There is much that is valuable in this work, as well as suggestive; though there are many things omitted that might be looked for in a book of reference: thus there is no sufficient explanation of the mode of calculating scantlings of timber beams. As to tables, or such as form the first portion of the volume, we may say that the figures of such tables, as calculated and printed, should stand published with the authority of the Government or of the Royal Society as the representative of the science of the country, that the tables should be stereotyped, and that no others should be liable to be put forward or used. Any engineer or calculator pointing out errors in such tables as are here suggested, would be doing good: his representation to the body charged with the supervision and publication, would be duly attended to; but to multiply settings of type, as by the publication of each fresh book of reference, tends to production rather than correction of errors in figures. The proper system would be for the society, authority, or body charged with such matter, to have stereotypes for each size of book-page, and to give casts to printers applying for them.

#### SOMETHING ABOUT ABERDEEN.

Between 500 and 600 miles of a railway ride is no joke, even in these days of swift locomotion, and not at all calculated to improve one's temper; hence it is, perhaps, that we find a page or two of our note-book full of bitter complaints and invective against all railway management whatsoever, but more particularly directed to that glaring mismanagement which is so conspicuous when we cross the Tweed. The North British Railway seems to be in a sadly neglected condition. The rails, for example, at the Berwick station, were worn through the flanges, and the station at Edinburgh would disgrace a third-rate manufacturing town in Lancashire. In the first place, it is beastly dirty; and, secondly, it is quite unfit for the traffic. A poor woman had been crushed off the platform and killed a day or two before we passed through; and the only wonder is that such fatal accidents do not occur more frequently. As for time being kept, that seems out of the question: we were nearly an hour behind time on our arrival at Aberdeen; in fact, the line between Perth and Aberdeen is one of the slowest and worst appointed on which it has been our misfortune to travel. If Mr. Gladstone's proposal to subject the railways to the control of the State should ever be carried into effect, we are quite certain that it would bring an improvement in Scotland, at all events.

But to our subject. The scenery from Perth to Aberdeen is tame and uninteresting. Here and there, indeed, a bright spot may be seen: we get a good view of the busy little seaport town of Montrose; a glimpse of the distant round tower of Brechin; a glance at Stonehaven, the very small county town of Kincardineshire, near which is the ruined and dismantled fortress of Dunnotar Castle—the ancient seat of the great Earl Marischals of Scotland, and the prison of the persecuted Covenanters. As we approach the Northern capital, the country becomes remarkably bleak and sterile. We are now traversing the broad, low, moorish outskirts of the Grampian mountains, at the most rugged and inaccessible part of the north-eastern coast. Numerous moraines and vast quantities of glacial detritus are easily observed. At last the prospect becomes perfectly barren and dismal; and it is with a sense of very high gratification and relief that we descey the Girlandines lighthouse and the smoke of tall chimneys; and then, all at once, see burst into view the broad expanse of the River Dee, the long railway viaduct, the forest of masts, and the city of Aberdeen.

\* "The Engineer's Pocket Remembrancer: an Epitome of Data, Rules, and Formulae, applicable to Civil, Mechanical, Marine, Hydraulic, Lighthouse, Telegraphic, Railway and Gas Engineering, Surveying, &c. by Francis Campin, C.E., President of the Civil and Mechanical Engineers' Society; Author of 'A Practical Treatise on Mechanical Engineering,' &c. &c. Second Edition, with an Appendix. London: Atchley & Co.' 12mo., pp. viii. & 192.

While enjoying the hospitable "Lemon Tree,"—the oldest inn in the place (like our friend Cornelius O'Dowd, we are fond of the old "inn"),—we shall, with the assistance of the guide-books and the "Gazetteer," give our readers some account of the history of this remarkable city,—of which we may say, *en passant*, that it is a place of great enterprise and originality, and that its inhabitants have positively worked wonders, both within the city and on the surrounding soil. Although it is not our primary purpose to demonstrate these facts, we cannot prevent them incidentally appearing in the course of our report.

The origin of a town proceeds often from the most accidental and sometimes unaccountable circumstances. But Aberdeen seems to have obeyed the general law which Schouw, and after him all good geographers, have recognised,—that the chief cities of the world have arisen on the banks of the great rivers or on the sea-coast. Of its antiquity we have abundant evidence. There are traces of a Druidical circle at Gilcomston, one of the ancient quarters of the town. Some writers identify the site with that of the Roman fortress Devana; and a porter brewery of some note close to the river has now, it would appear, inherited that Latin name. But the earliest authentic document which the antiquaries can discover respecting Aberdeen, is a charter of William the Lion (A.D. 1179), who conferred on the loyal burghesses by this instrument the right of trading as freely as their ancestors did in the time of his grandfather, King David I. William, it has been ascertained, built a palace at the east end of the green; and had also an exchange, with a mint for the coinage of money. Alexander II. founded a monastery of black friars here; and likewise conferred on the inhabitants the right of holding a weekly market. King Robert the Bruce gave it certain ample possessions for the support of its political dignity; and King David III., with the sanction of a Parliament held in Aberdeen, confirmed to the burghesses and community all that they had obtained from his Royal predecessors. In process of time the town seems to have been consumed by fire; then to have suffered from a severe and famine; it was totally destroyed by an English army under Edward III.; it was the scene of some of Wallace's exploits against the English; and in the year 1411 the inhabitants turned out and routed with great bravery, at Harlaw, a barbarous Celtic pretender named O'Donald of the Isles. "This great battle of Harlaw," Sir Walter Scott tells us, "might be said to determine whether the Gaelic or the Saxon race should predominate in Scotland." (See note 1 to chap. xix. of "The Antiquary," Edition 1848.) Aberdeen seems to have suffered great spoliation at the hands of the zealous Reformers in the sixteenth century; for, like all seats of ecclesiastical learning, it had been much indented to its Bishops. In the Covenanting era which followed on the heels of the Reformation, it was tolerably fleeced by both the contending parties. For some time it was in the possession of the Rebels when the standard of the Chevalier was raised in 1715. The Duke of Cumberland made it his head-quarters for a few weeks, when on his march to the field of Culloden. In short, Aberdeen has suffered all the vicissitudes which could possibly be incident to a place of strength and importance enduring the stormy and unsettled periods of Scottish history.

The gradual development of the town has been satisfactorily traced by the local topographers. The first dwelling-houses in Aberdeen were probably a few rude huts on the shore, near the spot where Trinity Church now stands. The ground next occupied was probably in the neighbourhood of the Castle. After the destruction of the town by the English army, in the fourteenth century, a grand improvement and extensive rock place,—in fact, a new town was then built. But with the exception of its few churches and public structures, this must have been rude and unsubstantial; for in the year 1545 a stone edifice was considered a mark of great opulence. Even so late as 1741 the houses on the west side of the Broad-gate were constructed of timber. The very best streets, long after this, were narrow, unlevel, and unpaved, or, at least, paved with a causeway of round boulders dug from the bed of the neighbouring river; and the town consisted of houses built so close to each other, and so inconceivably filthy, as to render them obnoxious in the highest degree to disease and pestilence.

But towards the close of last century the spirit

of improvement had spread northward, and Aberdeen was rebuilt, extended, and adorned, after the fashion in which the Imperial Government of the present era has adorned and remodelled the city of Paris. The Old Town was literally cut to pieces. A street was opened from Broad-street to the north; Marischal-street was opened from Castle-street to the south; and as it constituted the principal thoroughfare to the harbour and quay, it had the honour, above all other streets, of being paved, for the first time, with dressed cubes of granite. A loch was then drained, on the north-west, through which George-street was opened, to communicate with a new turnpike to Inverury. Finally, two grand new exits were formed from the middle of the town,—to the north by King-street, to the south-west by Union-street. To correspond with these new streets new squares were laid out, new churches were built, new banks, assembly-rooms, a town-hall, and other public buildings; and then, at the end of twenty-five years or so, came the day of reckoning. The result was that the corporation of Aberdeen awoke one morning and found themselves bankrupt. We do not find it stated in any of the authorities that we have consulted in what manner they got over their difficulties. They had, it was said, been misled by the architects and engineers; for example, the estimates for King-street and Union-street were 42,000*l.*, the actual cost to the corporation 171,250*l.* Undoubtedly they had been too sanguine also with regard to the prospective revenue; but it is the old story, and we need not dwell upon it further than to add the equally old maxim, that towns, like other communities, must grow up by a slow and gradual process of development, and all attempts to interfere with or unduly stimulate this process, either by municipal or imperial governments, is certain to end in disaster and ruin.

We shall add here that the town council of Aberdeen is composed of nineteen members, including a lord provost and four bailies. The general police is regulated by an Act passed in the year 1829. The town is distinguished for its shipping trade and manufactures. It has long been celebrated in the annals of commerce for its large exports of "salmon fish and granite stone;" and it is altogether worthy of its honourable position as the seat of a university, and the capital of the north of Scotland. The population of Aberdeen, at the census of 1861, was 73,794.

And now having given our readers a proper quantum of historical knowledge, we shall proceed to survey the principal features of the town. It is first of all necessary to explain that the capital of the north of Scotland comprises two towns—Old Aberdeen and New Aberdeen,—situated about a mile and a half from each other, of different aspects, and with distinct charters and privileges. Although included within the limits of one parliamentary burgh, they are, in fact, two separate towns. Of course it will be understood that our examination is chiefly confined to New Aberdeen, which, although not so interesting to the antiquary, is infinitely more so to the engineer and the architect.

Aberdeen, then, is situated on a cluster of eminences, which rise along the northern bank of the river Dee, and which slope gently through the Old Town to the south bank of the river Don. Although prettily enough environed, it has nothing of that grand and picturesque beauty which distinguishes Stirling or Perth. Its general plan is very irregular. All the modern streets, however, run at right angles to each other (or nearly so), and accordingly we can easily detect the incongruities of the junction with the older portions of the town. At present, reckoning only the extent of surface which is fully built on and inhabited, it covers a space of about eight miles in circumference. An error which is by no means peculiar to Aberdeen seems to have been committed in planning a poor street between two rich ones, such as Gordon-street, between Dea-street and Don Accord-street. Most of the houses have gardens attached to them even in the town. But this is always the case in the suburbs, which from this cause present a rich and exuberant appearance. Rubislaw-terrace is much superior to anything of the kind we have seen elsewhere in Scotland.

The greater portion of the city, as we have seen, is comparatively of modern date. Nevertheless, a few of the ancient houses remain—sufficient to instruct the student in the style and manner of the Scotch domestic architecture of the sixteenth and seventeenth centuries. Pass-

ing through Justice-street we have within Bothwell-court the last vestige of a tower which is said to have belonged to the Knights Templars. In the School Hill there is another old house with projecting circular staircase and antique lintel, which is said to have been the ancient manse or parsonage of St. Nicholas. In the Shiprow, and that building in the nether-Kirk-gate denominated "Wallace Tower" we have specimens of the ancient hosteleries; and lastly, we may note the old tenement in the Gallowgate, known as "Mars Castle,"—a very ancient building capped with a diminutive crow-stepped and corbelled gable with circular staircase and small square openings for windows. All of these ancient buildings bear a strong generic resemblance to each other, and are deserving, in our opinion, of more study than the local antiquaries seem to have bestowed on them. Of that portion of the old town which belongs to the later part of last century, there is nothing to observe except in a sanitary point of view; it has very little architectural interest; indeed the only thing worth noticing is the house in which Byron spent part of his boyhood. But of the most recent and improved quarters of the town we can only observe that these are the most remarkable things of their kind it is possible to conceive. Supposing we take our stand in Castle-street, which is the original market-place of the city, and has been described by the enthusiastic natives as "the glory, the pride, and the apple of the eye of Aberdeen,"—and look westward along Union-street, we have before us a vista such as no other city in the empire could furnish. It might be easy to find fault with its proportions; but Union-street, on the whole, is an architectural feature without a peer. About a mile in length, it consists of a double line of handsome public buildings and houses, all built of a greyish white and glistening granite. The tombs of Thebes, the Cyclopean walls, the marble temples of ancient Greece,—all rise up to the imagination of the spectator as the prototypes of this remarkable street. By moonlight, the *coup d'œil* is singularly surprising and romantic; for not only is the street spacious and elegant of itself, but it runs on a much higher level than the ancient parts of the town on its southern flank, and is carried over the ravine of the Den-lurn by a magnificent bridge of solid granite, the view from the parapet of which approaches something to that which we so well remember from the North Bridge of Edinburgh.

This Union Bridge, which is undoubtedly the finest in Aberdeen, was designed by Telford. It consists of three arches, two of them concealed, 50 ft. in span, and a large and elegantly built central arch, of which the span is 132 ft. The height from the top of the balustrade is 50 ft.; the rise above the spring, including cornice, parapet, and balustrade, is 29 ft.; and the breadth across the soffit is 43 ft. It consists wholly of Aberdeen granite, and the materials are supposed to weigh over 2,000 tons. It cost upwards of 13,000*l.* We may here point out that it is easy to understand why Aberdeen should be called *par excellence* "the granite city."

As an improvement to Aberdeen, Union-street, occupies pretty much the same position that Regent-street does to the metropolis. We mean, of course, in the design; for the analogy does not hold good with regard to the materials. What Mr. Nash would have done with such obdurate stuff it is now useless to inquire; but one thing is tolerably clear: there was greater room for free decoration and elaborative details in the granite than in the granite.—Although the granite buildings of Aberdeen are sometimes highly enriched, as we may observe on the Roman Catholic church in Huntly-street, which has its crockets and finials carved from the solid blocks. The most conspicuous object in Union-street is the Music Hall, which is adorned with a fine portico of six Ionic columns of whitish dressed granite, 30 ft. high. The Trades Hall, at the opposite side of the bridge, is a very handsome edifice in the Elizabethan style. The Aberdeen Bank is an elegant structure, of pure Grecian Doric; and colour is sparingly brought into play in the Town and County Bank, which is profusely embellished with Corinthian capitals and cornices of grey Aberdeen granite, relieved by red interlaced shafts and soffits. The north parish church, which seems to have been modelled after St. Pancras, has a very imposing portico and tower; and the Town House and North of Scotland Bank, which are built adjoining each other,

are excellent specimens of plain and substantial municipal offices. One of the best public buildings—to our judgment the very best—in point of composition in Aberdeen, is the new Grammar Schools in Skene-street, tastefully planned in the Scotch Baronial style, to which style the hard and obdurate material seems to have a sort of natural affinity. There is a façade of Ionic pillars, with centre arch, which forms the entrance to the churchyard of St. Nicholas; and there are many other architectural beauties scattered around, which we have no room to particularise. The grand defect—if we may be permitted to point out a defect—in the general aspect of the Aberdeen architecture, is the want of colour. So much white micaceous granite glittering in the sun comes at length to have a cold and chilling influence on the mind; and to such an extent does this feeling grow upon us, that the eye rests with positive relief on the tall and somewhat ungainly brick spire of that group of Free churches which are so conspicuous from Union Bridge. In a district of country where granite prevails in all shades of colour, this feature in the landscape might surely be of easy improvement.

As a piece of good construction, as well as of appropriate design, there is little in the north of Scotland we have seen to compare with the quadrangle of Marischal College. The striking and harmonious range of mullioned windows, the open arcades and centre tower, give us an excellent idea of what a college ought to be, and a still higher conception than what we had previously entertained of the capabilities of the material. It is a pity that the approach to this college should lie through the purlieus of a back street; and still greater we think that the effect of the beautiful buildings is destroyed by a clumsy and pretensions granite obelisk, 72 ft. high, erected in the very centre of the square, to the memory of Sir James Macgregor. However appropriate in itself such a monument may be, it is unquestionably out of all keeping with the character and design of the quadrangle, and with the nature of the site.

Speaking of the Aberdeen public monuments generally, we are sorry to say that there is far too much room for hostile criticism. In point of importance we may first advert to the bronze statue of the Prince Consort, by Marchetti, which is anything but a favourable specimen of that artist's powers. It consists of a figure of the Prince in the costume of a field-marshal, seated on a chair of state, which rests on a pedestal of red Peterhead granite. But the figure is far too diminutive and *petit*,—in fact, it seems to represent rather a slender youth than a full-grown and handsome man, as the Prince undoubtedly was; and there is too much prominence given to those accessories which ought always to be subordinate; the chair, for example, and the military boots, which are really the most conspicuous points in the statue. It is impossible to deny that there is much ingenuity and skill displayed in the modelling; but, as a work of art, it is a poor conception of an Albert memorial. In the Church of St. Nicholas, close by, there is a very fine marble statue by Bacon; and another in the south transept, "consecrated by his fellow citizens to the memory of Provost Blackie," by Westmacott. St. Andrew's episcopal chapel, in King-street, contains another marble statue of Bishop Skinner, by Flaxman. In addition to these bronze and marble statues, there are at least two in granite: one to the late Duke of Gordon, in the centre of Castle-street, and one—a priest in full canonicals—in front of the Roman Catholic schools. Perhaps the most curious and original of the Aberdeen statues is a very ancient effigy of Wallace, stuck in a niche of that old building we have mentioned in the nether Kirkgate. Of its history we know absolutely nothing; and of its artistic pretensions the less we say the better. It is only curious as a Medieval relic of that spirit which in our time seems to have extinguished itself on the Abbey Craig, near Stirling! When will the Scotch learn to say of their immortal patriot what Milton once said of Shakspeare:

"Dear Son of memory—great heir of fame,  
What need'st thou such weak witness of thy name?"

There are a number of excellent portraits in Aberdeen, some by Jamieson, the "Scottish Vandeyck," as he was called; a portrait of Queen Anne, by Godfrey Kneller; one of Prince Albert in Highland costume, by John Phillip, (who we believe is a native of Aberdeen); and there are others by Lawrence, Pickersgill, &c. The market cross is worthy of notice as being a

rare and un mutilated specimen of those ancient structures "whence royal edict rang," which are now gone out of fashion among the Edinburgh ballies and others of that ilk. There are also several ornamental fountains and antique public wells scattered about the town. Indeed, the Aberdeen authorities deserve credit for the zeal with which they preserve and restore the antiquities, and keep in proper repair the artistic features of their city. St. Nicholas, we may add here, has a fine old peal of bells—one of which (the great bell Lawrence) has a fine sonorous tone, and bears the date *Anno Domini* 1352.\* Of other subjects we will only remark that the number, size, importance, and general value of the Aberdeen churches quite took us by surprise. The steeples are as thick set in the granite city as they are in the city of London; and the churches are all filled there, which is more than we can say of the city here. But the churches are altogether eclipsed by the charities. There are, first of all, two or three different sorts of ragged or industrial schools, of the most useful institution the Aberdonian philanthropists were the nurses. Then there is an orphan hospital, an hospital for incurables, a deaf and dumb institution, two or three lunatic asylums,—all very handsome buildings. The Royal Infirmary is really a magnificent structure, and cost 17,000*l*. The very poor-house cost 10,000*l*. But the most conspicuous of the Aberdeen charities is the hospital, founded by an old miser of the name of Gordon, for the sons of the burghesses, who, on fine days, may be seen, like a juvenile regiment, parading the principal streets, to the tune of "O send Lewie Gordon home," which they play very well on their miniature hand of fifes and kettle-drums. The schools are equally numerous and well attended. But, for a complete list of the various churches and charities, together with the different medical, legal, philosophical, and theological seminaries, are they not all written in the pages of the Aberdeen Almanac?

We shall devote our next article to the sanitary condition of Aberdeen.

#### THE OLD TOWN OF SORRENTO.

THE southern side of the Bay of Naples is bounded by a hilly promontory, which, running out into the sea to the distance of some four or five miles, forms a line of coast about equal in extent to that on which the city itself stands, and which is separated by a narrow channel from the famous and beautiful island of Capri.

On the eastern side of the bay, and connecting the two promontories, is Mount Vesuvius, with the ruins of Pompeii at its feet, and its shore dotted with the numerous small villages which, in spite of the warning given by the ruins of the old city, and even in spite of the convulsions by which they have again and again been destroyed, still persist in growing along its slopes, and are still inhabited by large populations.

On the south is a second bay and a second mountainous promontory, on the side of which, on a clear day, may be seen the three temples of Paestum, appearing like white dots on the dim mountains.

Thus the little tongue of the plain of Sorrento separates the two great bays of Naples and Salerno, both of which may be seen without turning the head from some points among its hills.

Looking from the side of Naples, the outline of the promontory is beautifully broken into a series of peaks belonging to the chain of the Gran Sant Angelo; while the pointed crags which rise into the sea round Capri are visible at the termination of the main land; but when, after winding by a broad road round the Bay of Naples, you approach nearer and nearer, it becomes visible as an uneven plain rising towards the south, and surrounded by hills only, the high peaks of the Sant Angelo being hidden behind them.

The whole extent of the plain of Sorrento is divided by a low chain of hills, called, in opposition to the greater chain, the Piccolo, or Little Sant Angelo, which runs north and south, and makes an unequal division.

The greatest and most eastern of the two halves is bounded on the north by the sea, on

the east by a chain of four hills, down the most northern of which the great Naples road passes; on the south by the high land overlooking the Bay of Salerno, and on the west by the before-mentioned chain of the Piccolo Sant Angelo. In this part of the plain there are four villages through which the road passes, and various hamlets scattered over the hills; but the capital of the plain is situated on the western side of the dividing range, in a second plain or valley, surrounded on three sides by a curving ridge of hills, and on the fourth bounded by the sea, which, running into the land, forms a small gulf in the Bay of Naples, which has become the harbour of Sorrento.

On arriving at the gate of the town from the Naples road, the traveller finds himself in a city in which time seems almost to have stood still, the dark, narrow streets, the old walls, and the public buildings and churches having an ancient and venerable appearance, as though dating from Medieval times; and, although it has never been explored or investigated, and although the existing remains are but few, yet the date of the foundation of Sorrento is even carried back as far as the age of Rome, and it may be contemporary, for any proof to the contrary, with that of Pompeii.

The most ancient of the remains existing at the present time in the middle of the town is of much greater antiquity; but how it came there, and what its history is, can not be discovered, unless, indeed, the characters of the hieroglyphics which cover its sides can be deciphered. It is one of a class of statues, many of which are carefully preserved in museums of Egyptian antiquities, but at the present time only a portion of it remains.

On a pedestal of dark black stone, about 4 ft. or 5 ft. high, stands a tablet, with a flat stone on the top, covered with hieroglyphics, and hewn out of the same block as the pedestal; while on each side of it are the legs of a kneeling slave, the head, arms, and the greater part of the body being destroyed, and the hands alone supporting the tablet.

This monument has stood for year after year in the market-place, washed by the winter rain and baked in the sun during summer, until its surface has become black, smooth, and polished all over, on which account it is, during the heat of the day, the favourite resting-place of great swarms of flies, which may be seen covering its sides, and, as it were, basking in the heat of the sun.

It would be interesting to know whether it was originally erected in some other position, or whether it may possibly have been originally placed where it now stands; and this, probably, could be ascertained from the hieroglyphics.

The position of Sorrento was one of some strength in the times which followed the use of artillery. On the east it was defended by a long, deep, and narrow ravine, with a winter torrent flowing throughout it. On the north it overlooked the sea, being built on a range of cliffs which extend all along the coast line of the plain; and on the south and west two other ravines of equal depth with the first, of which they are branches, form natural defences. The more modern fortifications stand just within the natural boundaries, and sufficient remain of the Roman walls exist, to indicate that they occupied the same position. On the east are the piers of a Roman bridge, close to the more modern arch over which the road now runs; and on the south, where a gate was afterwards built, stood a second bridge, of which the piers still remain, covered with ivy and broken into blocks of unequal height. In the neighbourhood of the cathedral, near the east end of the present south wall, are many pieces of sculpture and relics of architectural decorations. More to the west, on the same side, in cutting a new road through the walls, the Roman fortifications were exposed to view, situated immediately within those of later date. Thus, on the south, east, and west, the old city appears to have covered the same ground as the present town; on the north, therefore, it is but natural to suppose it extended to the present boundary—the sea; and thus it occupied the whole of the little square, which, being surrounded on all sides by natural fortifications, seemed designed by nature for the seat of a small city.

To what date the foundation of Sorrento is to be ascribed it is difficult to decide; for, although most of the Roman remains belong to a period of very low art, and from the name of the Cæsars which appears in various places, must have been works of the time of the Empire;

\* In Black's "Guide-Book through Scotland" for this year (a most excellent and generally accurate work) the weight of this ancient Aberdeen bell is stated to be 1,000 lb. (nearly 15 tons). But this is obviously a mistake; 1,000 lb. (that is, nearly 35 cwt.) would probably be nearer the mark.

yet over the façades of the cathedral, and on each side of the door, are remains of fine Grecian sculpture of a high order. Beside the principal door are two pillars of Ionic order, cut out of fine marble, and surmounted by a simple but well executed capital; and above these, on an architrave of rough stucco, is a beautiful portion of a frieze, on which are cut two griffins, with an elegant foliated scroll growing from the ends of their tails and curling up to their wings, so as to fill the space which is generally left so bare on other friezes, and the whole is inclosed in a border of rich moldings; and from the position of the two figures, which stand face to face, it appears that they supported between them some kind of vase, now covered with a rough scutcheon of stucco, painted with some bishop's arms. The whole is cut in low relief, but sharply and carefully, and in richness and beauty of design and execution it rivals the most famous friezes of Rome. The material is a smooth, mellow-looking marble, with a slight amber tint, marked with brown in some parts where stained by the rain.

Both the pillars and the frieze evidently belonged to some Classic temple, and have been torn from its ruins to be erected in their present place by an architect who little knew what he was doing; for, in their beauty, they form a most striking contrast to the clumsy and ugly erection of which they form part. Unless these spoils were brought from a distance to their present site, the building of which they formed part must have been close to the spot where they now stand; and that they should have been sought from any great distance for the purpose of beautifying such a building as the cathedral, is not very probable. They therefore appear to have been originally placed in the vicinity of the town; and this fact would appear to bring back the history of Sorrento to a very early date, a time of perfection far exceeding that of the second class of remains.

The whole of the court-yard before the cathedral, and the vaulted archway which supports the great tower, are filled with relics of the second order; while sarcophagi of the same date may be found used as drinking-troughs, and the shafts of ancient pillars for door-posts, in every part of the town.

The court-yard contains the capitals of many pillars of the different orders, but all feebly and clumsily wrought, while altars, eagles, fluted shafts, and large sarcophagi are strewn over the yard or built into the walls.

In the gateway are several pieces of sculpture in very low relief, and almost infantile in their want of imagination and ignorance of form. The Roman eagle, or rather a kind of parrot, which is its representative, the four letters S.P.Q.R., and the names of the Cæsars, appear in all these pieces. The gateway has two pillars on each side, formed of bases, shafts, and capitals, which belonged originally to different columns; and of these four capitals, not one is of the same order as the one corresponding to it on the opposite side. One of the bas-reliefs represents the wise men of Greece standing in awkward attitudes; another, bolder and better than the first, a fight between warriors and amazons; and a third, perhaps the worst of all, two winged cart-horses drinking from a fountain surrounded with trees. The various pieces appear to have been executed at different times, the latest being the worst; and in their character they form a strange contrast to the delicate beauty of the former relic of earlier date.

The town appears to have been supplied with water from the hills, by a long but small aqueduct, of which portions still remain. The arches are all broken down, but from the distance between the piers it may be concluded that they were of a respectable span. Two piers, broken down to unequal heights, are to be seen crossing a ravine near the city, covered with ivy, and forming a most picturesque foreground to a view of tall rocks at the head of the gorge, down which, in winter, the silver thread of a torrent may be seen descending. Another pier is to be found at a much lower level, nearer to the town, and two or three more higher up the hill side, so that the slope of the aqueduct must have been considerable. It cannot, however, be determined at what point it entered the city, or where it began.

Such was the Roman town of Sorrento. Its history is continued until the times of the early Christians by the tradition attached to an aged tower outside the east gate, on the summit of which some of the first Christian martyrs suffered for the faith, a circumstance which is

commemorated in one of the paintings on the roof of the nave in the cathedral.

At an early date Sorrento became an episcopal see, and afterwards it was raised to its present dignity as an archiepiscopal city. It was subjected to attacks by the Saracens, who entered the city and carried away the great bell from the church of the patron saint, famous for his miracles; but when they had conveyed it to the midst of the sea, between Capri and the mainland, the legend, like that of the Bell Rock, relates that it was cast overboard, or sank through the bottom of the ship, into the sea, where it now is. On other occasions the town made some resistance, and appears even to have repulsed the infidels in several incursions.

The date of the present walls and defences is probably as early as the times of the Angevin princes, whose arms are to be seen carved on the wall of the Judgment Hall, in the middle of the piazza and the cathedral, with its great brick clock-tower, and the palace of the archbishop may probably be ascribed to the same date. None of the public buildings present any remarkable architectural peculiarities, and are but poor specimens of Italian art. The most striking feature in the cathedral is the frieze before mentioned over the gateway.

The walls follow the same line as the Roman fortifications. On the east the gateway alone remains, surmounted by a colossal bronze statue of the patron saint; but on the south and west the whole walls are standing. The Roman bridges are superseded by others of clumsier workmanship, leading to gates guarded by images of the saints, and provided with holes for the portcullises. Above are loopholes and brackets for archers, and windows through which the oil and pitch were poured on the heads of the enemy. On each side of the gate is a tower, from the sides of which the artillery could sweep the bridge, but so placed that either tower could have destroyed the other, and in many exposed parts of the wall the same unusual mode of defence is made use of.

The walls are lofty, ornamented with a narrow string-course, and composed of stone, so worn that it would be no difficult matter to climb them without any aid, save the hands and feet. They are covered with creepers, and the purple of the caper flower is to be seen in all parts of them. On the top are terraces, planted with vines, figs, oranges, and olives, except in one part, where the road runs close behind the fortifications, in which part the steps, battlements, and ramparts remain untouched, in one place looking down to the suburb, which has sprung up without them on the seashore.

Except by the hand of time they remain untouched since the day when they were last manned by the rude defenders, for whom alone they are fitted; for a few small guns would soon reduce them to a mass of ruins.

#### BARGA.

TRAVELLING in search of a cool spot in which to exist in Italy during the scorching, enervating heats of its summer, none offered a cooler retreat than one of the lovely vales of Tuscany called Bagni di Lucca, about fifteen miles from the town of the same name, and claiming the name of Bagni or Baths from its mineral springs, said to be efficacious for rheumatism, catanous diseases, &c. It is the Baden-Baden of Italy; and now that Aix les Bains has been ceded, with Savoy, to France, it lays claim to be the first and almost only resort for those to whom such remedies are necessary, in Italy. But the natural beauties of the spot; its home-like, comfortable hotels; its quiet and, above all, its refreshing coolness, are its first charms. Added to these is the surpassing beauty of its environs. Small carriages are to be hired in abundance that carry you to all parts, with the well-known speed with which the Italian Jehus drive their horses.

Through miles of chestnut forests, over as good roads as ever were made by the hand of man, with walls of vines on each side, now breaking down under the weight of the heavy grape of all hues, but which will soon be seething in the wine-vat, producing a richer wine than has been known for many a year, though not in such great quantity on account of the want of rain,—to one of the principal points of attraction, we drove for about eight miles, till we came to the town of Barga, one of the many old picturesque Tuscan towns built on one of the many rocky heights in the vicinity.

The town contains nearly 10,000 inhabitants. The houses, thickly crowded together on this side of the slope, give the idea of a much smaller and less densely populated place. Passing outside the walls, by a well-kept ground with seats on each side under shady acacias, and with an amphitheatre at one end, formed from a rising bank overtopped with shadowing trees, where the youths assemble in the evenings to play at their national game of "pallone," and through the old gate of the city, we mounted to the duomo, or principal church of the place, dedicated to San Cristoforo. It is an Early Lombard church, of grand proportions and much interest. It was restored about ten years since, and the whole gives an idea of its being in good preservation. The columns on each side the interior are coloured alternate white and black in horizontal stripes. A handsome low screen raised above three steps leading to the choir, divides it from the body of the church. It is of coloured marbles, with rudely-carved heads in relief at measured distances. Within, over the high altar, is a coloured terra-cotta life-size figure of San Cristoforo and the infant Saviour; before this is placed a modern painting of the same, only removed on festivals. In a small chapel to the right is one of the most exquisite bits of Luca della Robbia work: the two draped female figures of angels on each side of the small shrine are of perfect grace and beauty. The pulpit is of Early Byzantine,—the subjects in relief, crowded in in the most colossal of styles. On the north side are seen the three kings, hastening to pay their devotions, the horses conveniently prancing to get into the allotted space. On the west are the Annunciation; the Birth of our Saviour; the Washing of the Infant, at which two sagacious-looking, well-cut asses' heads are introduced, peering over the child. The south side has the four Evangelists. The pulpit stands on four twisted columns, each differently supported at the base,—one by a lion (which a gamin of about eight years old hestrade, to exemplify the size), crushing a dragon; a second by a lion, under which lies a man, his hand to the lion's mouth; a third by the back of a grotesque squatting figure of a child, with his hands on his knees: the fourth terminates with a simple pediment. The font is of the rudest Lombard. The exterior of the church has many well-cut heads inserted in the brickwork, which, as usual, should have been covered with marble. The western door is handsome, and has remains of deep, well-cut ornaments of leaves of the vine, the fig, &c.

From the steps leading to the entrance,—what a panorama!—are seen gray gigantic Apennine peaks rising to the sky in forms of grand beauty, unrivalled in any other European chain,—range beyond range, with such rich verdure on their slopes, as they near the foot, as fair Italy alone can show; beautifully situated towns and villages nestling among the valleys, and bathed by the small rivers of brilliant flowing waters over silvery boulders, worn round by the constant washing over them of the streams.

From one point of view, at Barga, can be seen thirty-two of such villages, either half hidden among the verdure or perched on sterile rocks. We then visited a neighbouring convent, to see two other beautiful specimens of Della Robbia; then descended through a shady green lane to the hospital, to view in its chapel works said to be by Della Robbia, but only of the school of Della Robbia, distinguishable as such by the colour introduced on the figures; but they were for the most part very fine. A terra-cotta of the Virgin and Child, with saints, almost life-size, in the cloisters of the old chapel, said to be a Robbia, and evidently of his time, was remarkably beautiful. In fact, all around that part of the country are to be found works either of Della Robbia or his school. (The finest we have ever seen for beauty of design and execution of the conception, is an Assumption, in the church of the Franciscan Convent of L'Osservanza, five miles from Sienna, and which is now about to be offered for sale, we hear.) If the secret of the composition be hidden, as the story goes, within one of the figures of the true Della Robbia, there is work enough for an army of iconoclasts in this neighbourhood alone in search of it. We found one of the most interesting museums of Cinquecento ironwork, majolica and Georgio ware, Venetian glass, &c., we have had the good fortune to meet with in many private collections in the possession of Signor Cardosi, one of the magnates of Barga. But to the English at home will Barga and its sister town Corelia be made more interesting by the fact that a class of people ever being brought before their notice come chiefly

from these two towns, namely, the *figuristi*, or makers of those images paraded about our streets on boards on the heads of itinerant Italians, or exposed for sale under available porticoes of churches, theatres, and elsewhere. There is a yearly emigration of 10,000 Italians from the duchy of Lucca, or rather that part of Modern Italy formerly so called, and from Barga alone 1,500. The duchy of Lucca is a most densely-populated part of Europe,—three persons and a half to the Italian *ettaro*, or 10,000 square metres (equal to about 2½ of our square acres). In the last statistical returns the population of England is said to be, including our overcrowded huge cities, 1,75 acres to each person. There are in Barga large silk factories, as in all the towns around. The makers of *gesso* (plaster) images have two large factories, and two in Corelia, three miles distant. They manufacture their Pio Nonos, their Garibaldiis, their Washingtons, their Little Samuels, their Walter Scotts, their Virgin and Family converted into "Religion" for Protestant England, with all absence of nimbs; and they carry off their wares to England, America, Anstralia, suiting them to the opinions, both religious and political, of the countries to which they wend their way, taking care not to carry their Garibaldiis to Venice, or their Pio Nonos to Milan, and finding purchasers for all in tolerant England. The aim of their life is to make a little fortune, return to their beautiful country, buy their plot of ground, for which our informant assured us, they invariably pay a third more than its value, plant their chestnuts, their vines, mulberry trees, and maize, and settle down for the remainder of their lives in their native country. What frightfully hideous contrasts have they to live through to gain that little territory of their own! Contrast in imagination the squalor, the suffocating bad air, the black smoky atmosphere of the parts of London where herd these poor image-makers, with the deep blue heavens above, the lovely groves, the mountain, the sweet ever-changing flowers of fair Italy, in one, too, of its most lovely spots; and the thought arises—the conjecture—how many of those annual 10,000 emigrants return to tell the tale of their wanderings and privations, with the end of both accomplished?

#### THE GLASS MANUFACTURE.

CHILDREN'S EMPLOYMENT COMMISSION.

The fourth report of the Children's Employment Commission is devoted to the metal manufactures of the Sheffield district, the foundries and machine shops of the West Riding of Yorkshire, the glass manufacture, type foundries, hand-loom carpet weaving, the manufacture of umbrella and parasol handles, artificial flower making, tobacco manufacture, India-rubber manufacture, paper manufacturing, tailoring, shoemaking, gloving, and hatting. Among these, the glass manufacture was assigned for inquiry to Mr. J. E. White, who visited most of the works in England, and prepared an exhaustive report upon the subject. He shows that the age at which children usually enter glass-works is from nine to eleven; but it varies much in different districts and kinds of work. In some works few boys are found, and in most the majority of those now at work are over eleven. At the works of Messrs. Chance, of Birmingham, there is a rule against any boys being employed under the age of twelve; and it appears to be strictly enforced; but a very few get in under that age. Several other employers expressed a dislike to boys below that age. The average age appears to be lower in Birmingham than at Stourbridge (where the work is of much the same kind), and at most other places.

Females are not employed in glass-making, though a few are found engaged in various ways in connexion with that department. In plate-glass works, the "smoothing" of the plates, a part of the polishing process, is done by females, as it is also in a large sheet-glass manufactory, where a like process is employed. Females are also employed in the cutting department of flint-glass works, in roughing or obscuring glass for lamp-globes, &c., in washing and cleaning glass, wrapping up in warehouses, and some other miscellaneous ways. In all the plate-glass works, boys appear to get regular wages. The girls who smooth usually work as helpers to some woman, and receive such part of the woman's wages as the latter allows.

The state of the places of work occasionally

renders the labour of the boys unnecessarily irksome. In consequence of the faulty arrangements of furnaces and kilns, they are sometimes placed literally between two fires. Some flint-glass works with comes of the old construction are also very hot. There are frequently strong draughts close to where the boys work, bringing a large amount of dust, with which their faces become begrimed. The new houses, especially at the largest manufactories, are comparatively cool, airy, and clean. In some work, as in crown and sheet-glass houses, the boys are almost permanently in a high temperature, the hottest being that of "pushers" in crown-glass houses, and of "shovel-holders" in sheet-glass houses—work done by the youngest boys. In one instance, Mr. White found the thermometer, held close to the head of a little shovel-holder, register 130 degrees. He adds that, while standing near the fire for that purpose, his hat was so drawn out of shape by the heat that it was unfit to wear until restored by a hatter. In many flint-glass cutting shops, attention to cleanliness and ventilation is much required. Putty powder, of which lead is the chief ingredient, is used in two of the finishing processes, and flies off plentifully. A certain amount of sharp particles are also thrown off from the glass, and from the stones or cutting-wheels, of which one kind consists of discs containing lead. The sheds in which boys grind, and those in which women and girls smooth plates or sheets of glass, are, in some cases, sloppy from the water used in those processes, a defect which could easily be removed. Owing chiefly to the above causes, cutting shops are generally regarded as much less healthy as work-places than glass-houses.

The hours of work in glass-houses of most kinds are very peculiar and varied, being governed mainly by one common principle, namely, the length of time which it takes to prepare and work out the quantity of "metal" which it is found expedient or practicable to manufacture at one time. In crown, sheet, and bottle-glass works, the "journey" usually begins as soon as Sunday is ended, and occupies from eight or nine to ten or eleven hours in sheet-glass houses, and an hour or two longer in crown and bottle-glass houses. In these works it is said to be impossible to secure any regularity as to hours.

Mr. White visited the Birmingham Plate-Glass Company's works at Smetwick, where information on the subject of the inquiry was given him by Mr. Lockhart, the manager; but he was not permitted to examine the boys employed there, the company considering that their mode of manufacture requires absolute secrecy. This was not the case at Messrs. Chance's works, in Spon-lane, of which Mr. White gives the following description:—

"These are very large and important works, covering many acres of ground, and employing many hundred workpeople, of whom only quite a small proportion are boys and children and young persons. There are many separate glass-houses, most for making sheet glass; others for crown, stained, rough plate, and optical glass. Boys are employed in grinding and polishing the plate-glass made, and females in smoothing it, in just the same manner as in the plate-glass works. The smoothers, whose work is wet and sloppy, are provided with muleskin aprons, and wear high wooden shoes. They are said by this means to be able to leave work dry and tidy. About thirty boys are employed in grinding lighthouse glass. Great regard has been shown by the employers for the education of those under or around them. Large and handsome schools, including three lofty school-rooms, with class-rooms to each, supplied with maps, &c., and a house for a master, have been built by the firm close to their works at their own cost, which must have been very considerable. The benefit of these schools, though mainly intended for, is not confined to those engaged in the work, including instruction in drawing, which is of great use in certain branches of glass work, though said to be not yet so much appreciated by those who would benefit most by it here, as by other persons near who avail of it. It having lately been thought by the employers desirable to ascertain the actual educational state of their young workpeople, all have been examined, and the result has led to a rule that all under the age of eighteen, who fail to show the required knowledge of reading, writing, and arithmetic, shall attend the evening school. A qualified surgeon is appointed to attend the people employed in the works, and has a surgery, forming part of the school buildings."

A visit to the Stourbridge Crown and Sheet Glass Company's Works completed Mr. White's inquiry into this branch of the manufacture, so far as the Midlands are concerned.

The inquiry into the flint glass trade commenced with a visit to Messrs. F. & C. Osler's works in Freeth-street and Broad-street, Birmingham. This is one of the leading firms in this branch of the manufacture, and the evidence of Mr. Percival gives a very full account of the flint glass-horse system in reference to the employment of boys. Visits while at Birmingham were also made to the works of Mr. Arculus,

Broad-street; Mr. Sarson, Upper Windsor-street; Mr. Hagbes, Tower-street; Mr. Hately, Chester-street; Messrs. Lloyd & Summerfield, Spring-hill; Messrs. Stone, Fawley & Stone, Dartmouth-street; Mr. Robertson, Brice-yard, Broad-street; Messrs. Gammon & Co., Brook-street. Mr. Webb, Messrs. Richardson & Smith, and Messrs. Walker & Son, Stourbridge, were also visited; and Mr. Renand, Dudley.

The Commissioners state in their report that they consider the protection of the Factory Acts Extension Act requisite in reference to the state of the places of work, the excessive hours of labour, the absence of proper rest for the young at meal times, and the education of the young. The very exceptional nature of the glass manufacture, involving as it does many varied and complicated details, renders it difficult to determine what the precise regulations should be in respect to some points; but they are of opinion that the evidence justifies the following recommendations, as securities against overtasking the strength of the young:—

No female to be employed in any manufacturing process. Boys under twelve to be excluded. Boys under sixteen not to work at night, nor more than twelve hours in one day, including intervals for meals amounting to the whole to not less than an hour and a half. Youths between sixteen and eighteen not to work more than eight hours at night, including intervals for meals amounting to the whole to not less than an hour; nor to be employed at night-work two consecutive weeks. Any excess of time owing to accidental delay in any of the processes not to exceed an hour. Boys under sixteen employed at glass "making," to attend school not less than nine hours each week, and other boys according to the regulations of the Factory Acts. The Factory Acts Extension Act to be applied to the processes of grinding, polishing, and cutting plate and window glass, the cutting of flint glass, and all the processes done out of glass houses.

The Commissioners express their belief that, if these recommendations should be embodied in legislation, they would work as satisfactorily as the regulations of the Factory Acts Extension Act have done in respect of the earthenware and porcelain manufacture.

#### FROM SYDNEY, AUSTRALIA.

It will have been noticed that a serious catastrophe occurred at Sydney on the 29th of June, in the destruction by fire of the Roman Catholic Cathedral, a spacious structure. The occasion has called forth the energies of the members of that church in this colony, who have subscribed liberally for its reconstruction. By somewhat of a coincidence it happened that previously to the fire a public meeting of the members of the Church of England had been called to raise sums for the completion of the Cathedral Church of St. Andrew, which, commenced many years since on a scale then very large for the means of the Church here, was but too long delayed in its construction. The efforts of the Roman Catholic body to raise means for their own object, very properly excited, in the meantime, the emulation of the Church of England community; and, at the meeting of the latter referred to, large subscriptions were contributed, and measures taken which insure the prompt finishing of the building. The general subscriptions will be applied to the building itself. The married ladies of the colony contribute 2,000l. for the purchase of a large organ. The numerous ladies gave 1,500l. for the eastern window. The children of Sydney gave means for the purchase of the font, and the pulpit, it is expected, will be supplied by English bishops.

Steps are at length, by news of date 21st June last, being taken by the Government preparatory to the erection of the new General Post Office, in George-street, according to the designs prepared last year by the Colonial architect. Tenders were invited for the removal of the old Post-office. The new building will be in the Italian style; it will have an architectural elevation in George-street, and also facing the new lane which it is intended to carry through to Pitt-street in continuation of Barrack-street.

The masonry for the new office of the Pacific Insurance Company is approaching completion, a portion of the walls being up to the cornice. Tenders have been invited for the enlargement of the Congregational Church in Pitt-street. The width of the building is to be increased, by taking in 25 ft. on the northern side; and additional accommodation is to be provided for 618 persons. A contract has been taken for a new Congregational Church, in the Gothic style, at the corner of Ocean and Piper streets, Woollara, to accommodate 340 persons, and to cost about 1,150l. A Gothic church, for the Wesleyan body, is

about to be erected at Chippendale, on the site adjacent to the old church; a design prepared by Mr. T. Rowe having been adopted. The plan is that of an oblong, with a chancel projecting from the centre of the east side; also with a projecting tower and porches on the west front opposite the road, and with four entrance doors. Above the tower will be a spire, terminating at a height of 126 ft. from the ground. The dimensions of the interior will be 100 ft. by 46 ft., exclusive of the chancel, including which the width will be 56 ft. The seats will be disposed so as to form a semicircle round the rostrum. In the chancel wall behind the rostrum there will be a wheel window; and below a rostrum with moulded arches supported on small columns. The walls will be entirely of stone, and cedar will be used for the internal fittings. The ground-floor is to accommodate 700 adults, and the gallery 500 children, with sixty adults; altogether there will be sittings for 1,100 adults. Tenders will shortly be called for the work, which will probably cost about 6,500l.

Considerable progress has been made with the lining and covering of the high-level reservoir at Paddington. The contract was to be finished in six months.

The tunnels for the sewerage of Woolloomooloo Bay are advancing towards completion. The width of the main tunnel is 10 ft., and that of the branch tunnels 6 ft. and 8 ft. Messrs. Lovelidge expected to complete their contract in three months.

#### FROM QUEENSLAND, EASTERN AUSTRALIA.

The foundation stone of the new Parliament Houses has been laid at Brisbane by the Governor.

We have received the following interesting particulars respecting this building:—

Some years ago Sydney made a great effort to build for itself a set of Parliament Houses more worthy of that colony than the wretched group of houses, now called by that name, in Macquarie-street; but, beyond issuing a competition for designs, and expending a large sum in prizes, nothing more was done. Our own Houses of Parliament in Queen-street, Brisbane, are nothing to be proud of either; and it is, therefore, gratifying to us to be able to record, that we are going ahead of our neighbours in having actually commenced a set of buildings, of which we hope future generations will be proud. The stone was laid with some ceremony on the 14th (of July) by the Governor, Sir George F. Bowen, in presence of a large concourse of people, after which the workmen sat down to a dinner, at which Mr. Charles Tiffin, colonial architect, presided, supported by the President of the Legislative Council, the Speaker, the Colonial Secretary, and several members of both Houses.

The general arrangement of Mr. Tiffin's design, now in course of erection, is that of a large quadrangle, 304 ft. by 230 ft., surrounded by buildings, the chief of which will rise 103 ft. to the top of the curved mansard roofs. The central portion will be three stories high, with circular-headed windows and detached columns, and having a projecting carriage-porch of five bays on the ground-floor. The entrance-hall is 27 ft. by 19 ft., and 18 ft. high, that being the height of all rooms on this floor. The grand staircase is 31 ft. by 23 ft., with central flight, branching off to the right and left, on the half-landing. Taking the entrance as the centre, both sides of the plan are alike,—that to the right belonging to the Legislative Assembly, whilst that on the left is intended for the Legislative Council.

Being one side, the space next the porch contains the hall to the public stairs to the galleries; there are two committee-rooms, 27 ft. by 14 ft., and 17 ft. by 14 ft.; also entrances for reporters and witnesses. At back are more committee-rooms, strong rooms, and staircases. On the first-floor are—the reading-room, library (with terrace over porch), and corridors leading right and left to the assembly and council chambers, which are each 63 ft. by 36 ft. 6 in., by a height of 32 ft. The public galleries pass over the writing-rooms and staircases, so that the upper dimensions are 80 ft. 6 in. by 36 ft. 6 in. At the further ends are entrances for president and speaker, from their respective private rooms. Sundry offices and reading-rooms occupy the second-floor.

The refreshment-rooms form a detached group at the back of the centre portion, with cellars, &c., in the basement, and kitchens on the

ground floor; whilst the refreshment-room, 49 ft. by 20 ft., and smoking-room, 27 ft. by 16 ft., are on the first floor, and are approached from the grand staircase. Above are attics for porters' bed-rooms. The style chosen is the French Renaissance, and, although devoid of much traditional ornamentation, it is considered effective by the judicious breaking up of the front and sky line, and by a two-storied loggia connecting the wings with the projecting centre.

The walls are of freestone, and the roofs will be covered with English slates, with iron cresting at the ridges. The principal floors are to be fireproof, the iron joists being supplied by Messrs. Fox & Barrett, of London.

From returns upon various subjects, which have been laid upon the table of the Legislative Assembly, and from evidence obtained through other channels, the *Queenland Daily Guardian* learns that the public works of the colony are not only rapidly becoming more numerous and important, but that they are being constructed in a permanent and substantial manner, and with a despatch that is satisfactory, considering that this is only the sixth year of the colony.

The engineer for the Brisbane Waterworks has reported to the Minister for Lands and Works, upon the progress made at the works, from which it appears, that the dam at Enoggera Creek is about half completed, and will be finished about November; and although unforeseen difficulties have arisen in carrying out some parts of the work, he expects to have the dam, tunnels, and main completed by the end of January next.

Numerous and important works are now progressing within the Brisbane city boundary, under the city surveyor, Mr. Ambrose, as well as the no less important works for which tenders have been called. The contractor for making the bridge approaches on the South Brisbane side, has commenced operations. The bridge between North and South Brisbane was opened on the 24th of June.

Great improvements are in progress at the eastern end of Stanley-street, by cutting away the hill; continuing the street in a straight line to meet the Ipswich-road; and filling up a dangerous siding at the top of the reserve. In North Brisbane side there are several works nearly completed;—the bridge and approaches in George-street; a large stone invert culvert in Old Boundary-street; the cutting in Leichhardt-street; cutting and formation in Elizabeth-street; and several important works of smaller magnitude. The slip on the North Quay has been made up; and, in addition, a landing-stage for market produce, for the convenience of the farmers up the river. The landing-stage is 90 ft. long by 20 ft. wide, with approaches from each end.

Among the largest of the many private buildings which have lately been completed and opened in Brisbane, the shop of Messrs. Perry, Brothers, ironmongers, of Queen-street, stands conspicuous. The front of the basement story, about 50 ft. in width, is occupied by two plate-glass windows, with door between. The shop is 47 ft. wide by 84 ft. long, with cedar counters running the whole length. In the centre of the shop is a large double flight of stairs, with carved banisters, leading into the show-room,—a lofty room, the same size as the shop, with open roof, the woodwork painted of a light neutral tint. At the back of the shop is the warehouse, the same width as the shop and 60 ft. long, two stories in height, but lighted entirely from the top. The upper story is in the form of a gallery round the walls, the centre being open, and traversed by a patent hoist, movable to any part of the room by a boy, and capable under such management of lifting and carrying to the place where it is wanted any package, however large and heavy it may be. The architect was Mr. Cowlishaw; and the builder, Mr. John Petrie.

#### "A WORD OF ADVICE TO MARGATE."

We have received from Mr. T. D. Reeve, the late sanitary inspector (Mr. Reeve has resigned the office), a reply, already made public by the local press, to the mayor's letter printed in our last, with a request that we should publish it. As it is simply a series of accusations against the mayor of having obstructed in all quarters the sanitary improvement of the town, which may or may not be true, we decline to do so. We were anxious to avoid the personal part of the subject, our object being, not the annoyance

of any individual, but the improvement of the town. The inspector's reply in our last, however, and his more recent assertion that the original "Word of Advice" is "an untruthful article," leave us no alternative but reply. This will be better done than by any words of our own, by the insertion of the following letter, just now received from the mayor of the town:—

Sir,—I am obliged by your recognition of my earnest desire to improve the sanitary condition of Margate. I may say, that the governing body are quite alive to the great importance, to the prosperity of Margate, of a strict enforcement of sanitary laws; that we listen to the kindly comments of friendly critics, and, so far from ignoring existing evils, are quite determined that they shall speedily be removed. It was not my intention to make any remark on letters from Mr. Reeve concerning myself; he, however, having replied to the article in the *Builder*, "A Word of Advice to Margate," begging an insertion of his contradictions and explanation of the alleged "facts" contained therein, it is, I conceive, but a simple act of justice to yourself for me to say, that although I feel it would be trifling with your time and mine to go into details which must be lengthened to explain Mr. Reeve's strange denial of notorious facts, I am prepared, either by personal inspection, or by any other way suggested by yourself, to prove that the nuisances mentioned in your paper really existed at the time of its publication. I must, however, take an exception to your theory of the cause of the stench at the back of Marine-terrace: it is new to me, and one that I am not able to determine. As Mr. Reeve's resignation of the office of surveyor and sanitary inspector has been received, it would be unfair to make any further allusion to his letter to yourself. I am reluctant personally to be drawn into this controversy, but my duty as a public officer compels me to thus briefly to notice Mr. Reeve's letter to yourself.

I remain, Sir, yours faithfully,  
THOMAS H. KRINZ, Mayor.

Margate, October 3, 1865.

Another correspondent says, with reference to the assertion of the late sanitary inspector that he has not, nor ever has had, "any house in Love-lane."—"This statement would be equivalent to a man owning property at the corner of Rathbone-place saying he had no interest in the lower end of Oxford-street! The property alluded to would naturally be spoken of in general terms as 'Love-lane,' that being the nearest thoroughfare; and the house charged as a nuisance is owned by Mr. Reeve. The right name, I believe, is 'Puddle-dock,'—certainly more suggestive than 'Love-lane.'"

We repeat, that we have no desire whatever to injure any individual; we care no more for the mayor than we do for Mr. Reeve: our sole object is to get such attention to the condition of the town as may lead to the supply of its obvious sanitary deficiencies; and we would specially call the attention of the medical men residing there to their evident duty, reminding them how much their own interest is concerned in removing from the town the stigma that attaches to it.

#### TERRA COTTA STATUE OF THE LATE PRINCE CONSORT.

At the terra cotta works, Stamford, Mr. Blashfield has just completed a statue of his late Royal Highness the Prince Consort, made from a model executed by Mr. Theed, the sculptor. The statue we are about to describe much resembles in pose and arrangement that which Mr. Theed modelled and executed in bronze for Coburg, the model for which may be seen in the Crystal Palace. The Prince is represented in the robes and order of the Garter. He stands in an easy and dignified position, holding a field marshal's baton in the left hand, while the right hand points to a scroll on a pedestal, upon which is indented the facade of the Crystal Palace of 1851. The pedestal has upon it a medallion portrait of her Majesty; and a wreath of flowers is entwined round the pedestal. The likeness of the Prince is truthful. The colour of the statue is a warm buff. The figure, inclusive of the plinth on which it stands, is 7 ft. 2 in. high. It has been burnt in one piece, is without flaw, and is as hard as black marble. The materials used in the formation of the statue are clays from the estate of Mr. Arthur Helps, at Bishop's Waltham, and clay from the Marquis of Exeter's celebrated pit at Wakerley, mixed with felspar and Lynn sand. Mr. Blashfield arranged that one of his patent kilns should be the workroom for building up the different parts of the statue after they had been removed from the moulds, and for finishing the entire work. We are informed that gas was laid on to the kiln for this purpose, and after the work was complete the gas was used for drying it. In this state the statue remained several weeks. When quite dry, the doorway of the kiln was bricked up, and the process of firing commenced, which occupied about a week. After a lapse of nearly another week, the kiln became sufficiently cool to enter and remove the

HAUGHMOND ABBEY, NEAR SHREWSBURY. SOUTH DOOR OF THE CHURCH FROM CLOISTER.

[See p. 702, ante.]

staine. The composition of the body has melted together in just sufficient degree to produce as much vitrification as shall make it proof against the weather and all acid or alkaline bodies, without warping or twisting. We sincerely hope it may prove so. Some modern works in terra cotta will not last a dozen years exposed to the weather. The statue is intended to be placed over the entrance of the new infirmary at Bishop's Waltham.

#### DISTRICT SURVEYORS AND THE METROPOLITAN BOARD OF WORKS.

At the meeting of the Board held on the 29th ult., Mr. Robert Taylor, pursuant to notice, moved the following resolution:—

“That it be referred to the Main Drainage Committee (a committee of the whole Board) to report generally on the payment of district surveyors by fees; on the extent, value, and convenience of the present districts; and on the expediency of their fusion and rearrangement; also as to the advisability of directing the payment of the fees collected under the Act into a common fund, out of which to defray the payment of a staff of salaried officers, devoting their whole time to the public service.”

In support of his motion he alluded to the very large sums received by district surveyors, and said that nevertheless, in many instances, the whole of the work was done by deputy, and all the district surveyor himself did was to receive the fees. Every district surveyor should be compelled to do his duty personally.

Mr. Taylor's view was, that 10,000*l.* per annum out of the 30,000*l.* paid to district surveyors would maintain a staff of officers connected with

the Board, and who should give their whole time to the work, so that 20,000*l.* a year would remain to be applied to improvements.

The Chairman, Sir John Thwaites, pointed out that it would not be legal so to apply such a balance. The proposition was discussed very dispassionately and ably, and the Board showed they were fully aware of the difficulties and objections that exist in the way of the alteration suggested. The motion was carried with a view to a full inquiry.

One member stated emphatically, and we believe with perfect correctness, that the district surveyors, as a body, did their work very efficiently, and with satisfaction to the public.

#### PROPOSED MONUMENT TO SHAKESPEARE IN STRATFORD-ON-AVON.

It will be remembered, with reference to the Tercentenary Shakespeare festival held in Stratford-on-Avon, that the erection of a permanent memorial of the poet there was contemplated. A design by Mr. John Gibbs, of Oxford, was selected, and a subscription to defray the cost was commenced. We are now assured that earnest efforts are again being made to obtain funds, the late Mayor, Mr. E. Flower, and the present Mayor, Mr. Jas. Cox, materially assisting, and that the memorial will certainly be erected. We have in consequence engraved a view of the design, and now lay it before our readers. The total height will be 106 ft.; the width at the bottom of the steps, 36 ft.

The plan at the floor-line shows four buttresses, ornamented with angular columns, capitals, and panels. Each of the buttresses supports a pedestal, on which a large statue will be placed. The memorial is not to be a solid structure, but so constructed at the lower part as to form a space in the centre for a vaulted chamber, lighted by four windows, and entered by an arched doorway on one side only. This chamber is intended to contain a marble statue of Shakespeare, resting on a carved pedestal opposite the entrance. The walls of the chamber are to be historically treated, by tinted sculpture in bas-relief. Medallions of dramatic writers and actors are to fill the spandrels of the doors and windows, and other parts, both internally and externally. The form of the statue-chamber is indicated on the design outside, as it rises by various architectural lines, amidst which are four large gables, partly occupied by the arms of Shakespeare, supported by dramatic characters. In the second stage more figures are shown, singly and in groups, illustrating personages in some of the chief plays of ancient English life, some being under canopies. The upper tier of statues is shown upon the third stage, which, with those below and the crowning group at the top, St. George of England slaying the Dragon, number between thirty and forty.

The estimate shows the following items:—

Mason .....	£2,220
External sculpture and carving .....	600
Internal sculpture .....	200
Statue of Shakespeare .....	500
Colour .....	100

£3,620

PROPOSED MONUMENT TO SHAKSPEARE IN STRATFORD-ON-AVON.—MR. JOHN GIBBS, ARCHITECT.

THE NEGLECT OF SANITARY LAWS.

DURING the remarkable summer which is now passing away, the death-rate of the metropolis has afforded matter for both agreeable and anxious thoughts; but, notwithstanding the very large number of deaths from typhus-fever and other disorders of a kindred class, the rate of mortality has been on the whole satisfactory. There are tangible reasons for this. From the large extent of the sanitary measures which have been in progress during the last few years, we have a right to look, as a natural consequence, for a reduction of the metropolitan death-rate, which ought, ere long, to be reduced from twenty or twenty-one deaths in each thousand, to say, seventeen in the thousand; a most important matter, when we consider that a saving of only 1 in 1,000 of the population of the London district,—taking it at three millions,—means 3,000 men, women, and children. The causes to which we may look for the decrease of the deaths, include the removal of large numbers of persons and their families engaged in the City into country quarters; the removal of others from the dens and alleys, which were situated somewhat similar to those in Maypole-alley, and some of the other parts in this neighbourhood and elsewhere, into more open spaces; the immense improvement of the drainage, the advance of medical science, and increased facilities of attendance on the sick poor; the disuse of intramural interments; the inspection of common lodging-houses; and, to a certain extent, the greater disuse of unwholesome food. These and other steps which are in progress will all have a sure and beneficial effect on the public health. In order to give some idea of the advantage which must result from the inspection of food alone, Dr. Letheby states, that in one seven weeks altogether as much as \$9,821 lb. of meat, or upwards of 40 tons, have been seized in the City markets alone. The meat consisted of 148 sheep, 12 calves, 40 pigs, 849 quarters of beef, 25 hares, and 65 head of game. A considerable quantity of this meat was affected by the prevailing epidemic, and it is easy to form an opinion of the immense amount of damage which would have occurred if those polluted articles had been used for food. There is still much to be done; and amongst other matters to which attention should be given is the enforcement of the sanitary enactments which already exist. If this were done, the abuses such as those which have been illustrated and described by us, as in Maypole-alley and many other places, would no longer exist; and by this means the typhus and other fevers, which have for some time past proved so fatal, would be checked to a great extent. If a proper inspection of houses let into numerous dwellings were systematically enforced, fever would be robbed of half of its victims. The very circumstance would of itself prevent mch overcrowding, and cause more attention to ventilation and drainage than is shown at present. We have found many places—some of them only at a short distance from King's-cross—which are hot-beds of disease. In one house eight navigators sleep in a garret; a man and wife in the back parlour; a man, wife, and two children in the front parlour; man, wife, and four children in front room of the first floor, or the drawing-room, as it is called. Our informant did not know how many there were in the back drawing-room, but it was inhabited by a family, and we will put the numbers at three only. In the kitchens are a family of eight, and three lodgers. We would thus find the population of this house as follows:—Garret, 8; front drawing-room, 6; back ditto, 3; front parlour, 4; back ditto, 2; kitchens, 11: making 34 persons in a small inconvenient house, very ill drained. This is a bad instance, but there are others which are much worse. We may here direct attention to some of these dangerous spots in detail; though this would be sure to inflict damage on individuals—a most unpleasant duty, even when it is performed with a view to save life and preserve health. But, as we have before said, these are matters which the State authorities of the country are bound to inquire into; and if this were carefully done, the evidence would be so clear, and the necessity so evident, that we should soon see an inspection of such houses carried into effect. Our readers know we are anxious to see a measure of this kind brought into working order. It will need to be done; but it requires long persuasion before the most necessary changes can be pressed upon the attention of the Government or a large mass of the people.

In the case above referred to, we believe that the lodging of the eleven navigators comes under the action of the Common Lodging House Act, and that the person who rents the house ought to be called upon to register this place as a common lodging-house; but this would not be done in consequence of the house not being fit for the purpose. In order to obtain a license for letting a house in this way, the drainage must be perfect, all parts trapped and secured, and water laid on so as to provide for personal and other cleanliness; there must be a sufficient sitting and cooking room for the lodgers, good beds, certain arrangements for the sleeping of the sexes, and a sufficient amount of cubic space for the occupants of the dwelling, and other provisions. In many other of the tenement houses this evil arrangement of admitting lodgers is carried on to a great extent; for instance, persons take one or two rooms for the express purpose of sheltering their families, and then admit lodgers who are not related to the tenant. In some instances two kitchens are rented, and then one, two, or more lodgers are taken in to sleep with part of the family in the back or front kitchen. This is completely against the law, and causes mischief. In such unfavourable conditions fevers break out which would never have occurred in the licensed common lodging-houses, and in those situations fevers are both generated and developed, so that the good intentions of a wise Act of Parliament are frustrated.

At the present time, when the overcrowding of a large number of tenemented houses has been increased, and is still increasing, attention to the water supply is of very great importance. In Maypole-alley they never had any water on the Sunday. How is it possible that they could have had, when the casks are so small and the population of the houses so large? Here there are little casks provided for the water, and there is no water laid on, so that the closets cannot be flushed; and is it likely that the people will "waste" the precious article, of which they have so little? If the drainage were right, a short leaden pipe would carry the water which is needed for the closet, and well flush the drains; but, as we have said a hundred times, when had drains and cesspools exist, this flushing does more harm than good. By the Act of Parliament, those who let houses are bound to provide water-vessels of a sufficient size; to have those vessels covered; to have dust-bins provided, and have them also covered over. How many instances throughout the metropolis,—how many hundreds, how many thousands of cases of neglect in this respect are to be met with? And yet the law as at present established is sufficient for the purpose of enforcing those regulations which are so especially needed.

In the present time of the cattle disease City and other parish authorities have employed additional inspectors; and, after all, the expense of these officers is not of large amount. Mr. Rendle remarks that, in the comparatively poor parish of St. George, Southwark, with a poor population, which pays poor-rates to the extent of not far from 30,000*l.* annually; where, as we have elsewhere stated, there were 400 deaths from fever in five years, and where, in the two last cholera epidemics, 1,600 persons died of that disease; if we estimate the number of fever cases in the five years referred to as eight cases of fever to one death, we have 3,200 attacks of fever, and it will be understood how great the expense must have been to the parish caused by those attacks of fever. Therefore it would have been, in a money point of view, better to have expended sums for sanitary inspection, and the enforcement of the laws connected with the public health.

It is clear that if the parochial authorities do not enforce the regulations, another and more active and independent power must be called in. Now that the cattle plague is raging to an extent which causes alarm in all directions, and which is ruining many persons, additional inspectors have been appointed. We believe that if inspectors to a sufficient extent, and of the right kind, had been appointed long since, and stricter regulations made in the cowsheds, the disease would never have appeared. And similarly in connexion with human health and life. By proper inspection of the dwellings, by the enforcement of needful measures, we shall the better be able to prevent the spread of cholera, against the attack of which we are by no means safe; for, if it has been partially stayed in some places, it is spreading to others which are nearer to us.

In Constantinople and the places near where this scourge has in part declined, typhus fever of the worst type has appeared, just as if it were, as we suggested, merely another state of the same disease. In one small place, out of 400 cases, 200 persons died. The cause of typhus following in the wake of cholera, however, is easy enough to comprehend on other grounds; for, in the panic, the populations, instead of fighting with the foe in their own neighbourhoods, have rushed away to places which were bad even in comparison with the spots they had formerly occupied, and the new resorts then became so densely overcrowded that, if cholera did not come, typhus was almost certain to arise and spread amongst the visitors.

FROM SUNDERLAND.

SIR,—I sallied out, a few mornings since, from my inn, in the pursuit of knowledge under difficulties. Unlike Doctor Syntax in quest of the picturesque, I was in search of the practical. A ramble through the highways and byways, the near ways and the narrow ways, the old ways and the odd ways of this ancient borough, supplied me with pictures for illustration as well as food for reflection, had I been an adept at the pencil.

Sunderland is a showy sort of a sea-port town, full of life, and much given to pleasure. Perhaps it is like other sea-port towns; social life is similar, though it has strange semblance and surroundings. Its main artery is High-street, and it appeared to me that the different High-streets of the several English, Irish, and Scottish towns and cities I have been through, bear a remarkable resemblance to each other. They have been high and low in situation and social life and manners, portions of them having been sacred to the *élite* and the lowly. High-street, in Sunderland, is no exception in this respect. It is an undulating, tortuous thoroughfare, of upwards of a mile in length, stretching from the antique church of Bishopwearmouth to the South Pier. Branching off at either side for its whole length there are about half as many side streets, entries, opens, garths, riggs, chares, closes, wynds, and lanes as there are houses. The upper and most respectable end of the street is entered by several side streets, faultless in appearance, befitting respectability; but, approaching the lower part of the street, when you pass Sans-street, and nearing where you enter for the Ferry Station, the narrow streets and entries on either side are anything but *sans* taste, *sans* smell, *sans* everything. From here to the lower end of High-street, branch off where you will on either side, but particularly to your right, and you will meet varieties in the animal, vegetable, and mineral kingdom to study.

"The freaks of the Fingis" are the least observable freaks witnessed here. If you are not particular as to perfumes, enter with me this narrow defile, called, out of respect to the builder, and scarcely wide enough to allow two to pass without rubbing each other's sides. Have patience, now; it is only one of a sample, and, as friend Pat says,—six of one and half-a-dozen of the other. Come on; but take care you do not crush with your boot-soles the little limbs of those belligerent babies squatted and squabbling beneath you on the doorstep and pavement. It is a warm day, surely, this, the middle of September, in the North, or their mammas would not let their little nude Adams and Eves gambol about in a state of nature, as innocent of covering as in the hour they were born. Perhaps it is washing-day, and mother or aunty has gone to the wash-house with the babies' bibs, &c. Perhaps—no, it is useless to speculate: we must move on. The children will have a roll in the muck, as well as the pigs; for pigs and donkeys, by the by, are to be met in these back slums of Sunderland, high as thick as they are in Skilherne.

The landlords of those wynds and garths are not particular about anything save the rent, and the borough officers pay their flying and peremptory calls for their taxes with their finger and thumb on their nose and a malediction on their lips, which is visited on the savoury inhabitants, whether they are successful or not in their errand. Sunderland is badly in need of a sanitary inspector to poke his nose into those back slums and shambles seething with rottenness and refuse, animal and human. Many of those narrow entries off the High-street are almost inaccessible to all save the unfortunate resi-

dents who perforce are located and obliged to live in them.

Were there a continuance of the warm weather experienced here for the last few days, and no better precaution adopted, cases of cholera, virulent enough in type, would probably exhibit themselves.

The Corporation of Sunderland, without doubt, has done a good deal, but much remains for them to do. They have drained a little, opened a park, and are adding thereto and daily improving it; have erected public urinals, and put up some small drinking-fountains. But these last accessories to health and sanitary improvements have been confined to leading thoroughfares, or in very close proximity to them, leaving the ulcerated spots untouched.

As long as these narrow back streets and entries are uncleaned, or but half cleaned at intervals, and the houses within them overcrowded with families, without sufficient accommodation and convenient water-supply cheap, and as long as they are not looked after and examined weekly—if not oftener—by a sanitary inspector or assistant, who cannot expect health, and you cannot be out of danger.

Bishopwearmouth district exhibits a large increase in mortality over the corresponding weeks of last year, as shown by the register. The River Wear winds its serpentine course sluggishly along, oozy and black, flanked by ship-building yards, iron and wood, foundries, stores, and many others more or less connected with the shipping interest.

There is always a goodly number of vessels in the river, but mostly connected with the coal trade; a few, however, trade with foreign ports. The river is spanned by a handsome high-level bridge, leading from Monkwearmouth to Bishopwearmouth, under which the tallest masted vessels can pass up the river. The inhabitants of Sunderland take great pride out of it. The original construction was put up in 1798; but alterations and improvements were added thereto under the direction of Robert Stevenson in 1853, whereby the approach each side was brought to a level: said improvements entailed an immense expense on the town. A toll was exacted for a long time for foot passengers, who had to pay, as there was no other crossing but the ferry. Though this toll is now for some time done away with, it is still exacted for traffic. It is rather intolerable to have such an impost levied on the carriage business of the inhabitants of such a business town as Sunderland. For horse or cart, hand-cart or barrow, no matter what kind the vehicle, whether drawn by man or beast, toll is exacted. The retention of the toll-bar on the bridge of Sunderland is the retention of a bit of barbarism, out of keeping altogether with the commercial status and municipal and industrial progress of this rapidly-improving town.

C. C. H.

#### SANITARY MATTERS.

*Bradford.*—In a communication to the local *Observer*, Dr. J. H. Bell gives a horrifying account of certain localities in Bradford; and winds up with the following remarks and statistics:—

"I do not know whether any attempt has previously been made to localize the excess of the mortality of the borough. I will, therefore, give you the result of my investigations for the year ending August 3, 1865. The annual mortality of the whole of England is about 21.8 for every 1,000 persons living. Assuming the population of our borough to be now 120,000, the death-rate for the past year has been 29.1. For the townships of the borough it has been as follows:—Bradford east, 30.9; Bradford west (excluding 30 deaths which occurred in the Infirmary), 29.9; Bowling, 29.0; Horton (excluding 143 deaths which occurred in the Workhouse), 28.1; Manningham, 19.9. In the back streets I have described, adding ten per cent. for the numbers from them who have died in the Workhouse, it is 51.1; and in the Leys, it rises to 67.3—the highest death-rate under ordinary circumstances I ever heard of. But disease in these parts is not only more common, it is also much more fatal, from causes quite different from those which produce disease. Taking fever (typhus and typhoid) as an example of preventable disease, the general mortality is about 12 per cent., and under favourable circumstances, only 8 per cent., but in these low streets it is about 50 per cent. The mortality from fever throughout the whole of England is 9.3 for every 10,000 persons living. In the borough, 1865, it is 12.5, representing 1,209 cases of fever; Bradford east, 19.4; Bradford west, 13.2; Bowling, 9.1; Horton (excluding 22 cases which occurred in the Workhouse), 6.4; Manningham, 5.4."

*Manchester.*—The sanitary state of this city at present is not satisfactory. Dr. Morgan, in his last weekly report, states that in the previous week there was an alarming increase of continued fever cases, a large proportion of which belonged to the typhus and typhoid forms of the

disease. "We are probably within the mark," he says, "if we affirm that no fewer than seventy cases of true typhus have been seen in the public practice of Manchester and Salford." Five of the cases are distinctly attributable to overcrowding. The Registrar-General's return for the week showed that the rate of mortality in Manchester was 34 in 1,000—the highest recorded among the eleven large towns with the exception of Liverpool, where the rate was the same. *Leitchfield.*—A public meeting has been held, "for the purpose of taking into consideration the sanitary state of the city, in order to the amending anything therein which may be dangerous to the health of the people." Mr. M. B. Morgan said he remembered the time when all the sewage flowed through Stows Pool, which took away all the refuse from the town, but now it all went into the sewers. All the water having been drawn away, too, they had now no means of flushing the sewers, and no attempt had been made to mitigate the evil. Their great want was water. He suggested an application to the trustees of the conduit lands for a largely increased supply of water; and to the corporation, for further sewage accommodation. Mr. Browne proceeded to notice a case in which, at a farmhouse not far from the city, three persons had died in six weeks from the fearful stench issuing from the stream which passed near the house. He believed the corporation were quite alive to the necessity of removing the nuisance, and the only obstacle was "the expense," which ought not to be considered in such a serious case. Mr. A. Hinckley drew the attention of the meeting more particularly to that part of the sewage which empties itself into a cesspool not far from his residence, at Stows, and stated that the supply of water had been so deficient that the cesspool was quite a nuisance, which he could sometimes smell at his own house. He suggested the appointment of a committee to take the matter into consideration. Archdeacon Moore proposed an adjournment of the meeting, and the appointment of a committee to report to the adjourned meeting on the 17th of October on the sanitary state of the city, and, if possible, to devise a remedy. The motion was adopted, and a committee appointed.

#### THE BUILDING TRADES.

*Plymouth.*—In the early part of May the members of the Society of Amalgamated Masons working in this neighborhood struck in consequence of the refusal of the employers to accept a "code of rules" which the society had drawn up. There were, it is stated, only two rules in the code which could be said to be different from those already in force in the principal establishments. The first was, that the current rate of wages should be 4s. 6d. per diem, instead of 4s., the usual rate up to that time; the second, "that no employer should sub-let any work, or mason sub-contract with any employer." The strike of the masons involved, to a greater or less extent, a suspension of work in Government and other contracts. Upwards of 4,000 excavators, and perhaps, 1,500 artisans, in addition to those on a strike, were consequently discharged. After a struggle of eighteen weeks Messrs. Branson & Murray, the contractors for the north-eastern defences, extending from Egg Buckland to Saltash, and employing some 120 masons and 1,000 excavators, yielded, according to the allegations of the other contractors, to the demands of the masons. The other masters, believing further resistance useless after so important a defection, met the delegates from the Masons' Society, and drew up a set of rules, embodying the two for which the masons had contended. The masters, it is said, have nearly come to the conclusion that they are in the men's hands; that they must not take contracts which are likely to require more than twelve months to complete; and that they must endeavour so to arrange their work that the Government and the public must indemnify them for all future advances in wages, which they fear will be perhaps more rapid than hitherto. In the last five years they have been advanced 50 per cent. Curiously enough, the success of the Amalgamated Society of the Stonemasons is said to have given offence to the Society of Operative Wall Masons, who charge them with tyrannical conduct, and have themselves announced by public advertisement that they are ready to work for any employer without

reversing the code of rules. Where the wall masons in an establishment are sufficiently strong to do all the work, they continue; but where there are few they are ejected as "blacklegs" by the stonemasons. When about fifty of the "amalgamated" men went to work again at Staddon, they found there a mason named Carter, and another, on whose discharge they insisted. Two "blacklegs" were permitted to remain, on payment of 4l. each, entrance money, to the dominant association.

*Gloucester.*—The committee of the operative carpenters and joiners of Gloucester have addressed a temperately-written circular letter to their employers, asking for an advance after Monday, April 2nd, 1866, of 6d. per day, or 3s. per week, on the present rate of wages; and that their working hours be reduced and regulated to 57½ hours per week, and all overtime to be paid at the rate of eight hours per day.

*Norwich.*—The carpenters and joiners of this city have struck work for an increase in their wages of a halfpenny per hour. The men employed by the following builders, embracing a majority of the trade, turned out:—Messrs. Brown & Bailey, Murray, Hall, Spaul, Lacey, Barrell, Hood, Wales, Rogers, Gilbert, Borking, Aldous, Wagg, and Atkins. It was stated that the masters were, on the whole, disposed to give the advance, if the increase became general, but none were found disposed to make a beginning.

*Liverpool.*—At a recent meeting of the house carpenters and joiners, it was resolved:—"That we, the operative house carpenters and joiners of Liverpool and the vicinity, having taken into consideration the high price of provisions of all kinds, and that our wages are five shillings per week lower than other branches of the building trades, propose to memorialise our employers for an advance of sixpence per day, with six months' notice, such notice to expire on the first week in May, 1866."—"That we, having seen the ill effects of the working rules not being adhered to, respectfully submit that they be ratified by both employers and employed, so that they may become the custom of the town and vicinity, the said rules to be revised to the satisfaction of both employers and employed;"—and, "That we resolve into one grand fontine, to be composed of every house carpenter and joiner in Liverpool and vicinity who wishes for an advance of wages, the object of the said fontine to be to raise the necessary funds to meet the expenses that may be incurred in agitating for, and obtaining an advance of sixpence per day."—The Liverpool Masons' and Quarry Masters' Society have held their annual meeting for the confirmation of new rules, which were unanimously approved. Rule No. 3 says:—"That the special object of this society shall be to protect the members against the speculative builders of Liverpool and suburbs." Rule 22 says:—"In the event of a building being incomplete, owing to the non-payment for labour or material supplied, no member shall complete the work until all due demands are paid by the purchaser or land-owner."

#### MASONIC HALL, BIRMINGHAM.

The foundation stone of the new Masonic Hall and Club Buildings, in New-street, has been laid, by Lord Leigh, the Right Worshipful Provincial Grand Master, in the presence of a large concourse of brethren and ladies. In the early spring plans were submitted in competition for these buildings, and the designs sent in by Mr. Naden and Mr. Holmes were selected conjointly, and those gentlemen were directed to amalgamate the best parts of their designs, and together work out a complete building. But there was great difficulty in carrying out these instructions, and after several preliminary sketches had been made, Mr. Naden and Mr. Holmes mutually agreed upon terms to separate, Mr. Holmes, with the sanction of the Board of directors, retaining the appointment of architect to the company. The directors finally adopted the plans & designs of Mr. Holmes, arranged almost entirely as in his original competitive drawings—the position of the entrances, staircases, grand lodge-room, grand banquetting-hall, and kitchen offices being identical. The style of the buildings will be, in conformity with the instructions to architects, Classical, the exterior partaking of the Greek treatment, while the interior will be carried out in a manner somewhat more free in character. The erections will comprise, on the ground-floor, the grand entrance

in New-street, and shops similarly disposed to those in the Exchange-buildings, by the same architect, with living-rooms, &c., in the basement, and warehouses in Pinfold-street. The remainder of the basement and sub-basement will be occupied by vaults and cellars. On the mezzanine story will be the smaller lodge-rooms, each 28 ft. by 25 ft., with preparing-rooms, ante-rooms, regalia-rooms, lobbies, and muniment-rooms adjoining; and on the same floor the offices for secretary and the club smoking-room, ascending by a grand staircase. On the first-floor, over the smaller masonic rooms, will be the grand banqueting-hall, 71 ft. 6 in. by 40 ft. and 32 ft. high. This hall will have a panelled and ornamented covered ceiling, springing from an entablature carried by marble columns with carved Corinthian capitals. An orchestra will form a prominent feature in the design of the end of the room, and adjoining will be ante and retiring rooms. The portion of the building on the first, second, and third floors, facing New-street, will be set apart to the purposes of the club, with a separate staircase from the ground-floor. A prominent feature in these rooms will be an angle-projecting window. It would seem that Mr. Holmes was the only competitor who complied with the express instructions, as to this, of the directors, who saw the importance of not losing the view of New-street to be obtained by this means. The grand lodge-room, together with the other rooms necessary for the carrying on of the objects of the craft are to be on the third floor. The grand lodge-room will be similar in area to the grand banqueting-hall, but 4 ft. less in height, and will be lighted from the ceiling when required. The kitchens and servants' rooms will be placed at the top of the building, and lifts will communicate with the various landings and serving-rooms throughout. In addition, there are to be service-stairs and several bedrooms and closets in every available corner.

THE WORKMEN'S HALL, BIRKENHEAD.

The new hall recently opened in Clanghton, Birkenhead, by the Workmen's Hall Company (Limited), has been erected to provide club-rooms, reading-room, refectory, committee-rooms, keeper's residence, and a large hall for meetings, concerts, public dinners, tea parties, or other aggregate gatherings. The architect was Mr. James Fisher, of Birkenhead, who designed the Free Library. The club-house will provide every convenience, a news-room and library, and appliances for serving all sorts of refreshments, except wine, beer, or spirits. The building occupied a little under fourteen months in erection. The entrances and stairways are commodious and plentiful, and are calculated to prevent any danger in the event of a sudden crush. The contractor for the building was Mr. Thomas Lund, of Tranmere.

