the great seal, writs to the sheriffs of counties, both for the counties and the boroughs. A sheriff, on receiving the writ for a county, appoints a day for the election, and by the practice prior to the ballot act, 1872 (35 and 36 Vict. c. 33) on the day fixed, he proclaimed the writ. If no more candidates were then proposed than were to be elected, he declared them duly elected; if there was opposition, a show of hands was asked, and the sheriff declared who had the majority. If a poll was demanded by the opposite party, the election was adjourned. The electors of each district voted at their several polling-places, and at the termination of the poll, the return was transmitted to the sheriff, who proclaimed the successful candidate. In borough elections in England and Ireland, the sheriff, on receiving the writ, issued his precept to the returning officer of the municipality, who superintended the election; in Scotland, the sheriff himself superintended the borough as well as the county elections. The names of the persons elected, both in counties and boroughs, were returned by the sheriff to the clerk of the crown. The candidates are now nominated by a writing signed by two electors, as proposer and seconder, and eight others as consenting, and delivered to the returning officer; if on expiry of an hour from the time fixed there are more candidates than vacancies, the election is adjourned and a poll taken. The vote is given by ballot (q.v.), and the result announced by the returning officer, and returned to the clerk of the crown in chancery. Vacancies occurring after a general election are supplied by new writs issued by authority of the house. When it is determined that a writ should be amended, the clerk of the crown is ordered to attend the house, and amend it accordingly.

A member of the house of commons can not, in theory, resign his seat, but on the acceptance of any office of profit under the crown, his election is, by an act of queen Anne, declared void, and a new writ issues, he being, however, eligible for re-election. By the reform act of 1867, members who already hold certain offices do not vacate their seats on the acceptance of certain other offices enumerated, the list seemingly comprehending all offices usually held by members. The resignation of office is held not to be complete until the appointment of a successor; and on the resumption of office, the seat is held not to have been vacated. A first commission in the army or navy vacates a seat; subsequent commissions do not do so. A member wishing to resign usually applies for the stewardship of the Chiltern Hundreds (q.v.).

Privilege.—Both houses of parliament possess extensive privileges for the maintenance of their authority and the protection of individual members. Some of these privileges have well-defined limits; others are so vague in their extent as occasionally to lead to conflicts between parliament and the courts of law. The privilege of speech is claimed of the sovereign by the speaker of the house of commons at the opening of every new parliament. At the same time, any member using offensive expressions may be called to the bar to receive a reprimand from the speaker; or, if the offense be grave, may be committed for contempt, in which case he is sent either to the tower or to Newgate. Persons not members of the house may also be committed for breach of privilege, and no one committed for contempt can be admitted to bail, nor can the cause of commitment be inquired into by the courts of law. The publication of the debates of either house has repeatedly been declared a breach of privilege; but for a long time back this privilege has been practically waived, except where the reports are false and perverted. Publication of the evidence before a select committee previously to its being reported is punished as a breach of privilege. Libellous reflections on the character and proceedings of parliament, or of members of the house, come under the same category, as also does assaulting or threatening a member. Willful disobedience to the orders of the house is punishable as a breach of privilege; but if orders be given beyond the jurisdiction of the house, their enforcement may be questioned in a court of law. The offer of bribe to, or its acceptance by a member, is a breach of privilege; so also is any interference with the officers of the house in the execution of their duty, or tampering with witnesses who are to be examined before the house, or a committee of the house. Members of both houses are free from arrest or imprisonment in civil matters, a privilege which is permanent in the case of peers, extending also to peeresses, whether by creation or marriage (though the latter lose it by subsequently marrying a commoner), and to peers and peeresses of Scotland and Ireland, whether representative or not. It continues in the case of members of the house of commons during the sitting of parliament, for forty days after each prorogation, for 40 days prior to the day to which parliament is prorogued, and for a reasonable time after a dissolution. Witnesses summoned to attend before parliament or parliamentary committees, and other persons in attendance on the business of parliament, are also protected from arrest. Protection is not claimable from arrest for any indictable offense. Counsel are protected for any statements that they may make professionally.

Meeting of a New Parliament.—On the day appointed for the meeting of a new parliament, the members of the two houses assemble in their respective chambers. In the lords, the lord chancellor acquaints the house that "her majesty, not thinking it fit to be personally present here this day, had been pleased to cause a commission to be issued under the great seal, in order to the opening and holding of the parliament," the lords commissioners, being in their robes, and seated between the throne and woollen sack, then command the gentleman usher of the black rod to let the commons know that the

“lords commissioners desire their immediate attendance in this house to hear the commission read.” Meantime, in the lower house, the clerk of the town in chancery has delivered to the clerk of the house a list of the members returned to serve; and on receiving the message from black rod the commons go up to the house of lords. The commission having been read in presence of the members of both houses, the lord chancellor opens the parliament by stating “that her majesty will, as soon as the members of both houses shall be sworn, declare the causes of her calling this parliament: and it being necessary that a speaker of the house of commons should first be chosen, that you, gentlemen of the house of commons, repair to the place where you are to sit, and there proceed to the appointment of some proper person as your speaker, and that you present such person whom you shall so choose here to-morrow at o’clock, for her majesty’s royal approbation.” The commons immediately withdraw, and, returning to their own house, proceed to elect a speaker.

Till a speaker is elected, the clerk acts as speaker, standing and pointing to members as they rise to speak, and then sitting down. If only one candidate be proposed for the office, the motion, after being seconded, is supported by an influential member, generally the leader of the house of commons; and the member proposed, having expressed his sense of the honor meant to be conferred on him, is called by the house to the chair, to which he is led by his proposer and seconder. If another member be proposed and seconded, a debate ensues; and at its close, the clerk puts the question, that the member first proposed “do take the chair of the house as speaker.” If the house divide, he directs one party to go into the right lobby, and the other into the left, and appoints two tellers for each. If the majority be in favor of the member first proposed, he is led to the chair; if not, a similar question being put regarding the other member, and answered in the affirmative, he is conducted to the chair. The speaker-elect expresses his thanks for the honor conferred on him, and takes his seat; on which the mace is laid on the table, where it is always placed during the sitting of the house with the speaker in the chair. He is then congratulated by some leading member, and the house adjourns. The next day the speaker-elect, on the arrival of black rod, proceeds with the commons to the house of lords, where his election is approved by the lord chancellor. He then lays claim, on behalf of the commons, to their ancient rights and privileges, which being confirmed, he retires with the commons from the bar. Nearly the same forms are observed on the election of a new speaker when a vacancy occurs by death or resignation in the course of the session.

The members of both houses then take the oath prescribed by law. See OATH, ABJURATION. In the upper house the lord chancellor first takes the oath singly at the table. The clerk of the crown delivers a certificate of the return of the Scottish representative peers, and garter king-at-arms the roll of the lords temporal, after which the lords present take and subscribe the oath. Peers who have been newly created by letters-patent, present their patents to the lord chancellor, are introduced in their robes between two other peers of their own dignity, preceded by black rod and garter, and conducted to their places. The same ceremony is observed in the case of peers who have received a writ of summons—a formality necessary when a member of the lower house succeeds to a peerage; otherwise his seat does not become vacant. A bishop is introduced by two other bishops, without the formalities observed with temporal lords. Peers by descent have a right to take their seats without introduction; peers by special limitation in remainder have to be introduced. In the commons, the speaker first subscribes the oath, standing on the upper step of the chair, and is followed by the other members. Members on taking the oath are introduced by the clerk of the house to the speaker. Members returned on new writs in the course of the session, after taking the oath, are introduced between two members. They must bring a certificate of their return from the clerk of the crown. On the demise of the crown, the oaths must be taken anew in both houses.

When the greater part of the members of both houses have been sworn, the causes of calling the parliament are declared by the sovereign either in person or by commission. In the former case, the queen proceeds in state to the house of lords, and commands black rod to let the commons know “that it is her majesty’s pleasure that they attend her immediately in this house.” Black rod proceeds to the house of commons, and formally commands their attendance, on which the speaker and the commons go up to the bar of the house of lords, and the queen reads her speech, which is delivered to her by the lord chancellor kneeling on one knee. Of late years the practice has been revived of the lord chancellor reading the royal speech in the queen’s presence. When parliament is opened by commission, the sovereign not being personally present, the lord chancellor reads the royal speech to both houses. Immediately after the royal speech is read, the house is adjourned during pleasure; but both houses are resumed in the afternoon, for the purpose of voting an address in answer to the speech from the throne. In each house it is common to begin business by reading some bill *pro formâ*, in order to assert the right of deliberating without reference to the immediate cause of summons. The royal speech is then read, and an address moved in answer to it. Two members in each house are chosen by the ministry to move and second the address. The preparation of the address is referred to a select committee; it is twice read, may be amended, and when finally agreed on, it is ordered to be presented to her majesty.

Adjournment, Prorogation, and Dissolution.—Adjournment of parliament is but the continuance of the session from one day to another. Either house may adjourn separately on its own authority, with this restriction, introduced by act 39 and 40 Geo. III. c. 14, that the sovereign, with advice of the privy council, may issue a proclamation appointing parliament to meet within not less than 14 days, notwithstanding an adjournment beyond that period. On reassembling, the house can again take up business which was left unfinished. A prorogation differs from an adjournment in this respect that it not merely suspends all business, but quashes all proceedings pending at the time, except impeachments by the commons, and appeals and writs of error in the lords. William III. prorogued parliament from Oct. 21 to Oct. 23, 1689, in order to renew the bill of rights, regarding which a difference had arisen between the two houses that was fatal to its progress. It being a rule that a bill of the same substance cannot be introduced twice in the same session, a prorogation has sometimes been resorted to, to enable a second bill to be brought in. Parliament can only be prorogued by the sovereign; and this may be done by having her command signified in her presence by the lord chancellor to both houses, by writ under the great seal, by commission, or by proclamation. Till recently, a proclamation for the prorogation of parliament from the day to which it stood summoned or prorogued to another day, was followed by a writ or commission; but by 30 and 31 Vict. the royal proclamation alone prorogues parliament, except at the close of a session.

Parliament comes to an end by dissolution. This dissolution may be by the will of the sovereign expressed in person or by her representatives. Having been first prorogued, it is dissolved by a royal proclamation, and by the same instrument it is declared that the chancellor of Great Britain and chancellor of Ireland have been respectively ordered to issue out writs for calling a new parliament. By 6 Anne c. 37, a parliament was determined six months after the demise of the crown; but by the reform act of 1867, the parliament in being at any future demise of the crown shall not be determined by such demise, but shall continue as long as it would otherwise have continued unless dissolved by the crown. Were the power of dissolving the parliament not vested in the executive, there would be a danger of its becoming permanent and encroaching on the royal authority, so as to destroy the balance of the constitution. An example of this danger is shown in the long parliament, to which Charles I. conceded that it should not be dissolved till such time as it dissolved itself. If the houses of parliament encroach on the executive, or act factiously or injudiciously, the crown may, by a dissolution, bring their proceedings to an end, and appeal to the people by sending the members of the house of commons to give an account of their conduct to their constituents.

There was originally no limit to the duration of a parliament except the will of the sovereign. By 6 Will. and Mary, c. 2, the continuance of a parliament was limited to three years, a term afterward extended by 1 Geo. I. c. 38 to seven years. The same act of William and Mary enacts that parliament shall assemble once in three years at the least; but the practice of granting the mutiny act and the budget for a year only, makes it necessary that it should assemble annually.

Conduct of Business.—Each house is presided over by its speaker. The speaker of the house of commons does not take part in a debate, offer his opinion, or vote on ordinary occasions; but, in case of equality, he has a casting vote; his duty is to decide all questions which relate to order, putting the matter at issue in a substantive form for the decision of the house, if his own decision is not assented to. He explains any doubts that may arise on bills. He determines the precedence of members rising to address the house. He examines witnesses at the bar. At the close of the session, he addresses the sovereign on presenting the money-bills passed during the session for the royal assent. He nominates the tellers on a division, and makes known the votes to the house. He may commit members to custody during the pleasure of the house, a confinement which terminates with the close of the session. When a vacancy occurs by death, he signs the warrant to the clerk of the crown to make out the writ for the election of a new member. He audits the accounts of the receiver of fees, and directs the printing of the votes and proceedings of the house. The lord chancellor, or lord keeper of the great seal, is the speaker of the house of lords; in his absence, the chairman of the committee of ways and means takes the chair. The speaker is not, as in the lower house, charged with the maintenance of order, or the decision who is to be heard, which rest with the house itself. The chairman of the committee of ways and means of the house of commons, as deputy speaker, performs the speaker's duties in his absence. The chief officers of the house of lords are the clerk of the parliaments, who takes minutes of the proceedings of the house; the gentleman usher of the black rod, who, with his deputy, the yeoman usher, is sent to desire the attendance of the commons, executes orders for committal, and assists in various ceremonies; the clerk-assistant; and the serjeant-at-arms, who attends the lord chancellor with the mace, and executes the orders of the house for the attachment of delinquents. The chief officers of the commons are the clerk of the house, the serjeant-at-arms, the clerk-assistant, and second clerk-assistant.

Each house has its *Standing Orders*, or regulations, adopted at different periods, relating partly to internal order, partly to certain preliminaries required in the introduction of bills and promulgation of statutes. A standing order endures till repealed (or "vacated," as it is called in the upper house); but each house is also in the practice of

agreeing to certain orders or *resolutions* of uncertain duration declaratory of its practice, which are considered less formally binding than standing orders.

The house of lords usually meets at 5 P.M.; the commons at a quarter before 4, except on Wednesdays and other days specially appointed for morning sittings. In the lords the chancellor, as speaker, sits on the woolsack. A standing order, which is never enforced, requires the lords to take place according to precedence. Practically, the bishops sit together on the right hand of the throne; the members of the administration on the front bench on the right hand of the woolsack adjoining the bishops, and the peers who usually vote with them occupy the other benches on that side. The peers in opposition are ranged on the opposite side, and those considered politically neutral occupy the cross benches between the table and the bar. In the house of commons, the front bench on the right hand of the chair is reserved for the ministry, and called the treasury bench, the front bench on the opposite side being occupied by the leaders of the opposition. By ancient custom and orders of both houses, rarely enforced, strangers are excluded while the houses are sitting.

Prayers are read before business is begun—in the house of lords by a bishop; in the house of commons by the chaplain. Every member is bound to attend the house—in the lower house personally; in the upper personally, or by proxy; but in ordinary circumstances, this obligation is not enforced. The house of lords may proceed to business when three peers are present; in the commons, forty members are required to constitute a house for the dispatch of business. The speaker counts the house at four; and if that number be not then present, or if it be noticed, or appear on a division, that fewer than forty members are present, the house is adjourned. A call of the house is an expedient to secure attendance on important occasions; when it is made, members absent without leave may be ordered to be taken into custody. When matters of great interest are to be debated in the upper house, the lords are “summoned.”

To make a motion, or, more properly, to *move the house*, is to propose a question, and notices of motions should be given on a previous day. The commons are in the practice of setting apart Mondays, Wednesdays, Thursdays, and Fridays for considering *orders of the day*, or matters which the house had already agreed to consider on a particular day, and to reserve Tuesdays for motions. Government orders take precedence of others on all order days except Wednesdays, which are generally reserved for the orders of independent members. Notices of motions are by a standing order not allowed to be given for any period beyond the four days next following on which motions are entitled to precedence. Questions of privilege may be considered without previous notices, and take precedence both of other motions and orders of the day. A motion may be accompanied by a speech, and must in the lower house be seconded, otherwise there is no question before the house. In purely formal motions this rule is not observed, and an order of the day may be moved without a seconder. A seconder is not required in the house of lords. A motion in the commons must be reduced to writing by the mover, and delivered to the speaker, who, when it has been seconded, puts it to the house; it cannot then be withdrawn without leave of the house. In the lords, when a motion has been made, a question is proposed “that the motion be agreed to.” When an amendment is proposed to a question, the original motion cannot be withdrawn till the amendment has been either withdrawn or negatived. An amendment is properly such an alteration on a motion by striking out or adding words, or both, as may enable members to vote for it who would not have done so otherwise.