The material is brick and stone, no cement in imitation of stone being used.

The accommodation consists of a well-lighted and ventilated coffee-room and reading-room, 38½ ft. by 21 ft.; a smoking-room, which will be also used for chess, drafts, bagatelle, and other games, the same size; two club-rooms for ordinary meetings; one lecture-room, which is so arranged as to be used as a room for extraordinary club-meetings; lavatory, &c.; a bar or attendant's room, from which the whole of the working men's club will be served with their requirements; a spacious kitchen, with apparatus sufficient to cook a public dinner; with pantries, larders, &c., &c.; and apartments for the hall-keeper.

On the upper floor is a large room, intended for concerts, public meetings, lectures, *soirées*, and other entertainments, having seating room for 900 to 1,000 persons, spacious orchestra to accommodate about 100 artists, retiring-rooms and every convenience, with suitable approaches easy of ingress and egress. A lift is provided from the kitchen department to this room for public dinners, tea parties, and *soirées*.

The building has its principal front to Clanghton-road, with a side elevation to Kendal-street, and rises to a height of 60 ft. to the top of main cornice. The style adopted is Italian, being freely treated by the architect.

The ground-floor is entirely appropriated to the purposes of the Workmen's Hall or Club.

The contractor for the gas-fittings was Mr. Hinson, of Birkenhead, and for the internal fittings, Mr. Wright, of Tranmere. The total cost, exclusive of land, was about 3,850*l*.

THE ATLANTIC CABLE.

THE spirit-wire has reached a cave  
Two thousand fathoms deep,  
Beneath the dark Atlantic wave,  
Where Nature lies asleep.

Oh! that a rare, unearthly thing,  
That spoked with tongue of fire,  
To imitate the lightning's wing  
In speed along the wire!

The spirit-wire will speak again,  
In time and season due;  
And send its message 'neath the main,  
Laconical and true.

Hold on your way, brave engineers,  
Nor let your hands grow slack:  
Bold Britons seldom cherish fears,  
And never turn their back.

Though mountain-waves the moon assail,  
And hackett tempests roar,  
The spirit-wire will tell its tale  
Even to the farthest shore.

And friends who dwell in distant lands,  
Three thousand miles apart,  
Will feel as they were shaking hands,—  
Conversing, heart to heart.

J. RITCHIE.

MUNICH AND ENGLISH STAINED GLASS.

Sir,—On returning from a tour on the Continent last week, I fell in with a back number of your paper with a letter in it recommending the Munich glass as superior to the English. In the few following lines, I trust to overturn an assertion so erroneous. The Munich designers are certainly not men of the same artistic capacity as the best artists who occasionally design for stained glass in England. One firm in England is especially noticeable as possessing some of the greatest living artists as occasional designers. I never saw any Munich designs as fine as those I saw exhibited last spring by Mr. F. M. Brown. The Munich method is totally false.

In a glass painting you have to paint with glass, not upon it. The Munich people paint upon it, enamel it, as they would paint upon canvas.

Glass being transparent, it is wholly contrary to the material to cover it over with colour. The only natural way is to use glass already coloured (pot metal only), which, however, may be occasionally stained, such as white-yellow, blue-green. The only colour placed upon glass should be the black lines, to designate outline. This is the English and true manner.

Glass being transparent, it is impossible to render perspective perfectly. Therefore, the Munich principle of trying to get the same pictorial effect as in an oil-painting is absurd.

Stained glass must always seek its effect by colour, not by subject; and in old times they well understood this, and introduced chiefly figures standing alone, or very simple subjects.

The Munich colouring is cold, dazzling, and ugly in the extreme. For instance, they use a cold dazzling blue, very offensive. The old blues in Venetian paintings—and surely these are good colour—invariably have a tone of green in them, just like the Oriental blues of the present day, warm, not crude or hard. If there is one thing modern German art cannot do, it is to colour.

CHARLES FRASER.

THE ANTIQUITIES OF ROUEN.

The thirty-second session of the Scientific Congress of France—a nomad tribe, like our own British Association, going about yearly to consult upon all that can promote man's welfare,—took place lately in Rouen, the ancient capital of Normandy, rich in archaeological monuments of every stage of antiquity.

Archæology and history formed the subject of the fourth section, in which were read papers on "The Entrenched Roman Camps," "The Art, Laws, and Geography of the Gauls in the Time of Julius Cæsar," "The Religious and Military Art of the Thirteenth Century," "The History of Ceramic Art," "The Nationality of Juan of Are," &c. Here we must regret that no paper was presented upon a single monument of archaeological and architectural character in Rouen especially when most of them are in such

a dilapidated state that after next winter some will possibly disappear. How then renew them? Take, for example, La Croix de Pierre, a cluster of private houses of intense artistic merit, ready to fall; and if they do, what will probably become of the stained-glass window of Saint-Godard and Saint Patrice, in more shabby walling than the former? The Hôtel Bourthe-roude, the type and study of the Renaissance; also Saint-Maclou, are undergoing reparation; but it proceeds so slowly that the work of time has already made fearful inroads on the newly-scraped work. There are so many needing care,—the Cathedral, Saint-Maclou, Saint Ouen, Saint-Vincent, the Palais de Justice,—that the delay in repairing is not to be wondered at, as the cost would be enormous. Will not the State come forward? Yes, provided the inhabitants subscribe a certain quota. Rouen is a wealthy town, and much visited; it should not shrink before any expense that will be well laid out.

WATER FOR PARIS.

The great aqueduct has been constructed to supply the water of the river Dhuis to the new reservoirs lately completed on the heights of Menilmontant, in Paris.\* On the 11th inst., at 1-40 p.m., the waters were let into the basin, but some days must elapse (during which the conduits will receive their first cleaning) before the regular supply is distributed to the service-pipes of the town. The aqueduct takes its rise in the Commune of Parçny (Aisne), and traverses the departments of Aisne, Seine et Marne, Seine et Oise, and Seine, the length of its course being 84 miles, thus composed—Portions constructed in masonry, with regular inclinations of 1 in 10,000, in length 74 miles; siphons or forced conduits of cast-iron, crossing the valleys, with a fall of 3'8 in. per mile, 10 miles. About 6 miles of the aqueduct in masonry have been executed in tunnel, the principal ones being those of Montmartré, Montretout, Montceaux, and Quincy, which are from 700 to 2,200 yards long. The principal siphons are those of Petit Morin, Grand Morin, the Marne, and Villemonble, which are from 1,100 to 4,900 yards in length, with from 180 to 210 ft. of Sagitta. The works were commenced on 20th of June, 1843, and the first water introduced for trial, on 2nd August last. The total cost is 640,000*l*., including the purchase of land and factories.

HEATING HOT-HOUSES.

M. LAURENTIN, the celebrated horticulturist, of Leipsic, has invented a species of thermo-siphon or hot-water conduit, for hot-houses, which can be obtained at a price within the reach of all classes of cultivators. The pipes, instead of being constructed of wrought-iron, as is usually the case, are of pottery ware, and are thus described by the *Journal de la Société Impériale et Centrale d'Horticulture*. The boiler of this thermo-siphon is of wrought-iron, cylindrical in form, and 6 ft. 7 in. long by 33 in. diameter. It has three boiler tubes or flues, 8 in. diameter, through which the flame and hot air pass. Each section of the earthenware water-tubes is 3 ft. 3 in. long, 6 in. external diameter, and of inch-thick pottery. One of its extremities is enlarged into a sort of neck, 12½ in. diameter, while the other end is fitted with a thread or screw, to better retain the cement which serves to form a hermetically-sealed joint. This joint is made with tow and a lute consisting of cement and soft cheese damped with whey. The tow is well soaked with this mixture, and then wound round the threaded end of the tube, which is introduced into the larger end of the next tube, and well secured into it. A layer of cement completes the joint, the luting becoming after a short time so hard that it is impossible to separate the pieces of tubing. This mastic can also be prepared by mingling six parts of graphite or common black lead, three of quick lime, eight of sulphate of barytes (heavy spar), and three parts of linseed oil varnish. Though the price of these earthenware tubes is only 1*s*. 1*d*. to 1*s*. 5½*d*. per lineal yard, yet, owing to the fragility of pottery, and the consequences resulting from a fracture that may occur, it may be found that cast-iron hot-water tubes are better suited for the heating of conservatories.

\* For description of these basins see *Builder*, Nov. 19, 1864, p. 815.

## FROM SCOTLAND.

*Edinburgh.*—At a recent meeting of the city council, a letter was read from the council of the Society of Antiquaries of Scotland, respecting the restoration of the ancient shaft of the City Cross, presented to the city by Mr. Mitchell, of Stow. The site proposed was the vacant piece of ground within the walls to the east of the great entrance to St. Giles' Church. The expense of transferring the shaft from the grounds of Drum, and placing it on a plinth, with large brown freestone steps, in the style of other market crosses, would not exceed £60, or £50. The lord provost's committee recommended that the council approve of the erection of the cross on the place proposed, and contribute one-half of the expense—the work being done at the sight and to the satisfaction of the city architect. This was agreed to.—A large space of ground known as Orchardfield, adjoining the Lothian-road, which belonged to the late Mr. Grindlay, and was bequeathed by him for behoof of several of the city hospitals, has within the past few years been fenced and built upon to a considerable extent; and at present building operations are in progress on several parts of it. Mr. David McGibbon, architect, was appointed by the trustees of Mr. Grindlay to lay off the ground in fees; and under his superintendence the fees already let have been or are being built upon, and already a great and important addition has been made to the house accommodation of the western district of the city.—The new peal of bells for the city has arrived from Sheffield. The black-washed steel octave was safely deposited on planks in the cathedral lobby, preparatory to being elevated to the mitre-crowned steeple of St. Giles'. The bells are of different sizes, weighing from about 5 cwt. to 15 cwt. amounting in the aggregate to a gross weight of about 4 tons. They are circled on the kettle and lips with the name of the casting firm, and some of them bear date 1853, and floriated scroll. The bells will be hoisted up by the grate-fenced apex of the groined arch through the timber-laced galleries by a clear riseway, where they will be fixed to a solid beam, upon which there will be no swing strain, the music being struck out by isolated hammers. It has been suggested that the first merry peal should be rung on the return of the old market-cross shaft from Drum.

*Glasgow.*—The foundation-stone of a new clubhouse for working men has been laid at Bridgetown. Sir Archibald Alison was a prominent figure at the head of the procession, wearing all his masonic badges of high office. At the conclusion of the ceremony he addressed the brethren. He said the reason why the efforts made on behalf of education had not hitherto been attended with the success expected was, that the people who directed the educational schemes considered man as an intellectual being only; whereas, to carry the mass along with them, they must address the moral being also, interest the heart, and do all to attract men to those places where learning was to be obtained. He trusted the working classes of the district would support the club-house well, shunning the ale-house, spirit-cellar, and all places where corrupt indulgences might be encouraged.

## EDINBURGH NEW CITY POORHOUSE.

The Parochial Board of the City of Edinburgh having found the present poorhouse inadequate to meet the requirements of the parish, and that, from the nature of the site, it was impossible to obtain the requisite accommodation by adding to it, were forced to look out for ground on which to erect an entirely new building. It was thought advisable the new building should be placed outside the city, and the Board have purchased the small estate of Craiglockhart, situated about two miles to the south-west of the city. The estate consists of nearly 250 acres of arable land, one-third of which it is proposed to devote to the purposes of the Board, the remainder to be disposed of for villa residences. The portion set apart for the poorhouse is isolated from the remainder of the estate by a range of low hills, on the southern slope of which it is proposed to erect the new buildings.

In order to obtain the best design for this purpose, the Board advertised for plans, offering four premiums of £500, £100, £50, and £20, and in answer to the advertisement, twenty-two sets of plans have been sent in, which have been exhibited in the Corn Exchange.

The requirements of the Board were, that accommodation should be provided for 1,200 inmates, and that a mode of classification should be adopted providing separate departments for the old and young of both sexes, regard being had to the character of the paupers. Small cottages to be set apart for married couples of good character; a suitable hospital for the sick, and an asylum for the insane. The building to be of stone, plain and substantial in character; the cost not to exceed 40,000.

Many of the competitors do not limit their estimates to the sum set down by the Board, and several of the designs are of an ornate character, but none of them display much artistic merit. Some of the plans, however, show much thought and ingenuity, and there are examples of almost every mode of arrangement. In some of them the different buildings are quite isolated; in others they are formed into quadrangles; a few adopt the pavilion system, one is on the village system, and one on the radiating principle.

Open competitions of this nature are apt to startle one from his preconceived ideas. It is an undoubted fact that we have made a great advance in taste within the last twenty years, and a large section of the educated public have acquired a knowledge and appreciation of what is just and true in architecture; and yet we find men, professing to be architects, who have not participated in this improvement, and who seem entirely ignorant of the change. These remarks are suggested by the elevations in one of the designs, with the motto "Economy," which show a building in the mock castellated style of last century, studded over with numerous small pepper-hox turrets, which are as far from being beautiful as they are from being economical.

## PROVINCIAL NEWS.

*Folkestone.*—Workmen have been engaged in driving piles, at high-water mark, on the beach, near the toll-gate, on the Lower Sandgate-road, from which place to Folkestone a broad sea-wall and esplanade, large enough to build marine residences upon, is about to be constructed by Lord Radnor. There is every probability that this will give an impetus to building operations along this road, as there are numbers of sheltered nooks under the cliffs where pretty villas could be erected.

*Leisford.*—The new cattle market has been opened. The sheep-pens are iron-fenced and asphalted, and capable of giving accommodation to from 1,000 to 1,200 animals. The office is a neat building, fitted up with desks, the floor being constructed of wooden blocks. The paths leading to the sheep-pens are of granite, and the space for the cattle gravelled, and the whole drained. At fairs or other times, if more space should be required for cattle, the gates in the fence at the south-western side will be thrown open, and the adjoining ground made available. There are also sheds for stock. The works are not quite completed.

*Oxford.*—The completion of the extensive alterations in the Hall of New College, which have been for some time in progress, will be celebrated on the 26th of October, by a grand banquet, to which the Lord Chancellor Cranworth, the Chancellor of the Exchequer, the Colonial Secretary, and other distinguished persons, numbering between 200 and 300 have been invited.

*Birkenhead.*—The graving docks have sustained some injury from the prevalence of fresh-water springs, which have been undermining one of the piers. At a recent meeting of the Mersey Dock Board, it was stated that the pier was in some danger of falling, and that the repairs would cost about 800.

## SHILLING COURT GUIDE.

THOUSANDS of your readers are probably unaware that there is a map of London, on the scale of 5 ft. to the mile, which is published in sheets of about 3 ft. by 2 ft., and at a shilling per sheet. It can be had at any map-seller's; and I have found it most useful in looking up certain insanitary districts to which my attention has been drawn by yourself and other good-doers, into which districts I should not have ventured to penetrate without some clue to their labyrinth. One sheet, or any number, can be had. This is old news to you, but I was quite unaware of the existence of the map till a month ago. Every court is shown clearly. W.

## COMMUNICATION BETWEEN PASSENGERS AND RAILWAY GUARDS.

OUR attention has been called to an invention of Mr. R. F. D. Campbell's now represented at the Anglo-French Exhibition in the Crystal Palace at Sydenham. The object is to inform the guard and engine-driver of accident immediately such may occur; such as carriage off the lines, fire, coupling broken, carriage oscillating dangerously, &c. The apparatus is self-acting, without requiring any interference from a passenger, intelligence being given with certainty even though a carriage be empty. The principle of this invention, as described to us, is, that two  $\frac{1}{2}$  in. or  $\frac{3}{4}$  in. tubes are fixed to each carriage, the ends of which tubes are so arranged as to connect of themselves without any trouble, by the mere pushing of the carriages together, and to disconnect by their simply coming away from each other. When a train of carriages thus fitted is formed, with the addition of the guard's van and engine, two air-tight tubes run the whole length of the train. Upon a train starting a fan upon the engine will commence working, drawing the air up tube 1 and blowing it down tube 2, with a speed of at least double that of the train. Now, if a ball placed in each tube it would be carried one to the guard's van, one to the engine; and by the particular shape of the ends of these tubes, when the ball arrives it would cause the air to sound as a whistle to call attention to its arrival. To each carriage the inventor proposes to fix five differently coloured balls (having the number of the carriage to which they belong marked on them) representing five signals such as those already referred to. Passengers could have a similarly arranged signal to tell of what would only be their own wants.

A new railway safety signal has been patented by Mr. John Anderson, assistant general manager of the Edinburgh and Glasgow line. This invention is not intended to supersede the ordinary fixed signals now in use, but to be wrought in connexion with them, appealing to the eye instead of the ear in all cases where "caution" or "danger" is indicated. The danger-signal presently in use, it is well known, is worked by means of a chain or wire passing along on pulleys from the station to the signal post, and Mr. Anderson proposes to extend this chain to (say) 600 yards, or any distance desired, beyond the ordinary terminal point, having at its extremity an arched piece of wood which may be fixed either inside or outside the rails. When the danger-signal on the line is at rest, this piece of wood remains in such a position that it is not interfered with by a passing train, but immediately the signal is put on "danger" at the station, the arch is so moved that it must be acted upon by the up-coming train. The arch is passed over by a lever arm depending from the front of the engine, guard-van, or tender, and a gong-hell is set in motion, the action of which may be prolonged for any length of time, and may also be arranged so as to register the fact that an alarm has been given.

## THE LONDON (CITY) BATHS AND DWELLINGS.

SIR.—With respect to your able article upon the above establishment, permit me to state that the rear or chapel portion of the buildings, with the arched doors, light iron railing, &c., were not designed by me, the arrangement of the lantern being the only branch of this portion of the establishment upon which I was consulted. The principal or front buildings have been erected by the principal proprietor, who is his own builder, with a view to obtain the greatest possible accommodation at the least cost, and to effect this he has adopted the principle of purchasing his materials and fittings immediately from the merchant or manufacturer, and of having the work executed by workmen employed upon the premises under his own superintendence, assisted by his foremen.

This anxiety on the score of economy has led to his departing from the more expensive modes of construction, as in the case of the divisions to the private baths, which, as well as the floors, were designed by me, and

with regard to the lightness of the roof (I refer to that over the front buildings), as you are aware, the swimming baths occupy the basement portion, and the introduction of intermediate supports would therefore have been objectionable; as a consequence, the several tiers of floors could only be carried upon the massive external walls and girders; and, to avoid weighting these to a greater extent than was absolutely necessary, the lightest kind of roof consistent with durability, was decided upon.

I beg to add that no estimate was at any time made, by my knowledge, of the probable cost of the establishment; but the benevolent proprietor, anxious to extend his benefits to the greatest number, has provided accommodation and extended the buildings to a magnitude far beyond that originally contemplated by him.

CHAS. MARTIN.

## CHURCH-BUILDING NEWS.

**Writtle (Essex).**—A meeting of the parishioners of Writtle, convened by the vicar and churchwardens, has been held to consider what steps should be taken for the repair and restoration of the parish church, which is at present in a sadly dilapidated state. The edifice was examined in April, 1864, by a local surveyor: it was reported to be unsafe, and, therefore, unfit for public worship. The churchwardens, acting under professional advice, at once took steps to make the building secure, with the least possible interruption of the usual services; and by so doing they incurred an outlay of 120*l*. A further expenditure of 80*l*. was necessary to replace the two cracked pillars at the north-west end of the nave, so that the total sum for which the churchwardens are liable amounts to 200*l*., to which must be added 30*l*. incurred for a survey of the church by Mr. Stock. There are no funds to meet this liability. The vicar and churchwardens urged strongly on the parishioners the need which exists for a thorough restoration of the building, and appropriate resolutions for the opening of a subscription, appointment of a committee, &c., were passed.

**Wolverhampton.**—The restoration of the collegiate church has been completed. Both exterior and interior of the edifice have been repaired and restored, as far as circumstances permitted, to their former and appearance at the time of their construction. The transepts or chapels have been renovated, and various unsightly incumbrances removed; the chancel has been rebuilt in a style according with that of the church, and is already adorned with eight painted windows.

**Burntwood (Wolverhampton).**—The new church of St. Ann's, Burntwood, has been consecrated. The edifice, with schools adjoining, has been erected and endowed by the Cannock Chase Colliery Company, at a cost of 3,000*l*., for the free use for ever of the adjacent population. The church, consisting of nave, aisles, and chancel, is built mainly of bricks of various colours, moulded for the windows and doorways and other openings. Very little stone is used, it being mainly confined to the capitals of the interior columns. Mr. E. Adams, of Westminster, was the architect. The building is in the Byzantine style. Mr. Highway, of Walsall, executed the work. The arches of the nave are formed with red and blue moulded bricks. The floor of the chancel is laid with Minton's tiles, the communion enclosure being of stone inlaid with alabaster. The font is of Caen stone inlaid with alabaster. Gas is laid with ornamental fittings. The organ, an instrument of considerable power, consisting of 886 pipes, was built by Mr. Joseph Walker, of London. It was the gift of Mr. McClean, the managing director of the company.

**Leeds.**—The church of St. John the Evangelist, newly erected in this place, has been consecrated by the Bishop of the diocese. The Coalbrookdale Company, in conjunction with Lord Forester, gave the site, and made donations to the building and endowment fund. The building is in the First Pointed style, and the seats will accommodate 302 persons. Every seat is free and unappropriated. The church was built by Messrs. Nevett, Brothers, of Ironbridge, from designs by Mr. John Ladds, of Lincoln's-inn-fields, architect.

**Chester.**—The proceedings in connexion with the intended rebuilding of Trinity Church are proceeding. The old walls and the tower are nearly down, and the foundations of the new north wall are level with the ground. The new church will consist of a nave, with north and south aisles, and will be thrown back from Watergate-street the depth of the present tower. This, however, will remain on its present foundations, and be connected by an iron railing with a vestry at the east corner of the south aisle. The cost of the tower and spire (some 1,600*l*.) will be defrayed solely by Mr. Charles T. W. Parry, as a memorial of the late Mrs. Parry. Exclusive of this the funds already promised amount to about 5,300*l*., which is within 200*l*. of the sum now contracted for, namely, 5,500*l*. This does not include the cost of lighting, warming, or of the internal fittings, for which 2,000*l*. more will be required.

**Burke (Yorkshire).**—The foundation-stone of a new church, in the Northern French style of architecture, has been laid at Marske by the Earl of Zetland. The church has been erected in consequence of the growing population attracted by iron mining, and owing to the old church of St. Germain's being too small, and at

too great a distance from the village. The new church will, when finished, contain sittings, free and open throughout, for 435 adults and 116 children. The Earl of Zetland has given the site, which is opposite the Literary Institute on the Redcar-road, and in a very central situation. His lordship also gives the stone for the building, a donation of 2,000*l*., and promises further help if needed. The architect is Mr. T. P. Cockerell, of London.

**Denton Holme (Carlisle).**—The chief stone of the Church of St. James, Denton Holme, has been laid by the Countess of Waldegrave, stepmother of the Bishop of Carlisle. The district embraces the whole of that extensive and now populous suburb of the town lying to the west of the River Caldew, which was opened out by the erection of the Nelson Bridge in 1852. The result of a competition was the selection of the designs of Messrs. Andrew & Pepper, of Bradford, architects, and tenders for the work having been called for, Mr. Dodd was selected to do the stone-work, and Mr. Davidson the joiner-work. The entire cost of the building will, it is believed, be about 3,500*l*., of which upwards of 2,000*l*. have been subscribed. The site is on a gentle eminence, formerly known by the names of "Seven Wells Bank," lying between the Cemetery and Murrell Hill House, and access to it has been obtained by two new streets, which have been formed by the Ecclesiastical Commissioners—one running from Norfolk-street to Dalston-road, and the other from Nelson-street to intersect it. On the angle formed by this intersection the church will be placed,—a spot already rendered interesting from the fact that there once stood a chapel dedicated to St. Bode, of which, however, no traces are now to be found. The church is to be in the Geometric style, and will be built of red and white stone. All the tracery and moulded work will be of white stone from Howrigg Quarries. The total length of the building, that is, from east to west, including the chancel, is 112 ft.; the width, including the aisles, 58 ft. At the south-west corner there is a round and spire rising to a height of 120 ft. One of the chief entrances to the church will be by a richly-moulded doorway through the tower. The tower is 54 ft. 6 in. high, and it is relieved by two windows on each side, filled with tracery and moulded work. The spire is of octagonal form, with pinnacles at each corner of the tower. The four other sides of the octagon have projecting windows also filled with tracery. The rest of the spire is relieved by white hands of stone. Adjoining the tower at this end is a large light window filled with Geometric tracery. The apex to this end of the building is finished with a carved stone cross. On the north side there are four two-light windows filled with tracery, and relieved by mouldings, finishing on carved bosses. On this side there is also another entrance by a porch projecting from the main building, the apex of which is formed with a stone cross, and at the north-east corner there is an entrance to the vestry. The walls are all relieved by buttresses. The chief feature in the east end are the circular chancel with three windows, and the windows for the vestry and chorister vestry. The south elevation is similar to the north, but has the tower at the south-west corner. The roof of the chancel will have an ornamental ridge. The height of the church from the floor to the top of the ridge is about 50 ft.

## DISSENTING CHURCH-BUILDING NEWS.

**Sevenoaks (Kent).**—The foundation stone of a new Congregational Chapel has been laid here. The new chapel is situated in the centre of a very populous district, the site being the corner of the National Freehold Land Society's estate, which, together with an adjoining estate, is now being rapidly covered with dwellings, and public roads pass it in every direction. The edifice is to be of Kentish rag stone, which will be dug from the quarries on the Knole estate, and all the interior fittings are to be of stained deal. There will be 450 sittings, and provision will be made for the erection of galleries at some future time, if necessary. The spire or tower will be 130 ft. high, and it is in contemplation to place in it an illuminated clock. The contract was taken by Mr. Potter, builder, of this place, the sum being 2,450*l*.; but the total cost, inclusive of the purchase of the land, will exceed 3,000*l*.

**Worcester.**—The new Wesleyan Chapel in St. Peter-street has been opened. It is built by voluntary contributions for the use of the

Conference Wesleyans, whose old chapel in Parchment-street had become unsuited to their religious and educational requirements. The site chosen is upon the east side of the street, on ground formerly occupied by the Convent of Benedictine Ladies (now removed to a more convenient spot in Essex), and nearly opposite the Roman Catholic Church of St. Peter. The architect was Mr. Pocock, of Guildford and London, who not only gave his services, but also subscribed liberally to the building-fund. The style adopted is Early English, treated in a rather continental manner. The building consists of two portions. The basement is occupied by large school-rooms, class-rooms, and offices. The chapel is approached from the road by a flight of steps, the entrance to the edifice being through two advanced porches. Above these are a wheel window and three other lights. The wall-work is done in stone and flints, the same materials being used externally throughout. The chapel is lighted on the north and south by six windows on either side. The east end is minus any light, being occupied by the pulpit. The south-east corner is reserved for a barmonium and choir, the opposite one giving access to the basement. The woodwork is all stained and varnished. The roof is partly open and partly ceiled, there being wooden supports to it from the chapel floor, which are somewhat detrimental in an architectural point of view, but they are, it seems, intended to provide, if necessary hereafter, for gallery accommodation. The chapel stands east and west. The edifice will, with the land, cost about 2,000*l*., of which 1,700*l*. have been obtained by subscriptions, including 300*l*. from the Conference Building Committee. The contractors were Messrs. H. Newman & Son.

**Swindon.**—The building committee of the new Congregational or Independent church in the course of erection here, we are informed, accepted the estimate of Mr. Bedford Ponton, but recommended that Mr. John Phillips should do a portion of the work if arrangements could thus be made, the estimates being so nearly equal. It was then arranged between the two tenderers to sign a joint contract, which was accordingly done, Mr. Phillips doing the carpenters' and joiners' work.

**Devonport.**—A special harvest thanksgiving service has taken place in St. John's Chapel, in celebration of the opening of the new eastern windows. Since the appointment of the Rev. Mr. Everett to the incumbency of this place of worship, there have been several improvements effected in its internal arrangements. A new organ has been erected at a cost of 400*l*. A new pulpit has also been erected from the design of Mr. Alfred Norman, architect, of Devonport. The new windows are of stained glass. The next step by the proprietors in the way of alteration or improvement will be the lowering of the seats and the formation of a choir. Some few years since it was mooted to have a set of bells for this chapel; but on the strength of the tower being tested it was found to be constructed far too weak, and in other respects ill-adapted for their reception.

**Blackburn.**—We understand that the contract for the erection of St. George's new Presbyterian Church, the foundation stone of which was laid in March last, on a plot of land in Preston New-road, has been let to Mr. Benjamin Abbott, contractor, Blackburn. The chapel will be constructed from designs by Mr. Patterson, architect, of this town, and will cost about 7,000*l*.

**Salburn-by-the-Sea.**—The new Wesleyan chapel here has been opened. The edifice, which is in Milton-street, is in the Early English style, the designer being Mr. Peachey, of Darlington, and it is estimated to seat 300, with provision for the erection of galleries, when needed, to accommodate an additional 200.

**Horssea (Yorkshire).**—The new Primitive Methodist chapel, which occupies one of the best situations in the town, has just been opened. It contains sittings for 360 persons, and is built of red bricks and Roche Abbey stone dressings, with a frontage to the main street of 45 ft. enclosed with iron palisading. The external dimensions of the chapel are 33 ft. by 48 ft. It is galleried on three sides. There is a platform instead of a pulpit, with preacher's vestry and organ gallery behind. The whole of the basement is occupied with school and class-rooms, with the usual out-offices in the rear. The pews and fittings are of red deal stained and varnished. The architect was Mr. J. Wright, of Hull, and the builders were Mr. F. Reynard and Mr. W. Allman, of Horssea. The total cost, including site and boundary walls, will be about 1,100*l*.

## STAINED GLASS.

*Memorial Church, Eype, Symondsburg (Dorset).*—The great chancel window has four lights, with three quatrefoil openings in the upper tracery. This is what is termed the "Mercy Window;" and at the bottom is an inscription stating that it is "In memory of the Rev. Gregory Raymond," to whom the church is dedicated. In the two centre lights are compositions, representing our Lord as the Good Shepherd, and the miracle of feeding the five thousand. Above the figures there are canopies. The side-lights are so arranged as to display four subjects, all connected with the same parable. In the tracery are represented the "Nativity," the "Circumcision," and the "Ascension." There is likewise a three-light window in the south-west of the chancel, which is from a design by the rector. In the centre compartment is represented our Lord as the True Vine, with the bread and wine in each hand; and in the side-lights are a sower and a vine-dresser, symbolical of the elements of the Sacrament which the Saviour instituted. In the tracery is the crest of the rector, with his arms, and those of the see of Salisbury. Adjoining this, on the south side of the sacristy, is a two-light window, representing in one compartment his charge to St. Peter, "Feed my sheep," and his miraculous release from prison. Above these are the arms of the late rector. Opposite, on the north, is a window of similar architectural features, the stained glass in which delineates the call of St. Peter. The whole of the chancel windows are thus filled with stained glass, which has been contributed by various persons. The whole of the work has been carried out, under the superintendence of Mr. Talbot Bury, by Messrs. Heaton, Butler, & Bayne.

*St. Paul's Church, Walsall.*—A large triplet window has been erected in this church, in memory of the late Mr. Darwall. The ornamentation of the glass is in the Romanesque style, in harmony with the architecture of the structure. In the dexter compartment is a representation of the Raising of Lazarus; and in the sinister is Christ raising the Widow's Son. In the central light is an angel seated on the side of the sepulchre, announcing to the two Marys that Christ has risen. In the upper portions of the dexter and sinister lights angels are introduced; and in the top of the central light are angels bearing musical instruments, surrounding a harp intertwined with a cross, emblematic of the musical acquirements of Mr. Darwall. The artists were Messrs. Ballantine & Son, of Edinburgh.

*Sutton Coldfield Church.*—A memorial window has just been placed in this church by the Rev. Mr. Bedford to his son, Arthur Edward Kiland Bedford. The illustration is our Saviour blessing a child, whom he carries in his arms. The artists are Messrs. Ballantine & Son.

*Altham Church.*—There has been lately placed in this church a stained glass memorial window in three compartments. In the first, our Saviour is addressing St. Peter and St. Andrew, who are both in a ship, with their nets, &c., about them, in those memorable words, "Follow me, and I will make you fishers of men." In the second, the Saviour, with lambs at His feet, presses a duty upon His disciples in these words, "Feed my lambs." In the third, the Saviour, surrounded by persons representing the inhabitants of Europe, Asia, Africa, and America, in their national colours and costumes, proclaims these words, "Preach the Gospel to every creature." The work was executed by Mr. Wailes, of Newcastle-on-Tyne.

*Trinity Church, Stratford-on-Avon.*—The four lower compartments of the south side chancel window of Holy Trinity Church, Stratford-on-Avon, have been filled with stained glass, illustrating the raising of Lazarus, taken from the 11th chapter of St. John. In the first opening, left-hand side, are the figures of St. John and St. Peter; in the next, our Saviour, with female attendant; adjoining light, Martha and Lazarus; and outside right-hand opening, Mary and two of the Jews. Above the figures are Perpendicular canopies, with ruby backgrounds. The glass was designed and executed by Mr. William Holland, of Warwick.

*Whitworth Church.*—A stained window has been erected in the parish church of Whitworth, near Rochdale, by Mrs. Rawstron, as a thank-offering for the restoration of health to her son. The window, which is Perpendicular in style, is divided by a transome, into three upper and lower compartments. The upper lights are filled

with ornamental garries, bearing the sacred monogram, and the emblematic rose and lily, and have a coloured border of a character in keeping with the style of the window. The entire of the three lower compartments is occupied by a subject, "Christ blessing little Children," having a rich background, and enclosed by tabernacle work. The window was executed by Messrs. R. B. Edmundson & Son, of Manchester.

## ROMAN CATHOLIC CHURCH-BUILDING NEWS.

*Hampton-on-the-Hill.*—Lord Dornier has just caused a life-sized figure of our Saviour on the cross, when yielding up his last breath, to be placed at the entrance to the Roman Catholic church in this village. It is painted in oil on a metal ground, by Mr. T. Dury, of Warwick.

*Wantage.*—The Roman Catholic Church of St. Mary, East Hendred, Berks, founded by Mr. C. J. Eyston, has been consecrated. The style of the building is English of the close of the thirteenth century. It consists of a chancel and sacristy, nave, and north aisle, and an octagonal belfry. The stained-glass was provided by Messrs. Hardman & Co. The church was built by Mr. Davidson, and the sculpture was done by Mr. Boulton, of Worcester. The whole was executed from the designs and under the superintendence of Mr. Charles A. Buckler, of Oxford, architect.

*Hastings.*—The first stone of the Church of St. Thomas of Canterbury, at Hastings, has been laid. The designs have been prepared by Mr. C. A. Buckler.

*Ashford.*—A new church at Barrow-hill has been opened. It is of the Gothic style and cruciform shape. The length of the building, when the chancel is finished, will be over 70 ft., the width of the nave 23 ft., and the transept 60 ft.

*Middlewich (Cheshire).*—A chapel has been opened lately here. It is very simple and plain, having been restored and built out of old materials. The building measures internally 30 ft. by 22 ft. A small chancel and vestry are placed at the east end. The architect was Mr. Edmund Kirby, of Liverpool.

## THE GRINDING-MONEY QUESTION.

At the City Sheriff's Court, on Wednesday, the 27th ult., before Mr. Gibbons, the Deputy, and the case of Thompson v. Jackson & Shaw, extensive building contractors, carrying out some large works in Clement's-lane, occupied the court for some time, plaintiff, a labourer, seeking to recover grinding-money under novel circumstances. Plaintiff, in opening his case, stated that he stood forward as one of a body of men to enforce a right, which had been previously agreed, and which he had had been discharged from his work by the defendants, and they refused to pay him the customary grinding-money. He was now at work at Messrs. Cubitt's, where the system was recognised, and plaintiff could not get twenty years' experience. In the present case plaintiff had worked up to the Friday night, but was too ill to resume his employment on the Saturday, and when he went on the Monday he found his place was filled up. His wages were paid, but the grinding-money was refused. Defendant's representative said he did not attend to dispute the principle of grinding-money as a rule. If the workman was discharged he was paid for setting his tools in order; but if he discharged himself he was not. Now plaintiff absented himself on the Saturday, and as defendants were under a contract to open a bank, in course of erection by them, by a certain day (and in default there was a penalty attached to the agreement), they were obliged to fill up his place. Plaintiff said he was not out all day on Saturday, but was confined to his bed with a severe cold. He did not know that defendants were under a contract to complete their works by a certain day. Defendant's representative informed the Court that all the men must have known it, as they worked till a late hour, and plaintiff with many others made "in times" eight days last week. Plaintiff urged that he was not bound to go to work if he was ill. He came from a body of men, the judge did not wish plaintiff to repeat the observation, as it was only calculated to prejudice his case. In fact, his Honour did not like cases in which men combined to fight or tyrannise over their masters. He considered that it was the duty of the man to give his master notice when he was ill; and if he did not do so he must take the consequences. It appeared in this case that the plaintiff was away on Saturday, and sent no intimation to his employers of the cause of his absence. They did what they were clearly entitled to do, filled up his place, and then the question of grinding-money arose. The judge was of opinion that if the man were discharged in the ordinary course he would be entitled to grinding-money; but if he absented himself from his work, and did not give his employer any reason for such absence, then he discharged himself, and could not claim the money. Plaintiff inquired if his Honour thought that a man was bound to send his master notice of his illness. The judge considered that he was. When contractors undertake large building works they make certain terms, and there was a time fixed for their completion, penalties being also fixed for every day over such time. Thus it was clear the workman was bound to give his employer such information as would preclude all failure of the contract; and if the workman was taken ill, he was bound to inform his master. Plaintiff must be consulted.

## Books Received.

"On Water-supply to Villages and Farms." By J. Bailey Denton, Mem. Inst. C.E. Chapman & Hall, London. The object of this essay is to show in what way rural districts may be supplied by the application of surface and drainage waters as they flow, or by the storage of those waters. Mr. Denton urges that the inhabitants of our villages and the stock of our fields ought not to remain dependent for their summer supply upon rain falling in the summer, though it may often providentially happen that the rain is so heavy and frequent during the summer months, as to allow of its being collected in sufficient quantity for present uses in ponds, tanks, huts, and other receptacles. The author is of opinion that there are few villages in which some adequate means of obtaining such a water-famine as that of the summer just past do not exist. Wherever, on this occasion, stock had a plentiful supply in the fields, the driest pastures became the heartiest feeding grounds, and cattle and sheep alike thrived well in spite of the apparent dearth of food. Mr. Denton's remarks, calculations, and suggestions are of practical and special importance at the present time.—"London Society" for the current month has a more than usually good shilling's worth of illustrations, by James Godwin, L. C. Henley, Edith Dunn, "Egomet," Brunton, and others.—Mr. Murray has published a pamphlet by Professor Kerr "On Ancient Lights and the Evidence of Surveyors thereon," which will have early attention at our hands. It includes tables for the measurement of obstructions.—"The Popular Science Review for October." Hardwicke. The present number of this excellent periodical contains interesting papers on "Epidemics past and present,—their Origin and Distribution;" on "Pure Water," by Dr. E. Lankester, F.R.S.; on "Atlantic Telegraphy," by Mr. Robert Hunt, F.R.S.; on "Lake Basins," by Professor Ansted; on "The Moon," by Mr. James Breen, F.R.A.S.; and on "Photography and some of its Applications," by the Editor, Dr. Lawson; with various others, besides the usual reviews and scientific summary.—"A Dictionary of Science, Literature, and Art." Edited by W. T. Brande, D.C.L., and the Rev. George W. Cox, M.A. London: Longmans & Co. The 6th part of the present issue of this standard work runs from "Learn" to "Lath." Brande's "Dictionary of Science" has long held a high place in the public estimation. The present edition has been re-edited throughout. Dr. Brande himself presides over its general chemistry and physics; the joint editor principally devotes himself to architecture and general literature; Professor Owen treats of the biological sciences; Dr. Lindley of botany; and so on.—A new series of the *Quarter* magazine (Casell, Potter, & Galpin) is now being issued on fine-toned paper. This is a fair example, as others of Casell's publications are, of what may be had for a penny, both in the way of literature and of engraved illustration. We may take this opportunity also of alluding to another periodical of the same publishers, the *Scientific Review and Journal of the Inventors' Institute*. The number for 1st October contains a useful paper on "The Cholera and its Sanitary Teachings," by Professor M'Cauley.

## Miscellaneous.

UNIVERSITY COLLEGE, LONDON.—The introductory lecture of the season will be delivered on the 9th inst., by Professor Hayer Lewis, F.R.S.; subject,—"The Fine Arts and their Connexion with Education."

NEW PIER FOR CAPE CLEAR.—Miss Burdett Coutts has signified her intention of subscribing 2,000l. towards the erection of a pier at Cape Clear, or in its neighbourhood, for the accommodation of the local fishermen, and of the seafaring interest in general.

MONUMENT TO THE PRINCE OF ORANGE.—A monument has been erected on the seaside at Scheveningen, in commemoration of the day when the Prince of Orange, afterwards George I., King of the Netherlands, returned from England. The monument is in the form of a pedestal, and bears the following inscription:—"God has saved the Netherlands, November 30, 1613: the nation is grateful: August 24, 1865."

**DULWICH.**—A new hotel has been erected near Dulwich Station. The builder, Mr. F. H. Green, entertained his men with supper on the completion of his contract.

**DARLEY DALE STONE.**—With reference to our remark in "Out and About" as to Mr. Whitworth's quarry, we are asked to mention that Darley Dale stone is still obtainable from the Darley Dale Stone Company, who have a quarry in full operation.

**RESTORATION OF STOW CHURCH.**—As a memorial of the late incumbent, the Rev. G. Atkinson, it has been resolved to endeavour to raise a sum of money for the restoration of Stow Church, and also for some more specific object in memory of Mr. Atkinson. A committee has been appointed to carry out the views of a meeting lately held on the subject.

**GUSTAVE DORÉ'S ILLUSTRATED BRIEF,** upon which he has been engaged for the last four years, is now on the eve of completion. Messrs. Cassell, Petter, & Galpin have purchased the engravings for their use in the English language. The illustrations will consist of 230 large page drawings, the cost of their production being upwards of 15,000.

**"JOURNAL OF SOCIAL SCIENCE."**—Under this title a new journal is announced, which will include the sessional papers of the National Association for the Promotion of Social Science. It will be edited by Dr. Lankester, and issued, by Messrs. Chapman & Hall, on the 1st of every month. The journal will be devoted to the publication of papers, reviews of books, and information on the various subjects embraced in the departments of the National Association for the Promotion of Social Science.

**THE MONT CENIS TUNNEL.**—A letter from an Italian engineer announced that the workmen employed in piercing Mont Cenis have come upon a bed of extremely hard quartz, which turns the edge of the best-tempered steel, and that it is feared this obstacle may retard the opening of the tunnel for four years. Foreign engineers have expressed an opinion that the tunnel will take longer to complete than the sanguine Italian managers anticipate. The summit railway, however, is likely to be made before the end of next year, and will shorten to four hours the passage of the mountain.

**ADORNMENT OF THE CAMBRIDGE CEMETERY.**—The disgraceful state of the grounds of this cemetery has been for some time a matter of local comment, but the *Chronicle* states that at least the incumbents of the several parishes have determined to remedy the defect. For this purpose they have consulted with Mr. Mudd, the curator of the Botanical Gardens, who offers his gratuitous services, and proposes to fill up blanks in the present beds, to plant an avenue of trees along the road leading to the chapel, to place standard roses by the sides of the paths, and where the space will allow, to form flower beds. In order to carry out this design a committee has been formed to seek for contributions. It is also proposed to furnish a bell for the use of the chapel.

**CLEARING UPPER THAMES OF SEWAGE.**—Mr. Menzies, acting under the deputy ranger of Windsor Great Park, recently attended at the Windsor Board of Health, and stated that he appeared on behalf of the Board of Works, for the purpose of obtaining the consent of the Windsor Board to the surveyor in giving the necessary statistics and other information with a view to the disposing and utilising the sewage of Windsor, instead of permitting it, as at present, to be discharged into the River Thames. From Mr. Menzies's statement, it appears that the Commissioners of the Thames Navigation have been making a general survey of the river, from Oxford, with a view of ascertaining the general effect of the discharge of sewage into the Thames from the various towns and villages between Oxford and London. Mr. Menzies, who, under the Board of Works, has the control of that portion of the drainage which passes through the private part of her Majesty's grounds in the Home Park, proved the present great nuisance, especially at low-water, not only at Windsor, but at all other towns on the banks of the Thames. He also stated that he had a scheme by which the sewage may be utilised and the discharge into the Thames avoided. The Board passed a resolution agreeing to afford Mr. Menzies all facilities in their power, with a view to carrying out the object contemplated.

**NORTH OXFORD ARCHÆOLOGICAL SOCIETY.**—This society, after four years' suspended animation, has had a field-day, under the guidance of the Rev. D. Royce, of Lower Swell, who conducted the party through the churches of Bleddington, Icomb, and Stow-on-the-Wold, and also through an ancient dilapidated mansion (formerly moated) at Icomb, at each place Mr. Royce reading papers he had prepared on the several places in view.

**SOMERSET ARCHÆOLOGICAL SOCIETY.**—The seventeenth annual meeting of the members of this Society has been held at Shepton Mallet. The meetings and the museum were held in the Music-hall, and everything possible was done to accommodate the Society. The museum collection was not large, but included many objects both curious and valuable. The Rev. Prebendary Scarth read a paper "On the Roman pottery kiln," discovered in Shepton Mallet, in November last. Shepton Mallet church was afterwards visited, under the guidance of Mr. E. A. Freeman; also Donlon church and quarries; and other proceedings took place. The second and third days of the meeting were set apart for excursions to various points of interest in the neighbourhood, including Pilton, Pylle, Ditcheat, Evercreech, Chesterblado, Cranmore, Masbury Camp, Chilcot, and Crocombe; after which the excursionists visited Binder church, and lunched with the rector. The party then went some to Wells and others to Shepton Mallet.

**A BUNGLED CENSUS.**—The taking of the State census in the city of New York is now nearly completed, says the *New York Herald*; and it appears to have been done most bunglingly and carelessly, and in a manner to render it entirely unreliable. Large numbers of families have not been visited at all by the enumerators, and in some cases entire blocks have been omitted. Some of these enumerators, it is said, are very illiterate, others devoid of common sense, and still more of them negligent of their duties, as evinced by the returns.

**GLUE.**—Common glue, as used by cabinet-makers, is not always sufficiently strong to resist the strain to which the pieces joined together with it may happen to be exposed; sometimes, even, it is required to make metal, glass, or stone adhere strongly to wood; in which case a mixture of glue and ashes of wood will be found greatly preferable to glue in its ordinary state. The latter should first be reduced to the proper consistency required for wood, and a sufficient quantity of ashes added to give it the tenacity of a varnish. It must be applied hot.

**STEEL AND CAST IRON.**—A process for the production of steel directly from the ore has been proposed by Mr. G. Hand Smith, of Philadelphia, in the Franklin Institute. Pure oxide of iron, such as the magnetic oxide, for example, is crushed, washed, and packed in layers alternating with charcoal, in the ordinary cementing furnaces; after heating, a porous mass is obtained which may then be rolled into plates. Mr. Fleury also described, at the Institute, a process of manufacturing steel analogous to that of Bessemer, in which the decarbonisation of the cast-iron was effected by introducing into it while melted pulverised oxide, whose oxygen served to combine with and remove the excess of carbon. He also gave an account of a process for increasing the strength of cast-iron by the addition of an alloy of zinc, lead, and tin, in the proportion of about seven per cent. This process has been patented in the United States.

**ACCIDENT IN A STONE QUARRY.**—An accident, resulting in the death of three men, has occurred near the village of Uplyme, in Devonshire. Three labourers in the employ of Mr. Simeon Fowler, lime-burner, went to a limestone quarry for the purpose of digging stone. Mr. Fowler, in passing the quarry, observed that about a hundred tons of stone and rubble, which previously overhung the pit, had fallen in; and, on seeing a horse and cart on the edge of the fallen mass, thought it probable that some one was beneath. He procured assistance; and, on removing the mass of stone, the labourers came upon the bodies of the three men, all dead and horribly mutilated. At the inquest a verdict of accidental death was returned, the jury expressing a wish that some mode might be found of working from above, and strict orders given that the quarrying should not be proceeded with without the presence of an inspector. Three men were previously killed in the same pit.

**THE MIDLAND INSTITUTE.**—Lord Wrottesley, the President of the Midland Institute, has delivered the inaugural address, before a crowded audience, in the Lecture Theatre. The President chose as the subject of his address "The Recent Applications of the Spectral Analysis to Astronomical Phenomena," on which text his lordship delivered an able and interesting discourse.

**DISCOVERY IN WORLHAM CHURCH, BASINGSTOKE.**—This church is in course of restoration, under the superintendence of Mr. D. Braudon. A curious discovery has been made in the floor of the church, of a stone monument, like a coffin, containing the figure of a lady, apparently an abbess of the fourteenth century, carved, with her hands crossed one over the other, and holding what appears to be a rosary, the ribbon of which passes round her neck. Her dress is fastened with a round brooch, which has a cross carved in the centre. The lower part of the coffin is closed, and a cross or crozier, 3 ft. long, is cut out upon it. The length of the whole stone is 6 ft. 3½ in.; the width at the head is 1 ft. 9½ in., and at the feet 1 ft. 5 in.

**COMPETITION FOR A MATURED DESIGN FOR IMPROVING AND ENLARGING THE PORT OF ODESSA.** The Russian Government proposes to carry out works for improving the port of Odesa. The competition is thrown open to engineers of all countries, who are to send in designs in accordance with a given programme. Engineers wishing to compete may address the Director-General of New Russia and Bessarabia, at Odesa, who will place at their disposal the plan of the port of Odesa mentioned in the programme. In their examination of the port, the competitors will receive every assistance from the local administration. The design that is adopted for execution by the Department of Roads of Communication will obtain a premium of 8,000 silver rubles (1,300*l.*); and the second-best design, if of sufficient merit, will receive a premium of 2,000 silver rubles (325*l.*). Incomplete designs will not be admitted to the competition.

**SCARBOROUGH CLIFF HOTEL.**—This building has been sold by auction. The edifice is about half complete, and has, it is said, already cost 90,000*l.*, including 30,000*l.* for the land. It has 222 ft. sea frontage. The building was subject to a mortgage of 20,000*l.*, an annual charge of 8*s.* 6*d.* to the Scarborough Corporation, &c. Mr. Yordall, solicitor, Leeds, was the first bidder, at 10,000*l.*, exclusive of mortgage. After several bids of 1,000*l.* each, Mr. Janowski, of Scarborough, offered 22,000*l.* Mr. Thos. Shaw, of Scarborough, shortly bid 23,000*l.*, and this was followed by 23,200*l.* Mr. Shaw increased this by 200*l.*, and the sale was declared open. The auctioneer having, to prevent any misunderstanding, explained the purchaser's liability to the mortgage claim, offered the lot at the price really offered, 43,400*l.*, at which sum the bidding remained for a considerable time. Mr. J. Benson, sharebroker, Leeds, then offered 43,600*l.*, at which sum the hotel was knocked down. It is said that a new limited liability company will be at once formed, and the building carried on.

**MOUSE POWER.**—A gentleman in Scotland has trained a couple of mice, and invented machinery for enabling them to spin cotton yarn. It is so constructed that the mouse is enabled to make atonement to society for past offences by twisting and reeling 100 to 120 threads per day. To complete this little pedestrian has to run 10½ miles. This journey it performs every day with ease. A halfpenny's worth of oatmeal, he says, at 1*s.* 3*d.* per peck, serves one of these treadmill culprits for five weeks. In that time it makes 110 threads per day, being an average of 3,850 threads of 25 in., which is nearly nine lengths of the real. A penny is paid to women for every cut in the ordinary way. At this rate a mouse earns 9*d.* every five weeks, which is one farthing per day, or 7*s.* 6*d.* per annum. Take 6*d.* off for board, and 1*s.* for machinery, there will arise 6*s.* clear profit from every mouse yearly! The canny Scot is going to make application for the lease of an old empty house, 100 ft. by 50 ft., and 50 ft. in height, which will hold ten thousand mouse-mills, besides sufficient room for keepers and some hundreds of spectators. Allowing 200*l.* for rent and task-masters, 10,000*l.* to erect machinery, and 500*l.* for the interest, there will be left a balance of 2,300*l.* per annum! Of course the "hundreds of spectators" are likely to be also made to pay for their house-room no less than the mice.

**LIVERPOOL WATER SUPPLY FROM THE RED SANDSTONE FORMATION.**—The enormous pace at which the population of Liverpool is increasing, and the consequent rapid augmentation of demands upon the water supply, are inducing the corporation to turn attention to every possible means of increasing the collection of water. All kinds of projects have been discussed, and the water engineer has for some months been busy exploring the Rivington and Bala districts, and investigating the possibility of laying the sea under contribution by evaporation. He recently reported that the red sandstone in the neighbourhoods of Aintree Boole and the Childwall Ridge could be turned to good account. He proposes to sink two wells in the two former, and to tap the latter, at a cost of 25,000l. He expects that in this way, with an expenditure of 1,500l. annually in working, a million and a half of gallons per day would be obtained from these sources.

**A READING-ROOM AND LIBRARY FOR BERMUDA.** We have a letter from the trustees of a local Association, in the island of Bermuda, in which these denizens of our remote Archipelago say,—“We have managed to erect an Institute, and we are supplying our reading-room with the periodical literature of the day—your own paper among others. What we next want most sadly is works of reference,—encyclopedias, dictionaries, maps, gazetteers, and so forth. We are not a wealthy colony, and are not ashamed to make an appeal; and we seem to think that there must be some at least among your readers who may have duplicates of such works, which they would be glad to send us in order to help along what no one can doubt to be a good work. Any works sent to Messrs. Richard Dixon & Co. 12, Fenchurch-street, London, directed St. George's, Bermuda, Young Men's Christian Association, will find their way here in due time.”

**NURSERY SCHOOL AND MISSION CHURCH, LONGTON.**—A comprehensive scheme of home mission has been devised for the improvement of the town of Longton, under the sanction and approval of the bishop of the diocese. The rector's plans include the building of parochial schools for 600 boys, girls, and infants; nurseries and a mission-school church; the building of baths, and the obtaining of ground for open-air recreation; the re-seating of the parish church, and its conversion from the pew-riser system; and the formation of an additional curate's endowment fund. It was estimated that, to carry out these projects, 6,000l. would be required; but the rector addressed himself in the first instance to the establishment of the nursery school and mission church, which his observation had led him to conclude were very urgently needed. The site chosen for the erection of the school and church is at Mount Pleasant, the highest and most airy part of the town, yet close to the population most needing assistance. The building is to be Gothic in style, and will be erected by Messrs. Collis & Hudson, of Longton, from designs by Mr. C. Davis, of Bath, and Mr. Burrell, of Longton. The chief stone of the building has been laid by Mr. Beresford Hope, M.P.

**THE NEW GRAVING DOCK AT JARROW.**—The newly-opened dock is situated at the west end of Messrs. Palmer's building yard, Jarrow, and lies nearly north and south. The entrance from the river will be rendered most accessible by the erection of two piers, similarly constructed to those at the entrance of the locks at Northumberland Dock, except that both are on the same plan. Long wooden piles have been driven into the bed of the river at short distances from each other, presenting an almost unbroken surface, and curving outwards. These are to be planked over the top, as at the Northumberland Dock, making convenient landings on each side. At the east side of the dock a brick engine-house has been built close to the entrance, which will contain the boilers and machinery for raising the ponderous entrance-gate, and be ready for any purpose to which it may be applicable. The depth of water which will be on the sill at high water, ordinary spring tides, will be about 16 ft., which is sufficient to admit a vessel of almost any tonnage without danger. The dock is to be open for any vessel, wood or iron, when not occupied by the firm to whom it belongs. It has been built under the superintendence and from the designs of Mr. John F. Ure, M.I.C.E., engineer to the River Tyne Commissioners. The contractor was Mr. Jackson, of York.

**RAILWAY MATTERS.**—It is proposed to bring an independent railway into Hull and the East Riding of Yorkshire, and a new project for crossing the Humber by a great bridge will be introduced into Parliament as the Hull, Lancashire, and Midland Counties Railway.—A Scottish nobleman, who is connected by property with the islands of Orkney, has offered to subscribe 60,000l. for the construction of railways “in that district,”—which, we presume, means on the main island, Pomona, where Kirkwall stands.

**DISCOVERY OF THE REMAINS OF A WELSH PRINCE.**—The workmen employed in the renovation of the chancel of St. Peter's Church, Carmarthen, on removing the monument of Sir Rhys ap Thomas, which is built immediately on the left of the altar, came to what afterwards turned out to be the old floor of the chancel, a portion of which was removed by a pickaxe. Beneath were discovered a quantity of bones, placed in a small heap, about the centre of the monument, and underneath the breast of the recumbent male figure. Some of these bones are believed to be the remains of Sir Rhys ap Thomas. He was buried in 1527, at the Old Priory of Carmarthen, but his remains were removed about twenty years afterwards to the chancel of St. Peter's Church, their present resting-place.

**ST. JAMES'S FIELDS, LONDON.**—A writer in *Notes and Queries* says,—In an Act, 1662, for repairing the highways of London and Westminster, among other thoroughfares of St. James's, mention is made of—“One other street in St. James's Fields, commonly called the Pall Mall; and also one other, beginning from the Mews up to Piccadilly (now the Haymarket), and thence to the stone bridge to the furthestmost building near the Bull, at the corner of Air-street.”—Knight's “England,” vol. iii. book viii. ch. iv., “National Industry.” I infer, from this account, that the whole of the streets mentioned, from Petty France to Air-street, were then St. James's Fields; which, like those of St. George's and St. Giles's, retained their names in popular reference long after they were mapped into streets, but without a definite idea of their bounds.

**DUBLIN.**—The Wesleyan chapel, in the suburb of Rathmines, has been re-opened, after having been closed for some weeks past while undergoing enlargement. More than twenty new pews, according to *Saunders's Newsletter*, have been added, and the church is now capable of seating a large congregation. Attention has been paid to the ventilation and heating of the church. Two vestries, two chapel-keeper's rooms, and an exit porch, have been erected. The plans were furnished and the work executed under the superintendence of Messrs. Holmes & Holbrook, architects, Great Brunswick-street, by Mr. Deeket, of Stephen's-green, builder.

**PARKESINE.**—In the Chemical Section of the British Association meeting at Birmingham, a paper was read “On the Properties of Parkesine, and its Application to the Arts, Manufactures, and Telegraphy,” by Mr. O. Rowland. Originally procured in small quantity from gun-cotton at 10s. a pound, since the *Athenaeum*, it is now producible in commercial quantities from other substances at an inexpensive price, in a fluid, plastic, or perfectly hard state, of any colour, either in the finest goldbeaters' skin, and as perfectly transparent as the finest plate-glass, or of any thickness, “as black as ebony or as white as marble,” and indestructible by oxidation. It is neither acted upon by strong acids nor by heat much exceeding that of boiling water. Articles illustrative of its value to comb and brush makers, cutlers, cabinet-makers, boot-makers, waterproofer, &c., as also of its applicability for electrical and telegraphic purposes, have been fabricated. It is stated that a multiple cable, containing an insulated sustaining iron-wire, and seventy-nine insulated conducting copper-wires, with insulating and protecting envelopes of Parkesine, is capable of bearing its own weight in air for a distance of more than a mile. Its insulation is also said to be much higher, and its inductive capacity much lower, than any telegraphic core yet constructed. Ordinary gutta-percha wire, covered with a coating of Parkesine, is improved in insulation by the great contractile force of that substance. Joints, it is stated, can be made with ease and perfection. Specimens immersed for four years in water have not deteriorated in quality; and at a dry heat of 212° F. it remains electrically unimpaired.

TENDERS

For two cottages, at Hornsey, for Mr. Dearman. Mr. H. Milton, architect:—  
Hart ..... 2385 0 0  
Watts ..... 757 0 0  
Warr ..... 685 0 0  
Elder ..... 620 0 0

For new Wesleyan schools, in Ranelagh-road, Pimlico. Mr. W. W. Pocock, architect. Quantities not supplied:—  
Wilson ..... £1,124 0 0  
Ager ..... 597 0 0  
Laltry, Brothers ..... 1,034 0 0

For the erection of a pair of semi-detached residences, on the Upper Lawes-road, on the Conservative Land Society's estate, for Messrs. Clayton & Wrag. Mr. Dallimore, architect:—  
Jackson ..... £740 0 0  
Tiehurst ..... 716 0 0  
Cobell ..... 560 0 0  
Bartlett (accepted) ..... 655 0 0

For erecting a house, at Sydenham Hill. Mr. George Truefit, architect:—  
Simson (accepted) ..... £2,285 0 0

For first portion of new offices, Nos. 4 and 5, Austin-friars. Mr. W. Wiginton, architect:—  
Browne & Robinson ..... £2,334 0 0  
Bishop ..... 2,303 0 0  
Morter ..... 2,303 0 0  
Ennor ..... 2,303 0 0  
Ash & Horner ..... 2,322 0 0  
Axford & Whillier ..... 2,250 0 0

For a detached villa, in Hornsey-lane. Mr. J. W. Reed, architect:—  
King ..... £1,627 0 0  
Carter & Son ..... 1,630 0 0  
Lambie (accepted) ..... 1,537 0 0

For a villa residence, at Addiscombe, Croydon, for Mr. Banks. Mr. J. W. Reed, architect:—  
Manley & Rogers ..... £1,707 0 0  
Carter & Son ..... 1,747 0 0  
Lambie ..... 1,653 0 0  
King ..... 1,616 0 0

For alterations and additions to house and shop, Dover, for Mr. Henry Divers. Mr. Rowland Rees, jun., architect. Quantities supplied:—  
Matthews ..... £190 15 0  
Perry ..... 492 11 6  
Venner ..... 487 16 0

Warehouse, City-road, for Mr. Usher. Mr. H. J. Hammon, architect. Quantities supplied by Mr. C. Bampfield:—  
Saunders, Brothers ..... £2,478 0 0  
Hutchins ..... 2,197 0 0  
Chessum ..... 2,159 0 0  
Bishop ..... 1,988 10 0  
Brown & Son ..... 1,688 0 0  
Percy & Son ..... 1,957 0 0  
Eastou & Chapman ..... 1,936 0 0

For repairs and alterations to House, No. 147, Great Portland-street, for Mr. Brown. Mr. Broadbridge, architect:—  
Doncanson ..... £205 0 0  
Stephens & Watson ..... 283 0 0

For repair and building additional room to house, No. 43, Gloucester-road, Regent's Park, for Mr. Blackstone. Mr. Broadbridge, architect:—  
Stephens & Watson ..... £209 0 0  
Lambie ..... 287 0 0

For the erection of new offices, Nos. 14 to 18, Mark-lane, for the City of London Real Property Company, Limited. Mr. Richard Bell, architect. Quantities supplied by Messrs. Franklin & Nichols:—  
Lottie ..... £28,820 0 0  
Holland & Hantou ..... 28,340 0 0  
Mann & Co. ..... 24,750 0 0  
Ashby & Horner ..... 24,400 0 0  
Jackson & Shaw ..... 23,117 0 0  
Rider & Son ..... 23,094 0 0

# The Builder.

VOL. XXIII.—No. 1184.

## The Holy City.

ERUSALEM (the heritage of peace) has, since the time when King David stormed the stronghold of the Jebusites, and founded there his capital, been the scene of the most sanguinary warfare and of the most terrible massacres the world has ever witnessed. Not to speak of

Egyptians, the Philistines, and the Assyrians; the Romans, under Titus, destroyed, during the siege, more than one million Jews within and around the city walls. The Arabs then had their turn, and afterwards the Crusaders, who slew there 70,000 Moslems in one week; again, the Mahometans fought for and conquered El Khuds (the holy), whence they believe the Prophet ascended through the Seven Heavens, as related in the 17th chapter of the Koran, during the "Night Journey."

Even in our own day, the holy places of Jerusalem, and of the neighbouring village of Bethlehem, afforded a pretext for the bloodiest contest of modern times, which fertilized the Crimean plain with the best blood of England, France, Russia, and Italy, and paralyzed the minds of great statesmen, rendering them impotent for future good. What a mournful picture of the results of religious bigotry does all this present to the Christian philanthropist and philosopher.

From causes similar to those which produced such direful effects, arose the wordy war that is now going on around us regarding the exact site of the holy places. The battle is still raging between Fergusson, Williams, De Vogüé, and others, about the position of Mount Calvary, and of the sepulchre of Our Lord. How each chief combatant crows when he discovers the weak points of his adversary! How each minor combatant chuckles when he thinks he has produced a new fact for the consideration of the archaeological world! At last, however, we have hopes of a truce; for a society has been established, composed of men of every shade of opinion and religious belief, for the purpose of investigating these matters thoroughly, by sending out an expedition of competent persons to explore, excavate, measure, draw, photograph, or in any other way obtain the information which is necessary to solve these doubts and end these discussions. So we must all be prepared to accept the truths which these efforts will bring to light; and, if necessary, to surrender our most dearly-cherished belief in the authenticity of all that has been said or written upon the subject previously. This would be a hard task for some, no doubt. It would be hard for the pious Russian who has journeyed from the region of Siberian snows, enduring privation in every form, for the privilege of visiting the holy tomb, of sleeping all Easter eve within the Rotunda in order that he

might be one of the first to light his taper at the miraculous flame (unsuspicious of the agency of lucifer matches), to find that his pilgrimage was in vain, and that he was in the wrong spot altogether.

It would be hard to the Romanist who has gone the circuit of all the holy places, under the guidance of a monk, and has received a certificate setting forth that he went the appointed round, to find that his certificate is false and only so much waste paper.

It would be hard, also, though in a slighter degree, to the untravelled Christian, who has formed a tolerable idea of the appearance of the surroundings and belongings of the Holy Sepulchre, from photographs, drawings, and panoramas, to find that his treasured ideal picture is but a dissolving view; that it disappears when he contemplates it, and somehow leaves him in a middle, and uncertain about his hearings. To all of these, we repeat, it would be hard to give up the long-entertained conviction that the Church of the Holy Sepulchre was what its name imported, and to be compelled to own that it was in some entirely different locality. It would be a painful wrench, as had as the pulling out of an eye-tooth; but still, if necessary, it must be borne, for "Truth is great and must prevail," as say the copybooks.

Pending the results of these investigations, we shall not hazard theories of our own upon the subject, but simply note what came under observation during our walks in and about the city of Jerusalem; and, as the true names of places are still in doubt, we shall, for the sake of avoiding prolixity in description, prefer to call places by their old world names, declining to adopt Lord Russell's phraseology, when speaking of the South as the so-called Confederate States, but saying the Holy Sepulchre, in place of the so-called Holy Sepulchre.

After what we have said about the wars that have been carried on, and the disputes that are now raging about Jerusalem, and more especially about the Holy Sepulchre, which is the kernel of the nut, our readers will be as much surprised to hear as we were to see, upon going to the terraced house-top early in the morning after our arrival (we always find it the best plan to endeavour to gain a general view of any town that is new to us as soon as possible, in order to lay down the bearings of any place we wish to see), that there was a great gap in the dome of the Church of the Holy Sepulchre. Many square yards of lead were wanting, the timbers were visible; and, whenever it rained, the water must have sapped the walls and poured into the building itself; and yet there were dwelling in Jerusalem dignitaries of all the Churches, who were squabbling, writing, and almost cursing one another, in order to obtain a footing in this self-same building, which they naturally considered the most sacred of any. We asked for an explanation, and were told in reply that France wished to repair it (the second Helena, of course, would be delighted to do so); Russia wished to repair it; England was, of course, indifferent; but the Sultan was anxious to have a finger in the pie, and the Christian Powers were unwilling that the infidel should participate, and thus have a further lien upon the sacred edifice: so between the three it was allowed to fall into a state of dilapidation which, if it occurred in a public building in England, would excite the interference of that despotic power, the police under the Building Act. We cannot vouch for the truth of the story, but the plain frightful fact was before us—typical, we afterwards had occasion to remark, of the anarchy produced in Jerusalem by strong prejudices. Fanatics of every faith abound. Jealousies, scandals, quarrels, and fights, even in the Holy Sepulchre itself (on the occasion of the lighting of the sacred fire in 1834, four hundred people were killed within the Rotunda), result from them, and profane the

holy pile,—ay, and will continue to do so until men learn that Charity is the elder sister of Faith.

From the top of our hotel we saw to our left the dome of the rotunda of the church, which is flat-sided. Next to it, the old Campanile, now disused,—for the Turks will not tolerate the sound of bells;—and beyond it a smaller dome, which stands over the choir. In front of us were the flat-topped houses forming our street; and over them was a large space of waste ground, formerly belonging to the Hospital of St. John, a foundation of the Crusaders, and now, we believe, ceded to the French—(why do they not build upon it?) In the distance was the green cupola of the Dome of the Rock, always the most imposing feature in a view of Jerusalem. The background was formed by the Mount of Olives, crowned by the Mosque of the Ascension. Behind us was the Pool of Hezekiah, black and stagnant, and surrounded by houses.

Before proceeding it would be well to give our readers a general idea of the form and position of the city. Many of them, no doubt, are acquainted with the plan of it; but those who are not may gain a tolerable notion of it in the rough by drawing a lozenge on a sheet of paper, point uppermost, and then sub-dividing it into four smaller lozenges by lines drawn from the centre of each side. Let them write upon the uppermost or northern division, Bezetha; on the southern, Zion; on the east, Moriah; and on the west, Acra. These will represent the four parts, formerly mountains, into which the city is divided within the walls. Bezetha is the Mahometan quarter; at its west angle is the Damascus Gate; at its east the Gate of St. Stephen. Acra is the Frank quarter; in it stands the Holy Sepulchre. Zion is the Armenian and Jewish quarter; and at its west corner is the Jaffa Gate. Moriah is occupied almost exclusively by the Haram-es-Sherif—the site of the Temple; and is separated from Zion by the Tyropean valley, which is represented by the dividing line, and which terminates in the Dung Gate, now closed. The Golden Gate, in the centre of the side of Moriah, is also closed; but there is an open gate in the middle of the south-west side of Zion.

Jerusalem is not a regular lozenge in form, but a trapezium, with the west and east sides longer than the others; nor does the point stand due north, but rather to the east. Still, the sketch we have suggested will convey a better idea of its form than any simple written description.

The city lies on the side of a mountain, sloping gradually towards the south-east, and is surrounded by valleys on all sides but the north-east—that of Jehoshaphat being on the east; that of Hinnon on the south; that of Gihon, which is shallow, on the west; beyond there are high mountains. Thus a traveller coming from Jaffa, when crossing the ridge of the mountains, sees little but the outer walls; whereas, from the summit of the Mount of Olives, on the east, he has a splendid panorama of the entire city.

The general character of the country around is arid, stony, and barren; here and there a little grass is to be seen, and in the valleys and on the slopes of the mountains there are a few olive-trees; otherwise all is burnt up, and of a brown colour. Of all representations of the character of the scenery, Seddon's picture, in the South Kensington Museum, is the best, the most faithful and conscientious. The colouring is here true to nature; but it appears to have been painted early in the year, when vegetation was green; we saw it in October, when it was the colour of hay. Roberts sacrificed truth for the sake of effect, by making the valleys too deep and the rocks around too precipitous. His views of the city are very charming, but they are of an idealized character.

Our first impressions were, we suppose, similar to those of most travellers. We were struck

with the insignificance of what was the royal city of David and Solomon, as compared with our modern towns; with the paucity of fine buildings; with the squalor of the inhabitants; with the crowded state of some parts of the town; with the Jewish quarter, for instance, contrasted with the great quantity of waste land in the Mahometan quarter, and in proximity to the walls; and with the heaps of dirt, dust, and ashes, which abound on every side. No wonder that parts of the Tyropean valley and other natural hollows have disappeared. There are but four practicable gates in the walls, and the inhabitants, rather than take the trouble to carry rubbish through them by a circuitous route, throw it into the nearest hollow. We believe that most of the modern houses are reared upon dust-heaps, and that deep excavations would reveal much concealed by this accumulation of ages, especially in those places where there have been valleys. There are but three chief thoroughfares in the city, and these are constantly crowded with shrieking Arabs, grave Turks, greasy Jews, Greeks, Armenians, and Copts, in variously-coloured dresses, the effect of which is toned down here and there by a European in sober black. One street leads from the Jaffa Gate to the Haram, and may be represented by the line drawn on our lozenge, except that it does not reach the corner, but the middle of Mount Moriah. A second leads from the Damascus Gate, with one or two turns to the Gate of Zion. A third leads from St. Stephen's Gate to the Holy Sepulchre, and is called the Via Dolorosa, as it is reputed to be that by which our Saviour was led from Pilate's Hall to Mount Calvary. There are many other smaller streets and lanes, dark and gloomy from being partly arched over, leading nowhere, or ending in the city walls. Along one of the former, which may be considered part of the chief thoroughfare, we walked to the great centre of attraction, the Church of the Holy Sepulchre. Turning to the left when we quitted our hotel, and then again to our right at a distance of a few hundred yards, we reached the narrow street of the Palmers, which flanks the south side of the church. Passing down this to the east amidst the booths of those who sold candles, beads, relics, and such like commodities to the pilgrims, we soon reached a square flagged area in front of the south entrance. Before us rose the façade which has been so often engraved and described. Two fine pointed arches, each of several orders of mouldings, spring from verde-antique columns with richly-carved capitals. These form doorways, and have lintels and tympana, with sculpture. The easternmost of these is blocked up. Above there is a richly-foliated string-course, and above that are similar arcades inclosing windows. The whole is as fine a façade of French Gothic of the latter part of the twelfth century as one could wish to see. Adjoining, forming the west boundary of the area, is a campanile of three stages, also in good style. Bases of columns existing on the south side of this area show that formerly there was a porch or atrium here. On entering the church our attention is arrested by a group of Turkish cavasses, who levy a tax of a few piastres upon pilgrims entering the church. The church is actually the property of Mussulmans, who are paid, as a Franciscan monk informed us, every time it is opened for service by the community, whether Latin, Greek, Armenian, or Coptic, whoever wishes to celebrate, and who also must receive considerable sums from pilgrims, as there are sometimes no less than 30,000 in the city during Holy Week. Whether this money goes into the treasury of the Government, or whether some of it goes to the Christian patriarchs, we cannot say; but it certainly seemed strange that the sepulchre of our Lord should be guarded by unbelievers.

In order to a clear comprehension of the plan of the building, let us imagine the transepts and circular apse of a French twelfth-century church, with a dome over the crossing, a choir carried to the western bay of the cross; and beyond it a sanctuary, both of them separated by walls from the transepts and circumambulatory; three radiating chapels in the large apse, a lady-chapel at the south-east corner, tacked on to a circular nave. The choir and sanctuary belong to the Greeks; they have also chapels in the south transept and in the Rotunda. The Armenians have the lady-chapel, in reality that of St. Helena; but the poor Latins are left "out in the cold" on the north side, where there are no holy sites, but they share the chapel of Calvary with the Greeks. The Rotunda is common to all, though

we believe the Eastern churches alone have the right of celebrating in it. Would that the building were more like what it was originally; but unfortunately, after the fire of 1808, it was rebuilt and beautified by a Greek architect, who cased the columns of the Rotunda, rebuilt the central chapel in bad taste, and otherwise altered and disfigured the interior of the church, so that but little pure Gothic is visible. Le Brun gives a large view of the interior in its former state, which in every point confirms M. De Vogüé's restoration. Within this building are crowded most of the spots which were the scenes of our Saviour's passion. We shall content ourselves with enumerating them. On our right on entering the church, that is, on the south transept, are two staircases of eighteen steps, leading up to the chapel of Mount Calvary. The floor of this is without doubt founded on a rock; for in one place may be seen the hole in which the foot of the cross was placed, and near it the rent that opened at the Crucifixion. In the transept near to the choir is the Stone of Unction.

In the thickness of the wall of the Rotunda are the tombs of Joseph of Arimathea and Nicodemus. Near the Latin chapel, on the north, is the spot where Christ appeared to St. Mary Magdalene. The chapels in the circumambulatory mark the place where our Saviour was stripped and crowned with thorns. There is no occasion for us to remark how many of these sites appear apocryphal to us, or the reverse, especially at a time when the authenticity of the whole is called in question. The Chapel of St. Helena is the most interesting for its architecture. Its floor is 16 ft. below the level of the church, and is reached by a flight of twenty-eight steps. It is square in plan, and has a central dome resting upon four pointed arches, which spring from as many columns with large capitals. The lower part of the bell of each capital is of basket-work. There is a row of acanthus leaves above, and the abacus has a classical character. They are altogether Byzantine, but the pointed arches are twelfth-century work; so we are naturally led to conclude that the chapel was rebuilt at the last-mentioned period, and that capitals of an earlier building were used. At the south-east corner another flight of steps leads down to a smaller chapel in a cave in the rock, in which it is said that the true cross was found by St. Helena.

Beyond the Chapel of St. Helena there is little to remark in the building. The Rotunda is in a nondescript style of architecture. The Greek choir is rich in decoration, and has a magnificent iconostasis. The Franciscan chapel is quite a modern structure, or, at all events, bears no marks of great age. There are many dependencies of both the Greek and Latin convents attached to the north and south sides of the church, but in none of them did we notice any architectural peculiarities.

Upon quitting the church, and proceeding eastward through the street of the Palmers, we perceive on our right-hand a fine Norman arch, with a label adorned with sculpture representing the months of the year. Within this arch have been two small arches forming the doorway of the Hospital of St. John, a sort of xenodochium or khan established by the Crusaders. It is now entirely destroyed, and its ruins occupy that plot of waste land which we saw from our hotel. At the corner are the remains of the Church of St. Mary the Great, and upon the opposite side of the street those of another church, St. Mary Latin. These three edifices, as well as the Church of the Holy Sepulchre, have been fine specimens of twelfth-century pointed architecture. What astonishes most is to find so many traces of the Crusaders and so many fragments of really good Gothic. In addition to the three buildings above mentioned, there are the Church of St. Anne, almost entire, that of St. Mary Magdalene, the Tomb of the Virgin Mary, and the Church of the Ascension. Besides these, the ruins of ten or twelve more churches are known, the sites of which have not been identified. Having passed the church on our left-hand, we turn southwards, pass the east end of the Church of the Holy Sepulchre; then again go a few yards to the west, and, ascending a flight of steps on our left, reach a platform, on which are several detached cells,—we cannot call them houses,—inhabited by black men, who, from their beardless faces and long blue robes, look like Arab women. These are the Copts and Abyssinian monks, and this is their convent. In the centre of the platform rises a dome. We find, upon looking into it,

it is that of St. Helena's Chapel, and that we are standing actually upon the roof of that chapel; for its floor, he it remembered, is 16 ft. below the level of the ground, and we are some 10 ft. or more above. The black monks take us to their chapel and show us every civility. They seem miserably poor. They get no live beef-steaks and such like luxuries here, but live in a state of indigence, and are barely tolerated by their fellow-Christians. We should say lived,—for since the time of our visit British protection, which was their sole safeguard, has been withdrawn, on the pretence that Abyssinia is a province of Turkey (how long shall we maintain the power of the Crescent against the Cross?), and the poor fellows, expelled from even this wretched abode, have had to trudge back to their own country, and have there excited the animosity of King Theodore against us. This had led to the imprisonment of our consul and missionaries, and has alienated from us the minds of all members of the Coptic church, which church, though it may be said to possess but a barbarous form of Christianity, flourished when our ancestors lived upon acorns, tattooed themselves in wonderful patterns of a bluish colour, and worshipped Thor and Woden, for whom we have still such a surviving affection that we perpetuate their memory in the names we give to the days of the week. May not our enemies likewise say that there are traces of paganism lingering amongst us still? Dr. Gobat, the Anglican bishop of Jerusalem, and Dr. Beke, the Abyssinian traveller, are the authorities for this account of the reasons for the exodus of these poor monks, and heter authorities there could not be, as both of them know more about the merits of the case than any one else.

Proceeding due east from the Church of the Holy Sepulchre, by a street which descends till it crosses the main thoroughfare from the Damascus Gate, we find ourselves in the Via Dolorosa; we find the spots where Jesus Christ is believed to have fallen under the burden of his cross, marked by columns; the house of St. Veronica; that of the wandering Jew; the place where Simon of Cyrene, helped to bear the cross; the chapel standing where the Virgin Mary fainted; the arch of the Ecce Homo, part of which is Roman work; and, lastly, the palace of Pilate, which adjoins the north side of the Haram. Here, seeing a street on our right, terminating in an inviting open space, with trees in it, we turned into it, but were soon startled from our meditations by the apparition of an infuriated Mussulman at the further end of it, who, by threats and violent gestures, signified to us that we must turn back, and we found that we had been strolling towards the sacred enclosure of the Haram, which none must approach except in the company of a consular cavass, prepared to smooth the path by a liberal bakhsheesh; so we consoled ourselves by visiting the ruined Pool of Bethesda, near St. Stephen's Gate, and looking at the Church of St. Anne, which stands opposite. The Pool is a cistern in the form of a parallelogram, about 300 ft. in length by 120 ft. in breadth, and about 60 ft. in depth. It is now half-filled with rubbish, from the crumbling walls around it. It lies along the north wall of the Haram. The Church of St. Anne, which has been ceded to the French, stands a short distance from the road, on the other side; it has nave, aisle, four bays, groined roofs, a low dome over the fourth bay, and three semi-octagonal absides. It is, as well as the other Pointed buildings in Jerusalem, thoroughly illustrated by De Vogüé. Why it is still disused, and allowed to remain in a state of neglect, we cannot imagine.

#### THE HEALTH AND DWELLING QUESTION AT THE SHEFFIELD CONGRESS.

THE meeting at Sheffield of the National Association for the Promotion of Social Science, commenced on the 4th and terminated on the 11th inst. With reference to numbers and the consequent financial results, we are disposed to think the congress will not prove so satisfactory as might be desired; but as respects the interest of the papers read, the ability and vigour displayed in the discussions, and the advantages, sanitary and otherwise, likely to ensue, it must be placed on a par with the most successful of previous meetings. We confine ourselves on the present occasion to the proceedings that relate to health, and for personal reasons make the reports given by the local press, the *Sheffield and Rotherham Independent* and the *Sheffield Daily*

Telegraph, the basis of our account. At the first meeting of the Health Department (on Thursday morning) Dr. J. C. Hall, senior physician to the Sheffield Public Hospital, read a valuable and elaborate paper "On the Effects of certain Sheffield Trades on Life and Health." In the course of it he said,—"What is the chief cause of disease? Poisoning by lead. I have already stated that the file rests on a bed of lead during the process of cutting, and that fine lead dust may be seen to rise every time the chisel is struck by the hammer. The men have a foolish habit of wetting the finger and thumb with which the chisel is held, by licking them; they frequently eat their meals without washing their hands, and often take dinner in the workshop where the files are cut. As though fine lead dust, handling the lead at each shifting, and licking the fingers were not sufficiently poisonous, I saw in one of the file-cutters' shops during the last few weeks a man whose wife had just brought him his dinner, eating it with unwashed hands, and dipping his fingers, blackened and covered with fine lead dust, into a paper which contained the salt for seasoning his beef. I went this day (September 25, 1865), to a file shop in which several men were at work cutting. These men all take their dinners in the shop; they never wash their hands till they go home at night—"sometimes not then." They do not change their clothes when they get home. One man made this statement:—"I have known a thousand file-cutters, but I only know one who takes the trouble to wash his hands before he gets his dinner; he works at Cammell's; I never think of washing mine."

Further on he spoke thus of the causes which produce the grinders' disease.—The cause of this disease is first the irritation produced by the metallic and gritty particles inhaled in grinding, and also in "hanging" and "racing" the grinding stones; and next, the constrained position in which they labour, and which is unfavourable to the free action of the respiratory organs; to this must be added the working for many hours in a badly ventilated room. When at work the grinder mounts what he calls his "horsing." This is a low narrow wooden seat. His elbows rest upon his knees, and his head, particularly when employed on very small articles, is bent over the stone. This position is a very injurious one, and when long continued is calculated, unquestionably, to induce pulmonary congestion. In many of the branches—table-knife grinding for example, the men often work in the coldest weather very thinly clad, their handkerchiefs off, their shirts open, and their chests fully exposed; and this, too, in a room every bit of glass from the windows of which has been removed, that the light may not be obstructed, by the splashing of the dirty water from the grinding stones. The floors of such hells are generally of mud, and always wet, dirty, and uncomfortable. The men perspire freely at their work, and in this condition often leave the mill, and, without putting on additional clothing, lounge about the yard in the open air, even when the weather is very cold. Inflammation of the lungs, pleurisy, rheumatic fever, and diseases of the heart are not unfrequent among them. I have seen many young boys suffering from grinders' disease arising from the dust inhaled in polishing; and in dry-grinders very often before the age of twenty, evidence is present of the existence of this fearful affection. I had a patient at the Public Hospital last week, a grinder aged twenty-two. On inquiring what was the matter with him, he said, "I grind razors, and have got what I shall never get shut on" (rid of).

He began to work at eleven, and had never used a fan. Both lungs were affected by the grinders' disease, but not nearly to the extent I have seen them, even in younger men than this poor fellow. At the commencement of the disease the breathing is difficult, more particularly when walking up a hill, going up-stairs, or ascending the steps leading to the upper bulls in which they work. At this early stage, the shoulders are often elevated, in order to relieve the distress occasioned by shortness of breath. The disease shortly increases, and day by day makes certain progress in all dry-grinders working without the protection of the fan. The digestive organs become impaired, the breathing is more and more short and oppressed, the face has a dirty-white aspect, the countenance is indicative of much suffering, he stops to cough in the street as he crawls to his work, supporting himself against the walls. They all complain of a dry sensation in the throat, and tell you "they

feel screwed up," and that something is so tight across their chests they cannot breathe. The cough is at first dry, but after a time there is a good deal of expectoration, which at first is frothy, and indicative of irritation.

As to prevention.—This disease was formerly almost unknown, and for this reason; until the year 1786, when the first steam wheel was erected, grinding-wheels were built upon the banks of rivers in and near Sheffield; and water being the power employed, it will at once be obvious that the grinder would have many interruptions to his trade, and that to grind day after day as the grinders now do was then impossible, and many of them were makers as well as grinders of cutlery. Nor was this all. By the old regulations of the Cutlers' Company, passed in the reign of Elizabeth, it was provided "that no person engaged in the said manufacture, either as a master, servant, or apprentice, shall perform any work appertaining to the said science or mystery of cutlers for eight-and-twenty days next ensuing the 8th day of August in each year, nor from Christmas to the 23rd day of January, upon pain and forfeiture, for every offence found and presented by twelve men of the said fellowship, of the sum of twenty shillings. No person occupying any wheel for the grinding of knives to allow of any work being done during the holiday months: penalty as before." When grinding became a separate branch of trade their hours were no longer limited, and then, it would appear, that the fearful effects on the animal economy of constantly inhaling particles of steel and grit day after day began to develop themselves. This, then, leads me to a first practical suggestion for alleviating the condition of the grinders,—namely, to diminish the hours of labour; and the most effectual way to do this is to abolish "Saint days," as the first days of the week are called by these men, and which are spent by too many of them in drunkenness and intemperance. What is the result? They crowd into three or four days the labour that ought to be distributed over the whole week, and many soon find, to their cost, the folly of such proceeding. It is a notion in some of the hells that a drunken grinder often lives the longest. This is a very great mistake. Intemperance has buried hundreds of these men into their graves.

Many years ago, the late Mr. Trickett, at the Union Wheel, showed me how the different processes could be gone through without injury to the grinder from the dust; and at the Soho Wheel I saw that shaping razors, and even "racing" a stone, by adding a properly contrived box, could be rendered perfectly innocuous by the use of the fan; almost all the dust being driven off by the fan, up a shaft on the outside of the building. The particles of dust and steel not carried away by the fan in "racing" a stone may be prevented from entering the air passages by tying, as all intelligent grinders do, when performing this work, a light handkerchief over their nose and mouth. That these fans, or "fannies," answer perfectly well, I have convinced myself by actual experience, and by the testimony of every dry-grinder who uses them. To prevent the grinders' disease, I am, therefore, of opinion,—1st. That the hours of labour should be reduced. 2nd. That wet and dry grinders should on no pretence be allowed to work in the same room. 3rd. That the owners of wheels should be compelled to provide a fan for all dry-grinders. 4th. That all wheels should be placed under proper inspection,—properly ventilated and kept clean,—the rooms built of a proper height, with sufficient space for each man, and every wheel properly provided with conveniences, the want of which at present, or the substitution for which, at many wheels, is a disgrace to the civilization of the nineteenth century, and, in a sanitary point of view, a great evil. No floor should be of mud. Where wet grinding is carried on the floor should be flagged on a sufficient incline to let the water run off.

The Workmen's Meeting, on Thursday evening, was a great success. The Alexandra Music Hall, formerly the theatre, crowded from floor to ceiling, pit, boxes, and gallery, with about 3,000 men, was a remarkable sight. Lord Brougham presided. The Common Serjeant, Mr. Thomas Chambers, the new member for Marylebone, made a most effective speech; and Mr. Thomas Hughes, M.P., and Professor Fawcett, M.P., also addressed the meeting. Mr. Hastings, the general secretary, introducing each to the meeting. We confine ourselves to what was said by the two speakers who had been requested to talk of health and homes.

Dr. Lankester, coroner for Middlesex, said he did not feel so much the having to speak after an honest labourer (Lord Brougham had so spoken of Mr. Chambers), as to have to speak after a brilliant orator. He felt, too, that after the subject of education, and the able manner in which the Common Serjeant of London had treated it, the subject of health would hardly be one that he could draw their attention to for a sufficient length of time to make any impression; at the same time he would remind them that if they were to be educated, if they were to develop their minds to the utmost, there was one condition necessary to that development, and that was good health. He appealed to the working men of Sheffield, and asked them whether that was not the platform on which all their hopes were centred, and from which all must spring. There was no working without health, there was no going on in life with integrity and success without health, and it was the want of health that rendered the poor man miserable and desolate. And yet they knew that in that very Sheffield,—that busy, active, successful Sheffield,—there were many working men who did not possess health, who were so little possessors of that health that there were whose whole classes of them who lived, not to the age of 70, which was the hope of man, nor to 60, nor to 50, nor to 40, nor to 30; there was a class amongst their folk grinders, the average of whose health was but twenty-eight years. He hoped they knew that; he hoped that had been told them; and he hoped that it had been told the folk-grinders that there was hope for them; that they had it in their power to relieve themselves from the desolation and misery brought about by having to give up life at twenty-eight which God intended to last till seventy. The Health Department would be no department of the Social Science Association unless they should come and show them by inevitable demonstration that life thus lost was unnecessarily lost, that there was no law of God that they should die at that great rate, but that it is by breaking the laws of life that their death was thus ensured. The second paper read in the Health Section that day shocked him. The death-rate in Sheffield during the present year was 34 in 1,000, and they were told that it had been rising year after year 1 in 1,000, from 28 per 1,000 up to 34. Well, what did that mean? Why, 34 in 1,000 was one of the heaviest death-rates in the kingdom. He did not know any other town where it was so high; and ought that to be in a city most gloriously situated for the purpose of obtaining health, surrounded by those everlastingly hailing, pouring down glorious torrents of water, ready to drink or to be used for washing or manufacturing purposes? There they stood, in a position by which all that accumulated filth—which produced disease—could be easily carried from them. What could be the cause of the high death-rate? He asked what were the employments of the men, and he was told of dreadful employments which carried off men unnecessarily, fork, razor, scissor, and needle grinding—all businesses in which life was shortened below the average of other artisans; and when they came to inquire why that was, they found that it arose from removable causes. He found that certain grinders worked at their trade and still had an average of life longer than the average of men employed in the same work. Where the means were properly employed of cleansing the atmosphere, life was prolonged. They had had the pleasure in the Health Section of seeing a grinder, and a more intelligent man he had not met during the meetings of their Association in the various towns. He had heard with great pleasure from the lips of John Wilson, of this place, the statement that the death of the grinder, and the disease of the grinder, were not the necessity of his employment, but due to the want of attention on the part, on the one hand, of employers, and on the other of the men themselves, in not using the proper means for the saving of their lives. Remove from themselves that cause of death, and discontinue carrying on their works under circumstances which necessarily led to the destruction of their lives. Let them educate themselves to the utmost on that point. Begin there. Leave, if they liked, their politics, their science, their mathematics, and study first how they were to live, how they were to make their existence healthy, their work the greatest success, and let nothing divert them from that study till they found they had discovered the means of preventing those terrible calamities coming upon them. He did not mean to say that this death-rate in Sheffield was

entirely owing to the grinders. There were other unhealthy occupations. They had heard from Mr. Holland that the workers in metal-mines were, from the want of proper ventilation and other inattentions, more exposed to danger than the workers in coal-mines. The deduction he drew from all this was, that there must be action taken on the part of the Government; for whenever the local authorities failed it then became imperative on the part of Government to interfere, and say, "We cannot allow this evil to continue. If the people would not do it themselves, then it would become necessary that Government should interpose and prevent this reckless waste of human life. The working men must look to Government for that protection of which they were at present deficient. He was no advocate of combinations of working men on wages questions; for there every man was entitled to get all he could; but he was confident that there would be justice in the working men combining to compel the masters to protect them whilst exercising their daily calling. Let that be part of their organization—let them remember that their health was a question of interest to their wives and families. The life of the working man was a question in which the whole community was interested. The death-rate of Sheffield ought not to be more than 21 at the utmost in 1,000. They managed to do with 23 per 1,000 in London, and a reduction of 10 per 1,000 would give a saving of 2,000 lives per annum in Sheffield. Did they think that those lives were worth nothing? Why surely they were worth 100l. per man. That was a small price for a black man, and he thought a white man was surely worth more. Well, but that increased death-rate of Sheffield over London was a loss to Sheffield of half a million of money per annum. He appealed to political economists whether he was in that statement reckoning without his host. If he were right, then what folly, what madness it was for people to go on in this penny-wise, pound-foolish manner, neglecting great things on which depended their life and happiness.

Mr. Godwin said it was a great satisfaction to him to be permitted to meet such an extraordinary assemblage of the "honest and sinew" of Sheffield, and to assist in making known to them the objects of the Social Science Association, and to show that in some of these objects they were as much interested as any part of the people. In respect of health, for example, it was of even more importance to the working classes than to capitalists, that they should be possessed of it. It was more important to them than to the capitalist, because the latter had his wealth to fall back upon, while the working man had either to starve, go to his benefit society, or receive parish relief. They had a right to look for protection in directions where they could not protect themselves; but unless they got information and learnt how to protect themselves no good would be done. They would then see, that to have health, it was necessary to have pure air. This would no doubt appear a very simple matter; yet people did not see that, if they shut up in a small house a man and his family, or a large number of persons in a small space, they would gradually undermine their health. So it was with the pent-up inhabitants of a large manufacturing town. The sanitary condition of London and other great cities was frightful. Man was doing all he could to render impure and lessen the quantity of the two great agents of nature—pure air and pure water. Ignorance prevailed to an extent that was almost incredible. At a watering-place on the east coast he found, a few weeks ago, a range of houses, in an extremely good situation; yet there was a constant succession of illnesses in the houses, and the medical men could find no cause. Accident revealed to him the cause: the pump which supplied each house was within 6 ft. of the closet cesspool. Could they wonder at the illness? He had felt surprise at the death-rate in Sheffield, but he had ceased to experience that feeling after a walk in the town. He proceeded to say, he was sorry that he had to make the remark he should make, and he did not wish it to be thought that the Social Science Association had come to Sheffield to find fault; but if such were the case, he hoped that the blame would be put upon his shoulders, and not upon the society generally. He had been through the courts of Peas-croft, of White-croft, and of Hollis-croft. What he had seen there would of itself more than account for the terrific death-rate which they had heard of that day. In one court, in which were seven houses, each having two rooms,

there were sixty-two people. The pavements were broken, and the stagnant water and refuse remained about them. The receptacle for the refuse had not been emptied to the bottom, as he was informed, for six months. To add to this, they were half-starved for water. Again, he would say, that to the whole of those sixty-two persons there was but one convenience, and that had neither door nor seat! Talk of education, it was perfectly ridiculous to suppose that education could have any hold or advantage there. What must be the people produced from such a home? Pretty men must be turned out from such a "manufactory"—the children were educated downwards instead of upwards. It was impossible that a good state of health could exist under such circumstances. Such things should not be allowed to exist. They had heard of home, there was a magic in that little word—but what was such a hole as the one he had mentioned? No clever farmer would have ventured to place his horses or dogs under such conditions as those in which he found these men and these women. Contrast this with a real home, a haven of rest, where the affections and powers might be alike developed. He implored the local press of the town not to stir the matter as they did, much against their will, in 1861, when the miserable condition had been set forth of the very places he was then talking of. He had spoken warmly because he felt warmly, and he expressed a strong hope that something would be done to remove so crying a disgrace. He knew there were many men in Sheffield most anxious to do it, and he urged that where life and progress were concerned, money should not be allowed to prevent the right work.

In the Health Department, on Friday, Dr. Lankester gave a discourse on "The best means of preventing the spread of contagious diseases?" He commenced by stating that a considerable amount of time had been wasted in the discussion of the question as to whether the small-pox, typhoid fever, or scarlet fever, were contagious. If they were contagious, the disease would be making progress while the discussion was going on. He held that the safest plan was to treat those diseases as if they were contagious, and to take the steps that were thought most proper to prevent the spread of them. At the present moment, whilst he had the cattle disease in our midst, a discussion was going on all over the country, as to whether the plague was contagious or not. He held that small-pox, typhoid fever, and scarlet fever, were all contagious, and that the way to ward off the approach of these diseases was to avoid all those things which induce them. It was one great mistake, however, to say that disease will only be found where there is an accumulation of filth to induce it. The contagion has been communicated to places where the sanitary arrangements were complete, and where the individuals themselves were supposed to be beyond its reach. As an instance he would give the case of the late lamented Prince Consort. No one could have imagined that contagion could have got into Windsor Castle, and yet it did. The spread of contagion was nuseen, and the modes by which it was spread were various. If small-pox was taken as an instance, it was impossible to say how the contagion was conveyed, the ways were so varied. It could be conveyed on the point of a lancet, or even on a piece of paper. Then, again, it was not every one who could be affected by the small-pox. Those who have had small-pox do not take it again, and those who are not predisposed to the disease will escape. In the case of typhus fever the disease is contagious, and the contagion can be spread by contact with the invalid or the clothes. It often happens, however, that if a member of a family be affected, all the others can attend them without contracting the disease, and it often happens the very reverse. In small-pox, there were cells formed, and those cells contained poisonous animalcules. Here was the reproducing agent of the poison; and if a healthy person came in contact with those cells, the disease was the inevitable result. As a preventive measure, he implored them not to neglect the vaccination of children. Typhus, he maintained, was never propagated but by contagion. You could so dilute the atmosphere as to render the poisonous influence inoperative. Dr. Christian approved of heat, and he was one of the greatest authorities. He said that a temperature of boiling water (212 degrees) would destroy the virulent influence of the disease. Let the clothes of the diseased be placed in an oven at that

heat, and the vitality of the disease would be destroyed. Oxidizing agents would do much to destroy the poison. Iodine was a most powerful agent in disinfecting organic matter, and it was easily applied: four grains of iodine would be sufficient to purify a room. Chlorine might be used with advantage, and was extensively employed. Anything more terrible than the existing fact that those poisons were self-propagating could not contemplate. They had the power of rapid multiplication. There is no doubt that persons may suddenly assume the power of propagation. I remember the case of an emigrant ship which sailed from the Thames in a perfectly healthy state. The vessel had hardly got down the river when the cholera broke out, and she put in at Torquay. There had been no disease there previously, but the cholera immediately broke out and ravaged the place. The air and water were a great medium in carrying disease. That it was found in water was evident from "his own case," as he called it, of the Broad-street pump, Golden-square, where 500 persons died in one night. He gave instances taken from Lambeth and Vauxhall, to show it might be conveyed in impure water. Typhus fever could be retained in clothes and dirty linen for years; that this was so, he quoted instances in which drawers and boxes had been opened a year or more after the occurrence of fatal typhus cases, and in which the disease again broke out and terminated fatally. In like manner he quoted cases of scarlet fever suddenly breaking out, and traced their propagation to the linen of deceased people having been retained in the house. Then there was predisposition to disease, and he was persuaded that this had something to do with the prevalence of the cattle plague. Into that subject he did not go further than to say that careful investigation and research would not unlikely reveal something which would enable us to prevent its spread—a remark which he applied to all forms of disease. At the same time, he felt humiliated to think, that whilst we were so careful about the cows, we were so indifferent to the life of human beings. Why, last year, he found from the official returns, that 119,000 people died in England of preventible diseases; and of the total number of deaths which took place in Sheffield last year, 1,109 arose from those preventible diseases, namely,—

Small-pox .....	250
Measles .....	121
Scarlatina .....	328
Diphtheria .....	41
Whooping-cough .....	177
Typhus fever .....	164
	1,109

He said that this was a fearful sacrifice of life among those who were the producers of the wealth of the country. He hoped the town council of Sheffield would consider the fact, that a farthing in the pound judiciously laid out would prevent a deal of disease.

Mr. Philip Holland commenced the discussion by taking exception to the theory held by Dr. Lankester as to all zymotic diseases being contagious. He contended that they were not so, and that the precautions taken to prevent the spread of diseases were the means by which they were spread still more. He referred to the case of the army in India, who were all huddled together when the yellow fever broke out. If they had been allowed to spread themselves, there would have been less chance of the disease proving so fatal as it did. Then, again, there were the quarantine laws, the observance of which was simply ridiculous and tyrannical. There were a lady and a gentleman lately coming from the Mediterranean who, it was suspected, were affected with a contagious disease. They were taken to Malta, and confined in a prison worse than any in which the felons in this country are put. There they were confined, and had to pay 10 guineas for their lodging and 15s. to the person for keeping them in it. He contended that such incarceration was a most dangerous proceeding. They ought to have been allowed their liberty, and the chances of taking the disease would have been lessened. It was a mistake to crowd infected persons together. They ought to be allowed to spread themselves in a wider area, and by that means the danger would be lessened.

Lord Brougham said he thought it clear that no harm could be done by viewing all doubtful diseases as contagious, while great harm might result from the contrary course.

Mr. Godwin was obliged to differ from that opinion. Harm could be done by inducing the belief that disorders not contagious were con-

THE WHITE HART INN, HIGH STREET, SOUTHWARK.

[See p. 726.]

tagions. He thoroughly believed that the best preventives of the spread of disease were plenty of good air, good water, and good food. Fear was a great predisposing cause of illness. He thought the well-known monk of Bury St. Edmund's, Lydgate, who wrote about the year 1380 the following lines, had correcter views:—

“By archis strong, his conrs for to reflecte,  
Thorgh condyte pyppis large and wyde withal,  
By certeyne means artyficiall  
That it made a ful purgacion,  
Of al odure and fytyles in the town,  
Wasshynge the stretes as they stode arowe,  
And the gutters in the erthe lowe,  
That in the cite was no fythe sene,  
For the canell scoured was so cleene,  
And denoyed into secrete wyse,  
That no man myght cepe nor deuyse  
By what enyge the fythes far nor nere,  
Were borne awaye by course of the ryvere,  
So covertly every thyng was covered,  
Wherby the towne was utterly assured  
From endengerynge of all corrupcion,  
From wycked ayre and from inflexion.”

“Wycked ayre,” indeed. A capital expression, but the air was not half so wicked as those men who forced persons to live in this “wycked ayre.” He said he was afraid that he should get quite a bad character in Sheffield. Some observations he had felt it his duty to make last night had offended some of the people. He could not help it: he must speak of the things he saw. When he entered the town on Wednesday, and took up his residence at the Victoria Hotel, he looked down upon the river Don, and the smell from it was so bad that it appeared to seize him, and he suffered for two hours severe illness. Let the people of Sheffield look at the river Don, and ask themselves the question, in what state would the town be if cholera came amongst us? The condition of that river Don, which was nothing more nor less than an open sewer, was a disgrace to any civilized town.

Alderman Saunders said he wished to reply to some of the observations of Mr. Godwin. He thought the town of Sheffield had been very unjustly attacked by some of those who had come into it. Mr. Godwin, he thought, had been far too strong in his condemnation. He remembered, some years ago, the editor of the *Builder* published a number of articles upon the town, and at the time he Alderman Saunders answered them. Those articles contained a vast number of misstatements about the state of things that existed in the town. Much had been said about

the death-rate in Sheffield. It was stated at 34 in 1,000. Admitting that the return was correct, he was far from saying that Sheffield was therefore, an unhealthy town, and that the death-rate of its regular inhabitants was 34 in 1,000. In all large towns there were a great number of poor and wretched people flocking from other districts to obtain a living, and the larger the town the greater this evil was. It was among this class of persons that the deaths were so numerous as to make the whole death-rate of the town appear so large. They would find that the death-rate in Sheffield was little above the death-rate in far more favoured places. If they were to go to such localities as sensation writers, anxious to produce telling articles, visited when they came to the town, there they might find the death-rate high enough. If they went to Pea-croft, Hollis-croft, and other such places, they would find a very high rate of mortality; but they must not take them as samples of the people of Sheffield. Such places existed in every town, and they were the natural consequences of poverty and ignorance, and had nothing to do with the sanitary arrangements and authorities of the town. Within five minutes' walk of the *Builder* office, in London, he had seen places full of filth and wretchedness, to which nothing in Sheffield could be compared. [A voice: “Two wrongs will not make one right.”] Such places as had been mentioned existed in the town from causes over which the authorities had no control, namely, poverty, wretchedness, and gross ignorance. They would find in Hollis-croft, and similar places, a death-rate of 44 and 54 per 1,000 instead of 34. It was people of this class, living in such localities as these, that raised the death-rate. They raised it not because of defective sanitary arrangements, but because of the poverty and ignorance of the inhabitants. They lived in wretched houses because they could not afford to pay for better. Sanitary reformers were in the habit of telling them that larger houses ought to be built, in certain forms and shapes, and that poor people ought to live in them. He was prepared to go further than that, and say that the poor ought to have good coats on their backs, and good food in their stomachs, and coaches to ride in when they pleased. But it was no use telling a man he ought to live in a house at five shillings a week if he could only afford to pay half-a-crown. Landlords built

houses, as they bought shares or invested their money in any other way, in order to get a return for their capital. (“More shame!”) They might say “shame,” but he thought there were few men in that room who would be willing to lay out their money in building houses to return them only 2 or 2½ per cent. If they built good houses they must charge a higher rent. He referred to the cellar dwellings which formerly existed in Manchester, and went on to speak of the state of the rivers in Sheffield, which had been referred to by Mr. Godwin. It was a sanitary question, and he spoke with some hesitation in the presence of ladies; but the fact was they had very few closets in Sheffield, and therefore the sewers contained very little more than surface-water and house drainage. The contents of them were of little or no value for agricultural purposes. The water of the rivers was discoloured by our manufacturing factories, and if they could prevent the sewage from running into the streams we should still have water dirty. There was another thing that made the amount of sickness greater than it was in villages, but not greater than it was in other large towns. This was the ignorance of the people. They were ignorant, and consequently reckless of the dangers to which they exposed themselves. Sanitary reformers appeared to have got the idea that laws and government must do everything for the people, but he urged that this kind of thing might easily be carried too far, until the people would do nothing for themselves. He complained of Mr. Godwin's remarks on Thursday night about the scarcity of water, and said how unfair it was to make such reflections at an exceptional time like the present, when nearly all the large towns of the country were in a similar position. The people who suffered most from disease were not half clothed, and in winter had no fires. He would answer for it that, knowing as he did the state of the Sheffield sewers, they might have the best sanitary arrangements in the town, and still they would not reduce the death-rate more than 1 per 1,000. Take the people in White-croft and Hollis-croft and remove them to High-street, and remove the people in High-street to those crofts, and the death-rate in High-street would rise to 41 per 1,000, while that in Pea-croft would fall to 17 per 1,000. The people and not the situation were the cause of the death-rate.

Pea-croft was as well drained as High-street, and ought to be as healthy. He referred to the death-rate in certain parts of London, which varied from 18 per 1,000 in the aristocratic quarters of St. George's, Hanover-square, to 29 per 1,000 in St. Saviour's, Southwark. He thought if Dr. Lankester would get the returns that had been prepared by the registrars in Sheffield, he would find that it was not on account of the public sanitary arrangements of Sheffield that the death-rate had increased, but because of the want of the means to secure comforts and necessities of life and the spread of knowledge among the mass of the workpeople.

Dr. Griffiths supported Dr. Lankester's view, that diseases should be treated as if they were contagious, in spite of the opinions that were entertained to the contrary.

Mr. Edward Smith (Fir Vale) said he did not believe any greater service could be rendered to the poorer classes, to whom reference had been made, than by sending among them a lecturer to explain and enforce upon them some of the great truths of which they were so lamentably ignorant. He felt sure that any rooms that could be got for such a purpose would be well filled, and that much benefit would result.

Mr. Mort, chairman of the Health Committee of Birkenhead, corroborated what Mr. Godwin had said about the smell near the Victoria Hotel, and said he had experienced most offensive smells in other parts of the town, and had been unwell in consequence.

Dr. J. C. Hall energetically denounced the state of the Porter and the Sheaf as a disgrace to the nineteenth century. It was one that the authorities were determined to put a stop to. It was in contemplation to make a covered sewer of the Sheaf right away from Heeley to the Don. It was useless to complain of Young's knacker's yard, for it was a bed of roses compared with the goat that was allowed to run just behind it. Mr. Saunders had said that the death-rate was only 17 in High-street and 44 in Pea-croft. He was glad to hear that, for if it meant anything, it was that things were so much better in High-street than in Pea-croft. They knew the haunts of cholera and fever, and if they did not remove the cause of these diseases, the swallow did not return to its nest more swiftly than cholera would return to its old haunts.

Dr. McAdam, of Edinburgh, supported what had been said about the state of certain parts of Sheffield. He had taken a walk by the side of the Sheaf, and found it to be merely an open sewer, with the aggravation of dead dogs and other things that did not belong to a sewer. Such a condition was certain to injure the health of the locality. In the soil of the bed of the river he found large quantities of putrid matter giving off the most noxious gases.

Dr. Lankester then briefly summed up the discussion, and said, he thought the chief point of difference among them was the question of the influence of the poison in producing contagious diseases. He quite agreed with Mr. Holland in what he had said about the folly of quarantine regulations. They were not only absurd, but quite ineffective for the purpose designed.

At another meeting of the Department, Mr. Griffiths said it had been suggested by one speaker that Government should take some action in sanitary matters. But it was not easy to induce Government to bring in a bill such as would be required to meet cases of that kind. Boards of Health were, he conceived, improperly constituted. For instance, they very seldom found an engineer, or a lawyer, or a medical man connected with them; and yet it was highly necessary that there should be an engineer to direct the works of drainage, a lawyer to show how far their action was legal, and one or two medical men, at least, to inform them respecting sanitary and other matters. There was no medical officer for the borough of Sheffield, and yet it had a population of 200,000 souls. There was a certain amount of parsimony exercised; and as an instance of this he stated, that some years ago, when certain members of the town council proposed certain improvements they were opposed, and at the following election they were opposed, and placards were actually put up to vote for "No" and "no improvement."

On Saturday, after a paper, by Professor Camgee, "On the Cattle Disease," in the discussion of which Mr. Robert Kawlson, who has been active in all the discussions, took prominent part,—

The Rev. Henry Moule read a paper, "On

the Use of Dry Surface Earth as a Deodorizer, and in the Removal of Excrementitious Matter, Preventing and Diminishing the Contamination of Air in Towns." This led to a long discussion, in the course of which Mr. P. Holland said, that any person who gravely proposed that water-closets and drains should be interspersed in towns by this dry earth system ought to have his head shaved; and, as we think, he was not far from right.

A paper was read by Mr. Godwin, "On the Familistère in Guise, France, with the particulars of which interesting experiment our readers are acquainted; and the meeting then adjourned, to sit again on Monday morning.

#### THE WHITE HART INN, SOUTHWARK.

THE old inns which have long characterized Southwark can scarcely hope to keep their place much longer. The large area they occupy in the shape of courts surrounded by buildings, with land at its present value, is too tempting a bait to owners and speculators, to be resisted. The Tabard,—Chaucer's Tabard,—as we said was about to be the case some months ago, has been sold, and is probably doomed to give way to modern buildings. The White Hart Inn, close by it, has been partly demolished within the last few weeks, and on the south side of the yard new buildings are being erected. We give a view of the old inn, as it appeared before the present works were commenced.

The White Hart was the head-quarters of Jack Cade when he held London, briefly, in the reign of Henry VI. Shakspeare makes him say,—“Hath my sword, therefore, broke through London gates, that you should leave me at the White Hart in Southwark?” The late Mr. G. R. Corner quotes a contemporary account of some of Cade's doings in Southwark, and “The Chronicle of the Grey Friars” records that,—“At the Whyt Harte in Southwark, one Hawaydyne of Sent Marytyns, was behcldyd.” Jack Cade's Inn, however, was burnt down in the great fire that consumed about 600 houses in Southwark in the year 1676; but was rebuilt soon after, on the model of the old one. It was in the present inn yard, such as we represent it, that Mr. Sam Weller was first introduced to an admiring public.

#### ITEMS FROM ROME.

THE artistic event of this city since we wrote last has been the opening to the public of the great hall in the Vatican (once pertaining to the picture-gallery) where Podesti has spent nine years on his pictorial illustration of the Immaculate Conception. Four lofty walls and a ceiling are covered by these frescoes, whose subjects may be classified as follows:—The Discussion of the Dogma, represented in the historico-allegorical style, with a group in which personified Theology takes her place among cardinals and prelates, and a statue of the Virgin dominates over the council scene; the Definition of the Dogma at St. Peter's, at the moment the Pope is intoning a *Te Deum*, while above the complex group of ecclesiastics and other assistants a celestial vision appears,—the Trine Deity represented, with one of those bold flights of imagination long encouraged at Rome; and, associated with the Divine persons, Mary, a central and supremely-honoured figure amidst the hierarchy of evangelists, prophets, Old Testament saints, doctors of the Greek and Latin Church, exulting angels, and skulking demons, who are driven into the infernal regions; the coronation of the Virgin's image, or Pius IX. placing a gold crown on her pictured head in the choir-chapel of St. Peter's, surrounded by the canons, the senator, and other officials, a peasant group in the foreground; the Triumph of the Church, an allegory in which a female, wearing the Papal insignia, and seated on a high throne, receives homage from the representatives of the world. On the ceiling, which is divided into six compartments, with gilt stucco reliefs in the interstices, are those heroines of the Old Testament regarded as types of the virgin mother, and other allegorical females; and along the lower wall compartments are chiroscenros, corresponding to the great groups, of the Pope holding a Consistory, the Birth of Mary, the Presentation

in the Temple, the Homage at the Papal throne, the Wolf and the Sibyls, of classic legend. We have had occasion, more than once, to express, in these pages, our impressions from modern painting in Rome, and may here state, that no merits manifest in Podesti's frescoes oblige us to modify the unfavourable opinion already held. Yet this great series, perhaps the master-piece of a veteran artist deservedly placed at the head of the local historic school, displays a degree of power, science, and technical skill, which it would be indeed unjust to ignore. The gorgeous ecclesiastical groups (most figures being portraits) are well composed and telling; the blending of the imaginative with the historic is highly ingenious; the colouring vivid without glare; and affording due praise to all which qualities, we are unable to recognise in these works any higher attributes. Poetic sentiment, religious elevation, spirituality, are not here; and the inferiority of the celestial to the terrestrial scenes is nothing less than painful, the hierarchy of Heaven seeming but an accessorial accompaniment to the ceremonial at St. Peter's,—no depth of distance, no mysterious supernaturalism or solemnised dimness. The position assigned to Mary, as absolutely co-participant in the glories of the infinite, strikes us as the most offensive example of idolatrous feeling in art, and suggests objections much too grave to be here entered upon more fully.

At Civita Lavinia (the antique Lannivim), a wild little town among the Alban Hills, has been discovered, by a local proprietor, a statue buried in the ground, 3 metres in height, of an imperial personage with the attributes of Jupiter, the head (severed, but not missing) crowned with oak-leaves; the face beardless, expressive, and noble; an eagle at the feet, and the fragment of an inscription, from the pedestal, containing reference to the tribunitial office. Conjecture has fixed on Vespasian, Domitian, Trajan, as the subject of this truly valuable antique; but we are led to prefer the theory well supported by a Roman antiquary, Signor Cori, namely, that Claudius, whose pleasure it was to be represented as Jupiter, is the emperor here seen in sculpture; and, indeed, the physical characteristics are sufficiently marked for a reference to Suetonius's description of his person (chap. xxx.) to corroborate this conclusion. On the same site was found a female torso, probably an Agrippina, with the attributes of Juno, the goddess especially worshipped at Lannivim; also a column of fine African breccia.

One may spend years in Rome before many an out-of-the-way remnant of antiquity chance to be seen or heard of, as we experienced the other day on first ascertaining the existence, in private hands, of two Classic fragments well worthy of notice. One is a bas-relief, on a large block of Parian marble, representing the façade of Hadrian's temple to Venus and Rome, curious indeed, on the sole authentic view of what that structure, now reduced to ruins in brickwork, really was in its olden magnificence, with a Corinthian peristyle of nine columns, and a triangular pediment adorned with bas-reliefs of Romulus and Remus suckled by the wolf; Faustulus and his wife with a flock of sheep on one side; on the other, Rea Sylvia surprised by Mars while sleeping. The proprietor, a marble-cutter, asks 2,000 fr. for this object; and we understand that the French Government has been treating for the purchase. The other curiosity we allude to is a small statue, 14 by 11 centimetres, found in 1861 in a vineyard beyond the Porta Portese, representing, in concave outlines, a segment of the Colossium, chiefly remarkable in that the large windows, now opening at wide intervals along the highest story, are here wanting; and a detail which only derogates from the majesty of the whole is thus shown to be due to one of its edifice's various restorations.

The Quirinal Hill, on its western slope, is now undergoing a complete transformation through levelling, for improvement of the approach to the Papal palace. Some mosaics, with figures in black and white, a centaur, a dolphin, and a marine horse;—near this another mosaic geometric design, also black and white, the torso of a statue, and some fragments of sculptured and painted ornamentation, recently exhumed on this declivity, are to be added to the list of treasures found in the course of these works. But most interesting among such results was the discovery of the majestic mausoleum front, in massive courses of square-hewn travertine, with an ample archway at the centre, and a frieze of graceful foliate design, with the epigraph below:—“*C. Sempronius C. F. Romilia Sem-*

\* In our Volume for 1861.

*grotto Ch. F. Savoy Lavica M. F. Mates.*—The whole elevation perfectly preserved, and measuring 21 palms in height by 18 palms in width. Amidst the buildings that have recently sprung up along the hill-side, this monumental antique is now completely surrounded and shut in; but, on application to an official, we obtain access to a narrow court, where we look down upon it from a level almost equal to its cornice line,—a position most unfavourable for the beholder, though by being thus encased and unapproachable, the monument is saved from the profanations which others in Rome have been exposed to. Observable, too, is the circumstance here manifest of the considerable depth to which the ancient lay below the modern hill-side in this direction; the universal alteration of Rome's level, caused by the vicissitudes of ages, supplying to this day one of the problems for antiquarian study to solve. An architect lately commenced some diggings on the Forum, with the object of laying open the channel of the Cloaca Maxima, hitherto only visible at a point nearer to the Tiber, and this research has not proved unsuccessful.

SANITARY MATTERS.

*Southampton.*—A meeting of the members of the town council, the guardians of the poor, and the medical profession of the town, has been held at the Audit House, convened by the sanitary committee, for the purpose of dividing the town into districts for house-to-house visitation. There was a numerous attendance. Dr. Parkes, of Netley Hospital, was present, and stated that on the previous day he received a letter from the Privy Council Office, directing him to visit Southampton, and report daily on the nature and extent of the diarrhoea and cholera prevailing there, the measures taken by the authorities, and the sanitary state of the town. He approved of the measures which had been so energetically and properly taken. Dr. Parkes said he gathered from the statements made at a meeting of the sanitary committee that seven cases of cholera had occurred in the town, three of which had proved fatal. The talk about alarm he regarded as puerile, for if they had cases of cholera here, it was their duty, as a matter of common sense, to do everything in their power to stay its progress. After some further proceedings a medical man was assigned to each of the several districts into which the town has been divided.

*Liverpool.*—The medical officer of health has presented his quarterly report to the health committee. The number of deaths registered in the borough of Liverpool during the September quarter, which terminated on Saturday, the 30th ult., was 3,507, being an increase of 259 on the corrected averages of the corresponding periods of the last ten years, and making its death-rate equal to 33.8 in the 1,000. Of the total deaths, 2,081, or 59 per cent, were of children under five years of age. Although the total number of deaths from zymotic causes was somewhat less than last year, yet the quarter presents the unfavourable aspect of excess in typhus, infantile fever, diarrhoea, and scarlatina.

*Blackburn.*—The people of Blackburn have been suffering very greatly in consequence of the scarcity of water. The reservoirs of the Waterworks Company were all but empty, and there were places in the town where the inhabitants had not had the water on for more than a week. The people were consequently driven to all manner of straits, and water had to be carried by them from the lakes in the park, and from springs and other places in the outskirts of the town. A committee of the town council was appointed to confer with the directors of the Waterworks Company on the subject, and at a meeting they had held, the directors stated that they had now again as much water in the reservoirs as would supply the inhabitants, for domestic purposes, for six days at one hour each day. The corporation, however, had accorded to them the privilege of taking water for the public from about thirty springs and pumps in different parts of the town, and a man had been stationed at each of these places to assist the public in getting the water. The members of the council were unanimously of opinion that the waterworks ought to be in the hands of the corporation, and a resolution has been passed authorising negotiations to be entered into with a view to purchasing the waterworks.

*Lincoln.*—A number of gentlemen have formed themselves into a committee for the purpose of obtaining signatures to a requisition to the

mayor, to convene a public meeting of the inhabitants to consider what steps should be taken to improve the sanitary state of the city, and to gain information from other towns as to the cost of effecting a complete system of drainage. Much valuable information has been obtained from the surveyors of towns where the Local Government Act is in operation. It appears, from the answers to the questions which were submitted, that the average cost of the drainage works was about 14s. per head, and that in every instance a great decrease in the mortality has been the result. Mr. Holmes, the registrar of births and deaths for Lincoln, has prepared a return of the deaths in the city, for the past five years, and the figures show how urgently improved sanitary arrangements are required. The mortality is at the rate of nearly 28 in the 1,000, while the general average of deaths, in towns of similar size, is about 21 in the 1,000.

PORTSMOUTH DRAINAGE.

The extensive system of drainage works for the borough of Portsmouth, designed by Mr. Lewis Angell, the borough engineer, were formally commenced on Tuesday, the 26th ult., by the mayor, Mr. R. W. Ford, who laid a memorial stone in presence of the corporation, heads of the naval and military departments, and a large number of the inhabitants of the borough. The stone, a block of granite, which will be built into the chimney-shaft of the pumping-station at Eastney, bears the following inscription:—

"This Stone was laid by The Worshipful the Mayor, R. W. Ford, Esq., To commemorate the commencement of a general System of Drainage Works for the Borough of Portsmouth. Lewis Angell, C.E., Engineer. Fredk. Furniss, Contractor. September 26th, 1865."

The contract for the first section of the work, comprising the sea outfall and a portion of the upper and low level mains, was let for 46,800l. The total cost is expected to be about 100,000l.

A SCHOOL OF SCIENCE FOR PLYMOUTH.

A public meeting has been held in the Plymouth Guildhall, the Mayor in the chair, for the purpose of hearing a speech from Mr. J. Buckmaster, as the representative of the Science and Art Department of the Government, on the advisability of establishing a School of Science for Plymouth and the neighbourhood. There was a large and respectable audience, and the remarks of Mr. Buckmaster were listened to with marked attention.

Mr. Buckmaster, on being introduced by the Mayor, briefly detailed the reasons of his being present, and then proceeded to show the importance of science becoming one of the elementary subjects of education. He maintained that the reason why manual labour was often irksome was because the workman failed to understand the science of his work; if he did, the work, on the contrary, would be most interesting. If he knew his work by the light of knowledge and science he would no longer be inclined to look upon it as a dark unmeaning process, but would regard it as the object of inquiry and investigation until what was hitherto regarded as difficult and inexplicable obtained a ready solution. He trusted the object proposed would be fully carried out. Mr. Spence Bate moved the establishment of a school in the town, and pointed to such men as Humphrey Davy and George Stephenson to show what years of study they might have spared themselves if they had known the laws of science. This resolution having been carried, a resolution was also passed nominating several gentlemen for the committee. A vote of thanks to the Mayor terminated the proceedings.

LIVERPOOL ARCHITECTURAL SOCIETY.

VARYING VALUATIONS.

The first meeting of the present session of this society was held on the 4th inst. Mr. Joseph Boulton presiding. Mr. Frank Howard was elected a member of the society. Mr. Watt called attention to the discrepancies in the valuations of property lately given in this town and neigh-

bourhood, saying they had caused some scandal. He thought the society would do well to give some expression of opinion on this subject. It was remarkable that such different valuations should be made by professional men examined on oath, and that the valuations of all the gentlemen on one side should be so enormously above or below those given by the gentlemen on the other side. The difference was sometimes as great as 75 per cent.; 50 per cent. was an approximate valuation; and only 30 per cent. difference was considered very close. He thought it strange that architects seemed, as if they were, to take briefs on one side or the other; and that those on one side should all agree, while differing so widely from the other side. The sooner such a society as this took the matter into consideration, and attempted to lay down some rule, the better. The president observed that it should be remembered that gentlemen on each side, whose evidence was not considered satisfactory, were not called in disputes of the character referred to. Those who were not high enough for the property owner, or those who were too high, were winnowed out. The connecting links between the two extremes were, therefore, lost; and, by leaving out all intermediate opinions, marked discrepancies might appear.

In his opening address the president referred to the same subject. He said, that in compensation cases, the surveyor consulted, with a view of giving evidence, was not in the position of a person who acted for both parties. He acted *ex parte*. The regard which a surveyor had for his professional standing and repute was the check which should prevent any gross abuse, and this made it so desirable that the persons who conducted cases of this kind should select as witnesses men of experience, honour, and probity. There were other conditions which occasioned discrepancies in the opinions of surveyors, included under such items as conditions of tenure, letting and sub-letting, life interests and settlements, good-will, and others. Some of these involved points of law, upon which the surveyor received special instructions. Sometimes the special advantages or drawbacks were known to one side only, and the surveyor might be entirely ignorant of their existence until he learned them in open court.

COMPETITIONS.

*New Unitarian Church, Bradford, Yorkshire.*—Designs have been submitted in competition from several architects for the erection of a new church on the site of the present old one. The plans selected by the committee were under motto "Unity" and are by Messrs. Andrews, Son, & Pepper, of Bradford, by whom the design will be carried out.

*Silloth, Cumberland.*—Designs were, some little time ago, submitted by several architects, in competition for a new church about to be erected at Silloth, Cumberland. The committee selected those submitted by Messrs. Andrews, Son, & Pepper, of Bradford, Yorkshire, who are instructed to proceed with the works immediately.

*The Proposed Manchester Infirmary.*—The designs for the new infirmary which have been sent in by the three selected architects (Mr. Waterhouse, Manchester; Mr. Stevens, Macclesfield; and Mr. Lee, London), are now exhibited in the Assembly-room, Town-hall, for the inspection of the committee and subscribers, and any other persons who may take an interest in the Institution.

*The Edinburgh City Poor-house.*—The city parochial Board met on Monday, to decide on the plans. Having heard the report of the special committee appointed to consider them, and opened the sealed letters accompanying them, the Board awarded the premiums as follows:—1st, 120l. No. 21, "Comfort for the Poor"—Messrs. George Beattie & Sons, Edinburgh; 2nd, 100l. No. 9, "Alpha B"—James Thomson, Glasgow; 3rd, 80l. No. 1, "Alpha A"—Perkin & Son, Leeds; 4th, 50l. "Stella Diurna"—J. G. Peat, Hamilton. A committee of the whole house then appointed the authors of the first prize plans—Messrs. George Beattie & Son—to be architects for the new poor-house, by a majority of 18 to 3.

*Belfast.*—A correspondent writes,—"Can any of your readers give any information on the state of affairs at Belfast, connected with the Albert Memorial Clock Tower, which you previously ventilated in your columns? It has vainly applied for my drawings. Can Mr. Lanyon throw some light on the matter?"

THE FRENCH EXHIBITION PALACE  
OF 1867.

We copy from a recent number of *Le Patrie*, on the reduced scale of 400 ft. to an inch, the ground plan of the French Exhibition building about to be erected in the Champ de Mars; and also reproduce, for the sake of comparison, the ground plan of the design for an exhibition building by Messrs. G. Maw, of Broseley, and E. J. Payne, of Birmingham, that was published in the *Builder*, of February 16th, 1861, and to which we have already referred as the apparent source from which the French Commissioners' design was derived.

Independently of the very peculiar and striking system of classification suggested by Messrs. Maw & Payne, which the Imperial Commissioners have adopted, their building appears to be a close reproduction of Messrs. Maw & Payne's plan; the only material deviations we observe being a slight elongation of the ellipse and the omission of some of the rectangular apartments external to the ellipse. Otherwise, the elliptical form, the central elliptical garden, the number of the avenues radiating from the central garden, and even the widening of four out of these sixteen avenues into intersecting transepts, and the external arcade surrounding the elliptical building, are common to both designs.

We would also point out that the arrangement of the concentric avenues and courts which in the French ground-plan appear to slightly differ from the engraved plan of Messrs. Maw & Payne's design, is actually described and suggested in Messrs. Maw & Payne's letter-press. They say, "If it is desired to divide the whole or any part of the space into courts, as in the Exhibition of 1851, the avenues can easily be converted into enclosed spaces without sacrificing the double system of classification;" and again, that "As some of the specific divisions might require wider exhibiting blocks than others, there would be no objection to vary the widths of the concentric rings to suit necessity;" both these suggestions are carried out in the French design.

It is a matter of surprise that without any definite data to work from, Messrs. Maw & Payne should have arranged a plan that can be at once applied to the requirements of a particular exhibition, with such trifling alterations as those made by the French Commissioners.

It is scarcely possible that the numerous points of identity of the two designs can be the result of a series of accidental coincidences, or of separate and independent invention. This is made more manifest by the disavowal by the official architect of the authorship of the plan, which had been adopted before he was appointed by the Commissioners. It is also worthy of remark, that in so great an undertaking no one should have been put forward as the author of the Commissioners' design.

The greatest length of the oval is 1,575 ft., the greatest width, 1,215 ft.

A. The central garden is 56 metres wide, and 166 metres long.

B. Circular gallery, 7 metres wide, in which will be gathered together all objects belonging to the History of Labour.

C. Gallery of the Fine Arts, 15 metres wide.

D. Gallery reserved for the material and the application of the Liberal Arts.

E. Central road through Gallery D, 5 metres wide.

F. For furniture and connected industries; the part nearest the centre 17 metres wide, the other part 14 metres.

G. Pathway, 5 metres wide.

H. reserved for the industries connected with clothing; the first part, 7 metres wide; the second, 14 metres.

I. Pathway, 5 metres wide.

J. Gallery for raw materials, 9 metres wide.

K. Gallery for machinery, with a total width of 35 metres, with a pathway, L, 6 metres wide, and a raised passage-way, M, 3 metres above the surface.

N. Gallery for products used as food, at the outer extremity of which will be placed the refreshment counters, with a covered promenade, 3 metres wide.

The entrance to the Exhibition Building will be at P, Q, R, and S; the first, P, next the Seine, being the only doorway of monumental character. The ground surrounding the building will be laid out as an English park, and will contain separate buildings for agricultural productions, models of workmen's houses, &c. &c.

PLAN FOR AN EXHIBITION BUILDING BY MESSRS. G. MAW & E. J. PAYNE,  
PUBLISHED IN "THE BUILDER," FEBRUARY, 1861.

NEW GRAND STAND AT KNUTSFORD,  
CHESHIRE.

A VERY convenient Grand Stand has been provided for the Knutsford Race-course, through a company organised for the purpose. The ground floor is subdivided into a refreshment-room, 40 ft. by 20 ft.; a committee-room and a jockeys' room, each about 12 ft. square; and apartments for weighing and other purposes.

The first floor consists of a covered gallery, a steward's-room, and passages. The gallery is made to project forward from the lower front like a balcony, the front being open, and the roof supported by a range of ornamental iron columns, with brackets above, forming a series of arches, and projecting forwards so as to support the higher balcony on the roof level. Raised tiers of seats are provided in the covered gal-

lery for the accommodation of 600 persons. The slated roof and the projecting balcony are furnished with planks affording standing-places for about 900 people. At the south end there is a brick tower, wherein is a spacious and convenient oak staircase. At the north end is situated an outside staircase of ironwork leading to the covered gallery, and a set of enclosed stone steps conducts to the stand upon the roof.

The entire works have been executed by Mr. Paul, builder, of Knutsford, from a design by Mr. Richard T. Bellhouse, architect, Knutsford, at a cost of about 1,700*l.* The ornamental ironwork in front of the covered gallery forms an important feature in the design.

The length of the building is divided into ten bays, with iron columns, spandrels, brackets, &c. Messrs. E. T. Bellhouse & Co., of Manchester, supplied this portion of the work.

THE GRAND STAND, KNUTSFORD, CHESHIRE.—MR. RICHARD T. BELLHOUSE, ARCHITECT.

THE FINE ARTS AND THEIR CONNEXION  
WITH EDUCATION.\*

In beginning this address, I feel it to be my duty, and a most pleasing one, to refer to my predecessor, Mr. Donaldson. There are few amongst us in our profession who have not experienced his kindness; and I rejoice to know that it was from him that he resigned the position to which I have succeeded; but that, in full possession of every faculty, he has chosen to give place to a younger man; and we may well look forward, so far as one may venture so to do, to his enjoyment of a vigorous and honoured old age.

I have selected the subject of the Fine Arts generally, not because I arrogate to myself any special knowledge of sculpture and painting, but because I hold the only professorship connected with the Fine Arts which exists in any university in the United Kingdom. Where anything akin to it has been founded,—as, for example, in King's College,—it really takes no cognizance of architecture in anything beyond construction; and the clever professor there, whose talents could well adorn any one of the subjects which I must teach, is limited to the range of mechanical art and constructive science. Your council has thus procured for this college the credit of being the only one in which a knowledge of any one, even of the Fine Arts, has been considered as an essential part of a learned and liberal education. I think that the time is not far distant when such a fact as this will be looked upon as singular enough, and be recorded in the same way as that mentioned with surprise by a well-known German traveller, who, describing one of our greatest manufacturing towns, and thinking of the numberless statues that used to decorate an ancient city, noticed it as his belief that it was the only one in the world, with 100,000 inhabitants, in which there was but one public statue to the memory of the statesman or the soldier who had deserved well of his country, or the citizen who had adorned his town. The one college will, I think, meet with many an equal in future times, as the one statue in that town already has. But there is another reason for speaking of the three Fine Arts together: the feeling that they ought to be considered in our minds as being parts of one great whole, to be thought of and spoken of in common—that the one without the other is disjointed and fragmentary—that architecture without sculpture and painting is like a strong-limbed tree throwing around its sinewy arms without the delicately sculptured foliage to give it grace, or the beautifully coloured flower and leaf to give it life. The arts are dissevered now, no doubt, in real practice; perhaps still more so in the popular view of them. But look at the result: contrast the bald and lifeless works of the last two centuries, wherein the sculptor and the artist seem to have hid farewell to the architect and the engineer—to all with the glories of the time preceding—no matter what—when art was vigorous—in Italy and Greece and in our own land—in Westminster and Wells, Canterbury and York.

Walk round any of those cathedrals, and see if you can find a spandrel or a panel, or a vacant space in which you seem to want the sculptor's art, and see if it be not there applied. Defaced and half destroyed as some of them are, enough has still been left to show us what must have been the full effect when their sculpture was still perfect, and their mouldings and ornaments were glowing with gold and colour. Study the remains which the Greeks have left us, and imagine, if you can, the Parthenon without the sculpture which clothed its form with life, and the painting with which it glowed; or think of that same sculpture dissevered from the glorious frame which binds the whole together into one harmonious whole: they were not things to be resolved into the different phases of framework and decoration, but each formed one essential part of all, without which there could be no perfect unity—without which each would be a lifeless part, a portion only of a perfect whole. But go back to earlier times than even Greece: study, as our museums and libraries may well permit you, the relics left to us by the Assyrian and Egyptian, and of their palaces and temples. No grander outline ever perhaps was left to us than the Pharaohs have left on the banks of the

Nile; none more picturesque than those which Sennacherib and his brother Assyrian kings have bequeathed to us from the banks of the Euphrates; and each one of the great edifices has the history of its founder, its nation, its wars and conquests, its kingly customs and domestic life, sculptured on every portal, coloured on every wall. Discover the three arts in these colossal works, and you would have robbed the buildings of their history, and consigned the sculpture and the painting to oblivion. But I will take one other and a last illustration—I think a very apt one—the graceful architecture of the Saracens: one so light, so elegant, so redolent of the grace and luxuriance of the East, and yet so hold that no artist could seek a better subject for his pencil, no poet a more graceful rendering of his dream. Seek where you will, you will not find a more lifelike embodiment of all that is beautifully delicate to illustrate an Eastern tale. And these Saracens were limited, as we are not, in their architect daret put the likeness of no living thing. The Eastern workman, as he carved the glorious buildings which the Arabs have left to us in Egypt and Spain and India, dared grave upon it no flower or plant or animated form which might remind him of his native land; and seldom, very seldom, do you find upon it one form, the likeness of anything upon the earth which contravenes the Prophet's order. A form of beauty was, with the Mussulman, a thing to be fashioned out,—created, as it were, in his own mind, beyond the realm of Nature; for the great source of wellnigh all that we think beautiful was with him a blank. Yet see how, with the inborn sense of the beautiful within him, he created forms unknown before, special to him alone, and "with light by one entrance quite shut out," was able to lavish upon his works the hewildering mass of sculpture and painting which adorns them, and which he has worked into them, not as a decoration only, to be put or withdrawn at pleasure, but as part of their very being, their life, their form. Not that I seek to urge the Discover from his works—from the works of the Gothic architects, the Greek, the Assyrian, and Egyptian—from any race whose works have been preserved to us and are worth preserving—either of the three arts, and you leave in them a most painfully apparent void. Not that I seek to urge the loading of a work with ornament; I know too well that ornament, of whatever kind, may be added to a snuff; but until the three sister arts are joined together more closely than they are, and until each one is valued as much by the assistance it gives the others as by its own intrinsic worth, we may expect and shall assuredly meet with extremes of redundancy and of poverty.

Now look at the history of the men to whom we owe the works which I have described, and whose memories, if even their names have perished, shall live for all time. We smile at the old writer when he tells us that the architect must be at once skilled in literature, erudite in geometry, familiar with history of all periods and countries, acquainted with philosophy, music, law, the aspects of the heavens, and the influence of seasons and climate. But trace the actual lives of many of the men to whom we owe chief art-works, and you will find his dream has wellnigh been realized. We scarcely realize it ourselves. How many of us are there who, standing entranced before the beauties which Da Vinci has traced upon the canvas and the wall, pause to remember him as the sculptor, the architect, the engineer of his age, and the first geologist on record! How many who pace the Loggia at Florence, or gaze upon its richly coloured cathedral walls, think of Arnolfo, the sculptor as well as architect; or of Gaggione, the painter, poet, and sculptor, who chiselled with his own hands the sculptures upon the edifices he designed! Do you wonder at the marvels which we owe to Giotto's pencil? Think of that which we owe to Giotto's pencil which we owe to him as glorious campanile which we owe to him as architect. Do you tread at Pisa with reverent feeling the sacred field of the dead? Remember that it was Giovanni the sculptor who designed that it was Giovanni the painter of our St. Paul's, it. Look at my mind surpassed, and recall to your mind that the architect was at the same time the first geometer and astronomer of his age. And when you think of the heaven-like beauties which Raphael drew—of the prophets and the sibyls which awe us still in the Sistine Chapel of Buonarroti, of the unearthly grandeur of his statues which adorn the churches of Florence and of Rome—remember that they came from the same hands which designed many a palace

there, and to whom we owe the grandly towering dome of St. Peter's and the splendid façade of the Farnese. Now, in considering the works of these great men, we must remember that they are the chief outward visible embodiment of their country's glory and power and skill. True it is that the historian will, in the glowing pages of his book, commit to immortality the stirring deeds, the conquests in the moral and the material world which adorn the history of his nation, more vividly and more truly, with as great power and skill as the artist will in depicting them upon the canvas. The poet and musician will sing them in melodies which shall raise the thoughts beyond the things of earth, and for the time transport us to the outer world; and the philosopher, with far research and deepest thought, will penetrate into the outer and inner worlds of Nature, and bring forth their secrets for the use of man. And all these men shall help to immortalize the nations of whom they form the chiefest ornament, and shall themselves be honoured through all time. But the actual visible marks of their country's greatness are the monuments which the architect, and the sculptor, and the painter have left upon her soil. The stranger from a far land will walk the aisles of Lincoln and of Westminster, and see in their wondrous beauty the realized embodiment of the nation's skill, though he be ignorant of the historian's tale, nay, of the very names, of the illustrious or dead whose monuments perchance ornament or disfigure its walls, and whose memories cast a halo around them in the eyes of those with whom their names have been household words.

And you will pass the grand Cathedrals of Strasburg and St. Marc's, and be hushed into reverential awe at their beauty and their grandeur; and, Protestants as you are, almost bow down and worship as you hear the solemn strains which speak to us, in harmony with all around, and seem to breathe the very soul of Alleghri or Mozart. You forget the great ones of France and Italy, and think only of the works which the architect, and the sculptor, and the artist have raised and adorned. Not that the fame of historian, or poet, or philosopher is by comparison diminished. Their works are before your eyes, their words graven upon your minds and lastingly present with you, whilst the effect of a work of art is soon diminished,—often, perhaps, lost; but, whilst present, it is to you the outward symbol of a nation.

And in every time since detailed records of it have existed, these great works of art have been more than the visible signs of the presence of great, exceptionally great minds. They have been, too, the sign of progress in intellectual power and skill of the general body of the nation, of whose advance the illustrious men of whom I speak are the mere striking representatives. The palace or cathedral is not a mere exceptional work to be studied and admired as something quite beyond the ordinary verge of art, but as the mere culminating point of it; not a mere isolated peak standing as a landmark for all time, and utterly disengaged from anything around, but as a people with whom art was the minds and works of a people with whom art was ever present, and amongst whom the appreciation of form and detail was innate,—who had been so used to see the beautiful or severely true before them in every stage of ordinary life, no matter how trivial, how common, that they had been self-trained, unknowingly taught, and educated to understand and appreciate, and practise it.

It is from the general training and education of a people that must ultimately come those greater efforts of the mind which some would seem to think may rise spontaneously from the barren soil of ignorance in art. Think if it even did so. Look at the objects now gathered into our museums as things for us to value and study, classed now as works of art, beautiful alike in form and detail.

Why, one half of them were the mere household goods of the Roman and the Greek,—the ordinary accompaniments of the Medieval convent or church. You stop at a lovely bronze, delicately-moulded piece of earthenware, and delicately-tinted page, and you find that it was a lamp that lighted their chamber,—the frame of one of their little mirrors,—the missal which they used at prayer. You will pass,—the most skilful of us will pass,—many an hour before we design anything more graceful, yet more useful and more true withal than the common household pottery of the Romans,—their wine vessel, the very sports which took the water from the roofs, the utensils of the kitchen, the ladies, and

\* The Inaugural Lecture delivered at University College, London, on the 9th of October, 1865, by Thomas Haylor Lewis, F.S.A., F.I.B.A., Professor of Architecture and Construction.

the great bronze caldrons which they used there. And think of the skill which the common blacksmith of our country showed in the commonest things of use,—the handle of a key, the hinge of a door, the cover of a book.

And these things, though looked upon (as indeed they are) as art-relics now, were not made up for us to see, as something special to be put aside as things for study. I doubt if the most advanced of Romans ever dreamed that the things his servants used,—the lamp that lighted his chamber, his ladies and his caldrons, would be considered of so great value as to form the ornaments of a museum. And little did the village blacksmith think of the delicate little key, that it would be covered up in after-times in a glass case, as a thing to be admired, and considered, and talked about as one that we would equal if we could. And even less, perhaps, did he imagine that, in a few centuries only, and in his own land, the very traditions of his work would be so lost that the fabric of the metal, the design in which he worked it, and the method of its working, would all be studied as something to be learned.

And yet it is so. Few there are, comparatively, of those who visit our galleries and museums, and admire (sometimes not that) the mass of artistic wealth they see there, who realise to themselves the truth that it is, in the main, a collection of common things,—of household goods,—as much the things of ordinary life as the willow-pattern plate or the threaded fork with us.

Will it be the same with us? Will the ordinary fittings of our households be ranged as things of beauty in the museums which our descendants will form? Will the New Zealander of Maanley place our works by the side of those of the Roman and the Goth, as food for study and instruction? I fear not. Few, I think, will say they will. Many perhaps will scarcely think it of any consequence whether what we do is worthy of being preserved or not. But, believe me, if art be not so commonly diffused amongst us—if it be not so far appreciated—so made part of the mind of our people that its presence may be made visible to them in the most common things of life as well as in its most refined, if they be not in fact so educated by the constant presence of art to grace of outline and harmony of colour, as to have an almost intuitive perception of what is good and beautiful and true in outward things, we shall never attain to that excellence in minor things, nor be able to develop them into those higher ones which we admire, and envy, and wonder at.

In those times whereof I have spoken, art was a fact everywhere—with the lowly workman as with the wealthy world who employed him. You cannot investigate the history of any period of ancient or Mediaeval art without discovering that not only the master who designed the work and a full appreciation of the beautiful or quaint, but that the man who carried out its details—who worked its mouldings, carved its sculpture, and tinted it with colour and with gold—was in himself, in his own humble way, an artist, appreciating the beauty of the whole and the value of his own part in it, and showing by some little variation of design, some turn of a leaf, some free movement in the foliage, that he rested in the doing of it from his own resources, and that the work was stamped with his own feeling as being in some sort his own, and not a mere literal rendering of another man's design. And this independent feeling, which made him trust in some sort to himself, gave a freshness to it which a mere copy never could. No mere copyist, too, could ever much love his work; and if he do not, there is little chance of his doing much that is worth the doing.

Now, with our museums and art-schools, and all more by the general interest which has of late years been taken in all that relates to art, we have, no doubt, done much. But try now, in anything beyond the commonest range of the science and rule (and so far, no doubt, our workman could scarcely be excelled), and leave them to carve the stone or to forge the iron into forms of quaintness or of grace, or to give the silver or the gold a beauty such as was found with it in the quaint old goldsmiths used to work it, and (with exceptions happily more common now than they were wont to be), one quickly finds that they are altogether lost, and that the stone and metal are taking forms which, although they are their own, have scarcely the recommendation of quaintness or of beauty.

But worse than that, I fear, I much fear, that the workman's skill, be he skilled ever so much, would scarcely be so appreciated by the general world as to allow him much reward. Yet there is hope for the future. There is no want of interest in it in any of its phases—no want of admiration of the great works which adorn our own and foreign lands.

But admiration is not knowledge; sometimes, we well know, quite otherwise; the subject of it is oftentimes an unworthy one, and the danger is that the two may be mistaken for the same thing,—that the pleasure which all must feel in looking at a work of art may be judged to be the result of an innate power of appreciating it—a power which would make a special study for obtaining it quite useless. As if the admiration which we bear the eloquence of an advocate could fit us for the practice of the law—as if wonder at the skill by which there is built up, from a few dried and broken and discoloured bones, the whole body of the extinct denizen of a former world, could give to us the art of the anatomist.

And of all ignorance none can be so great, so helpless, as that of one who, knowing little or nothing of a subject, is thoroughly well satisfied that he knows it well.

Your eye may, indeed, by habit or association, be brought to such a state of perfectness as that the good and the bad may be discerned by it without a special study. But then, that case is the very one I put before, viz.—that of a constant presence of and association with correct and harmonious forms and colouring, giving of themselves a constant lesson of the beautiful; and we are very far from having arrived at that state yet.

Rely upon it, art has a grammar to be learnt as much as language has. A certain amount of study—I might almost say, of drudgery—has to be gone through, before the understanding (set aside the practice) of an art can be mastered.

It is, I think, scarcely necessary for me to plead on behalf of art and of its diffusion. I know that it may be said, and it is indeed a matter of some wonder, that the knowledge of the beautiful is most conspicuous in the nations of the East, enervated, treacherous, and fierce. But all their art came to them traditionally with their blood. You see in them the relics only of the skill and taste which made the capital of the Persian kings, the great store-hive of all which was most beautiful and grand in art. It is passing away now, as their power has passed; and many a lovely work, which, but a few years since, would have been one of mere routine, could scarcely now be done at all. It was not their artistic knowledge which has debased them; they have been debased in spite of it, and in their debasement are gradually losing it.

But I have heard it said that the full appreciation of the beautiful is a gift reserved for the nations of the South and East—India and Persia, Italy and Greece; that art here can never have a general growth; and that we may perhaps improve in it, but never excel.

Never excel! Can we Northernmen forget Westminster, and Wells, and Lincoln? Why, when Giovanni was sculpturing his Pisa pulpit (a world-famed work), the niches at Wells were being filled, and, all classic as he was, Flaxman admitted that though the sculpture is rude and severe, it has a beautiful simplicity and grace, often excelling the productions of modern times.

True, the name of their sculptor is lost. So is the name of many another artist of Mediaeval times, who worked in his cloistered cell, and of whose memory and record nothing survives. Truly illustrious instances of utter self-negation. But that they were Northern if not English men, there is no doubt. I know that William of Sens began the glorious choir of Canterbury, but I know that English William finished it. And, to come down to later times, Wren was no less English when he designed the spires (his own creation they are) which so adorn our city, because he went for the details to the same source as the Italians did.

But it has been said, too, that opinions are so different in questions of the arts;—there are so many schools, and each with such ardent advocates, that nothing can be taken as truly certain; and to understand them even, would seem to be attempting a hopeless task.

Now do you find agreement in Theology, in Medicine, in Music, in anything, in fact, worth fighting for? But in every case there is a certain groundwork, a solid stand-place from which all disputants take their start, and it is only

when that is quitted and we enter into the more subtle details that we begin to differ. And it is that groundwork only that I want taught. Some will stop there. Others, more captivated, will be led, by study or association, to follow art in her various paths, each in his own. But, in any case, the means by which he reached the standing-place will have brought with them some better appreciation of the beautiful than he had before, and, rest where he will, will not be altogether lost.

To descend to details; I fully believe that, in order to be able thoroughly to appreciate the beautiful in form, one must, as a general rule, be able to draw it.

Some minds, of course, may, by an otherwise cultivated taste, have arrived at a high standard of it; but this is rarely found. Be this, however, as it may, no one who has been well accustomed to mark with his own hand the graceful flow or contrasted curve of a line, could fail to see the want of grace in an object that he was making, or that he was about to buy.

Get so far as this on the one side with the mechanic, on the other side with his patrons, and we have got a very long way on indeed.

I believe that if in the schools of our little villages, as well as those of our great towns, each youth were taught to know, by drawing it with his own hand, what is graceful in form; if he were taught to draw, with the special object of showing him that one outline is beautiful and another is not; if he were shown, with the things before him and his own hand to mark it, the beauty of the common things he sees about him—the curve of the ear of corn as it bends gracefully on its stalk, the veins of the willow leaf, the delicate drooping of the willow bough, the contrasted curve of the chestnut or the oak—we should in a short time have effected a mighty change.

I do not say you would have taught these things to all; not a twentieth part, perhaps, of those who at first learnt, would very much appreciate them. You cannot make clever scholars in anything, no matter what, if there be not the wish to learn, or the special genius to apply. But you would have given all a chance, and many a time developed a latent power otherwise lost. And many a clever mechanic, who now does so excellently well exactly what he is told to do, and no more, would have a chance of being able to work up a thing in whose designing he has had some hand.

And those of the ranks above, whose knowledge and acquirements cause them to be, to a great extent, the arbiters in things of taste,—of how much real value would their knowledge be had it been directed specially to the beautiful in form, in place of the poor conventionalities now taught? A tree is a thing one is taught to draw, because to copy it is difficult. I have seldom heard of its chequered and rugged bark, the massive sweep of its boughs, or the delicate curve of its leaves and tendrils, being marked out as things of beauty, and specially to be drawn as such. And if not put upon this path, your drawings will scarcely be of much use, so far as my object goes.

I think that I can see some change that way; but it is not easy in any subject to make a likely guess, when the time is very limited. To use a simile not my own, we are there as one looking at the tide on the sands, and watching the unquiet sea. Sometimes a great wave will overleap the rest, and dash up to your very feet, and you will think the great sea is coming in. And then will come many another, smaller and more gentle than the last, and you will think that the sea is surely falling back.

So it is with art. Sometimes a great work is done, and we think that the man who did it is a forerunner only of many another, and that we are to see the olden times again. And then there comes a death in art, and all looks blank. But I hope now for the best.

I wish now, in a few words, to point out to you, my hearers, whose training and education have been of the higher class, the attractions which the arts will offer; how fascinating to yourselves, how useful to others may their study be in ways quite different from those in which they usually are studied.

No one here but knows that it is within a few years only that new chapters have been added to our history by the unlooked-for discoveries of Layard in Assyria. Much the same has been done in Egypt. And how has this been done? The page of history was silent. Every line which Herodotus is said to have written on Assyria has

been lost. Of the earlier times of Egypt all that we know well-nigh is from the list of kings—a bare barren list, understood by none, altogether disbelieved by many. There is enough, just enough, in Holy Writ to excite our curiosity and wonder, but nothing more; and the grave appeared to have closed for ever over the records of those mighty kingdoms, whose grandeur would seem to have surpassed all that the world has witnessed since.

We know it now. We have seen the great cities of Assyria disinterred, and on the walls of her palaces and temples we find graven the sculptures which the Jewish prophets saw when Nineveh was the capital of the great Assyrian king, and in this sculpture read her history.

Strike from the list of things that are what men call ornament. Strike out from the cities of the nations the works of the sister-arts, and those bright pages of long-lost history would have been lost still—utterly, irrevocably lost. But there is more even than this.

We all know, as household words, how Rome and Carthage, Athens and Thebes, were founded, and in the simple stories willingly forget or soberly disbelieve the facts whereby the historians of our day have shown them to be well-nigh myths.

But they show no more. Our old belief has been destroyed, but we get no certain other in its place. Go back some four or five centuries only before the time of Philip the Macedonian king (a space no greater than from our time back to our second Richard), and the guides of our written history disappear, and their accounts are lost in the dark and gloomy fable.

How shall we recover the lost chapters of our early race, peoples of whom the Bible gives us but uncertain glimpses, of whom the Father of History speaks only with dark and doubtful words?

Who shall tell us the deeds of, and what our nations owe to, that mysterious race who has left upon our country and every other in Europe, and in Africa, and in all Asia between us and India, those stupendous works which, in our utter ignorance of their authors, we call Celtic, or Druidical, or Pelagie?

How shall we find the solving of that riddle of the Western world—the sudden coming of a Northern race, whose ancestors and whose native country are alike unknown, and introducing or working out in a few years a state of civilization in Mexico and Peru, which was as much the astonishment of its first discoverers as it is now? Or how recover the annals of that people, one of the mightiest that ever overran the earth, who, Lycian, Etruscan, Greek, whoever they may have been, seem to have formed the groundwork of all that was grand in the nations of Greece and Rome? Not in the pages of history will they be found. Those pages have all been scattered to the elements thousands of years back; and if ever their annals are recovered, it will be by the records of the arts, as it has been with Assyria and with Egypt.

And not only will this be from the characters on the walls (the Greek-like writing of Etruria) the Runic lines of the Druids. There is not an ornament, a moulding, a change of style in the sculpture or the painting that will not come to the aid of the careful student. It will help to tell him what the race whose history he investigates has borrowed from the other known nations around. How it has improved or how deteriorated. For, strange as it may seem, the history of the races of mankind may be studied, and to some purpose studied, in a hold general way, by the traces which they have left in their architecture, their sculpture, their painting; and as the earth can be holdly marked into definite tracts of strata by the fossils they contain, so these fossilized artistic works of man will tell us truly of the extinct race who reared them. And the change of these races, as one swept over a country and dispossessed another, will be as plainly shown by the works they have left behind, as change from one fossil to another shows that we have passed from the strata of the silures to those of the oolites. We have no scale of time as yet in either case, but we have a scale of succession; and the help which that gives us is immense.

And thus it is that though the state of art in the early ages of the earth may at first sight seem scarce worth notice now, you will find its study of a deepening interest, although the name and memory of the earliest of the nations may for many a century have passed away.

It is the same with art of later date. You can tell in a Gothic building the nation by

whose artistic influence the mouldings were shaped, the sculpture cut. You can tell within a few years the time at which each part was done; and there is as much difference in the enjoyment of the beauties of a great cathedral or a village church by those who understand these things and those who do not, as there is between the feelings of a hotanist or geologist and of one ignorant of their arts, as they look at the splendours of a hotanic garden or the finest series of strata or of fossils.

But other questions still suggest themselves in studying the higher branches of the Fine Arts. One cannot carefully consider the details of the works to which I have alluded in Egypt and Assyria without being struck by the discovery that the earliest works of art are in many a case the best; that some luxuriansness of detail and many a grace, perhaps, were afterwards added; but that a force and energy were shown in the earliest works never exceeded in the latest. Now see what a new world this opens out to us. At the time when the patriarch Abraham and his tribe were wandering shepherdly, not only did there exist in the plains of the Tigris and Euphrates a civilization and advance in art which move our wonder now, but that, at that early time, art had advanced to almost the utmost monarchy ever carried it. What thought does that not give us of a distant world, far reaching beyond the narrow boundary fixed by our present knowledge, and how does that boundary which once appeared its utmost limit seem but a barrier hiding the times beyond?

Whence came this civilization and these arts? From some great and earlier nation still, the memory whereof has perished? Or was the Assyrian or the Egyptian itself the great primeval race? And did the art of those early times come gradually and painfully into being; or did it spring, as I believe it did, and as the legends of the Greeks would have it, in its full strength, all armed, as Minerva sprang direct from the god,—as little a creation of man's as language is?

Have we ever had, in any case, in any time, a clear authentic record of an advance in art and civilization from the lowest point to the highest? Is it not, rather, the result of all experience, that when a nation's art or industry has suffered change, it has come, not from the unassisted mind of the nation itself, but from some altogether different influence of another race, conquering or civilizing as the case might be, and bringing with them their own peculiar style of art to mix with or supersede the other?

We know no more of architecture in its beginning than we know of the origin of language; nor of any of the higher branches of intellectual knowledge, which seem to have been favoured gifts, from a higher Power than ours to some favoured nations. But we do know that, so far from art having gradually emerged, as a matter of ordinary progress, from the necessities of mankind, it is quite certain that it never has appeared at any time, except amongst those nations who have derived it direct from the banks of the Nile, the Euphrates, or the Ganges; and that these three came from the same source can scarcely be denied.

Wherever insulated from contact with these favoured nations, no power of mind or body has been able to raise up to a state very much beyond the savage any other race whatever. One exception may be cited, viz., the civilization of Mexico and Peru. But we are utterly ignorant of the conquering or civilizing races there, and the whole is, at present, an utter enigma. The arts rose, too, where they did rise, to perfection, not by a steady, gradual progress, but by a series of waves, as it were—suddenly rising to the summit, slowly curling over, and then, first hurriedly and then with more gradual course, sweeping over the sands of time: sometimes to be there altogether lost, and sometimes to be urged on again by some new force; but never from the same direction.

The story of the arts has ever been that of a nation's power and of all civilization, since records have existed; and a more fascinating study—one that would lead you to higher thoughts—I do not believe exist.

And now a few words to those who are about to make my profession a study.

The course marked out for them is a wide one—the history of the art of all nations; and truly it forms so clearly connected a series, that it is hard to say where one can stop with any definite mark. But I wish this all to be studied

as a history only; to be thought of just so much as, and no more than, in an architectural practice, the laws and usages recorded in history affect us now at our present time.

And above all, do not imagine that, because you have so studied, you can, at your pleasure, take up their several styles, and practise them, and make them your own. You may, indeed, be called upon to do so, as we all are at some time or other; but do not suppose that this is a matter of indifference, and that you can work in your own practice upon many styles with a chance of success.

Depend upon it, it is hard enough, as you will find, to excel in one only.

Now, when we are wandering in so many ways, and so much doubt is felt as to which is the right, it would scarcely be right for me to indicate the path; but what I wish to impress upon you is, that you should mark out for yourselves one clear, distinct, definite course of study in architecture and all that relates to it, and keep that one prominent in all you do.

Do, as all must do in other things who hope for excellence in them: fix your mind steadily upon one, and follow it to the utmost.

One word more, and I have done. Your course of study will embrace more than the mere history of an art. It will take in, too, its ordinary practice and all those several branches of knowledge connected with it.

It is only in a general way that I can teach them, for time will allow no more; but I would urge most earnestly upon you that you satisfy yourselves as you go on that you have obtained a solid groundwork in them; that you have clearly and distinctly understood the general laws of each. If not, consult the various authorities whom I shall indicate until you do so. Leave details, if need be, for future study, as time or occasion may suggest.

There is a vast difference between raising for yourselves an edifice complete in look but fragile in reality, and laying the foundation of a solid one, to be finished hereafter, thoroughly well, at your leisure.

And to conclude, speaking to those who have the battle of life to fight, and their own way perhaps to work, unaided, upward in a world where chance and talent go for much, but steady enterprise for more, I would say in the words of that Book which we all learn when young, but value perhaps at its full worth only in our riper years: "Whatsoever thy hand findeth to do, do it with thy might."

#### CHEMICAL RESTORATION OF ANCIENT GLASS.

ON this subject Mr. Crace Calvert, in his Cantor Lectures, has some observations which may interest our readers:—"It has been for a long time a disputed question," he says, "whether the stained windows we all admire in old cathedrals could be restored in such a way as to resume the brilliancy they had at the time they were placed there by the artists. At all events, there is now no doubt that this can be effected by the process discovered by my eminent master, M. E. Chevreul, as is proved by the application of it in connexion with the restoration of stained windows existing in a well-known church in Paris—that from which the tocsin of St. Bartholomew was sounded,—St. Germain des Prés. The process devised by M. Chevreul is highly practical; it consists in removing the stained glass from the windows, and dipping it for several days, first, in a weak solution of carbonate of soda of a specific gravity of 1.068, then washing it, and dipping it for several hours in a solution of muriatic acid of a specific gravity of 1.080. On the glass being washed and dried, it will be found as brilliant and beautiful as when it came from the hand of the manufacturer. M. Chevreul has found that the dim and dirty appearance which stained glass assumes by time is due, especially in large towns, to the various products of smoke being first condensed on the glass by fog and rain, and then, becoming oxidized, they act as a cement to various mineral matters, such as chalk, gypsum, oxide of iron, &c., which help to impoverish the transparency of the glass. The alkali acts upon the organic matter and dissolves it, while the muriatic acid removes the minerals. The durability of glass placed in our monuments is extraordinary, when we hear in mind the curious results published some years since by the eminent chemist, Pelouze, who observed that

when window, bottle, and other varieties of glass were reduced to a fine powder, and mixed with water, they were soon acted on, yielding a large quantity of silicate of soda to that fluid, amounting in several cases to eight or ten per cent. In cold water, and even to thirty-six per cent. when the finely-pulverised glass was boiled in water, and that, in many cases, it was a definite compound which was dissolved from the glass, namely, a silicate of soda, composed of three equivalents of silica and two equivalents of soda. M. Pelouze explains the extraordinary difference in the effect which water produces on glass when in large masses or plates, as compared with its influence on the same substance when reduced into a fine state of powder, by assuming that, in the first instance, water does not act because it seldom remains sufficiently long in contact with the glass to act upon the elements which compose it; while, in the second case, there exist numerous points of contact between the fluid and the solid body, thus facilitating the action of the fluid on the solid material. I am inclined to think that the peculiar molecular condition which the surface of glass assumes, when manufactured in plates or otherwise, must exercise a great influence on the property which glass has to resist the action of water. If it were not so, how could be explained the limited action which watery fluids, such as wine, cause upon the interior surface of a bottle, though they remain in contact for many years? I can conceive glass assuming a peculiar surface by the pressure of the atmosphere, thereby producing a homogeneous one susceptible of resisting the action of water. A similar instance occurs in the case of polished steel, or of the rolled surface of wrought iron, or the skin of cast iron, which resists the chemical action of either air or acids in a far greater degree than does the interior of the substances which compose those metallic bodies.

THE STAFF OF A BISHOP IN THE ROMISH CHURCH.

RESTORATION OF THE CITY CROSS, WINCHESTER.  
 Sir.—“G. M.,” who writes from the *Charterhouse* to “*Sylvanus Urban*,” regards as a “groundless objection,” but fails to disprove my opinion, to which you kindly gave expression, that it is a mistake to represent, or rather misrepresent, a bishop with the pastoral staff in his right hand.  
 My remark was entirely practical, and, I believe, incontrovertible, being grounded on the highest authority, namely, the Pontifical and the Ceremonial by which the bishops themselves are guided. Episcopal functions do not depend on the evidences of sculpture or painting, whose value as authorities is precisely commensurate with the amount of knowledge which inspired their respective authors.  
 “G. M.” identifies the crozier with a crutch or walking-stick. For the disposal of this bright theory I may refer him to Bona and Durandus. He asserts that, “when passing in procession up the church to his episcopal station in the choir, the bishop naturally held the crozier in his right hand, to steady his step,” &c.  
 The Ceremonial (lib. i., cap. xvii.), on the contrary, directs that the bishop should use his pastoral staff in his own city or diocese; and that, in processions, if the distance be long, it may be borne before him by an attendant, who will carry it with both hands; but, if the way be short, the bishop himself will carry it in his right hand,—which is to be understood, when the bishop is vested in cope and mitre (“*nam mitra et baculus pastoralis in episcopis sunt correlati.*”)  
 If the bishop be vested in *chasuble*, we are guided by the Ceremonial for Pontifical High Mass, which reduces the question to a narrow compass (lib. ii., cap. viii.; lib. i., cap. xvii.). The bishop with the pastoral staff in his left hand, the crook turned towards the people, when he proceeds from the sacristy to the altar, from the altar to the throne, and from the throne to the altar, &c.; thus leaving the right hand at liberty to bless, to give, or to receive.  
 I may repeat the conclusion, by no means “groundless,” derived from the Pontifical, that, at the consecration of a bishop, the pastoral staff is placed in his left hand by the consecrator, and that it is subsequently so held,

with very few exceptions, easily to be enumerated, in which the pastoral staff is supported by both hands. Moreover, that it is satisfactory to be correct, and very poor consolation to be able to cite precedents for blunders.

C. A. BUCKLER.

COMMUNICATION BETWEEN PASSENGERS AND GUARDS.