A question may be evaded or superseded in four ways: 1. By adjournment. Any member in possession of the house may move “that the house do now adjourn.” The house may also be adjourned, even while a member is speaking, on its being noticed that there are fewer than forty members present. The motion, “that the debate be now adjourned,” does not supersede the question, but merely defers the decision of the house. 2. By a motion, that the orders of the day be now read, which may be put and carried on days on which notices of motion have precedence. 3. By what is called *moving the previous question*. The act of the speaker in putting the question is intercepted by a motion, “that the question be now put.” The mover and seconder of this motion vote against it; and if it be resolved in the negative, the speaker is prevented from putting the main question, which, however, may be brought forward on another day. 4. By an amendment substituting words of an entirely different import for those of the motion, so that the sense of the house is taken on a totally different question.

When the question is put by the speaker in the lords, the respective parties exclaim “content” or “non-content;” in the commons, the expression used is “aye” or “no.” The speaker signifies his opinion which party have the majority, and if the house acquiesce, the question is said to be resolved in the affirmative or negative; when his decision is disputed, the numbers must be counted by a division. Both houses now divide by the content or ayes going into the right lobby, and the non-contents or noes into the left, each being counted by tellers appointed by the speaker. In the house of commons, two clerks with printed lists of the members put a mark to the name of each as he re-enters the house, so as to secure accuracy in the division-lists. The speaker of the commons, who does not otherwise vote or take part in a debate, has a casting-vote in case of equality. In the house of lords, the speaker is, on the other hand, not disqualified from taking part in a debate; he votes on divisions, but has no casting-vote;

and on an equality, the non-contents prevail. The system of pairing commonly practiced, though never directly recognized by the house, enables members on opposite sides to absent themselves for a time agreed on, each neutralizing the votes of the other. A member of the upper house may, with leave of the house, by a protest enter his dissent from a vote of the house, and its grounds. Every protest is entered on the journals of the house, together with the names of all the lords who concur in it.

No question or bill is allowed to be offered in either house substantially the same with one on which the judgment of that house has already been expressed in the current session. A resolution of the house, however, may be rescinded, and an order discharged; and by 13 and 14 Vict. c. 21, it is provided that every act may be altered, amended, or repealed in the same session of parliament.

In debate, a member of the commons addresses the speaker; a member of the upper house the lords generally, in both cases standing and uncovered. No member may speak except when there is a question before the house, or with the view to propose a motion or amendment, the only admitted exceptions being in putting questions to ministers of the crown, or to members concerned in some business which is before the house, and in explaining personal matters. A member is not allowed to speak twice to the same question except in explanation, and the proposer, in some cases, in reply—a restriction which does not apply in committee. By the rules adopted by both houses for preserving order in debate, no allusion is allowed to debates of the same session on a question not under discussion, or to debates in the other house of parliament. All reflections on any determination of the house are prohibited, except when made with a view of moving that the determination be rescinded; so is the mention by a member of her majesty's name either irreverently, or to influence the debate, and the use of offensive and insulting words against parliament or either house, or a member of the house in which he is speaking. No member is allowed to refer to another by name, or otherwise than by the rank or office which he enjoys, or place which he represents. The speaker *naming* a member to the house, is an old established form of censure. New procedure rules were adopted, 1882, securing the right of deciding when the vote should be taken.

Messages.—It is often found necessary for the houses to communicate with each other regarding matters occurring in the course of business. Messages from the lords were formerly sent by masters in chancery or judges, while the commons sent a deputation of their own members. According to a new arrangement adopted in 1855, one of the clerks of either house may be the bearer of a message.

Committees.—Parliamentary committees are either “of the whole house,” or “select.” A committee of the whole house is the house itself, with a chairman instead of the speaker presiding. The chair is taken in the lords by the chairman of committees appointed at the beginning of each session, in the commons by the chairman of the committee of ways and means. Matters relating to religion, trade, the imposition of taxes, or the granting of public money, are generally considered in committee before legislation, as also are the provisions of any public bill. Proceedings are conducted nearly as when the house is sitting, the lords being addressed in the upper house, and in the lower the chairman, who has the same powers to maintain order as the speaker, and a casting vote in case of equality. In committees of the commons, as in the house itself, a quorum of forty members is required; but if that number are not present, the speaker must resume the chair to adjourn the house. A motion in committee need not be seconded, and there is a more unlimited power of debate than in the house, members being at liberty to speak any number of times on the same question. A motion for “the previous question” is not allowed. When the business of the committee is not concluded on the day of sitting, the house is resumed, and the chairman moves “that the house be again put into committee on a future day,” in the lords, and in the commons reports progress, and asks leave to sit again.

Select committees are composed of a limited number of members appointed to inquire into any matter, and report. In the commons, it is usual to give select committees power to send for persons, papers, and records; in the lords, they may, without any special authority, summon witnesses. In neither house can a committee enforce the attendance of a witness; this must be done, when necessary, by the house itself. The commons have certain standing orders for insuring the efficiency of committees, and impartiality in their appointment. No committee is to consist of more than fifteen. Members moving for a committee must ascertain whether the members whom they propose to name will attend. Lists of the members serving on each committee are to be affixed in the committee clerk's office and the lobby. To every question asked of a witness, the name of the member who asks it is to be prefixed in the minutes of evidence laid before the house; and the names of the members present at each sitting, and, in the event of a division, the question proposed, the name of the proposer, and the votes of each member, are to be entered on the minutes, and reported to the house. In the lords there are no special rules regarding the appointment and constitution of committees; but resolutions containing arrangements similar to those of the commons regarding questions to witnesses, minutes of proceedings, and divisions, have been adopted since 1852. Select committees have the power of adjournment from time to time, and sometimes from place to place. By an anomaly not easily explained, the commons have always been considered not to have the power of administering oaths; a power of examining on

oath has, however, by statute been granted to election committees, and committees on private bills. In the house of lords, witnesses had formerly to attend at the bar of the house to be sworn; but the oath may now be administered by any committee of the house. Except where leave of absence has been obtained, no member, unless above the age of sixty, can excuse himself from serving on committees, or for not attending when his attendance has been made compulsory by order of the house. In committees on private bills in the commons, the chairman has a deliberative as well as a casting vote. Since 1864, joint committees of both houses, composed of an equal number of members of each, have occasionally been appointed.

Bills.—The principal business which occupies both houses is the passing of bills. In early times, laws were enacted in the form of petitions from the commons, which were entered on the rolls of parliament, with the king's answers subjoined; and at the close of the session, these imperfect records were drawn up in the form of a statute, which was entered on the statute rolls. It was found that, on undergoing this process, the acts passed by the parliament were often both added to and mutilated, and much of the legislative power practically came into the hands of the judges. Bills in the form of complete statutes were first introduced in the reign of Henry VI. Bills are either public or private; the former affect the general interests of the community, the latter relate to local matters. Public bills are introduced directly by members; private bills by petitions from the parties interested, presented by members. Bills may originate in either house; but the exclusive right of the commons to deal with all legislation regarding taxes or supplies, makes it necessary and expedient that by far the greater part of both public and private bills, except such as are of a purely personal nature, should originate in the lower house. Bills regarding restitution of honors originate in the house of lords. One description of act alone originates with the crown—an act of grace or pardon. It is read only once in each house, and cannot be amended, but must be accepted in the form in which it is received from the crown, or rejected.

Public Bills.—In the house of lords, any member may present a bill. In the commons, any member may move for leave to bring in a bill, except it be for imposing a tax, when an order of the house is required. When the motion is seconded and leave given, the mover and seconder are ordered to prepare and bring in the bill. Such bills, however, as relate to religion, trade, grants of public money, or taxation, are required to be introduced by the house itself, on a report of the committee of the whole house. A bill is drawn out on paper, with blanks or italics where any part is doubtful, or where sums have to be inserted. It is read a first time, and a day fixed for a second reading, allowing a sufficient interval to let it be printed and circulated. When ready, which is often as soon as the motion for leave to bring it in has been agreed to, it is presented at the bar by one of the members who were ordered to prepare and bring it in, and afterwards, on an intimation from the speaker, brought up to the table. The question is put, "that the bill be now read a first time," which is rarely objected to; and in the commons can only be opposed by a division. The short title of the bill, as entered in the orders of the day and indorsed on the bill, is then read aloud, which is accounted sufficient compliance with the order of the house. A day is then appointed for considering the question, "that the bill be read a second time," allowing a sufficient interval to elapse to let it be printed and circulated. At the second reading the member in charge of the bill moves "that the bill be now read a second time." This is the usual time for opposing a bill whose general principle is disapproved. This is done by an amendment to the question, by leaving out the word "now," and adding "this day three months," "this day six months," or some other time beyond the probable duration of the session. Counsel are sometimes allowed to plead at the second reading or other stages. If the bill be approved on the second reading, it is committed, either to a select committee, or to a committee of the whole house, to consider its provisions in detail. When the proceedings in committee are terminated, the bill is reported to the house with amendments, which may be agreed to, amended, or disagreed to. It is then ordered to be read a third time, when the entire measure is reviewed. No amendments, except what are verbal, can then be made, and the question is put to the house, "That this bill do now pass." The title of the bill is last settled. The bill, when passed by the commons, is sent to the lords, where it goes through the same forms: if rejected, no further notice is taken of it; if passed, a message is sent to the commons that the bill is agreed to. If amendments have been made, they are sent down along with the bill to be discussed by the commons; and if they are not agreed to, a conference is demanded by the commons, to offer reasons for disagreeing to the amendments. A conference is a mode of communicating on important matters between the houses, in which each house is brought into direct contact with the other by a deputation of its own members—the time and place of meeting being always fixed by the lords. A conference is conducted, for both houses, by managers, who, on the part of the house desiring the conference (in the case supposed, the commons), consist of the members who have drawn up the reasons, with others sometimes added. If the lords be not satisfied with the reasons offered, a second conference is desired, after which what is called a "free conference" may be demanded, in which the managers have more discretion vested in them to advance what arguments they please. No free conference has been held since 1740. By resolutions of both houses, agreed to in 1851, reasons for disagreement from amendments may be

communicated by messages without a conference, unless the other house should desire a conference; and since that time there has been but one instance of a conference where a message would have been available. If the commons eventually agree to the amendments, the bill is sent back to the lords; if not, it is dropped. The same forms are gone through when a bill originates in the house of lords. The official record of the assent of one house to the bill passed, or amendments made by the other, is an indorsement on the bill in Norman French. Thus, when a bill is passed by the commons, the clerk of the house writes on the top of it, "Soit bailé aux seigneurs." When the lords make amendment to a bill, it is returned with the indorsement, "A ceste bille avesque des amendments les seigneurs sont assentus." When it is sent back with these amendments agreed to, the clerk of the house of commons writes, "A ces amendments les communes sont assentus." When both houses have agreed to a bill, it is deposited in the house of lords, to await the royal assent, unless it be a money-bill, which is sent back to the commons.

Private Bills.—In private bills, the functions of parliament partake of the judicial as well as the legislative character, and the difficulties of reconciling the interests of the public and of individuals often give rise to inquiries too extensive for the house to undertake, which therefore delegates them to committees. The standing orders require certain notices to be given to parties interested by personal service, and to the public by advertisement. The practice in both houses now is for all petitions for private bills to be referred to four "examiners," two from the lords and two from the commons, whose duty it is to examine whether certain notices and other forms required by the standing orders of the house have been complied with. If the report be favorable, leave is given to bring in the bill; if unfavorable, it is referred to a committee, called the committee on standing orders, who report on the propriety of relaxing the standing orders in this individual case—should they report unfavorably, it is still in the power of the house to relax the standing orders, though this is rarely done. Three days must elapse between the first and second reading. At the second reading, the principle is considered, as in the case of public bills; and if the bill be carried, it is referred, if not a railway, canal, or divorce bill, to the "committee of selection," consisting of the chairman of the standing orders committee, and five other members nominated at the beginning of the session, whose functions are to classify the bills, to nominate the committees on them, and to arrange their time of sitting. A railway or canal bill is referred to the "general committee of railway and canal bills." This committee forms bills of this class into groups, and appoints the chairman of the committee which is to sit on each bill from its own body, the remaining members, four in number, being chosen from the committee of selection. Before the sitting of the committee, every private bill, whether opposed or unopposed, must be examined by the chairman of the committee of ways and means and his council. It is also laid before the chairman of the lords' committee and his council, and effect is given to their observations, a proceeding which greatly facilitates the after-progress of the bill in the house of lords. The board of trade, the secretary of state for the home department, the lords' commissioners of the admiralty, and the commissioners of woods and forests, also exercise a supervision over private bills of various kinds, by which the respective rights of their departments may be supposed to be encroached on. In the house of lords, estate bills are referred to the judges. Every bill, at the first reading, is referred to the examiners, before whom compliance with such standing orders as have not been previously inquired into must be proved. The standing orders committee of the lords is now assimilated in functions to that of the commons. The bill is returned to the commons either with amendments, or with a message that it is agreed to without amendments. In case of disagreement between the houses, the same forms are observed as in public bills.

In recent times, the necessity for obtaining private acts has been, in many cases, obviated by general laws adapted to different classes of objects, of which parties are enabled to avail themselves, instead of applying to parliament for special powers.

Royal Assent.—A bill becomes a statute or act of parliament on receiving the royal assent, which is given in the house of lords, the commons being also present at the bar. It is given in either of two ways: by letters-patent under the great seal, signed by the sovereign's own hand, and communicated to the two houses by commissioners; or by the sovereign present in person in the house of lords. When the royal assent is given by commission, three or more of the lords commissioners command black rod to signify to the commons that their attendance is desired, on which the commons, with the speaker, immediately come to the bar. The commission is then read at length; and the titles of all the bills being read by the clerk of the crown, the royal assent to each is signified by the clerk of the parliaments in Norman French, and so entered on the lords' journals. In assenting to a public bill, the words used are: "Le roy [la reyne] le veult;" to a private bill, "Soit fait comme il est désiré;" and to a bill of supply (which is presented by the speaker, and receives the royal assent before all other bills); "Le roy remercie ses bons sujets, accepte leur benevolence, et ainsi le veult." In the case of an act of grace, which has originated with the crown, there was, till lately, no further expression of the royal assent; but the clerk of the parliaments, having read its title, said: "Les prélats, seigneurs, et communes en ce présent parlement assemblés, au nom de tous vos auctres sujets. remercient très-humblement vostre Majesté, et prient à Dieu

vos donner en santé bonne vie et longue:" the royal assent, however, has been latterly given to acts of grace in the usual form. The refusal of the royal assent is announced by the words, "Le roy s'avisera." But the necessity for such refusal is generally removed by the observance of the constitutional principle, that the queen has no will but that of her ministers, who only continue in office so long as they have the confidence of parliament. The last instance in which the royal assent was refused was by queen Anne in 1707, regarding a bill for settling the militia in Scotland.

The royal assent is seldom given in person, except at the close of a session, when the queen attends to prorogue parliament, and then signifies her assent to such bills as have been passed since the last commission was issued; but bills providing for the honor and dignity of the crown, and bills for settling the civil lists, have generally been assented to by the sovereign in person, immediately after they have passed both houses. When the royal assent is given in person, the clerk of the crown reads the titles of the bill; and the clerk of the parliaments, who has previously received her majesty's commands in the robing-room, makes an obeisance to the throne, and signifies her majesty's assent, as already described, the queen giving a gentle inclination.

Supplies.—Prior to 1688, in addition to parliamentary taxation, imposts were sometimes levied by an exercise of the royal prerogative. Since the revolution, no taxes have been raised otherwise than by parliamentary authority. The commons have the exclusive right to impose taxes and vote money for the public service. The lords cannot even make an alteration in a bill of supply, except to correct a clerical error. The lords are not even entitled to insert in a bill any pecuniary penalties, or to alter the amount or application of any penalty imposed by the commons; a rule whose rigid assertion has been found to be attended with so much inconvenience that there has latterly been a disposition to relax it. If a bill containing provisions which make a pecuniary charge on the public originate in the lords, any such provisions are struck out in the bill as sent to the commons. In the commons, these provisions are printed in red ink, and supposed to be blank, and may be agreed to in committee. But though the commons has the exclusive right to grant supplies, a grant requires the ultimate assent of the queen and the house of lords.