Sir,—It is much to be deplored that no practicable method has hitherto been brought into use to avert the frequent railway accidents and collisions that are taking place, and the fearful loss of life resulting therefrom. I have suggested a fog-bellows for the means of communicating with passengers and guards. The bellows are about the size of a kitchen bellows, and so easy to blow that a child may blow them with ease. I would suggest that a bellows should be placed in every carriage, with printed directions when to blow, and a penalty for blowing without occasion; the first from the guard to blow one, and continue to blow one till the guard has his attention directed to it, and communicates with the engine-driver, by means of a bell, to stop the engine as soon as practicable; the second to blow twice, and the third three times, &c. Every express carriage should have two.

RICHARD LIMBURY.

TO DESTROY ANTS.

I HAD the basement story of my house fearfully infested with ants. I tried all kinds of means to destroy them without avail: it then occurred to me to syringe all the parts infested with fluoric acid, which I did, and the effect was marvellous. In about one hour after there was not an insect to be seen alive,—it entirely destroyed them. I may also say that I syringed the same places afterwards with spirits of tar, commonly called oil of tar. I did this about three years ago, and have been quite free from these annoying insects ever since. I use the tar and acid in my profession, therefore I had no difficulty; but should any of your readers find it difficult to procure the fluoric acid, I presume sulphuric acid would answer the same purpose. But if fluoric acid be used, it must be done with a leaden syringe; a glass one would not answer, the acid would soon destroy it and its own chymical properties.

CHARLES A. GIBBS.

Stained Glass Works.  
 \*.\* Hydrofluoric acid is also painfully destructive to the skin, and requires very careful management; as, indeed, though in a less degree, does sulphuric acid.

SANITARY CRIMINALS.

MR. EDITOR,—I have perused your note on Shrewsbury, and, after a deal of hattling and floundering in past years, I find you have hit on the sovereign remedy at last—the rope, ay, the rope. To such a pitch are we arrived and arriving, that, take my word, nothing but the rope will put an end to sanitary as well as social disorders: it is the grand panacea; once remove the cause, and the effects will cease. Go on, then, sir, to advocate the rope, and let those who have inflicted this mass of misery, sanitary and social, and whom no preaching or teaching has hitherto moved to their duty, feel the penalties of their misdeeds and taste the rope, the glorious rope, that has been effective upon great criminals as well as small.

A WELL-WISHER AND EXONIAN.

CIRCLES OF STONES.

At the recent meeting of the Wilts Archaeological Society, a paper on the Geology of the Stones at Stonehenge was read by Mr. Cunningham, F.G.S., who first pointed out the erroneous statement that had been made on the subject at various times, and showed the difference between the sarsen stone and the oolite.  
 On the second day an excursion was undertaken to Stonehenge, Old Sarum, Stratford Church, Woodford Church, Great Durnford Church, Ogbury Camp, Lake House, and other places being noticed on the route. On the arrival of the party at Stonehenge, Dr. Thnmann,

of Devizes, came forward and gave an explanation of its principal features. In reference to the projected raising of the trilithon and altar-stone, which he said had been suggested by the British Association, and which had brought their society into so much notoriety within the last few months, he was of opinion that it might have been done without endangering the structure in the least. If they had placed the matter in the hands of competent engineers, the altar-stone might have been undermined, and this have been the means of eliciting much valuable information, without endangering its safety.

Mr. Parker reminded the meeting, that in the Oriental languages a circle of stones was called a gillgal, and in Scripture there was every reason to believe that such a place was a circle of stones. A gillgal was a temple where holy rites were celebrated, where the army met together, and was also used for a place of burial for the chieftains; and if they put all things together, and took into consideration that the Celtic tribes were sprung from Oriental origin, it was clear that Stonehenge was a gillgal, and was erected for the purpose of celebrating holy rites, a place where the army met, and where the chieftains were buried. They might, therefore, call it a burial-place, or a House of Commons.

HAMPTON COURT PALACE.

As an instance of how rapidly things pass “out of mind” when they are “out of sight,” we may mention that the recently uncovered tapestries at Hampton Court, and of which many persons speak as if they were altogether new discoveries, have only been hidden from view for about thirty years. In a small guide-book to Hampton Court, published in the reign of William IV., these tapestries are described as to be seen on the walls of “Her Majesty’s Gallery,” showing that the pictures had not then been placed over them. While speaking of guide-books, a word of praise may justly be given to the exceedingly well-compiled little manual now sold within Hampton Court Palace, at the small charge of sixpence. This clever little handbook gives a curious amount of interesting and pertinent information; and the directors of many another picture-gallery might advantageously take a lesson from “The Stranger’s Guide to Hampton Court Palace.”

FROM SCOTLAND.

Airdrie.—Two public drinking-fountains have been inaugurated here. One is the gift of Provost Forrester. It was executed by Messrs. Walter Macfarlane & Co., of the Saracen Foundry, Glasgow. It is erected in the centre of Graham-street, opposite the Royal Hotel, and consists of a column, or centre-piece, furnished with a saucer-like reservoir, into which the waste water runs. Above the taps is the figure of a pelican, which occupies the centre of an arch with four sides. This arch is surmounted by a canopy of ornamental work, in which are fixed four shields, on two of which is inscribed the name of the donor; and on the other two shields figure the burgh arms. A large lamp crowns the whole. The extreme height is from 18 ft. to 20 ft. The other fountain is the gift of Mr. Patrick Rankin, of Auchingray and Otter. It has been designed and executed by Messrs. George Smith & Co., of the Sun Foundry, Glasgow. It is in the Early Decorated style. The base is an irregular octagon, and projects from the broader faces into a cruciform shape, at the same time providing bases for four embossed shafts, with floriated capitals, thus forming a clustered column. These four small columns carry four brackets. These, with the centre octagonal column, support a circular basin, simply ornamented by a projecting dog-tooth on the outer edge, and a twisted head on the inside. From the four trusses, or brackets spring four floriated buttresses, forming a support to the centre column, which rises from the basin in a series of mouldings, in which, at the junction of the four stays, is the chamber from which the water is supplied by four taps in the space between the stays. Here the shafts supporting the superstructure take a slightly tapering form, some 4 ft. high, terminating in a moulded and coronated cap, from inside of which rises a floriated pierced circular bracket, of an O G form, for supporting the canopy. On this circular band, at equal distances, are placed four small lambs. The

Gentleman’s Magazine, October, 1865, minor correspondence.

canopy takes a simple curved outline for some little height, and the plainness, which would otherwise be apparent, is relieved by a number of goblets filled with tracery, and surmounted by small finials. An open fret gives relief to this heavy portion, and terminates in a small dome, surmounted by a lamp. This fountain has had the site of the old cross, where four roads meet, assigned to it.

### METROPOLITAN BOARD OF WORKS.

At the last ordinary weekly meeting of this Board, the following proceedings took place:—

#### City Improvements.

Mr. Pollard, the clerk to the Board, read a letter from the City Commissioners of Sewers, stating that some of the houses were about to be removed at the corner of Gracechurch-street and Lombard-street, and that they had communicated with the Fishmongers' Company, with the view of widening those streets. That company had offered to sell the ground wanted for 8,000*l.*, and the commissioners asked the Board to contribute.

The letter was referred to the streets committee.

#### Ventilation of Sewers.

Mr. Bazalgette said the Board had received various plans for the ventilation of the sewers. They were under consideration.

**Thames Embankment Works—Low Level Sewer, North, &c.**

Mr. Bazalgette brought up his monthly report on the progress of these works, which stated as follows:—

"North side of Thames (Contract No. 1) between Westminster and Waterloo Bridges.—About 1,415 ft. in length of timber coffer-dam have been either completed or are in course of construction, and about 1,766 ft. in length of caisson dams are sunk, or in process of sinking. Structural works of concrete, brickwork, granite, and other masonry, &c., are in various stages of progress within a length of about 1,074 ft. of dam, and preparations are made for excavating within a further 470 ft. of dam. A part of the works, 723 ft. of the Low-level Sewer, 284 ft. of the flushing-sewer, and 1,600 ft. of the 4 ft. by 2 ft. 9 in. brick sewer for intercepting small drains, &c., have been completed, and about 571 ft. of the subway have now been completed, or are in a forward state. The works at the Westminster steam-boat pier have been for the most part brought up to the level of the subway, and the river wall and works adjoining are in a still more forward state. About 375,500 cubic yards of material have been filled in behind the embankment either from the land by means of carts, or dredged from the river and barged to the works. The approximate value of the whole of the foregoing, including the material and plant upon the ground, is 215,905*l.*, of which the sum of 45,324*l.* is for the progress made by Mr. Furness in the past two months. Of the total amount, the proportionate sum of 97,216*l.* is for works, 36,327*l.* for materials, and 92,368*l.* for plant.

**Thames Embankment (Contract No. 2) between Waterloo Bridge and Temple-gardens.**—The coffer-dam forming Somerset House, and extending from the west end of this contract, near Waterloo Bridge, is completed and made watertight. The dam at the eastern end is also fast approaching completion, and thus, by the completion of both dams, the entire length of works will shortly be enclosed from the effects of the tide. The construction of the Temple steam-boat pier is being rapidly pushed forward. Since my last report, 11,420 cubic yards of excavation have been removed, and 5,340 yards of concrete filled in, 167 rods of brickwork constructed for the low-level sewer and subway, and 7,366 cubic feet of granite bedded for the river wall. The approximate value of the whole of the works completed, and of the material and plant upon the ground, is 144,871*l.*, or 13,145*l.* for the progress made by Mr. Risson in the past two months. Of the total amount, the sum of 83,654*l.* is for works, 20,880*l.* for materials, and 39,017*l.* for plant.

**Low-level Sewer.**—The total length of the main line of sewer completed is about 2 miles 1,385 ft., and of the Old Ford branch 3,231 ft., making in all a completed line of about 3 miles of sewer. The works under the river Lea, from their nature necessarily progress but slowly, but, at the same time, they are proceeding safely and satisfactorily. The total approximated value of the completed work is 144,118*l.*, of which the sum of 26,666*l.* represents the work done by Mr. Webster in the two past months.

South side of the Thames.—The Thames Embankment works have been commenced.

Greenwich and Deptford Sewers.—These works are now virtually completed.

The report was approved.

#### Increase of Engineers' Salaries.

Mr. Pickett moved that certain resolutions of the Board, fixing the salaries of the chief engineer and his assistants, be rescinded, with the view of increasing their remuneration. He proposed to raise that of Mr. Bazalgette to 2,000*l.* a year.

Mr. H. L. Taylor moved that the whole question be referred to a committee of the whole Board, and report.

After a long discussion the amendment was carried by a majority of 26 to 3.

#### The Thames Embankment Contracts and the Contractors.

The engineer brought up his replies to the questions that had been put to him by Mr. H. L. Taylor, relative to the Thames Embankment contracts, on Friday previous. They were as follows:—The contract No. 1, amounting to 620,000*l.*, for No. 2, 225,000*l.*. The date of the order to commence No. 1 was the 10th of February, 1864, and the contractor was bound to complete it within a period of two years and six months. The order for commencing No. 2 was dated the 19th of March, 1864, and the contractor was bound to complete it in two years. The contractor did not obtain possession of the wharfs and ground necessary until some time after the date of the engineer's orders; and there were other causes of delay, for which the contractor was not responsible. The penalty for the non-completion of the work at the specified time was 1 per cent. on the amount of the tender for each and every week that might elapse between the appointed and the actual time of completion. That amounted to 2,500*l.* per week on contract No. 1, and 2,250*l.* per week on contract No. 2. The value of No. 1 contract, including plant and materials on the ground, was 215,905*l.*, which showed a monthly progress of 11,363*l.*. The amount required in

future per month to complete the contract within the time specified, extra included, was 27,645*l.*. The value of the work done on contract No. 2, including plant and materials on the ground, amounts to 144,871*l.*, which showed the amount of the progress per month to be 8,048*l.*. The amount required in future to complete the contract within the time specified was 14,021*l.*

In reply to a question.

The Engineer further stated that the value of the works done in the last two months amounted to 45,000*l.*

Mr. L. Taylor moved that the statement of the engineer be entered upon the minutes.

Mr. Carpmal said, that at the rate they had been going on they would complete the works in the time specified.

Mr. Taylor said he was credibly informed that it would be years before the works would be finished.

Mr. Bazalgette said the delay might be a few months, but certainly not years.

The motion that the statement be entered on the minutes was agreed to, and the engineer was ordered to add a report of the state of the works to it.

### CHURCH-BUILDING NEWS.

**Hollington (Sussex).**—The foundation-stone has been laid of a new church, to be called St. John the Evangelist's, for the accommodation of the inhabitants of a large district of the parish which has sprung up within the past few years. The site is about two miles and a half to the north-west of Hastings, on a rising ground to the right of the road which leads to Beaupont and Battle, and just beyond Tivoli. It will be in the Gothic style, and capable of accommodating about 400 persons. Mr. Edward A. Wyon was the architect of the design chosen out of five submitted for approval, and the tender of Mr. John Howell for 3,342*l.* was accepted.

**Leicester.**—The chief stone of the new church of St. Matthew the Apostle in Chester-street has been laid. The edifice, which is in the style of the fourteenth century, will consist of nave, 84 ft. 6 in. by 30 ft.; north and south aisle, 84 ft. 6 in. by 20 ft.; chancel, 86 ft. 8 in. by 26 ft.; and chancel aisle, 26 ft. 8 in. by 22 ft. The tower will be at the south-east angle of the building, with vestries under it. The height of the spire will be 220 ft. to 230 ft. The church will be built of Montserrat stone, with brick dressings. The principal entrance will be at the west end of the nave, and another entrance will be provided at the south porch, and a private entrance is to be placed for the clergymen at the north side. The architect is Mr. Scott, and the contractor, Mr. J. W. Tims, of Stamford. The whole of the works, which are expected to be completed in November, 1866, are being conducted under the superintendence of Mr. Saville, as clerk of the works. It is calculated that the building will accommodate 1,100 persons.

**Wolverhampton.**—The restorations of the collegiate church of St. Peter, in this town, have been completed, and the church re-opened. In the nave the clerestory has been rebuilt, and a new roof erected, in substitution of that previously existing. The new roof is in the Perpendicular style. The material used is English oak. A new oak roof, of plainer design than that of the nave, has also been placed on the north aisle. The south aisle roof is likewise entirely new. The porch has been restored, and a new parapet added. The lead-work of the tower has been repaired, and new parapets and pinnacles have been erected. The surface of the tower required but little repair, that part of the church being built of a superior kind of stone to the rest of the building. The west front is new, and constitutes one of the main features of the building. It replaces a restoration of a few years previously, combining anomalies, in an architectural point of view. In the north transept, the "very beautiful roof," as the architect describes it, has been repaired. In a niche in the transept has been placed a full-length statue of John the Baptist, in Caen stone, executed by Mr. Earp, of London. A new roof, corresponding with that of the north transept, replaces the previously-existing covering of the south transept. The whole of the windows have been re-glazed. An improvement has been effected in the drainage. In the interior of the church, an old organ-gallery at the east end of the nave has been removed, and a floor under the tower cut away, thus opening a view from the western door to the end of the chancel. The piers and arches under the tower have been restored. In the nave and north and south transepts the walls, which had been disfigured years ago by whitewash, have been scraped and restored, and the warm facing of the red sandstone is now exhibited as in the early history of the church.

In the side aisle the old plaster has been removed, and new put on in its place. A hot-water apparatus has been introduced, as a substitute for the stoves formerly employed for the purpose of warming the church. The side-walls of the new chancel stand on the old foundation; but the present chancel is longer than its predecessor, by reason of its having an apsidal ending. The walls exteriorly are constructed of stone of the same kind as that used in the other portions of the church; and, in the interior, above the string-course of the windows, they are finished with the same material. The roof is open-timbered, and of English oak. The roof of windows of the apse are filled with stained-glass, each of two main lights and tracery, of the Early Decorated period, the whole forming a public memorial of the late Mrs. Parke, of the Deanery. The windows are designed to illustrate the mission of our Lord upon earth, and that of his apostles, St. Peter, either by his figure or in emblems (as the patron saint of the church), being always borne in mind, subservient to our Lord, of course. The outer windows, north and south, are of single figures, four figures in each window. The four on the north side represent the Gospel writers, St. Matthew, St. Mark, St. Luke, and St. John; and the four on the south side the Epistle writers, St. James, St. Peter, St. Paul, and St. Jude. These figures are placed upon a diapered curtain background. The main lights of the remaining windows of the apse contain a consecutive series of subjects from the life of our Lord:—1. The Nativity; 2. The Epiphany; 3. The Baptism; 4. The Transfiguration; 5. The Call of St. Peter; 6. The Agony in the Garden; 7. The Crucifixion; 8. The Resurrection; 9. The Last Supper; 10. The Appearance to St. Mary Magdalene; 11. The Denial of St. Peter; 12. The Charge to St. Peter; 13. The Ascension; 14. The Descent of the Holy Ghost. The cost of the windows was about 500*l.* The first window eastward in the chancel and on the south side is of a memorial character. It was erected in commemoration of the death by drowning of the Rev. T. H. Campbell, his wife, and five children, at Dnened, in New Zealand. In the main part of the centre is a single figure, nearly life-size, of Our Lord Walking on the Sea (St. Mark, vi. 50); above Him, a cross of stars, to represent the constellation of the southern cross, the sign of the southern hemisphere; on the left, Noah, with his ark behind him, as a symbol of resurrection, and especially from a watery grave; to the right, St. Peter, with a net, as a fisher of men. The lower portion of the window is filled with groups: under Noah, Noah's Sacrifice (the rainbow intended as a symbol of covenant with God); under our Lord, His Blessing Little Children; under St. Peter, our Lord's charge, "Feed my Sheep." All these windows are the production of Messrs. O'Connor, of London. The other windows of the chancel are of ordinary glass. The restoration was planned by Mr. Christian, of London, and the works have been executed, under his superintendence, by Messrs. G. & F. Higham, builders, Wolverhampton.

**Leintwardine.**—The parish church has been re-opened. The restoration has been carried out according to plans prepared by Mr. Nicholson, the diocesan architect. The first work was to rid the church of its galleries and the seats in the nave, the former being abolished entirely, and the latter superseded by low, open seats of red deal, stained and varnished. The roof and the pillars of the aisles and the walls have been cleared of whitewash. This operation disclosed to view in the roof of the nave some oak carving of the fifteenth century, which has been restored by Mr. Merrick, of Hereford, who was the contractor for the whole of the interior work. The roof of the north aisle has been restored, but that of the opposite side has been replaced by a new one. The roofs, being nearly flat, were covered with lead, which was found to be in a very rotten state; and this, therefore, has been removed and new substituted. The masonry of the walls has been freshly pointed and restored. The principal alteration internally has been, perhaps, the elevation of the chancel arch. The church will now afford accommodation to 600 or 700 persons. The contract for the exterior work was taken by Mr. Taylor. The total cost of the work, we believe, is about 2,200*l.*, which is exclusive of the repair of the tower, which will be commenced as soon as the funds in hand will justify. During the excavations for laying the new floor of the church, there were brought to light a number of encaustic tiles bearing the arms of the family of Hugh de Mortimer, who, as an ancient document informs us, gave the parish church and other properties to the Abbey at Wigmore.

THE THEATRE.

**Princess's Theatre.**—Whatever objection may have been felt on the first night to Mr. Reade's drama, "It is Never too Late to Mend," it now "goes" successfully from beginning to end. The second act, showing what has been done at times in our prisons, is not so agreeable as the rest of the piece; but it tells a useful story, and may serve to disabuse that portion of the public who have taken it into their heads to believe that to be sent to jail now-a-days is no punishment. The piece was played for some time in its present shape in Manchester, where Mr. S. Calhaem acted, as now, the *Australian Jacky*. Mr. Vining plays *Robinson*, the reformed thief, with great vigour and force; and Mr. Dominick Murray, Mr. T. Mead (better known in the East than the West), Mr. J. G. Shore, and Mr. F. Villiers, also merit commendation. Mr. F. Lloyds has again produced some very striking scenery, especially "The Grove Farm," with all the adjuncts of farm life, the interior of a "Model-prison" and a "Ravine," in Australia. The last is seen under three aspects,—moon-light, the rise of morning, and the setting sun, and is very artistically constructed and painted.

**English Opera, Covent-garden.**—The management have put forth a very promising programme. The house will open on the 21st, with an English version of Meyerbeer's "*L'Africaine*," the libretto translated by Mr. Chas. Lamb Kenney. A new opera by Mr. Henry Leslie, called "Ida," will be produced early in the season; an opera by Mr. C. Döfler, called "Christmas Eve" and a version of Felicien David's "*Lalla Rookh*." A grand ballet, too, will be early given. The list of artists engaged includes Miss Louisa Pym, Mlle. Ida Gillies, M<sup>me</sup>. Sherrington, Mlle. Florence Lancia, Mr. Chas. Adams, Mr. Haigh, Mr. Alberto Laurence, Mr. Henri Corri, and other well-known names. Those who desire to see an English Opera House established, where English composers and English singers may get a fair hearing, should support the present undertaking.

Miscellanea.

**THE LATE MR. JOHN BROWN.**—We mention with great regret the untimely death of this clever sketcher and earnest labourer in sanitary matters, of whom we took occasion to speak only a fortnight ago. He had been ill, but was better, and went down to Southampton last week to learn something of the sanitary condition of the town. By an accident, the exact particulars of which have not reached us, he fell from the quay into the water; and, though he was rescued and rallied, diarrhoea set in, and he died the next day. He appears to have been kindly attended to by Dr. Cooper, and by Mr. Mabb, of the Platform Tavern. He has left a widow and several young children utterly destitute.

**DUBLIN EXHIBITION AWARDS.**—There has been a ceremonial in the Exhibition building, on the occasion of the declaration of the awards of the jurors. The Duke of Leinster presided. Addresses were delivered by the Duke of Leinster, Earl Russell, the Earl of Meath, Lord Houghton, the Lord Mayor, the Lord Chancellor, and Sir J. Peel. The price of admission was half a crown, notwithstandng this charge there was a large assemblage. The building was brilliantly lighted up. The medals not being yet ready, the proceedings were necessarily confined to an announcement of the awards.

**INTERPRETATION OF CONDITIONS OF SALE.**—On a sale of lands, by one of the conditions of sale it was provided that, in the event of the purchaser making any objection to the vendor's title within a certain time, the vendor might, at his election, either rescind the contract on repayment of the deposit money without interest costs, or negotiate with a view to the removal of the objection; and by a further condition it was provided that any such negotiation should not prejudice the vendor's subsequent right to succeed. In this case (*Gardour v. Lee*) where, as the purchaser making an objection to the vendor's title, the vendor declared the objection abandoned and held the purchaser to his contract, it was held by the Court of Exchequer that this operated as an election on the part of the vendor not to rescind, and that he could not afterwards rescind on repayment of the bare deposit, but was liable for interest and costs at the suit of the purchaser.

**TRADE BOOKS.**—Messrs. Cottam & Co., of Winsley-street, have recently issued two catalogues which will be found useful; one of Stable Fixings, the other of Balconets and Railings for Tombs, graves, and chancels. The prices are given, and the drawings are to scale. Some of the designs for railings are exceedingly satisfactory. In respect of good workmanship the Messrs. Cottam need no commendation from us now.

**BIRKENHEAD IMPROVEMENTS.**—On Tuesday, the Birkenhead commissioners agreed to expend 21,300*l.* in the construction of a new road, to extend from the upper end of Hamilton-street and join the Happy Valley-road, made by the Tranmere Local Board. The new thoroughfare is to be called the Borough-road, and will give ready access from Woodside Ferry to the heart of a suburban district, which is already being rapidly covered with houses. The design includes a large square at the junction with Hamilton-street, which will probably be used as a hay and straw market.

**SHOREHAM CHURCH.**—It has been resolved by a few of the most influential parishioners to restore the entire building,—a work which, it is thought, can be accomplished for 8,000*l.* or 9,000*l.*, the expense being considerably curtailed by the circumstance that the whole of the old foundations have never been disturbed, and are available for the work of re-building. To consider the matter and bring it more prominently before the public, a vestry meeting was called, and has passed resolutions approving of a report prepared for presentation to the meeting. The plans were executed in 1853 by Mr. E. Carpenter, architect. A committee has been appointed by the vestry to carry out the objects of the meeting.

**PLYMPTON ST. MAURICE, DEVON: MEMORIAL OF SIR JOSHUA REYNOLDS.**—A desire has been expressed that some worthy memorial of Sir Joshua Reynolds, in this his native place, should be erected; and a window in the church, it is thought, will be at once the least expensive and most durable. At present, the visitors from all parts who come to Plympton as the birthplace of Reynolds, find little to remind them of him. The small town has a somewhat picturesque appearance, owing to some of the houses being built upon pillars, and thus extending over the footpaths. The grammar-school, where Sir Joshua was not only educated, but born, is almost shut out from view by a high wall, and is in bad repair. It is hoped that the Charity Commission will shortly expend in the repair of the building. The church itself requires a considerable outlay, and a committee has been formed, who hope to be able to do some portion of the restoration in the spring. A number of the very wealthy possessors of Reynolds's pictures, it is hoped, will be willing to aid the committee, of whom the perpetual curate, the Rev. Percy Nicolas, is a member, with some small sums—say 10*s.*—from each person. Mr. Henry Graves, 6, Pall-mall, London, who has subscribed 5*l.*, will receive subscriptions.

**THE HAWKS MEMORIAL.**—Shortly after Mr. Hawks's death the workmen of the Gateshead Ironworks resolved to design a monument to his memory, and various designs were submitted for that purpose. Ultimately one by Mr. J. Craggs, of the firm of Messrs. Craggs & Sons, of the Percy-street Marble Works, was selected. The artist is a native of Gateshead. The memorial consists of a statue of the late alderman on a pedestal, on either side of which is a drinking-fountain. The figure, which is 7 ft. 3 in. high, has been cut out of a block of Sicilian marble, which originally weighed about 7 tons. Mr. Hawks is represented in his official costume as mayor of Gateshead. The pedestal, which is formed of Pruddon stone, is about 14 ft. high, and rests upon a large double stone platform, the second layer being less, so as to admit of an approach to the plinth by a step. On either side of the monument the drinking-fountains are placed. The fountains are of iron, with basins of Sicilian marble, which are supported on pedestals of Pruddon stone. The fountains work upon a principle patented by Mr. Macfarlane, of Glasgow, the water being obtainable by pressing the drinking-cup against a button spring in a socket immediately below the supply pipes. Two cups are attached to each fountain, and are so suspended by chains that they cannot touch the marble basins, which therefore will not be injured by the cups being thrown upon them.

**THE THAMES EMBANKMENT.**—Within the last few days the cofferdam fronting Somerset House, and extending to the west end of No. 2 contract, near Waterloo-bridge, has been completed and made water-tight. The dam at the eastern end is also fast approaching completion; and thus by the completion of both dams the entire line of works will shortly be inclosed from the effects of the tide.

**CONCRETE.**—Sir: In your last number you speak of arches in concrete, the walls being 13 ft. apart. I have used this material exclusively, and in various ways, for many years. More than twenty years ago, at the residence of the Bishop of Exeter, Bishopstowe, Torquay, I arched, or rather groined, the whole of the cellars under the dining-room, &c.; also arches in the corridors (which receive the floor above), and the ribs under being constructed in the same manner.—JOHN MASON.

**COTTON AND LINEN TISSUES.**—Professor Boettger has discovered the means, by the aid of chemistry, of recognising the presence of cotton in linen fabrics. He takes a piece of the suspected cloth, about 2 in. by 2 in., and, after having unravelled both weft and warp, plunges it in an alcoholic solution of aniline and fuchsin. The superfluous colouring matter is removed by washing the piece of cloth thus dyed several times in water. If, while it is still wet, it be placed in a sancer containing ammonia, the cotton fibres will immediately become discoloured, while those of linen will preserve a fine red colour.

**COMPLETION OF THE PNEUMATIC DESPATCH RAILWAY.**—A train of two trucks, containing a quantity of goods, has been driven through the pneumatic despatch tubular line of railway, from the central station at the Bull and Gate, Holborn, to the terminus on the premises of the London and North-Western Railway, at Easton-square, the carriages on their transit passing beneath the crowded thoroughfares of Holborn, Oxford-street, Tottenham-court-road, the Hampstead-road, and Drummond-street, to their destination. The time occupied in running between the two stations, a distance of about a couple of miles, was some five minutes. The line is now ready for opening between Holborn and Easton.

**COAL MINE AT THE FOOT OF MOUNT OLYMPUS.** As soon as the discovery of coal in the neighbourhood of this classic mountain was communicated to the Viceroi of Egypt, he gave instructions for at once exploring the seam. The works were successfully carried out; and, after having reserved all the quantity necessary for the Azizto Company's steamers, the Viceroi offered to supply all nations with the combustible at 10 francs (8*s.*) per English ton, a lower price than that charged by any of the coal depôts existing on the shores of the Mediterranean. As coal can be transported from Mount Olympus and put in reserve at Suez at less expense than that fuel derived from any other source of supply, it is not improbable that depôts will be made for the use of the Red Sea trade in addition to the supplies that can be furnished to all Mediterranean steamers trading with the Eastern ports.

**THE WEST DERBY MAIN OUTLET SEWER, LIVERPOOL.**—At a recent meeting of the West Derby Local Board, it was reported that deputations from the main sewerage committee of the West Derby Local Board and the Walton Local Board had met to consider how the expenses of the main outlet sewer should be defrayed by the respective Boards, and that the deputation from the Walton Board had made a proposition to the effect that the total cost of the whole sewer should be defrayed by the two Boards in respect to their own acreage, and that the repair and maintenance of the sewer be paid for on the same principle. Mr. Pearson Lee's tender was recommended to be accepted. It was stated that the amount which would have to be paid by the West Derby Board for the work done in that township was 9,234*l.*, that being the estimate upon a low-level amounted to 12,760*l.*, the difference between these sums being paid by the railway company under whose line the sewer must pass in its progress across Prescott-road and Edge-lane. The proceedings of the committee were confirmed, excepting that part relating to the portion of the sewer in which the Walton Board was concerned, and which was referred back to the committee for further consideration.

CAMBRIDGE.—The new university club-rooms are being commenced, from a design by Mr. Waterhouse. Messrs. Jackson & Shaw, of London, are the contractors. Little Casterton freestone, a correspondent states, is to be used.

RAILWAY RETURNS.—The traffic receipts of railways in the United Kingdom amounted for the week ending the 30th of September, on 12,252 miles, to 754,508*l.*, and for the corresponding week of last year, on 11,915 miles, to 707,240*l.*, showing an increase of 337 miles and of 47,268*l.*

THE NEW COURTS OF JUSTICE.—The Commissioners of the Courts of Justice Concentration Site Act have taken possession of their official residence, at the old Insolvent Debtors' Court, in Portugal-street; and are causing notices to be served upon all persons having any interest in the proposed site for the erection of such courts. The following is the form of such notice:—"If after twenty-one days' date no claim is sent in, the Commissioners will proceed *ex parte* under the 21st and following sections to ascertain the value of such houses as may be required to be pulled down for the purpose of clearance."

THE NORWICH STRIKE.—The carpenters and joiners' strike, at Norwich, having continued for more than a week, a meeting of the master builders was convened at the Rampant Horse Hotel. The attendance was numerous, and comprised the principal builders in the city. Mr. J. W. Lacey having been called to the chair, it was unanimously resolved that the increased rate of wages demanded by the workmen be not paid until a sufficient time has elapsed for the completing of existing contracts, but that such increased rate shall be paid from the 1st of March next.

MEETING OF WOOD-CARVERS, BIRMINGHAM.—The general wood-carvers of this town held a meeting at the Rodney Inn, Hill-street, on Monday last, for the purpose of taking into consideration the best means of promoting the interest of their trade, which, for want of unity and combination, has fallen into a serious state of decay. It was shown by several speakers that an unfair and ruinous competition existed in most of its branches, which need not be the case if a friendly communication were kept up among them. After some consideration, it was resolved to amalgamate with the Cabinet Makers' Society of this town, and contribute to their funds, but the resolution was unanimously carried, and all present gave in their names to join the above-named society.

[ADVERTISEMENT.]

CHURCH, TURRET, and STABLE CLOCKS. J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tubes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 33 & 34, Ludgate-hill, E.C. Established 1749.

TENDERS

For additions to house at Mill's-pit, Hendon, for Mr. H. Baker. Quantities not supplied. Mr. Thos. Harris, architect:—
Barrat & Son ..... £302 7 0
Hall ..... 325 0 0
Howard & Sons (accepted) ..... 315 0 0
For alteration to premises No. 136, Regent-street, W., for Mr. J. Izzard, fittings not included. Quantities by Mr. Snull:—
Simpson & Son ..... £265 0 0
Longmire & Burge ..... 502 0 0
Moutrie ..... 832 0 0
Hall (accepted) ..... 850 0 0
For parsonage-house for Mortlake, Surrey, to be erected at East Sheen, on land presented by the Right Hon. James Stuart Wortley, under the direction of Mr. Hudson, architect. Quantities supplied:—
Sims ..... £2,162 0 0
Sewell & Son ..... 2,063 0 0
Goodall ..... 1,885 0 0
Sweet ..... 1,580 0 0
Nicholson ..... 1,780 0 0
Adamson & Son ..... 1,770 0 0
Bowling (accepted) ..... 1,300 0 0
For villa residence at Eltham, Kent, for Mr. W. Theakstone. Mr. Herbert Ford, architect:—
Rawlins (accepted) ..... £1,354 0 0

For the erection of three houses and shops, High-street, Slough, for Mr. Frederick Charley. Mr. H. Sargeant, architect:—
Atkins ..... £3,980 0 0
Watson ..... 3,785 0 0
Hayson ..... 3,750 0 0
Wilson ..... 3,642 0 0
W. Sargeant ..... 3,640 0 0
Liddiard ..... 3,564 0 0

For repairs, Galkfield House, Streatham-common. Mr. James Harrison, architect:—
Smith ..... £455 0 0
Colls ..... 350 0 0
Prosser ..... 302 0 0
Richardson ..... 288 0 0
Bastard ..... 140 0 0

For completion of the central buildings of the proprietary school, Tettenhall. Mr. Geo. Bidlake, architect:—
Barnsley ..... £1,954 0 0

For the erection of the Wexlin Hotel, Wellington, Shropshire. Mr. Geo. Bidlake, architect:—
Trow & Sons ..... £3,370 0 0

For works to house No. 26, Duke-street, Portland-place, for Mr. Hall. Mr. Bull, architect. Raising present story 1 foot, and building another story and repairs:—
Burke ..... £448 15 0
Duncanson ..... 437 10 0
Stephens & Watson ..... 431 0 0

For building villa residence at Finchley, for Mr. A. E. Marguerson:—
Hargers ..... £995 0 0
Howard ..... 982 0 0
Sivill ..... 965 0 0

For alterations and additions to two houses in Franchise-street, Hornsey-road, Holloway. Mr. D. Gylby, architect:—
Carter & Son ..... £1,570 0 0
Kent ..... 1,140 0 0
Gillet & Wisbey ..... 1,045 0 0
Macfarlane ..... 1,045 0 0
Palmer (accepted) ..... 1,038 0 0

For various alterations and repairs to No. 15, Charles-street, Middlesex Hospital, for Mr. Samuel Smith. Mr. F. F. Halseworth, architect. Quantities not supplied:—
Baugh & Bryant ..... £447 0 0
Tracy & Co. .... 418 0 0

For alterations and additions to No. 4, Park-green, Regent's Park, for Mr. C. J. Allen. Mr. W. J. Trehearren, architect. Quantities supplied:—
Robinson ..... £3,450 0 0
Sharpening & Cole ..... 3,333 0 0
Tracy & Cole ..... 3,048 0 0
Longmire & Burge ..... 2,850 0 0

For building a public house, corner of Pembroke-road, Kilburn, for Mr. J. Garrett, Messrs. New & Camings, architects. Quantities supplied:—
Williams ..... £2,608 0 0
Tracy & Co. .... 2,448 0 0
Ehha & Son ..... 2,400 0 0
Ferguson ..... 2,358 0 0

For house at Acton, for Mr. W. Davis. Mr. T. J. Hill, architect:—
Keys ..... £275 0 0
Anley ..... 227 0 0
Webster ..... 745 0 0
Edymann ..... 670 0 0

For the erection of a public house at Lordship-lane, East Dulwich, for Miss Amelia Hudson. Quantities supplied by Messrs. Pain & Clark:—
West & Morse ..... £2,048 0 0
Rogers ..... 2,020 0 0
Gales & Co. .... 1,809 0 0
Dover ..... 1,849 0 0
Sawyer ..... 1,871 0 0

For the erection of a pair of villas at New Malden, for Mr. G. Hinmus. Quantities by Messrs. Pain & Clark:—
Wardle & Baker ..... £1,480 0 0
Heath ..... 1,443 0 0
Gales & Co. .... 1,385 0 0
Parker ..... 1,312 0 0
Jones ..... 1,300 0 0
Viner ..... 1,300 0 0
West & Morse ..... 1,278 0 0
Lamble ..... 1,177 0 0

For the erection of house, shop, and warehouse, at Slough, for Mr. R. Griffith. Mr. H. Sargeant, architect:—
Snowball ..... £1,919 0 0
Edwards ..... 1,740 0 0
Watson ..... 1,600 0 0
W. Sargeant ..... 1,600 14 0
Harley (accepted) ..... 1,650 0 0
Liddiard (withdrawn) ..... 1,389 0 0

For erecting a tavern in the Albert-road, St. John's-road, for Mr. D. Tildeley. Mr. F. G. Widdows, architect:—
Kellond (accepted) ..... £1,800 0 0

For alterations and repairs to Bush Hill House, Edmonton, late in the occupation of the Dewagar Countess of Meath. Mr. F. G. Widdows, architect:—
Green & Son (accepted) ..... £2,796 0 0

For erecting a gardener's cottage, Ridge-road, Enfield, for Mr. Bathgate. Mr. F. G. Widdows, architect:—
Cushing (accepted) ..... £299 0 0

The best of references given. Apply to ALLEN & CO., 205, Great Russell-street, London, W.C.

# The Builder.

VOL. XXIII.—No. 1185.

## The Prevention of Strikes.

THE relations of capital and labour, between masters and workmen in the building trades, continue disturbed or threatened throughout the country; and in some branches of the trades, notice has been given to the masters, of a required advance of the rate of wages, to commence in the spring or summer of next year. Since our recent articles on the Prevention of Strikes appeared, nearly every one of the numbers of the *Builder* has recorded several instances of the disturbed relations; and, now, some amount of injury to both parties is rather probable, than the speedy establishment of a position conformable with the mutual interests. In certain cases, the dispute has arisen in some claim of the men to make regulations such as would in effect tend towards the formation of a barrier to each and every career at present open to individuals of the working classes: in other cases, the claim operating indirectly, yet certainly, would tend to reduce the demand for the sort of labour immediately in question, or at least where the labour of the particular agitators was not supplanted by that of other persons. An example of the first kind of position is afforded by the strike of the masons at Huddersfield, where, as mentioned by us, the request that the masters should not have more than one apprentice to five journeymen, if made and acceded to in all trades, would have placed 3,000 youths in the town in the position of inability to learn any trade. Generally, however, an increase in the rate of wages, as by one halfpenny per hour, is claimed, and on the ground that house-rent, and the cost of all necessities of life, have risen. There have been cases of intimidation of workmen by trades-unionists; but, for the most part, physical force has not been brought into play; and there have been disputes arising from peculiar and hardly defensible customs sought to be maintained; but, again, these form the minority. In short, it is impossible not to recognise, not only an improved tone in the demands, but also truth in much of what is adduced. More, it is evident that better study of the condition and claims of those who are called the industrious classes, than has been given on the part of the section of the community who are, or are in the position of, masters, is desirable and due. On both sides, a considerable amount of ignorance still prevails; whilst, on the part of the class which comprises the capitalist and the employer of labour, the ignorance has been presumed to exist only with the other class. But the capability of working-men to explain their own case, and to appreciate the arguments based on political economy, is increasing daily; and few even of those who are thoroughly interested in the condition of the artisan, and in the question treated by Mr. Mill, the "probable futurity of the labouring classes," can listen to some of those expostulations which we refer to, of the case, without being greatly advanced in the subject of study, thereby. Unfortunately, though it has been from the body

of workmen, that the greater number of those who are masters have sprung, the knowledge has not been the more accurate from the circumstance. The very kind of man who should be able to enlighten us respecting the just claims of the class to which he belonged, has too often a curious forgetfulness of everything except what concerns his new interests, or those which he views as such.

But were there at this juncture, the mutual respect or regard that we should like to see, it would not necessarily follow that the manifestation thereof should be in the form of an increase in rate of wages. We indeed desire that a greater amount of the comfort and harmless gratification that money helps to obtain, should be within reach of the working man; and, on the other hand, we can but observe that the comparison between results of the position of a skilled workman, and of that of a not better-paid clerk in an office, is often drawn correctly. Too frequently the former member of the community is badly housed, or lapses into pauperism, only because of the large proportion of his earnings that he spends on indulgences, and on amusements, costly, and not more serviceable as needful relaxation than those which are inexpensive whilst intellectually improving.

However the estimate of his necessities, the proper question for the workman must always be, whether an obtainable increase of wages is justified by circumstances of a demand for his labour. If not justified, there is absolutely no other resource except to find another pursuit, to emigrate, or change his place of residence, or to wait. Even should he plainly see the increase to be justified by the circumstances, it cannot be permitted that he should decide that it take place, unless in becoming an employer himself. These things are getting to be recognised as truisms by the working-classes themselves, to whom great credit is due for progress that is indeed being made in the comprehension as well as elucidation of the subject.

The obvious tendency of the increase,—we might say, even though prices generally of commodities had risen,—would be to diminish demand for the particular labour; and the retrograde course would be very soon commenced, were the increase to make the article produced altogether too expensive for the public purchaser, or were there immediate means of substituting new, even unskilled, labour, for the other. Now, it is exceedingly important, to themselves and the whole country, that those who are striving, with judgment or the reverse, should not leave out of consideration the possibility of a supply of both materials and labour being procured out of England. In certain handicrafts connected with building, foreign workmen have long been employed; we know that on the occasion of the most important dispute of recent years, masters in the building-trades were on the point of procuring labour from the Continent; and we have now patent to us the fact that railway companies, actuated by economy, have gone to France for locomotive engines,—as, previously, builders had gone to Belgium for cast or rolled iron girders. The London agents of Messrs. Schneider & Co., of the Creusot Works, in France, whilst offering to English firms foreign manufactured iron and machinery at less than English prices, were lately saying, as we reported, that it was obvious to every one that "by the operation of 'strikes' and 'lock-outs' alone, the great natural advantages of the English ironmasters" had been "considerably curtailed, and the carrying out of important undertakings sometimes jeopardized, and even altogether prevented." They added: "Other sources of supply, even though foreign, have therefore become a necessity of the times,"—having previously alluded to the fact of the use of foreign manufactured iron, even in the centre of the English iron districts, and to the supply of castings that

could not be made by the English founder, except with derangement of his appliances, and at greatly increased prices. The foreigners who are at present in England, as refugees, are numerous; as they have been at previous periods in our history,—the gain to art and manufactures having been considerable and permanent. Should the condition of certain parts of Europe permit many of these persons to leave us, the continuance of peace, and the progressing knowledge of countries of one another, will far more than fill the gap, and will cause the incidence of the operation of the laws of supply and demand as affecting labour like other commodities, to spread beyond boundaries of countries, and to be productive of an adjustment between the rates of country and country,—similarly to that between town and town, to which there is always a tendency; and no one anxious for progress throughout the world, would wish the circumstances to be otherwise.

Since the foregoing portion of our article was written, an illustration of one tendency to which we have alluded, has been afforded on the hearing, elsewhere mentioned, of a charge against two men, members of a trades-union, of intimidation of non-unionists. At the hearing, at the Mansion House, the Lord Mayor observed that were he a builder, he would "import a lot of foreigners." The men were sentenced to two months' imprisonment, with hard labour. It does not seem to have occurred to those who, like Professor Fawcett, have been lately stating the conditions subject to which workmen may lawfully combine,—any more than it has to speakers belonging to the working classes,—to show that there may be now this dilemma making itself felt; namely, that, whilst, on the one hand, intimidation is checked, and rightly so, by the law, or if successful in one trade tends to produce pauperism out of it; on the other hand, combination without intimidation will find itself powerless to control a rate of wages,—just as political economy would say,—and therefore may become of no use at all.

The present position of the question in the building trades is simply this. The men have given notice to the masters of a required advance: and it is assumed that this will be granted; that the masters, having been able to take the increase into account in their prices and contracts, will lose nothing, any more than the men; and that the measure is to be justified as in accordance with the rise before alluded to, in prices of all commodities,—and, we might add, with the growth of new desires that have become necessities, inclusive of some which the spread of education itself tends to produce. There is danger, however, of mistake on some of the points. The lessened price of certain things, as clothing, may have been left out of consideration; and should the cost of building be seriously augmented, it is just possible that the increased expenses thereby, for the producer of such requisites, would require the latter party to demand prices that would negative any gain to the working man. It is also possible that the proportion of work in building, to the hands requiring work, would be reduced as before suggested. There are other matters entering into the question, such as the increased cost of his own place of residence, to the building artisan; but there are so many weights to be picked up and marked with their values, and to be put into one scale or the other, that it is next to impossible for any one not a party in the question, to assume responsibility: the best must be made of the opportunities, which are not great, of the parties themselves, for predicting what will happen.

The profits of the undertakings in which a master and his men are engaged, may be regarded as a common fund, the division of which, under the now usual relations of the parties, is made by the master; and we do

\* See pp. 363 & 366, ante.

not lose sight of the view that, in this present system of administration, one party may be getting so large a share, that reduction could be made with little injury to him deserving to be named along with the benefit to the other,—cost of the article being left unannounced. But the object should be to arrive at the adjustment without even so much of threat as is covered by the notices that have been lately given to the masters. Each master must at present feel in the position of being called upon to reduce his profits, or lessen the extent of his business and the number of his workmen, or to subject himself to a strike, only differing from hundreds of strikes that have preceded, inasmuch as moral force and *esprit de corps* may have taken the place of intimidation and violence. We leave out of the question that the master might make different use of his capital, because we are not indisposed to think with some, that too much may have been made of that line of argument. Can therefore the sort of expectancy we have alluded to, be favourable to a kindly spirit on the part of the master, and to the interests, ultimate if not immediate, of the men? The "armed truce" which has hitherto existed continuously, too nearly resembles the state of war, to ensure a due regard on either side for the welfare of the other. Not saying that the right to combine, and to strike, should be taken out of the hands of workmen, we must observe that the master will not be served to the extent of the abilities of the workmen, nor will the workman be better than a bird of passage from one establishment to another,—denied work when his strength fails, and pauperized when he should be pensioned,—so long as the attitude of the parties resembles even that which we now witness.

In recent articles we discussed, as we had long previously, the question of the means open to the workman for bettering his condition, and mentioned different examples of a combination of the principle of co-operative societies with that of a limited liability partnership of the workmen with the master. One of our French examples was taken from one of the building trades; and after suggesting that, although it might not be possible, or to be desired, that such associations should entirely supplant the old relation of master and man, they would be valuable as well for establishing standards of wages as for the direct benefits to the members themselves of the societies, we asked whether there could be any difficulty in applying the principles that had guided several founders of similar partnerships in England, to the institution of these partnerships of masters and men in the building trades. Our advertising columns will have shown that one attempt at least is making to answer the appeal. We allude to the projected company of "Frederick Braby & Co., Limited." Generally, attention to the subject has increased. At the Social Science Congress at Sheffield, a paper was read by Mr. G. F. Holyoake on the "Partnerships of Industry,"—as, by some, the concerns are called which involve the new relation that we have referred to, between capitalists and workmen-producers, and under which the latter receive in addition to their wages, a share of the extra profits they create. The best English illustration which we were able to afford in our last article, was that of the company of "Henry Briggs, Son, & Co., Limited," for working certain collieries in Yorkshire.

Materials for elucidation of the subject continue to reach us from France. There is now edited in Paris, and published there and in Brussels, an organ of the co-operative movement, somewhat resembling *The Co-operator*. It is entitled "*L'Association: Bulletin International des Sociétés Co-opératives*." In a number now before us, we find particulars by M. Talandier, of the scheme of Messrs. Briggs, in continuation of others which had been supplied before our own appeared; and in the leading article, by M. Paul Blanc, there are passages expository of principles enforced, that should calm apprehensions which in some cases exist. We read, that the workmen in partnership ought never to make use of other labourers (*Les ouvriers associés ne devront jamais exploiter les autres travailleurs*). M. Paul Blanc continues: "We are all agreed upon this point, that the object of the partnership amongst working men [*l'association ouvrière*] is to keep for the workman the remuneration due for his labour. Let us say in passing, that this single idea, well comprehended, suffices to reject the so-called system of equality of salaries; after which, every one being treated equally, no one receives a

remuneration proportional to the value of the work furnished. Thus, the partnerships of labour are organisms which have for their mission to guarantee to the labourer the full and entire enjoyment of his property, that is of his labour." Whilst contending that workmen associated in a partnership should not make use of the labour of individuals not of the association, he equally considers that such individuals should not be regarded as having any natural claim to be admitted into any particular association. And he says it would be wrong to fear competition between associations; and that it should rather be to be feared that the competition might not exist.

In the *Presse* of the 5th of this month, mention was made of a conference of English, French, German, Swiss, and Belgian workmen, as having taken place some days previously in London, preparatory to a working-men's congress to be held in Geneva in May, next year, and to the foundation of an International Association of Working-men (*Association Internationale des Travailleurs*). Although the conference contrived to hold its meetings without our knowledge, we are inclined to think that good may arise from such discussion as is proposed, of subjects that we find in a list of twenty which are set down for the congress. Amongst them are:—Labour and its Sanitary and Moral Effects, and the universal obligation to labour; Work of Women and Children, in the sanitary and moral point of view; Want of Work, and the Means of remedying it; Strikes and their Effects; Primary and Professional Education; the Relations of Labour and Capital; Foreign Competition and Treaties of Commerce; Formation of an International Mutual Loan Fund; Co-operation distinguished from Partnership, property; Reduction of the Hours of Work; and others. The list bears marks of French origin, and is now the ground of controversy between the *Presse* and the *Sicde*; and the selection from it may serve to show that if labour could be brought by capitalists from one country to another, international study of the whole subject of the relations would be going on the while. The co-operative societies of France are favoured by the Emperor; and the Minister of Agriculture, Commerce, and Public Works, has just appointed a commission charged with an investigation of all the facts and data, in that country and elsewhere, concerning such societies.

The most important suggestive material since the date of our last article, has come to us from M. Leclaire, of Paris, the founder of the combined partnership and co-operative labour association, for house-painting, of which we gave some short account from materials then in our hands. It includes printed reports up to a very recent date, or later than our article; and in one of these M. Leclaire gives a complete history of his exertions for the welfare of his workmen, observations connected therewith, and a statement of results,—the whole being just now most interesting and valuable.\*

With the reports are other brochures connected with this subject, or that of the "Frauds of Painters" treated recently by us (with mention made of M. Leclaire), or connected with both subjects; for, all the particulars of the Association, with the regulations to be observed in the workshops, and in the execution of work; show that elevation of work are intimately connected, and to be served by the same agency. All that concerns the welfare of the workman, should interest the architect. Amongst the pamphlets of this year, which help to make manifest M. Leclaire's activity of mind, is a brochure on the Origin of Monetary Crises, and Means to be employed for Preventing them.† It preceded the presentation of a petition to the Senate.

Prices of work are given in separate pamphlets; and with them are explanations of the proceed.

\* "Entreprise de Peinture, Dorure, Tenture, Vitrierie et Miroiterie, Rue Saint-Georges, 11, à Paris. Compte Rendu par M. Leclaire aux clients de sa maison des résultats qu'ils lui ont aidé à obtenir pour le bien-être de ses ouvriers. Société de Secours Mutuels intéressée dans une entreprise industrielle. Participation de l'ouvrier aux bénéfices du patron. Paris: Imprimerie de Madame Veuve Bouchard-Huzard, Rue de l'Éperon, 6, 1865." *Svo.* pp. 31.

† "De l'Origine des Crises Monétaires et des Moyens à employer pour les prévenir." Paris. 1865. *Svo.* pp. 24.  
‡ "Pétition adressée au Sénat sur l'Article 1183 du Code Napoléon par plusieurs Commerçants et Chefs d'Industrie de la Ville de Paris, pour faire cesser de plein droit l'intérêt légal au Profit du Producteur ou du Vendeur qui a livré son Travail ou sa Marchandise. 5 Avril, 1865."

ings by which greatly reduced prices are often charged, and of the deceptions by which such reduction is obtained. In another brochure, in 1863, M. Leclaire, in conjunction with M. Augustins made certain observations and propositions relating to the tariff of prices of the city of Paris, of the previous year. It contains much useful matter as to the execution of painters' work; but, at present, we merely indicate this one of the sources of information, and say that each of the pamphlets might help somewhat in the subject that we commenced in July last, when we referred to yet another of M. Leclaire's brochures.

Although we have already supplied general information, the particulars of the gestation and growth, and the present position of the Association, are so interesting, and as we have said are just now so peculiarly important, that we shall give them at some length.

In forwarding to us, about ten weeks since, his latest report, then just published, M. Leclaire addressed to us words which, translated, merit the attention of every master in England. After referring to our articles, he said, "The question of strikes is not better understood in France than in England. There exists a law which was born with the world, and which will finish only with it,—if it ought to finish,—that law, it is the law of offer and demand. This law, so simple, taught and reproduced by the economists of all times, by the most illustrious as the most modest,—that law which all the world understands,—that law which all the world understands,—that law which relates to buying more or less dear an article of merchandise of whatever kind, does not enter into the head of any master [*Chef d'industrie*] when the matter in question is the merchandise, arm of the workman. So then those masters undergo the consequences of their ignorance; for, in place of having but a temporary augmentation, and only whilst the hands are scarce, it results that if after having resisted they are obliged to yield, the day's rate is found definitively raised; and upon which they cannot again fall back. Every increase of wages made voluntarily on the part of the employer, when hands are wanting, can always be modified when hands are abundant. This the workmen understand: this they are always ready to accept; and the proof is that they demand increase of wages only when works in progress are numerous." As we make out from M. Leclaire, however, his association has been found productive of a state of things even better than that which is here in his mind. We shall make this evident in another article.

#### JEWISH ART AND THE PALESTINE EXPLORATION SOCIETY.

The new society which was instituted on the 22nd of June last, for the exploration of Palestine, is one in which considerable interest will be felt by all who consider the study of ancient architecture as of any importance; for it appears to promise the discovery of the long-lost Jewish style, and the explanation and classification of those architectural fragments which are found scattered over the whole of Syria.

The first object of the society is to explore and examine those remains which are still uncovered. Of these, there exists no good summary; and the authors who have written on the subject have none of them been enabled, by a practical acquaintance of ancient art, or by the professional knowledge of architects or engineers, to give such correct and satisfactory descriptions or to make such thorough investigations as would be possible for a staff of experienced explorers supported by sufficient means.

A perfect summary of these remains, and of all that has been written concerning them, is greatly wanted; and only M. Vogüé has attempted in any manner to supply the necessity; yet, although he has described the greater part of the ruins, he has not given anything of what was before written on the subject; and it is not impossible that objects which have escaped his attention may have been observed by earlier travellers.

Again and again have the ruins of ancient Palestine, the massive foundations of Jerusalem and Hebron, and the tombs, synagogues, and temples scattered over the whole country, been described by travellers of all nations; but never before have a party of explorers whose sole aim and object is to describe, survey, and map out the whole country, started forth, supported with adequate means and practical experience.

But even when the relics which still meet the eye of the traveller have been explored, but little will have been done; for these are so few, and generally of so late a date, that the history of Jewish architecture cannot be made out from them alone.

In order to carry out in a truly useful and perfect manner the work contemplated, it will be necessary to enter upon the untouched province of excavation. Wherever the soil has been dug, whether for the purpose of discovery or merely in the works of modern buildings, it has been found to cover an extent of ancient remains of which until lately no one had any idea.

In Jerusalem itself it has been gradually discovered that nearly the whole of the modern town stands upon mounds of rubbish which cover the ancient city, and have, until lately, made its archaeology a dark and unknown subject; and this is probably the case in the rest of Palestine. If under the modern towns excavations were made, we should perhaps become acquainted with ancient cities now as much unknown as Pompeii was before its accidental discovery. At the same time, it must be remembered that in proportion to the decline in importance, wealth, and independence of Palestine was the gradual decline of its cities, which have degenerated into the miserable villages which now cover the country; and thus such explorations must be carried beyond the modern towns, and in all directions around them there will probably be found remains of their ancient grandeur.

In the capital itself, of which more is known than of any other of the cities of Syria (although that which has been discovered of this even is but little), the shrinking in of the city boundaries is to be observed. The Russian establishment is situated at some distance from the modern city wall, and yet here portions of the ancient fortifications have been discovered; and probably, if these excavations were continued even further to the north, the whole course of these structures might be made clear. It is known that in the present town great heaps of rubbish cover up the old foundations, and the same is apparently the case without the walls; in fact, the part which was most probably that covered by the ancient fortifications is at the present day marked by mounds or ridges of earth which have long invited the attention of the explorer, and which, it is to be hoped, will be fully investigated by the present expedition.

That the remains of the cities, their walls, gates, palaces, and humbler abodes, should be thoroughly explored is most necessary. It will give us an insight into the fortifications, the military tactics, and engineering knowledge of the Jews; their domestic life may be illustrated; and, although none of the paintings or sculpture which have been found in Assyria or Egypt could be expected in a land in which no graven images were allowed, yet it is not impossible that relics of the Pagan worship of the Jews may yet be found in some of those innumerable altars and idols which were set up on every high hill and under every green tree.

But, above all, these explorations will throw light on the architecture of the Jewish race, a subject hitherto unstudied, or in which the student has been led only by the light of theory and argument. While Greece was as well known as Medieval Europe in all the forms of its architecture, and while the buildings of Egypt and Assyria are familiar to every one, the noble piles which beautified a much richer and far more interesting country are merely the objects of desultory controversies and contradictory theories. The best books on ancient architecture can give but a short and unsatisfactory account of the works of this great nation; and, after all, the chief authorities are the venerable compilations of Lamy and Calmet, from which the general ideas have been derived, and which have been handed down with some little modifications as new discoveries.

The difficulty is that most of the relics and ruins are of a date not much earlier than that of Herod; a time when, as may be easily imagined, the greatest alterations had been made in the style of art; and when, instead of the Egyptian and Assyrian, the Roman element was brought in to modify and perhaps to revolutionize the whole. The various monuments which were fondly believed by the ancient fathers to have been the tombs of kings or patriarchs, have been proved, by their resemblance to the later Greek architecture, to be but the sepulchres of princes of the age of Herod; and except the wondrous masonry of the Haram

walls of Jerusalem and Hebron, no relics of the true old Jewish style have been found.

In various parts of the Holy Land there are, however, the ruins of synagogues, and some even perfect examples are to be found in Galilee; and it is important that these should be well and carefully examined on the present occasion, since in them, however simple their structure may be, will probably be found the elements of Jewish construction.

The general theory that the arts of Assyria and Egypt combined formed the Jewish style, is perhaps a natural one.

Before the descent of the sons of Jacob into Goshen they dwelt in tents, and do not appear to have built any more extensive stone erections than the altars erected at different places; thus it would appear that their first acquaintance with architecture would be in the land of bondage; and hence their own buildings in Palestine may be naturally supposed to have resembled the pyramidal structures which they had erected on the banks of the Nile. But when they fell into a second captivity, and even before that time, they became acquainted with the second style,—that of Assyria; and hence it is argued that as Egypt or Babylon gained ascendancy over the land, the style belonging to either nation prevailed in the combination.

This theory appears to be borne out by the ruined synagogues, for in them may be found a style which unites the semi-pyramidal form of the temples of Phylia with the characteristics of buildings lately discovered at Birs Nimroud; but their form is so simple, and their ornamentation so free from any peculiarities, that from them alone it would be impossible to prove any theories; and to prove this, and settle the date and origin of these buildings, and to destroy, or confirm by sufficient evidence the truth of the general belief, must be the aim of the present expedition.

Such, then, will be the objects of this branch of the society, first to explore what is above ground, in which category the synagogues of the whole of Syria must be included, and of which, although until now unnoticed, they form a most important part. Secondly, to investigate, by excavation, the ruins, below the soil of which work the exploration of the great plateau to the north of Jerusalem ought to form a portion; and, thirdly, to give facilities for the classification of the different remains, referring them to the age of true Jewish architecture, or to that which may be termed the Græco-Jewish style.

In the execution of this design there is not a little difficulty.

In the first place, it has been before said to be important that the work should be entrusted to such explorers as have both a knowledge of the country and experience in all the trials of a traveller, together with a practical acquaintance with architecture and engineering. Almost the only gentleman who unites these requisites, and whose name is placed on the list of the society, is Mr. Tipping, by whose patient examination and dangerous explorations the topography of the Great Temple Hill was first made clear.

The Archbishop of York, Earl Russell, and the Deans of St. Paul's, Westminster, and Canterbury, are not likely to set out with the intention of exploring the Holy Land; and, even if they did, it is doubtful whether their united efforts would accomplish so much as has been already done by the experience of Mr. Tipping in his unaided endeavours. Yet it is of reverend and distinguished names like these that the list is principally composed.

Very few are the names belonging to men competent for the work now contemplated. Those who have examined the sacred sites and written concerning them, have paid most attention either to the geography or to the controversies, or even to the picturesque description of the country alone, and thus until the visits of Mr. Tipping, M. Vogüé, and M. Pierotti, the archaeology and architecture were greatly neglected, the first being left unexplored, and so partial a knowledge of the latter possessed by the writers, that it was impossible even to assign dates to the visible remains, or indeed to estimate their value and importance.

The second difficulty is, perhaps, more formidable; but this may also be probably overcome.

The exclusive character of the Mahometan religion, the importance attached by the Turks to the possession of the sacred sites, and the veneration in which these are held by them, which is so great that it is almost impossible for any one not of the number of the Faithful to obtain admission into any sacred precincts, are

great obstacles to the progress of science and exploration. Hardly a dozen Christians have entered the enclosure of the Haram at Jerusalem, and still fewer into that at Hebron; when these few did penetrate into the sacred edifices it was generally by artifice, and very rarely by permission. In Jerusalem there must be great difficulties in this particular, since it is very doubtful whether explorations of any kind would be permitted under either the Haram or the other sacred sites, or in any part of the city which remains under the guardianship of the Turks; and, on the other hand, when their permission was not required, the difficulties would be equal. The great quarries and rock-cut balls under the city are unknown to the Mahometans, and it is more difficult to obtain access to them, because the Jews, fearful of their discovery, are extremely unwilling to lend a guide to their hidden entrance.

In the city itself, and especially in the Jews' quarter, it is most probable that the greatest number of remains are to be found; yet how they are to be discovered is difficult to see, since however miserable may be the external appearance of the houses under which such explorations must be carried on, yet, after passing through many dark passages, the traveller finds himself in mansions of whose comfort and magnificence those without can have no idea. It will be, therefore, a matter of no small expense to carry on the work of discovery in this part.

The only remedy is to obtain, if possible, the mandate of the Sultan, or, at least, the orders of the pashas of each province; and thus to get from these, and from the whole body of the ruling nation, all possible assistance and support. By these means it will, perhaps, be possible to overcome the scruples and superstitions of the inhabitants of the spots to be investigated.

If these difficulties be overcome, and if the object of this section of the expedition be successfully carried out, the result will be most interesting and most useful.

The plan of the work is most justly considered, and the results of these explorations are to be given to the world without comment, hereby giving materials both copious and reliable to those who may wish to test their theories by newly-discovered facts; while, at the same time, all arguments, controversies and conclusions, are laid aside, and the truth allowed to speak for itself.

Since Palestine became known and interesting to Europe, there has been no effort like the present made. At first the pious pilgrims of the Middle Ages saw and described with implicit confidence the various spots which were asserted by the Church to be the true sites of sacred places. Thus the various monuments were given their date merely by tradition, and any research after truth was impossible. These were followed by later travellers, who, constructing theories of their own, made all facts subservient to them; and these have been superseded by the few and isolated explorers who have as yet endeavoured, without falling either into the errors of the pilgrims or into those of their immediate predecessors, to find by patient research facts whence they may start their theories with safety.

Now, in their turn, come the explorers of whom the rest were but the pioneers, and who, if it may be hoped, will be enabled, by the means at their command, by their numbers and practical skill, to finish the great work which as yet is almost untouched.

If their objects be fulfilled, we shall be enabled to speak with as much certainty of the architecture, the masonry, and the private buildings of the Jews as can now be done regarding those of the inhabitants of Nineveh, concerning which, until a work similar to that to be done in Palestine had been accomplished, less was known and less care or interest was felt than has been the case even in Syria, until the formation of a society for its exploration.

ACCIDENT.—On Tuesday morning, a serious accident occurred near Camden-road. A large building is in course of erection in the Hildrop-road, close to the Brecknock Arms, and the entire scaffold, on which a number of men were employed, fell to the ground. The noise brought a number of persons to the spot, and the poor fellows, buried beneath a mass of timber and building material, were extricated and taken to the North London and University College Hospitals. Two of them were so much injured that no hopes were given of their recovery.

### WHY PEOPLE DIE IN SHEFFIELD BEFORE THEIR TIME.

In the account of the proceedings at the last meeting of the Sheffield town council, given in the *Independent*, we find, in a report from Mr. Chapman, then read, touching the occurrence of a case of cholera, the following passages:—

"I have had my attention drawn to a remark made by Mr. George Godwin, editor of the *Builder*, stating that he had inspected White-croft, Hollis-croft, Pea-croft, &c., and had found a court in which seven houses had but one privy provided them. This property had been brought under the notice of the health committee, and a summons ordered by them at their meeting on Monday, October 2nd, to compel the owner to remove the nuisance and provide the necessary accommodation.

I may also add, that six weeks ago Dr. P. Hunter (inspector from the Home Department) and myself went through the whole of the before-named crofts, and he admitted that there was little to be complained of in respect of nuisances or cleanliness.—R. CHAPMAN.

Sheffield, October 9th, 1865.

Alderman Webster.—Does he mean that he has visited White-croft and Pea-croft?

Alderman Sanders.—Yes.

Alderman Webster.—I am sorry he has not better eyes in his head."

Well might Alderman Webster make that observation. We will gladly give Dr. Hunter the opportunity to qualify Mr. Chapman's statement if incorrect. If it be correct, we do not hesitate to assert the truth of one of two things. Either Dr. Hunter was misled, or he wants aptness for the office he fills. We invite his attention to the statement.

At the same meeting, as we find in the account quoted, a Mr. Ironside,—

"caused great amusement by the heartiness with which he denounced Mr. Godwin, the editor of the *Builder*. That gentleman had spoken of Pea-croft and White-croft, but the people of Sheffield knew that since the erection of the Catholic schools and the Ragged schools, they had necessarily attracted a great number of Irish to that locality. He had no objection to the Irish as human beings [charitable Ironside!], but they were most filthy in their habits, and this was the reason they were reduced to such a low position in the social scale. Formerly it was said they lived upon potatoes and buttermilk, but now it was seaweed and sawdust. A great deal was said about privies behind their houses. The fact was, they had no such conveniences behind their mud cabins; and when they came to a civilized country they did not know what use to make of them. Mr. Godwin had said he had found a privy common to seven houses containing sixty-two people, and which was without a door. In his (Mr. Ironside's) opinion, it was much better without a door under such circumstances. He should not wonder if the Irish tenant of the nearest house had sold the door for a red herring, and then burned up the seat to make a fire to cook it with. (Great laughter)."

Very amusing, certainly. No lives at stake, no souls! The poor creatures are rude and uncultivated (small thanks to their Church or ours), therefore keep them so. Abaso them still further: smash out of them anything like a sense of propriety and of decency; prevent its growth: as they are dirty, give them no water; lower their health; force them into the public-house for stimulants and something like comfort, and then look for a cleanly, careful, grateful, and improving population! The gentleman named Ironside went on to ridicule the proceedings of the Association, and in doing so showed so little wisdom that, under ordinary circumstances, it would seem to be scarcely necessary to reply to either his denunciation or his observations. But very serious interests are here at stake. Men and women are dying by hundreds in Sheffield every year before their time, and without any real occasion; dying simply because they reside in Sheffield, and that public affairs are governed by such men as Mr. Ironside. His remarks, therefore, may not be altogether passed by. He denounced the vice-president of the Health Department for observations which had been endorsed on the instant by the chairman of the Birkenhead Health Committee, and by Dr. McAdam, of Edinburgh, and for which observations the thanks of five leading inhabitants of the town, medical men and clergymen, were afterwards spontaneously offered; he denounced him for statements the correctness of which had been actually admitted in the report of the Sheffield Health Committee, read at that very meeting.

Briefly,—What had been seen in these crofts that was thus defended by Sheffield Ironsides? What was the bad cause thus aided by an armour-plated Monitor? On one particular piece of property,—a sample of many,—consisting of seven two-roomed houses in Pea-croft, not far from Paradise-square (how pleasantly smells the bloom,—what a foretaste we get of Heaven!) there were admitted to be living sixty-two persons, for whose convenience there was one privy, which had neither seat nor door! A dozen women, several with children in their arms, and of whom evidence was taken, positively screamed with indignation in speaking of what

they had to undergo in this respect. Water could he had from a tap three days a week for a certain time; but, as they had but small means of storage,—some of them none,—the possibility of being clean was small. On Sundays there was little water to be found in any of the rooms! The pavements were broken up so as to hold decaying refuse; and the general "dust-hole," so to call it, had not been emptied to the bottom, as several of the inhabitants separately asserted, for six months. These are the conditions under which the gentleman who has "no objection to the Irish as human beings," thinks that, not the sixty-two persons in this particular spot, but hundreds of his fellow creatures in Sheffield, especially if Irish, should be permitted to dwell. The fact is, however, that many who were spoken to were not Irish, but English,—some of them, wonderful to say, yet retaining remnants of modesty and self-respect. To keep these qualities long in such places is out of the question: decency is impossible, health is impossible. Add to what has been said the condition of the drainage, the state of the River Don and the River Sheaf, and the effects of some of the trades carried on there, and who will wonder to hear Mr. Rawlinson asserting that the death-rate of Sheffield is not merely 34 in 1,000, nor 63; but that it is in parts 100 in 1,000!

We are quite willing to be denounced for making evident such a state of things; and we hope that the right-thinking portion of the men of Sheffield may feel strengthened to persevere in their endeavours to improve it.

### HEALTH DEPARTMENT, SOCIAL SCIENCE ASSOCIATION.

RESUMING our notice of some of the proceedings at Sheffield in this department, we reach Monday, the 9th, when Dr. Lankester delivered his departmental address. We take some of his observations on

#### Sanitary Legislation.

It is the duty of the civil government, in matters of life and health, to do for the individual what he cannot do for himself; and it is the duty of individuals to do for themselves what the Government cannot be expected to do for them. If we could place our towns and cities under the governance of an enlightened despot, we should at once gain much from the application of our present knowledge of principles. Could we carry out as severe a code of sanitary laws as those which the ancient Jews submitted to as a Divine dispensation, there is no doubt that results of a most astonishing nature would follow. But we must rest satisfied with following the slow genius of our nation, and submit to the government and institutions with which we are surrounded. I cannot here enter into the details of our sanitary legislation. It has been slow, and its action has been by fits and starts, as now and then the public mind has been alarmed, and the Legislature has sympathised with it. But the fearful death-rate of many of our large towns, the neglected and insanitary state of our villages, show that whatever our legislation may have been, it has yet failed to produce any great impression on the mass of our population. Dirt and filth, disease and death, keep pace with our activity. We no sooner improve than we go back again. My conviction is, that our Legislature wants earnestness. All our Acts of Parliament are so constituted that they may be defied with impunity. They, in fact, give the power of action or inaction to those who are either interested in maintaining sanitary abuses, or are ignorant of the dangers which arise from their toleration. The Metropolitan Management Act was, undoubtedly, the largest instalment that legislation ever made towards correcting the sanitary abuses of London, and in the creation of the office of Medical Officer of Health, has laid the foundation of future sanitary legislation. That this office has worked well in London, and has contributed to a large amount of sanitary action, there can be no doubt. But, from the fact of the medical officer of health being entirely dependent on the vestries of London for his appointment, his duties have in many districts been interfered with, and his ability to act for the public good reduced almost to a sinecure. So much has this been the case, that persons have suggested that he should be appointed by the Government, and responsible to the Government alone. The objection to this plan is, that he is at present paid

by the parishes requiring his services, and that Government appointments are not always free from the objection that Government does not monopolise all the intelligence of the country, and is not free from the charge of favouritism in its selection of officers. The great bar to sanitary action in our vestries and local Boards is their parsimony; and if they could be once made to see that disease and death are the most costly luxuries in which man can indulge, they would possibly give more scope to the action of their medical officers of health. Perhaps one of the greatest improvements that could take place in the London system would be the appointment of medical officers of health for life, and reducing their numbers, giving them larger districts to superintend, and appending salaries which would render it unnecessary that they should attend to private practice. The same system should be extended to districts beyond the metropolis. It is almost impossible under our present laws to initiate sanitary improvements in the villages and small towns of the country. The most gigantic nuisances are allowed to grow up without let or hindrance, and it is only when some terrible calamity visits a place that any action is taken. The metropolitan boundary is studded with villages that the Management Act does not reach, and which are a disgrace to our civilisation. Such a village exists at Ohld's Hill, in the midst of a farm belonging to the Lord President of the Privy Council. I mention this to show how defective our sanitary legislation is at the present moment, so that the representative of all sanitary authority in Her Majesty's Government is helpless to remove nuisances at his very door. It is most necessary that medical officers of health should be appointed to large districts in the country, with power to remove, and compel owners of property to remove, the most common and obvious sources of death and disease. In all great public improvements, which have for their end the health of the people, the law should act with more certainty, and the rights of property should not be allowed to interfere with the higher claims of health and life. In thus commenting on what appear to be the defects of the law, I am aware how fully the laws represent the opinions and feelings of the people of this country; and if the law is inefficient or unacted upon, it arises from the want of knowledge on the part of the people themselves. Not only does this ignorance tell upon the Legislature, but even were it possible for the Legislature to provide all the conditions of a healthy existence, this object could not be obtained unless the people were sufficiently instructed to avail themselves of the rights thus conferred upon them. I have alluded to some of the great facts upon a knowledge of which our healthy existence depends. It is in vain that the Legislature enacts a plan upon which houses shall be built to ensure ventilation, unless the inhabitants of those houses understand the worth of fresh air. In vain is fresh water brought to our doors, if, in our indolence and ignorance, we refuse to use it. There must be intelligence both in the legislator and those for whom he legislates, if we are to take advantage of our present knowledge of the laws of life to secure us from disease and death. When one sees how little is the effort made to introduce into our general systems of education a knowledge of those great laws of physics, chemistry, and physiology, on which our life depends, one is filled with dismay at the prospect before us. When the leading educationists in our country are carrying on a controversy, as to whether in our examinations the highest rates of marks shall be given to classics, mathematics, history, or modern languages, one feels that they are quarrelling over dry bones, and forgetting all that which gives life and reality to our existence. It is not till the great facts of the natural sciences shall take a proper position in the studies of our universities, where the majority of our statesmen are instructed, that we can expect them to be taught in the middle-class schools, where our vestrymen gain the elements of their education. It is only when those who instruct weekly in our pulpits, and influence the education of our lower-class schools, are themselves taught the great laws by which the Creator governs the life of the world, that we can expect our working classes to exercise that judgment and self-control with regard to their health, the want of which causes the sacrifice of holocausts of victims amongst them every year. When I consider the sacredness of human life, when I know how sacred we all regard it, I feel as if it were a bathos which I ought to avoid, to remind you how costly a thing is disease and

death. But it is true the gain of 100,000 lives annually would pay ten times over the cost of all the exertions that would arise to secure them for life and for their country. But I will not pursue the subject. I leave now the question of the public health in your hands, to work out its great problems, as amongst the most patriotic and the noblest to which the human mind can be devoted.

*Quarantine and the Cholera.*

Dr. Gavan Milroy read a paper on Quarantine and the Cholera, with special reference to the present epidemic in the Mediterranean, in which he showed that quarantine regulations were both cumbersome and inefficient.

Mr. Trench (Medical Officer of Health for Liverpool), after offering some introductory observations on the existence of contagion as a cause of disease, expressed his accordance with the views of Dr. Milroy as to the utter failure of the cumbersome and oppressive system of quarantine as at present practised in the Mediterranean ports. But while we acknowledge the inefficiency of quarantine, it is right for us, as practical men, to consider our own position in reference to the probable approaching visit of cholera. The Government wrote to the municipal authorities of our seaport towns that there were reasons to apprehend this approach, and called upon them to provide receptacles wherein the sick could be placed apart from the healthy. It appeared to the Health Committee of Liverpool that in the possible arrival of a vessel from the Mediterranean, having cholera patients on board, it would be better to detain the sick in the vessel, and only to allow the healthy to come on shore, and thus not to bring the plague into the town, as was done in 1848, when from a single case it spread throughout the borough with fearful intensity. The Mayor was requested to write in this spirit to the Government; but the reply was, that they saw no reason to sanction quarantine. The consequence is, that a cholera patient arriving in the Mersey will be landed in a population of 500,000 people. He was free to confess himself a contagionist, and therefore regarded this arrangement, however carefully managed, with great apprehension. He would not only separate the first cases of cholera from the healthy community, but he would advise, throughout an epidemic, the continuance, as far as practicable, of regulations to keep the sick poor from the crowded districts. He would not only separate the sick, but he would like to see established by the authorities mortuary chapels, whither the dead could be at once conveyed from those single rooms of the poor, which was also the apartment of the living.

Dr. Holland and several other gentlemen followed in the discussion, the tendency of their arguments being to show that the danger to the public was not so much from the contagious character of the cholera as from the existence of filth and other predisposing causes amongst the people to be protected.

Mr. Rawlinson remarked that a great deal had been said on both sides of the question as to the contagious or non-contagious nature of cholera. Without going into the reasons for his belief, he would say he believed it to be both contagious and, in another sense, not contagious. The seeds of the disease might be in the system, and, if they were treated in a particular way,—if the people were placed under a condition favourable to the development of that disease,—it would be produced and would spread wherever the same conditions existed. After giving his experience of the prevalence of the cholera during the Crimean campaign, he spoke of the epidemic in England in 1854, and the striking sanitary facts that were deduced from it. In that year the disease was brought into the Tyne, and broke out in Newcastle, and in one month it swept away 2,000 persons. Now the town of North Shields was within a short railway journey of Newcastle. There was a constant communication between them; and there was no quarantine. Two months before the cholera appeared, the local authorities at Shields had thoroughly cleansed the town. They had sent out thousands of tons of refuse; distributed lime-wash and brushes to the people in the foul courts; and had forcibly lime-washed the houses of those who did not do it for themselves. The result was that there were only seven deaths in North Shields, and every case came from Newcastle. It happened that one side of a particular street belonged to the township of North Shields, whilst the other was under the superintendence of another local body. On the latter

side, which had not been cleansed, the cholera appeared in almost every house; the other side of the street was untouched. These lessons ought not to be lost upon society.

Mr. McGowen, deputy town clerk of Liverpool, said he had been anxiously waiting to hear what practical conclusion Dr. Milroy had arrived at. He was fully aware that the doctor at the outset of his remarks had said that he should chiefly confine his paper to narrative, but he had observed as he came towards the close that he had quoted the 15th resolution of the Quarantine Congress, to the effect that in countries where the quarantine regulations were strongest, and their execution most rigid, cholera had still been disseminated. Now he (Mr. McGowen) could not allow the question to stop at that point. The tyranny and folly of quarantine, as established in many parts of Europe, ought to be swept away. There was, however, another extreme equally to be avoided, and that was the absence of all restraint. No doubt much might depend on predisposing causes, such as the habits of the people where the disease might appear, but in seaport towns those causes were always in full activity, and the people must be protected. It was a very important question for the public as well as commerce. Industry should not be needlessly trammelled, but, on the other hand, people suffering under contagious disorders ought not to be allowed to come ashore without check or restraint.

*The United States Sanitary Commission.*

The Rev. W. H. Channing went into an elaborate statement of the origin and operations of the great voluntary organisation which is known as the United States Sanitary Commission. He showed in the outset that the American people had copied the example set by England during the Crimean war. The Sanitary Commission had sprung from the tree of life which the English people had planted. It was through the instrumentality of the British commission that the whole sanitary movement in America originated. He then went into an estimate of the various departments of the commission, showing how it secured for the wounded upon the battle-field; cared for them in the hospital; superintended their removal; provided them with every comfort that money could procure; arranged with the Government for their pay; and, finally, if they were disabled, secured to them the pensions to which they were entitled. He explained that the entire agency was supplemental to the action of the Government. As instancing the magnitude of the operations of the commission, he said that at the battle-field of Gettysburg alone they had expended 74,838 dols. (15,000*l.*). The total cost of a department of the commission for special relief was 251,100 dols., the total expenditure of the Sanitary Commission, 3,000,083 dols. There was a standard set up from which they could never fall back, and the question was how far could they widen and transform what had been an experiment into a universally established system? The whole sum expended from voluntary means was 212 millions of dols. during the civil war now happily at an end.

*The Air of Towns.*

Mr. J. D. Leader read an abstract of a paper on this subject by Dr. Angus Smith, there not being time to read the whole. Dr. Angus Smith gave his view of the present state of the chemical questions most obviously involved in ventilation. He brought forward experiments, showing that the oxygen in the air is diminished in such places as are considered only slightly inferior in quality of air, showing also the differences in ventilated and unventilated places or close parts of the town. He also said that observation had shown that the carbonic acid of pure places was from 300 to 340 in a million; that in towns, which seem very much polluted by smoke, it rose only to 403 as our average in the best streets, although in places manifestly impure the average obtained was 774. In workshops it rose to 3,000 or more, and in mines sometimes to 20,000 or even more in a million. Although in towns carbonic acid cannot alone be blamed, he showed that carbonic acid of itself was a gas with a very distinct effect, diminishing and weakening the heats of the pulse and quickening respiration. Three methods were given for ascertaining the amount of carbonic acid, simply applicable. He said that carbonic acid is not the only guide in all cases: for example, when the temperature rises we require increased ventilation, independently of the increase of carbonic acid. Below 55° Fah. it is probable that organic matter has little in-

fluence. Above 55° Fah. it increases rapidly in influence, and the amount arising from the person increases. For these reasons he believed that we could hear in cold weather an inferior ventilation. Many who insist on pure air forget this, although instinctively we act on it when not misled. It is well to remember that ventilation is a struggle between pure air and warmth, where both sides must be respected.

Dr. Stevenson M'Adam read some remarks on the contamination of air. After pointing out the chief causes of contamination, he said that they had a bad system of main drainage in Sheffield, where the rivers Sheaf and Don were mere open sewers running through the town, giving off gases most injurious to health. He referred to the means to be adopted to remove the evils of contamination. First, there was ventilation, and a good supply of air was no less important than a good supply of food. Corporations could do little to enforce ventilation of each man's house, but they could see to it in schools and public buildings. There should be as far as possible perfect combustion of fuel, and a speedy removal of all refuse materials, by flushing the drains and also by carrying the drainage away from towns without throwing it into the rivers. The question resolved itself into one of better air in houses, and the better supply of water to remove impurities into drains and main drains, and to arrest the deposition of foul matters in and near towns. The means of diminishing the contamination of air in towns was undoubtedly within the reach of corporations, and the question of convenience or of rates should not be allowed to interfere with any praiseworthy efforts to purify the air which are necessary to decrease the mortality.

In a discussion that ensued on a paper read by Alderman Saunders,

Mr. Rawlinson said the writer had fallen into a fallacy by meddling with statistics. The alderman's statistics with regard to areas did not bear upon the facts. It was not true that there was necessarily the greatest amount of mortality where the greatest number of people were crowded upon the smallest area, but, with proper sanitary arrangements, he might almost say the converse was the truth. Take the area of a gaol. The rate of mortality there would be incomparably below that of the country around. Sanitary science had now gone so far that if any human being in Great Britain wished to enjoy the greatest amount of health he was capable of, he must get inside the four walls of a gaol. The deaths in the line were 9, in the police 9, and in gaols 3½ in the 1,000; and in lodging-houses that were properly planned and apportioned, the mortality was not greater than in the best country districts in Great Britain. As to the mortality of Sheffield, although 34 in the 1,000 was a great deal for the whole of the borough, he could tell Mr. Saunders this, that the mortality of the worst parts of Sheffield was, not 34, nor 64, in the 1,000, but, he would undertake to prove that in some parts of the town it was, at this moment, above 100 in the 1,000. That state of things the corporation ought to attempt to remove, and they might do it at once.

*Increase of Great Cities.*

On the following day Mr. J. Morgan, M.D., hon. secretary of the Manchester and Salford Sanitary Association, contributed a paper on "The Danger of Deterioration of Race from the too rapid Increase of Great Cities." Dr. Morgan commenced his paper by referring to the increasing tendency on the part of the labouring classes to mass together, and either to form new centres of industry, or to swell the population of those already existing. He alluded to the influence which this migratory tendency was likely to exert on the public health, and spoke of the general want of stamina which characterises the great majority of the labouring classes in our great towns, manifesting itself either in the gait, the hearing, the voice, or the frame. He proceeded to inquire into the cause of this degeneracy, the extent to which it prevailed, and how far it was to be ascribed to the influence of a city life. The great majority of the 864,000 grown-up men and women who migrated to the capital came from the healthiest agricultural counties in England, hence they might be looked upon in the mass as picked lives. It was impossible to form a correct estimate of the relative value of life in town and country districts by calculating the rate of mortality in every 1,000 of the population. The country was robbed of a large portion of the productive population; men and women in the prime of their strength

emigrate to the towns, and thus a comparison is instituted between the places they have deserted and those to which they have removed. The result of all such calculations must prove over favourable to the towns. This source of error was, to a great extent, avoided, if the inquiry was confined to the young. Few, comparatively, leave their homes under fifteen years of age. The death-rate, instead of amounting in the four great cities to 26.1, was expressed by 40.7. It was highest in Liverpool, where the average rate for the two years was 48.5. In Manchester it was 42.5; in Birmingham, 39; and in London, 33. In Wiltshire the rate did not exceed 18; in Berkshire, Dorsetshire, and Westmoreland it was 18.5. In the whole of the agricultural counties, taken collectively, the average for the two years was 21.1. In the course of the ten years from 1851 to 1861, small towns and county districts increased at the rate of only 3.9 per cent., while populous cities added nearly 17 to every 100 of the population. Cellar dwellings should be closed up and alleys cleared out, and the sites which they occupied left open to serve the double purpose of air-shafts and playgrounds. Factories and workshops, instead of being piled up in the centre of our towns, should be scattered over the country in airy and healthy localities. If these suggestions were in any degree practicable, as the importance attached to them was not overdrawn, it would be admitted that they could not be too often or too urgently pressed on those who had the power of enforcing them.

#### MEAUX.

ON a fine day in May, 1865, I made an excursion from Paris to see Meaux and the cathedral of Bossuet. My day was too short for the occasion; but the morning had been curtailed by a call that it would have been a vexation to me to have missed. A *fête--a carousel*--was over when I arrived, but the little city was still in all the excitement of a fair.

The cathedral is worthy of much more detailed attention than time permitted me to bestow upon it; but short as my time was, I carried off impressions that will remain with me as if from a lively and interesting, though over-hurried conversation. It stands high; the street rising steeply to its western and southern entrances, and has a base of numerous steps to its triple and deeply-recessed portal. Two western towers were designed; one only is finished.

The exterior is variously built up against,—why search for a less awkward phrase to express obstruction and awkwardness? The sculptures are defaced, and tracery has suffered no less; but, after every allowance has been made, on account of maltreatment, the utmost that the external aspect presents as commendable is distinctness in exhibition of the cruciform plan and symmetrical towers, with no pert interference of a forest of crowding, almost jostling pinnacles. The system of buttressing, however, has its faults, and is, or what is quite as bad, appears to be, heavier than necessary, not merely for construction, but for style; while the horizontal lines and string-courses are scarcely sufficiently subordinated to the verticalities. On the whole we have an illustration, no frequent phenomenon in early Gothic, of the marked superiority of an interior, as compared with its exterior, in ripeness of artistic power. This was in all probability due to interiors, as more urgent and important, receiving not only a disproportionate share of the resources for enrichment, but also of attention and study. The time, as well as fancy and funds, of the architect seems often to have been fully employed within, and then it is fortunate if the exterior was only neglected and not unfairly sacrificed.

In the interior at Meaux I found a great deal to admire, commend, and be thankful for. The church is but small, and its relative loftiness,—and it is even, in accordance with usual French tendencies, absolutely lofty,—gives it some effect of shortness, though this would be in some degree relieved on removal of the temporary partition that screens the progress of reparation at the east. We have, in the first place, the comfort of the spectacle, rare in England, but for ever welcome, of a Gothic interior completely and consistently vaulted throughout; of shafting and pier sections loyally respondent to vaulting, and all taking original but simple variation from varying emergencies of plan introduced without effort and without caprice; of arches of transepts, aisles, clerestory, not merely ad-

mitting windows and window-mouldings, but fairly filled and occupied by them. It must be left to imagination to complete the effect from painted glass in windows so distributed, and thence the general redemption from coldness of the bare stone of vault and wall.

The nave piers successfully exemplify the art of combining subordination with development in a very simple type.

Harmonious effect in such a combination depends on the expressive appropriateness of gradation by which the large shaft on the chief face of the pier receives due and not extravagant emphasis while the shaft for the diagonal rib is allowed to assert itself by contrast with the still smaller that run up on either side of it. Many were the experiments, and it must be said that many and conspicuous were the failures as well as the successes of the Gothic architects in adjusting these sequences; the vitality of the art in their hands depended on the resolute self-reliance with which they marked down the point of weakness in the work of a gifted predecessor, and set themselves to find the solution of the discord, as well as on the keenness with which they caught the hint of a novel and still happier combination. A close examination of authentic measurements would, I doubt not, show that they sought to help themselves more or less by a theory, in modifying dimensions and combining dimensions of grouped shafts. That it would prove to be a thoroughly satisfactory, and thence a thoroughly efficient theory, I should not expect. The main credit of their successes would thus still remain with natural taste and empiricism of the eye,—that working by "swool of brow" which is inspiration itself as compared either with "rule of thumb" or rule of precedent.

There is fully as much scope for instructed application of proportion in Gothic as in Greek architecture, and, with such application in efficient hands, there is a field yet open for the style to surpass itself.

By the introduction of an intermediate line of pillars,—pillars, not piers,—the church acquires a double aisle throughout, both in nave and choir, excepting that, in the turn of the apse, partitions for chapels interrupt the outer aisle. In the nave the double aisles are clear, and some chapels are obtained by inclusion of inter-bay spaces, on the system by which the original plan of Amiens was altered and extended. The aisle pillars are for the most part plain and cylindrical, and relieve the shafted piers of the nave with very lively effect. The loftiness of the aisles of the choir has a most noble effect, and is looked back to with regret when we find ourselves in Notre Dame, at Paris. At this point, again, we come upon an occasion for the application of theoretical proportion. Unfortunately, there are comparatively few Gothic buildings of which we possess measurements at once complete and accurate; but good service would be done if architects would systematically append to their notices of parts of designs that produce the sense of proportionate beauty, even approximate notes of a general dimension. Where such a feeling is not produced, the trouble may well, and, indeed, had better, be spared.

This is one of the instances in which the westward termination of the aisles is happily managed; the last bays are larger and are vaulted with more elaborate consideration, and thus form a sort of internal porch or section of included narthex. The unworthy bathos so frequently encountered here in Gothic cathedrals is thus avoided, and the first impression on entering by the recessed side doors is for once a preparation for a dignified interior, not a sense of indignity at the unfulfilled promise of the façade.

A visitor with more time at command, may bestow it, with good return, in unravelling the sequence of changes in the building. The sooner he commences the better, for obliteration ever moves hand in hand with reparation, and reparation is busy throughout France. I would invite his attention especially, or rather among other points, to some peculiarities of treatment about the north-west pier of the central quadrangle, the adjacent nave pier, and wall of aisle. Of the garden and the statue of Bossuet let the guide-books speak; I am unworthy. I opened the *Oraisons* only once, and only to close them again with the sentence of artificiality and adulation; commendations abound of such quality as to imply that the sentence should be at least revised, and revised it must be when courage revives.

Above the stalls of the choir are fall-sized copies, in oil, of the cartoons of Raffaele, or

rather of the tapestries executed from them, for they follow these in daily reversing the design of the cartoons, and making right hands right. The Conversion of St. Paul, and the Stoning of Stephen are included; the latter has remarkable force. It would be premature to speculate on the influence of these pictures traceable in the genius of Bossuet, before being better assured that they were there in his time.

This opportunity may be taken for noticing that as the cartoons are now so sufficiently exhibited at South Kensington, though in a room still unfortunately too narrow, it would be well that rather large mirrors on movable stands, should be placed in the room to afford views of the groups as the painter intended them to be seen, and as no doubt he considered them while he wrought. The best copies obtainable of the missing designs of the series should also be commissioned by the nation. Would! and should! and might! and ought! Why weary oneself and the world with reclamations and contingencies? What is the condition of the Phidian marbles in the British Museum? Even what it has been, and is likely to be.

But to return to France, where some such things at least are managed better. The cathedral tower is worth ascending, for the sake of the view of the city, the winding Marne, the country round. Note the pains bestowed in moulding the newel at the very top.

The train took me back, with many a holiday-maker, to Paris. In my compartment a happy-looking dame soon revealed that it was the secret of her happiness that she was the mother of the young soldier who had carried off the honours of the *carousel* in the morning. The compliments of the company—second-class though they, though we were,—were as cordial as they were welcome: and it was pleasant to see how kindly all submitted to the retold story of the gallant son's distinctions and decorations, and, indeed, how considerately and cleverly an opportunity was ministered for reviving it whenever a station brought in a new traveller. A mild contribution to the glorification from the Englishman,—that the mothers of such sons ought to be encouraged by a decoration also,—had remarkable success. And so, and with a wetting through by a thunderstorm at Paris, between station and great hotel, ended my excursion to the city of Bossuet.

#### THE NEWCASTLE MEMORIALS IN SHIREOAKS CHURCH.

THE memorials in this church to its founder (the late Duke of Newcastle) are fast approaching completion. The *eredos* is divided into three compartments, surmounted by canopies on slender pillars, richly capped. In the centre division is the Crucifixion of our Lord, in *basso relievo*, with the three Marys at the foot of the cross. In the side compartments are saints and martyrs in adoration. In the niches dividing the subjects are figures of the four Evangelists, and below, in *quatrefoils*, are their emblems. Over this, in perforated alabaster, is, "By Thy cross and Passion, good Lord, deliver us," and above are four angels in attitudes of praise and adoration. On the *scillia* are two medallions, one representing our Lord sending forth the Apostles to preach; the other, the *Laying on of Hands*; while above, on pedestals, are Moses, our Lord, and Elias. The credence-table, on the north side, is of Derbyshire spar and Italian marbles; the canopies and all the wall-panelling being inlaid with mosaic work in varied marbles. Round the whole of the sanctuary, inlaid in alabaster, is the inscription. Messrs. Hind & Evans, architects, designed the memorial, and it has been executed by Mr. T. Earp, sculptor. The memorial windows are now being put in—the five in the chancel; all are on the subject of the Lord's passion, death, burial, resurrection, and ascension. These are given severally by the Prince of Wales, the Chancellor of the Exchequer, Messrs. Cooke and Ouvre, and Miss Dennett, all personal friends of the late Duke of Newcastle. These windows, with the *eredos*, &c., and candlesticks, form what may be termed the "private memorial," as distinguished from the public ones, viz., a rood screen, in metal, by Messrs. Thomason & Co., erected by the parishioners and others, and the three windows in the west end of the church (subjects, — Our Lord's Advent, Birth, Flight into Egypt, and Early Life); together with a fresco painting of St. Luke, as a memorial of their late colonel, by the officers and men of the Sherwood Rangers.

## SOME THINGS THAT MAKE OUR HOUSES UNBEARABLE.

In a former paper we gave an approximate list of the members of the vegetable kingdom peculiar as parasites to man and his house. In the present notice we propose to review the principal members of the animal kingdom that in this country either infest the dwelling of man, or prey upon his person; and of those, as in the vegetable kingdom, their name is legion: for the house itself, the various articles of furniture in it, and the master himself, have distinct tribes of destructive animal parasites constantly at work, ever busy, tunnelling, boring, eating, and destroying nearly every object in the house.

If we leave the smaller insect tribes for a short time and take cognizance of the larger creatures that are a nuisance in our houses, the rat should have a foremost place. In London, this really dangerous animal is extremely common in our houses, living as it does in the sewers; and, so readily making its way through every obstacle, it constantly presents itself in our kitchens, and not infrequently appears in the bed-rooms. Should the Londoner live on the outskirts, like the writer, and near brick-fields where there is a large accumulation of straw, the visits from this animal are much more common, as it either comes over the low walls, or like Mephistopheles, suddenly rises from the ground and as suddenly disappears; for in the suburban garden, when the master takes his morning walk, he will observe a hole in the ground, 2 in. or 3 in. in diameter, made by a rat during the night, who having visited the back premises, and perhaps entered the house when the family were at rest, has returned to the brickfield or sewer from whence he came, by the same subterranean passage, before morning light. If this hole he stopped up with stones and earth, another will be found a few feet off the following morning, where our persevering neighbour has changed his course. It need not be said here how much this animal is dreaded by the female members of the household, and husbands and brothers do not always feel inclined to attack it. It is essentially a fighting and carnivorous creature, and few domesticated animals dare assault it; yet it cannot be said to be without its uses in our drains and sewers, where it ravenously feeds on the putrid animal matters. It is well known, too, that it hunts and destroys the domestic mouse, which perhaps is more really destructive of the house than the rat itself. The only safe method of ridding a house of these two intruders is the trap, but so wary and cunning are they both, that, after a few are caught, others will not approach the ambuscade for a considerable time. The mouse far more thoroughly takes up its quarters in the house than the rat, and commonly resides between the joists or the timbers of partitions, where it breeds several times in the year. In preparing nests for the young few objects withstand the destructive instincts of this animal: the woodwork of a house is frequently rendered unsafe by its gnawings; and, having found access to the living-rooms it attacks everything in its way: wooden objects of furniture become gnawed and damaged, carpets bitten into holes, and papers, books, and clothes reduced to shreds.

Where a large number are in a house they are extremely bold, coming out from their nests in the evening with little fear, and scampering about the rooms in the full light of the lamp. It is probable that if houses were more substantially built, the brickwork and cement of the foundations better, and the drains well formed, we should have fewer of these animals in our homes. A cat will often keep them comparatively down, but poisons, for many reasons, ought always to be avoided. The appended method is said to be an excellent means of destroying rats in a house, so it may not be out of place if given here:—Oil of amber and ox-gall mixed in equal parts, added to thin oatmeal and flour sufficient to form a paste; divide into little balls and lay in the middle of the apartment infested. These balls will form an irresistibly attractive bait for the rats, who will ravenously eat them, but will immediately be seized with intense thirst. Several vessels of water must be laid close by, at which the rats will drink till they die on the spot.

We do not propose noticing here such animals as owls, bats, and some others that are locally attached to certain ancient buildings that would be much better without them, but will pass on to some of the smaller pests of our houses. After quitting the rats and mice, such an array

of smaller creatures present themselves, that it is difficult to single one out for precedence. But perhaps for loathsomeness, as well as destructibility, the horrible and offensive cockroach (sometimes erroneously called blackbeetle) should stand first. Some houses are infested by this creature, and unless strenuously kept down, most houses soon would be, so enormous are its breeding powers. Cockroaches generally take up their quarters in the basement of the house, where they exist in thousands, preying generally on the provisions, few things coming amiss to them. In many eating-houses in the city a hedgehog is kept to keep these creatures down, which they do very effectually. Cats, too, will frequently eat them, but not in sufficient numbers to thin them. Poison is said to be the only really effectual plan; but there are many ways of destroying hundred after hundred every night. Perhaps the best of these is the old plan of setting beer, or treacle-and-water, in a deep basin, with pieces of wood for the cockroaches to go up, which they always readily do, attracted by the odour: so, falling into the sweet but deceitful liquid, of course they never come out again alive. In the morning a little scalding water soon ends their sorrows. They are frequently found in bed-rooms and in beds; and it has been the experience of many persons to awake in the night and find one on their face or body, or on the bed-curtains. During the last few years it has been incontestably proved that the cockroach (as well as the spider) preys on the bed-bug. So numerous are the witnesses, and so indisputable the evidence, that, strange as it may appear, there is no room for doubt. Who can say that even this loathsome creature does not do some good, although the damage it does in a house is immense? When it gets into clothes-drawers and wardrobes it riddles the clothes with holes; in book-cases it serves the books and papers in the same way, and has been known to eat large holes in boots, carpets, and similar things.

A very near relation to the cockroach is the house-cricket, but far more endurable, and without the offensive odour of the former; it always makes its presence known by the curious loud chirping noise it makes, which, although cheerful music to some ears, is a disagreeable grating noise to most people, when heard in a house, however endurable it may be in the fields, from the field-cricket. They are probably as destructive as the cockroach, as papers, clothes, carpets, boots, &c., are destroyed by them, without doubt, as they have been seen in the act; they also eat small insects; but it is only of late that it has been clearly proved that they prey on their neighbour, the cockroach, and that wherever the cricket exists in any numbers the cockroaches vanish. By the published accounts it would seem that the latter have an *instinctive dread* of the former, and have no chance of life when once the punier has caught its prey; and thus in a few lines we once more see plainly exemplified the great natural law of destruction. We know on what the bug preys, the cockroach on the bug, and the cricket on the cockroach (among other creatures); many birds would be glad to find the cricket, and many of the hawk tribe the bird; and man, to complete the circle, is very ready, gun in hand, to bring down any rapacious birds.

Articles of apparel, as every one knows, are subject to the attacks of the destructive clothes-moth, or moths, for there are certainly more than one. It is needless to recapitulate here their propensities, and so many moths appear in houses that never touch clothes, that it is difficult to recognise the real culprit. The small caterpillars of these moths are sometimes abundant enough, and live on the clothes of man. It is difficult to mention any really good remedy, unless it be the frequent airing and brushing of the stuffs, hangings, or clothes infested.

In the house as well as out of it, how many objects are destroyed by the flies (of which there are nearly a thousand species in this country), especially delicately-painted and gilded objects in glass, wood, or metal, that get stained beyond remedy if exposed to the air and their visits. Residents in the country and outskirts are more troubled than Londoners by them (plentiful as they are here), especially if trees and shrubs grow close to the house. There are many well-known plans of ridding houses of these pests, of more or less efficacy; but the fly has many insect enemies, and in the autumn a fungus commonly attacks it, and grows between the scales of its body while still alive: the fly then dies on the window-pane, and the white powdery stain round the dead fly, so common on window-

panes in wet weather, is a mass of the seeds or spores of this fungus ready to be blown into the joints of another fly, and cause its death.

There are a large quantity of minute beetles in nearly every house (they sometimes abound in myriads in old houses): they eat through the solid substance of books in every direction, and attack the woodwork of furniture, or the timber of the house, and soon as effectually reduce all to dust as the dry-rot. Nothing valuable appears to come amiss to these things, for nearly every object, unless metal or glass, is liable to be rapidly destroyed if the beetles exist in any numbers. This includes the death-watch beetle and the so-called book-worm. They are seldom seen, as they are sly and wary in the extreme, and being minute are not noticed.

In some parts of London the house ant is very abundant; where it does abound it is a most abhorrent nuisance, as it not only destroys many objects and inserts itself into every article of food and drink, but attaches itself to the members of the household, inflicting most painful bites.

In the present notice it may be well perhaps to confine ourselves to the animal parasites of the house, and omit the animals that find a subsistence on the human occupants: the principal of these, viz.—the bug, the flea, and the louse (probably peculiar to man), will not appear where cleanliness is the rule, but they are always apt to be brought into the house in various articles purchased for use; but where order and extreme cleanliness are observed, they will never obtain a footing. Besides these creatures there are a large number of others that delight to suck the blood of the human subject, or insert themselves under his skin, or worst of all, live in his intestines. What with parasites, vegetable and animal, outside and inside the human subject and his house, there are more than enough; what might he said of his food, of his crops, his corn, his potatoes; how many things there are at work to poison him if possible, to bring his house over his head, or make it a misery to him!

One cannot wonder that so little is left of the works of man, that every trace of him is soon removed where there are so many thousands of silent hard-workers bent on destroying everything he does. Volumes might be written on members of either kingdom, whose entire lives are absorbed in destroying either man or his handiworks; add to this wilful destruction of property, accidental destruction, sudden flooding by water, or burning up by fire, ignorant carelessness of servants, and many other causes, the wonder appears to be that there is so much left of ancient handicraft as there is; but there can be no doubt that year by year it grows less and less: fires are continually burning ancient pictures and buildings, and ancient objects of art are destroyed, lost, or stolen. W. G. S.

## PUBLIC WORKS DEPARTMENT IN INDIA.

DURING the last seven years a large number of young men have entered the service of the Indian Government as civil engineers, and the Department of Public Works in that country is likely to offer an increasing field to the younger members of our profession. It will, no doubt, be interesting to many readers of the *Builder* to hear what one of the senior and more fortunate of these "Stanley Engineers," as they are called, has to say as to the present state and the future prospects of the service. It is well known, both in India and at home, that much dissatisfaction has been felt and expressed by the Stanley engineers; and it is believed that considerable distrust has arisen in the minds of young men in England, which prevents eligible candidates from coming forward. Some of the causes of dissatisfaction have been removed or mitigated; others still exist. It is the object of the present article, on the one hand, to enable intending candidates to form some opinion on the advantages and disadvantages of the service; and, on the other, to point out to those in authority the reasons which have caused a marked falling off in the status and qualifications of the candidates.

Some recent changes have been made, of considerable importance, which do not appear to be widely-known in England: those it will be useful to point out in their proper place. These changes have improved the position of the civil engineers to a certain extent, and show a disposition on the part of Government to consider their claims to more liberal treatment. It is probable that, as

the requirements of the case, and the disadvantages which civilians consider as drawbacks to the service, become better understood by those in authority, further concessions will be made.

We shall first take up the question of pay. The several grades and their salaries stand, at present, as follows:—

	Per Ann.
Chief and superintending engineers .....	£1,200 to £1,500
Executive engineers, 1st grade .....	1,050
" " 2nd grade .....	900
" " 3rd grade .....	720
" " 4th grade .....	600
Assistant engineers, 1st grade .....	480
" " 2nd grade .....	360
" " 3rd grade .....	240

There is also a grade of chief engineers, first class, on a salary of 2,700l., but there are only three officers of this grade in the whole of the Bengal Presidency; and as they are invariably military men, they cannot be taken into account in estimating the prospects of a civilian.

The period of service in each grade varies greatly, according to merit, luck, and interest, but the average may be said to be, for civilians,—

Assistant engineer, 3rd grade .....	1½ years
" " 2nd grade .....	3 "
Executive engineer, 1st grade .....	2½ "
" " 4th grade .....	3 "
" " 3rd grade .....	3 "
" " 2nd grade .....	3 "
" " 1st grade .....	3 "
Total .....	20 years.

That is to say, a man may reasonably look for a salary of 1,200l. a-year after twenty years' service; he may get it much sooner, or he may have to serve much longer. It is confessedly difficult to strike an average of this kind; the reorganization of the department only dates from 1856, and the means of estimating the probable service in the higher grades are imperfect. As to the lower grades, however, some opinion can be formed from the following facts:—

The Stanley engineers of 1859 have been six years in the service; three are executive engineers of the fourth grade, and the rest are assistants of the first grade.

The batch of 1860 have been five years in the service; one is an executive engineer of the fourth grade, the rest are assistants of the first grade, excepting one, who is still in the second grade.

The batch of 1861, with four years' service, are all assistants of the first grade, with one exception, who is still in the second grade.

The batch of 1862 have been three years in the service; three are assistants of the first grade, the rest are still in the second grade.

The average number of each batch is ten. The earlier batches only served a few months in the lowest grade.

Now, when we compare the pay obtainable after five or six years' service, with that of railway engineers, or of other departments of Government service, such as the army staff, the medical service, and still more the civil service, it will be found exceedingly small. Railway engineers usually begin with 400l. or 500l.; the medical service and the civil service commence with about the same sum; and even a lieutenant in the army, whose work and qualifications are alike remarkably small, draws 600l. a year when in India.

It cannot be too often repeated, that living in India is daily becoming dearer, and that small salaries are really equivalent to but one-third of their nominal amount at home, while large salaries are only equal to one-half at the most; that is to say, a man can live as comfortably on 100l. a year at home as he can on 3,000 rupees (800l.) in India; and he will be no better off with 1,000l. a year out here than with 500l. in England. Clerks and shopmen, who would be paid 60l. to 100l. a year in England, receive 250l. to 400l. in India; beer costs 2s. a bottle, a pair of kid gloves 8s., and other things in the same proportion.

On the other hand, the service, so long as one conforms to its rules, is pretty nearly a certain provision, and a small pension may be obtained after thirty years' service; but on the whole it must be considered as somewhat on a par with the civil service in England in point of remuneration; it is a moderate but a permanent provision, with this difference, that the work is three times as hard, and has to be done in an Indian climate.

The pay of assistant engineers has recently been raised. Their salaries formerly were lower by 50l. a year than those shown in the above table. But it is the opinion of the writer that no young man of decent abilities who can obtain

any employment in England or elsewhere, on however small a salary, would be prudent in coming out to India for less than 400 rupees per month (80l. a year). That is the lowest salary upon which any one in the position of a gentleman can live with ordinary comfort. Even this will not admit of many luxuries. If the Government would appoint the Stanley engineers as first-grade assistants upon landing, they would attract a better class of men than they can expect to get at present.

They should require two years' practical experience in all cases, and should raise the minimum age. The last two or three batches have consisted largely of very young men, from "cramming schools;" and scarcely more than one or two articulated pupils of engineers of any standing have entered of late years.

The Government have admitted the principle of allowing for past experience by bringing in several young officers of the Royal Engineers as assistants of the first grade, on the plea that they had been employed on works at home. A similar consideration should be shown to Civil Engineers. At present, civilians who have been two years at the Roorkee College (where they are educated at Government expense), and who have had no practical experience at all, are admitted on exactly the same footing as the Stanley engineers, who are required to have had three years' professional education at their own expense, and who must, according to the rules, at least, have had not less than one year's practical work.

One very grave cause of dissatisfaction among the civil members of the department is the inequality between their pay and that of the military members. In all other civil departments, and even in the semi-military police, the pay is "consolidated;" that is, soldiers and civilians are paid alike, according to their standing in the department. But in the Public Works Department, military men receive departmental pay in addition to the pay of their army rank; thus they are always paid more than,—sometimes twice as much as,—civilians holding the same appointments and doing the same duties. Nor is this all; it often happens that a subordinate officer receives more than his superior, if the latter happens to be a civilian.

The annexed table shows the pay of civilians and military men in the same grades in the department.

	Military.	Civil.
Assistant, 3rd grade (Lieut.) .....	Rs. 394	Rs. 200
" " 2nd " " .....	392	300
" " 1st " " .....	413	400
Executive, 4th " " (Capt.) .....	643	400
" " 3rd " " .....	632	500
" " 2nd " (Major) .....	792	600
" " 1st " .....	1,119	750
Superintending 2nd grade (Lt.-Col.) .....	1,210	900
" " 1st " .....	1,627	1,000
Chief engineer .....	1,827	1,400

To add to the unfairness, the leave and pension rules of military men happen to be infinitely more liberal than those of civilians. The military man can claim, as a matter of right, a pension of 200l. a year after twenty years' actual service in India, while the civilian must serve thirty years, and even then cannot claim a pension at all,—it is only given as a matter of favour.

The promotion of military men is also quicker than that of civilians; so that the latter stand in a very inferior position, notwithstanding the equality theory, and the loud protestations of impartiality which the Government, with rather suspicious eagerness, are continually putting forth.

The financial commission, and even some of the military members themselves, have strongly remonstrated against this unfair system of payment, and more than one attempt to substitute "consolidated pay" has been made; but the military element has hitherto been too influential to allow it. An obvious remedy would be to raise the pay of civilians to the average of that drawn by military men in the same grades; but the wretched parsimony which has succeeded to the former extravagance of the Indian Government,—and which is alienating all servants of the State by ill-judged retrenchments from salaries already low,—apparently forbids even the suggestion of such a plan.

The question of pay has been discussed at such length because it is naturally the most important to persons about to enter the department, and it is one upon which great misconception prevails. We may now pass on to the subject of promotion.

The system of promotion may be described as one of combined seniority and selection, con-

siderably modified by luck and personal interest at head-quarters.

Recommendation-rolls are submitted every half-year by the superintending engineers to the Local Governments, and the senior officer recommended is usually promoted, unless there is something against him. The promotions are generally fair; there is a tendency,—but not more than must be expected,—to push on officers of the Royal Engineer Corps, and occasionally a job is perpetrated. Considering, however, that the Royal (Bengal) Engineers fill all the highest posts in the department, and that they not unreasonably think an officer of their own corps superior to any civilian, the preference shown is not surprising, and must be accepted as inevitable. Still must be borne in mind by intending candidates as one of the features of the department.

The worst point is the disposition sometimes shown to break, in favour of the Royal Engineers, the very rules which are rigorously enforced against the civilian. For instance, it was formerly a rule that no officer could be made an executive engineer (or special assistant engineer) until he had passed the prescribed Hindustanee examination; and it is also a standing rule that no officer can be advanced more than one step at a time. Now, two Stanley engineers were lately promoted by the North-west Provinces Government in contravention of the first rule. Six months afterwards, the Supreme Government cancelled their promotion, as being against regulations, and compelled them to refund the additional pay they had received: a step of questionable legality. But immediately after this harshly enforcing the rule against these two civilians, the Supreme Government itself promoted a young lieutenant of engineers who had not passed in Hindustanee, from second grade assistant to special assistant (a grade since abolished), thus superseding all the assistants of the first grade, and breaking both the rules above referred to. To be sure, the pretext was made that the promotion was only temporary; but the officer concerned was afterwards confirmed in his rank, and has since been again promoted. This is not an isolated case; other instances of partially to Royal Engineers might be quoted, did space permit.

The Government has at length in part avowed their policy by ruling that all military officers shall be henceforth appointed to the department as assistant engineers of the second grade, while all civilians must commence at the third grade, thus giving the former one or two years' start of civilians in the race for promotion. Much less irritation would be felt if Government would honestly avow, as they did up to 1856, that the military members have a prior claim to promotion. The civilians cannot but feel indignant at seeing Royal Engineers steadily pushed a-head, and allowed to fill the best appointments, all the while that Government is persistently declaring a perfect impartiality.

All this may perhaps be inevitable, so long as nearly the whole of the Public Works secretariat, and the twenty highest posts in the department, are in the hands of the Royal Engineers; but it must be seriously considered by those about to enter the service. A military régime is very different from the service of a railway company, or of an engineer in private practice, and considerable patience is necessary in those subject to it.

It is a pity that the military members should evince so much opposition as they have lately done to the appointment of one or two civilians to be superintending engineers of the lowest grade; such a line of conduct embarrasses the Government, and gives rise to much of that ill-feeling between the two classes, which the military men are the first to deprecate in theory. Already the civilians form two-thirds of the whole Engineer establishment; and it is to be hoped that Government will soon see the necessity of allowing them a fair share of the higher appointments; but at present the whole power and influence in departmental matters lie in military hands, and civilians are debarred from participating in the management and supervision.

In connexion with the subject of promotion, it should be mentioned, that the Indian Government have recently raised the proportion of first-grade assistants from one-fourth to one-third of the total number of assistants of every grade, and have submitted to the Home Government a proposition to similarly increase the proportion of the higher grades of executives. On the other hand, unless some inducement be offered to civilians to retire after twenty years

of actual service, the decreasing number of military men in the department will sensibly decrease the rate of promotion in future; for military men seldom serve longer than twenty years, but civilians must wait, under the present rules, for thirty years before they can get a pension. Few men are worth much, mentally or bodily, after twenty years of severe work in India, and it would certainly be worth the while of Government to offer a retiring pension of 200*l.* a year after twenty-two years' service (twenty actually spent in India) with a view to quicker promotion, clear off the older hands, and insure a more frequent infusion of fresh blood into the department. Such a pension would add much to the attraction of the service, nor would the additional cost be very great; comparatively few would live to claim it, and of those who did the best men would probably find it their interest to stay longer.

There is a standing rule that all persons shall enter the Public Works Department in the lowest grade, but the Government, rather amusingly, reserve the right of breaking the rule whenever they see fit.

Promotion in the "Minor Administrations" under the Supreme Government (such as British Burmah, Outh, the Central Provinces, Mysore, &c., &c.) is rendered needlessly uncertain by the practice of bringing in "outsiders"—railway engineers and others—as executive engineers of any grade, and as assistants of the first grade.

This is obviously unjust to all the officers in lower grades, as each such appointment loses to them a step which they have a right to expect; the men thus superseded often have longer experience and greater claims upon Government than those who are put over their heads. These appointments from without are in the gift of the Secretary to Government of India for the time being, who naturally wishes to retain such patronage; but the system causes much discontent, and should be abolished. The only excuse for it is the want of sufficient qualified officers to keep the Department supplied for the lower grades; but the remedy is obvious; let the Government but offer liberal terms, and convince the public of their good faith, and there will be no lack of qualified candidates.

I will continue my letter in another number.  
Bengal. C. E.

#### ART IN THE COLONIES.

Our readers will be pleased to hear that art education is progressing at Capo Town, in South Africa. About three years since, an "Institution for the Intellectual Improvement of Young Men" was established under the auspices of the Lord Bishop of Capo Town, and it was soon after determined that a school of art should be started, on the plan of the schools in connexion with the Department of Science and Art in England. The services of a trained teacher from home being obtained in 1864, the school is now one of the institutions of the colony. There are in full work six evening and five morning classes, four of which are attended by ladies. With hardly any manufacturing class, the practical value of art-training was hard to demonstrate; but the school has flourished nevertheless, and, after just one year's labour, the first exhibition, consisting entirely of students' works, was held in July last, and opened by his Excellency the Governor, Sir Philip Wodehouse, who has proved himself a liberal patron of the school. The students in the various classes number over one hundred; and, amongst this number, there is a young Kafir, who draws remarkably well, and whose enthusiasm was so great, that he actually walked from Shellenbosch, thirty-five miles by road, to see the exhibition! As the school is quite unconnected with the central authority at home, it is cut off from its paternal care, and also from Government assistance.

The master, Mr. F. M. Lindsay, deserves the highest commendation for the energy and spirit with which he has achieved a high standard of excellence; nor should the valuable services of the Hon. Secretary, Mr. Foster,—a name well known amongst the partisans of art and literature in London,—be overlooked. This gentleman, indeed, may be fairly described as the prop and parent of the institution. In the report now before us, we find five prizes were awarded for architectural drawings; one of two guineas for a set of drawings showing elevation, plans, and section of a building, coloured, to S. Walter; another, of one guinea, for drawings of details, to W. Fell; the third, also one guinea, for a like

sheet, to J. Kington; and ditto, ditto, to G. Rose and W. Ingleby. For the best drawings of historic ornament, two guineas to R. C. Blackmore.

#### FOREIGN WORKS.

A Dutch company, formed at La Haye, has just purchased six gasworks belonging to the General Society of Credit in Spain; and the shares of the new company are to be issued by the Bank of Antwerp. These establishments are in full working order at Valladolid, Xeres, Alicante, Cartagena, Burgos, and Pampelna.

The Neapolitan journals announce that, in a few days, a very interesting hydraulic operation is to be carried on at Avezano, by which an outlet will be given to the waters of the Lake Prino, so that it can be drained, and the land rendered available for agricultural purposes. The flow will take place by a magnificent aqueduct, called the Emissary of Clandius, about 4 kilometres long. This important structure formerly served to drain the lake; but, on its falling into a state of ruin, the water again took possession of the bed of the lake. The restoration of the aqueduct has been accomplished by a Neapolitan company, of which Prince Torlonia is the principal shareholder.

The French Chambers and Senate have approved of the convention passed between the Minister of War and M. L. Fremy, governor of the Crédit Foncier of France and Algeria; Paulin Talabot, director-general of the Paris and Mediterranean and Algerian Railways; and consorts, authorizing them to procure capitals and open credits, as a company, for carrying on all agricultural, industrial, and commercial operations in Algeria. The capital of the company is to be 100,000,000 francs, or 10,000,000*l.* sterling, in 200,000 shares of 50*l.* each; and the works are to consist of public works of utility, the working of mines, the cultivation of lands and forests, the execution of weirs and canals of irrigation, the establishment of factories, &c. The convention states that,—1. The company is bound to realize, at the requisition of Government, in the proportions that it may deem necessary, either by means of calls upon the shareholders or by the emission of obligations, to the amount of 100,000,000 francs, in the delay of six years, the sums that should be employed in Algeria for the works or operations above stated. Moreover, the company engages to place at the disposition of the State another sum of 100,000,000 francs, which it is to employ in the execution of great works of public utility, consisting in roads, ports, railways, canals, weirs, irrigation, &c. Each year the programme of the works to be executed by aid of this sum shall be decided upon by the Government, by the advice of a special commission with the consent of the company. The said sum of 100 millions to be paid into the public treasury by sixths, quarterly, from year to year, the first payment being made the 1st of April, 1866. The amount of each payment shall be reimbursed by the state to the company by means of annuities calculated at the rate of interest of 5*½* per cent, and comprising a sum of 50 millions, and comprising a sum of 50 millions, and comprising a sum of 50 millions. Each annuity to be payable half-yearly, annuities will be considered as special securities for the obligations issued by the company for the execution of the works of the convention.

2. Notwithstanding during the course of the first three years, beginning from the first payment, the Government to have the faculty of reducing to 72,000,000 francs the sum that the company should place at its disposal.

3. The state promises to sell to the company 100,000 hectares (247,114 statute acres) of land, which shall be delivered up by the Government from the State domains in Algeria. The price per hectare to be 1 franc per year, payable annually, from date of possession, during fifty years. Moreover, the State yields to the company the mines it may discover during a period of ten years.

A French engineer, M. Paulin Gay, has lately perfected a machine, on the disc principle, for sawing or cutting through the hardest rock in quarries and tunnels. Experiments have been made lately at the Conservatoire des Arts et Métiers of Paris, and the following is an extract from the report of M. Tresca, the sub-director, countersigned by General A. Morin, chief director, relative to the performance of this machine:—

"The contrivance of M. Gay depends upon the new and special application of a principle, and

consists of apparatus whereby a disc of lead penetrates vertically or horizontally into the stone, being impressed with a rapid circular motion, while powdered emery is applied to the edge of the disc by means of a small jet of water. The emery, as fast as it is applied, falls into a receiver, whence it is lifted to be replaced in the feeding hopper and used over again. The disc is mounted upon a shaft so as to move in a plane perpendicular to that axis, and is guided by friction wheels whereby its motion is steadied. The body of this disc is of wrought-iron plate 4 millimètres thick, and is pierced all round the edge with a double row of elliptic holes, to afford passage for the melted lead which is cast upon the wheel to the thickness of 6 millimètres, and a total width of 7 millimètres. This wheel is put into motion by a machine or motive power, the strength of which is regulated by the diameter, and also by the nature of the stone to be cut, and, placed upon a moveable chariot on rails, it advances into the tunnel, resting on the floor of the heading. If a block of stone be required to be cut for building or other purpose, the machine is fixed while the block is pressed against the revolving disc by a counterpoise. For tunnel work M. Paulin Gay has an enormous disc 2 mètres in diameter."

#### MONUMENT TO DON PEDRO IV., LISBON.

In the Place du Roggio, now called Place Don Pedro IV., in Lisbon, a monument has been erected to the memory of Don Pedro IV., King of Portugal and Emperor of the Brazils. The Place is rectangular, enclosed by four streets and an alley of trees, and affords an excellent site for the structure. It consists of a surbase, pedestal, column, and statue. The surbase is formed of a block of granite, on which rests the pedestal, with an allegorical statue, in a sitting position, at each of the four angles. These represent the four cardinal virtues, Prudence, Justice, Force, and Temperance. On the surbase, uniting them, appear the arms of twenty of the principal towns of Portugal, suggestive of the patriotic co-operation of the nation. The second part of the monument, the pedestal, on which are inscribed the deeds the memory of which the structure is designed to perpetuate, contains four tablets of simple yet bold design, decorated with garlands and crowns, and surmounted by the initials of the founder of the reigning monarchy. On the base of the column are four *bass reliefs*, joined together with garlands and crowns. The shaft is fluted, and the capital contains, on each of the four faces, the shield and arms of Pedro IV., surmounted by a royal crown, interlaced with palm-branches and symbolical flowers. Lastly, on a pedestal supported by the capital, stands the statue of the king, in the uniform of a general officer; he holds in his right hand the constitution, and his left rests upon the hilt of his sword. It is 3m. 30c. in height, and was cast of bronze, its present gilt surface having been given by the electro-plastic process.

Altogether the monument is 27m. 50c. (90 ft. 3 in.) high. It is the work of M. Davoud & Robert, who obtained the first prize at the public competition of designs. The other prize-givers were,—second, M. Antonio Thomaz de Fouseca, of Portugal; third, M. F. A. Gilbert, of France; fourth, M. Pagani & F. Baraghi, of Italy; fifth, M. A. Bezzi, of Italy.

#### CHETWYND, NEWPORT, SHROPSHIRE.

PREPARATIONS are being made for the erection of a new church in this parish, on a site given by Mr. Burton Borough, the present parish church being ill-arranged, having scarcely any free sittings, and being too small for the congregation.

The design for the new church, which is in the Geometrical Decorated style, has been prepared by Mr. Ferrey, architect, consists of a nave and south aisle, 33 ft. wide and 57 ft. long; chancel, 19 ft. wide and 31 ft. long; a massive tower and spire at the north-east junction of the nave and chancel, and a north porch. The exterior walls will be of the local red sandstone, in irregular random courses, with wrought quoins. The interior will be lined with white ashlar. The roofs will be covered with blue and red tiles, variously arranged. The chancel roof will be of oak; the other roofs of deal.

The church is intended to hold 250 persons: 130 sittings will be free. The height to the ridge of the nave roof will be 38 ft. In the

## WINSCOTT, NORTH DEVON.

tower will be placed a peal of six bells, the base of the tower forming the vestry and organ-chamber, under which will be a hot-air apparatus, the organ-chamber opening into the chancel. The height of the spire will be about 90 ft.

On a site contiguous to the church, a school, master's house, and national schools to contain seventy children, will also be built; the present schools in this parish being about a mile distant from the church and rectory. The building will consist of a schoolroom, 33 ft. by 20 ft.; a classroom, 17 ft. by 15 ft.; and a house for the master, built according to the regulations of the Council of Education. The style of the buildings will harmonize with the new rectory, which is nearly completed, and the grouping of the three will be very picturesque from the Chester road, which passes close to them on the north side.

## WINSCOTT, NORTH DEVON.

WINSCOTT, the residence of Mr. J. C. Moore Stevens, is situated at the brow of a hill, on the road between Torrington and Hatherleigh, commanding fine views to the east and south. The new house, of which we now publish illustrations, is built of stone from local quarries, with dressings of Hatherleigh stone, which is spoken of as one of the finest stones in England for building purposes. The porch is vaulted in brick, with stone ribs, and the shafts carrying the arches are monoliths of granite. The central hall is nearly 30 ft. square, open to the roof, and finished with a lantern. An arcaded gallery connects this with the porch below and above. The drawing-room and dining-room are each about 30 ft. by 20 ft. On the left at entering is the drawing-room, and next to this is the library, beyond which is a justice-room, accessible to the

back entrance and the servants' hall, and provided (through a lobby) with a W.C. and a private staircase to the dressing-room and bedroom above. Over the porch is a boudoir, with a smoking-room above, approached by a gallery and turret staircase from the front landing. The hall is paved with Minton's tiles. The roof is covered with Delahole slates, large "ladies." The office arrangements and the sleeping accommodation, it will be seen, are extensive. The architect was Mr. William White, of London. The builder was Mr. Samuel Hooper, of Hatherleigh. The entrance-gates are of iron, exceedingly well wrought, by Tardrew, of Bideford. The cost of the building is over 7,000l.

The proprietor has likewise just rebuilt, at his own expense, his parish church; which was endowed by his father, the late Archdeacon Moore Stevens, of Exeter.

WINSCOTT, NORTH DEVON.—MR. W. WHITE, ARCHITECT.

— Section on C.D. —

### THE SANITARY CONDITION OF ST. GEORGE'S, SOUTHWARK.

The recent strictures, in the *Times* and *Builder*, on the state of certain parts of the parish of St. George's, Southwark, have excited great commotion among the vestrymen, some of whom have shown a right spirit in regard to these strictures, which, however, have also been received in the vestry much rather in the personal and *tu quoque* manner of stupid people than in the calm and deliberative interests of the public health, as they ought to have been.

Mr. Bash very properly remarked that, as sensible men, and especially after reading their own medical officer's report, they should do all they could to remedy many evils in the parish. *They were not doing so. They had not even a sanitary inspector*, although they were surrounded by so much disease and wretchedness. He believed Mr. Rendle [the grand target for the bullies of the vestry] was sincere in his purpose of improving the sanitary condition of the parish.

Mr. Bendle, a tailor, broke out in a very different strain, as to the "cruel and hase manner" in which they had been "calumniated," and he "threw hack all such calumnies in the teeth of the calumniators." In his estimation the gentlemen who reported to the press on the state of the courts and alleys of Southwark, whether they wrote for the *Times*, or the *Lancet*, or the *Builder*, were all "hngered scribblers,"—a fine idea which Mr. Beadle seems as much to delight in repeating as would any parrot who might chance to learn the words by rote. As to the naked child in Maypole-alley, which the *Builder* had sketched, it had run out of a house "for an airing" while being washed; and it was induced to stand there till sketched. Now we have heard of naked savages being induced to stand outside their wigwams to be sketched by "foreign-looking" artists; but, if manners in Maypole-alley, London, be so free and easy that children (and two were sketched, it will be remembered,—not one merely) are allowed by their parents and neighbours to stand stark naked in the street till they are sketched, this floundering member of the dirt interest does not seem to us much to mend the matter, or greatly to uphold the morality or manners of Maypole-alley by his advocacy. And what of the poor old semi-nude woman whom we saw in the alley? *She was washing,—not washed.* Again we say, would that missionaries who enter Maypole-alley would preach decency and cleanliness to the people living there. On the vestry generally, however, we are glad to note, from the *Times*'s report, that our sketches of the alley seem to have produced some impression.

"The early part of the sitting," remarks the *Times*, "was taken up with parish details, with matters which on other occasions would doubtless have caused long discussions and numerous divisions; but now these passed almost without notice, for the vestrymen were occupied in examining an illustrated newspaper, in which appeared several cuts of wretched dwelling-places in the parish, and one depicting a nude child in a miserable court of the parish appeared to receive their deep attention."

In respect to the foul and fever-tainted dwellings of the helpless poor in this alley, our loud-mouthed spokesman, Mr. Beadle, supports the landlord interest, and thinks that if such dwellings are to be "heantified and repaired" by landlords, they might as well throw up their property. To thoroughly cleanse a fever-tainted house must be—merely and very unnecessarily, no doubt,—to "heantify" it, in Mr. Beadle's view of it; and doubtless, on this principle, to cleanse a pig-sty is merely to heantify it. We had always thought it was not only the duty, but the interest, of a landlord even to "beantify and repair" his property, far less to rid it of fever-taint. How much Mr. Beadle must have pitied the poor landlords of the Jewish plague-tainted houses, when he read from Leviticus, as no doubt he has done, how unmercifully the priest "beantified" them!

"And he shall cause the house to be scraped within round about, and they shall pour out the dust that they scrape off without the city into an unclean place; and they shall take other stones, and put them in the place of those stones; and he shall take other mortar, and shall plaster the house again. And if the plague come again, and break out in the house, after that he hath taken away the stones, and after he hath scraped the house, and after it is plastered, then the priest shall come and look; and, behold, if the plague be spread in the house, it is a fretting leprosy in the house, it is unclean. And he shall break down the house, the stones of it, and the timber thereof, and all the mortar of the house; and he shall carry them forth out of the city into an unclean place."

True, it was not fever, but leprosy, to which this thoroughgoing and most excellent law of Moses related; but are not fever-tainted dwell-

ings plague-houses, and are not just such fever-traps the haunts of still worse plagues than fever?

At the vestry meeting of which we have been speaking, a report by Mr. H. Bateson, the vestry's medical officer of health, was read, in which, while fully admitting the "depraved state" of the "degenerate race" which inhabits some parts of the parish, and the filth and overcrowding, infection, disease, and misery, which have caused such degeneracy and depravity, he makes strenuous endeavours to whitewash the vestry at least, though not the filthy alleys. He says,—

"It requires the mere gift of making a noise to point out faults, whilst it requires wisdom to remedy them. The former we have had to satiety; let us in the future have the latter."

Well may the vestry say—defend us from our friends. The very office of the press, as sanitary reformers, is "making a noise to point out faults;" and we have often ourselves talked of "dinning" such faults into the deaf ear of the public; but it is the duty of parish and other authorities—who are often still deaf to the public,—by "wisdom" to "remedy them." It would appear, however, from the report of the medical officer of the Southwark vestry, that, as a body,—though there are a small minority of willing and able sanitary reformers, such as Dr. Rendle, among them,—that vestry has not heretofore had the wisdom to remedy those faults which have been dinned into their ears by the "noise" of the *Builder*, and its coadjutors of the press; and the vestry's medical officer, can only hopefully look to "the future" for it!

"To destroy all these sources of harm and disease" (he remarks) "what a time must be required! what a change wrought! What a work done!"

Very true; but why don't they do it? why don't they begin to do it? We hope, with their medical officer, that the wisdom of the future will expiate the folly of the past.

### A WORD FOR SUNDERLAND.

SIR,—Whilst I have been both amused and interested by the lively criticism on some of the material and moral aspects of this borough, contributed by a correspondent, "C. C. H.," to your journal, p. 713, I must also add that I was grieved that the value of his communication should be impaired by grave errors. It is, I heartily acknowledge, a great advantage to the inhabitants of a town, and to the authorities charged with its government, to learn what is thought of it by intelligent visitants.

The description of the High-street of Sunderland, as being upwards of a mile in length, and in part "undulating," is so far correct; but as to its being "tortuous," I submit that term conveys an incorrect and unfavourable impression of its appearance.

Except for the "undulation" spoken of, which greatly adds to its beauty, you could see in a continuous line the street for more than three-quarters of a mile; and where the line is not continuous only in one part, it would be much more correct to call it a curved line than "tortuous." Cobbett's description of this street, written on a visit to the town in 1832, and published in his "Northern Tour," might be put in contrast with that of your correspondent. Cobbett describes the appearance of the shops in the High-street as "equal to the finest in Regent-street or the Strand;" but although this may be true of some of the shops, we cannot take any credit for our street architecture; and had your correspondent expressed his admiration of the magnificent line of street, whilst condemning the generally mean appearance of its brick buildings, and the monstrosities perpetrated in some of its recent "improvements," he would have been warranted by facts, and have rendered a useful service. Immense improvements, however, are shown in the style of house architecture in the newly erected portions of the town, especially since the formation of the public park.

The description given by "C. C. H." of the lanes and alleys, branching out on either side of the lower part of the High-street, is too truly correct so far as relates to their contracted size, but in other respects the description in the paragraph beginning, "The freaks of the fungi," is an exaggeration of the reality. He describes some "narrow defile" called "out of respect to the hulder a street," so contracted, that two persons could not pass without jostling each other; and in this lane or street apparently the

scene of his observations was laid, and he calls it "only a sample of the lot." Now, the narrowest "street" in old Sunderland, except an opening miscalled "Hodgkin-street," but properly "Little Flag-lane," is 10 ft. wide. If "Hodgkin-street," were the one your correspondent entered, there are not more than eight or ten tenemented houses in it; the remainder is occupied by the hack-doors or warehouses of business premises. \* \* \* \* \*

The local authorities, with all the vigilance they can exercise, find it impossible wholly to prevent the nightly commission of nuisances in some of these narrow lanes; but for such people they are, on the whole, commendably clean and wholesome, and certainly exhibit a most pleasing improvement on the state of things a few years ago. Most of the houses in these lanes and streets are built hack to back, with no yards; hence there is no space for ash-pits and privies; and to introduce water-closets into these tenemented houses is a work of great difficulty. Yet it has been done to an extent, and with satisfactory results, not exceeded, I believe, by any town in the kingdom.

The town has had the services of a sanitary inspector for some years; a second has just been appointed; and, as chairman of the sanitary committee, I am well aware that a town of such magnitude will require their unremitting vigilance to keep its sanitary affairs in a satisfactory condition.

Your correspondent truly acknowledges the corporation have done "a good deal," and Mr. Rawlinson, on a recent visit, after about a dozen years' absence, publicly expressed the warmest approval of the great improvement which had been made in the appearance and sanitary condition of the town. Indeed, he said he knew of no town which had been more improved by its local authority.

"C. C. H." says "the corporation have drained a little," but the fact is that they have done so much in this way that nothing remains to be done, except connecting the newly-erected houses with the main drainage continuously as they are built. Between 1854 and 1857 a complete system of main sewerage, of the most perfect character, was carried out; and since then nearly 10,000 houses have been connected by properly-trapped house-drains with the main sewers. The whole of the subsidiary drainage is of the best London stoneware pipes. As to urinals and water-closets, on the best principle and cleansed every day, they are so numerous that no town in the Kingdom would, I think, be found better provided with these important requisites to decency, health, and comfort. On inquiry I find the number of urinals, or urinals and water-closets combined, is forty-seven, with accommodation for 164 persons. They (the corporation) have "put up some small drinking-fountains." If they are "small," they are, nevertheless, neat and unpretending, and as ample in their accommodation as those costly ones about the "inauguration" of which such a noise is made in some towns. The friends of the drinking-fountain movement might take a lesson from Sunderland, where twelve really neat fountains, with two cups to each, and some with four cups, have been erected, at an average cost of about 12l.

As to the placing of the fountains, they are, I submit, rightly placed in or close to the main thoroughfares and places of public resort; and they are not at all required in the narrow lanes, for the reason, which your correspondent appears not to have known, that every house has, or may have, an unlimited supply, and that, too, without intermission, of the inestimable blessing of pure water, at the rate of only one penny farthing per week,—and this, too, payable weekly.

The river Wear, we are told, "winds sluggishly along." Surely no one needs to be informed that the Wear at Sunderland is a tidal river close to the sea, and flows quick or slow, just as the tides flows and ebbs; but it is nowhere "coaly or black." No coals are shipped on it nearer than about one mile from its mouth, considerably west of the parish of Sunderland.

It was the late lamented Robert Stephenson—not "Stevenson"—who designed and carried out the alterations and improvements referred to by your correspondent. It was one of the last works on which he was engaged, and was rather a labour of love to preserve a structure he admired so much than a professional undertaking. The alterations cost upwards of 40,000l. The

\* Simply a slip of the pen.

expenditure coming upon the town almost simultaneously with its sewerage, public and private, and an enormous expenditure annually for flagging, a toll was indispensable on waggon, carts, &c. It is very fine to talk about a liberal and enlightened policy, but there are limits to the rate-paying capacity of hundreds of poor rate-payers; and it would have been a cruel injustice upon these, with their present hardships, to have laid an additional rate of 9d. in the pound upon them that the owners of carriages, the railway company, and manufacturers and merchants, might have their heavy traffic conveyed across free of toll. It should be stated, too, that the corporation have no property from which a revenue can be derived in aid of the rate-fund. Everything has to be accomplished by rates upon the inhabitants.

No foot-toll has been levied on the present bridge since it was altered, and it is nineteen years since the foot-toll was abolished. For some years also previous to the costly alteration no carriage and traffic toll was taken. It was entirely toll-free. In a few years' time I anticipate the corporation will be both able and willing, with the consent of the inhabitants, to abolish the tolls and charge the maintenance of the bridge and the discharge of its debt on the rates. In justice to the corporation and the town, it should be stated that one of the first things done under the Improvement Act, which was obtained about a dozen years ago, was to arrange with the trustees of the turnpikes entering the borough to have all the toll-gates removed a distance from the town: hence in one direction the nearest toll-gate is three miles, another is two miles, and the nearest is a mile and a half from the town.

The health character of Sunderland, as indicated by the registrar's returns of births and deaths, and the causes of death will bear favourable comparison with the average of towns. Last year the aggregate death rate was 22.63; and the birth rate 41.64 to every 1,000 living. The birth rate is exceedingly high, and the increase of population from excess of births over deaths is much above the average of large towns. We are not all disposed, however, to rest content with the present condition of things. Those narrow courts and alleys, the cause and consequence of poverty, disease, and crime, must be gutted. These must give place to properly-formed streets and dwellings compatible with health. That is work for the future; and to the pages of the *Builder* we are accustomed to look for encouragement and counsel in all such matters.

J. W.

\*.\* We have received a statement from our correspondent, to whom the above was submitted, justifying his original remarks. Part of this we may hereafter print, though this is scarcely necessary, as the excellent Chairman's own letter shows conclusively how well-timed and loudly-called for those remarks were.—Ed.

#### THE SANITARY MOVEMENT IN OUR TOWNS.

London.—The City officer of health, Dr. Letheby, has reported on the health of the City for the quarter ending September last. From this report it appears that the death-rate for the last quarter is not only less than usual, and much less than that of the chief towns of England, but hardly greater than the death-rate for the whole country. As in the case of the birth-rate, however, some allowance must be made for the displacement of many of the poor. Most of the diseases of the zymotic class have been less than usually fatal. This in itself indicates a satisfactory state of the public health; and the same indication is also furnished by the sickness returns from the medical officers of the City unions. At the time of the appearance of virulent cholera among us on previous occasions, there was a large amount of zymotic disease, especially diarrhoea and dysentery; and as at present, there are none of these significant fore-warnings of an approaching epidemic, the reporter is hopeful that the disease will not visit us on this occasion, especially as the route by which it has always reached us was different from what it is in the present epidemic, which may be confined to countries near the Mediterranean.

Woodwich.—The inhabitants of North Woodwich are compelled to pay sewerage rates; but owing to the peculiar situation of the town it is almost destitute of sewers. At the last meeting

of the Woolwich Local Board of Health, it was stated that the condition of the locality was disgraceful; abominable nuisances prevailed; and if cholera visited the country, it might be expected to make a clean sweep of the district.

Basingstoke.—In compliance with a requisition signed by upwards of 200 ratepayers and other inhabitants, to consider the sanitary condition of the town with the view of adopting the Local Government Act, the corporation have held a special meeting on the subject, and after some discussion the motion to adopt the Act was rejected, the majority in favour of it being only nine, while the minority was five; and by the Act two-thirds of the members present must vote in favour of it before it can be carried.

Oxford.—At a recent meeting of the local board a letter from Sir Benjamin Brodie, on the condition of the river by Magdalen Bridge, was read. Sir Benjamin remarked that it was little satisfaction to the residents in the vicinity to be promised a complete system of drainage hereafter if they were to be poisoned in the meanwhile; and he hoped something would be done to mitigate the temporary evil. The deposit, he was informed, was largely increased, owing to the new workhouse drain, and he suggested that it should be removed as far as possible. The matter was referred to the surveyor, with instructions to do all that could be done.

Warwick.—At the last meeting of the town-council, two rather disagreeable letters were read. One was from the agent of Mr. Staunton, of Longbridge, stating that, unless assurance was given that the present system of draining into the river Avon would be abandoned, application would be immediately made to the Court of Chancery. The other was from Mr. Jeremiah Matthews, of Edglaston, who, as agent for Miss Ryland, complained that, from the discharge of Warwick sewage into the Avon, the smell and nuisance at Barford had become so intolerable that Miss Ryland's house was no longer fit for habitation. What is called a "suitable reply" was sent to each party, stating that attention would be at once given to the subject of complaint, but the Board seems really to have no idea of a remedy for the evils which are now created. Draining into the Avon, though attended with consequences equal to the maintenance of two Chancery suits, is apparently the only outlet for sewage which the town-councillors of Warwick can devise.

Woodditton.—Typhus and typhoid fever have again been raging in this village. A pond which was considered to have been a cause of fever last year has been cleared out, but still appears to be in an unwholesome state. It had for years been getting worse and worse. On another marshy spot in the same locality there are open drains along the front of the cottages; and in these dwellings there is great overcrowding.

Norwich.—Mr. Bazalgette's report on the city drainage has been received, and is now under consideration. It recommends extensive works, at an estimated cost of 60,000.

Newcastle and Gateshead.—No one who has perused carefully the exhaustive report of Dr. Ewbleton, the medical officer for the Newcastle Fever Hospital for the past year, says the *Gateshead Observer*, but must be struck with the fact that this borough and Newcastle are, as shown by the number of cases sent to the hospital, in anything but a favourable sanitary condition. Frequently, in the columns of this journal, we have called the attention of the public to the disgraceful state of many of our lanes, courts, and alleys; but nothing gets done. Some "old man of the sea" sits on the back of improvement, and things just remain as they were. But this must not be any longer. The health of our town requires that the "how-not-to-do-it" system should not longer continue.

In the report itself, which we have perused, Dr. Ewbleton says:—

"From various inquiries and observations that have been made, there can be little doubt that the great cause of the continuance and spread of the typhus has been the overcrowding of human beings and the uncleanness of their dwellings. The rooms in which labourers in many casual-lie are situated in confined and unwholesome yards and courts, and for space, light, air, and cleanliness, are models of insufficiency and unsalubrity, and a disgrace to any civilized community; in them, men, women, and children lie at night, huddled together; and as regards the men, the night-shift succeed the day-shift, and the day-shift, the night-shift, in unbroken series for some time together, the beds having scarcely time to cool, the whole house badly supplied with water, and worse, with privies, dirty, unventilated, and pestiferous. In such conditions of domestic arrangement, to say nothing of the uncontrollable dietary irregularities of the people, we cannot marvel that the blood becomes deranged, that typhus is nursed, becomes

intensified, and is rendered epidemic; the wonder is that disease and death are not more prevalent than they have been. And I trust that I am not overstepping the limits of propriety when I say that the municipal authorities are much to blame, and have much to answer for, in allowing such hot-beds of disease as those which have from year to year been distinctly indicated, to exist in the midst of our industrial population. A few weeks, or at most months, ought to suffice for the extinction of typhus, if those in power would or could adopt and enforce the proper means for securing that desirable end; and yet this is the second year during which the fever has gone on rapidly gaining ground, until it has exceeded nearly all previous experience, and the foundations are being certainly laid for a much more serious epidemic in the winter and spring ensuing, than even that of the past year."

#### THE CHAPEL OF ST. JOHN'S COLLEGE, HURSTPIERPPOINT, SUSSEX.

The new chapel was commenced in 1851, and on the 17th day of September in that year, the north-east corner stone was laid by the Provost of St. Nicholas' College, Laneing. The original designs for the chapel had been prepared in 1851, by the late Mr. C. Carpenter, the architect of the other buildings of the college, but up to the present time the crypt of the dining-hall has been temporarily used for service. The position of the new chapel is on the north side of the upper quadrangle, adjoining the east wall of the dining-hall, and extending eastwards beyond the wing.

The portion at present built under the direction of Mr. W. Slater, and Mr. R. H. Carpenter, the architects to St. Nicholas College, with which St. John's is in connexion, is the choir; the antechapel and tower situated between the choir and dining-hall are not yet commenced, but will form, when completed, important features in the design. Before entering into details of the building, a few general dimensions should be given of the choir, that a right idea of its grand proportions may be entertained.

The length inside the walls is 121 ft.; the width, 37 ft.; the height to cornice, 40 ft., and to the ridge, 72 ft.; the antechapel and transeps will be 65 ft. wide; and the tower, 120 ft. high. The material used for the external facing is flint, and the windows, dressings to buttresses, &c., are of Caen stone. The whole length is divided into seven bays, in each of which (except where the wing of the college abuts against the south wall), is a large and lofty window of three lights, the tracery of which is in geometrical forms, and varied in its design. The internal arches are richly moulded, and supported by shafts, with carved capitals and bases. Between each window, and on line with the springing of the arch, is a moulded stone corbel bearing a wooden octagonal column, also with a carved capital, from which springs one of the moulded arched ribs of the roof. The east window is of seven lights, with moulded external and internal arches and elaborate geometrical tracery.

The site is placed 20 ft. from the ground floor level. Between each of the side windows, and against the east wall, are massive buttresses; and the roof is of a high pitch, covered with brown tiles, with an ornamental cresting. The accommodation is for about 420 persons, the seats being ranged facing north and south, leaving a 10-ft. passage between, and occupying the four western bays; each row of seats rises a step above the other, and on the upper platform will be the stalls for the fellows; the return stalls against the west wall will be for the provost, vicar-provost, head master, chaplain, and fellows of St. Nicholas' College. The Bishop of Chichester will take his stall as visitor at the east end, on the south side. At present the floors only are laid with some temporary deal seats and stalls, but it is intended to replace these with carved stalls of oak. The three eastern bays are occupied by the ascent to the altar, which is of three flights, of five steps each, the upper five returning against the east wall on each side of the altar. Very much remains still to be done in completing the furnishing and ornamenting of the interior, viz., stalls, tiled floor, stained glass, ornamenting the roof and walls with colour, the organ, gas-fittings, &c.; the reredos is already partly executed, and erected by Messrs. Poole, from the architect's designs. The intention is ultimately to cover the lower part of the side and east walls of the sanctuary, with an architectural composition containing life-size sculpture, representing the principal events in the life of St. John from his calling to his Revelation in Patmos. The portion at present undertaken is that immediately behind and on each side of the altar, and consists of three large cusped and pedimented

arches, resting on columns of various coloured marbles, and flanked by lofty pinnacles and niches, which also rest on marble columns. The arches each inclose one of the pieces of sculpture, the Crucifixion (in the centre), the Agony in the Garden, and St. John at the Sepulchre of our Lord. In the niches of the pinnacles will be figures of the apostles, and on the centre canopy or pediment the four Evangelists, with a sitting figure of our Lord in majesty. The lower part of the reredos will have on each side of the altar four niches, with figures of the four greater prophets, and Moses, David, Solomon, and Ezra. The sculpture will be in Caen stone. The material of the other portions of the reredos is alabaster, with columns and inlays of various rich marbles. The central sculpture is not at present finished. These, with the other sculpture and figures, will be the work of Forsyth, of London. The total cost of the reredos is estimated at upwards of 1,200*l*. The organ is intended to be placed against the blank bays on the south side, and is to be of very large size. The present temporary organ has been altered and rebuilt by Mr. Walker, of London. The pulpit, gasfitting, &c., are merely temporary, and intended hereafter to be replaced by others of a more fitting character. The builders employed were Messrs. Jackson & Shaw, of London, for the foundations; Mr. J. Fabian, of Brighton, for the carcases; the floors, fittings, &c., are by Mr. Bushby, of Littlehampton, Mr. Holland and Messrs. Palmor & Green, of Brighton; Mr. Knight being the architect's clerk of the works.

The chapel was opened by licence on the 17th inst.; the consecration being, for technical reasons, at present postponed for a short time.

#### PUBLIC IMPROVEMENTS IN OXFORD.

The usual *résumé* of the improvements carried out during the past season in the University and city is given in the local *Journal*. This year has not been specially remarkable for the number of undertakings which have been commenced, but works of considerable importance and magnitude have been continued or completed.

The new buildings at Christ Church, which were commenced in 1862, are now on the eve of completion. They occupy the site of the Chaplain's Quadrangle and Fell's Buildings, and present an imposing façade of 330 ft. The style is Venetian Gothic, and the architect is Mr. T. N. Deane, of Dublin. The work has been executed by Mr. Symm, under the supervision of Mr. W. C. C. Branwell, resident architect.

The spacious hall of New College has been re-erected, the work being executed by Mr. Franklin, of Deddington.

The Gothic tower of Brasenose College was restored two years ago, and it has now been beautified by the addition of the armorial bearings of the college, which are distributed in the niches. The work was executed by Mr. Nutt, of St. Ebbe's-street.

Extensive improvements are being made in the organ at Queen's College Chapel. The front will be entirely new. The work is entrusted to Mr. Walker, of London.

Further restorations and additions have been made at St. Alban Hall, and, when completed, as intended by the new plans, there will be accommodation for between thirty and forty students. The works have been executed by Mr. C. Selby, from designs and under the superintendence of Mr. John Gibbs, architect, of this city, and the cost is borne by the Rev. W. C. Salter, the principal of the Hall.

A painted east window has been inserted in the chapel of St. Edmund Hall, in memory of the late principal, the Rev. J. Branthwaite. The centre light has been filled in with a representation of the Crucifixion, and the minor compartments are devoted to other Scripture subjects. The work was executed by Messrs. Clayton & Bell, of London.

At other colleges minor reparations have been carried out.

Church improvements are being actively carried on, the most important this year being the restoration of All Saints', which was erected in 1699, the original structure having fallen down.

Amongst works of a secular and more general character, prominence is due to the Randolph Hotel, which is now approaching completion. It was commenced in April, 1864, the design being by Mr. Wilkinson, architect, and the contractors being Messrs. Kirk & Parry, of London. The

building has been designed with a view of making it a first-class hotel, and every new appliance will be introduced to render it as complete as possible.

The Shakespeare Hotel is now nearly completed. Mr. T. Wyatt (one of the proprietors) was the architect; and the masonry was executed by Mr. G. Yateman, of Handborough.

The Post-office has undergone great improvements, under the direction of the Government Board of Works.

The infirmary in connexion with the Workhouse is in course of erection.

In St. Aldate's new parochial school-rooms are being built. Mr. Selby has taken the contract at 1,590*l*., exclusive of gas and other fittings.

Improvements are every year being made in the shops and private residences in the city; and in the suburbs building operations have been actively carried on. At the eastern extremity of the city new streets are rapidly being made, and the recent incorporation of this district with the Oxford Local Board will furnish it with lighting, paving, and other conveniences.

In Christ Church Meadow great improvements are being made.

The Street Commissioners have been suspended by the adoption of the Local Government Act, under which the local Board will have the fullest powers of dealing with drainage and any other matters affecting the health and convenience of the inhabitants.

#### RESTORATION OF HORSHAM CHURCH.

THE committee appointed to assist the vicar and churchwardens in this work have now exhausted all the funds (6,100*l*.) hitherto entrusted to them, and it is found that 1,600*l*. further will be required to complete the undertaking. It was impossible, in so large and decayed a building, to determine with precision the amount of repairs required, or to foresee the various contingencies that have unavoidably arisen. The committee again appeal to the public for the means necessary for its completion. Donations will be received by the Rev. J. F. Hodgson, vicar of Horsham, or may be paid into the London and County Bank.

The money has been expended thus:—

Amount of original contract .....	£5,328
Extras originally contemplated, including lighting, warming, legal and architect's charges .....	1,000
Further outlay found necessary during the progress of the work .....	1,872
Total .....	7,700
Subscriptions included in the first list, including Society's grants, and 1,000 <i>l</i> . raised by the parish .....	6,100
Further sum required .....	1,600
	£7,700

The following donations have been already promised:—The Vicar of Horsham, 200*l*.; Mr. R. H. Hurst, M.P., 100*l*.; Messrs. Lintott & Friends, 100*l*.; Major Aldridge, 50*l*.; Mr. John S. Bostock, 50*l*.; Mr. P. Medviu, 10*l*.; Mrs. Gilbert, 10*l*.; Canon Swainson, 5*l*.; Rev. H. W. Hodgson, 5*l*.; Mr. G. S. Rendell, 5*l*.; Rev. W. Hampshire, 5*l*.; Mr. Mitchell, surveyor to the highways, 1*l*. Thus between five and six hundred pounds of the deficiency have already been subscribed.

#### RAILWAY MATTERS.

THE City Branch of the London and North-Western and North London Railways has been inspected. Its terminus in Liverpool-street, City, and the stations upon the route, showed that the permanent way and general works are in such an advanced state as to allow of the almost immediate opening of the line. The City terminus occupies the site of Broad-street Buildings, near the Roman Catholic Chapel, Moorfields. By means of this junction, passengers will be enabled to proceed from the City station in Liverpool-street (hardly five minutes' walk from the Bank of England), either to Kingsland, Hackney, Bow, Stratford, and Fenchurch-street, or to Easton-square, and all stations upon the London and North-Western system. The new line, which is about 2½ miles in length, with an average width of 36 ft., has, in fact, given direct means of communication between the City and the populous north, north-eastern, and north-western districts of the metropolis, as well as with the railways throughout the country.

The Midland Company have already swept away, somewhere, the bulk of the wretched population of Agar-town. That was for the uses of their great goods station. But the company is not content to remain so far from the heart of the city of London as Agar-town, for it would be next to impossible for them to command passenger traffic if their passenger trains had to be delivered at that point; and, accordingly, they purchased the site for a terminus in Somers-town. It is in Euston-road, about midway between Euston-square and King's-cross. The property in question extends on the front in the Euston-road, from St. Pancras-road to Skinner-street, and runs inwards in a wedge-like form. The hooking and other offices and the station behind them, according to the *Railway News*, will, together with the carriageways on each side, occupy an oblong rectangular block of vast dimensions. The station-front to Euston-road will be about 340 ft. long, and the length backwards to the end of the platforms about 750 ft. The spare land on the Skinner-street side will be occupied by a large hotel, for which competing designs will be invited. The station itself will be 240 ft. wide, and will be covered by an iron girder roof in one span, wider than any yet existing. The arch will be peculiar, inasmuch as it will be neither a semicircle, nor a segment, nor an ellipse, but a compound curve, consisting of two segments, which will raise its pike slightly above that of a semicircle. The station has been designed by Mr. W. H. Barlow, engineer-in-chief, and the works will be carried out under the personal superintendence of Mr. Frederick Campion, resident engineer. The Great Eastern will probably obtain access to this station when their northern extensions and alliances have been completed and settled.

The Central Wales line of railway has been opened from Knighton to Llandrindod. The accomplishment of this piece of work has opened up about twenty miles more of that direct communication between Milford Haven and the manufacturing districts of the north of England, which it was the original object of the promoters to establish. The piece of line from Knighton to Llandrindod has been five or six years in course of construction, and the engineering difficulties that have had to be encountered were very great—so much so, indeed, that at one time it was feared the work would have to be suspended. The country through which the line passes is a succession of mountains and valleys, affording some of the most romantic and beautiful scenery anywhere to be met with. A viaduct of local stone has been thrown across the Heyop Valley, having thirteen arches of 36 ft. span, and reaching at its highest point an altitude of 75 ft. The trains will have to pass through two tunnels, one at Llwynnoco, which is 700 yards in length, and the other at Penrynhoth, 400 yards in length. The course of the line is very winding, and the curves in some places are very sharp. The gradients, at some places, are rather stiff. The construction of the line has been carried out by Messrs. Hattersley & Morton, the contractors.

The engineer-in-chief of the Stockton and Darlington Railway, Mr. John Dixon, C.E., has died at his residence, Belle Vue, Darlington, aged 76. Mr. Dixon was a pupil of the late George Stephenson, and was appointed engineer-in-chief to the Stockton and Darlington Railway soon after its commencement, and has held the appointment up to his death.

A new railway axle-box, in which water is used instead of grease or oil, is in use in the north of England. It is thus described:—On the axle, which, as well as the sides of the box, receives the thinnest possible coating of grease when the parts are fitted up, rests a socket, made of gun-metal, greased in the same manner, and provided with a groove lengthwise. At the end, towards the nave of the wheel, a kind of shad is attached to the socket, bent in the form of a horse-shoe, and running in a groove in the axle, to prevent the water from being ejected out of the box at that side of the bearing. The box is then placed over the socket, and an iron disc is fastened on the fore end of the axle: on this disc, and at the top of the box, there rests a small metal spout in the form of an inverted **L**, which is kept in a vertical position by means of the upright branch of the **L** being guided in a groove at the top of the box, which is fastened up by two plates at the back and the front, made water-tight by means of india-rubber washers, &c. The water is then poured in through the orifice of a cup attached to the box outside, and communicating with the inside; the level of the

water in the box not standing quite as high as the lowest point of the axle. As soon as the carriage is put in motion, the disc, of course, moves along with it, and, as it touches nearly the bottom of the box, it carries up the water, by means of the centrifugal force, to the top of the box, where it is caught by the spot 1, and forced down into the socket, falls through the groove of the latter on the axle, lubricates it, falls by the bottom of the box, is caught up again by the disc; and this action of the disc being continuous, the lubrication is, of course, equally constant, and perfect in the extreme, on account of the absolute fluidity of the water. The lubrication increases in the same ratio as the velocity is augmented, and consequently the danger of heating the axles is entirely avoided.

The traffic receipts of railways in the United Kingdom amounted for the week ending the 7th of October, on 12,284 miles, to 751,261*l.*; and for the corresponding week of last year, on 11,925 miles, to 696,282*l.*, showing an increase of 359 miles, and of 57,982*l.*

#### THE WAGES QUESTION.

**Northwich.**—The committee of the operative carpenters and joiners, now on strike for an advance of wages, put out a placard stating that, as they had not been communicated with by the masters as to the result of a meeting reported to have been held by them, when they determined to give the advance asked for after March next, on their present contracts being completed, the strike would still continue. About 130 men were, however, at work at the advanced rate; and owing to the number that left the city, only about 130 hands remained out, several of whom expressed their determination to seek employment elsewhere. Another meeting of the master-builders was afterwards held, when it was unanimously resolved to adhere to their former resolution, namely, that the increased rate of wages demanded by the workmen be not paid until a sufficient time has elapsed for the completing of existing contracts; but that such increased rate shall be paid from the 1st of March next.

**Hartlepool.**—The whole of the "bondmen," as they are termed, who work in the timber-yards at West Hartlepool have turned out for an advance of wages. They have been receiving 2*l.*s. and 22*s.* per week, and they now demand 2*l.*s., which, it is stated, is being paid to many bricklayers' labourers. The masters refused to give the advance, and the consequence is that about 300 men are still out of employment.

**Carlisle.**—Another strike of stone-masons has occurred at Carlisle, about sixty stone-masons in the employment of Messrs. C. & J. Armstrong having turned out. A deputation of two men had waited upon Messrs. Armstrong, and stated that those gentlemen had a man working for them who was not a member of the "Society," and requested that he should be dismissed. Messrs. Armstrong replied that the man was about sixty years of age and did not wish to have any connexion with the Society; and, besides, the request made was contrary to the last agreement made between masters and men, and they were not disposed to dismiss the old man. The deputation retired, and the whole of the masons employed by the firm in Carlisle turned out on strike. By this movement the building of the Church of St. John the Evangelist is again at a stand-still.

**London.**—At the Mansion House, on the 14th inst., two masons, Thomas Glenover and Charles Lawson, were charged with intimidating and endeavouring to prevent certain workmen in the employ of Mr. Pritchard, a builder, from continuing their work. Mr. Pritchard, it was stated, had two men in his employ named Crombie and Ford, and on the 31st ult. the prisoners came to him and insisted on these men being discharged, because they did not belong to the Masons' Society. The demand was refused, and the prisoners and a number of other men left his service at once, and he was compelled to employ others. Since then the prisoners had watched the men as they went out for their meals, and threatened and intimidated them. These facts having been proved, the Lord Mayor said the conduct of the prisoners had been most illegal and improper. The only object of these trades-unions was to enable bad workmen to get the same wages as good workmen. If this conduct were repeated they would receive most severe punishment. He would now order them to be imprisoned with

hard labour for two months.—A meeting of journeymen cabinetmakers was held at the Alliance Hall, Old-street-road, on the 11th, to consider what steps should be taken towards obtaining a general rise of 10 per cent. on the rate of wages. There was a crowded attendance, numbers being unable to obtain admission. Mr. Brown, journeyman cabinetmaker, was voted to the chair. He impressed on all present the necessity of joint action in the matter, but at the same time to try to obtain their end by fair argument with their employers, showing them the increased cost of provisions, rent, &c. Letters were read from some employers expressing their desire to grant any reasonable demand made. After a discussion as to the means of attaining their end, it was resolved that each shop represented at the meeting should appoint a delegate to report the feeling of the men as to the organization that should be decided on.

**Sheffield.**—At the meeting of working men held in Sheffield during the session of the Social Science Association, Mr. Thomas Hughes, M.P., spoke in a very pointed manner respecting the charges of trade outrages which were made against Sheffield workmen. The question which Mr. Hughes put to the workmen then present was, "Were they guilty of the charges?" Since that meeting several workmen have come forward to defend themselves from the imputation, and this week the members of the file trade invited Professor Fawcett, M.P., to a conference, which was held in the Temperance-hall. The gathering was the ordinary trade assembly, and not open to the public; but we are informed that the men as a body disclaimed the outrages, but admitted their dislike to file machinery and their refusal to finish work partly done by it. They had no desire, however, to interfere with those employed at the machines, who "wore the scum" of their class. It is sometimes said that men in a body will do disgraceful things, which, as individuals, they would not have done; but here we are glad to see we have men who repudiate as a body the dastardly deeds by which individuals amongst them have given Sheffield evil notoriety.

#### A GIFT HOUSE.

On the 9th of October, the foundation stone was laid of a new mansion, at Catsfield. It is within four miles of Battle, in Sussex, and beautifully situated in about 1,000 acres of park-like grounds, with extensive views of the sea and surrounding country. The house is intended as a present from Mr. Thomas Brassey, of London, to his eldest son.

The house, with offices attached, will have upwards of 200 ft. frontage, and will be built entirely of blue local stone and Portland stone dressings. The style will be Enoch, of the period of Francis I. The house has an octagonal tower 20 ft. in diameter, rising from the south-west angle of it to the height of 80 ft., and a large conservatory is attached also to this end.

The stone was laid by Mr. and Mrs. Brassey, jun., in the presence of their friends. Under the stone was deposited a bottle containing the *Times* of the day, with photographs of them and their two children, some coins, and an illuminated record of the event on parchment. A silver trowel was presented to Mr. and Mrs. Brassey by the builders, Messrs. Lucas, Brothers. Messrs. E. Habersohn, Spalding, & Brock are the architects. The cost of the building (the house, offices, stables, and lodges), will be about 30,000*l.* Certainly a very pretty present.

#### CONCRETE.

**SIR,**—There is a note on this material in the last *Builder*, by "John Mason," which alludes to the concrete vaulting at Bishopstowe, the seat of the Bishop of Exeter, near Torquay, in which Mr. Mason's memory seems in some measure to have failed him. The vaulting and ribs of the corridor did not merely receive the floor above, but the floor was formed in the same material by one operation; and the cellar vaulting was not groined, but that of the library (not mentioned by your correspondent) was groined, and was the only portion of concrete vaulting where the walls were more than the 13 ft. apart, which seems to be the chief reason for alluding to it at all. I am happy to say that the whole has stood extremely well.

THE ARCHITECT.

#### DISEASES OF GLASS CUTTERS.

In a recent impression of the *Builder*, you say, and justly, that glass-making is more healthy than glass-cutting. Will you allow me, as an old workman (glass-cutter) to explain what I think is the cause or causes of its being unhealthy, leaving ventilation out, as a masters' question, which they will do as they please about, without consulting their workmen's health.