The public revenue of the crown is derived in part from permanent charges on the consolidated fund, and in part from actual grants for specific public services, which require the yearly sanction of parliament. On the opening of parliament the queen demands from the commons the annual provision for the public services, and directs estimates to be laid before them. On agreeing to the address in answer to the royal speech, the commons order the speech to be taken into consideration on another day. On the arrival of that day a motion is made: "That a supply be granted to her majesty," and the house resolves itself into a committee to consider that motion. On the day appointed, the committee sits and agrees that a supply be granted, which, being reported, is agreed to by the house. The house then appoints another day on which it resolves itself into a "committee of supply." The estimates for the army, navy, and ordnance departments, are first laid before the committee; then the estimates for civil services, known as the miscellaneous estimates. The first business of the committee of supply is to elect a chairman, who is known as the chairman of the committee of ways and means, over which he also presides. When the first report of the committee of supply has been received and agreed to, a day is appointed for the house to resolve itself into a "committee of ways and means." This committee is not appointed till a sum has been voted by the house, nor is it afterward allowed to vote in excess of the expenditure voted by the committee of supply. It is the function of the committee of supply to consider what specific grants are to be voted, and of the committee of ways and means to determine how the funds shall be raised which are voted by the committee of supply. Without special parliamentary authority, the consolidated fund could not be applied to meet the supplies voted for the service of the year; but to make it so available, the committee of ways and means votes general grants from time to time out of the consolidated fund "toward making good the supply granted to her majesty;" and bills are founded on the resolutions of the committee, by which the treasury receives authority to issue the requisite amount from the consolidated fund for the service of the year. It belongs to the committee of ways and means to determine what sums shall be raised by exchequer bills in anticipation of the annual revenue, to make up the supply granted to her majesty. When the committee of supply has determined the number of men that shall be maintained during the year for the army and sea-service, and its resolutions have been agreed to, the *mutiny bill* and *marine mutiny bill* are brought in, providing respectively for the discipline of the troops and marines when on shore. Apart from this annual sanction, the maintenance of a standing army in time of peace would be illegal, and the army and marines would be relieved from all martial discipline. The committee of ways and means receives the annual financial statement from the chancellor of the exchequer, popularly called the *budget*. That minister gives a general view of the resources of the country, and of the financial policy of the government, and presents a probable estimate of income and expenditure for the twelve months ending on the 12th of April of the following year. He states what taxes he intends to reduce, and what new ones he means to impose, and ends by proposing resolutions for the adoption of the committee, which, when reported to the house, form the groundwork of bills for accomplishing the finan-

cial objects proposed. The charges for collecting the revenue, have, since 1854, been brought under the supervision of the house of commons; and estimates are voted for the revenue departments. A new tax cannot be proposed except by a minister of the crown. The resolutions of committees of supply and of ways and means are reported on a day appointed by the house, and read a first time without a question, and a second time on a question put from the chair, and are agreed to by the house, or may be disagreed to, amended, postponed, or recommitted. When the committee of supply is closed, the committee of ways and means authorizes the application of money from the consolidated fund, the surplus of ways and means, and sums in the exchequer, to meet the grant and services of the year, and the resolutions of the committee are carried into effect by the consolidated fund bill, or as it is often called, the *appropriation bill*. By a standing order of April 3, 1862, a standing committee of public accounts is appointed at the beginning of each session to examine into the appropriation of the sums granted by parliament to meet the public expenditure. Taxes of a permanent and general character are not now considered in the committee of ways and means.

Petitions.—Among the duties of parliament is the receiving of petitions. A petition must be presented by a member of the house to which it is addressed. Petitions from the corporation of London are, however, presented to the house of commons by the sheriffs at the bar, or by one sheriff, if the other be a member of the house, or unavoidably absent. In 1840, a petition was allowed to be presented by the lord mayor and aldermen, when the sheriffs were in custody of the serjeant-at-arms. The lord mayor of Dublin has been allowed to present a petition at the bar of the house, and the same privilege would probably be conceded to the lord provost of Edinburgh. Petitions which violate any of the rules of the house, are not brought up, but returned to the petitioners; and if an irregularity be discovered after a petition is brought up, its presentation is not recorded in the votes. In the house of lords, when a petition is laid on the table, an entry is made in the lords' minutes, and afterward in the journals of the house, which, however, does not describe its nature and substance. A petition may, on presentation, be made a subject of debate, but unless this is done, there remains no public record of its import, or of the parties by whom it was signed. In the house of commons, according to standing orders adopted in 1842, the member presenting a petition is to confine himself to a statement of who the petitioners are, the number of signatures, the material allegations of the petition and its prayer. In case of urgency, or where questions of privilege are involved, the matter of the petition may be discussed; but in ordinary cases no debate is allowed, and it is referred to the committee on public petitions, and if relating to a subject with regard to which the member presenting it has given notice of a motion, it may be ordered to be printed with the votes. The reports of the committee on public petitions are printed twice a week, and point out the name, the subject, and the number of signatures of each petition, and the total number of signatures, and petitions relating to each subject; and, in some cases, the petition itself is printed at full length in the appendix.

Communications with the Crown.—Besides at the opening and proroguing of parliament, and giving of the royal assent, there are other occasions on which the crown communicates with parliament by a *message*, under the sign-manual, to either house singly, or both houses separately. Messages are brought by a member of the house, being a minister of the crown, or one of the royal household, and may relate to important public events, the prerogatives or property of the crown, provision for the royal family, etc. An *address* is the mode in which the resolutions of parliament are communicated to the crown. Addresses may be joint, of both houses, or separate, of either house.

Returns.—Each house has the power of ordering returns from all those public departments which are connected with the revenue, under control of the treasury, or regulated by statute; but returns of matters connected with the exercise of royal prerogative, as from public departments subject to her majesty's secretaries of state, are obtained by means of addresses to the crown. A return is not allowed to be ordered in one house regarding the proceedings of the other; when such return is wished, it is usual to make an arrangement by which it is moved in the house to whose proceedings it relates, and after it has been presented, a message is sent to request that it may be communicated. Returns cannot be moved from private associations, or persons not exercising public functions; and the papers and correspondence sought from government departments must be of an official, not a private or confidential description. This rule was, under special circumstances, departed from in 1858, in regard to the opinion of the law-officers of the crown in the case of the *Cagliari*. Accounts and papers presented are ordered to lie on the table, and when necessary, ordered to be printed, or in the commons referred to the printing committee appointed at the beginning of each session.

Election Petitions.—Until 1770 all questions regarding controverted elections were decided by the whole house; the Grenville act of that year introduced the practice of appointing committees for their trial, and the proceedings of election committees were further regulated by 11 and 12 Vict. c. 98. By the "parliamentary elections act, 1868" (31 and 32 Vict. c. 124), election petitions are now presented to the court of common pleas in Westminster or Dublin, or the court of session in Scotland, and tried by a single judge appointed by the court, and sitting in the borough or county whose election is contested. An election petition must be signed by some person who voted, or had a

right to vote at the election, or by some person who claims to be returned, or alleges himself to have been a candidate, and presented within 21 days after the return objected to, or, if it proceeds on the allegation of bribery, within 28 days after the alleged payment. Security is to be found for costs to the extent of £1000, either by sureties not exceeding four, or by a deposit of money, or partly in each way. The judge determines whether the member was duly elected, and certifies to the speaker his determination, which is final. Should the petition allege corrupt practices, the judge shall also report to the speaker whether there has been any corrupt practice within the knowledge and consent of any candidate, the names of persons proved guilty, and whether corrupt practices have prevailed extensively at the election; also the judge may specially report any matter for consideration of the house of commons. Where, on application of any party to a petition, it appears that the case raised can be conveniently stated as a special case, it may be so stated and determined by the court, who certify their decision to the speaker, which is final. An election petition cannot be withdrawn without leave of the court or judge on special application; and a person who might have been a petitioner may apply to be substituted for the person withdrawn. The court or judge is to report to the speaker whether in their opinion the withdrawal of the petition has been induced by any corrupt arrangement. The most frequent subjects of special reports are bribery, treating, and the use of undue influence, matters regarding which, prior to 1868, various acts had been passed, the most important being 17 and 18 Vict. c. 102 (1854), 21 and 22 Vict. c. 87 (1858), and 26 Vict. c. 29 (1863), three statutes known as the "corrupt practices prevention acts." By the act of 1868, a candidate convicted of bribery is punished by voidance of his election, incapacity during 7 years to be elected or to vote, to hold any office under 5 and 6 Will. IV. c. 76, or 3 and 4 Vict. c. 108, or any municipal or judicial office, or to act as justice of the peace; and the same disqualifications to vote, to be elected, and to hold office, are incurred by any person other than a candidate found guilty of bribery. If a candidate is proved to have knowingly engaged as canvasser or election-agent a person found guilty within the previous seven years of any corrupt practice, his election is void. Act 15 and 16 Vict. c. 57 enacts that upon the joint address of both houses of parliament, representing to her majesty that a committee of the house of commons has reported that corrupt practices have extensively prevailed at any election, her majesty may appoint commissioners to make inquiry; and by the act of 1868, the judge's report to the effect that corrupt practices have prevailed, or that there is reason to believe they have prevailed, is to be accounted equivalent to the report of the house of commons' committee to that effect under the previous act. It is further provided by the act of 1868 that within 21 days of the return to the clerk of the crown, or within 14 days after the meeting of parliament, a petition may be presented by any two electors, alleging that corrupt practices have extensively prevailed at their last election, or that there is reason to believe this to have been the case. If, on such petition, an address by both houses of parliament be presented to the crown, praying for inquiry into such allegation, the crown may appoint commissioners to inquire, with the powers and subject to the provisions of act 15 and 16 Vict. c. 57.

By the act of 1854, the offering of money, office, employment, etc., to a voter to induce him to vote or abstain from voting, or the offering of a similar consideration to any person to induce him to procure the return of a candidate or the vote of an elector, the acceptance of such consideration, and the payment of money in the knowledge that it is to be expended in bribery, or the repayment of money which has been spent in bribery, are all declared to be acts of *bribery* punishable by fine and imprisonment, as well as by the forfeiture of £100 with costs to any person who will sue for the same. Any voter who agrees to receive money, office, or employment for voting or abstaining from voting, and any person who, after an election, receives money or other consideration on account of any person having voted or refrained from voting, is also guilty of bribery, and liable to forfeit £10 with costs to any one who will sue for the same. *Treating*, which is defined as the providing of meat, drink, or other entertainment to any person in order to be elected, or in consideration for any person voting or abstaining from voting, involves a penalty of £50 similarly recoverable, as also does *undue influence*, or interference by intimidation, abduction, or otherwise, with the freedom of electors. Persons guilty of any of these offenses are, by the provisions of the same acts, to be struck off the register, and their names inserted in a separate "list of persons disqualified for bribery, treatment, and undue influence," which is to be appended to the register of voters. Cockades are prohibited, as is the furnishing of refreshment on the day of election to a voter in consideration of his being about to vote. By the corrupt practices act, 1854, it is however declared lawful to provide a conveyance for a voter, though not to pay him a sum of money for traveling expenses. By the act of 1863, no payment is allowed to be made on behalf of a candidate except through his authorized agent, and all claims against a candidate in respect of an election must be settled within a month, otherwise the right to recover them is barred. A detailed account of election expenses with vouchers is required to be delivered within two months of the election to the returning officers, by whom it is published in a local newspaper, and the vouchers are to be open for a month to the inspection of voters. The act of 1863 provides that when an election committee has reported that certain persons named have been guilty of bribery, and their report is confirmed by a commission of inquiry, such report, with the evidence

taken, is to be laid before the attorney-general with the view of instituting a prosecution.

Impeachment.—There are instances, as far back as the times of the Plantagenet princes, of the supreme power of parliament being exercised to punish offenses where something extraordinary in the nature, or some unforeseen obstacle to the execution of the ordinary laws, was deemed to render this advisable. This was done by a bill of attainder, which in the reign of Henry VIII. became the usual mode of proceeding against state offenses. A bill of attainder sometimes followed a regular trial and conviction, as in the case of Empson and Dudley, but was often passed without trial, examination of witnesses, or hearing the accused party, as in the attainder of Fisher and sir Thomas More. Bills of attainder were sometimes, but rarely, had recourse to under the Stuart kings; the last instance was the case of sir John Fenwick, in 1696. The practice of impeachment of extraordinary offenders before the lords by the commons, which had been frequent during the 14th and 15th centuries, was revived in the reign of James I. This proceeding is not like bills of attainder or pains and penalties, the making of a new law *pro re nata*, but a carrying out of the already known and established law. The great representative inquest of the nation first find the crime, and then as prosecutors support the charge before the highest court of criminal jurisdiction. It has always been allowed that a peer may be impeached for any crime whether cognizable by the ordinary courts or not. The right of the commons to impeach a commoner of a capital offense, which was at one time doubted, has been solemnly affirmed by the house of lords. The trial is conducted by managers for the commons. Witnesses are summoned by the lords at the desire of the commons, and Westminster hall has usually been the place of trial, the lord high steward presiding. The managers make their charges and adduce evidence; the accused answers, and may defend himself by counsel; and the managers have a right to reply. In giving judgment, the question is put by the lord high steward to each peer, beginning with the junior baron, on each article separately, whether the accused be guilty. The answer is, "guilty, on my honor," or "not guilty, on my honor," the lord high steward giving his opinion the last, and the numbers being cast up, the accused is acquainted with the result. Impeachments have not been common in later times, though they are still a competent proceeding; the latest memorable cases are those of Warren Hastings in 1788, and lord Melville in 1805.

Trial of Peers.—Peers are, in all cases, tried by their peers for treason, misprision of treason, felony, or misprision of felony. For misdemeanors, however, they are tried before the ordinary courts of law; and the lords spiritual are in all cases tried before the ordinary courts of the country. During the sitting of parliament, the trial proceeds before the house of lords, or more properly before the court of parliament presided over by the lord high steward. When parliament is not sitting, the trial takes place before the court of the lord high steward—a tribunal whose constitution was at one time very objectionable, that officer being allowed to summon what peers he pleased, only with the proviso that the number should amount in all to 23. Act 7 Will. III. c. 3 requires that all the peers who have a right to sit and vote in parliament be summoned. Peers of Scotland and Ireland are, in terms of the acts of union, tried in the same way. By 4 and 5 Viet. c. 22, a peer is liable on conviction to the same punishment as any other of the lieges.

See sir T. Erskine May's *Laws, Privileges, Proceedings, and Usage of Parliament*, 7th edition, 1873; Lucy's *Parliamentary Procedure*, etc.

PARLIAMENT, REDISTRIBUTION OF SEATS IN. See page 886.

PARLIAMENTARY CHURCH is a church erected under the authority of an act of parliament. In England such a church is generally called a district church; and the acts of parliament authorizing such churches, are known as the church building acts. See **PARISH**. In Scotland similar churches are called *quoad sacra* (q.v.) churches.