Glass-cutters suffer principally from chest diseases; consumption is common among them, dropped hands, lead complaints, with all their horrible sufferings; constipation of the bowels; from these complaints many live a living martyrdom, and die an early death.

Our society has, at its own expense, sent me afflicted with lead disease to a professor in London to have the benefit of the medico-chirurgical baths: the expense was very heavy, but of no avail; the men returned to the country only to die.

The first cause of our sufferings and early death, I consider to be the placing of lads, at very tender ages, at the frames to feed up to the workmen. It is a fact beyond dispute, that from the moment that a lad takes the brush to feed either to the putty wood, or, what is a hundred times worse, the putty brush wheel, he is on the road to disease and death: these wheels revolve with great rapidity; the lad stands in the very face of the wheel, which is turning towards him: in an hour or two the doomed lad looks like a dirty miller's boy; in a short time his face becomes sallow, the lead is doing its deadly work, and is slowly but surely drawing him to a painful and premature grave.

This, sir, is in my opinion the first and principal cause of our ill health. Other causes are the stooping posture, the cramping of the chest, positions that preclude all possibility of the expansion of the lungs; the constant inhaling of fine dust that the revolving wheels keep floating in the air we breathe; add to this the stopy nature of our work: can it be wondered at that, as a class, we are unhealthy?

Some years ago, a physician of one of the hospitals of Birmingham was so impressed with the sufferings and early death of us workmen, that he endeavoured to find out the cause; but that was treading on forbidden ground, and the matter, like many other good intentions, fell to the ground, and was heard of no more.

At the time the medical gentleman spoken of wished for information, my opinion then was that no lad should be put to the frame before fifteen years of age, and not to feed to any other work than his own; and after many years' experience I think so still. It would be a most happy thing for the Factory Act to be applied to our trade, as sweaters are starting in every town, employing nearly all lads, in ill-built and non-ventilated shops, getting an easy and luxurious living out of the lives of young children.

J. OHLSON.

#### CHURCH BELL-RINGING.

I AM convinced church bell-ringing might be rendered a very agreeable recreation as well as conducive to the health of some of our over-fad too stout gentlemen, who require some other exercise to keep their fat within healthy bounds besides a short walk, and considering the action and position required in the arms and body in ringing a peal of changes (so strengthening to the muscular parts of the former), what could be better than for a party of gentlemen to engage a ringer to advance them in the art sufficiently to enable them to ring a peal of eight hundred or two thousand changes, and afterwards for them to meet once or twice during the week at some church in the evening and enjoy the pleasure to themselves.

The art of ringing changes on church bells having been practised (with some few exceptions), by men of the lower class, has occasioned it to be looked upon with contempt. Could this prejudice be overcome, and a few gentlemen induced to make a trial, they and others would perhaps be obliged for the hint here thrown out. While on bell-ringing, I will add a suggestion of an alteration connected with the church-steeple that, if carried out, would be an improvement. Instead of the heavy-looking stone or wood louvres in the windows, round the place where the bells are hung, I recommend pieces of glass, of the usual shape and thickness, to cross the opening in the wall of each of the four sides of

the tower.\* This substitute for the old material would expose to the view of passers-by in the open air the bells as they hang on the frame, as well as the manner in which they act when raised and rung on the balance, when each bell swings round, hanging by the stock to which it is suspended, when to each blow of the clapper it makes a circle. Glass being favourable to sound, the tone of the bells would be improved.

HAYDN WILSON.

#### KAMPTULICON.

Sir,—There has recently come under my notice a decayed floor, in a house in the City, and the only apparent way its condition can be accounted for is, that kamptulicon was laid down upon it three years ago. It is the upper surface of the boards which is affected, although in one or two spots the board is decayed quite through. It is on the second-floor that this has occurred; and I should mention that the building, which has been erected a number of years, is in all respects a sound and substantial structure, even the boards affected being quite sound on the under side. Perhaps you will consider the matter of sufficient interest to allow me to ask your readers if they have met with any instance of kamptulicon affecting a floor injuriously?

WILLIAM BURNET.

#### HOW UTILIZE SEWAGE?

Sir,—A portion of the sewage of a small town in my district has hitherto been discharged into a pond, the water of which has become deteriorated in consequence. I wish to cut off the sewer from the pond, and receive its contents in a reservoir, in order to apply it to the grass land adjoining. I shall be very glad if some of your correspondents will kindly give me a few suggestions as to the best means to effect my object.

A SANITARY INSPECTOR.

#### FLIES AND ANTS.

In one of your numbers, about the month of June, a remedy was suggested for the plague of flies, namely, placing about the rooms a strong solution of chloride of lime. With what effect this was tried in England I know not; my experience of its effects in Italy proved that there it was inefficacious. I doubled the quantity of lime prescribed; left it in all parts of the rooms, and the flies heeded it not; in fact, I frequently saw them perched on the edge of the large-mouthed bottle containing the lime, and the smell, to many almost overpowering, had no preventive qualities to them. Any remedy this summer would have been a veritable boon; they were equally trying as the heat; they swarmed so thickly on ceilings and walls as to defy every attempt to destroy them; spoil any garment hanging up in wardrobes not all but air-tight. The "fire-mosket" papers were tried, but the dead bodies of the flies attracted instantly swarms of ants, who travelled in long regular lines, divested the flies of their wings, and carried off the trunks of the bodies. Upon the ants the chloride of lime had no effect. That which alone can be done with the ant is to trace its nest, pour down boiling water, and then stop up the hole with cement. If the nest be not entirely destroyed, the survivors will manage to carry away the cement in time, when the same operation must be repeated.

F. C.

#### ARCHITECTS' CHARGES.

Sir,—Will you permit me to call attention to a practice of some London architects, and to request some of your experienced professional readers to state their opinion thereupon?

I have now before me a copy of the "Professional Practice and Charges of Architects." Article 1 states that "the usual remuneration for an architect's services is a commission of 5 per cent. on the total cost of the works executed from his designs." Now, the course adopted by one London architect (and I am assured that some others act in a similar manner) is to charge 5 per cent. upon the *estimate* of the tenders sent in for the work proposed to be done. To me this seems an unjust mode of assessment, and one which is calculated to lead to great irregularity, and thereby considerably increase the amount of commission; or a builder might make a mistake, as frequently happens, in pricing his quantities, or in casting up the totals, and produce a like result to the architect. I am in a position to prove a case where an architect, through such a mistake on the part of one of three builders tendering for a small job, was able to add some 25*l.* to the amount of commission he would have been entitled to receive on the accepted tender.

As this is a matter of some importance to the profession, and as doubt exists in the minds of many clients respecting the proper and legitimate mode of calculating the architect's commission of 5 per cent., I venture to hope you will deem it worthy of notice in an early impression of the *Builder*.

X. Y. Z.

\* Glass has been so used.—Ed.

#### THE OUTBREAK OF CHOLERA NEAR EPPING.

THE outbreak of cholera at Epping, of which our readers must have heard, seems to have subsided. Among the measures taken by the local authorities, two railway truck-loads of quicklime have been thrown into cesspools and upon the dungheaps near the houses in danger of infection. A strict supervision of the labourers' cottages is also being made; and at a meeting of the Board of guardians on Friday, it was ordered that a house-to-house visitation should be made; and Dr. Clegg was duly invested with power to see that the instructions of the General Board of Health are properly carried out under the orders of the magistrates.

When Dr. Clegg was called in to see one of the suffering families, he discovered that there was a communication between the water-closet and the well from which the family drank, and he at once put a stop to their using it. The connexion of cholera with impure water has long been known, and it may be that its tendency to take a course along rivers has been owing to the defilement of such rivers, and their use nevertheless in water supply.

#### THE PROPOSED MACCLESFIELD INFIRMARY.

At a meeting of the general committee of the intended infirmary, for the purpose of devising the best means of determining upon the plans and designs on view in the Town-hall, for the inspection of the subscribers and the public, only a brief discussion took place, for the meeting felt the difficulty of undertaking, without professional guidance, the important and responsible task of making a selection from the three sets of plans and designs sent in by Mr. Stevens, Mr. Waterhouse, and Mr. Lee. Mr. Hakewill, of London, also sent in a design, not so much for competition as for the inspection of the committee. It was unanimously agreed that the chairman should place himself in communication with Mr. Currey, the architect of the new St. Thomas's Hospital, London, putting him in full possession of all the details, and inviting him to examine the plans and report upon them.

#### FROM SCOTLAND.

Edinburgh.—There has been exhibited in the council chambers a model, designed by Mr. Coyne, civil engineer, of a new fruit and vegetable market, tunnel, and railway goods stations, at the Grassmarket. According to the model, says the *Scotsman*, it is proposed to place the fruit and vegetable markets on the area of ground occupied by a lot of old houses, immediately to the west of the old corn-market, bounded by the west port on the south, and by King's Stables on the north. The proposed fruit and vegetable market is to be covered in, having a glass roof, and a semi-circular front to Grassmarket. The old corn-market is to be removed. It is intended to approach Grassmarket and the new markets by a tunnel, which is to branch off from the west side of the mound, opposite the lower end of the National Gallery, keeping above and clear of the mouth of the tunnel that goes under the galleries. The length of the tunnel is 270 yards, and its width is to be 50 ft., having two side pavements of 8 ft. wide, each for foot-passengers, and clear carriage-way of 34 ft. Mr. Coyne also proposes to occupy as a railway goods station, for the North British and Edinburgh and Glasgow railways, the area of ground partially covered by houses, stable, and tanneries, west from the proposed markets.—The new Water of Leith drainage works are being actively pushed forward. They were commenced some months ago. The pipe-track commences a little to the west of Colbridge, and terminates near the Black Rocks at Leith Sands. The works, when fully completed, will consist of one main conduit and ten branches. The great sewer is to follow as nearly as possible the course of the stream, but will only occasionally lie within the bed of the river itself. Where such is the case it is composed of cast-iron pipes, not exceeding at any point 24 ft. in diameter. When the course lies along the banks, brick culverts or tunnels are substituted for the pipe, as being much cheaper and equally good. The total length of the main sewer is upwards of 5 miles, and the branches are equal to other 2 miles.

Dunfer.—A very large organ, by Messrs. Foster & Andrews, of Hull, has been erected in the Music-hall, which has been altered for the purpose. The main features of the design are simply the massing of the pipes into four towers, with curtains of pipes between. The two centre towers are at each side of the keyboard; then the case recedes diagonally at each side towards the other towers, from which it recedes diagonally to the wall. In the two centre towers are the large 16-ft. pipes of the diapason of the pedal organ; and in the flanking towers are the pipes of the pedal principal. In the front between the towers are the pipes of the violin diapason of the great organ. Between the centre and flank towers are the pipes of the large open diapason of the great organ. At the sides are the pipes of the large pedal organ diapason. The pipes have all been decorated by Mr. Blackmore, of Euston-road, London. They are in various colours, but gilding predominates.

#### CHURCH-BUILDING NEWS.

Shipton Mowna.—The parish church has been re-opened. With the exception of the north porch and a small chapel on the south side, the whole has been rebuilt, and enlarged by the addition of a south aisle. It is built in the Decorated style, with a chancel, nave, north and south aisles, porch, and vestry. The roof is of high pitch, open in the interior to the ridge-pole, and painted ultramarine blue between the rafters. The whole of the interior is lined with ashlar. The north and south windows are double lights, filled with stained glass, in patterns. The whole of the glass, with the exception of the east window, was provided by Messrs. Powell & Son, of Whitefriars. The east window is of three lights of stained glass, by Messrs. Lavers & Barrard, of London, and is the joint gift of the Right Hon. T. H. Sotheron Estcourt, the Rev. T. G. Golithly, and the architect, and represents the Ascension of our Lord. Immediately under the west window, which is of three lights, filled with stained glass in patterns, is the baptistery, which contains a font in Caen stone, executed by Mr. Earp. The tower and western porch are the gift of Lady Estcourt. The tower contains six bells; and the north-east corner is surmounted by a turret. All the seats are open, and of stained pine. The chancel is paved with encaustic tiles, from Messrs. Simpson's, of London, after a design by the architect. Mr. Wyatt was the architect, and Mr. Brown, the builder.

Grittleton.—The parish church of Grittleton, near Chippenham, has been re-opened, after a partial restoration, at the cost of Sir John Neeld, bart., under Mr. Blomfield, architect. The chancel has been rebuilt. There is a reredos of mosaic, under the east window.

Warmminster.—The chapel of St. John the Evangelist, at Boreham, has been consecrated. The site was given by Mr. W. Temple and Mr. George Temple, of Bishopstow. The church was designed by Mr. G. E. Street. Mr. Strong, of Warmminster, was the builder; and Mr. Loxley, the clerk of the works. It is built of Hissomley stone, with Bath stone dressings, and will seat about 350 persons. All the seats are free and unappropriated. It is in the Early English style of architecture, and consists of a nave and north aisle, and chancel, with organ chamber and vestry on the north side.

Tenbury.—The Nash church, in the rectory of Burford third portion, has been re-opened. The edifice under notice stands in a lawn-like field, a very short distance from the residence of Mr. G. Pardee, by whom the restorations, additions, and repairs have been effected. Before it came under the hands of the restorer, the building was plain in the extreme, with whitewashed walls, plain ceiling, and the usual west-end gallery, in which was the organ. The general style is the Early English, with a specimen of an Anglo-Norman arch over one of the windows; and the structure, before the restorations were begun, was without choir or aisles. In the building there is no chancel arch to part the choir from the nave; but a screen effects this object. All the windows on the south side, which have been preserved, are in the Early English style. In the nave they are glazed in diamond quarries with tinted borders. Two windows on the same side in the chancel are filled with stained glass. The east window is of enamelled flower glass, with a coloured border. The aisle is separated from the nave by an arcade, springing from plain

columns, moulded bases, and carved capitals. At the east end of the north aisle is the organ chamber, and beyond that is the vestry. The roof of the nave and chancel is of open timber work, the lines of the curve being in unison with the general style of the building. Low open pews of old oak, arranged in three rows, will give ample room to the parishioners attending this church. The glazing of the north aisle is in single and double quarry with a cathedral-green border.

**Rowberrow (Somerset).**—St. Michael's Church, Rowberrow, has been re-opened after undergoing considerable restoration. The architect, Mr. Norton, of London, being desirous of exercising a conservative principle in the restoration of the edifice, which belongs to the thirteenth and fifteenth centuries, purposed merely repairing the walls and roof; but so dilapidated had the former become, and so rotten the latter, that rebuilding was indispensable. The builder employed was Mr. John Palmer, of Weston.

**Rowlestone.**—The church of Rowlestone, in the diocese of Hereford, has been re-opened. The work of restoration has been to strip the whole of the roofs and to re-cover them with stone tiles and red tile cresting, except the tower, which is covered with Broseley tiles. The whitewash has been removed from the walls throughout the church. The south wall of the nave, which was bulged, has been rebuilt; the perpendicular window has been taken out, remodelled, and restored, and various other restorations have been effected. The church now contains 120 sittings, all free. The mosaic tiles are from the manufactory of Mr. Godwin, of Lurgardine; and the ornamental iron-work of the doorway, porch, cross, &c., was supplied by Mr. John Cognell, of Cheltenham. The work has been performed by Messrs. King & Godwin, of Gloucester, builders, from the designs and under the superintendence of Mr. G. C. Haddon, of the firm of Messrs. Elmslie, Franey, & Haddon, of Hereford, Great Malvern, and London, architects. About 400l. have been expended on the work of restoration.

**Balsall Heath (Birmingham).**—The chief stone of the new aisle and chancel to St. Paul's Church has been laid. Mr. Holmes is the architect.

**Riccall.**—After a lapse of nearly three years, says the *Doncaster Gazette*, the Parish Church of Riccall has again been opened for divine worship. The church, which has been restored, by the contractors, Messrs. Lilly & Cawthorne, of Retford, under the superintendence of Mr. Pearson, of London, architect, is built of stone, and consists of a chancel, nave, and south aisles. It has open oak seats, and will accommodate 300 persons. The pulpit is made of Caen stone, and is carved. The Norman tower contains three bells, and has a new clock, presented by the rector. The cost of the restoration has been £3,000, of which sum Lord Wenlock, the principal landowner, contributed 700l., and the rector of £1,000.

**Overton (Doncaster).**—All Saints' Church, Overton, has been re-opened after completion of a series of restorations, &c., extending over the last four years. The improvements and alterations were carried out from the designs and under the superintendence of Mr. Teale, architect, Doncaster. The wood-work has been done by Mr. Clarke, and the mason's work by Mr. Athron, of Doncaster; the plumbing and glazing by Mr. Jubb, of Campsall. The cost has been considerable, and the sum subscribed falls short of the actual outlay.

**Brigham (Carlisle).**—Brigham Church has been re-opened, after being restored. The nave, tower, and aisle have been restored, according to plans prepared by Mr. Butterfield, architect. The repairs of the chancel were left to some future time. The expenses (1,800l., including a heating apparatus) are nearly liquidated. The work was executed, by day-labour, by the parishioners. From long-continued neglect, and injudicious repairs and alterations, the edifice had gradually fallen into a very dilapidated and discreditable condition; the original Gothic roof had given place to mislaid barn-like structures, with flat lath-and-plaster ceilings; the tracery of the south windows had been destroyed, and wooden frames substituted; from want of drainage the foundations had sunk; the walls were rent and out of perpendicular; and a few more years would probably have sufficed to complete the work of ruin. The architecture of the exterior has been interfered with as little as possible, the original style being adhered to. As regards the interior, the ancient sculptures and carvings have been preserved by being fixed in the masonry of the walls. The floor has been

newly tiled, and the roof ornamented with Gothic woodwork. The pews are also new, of stained pine. Among the additions are three stained-glass windows. The principal one has been presented by Mrs. Harris, Groganston, and represents, in the centre, the Nativity; and at each side, the Adoration of the Shepherds, and that of the Wise Men of the East; above these is a figure of our Saviour sitting in glory, surmounted by the heavenly choir; the whole being surrounded by figures of the Apostles. The eastern of the other two windows represents the Annunciation; and the western, the Temptation and Expulsion of our first parents from the garden of Eden; these two last windows have been the gift of the workmen employed in the restoration of the church. The total cost of these windows, including fitting, was 320l.; and they were manufactured by Mr. Gibbs, of London.

#### ROMAN CATHOLIC CHURCH-BUILDING NEWS.

**Liverpool.**—The new church of St. Michael has been opened for divine service, by the Roman Catholic Bishop of Liverpool. The design was by Mr. E. Welby Pugin. The style is Continental Gothic. The principal front or gable end faces the West Derby-road, but is set back a few feet from the road, the small space of ground which intervenes being inclosed by railings. The gable end forms the front. It is divided by two buttresses, surmounted by figures of angels bearing crosses, and between the buttresses is an arched recess. Inclosed by the arch is a large circular tracery window, some 15 ft. in diameter, and below is an arcading with stone arches and pillars. The doorway is recessed and moulded, and above the arch of the door is a carving, representing a group of angels, with St. Michael, to whom the church is dedicated, and carved panels display the arms of the bishop of the diocese. The gable, like the buttresses, is ornamented with figures of angels, and immediately below is an arched recess for the bell. The extreme height of the front gable end from the ground to the top of the cross is 76 ft., and the extreme breadth 53 ft. The sides of the building are parallel to a new street branching off from the West Derby road, and at the side next this street is an aisle without windows, but having sculptured panels, and divided by buttresses. Above is the large clerestory, with coupled lancet windows, about 13 ft. in height, which are continued round the apsidal end of the chancel. Of these windows, there are altogether thirty-six in the clerestory. The interior dimensions of the building are 106 ft. in length, and 50 ft. in breadth. The aisle opens into the nave by six arches, carved on clustered columns, and on the side next the tower are a number of confessionals, and two sacristies. Over the principal entrance is the organ-loft, and at the opposite side to the sacristies is a Lady Chapel. The church is built of patent red brick, with bands of blue brick, and dressings of Stourton stone. The entire cost of completion will be close on 5,000l. The contractor is Mr. George Glaister, of Liverpool.

#### STAINED GLASS.

**St. Mary's, Southampton.**—The east window of the chancel of this church has been filled with stained glass. This has been done at the expense of Capt. H. G. Ayscough, R.N., and is intended to commemorate the late Admiral Ayscough and his wife, the father and mother of Captain Ayscough. The style is Perpendicular. The window is divided vertically into five principal openings: these are crossed by a transom, which thus forms ten divisions, in each of which is set a picture, enclosed and framed by worked canopies. The pictures in the five upper divisions are devoted to the memory of Mrs. Ayscough, and are intended to illustrate the life and resurrection of a person whose career was one of Christian charity. The lower divisions are appropriated to the commemoration of the virtues and public services of Admiral Ayscough. With the exception of a picture of the nativity of our Saviour, in the centre opening, the illustrations are those of events which took place on, or in connexion with, the sea; such as our Saviour with Andrew and Simon, James and John, the miraculous draught of fishes, &c. The glass is by Messrs. Edmundson & Son, of Manchester.

**Aldridge Church, Walsall.**—The east window of the chancel of this church has very recently been filled with stained glass from the manufactory of Messrs. Ward & Hughes, of Fritch-street, Soho-square, London. The window has three lights, with tracery in the upper portion, and the scene represented is the Crucifixion of our Lord. In the centre light Christ hangs on the cross, at the foot of which is the Magdalene kneeling; and in the two side lights are the figures of the Virgin (to whom the church is dedicated) and St. John, the beloved disciple. In the background are the walls and towers of Jerusalem. The tracery above is filled with angels and emblems. The cost was defrayed by subscriptions from land-owners, residents, and others connected with the parish, and so successful was this movement that funds sufficient were raised to fill a second window with stained glass—one of those in the south aisle having two lights; and there is yet a balance in hand for the further decoration of the church. The window in the south aisle has been filled with "Powell's Quarries" and two medallions, in one of which our Lord is represented walking on the sea, and in the other St. Peter sinking in the waves. This village church, restored and enlarged in 1853, has now seven stained glass windows.

**St. Mary's (K. C.) Chapel, Halifax.**—Three windows have been placed in this chapel. They each comprise two lights, and are Perpendicular in style. One window, which is a memorial to the Rev. Father Kavanagh, is occupied by a life-size figure of St. Matthew, in one light; in the other a likeness of the deceased clergyman, of corresponding size, in his priestly vestments. At the base of the window is the dedicatory inscription, recording the birth and demise of the gentleman to whose memory it is erected. The second window of the series is a memorial to the Rev. Joseph Fanclough, of Halifax, and in each light is a full-sized figure, respectively of the Virgin Mary and the Archangel Gabriel, representing the Annunciation. The whole of the figures are surmounted by canopies of a severe though elaborate design, and are inclosed within a border of plain but quaint leadwork. The third window is completely devoid of colour or any pictorial adornment, and is entirely composed of ornamental leadwork, enclosed within a border of the same description as the others. Messrs. Edmundson & Son executed all the three windows.

**Durham Cathedral.**—A stained-glass window has been placed in the nine altars, in what was formerly the chapel of St. Peter and St. Paul, in the cathedral. The window was by Mr. Bell, of Bristol, and is erected by the Rev. John Name, in memory of Michelangelo Taylor, for many years member for Durham, and uncle of the late Marchioness of Londonderry. The window is 26 ft. by 5 ft. In the centre are two figures, each about 5 ft. high, of St. Peter and St. Paul, with their emblems; while above and below each of these two figures are four circles, two large and two small. The small ones are filled with figures and angels bearing scrolls, while the large circles, commencing from the top, have the following subjects:—1. "St. Peter walking on the Sea;" 2. "Feed my Lambs;" 3. "The Conversion of St. Paul;" 4. "St. Paul before King Agrippa." The whole window is in the style of the thirteenth century, the spandrels and borders being occupied with the foliage of the period. The window is seen on entering the north doorway of the cathedral.

**St. Peter's, Newcastle-upon-Tyne.**—Two new memorial windows have been added to St. Peter's church, and all the windows in the chancel are now of that character. Some time ago, a stained glass design was placed in one of the north-east windows, by Mr. I. G. Brown, solicitor, of this town, as a memorial of his late wife; and that gentleman has just had the other portion of the window filled in a similar manner. The subjects represented are, Christ offering the Holy Eucharist, and Christ blessing St. Peter and St. Andrew. On the opposite side of the chancel, another window has been erected at the cost of Miss Dobson, to the memory of Mr. John Dobson, of this town, architect, and her brother, Alex. Dobson. The upper part is a representation of the building of Solomon's Temple, and the lower the fall of the Tower of Siloam.

**Maindee Church (Gwent).**—A window (the east) has been erected at St. John the Evangelist's Church, Maindee, in memory of the late Mr. James Rennie, of Maindee Park. The principal subject is the Ascension of our Lord, which occupies the centre lights. The side lights con-

tain the Evangelists, with their emblems; and underneath, the passage, "And he led them out as far as to Bethany, and he lifted up his hands, and blessed them. And it came to pass, while he blessed them, he was parted from them, and carried up to heaven."—Luke xxiv., 50 and 51. The tracery (at the top of the window) consists of our Lord, seated on the throne, in the act of opening the seven seals, surrounded by adoring seraphim and cherubim, angels and elders casting their crowns before him. The seven angels are proceeding from the throne. In other parts of the tracery are angels bearing texts. The base represents the three principal mysteries of the Gospel, viz., the Birth, Crucifixion, and Resurrection. It also contains shields, on which are emblazoned the arms of the deceased to whose memory the window is erected. At the bottom is the inscription. It was executed by Messrs. Chance, Brothers, & Co., Birmingham, at a cost of upwards of 300l.

#### SCHOOL-BUILDING NEWS.

**Sheffield.**—The new national schools erected near Sheffield Church have been opened. The new building has been erected by Mr. J. Cross, of Hutton, from designs by Mr. Bartlett, of Brentwood. It is in the Gothic style. There are at present 185 boys and girls attending the schools.

**Birmingham.**—The foundation stone of a new lecture-room and schools, for the use of the Baptist congregation worshipping in Cannon-street, has been laid in the rear of the chapel, and fronting to Little Cannon-street, on a considerable piece of ground, which in the earlier days of its history was used as a burial-ground. The plans of Mr. Holmes, of Birmingham, architect, were accepted. The new buildings will consist of a school-room on the ground-floor, 29 ft. long, 27 ft. 6 in. wide, by 14 ft. high, and lighted by four wide windows from Little Cannon-street, the entrance being on the right to the school. There will also be an entrance on the left, leading to the lecture-room, which will be on the floor above the school, and be 37 ft. long, 34 ft. wide, and 20 ft. high. At one end of the room will be a raised platform for speakers, the front of which will be of an ornamental character, and surrounded by an ornamental railing of iron. The room will also be lighted from Little Cannon-street, by means of a bay window in the centre, and other four windows, two on each side of the large window. Two iron columns in the lecture-room will assist in carrying the floor and roof, and will have ornamental capitals, bases, and hands. The style of architecture is founded on the Early Pointed period of English architecture, and the walls will be of brick. In the front elevation facing Little Cannon-street, blue and moulded bricks will be introduced, the more prominent parts being of Bath stone. The ceiling of the school and the roof of the lecture-room will be strengthened by ornamental deal beams, which, with the other timbers of the floors and roof, will be stained and varnished, and the ornamental iron-work will be picked out in colours. The roof will be covered with slates, and surmounted by an ornamental ridge. The present school-room, in the rear of the chapel, will be divided into vestries. The contractors for the building are Messrs. Jeffreys & Pritchard.

**Sheffield.**—The chief stone of a building, which will be used as a Sunday and day school, in connexion with the Independent denomination, at Brightside, has been laid by the mayor of Sheffield. The site of the building closely adjoins the railway, near to the Station Inn. The large works over which the mayor presides employ a great number of hands; and there are others of importance in the immediate neighbourhood in rapid progress towards completion, which will necessarily add largely to the population of the district. The new building will occupy the same site as the old one: it will be of dressed stone, and will accommodate 250 scholars in one large room, besides which there are two class-rooms for senior scholars, and provision is made for a gallery. There is a vault beneath, and a gill-stove for warming is included in the contract. A system of ventilation is also provided for all the rooms. The windows are large, and those in the gables will have geometric quarry glazing. The outside is comparatively plain, but the interior will have some simple decoration. The works are let by contract for 432l. Mr. C. J. Innocent, of Sheffield, is the architect.

#### Books Received.

*Illustrated Guide to the Great Eastern Railway; Colchester Line.*—*Illustrated Guide to the Great Eastern Railway; Cambridge Line.* By GEO. MEASON. Griffin & Co. London.

THESE books, published under the authority of the directors of the Great Eastern Railway, contain a very large number of illustrative engravings, and a pleasant chatty account of the principal places on the line, including, in the case of the first of these, a dive into Holland, led up to by the fact that steamers start for that country from Harwich. For anything more, however, than what we have pointed to, it is of no use looking to these volumes. Turning to the volume devoted to the Cambridge Line, we open it at Ely, to learn what is said of the painted ceiling in the Cathedral nave: it is not even mentioned. We turn to *Standon*, to see what is thought of the interesting church there, recently restored: no intimation is given that the parish has a church; and so we might go on from one end of the book to the other. Suffice it: they contain some useful maps, and the wood engravings, to which we have already alluded, are worth more than the small cost of the books.

#### VARIORUM.

**THE Bombay Builder**, a new illustrated venture, published monthly, at 30 rupees per annum, contains a lithograph view of Lady Frere's Temple, in the Victoria Gardens, Bombay. This is a version of the Choriagic monument, 35 ft. high, in stone, and serves as a canopy for the bust of Lady Frere, by Nolte. It was commenced under Mr. W. Tracy, and completed under Messrs. Scott & McClelland, to whom all the buildings in the gardens were confided upon the death of Mr. Tracy.—*Fraser's Magazine* for October (Longmans & Co.) contains a graphic and amusing paper by Miss Colbe on Ireland and her Exhibition in 1865. It closes with some rather startling statistics; but as the author is afraid that some "agrarian reviewer, shooting at her from behind the shelter of his journal, may do her to death with the famous remark that nothing is so false as figures except facts," we shall refrain from passing any remark whatever on them, as we do not wish her to class among those rude literary ribbonmen who could fire away from behind his hedge at a lady's statistics.—"Poultry Breeding in a Commercial Point of View, as carried out by the National Poultry Company (limited), Bromley, Kent. By George Kennedy Geyelin, C.E. London: Simpkin & Marshall." The multiplication and cheapening of the food of the people is an important subject in which we always feel interested. Mr. Geyelin's system contemplates the natural and artificial hatching, rearing, and fattening of poultry on new and scientific principles; and the author here gives all the necessary plans, elevations, sections, and details, together with a notice of the poultry establishments in France.—"The New Path" (Miller, New York), gives a description of a fine-arts school, of size and character, now in course of erection for Yale College, at the sole cost of Mr. Augustus Russell Street, a citizen of New Haven. The building will provide for both instruction and exhibition.

#### Miscellaneous.

**CRYSTAL PALACE SCHOOL OF ART, SCIENCE, AND LITERATURE.**—This institution is about to enter upon its sixth annual session. The various classes are established on the collegiate system, which embraces a liberal and finished education at a reasonable cost, each subject being supervised by an experienced professor. During the last session nearly 200 ladies availed themselves of the advantages thus afforded.

**WORKING MEN'S COLLEGE.**—The first term of the twelfth year will commence on Monday next, the 23rd, when the usual classes will be formed in art, mathematics, language, history, geography, and physical science. Special courses of lectures will be delivered during the ensuing session on "The Constitutional History of England," by Mr. Thos. Randall Bennett, M.A.; on "The General History of Europe," by the Principal, the Rev. F. D. Maurice, M.A.; and special classes will be formed for the study of chemistry, geology, and botany.

**THE SURVEYORSHIP OF PENRITH.**—There were the large number of forty-five applicants; and, after a careful investigation of the claims of each, nineteen have been selected for further consideration.

**METROPOLITAN BOARD OF WORKS; SALARIES OF THE ENGINEERS.**—It has been resolved, by a large majority of votes, to raise the salary of the chief engineer, Mr. Bazalgette, from 1,500l. to 2,000l. a year, with 200l. a year for incidental and travelling expenses as heretofore; and the salaries of the other engineers, Messrs. Lovick, Grant, and Cooper, from 500l. to 800l. a year each, with 200l. a year for expenses as heretofore.

**CITY IMPROVEMENTS.**—The City Sewers Commission have agreed to the following resolution:—"That a special committee, to consist of five members, be appointed to consider and report relative to improvements now in hand or contemplated, also generally, or any needed in the judgment of such committee, and upon the powers of the commission to provide means for improvements, and any recommendations such committee may see fit to make thereon." This may be valuable.

**IPSWICH SCHOOL OF ART.**—The report of the Committee of the Ipswich School of Art, for the year ending January 31st last, has just been issued. The committee state that they feel happy to have it in their power to congratulate the patrons and supporters of the school on the continued success of its operations, which is in a great measure due to the exertions of the master, Mr. W. T. Griffiths. There is a small balance against the school, occasioned principally by a larger sum than usual having been expended in the purchase of models. The financial statement shows the receipts to have been,—Students' fees (central school), 176l. 5s. 11d.; fees from public schools, 70l. 17s. 6d.; balance of last year's account, 3l. 8s. 8d.—total, 250l. 12s. 1d. The expenditure amounted to 263l. 2s. 8d. and, therefore, there is a balance of 12l. 10s. 7d. against the school.

**MANCHESTER SCHOOL OF ART.**—The annual report of this school by the head master, Mr. W. J. Micklethay, states that "at the national competition which took place in May, 1864, seven awards were made, and three of the works were purchased by the Department as examples for the use of other schools, and three designs were also purchased for paperhangings by the manufacturers themselves. Two hundred and four works were forwarded to London in March last for competition, and at the examination which has taken place very recently, still greater success has attended Manchester, as shown by the fact that thirty-five local medals have been awarded to the students of this school, being the greatest number that has ever been given to it at one examination," as thirty medals was the highest number received by a school at one time. Among the prizes awarded for 1865 are also eight national medallions and nineteen books, besides thirty-two certificates. Of the House of Commons Committee, the report of the Local Committee at Manchester says:—"The decision of that Committee is now well known; and notwithstanding its adverse character, it is so far satisfactory to know that the matter is at length decisively settled. It is decided that each school shall provide for its own pecuniary support; and all assistance from Government has almost entirely ceased, as far as general outlay is concerned."

**NOVEL NAVAL ARCHITECTURE.**—The cigar-ship will, as at present arranged, be launched from the premises of her builders, Messrs. Hepworth, Millwall, on the 19th instant. An experimental vessel on an entirely new principle is about to be laid down by an eminent ship-building firm for the projectors, who have patented the invention. It is described as the light-draught roller ship, or water chariot. This invention consists in supporting a car or vessel, above the water-level, on axles or shafts passing through rotary hollow drums or cylinders, which are made to revolve on their axes by steam or other motive power. This car or vessel, constructed to carry passengers and freight, is supported by the buoyancy of the drums, and kept suspended above the water-level. The advantages of the invention are said to consist in increased speed at a much less expenditure of motive power and fuel, and from the light draught of water, greater safety from shoals, rocks, &c. It would be highly useful for the navigation of shallow creeks and rivers.

HASTINGS AND ST. LEONARDS.—Mr. Andrews, a surveyor to the local board, has submitted a plan of sewerage for Hastings and St. Leonards, and it is intended to secure the joint services of the Bazalgette in carrying out the sewerage of both places.

WALL OF THREE HOUSES.—On Tuesday morning the front of the house No. 171, Eastfield-street, Limehouse-fields, a short distance from Spukey Old Church, fell into the street, carrying with it the front wall and roofs of the two adjoining houses—170 and 172. The ruins fell on and killed a child named George Reed, aged 7 years, who was passing. The occupants of the houses had been forewarned, and were in lower rooms. They escaped without injury.

ANOTHER NEW GUNPOWDER.—Near Potsdam, Prussia, gunpowder is being manufactured from wood on something like the gun-cotton principle. It is now some years since we first heard of the conversion of sawdust into an explosive by means of acids on the gun-cotton principle; but Captain Schultze, of Potsdam, appears to have carried out the invention into a practical manufacture. By machinery he cross-cuts beech or other timber into very thin veneers, which he easily crumbled into a coarse-grained powder of sawdust, which is then exposed to the action of acids, probably in much the same way that is used to form gun-cotton. The grains are then reduced in size, and rendered explosive when dried, without yielding either smoke or smell in the combustion, but giving a brilliant light suitable for pyrotechnic displays.

THE METROPOLITAN AND PROVINCIAL WORKING-CLASS INDUSTRIAL EXHIBITION.—As we anticipated, those interested in industrial exhibitions are beginning to find that the local system has been overdone, as, indeed, the failure of some of them latterly in a financial point of view, in itself clearly shows. It has, therefore, been resolved to open a general exhibition of the works of the industrial classes of both town and country, in the autumn of next year, at the Agricultural Hall, Islington. The special features of the exhibition will be the encouragement of skilled workmanship, amateur productions, facilities for the sale of articles, machinery in motion, musical gatherings, lectures on popular subjects, manufacturing processes in operation, and, over shows, *conversations* of masters and workmen, free admission of schools, free reading-rooms, prizes for evergreens, &c., in pots, and a small garden.

NORTHERN ARCHITECTURAL ASSOCIATION.—At the first meeting of the session, held at the Old Castle, Newcastle, Mr. J. Green presiding, Mr. D. Birkett read a paper "On the Ornamental Construction of Windows in Domestic Buildings." After giving a short sketch of glass-making, Mr. Birkett showed that the window-opening had always depended upon the progress of glass-making. He then proceeded to describe the best form of a modern window to fulfil the required conditions of a living-room for showing the prospect, and for obtaining the proper admission of light. He considered that the best size for a window was to have the opening about one-sixth or one-eighth of the area of the floor. The best form of a window-opening was, in his view, two or three windows with the space between them so as to form a mullion. The paper closed with a description of exterior ornamentation. An arrangement was made for giving architectural assistants a half-holiday on Saturdays.

THE GATESHEAD TOWNHALL SCHEME.—The town council have adopted a report by the town hall committee, recommending a curtailment of the plans, as follows:—"The portions of the original design which the committee recommend to be altogether omitted are as under:—Fire-escape arches, 760l.; attic-story, 750l.; carcass of upper rooms, 595l.; finishing of ditto, 480l.; portion of roads, palisading, and green, 580l.; twenty-court, 3,180l.; less half West-street square, 700l.; portion of furniture, 55l.—total, 6,000l. . . . The annexed statement will show that the figures in this report agree with a total of 22,300l. specified in the original report of the town surveyor:—Works now recommended to be executed, 9,800l.; works recommended to be entirely omitted, 5,700l.; public-hall and central block, 6,850l.; Swing-bridge-place-road and High-street flagging, 710l.—total, 23,060l. Original estimate, 22,300l.; cost of quarrying, 840l.; add money spent, 1,000l.—total, as above, 23,060l."

FALL OF A GRAND STAND.—Prior to starting the first event at the Leek races, a noise was heard, and the grand stand came down, carrying with it a good many people, and burying in the debris a number of ladies. One gentleman had all his teeth in the upper jaw knocked out. The ladies were got out with some difficulty.

THE CHESTER NEW TOWN-HALL.—Messrs. Clarke & Son, the contractors for this building, in view of the laying of the chief stone on the 25th instant, sent a large force of workmen to pull down the buildings resting on the site to be occupied by the new Town-hall. The stone for the new structure is being prepared. An accident has happened to some of the men engaged in pulling down the old buildings. They were occupied in taking the inside materials from an old house, portions of the extensive walls of which were standing, when all that remained of the building came down. The debris fell towards the workmen, one of whom was so completely covered with it that twenty minutes elapsed before he could be extricated, whilst others were injured by the falling mass.

ART-WORKMEN'S ASSOCIATION FOR MANCHESTER.—A meeting of gentlemen interested in the establishment of this Association, has been held in the town-hall, when the report of the committee, which described the object of the Association, was read. The object was the encouragement of art and manufacture amongst the working men of Manchester and district. Mr. Robertson said that a little jealousy which had existed among employers had been removed by their having been invited to join the Association as honorary members, and the employers had cordially acceded to the request. A room had, within a month after the formation of the Association, been conceded to them in the Royal Institution for holding their meetings, and they might hope for rooms in the same institution in time to hold their show. A guarantee fund of 1,000l. was proposed, and several gentlemen offered to subscribe 50l. each towards it.

WALL PAINTING IN ST. MARTIN'S-ON-THE-HILL, SCARBOROUGH.—The painting on the eastern wall of this church, which has been so long in progress, is now completed. The central object of the decoration is a representation of the Adoration of the Eastern Kings. In the background, are angels adoring, and in the upper part of this panel, are the quaint red tiles of the roof of the stable, with the doves hovering over it. On each side of the central panel, are three small figures of angels with musical instruments in their hands, worshipping the infant Redeemer. The four outer panels contain figures of the four archangels. All these are on a background of gold, toned down by flowers and foliage. The whole wall is covered by a diaper pattern: in this pattern is worked the letter M, standing for St. Martin, in whose name the church is dedicated, with the abbreviated Latin inscription,—"In mem. ater. erit justus." "The righteous shall be had in everlasting remembrance." The painting is Miss Mary Craven's additional gift to the church. It was executed by Messrs. Morris, Marshall, Falkner, & Co., of Red Lion-square, London.

PRIMROSE HILL.—On Primrose-hill, which is under the same management as Regent's Park—namely, that of Mr. Edwards—a new walk has been finished within the last few weeks, from near the waterworks reservoir, in a southerly direction, to Albert-terrace, Albert-road. It is about 700 or 800 yards in length. A couple of those iron works that one sees occasionally near cab-stands in the streets would not be out of place on Primrose-hill. On the south side of the hill there is a fine open air gymnasium, which is more frequented than any other in London. It is a great pity that some attempt is not made, before it is too late, to connect Regent's Park with Hampstead Heath, by means of a carriage-drive which might be brought round the lower parts of Primrose-hill, through the handsome piece of road, with the fine old trees on either side of it—from Belsize Park to Haverstock-hill, and so on to Hampstead. A rather novel suggestion has been made as to Primrose-hill, which is neither more nor less than that a *donkey* Rotten-row, with model asses and equipments, and well-dressed, respectable attendants, should be established there. And there is little doubt that if women and children only were allowed to ride, the innovation would be highly appreciated by the majority of the frequenters of Primrose-hill.—*Times*.

THE GREENWICH EXHIBITION.—The South-Eastern Industrial Exhibition in Greenwich Hospital is to be opened on (this) Friday, the 20th, by Viscount Sydney, lord-lieutenant of the county.

LOUGHTON.—The committee of the Loughton National Schools are now carrying out additions thereto, under the direction of Mr. T. H. Watson, their architect, who designed the original work, previously to his going on the Continent as travelling student of the Royal Academy of Arts.

THE DUBLIN O'CONNELL STATUE.—At a meeting of the committee, on the 4th instant, it was resolved to give the commission to Mr. Foley. At a meeting on the 11th, however, according to the *Dublin Builder*, notice was given of a motion for the following meeting to rescind that resolution, and nominate a resident Irish architect.

DISCOVERY IN BEDFORD CHURCH.—This church is closed for extensive alterations, restorations, &c. While the workmen were engaged removing an arched recess, there was discovered on it a wall painting in excellent preservation, representing "The Last Judgment." Photographs of it have been taken, to be sold for the benefit of the church restoration fund.

MURAL PAINTING.—BUNBURY CHURCH.—In the course of the restoration of Bunbury Church, on removing some of the whitewash in the Crewy Chapel the remains of an old mural painting were observed immediately over where the altar stood. The subject is the "Resurrection." The picture is of small dimensions, and simple in treatment. Our Lord is represented as rising from the tomb: on each side one of the Marys is standing, behind whom is the figure of a bishop.

SOUTHWARK BRIDGE.—The Court of Common Council have resolved, on the motion of Alderman Salomons, that Southwark Bridge shall be kept open for other twelve months, with the option of purchasing the bridge altogether. The motion was strenuously opposed, not from any doubt as to the convenience afforded by the bridge being free, for that was admitted on all hands, but because the motion pointed to the chance of the corporation purchasing it altogether, for which it was said that there were no funds forthcoming.

THE CONSERVATIVE LAND SOCIETY.—The report of the committee presented on Tuesday, the 10th inst., states that the receipts for the year ending September 30, 1865, were 80,260l. 2s. 1d., one of the largest ever received by the society. The reserve fund was 11,471l. 6s. 4d. The total amount paid into the society since its formation was 826,649l. 15s. 11d. The 50l. shares issued were 22,925, representing 1,146,250l. The use made of the society as a savings and deposit bank is indicated by the withdrawals which, since September, 1852, reach 256,906l. 14s. 4d. This society has acquired sixty estates in twenty-six counties, and the sale of land to Michaelmas was 415,850l. 16s. 4d. The sales on the old and new properties had been unusually great in the year, especially in the suburban districts. Five new estates at Stafford, Hereford, New Ferry (opposite Liverpool), St. Austell (Cornwall), and Putney, are to be allotted this year.

MANCHESTER ARTISTS AND THE ROYAL INSTITUTION.—A correspondent of the *Bolton Chronicle*, writing from Manchester, discusses the causes of the indifferent collections of modern pictures obtained for the annual exhibition at the Royal Institution, and arrives at the conclusion that the result is mainly, if not solely, due to a want of encouragement of local artists by connoisseurs and picture-buyers. The writer says:—"Those works which have already met with purchasers are very small pictures, varying in price from one guinea up to forty guineas, and the whole number of works disposed of is twenty-nine, amounting to the value of 373l. 9s. This is the result after a fortnight's display; whilst the sales at the Liverpool Academy, on the private view day alone, generally approach 2,000l. Does this speak well for the encouragement of art and artists in Manchester? There are good names on the council of the Royal Manchester Institution; a few of them are purchasers of works of art, but very rarely from the walls of the Royal Manchester Institution. Not so in Liverpool. If a young artist there displays talent, he is taken by the hand, his works are bought, and commissions given. Several Manchester artists have won for themselves honourable positions in London."

ARCHITECTURAL ASSOCIATION.—The conversation of the Association will be held at the House, in Conduit-street, Regent-street, on Friday next, at 8 p.m.

THE PROPOSED NEW CORN EXCHANGE FOR DORCHESTER.—At the last council meeting, the tender of Mr. Wollspring, of Dorchester, who agrees to complete the work for 2,135*l.*, was accepted by a large majority, and it was resolved that the work should be immediately carried out. The only other tender was that of Mr. Monday, for 2,189*l.*

REFUSAL OF LICENCE TO A DEFECTIVE THEATRE. Application was lately made to the Darlington magistrates, by the proprietor of the local theatre, for a licence. Mr. Dickinson, the engineer to the Local Board of Health, and on their behalf, opposed the application, on the ground that the building could not safely be used for such purposes as proposed, owing to the make of the walls. Several persons were examined pro and con., and ultimately the magistrates declined granting a licence until the walls, &c., were strengthened to the satisfaction of the Local Board of Health's representative.

AGRICULTURAL PROGRESS.—A new means of increasing the fertility of land has been invented, and, it is said, successfully tried at Annaberg, near Bonn. The object of the new invention is to extend the generation of humus to the lower strata, by introducing air into the earth. To this end pipes, very similar to the ordinary drains, but riddled by narrow apertures, are laid down at a depth of from 3 ft. to 6 ft. Instead of a central drain, they lead to a hearth, where a fire rarefying the air causes a constant draught to pervade the pipes. The atmosphere, says the description, thus freely entering and issuing from the pipes, preserves the normal condition underground, and through the numerous apertures approaches the strata which contains the roots: thus the soil is loosened, and penetrated by oxygen so effectually, that though the air from above may be shut out from the hearth, the fire will continue to burn all the same. The invention, or rather the experiment, which may be destined to mark a useful progress in agriculture, was suggested by Herr Noonenbruck, and executed under the superintendence of Dr. Hardstein, both attached to the Agricultural Academy connected with the University of Bonn. The supply of heat, though perhaps not specially of air, to the soil, by somewhat similar means, has been before suggested.

NEW WAREHOUSE AT SUNDERLAND DOCK.—The new grain warehouse, erected by the local Commissioners at the South Dock, is ready for the reception of grain. The warehouse is a brick building, of six stories in height, 137 ft. in length, 65 ft. in breadth, 63 ft. 9 in. to the eaves of the roof, and 73 ft. to the apex of the roof. The lower story is 14 ft. in height, the four immediately above are 9 ft. each, and the upper flat 9 ft. to the level of the roof, which is open. The walls are of varying thicknesses, from 4 ft. to 24 in. The foundations are excavated to 10 ft. to the solid rock, upon which a bed of concrete 4 ft. thick is laid, and upon this are raised columns of ashlar masonry, on which rest cast-iron columns supporting the interior of the warehouse. The girders supporting the floors pass through openings in the top of each column. These girders are continuous, each one being 14 in. thick, and running the entire length of the building, 135 ft., without break. The continuity has the advantage, it is estimated, of adding 25 per cent. to the strength. The breaking strain of each girder in the centre is 40 tons, but the weight has been distributed so as not to exceed 20 tons. The roof is double ridged, and supported in the centre by timber framing resting upon the girders. There are two tiers of hatchways from the top to the bottom—one over the lower floor, and the other on a line of railway running right through the centre of the warehouse, so that grain can be placed upon trucks under cover. The building is erected to contain 12,000 quarters of grain. A stone fire-proof staircase, with iron doors to each loft, runs up the north-west side of the building. A water-main runs up to each floor, to which hose can be attached. The floor is air and water-tight, iron slivers being introduced between each batten for that purpose. The contractor for the building was Mr. Walter Scott, of Newcastle. The plans, &c., were prepared by Mr. Thomas Meik, the engineer to the Commission, and the estimated cost is 10,000*l.*

PARISIAN MIDDLE-CLASS ASYLUM.—A retreat for the aged has just been opened at Anteuil, near the Bois de Boulogne: it was established by the Administration of Public Assistance, with funds given by a gentleman and lady named Chardon-Lagache. The new asylum receives married couples as well as single.

WOLVERHAMPTON NEW TOWN HALL BUILDINGS.—The committee appointed to take steps for the erection of new public buildings in Wolverhampton have met for the purpose of inspecting the nineteen plans which have been sent in by architects in accordance with the committee's advertisement, and have selected eight for further consideration. The selected designs are hung in the Council chamber. We understand that the borough surveyor has instructions to report upon the plans.

THE NEW POLICE COURT, NORTH SHIELDS.—The new police court for the borough of Tynemouth has been completed. It is situated at the corner of Saville-street and Norfolk-street, and consequently is at right angles with the old police court, the end of the two courts adjoining each other. The new court is the more spacious of the two, being 51 ft. long by 27 ft. broad, whilst the old court is only 41 ft. by 20 ft. The height is 14 ft. The courts are on the same floor, and there is a ready communication between the two, with adjoining apartments common to both. The borough surveyor, Mr. Robson, planned the arrangements. Adjoining the new court-house, and in Norfolk-street, is a new stone building, where the fire-engines are kept. The upper portions of the building form the residences of the inspector and another officer of the fire brigade. The old court will be retained for the sittings of the town council.

TENDERS

For the erection of a villa at Kingston-on-Thames, for Dr. Jackson Kent. Mr. W. P. Griffith, architect. Quantities not supplied:—

Dunkley ..... £1,478 0 0
Whistley ..... 1,390 0 0
Dimsdale ..... 1,390 0 0
Boxall ..... 1,374 0 0
Ebbage (accepted) ..... 1,280 0 0

For alterations to 88 and 89, Borough, for Mr. Sheppard. Mr. W. P. Griffith, architect:—

Ebbage ..... £206 9 0

For two shops, in High-street, Hereford, for Mr. Boulton. Messrs. Emislie, Franey, & Haddon, architects:—

Lewis & Day (accepted) ..... £740 0 0

For new shop, in High-street, Hereford, for Mr. R. P. Morris. Messrs. Emislie, Franey, & Haddon, architects:—

Freeman (accepted) ..... £555 0 0

For building four houses, in Renfrew-road, Kennington, for Mr. Mills:—

Nightingale ..... £1,250 0 0
Wootton & Land ..... 1,235 0 0
Brown ..... 1,215 0 0
Granch ..... 1,200 0 0
Sarridge ..... 1,075 0 0
Hogel ..... 1,059 0 0
Hales ..... 1,000 0 0
Neale (accepted) ..... 1,000 0 0

For new floor to warehouse, No. 34, Milk-street, Cheap-side. Mr. Robert W. Edis, architect:—

Scrivenner & White ..... £24 0 0
Conder ..... 736 0 0
Hardiman & Sandon (accepted) ..... 648 0 0

Accepted, for two shops and buildings, for Co-operative Society's store, Limited, Chitrose. Mr. Edward Fritschard, architect. Quantities supplied:—

Mason's Bricklayer's, and Excavator's Work.
Petty ..... £245 0 0
Joiner's Work.
Grinshaw ..... 529 9 8
Slaters and Plasterer's Work.
Tomlinson & Shaw ..... 78 15 0
Plumber's Work.
Hodgkinson ..... 133 10 0
Ironfounder's Work.
Cockshott & Co. .... 30 10 0

For first part of new warehouses, in Kingsland-road, for Mr. John Carter. Mr. E. Roberts, architect. Quantities supplied by Mr. D. C. Nicholls:—

Messrs. Nicholson ..... £280 0 0
Alston ..... 680 0 0
Wells ..... 675 0 0
Scrivenner & White (accepted) ..... 663 0 0

For alterations at 173, Blackfriars-road. Mr. R. Tress, architect:—

Fowler ..... £280 0 0
Browne & Robinson ..... 950 0 0
King & Son ..... 939 0 0
Downes ..... 803 0 0
Patrick & Son ..... 849 0 0
Newman & Mann ..... 785 0 0

For pulling down and rebuilding Nos. 41 and 42, Monk-well-street, for Mr. C. E. Wilson. Mr. B. Taberner, architect:—

Bostel (accepted) ..... £720 0 0

For proposed additions and alterations, with new stabling, &c., at the residence of Mr. Charles Lya. Stokess-green, Bucks. Mr. Wm. Sun, architect. Quantities supplied:—

Fish ..... £2,762 0 0
Elliott ..... 2,598 0 0
Passing & Son ..... 2,598 0 0
Harding ..... 2,277 0 0
Sargeant ..... 1,981 0 0

For pulling down premises at rear of house, and erecting new ditto, at No. 14, Finsbury-pavement, for Mr. F. Beard. Mr. Hammond, architect:—

Woodward ..... £270 0 0
Chasman ..... 273 0 0
Bostel (accepted) ..... 274 0 0

For new malt-olices, in Hexthorpe-road, Downes-street, for Mr. George May. Mr. Charles Baily, architect:—

Mackenzie ..... £1,350 0 0
Lane ..... 1,305 0 0
Fretwell (accepted) ..... 1,279 0 0

For new gate-lodge, carriage-house, stables, &c., for Mr. J. C. Bambridge, Newark-upon-Trent. Mr. Charles Baily, architect:—

Fretwell ..... £608 0 0
Lane (accepted) ..... 596 13 0
Lane (accepted) ..... 693 10 0

For new cottage, stables, carriage-house, &c., for Mr. Smith, Newark-upon-Trent. Mr. Charles Baily, architect:—

Lane ..... £355 0 0
Chippage ..... 277 0 0
Fretwell ..... 570 0 0
Mackenzie (accepted) ..... 570 0 0

For new Song School master's house, for the trustees of the estates of the late Rev. Thomas Magnus, Newark-upon-Trent. Mr. Charles Baily, architect:—

Common Front Brick Ancaster
Brick Facing Facing Rubble Facing
Lane ..... £987 10 0 .. £1,019 10 0 .. £1,049 10 0
Mackenzie ... 864 0 0 ... 879 0 0 ... 904 0 0
Fretwell ... 852 0 0 ... 867 0 0 ... 922 0 0
Accepted.

For taking down and rebuilding the Old Rose public house, Russell-street, Bermondsey. Mr. Charles Sewell, architect:—

Clemence ..... £1,075 0 0
Fish ..... 1,830 0 0
Wells ..... 1,441 0 0
Wells ..... 1,570 0 0
Roffey (accepted) ..... 1,483 0 0

TO CORRESPONDENTS.

Messrs. C.—W. S.—R. W. E.—A. H.—R. T.—O. R.—J. W.—R. W. J. W.—W. E. B.—J. G. W.—J. G.—C. H.—J. R. W.—T. F. (progress).—A. T.—W. T. (a wash of milk answers very well). A. E. W. (Buck).—W. T. (see our marking inquires).

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course with the authors.

Advertisements cannot be received for the current week's issue later than FIVE O'CLOCK, p.m., of Thursday.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder, No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

[ADVERTISEMENT.]

CHURCH, TURRET, and STABLE CLOCKS. J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tines on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 83 & 34, Ludgate-hill; E.C. Established 1749.

NEWSPAPERS and MAGAZINES.

Messrs. COX & WYMAN, Printers of "THE BUILDER," and other First-class Publications, beg to call the attention of Proprietors of Newspapers and Periodicals to the unusual Facilities their Establishment presents for the production of the above class of Works with regularity and in the best style.—Litho's Iron Steam Printing Works, 7-17, Great Queen-street, W.C.

Dedicated, by permission, to the Right Hon. Lord Palmerston.

DESIGNS FOR MONUMENTS, TOMBS, and GRAVESTONES, &c. price 3*s.* complete in one volume.

By JOSEPH H. ROBINSON, Sculptor, Wexley.

The design in this volume are suitable for either cemetery or churchyard. The book forwarded free to any part of the Kingdom on post-office order.

FOR ARCHITECTS, SURVEYORS, LAWYERS, AND LANDLORDS.

THE DAY, &c.

ON ANCIENT LIGHTS

By ROBERT KERR, Architect, Author of "The English Gentleman's House." JOHN MURRAY, Albemarle-street.

# The Builder.

VOL. XXIII.—No. 1186.

## Obstruction of Ancient Lights.

OUR readers do not now require to be told of the difficulties that arise in dealing with "ancient lights," and the little certainty that can be entertained as to the result of any law proceedings in connexion with the questions to which they give rise. "As the value of house property has increased, disputes of this class have become more common than ever, more difficult of settlement, and more expensive. Serious complaints are made in all quarters,—on the one hand, that vexatious litigants are permitted by frivolous technicalities to hamper improvement where improvement ought most to be encouraged; on the other, that bold speculators

are able to override the rights of less wealthy and more timid neighbours, the very class who most require protection. Demands are made for legislative interference; and even Chancery judges confess themselves bewildered in the subtleties of pleading, and the conflict of interests equally entitled, not merely to legal respect, but to personal sympathy."

Professor Kerr, in a pamphlet on the subject he has just now published,\* thinks that the fault lies in the defective nature of surveyor's evidence, and not in the law at all; and asking, "What is surveyor's evidence?" replies, "In all litigation the basis of judgment must be what are called 'the facts.' If the facts are misrepresented, the judge cannot be responsible for his decision, and the law cannot be responsible for its justice. Lawyers will supply the reasoning, but they must be supplied with the facts. The facts of light cases, then, are supplied by the surveyors. It is upon their statements alone that the law is capable of being applied. They make oath and declare, as experts, that certain lighting will be 'materially diminished;' or that it will not be so; and, in reality, these statements have to do duty for 'the facts.' And when half-a-dozen surveyors on one side swear one thing, and another half-dozen on the other side swear quite another thing, and all in the most empirical and dogmatic way, not only not assigning reasons, but positively withholding reasons by prudential rule, can it be wondered at that on such a basis of 'facts' the law should find itself at a loss?"

\* On Ancient Lights, and the Evidence of Surveyors thereon. With Tables for the Measurement of Obstructions. By Robert Kerr, Architect, Professor of the Arts of Construction in King's College, London. London: John Murray. 1865.

Opinions of this kind, he thinks, ought to be matter of intelligible proof,—ought not to be ventured upon unless arrived at by such proof. The object of his pamphlet is to give what he thinks will afford the means of proof, so that their opinions may be both definite and intelligible; and he ventures to think that, if surveyor's evidence can be made all it might be in these respects, the public will find little to complain of in the state of the law.

The treatise is divided into three parts, namely,—

I. The rationale of the law of ancient lights.  
II. The employment of window-lighting, and the classification of lights.

III. The measurement of window-light, and the proof of its diminution and damage.

It is this third part that possesses novelty, and is proposed as the solution of the difficulty. He gives in it tables of valuation for the measurement of window-light, and suggestions for their employment in practice. Admitting that there may, perhaps, be differences of opinion respecting the data on which these tables are based, he maintains, that if such tables can be accepted, they must go a great way towards providing surveyors with those means of proof, the want of which at present renders their evidence so unsatisfactory "as facts."

The term for which the light has been enjoyed that gives a right is, as every one now knows twenty years. The term was at one time doubtful; but by the Act 2 and 3 William IV., cap. 71, called the Prescription Act, it was determined that in future certain definite terms of years should be accepted,—in cases of house-light, twenty years. The practical hearing of this usually is, that if a window can be proved to have received light over a neighbouring property for the last twenty years, the owner of the neighbouring property must not deprive it of any necessary part of its light by his operations on his own property, no matter what his own necessities may be. The words of the Act are,— "When the access and use of light to and for any dwelling-house, workshop, or other building, shall have been actually enjoyed therewith for the full period of twenty years, without interruption, the right thereto shall be deemed absolute and indefeasible, any local usage or custom to the contrary notwithstanding,\* unless it shall appear that the same was enjoyed by some consent or agreement expressly made or given for that purpose by deed or writing" (in which case, obviously, the agreement would explain itself).

To define precisely what is the right of lighting here involved, the author gives the following as rules to be remembered:—

1. It must be lighting "actually enjoyed,"—really made use of beneficially as a necessary—the loss of which would be a tangible deprivation to the building; that is to say, the window in question must be necessary to the house, and the particular lighting in question necessary to the window. The law will not enforce any restriction upon the servient property except for a tangible and essential benefit to the dominant.
2. The privilege must have been enjoyed for twenty continuous years immediately past, without any abandonment except for a temporary purpose.
3. It is necessary, the "actually enjoyed" amount of lighting, which must not be diminished; any unnecessary or unenjoyed surplus must be obstructed without wrong.
4. The diminution must be of such extent as to be sensibly appreciable by ordinary persons; not speculative or theoretical, but practically apparent both in kind and degree—what the law calls "a material," or "substantial," or "considerable" obstruction, not even recognizing any personal peculiarity, far less any eccentricity or caprice, of the complainant, but looking strictly to ordinary uses and purposes of the particular kind in question judged by the standard of ordinary apprehension.
5. The enjoyment of the lighting is limited by the precise purpose served by the window; for instance, whether to light a cellar, where but little illumination is needed,—or to show delicate goods in a sub-room, where the requirements may be extremely fastidious.
6. The particular purpose for which the lighting is claimed must be limited to that purpose, or its equivalent, for which the twenty years' enjoyment has been continuous.

\* "The ancient custom of the City of London, for example," says Mr. Kerr, "permitted a new wall to be carried up to any excess of height, provided it stood on the old foundation, and provided there was no agreement in writing to the contrary. This custom, however, is obviously now set aside."

tinuously possessed; for instance, an apartment used originally as a dwelling-room, and converted into a sale-room within twenty years, is only entitled to sufficient light for a dwelling-room.

7. The bias of the law leans towards the servient property, so that the dominant proprietor is expected to be reasonable and considerate in the enforcement of his privilege. Indeed, to a certain extent, the courts will take into account the comparative importance of the conflicting claims,—on the servient side, perhaps, a great commercial enterprise, and on the dominant side possibly a purpose of little real value.

An interruption of the right acquiesced in for one year would seem to be sufficient, it should be mentioned, to destroy it. Moreover, the owner of a light may sacrifice his right to it by injudicious alterations of his own: "If he pulls down his old house, and within reasonable time builds a new one which contains the accustomed lights in precisely their accustomed form, or in an equivalent form in every respect, or in a form less oppressive than before—position as an essential point being unaltered, and size not increased—he has not reinstated that which was his own. But if he takes the opportunity to make a further encroachment, in whatever shape, this additional easement becomes entirely separated in the eye of the law from the former privilege, and it has no protection till sanctified by its own twenty years of enjoyment. If, again, he extinguishes the old easement, and thinks to transfer his title to an equivalent in another position, he loses the old without gaining the new: the servient neighbour has but to wait the prescribed year, and he may obstruct the new with impunity, when it has become too late to reclaim the old." Lastly, if old and new should have been so confused together as to be indistinguishable, the servient possessor is not to be prevented thereby from protecting himself by obstructing the new, and the undistinguishable old must take its chance.

Now let us see how a question arises. A building is increased, either in extent laterally or in height vertically, and so is considered to intercept the access of light of day to a neighbour's window, to his consequent damage. "The neighbour in effect pleads this:—By that window I have hitherto received into my house from the atmosphere an amount of lighting which may be called say 100 measures of lighting; of this quantity I have always used (in a definite way to be accounted for) say seventy measures to my benefit, so that the enjoyment of seventy measures has become an essential necessary of the occupation of my house, and is therefore by law my property; but the defendant obstructs (or intends to obstruct) the access of such lighting materially, for I shall receive but say fifty measures; and thus I am to be by him permanently deprived of say twenty measures of lighting, which is my property; and I claim the preservation of this twenty measures of lighting to my use, or compensation for its loss, as the case may be." The right being established, the law has little more to do than to ascertain whether, by reason of the cause assigned, the amount of lighting hitherto used in the manner accounted for is, or is to be, so much lessened as to involve a substantial deprivation to the complainant; if so, the obstruction is a nuisance.

Approaching Mr. Kerr's scheme for the measurement of window-light and the proof of its diminution and damage, we must give up the idea of explaining it to our readers. Even set forth with diagrams and at full length, it is not very clear, and such notice as we can take of it must be understood as simply referring our readers to the pamphlet itself; for though, as we are forced to say after full consideration, we cannot find in it the hoped-for solution of existing difficulties, it will certainly be found useful by all who are concerned in such questions. Broadly, the author constructs one diagram by forming a quadrant against "the horizontal plan of a common wall-window" (with its centre in the middle of the window), and dividing this quadrant into four, parts, by means set forth, a

comparative value upon each division as regards the amount of light received from it. A similar diagram is constructed on the vertical section of the same wall-window, and gives the same comparative values to the divisions there. The results are then modified by certain obvious considerations (considerations not quite so obvious being left out of the question altogether), and these values of elevation are multiplied systematically into the values of plan, and a table is produced, which, according to the author, makes "the measurement of lighting power simple and reliable." It then becomes necessary to consider what has to be done in order to apply this to any given case of the lighting of a certain space within. "In a word," says the author, "we must look into the question of the proper proportion which window space ought to bear to the size of the apartment lighted. Or, to put the matter once more, and in special relation to easements, by what means is the surveyor to determine, in any particular case, not how much light is obstructed (because this is not the point at issue), but how much the lighting power has been reduced below the necessities of the Easement?"

Much has been assumed to accomplish the first stage; but, arrived at the second, the author candidly admits that it would be vain to attempt the establishment of rules to apply to all cases; the surveyor must judge for himself, according to the circumstances of the Easement, what are its necessities; but it is argued that principles may be laid down "for his consideration, so that his judgment may be founded on an intelligent and intelligible reckoning." To this end, "a standard minimum of necessary lighting" is laid down, and a scale of widths of window space, with corresponding dimensions of rooms suggested. With this and the previous table, the ascertainment of the exact amount of injury to any Ancient Light is thought to be "easy enough."

The "exact amount" of injury is seldom the question: it is not, as Mr. Kerr has put it, "how much the lighting power has been reduced below the necessities of the Easement," but how the lighting power has been reduced below what the possessor has heretofore enjoyed and still requires for his purposes. Evidence founded on the diagram, a diagram of hypothesis, to the effect that the light had not been reduced below the necessities of the Easement, would weigh but little with either judge or jury as against plain testimony that there was less light to the room than there was before the erection of the obstruction, and not enough for its accustomed uses. We doubt even whether the latter testimony would be considered as materially strengthened by evidence from a diagram founded on the same bases; as, besides the original assumptions in making the tables, there would be so many influencing things to consider, such as aspect, the position of the window, especially with reference to the ceiling, the nearness or farness of existing obstructions or permanent reflecting surfaces, and several other points, that agreement as to their several values on the part of different minds would be, we fear, as unlikely as in opinions arrived at from simply viewing and studying the place and exercising the judgment. The scheme, we need scarcely say, is worked out with much ingenuity and acuteness, and may prove suggestive to professional witnesses, and so far valuable.

#### THE PREVENTION OF STRIKES.\*

The exposition already referred to, of the train of thought which led M. Leclaire to the foundation of his association, is preceded by some observations concerning a common lot of the workman. In the case of a concern, or the "good-will" of a business, passing to a new proprietor, he says that the new master will keep the recognized good workmen, and those whose appearance does not betoken age, but will dismiss without pity those whose appearance discloses a decrease of strength. Each successor in the concern does the same: evidently he has not any motive to act otherwise. A dismissal of this kind gives a terrible blow to the workman.

"So far, he had not thought of his years; his ardour in work in the business establishment that he had accustomed himself to consider as his own, was making him forget them.

But darning from this fatal day, he acquires the sad conviction that everywhere where he may go and demand

work, they will judge at first sight, from his countenance and his bearing, that he is too old to well acquit himself of it.

Then what become those intelligent men who lately formed the élite, the novel of the establishment — that sacred battalion that upon a word, upon a sign even, understood the wish of the master? . . .

What become those fellow-labourers whose devotion allowed of the doing of the most difficult and who, by their example, forced to activity the workmen who were working at the establishment only temporarily? . . .

What would one be able to do for those noble remnants of the workshop, that are repulsed on all sides, like tools become unfit for any service? . . .

What would one be able to do for those men who have been the élite of the works, whom the clients were personally acquainted with, whom they called by their name, whom in a multitude of cases they preferred to the master? . . .

For those men to whom one accorded as much confidence as to the most faithful servants, when they were working in the interior of the habitation? . . .

For those men who were happy, honoured in receiving the orders of clients; and who, with all the politeness, all the respect possible, were eager to fulfil all the exigencies, sometimes even the caprices, of those who loved to command them? . . .

For those men, in fine, that rarely one allowed to go out of one's house without giving them a proof of one's satisfaction, and one's munificence, and even in asking of them news of their family? For one meets with clients who extend good-will and civility even to interesting themselves to that extent.

Is it that like workmen, by these different vouchers, would not have acquired some rights in the value of the connexion of the establishment? For, in short, it is with their co-operation that it was formed, preserved, and increased."

Such, says M. Leclaire, was the delicate question that he proposed to himself; and after giving some particulars of himself, on the one hand, and of workmen on the other, the class, he proceeds to show how he answered the question without neglecting his own interests.

We may here say, there is perhaps something in what has been said above, and in what has to be said, respecting the workman, that may be considered as of exact application only in France. That may be so; but the correction required for difference of race and manners, is not greater than the English reader can supply, leaving the argument, after all, not very different from the position in which it is put for the French reader.

M. Leclaire's early associations with the class with which his career has been, in one way or another, bound up, were precisely such as have counterparts in England, in cases to which we have alluded. Only, M. Leclaire knew how to make the most of his experience.

The story of his life is worth the telling. His father was a poor village-shoemaker. The son was obliged to earn his own living from the age of twelve. When seventeen years of age he came to Paris; and there he learned the business of house-painting. He was in the position to hear what was said, good and bad, concerning masters; and he speaks of sly and sly doctrines, but of good sentiments animating the mass. Referring to one point, he says:—

"People do not sufficiently know the workman, nor his susceptibility on the side of honour: to know him, it is necessary to have been the workman oneself, and especially to have the recollection thereof; for, in the case of many, from the day after they are no longer, they believe themselves kneaded of another dough than their old companions of the workshop."

M. Leclaire confesses to have himself once participated in a feeling that those having wealth, concern themselves little about the workman. He observes that such a thought profoundly wounds the workman, since the latter really attaches importance to the esteem and consideration of those above him. His susceptibility is such that a mere mistake about a salutation may be the cause of his humility and respect being transformed into the opposites; and, M. Leclaire says, matters of this sort, trifling though they appear, contribute more than one might think, to nourish antipathy of one class to another.

He then refers to the loss of days idleness, and to the habit of frequenting the *cabaret*, or what may be taken as equivalent to the public-house. On the latter matter, his words would apply with more force, indeed far more, to the case of London than that of Paris. He says, it does not depend always upon the workman not to go to the *cabaret*: his work does not lay near his dwelling: he cannot take his repast at home; he is forced to go to eat at the wine-merchant's; and once there, he must have great force of will to consume only what is necessary, especially as there will be comrades who force even the most reasonable workman to act like them, or succeed by taunts in inducing him. Even misery will drive the workman to frequent the public-house. Perhaps he has not anything but his working-coat for holiday-times; so, preferring not to join his friends going into the country, he gets to where he can make himself drunk, even alone. Misery also causes tarred in a man's home; and that sends him to drink.

We have read much in the French journals about drunkenness, and its increase in France; but observation would have led us to say that in Paris at least, there was little of it compared with what there is in London. Sad effects however are attributed to *abstinence*. One advantage, the French workman has over the English one. He is not absolutely compelled to go to the *cabaret*, or the wine-merchant's shop. He can find in any street, even of the suburbs, of most of the towns, (as of course he can in Paris,) comfortable *cafés*; where he need take nothing stronger than a cup of coffee, or chocolate, or even a glass of sugared water. The dirty dens in London, that are called coffee-houses, where a nasty liquid styled coffee is to be had, are as inferior to the commonest workmen's *cafés* of Paris, as all our arrangements for the preparation and service of food for those compelled to get their meals from home are to such things in France, and as are our penny reading-rooms to the Parisian *cabinets-de-lecture*. It would be fortunate for the working classes here, were all the French appliances that we refer to, to be found; or were at least the *café* as general in London and its suburbs, as the public-house, and inviting in its appearance. M. Fréugier, quoted by M. Leclaire, said in his important work on the Dangerous Classes in Towns ("Des Classes Dangereuses de la Population dans les Grandes Villes") that the habit of going to the *cabaret* was less connected with ill-regulated habits on the part of workmen, than with caprices, influencing their conduct only by reason of the masters not occupying themselves sufficiently with the interior discipline of their shops. Immediately afterwards the same writer speaks of the origin of excess, in feebleness of character, or pride; but further on he says (the words being translated from the quotation given by M. Leclaire):—

"The case is the same with the pleasures of the Monday with the ordinary frequenting of the *cabaret*. It is an usage due only to the contagion of bad habits, and that it would not be difficult to destroy, if the undertakers of works were better able to appreciate the advantages of a good discipline, and by the facility that they would have to maintain it among their workmen in bringing into their relations with them an exact justice, a continued good will, and a calm firmness."

It is scarcely necessary to point out the intimate connexion of all that has been said, with the subject of this article.

When he had become a master, M. Leclaire recollected the different facts that had been before his attention as a workman, inclusive of those of the privations that even the man in receipt of wages has to undergo, to meet his daily wants, and the consequences of illness and of being out of work. He recollected, he says, that with a daily salary, it was impossible for a workman, who had almost always children or old parents at his charge, to make the least saving for his old age. He says:—

"I suffered this impression,—that the day when I might retire, the steady workmen who would have remained attached to me, would not be able to do as much, and that my successor would do with them that which you know."

I then thought that I should not enjoy a complete happiness in remembering the lot that those would necessarily have, who would have contributed to enable me to carry into effect my wish to glide along my old days happily."

After 1830, an idea of the necessity of augmenting the well-being of the industrious classes, "not in impoverishing the rich, but in enriching the poor," as it was expressed by François Arago, seems to have prevailed in France. In 1838, M. Leclaire founded a Provident and Mutual Aid Society which served to bind together a newel, (*noyau*), or staff, of good workmen. About the same time he framed regulations to be observed in his workshops, which perhaps differed little from some that are before us, dated 1864, and to which we shall return.

About this time, M. Fréugier, collecting materials for his work, came to M. Leclaire. They were led to discuss the question of the relations between master and workman. M. Leclaire spoke of the difficulty of terminating the antagonism. M. Fréugier suggested, as the only solution, participation of the workman in the gains of the master. For some time, the thing seemed quite impracticable; but at last M. Leclaire discovered the way to apply the idea of M. Fréugier,—serving his own interests, and being useful to the workmen and *employés* who might attach themselves to him. This was in 1840.

We have just mentioned that there was already a Provident and Mutual Aid Society for the workmen of M. Leclaire's establishment. It was entitled, "Société de Prévoyance et de Secours

\* See p. 737, ante.

Mutuels pour les Ouvriers Peintres de la Maison Leclaire, à Paris." It received the authorization of the Minister of the Interior in September, 1838. This society was originally formed for fifteen years' duration, the period however being capable of being extended by a majority of two-thirds of the votes of the members in a general assembly. The society was actually reconstituted in 1863; and we can conveniently refer to its rules when we come to that period of our narrative. But we may here mention, that whilst the society was mainly intended to be for the benefit of the workmen of the "Maison Leclaire," men ceasing to work for that concern were at liberty to continue their membership. This society having helped to bind together a staff of good workmen in the establishment, and a code of regulations to be observed in the workshops being already in existence, the further steps were facilitated.

For the more important ends contemplated from 1840, a wider base of organisation became indispensable; and M. Leclaire says he felt himself "dominated by this presentment," that he was founding a useful institution that might be expected to last beyond his own life.

An essential condition for the attainment of the object, in his mind, was that the greatest rectitude ought to exist in all possible relations with whomsoever might address himself to the concern; and, in order that it might not come into the thought of any workman and employed to swerve from these principles of honesty, M. Leclaire took measures for unveiling the frauds commonly practised in work. He published his "Collection of Notes on the Abuses introduced in the Painter's Work in Buildings, and also in the Gilder's, Paperhanger's, and Glazier's Work," which we mentioned in a note to our article on the "Frauds of Painters,"\* when we more especially referred to his "Diagnoses on Competition without Limits," &c. About the same date appeared his "Some Ameliorations that it would be possible to introduce into the Lot of the Operative House-painter." Exposure of the frauds seemed the more necessary, since it would not fail to be hawked about that the workmen employed being interested in his profits, the uprightness of one and the other could not be anything else but matter for suspicion. At different times since, M. Leclaire has issued particulars having the same object. They were alluded to in our last. One of the brochures is a little hand-pamphlet, of twelve pages, five of them given to prices of work, whilst the remainder relate to abatements that are made, and to the means of preventing or recognizing fraud.†

All the arrangements being made towards progress of the affairs of the concern, without alteration by deaths, resignations, and other events, M. Leclaire, at the end of 1841, brought all the men working for him at the time, together, in a place which he had constructed for the object (and which still preserves a similar use), and made them acquainted with his measures and intentions. He says,—

"I insisted upon this important point: that often we should be met with a disloyal opposition; and that to combat it, we should never be bound to have recourse to the fraudulent eras that it employs; that our activity, our energy, ought to make up for it, and suffice to conquer it.

"That we ought to inscribe upon our flag this motto:—*To execute works cheaply, well, and quickly.*"

He announced to them that, starting with 1812, the working day would be reduced from eleven hours to ten, and that the most deserving would receive each year, "après l'évaluation," (as says the "Compte Rendu" before us), a share in the gains. The consequence of this proposal was real emulation on the part of all: M. Leclaire's task became easy; and his establishment was in a position for developing itself to the extent which it has at this moment attained. The efforts met with some opposition; and

\* See p. 514, ante.  
 † "Maison Leclaire et Cie, Entrepri de Peinture, de Dorure, et de Vitrierie, Rue Saint-Georges, 11, Paris.— Tarif de Peinture, Dorure, et Vitrierie.—Des Rabais qui ont lieu sur les Prix de Travaux dans ces Entreprises; et des Moyens à employer pour prévenir et reconnaître la Fraude qu'on y fait. 1855."

Much information on the same subject, as well as prices, may be obtained from a more important brochure alluded to, which is entitled:—"Peinture, Dorure, Peinture, et Vitrierie.—Observations et Propositions ayant rapport Année 1842, sous l'approbation de Monsieur le Préfet du Département de la Seine, suites de Sous-Détails en vue d'obtenir des Modifications pour 1843, conformes aux Variations qu'ont subies les Prix de la Main-d'œuvre et des Matériaux, par Leclaire et Augustin, Entrepreneurs de Peinture, Paris, Imprimerie de Madame Veuve Bouchard-Huzard, Rue de l'Éperon 5, 1843." 4<sup>to</sup>, pp. 88.

M. Leclaire alludes to a democratic journal which excited suspicion on the part of workmen that his measures had for their object, in a given time, the reduction of salaries; but in the establishment itself, everything went on without strike,—without demand for increase of pay,—and that even in 1818, the year of the revolution. On the 24th of February, and the 24th of June, in that year, all M. Leclaire's men were at work. In February, when the Orleans railway workmen were so troublesome that the railway and its administration had to be sequestered by the republican government, some forty of M. Leclaire's men engaged in painting the carriages, never left their work; and on the 24th of June, when the College of France, where M. Leclaire had work in hand, was entered by the insurgents, the demeanour of his workmen was of a similar kind, and produced a letter of congratulation to M. Leclaire from the architect, M. Danjou. It is scarcely possible that the importance of such facts can be fully appreciated without more intimate knowledge of the revolution of 1818 than is possessed, after the lapse of seventeen years, by the majority of English readers. Even in 1850, one lady, Madame la Baronne Denis, for whom a house had been built, near Honfleur, had suffered so much vexation from the workmen of the finishing, and feared to have workmen in the house. Reassured by a letter testifying to the good conduct of men of M. Leclaire's, who were working at the house of the Comte Du Barry de Merval in February 1848, she allowed the works at her house to be commenced; and on their completion she wrote to M. Leclaire in terms such as these, speaking of the workmen:—

"Their conduct as regards employment of time, conscientious care in the work, their good bearing, their politeness towards everybody, and between themselves, has been a compensation for all that I had had to suffer from others. Not the least bad word has come from the mouth of any: thus have they made an excellent impression in the country; and our neighbourhood cites as example the workmen of M. Leclaire.

"Since the events that we were already then foreseeing, how many times have we thought that if each head of an establishment would generously apply himself to moralising his workmen as you have yours, there would be much less evil to deplore in the present and to dread for the future."

Mr. Mill has lately said, in his "Utilitarianism," that the deplorable state in which education and social organization are at this moment, is the only real obstacle to happiness being within the reach of nearly every man; and the chapter to which we have more than once alluded, in his "Principles of Political Economy," shows that the hopeful view of the future in store for the working-classes is not the mere dream of enthusiasts and theorists in France, that each revolution has allowed to speak.

Another article will enable us to mention a comprehensive scheme of M. Leclaire's, of the measures required for this family, and will lead us directly to our contemplated presentment of particulars of the actual organization and working of his association.

THE LONDON RESIDENCES OF LORD PALMERSTON, &c.

"To show that Englishmen have learned to honour those who best deserve their gratitude."

HENRY JOHN TEMPLE, VISCOUNT PALMERSTON, third Viscount Palmerston in the peerage of Ireland, K.G. (and the only commoner Queen Victoria so invested)—above all, Prime Minister of Great Britain when he died,—will be buried this Friday, 27th, in the north transept of Westminster Abbey, close to the graves of two English statesmen who knew him well, in and out of the House of Commons,—Lord Castlereagh and Mr. Canning. It was his wish to have been buried at Romsey, in Hampshire; but, at the desire of his Sovereign, and with the express approval of Lady Palmerston, Westminster Abbey will hold his remains. And rightly too; for there—as in Pope's imaginary "Temple of Fame,"—

"Heroes in animated marble frown,  
 And legislators seem to think in stone."

Pope wrote some verses "On one who would not be buried in Westminster Abbey." When Sir Godfrey Kneller was asked where he would be buried, he replied, "Not in Westminster

\* From Lord Brougham's Westminster Abbey inscription on James Watt,—the word "mankind" altered, as above.

Abbey—they do bury fools there." When Qain, the actor, was asked where he would be buried, "Anywhere" was his reply,— "anywhere but in Westminster Abbey."

Lord Palmerston died at Brockett Hall, in Hertfordshire, and desired to be buried,—not where he fell, with his friend Prime Minister Melbourne, in the church of the parish (Hatfield) in which Brockett lies,—Prime Minister Palmerston desired to be buried where he was born, at Romsey, in Hampshire, in the parish church of Broadlands,—a favourite retreat with the great Prime Minister of England. "Victory or Westminster Abbey" were among the last words of Nelson. The great Vice-Admiral gained the victory he sought, and his burial, not in Westminster Abbey, as he had wished, but in St. Paul's. Lord Palmerston's wish to be buried at Romsey was not fulfilled. Westminster Abbey is to cover all that is mortal of Henry John Temple, Prime Minister of England, and something more.

Prime Minister Lord Palmerston was in heart a thorough Londoner,—not a Cockney, but a John Bull,—a combination of the sterling qualities of her Majesty's three kingdoms. Above all, he was true to his country.

As a Londoner alone, we purpose here to treat of him—as of a man thoroughly well known, particularly, not in Westminster Abbey, as he had wished, but in St. Paul's. Lord Palmerston's wish to be buried at Romsey was not fulfilled. Westminster Abbey is to cover all that is mortal of Henry John Temple, Prime Minister of England, and something more.

Three-and-sixty years ago the great Prime Minister whose loss we lament succeeded his father, and became Viscount Palmerston. He was then just of age, fresh from Harrow School, the University of Edinburgh, and the University of Cambridge,—a combination of advantages that was in no manner of way lost upon him.

When the Hon. Henry John Temple was a Harrow boy, his father lived at No. 20, Hanover-square, in London; at East Sheen, in Surrey; and Broadlands, near Romsey, Hants. Sir William Temple lived at East Sheen, and there Swift was taught by King William III, to eat asparagus in the Dutch manner. At No. 20, Lord Palmerston's father had as next-door neighbours the Marchioness of Downshire and Lord Mendip.

When (1806) first M.P. for the University of Cambridge, Palmerston lived at No. 1, North Audley-street.

In April, 1807 (then in his 23rd year), the Premier that was to be was still living at No. 1, North Audley-street, whence he removed to No. 24, Hanover-square,—his father's old house with, we presume, a new number. Street-door numbers in London were frequently altering. In Boyle's "Court Guide" for January, 1810, Lord Palmerston's Hanover-square residence is numbered 23.

From Hanover-square Lord Palmerston fitted in 1810-11 to 53, Lower Grosvenor-street, with the Earl of Radnor as his next-door neighbour on one side, and Earl Temple on the other.

In three years' time (1814) he "fitted" once more, removing from Lower Grosvenor-street, Grosvenor-square, to No. 9, Great Stanhope-street, Mayfair, next door to the Earl of Conyngham, at No. 8, and to Bamber Gascoigne, at No. 10. Here Lord Palmerston lived for many years. He was there when (1820), in the drawing-room of No. 12, the late Sir Robert Peel was married to Miss Floyd.

In 1843, Lord Palmerston removed his papers, despatch-boxes, and household deities from Great Stanhope-street, to No. 5, Carlton House-terrace, where he had the Duke of Leinster for his neighbour on one side, and Bunsen, the Prussian prime minister, on the other.

From Carlton House-terrace he removed at the death (1850) of the late Duke of Cambridge to what has been called Cambridge House, Piccadilly. Either his body was removed from Brockett, where he died, and thence it will be taken to Westminster Abbey.

Funerals, of late years, have been very rare in Westminster Abbey. We can call to mind four; and at all these we were present. We were at the funeral in the Abbey, and near to the grave, of Thomas Campbell, the poet of "The Pleasures of Hope," and of other exquisite works. The chieftain of his race, the Duke of Argyll, was a pall-bearer; and Ronbillac's fine monument to the Duke of Argyll was, to all appearance, still more animated marble than it is. We were present at the funeral of Lord Macaulay, and saw the coffin of the great historian and essayist laid at the foot of Addison's statue; and we were close to the grave, in the nave of Westminster Abbey, when Stephenson, of the Tubular Bridge, was laid by Telford, of the

Menai Bridge; and when Barry, of the Houses of Parliament, was laid by Stephenson.

"Oh! let me range those gloomy aisles alone,  
Sad luxury! to vulgar minds unknown,  
Along the walls where speaking marbles show,  
What wretches form the hollow'd mould below;  
Proud names who once the reins of empire held;  
In arms who triumph'd, or in arts excell'd;  
Chiefs graced with scars, and prodigal of blood;  
Stern patriots, who for sacred freedom stood;  
Just men by whom impartial laws were given,  
And saints who taught and led the way to heaven."

Lord Palmerston's London residences will be long remembered—Cambridge House in particular. Parliament, too, will remember his services—pay for his dean and chapter burial fees (no slight sum), and erect a monument to his memory near to his grave. But who will be the Rouhiliac, or Banks, or Bacon, or Nollekens, or Flaxman, or Westmacott, or Chantrey, entrusted with the Government commission, it is wholly idle to speculate upon at this moment.

#### EXPLOSIONS OF GUNPOWDER STORES.

DURING the concluding week of September, three more explosions of gunpowder occurred to continue the alarm in the mind of the public, caused by those which have so lately happened.

When the awful catastrophe took place at Erith last year, many besides myself looked forward to the probable causes of such explosions being ascertained either during the course of the coroner's inquest, or during any inquiry arising out of it. But finding that the questions raised tended rather to discover what person might have been in fault, I took up the inquiry and tried to satisfy myself as to what would cause explosions of gunpowder irrespective of a spark, a flame, or actual heat of some intensity. With this object in view, various publications were perused treating popularly on gunpowder; but all of them, with one exception, and that one only in a somewhat cursory manner, have overlooked the question. Mentioning the inquiry to one or two friends practically acquainted with the material, it appeared that with them the subject was also ignored. Continuing my labours, they were at last eased by an accidental reference to a work, the observations in which appeared to be so much to the purpose that, placing all my notes in a condensed form, I forwarded them for publicity, believing that if attention were gained to the subject, the frightful results which generally attend an explosion would be modified if not prevented, and the damage be confined to the building in which the primary calamity might occur.

I shall not touch upon the causes of explosions arising in the grinding and other mills, except to inquire if the invention of James Monk, of Tonbridge, for "diminishing the hazard both to the workmen and machinery in case of an explosion taking place during the grinding and mixture of the materials for gunpowder" is still employed during that dangerous operation. He was rewarded with a silver medal and twenty guineas, by the Society of Arts, &c., in 1819, when the invention was stated to have "hitherto been confined to a single manufacturing establishment, and appears already to have saved eight mills, and probably several lives."

But this first explosion having occurred, why should another, and another, and perhaps even others follow it? The public are generally led to believe that flames have reached the barrels of powder contained in the buildings, or that the building has been blown down and sparks or embers have reached the barrels burst open by the fallen materials. Others have suggested that friction might have occurred; but they have not entertained that forcible form of friction which will be more readily understood as "concussion."

Amongst my notes is one collected from the *Courier* newspaper, relating that "a sad accident happened this afternoon (July 15, 1812), at Portsmouth, in removing the powder out of the *Queen* transport, when several barrels blew up in the magazine and wounded a number of soldiers." This reads as if it were a parallel case to that of Erith. Another and well ascertained case of damage caused during the removal of gunpowder, is related by Colonel W. Anderson, in his interesting work, entitled "Sketch of the Mode of Manufacturing Gunpowder at the Ishapore Mills in Bengal," edited by Lieut.-Colonel Parhly, and published in London.

\* On the death of Addison, and his burial in Westminster Abbey.

don, 1862, Svo. It is the only publication in which I observed satisfactory information. Anderson's account is thus stated (p. 211):—"At Allahabad, in 1823, a long string of men was carrying barrels of powder to the drying-terrace; it was supposed that one man let a barrel fall, and that the whole quantity of powder exploded, killing some men, and all the others were much burnt." May we not surmise that at Portsmouth as well as at Erith, a barrel unfortunately dropped, and hence the true cause of the explosion; not that at the latter place, the caddy fire was alight, or that any of the men were smoking. In support of this view of the case, the following paragraphs from the reports of the inquiry are important. Mr. H. A. Howe, the manager at Messrs. Curtis & Harvey's magazine, stated that "some of the barrels were 'handed' in, and some 'thrown' in, from the barges to the people on the jetty, according to their weight. The closer the magazines are to the barges the better, because the powder has not to be carried so far." To the question put by the coroner, "Is it possible for an explosion to take place by the falling of powder barrels or by droppings from [?] dropping of] the casks?" he replied, "It is very seldom any drops, but I think not." Mr. W. Monk, who had been upwards of forty years in the employment of Messrs. Hall at Faversham, said that "the powder casks were handed from one man to the other with the greatest care. No one stood on the ground while the powder was being unloaded, as one man stood in the cart and another on the barge,"—my inference being that a barrel dropped from the cart into the barge. The coroner in his summing up, stated that "it was perfectly clear that it [the explosion] must have been caused in the barge by some loose powder on which a spark must have fallen." The verdict, however, was nearer the statement of the facts, when it was declared that "how this explosion was caused this jury have no evidence to show."

It will be seen that my views of the cause of such explosions is "concussion." If some persons will continue to maintain that blows will not explode gunpowder, they must be referred to the valuable pages of Col. Anderson's work above quoted, a practical authority. "The explosion," he relates, "constantly, of either the mixing barrels or mills, excited my curiosity, and I attempted to examine the cause. This had been identified by several agents with friction, with bits of wood, of stone, or copper; with wilful neglect or intention on the part of the workmen; and to any cause but the correct one, of concussion. Though disallowed by all, I found it was facile in the extreme, with a very slight blow, to ignite gunpowder placed between different substances. To a committee sent up to Ishapore by Government, I proved that, with gunpowder placed as follows, the results, with a hammer of about four pounds in weight, were:—

Iron upon iron.....	45 explosions,	5 misses.
Brass upon iron.....	47 "	3 "
Iron upon brass.....	41 "	9 "
Brass upon brass.....	30 "	29 "

"I had previously tabulated all the mill explosions I could find recorded, and had traced them to this cause of concussion on heated dry composition. This cause also accounts for the firing of the mixing barrels in the direct impingement of one brass ball on another" (pp. 241-3). "It is this concussion," he also adds, "that the men fear so much by any sudden contact between the raised edges of the cylinders and the high edge of the bed of the mill." Anderson's work also contains an extract from the *Mechanics' Magazine*, explaining the cause of "the explosion of a cylinder mill at Hounslow, from a cricket-ball having been struck from a distance and falling into the trough of the runners or cylinders as they were moving." He, however, does not give the date on which this occurred. In the list at the end of this notice will be seen the death of an officer and his men, by the explosion of a shell which, having himself filled it with powder, he was engaged boring to fix the fuse in a better position. In making fireworks, a wooden rammer and mallet is used to beat down the powder in the cases; and in boring the cases it is recommended always to use a copper bit or tool, and never anything made of iron or steel. Shells are made of iron. Was the officer using a steel bit?

Amongst other works which attracted my attention, that by Col. E. M. Boxer, a high authority, entitled "Treatise on Artillery, &c.," Svo. London, 1855, states that "gunpowder may be ignited by percussion; and it appears

from experiments made in France in 1825, that it can be accomplished by the percussion of copper against copper, copper against iron, lead against lead, and even lead against wood, when the shock is very great, such as would be given by a ball fired from a musket. It was also found to be more difficult to ignite gunpowder between copper and bronze, or bronze and wood, than between the other substances. Again, out of ten samples which were wrapt in paper, and struck upon an anvil with a heavy hammer, seven of grained powder exploded and nine of mealed powder. These are most important points, the knowledge of which cannot but be of great service in the art of gunnery, for various effects which otherwise would be unintelligible can by their means be accounted for" (page 16).

I am led to believe that this Indian Government committee's inspection of Anderson's trials, and the French experiments (are there no English experiments to have quoted?), can be but very little known even in the army, as nothing of the sort is referred to, either in the papers of the corps of Royal Engineers, or in the *Aide Mémoire* of the same body; both of which works I opened in the first instance.

Amongst the popular works, the writer of the article "Gunpowder," in the *Encyclopædia Britannica*, appears to be the only one whose attention has been called to this point. He states that "it is a great mistake to suppose that the absolute hardness of any metal is indispensable to the production of explosion in gunpowder. A blow sufficiently powerful, or friction caused by sufficient weight and rapidity, will compensate for the absence of this, in any soft metals, as well as in many other substances which do not readily give fire. The softness even of the purest limestones is no defence, as the friction between these is still more capable of setting fire to gunpowder than that of iron." He then recommends that the workmen should labour barefooted, as the "heavy leather slippers in common use are far from safe; as, from not fitting well, they are frequently dragged along, in which way they may easily entangle particles of sand. It ought to be known to all powder-makers, that the breaking of a fragment of quartz, or the sufficient friction of two grains between copper, or even wood, is capable of igniting gunpowder. This is more particularly the case when the finer charcoals are used; as it is this which is the susceptible ingredient."

Col. Anderson relates that in India, "before powder is carried to any distance, the barrels are done up in wax cloth and in *gunny* (a coarse canvas), also well lashed with rope. In our longest campaigns the gunpowder was never found to be injured." This was probably done not only to keep out damp, but in case of a barrel falling, the ropes would break the force of the blow to a very great extent.

Supposing that we may now have arrived at correct ideas of the causes of explosions under circumstances which have been hitherto considered unaccountable, I will give a few notes upon the results of explosions to other portions of the premises. From the few detailed accounts of the explosions of mills which I have been able to collect,—few, indeed; for descriptions of them did not get into the papers in any detail,—I find that the buildings in England explode one after another at about only one, two, or three seconds of time. Those that exploded at Hounslow in 1850 were about 70 yards to 150 yards apart; but the quantity of powder in each of the six buildings was not mentioned. The interval of time between the explosions is of some importance as leading to the discovery of the causes of them, and the absence of evidence prevents a detailed inquiry into the subject.

On this point as well, I would refer to Colonel Anderson's work, for the subject did not escape his observation. He says the buildings "should be beyond the range of the quantities contained in each house. The range of powder forced by resistance into one direction is as the quantity; but, when left unconfined, will perhaps be as the square root of the quantity. The distance between the Ishapore Mills, say 60 yards, is proved by experience to be well calculated for about 80 lb. or 100 lb. of powder, and may be assumed as the unit. Hence, for the press-houses, and corning-houses, containing upwards of 400 lb. of powder, the interval should be double, at least. From the flight of burning beams or splinters lies the great secondary danger from explosion" (page 147). It may be as well to add that powder may be heated in a copper pan to about 400° Fahr.: at 500° the sulphur begins

to evolve; and at 600° exactly the powder explodes.

With all this valuable and little known evidence of gunpowder exploding by "concussion," and with other concurrent circumstances which it is needless here to add, I would fain hope that the subject may not yet be considered exhausted, but that further inquiries and experiments would be made. I know not whether the commissioners lately appointed by the Government to consider as to storing and removal of powder, have yet sent in their report: if it has been submitted, it has not met with much attention from the press. That the Americans are not better informed than ourselves is evidenced, as it appears to me, by the fact of the thorough failure of their attempt to injure Fort Fisher, at Wilmington, by firing a vessel filled with, it was stated, 215 tons of powder. It is not "concussion of the air," I would maintain, that causes the explosions; but "concussion of the earth" disturbing the powder or barrels of powder. It must be remembered that these barrels are not completely filled, but have a space of one inch, or more,—quite enough for an effect to result from concussion, which is friction of one sort. Thus, powder in a 100 lb. barrel, lifted 1 inch, would fall with a slightly-increased weight; and the explosion of one barrel in a storehouse would do all the mischief by breaking up the others. Grains of unburnt powder were found at a distance from the scene of the disaster at Erith, as noticed in your pages at the time: this may be explained by some of the barrels, especially the upper ones, not exploding, but being blown into the air and hursting, and the grains distributed by the wind, as occurs with an overcharge of powder from a cannon. At Wilmington the naval authorities anchored the vessel about 500 yards from the fort, and left it floating, though that part of the story is not very clearly stated. If so, not only was the vessel too far distant for its quantity of powder, but the effective power of the explosion would be lost in the water. The Federals, however, after they obtained possession of the fort, managed to blow up the magazine, along with, as stated, about 200 of their comrades!

We have this year been informed that a German has discovered a new gunpowder three times the explosive force of that now in use, and one-half cheaper; and moreover, that the substance can be kept separate until required. Still later, we learn that the works of the Safety Powder Company, at Plymouth, were burnt down nearly entirely, loose powder and all! but that from the nature of the patent its explosion was harmless to the neighbourhood. The papers have lately stated that Government has been considering this latter (or a somewhat similar) apparently harmless invention.

These notes and observations have been condensed as much as possible. As may be obvious, I have refrained from extended comments on some of the passages, in order that your pages should not be too far trespassed upon: possibly the force of these remarks will have induced your readers to agree in the view with which I started in my researches, and which, I submit, have been so well supported by the extracts now laid more prominently before the public for the first time. The view taken by me is, that "concussion" causes the explosion of a barrel; and that "concussion" propagated through the ground will be found to be the true reason of the explosions of adjoining storehouses and factories placed too close to one another; that if the buildings were erected at sufficient distances apart, as herein detailed, such results would not ensue, even if the buildings fell in from any concussion of the air. Something might be said, too, on the question whether gunpowder stores should be built in valleys, level plains, or on hills; but I refrain from that inquiry, seeing that round London at least, there are no hills of which to boast.

As to the construction of the buildings, I beg to append a short extract on that subject in respect of earthquakes, which appears to me to be a kindred effect to that of explosion. The method described is somewhat similar to that recommended for the Maritimes as necessary against hurricanes, where everything should be tied together; the buildings, if of wood, should be secured to the ground; substantial partitions placed at intervals, or inside hutresses erected; joists for verandahs are not to be let into the walls, as tending to upset it; if the building be arched like a gunpowder magazine, it has been injuried; parapet walls assist to protect the roof, which if flat

is better. This abridged description will be found in the "Papers of the Corps of Royal Engineers, new Series, Svo. London, 1851," vol. i., pp. 120-1; which also gives, page 12, the following memorandum. It would be difficult, I confess, to combine the two principles; but they are each adaptable according to the concussion that might be expected,—that of the air, or of the ground.

"Memorandum transmitted by Colonel R. Jones, Commanding Royal Engineer, Malta, Nov., 1849, on Precautions adopted in new Buildings in Sicily, with a view to neutralize the Effects of Shocks of Earthquakes, collected from the best information he could obtain from some intelligent and experienced Sicilians then at Malta.—The difficulty of successfully combating even minor effects of earthquake, by one fixed principle of construction, is apparent when the various motions given to the ground so acted upon are taken into consideration, earthquakes being known to act by, 1, horizontal or undulating motion; 2, perpendicular, saltatory, or vibratory motion; and 3, vorticeous, or whirling motion. The secret plan for detached buildings is that they should be of wood, and the several pieces of timber composing the roof and sides so united and firmly connected together as to form one mass, which mass should have no foundation inserted in the ground, but be placed either on a prepared surface of the natural rock, or on a paved space of greater extent than the area of the building, having a gentle inclination from the centre outwards. The height of such a building should never exceed its length or breadth, but should rather be under these dimensions. By these precautions the centre of gravity would always remain within the area of the base. The vibrations of an ordinary shock of earthquake might cause a tremulous motion, but could not destroy or overturn a building so constructed.

Buildings on mountains, hills, or elevated grounds have been found less subject to the influence of ordinary shocks than those situated in valleys or low grounds. . . . Though no precaution has been found hitherto completely successful against the various and uncertain actions of elementary convulsions, yet certain principles have been found by experience greatly to qualify the destructive effects of an ordinary shock. These are:—1. To give little elevation to the building. 2. To build substantial walls, with a latter; and, when practicable, to strengthen the angles by pilasters of pyramidal shape. 3. Cellars, tombs, and excavations round a building have been found advantageous. 4. When the best cement has been plentifully used, and blocks of stone carefully laid in a rough state and bonded, and all interstices filled in so as to leave no void in any part, walls have been found to stand like monoliths; while the best constructed walls of squared masonry in the immediate neighbourhood have been found to separate and fall. 5. Stone arches or groined roofs are not to be used in upper floors. 6. The ends of beams are not to be inscribed into the walls, but are left free to oscillate with the motion of the earth; they rest on a projecting ledge of the interior wall, and are supported by strong transverse beams similarly laid, the ends of which rest in the strong angular piers. In some instances, the heads of beams have been passed completely through the walls, and the latter braced together externally by iron braces; but the openings have been found to weaken the masonry, and the practice has not become general."

My observations now close with a list of several explosions of various sorts, which have met my attention in the course of these researches. They are appended for the benefit of future inquiries into this subject, and the list could, no doubt, be much extended, for it is reported that "during the last twelve years, upwards of fifteen serious explosions have been recorded in the public journals, by which more than 600 persons have been killed."

- 1849. January 4. Tower-street, London.—Caused by twenty-seven barrels exploding in a shop, at eight o'clock at night; described in a pamphlet of eight pages.
- 1850. January 16. Faversham.—The third within seven years; five men, a boy, and two horses killed. September 24. Dartford.—Two men killed.
- 1851. November 27. Waltham Abbey.—Seven men killed; two distinct explosions, at an interval of little more than a second.
- 1852. July 4. Hounslow.—Two men hurt. July 14. Hounslow, N.B.—Two men killed and one hurt.
- 1853. August 21. Hounslow.—Two explosions. Three men hurt.
- 1854. September. Battle.—Three men blown to atoms.

- 1843. April 13. Waltham Abbey.—Seven men killed, four buildings destroyed within a few seconds and a minute or so of each other.
- 1850. About March. Hounslow. Hounslow.
- 1850. October 1. Erith Marshes. Two barges and two storehouses exploded. Two persons killed.
- December 6. Bhoatan.—Officer and men destroyed by boring a shell filled with powder.
- December 9. Buenos Ayres.—160 soldiers killed; store exploded.
- December 16. Liverpool.—Powder vessel blew up. December 24. Wilmington.—Powder vessel exploded. No damage.
- 1855. May 24. Mobile.—About 300 persons, &c., destroyed; ordnance-stores being removed. March 29. Faversham.—Green charge ignited; two persons injured.
- April 11. Suffolk-street, Southwark.—Shop caught fire, and four or five barrels, or 100 or 125 lb. of powder, exploded.
- September 21. Manchester.—Firework Manufactory.
- September 25. Ewell.—Two men killed; press-house destroyed.
- September 26. Bristol.—Firework Manufactory. October 9. Chatham.—110-pounder shell burst, the fuse being driven too far down.

WYATT PAWORTH.

SANITARY REPORT ON ST. MARY'S, ISLINGTON.

The report, for 1864, of Dr. Ballard, the medical officer of health for this parish, has been printed. It contains some interesting statistics.

It is remarkable that more than half the adult population of Islington are from the country, or were not born in London. Probably the comparative elevation of the locality above sea level, and its general repute for wholesomeness, have something to do with its selection by provincials. The principal influx of male provincials takes place between the ages of 20 and 25 years. The influx between these ages appears to be nearly four times as large as that into London generally. The influx of female provincials is altogether very much larger than of males, and takes place chiefly between the ages of 15 and 20 years. There are more males than females entering from outside between 20 and 25 years.

The extent to which certain trades and occupations are carried on in a district affects its healthiness and its death-rate. "To trace out the influences of occupation upon our death-rate completely," says Dr. Ballard, "would be an almost endless task; I have, however, taken out from among the occupations followed by males, sixteen, for comparison of their death-rate with that of the rest of our adult male population. Out of these sixteen there are eleven which with us predominate over London in the number of those which follow them. We have among us thus an excess of law clerks, commercial clerks, schoolmasters, printers, goldsmiths, jewellers, watchmakers, butchers, carpenters and joiners, bricklayers, plasterers, and brickmakers. In the remaining five we stand more or less below London generally as to number, namely, publicans, hakers, tailors, shoemakers, and labourers. In the case of the females we have a slight excess of schoolmistresses, dressmakers and milliners, washerwomen, and domestic servants. The class of needlewomen (a poverty-stricken and most heterogeneous class of persons) is with us a comparatively small one. These five classes include 593 out of the 1,000 of bread-earning women. The domestic servants alone form 391 per 1,000 of them. This more than half of our occupied women appear devoted to ministering to the necessities of the wealthier part of our people."

The following class statistics are condensed from the report:—

- 1. Publicans, Beerhouse-keepers, &c., stand highest with us in their rate of mortality. For the seven years it was 1,676 per 10,000, or 235 per 10,000 per annum. It is one of the most fatal occupations with us, as it is throughout the kingdom. I find that at 23 years of age their expectation of life with us is 26 years. The expectation of life at 20 years of males generally, according to the English life table, is 30 years. In this respect they stand fourth in our list for short lives.
- 2. Labourers stand second on our list for high death-rate, viz., 1,256 per 10,000 for seven years, or 185 per annum. In early death they stand sixth, their expectation of life at 20 years old being 28 years. For England generally, the death-rate in 1851 was 2169. Working mostly in the open air, they would doubtless live longer if they were more wholesomely lodged and spent less of their time at the public-house. The unwholesomeness of their habitations is shown by the enormous proportion of their deaths from the miasmatic diseases. Heart diseases, apoplexy and paralysis, chronic bronchitic affections, inflammatory chest diseases and phthisis, with kidney disease, as leading causes of death, testify to the unfavourable conditions under which they live and labour. Bricklayers and builders labourers seem especially prone to die from phthisis; 20 out of 41 deaths of such persons on my returns, or 454 per cent., were from this disease. Probably the dusty atmosphere they breathe is the main

cause of this large proportion. Their expectation of life is 27 years. I find on my list four deaths of *sewer labourers*. All died comparatively young—two aged 32 years, one aged 43, and one aged 49, the mean age of death being 40 years. Two died of bronchitis, one of phthisis, and one of disease of the heart.

3. *Brickmakers* stand third. Their death-rate is 1,237 per 10,000 for seven years, or 175 per annum. Their expectation of life is 33 years; but as they appear to come close upon the average for England generally. This discrepancy may be accounted for. The brickmakers usually commence their occupation as "brickfield labourers." Most of the latter rise in time to work under the sheds, but usually not much before the age of 30 years. Good brickmakers, I am informed, are difficult to obtain. I distinguish between brickmakers and brickfield labourers. The latter commence as boys, and at 20 years of age have, with us, an expectation of life of 30 years. Brickmakers obtain good wages, but are very improvident; more than half the deaths on my table took place in the workhouse. They suffer from their customary habitations, much as labourers do; and acute chest diseases carried off a large proportion. On the other hand, their working in places open to the air and with materials moist, and so not giving off dust, gives them a remarkable immunity from phthisis. Were these people habitually temperate and provident, their trade would prove, I am convinced, one of the most salubrious of those followed in their rank of life.

4. *Law Clerks*, including *law-writers*, rank next. Their seven years' death-rate was 1,147 per 10,000, or 163 per annum. Their expectation of life with us at 29 is 25 years. They have a high mortality from the miasmatic diseases and phthisis. As a class, I am informed, to which, of course, there are honorable exceptions, they are not remarkable for leading steady lives.

5. *Shoemakers* exhibit with us a death-rate of 931 per 10,000 in seven years, or of 133 per annum. In England generally, in 1851, it was 186 per 10,000. Their expectation of life at 29 is 34 years. They exhibit a high mortality from apoplexy, paralysis, and other diseases of the nervous system, probably in a measure due to their sedentary mode of life and the posture in which they work, and perhaps also to irregular habits.

6. *Bakers*.—Their expectation of life at 29, calculated on one seven years' experience, is 24 years. The unnatural and unhealthy life is, as is well known, familiar to you. The fatal diseases to which such a life, the extremes of temperature to which they are exposed, and the heavy weights they sometimes have to lift and carry, all predispose them, are bronchitis and miasmatic diseases (including emphysema of the lungs), heart disease, apoplexy, paralysis, &c. The deaths from bronchitis constitute 25 per cent. of the total, and phthisis 21 per cent.; that is to say, half the deaths of bakers arise from these two diseases directly, and another fourth from heart disease, paralysis, &c. The remedy for all this is obvious.

7. *Carpenters* follow next in the list, with us a seven years' death-rate of 832 per 10,000, or 121 per annum. For England generally it is stated at 184. Their expectation of life is 31 years at 29 years of age. They seem to suffer considerably from miasmatic diseases, probably the result, in the case of journeymen, of unwholesome domiciles. They suffer equally with bakers from phthisis, but less than they from bronchitis and heart disease, although their mortality is still considerable. They show a considerable mortality from apoplexy, paralysis, and other diseases of the nervous system, which, as their mortality from heart disease is not large, is probably associated with other causes. Their penitents are in excess in this parish, being employed about new buildings, where they are exposed to draughts of cold air, and have sometimes to raise heavy weights. It is important to note that the joiners who work in close dusty workshops, differ in many respects from the carpenters, for their expectation of life is much shorter; it does not exceed 24 years at 20. They suffer less from fatal bronchitis (187 per cent.), but their mortality from consumption is very high, 44 out of every 100 deaths being from this cause. They have a lower mortality from heart disease (83), and a higher one from kidney diseases (83). They would live longer if their workshops were well ventilated and kept free from accumulated wood-dust, some means being taken also to lay the dust during working hours.

8. *Tailors*.—The seven years' death-rate of our tailors is 837 per 10,000, or 119 per annum. In England, in 1851, it was 139 per 10,000. The great difference probably arises from our tailors not working in large crowded establishments like some of those in the City and at the west end of London. Their expectation of life is 33 years, a little lower only than that of our shoemakers. They exhibit a high mortality from bronchitic affections and phthisis.

9. *Watch and Clockmakers* exhibit a seven years' death-rate of 831 per 10,000, or equal to 119 per annum. Their expectation of life is 23 years. Their largest mortality is from paralysis, next from apoplexy and other diseases of the nervous system.

10. *Hatters* show a seven years' death-rate of 820 per 10,000, or 118 per annum. Their expectation of life at 20, so far as our limited experience goes, is 20 years. Their principal mortality was from phthisis (25 per cent.) and paralysis, with disease of the brain and epilepsy, altogether 279 per cent. The latter is due apparently to some other causes than those which operate in producing heart disease. Some lights seem thrown upon the cause in finding 74 per cent. of deaths from gout and dropsy. I do not know enough of the special habits of this class of persons to speculate further upon the subject.

11. *Butchers* have, with us, a seven years' death-rate of 793 per 10,000, or 117 per annum. This is low; for the death-rate of butchers in all England for 1851 was 213. The more favourable position in which our butchers stand is probably due to the more wholesome circumstances in which they live and work. Their expectation of life at 20 years is however short, being only 25 years. The largest proportion die between 40 and 60. As causes of high mortality among butchers, the Registrar has suggested a diet into which too much animal food and too little fruit and vegetables enter, drinking to excess, exposure to heat and cold, and, as probably the most powerful cause, the elements of disease matter by which butchers are surrounded in the slaughterhouse and its vicinity. I think other causes might be suggested, as the damp and wet to which they are constantly exposed out of doors and in the slaughterhouses, the fatigues they have to encounter, and the heavy weights they have often to raise and carry.

12. *Printers*.—We have twice our proper share of these living in Islington. Their seven years' death-rate is 769 per 10,000, or 110 per annum. Their expectation of life is very low—only 24 years. Our printers seem to have suf-

fered disproportionately from fatal fevers and from that class of diseases to which erysipelas belongs, as it, indeed, their work-places exposed them, in some way that I cannot understand, to putrid miasmata; but it may be that their degraded health renders them more liable to succumb to miasmata, to which they are exposed elsewhere. They have a high mortality from acute inflammations of the chest, probably from sudden alternations of temperature; and they show exactly the largest proportion of deaths from heart disease, very likely the result, through rheumatic fever, of the same cause. Printers, according to Dr. Edward Smith, are considerably liable to take out of their work, in high, also, as the fatal diseases of the liver and kidneys, and nearly a third of the deaths are from phthisis.

13. *Commercial Clerks*.—Our table tells a sad tale respecting them. The death-rate cannot be relied upon; but it is very evident that if young men entering upon the life of a commercial clerk, as they do on leaving school, continue in it and rise no higher, they have at the age of 29 a reasonable expectation of only living 18 years. Looking at the causes of death of these persons, we must be struck with the fact of 40%, or nearly half the deaths, being produced by consumption. The deaths from syphilis, delirium tremens, and kidney diseases, point to dissipated habits of life. But to what is this high fatality from consumption due? I believe mainly to two causes, which it is for employers to remove, if the high prices at which business is carried on now-a-days will permit of it. In the case of clerks employed all day, tied down at the desk, to their sedentary life, in close, gas-lighted, unventilated counting-houses and offices, in the case of other young clerks it is intense bodily fatigue.

14. *Goldsmiths, Silversmiths, and Jewellers*.—Although their deaths from phthisis, apoplexy, and paralysis are high, and they seem to suffer disproportionately from kidney and liver diseases.

15. *Bricklayers* come vastly better off than the labourers who assist them; they are less exposed than the latter to some of the diseases, and especially to the cause of phthisis. They show a seven years' death-rate of 675 per 10,000, or 96 per annum. Their expectation of life is 34 years. They seem chiefly to die from acute and chronic diseases of the chest (excluding phthisis), rheumatism or exposure, and from miasmatic diseases, probably derived from their residences. They exhibit a high proportion of fatal liver disease. The high proportion of heart disease is probably the result, through rheumatism or bronchitis, of exposure to cold and wet.

16. *Schoolmasters*.—Only a small proportion of these die; the expectation of life, from our limited experience, being 34 years.

The rate of mortality of females following industrial occupations cannot be estimated, nor yet, fairly, the average age at death, in consequence of the imperfection of the mortuary returns, which in the instance of married women do not in all cases specify the occupation followed.

*Dressmakers and Milliners* appear to die to a large extent from consumption, as we see from the deaths being attributable to this cause. There is no difficulty in associating this with the damage inflicted upon the health from excessive and late hours of work in close, crowded, and confined rooms, together with deficient bodily exercise. The large proportion of young persons following these occupations, who at a later period of life are lost sight of in consequence of marriage, will also, as a result of disease in the earlier stages, through rheumatism or bronchitis, of exposure to cold and wet.

*Well-to-do* suffer more from poverty, immoderate use of wine and spirits, and other causes, than the "darned," both in the census tables and the mortuary schedules, is in numerous instances probably only ostensible.

*Domestic Servants* die to the extent of one-fourth from phthisis, especially in the earlier ages; and a high death-rate from phthisis. They seem unusually exposed to suffer from fever and other miasmatic diseases. *Well-to-do* suffer more from poverty, immoderate use of wine and spirits, and other causes, than the "darned," both in the census tables and the mortuary schedules, is in numerous instances probably only ostensible. *Domestic Servants* die to the extent of one-fourth from phthisis, especially in the earlier ages; and a high death-rate from phthisis. They seem unusually exposed to suffer from fever and other miasmatic diseases. *Domestic servants* suffer largely from "enteric fever," from their disproportionate exposure to drain emanations at the lowest level of the earth, where they live in the kitchen, in the kitchen, even of good houses, are properly trapped, and the servants are the first to suffer from the neglect. An inefficient siphon-trap is usually all that is provided. Where houses are built upon rubbish, filling in the site of former erections, another source of malaria and specific poison is provided for the denizens of the kitchen. We all know what this rubbish consists of. *Landmistresses* seem to suffer to about the same extent from fever, probably partly due to their residences and partly to the clothing of fever patients which they come into contact with. Their most remarkable mortality, however, is from chronic bronchitis and heart disease, the direct result of their business. The deaths of our *Schoolmistresses* are too few to comment upon.

It is satisfactory to learn from this report that during the past year the inspectors have found less overcrowding than heretofore. The medical officer had occasion to interfere in one instance where a number of girls were crowded into two small rooms to work at lower-making, on account of typhus fever spreading among them. On the occasion of the annual licensing, all the slaughterhouses and cowsheds in the parish were personally inspected by himself, and those that he objected to by the sanitary committee also. The number of slaughter-houses licensed was 108, and the number of cowsheds 71. Licences were refused to seven slaughter-houses. Several cow-keepers, whose sheds and yards had during the year been frequently subject to complaints of uncleanness, although their licences were granted, were warned that if similar complaints arose a

\* There ought always to be a "siphon-trap" at the junction between the pipe descending from the sink and the drain.

second time, the licence would be withdrawn. In one instance a licence was withdrawn in consequence of refusal to make the necessary amendments. The magistrates thus strengthen the hands of the sanitary authorities of the parish.

#### SHEFFIELD AND THE HOME OFFICE INSPECTOR.

We have pretty good authority for saying, that but for the ordinary rules of the service, Dr. Hunter would, in accepting our invitation to reply, have given a somewhat different opinion to that ascribed to him. As we understand, his inquiry there was limited to certain defined evils, of which few instances were presented to him; but we happen to know, on the other hand, that in other respects, he saw in Sheffield greater nuisances and want of cleanliness than he had ever seen elsewhere, all circumstances being considered.

We do most earnestly exhort the inhabitants of Sheffield, now that the municipal elections are taking place, not to be led to support men simply because they profess a desire to save the ratepayers' money, as shown by opposing every scheme for the improvement of the town. That would seem to be a saving thus effected, usually proves to be an extravagance. "There is that giveth and yet increaseth; and there is that withholdeth more than he meet, but it tendeth to poverty."

We offer our hearty thanks to the conductors of the local press, the *Independent* and the *Telegraph*, for the frankness with which they have at once made known to their fellow townsmen the observations we have been compelled to make, and for their own able and energetic efforts in the same direction.

#### ST. MICHAEL'S, IN ST. ALBAN'S.

You were good enough, for the sake of a good cause, to insert in the *Builder* of the 3rd of June last, a letter bearing my name, headed "A Plea for St. Michael's Church, in St. Alban's," now in course of restoration or revolution (Charles II. or King James II.) under the eye of Mr. Scott.

Your readers will doubtless like to hear how the work is going on; and, as I sit in the churchyard of the church after a painstaking survey, and a talk with the intelligent contractor touching what can be done, and done well, with the money we have got, and an after-chat with our well-versed architectural vicar on the same subject, I can safely state that, with a better balance at our banker's, we might effect more than we are likely to effect,—spiritually and in the spirit of the Church itself.

If all goes well, we (in St. Alban's) shall be able to boast, not only of our having one of the most early and interesting little churches in England,—betraying, in mingled confusion, Roman, Saxon, Norman, and Perpendicular periods of style,—patched and reconstructed, filled in and then half opened with every caprice of churchwarden necessity or taste, but one of the best fitted little churches in England for the purposes of the Protestant religion.

Our fireplace-and-poker-and-long pews, lined with purple cloth or green baize, and edged with brass nails, are all out of the church for ever. We were to have open deal seats of a pattern that Pugin would have liked, for they are copied from a solitary and tasteful example of a real Tudor bench or form, with a good back to it, left by accident or want of funds in the church; but happily, with true spirit, Mr. Tomlin, of Chilwickbury, in the parish of St. Michael, has stepped to the rescue, and by his wand or pen over cheques upon bankers, has transformed (I mean no pun) stems from *fir* into trunks from *oak*. Lord Verulam, it is possible, will fill, if needed, a few ancestral oaks from Gerlbambury, and thus add an extra association to the church.

The burial-register of St. Michael's in which Lord Bacon's burial was entered by the vicar of 1623, does not (unhappily) exist; but, in the earliest volume of "births, marriages, and deaths" preserved in the vestry there, we read that the well-known family of "the Gapes" were settled in the finely-situated house the family still continues in strict descent to inhabit, on the banks of the Ver. We trust we are not betraying any secret, but only lending proper publicity to an act of good taste, when we an-

notice (for the first time of telling in print) that the Misses Gape have consented,—voluntarily rather,—to fill, at their own "proper cost," three windows in the church with glass, in what I shall attempt to describe, in brief, as the best Clayton & Bell style.

Then the partial opening of the tower at the west end into the church is to be so contrived that more seats—

"More room for sitting, mis-called sitting-room,"

can be had (for St. Michael's is a fertile parish), and an open screen of wood will be set up to serve all the purposes of use and decoration that it may be required to serve.

Then our organ, or another and better organ, is to be placed where, like to the harp of Æolus, it can be heard, not seen. So that this displacement, or concealment, will perhaps bring over to the Church of England from the Kirk of Scotland the few Caledonians who live on literature, law, or oatmeal in St. Alban's.

The roof of the nave—of timber—and described by the architect as "remarkably good," is now to be seen, and fully deserves all that he foresaw—with what the great Lord Chatham called "the prophetic eye of Taste"—that it would.

The removal of the old Jacobean-Bacon door in the south chancel caused me a pang the other day; but I feel its removal the less, because it is so happily replaced, not stone by stone, but with a friilled doorway which the ladies of St. Alban's will be sure to admire. I may say with the poet Gray, when lamenting the loss of his young friend Richard West (Gray's "Lycaidas"),

"I weep the more—because I weep in vain."

Bacon's doorway at St. Michael's has gone, like Inigo's gate on the Thames at Hungerford.

"With line and rule

Works many a fool—  
Good morning to you, Master Bricklayer,"

exclaimed a frail fair one to Ben Jonson when working on the walls of Lincoln's Inn; and while quoting the lines, I at the same time most unfeignedly admit that I do not apply them to Mr. Scott, for whose skill in his art I have the highest admiration—wishing, however, that his reverence for antiquity and "associations" was more reverential than it is, and his hand more sparing than it seems at times most needlessly to be.

P. C.

#### THE CORN EXCHANGE AND PUBLIC MARKETS AT AYLESBURY.

THE NEW CORN EXCHANGE AND COVERED MARKETS for the sale of meats, poultry, vegetables, &c., which were begun in the spring of last year, from the designs of Mr. David Brandon, have been completed, and the occasion of opening them for public use was inaugurated on the 11th inst. by a dinner, Lord Carrington, the Lord Lieutenant of the county, presiding, supported by the members for the county and borough, and about 300 ladies and gentlemen of the neighbourhood.

The edifice is built in the late Elizabethan style, of red brick with stone facings. The front of the edifice adjoining the County Hall, consists of three archways, one for carriages, 18 ft. wide; the other two for foot passengers, each 7 ft. wide, the centre arch being 20 ft. high. On each side of the centre archway is a head of Pomona and Flora, carved in high relief in a sunk panel, 2 ft. 6 in. in diameter. These archways lead into the new road, forming a junction with the new street known as Exchange-street, leading from the North Western to the Great Western Railway stations. Above the archways which we have described, are two handsome rooms, separated by folding doors, and, when thrown open into one, forming an assembly-room, 44 ft. by 33 ft., with retiring-rooms, and other conveniences. This part of the building is entered by a detached staircase on the left-hand of the archway, surmounted by a high-pitched roof with a weather-vane and ornamental cresting. The staircase also communicates with the gallery in the Corn Exchange. This building is placed in a parallel line with the front of the County Hall. It is approached by three stone steps on the left-hand side of the archway by recessed folding-doors, 6 ft. wide, surmounted by carved stonework in a semicircle enclosing figures of boys supporting cornucopias, and an inscription in the centre. The building is 90 ft. by 45 ft. in the clear, the roof being supported by semicircular iron ribs upon carved

stone corbels, the spandrels filled with tracery. The carving of each corbel is emblematical of architectural produce. The height in the centre is 38 ft. Light is afforded to the whole building by a skylight extending for 70 ft. along the centre of the roof, as well as by the clerestory windows. The space between the buttresses designed to resist the thrust of so large a roof is enclosed to form private offices for business, to the number of twenty. At the opposite end of the Exchange there is a gallery, approached by a back entrance and a suitable staircase; and it is intended to place in this an organ adequate to the dimensions of the building. Ample provision has been made for ventilation and warming. There are two open fireplaces, and flues have been provided for any heating apparatus that may be desirable. The building is lighted with gas sun-lights at the top of the roof, and the effect has already been ascertained to be remarkably brilliant. There is, also, provision for ventilation by means of the skylight. Under a portion of the building is a store to be used for the forms and tables required when the hall is used for public occasions, or for storing samples.

Between the Corn Exchange and the general market are a kitchen, scullery, and butler's pantry, for use on the occasion of public dinners. There is also an office let with the wine-cellars under the market, and a tap for the sale of beer, &c. The general market, in the rear of the building, extends 112 ft. by 61 ft.; and is covered in with slate and glass. The roof, consisting of three spans, is supported by iron columns 14 ft. high, with ornamental brackets, the clear height being 22 ft. Three pairs of ornamental iron gates afford an entrance from the road. Under the general market, spacious vaults have been constructed, all of which are let. Should the requirements of the market extend beyond what is at present contemplated, it would be easy, by lengthening the building, to provide additional accommodation.

The cost of the works has been between 9,000l. and 10,000l.; and they have been carried out by Mr. Conder, of Baltic Wharf, Kingsland; Mr. French being the clerk of the works. The stone carving was executed by Mr. Jackson, of Maidenhill.

#### THE LIVERPOOL SCHOOL OF ART.

THE annual presentation of national medals, or Queen's prizes, local medals, &c., to the pupils of the Government School of Art, Mount-street, Liverpool, was made in the theatre of the Liverpool Institute, on Monday evening before last, by Lord Houghton, D.C.L. On the motion of Mr. Bright, the president of the Institute, Lord Houghton was voted into the chair.

Mr. Flinck, the head-master, having made a statement as to the present condition of the art-portion of the school,—

The Chairman addressed the meeting, and in the course of his very able speech, he said:—I am old enough to remember the commencement of the schools of design in this country, which were appropriated solely for the purpose of assisting the deficiencies that were supposed to exist in some of our manufactures. The schools which were founded for that purpose did not quite maintain that position. They deviated into a general rule. It was so difficult to keep the pupil who had a real taste for design from going somewhat further than the design which was before him. It was so difficult to prevent the master, who saw the nascent talent in that boy or that girl, not only desiring to cultivate that talent, and to raise, as it were, the designer to the position of the artist; and therefore this condition, which was almost a necessary one, is now in some degree accepted. And I think we may say that it is clearly understood that these schools of art, though intended primarily and simply to assist in giving the power and beauty of art to the manufacturers of this country, nevertheless do not exclude, or desire to exclude, the cultivation of the pure artistic talent. I think it is well it is so, because I know of no history, no point in art in the world, in which the arts of design have attained any great eminence perfectly and entirely separated from the general notion of art. It is, no doubt, quite true that the study of art,—the study of design itself,—is extremely interesting; much more interesting than would seem to persons from the outside. His lordship then proceeded to illustrate the truth of this assertion, and showed how, by the development of the artistic spirit, and

the philosophical and literary spirit, in the little kingdom of Greece, which was like an atom on the face of the globe, those great flames of light were spread which now almost embraced the whole world; how, through the want of the true artistic spirit, the people of Switzerland were utterly unconscious of the beauties and glories of their own country; and noticed the fact that many cultivated people of 100 years ago, such, for instance, as the greatly cultured and classical writer Addison, had no pleasure whatever in beautiful scenes of nature. The first object of this Institution is, that you should learn to make yourselves masters of the art of design in each of the businesses and professions to which you each will belong. In this country of ours we never lose sight of the power of making money by what we can do. Money means something more than the mere coin it represents; money means health, wealth, and liberty. These are things for which it is well for men to strive; these are things which it becomes men to consider. Therefore, I say, do not let any of you be led away from the use of a faculty which he can usefully and practically employ, such as the faculty which will make man a good architect or a good designer,—a designer in any form, from the mere ideal object of making himself a good artist. There will be some of you, however,—there may, at least, be some of you,—in whom the desire for art is so strong, so overpowering, so overmastering the considerations of prudence itself, that it were hard to say to that boy or to that girl, *Stick to your design, and give up your higher art.* But these cases will be very rare indeed; and it becomes you to consider whether you are ready to encounter all the consequences of that position.

#### "OLD MEETING," LUTON, BEDS.

EVERYTHING connected with the life and times of John Bunyan must be of interest, not only to Dissenters, but to men in general. The "Old Meeting" of Luton is about to be pulled down; and very shortly the strange "octagon barn" of red brick, which for ages has been the resort of the Nonconformists of the neighbourhood, will have been replaced by a chapel of modern design. The present structure dates back to the times of Bunyan, whose exertions were the means of its erection. It is stated that he actually preached in it; at any rate, one of his first ministers was his companion and fellow-prisoner in Bedford jail.

If any are curious to look upon this peculiar relic of the past, they will find it at the bottom of a pretty avenue of trees, leading out of the principal street of Luton. The new chapel is being built in the rear of the "Old Meeting," from the designs of Mr. F. Warburton Stent, of London.

#### THE CHURCH OF ST. CROSS HOSPITAL, WINCHESTER.

THE Church of St. Cross Hospital was reopened, after somewhat extensive restorations, by the Bishop of Winchester, on the 19th inst. In the view of the interior looking east, which we now present to our readers, the architectural student, and, indeed, every one acquainted with the general aspect of the place a few years since, will detect a considerable change, an effort having been made to bring it to its original form and outline.

The two lowest windows, closed so long, have been re-opened, and richly glazed; and the four narrow lights above them have, by an interesting discovery, been brought back to precisely their original shape and size, and also filled with appropriate glass. The two uppermost windows which had never been tampered with, remain in outline the same as before.

It may prove not altogether uninteresting to place on record what has been done in this interesting old church during the last few years, and the way in which it has been effected; first reminding readers that the church was founded in the year 1136 by Henry de Blois, Bishop of Winchester, and brother of King Stephen, and is one of the finest existing specimens of transition Norman architecture to be found in our country. After extensive repairs by John de Campden, the friend of Wykeham, in the fourteenth century, it was in the fifteenth selected by Cardinal Beaufort as the chapel for his new foundation "the Almshouse of Noble

BRASS LECTERN AND ALTAR-RAIL: CHURCH OF ST. CROSS, WINCHESTER.

Poverty." Although the hospital buildings in general had been placed in a state of substantial repair, on the resignation of the late Master (Earl of Guilford), in 1854-5, the church internally was in a most deplorable condition—the walls, piers, Purbeck columns, and stone groined roofs were all coated with whitewash and plaster; the woodwork was painted, and affected with dry-rot; and the pavement (though rich in monumental slabs, brasses, and encaustic tiles), in the most confused, uneven, and miserable state. Under such circumstances, the present Master (the Rev. L. M. Humbert) expressed a hope, in a lecture given by him on the Hospital of St. Cross, in 1856, a little more than a year after his institution, that he might live to undo the work of some of his predecessors,—quoting from the burial register of one of them—"This church was whitewashed by the said Master, and finished about three weeks before he expired, in the year 1728."

Mr. Humbert's wish has been, to a great extent gratified; but not without difficulties and interruptions. As early as July, 1857, a committee of the newly appointed trustees reported that "the removal of the whitewash, and necessary repairs of the church adapted to the character of the building, should form one of the earliest subjects to which the attention of an architect should be directed." In the following January, Mr. Butterfield was appointed architect to the hospital. After several delays, owing to the want of funds, which were quite inadequate to undertaking work of a really permanent character, it was resolved, in the summer of 1860, at all hazards to commence with the nave and western portion of the church; this was

well cleansed from the repeated coats of whitewash: the floor was relaid on brick piers free from the earth, and ready to receive the encaustic tiles (which have now at last been laid down); new doors were made after the old patterns; and altogether a sum of about 650*l.* was expended. But at this point the work was abruptly checked in consequence of the pressure of remaining Chancery costs then unpaid, and a total want of means. This interruption must have continued to the present day,—except such scraping as was within reach of the Master himself and one or two of his friends, assisted by an aged member of the fraternity, *Brother King*, an old mason, who well deserves honorable mention,—but for the munificent offer of 500*l.* towards continuing the work, made by an entirely unknown benefactor, "*Z. O.*," in August, 1863. This donation was specially given for the choir and east end of the church; but the Master, by persevering exertions, has raised among his friends and neighbours (with the encouragement and support of the bishop of the diocese) a sum sufficient to include the transepts, choir-aisles, and lantern, and so to attempt, with more or less completeness as funds allow, the general restoration of the whole building; a work which, although not complete, and leaving ample scope for further liberality, still renders the building fit for the purposes of worship, and conveys a fair notion of its former appearance prior to the era of whitewash. The contract for the stone-work has been most conscientiously fulfilled by Messrs. Newman & Son, Winchester: the Brothers' stalls and fittings (as far as funds allow) are by Steddy, of London; but a new pulpit is sadly needed. The new tiles (where necessary)

are by Minton. The six principal windows at the east end are by Wailes, and represent the Annunciation, Nativity, Epiphany, Resurrection, Ascension, and Descent of the Holy Ghost. Two windows, by Alex. Gibbs, in the north transept, represent the Healing of the Impotent Man at Bethesda, and the Agony at Gethsemane.

The polychrome enrichments at the east end are, as far as they go at present, the gift of Mr. Melville Portal, from designs by Mr. Butterfield, executed by Mr. Fisher, of London. There are the evident remains of colour throughout the choir and in other parts of the church; and Mr. Portal hopes that other county gentlemen may be induced to continue the work which he has started. The elaborate metal and gilt communion rails are the gift of Major and Mrs. South, who have in many other ways contributed largely to the work. The brass eagle lectern is the gift of Mrs. Waddington, of Twyford Lodge, as a memorial of her late lamented husband, Mr. J. T. Waddington, a trustee of the hospital.

The capitals, where painted, have a background of red colour, the foliage being partially gilt. The upper fillet of the abacus is deep red, the bead underneath white, the hollow under this pale bluish slate, then another line of white. The prevailing colours are Indian red; pale carnation, approaching flesh-colour; bluish grey, somewhat resembling Purbeck marble; pale subdued green; and a very small quantity of black and gold.

The stone zig-zag work of the right-hand lower window is different in design and more acute than the left, which gives the two windows a different appearance. It consists of four reeds in the left-hand window, the two innermost and the outermost being painted; the remaining reed left unpainted; in the right-hand window there are only three reeds, the middle one being unpainted. Each wedge of the painted zig-zag is varied with salmon colour and grey.

The two bosses of the groining of the choir are partly gilt, with red backgrounds; and the bosses of the roof of the nave retain traces of the ancient painting. The cross between the windows is of white marble, inserted in a background of Sienna marble. The scroll work, rosettes, &c., are in some instances painted the above colours on the naked stone; in others, a black composition is filled into incised lines. The altar-railing, lectern, &c., are executed by Messrs. Hart & Son, from Mr. Butterfield's designs. The former is of wrought iron, painted black and picked out with gold; the latter, which reflects great credit on the above firm, is an elaborate piece of work in brass, of which we give a separate illustration.

The church, though small in dimensions,—being internally 124 ft. in length from east to west, 115 ft. broad at the transepts, and 57 ft. high to the vaulting, which is stone-groined throughout,—is quite a little cathedral in its plan and proportions, and, when fully restored, will be one of the most complete works of its kind that we have.

Very extensive remains of wall-painting have been found beneath the limewash. One fine Descent from the Cross, on a large scale, covering the whole end wall of the south transept, is in a very fair state of preservation. But we have said enough. We recommend our readers to go and see for themselves, partake of the dole of bread and beer at the lodge, and then leave the Master some substantial aid, to enable him to carry forward without stint the work in which he is engaged. When he has finished the inside, he will still have work to do on the outside of his noble church.\*

\* The Rev. L. M. Humbert writes to us as follows:—"Will you permit me, through the medium of your widely circulated columns, to make known a most liberal offer in furtherance of the restoration of the grand old church of St. Cross, which I sincerely trust may be duly responded to. It was conveyed to me, after the solemn re-opening of the church last Thursday, in the following terms:—"A native of Hampshire, pleased with what has been already done at St. Cross, offers a donation of 50*l.* towards the decoration of the church, on condition that nine other persons will contribute a like sum for the same purpose during the next month." A friend, not a native of Hampshire, but holding a curacy in the county, had previously offered me 50*l.* the same morning, without special conditions; and now a third friend (already a handsome contributor to the church), writes to me—"And I shall be happy to be one of the nine contributors of 50*l.* each towards his fund." Thus encouraged, I am led to hope that the proposal of the Hampshire native need not to be more widely known to secure within the given time the required number of contributors. It will be observed that there is no limitation to natives or residents within the county; for, as one of my three friends says, "surely the restoration of St. Cross Church, so well carried out thus far, ought to be a national work, and not restricted to the county of Haunts."

CHURCH OF ST CROSS, WINCHESTER INTERIOR, LOOKING EAST.  
RESTORED UNDER THE DIRECTION OF MR. BUTTERFIELD.

I still think and repeat that the impost of a toll on Sunderland bridge is indefensible, and altogether out of character with the improvement of the times and the rapidly-extending manufacturing capacity and commercial importance of the port.

I shall not now lift the veil from the night side of Sunderland, and picture her great "social evil" and her other dark spots of criminal dye. Of drunkenness, also, I could say not a little of the town, where beershops are as plentiful as blackberries. My purpose was not to scandalize, but to draw attention to evils that could be cured and that should not be endured.

I should be happy to stand corrected, but I could not brook to be charged with misstating facts which I personally witnessed and practically examined before writing of. If anything was wanting to convince me of the rectitude of my statements, it is the admission of the chairman in the concluding sentences of his letter. Out of his own mouth—out of the mouth of a resident "now nearly fifty years," of Sunderland—the moral and social condition of the town is complained of and condemned.

To the work which the chairman says the corporation are prepared to undertake in the future, let me add that of the erection of slaughter-houses. At present every butcher's shop is a shamble, where one may see the regular execution of cows, sheep, and pigs going on, even in the front streets. The erection of a few proper slaughter-houses, however, is not a work for the future, but one for the present; and another summer should not find Sunderland without them. C. C. H.

#### THE CONDITION OF NEWCASTLE AND GATESHEAD.

At a recent meeting of the Northumberland and Durham Medical Society, held in Newcastle Infirmary, a resolution was adopted to the effect that a memorial be presented to the local governing bodies in Newcastle and Gateshead on the subject of the serious prevalence of typhus fever in the two towns, with a view to taking the necessary steps for the removal of some of the fruitful causes of this and kindred diseases. On Thursday week there were twenty-nine cases entered on the books of the Fever Hospital in Newcastle. The local *Chronicle*, in a leading article on epidemics, points attention to the fact that epidemics in Newcastle and Gateshead, and in particular the cholera, always break out in "the old places" or in new places equally bad as the old in sanitary respects. Sandgate, "the greater part of it not fit to be inhabited," is "the old place" in Newcastle, and Pipewellgate in Gateshead. It was from such vile centres that the epidemic spread, until it involved less and less unhealthy localities in its deadly circle. And as it declined, in 1831, it gradually shrunk back into "the old place," where it finally was extinguished. Facts such as these ought not to be forgotten.

"Not to timorous counsellors," remarks the *Chronicle*, "but to the faithful men who portray what is ams, and who report to us what wretchedness and misery, what fevers and epidemics, what diseases and mortality, have their birth and their home in 'the old places' and the new, should we respectfully and thankfully listen; and the wise admonitions which they bestow we should gratefully and gladly obey. Their prescriptions may be summed up in the one word—*cleanliness*. Our towns are to be *wholly* made, like the outside of the platter when royal personages come, 'sweet and clean.' Overcrowding is to be curbed, and the air purged of its foulness; and the public health guarded against those fœta which always lie in wait for avenues left open for their entrance. Do what we can, disease and death must come, for men are frail and mortal; but we may lessen and minimize their power, and not invite them to their conquests. To death we must submit, but to preventible causes of death no submission is due. We should give them no quarter, but in the land which has been given to us for our inheritance."

A lecture on "The Night Side of Newcastle, or a Saturday Night's Ramble in some of the Back Streets and Lodging-houses," has been delivered by the Rev. J. C. Street, in which some of the dark parts of the town are flashed for a moment into the light. In reference to the state of the lodging-houses, Mr. Street says:—

"I have seen no lodging-house here which ought to be tolerated. It is all very well to regulate and supervise—that is, doing the best with a bad thing; but places like these ought not to exist. I saw the observations of Dr. Hunter, the Government medical inspector, in a letter quoted in the *Newcastle Daily Journal* the other day, where he said, 'I cannot, seeing the natural difficulties of a town of single-room tenements, speak too highly of the management of the common lodgings.' But my inspection was for social and moral, not merely medical purposes. I wanted to ascertain how moral pestilences

were generated, as well as physical pestilences. Dr. Hunter may be right in what he says, and yet not invalid qualifications. He speaks of 'natural difficulties' and 'single-room tenements.' Against these lies the gravamen of my charge. I dare say that the houses which are under suspicion are as well managed as such houses can be. But, in the nature of things, all belonging to such places must be bad; and no one can see the small rooms, with their numerous occupants, without feeling this. Intemperance and selfishness are handed together for the maintenance of these places. It is time that philanthropy interfered and fought them on their own ground. So long as strangers coming and going—so long there should be made cleanly, decent, and well-regulated temporary homes for them; homes where they can and must be washed; where cooking can be properly done; where some slight means of recreation are provided; where there shall be separate sleeping accommodation for separate families; and where order and sobriety shall be enforced."

After the lecture, a number of gentlemen formed themselves into a provisional committee, with Mr. John Mawson as chairman, for the purpose of giving practical effect to the suggestions of the lecturer, and of endeavoring to initiate some scheme to remedy the evils complained of, and generally of attempting to improve the moral and social condition of the migratory population. The first meeting of this committee was held in the Working Men's Club, Nelson-street, Newcastle, when it was resolved that the committee be called "A provisional committee for the purpose of devising means for supplying improved common lodging-house accommodation in Newcastle-on-Tyne and Gateshead." Mr. Thomas Humpfrey was appointed treasurer, and Mr. Robert Fisher hon. secretary. The chairman said he was glad to announce several subscriptions towards the preliminary expenses. It was resolved that 500 copies of the lecture be sent to the clergy and ministers of all denominations, and to the magistrates and others holding official positions in the town, with a circular inviting their perusal of the pamphlet, and asking their co-operation.

#### NUISANCE IN THE HACKNEY-ROAD.

SIR,—A few days since I had occasion to make a survey in a street adjoining the Hackney-road; and, on my way from the property in a narrow street scarcely 20 ft. in width, I was suddenly sickened with the most horrible smell; and, on inquiring of a man who stood at his door as to its cause, I was told that "over the way, under the gateway, there was a large hole, in which they kept fish refuse." There evidently existed a hole covered with a flap at least 10 ft. by 7 ft., and used for some such purpose.

What can the vestry of Bethnal-green be dreaming of to permit such a thing to exist at the present critical time? AN ARCHITECT.

#### SOUTH EASTERN INDUSTRIAL EXHIBITION.

SIR,—Permit me to correct a statement that has been made generally. I refer to the opening of the South Eastern Industrial Exhibition, which will take place on Saturday, the 28th inst.,—not, as stated, on the 24th inst. The inaugural ceremony will be performed in the celebrated Painted Hall, Greenwich Hospital, by permission of the Admiralty; and, as you informed your readers, under the presidency of Viscount Sydney.

I trust the promoters of this movement will be favoured with the same valuable support which you have at all times rendered to projects advancing the social interests and moral culture of the artisan.

Yours, DISBURIED,  
Surveyor to the South-Eastern Industrial Exhibition.

#### THE SHAKSPEARE MONUMENT, STRATFORD-UPON-AVON.

SIR,—Myself and other members of the Tercentenary Committee were much surprised to see in the *Builder*, of the 7th proximo, an engraving of a "Selected Design for a Monument to Shakspeare, in Stratford-upon-Avon;" and in the description of it you say, subscriptions are being made to defray the cost of its erection, and that the design will certainly be carried out.

I have made inquiries of many members of the committee and subscribers to the Monumental Fund, all of whom say they have never seen or heard of a design, and Mr. Gibbs is unknown to them.

I am aware the responsibility for the assertion that the design has been selected rests with the architect; and as the statement is now printed in the newspapers throughout the length and breadth of the land, perhaps Mr. Gibbs will kindly inform the public when and to whom he submitted his design, and who selected it.

S. A.  
\* \* \* We received the assurance of the designer, before inserting the view, that his design was to be carried out forthwith.

#### FALL OF RAILWAY ARCHES IN BATTERSEA FIELDS.

On Sunday night last the inhabitants of Battersea and Wandsworth were aroused by a great noise. Near Battersea Bridge, and close to the London, Chatham, and Dover Railway, the contractors for the extension of the Brighton line have been turning large brick arches, in order to form the supports of the permanent way, and, from some cause, five of these fell, one after another, and produced the noise in question. Fortunately, it being Sunday, none of the men were at work, consequently no one was injured. Without any wish to prejudice parties concerned, we feel bound to say that the spectral character of these arches, and of some others close by, had struck us more than once in passing.

#### RESTORATION OF WINCHESTER HIGH CROSS.

THE PASTORAL STAFF.

NOTWITHSTANDING the remarks of Mr. Buckler, published in the *Builder* (Oct. 14th), I think Mr. Scott was justified in placing the pastoral staff (not crozier, as that was peculiar to archbishops) in the right hand of William of Wykeham.

An altarpiece in the Louvre, representing the "Coronation of the Virgin Mary by her Son the Redeemer," the work of Fra Angelico Pisicolo (born 1387, died 1455), has a bishop with pastoral staff in the right hand.\* I have an impression of a seal of Thomas (Tysbet?), abbot of Tilney Abbey, Essex. The figure has the hands clasped in prayer, and the staff resting on the right shoulder. In "Dugdale's Monasticon," are drawings of the seals of Battle Abbey, St. Werburgh, Chester, John Multon, abbot of Thorney, and John Sauscot, abbot of Hyde, all holding the pastoral staff in the right hand.

In the *Catalogus Benefactorum* of St. Alban's Abbey is a drawing of a Benedictine abbot carrying it in the same manner; and, in the brass of Elizabeth Herwy, abbess at Elston, Beds, c. 1530, her staff rests on the right shoulder.

In the recumbent effigies of Andrew, abbot of Peterborough, 1139, in Peterborough Cathedral, and one of the early abbots of Westminster, in the Cloisters, Westminster Abbey, the pastoral staff is held by the right hand. So in the figure of St. Augustine, at the door of the chapter-house, Rochester Cathedral.†

In the east window of the choir of Winchester Cathedral, St. Swithin, and William of Wykeham himself, vested in *chasuble*, hold their staves in the right hand.

At Welbeck Priory, Notts, is a stone of the eleventh century, with a pastoral staff of very curious form, grasped by a right hand. ‡

J. P.

#### FATAL FALL OF HOUSES AT LIMEHOUSE.

MR. JOHN HENNINGSEN, Middlesex coroner, has held an investigation at the London Hospital, into the cause of the fall of houses in Eastfield-street, Limehouse, by which a boy, who was passing at the time, was killed.

Richard Read, the father of the deceased child, said that there was a terrific crash in the street, and witness ran out, and saw that the whole front of 171, Eastfield-street, had fallen out into the roadway, bringing with it part of the front and roofs of the houses on either side of it. Witness had no idea that anything had happened to his son, and he got a rafter to hold over his head while he entered the house to reconnoitre those who might be in it. He found no one there, however. When he came out his wife met him and told him that deceased had been buried by the bricks in the street. Witness took him to the hospital, but he died before admission. Witness had carefully examined the premises. He could judge of their condition, for he was a bricklayer himself. The catastrophe was occasioned by the bad construction of the premises. There was no pulpit; the month-pieces of the rafters were merely nailed; they were not tied in any way. The result was that the front and back of the house were not bound together, and the span roof being placed on them, without a tie, pressed them outwards, and the fall was the result. The brickwork and the mortar were good. Witness admitted that parties were not uncommonly neglected in such houses, but he said that it was so much the worse for the public; they ought to be used in all houses, and it was improper to omit them.

Mr. James Edmeston, architect, and other witnesses, having been examined, the jury returned a verdict, "That deceased was killed by the fall of the house, and the jury say that the landlord of the said house had received sufficient warning of the dangerous state of the house, and ought to have shored it up."

ARCHITECTS' ACTIONS.

IN THE EXCHEQUER.—GREEN v. THE TUDMORDEN TOWN-HALL COMPANY.

This was an action for architect's commission, and for money paid for builders' quantities in and about the Tudmorden Town-hall. The cause was partly tried at the Manchester Assizes, before Mr. Justice Mellor, where it was noticed on these pages. The Attorney-General James, Q.C., and Mr. T. Jones, instructed by Mr. Eastwood, were for the plaintiff, and Mr. Temple, Q.C., and Mr. Quinn, instructed by Mr. Stansfield, were for the defendants. After the trial had proceeded some time, it was referred to Mr. Alfred Waterhouse, architect. By his award he finds that Mr. Green had good cause of action against the company, and was entitled to a verdict thereon on each and every of the issues joined in the action, and awards to Mr. Green, in addition to and beyond the 170*l.* paid into court since the commencement of the action, the sum of 204*l.* 7*s.* 2*d.* It being part of the terms that the costs of the action should abide the event of the award, the defendants have to pay Mr. Green's costs in the action. Defendants had paid to Mr. Green 150*l.* before the commencement of the action, making altogether 524*l.* 7*s.* 2*d.* for commission and quantities. Mr. Waterhouse also awards that the defendants shall pay their own costs of the reference, and that they shall also pay Mr. Green's costs of the reference; and further, that they shall pay the arbitrator's costs, which last-mentioned costs are 147*l.* 1*s.* 9*d.*

"COMPETITION COURTESIES."

8 Sir.—The *Builder* of June and July contained an advertisement to "Architects, Surveyors, Draughtsmen, and Others," offering a premium "for the best ground-plan and elevation of a good public-house or tavern, proposed to be erected on the Birbeck Freehold Land Society's estate at Upper Holloway;" and the plans were to be sent in on or before Monday, July 31st, 1864. Since then, nothing that I can ascertain has been heard of the matter, and no reply whatever has been vouchsafed to my written applications for information. There is one feature that I ought to have investigated at the time (and did since then, but without success), which is that the advertiser closes with this suspicious announcement: "The plans will not be returned." I have tried to comfort myself with the conclusion that this referred either to the premiated design, or that, although ultimately awarded, it meant that the plans must be applied for, and that the manager would not trouble himself to send them, since then, as no information has been offered, I have feared that the scheme was to get possession of a lot of plans, more or less valuable, for the society's use. Perhaps the insertion of this in the *Builder* may set the matter at rest. A CORRECTIVE ARCHITECT.

\* \* \* An architect foolish enough to respond to such an advertisement has no ground now for expressing surprise that he cannot regain his drawings.

RAILWAY MATTERS.

At the Broad-street terminus of the City and North London and North Western and North London Railways (which occupies the site of Broad-street-buildings, near the thoroughfares leading to the Bank of England) the works within the last week or two have been very much advanced. The main building, which is erected of polychrome brick, stone, and terracotta, is of an Italian character. On each side of the façade are the offices of the two railways, those of the North Western being on the west, and those of the North London on the east. A covered way has been provided in front of the terminus. The arrival and departure platforms, of which there are three, are covered with stone slabs, and are reached by wide staircases leading from the booking-offices. The roof is of ornamental iron, wood, and glass, supported by cast-iron pillars. Leaving the terminus, the line is carried over Broad-street, Bishopsgate, by a girder bridge and rock viaduct, to Worship-street, where the railway narrows to three lines of rails, there being also a sharp curve from the terminus to this spot. From Worship-street, which is crossed by another iron bridge, the railway is almost straight and nearly level to the Old-street-terminus, erected at the south-west corner of the Kingsland-road, facing Shoreditch Church. Leaving the Old-street-road station, the railway is taken over the Kingsland-road diagonally upon a wide span girder bridge, the route being continued along a brick viaduct between the latter thoroughfare and the Hackney-road, girder bridges being thrown across the intersecting streets wherever necessary till it reaches the Regent's Canal on the west of the gas-works. An iron bridge has been constructed over the

canal, and from this point there is a rather steep descent (about 1 in 60) to the Dalston station and junction, whence the line curves right and left to the North London Railway at Kingsland. The line now only awaits the inspection and sanction of the Board of Trade previously to its opening for traffic.

The Hatfield and St. Alban's Branch Railway has been opened. The contractor was Mr. Francis Rummena. It is about five miles long, and runs into the St. Alban's branch of the London and North Western Railway, close to the station. The St. Alban's station of the new railway is in the London-road, below the turnpike: it is a plain brick building. Progress is being made in the construction of the Midland line, which passes over the Hatfield and St. Alban's by a gigantic bridge which is now being built.

Mr. Shaw has invented a pneumatic railway brake, which has been attached, by way of experiment, to a carriage in the works of Messrs. Gardiner & Mackintosh, New Cross. The principle of this brake is said to be simply that the buffer of each carriage, working in a pneumatic tube, by the aid of very simple machinery, brings the full brake-force to bear upon the wheels. The motive power is obtained by the momentum of the train; and it of course follows that the driver of the train, by merely stopping the engine, puts at once the whole of these brakes into action. The power of the brake is thus necessarily regulated by the speed of the train. The driver of the engine is no longer at the mercy of a guard, who may be asleep; he can himself apply his brake-power when he pleases. This new brake, further, when attached to a carriage, is self-acting, and requires no coupling or joining by means of iron rods. It is also much cheaper than the ordinary brake.

The manufacture of railway signals, with their machinery, has now become an extensive business, employing hundreds of skilled workmen. The signals on a railway forty or fifty miles long cost as much as 3,000*l.*, and the complicated ones at a chief station on a great railway will cost 2,000*l.* These signals are of a semaphore kind. Immense levers move railway points and signals at the same time. One of the principal railway-signal manufacturers, who employs 400 hands, was formerly a common carpenter on a railway.

FROM IRELAND.

Sligo.—The foundation stone of a town-hall has been laid on the site in Quay-street, by the mayor, in presence of a large assemblage of people. In the middle of last year a competition for plans for the proposed building was opened, when the premium was awarded to Mr. Hague, of Dublin. The proposed building will be in the modern Italian style, and will, when completed, be surmounted by a dome and lantern, under which will be placed a public clock. The materials to be used are limestone from the County Sligo, with Monachich and local stone dressings, so as to contrast the colours and produce a varied effect. It will extend to 90 ft. in length, by 82 ft. in width, with an altitude of 42 ft. from the pavement. The ground floor will consist of an Exchange and Library, Borough Court and Council Chamber. The latter will be 38 ft. by 33 ft., and will, as well as the other departments, have a retiring-room attached. On the same floor will be situated the town clerk's and other offices. A flight of stone steps will conduct from the lower to the upper floor, which will comprise a large assembly-room for balls, concerts, and meetings, &c. Its dimensions are 74 ft. by 32 ft. The execution of the work—the estimated cost of which is about 5,500*l.*—has been entrusted to Messrs. Crowe, Brothers, of Dublin.

Ballymoney.—The new building in Church-street, in which the business of the Ballymoney branch of the Ulster Banking Company is to be conducted, has been completed. It occupies the site of Reid's Hotel, and standing 3 ft. 6 in. back from the line of the street, with the front built of cut stone from Cookstown quarries. The length of the front is about 50 ft.; height, nearly 40 ft. In the second story are four windows glazed with polished plate-glass, having a bold architrave in wrought stone round each, surmounted by an entablature and tresses, carved; and each of the keystones is embellished with carvings of fruit and flowers. On the left of the principal entrance are two windows, and on the right one, all having circular tops, and orna-

mented and glazed in a similar manner to the windows above. At each side of the entrance is a column with a wrought capital in fruit and flowers, and the frieze course is carved in the same style. The doorway is spanned by an arch with suitable panelling. An ornamented cornice runs along the top of the building, and completes the exterior decorations. The cash office, which is to the left of the entrance, is 24 ft. by 23 ft.; height, 15 ft. The ceiling is divided into panels, and the cornice is supported by ornamented blocks. The floors of the entrance porch and office are laid with Minton's tessellated tiles. The architect was Mr. Thomas Jackson, of Belfast; and the contractor, Mr. S. Kirkpatrick, of Coleraine. The contractor for fitting up the office was Mr. Robert Kelly, of Belfast; for painting, Messrs. J. & D. Baxter, of Coleraine; and the whole was superintended by Mr. E. Anderson, of Coleraine, foreman to the head contractor.

CHURCH-BUILDING NEWS.

Bramford (near Ipswich).—The small church of this place has been farther restored. The works which have now been carried out comprise a restoration of the chancel by the Ecclesiastical Commissioners, with a stained glass window by the parishioners. This window was the work of Chance, Brothers, of Birmingham, and was erected by Messrs. D. & E. Hagar, of Ipswich, who presented one of the smaller side windows. The east window is now in the Decorated style, but is elliptic headed. It contains a representation of the Crucifixion, in three compartments. The picture contains twenty-one figures. The rest of the restorations in the chancel consist of the removal of the doors which opened in the north and south walls. The exterior works done by the Ecclesiastical Commissioners, consist of a stripping of the chancel walls of the plaster, and restoring the rubble walls. Mr. Bedford suggested to his parishioners that this would be a fair opportunity to restore the south side of the church, and this has been done as nearly as possible in accordance with the work done to the chancel. The works now executed by the Ecclesiastical Commissioners have all been planned by their architect, Mr. Christian, of London, and the contract was taken by Mr. Givling, of Ipswich. The present contract with the Ecclesiastical Commissioners was for 400*l.*; and this sum, with the amount paid by the parishioners for other portions of the restorations during the last few years, makes a total of more than 1,200*l.* The works are nearly completed.

Friday Bridge (near Wisbech).—The small church of St. Mark, in the district of Friday Bridge, is now so far completed as to be about ready for consecration. Owing to the spongy nature of the Fen district site, the foundations were costly; but concrete, cement, hoop-iron, &c., were used to obviate danger. The ground plan is a Latin cross, comprising chancel, 21 ft. long by 20 ft. wide, with sacristy on the north and chantry chapel on the south; nave, 60 ft. by 25 ft., the aisle of which is paved with best pressed Staffordshire quarries. On the south-west is a porch, and on the north-west are the foundations of a clock-tower, which is to be furnished with three bells and surmounted by a spire. The materials used in construction are white Whittlesby bricks and Ancaster stone. The building is Early Decorated. There will be accommodation for about 300 persons. The estimated cost of the building, when completed, is 2,500*l.*, more than half of which has been already subscribed. There is no painted deal to imitate oak, and no stucco to imitate stone. The internal walls are brick, and no plaster conceals it: between the rafters of the roof only is plaster anywhere used. In the chancel, Minton's encaustic tiles, in buff and chocolate, have been laid down with alternate plain tiles in buff, and within the rails of the sanctuary the design is a white fleur-de-lis, on a blue ground, alternate with a floriated cross of chocolate on a buff ground. The floor of the memorial chantry is similar to that of the chancel, except that the plain tiles are left out. The stonework intended to be carved is left in block for future ornamentation. The windows are filled with cathedral glass from the works of Messrs. Hodgson, of York; and the architect is Mr. J. H. Owen, of the Board of Public Works, Dublin, whose services have been gratuitous. Mr. Owen being a brother-in-law of the incumbent. The memorial chantry was the gift of one of the building committee, who has also given a painted window

with the figures of SS. Michael and Gabriel, executed by Messrs. Heaton & Butler. Another parishioner has given painted glass for the north window of the chancel, with the subject of St. Thomas addressing our Lord. The tracery of the east window has been filled with painted glass, the work and gift of Mr. E. M. Smith, of Wisbech, and other tracery has been filled by the family of the incumbent.

**Pidley-cum-Fenton.**—The new church here, erected on the old site, has been opened for divine service. It is in the Gothic style, and consists of a tower and tiled spire, a nave, chancel, vestry, and porch. It is very plain. The total cost has been 1,050l. It is situated about midway between Pidley and Fenton. The work was commenced by Messrs. Cock & Jenkins, who shortly after failed, and it was then carried on and completed by Mr. Saint, of St. Ives, and Mr. George Richardson, of Huntingdon; the former doing the brick and stone work, and the latter the woodwork, from designs by and under the superintendence of Mr. W. M. Fawcett, of Cambridge, architect. The exterior of the tower, nave, and chancel is of stone and rubble work, and the spire is covered with red tiles. The height of the spire from the ground is 70 ft. The entire length of the church is 95 ft. In the interior, the chancel-roof is of a waggon-head form, panelled, and made of oak. The floor is laid with encaustic tiles, in patterns. The fittings of the chancel are in oak. The altar is made of alabaster. The nave roof is open-timbered and panelled, and the woodwork is stencilled. The walls are lined with brick, with rows of black bricks and stone. The floor is laid with square red floor tiles, and the seats are of deal, stained. In the tower is placed a square stone font. The tower also contains three bells.

#### DISSENTING CHURCH-BUILDING NEWS.

**Southampton.**—The Baptist Chapel in Lake-road has been opened for divine service. It is a Classic building, 88 ft. long by 61 ft. 6 in. wide, internal dimensions; and is built of bricks with Bath stone dressing up to the entablature. The facade is surmounted with a pediment extending nearly two-thirds of the width of the whole front, supported on attics or pilasters of Bath stone, with capitals and entablature of the Roman Corinthian order, executed in Portland cement; but the cornice is divested of medallions, dentils, and other enrichments. The whole of the windows and door dressings are executed in Bath stone. The floors and pews, with their aisles, in the body of the chapel, are on an inclined plane from the pulpit or platform. The gallery front is formed of open ironwork, with circular corners. It is supported on iron columns, extending upwards and supporting the roof, which is so constructed that the whole of the space up to the collar of the principals (a height of about 13 ft.) is occupied by the large cove of the ceiling, extending from end to end, and therefore thrown into the chapel. The cove of the ceiling springs from the architrave or cornice, supported by elliptic arches turned from column to column, transversely and longitudinally, round the chapel, the soffits of which are panelled and moulded. On the west side of the chapel is a large school-room, nearly complete, built of brick, with Bath stone dressings, and in the same style of architecture, the internal dimensions being 80 ft. long by 28 ft. wide, and 23 ft. high to the apex of the ceiling. The ceiling is formed by lath and plastering to the under-side of the rafters. The school has a gallery at the front end, covering two close rooms, which are divided from the school-room by sliding doors or partitions. The whole of the buildings have been erected by Mr. Thomas Backhurst, of Landport, builder, from designs prepared by and under the superintendence of Messrs. Rawlingson & Son, of Southampton and London. The new organ was made by Messrs. Gray & Davidson. It contains fifteen stops and about 800 pipes, having a trumpet stop throughout in the great organ, and 16 ft. open pedal-pipes. The organ is inclosed in a Grecian case to correspond with the building. The cost of the buildings will be upwards of 5,000l., of which upwards of 2,000l. have been obtained.

**Keighley.**—The Baptist new chapel has been opened for divine service. The building occupies a plot of land at the corner of Albert-street and Scott-street, and adjoining the site of the intended new town-hall. In general form the

edifice is rectangular, and it is covered with a roof of single span. A school-room extends underneath the whole of the chapel: the floor of the chapel is, therefore, kept up several feet above the front street, and this has necessitated a flight of steps to each front entrance. All the external walls are built of local stone, faced with pitch-faced wall-stones: the quoins at the angles and other features are of hewn or ashlar stone. In point of style, the character is Lombardic. The vestries are under the organ floor, and communicate with the baptistery platform by doorways on each side of the pulpit. In addition to the school-room below the chapel there is a lecture-room connected with the former by folding doors, also five class-rooms and a tea-room. Below the tea-room is a chamber for the hot-water apparatus. Two stone staircases communicate between the school-room floor and the chapel floor and galleries. Two external entrances are provided to the school-room, approached by steps from Scott-street. The general internal dimensions of the building are as follow, viz.:—Chapel, 45 ft. wide; 81 ft. long (inclusive of organ recess); and 34 ft. greatest height. School-room, 42 ft. wide, 45 ft. long, and 14 ft. high. Lecture-room, 27 ft. by 23 ft., and 12 ft. high. Class-rooms and vestries vary from 14 ft. by 12 ft. to 13 ft. by 9 ft. The entire outlay has been about 3,800l. The chapel seats 750 persons. The contractors for the whole of the works were Messrs. Gibson & Mande, of Keighley. The heating apparatus has been supplied by Messrs. Clapham, Brothers, of Keighley, who have also executed all the constructive and ornamental ironwork in the building. The gas fittings were by Mr. Brawn, of Birmingham; and the gas-piping was laid by Mr. Holmes, of Keighley. The architects, under whose superintendence all has been done, were Messrs. Paull & Ayliffe, of Manchester.