PARLIAMENTARY LAW. The course of procedure, rules of order, and customs of debate in American organized conventions, legislative bodies, and societies, are those laid down in the manual arranged by Thomas Jefferson, while he was president of the U. S. senate; and in the *Law and Practice of Legislative Assemblies*, by Mr. L. S. Cushing. But the foundation of both these works, and of the methods in vogue under their suggestion, has been the law of parliament. See **PARLIAMENT**, *ante*. And this applies equally to all voluntary and temporary organizations in America, to local and business corporations, and to political meetings; excepting, as regard the parliamentary origin of rules of order and the business of public meetings, when these have been specifically altered by the laws and customs of congress, which may be considered as the immediate fountain-head of all such rules and business in American assemblies. Public meetings are usually organized at first temporarily, and the details of permanent organization left to a committee appointed by the temporary chairman. It is a common practice in such cases to elect more than one vice-president, and several secretaries; these offices being, however, usually honorary. In certain legislative bodies in the United States, and notably in the U. S. senate, and in the upper house in some of the states, the presiding officer is not a member of the organization. A quorum of members is always required for the transaction of business, and if the number necessary to a quorum be not fixed by law, it is always a majority of the members. Business is entertained as being before the house, when a member is recognized by the chairman as having offered

a motion, or when a communication is acknowledged by the same officer and laid before the meeting; provided that in the case of a motion it be seconded by a member other than the one offering it. Motions to lay on the table, and for the previous question, are customary methods in use to dispose of questions and to cut off debate. It requires a two-thirds vote to suppress a question without permitting any debate. A motion to reconsider a question which has been decided, can only be made by one who has voted affirmatively; in congress this can be done on the day following that of the original action on the question. A motion to adjourn, when unqualified, is always in order, provided there has been debate on any question since its last previous offer. A rule adopted must be enforced by the chair without question, though a motion to suspend the rules gives temporary priority to one question in behalf of which such action is taken, provided that the motion be sustained by a two-thirds vote. On an appeal against a decision of the chairman, the latter is permitted to speak without leaving the chair, a course which is not permitted under other circumstances. Debate must be confined to the question, the chairman being addressed, and personalities being out of order. Motions which are undebatable are the following: to reconsider, where the question is undebatable; the previous question; to lay on and take from the table; an objection to consideration of any question; an appeal, provided it shall relate to transgression of the rules, or to indecorum; questions relating either to priority of business, to withdrawing a motion, to reading papers, or to suspending the rules; a call for the order of the day; a motion to adjourn, when unqualified; to fix a time to which to adjourn; and a motion to postpone indefinitely. None of these motions can be amended, excepting that to fix the time to which to adjourn. Precedence to motions is given in the following order; and any motion, except to amend, can be made while one of a lower order is pending, but none can supersede one of a higher order: to fix the time to which to adjourn; to adjourn, when unqualified; a call for the order of the day; to lay on the table; the previous question; to postpone to a certain time; to commit, amend, or postpone indefinitely. It is usual in all deliberative assemblies to simplify their business by referring questions requiring investigation or testimony, to committees appointed for the purpose. Sometimes such committees are appointed by the chair, at others they are elected by the members. On occasions when the assembly resolves itself into a committee of the whole, for the consideration of any special question, the chair appoints a presiding officer, or he may be elected by the committee. The course of a bill through congress, involves its introduction into the senate or the house of representatives, on the report of a committee, or on motion for leave to introduce by a member who shall have previously given at least one day's notice of his intention. It is then, unless otherwise specially ordered, read three times on three different days; the merits of the bill being usually discussed after the second reading, which generally immediately follows the first, on an accepted theory that the second reading is by special order. If ordered to be engrossed, a day is appointed for the third reading, and after this reading the question is on the final passage of the bill. Commonly the second and third readings are held to mean only the reading of the title of the bill. On the passage of the bill in one house, it is certified by the clerk and sent to the other; upon passing which, it is enrolled on parchment, examined by a committee of two from each house, signed by the speaker of the house and the president of the senate, presented to the president of the United States, and on receiving his signature becomes a law. If it is vetoed, it may be still made a law on receiving a two-thirds vote in each house, and if not returned by the president within ten days after its receipt by him (Sundays excepted) it becomes a law without his approval. A similar mode of procedure in the case of bills generally obtains in the state legislatures. Societies and voluntary organizations of all classes in the United States, usually have their constitution, by-laws, and rules of order, as adopted after full discussion, printed, or engrossed, and conveniently placed for the information of the members. But these, except in minor points of detail, are usually made to conform to Jefferson's and Cushing's manuals, to which the reader is referred for further information.

PARLOA, MARIA. See page 886.

PARMA, a former sovereignty of upper Italy, having the rank of a duchy, and bounded on the n. by Lombardy and Venice, e. by Modena, s. by Genoa and Tuscany, and w. by Piedmont, consisted of the duchies of Parma and Piacenza, which were subdivided into 5 districts, and contained in all 2,268 English sq. m., with a pop. (1871) of 490,259. The Apennines, which cross the southern division of the duchies, send off spurs northwards, and give to the northern part of the country the character of a plain, gently undulating, but sloping uniformly to the Po, which is the recipient of all the rivers of the country. The highest peaks of the Apennines in Parma are, Monte Alpe di Succisio, about 7,000 ft.; and Monte Parma and Monte Orsajo, both more than 5,250. The mountain-range is richly clad with oak and chestnut forests. The plain, which is very fertile, produces rich crops of grain (including rice), leguminous plants, fruits of all kinds, olives, and grapes; while marble, alabaster, salt, and petroleum are the chief mineral products. Next to agriculture, the production and manufacture of silk, the rearing of cattle and poultry, cheese-making and the extraction of the mineral products, afford the chief employment. Silk and cheese are the chief exports. The cheese, however, known as Parmesan, is not made here, but in the neighborhood of Lodi (q. v.).

The form of government was monarchical, and the Roman Catholic religion the only one tolerated, though a few Jews are found here and there through the country. The condition of education, though improved of late, is still very defective. The administrative power was in the hands of a council of state, which was divided into two sections—one for internal administration, which acted as a court of final appeal in matters of justice, the other for finance and military and foreign affairs. The revenue of Parma in 1859 was estimated at 11,566,648 liras (£458,085), and the expenditure at 11,273,883 liras (£446,490). The total debt, funded and redeemable, amounted to 15,558,218 liras (£616,167). The army (1859) before the annexation, according to the statistics of 1863, consisted of 3,290 soldiers; the duke had also the occasional loan of an Austrian regiment, and the fortress of Piacenza was garrisoned by the troops of that power.

History.—Parma and Piacenza belonged in the time of the Roman empire to Cisalpine Gaul, and after its fall came under the rule of the Lombards, to whose rule succeeded that of the kings of Italy and the German emperors. In the 12th and following centuries, they joined the other territories of northern Italy which were struggling for liberty and independence, and consequently became involved in the Guelph and Ghibelline contests. Weakened by these strifes, they fell under the domination of the powerful houses of Este, Visconti, and Sforza; but in 1499 they passed under the yoke of the French monarch, Louis XII., from whom they were soon recovered by the emperor Maximilian, and handed over to pope Leo X. in 1513. They continued under the sovereignty of the popes till 1543, when they were alienated by pope Paul III., and with the surrounding territory were erected into a duchy for his natural son Pier-Luigi Farnese, the grandfather of Alessandro Farnese, the celebrated regent of the Low Countries. On the extinction of the male line of Farnese, in 1731, by the death of the eighth duke, Antonio, his niece Elizabeth, the queen of Philip V. of Spain, obtained the duchies for her son Don Carlos, who, however, exchanged them in 1735 with Austria for the throne of the two Sicilies. In 1748 they were restored along with Guastalla to Spain, and became a duchy for the infante Don Philip, with a reversion to Austria in case of the failure of his male descendants, or of any of them ascending the Spanish or Neapolitan throne. Philip was succeeded in 1765 by his son Ferdinand, who was an able and enlightened ruler, and expelled the Jesuits in 1768. He died in 1802, and his dominions were immediately taken possession of by the French, and were incorporated with France under the designation of the department of Taro in 1805. In 1814, by the treaty of Paris, Parma, Piacenza, and Guastalla were presented as a sovereign duchy to the empress Maria Louisa, a proceeding strongly opposed by the king of Spain, who demanded them for his sister, Maria Louisa, the widow of Louis, king of Etruria, the son of duke Ferdinand. However, in 1817, it was settled that Maria Louisa of Austria should possess the duchies, and that on her death they should descend to Ferdinand Charles, duke of Lucca, the son of Maria Louisa of Spain, and the rightful heir; and on failure of his heirs, Parma should revert to Austria, and Piacenza to Sardinia. The empress governed very much after the Austrian fashion, but with gentleness, though liberal sentiments were looked upon by her with little favor. On her death, in 1847, the duke of Lucca succeeded as Charles II., and certain exchanges of territory, previously settled by the great powers, took place with Tuscany and Modena—the chief of which being the transfer of Guastalla to Modena in exchange for the districts of Villa-franca, Treschietto, Castevoli, and Melazzo, all in Massa-Carrara, resulting in a loss to Parma of about 77 English sq. m. of territory, and a gain of 193 English sq. miles. This transfer was not made without great discontent on the part of the inhabitants. The duke's rule was severe and tyrannical, and on an address being presented to him with a view of obtaining a reform of certain abuses, and a more liberal political constitution, similar to what Tuscany had (Feb., 1848), obtained from its grand-duke, he threw himself into the arms of Austria, and consented to the occupation of his territory by Austrian troops. In March, 1848, a revolution broke out, and the duke was compelled to grant the popular demands, but he almost immediately after retired from the country. Parma joined with Sardinia in the war of 1848–49 against Austria, but on the triumph of the latter power was compelled to receive Charles III. (his father, Charles II., having resigned his throne, March, 1849) as its ruler. The new duke recalled the constitution which his father had been compelled to grant, and punished with great severity the active agents of the revolutionary movements in his dominions. His arbitrary measures were effectively seconded by his chief minister, an Englishman named Ward, who shared the public obloquy with his master. After Charles III.'s assassination in March, 1854, his widow Louise-Marie-Therese de Bourbon, daughter of the last duke of Berry (q. v.), assumed the government for the behoof of her son Robert I., and made some attempts at political reform; but owing to the excited state of the people they were little effective, and she and her son were compelled to leave the country in 1859, on the outbreak of a new war between Sardinia and Austria. In March 18th of the following year the country was annexed to Sardinia, and it now forms a part of the kingdom of Italy, constituting the two provinces of Parma (area 1251 English sq. m., pop. in '81, 267,386) and Piacenza (area 965 English sq. m., pop. 225,775), a few of the outlying districts, amounting to about 150 sq. m., being incorporated with other provinces.—*Official Statistics of the Kingdom of Italy* (Turin, 1861); *Budget of the Æmiliæ*; *Report of the Marquis Pepoli to the Minister of Finances* (Turin, 1860); *idem. Report of General Tozze to the Minister of War* (1863).

PARMA, the chief t. of the province of the same name in Italy, and formerly the capital of the duchy of Parma, is situated on both sides of the river Parma, 12 m. s. from the Po, 75 m. s.e. from Milan, and about the same distance e.n.e. from Genoa, with a pop. '81, of 45,217.

The town is of a circular form, and is surrounded by walls and ditches flanked by bastions; the streets are straight and wide, and meet at right angles, the chief of them, a part of the Roman Via *Æmilia*, crossing the city from e. to w., and dividing it into two nearly equal parts. Parma is celebrated for its churches, 10 in number, the chief of which are the *Duomo*, or cathedral (consecrated 1106 A.D.), built chiefly in the Lombard style, having the interior adorned with magnificent frescoes by Correggio, and paintings by other artists, and surmounted by a beautiful dome; the *Battisterio*, or Baptistery, one of the most splendid in Italy, begun in 1196 and completed in 1281; the church of the *Madonna della Steccata*, containing the famous painting of "Moses breaking the Tables of the Law" by Parmigianino. The other celebrated buildings are, the Farnese palace, a gloomy and ill-constructed edifice; the Farnese theater, built (1618-28) of wood, and now in a most dilapidated condition. Parma has also a library containing 120,000 volumes, mostly well selected, and many of them rare and valuable works; a museum of antiquities; a botanic garden; a theater (*Teatro Nuovo*); an academy of fine arts, founded in 1752, possessing a collection of 600 pictures, many of which are exceedingly valuable. The pictures most highly esteemed are the "Madonnas" of Correggio and Francia, the "St. Jerome" of Correggio, and the "Jesus Glorified" of Raphael.

The manufactures of Parma are stockings, porcelain, sugar, wax-candles, and vessels of crystal, also silk, cotton, and fustian stuffs. The chief exports are cheese and silk goods; and in June there is an annual silk fair.

PARMA, BATTLES OF. An indecisive engagement took place here June 29, 1734, between the confederated armies of England, France, and Spain, and the Austrians; and on June 19, 1799, the French under Macdonald were routed by the Russians under Suwarof, with a loss of 10,000 men and 4 generals.

PARMA, DUKE OF. See **FARNESE**, *ante*.

PARMELIA, a genus of lichens, with a leafy horizontal thallus which is lobed and cut; and orbicular shields (*apothecia*) fixed by a central point, concave, and bordered by the inflexed thallus. The species are numerous, and many are found in Britain. Some of them are occasionally employed in dyeing. Various chemical principles have been discovered in lichens of this genus, as *Usnine* or *Usnic acid* (also found in species of the genus *Usnea*), and *Parietin*. Valuable medicinal properties—tonic and febrifugal—have been ascribed to *Parmelia parietina*, the common yellow wall lichen, or common yellow wall moss of the herb shops, a bright yellow species with deep orange shields, plentiful on walls and trees in Britain and most parts of Europe.

PARMENIDÉS, a Greek philosopher of Elea, in lower Italy, and in the opinion of the ancients the greatest member of the Eleatic school, flourished about the middle of the 5th c. B.C. Nothing is known with certainty regarding his life, but he is said to have visited Athens in his old age, and to have conversed with Socrates, then quite a youth. The story, though it rests on the authority of Plato, has a suspicious air, and seems as if it were intended to account for the influence which the philosophy of Parmenides undoubtedly exercised on that of Socrates and Plato themselves. Parmenides, like Xenophanes of Colophon, sometimes regarded as the first of the Eleatics, expounded his philosophy in verse—his only work being a didactic poem *On Nature*. The leading design of this poem is to demonstrate the reality of absolute being, the non-existence of which Parmenides declares to be inconceivable, but the nature of which, on the other hand, he admits to be equally inconceivable, inasmuch as it is dissociated from every limitation under which man thinks. Parmenides is not a theologian in speculation, seeking rather to identify his "Absolute Being" with "Thought" than with a "Deity." Only fragments of his poem remain, which have been separately edited by Fülleborn (Züllichau, 1795); another collection is that by Brandis, in his *Commentationes Eleaticæ* (Altona, 1815); but the best is to be found in Karsten's *Philosophorum Græcorum veterum Reliquiæ* (Amstelod. 1835).

PARMER, co. Tex. See page 886.

PARMIGIANO, GIROLAMO FRANCESCO MARIA MAZZOLA, called Parmigiano or Parmigianino, b. at Parmo in 1503, an able painter of the Lombard school, and the most distinguished of those who followed the style of Correggio. His pictures attracted much attention when he was little more than 14 years of age. In 1523 he went to Rome to follow out his studies, and was soon favorably noticed and employed by Clement VII. He was in that city when it was stormed by the imperialists under Bourbon in 1527, and, it is said, was calmly at work on his picture of "The Vision of St. Jerome" (now in the national gallery, London) when soldiers, bent on pillage, burst into his studio. He was, however, protected by their leader. After this event he left Rome for Bologna, where he painted various important works, and returned to Parma in 1531. Having engaged to execute several extensive frescoes in the church of St. Maria Steccata, after repeated delays, he was thrown into prison for breach of contract, and on being released, in place of carrying out his undertaking, he fled to Casal Maggiore, in the territory of Cremona, where he died soon afterward in 1540. Vasari, in his notice of Parmigiano, attributes

his misfortunes and premature death to his passion for alchemy; but this oft-repeated story has been disproved by the researches of late biographers. He executed several etchings, and some wood-cuts are attributed to him.

PARNAHIBA, or **PARANAHYBA**, a river of Brazil, rises in the Sierra dos Coroados, between the provinces of Goyas and Piauí, about 11° south. It flows n.e and n., and enters the Atlantic in long. about 41° 40' w. by five mouths, which inclose a delta about 30 m. wide along the shore. These mouths, however, are only from two to four fathoms deep. It drains the province of Piauí, and forms the boundary-line between it and the province of Maranhão. Total length estimated at 750 miles.—A chief tributary of the Parana also bears the name of Parnahiba.

PARNAS'SUS, a mountain greatly celebrated among the ancients, and regarded by the Greeks as the central point of their country. It was in Phocis. It has three steep peaks, almost always covered with snow, and seen from a great distance, the highest being fully 8,000 ft. above the level of the sea; but as only two of them are visible from Delphi, it was customary among the Greeks to speak of the two-peaked Parnassus. On its southern slope lay Delphi (q.v.), the seat of the famous oracle, and the fountain of Castalia (q.v.). The highest peak was the scene of the orgies of the worship of Dionysus (Bacchus); all the rest of the mountain was sacred to Apollo and the Muses, whence poets were said to "climb Parnassus," a phrase still thus employed.

PAR'NELL, **CHARLES STEWART**, b. Ireland, 1847; of an aristocratic family, one of whose connections was the poet Parnell. He inherited the estate of Avondale, in Wicklow, Ireland; was educated at Harrow school, England, and Magdalen college, Cambridge. Mr. Parnell's mother is the daughter of admiral Stewart—"Old Ironsides"—who commanded the U. S. frigate *Constitution* during the war of 1812. In 1876 he entered parliament from Meath, and has continued a member to 1881, being last elected to represent the city of Cork. He has displayed remarkable ability both as a parliamentary debater and tactician, and as an organizer in the interest of the Irish "home-rule" party. He identified himself with the tenant-farmers of Ireland in their struggles with absenteeism and high rents, and was chiefly instrumental in forming and sustaining the "Land League" of 1879-80. Justin McCarthy said of him in his *History of Our Own Times*: "Mr. Butt had been failing in physical power and in influence for some time. His place as a leader had long been practically disputed by Mr. Parnell, and was evidently about to be taken by him. Mr. Parnell, a young man but lately come into parliament, soon proved himself the most remarkable politician who had arisen on the field of Irish politics since the day when John Mitchell was conveyed away from Dublin to Bermuda." In the beginning of Jan., 1880, Mr. Parnell made a visit to the United States with the design of interesting the Irish-American population in the cause of the land league. He failed in producing the effect which he had anticipated, and being opposed by the press, was obliged to return home chagrined and defeated. He became virulent and bitter in his public addresses in Ireland, and appeared desirous of fomenting disorder. Possibly, however, to him may be attributed much of the influence which brought about the introduction of the Irish land act into parliament by Mr. Gladstone, in April, 1881.

PAR'NELL, **HENRY BROOKE**. See **CONGLETON**, Lord.

PAR'NELL, **THOMAS**, 1679-1718; b. Dublin; son of an English landed proprietor. He graduated at Trinity college, and was ordained deacon, though under the canonical age. In 1705 he was appointed archdeacon of Clogher. About this time he began to compose verses, in the manner of Pope; they attracted much attention, and secured him the friendship of the London wits. He contributed to the *Spectator* and *Guardian*; and was the associate of Pope, Arbuthnot, and Gay, in the "Scriblerus Club." On the fall of the whig government, near the close of Anne's reign, he went over to the tories, and stood in high favor with the Oxford administration. But his prospects of advancement from that quarter were destroyed by the overthrow of the tories at the death of the queen. By the influence of Swift he was made prebend in 1713, and 3 years later he was presented to the vicarage of Finglass. His disappointment at not obtaining more adequate promotion, and the death of his wife, which happened in 1712, threw him into a profound melancholy; and he is said to have hastened his death by intemperance. An edition of his poems, selected by Pope, appeared soon after his death; and a volume of doubtful authenticity, containing his posthumous works, was published in 1758. *The Hermit* is his best known poem; and among his other productions, *The Rise of Woman*, *The Fairy Tale*, *The Vigil of Venus*, and *The Allegory on Man*, deserve mention. A life of him, by Goldsmith, appears in the latter's works.

PARO'CHIAL BOARD, in Scotland, is the board in each parish which manages the relief of the poor. In England the same duty is performed by overseers, and in some cases by guardians of the poor.

PAROCHIAL RELIEF is the relief given to paupers by the parish authorities. See **POOR**.

PARODY (Gr. *para*, beside, and *ode*, a song), the name given to a burlesque imitation of a serious poem. Its peculiarity is that it preserves the form, and as far as possible the words of the original, and thereby differs from a travesty, which is a looser and less

literal kind of burlesque. The invention of parodies is commonly ascribed to the Greeks (from whom, at least, we have derived the name); the first parodist, according to Aristotle, being Hegemon of Thasos, who flourished during the Peloponnesian war; according to others, Hipponax. From the fragments that are extant of ancient parody, we infer that Homer was the favorite subject of comic imitation. Thus Hipponax, in his picture of a glutton, ludicrously insinuates a comparison between the feats of his hero in eating and those of Achilles in fighting, by commencing as follows:

Sing, O celestial goddess, Eurymedon, foremost of gluttons,
Whose stomach devours like Charybdis, eater unmatched among mortals.

The *Batrachomyomachia* (Battle of the Frogs and Mice), erroneously ascribed to Homer, is also a happy and harmless specimen of the parody, which, however, soon began to exchange its jocose and inoffensive raillery for a biting and sarcastic banter, of which numerous specimens may be seen in the comedies of Aristophanes; while the philosopher Timon of Philus invented, under the name of *Silla*, a new species of satirical parody. Among the Romans we first meet with this form of literature in the period of the decline; All the power of Nero could not prevent his verses from being parodied by Persius. Among modern nations the French—as might naturally be expected from their character—have been most addicted to this literary mimicry. Corneille parodied Chape- lain in his *Cid*, and Racine parodied Corneille. The *potpourris* of Désangiers are considered by his countrymen models of this ungracious kind of literature. Schiller's famous poem of the *Bell* has been often parodied by German wits. In England, perhaps the best compositions of this nature are the *Rejected Addresses* of the brothers James and Horace Smith. Many will remember, in particular, the parody on Scott's "Battle of Flodden" in *Marmion*, ending—

'od rot 'em
Were the last words of Higginbotham.

Barnham's *Ingoldsby Legends* contains a felicitous parody on Wolfe's *Lines on the Burial of Sir John Moore*. We quote the first stanza as a specimen:

Not a sou had he got, not a guinea or note,
And he looked most confoundedly flurried
As he bolted away without paying his shot,
And his landlady after him hurried.

Thackeray's *Miscellanies* also contain some very clever and satirical prose parodies upon certain of his brother novelists.

The historical development of the parody has been treated by Moser in Daub's and Creuzer's *Studien* (6th vol.). See also Moser's *Purodiarum Exempla* (Ulm. 1819) and Weland's *De Præcipuis Parodiarum Homerocarum Scriptoris* (Gött. 1833).

PAROLE (literally, a word) is the declaration made on honor by an officer, in a case in which there is no more than his sense of honor to restrain him from breaking his word. Thus a prisoner of war may be released from actual prison on his parole that he will not go beyond certain designated limits; or he may even be allowed to return to his own country on his parole not to fight again, during the existing war, against his captors. To break *parole* is accounted infamous in all civilized nations, and an officer who has so far forgotten his position as a gentleman, ceases to have any claim to the treatment of an honorable man, nor can he expect quarter should he again fall into the hands of the enemy he has deceived.

PAROLE EVIDENCE, in law, means such evidence as is given by witnesses by word of mouth at a trial or hearing of a cause. Parole agreement, in English law, means any agreement made either by word of mouth or by writing not under seal. If the agreement is made by writing under seal, it is called a deed, or indenture, or covenant, according to the nature of its contents.

PAROPAMISAN MOUNTAINS. See AFGHANISTAN.

PAROQUET, PARRAKEET', or PARROQUET, a name very commonly given to many of the smaller species of the parrot family; generally to species having long tails, and natives of the East Indies, Africa, and Australia, not so frequently to American species; although it is sometimes also applied to some of these, indifferently with the name parrot.—One of the most beautiful groups of the *psittacidae*, combining gracefulness of form with splendor of plumage, is that to which the ALEXANDRINA PAROQUET or RING PAROQUET (*Palæornis Alexandri*) belongs. It is about the size of a common pigeon, green, with a red collar, whence its name ring paroquet, and is a native of the East Indies. It is said to have been brought to Europe by some of the members of Alexander the great's expedition to India, and to have been the first of the parrot tribe known to the Greeks and Romans, by whom it was highly prized, as it still is, not only for its beauty, but for its docility and its power of imitating human speech. Like many of its tribe, it is gregarious, and immense flocks make their abode in some of the cocoa-nut groves of the western parts of Ceylon, filling the air with the most deafening screams. The ring paroquet has many congeners, natives chiefly of the East Indies, exhibiting much variety of splendid plumage.—Somewhat like them in length and form of tail, but with longer and stronger legs, is the GROUND PAROQUET, or GROUND PARROT (*Pezophorus formosus*), of Australia, a bird very common in all the southern parts of New Holland and in Van Dieman's Land, inhabiting *scrubs* or ground covered with very low underwood.

Its habits are very unlike those of parrots in general; it runs along the ground, and even seeks to escape from enemies by running, unwillingly takes wing, and then only for a short low flight. It makes no nest, but lays its eggs in a hole in the ground. It is a small bird, not much more than 12 in. in entire length, one half of which is occupied by the tail; its color, dark green above, yellowish below, less brilliant than in many of the parrot tribe, but finely marked and mottled. Its flesh has a very strong *game* flavor. There are numerous other Australian species, distributed in several genera, some of which, although less exclusively than that just noticed, live and seek their food on the ground. Some of them exhibit the greatest splendor of plumage. The only one we shall notice is the ZEBRA PAROQUET (*Melopsittacus undulatus*), a very beautiful little species which has often been brought to England, and has sometimes bred in it. In the vast inland plains of Australia, this paroquet is to be seen in flocks of many hundreds feeding on the seeds of the grasses, which afford food also to many other small species.

PA'ROS, one of the larger islands of the Grecian Archipelago, is situated w. of Naxos, from which it is separated by a channel from 4 to 6 m. wide. Greatest length, 15 m.; greatest breadth, 9 m.; area, about 95 sq.m.; pop. 6,000. The surface is hilly, the scenery picturesque, and the soil naturally fertile, but imperfectly cultivated. The island is especially productive in cotton, wax, honey, partridges, and wild pigeons. Near the middle of the island, the mountain Capresso (ancient *Marpessa*) abounds in the famous Parian marble, which was used by many of the greatest sculptors of antiquity. Parekhia, on the w. coast, is the principal town, and Naussa, on the n. coast, is the chief port.

In ancient times, Paros, which is said to have been colonized by Cretans, attained great maritime prosperity, and became wealthy and powerful. It submitted to the Persians; and after the battle of Marathon was assailed ineffectually by Miltiades, who received here the wound of which he soon after died. After the defeat of Xerxes, Paros came under the supremacy of Athens, and shared the fate of the other Cyclades. Archilochus, the inventor of Iambic verse, was born here.

PAROT'ID GLAND. See SALIVARY GLANDS.

PARQUETRY, a kind of wood mosaic used only for flooring. The art of making inlaid wood floors has until lately much declined in this country, but on the continent it has been much in use, and has been carried to great perfection. Parquetry floors are usually of oak, but other and more ornamental woods have also been much used for giving variety and beauty to the pattern. In the more elaborate kinds of parquetry, veneers are used, but it is much more generally composed of blocks of wood squared at the sides, and laid down so as to combine and form a geometric pattern. Of late the taste for this work has revived in Britain, and it is beginning to be extensively employed in the better class of buildings.

PARR, CATHARINE. See CATHARINE PARR, *ante*.

PARR, genus of fish. See page 886.

PARR, SAMUEL, LL.D., a once notable scholar, was b. Jan. 15, 1747, at Harrow-on-the-hill. He entered Emanuel college, Cambridge, in 1765; but the death of his father, two years afterward, necessitated his doing something for himself, and he was, in consequence, induced to accept an assistant-mastership at Harrow, where he remained five years. The head-mastership then becoming vacant, Parr applied for it, but was rejected, whereupon he left, and started as an independent schoolmaster. In 1777 he was appointed master of Colehester school, where he was ordained priest, and obtained the curacies of Hythe and Trinity church. Next year he became master of Norwich school; but in 1786 settled at Hatton in Warwickshire, where he spent the rest of his life. In 1787 he published an edition of Bellenden, to which he prefixed his celebrated preface, which is as remarkable for its uncompromising advocacy of whig principles as for the scrupulous Ciceronianism of its Latinity. He died Mar. 6, 1825.

It is almost impossible to understand the reputation which Parr once had. None of his voluminous writings justify it. That he was in some respects an accomplished, and even a great scholar, is undoubted, for he could write Latin of Ciceronian purity and finish; but it is equally undoubted that he never did anything with his boasted scholarship. Parr has left the world absolutely nothing to keep it in remembrance of him, yet his complete works (edited by Dr. J. Johnstone in 1828)—exclusive of his contributions to periodicals—form eight enormous tomes, and contain 5,734 octavo pages, many of them printed in small type. They relate to matters historical, critical, and metaphysical, but in all of them "the thread of Parr's verbosity is finer than the staple of his argument." What, then, gave him the fame that he certainly enjoyed during his life? Beyond all question, it was his conversational powers. He was an amazing, an overwhelming talker. Bold, dogmatic, arrogant, with a memory profoundly and minutely retentive, and with a genuine gift of ephemeral epigram, he seemed, at the tables of statesmen, and wits, and divines, to be a man of tremendous talent, capable of any literary feat; but the learning and the repartee have left little trace of their existence, and posterity declines to admire the wonders that it has neither seen nor heard. See De Quincey's famous essay on "Dr. Samuel Parr on Whiggism in its Relations to Literature" (Author's edition, vol. 5. Edin. Adam & Charles Black, 1862).

PARR, THOMAS, 1483-1635; b. England. According to a curious pamphlet published by John Taylor in 1635, and called *The Olde, Olde, Very Olde Man*, etc., Parr's first mar-

riage took place in his 81st year, and his second when he was 120. He is said to have had a love affair when 105 years old, and to have been condemned to do public penance for it, by standing in a sheet at the church of Alderbury. He died in London, and was buried in Westminster abbey.

PAR'RA. See JACANA.

PARRAMATTA. See PARAMATTA.

PARRAS, a well-built t. of Mexico, in the state of Coahuila, 470 m. n.w. of Mexico, near the e. shore of lake Parras. It derives its name from a species of indigenous vine much cultivated, and has always been celebrated for its wines and brandies. There are many old Spanish families here. Pop. 8,000.

PARRHA'SIUS, one of the greatest painters of ancient Greece, was the son of Evenor, himself an artist, and was b. at Ephesus in the 5th c. B.C. He practiced his profession, however, at Athens, the inhabitants of which held him in high estimation, and conferred on him the rights of citizenship. He was already celebrated in the time of Socrates, with whom, according to Xenophon, he held a conversation (*Mem.* 3, 10), and was also a younger contemporary of Zeuxis. The date of his death is unknown. Seneca, who lived several hundred years after, tells a monstrous story about him. He says that when Parrhasius was painting his "Prometheus Vincit," he got hold of one of the prisoners taken at the capture of Olynthus by Philip of Macedon (347 B.C.), and crucified him in his studio that he might copy from life the expression of agony. Fortunately for Parrhasius's memory, the anecdote is almost certainly untrue, as it would require us to suppose that he was still alive and painting when upward of a hundred years old. Parrhasius appears to have surpassed all his predecessors in purity of design, accuracy of drawing, force of expression, and what is technically called "finish." According to Pliny, he was the first who established a true proportion between the different parts of a picture, and delineated with elegance and precision all the minutiae of the features, even to those evanescent motions that betray the most delicate sentiments of the soul. He painted the extremities, such as the hands and fingers, in so exquisite a style, that the intermediate parts seemed relatively—but *only* relatively—inferior. Quintilian calls him the legislator of his art, because his canon of proportion for gods and heroes was followed by all contemporary and subsequent painters. Among his works were an apparently symbolical picture of the Athenian *Demos* ("people"), a "Theseus," "Naval Commander in full Armor," "Ulysses feigning Madness," "Castor and Pollux," "Bacchus and Virtue," a "Meleager, Hercules, and Perseus" on one canvas, a "Cretan Nurse with a Child in her Arms," a "Priest officiating with a Child bearing Incense," "Two Young Children," an "Achilles," an "Agamemnon," etc. But his subjects were not always of a pure or lofty character. His "Archigallus" (high-priest of Cybele) and his "Meleager and Atalanta" were most licentious representations, and gave such pleasure to the emperor Tiberius, a man of unbounded sensuality, that he kept them in his bedroom, and valued the second in particular at more than a million sesterces.

Parrhasius was of an excessively proud and arrogant disposition. He called himself the prince of painters, and claimed to be descended from Apollo; he also painted himself as the god Mercury, and then exposed his own portrait for the adoration of the crowd. His vanity was equal to his pride, and showed itself even in his apparel, which was of the kind called "gorgeous." He generally dressed in a purple robe with a golden fringe, sported a gold-headed cane, and wore boots tied with golden clasps.

PARRICIDE (Lat. *paricida*) is rather a popular than a legal term. In the Roman law it comprehended every one who murdered a near relative; but in English the term is usually confined to the murderer of one's father, or of one who is *in loco parentis*. The parricide does not, in any respect, differ in Britain from the murderer of a stranger; in both cases, the punishment is death by hanging. In the Roman law, a parricide was punished in a much more severe manner, being sewed up in a leather sack, along with a live cock, viper, dog, and ape, and cast into the sea to take his fate with these companions.

PARRIS, ALBION KEITH, 1788–1857; b. Maine; graduated at Dartmouth college in 1806, studied law and settled as a lawyer at Paris, Me., where he resided many years. In 1815 he was a representative in congress and three years later a U. S. district judge, at which time he removed to Portland. During the following 30 years he was a judge of probate, governor of Maine, U. S. senator, judge of the state supreme court, second controller of the U. S. treasury, and mayor of Portland, in which city he died.

PARRIS, SAMUEL, 1653–1720; b. London, Eng.; came in youth to Massachusetts; studied at Harvard college, but did not graduate; was a successful merchant in Boston; entered the ministry, and was pastor of the church at Danvers, Mass., in 1689–96. The delusion of Salem witchcraft originated in his family, his daughter and niece accusing Tituba, living as a servant in the family, with bewitching them. Mr. Parris beat her and compelled her to confess herself a witch. Her husband for his own safety accused others, and a sad persecution was commenced. The delusion lasted 16 months. Mr. Parris having been a zealous prosecutor, his church brought charges against him. He acknowledged his error, but was dismissed. After preaching for a time at Stow he removed to Concord, and preached six months at Dunstable. It should be remembered that at that time the most learned men in Europe, ecclesiastics and lawyers, were

believers in witchcraft; and that many years after the Salem delusion had passed away persons were put to death in England for the alleged offense.

PARRISH, EDWARD, 1822-72; b. Philadelphia; principal of the Philadelphia school of practical pharmacy, where he became professor of materia medica in 1864. He published, besides a large number of papers in scientific periodicals, *Practical Pharmacy*, 1856; *The Phantom Bouquet*, 1863; and *Education in the Society of Friends*, 1866. He was a commissioner to the Indians on the plains at the time of his death.

PARRISH, JOSEPH, 1779-1840; b. Philadelphia; educated at the university of Pennsylvania, where he took a degree in medicine, 1806. He began practice in Philadelphia; was connected with several local medical institutions; from 1816 to 1829 was surgeon of the Pennsylvania state hospital, and for the last five years of his life was consulting surgeon of the Philadelphia dispensary. He obtained a high rank in the profession; was noted for his philanthropy, and contributed many articles to the medical periodicals. He published a revised edition of *Lawrence on Hernia* with notes and an appendix.

PARRISH'S CHEMICAL FOOD is the popular name for a non-official preparation medicinally known as *Compound Syrup of Phosphate of Iron*, every dram of which contains 1 grain of phosphate of iron, $2\frac{1}{2}$ of phosphate of lime, besides soda and potash. Mr. Parrish of Philadelphia was the first to publish a formula for this very useful compound.

PARROT, *Psittacus*, a Linnæan genus of birds, now the family *psittacidae*, of the order *scansores*, or climbers (q.v.), comprehending a vast number of species, natives of almost all tropical and subtropical regions; a few species extending further north and south, in America, in New Zealand, and in Van Diemen's land, even to the neighborhood of lake Michigan in North America, and to Terra del Feugo in South America. They are mostly birds of splendid plumage; they vary very much in size, from the great macaw, more than three feet in length, tail included, to the little love-birds, not larger than sparrows. They are mostly gregarious, and are often seen in vast flocks, generally inhabiting forests, and making their nests in trees, feeding chiefly on fruits and seeds, partly also on leaves and buds; but some of them dwelling in open plains, feeding on the seeds of grasses and other plants of humble growth, bulbs and succulent parts of vegetables, and living mostly on the ground. The voices of the parrot tribe are generally harsh and discordant, although some of the smaller kinds have not unpleasant voices; but many of the larger have a remarkable power of imitating human speech, and in domestication become capable of articulating not only words but sentences. They exhibit a greater degree of intelligence than is usual in birds, with a monkey-like restlessness and love of trick; and although docile and affectionate, are generally of capricious irritable temper. They have a short, stout, hard beak, rounded on all sides, and enveloped at the base in a membrane in which the nostrils are pierced; the upper mandible generally much longer than the lower, much curved, and sharp pointed. The tongue is almost always very large, thick, round, and fleshy; the muscles which move the mandibles are more numerous and powerful than in most other birds. They make use of the powerful hooked bill as well as of the feet in climbing trees; and employ their feet as hands for holding their food, and bringing it up to the mouth. Their feet differ from those of all other climbers, in being covered with small tubercle-like scales instead of plates. Some have short and some have long tails. Most of them have short wings. Their intestines are very long and slender, and without cæca.

The *psittacidae* are easily distinguished from all other birds; but their division into distinct subordinate groups has not been found so easy. Whilst the name parrot popularly includes all, except that it is seldom given to some of the smallest species, some are known by the names macaw, cockatoo, parrakeet, lory, love-bird, etc. See these heads. But some of these names are very vaguely applied. And although the parrot family is regarded as consisting of a number of very natural groups, the characters and limits of these groups have not yet been very well defined.

The name parrot, in its most restricted sense, is sometimes applied only to those species which have the upper mandible very distinctly toothed, the lower mandible longer than it is high; and the tail short, and square or rounded; but this use is rather ornithological than popular, the most restricted popular use equally including long-tailed species, such as the Caroline parrots, which are ornithologically ranked with the macaws.—The CAROLINE PARROT (*conurus Carolinensis*) is the species of which the northern range extends far beyond all others of its tribe to the shores of lake Michigan; although by the increase of cultivation, and the war waged against these birds for their depredations on orchards and corn-ricks, their numbers have been greatly diminished in regions where they were once plentiful. Its whole length is about 14 in., of which about one-half is occupied by the tail; the general color is green, shaded with blue, and diversified with orange, the wing primaries almost black. It is gregarious, prefers to roost in the holes of hollow trees, and in such situations also the females lay their eggs. It seems to love salt, frequenting salt licks like pigeons. It is easily tamed, but does not acquire the power of articulation.—Of the short-tailed parrots, one of the best-known is the GRAY PARROT (*psittacus erythacus*), a west African species, about the size of a small pigeon, of an ash-gray color, with a crimson tail. It is famous for its docility, its power of articulation and of imitating noises of all kinds, its loquacity, and its mischievousness.

It is very often brought to Europe, and often lives to a great age in confinement. Individuals have been known to attain the age of nearly 100 years.—The GREEN PARROTS (*chrysotis*), natives of the tropical parts of South America, are also among the short-tailed parrots most frequently seen in Britain.

PARROT-FISH, *Scarus*, a genus of fishes of the family *labridæ* (q.v.) or *cyclo-labridæ*, of oblong and massive form, with large scales, and remarkable for the structure of their jaws and teeth, the jaws being divided into halves by a median suture, the teeth incorporated with the bone in crowded quincuncial order, the surface even and polished in some species and rough in others, the oldest teeth forming the trenchant border of the jaw, and being succeeded by others as they are worn away, whilst new ones are formed behind. The species are numerous. Some of them feed on fuci, and some on corals, the younger branches of which they crush, so that the animal part affords them nourishment, whilst the calcareous part is rejected. They are fishes generally of brilliant colors, some of them of wonderful splendor, and have received the name parrot-fish partly on this account, and partly on account of a fancied resemblance in their jaws to a parrot's bill. Most of them are natives of tropical seas. One species is found in the Mediterranean (*S. creticus*), the *scarus* of the ancients, of which many wonderful stories were told as to its love, its wisdom, its ruminating, its emitting of sounds, etc., and which was esteemed the most savory and delicate of all fishes. It is still held in high esteem for the table. The Greeks cook it with a sauce made of its own liver and intestines.

PARROTT, ENOCH G., 1814–79; b. Portsmouth, N. H.; entered the navy at the age of 17, and was promoted to lieut. in 1841. About 1843 he accompanied commodore Perry in the frigate *Congress* to the w. coast of Africa. He was with gen. Fremont in several engagements in the Mexican war, and was prominent in the siege resulting in the capture of Guaymas and Mazatlan. In the war of the rebellion he went with the expedition to Norfolk, Va., April, 1861, when the navy-yard was destroyed, and in that year was made commander. He was in command of the steamer *Augusta* at the battle of Port Royal, and engaged the confederate gunboats in Charleston harbor Jan. 13, 1863. In June, 1864, he commanded the iron-clad *Canonicus* in the engagement with Howlett's battery and in subsequent engagements on James river, and was in command of the *Monadnock* at Wilmington, a favorite resort of blockade runners. He was present at the bombardment and surrender of fort Fisher Jan. 15, 1865, under admiral Porter and gen. Terry, and was highly commended for gallantry. In 1866 he received a captain's commission, was promoted to commodore in 1870, rear-admiral in 1873, and retired from active service in 1874.

PARROTT, ROBERT PARKER, b. Lee, N. H., 1804; graduate of West Point 1824; entered the army as 2d lieut. of artillery; was appointed assistant professor of mathematics at West Point and principal assistant professor of natural and experimental philosophy, and filled the office 1824–29. He was detailed for ordnance duty 1834, and was in the war against the Creeks. He was transferred to the ordnance corps as capt., 1836, resigned the same year, and was appointed superintendent of the West Point foundry at Cold Spring, Putnam co., N. Y. In 1844–47 he was judge of the court of common pleas in Putnam county. He invented a system of guns and heavy ordnance extensively used in the war against the rebellion, and of which the 10-pounder, 30-pounder, and 100-pounder are considered capable of producing the best results. One 30-pounder proved its power of endurance, having been fired 4,606 times before bursting. They were first introduced at the battle of Bull Run, July 21, 1861. He d. 1877.

PARRY, Sir WILLIAM EDWARD, commonly known as sir EDWARD PARRY, a celebrated English navigator, was born at Bath, Dec. 19, 1790. His father, who was a physician of some eminence, destined him for the medical profession; but acting on the advice of a friend, entered him as a first-class volunteer on board the *Ville-de-Paris*, the flag-ship of the channel fleet in 1803. After several years' service, he received his commission as lieut., Jan. 6, 1810. Though thus early engaged in active service, his education had not been neglected; he had attained at school to considerable eminence in classical knowledge; and for the first five years after entering the navy he had particularly studied French and mathematics under the chaplain's superintendence, after which he constantly employed his leisure time in nautical and astronomical studies. In Feb., 1810, he was sent to the Arctic regions in command of a ship, for the purpose of protecting the British whale fisheries and improving the admiralty charts of those regions; but in 1813 he was recalled and dispatched to join the fleet then blockading the coast of the United States. He remained on the North American station till the spring of 1817, and during this time he wrote and distributed MS. copies of a work entitled *Nautical Astronomy by Night*, in which rules were given for determining accurately the altitude of the pole by observations of the fixed stars. This work he subsequently published in London. Having returned to England too late to take part in the African exploring expedition, he was, at his urgent request, backed by the recommendations of Mr. Barrow, secretary to the admiralty, appointed to the command of the *Alexander*, under the orders of capt. John Ross in the *Isabella*, and dispatched in search of the "north-west passage" (q.v.) in April, 1818. The expedition returned to England, having made no important discoveries. The admiralty were dissatisfied with the report of capt. Ross; and Parry's opinion, though only communicated to his private friends, having become known to

them, he was again sent out (May, 1819), and this time commenced that career of discovery (see NORTH-WEST PASSAGE) which has immortalized him as the greatest of all Arctic explorers. Parry on his return to Britain was hailed with the utmost enthusiasm and was made commander (Nov. 4, 1820), and a member of the royal society. He subsequently made a second and a third voyage to the same regions, but effected nothing further of importance. Parry now devoted himself to the discharge of his duties as hydrographer, but such labors were too monotonous for one of his temperament, and he accordingly prepared a plan of an expedition for reaching the north pole, which being submitted to the admiralty and approved of by them, his old ship the *Hecla* was fitted out for a polar expedition, and Parry set sail in her, accompanied by lieut. J. C. Ross, April 4, 1827. See POLAR VOYAGES. The *Journals* of these voyages were published by order of the admiralty.

Parry's career as an explorer was now closed, and he again returned to his duties as hydrographer, but his health now gave way under this sedentary mode of life, and he exchanged his office for that of commissioner to the agricultural company of Australia, for which country he sailed July 20, 1829. He returned to England in Nov., 1834, and filled in succession various government appointments up till Dec., 1846, when he retired from active service, receiving a sinecure office. On June 4, 1852, he was raised to the rank of rear-admiral of the white, and in the following year was appointed lieutenant-governor of Greenwich hospital—an office which he held till his death, July 7, 1855, at Ems in Germany, whither he had gone for the benefit of his health. A complete edition of his voyages was published in 1833 (Lond. 5 vols.). His life has been written by his son, the rev. Edward Parry, M.A., of Balliol college, Oxford (1857).

PARRY SOUND. See MELVILLE SOUND, *ante*.

PARRY SOUND, a district in n. Ontario, on Georgian bay, drained by the outlet of lake Nipissing and other streams; 3,400 sq. m.; pop. '81, 1,300. Capital, Parry Sound.

PARSEES (people of Pars or Fars, i.e., ancient Persia) is the name of the small remnant of the followers of the ancient Persian religion, as reformed by Zerdusht, or Zoroaster, as he is commonly called. They are also known under the denomination of Guebers, under which head some account will be found respecting their recent history and present numbers. The pre-Zoroastrian phase or phases of their primeval religion will probably forever remain shrouded in deep obscurity; so much, however, is fully established by recent investigations that this, and what afterwards became the Brahmanic religion, were originally identical; that in consequence of certain social and political conflicts between the Iranians and the Aryans, who afterwards peopled Hindustan proper, an undying feud arose, in the course of which the former forswore even the hitherto common faith, and established a counter faith (Ahura), a principal dogma of which was the transformation of the ancient, now hostile, gods into demons, and the branding of the entire Deva religion as the source of all mischief and wickedness. Zerdusht, the prophet, whose era is given very differently by ancient writers and by modern investigators, placed variously between 500 or 600 B.C. (Röth) and 1200 B.C. (Haug), had, like all prophets and reformers, many predecessors, chiefly among the Soshyantos or fire-priests (Atharvans); yet to him belongs the decisive act of separating forever the contending parties, and of establishing a new community with a new faith—the Mazda-yasna or Parsee religion proper, which absorbed the old Ahura religion of the fire-priests. Referring for a summary of what is known and speculated about the person of the great reformer to the article under his name, we shall here confine ourselves to pointing out, as the characteristics of his leading doctrines, that the principle of his theology was as pure a monotheism as ever the followers of the Jehovistic faith were enjoined. He taught the existence of but one deity, the Ahura, who is called Mazdaô (see ORMUZD), the creator of all things, to whom all good things, spiritual and worldly, belong. The principle of his speculative philosophy is dualism, i.e., the supposition of two primeval causes of the real and intellectual world; the Vohu Manô, the good mind, or reality (Gaya), and the Akem Manô, or the naught mind, or non-reality (Ajoyâiti); while the principle of his moral philosophy is the triad of Thought, Word, and Deed. Not long, however, did the pure idea of monotheism prevail. The two sides of Ahura Mazdaô's being were taken to be two distinct personages—God and Devil—and they each took their due places in the Parsee pantheon in the course of time:—chiefly through the influence of the sect of the Zendiks, or followers of the Zend, i.e., interpretation. According to Zerdusht, there are two intellects, as there are two lives—one *mental* and one *bodily*; and, again, there must be distinguished an *earthly* and a *future* life. The immortality of souls was taught long before the Semites had adopted this belief. There are two abodes for the departed—Heaven (Garô-Demâna, the house of the angels' hymns, Yazna, xxviii. 10; xxxiv. 2; cf. Is. vi., Revelat., etc.) and Hell (Drâjô-Demâna, the residence of devils and the priests of the Deva religion). Between the two there is the bridge of the Gatherer or Judge, which the souls of the pious alone can pass. There will be a general resurrection, which is to precede the last judgment, to foretell which Sosiosh (Soskyans), the son of Zerdusht, spiritually begotten (by later priests divided into three persons), will be sent by Ahuramazdao. The world, which by that time will be utterly steeped in wretchedness, darkness, and sin, will then be renewed; death, the arch-fiend of creation, will be slain, and life will be everlasting and holy. These

are the outlines of the Zoroastrian creed, as it flourished up to the time of Alexander the great, throughout ancient Irania, including Upper Thibet, Cabulistan, Sogdiana, Bactriana, Media, Persis, etc.; and it is curious to speculate on the consequences which might have followed Marathon and Salamis had the Persians been victorious. The religion of Ormuzd would have dethroned the Olympians, as it dethroned the gods of the Assyrians and Babylonians; and it would certainly have left its traces upon the whole civilized world unto this day in a much more direct and palpable shape than it now does. From the death of Alexander, however, it gradually lost ground, and rapidly declined under his successors, until, in the time of Alexander Severus, Ardshir 'Arianos' (cf. Mirkhond ap. de Sacy, *Mémoires sur div. Aut. de la Perse*, etc., p. 59), the son of Babegan, called by the Greeks and Romans Artaxerxes or Artaxares, who claimed descent from the ancient royal lineage of Persia, took the field against Artabanus, and slew him (225), thus putting an end to the four hundred years' rule of the Parthians, and founded the Sassanide dynasty. This he effected in conjunction with the national Persians, who hated the "semi-Greek" dynasty of the Arsacidæ, their leaning to the foreign, and contempt for the Zend religion, and finally for their powerlessness against the spreading conquests of the Romans. The first act of the new king was the general and complete restoration of the partly lost, partly forgotten books of Zerdusht, which he effected, it is related, chiefly through the inspiration of a Magian sage, chosen out of 40,000 Magians. The sacred volumes were translated out of the original Zend into the vernacular, and disseminated among the people at large, and fire temples were reared throughout the length and the breadth of the land.

The magi or priests were all-powerful, and their hatred was directed principally against the Greeks. "Far too long," wrote Ardshir, the king, to all the provinces of the Persian empire, "for more than five hundred years has the poison of Aristotle spread." The fanaticism of the priests often also found vent against Christians and Jews. The latter have left us some account of the tyranny and oppression to which they as unbelievers were exposed—such as the prohibition of fire and light in their houses on Persian fast-days, of the slaughter of animals, the baths of purification, and the burial of the dead according to the Jewish rites—prohibitions only to be bought off by heavy bribes. In return, the magi were cordially hated by the Jews, and remain branded in their writings by the title of demons of hell (*Kidushin*, 72 a.). To accept the instruction of a magian is pronounced by a Jewish sage to be an offense worthy of death (*Shabb.* 75 a.; 156 b.). This mutual animosity does not, however, appear to have long continued, since in subsequent times we frequently find Jewish sages (Samuel *the Arian*, etc.) on terms of friendship and confidence with the later Sassanide kings (cf. Moed Katan, 26 a., etc.). From the period of its re-establishment, the Zoroastrian religion flourished uninterruptedly for about 400 years, till, in 651 A.D., at the great battle of Nahavand (near Ecbatana), the Persian army, under Yezdezird, was routed by the caliph Omar. The subsequent fate of those that remained faithful to the creed of their fathers has been described, as we said before, under GUEBERS. At present some remnants inhabit Yezd and Kirmân, on the ancient soil of their race; others, who preferred emigration to the endless tribulations inflicted upon them by the conquering race, found a resting-place along the western coast of India, chiefly at Bombay, Surat, Nawsari, Achmedâbâd, and the vicinity, where they now live under English rule, and are recognized as one of the most respectable and thriving sections of the community, being for the most part merchants and landed proprietors. They bear, equally with their poorer brethren in Persia, with whom they have of late renewed some slight intercourse for religious and other purposes—such as their Rivâyets or correspondences on important and obscure doctrinal points—the very highest character for honesty, industry, and peacefulness, while their benevolence, intelligence, and magnificence outvies that of most of their European fellow-subjects. Their general appearance is to a certain degree prepossessing, and many of their women are strikingly beautiful. In all civil matters they are subject to the laws of the country they inhabit; and its language is also theirs, except in the ritual of their religion, when the holy language of Zend is used by the priests, who, as a rule, have no more knowledge of it than the laity.

We have spoken of the leading fundamental doctrines as laid down by their prophet. Respecting the practical side of their religion, we cannot here enter into a detailed description of their very copious rituals, which have partly found their way into other creeds. Suffice it to mention the following few points. They do not eat anything cooked by a person of another religion; they also object to beef, pork, especially to ham. Marriages can only be contracted with persons of their own caste and creed. Polygamy, except after nine years of sterility and divorce, is forbidden. Fornication and adultery are punishable with death. Their dead are not buried, but exposed on an iron grating in the Dokhma, or tower of silence, to the fowls of the air, to the dew, and to the sun, until the flesh has disappeared, and the bleaching bones fall through into a pit beneath, from which they are afterwards removed to a subterranean cavern.

Ahuramazdao being the origin of light, his symbol is the sun, with the moon and the planets, and in default of them the fire, and the believer is enjoined to face a luminous object during his prayers. Hence, also, the temples and altars must forever be fed with the holy fire, brought down, according to tradition, from heaven, and the sullying of whose flame is punishable with death. The priests themselves approach it only with a

half-mask (Penom) over the face, lest their breath should defile it, and never touch it with their hands, but with holy instruments. The fires are of five kinds; but however great the awe felt by Parsees with respect to fire and light (they are the only eastern nation who abstain from smoking), yet they never consider these, as we said before, as anything but emblems of divinity. There are also five kinds of "sacrifice," which term, however, is rather to be understood in the sense of a sacred action. These are—the slaughtering of animals for public or private solemnities; prayer; the Daruns sacrament, which, with its consecrated bread and wine in honor of the primeval founder of the law, Hom or Heomoh (the Sanscr. *Soma*), and Dahman, the personified blessing, bears a striking outward resemblance to the sacrament of the Lord's supper; the sacrifice of expiation, consisting either in flagellation or in gifts to the priest; and, lastly, the sacrifice for the souls of the dead. The purification of physical and moral impurities is effected, in the first place, by cleansing with holy water (Nirang), earth, etc.; next, by prayers (of which sixteen, at least, are to be recited every day) and the recitation of the divine word; but other self-castigations, fasting, celibacy, etc., are considered hateful to the divinity. The ethical code may be summed up in the three words—purity of thought, of word, and of deed: a religion "that is for all, and not for any particular nation," as the Zoroastrians say. It need hardly be added that superstitions of all kinds have, in the course of the tribulations of ages, and the intimacy with neighboring countries, greatly defiled the original purity of this creed, and that its forms now vary much among the different communities of the present time.

Something like a very serious schism, however, has lately broken out in the Parsee communities, and the modern terms of conservative and liberal, or rather bigot and infidel, are almost as freely used with them as in Europe. The sum and substance of these innovations, stoutly advocated by one side, and as stoutly resisted by the other, is the desire to abolish the purification by the Nirang—a filthy substance in itself,—to reduce the large number of obligatory prayers, to stop early betrothal and marriage, to suppress the extravagance in funerals and weddings, to educate women, and to admit them into society. Two counter alliances or societies, the "Guides of the Worshipers of God" and "the True Guides" respectively, are trying to carry out at this moment, by means of meetings, speeches, tracts, etc., the objects of their different parties.

The literature of the Parsees will be found noticed under PERSIAN LANGUAGE AND LITERATURE, and ZEND-AVESTA. Besides the latter, which is written in ancient Zend, and its Gujarati translation and commentaries, there are to be mentioned, as works specially treating of religious matters, the *Zardusht-Nameh*, or Legendary History of Zerdusht; the *Sadder*, or Summary of Parsee Doctrines; the *Dabistan*, or School of Manners; the *Desatir*, or Sacred Writings, etc. All these have been translated into English and other European languages.

On the influence Parseism has had upon Judaism and its later doctrines and ceremonial, and, through it, upon Christianity and Mohammedanism—which besides drew from it directly—we cannot dwell here at any length. So much, however, may be stated, that the most cursory reading of the sacred Parsee books will show, in a variety of points, their direct influence upon the three Semitic creeds. Of works treating on the subject of this article, we mention principally. Hyde, *Vet. Rel. Pers. Hist.* (Oxon., 1760, 4to); Ousely, *Travels in the East* (Lond. 1819); Anquetil du Perron, *Exposition des Usages des Parses*; Rhode, *Diehe. Sageaer alten Baktrier, Meder u. Perser*, etc. (Frank.-a-M., 1820, 8vo); Dosabhoj Framjee, *The Parsees*, etc. (Lond. 1858); Dadabhai Naoroji, *The Manners and Customs of the Parsees*; and *The Parsee Religion* (Liverpool, 1861, 8vo); and lastly, Haug's *Essays on the Parsee Religion* (Bombay, 1862), and Spiegel's *Erân* (Berl. 1863.)

PARSLEY, *Petroselinum*, a genus of plants of the natural order of *umbelliferae*. The species are annual or biennial, branching, smooth, herbaceous plants, with variously pinnated leaves.—COMMON PARSLEY (*P. sativum*), which has tripinnate shining leaves, one of our best known culinary plants, is a native of the south of Europe, growing chiefly on rocks and old walls, and naturalized in some parts of England. The cultivation of parsley is extremely simple, and an annual sowing is generally made, although when cut over and prevented from flowering, the plant lives for several years. A variety with curled leaflets is generally preferred to the common kind with plain leaflets, as finer and more beautiful, being often used as a garnish; it is also safer, as the poisonous fool's parsley (q.v.) is sometimes gathered by mistake instead of the other.—HAMBURG PARSLEY is a variety with a large white carrot-like root, cultivated for the sake of its root, and much in the same way as the carrot or parsnip. To produce large roots and of delicate flavor, a very rich soil is required. The foliage of parsley is not merely of use for flavoring soups, etc., but is nutritious, at the same time that it is stimulating, a quality which it seems to derive from an essential oil present in every part of the plant. Parsley contains also a peculiar gelatinous substance called *apiine*. The bruised leaves of parsley are sometimes employed as a stimulating poultice. The seeds are a deadly poison to many birds, and when powdered, they are sometimes used for killing lice.

PARSNIP, *Pastinaca*, a genus of plants of the natural order *umbelliferae*, having compound umbels with neither general nor partial involucre; yellow flowers with roundish, involute, sharp-pointed petals; calyx almost without teeth; fruit dorsally compressed and

flat, with a broad border, the ridges very fine. The species are annual, biennial, or perennial herbaceous plants, with carrot-like, often fleshy roots, and pinnate leaves — The COMMON PARSNIP (*P. sativa*) is a native of England, although not of Scotland, and is abundant in some districts, particularly in chalky and gravelly soils. It is also found in many parts of Europe, and of the north of Asia. It is a biennial, with angular furrowed stem, 2 to 3 ft. high, pinnate leaves with ovate leaflets, rather shining, cut, and serrated, and a three-lobed terminal leaflet. The root of the wild plant is white, aromatic, mucilaginous, sweet, but with some acridness; and injurious effects have followed from its use. Cultivation has greatly modified the qualities both of the root and foliage, rendering them much more bland. The parsnip has long been cultivated for the sake of its root, which in cultivation has greatly increased in size, and become more fleshy. The flavor is disliked by some, as well as the too great sweetness, but highly relished by others; and the root of the parsnip is more nutritious than that of the carrot. The produce is also, on many soils, of larger quantity; and although the parsnip delights in a very open rich soil, it will succeed in clayey soils far too stiff for the carrot. It is rather remarkable that it has not been extensively cultivated as a field-crop, and for the feeding of cattle, except in the Channel islands and in limited districts of continental Europe; more particularly as cattle are very fond of it, and not only the flesh of cattle fed on it is of excellent quality, but the butter of dairy-cows fed on parsnips in winter is far superior to that produced by almost any other kind of winter-feeding. The mode of cultivation of the parsnip scarcely differs from that of the carrot. There are several varieties in cultivation. A very large variety, cultivated in the Channel islands on deep sandy soils, has roots sometimes 3 or 4 ft. long; but this is fully twice the ordinary length, and there is a smaller turnip-rooted variety sometimes cultivated in gardens where the soil is very shallow. The parsnip is used chiefly in winter, whether for the table or for feeding cattle. It is improved rather than injured by frost; but is apt to become *rusty* if allowed to remain too long in the ground; and exhibits acrid qualities after it has begun to grow again in spring. The root of the parsnip is much used in the north of Ireland for making a fermented liquor, with yeast and hops; and both in England and Ireland, for making *parsnip wine*, which has some resemblance to Malmsey wine. — Another species, the CUT-LEAVED PARSNIP or SEKAKUL (*P. sekakul*), having pinnatifid cut leaflets, a native of India, Syria, and Egypt, is cultivated in the Levant, and is very similar in its uses to the common parsnip.

PARSON, in English ecclesiastical law, means the incumbent of a benefice in a parish. He is called parson (Lat. *persona*) because he represents the church for several purposes. He requires to be a member of the established church of England, and to be duly admitted to holy orders, presented, instituted, and inducted; and requires to be 23 years of age. When he is inducted, and not before, he is said to be in full and complete possession of the incumbency. The theory is, that the freehold of the parish church is vested in him, and as the legal owner, he has various rights of control over the chancel. He is also the owner of the churchyard, and as such is entitled to the grass. As owner of the body of the church, he has a right to control of the church bells, and is entitled to prevent the church-wardens from ringing them against his will. The distinction between a parson and a vicar is, that the parson has generally the whole right to the ecclesiastical dues in the parish, whereas the vicar has an appropriator over him, who is the real owner of the dues and tithes, and the vicar has only an inferior portion. The duty of the parson is to perform divine service in the parish church under the control of the bishop, to administer the sacraments to parishioners, to read the burial service on request of the parishioners, to marry them in the parish church when they tender themselves. He is bound to reside in the parish, and is subject to penalties and forfeiture if he without cause absent himself from the parish. He is subject to the clergy discipline act, in case of misconduct.

PARSONS, a city in Labette co., Kan., on the Missouri, Kansas and Texas railroad, near the junction of the Big and Little Labette rivers; pop. '80, 4,199. It has churches, schools, 2 banks, a public library, and 3 newspapers. The car and machine shops of the railroad are here. Carriages, chairs, plows, etc., are manufactured.

PARSONS, Kan. See page 887.

PARSONS, JONATHAN, 1705–76; b. Mass.; graduated at Yale college 1729; was ordained pastor of the Congregational church in Lyme, Conn., 1731, where he continued until 1745; settled at Newburyport, Mass., in 1746, where he died. He was distinguished for his learning, for his skill as a controvertist, and as a preacher. He published *Letters on the Christian Ministry; Letters on Baptism; Lectures on Justification; Good News from a Far Country, in Seven Discourses; A Sermon on the Death of G. Whitefield; Freedom from Civil and Ecclesiastical Tyranny the Purchase of Christ; Sixty Sermons on Various Subjects*, 2 vols.

PARSONS, SAMUEL HOLDEN, 1737–89, b. Conn., son of the rev. Jonathan Parsons. After graduating at Harvard college, 1756, he studied law at Lyme, Conn., with gov. Matthew Griswold, his uncle; began practice in Lyme, 1759, and for many years represented the town in the colonial assembly. In 1774 he removed to New London, and was made prosecuting or king's attorney. At the outbreak of the revolution he took command of the 6th Connecticut regiment, was present at the battle of Long Island and the siege of Boston, and for his services was promoted to the rank of brig. gen.; in 1779 he became

Putnam's successor in the command of the state militia, and in 1780 was made a maj. gen. At the close of the war he opened a law office in Middletown, Conn. Congress in 1785 appointed him a commissioner to treat with the Miami Indians, and a few years later he negotiated the treaty between Connecticut and the Indian tribes about lake Erie, by which the claim of the latter, to what became known as the Connecticut western reserve, was extinguished. In 1787 he headed a New England colony which settled on the reserve near the Ohio river. He published a paper on the *Antiquities of the Western States* in vol. 2 of the *Transactions of the American Academy*.

PARSONS, THEOPHILUS, LL.D., 1750-1813, b. Mass.; graduated at Harvard in 1769, and was admitted to the bar in 1774. He began the practice of his profession at Falmouth, now Portland, Maine, which was laid waste by a British squadron in Oct., 1775; and Parsons, whose prospects for professional success at Falmouth were ruined by this disaster, withdrew soon afterward to Byfield, his native town. There, for some years, he studied in the library of judge Edmund Trowbridge, then the first jurist in New England, and whose collection of law books was at that time perhaps the most complete in this country. Parsons finally removed to Newburyport, where he soon acquired an extensive practice; and for some ten years he exerted a considerable influence in public affairs. In 1778 he was active in the discussion of the new constitution of Massachusetts, then recently framed by the legislature. Parsons was strongly opposed to the adoption of that instrument; he was a member of the "Essex Junto," which comprised a large number of the citizens of Essex co. hostile to the new constitution; and the pamphlet called *The Essex Result*, and which had a great influence in bringing about the defeat of the new constitution, is attributed to him. In 1779 he sat in the convention which drew up the constitution which, with some changes, still subsists in Massachusetts. In 1788 he was a member of the state convention called to act upon the adoption of the federal constitution. He warmly supported the latter, and the so-called "Proposition" in favor of its adoption, though offered by John Hancock, was drawn up by Parsons. Besides serving from time to time in the legislature, this was his last appearance in public life. He settled in Boston in 1800, and continued his law practice, which had long included causes from all parts of New England. From 1806 till his death he was chief justice of the state supreme court. His judicial opinions have not been as fully reported as could be desired, but those preserved in the early Massachusetts reports, and in his *Commentaries on the Law of the United States*, show great ability and learning, especially in the departments of real property and marine insurance. He was expeditious in the dispatch of business, and thoroughly conversant with the old common law system of pleadings. In politics he was a federalist in principle, but after his elevation to the bench, punctilious to take no share in them.

PARSONS, THEOPHILUS, LL.D., b. Mass., 1797; son of chief justice Parsons. He graduated at Harvard in 1815, was admitted to the bar, and began to practice in Taunton. Soon afterward he removed to Boston, where he became the founder and editor of the *United States Literary Gazette*. He also contributed regularly to the *North American Review*. In 1847 he was appointed Dane professor of law at the law-school of Harvard university, where he remained for a quarter of a century. Dr. P. published a number of treatises on legal subjects. His *Law of Contracts*, which has become a standard work upon its subjects, and has gone through many editions, appeared in 1853, and was followed by *Elements of Mercantile Law*, 1856; *Laws of Business for Business Men*, 1857; *Maritime Law*, 1859; *Notes and Bills*, 1862; *Law of Partnership*, 1867; *Marine Insurance and General Average*, 1868; *Shipping and Admiralty*, 1869; and *Political, Personal, and Property Rights of a Citizen of the United States*, 1875. He was a Swedenborgian, and he produced a number of works maintaining the doctrines of the New Jerusalem church. The most important are his *Essays*, in 3 series; *Deus Homo*, 1867; and *The Infinite and the Finite*, 1872. He d. 1882.

PARSONS, THOMAS WILLIAM, b. Boston, 1819; educated at the Boston Latin school. He went to Italy in 1836, and carefully studied Italian literature, particularly the works of Dante, a translation of the first 10 cantos of whose *Inferno* he published in 1843. Returning to Boston, he took a medical degree at the Harvard medical school, and for some time practiced dentistry. For a number of years he lived in England, and now resides in Italy. He published in 1854 a collection of poems under the title of *Ghetto di Roma*. His translation of the *Inferno* was finished in 1867, and he is now translating the *Purgatorio*. Three volumes of his poems have appeared since 1867: *The Magnolia*, *The Old House at Sudbury*, and *The Shadow of the Obelisk*. He occasionally contributes to the *Catholic World* and other periodicals.

PARSONS, USHER, 1788-1868; b. Maine; received an ordinary education, and studied medicine under Dr. John Warren of Boston. In the war of 1812 he entered the naval service as surgeon's mate and was acting surgeon of Perry's flag-ship, the *Lawrence*, and in that capacity was present at the battle of lake Erie, Sept. 10, 1813. He remained in the navy until 1822, was present at the attack on Mackinac, and after resigning his commission practiced his profession at Providence, R. I. He became a professor in Brown university medical school, president of the state medical school, and first vice-president of the national medical association. He published a life of sir Wm. Pepperell,

1856, several medical works, and a number of biographical sketches and speeches connected with the events of the battle of lake Erie.

PARSONSTOWN (anciently called BIRR), a considerable inland t. on the river Brosna, in King's county, Ireland, 69 m. w.s.w. from Dublin, with which city it is connected by a branch-line issuing from the Great Southern and Western railway at Ballybrophy. Pop. '81, 4,955; of whom 4,000 were Roman Catholics, 725 Protestant Episcopalians, and the rest Protestants of other denominations. Birr had its origin at an early period in a monastery founded by St. Brendan, and was the scene of many important events, both in the Irish and in the post-invasion periods. The castle, which was anciently the seat of the O'Carrolls, was granted by Henry II. to Philip de Worcester; but it frequently changed masters, and even alternated between English and Irish hands. By James I. it was granted to Lawrence Parsons, ancestor of the present proprietor, the earl of Rosse; but through the entire period of the civil wars, its possession was constantly disputed, until after 1690, when the Parsons family was finally established in possession. About this time Birr returned two members to parliament, but the privilege was temporary. The castle has been rebuilt. Parsonstown is one of the handsomest and best built inland towns in Ireland, with several fine churches and chapels, a nunnery, a statue of the duke of Cumberland, a bronze statue (erected in 1876) of the third earl of Rosse, a town-hall, a library, literary institute, a model and other schools. But the great attractions of Parsonstown are the castle, the observatory, and the laboratory of the late earl of Rosse (q.v.), still maintained in active use by the present earl. Parsonstown is an important corn-market, a considerable center of inland commerce; but with the exception of a distillery and brewery, it is almost entirely without manufactures. It is a military station, and the seat of a union workhouse.

PÂRS'WANÂTHA, the twenty-third of the deified saints of the Jainas, in the present era. He and *Mahavîra*, the twenty-fourth, are held in highest esteem, especially in Hindustan. In a suburb of Benares called Belupura, there is a temple honored as the birthplace of Pârswanâtha. See JAINAS.

PART, in music. When a piece of music consists of several series of sounds performed simultaneously, each series is called a part.

PARTÁBGARH, PRATÁBGARB, or PERTÁBGURH. See page 887.

PARTANNA, a market t. of the island of Sicily, in the province of Trapani, 36 m. s.w. of Palermo. Pop. 12,467.

PARTERRE, in gardens laid out in the old French style, the open part in front of the house, in which flower-beds and closely-cut lawn were intermingled according to a regular plan.

PAR'THENOGEN'ESIS (from the Gr. *parthenos*, a virgin, and *genesis*, the act of production) is a term invented by prof. Owen to indicate propagation by self-splitting or self-dividing, by budding from without or within, and by any mode save by the act of impregnation; the parthenogenetic individuals being sexless or virgin females. See the article GENERATIONS, ALTERNATION OF. For many remarkable facts in relation to parthenogenesis in insects, the reader is referred to prof. Owen's 18th lecture, *On the Comparative Anatomy and Physiology of Invertebrate Animals*; and to Siebold, *On Parthenogenesis*, translated by Dallas.

PARTHENOGEN'ESIS (*ante*). This term, as employed by prof. Owen and applied, as noticed in the preceding article, to the processes of gemmation and fission as exhibited in sexless beings or virgin females, is not strictly the generative process which is now indicated by its use. The term is now confined to the generation of new individuals from the development of *ova* by virgin females without contact with the male element. The peculiarity of this process is appreciated by regarding the proper definition of an ovum, and its distinction from an internal bud. An ovum is usually contained in an ovary, and always has a germinal vesicle and a germinal spot, and during its development undergoes what is known as segmentation of the yelk. Examples of true parthenogenesis are seen in certain plant-lice (*aphides*), the honey-bee, and some of the lower and smaller crustaceans, as now classified. In the autumn, plant-lice consist of males and females, which by sexual union produce ova; but these remain dormant during the winter. In the spring they are hatched, but, instead of producing males and females, the young are all of one kind, variously regarded as neuters, females, or hermaphrodites. These oviparous products, whatever their nature may be, now produce viviparously a brood of young resembling themselves, these in turn bringing forth a third generation; and the same viviparous process may be repeated a considerable number of times during the summer. The last generation, however, brought forth at the commencement of autumn will not be all of one kind, but will consist of distinct sexes. Now sexual reproduction by means of eggs takes place, as in the preceding autumn, to be followed in the spring by another series of viviparous generations. The viviparous multiplication of the aphides is multitudinous, and it has been estimated that ten generations of a single aphid during one summer may reach the number of one quintillion. The ovary of each viviparous aphid resembles that of a fertile female, with certain exceptions which cannot well be described here. It may be regarded as a pseudo-ovary, and it generates or develops eggs or "pseudo-ova," which, without male intervention, are developed into young aphides. There is no anatomical difference between the pseudo-ova and true ova, the

distinction being purely physiological. Some naturalists, however, maintain that the viviparous aphides are hermaphrodites, possessing both sexual elements, in which case their mode of generation would not be an example of parthenogenesis; but this view is not entertained by most observers. In regard to certain reproductive phenomena among honey-bees there seems to be but little doubt. There are three classes of individuals in a hive of bees; a *queen*, or fertile female; *workers*, forming the bulk of the community and which are examples of arrested development in females; and, thirdly, the *drones*, or male bees, produced at certain times of the year. The wonderful impregnation of the queen, which occurs during her "nuptial flight," results in the storing up of fecundating material in a receptacle which communicates by a tube with the oviducts, and which material, it is said, can be used at will, or at least is used periodically, as occasion requires. The ova which become undeveloped females, or workers, are fertilized during their passage through the oviduct; and the subsequent development of these fecundated ova into queens or into workers, as the case may require, depends upon the form (seemingly) of the cell which receives the ovum, and upon the food which is given to the larva. There is nothing in the evidence so far produced to show non-sexual generation; but careful observers have succeeded—by preventing, as they assert, the contents of the seminal receptacle of the queen from passing into the oviduct, and thus coming into contact with the ovum—in causing her to produce none but males, or drones. If these observers are correct, this case is one of parthenogenesis; and at present the prevailing tendency is toward the acceptance of their conclusions.

PAR'THENON, the temple of Minerva at Athens; one of the most celebrated of the Greek temples, and usually regarded as the most perfect specimen of Greek architecture. Many of the sculptures have been brought to England, and are now in the British museum. See GRECIAN ARCHITECTURE.

PARTHENOPE'AN REPUBLIC (from *Parthenope*, the oldest name of the city of Naples) was the name given to the state into which the kingdom of Naples was transformed by the French Republicans, Jan. 23, 1799, and which only lasted till the following June, when the invading army was forced to retreat.

PAR'THIA, anciently a country of western Asia, lying at the s.e. end of the Caspian sea, from which it was separated by a narrow strip, known as Hyrcania, now forms the northern portion of the province of Khorassan, and is an almost wholly mountainous region. Its rivers are merely mountain torrents, which are supplied by the melting snow on the Elburz range during winter and spring, but are mostly dry in summer and autumn.

The original inhabitants are believed to have been of Scythian race, as shown by their language as well as by their manners, and to belong to the great Indo-Germanic family. If this be the case, as is very probable, the term Parthian, from its analogy to the Scythian word *parthe*, banished, seems to indicate that they were a tribe who had been driven to Parthia out of Scythia (i.e., central Asia). The Parthians during the time of the Roman republic, were distinguished by primitive simplicity of life and extreme bravery, though at the same time much given to bacchanalian and voluptuous pleasures. They neglected agriculture and commerce, devoting their whole time to predatory expeditions and warfare. They fought on horseback, and after a peculiar fashion. Being armed solely with bows and arrows, they were rendered defenseless after the first discharge; and, to gain time for adjusting a second arrow to the bow, turned their horses, and retired, as if in full flight, but an enemy incautiously pursuing, was immediately assailed by a second flight of arrows; a second pretended flight followed, and the conflict was thus carried on till the Parthians gained the victory, or exhausted their quivers. They generally discharged their arrows backward, holding the bow behind the shoulder; a mode of attack more dangerous to a pursuing enemy than to one in order of battle. The Parthians first appear in history as subject to the great Persian empire. After the death of Alexander the Great, Parthia formed part of the Syrian kingdom, but revolted under Antiochus II., and constituted itself into an independent kingdom under the *Arsacidæ* (see ARSACES), 250 B.C., a race of kings who exercised the most completely despotic authority ever known, treating their subjects as if the vilest of slaves; yet so accustomed did the Parthians become to this odious rule, that some of the later monarchs, who had received a Roman education, and after their accession treated their subjects with ordinary justice and humanity, were completely despised. The capital of the Parthian monarchy was Hecatompylos ("the city of the hundred gates"), now Damgan. The Parthian dominion rapidly extended to the Euphrates on the w. and the Indus on the e., and became a most powerful and flourishing empire; Seleucia, Ctesiphon—the capital of the Persian emperors of the Sassanidæ—and other celebrated cities date their rise from this period, and soon eclipsed, in size and splendor, the ancient Hecatompylos. In spite of repeated attacks on the part of the Romans, the Parthians maintained their independence (see CRASSUS SURENA); and though Trajan, in 115–116 A.D., seized certain portions of the country, the Romans were soon compelled to abandon them. In 214 A.D., during the reign of Artabanus IV., the last of the Arsacidæ, a revolt, headed by Ardashir; son of Babegan, broke out in Persia, and the Parthian monarch, beaten in three engagements, lost his throne and life, while the victor substituted the Persian dynasty of the SASSANIDÆ (q.v.) for that of the Arsacidæ. Some scions of the Parthian royal

family continued for several centuries to rule over the mountainous district of Armenia, under the protection of the Romans, and made frequent descents upon Assyria and Babylonia; but their history is obscure and of little importance.

PARTIAL LOSS, in the law of marine insurance, is a loss which is not total; and therefore the insurer is not entitled to abandon or give up the remains of the ship or cargo, and claim the entire insurance money; but he is bound to keep his ship or goods, and claim only in proportion to his actual loss or damage.

PAR'TICIPLE (Lat. *participium*, part-taking), the name of a class of words which have the meaning of a verb with the form of an adjective. The name is said to have been given from their partaking of the nature both of a verb and of an adjective. Some grammarians make the participle a distinct part of speech, but it is more commonly classed as a part of the conjugation of the verb. There are in English two participles, one in *ing*, usually called the present, but properly the imperfect, because it expresses continued, unfinished action, e.g., *loving, writing*; and the other expressing past action, and ending either in *ed* (*t*) or in *en*, e.g., *loved, written*. In Ang. Sax. and old Eng., the imperfect participle ended in *and*, e.g., *haband* (having), corresponding to the modern Ger. *habend*, Gr. *echont* (os), Lat. *habent* (is). In the sentence, "he is *writing* a letter," *writing* is the imperfect participle; in "the *writing* of the letter occupies him," or "*writing* is a difficult art," it is a substantive, and had a different origin. In the latter case, *-ing* corresponds to the Ang. Sax. termination *-ung*, used in forming substantives from a large class of verbs; thus, Ang. Sax. *halgung* (hallowing) is equivalent in meaning and in etymology to Lat. *consecratio*; similarly, modern Ger. *Vernichtung*, annihilation, from *vernichten*, to annihilate. Such a phrase as, "while the letter is writing," seems to be a shortened form of the now antiquated, "is a-writing," which was originally, "is in writing." Although this mode of expression is liable in some cases to ambiguity, it is terser and more idiomatic than the circumlocution of, "is being written," which is often substituted for it. The verbal substantive in *-ing* is often exactly equivalent to the infinitive; thus, "*standing* long in one position is painful" = "*to stand*," etc. It has this advantage, that while it can be construed as a noun (e.g., with a possessive case), it can retain at the same time the usual adjuncts of a verb; as, "what are we to infer from the king's dismissing his minister?" The use of this form contributes not a little to the peculiar brevity and strength of the English language.

PARTICK, a t. of Scotland, in the co. of Lanark, prettily situated, chiefly on a rising ground on the Kelvin, immediately above its junction with the Clyde, and about 3 m. w.n.w. of the cross of Glasgow, of which city it now forms a suburb. Nine-tenths of the workmen of Partick are engaged in ship-building, and there are numerous ship-building yards, flour mills, cotton factories, and bleach-fields. A large proportion of the inhabitants are engaged in business in Glasgow, and for their accommodation extensive ranges of handsome villas have been built here. Pop. '51, 3,132; '61, 8,183; '81, 27,410.

PARTINICO, SALA DI, a post-town of Sicily, in the province of Palermo, and 19 m. s.w. of the city of that name, at the foot of a grand precipice of red limestone. The plain in the vicinity is of surpassing fertility; corn, wine, oil, fruit, and sumach are produced in rich abundance: and linen and woolen goods are manufactured. Pop. '72, 20,154. Scattered vestiges of ancient habitations are still to be seen on the summit of the height above the town, and are said to be the ruins of the ancient *Parthenicum* mentioned in the *Itinerary* of Antoninus, and there only.

PARTISAN is a name for a halberd or pike, or for a marshal's baton. The name is also given to the leader of a detached body of light troops, who make war by harassing the enemy, rather than coming to direct fighting, by cutting off stragglers, interrupting his supplies, and confusing him by rapid strategy. The action of such a corps is known as *partisan warfare*.

PARTITION, a thin interior wall dividing one apartment from another. It is usually of brick-work, $4\frac{1}{2}$ or 9 in. thick, or of timber with standards about $4\frac{1}{2}$ in. thick, covered with lath and plaster. Wooden partitions are used when there is no sufficient support for brick. When these have to carry joists or any other weight they ought to be constructed in the form of a truss (q. v.).