**Brampton.**—The new chapel here has been opened for divine service. The building, which has cost 767l., is in the Gothic style. It is nearly in the form of a parallelogram, the sides in the middle being some feet wider than at the ends. It is 27 ft. long and 24 ft. broad. The walls are of brick and stone, with ornamental red and black bricks in the exterior, and a tracery window in the front elevation, ornamental buttresses and pinnacles. The windows are glazed with cathedral glass, with white borders. In the interior, the roof is open-timbered and plastered between the principals, the floor hoarded, and the seats are open, made of deal and stained for varnishing. In the centre, on a platform about 2 ft. high, is the reading-desk, with an ornamental iron rail and tracery on each side. It is lighted with petroleum lamps suspended from the roof. The work has been carried out by Messrs. Maile & Richardson, of Huntingdon, under the superintendence of Mr. Hutchinson, architect.

#### SCHOOL-BUILDING NEWS.

**Knighton.**—The national school in the parish of Heyop, situated about four miles from the town of Knighton, has been opened. The site was given by Mr. R. G. Price, together with a large donation. The building is of native stone, with Bath stone facings, from a design by Mr. Nicholson, of Hereford: the former material was supplied by Messrs. Morton, the contractors for the Central Wales Railway.

**Levenshulme.**—The foundation stone of a new school to be erected in connexion with the Methodist Free Church, Levenshulme, has been laid by Mr. Albert Whitworth, at whose expense the building is to be constructed. The school will be built upon a plot of land fronting the Stockport-road, and adjoining the chapel recently erected, and will have accommodation for 250 children, with class-room, infants'-room, and gallery above them. It will be constructed of white burnt common bricks, with polychrome decoration, and have an open-timbered roof. Warm-water apparatus will be used for the heating. Messrs. Whyatt & Redford, of Manchester and Heywood, are the architects. The contract has been undertaken by Mr. J. Davison, at a cost of 500l.

**Sunderland.**—The foundation stone of a new day and Sunday school, about to be built by the Wesleyan Methodist body, in King-street, Bishopwearmouth, has been laid. The school will be a stone-fronted two-story building, designed by Mr. Tillman, architect, with two large school-rooms upon the lower and upper stories, the first for young children, and the other for

those of older years. The total cost of the building, the ground, &c., will be between 1,200l. and 1,300l., and the contract has been let to Mr. C. Stoney, builder.

**Lindley, near Huddersfield.**—National schools have been opened here. The building comprises a boys' school-room, 63 ft. by 20 ft. and 16 ft. high to the ceiling, with class-room attached, 18 ft. by 17 ft.; a girls' school-room, 65 ft. by 20 ft.; and infants' room, 23 ft. by 20 ft. There is also a schoolmaster's house, detached, with the usual accommodation. The cost of the whole, including boundary walls, &c., complete, has been 1,250l. Mr. James N. Crafts, of Cook-street, Liverpool, was the architect.

#### ROYAL ENGLISH OPERA.

AIDED with the scenery and appointments prepared by Mr. Gyo, last season, the Covent Garden Opera Company have produced Meyerbeer's "Africaine" with great splendour and completeness. The first scene, a noble Byzantine interior, decorated with mosaics and gilding, is a picture worth preservation. Miss Louisa Pyne, Madame Sherrington, and Mr. Charles Adams sing the music admirably, and Mr. Mellon's orchestra is unapproachable. Mr. Kenney, too, has shown more than ordinary skill in the execution of the English libretto. As an acting opera the "African," which ought to have been called the "Indian," will probably never take the same bold on the world as "The Huguenots" and "The Prophet" have done, wanting, as it is, in dramatic interest, compared with them; but admiration for the music is growing with the English public, so that the English version of it, as set forth at Covent Garden, can scarcely fail to be popular. We have a word to say to the directors of the company. On the first night, some of the representatives of the Press, invited to be present, were not well treated: in fact, on the ground that the paying public were filling all the seats, they were refused admittance to the house. This was a great mistake, and very stupid. Mr. William Harrison on some occasions committed the same error, and was damaged by it. If a journal be invited to send a representative to give that publicity (with fair and honest criticism) without which no undertaking meeting the public can prosper, those representatives, so far from being permitted to remain in the vestibule kicking their heels until a proper person can be found to tell them, politely done as it may be, that they cannot be allowed to pass on that particular occasion, should under any circumstances be admitted and accommodated. They are there at the request of the management, and for the advantage of the public, not for their own pleasure; and it is perfectly preposterous to put them in the position of beggars for a favour. A new ballet was presented on Wednesday night, but having heard of the difficulties on the first night of "L'Africaine," we sent no representative, and can say nothing as to its goodness or otherwise. At this of course the directors of the company can afford to smile. It is of little consequence to them, they may think, whether or not the *Builder* has been enabled to say the scenery is good, and the effects are artistic; it is of still less consequence to us; and we speak solely with reference to their own success, and the position of the Press generally. The want of common sense that would be shown by discourtesy in that direction would be quite sufficient to bring about a very different result to their undertaking to that which we anticipate for it, and very sincerely wish it may have.

#### Books Received.

*A Descriptive Handbook for the National Pictures in the Westminster Palace.* By T. J. GULLICK. London: Bradbury & Evans, and at the Palace, 1865.

This Handbook will very much increase the pleasure and advantage of a visit to the forty pictures, by modern artists, in fresco and the water-glass process, now to be found in the Houses of Parliament and adjacent galleries. Mr. Gullick has not confined himself to a description of the paintings, but has sought to point out the significance of their subjects, and the principal association they should call forth.

In describing one of Mr. Dyce's works, by the

way, "The Vision of Sir Galahad and his Company," derived from the romance of the St. Greil, he says,—

"We need only remind the reader that, according to the later romance (which appears to be derived from the apocryphal gospel of Nicodemus), the St. Greil is the holy vessel, or "hansap," from which Christ drank and gave of the wine to his disciples at the Last Supper, and which is said to have been afterwards used by Joseph of Arimathea, to collect the blood which flowed from the wounds of the saviour."

This seems scarcely to convey the story. The "true hood" was the *Sang-réal*, and it was the search for this in the vessel described, brought over and hidden, as was supposed, somewhere in Britain, that was the grand object of the institution of the Round Table.

Mr. Gullick has executed his task well, and has produced a little book equally agreeable to read either before the pictures or at home.

*Builder's Travels into several Remote Regions of the World.* By DEAN SWIFT. A new edition, with Life of the Author, by JOHN FRANCIS WALLER, LL.D. Illustrated by T. MORTON. London: Cassell, Potter, & Galpin.

THIS is a very nice edition of Swift's universally known satire and libel, and will aid in keeping up the wonderful popularity of the book. The illustrations by Mr. Morton, though sketches rather than drawings, are very spirited and effective; those in Lilliput, as it seems to us, being most satisfactory. The difficulty of making Gulliver, when in Brobdingnag, look like an ordinary man, amongst enormous giants, is not an unobscure one. It is rather a mankin amongst men. One of the illustrations of the Yahoos (p. 808) will strike the reader as being adapted from well-known works by Hogarth, notably "The Rake's Levée." This is so obvious indeed, that we must conclude the artist chose to take his Yahoos from a known source rather than create them. The volume forms a capital present-book for the coming season. Swift himself is a problem and mystery never yet solved.

#### VARIORUM.

THE current *Quarterly* has an article on the "Cathedrals of England," based on Mr. Murray's series of Handbooks to the Cathedrals. It has no special motive or result, but introduces them all agreeably. We quote a passage referring to early work:—

"Of the period before the Conquest, there are few actual remains. In many instances, of course, the site of the existing cathedral is the same that was occupied by the earlier building. It is possible that some fragments of walls or of piers, though we suspect not many, may date from the early part of the eleventh century. The most important relics exist in the North. For although the cathedral of York is, in many respects, roughly, as the most great resting-place of the faith in England, containing within her walls the actual ground covered by the loveliest monument first given by Ethelbert to Augustine—she can claim to such tangible witness of antiquity as the remainder of the crypt of York Minster, which, if it is not, as is very well may be, a portion of the church erected by the twelfth of Northumbria at the place of his baptism by Augustine (A.D. 627), is at least not later than the time of Archbishop Albert, who came to the see in the year 767, and who is recorded by Ailwin as the builder of a "most beautiful church" in his metropolitan city. On this point, therefore, we gaze with veneration; but if we desire to be fairly carried back to those remote centuries, we must pass from York to the sister cathedral of Ripon, seated, not on the site of the famous monastery built by St. Wilfrid, but on that of a second church, which there is no doubt was also founded by him. Under the central tower of Ripon Minster, the construction of which must have greatly influenced, is the remarkable crypt known as 'St. Wilfrid's Needle,' a small subterranean chamber, the strong Roman character of which at once expresses the antiquity. It is, in truth, a surviving example (and not a solitary one, since there is another crypt closely resembling this below the church of St. Peter, at Hexham, also a recorded foundation of Wilfrid) of that mode of building which Wilfrid is expressly stated to have brought from Rome; and as we pass through the dark, narrow passages that lead to it, we are struck by the rude walls, pierced by small niches, bearing the marks of more than a thousand years, we feel—so completely are we removed from all modern associations, almost brought face to face with the most memorable and energetic "apostle" of the English Church, by whose care the crypt was constructed—the latter half of the seventh century. Its original purpose seems little understood; but, more than any of the crypts of the republicans, from which the host, the "Priest Lord," was brought up to the choir on Easter Day; or it may have served for the occasional exhibition of relics. But, in truth, it belongs to a period so remote, and presents a condition so different from that even of the Middle Ages, that we can do little more than gaze at its uses and meaning."

See on "Cells, Sanctuaries, and Crypts" in *Builder* of 1862.  
Two papers on this remarkable crypt, by Mr. J. R. Lebrun, of Ripon, who was the first to point out its main date, will be found in the *Journal of the Archaeological Institute*.

Messrs. De la Rue & Co. are early in the field with their "Indelible Diaries" and "Red Letter Diaries" for the coming year, of all sizes and conditions, edited as usual by Mr. Glaisier, F.R.S. That same red letter, by the way, though giving variety of aspect, is seldom pleasant to read. The information given is of the soundest and solidest character, and the illustration in each case is a copy of a portion of a photograph of the moon, 38 in. in diameter, showing the remarkable craters, if such they be, that cover parts of its surface.

#### Miscellaneous.

DINNER OF THE BUILDERS' BENEVOLENT INSTITUTION.—The annual dinner of this valuable institution took place at the London Tavern on Thursday evening last. We shall report the proceedings in our next.

THE LEEDS NEW DISPENSARY.—The foundation-stone of this new building has been laid by the mayor with some ceremonial. The architect is Mr. Hill, of Leeds. The building is estimated to cost 3,500*l.* The contractors are:—Bricklayers, Messrs. Lax & Moody; mason, Mr. H. Smith; joiners, Messrs. Thomas Hall & Co.; plumbers, Messrs. T. & W. Storey; plasterer, Mr. Branton; painters, Messrs. Wood & Son; and slaters, Messrs. Hill & Sutcliffe, Bradford.

THE BIRMINGHAM WORKMEN'S INDUSTRIAL EXHIBITION.—Nearly 100,000 persons have visited Bingley Hall while open for the Workmen's Exhibition. In a financial sense, therefore, it has been a decided success, as well as in the object aimed at by its originators and supporters. The workman has come forward and been identified with the work of his leisure hours, and he has seen what his fellow-workmen can do in theirs. Nevertheless, as the local *Daily Gazette* remarks, the collection was full of encouragement rather on account of its promise as to what may be done in the future, than because of anything that has yet been accomplished. Another Working Men's Industrial Exhibition in Birmingham must be better than the one now closed, or else the local public will be likely to disregard it; for workmen will be expected to improve by their experience of the past two months.

ST. HELEN'S, BISHOPSGATE.—We very much regret to learn that the necessary funds for the restoration of this fine old City church, of which we spoke recently, are not at present forthcoming. This is the more unfortunate because the necessary repairs will swallow up much more money than the parishioners, most of whom are non-resident, can provide. In such a dilapidated state, indeed, is the entire roof discovered to be, that the architects, Messrs. Wadmore & Baker, have been compelled to report that it will be positively dangerous to re-open the church for Divine service until all the beams are replaced. Instead of doing the work properly at former periods, those who had the contract contented themselves with pasting brown paper over the worm-eaten timbers, the result of which is now apparent in rottenness from one end of the church to the other.

ASSOCIATED ARTS INSTITUTE.—The first meeting of the season 1865-66 of this Institute, the objects of which are to deliver addresses and hold debates on questions connected with the fine arts, to exhibit sketches, and by its meetings to promote social intercourse among young artists, was held last Saturday evening, at 9, Conduit-street, Regent-street; Professor Westmacott, R.A., in the chair. After some introductory remarks by the chairman, Mr. A. H. Wall, a member of the committee of the Institute, delivered an address on "The Importance of General Mental Culture to the Artist." In the course of it, Mr. Wall proceeded to say that the Association had been formed since January, 1863, and had been growing from that date. Remembering that they learned nothing so perfectly as that which they taught, they assembled to impart to each other freely and unhesitatingly the knowledge and experience they possessed. Believing that each of them might, as Carlyle says, have copied a little sentence or two faithfully from the inspired volume of nature, they came here to put those sentences together, and then compare them or read what they said when thus combined. A discussion followed.

THE WEDGWOOD INSTITUTE.—The Art Exhibition of Alton Towers closed last week. A sufficient sum has been realised to enable the committee to proceed with the complete erection of the Wedgwood Institute. The supplementary bazaar, held in Barstlem, which closed on the evening of Friday week, realised nearly 400*l.*, making the total gross receipts at the two bazaars about 1,400*l.*

NATIONAL AND PROVINCIAL BANK OF ENGLAND WORCESTER.—On the 12th inst. the foundation-stone was laid by Mr. R. Davy, manager, and a party of friends, after which lunch was partaken of, &c., at the manager's residence; and in the evening a supper was provided for the men, to the number of about forty. The style of the building is Italian with Hollington stone and stock brick front. Mr. John Gibson, of London, is the architect; Mr. Glover, clerk of works; and Mr. James Davis, of Malvern Wells, the builder. It is expected that the building will be completed by April next.

GREENS PROHIBITED IN ROME.—The Special Board of Health of Rome has followed up its recent prohibition against the importation into the Papal States of sulphuric and hydro-chloric acids, as containing arsenic, by also prohibiting as well the importation as the manufacture and sale of green-coloured paperhangings, as containing preparations of copper and arsenic, commonly called "verdeto," "Schweinfurter's green" and "life green," by means of which arsenical poisons are easily introduced into the human frame, with more or less prejudice to health.

THE ASSEMBLY-ROOM, CHELTENHAM.—The walls of the Assembly-room have been newly papered with a paper manufactured for the purpose. The pilasters are marbled, as before, the Corinthian capitals being pure white, with narrow gilt banding. The skirting is in imitation of green marble. The ceiling has been decorated. The cornices are coloured, and have been relieved by gilt banding. The open floral devices from which the glass chandeliers hang, and which act also as ventilators, have been renewed. Mr. Buckman has added several new ventilators, some of ornamental design. The front of the gallery has been relieved by the use of two tufts, instead of one, as heretofore. The auto-rooms, &c., have also been re-decorated.

MONUMENTAL.—The sculptor, Mr. Foley, is now actively engaged on the statue to be erected at Birmingham in memory of the Prince Consort. The model is completed, and he is now at work on the marble. The statue will be of life size, and the Prince will be represented wearing the robes of a Knight of the Garter. The sculptor, while working at his statue of Sir James Outram, slipped and sprained his foot. He is now recovered, and the Albert Memorial may be expected to be finished in about a year.—A statue to the memory of the late Earl of Eglington, the work of Mr. Noble, of London, has been inaugurated at Ayr with masonic ceremonial.—The inauguration of Buffon's statue took place at Montbard on the 9th. Montbard, the birthplace of Buffon, is a town of 2,600 inhabitants on the Paris and Lyons Railway, between Tonnerre and Dijon.—The four bronze statues under the dome of the Invalides, in Paris, representing Peace, Justice, Prudence, and Charity, which were melted and sold in 1793, are to be replaced by four statues representing the four Evangelists, each of which is to be 12 ft. high.

THE RUSSIAN AND AMERICAN TELEGRAPH.—The *New York Herald* says:—"A telegram has been received from Paris St. James, on Fraser River, stating that the Russian-American telegraph has been built from New Westminster to that point by Assistant-Engineer Conway, who was progressing still further with great success. Captain Conway's party will undoubtedly reach Stuart's Lake before the close of the season, where Captain Carlin is preparing bateaux to cross supplies for the passage of Lake Babine. Messrs. Henley & Co., of London, are manufacturing wire for the main line of the company, and 1,400 miles will soon reach Colonel Bulkeley at Siska. This is in addition to 1,200 miles of wire previously sent from New York. The cable which is to cross the Straits has been ordered in England. The whole enterprise, according to latest advices from official sources on the Pacific, bids fair to be most successfully and triumphantly carried out to final completion at a much earlier day than has heretofore been anticipated by its most sanguine friends."

WORCESTERSHIRE ARCHITECTURAL SOCIETY.—The annual meeting of this society has been held, in the council-room of the Natural History Society. The chair was taken by Mr. G. J. A. Walker. The report, which was a satisfactory one, was read and adopted. It gave a lengthened account of church building and restoration carried on in the county during the last year. The election of office-bearers, and other business, then occupied the meeting.

STEAM ROLLER FOR ROADS.—Steam scavengers and "macadamizers" having been found to answer their purpose extremely well in the streets of Paris, there is now in daily operation a steam roller for crushing the stones and levelling and consolidating the roads. This powerful machine is being worked with the utmost facility on the Pont Royal, making the ascents and descents without the least difficulty. Two men,—an engine-driver and stoker,—are sufficient to work the engine.

A ROMAN VILLA NEAR BATH.—Further evidence of Roman occupation in the neighbourhood of Bath has lately come to light. In a field in Wick parish, a considerable portion of an extensive Roman villa has just been uncovered, and the plan of two hypocausts, and the foundation walls of several rooms taken. From the extent and massiveness of some of the main walls, it appears to have been a villa of considerable importance. A great quantity of roofing tiles, made of "pennant" stone, broken pieces of pottery, and many other objects of interest, have been found, all of which will be deposited at the Literary Institution.

THE SOCIETY OF SAW GRINDERS AND MACHINERY, SHEFFIELD.—We have been requested to say that, at a general meeting of the Society of Saw Grinders, held at the Royal George Hotel, Carver-street, on Tuesday, a vote of thanks was unanimously passed to Mr. William Broadhead, the secretary, for the very able and correct manner in which he had represented the views of this society at the Social Science Congress, in answer to Alderman Jackson's question on the subject of trades-union opposition to the introduction of machinery. The resolution goes on to say:—"This society trusts that its sincerity will be tested by the employers giving its members a fair opportunity of working the machines, instead of driving them to other towns for that purpose."

ACCIDENTS.—A shocking accident, by which a well-sinker lost his life, has occurred at the Birkenhead Waterworks. A new well is being sunk, and the deceased went to work under the influence of drink. He overbalanced himself, and fell to the bottom, a distance of 73 ft., and was fearfully mangled, death being instantaneous. He had in his pocket a bottle containing rum, but though he was literally smashed, the bottle was found to be uninjured. At the quarry of the South Devon Slate Company, Ivyridge, a mass of rock and stone, estimated at three tons weight, fell upon a man, from a height of about 40 ft. He was completely buried, and killed. A man has also been killed, and four injured, at the Gullett Quarry, Hawksworth-wood, Kirkstall. The blocks of stone were raised from the quarry by means of a traversing crane, erected at about 40 ft. from the ground. A heavy block of stone was attached to the crane, when the props supporting the tramway gave way, and the men, the railroad, and the crane were precipitated to the foot of the quarry.

GREAT CASTING OF BESSEMER'S STEEL.—The operation of casting a cubic block of steel, of the weight of 100 tons, has been successfully accomplished at the new works of Messrs. Bessemer & Sons, at East Greenwich. At Bolton, in Lancashire, a block of steel weighing 250 tons was cast, by the aid of Messrs. Ireland & Sons' patent upper-twyer cupola furnace. The cupola furnace lent by Messrs. Ireland & Son for reducing the Bessemer steel to a liquid condition melts at the rate of thirteen tons in an hour, and is charged with 3 cwt. of coke to about 500 of these furnaces in operation in many parts of the world. The large mass which has been cast at Greenwich will take about six weeks to cool. The liquid metal was poured into the sunken mould,—a large square hole, like a tan-pit,—in quantities of about four tons every twenty minutes, and the entire operation was accomplished between light and dark. This, and another block weighing 57 tons, are to serve as anvils for steel hammers in the new works of Messrs. Bessemer.

DRAWING CLASSES, KING'S COLLEGE, LONDON.—The authorities of King's College, London, have this session doubled the duration of the drawing-class on each evening of its meeting, while they leave the fees unchanged. The class seems to recommend itself to the notice of young members of the profession who have inclination to improve themselves in that very necessary part of their education and practice.

A CHURCH STRUCK BY LIGHTNING.—Nottingham has been visited by a thunder storm. On the north-west side of the town, on an elevated spot, stands the church of All Saints, in connexion with which a parsonage-house is in course of erection. After the first vivid flash of lightning, the men at work put up their tools, and hastened from the scaffold, expecting, as they state, that it would be struck. Shortly afterwards, it was found that the church had been struck by the lightning, which passed down the conductor placed against the tower, until within about eight feet of the ground, when, some masonry obstructing its course, it passed through the stone wall, shattering it and making a large hole.

THE CONDITION OF BETHNAL-GREEN.—An inquest has been held on the body of one of five children of a labourer and his wife, lately living in Union-place, Shoreditch. On Saturday week the family removed to No. 3, Nelson-place, Bethnal-green, one of ten houses which the jurors stated had been in a disgracefully insalubrious state for the last eight years. The girl, who had fractured a rib, immediately got much worse. On the Tuesday following Dr. Chambers was called in, and she died on Thursday. Dr. Chambers stated that the girl might have recovered; but that the removal to Nelson-place was most injurious, owing to the foul emanations and effluvia from the houses, the dust-heaps, &c. The houses consisted of two rooms each, and the rent paid was 5s. per house per week. He had a case of smallpox in one of them, which he believed arose from poison in the houses, for it had not come on like ordinary smallpox. The effluvia from the premises affected his throat for hours after he visited the court. The jury returned a verdict to the effect that the deceased died from the injuries caused by a fracture of a rib, adding that the conduct of Mr. Christie, the inspector of nuisances, is reprehensible for neglect of duty, and that the landlord of the premises is highly culpable for allowing them to remain in such a disgraceful condition. The jury also requested the coroner to write to the vestry complaining of the manner of the inspector before the court. It was stated in the inquest-room that it was in consequence of directions Mr. Christie had received that he only inspected such nuisances as might be brought specially under his notice.

TENDERS

For the erection of a public-house, in Hosier-street, Reading, for the Berkshire Brewery Company (limited). Messrs. W. & J. T. Brown, architects:—

Table with 2 columns: Name and Amount. Includes Barnicoat (£510 0 0), Searle (£48 0 0), Matthews (£82 0 0), Sheppard (£77 0 0), Inley (£69 0 0), Willett (£43 0 0), Carter (accepted) (£36 10 0).

For the erection of a public-house, in Coley-street, Reading, for the Berkshire Brewery Company (limited). Messrs. W. & J. T. Brown, architects:—

Table with 2 columns: Name and Amount. Includes Searle (£437 0 0), Sheppard (£411 0 0), Matthews (£419 0 0), Strong (£385 0 0), Willett (£385 0 0), Barnicoat (accepted) (£389 0 0).

For building seven houses, in arcades, in the Junction-road, Holloway. Mr. W. F. Hooper, architect:—

Table with 2 columns: Name and Amount. Includes Evans (£1,300 0 0), Carter & Son (£1,600 0 0), Rowley (accepted) (£1,600 0 0).

For finishing two houses in the same road. Mr. W. Hay, architect:—

Table with 2 columns: Name and Amount. Includes Rowley (accepted) (£1,015 0 0), Ford (£527 0 0), Walsh (£420 0 0), Carter & Son (£420 0 0), Disney (£418 0 0), Jarrett (£411 0 0), Canham (accepted) (£411 0 0).

For repairs and alterations, Creek-road, Deptford. Mr. T. Dinwiddie, surveyor:—

Table with 2 columns: Name and Amount. Includes Ford (£2,900 0 0), Hill & Kettle (£2,531 0 0), Collis & Nodder (£294 0 0), Sharrington & Coe (£2,537 0 0), Nicholson (£2,900 0 0).

For the erection of a villa, for Mr. George Davis, Caterham, Surrey. Messrs. Dyer & Fuller, architects:—

Table with 2 columns: Name and Amount. Includes Mansbridge (£1,300 0 0), Mansfield & Son (£1,650 0 0), Ward (£1,482 0 0), Baldwin (£1,045 0 0).

For British schools, Portland-street. Mr. J. C. Clarke, architect:—

Table with 2 columns: Name and Amount. Includes Holland & Hannen (£5,841 0 0), Patman & Fotheringham (£4,750 0 0), Mansfield & Son (£5,860 0 0), T. Anson (£5,590 0 0), Collis & Son (£4,468 0 0), Hack & Son (£5,327 0 0), Conder (£5,290 0 0), Pritchard (£5,284 0 0), Browne & Robinson (£5,075 0 0), Scrivener & White (£4,950 0 0).

For two warehouses and tavern, in Cow Cross-street, for Mr. D. Grant. Mr. H. Dawson, architect:—

Table with 2 columns: Name and Amount. Includes Pritchard & Sons (£4,765 0 0), Collis & Son (£5,534 0 0), Ashby & Horner (£4,465 0 0), Browne & Robinson (£4,200 0 0), Conder (£4,179 0 0), Piper & Wheeler (£4,031 0 0).

For alterations and additions to a house and premises, at Cold Ash, near Reading. Mr. W. Lacey, architect.

Table with 2 columns: Name and Amount. Includes Quantities supplied by Messrs. Pains & Clark (£2,307 0 0), Wheeler (£1,307 0 0), Elliott (£1,250 0 0). Allowed for Old Materials (£20).

TO CORRESPONDENTS.

PUBLIC WORKS DEPARTMENT IN INDIA.—We are forced, by pressure of matter, to postpone the completion of this communication until next week. T. D.—R. H. B.—P.—W. C.—J. R. G.—H. R. F.—Rev. Mr. H.—J. B.—J. P.—W. B.—D. & F.—H.—Messrs. M.—G.—S.—R. P.—W. B.—Dr. H.—C.—C. H. (omissions in the letter were made by mistake. T. H. shall appear).—D. J. H. (ditto)—F. F. (we know nothing to prevent them).—J. P. We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. Advertisements cannot be received for the current week's issue later than FIVE o'clock, p.m., on Thursday. NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

[ADVERTISEMENT.]

CHURCH, TURRET, and STABLE CLOCKS. J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergy-men, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 33 & 34, Ludgate-hill, E.C. Established 1749.

ADVERTISEMENTS.

TO AMATEUR AUTHORS, &c.—Messrs. COX & WYMAN execute every description of PRINTING in the best manner, with promptness and punctuality, and at moderate charges.—COX & WYMAN, Oriental, Classical, Fine Art, and General Printers, 1475, Great Queen-street, Lincoln's-Inn-fields, W.C.

THE QUARTERLY REVIEW.

No. CCXXXVI. is published THIS DAY. CONTENTS: I. ENGLISH OUTBROKES. II. THE MARINE COMPASS. III. STATE AND PROSPECTS OF ITALY. IV. POETRY OF PEACE AND LOUD HOUINGTON. V. THE EDUCATION OF THE BLIND. VI. FIELD SPORTS OF THE ANCIENTS. VII. THE GALICIAN CHURCH. VIII. ENCLOSURES IN ASIA. JOHN MURRAY, Albemarle-street.

LOUDBON'S RURAL ARCHITECTURE, TREES, and SHRUBS. In 1 thick vol. 8vo. with about 2500 Woodcuts, price 4s. LOUDBON'S ENCYCLOPEDIA OF COULDBON'S ENCYCLOPEDIA OF COULDBON'S ENCYCLOPEDIA OF COULDBON'S ENCYCLOPEDIA OF TREES and SHRUBS. London: LONDON, GREEN, & CO. Paternoster-row.

One Volume, royal quarto, 72 Plates, with Letter-press and COLLINGS' ART FOLIAGE. In consequence of the great addition of Plates, Woodcuts, and Letter-press, the publication of ART FOLIAGE has been delayed, but will now be ready for delivery on the 1st of November next. Price 30s. to subscribers, whose names are sent to the Author; 35s. to those who order before November 1st, when the subscription-list will be positively closed, and the price permanently raised to 40s.

WATER SUPPLY to the COTTAGER, in DRY RURAL DISTRICTS. A Short Treatise on the System, for the use of the Poor, in the Country. To be obtained of Mr. OROOM, 27, Wigmore-street, Cavendish-square, London, W.

# The Builder.

VOL. XXIII.—No. 1187.

*The Buildings on Mount Moriah.*

WE were informed that, in order to see the noble inclosure of Mount Moriah,—which embraces the site of the Temple of Solomon, and contains the Dome of the Rock, the Mosque el Aksah, and the Golden Gate,—we must make application to our Consul the day before that of our intended visit, in order that he might give notice to the Scheikh of the Mosque to clear the Court of the Haram of all devout dervishes, Bokharian pilgrims, and all such fanatical individuals, lest any of the half-crazy

creatures, scandalised at the profanation of their holy place by the foot of the infidel, should run amuck at the party of visitors, or manifest their zeal by in any way molesting or reviling them.

Fifty years ago it would have been death, and twenty years ago it would have been dangerous, for a Christian to be found within the precincts of the Mosque. It is a sign of brighter times that an Englishman can now enter even the most holy places in the East,—as Mr. Fergusson entered the Mosque of Hebron,—through the intervention of his Consul and by a judicious use of the golden key. We accordingly went to consult our Consul, who considerably gave us information about the mode of proceeding, the amount of *baksheesh* to be distributed, and its proper division between the scheikh or the mollahs, and the hekjeses or police of the Haram; and arranged that his dragoman should call at our hotel on the following morning to conduct us to the Mosque.

We started at an early hour. Our road lay through the deserted streets which skirted the sacred inclosure. Entering through a gate at the north-west corner, we found ourselves in an oblong area, extending from north to south about 1,500 ft., and from east to west about 1,000 ft. The boundaries on the north and west sides were formed chiefly by the pasha's palace and other houses; on the east by a long line of wall, above which was seen the Mount of Olives; and on the south chiefly by the Mosque el Aksah and its adjuncts. Near the centre was a flagged platform, about 600 ft. square, raised some 5 ft. or 6 ft. above the general level of the ground, and approached by steps at the sides. In the middle of the platform rose the octagonal Mosque Es Sakhrab, or the Dome of the Rock.

Beyond the edge of the platform the ground is covered with turf or gravel, through which the rock may be seen cropping up. The enclosure boasts a few trees, chiefly cypress, none of them remarkable for their size. Here and there are placed small *koubets*, or places of prayer, usually tenanted by devotees. Two mollahs, sallow of complexion, with short-cut beards, and

wearing green turbans, to signify their descent from the Prophet, met us at the gate, whence they at once conducted us to the steps leading to the platform. Here we all had to take off our shoes; and as no slippers were allowed, our progress hence was, owing to the numerous small pebbles, worse than a pilgrimago to Loretto with peas unboiled, especially to the two ladies of our party; and we were all thankful to reach the smoother pavement of the mosque.

The exterior of the building presents no very striking architectural features, as the details are on a small scale. Four sides of the octagon have doorways in them; the other four have seven windows each. A low sloping roof runs all round, and from the centre springs the dome, which is so conspicuous a feature in all views of the Holy City. The exterior is inlaid with tiles, covered with rich patterns, in which purple and green are the prevailing colours. These, together with the copper-covered dome, impart to the entire building, when seen from a distance, that peculiar bluish green colour resembling the "patin" on a bronze or coin, which characterises the edifice.

As soon as the threshold is passed, the "motif" and object of the building become evident, in a huge mass of rough rock, which occupies the entire space beneath the dome. This irregular lump of stone, which stands 4 ft. or 5 ft. above the level of the pavement, is manifestly the jewel over which this exquisitely beautiful case has been constructed, for the purpose of preserving it, and hiding it from profane gaze. This rock, and the double passage or aisle round it, in fact, occupy the whole of the interior of the mosque. The dome, which is 65 ft. in diameter, and of a stilted form, is supported by four massive piers and twelve intervening columns. A wooden railing, elaborately painted and gilt, placed between these columns, guards the holy rock. Between this row and the outer wall there is a second row of eight piers and sixteen columns (two between two piers), which support arches, either semicircular or almost imperceptibly pointed, and wall above, upon which rest the timbers of the roof. The columns, which are of verde antique and other rich marbles, stand upon plinths, and have capitals like Corinthian, with architrave blocks, upon which rest beams moulded in imitation of a classical frieze and cornice. These beams extend from pier to pier, tying the arches together at their springing. The soffits of the arches and the interior of the dome are adorned with rich mosaic work. The woodwork in the aisles is elaborately painted; the windows are filled with the jewellike glass, in small pieces, peculiar to Eastern buildings. All this colour, together with that of the draperies of intricate pattern, which hang over the holy rock, gives the interior that richness for which this building is unsurpassed. Universal testimony proclaims this to be for colour the finest interior in the world. While conducting us hurriedly round the rock our guides showed us a rude indentation on the upper surface of the rock, which they said was the impression of the footstep of the Lord Eessa (Jesus Christ).

At the south-east corner of the rock there is a small door which leads, by a flight of steps, into a cavern beneath the rock, measuring about 30 ft. by 20 ft. This cave has a small opening at the top. At the sides of it there are elegant niches pointed out by the mollahs as the praying places of Abraham, Solomon, David, and St. George,—quite a catholic assemblage. Their prophet was accustomed to sustain the superincumbent rock upon his shoulders during his devotions. This appeared to us quite a work of supererogation, as it seemed to rest firmly enough upon its base,—though the Moslem believes, contrary to the evidence of his senses, that it is in reality suspended in the air over the entrance to the infernal regions. Beneath

this first cave is a second, which has subterranean passages connected with it, one of which leads to the Pool of Siloam, and others conduct into rock-cut cisterns. It is about this rock and the surrounding building that the great controversy is raging. One party affirms that the rock is the original thrashing-floor of Araunah the Jehusite, and the site of the altar of the temple; and that the caverns and passages beneath it, were for the reception and conveyance of the blood of the victims to the King's Gardens, near the Pool of Siloam. Another party asserts that the temple could never have covered this spot. Mr. Fergusson, who is the originator of this opinion, and the representative of the party, has clearly explained his views, in a small volume, lately published, containing the lectures delivered at the Royal Institution. He divides his evidence into historical and architectural, and shows that the temple, as rebuilt by Herod, occupied only a square of 602 ft. at the south-west angle of the inclosure, and that consequently the rock was some 160 ft. from the outer wall of the temple. He advances that the character of the outer row of columns, with the architrave blocks and cornice, is of about the period of Constantine, and that therefore it may reasonably be alleged that the Dome of the Rock is the Anastasis which Constantine raised over the spot which he believed to be the sepulchre of Christ. The extracts from the writings of early travellers which he gives are strikingly confirmatory of his opinions. In support of both these views architectural evidence is adduced; but, to settle the question beyond dispute, we consider that further information is required, such as correct drawings of the columns in the Dome of the Rock, for there is considerable difference between Arundale's and De Vogüé's drawings of the capitals;—as far as we can trust our recollection, the latter are the more correct;—profiles and elevations of the cornice, carved on the beam above; an elevation of the west wall of the subterranean chamber adjoining El Aksah; and plan of section of the Golden Gate, besides various sections through the Haram, showing the nature of the ground, and where the rock terminates. All these we hope the Palestine Exploring Expedition will be enabled to supply; and until that shall be the case, we prudently reserve our own opinions upon this momentous question.

What is certain about the Mosque is that, in the time of the Crusaders, it was a church known as Templum Domini, and that it gave a title to the most renowned order of Knights that has ever existed, the Knights Templars. Mandeville says of it,—“That is a fair house, and it is all round and right high, and covered with lead; and it is well paved with white marble. The Saracens will suffer no Christians nor Jews to come therein, but I was suffered to go in, for I had letters of the Soldan. And in this Templum Domini were wont to be canons regular and an abbot.”

On the east side of the Dome of the Rock is a smaller edifice, called the Kouhet el Beraréh, or Dome of the Judgment, as it is believed that here will be suspended the balance when the Judgment shall take place in the Valley of Jehoshaphat. It is more modern than the Dome of the Rock, and is entirely a Mahometan structure.

At the southern extremity of the platform is another praying-place, or more probably a preaching-place, as it consists of an elegant *minber* or pulpit, which, if it were found elsewhere, might almost pass for Gothic of the best period. In the neighbourhood of the pulpit there are several cypress and olive trees, forming a sort of avenue, which leads up to an arcade of seven pointed arches, which form the north portal of the Mosque El Aksah. The three in the centre are the work of the Crusaders, as they have Gothic mouldings. Those at the sides are probably imitations of the Moslem period.

This building, as it at present stands, has all the appearance of having been erected for a mosque, since it has seven divisions running longitudinally from north to south, or, as we should say if speaking of a church, a nave and six aisles; and we know of no ecclesiastical edifice built on such a plan. Again, the monolithic marble columns and piers which form these divisions, though they have for the most part basketwork capitals of Byzantine workmanship, are surmounted by stilted Saracenic arches. In its length there are seven bays, terminated by a sort of crossing, over the central part of which there is a dome. Though the numerous columns, piers, and arches give a degree of intricacy to the interior, it has on the whole a bald effect for want of mosaic and other wall decoration. This is especially striking after coming into it direct from the glowing Koabbet es Sakhrak. Our guides took us to a spot in the crossing where two columns stand near to one another, and requested us to pass between them, telling us that the virtuous only can effect a passage, but that the wicked stuck fast in the middle. This ordeal, like the St. Wilfrid's needle in Ripon Minster, and, if we recollect rightly, a similar passage in Carcasonne Cathedral, would seem to prove that fatness is synonymous with vice, and leanness with virtue. Thus, that fat was an evil would appear to have been a doctrine long before the time of the teaching of Banting. As the columns are in places worn into concavities by the frequent passage of anxious obese believers, we contrived, by judicious management, to pass through safely, and thus clear our characters in the eyes of the Moslem. The only part of the interior which we noticed in our cursory survey as presenting marks of the occupation of the Crusaders who used this building as a residence, was a gable in the east side, which had a wheel window, apparently the work of Christian builders.

This window is a large quatrefoil, with smaller intervening foliations. The quatrefoils spring from colonettes, which meet in the centre. Below this is a round arched window, of a single light, the inner arch of which is built of small stones. It is slightly stilted, and rests upon shallow architraves, which surmount dwarf pilasters with rude capitals, like Corinthian, and regular bases. The round window was unlike any Saracenic work we have ever seen. The lower window resembles Byzantine work, but it is possible that it may have been constructed by Arab masons with fragments from an older building.

Leaving the Mosque by the north porch, we descended by a flight of steps to a subterranean passage, which runs the whole length of the building; parallel to it is a second similar passage, divided from the former by a row of piers and arches. Before reaching the end of the passage, which is formed by the southern wall of the Haram, the division ceases, and a chamber is left, almost square, having in the centre a monolithic column. The architecture of this part is so remarkable, that we give a detailed description of it, refreshing our memory by a rough sketch which we had an opportunity of making on the spot:—Four flat segmental arches, springing from a single central column, divide the roof of the chamber into four squares. Each of these arches has two sunk panels on the soffit. The one on the south side rests on a corbel in the outer wall of the Haram; those on the west and north sides rest upon half-columns engaged in the wall. The columns and half-columns are, as far as we can recollect, about 12 ft. high, circular, and without hands. The column has a symmetrical bell-shaped capital, ornamented with long strips of foliage, like palm-leaves, placed side by side perpendicularly, and in low relief. Each of the four divisions thus found was covered by a very flat domical vault, formed of two concentric rings of large stones, very carefully worked and jointed, with a circular key; the spandrels are enriched with radiating flues, in an scallop-shell pattern. There had been doorways in each of the southern divisions, opening on to Mount Ophel, as the narrow ridge lying between the Mount Moriah and Siloam was called. The position of the westernmost doorway is marked by two columns. Externally one half of the other doorway is visible; it goes by the name of that of the Prophetess Hulda. Mr. Fergusson considers it to be the work of Julian, when he attempted to rebuild the Temple, A.D. 363. This may be the date of the chamber and passages within, as the character of the work is earlier than that of the time of Justinian as exhibited in St. Sophia,

at Constantinople, and at Salonica. Had they been erected in the time of Herod, the capital would doubtless have foliage more closely resembling the Corinthian, that being the order employed by him in the Stoa Basilica, which stood above the chamber.

While we were in the upper building, the two mollahs who acted as our guides had intimated pretty plainly that they would like their bakshesh then and there. They did not delicately approach the subject by throwing out hints: a Turk generally asks for what he wants curtly, and sometimes peremptorily. They said, in short, "Ver para," which may be interpreted "Give us the farthings" (if the word "mite" represented a coin of appreciable sterling value, it might be used to render the word *para*, which is in reality the twentieth part of a penny). It is remarkable how, when men speak of money, they do so in a depreciatory manner. A Frenchman calls gold silver; we call it tin or brass, in vulgar parlance; a Turk calls it mites. We naturally declined to pay our mite until we had seen the whole show; for, knowing well the duplicity of the Oriental character, we thought it probable that if we did so we should see nothing more.

When we were in the darkest part of the vaults their demand was repeated, and this time backed by the dragoman. This appeared to us so much like an attempt at intimidation, that one of our party, vexed at the pertinacity of the dragoman, seconded his refusal by a slight push; whereat that gentleman became exceedingly irate, and said that if the aggressor had not been a British subject, he would have excited the Turks against him. That we had acted prudently in refusing to accede to their request, was subsequently manifested, for the guides were about to take us to the Golden Gate without showing us the extensive vaults which occupy the whole south-east angle of the inclosure, and which we insisted upon seeing before paying our bakshesh.

The descent into the vaults is difficult. They are reached through an aperture in the roof by clambering down the wall, assisted by projecting stones and by shrubs growing in the crevices. We found that they consisted of a series of arcades running from north to south, supported by piers irregularly built of courses of large single stones, rebated at the edges. The vaults above the arches were barrel-shaped, and constructed of smaller stones. The passages thus formed appear to be about 20 ft. wide and 40 ft. high in the highest part; but the surface of the ground was very unequal: in some places there were immense heaps of rubbish, and in others pools of water. A careful examination of these vaults will be necessary in order to determine whether they are of Justinian's time or of an earlier period. They extend fully 300 ft. on the south side, and about half that distance towards the north in the longest part; on this side the boundary is very irregular, probably because it is formed by natural rock. If it were possible to cut through the western boundary wall, there would be no difficulty in ascertaining whether it really concealed the eastern boundary of the Temple. A compartment of the vault at the south-east angle is walled off from the rest, and approached by a staircase. This is generally shown to visitors, as it contains a hollow stone which they are informed is the cradle of the Lord Eesa (Jesus).

We next proceeded to the Golden Gateway, which is situated in the east wall of the Haram, about three-quarters of its whole length from the south corner. It is in reality an oblong porch, divided down the middle by two Ionic columns of rude character, with Corinthian pilasters ranging with them at the sides, and half columns at the ends. (In plan both this gateway and that under the Aksak, seem to have followed the colonnades of the Temple itself, which we are expressly told were double,—that is to say, divided longitudinally by a row of columns. The aisle of the Dome of the Rock is also double.) From the columns spring segmental (not semicircular, as shown in Catherwood's drawing) arches. In the two eastern compartments are regular domes with pendentives; in the other, flat domical coverings, not unlike those under the Aksak. The bases of the columns stand upon plinths, and are rude imitations of the Attic base. Both the external faces of the gateway have pilasters at the side, with foliated caps resembling Corinthian, with elaborately enriched architraves carried in flat segments over the walled-up openings, and thus corresponding with the

arched passages within. At the north and south sides there are pilasters with capitals in the block supporting architraves, which do not range with those on the front. Within the Haram the ground has risen on both sides, so as to bury the building to one-half its height. On the south side of the interior is a small arched doorway, reached by a few steps. The mollahs were particularly jealous of our approaching this doorway, as the Mahometans believe that the city will one day be taken by a Christian conqueror, who will enter by this gateway. The mere proximity of any Christian to it seems to rouse their bile. There is a tradition that this is the gate through which our Lord made his triumphal entrance into Jerusalem. Sir John Mandeville says, "In the vale of Jehoshaphat, without the city, is the church of St. Stephen, where he was stoned to death; and thereby is a gate builded that may not be opened. Through this gate our Lord entered on Palm Sunday upon an ass, and the gate opened unto him when he would go to the Temple." Upon emerging into the open, we discovered the real reason why our mollahs had been anxious to pocket their mite at an early period, in the presence of the sheikh of the Mosauq,—a fine old man, who, as far as stature and commanding presence go, might have been our brother to the great Chang. This majestic grey-beard strode up to us, staff in hand; and, after saluting us with a *Sabz el hair*—which means Good morning, but which sounds like a preparation to exhortation—held out his hand for the gold which was his due. As the dragoman understood as well as we did the proper amounts to be distributed between the sheikh and the bekjes, we left him to act as paymaster; but he, afraid probably to resist, allowed the great man to take the lion's share, i.e., the whole. Now, we have an Englishman's natural horror of injustice, especially when it is perpetrated by a minister of religion, whether he wear the episcopal lawn, the plain cassock, or the green turban; so, mustering our best Turkish, we called after the sheikh, who had walked off with his booty, and talked to him in a paternal manner about the impropriety of his conduct in defrauding the bekjes. After a while, he seemed to see the justice of our argument, and refunded; and we left the holy precinct congratulating ourselves upon the improved signs of the times. Whereas, a few years ago, no Christian dared venture within this holy place, now a Frank could actually call to account El scheikh El Haram, and, what was more, induce him to give up his ill-gotten gains. We look upon it as the duty of every traveller to resist extortion, for the sake of his successors; and, in this case, our Consul's instructions were precise upon the subject. Our guides had evidently been accustomed to similar proceedings on the part of the superior, and had timed their demands accordingly.

Altogether, the day of our visit to the site of the temple was one of the white days of our existence. This is, or ought to be, one of the most interesting spots in the world, when it is remembered that a careful investigation of the buildings on it—such is the advanced state of acquaintance with architecture evidenced—will determine whether the whole Christian world has for ages been mistaken or not about the great scheme of man's Redemption were enacted. Who can be indifferent on such a matter, especially when he has the power of himself forming a judgment from these evidences; and who, being thus interested, can refuse help to the utmost of his ability, in the furtherance of any project necessary to bring about such a desirable investigation?

#### THE PREVENTION OF STRIKES.\*

Efforts for the Prevention of Strikes mingle, or run parallel, with some that aim at results far beyond what the title we have adopted would necessarily suggest the idea of; and M. Loclair is one whose hopeful views are not limited to a mere realization of terminated strife between masters and workmen. In 1850, he gave to the world a pamphlet "On Misery and the Means to be employed for its Cessation." We should say,

\* See pp. 737, 758, ante.

\* "De la Misère et des Moyens à employer pour la faire cesser; par Loclair, Entrepreneur de Peinture. Il n'y a pas d'effet sans cause. Tout, dans la Nature, a sa raison d'être." Paris, Imprimerie de Mme. V. Boucard-Huzard, Rue de l'Éperon, 3, 1850. 8vo, pp. 93.

in parenthesis, that it is difficult to fix upon an exact English equivalent for the French words *misère* and *miserable*; as the reader of Victor Hugo's "*Les Misérables*" may have discovered. The pamphlet is perhaps the best exposition of the views of its author at the period of the establishment of his Society. It was written at a time when the future, and the means of escape from the embarrassment entailed by the revolution of 1848, were the subject of deep thought in France. It begins by mentioning the opportunities, to which we have already referred, that the author individually had had of judging of the position of both master and workman. Having mentioned that he was born in the country, that he knows how people are there brought up, and what education is received, and how they live and work there; that he has inhabited the great city, laboured there as a workman, and lived the life of one; that he knows all the privations which must be self-imposed in order to make the least saving; and that he knows also the opinion, more or less favourable, that workmen have of their master, and of those who possess wealth, and how they appreciate the institutions tending to amelioration of their lot, M. Leclaire thus continues—

"During more than twenty years we have lived in Paris, the life of a master [*chef d'industrie*]; we know all the preoccupations that are experienced in that condition, to arrive at making what is called one's way; we know all the difficulties, the urgency of affairs of business the occasions, and all the vexations that sometimes those which demand attention cause; we know all the fears that a man of right feeling experiences about falling of his engagements; we know all the activity that it is necessary to display, and all the energy that must be used in order to resist this frightful torrent, this competition with the limits, which swallows up so many operations of contrivance in spite of the care that these bring to the direction of their bark that it be not upset.

Finally, we know, after a courageous struggle, after having come safe home, how difficult it is to preserve the fruits obtained by long and hard labour; and we have seen enough of violent revolutions to know all the disorder that they cast into the material and moral existence of families, and to desire more than ever to see a new one.

But what we know also are the physical and moral privations that generally workmen undergo when the unhealthiness of their avocations disorders their health; when maladies, infirmities, reach them, especially when they have the expenses of a family to support, and in their everything that awaits them when they can work no more."

The position of the workman is illustrated by particulars of that of each one of fifty-five individuals of M. Leclaire's own establishment, who had scarcely ever been in want of work; and annexed to the statement are the statutes of the original, or temporary, society "*de Secours Mutuels*," which we have referred to.

The body of the pamphlet commences with an enumeration of some of the marks of the "profound evil," the "*terrible evil*,"—what the author designates "*la misère*," that afflicts society. M. Leclaire traces to it selfishness, division of families, and the extinction of the most pure and generous sentiments that the Creator has placed in men's hearts. He says, it degrades the man in his own eyes, and engenders a multitude of crimes, which he specifies. All are agreed that it is indispensable to aim at the extinction of misery, or the diminution of its worst effects. Those whose labour is their means of existence, ask to be occupied constantly, and to be remunerated, so that they and their families may live honourably. Those who have wealth recognise the existence of suffering, and the importance of finding a remedy. On the one side, it is thought that to arrive at the object, it is necessary to have recourse to new means; on the other hand, known means are believed sufficient. The author shares entirely the latter opinion, seeing that in his point of view it is sufficient to develop these means, and to co-ordinate them, to obtain the result that each one desires. Any difference then, he says, as to the means of suppressing misery, is to be attributed rather to grievous misunderstanding than to any other cause.

There being accordance upon the main points, nothing is easier between men of feeling, according to M. Leclaire, than to come to an understanding; but he argues that the agreement in a matter of social reform, must not be by way of concessions, any more than in a mathematical question. He says,—

"We are all agreed that every being that is born, by the very fact that it comes into the world, has the right to live;

We are agreed that there is not effect without cause; we are agreed, in fine, that everything in Nature has its reason for existing;

But, to be consequent, we must admit that God in his divine creation has not desired that any being should suffer hunger on earth, and that if that is produced, we must attribute the effects only to causes that escape our observation, to our improvidence."

After saying that man has been created for

life in the family, and in society, he proceeds to argue that the individual man is rather destined for an agricultural life, and a continued residence in the place of his birth, than condemned to undergo the industrial disorder in which he only vegetates. Without entering into the discussion of some of these views, we may mention that the author concludes that the solution of the social problem is the finding the bond of the man to the soil where he was born, and that such bond is "the organization of the *commune*, conformably to the intentions of creation."

But the English reader will please not necessarily to associate the word *commune* with what is called *Communism*, and is sometimes so called with little knowledge of what "*Communism*" is or was intended to be. Whatever may be the view taken of the one of M. Leclaire's propositions just now alluded to, there is little in that which he proposes relative to the organization of what is merely a portion of territory (like *parish, township, or hundred*), that need not be adopted in England. He himself says—

"Let not people frighten themselves in the least at this proposition of organizing the *commune*. The question is not of constructing a phalanstery."

The object being to reunite and co-ordinate things already possessed, he proceeds to state what these materials of the organization would be. He shows that each district, or, in France, *commune*, would require:—

1. A minister of religion;
  2. A Society for Mutual Aid and for Retiring Pensions;
  3. A public nursing institution (*crèche*);
  4. An infants' school (*école d'enfants*);
  5. A school for older children (*école*);
  6. An office for registering the workmen without work;
  7. A method of wages-remuneration, especially for what has relation to agricultural works;
  8. Associations agricultural and industrial;
  9. Prizes in connexion with agriculture;
  10. A public bathhouse (*four communal*);
  11. A supply of water (*fontaine d'eau*);
  12. A service of firemen;
  13. A public washhouse and baths;
  14. A library;
  15. Arrangements for companionship in working at night during winter;
  16. A festival of the patron-saint;
  17. Public promenades;
  18. A hall of amusements;
  19. A society for festivals and games;
  20. A council of "*Fraichommes*;"
  21. Highway and building regulations.
- Lastly, as complement, some modifications in existing legislation."

There is scarcely more than one of these institutions that we need except, as peculiarly adapted to France, in saying that they comprise what should be found at or near to every centre of industry. Indeed, provident societies, schools; registration-offices in substitution for the present "houses of call," "statutes," or other agencies for hiring; adequate water-supply, baths and wash-houses, public libraries, promenades and places of amusement, and courts of arbitration, are so many things that have been steadily projected, or have been set on foot, by the friends of the working-classes in this country; and some of them are aimed at in our workmen's benefit-societies. But what district is there in England, that yet is adequately provided with such essentials to comfort of its labouring population? We cannot but call to mind that, on the occasion of one of the disputes of late years, in the building trades, when masters were anxious to put down the adverse proceedings of the trades-unions, the masters expressly reserved for after-consideration the organization of substitutes for the benefit-societies, and that since, they have shown no sign of movement in that matter. We think that, with advantage to themselves, they might interest themselves in a multitude of things in the comfort of those whom they employ; and it is on this account that we are going to notice at length, one example that has been set them.

Concerning the Mutual Aid Society, M. Leclaire observes that the help accorded to the members has the advantage of not wounding the sentiments or dignity of the recipients; and that the society is a powerful moralizer; as also that, because of the required submission of its members to rules, it is a living course of lessons in public law. The Mutual Aid Society is the mother, so to speak, of the Annuity Funds, or *Cotises de Retraite*. Amongst suggested arrangements for the society, M. Leclaire mentions those,—that each individual, without distinction of sex or rank, should form part of the society from the time of his birth,—provision however being made for new-comers, after a certain period of their residence in the locality or *commune*.

What is said of the public nursing-institution, would deserve to be brought to the particular notice of philanthropists in this country; where when it is understood what the meaning is of

the word *crèche*, there is always fear lest an imitation of the institution should involve neglect of the maternal duties and weakening of the affection. M. Leclaire gives satisfactory statements to the contrary of these suppositions; and we can corroborate the statements from our own observation and inquiries. He adduces arguments to show that the temporary separations involve gain in every respect, for both mother and child. As regards the infants' school, or *salle d'asile*, it is observed, that to have an exact idea of the services rendered by such an institution, the details given by Mr. Frégier in the work entitled "*Des Classes Dangereuses*" (which has been already referred to), should be read. As to the superior schools, we need only mention that the author's scheme of instruction,—even, it would seem, as for the schools of *communes* in agricultural districts,—would include linear-drawing, and a certain amount of practical geometry, and also vocal music, besides the rudiments of trades and callings connected with building, as masonry, carpentry, roof-covering, work, cabinet-maker's work, smith's work, &c. Of the need of a registration-office for men of work, the author of the pamphlet before us had spoken in 1842, in a previous brochure, that we have mentioned.\* He now alludes to the frequent loss to those who come long distances, attracted to works announced or known of as in hand. And he says, referring to the workmen who may be found at certain spots in Paris, waiting till they are sought for:—

"If we go within doors of the wine-merchants', the dealers in liquors', that spring up around those places, we shall see the workmen hired, pay for a glass of wine for the workman-hirer, in sign of gratitude; we shall see others of them paying for this glass as a mere colour of anticipation; at length, we shall observe some of them who, pushed to despair by want of work, drown their vexation in strong liquors."

Numbers of our readers know that a trifling alteration in these particulars would make them applicable to London; where, indeed, in some respects, the case is, as we have said, worse.

In a section treating of the mode of remunerating work, the author adduces arguments in favour, in some cases, of a payment "in kind," as enabling both parties in the labour-transaction to be deriving benefit at times when otherwise neither would be doing anything for himself. But much more would need to be said critically on such suggestions, than we have here opportunity for; and M. Leclaire has not noticed "the truck-system," from which his method,—though perhaps suggested chiefly for agricultural districts,—would seem not to differ materially.

Without mentioning further some of the objects or institutions suggested, we will give more at length his views on two of the matters which are most immediately connected with our subject as stated in the heading of these articles. First, of association, or partnership. As to this he thus speaks:—

"The division of forces, it is the division of interests; division of interests, it is envy, asperion of other people; it is calamity; it is a terrible strife that the chief of industry give themselves up to amongst themselves; it is despotism; it is slavery and idleness at once; it is competition without limits; it is the crushing down of the feeble by the strong; it is the general *quo-pro-quo*; it is to whom shall he mistake, the better; it is fraud, it is deceit, it is anarchy; it is the misery, in short, that we undergo.

Division of interests, it is the annihilation of property by its indefinite breaking up into bits; it is the oppression of every range so useful for the health of the cattle, and the quality of the meat from them. It is the impoverishment of the soil; it is confusion; it is chaos.

The re-union of interests, it is the contrary of all that precedes.

It is the concord of the interests of those having means, with the interests of those who live by their work; all cause of division ceasing, it is the respect for others and for their welfare; it is the liberty of each one arresting itself where the liberty of others is touched. It is emulation; it is order; it is peace; it is the reign of truth; it is happiness upon earth."

This may appear very enthusiastic; but there are in England those who have particularly studied the subject of co-operation, who might be expected to speak substantially in the like effect; and, indeed, they have done so—as references in our preceding articles may testify.

M. Leclaire says that partnership is easier of organization in agriculture, than in the description of affairs that he calls *industry*. About the latter we shall further see. As to the former, he gives different forms of association.

But he points to the suggested institutions together, as comprising what would prevent strikes of workmen, and frightful scenes to

\* "Améliorations à apporter dans le Sort des Ouvriers Peintres," &c

which he alludes, and would take away all pretext for revolutions.

The particulars given of the condition of fifty-five individuals attached to M. Leclaire, show clearly the difficulty of the position of the workman, especially of one who has grown old. As for the position of the man who has not been attached to a particular establishment, he says an opinion may be formed of what it would be, by noticing that even he who has remained attached long in an establishment, finds at the age of fifty no more work. More would such be the case with the wandering workman, who had been tossed all his life from place to place.

"For, the latter, who has been obliged to bend to all exigencies, to all the caprices of so many foremen of workshops, ceases to be himself; he exercises his calling with disgust, without courage, without intelligence. He acts like a true machine; he is stifled; he is morally dead! And what become then those beings who have no more the sentiment of their dignity, who are repulsed on all sides? What they become it is easy to understand: as they are no longer capable of doing anything, the liable contributors are obliged to provide for their subsistence, and even to pay up to the expenses of internment, according to those unfortunate succumb."

Witness of so many miseries, M. Leclaire sought to lessen them by the original institution, in 1838, of the Provident and Mutual Aid Society.

In a future article we shall give particulars of the Society that now exists, and of the entire organization and present position of the partnership which M. Leclaire has formed between himself and his workmen. The information that we have, is full and precise; it could not but be interesting at any time; and it is particularly so now. We could not feel satisfied to give these particulars without preceding them with an ample account of what led to the existing position: for, whilst there may be relations of masters and workmen in the two countries which are differently affected,—as by differing circumstances in habits and character,—there are many more in which the words of description will be recognised as applicable, or most suggestive, for the relations that concern us at home.

#### A LOUNGE IN LIVERPOOL.

THERE are several piles of handsome new buildings in course of construction in Liverpool at the present moment. Indeed, visitors cannot but be amazed by the number of these evidences of prosperity and progress; for an impression of merchant-princely opulence is diffused in their neighbourhood that at once strikes the eye and sets trains of thought in motion. The new Corporation-buildings and the Exchange, now both showing well through the scaffolding, are, at first sight, just the vast temples one would expect a merchant community, already committed to the Classic style by St. George's Hall and the Free Library, to rear. And we cannot but admit as we gaze, that Commerce is justified of her children in the extent and magnificence of the fanes they have reared in her service, and for the convenience of the administration of that order without which industry cannot be transmuted into wealth. When these buildings and the numerous blocks of handsome offices we are about to mention are finished, Liverpool may well be proud, although it has no Belgravia, no cathedral, no blue blood, and no mellow masonry.

The handsome Exchange is now built up as high as the windows over the principal floor. We have said that at first sight it fulfils the conditions we should assume requisite in a building devoted by merchant princes to commercial transactions. When we have examined it more minutely, viewed its large area and vast scheme, we begin to feel sorry for some of the details. The mouldings of the architraves and windows, and the pilasters, especially, appear somewhat pinched in their proportions, as though price had been the first consideration. No niggardness should be perceptible on such a building. It is impossible to be in the neighbourhood of the Free Library without feeling that the Liverpool merchants know how to give right regally; and consequently we note with the more regret any shortcoming. Nevertheless, the Exchange buildings will be a great ornament to the town. The courtyard of the edifice is now occupied by a brick building temporarily raised for the convenience of merchants.

The Corporation-buildings are also on a very large scale. They occupy an enormous block site in Dale-street, stretching from Crosshall-street to St. Thomas's-buildings, the façade being, roughly paced, some 250 ft. long. The principal

front consists of a centre, with two advancing wings, and is now as high as the top of the first story. It is faced with stone, and lined with brick, and the doorways are of granite. The caps of the Corinthian columns are ornamented with fern leaves instead of those of the acanthus; and considerable spirit and merit are apparent in the general design.

A marked feature in the Liverpool streets is the variety in the way in which the corner houses are treated. There are but few corner houses that are not splayed at the angle, or carved, or partly one or the other, with the projecting part supported on brackets; and few that do not display cunning devices to make the most of the position. Some observations in these pages a few years ago on the treatment of angles in foreign towns may have had effect. A new example, in the Gothic style, at the corner of Charles-street and Whitechapel, presents considerable liveliness of treatment. It is a public house, or gin-palace, three stories in height, built in red and white, and the local bricks, in hands. It is ornamented with carvings in stone, and a Gothic railing over the cornice of the shop, and is capped with a Gothic cornice of stone. The entrance is in the splayed angle, and over it is a circular window on the principal floor. The only mistake is that the capitals and carvings are so ecclesiastical in character, they might have been copied from a church. The sanitary condition of the crowded neighbourhood in which this house is situated, requires supervision, we perceive.

Of the many groups or blocks of new business-offices, we would especially mention a huge corner pile of building, called Oriol Close. This consists of a four-storied building, every window in which is an oriel. Altogether there are more than fifty oriels in it, all of which are exactly alike, and arranged in straight tiers. Between each oriel there are moulded pilasters, or buttresses, reaching in one continuous line from basement to parapet, which are profusely decorated with Early English dog-tooth ornament. The principal rooms are lighted by three oriels, and their ceilings, owing to the exigencies of the fireproof floors, are arched; each arch corresponding with an oriel, or three arches in each room. The fireproof floors are made of brick, each apartment being thus rendered independent of the accidents that may happen to others. Rigby's buildings are a series of shops with offices above. These are in course of being refronted above the shops, in cement, and ornamented with sculpture to meet the requirement of the day we might call eye-worthyness. In this respect they are in advance of some adjacent buildings, which would be the better for some such expenditure of enterprise: the old-fashioned George Hotel, for example, and the Royal Hotel, at the corner of Moorfields, coming first to mind.

It is this mixture of wealth with penury in buildings that is another distinctive feature in Liverpool. In the metropolis a fine site is usually occupied with houses of corresponding and nearly uniform appearance. But the Trafalgar-square of Liverpool, though having many points in common with that of London, has a strong dash of Tottenham-court-road thrown into it by the existence of a few shabby unworthy houses among the buildings surrounding it. Standing under the terraced portico of the Free Library, and looking upon St. George's Hall and the railway station, as one might look upon St. Martin's Church and Northumberland House from the entrance to the National Gallery, the resemblance of the two sites is striking, even to the street opening out of it in a similar position to that occupied by Parliament-street. But here the resemblance ceases. The houses in this street are small and dirty, and should make way for better ones. Their chimney-pots occupy the position that should be occupied by the drawing-room floors of a handsomer class of buildings. Although one side of the square is sumptuous with the enormous American hotel, another side has an ugly eyesore in a shabby group composed of an American and Canadian kerosine and petroleum oil dépôt, a cigar-shop, a frail bazaar, an eating-house, the turning into a narrow dingy street called Liversley-place, two or three old public-houses,—the Warriors' Rest and the Angel, to wit,—and Bentley's book store, most of which specimens of the domestic and commercial architecture of the last age are made still more garish by enormous announcements of the wares dealt in by their proprietors permanently painted upon them in huge black letters. A few masterly touches, such as the removal of inadequate objects occupying conspicuous sites, and Liver-

pool would be more like the cities of the ancient Classic world than anything we have. Incessant attention, however, is required to keep even first-class arrangements in order. We were forcibly reminded of this fact beneath the portico of the Free Library, where some of the paving slabs had sunk, and the rain lay in shallow pools many feet long. And here, perhaps, we may give agreeable information to many, when we say that, turning into the reading-room of the Free Library, we saw 200 readers sitting so silently over their respective books that the fall of a pin would have been audible if it had occurred anywhere of the india-rubber pathways between them. Most of them appeared to be clerks and steady working men; but there were some in actual tatters, the slow movement of whose heads as they read, from the beginning to the end of a line, told their poor scholarship and their scanty opportunity of study. That the most ragged beggar is free to walk into a good room, and sit down and read any book that he can ask for till he is tired, is another fact that Liverpool may rejoice over. The Museums of Natural History were also well attended, as well as a Gallery of French Engravings, to which we have referred before.

Fire-proof flooring is much in esteem in Liverpool. It comes, perhaps, of a community of merchants that chances should be calculated to a nicety, and that all risk should be reduced to the minimum as far as expenditure can insure that desirability. In the court of the block of offices called the Temple (distinguished as the Inner Temple), there are huge piles of offices in course of erection in white and red bricks, with iron girders, to carry the floors and iron mullions to the window openings. This precaution is being taken in many other cases, but, curiously, not in that of the Exchange. This building has plate beams to carry ordinary floors.

The Alexandra Buildings are a group that promise to be further ornament to this fine landing-stage to Old England from the New World. And near the Exchange Railway-station, at the corner of Tithebarn-street, there are three groups side-by-side, all building, that are remarkably striking in their effect. A narrow street intervenes between two of them, and another flanks the third, thus affording return frontages to all three. Two of them, each four stories high, but one much more advanced towards completion than the other, are built of stone, and might be compared to Italian palaces. The principal front of the loftier of the two has four tiers of nine windows, or thirty-six in all, with a handsome parapet above them, with a large piece of sculpture in the centre of it. The second is not so far finished as to admit of description. The third consists of a series of segmental arches in three tiers, with eight straight-headed windows in each, with brick jambs and stone arches, and tympanums and iron columns for mullions. In the return are some thirty windows of the same kind as those in the principal façade. Besides the numerous buildings, yet veiled in scaffolding, there are many from which it has been removed long enough for the weather to have toned down the appearance of extreme newness, but which absentees from Liverpool will find to have sprung up within the last few months. The gymnasium, with its novel façade, composed of a low centre and wing, with a tall mansarded tower at both ends, is one of these instances, as well as the little colony of chapels and churches grouped in its neighbourhood. Of the latter, Hope-street Church and School-buildings would be creditable to any community, both in design and workmanship. The materials, however, are not quite faultless, the choice of wooden gates having entailed early dilapidations.

Across the full glittering bosom of the Mersey, bared to as noble a merchant and passenger fleet as the sun can shine on, there is more work going on close to the water's edge. New hotels and extensions of railway stations mark the great increase of traffic of the present day, as well as the national daintiness and nicety in the requirement of clean, comfortable, and commodious quarters.

ADVANCE IN THE PRICE OF COPPER.—In consequence of a further advance of 5l. per ton in the price of copper, the principal firms yesterday raised the price of brass and copper wire and tubing a halfpenny per lb., and yellow metals a farthing per lb.—*Birmingham Gazette.*

## THE PUBLIC WORKS DEPARTMENT IN INDIA.\*

The next point to be discussed is the "Leave and Pension Rules."

About two years ago the Government attempted to force upon the covenanted engineers a new set of rules, considerably less favourable than the not very liberal ones originally held out as the condition of their appointment. The attempt appeared scandalously unjust and dishonourable, and its legality was very questionable. Great indignation was excited among the Stanley engineers, who fought for two years against the imposition, and have at length been successful in obtaining the option between the New and the Old rules. The effects of the breach of faith, however, remain. The manner in which the Government treated the first remonstrances made to them,—by ignoring altogether the existence of a covenant equally binding upon Government as upon the other side, and by treating the covenanted engineers as entirely without rights or claims on the score of their agreement,—gave rise to deep and widespread distrust. Counsel's opinion was taken upon the covenant, and the result was not favourable to the good faith of the Government. It was found that, while professing to secure to the engineers certain rights, privileges, and benefits, as the conditions of their appointment, the deed was ingeniously worded so as to bind the Government to nothing, and the other side to everything—in fact, to place the engineer, who believed he had a charter of rights, entirely at the mercy of his employers. It is most important to candidates to be aware that their agreement, so far from securing them any rights, is worth little more than waste paper; and although the Government have hitherto, except in the instance of the new Pension Rules, used their power with forbearance, it is possible that when certain officers, who openly avow their hostility to civil engineers, come to the top of the Department, as in the natural course of things they must soon do, these powers may be used greatly to the disadvantage of the civilians. Already it sometimes happens that a civil engineer under covenant, who has been guaranteed in his deed of agreement "an adequate travelling allowance," and "all articles necessary to the due performance of his public duties," is compelled to keep, out of his own pocket, two or three horses, solely for the public work, without receiving one penny of allowance.

As all engineers who now enter the service are subject to the new (uncovenanted) leave and pension rules, which were promulgated in July, 1863, it is unnecessary to refer any more to the old rules, or to point out wherein the two sets differ. But a short résumé of the rules now in force may perhaps be useful. They are as follows:—

1. *Leave*.—One month in each year, on full pay, and, counting for service, may be granted at the discretion of the chief engineer, provided no inconvenience or expense to the State is caused.

One year's furlough after ten years' service in India, and a second after eighteen years in India, on from one-sixth to one-fourth of the full pay of appointment; or, instead of furlough, six months' leave, on private affairs, once every six years, on half-pay of appointment.

Leave without pay, up to one year, may be granted once during service, at discretion of local Governments. Sick-leave is allowed to the extent of three years during the whole period of service, on half-pay for the first fifteen months, and one-fourth for the remainder of the leave.

Neither sick-leave, furlough, nor leave on private affairs counts for pensions.

2. *Pension*.—No pension is a matter of right; it is entirely optional with the Government to grant the full pension allowed by the rules, or a part, or none at all. Sir Charles Wood has recently directed that the full pension is not to be given except in cases of special merit.

A pension not exceeding 400l. a year,—if the average salary for the last five years is under 2,200l. a year, or not exceeding 500l. a year, if over that amount,—may be given to officers who have completed thirty years' actual service in India. (This is only to be given in full to particularly meritorious servants.)

A pension of similar amount may be given to an officer after twenty-five years' service in India, if he be certified by a medical board to be utterly worn out, and totally unfit for further service.

A pension not exceeding 200l. a year for salaries averaging, for five years preceding, less than 1,200l. a year, and not exceeding 300l. for salaries averaging over that amount, may be given to officers obliged to leave the country under a similar medical certificate, after fifteen years' of actual service in India.

Officers whose health may fail before they have completed fifteen years' service, receive no pension or gratuity whatever, but are entitled to a free passage back to England.

As before observed, the above rules are less favourable than those formerly in force, although even they presented but small attractions. In estimating their advantages, it must be borne in mind that sick-leave and furlough do not count for pension: so that about five years must be added to the above periods of actual service on this account; and further, that service before the twenty-second birthday likewise does not count towards pension. On the other hand, three years of sick-leave and two years of furlough give a large allowance of leave to England to those who can afford to avail themselves of the privilege; married men, with children, seldom can do so, as the expense is too great. Indeed, a man cannot prudently marry on his pay alone, unless he makes up his mind to stay all his life in India. The uncertainty of his own pension, the absence of any provision for the widows and orphans of those who die in the service, and the impossibility of a man with a family saving out of his pay, are grave reasons against marrying without private means.

The pension rules are perhaps the greatest drawback to the service. If a pension is given at all, it should be absolutely certain; and not unreasonably deferred, however small in amount. Government can dismiss a servant who is found to be inefficient or careless; but the man who is thought worthy to serve half a life-time, is also worthy of his reward. The pension, in fact, has been justly earned, for it is part of the consideration for which service has been rendered. If the amount of pension, or the obtaining of a pension at all, is to depend on "merit," which often comes to mean the chance favour or disfavour of the head of the department, the prospect is too uncertain to have any real value. It must be inexpressibly galling to a man of independent spirit to have to restrain himself from expressing any opinion distasteful to "the authorities," lest he should endanger the only provision he has to look to for his old age.

About two years ago efforts were made to obtain better pension rules for civil engineers. The present rules were originally intended for natives of India in inferior positions, such as moonshoes, office-keepers, head constables, &c. A petition was therefore addressed to Sir Charles Wood, and forwarded, it is understood, with a strong recommendation from the Government of India, praying that civil engineers, as professional men who have had previous experience and a special education, might be placed on an equality with the natives in the legal, educational, and judicial departments; who, although serving in their own country, and able to live much more cheaply than Europeans, are allowed much more liberal terms of pension. Sir Charles, characteristically ignoring the merits of the case, replied that as plenty of civil engineers could be got on the present terms, he saw no necessity for improving them. We are glad to see, however, that the younger members of the profession are beginning to appreciate the appointments offered them at their true value; and that at the last examination there were only six qualified candidates for ten vacancies. So Sir Charles has reckoned without his host.

The rules as to examinations in the native languages and in professional knowledge have been considerably altered of late, and now stand as follows:—

The first standard in Hindustani, and a professional examination, must be passed, the latter within a year of arrival in India, the former before promotion to assistant engineer, first grade.

The second standard in Hindustani must be passed in order to qualify for the rank of executive engineer, fourth grade.

The professional examination is conducted by a committee of three officers of the department. Its scope is rather vague, but it is intended to test the aspirant's knowledge of the materials and resources of the district and the local peculiarities of work. It is not an ordeal to be feared by any one of ordinary good sense.

The Hindustani standards are more serious affairs. The first requires a fair colloquial

knowledge of Oordoo, and the power of translating from tolerably easy books in the Persian and Nagari characters. The former is used for the Oordoo, and the latter for the Hindee dialect of the composite *lingua-franca* known as Hindustani. A little industry will enable the student to achieve the first standard in two years after arrival.

The second standard comprises translation from more difficult books in Oordoo and Hind, reading and translating Persian and Nagari manuscripts, and writing exercises from English in both the characters and dialects before mentioned.

This standard is considerably more difficult than the old one, which used to be called the P. H.; and, as comparatively few of the Stanley engineers succeeded in passing even that, it is thought that the new standard will prove a serious difficulty. The Government have made an excellent rule, allowing assistants three months' leave on full pay to study the languages. This concession was granted, it is believed, in consequence of the strong remonstrances and complaints of the Stanley engineers; and is encouraging as a proof that Government are not deaf to their representations, when patiently and perseveringly pressed upon them.

The writer could have wished to give his readers some idea of the varied and extensive duties which devolve on a Government engineer in this country; but the length of this communication warns him to defer that subject to some other time. A few words, however, must be said upon one important branch of his duties which causes the engineer much trouble and money,—I mean the accounts. As responsible contractors scarcely exist beyond the presidency towns, the engineer has to carry out his own works by petty jobwork, or even by daily labour. The system of accounts is complicated, lumbering, and needless to a degree; and, moreover, it is revolutionized about once in three months, to say nothing of petty changes every week. The Government, with that foolish shortsightedness which somehow inevitably clings to official proceedings, will not allow the engineer proper assistance in the way of time-keepers, clerks, and accountants, because they have set up a highbar called "percentage of establishment,"—the meaning of which is, that they cut down the supervision and establishment, until the work alone becomes costly and bad, and then rejoice that they have reduced the cost of spending a shilling from fourpence to threepence; forgetting that if they now got for fifteenpence only half what they formerly got for sixteenpence, the arrangement on the whole is not economical. The engineer is called on to spend half his time in mere mechanical work, compiling accounts, drafting returns, &c., which might just as well be done by a clerk on one-fourth of his salary.

But there is worse than this in the system: under recent recent orders (*viz.* chap. xx, New Code) every item of expenditure, however proper or however unauthorised by higher officers, to which the controller chooses to object,\* if not recovered within three months (which may be quite out of the power of the engineer), is to be summarily retrenched from his pay; and further, if the accounts are delayed beyond a certain date (which again may be entirely beyond the control of the engineer), half his salary is to be forfeited for that month. If it is replied that these orders are not meant to be enforced, it will be found, on referring to the New Code, that the controller is bound to enforce them; and a friend of the writer's actually was fined a month's pay for not sending in a return which he had never been ordered to submit. He recovered the money by threatening legal proceedings, but destroyed his prospects in the Department by his contumacy. These rules are perfectly illegal, at least as regards covenanted engineers; but any one who ventures to object to them must expect to become a marked man, and to lose all chance of promotion, even if he escapes being dismissed under some pretext of "insubordination." Those, however, who choose to enter the service, knowing the existence of these rules, cannot complain if they are enforced against them.

It will be gathered from the description above given, that the writer, in common, he believes, with the great majority of his confrères, cannot at present recommend the service to young engineers looking out for employment. At the same time it has undoubted advantages; and

\* See p. 743, ante.

\* That is, every item which he chooses to place under the heads "Inefficient" and "Correctious."

under altered conditions may yet offer them a good field, and a reasonably attractive career.

Society in India is very pleasant and friendly to those who take a little pains to cultivate it. Every one's position is so well known, that there is little of the reserve and exclusiveness which foreigners complain of in England. All members of the department, civil and military, have a strong fellow feeling; they all know each other more or less, and wherever you go, you are sure to find kind and hospitable friends. The Bengal engineers and the civil servants, with whom civil engineers are chiefly brought in contact, are fine fellows, generally clever, well-informed, agreeable companions, whom it is a pleasure to know and to work with. Even bigwigs, who seem sometimes in their official capacity, seen through a fog of foolscap, the enemies of mankind, turn out on a personal acquaintance, frank, unaffected fellows, whom you have not the heart to abuse any more. By the way, it is astonishing to a stranger to find how every one in India hates everybody else, till he discovers that it is all talk. Anglo-Indians abuse each other, their superiors, their friends, their predecessors in office, and especially the Government, from morning till night. But there is no ill-nature in it, all the renown of which Anglo-Indians are capable being reserved for one person, whom it is unnecessary to name.

The work is hard and trying to health and temper; but it is interesting and satisfactory. In assisting to "develop the resources," the engineer feels that he is taking a part in one of the most beneficial functions of Government: and his works remain after him, permanent monuments of his labour. Pecuniary anxiety need not trouble him after the first few years, if he is prudent enough to remain a bachelor; and if he can reconcile himself to exile, natives, prickly heat, mosquitoes, and so forth, he may be tolerably happy. But sooner or later the "English fever" will seize him; a maddening hatred of India and all it contains, a wild desire to get "home" if he has to sweep a crossing for a living, takes possession of his whole being. Happy for him if, when he seeks for the friends of his youth, he finds not an empty solitude! Many a man, after rushing to England to enjoy the fruits of twenty years' anticipation, has found his place filled up, and returned, broken-hearted, to lay his bones in the land of his exile.

The writer has described, as fairly as he is able, the career which is likely to open itself to more and more of our young engineers. A scheme is now under the consideration of Government, for raising and spending, in the next ten years, twenty millions sterling upon irrigation works. To carry out this plan some 250 civil engineers will be required from England. The result of the last examination shows that higher terms must be offered to obtain them. It is hoped that this paper will assist intending candidates in estimating the advantages which may be offered. With the drawbacks herein pointed out removed; with the salary on entrance raised to Rs. 400 a month; with pay and promotion equalised to those of military men; with the higher posts thrown open to civilians in practice as well as in theory; with equitable leave and pension rules; and a certain retiring allowance after a reasonable period, the Department would offer a very fair career to young men without interest at home, who may prefer a modest competence in an honourable and useful position, to the chances of fortune in struggling for the glittering prizes of ambition. Let us hope that the Government will give Lord Stanley's experiment a fair chance of success, by granting the reasonable concessions above pointed out. C. E.

Bengal.

#### SEWAGE UTILIZATION AT PRESTON.

A REPORT by Mr. J. Newton, C.E., on this subject, has been presented to the Corporation, and printed by their order. Mr. Newton's plan is to appropriate the sewage at Marsh-end, near the junction of the two mains which drain the whole town into the Ribble, and from this point to force the sewage, by means of a forty-horse power engine, through iron pipes, of 20 in. diameter, on to the marsh lands purchased for the purpose. The cost he estimates at 73,000*l.*, including the purchase of 865 acres of Glifton-marsh, and the annual expenses at 5,043*l.*, or 5,168*l.* an acre. He anticipates from the working of the scheme a revenue of 7,500*l.* per annum, clear of all expenses.

#### THE WINTER EXHIBITIONS OF PICTURES AND DRAWINGS.

The thirteenth annual display of pictures painted by British artists shows evidence of the same taste and judgment which has secured for its precursors a good name in its local habitation, 120, Pall Mall. The success attending these minor but very interesting exhibitions has naturally led to an extension of the system; the Society of Water Colour Painters adopted it; and now, in addition to those already established, one on a greater scale of magnitude, embracing oil and water-colour performances, with a section representing French, Flemish, and female practice in particular as a special adjunct, has been arranged and opened by Mr. Wallis at the Suffolk-street Gallery.

Any pleasant relief that may be offered for shortening the long short days of this gloomy period of the year must be acceptable indeed; even to those whose chief complaint is that they are not long enough; and any one who may assist in providing it has some claim to consideration as a public benefactor. Even the most philosophic must at times find it necessary to be reminded that spring, summer, autumn, and winter are pretty equally divided, after all; that their succession is alike valuable and indispensable; for some are apt to overlook gratefully the advantages of all seasons but those that really are not to be sneezed at, and to doubt if they ever get a fair share of what they may like best.

The parent of these institutions,—that which has so agreeably helped to sustain a public belief in the existence of art and artists, in all kinds of weather, for the last dozen years,—welcomes the visitor as gracefully as ever to her select "at home." No better occupation of a painter's leisure could be recommended: the pictures are just sufficient in number to satisfy without fatiguing; the fastidious will find their inspection repaid by much that is clever, and more that is pleasing; and those who see good in everything, but are content with a glance at it, may calculate on having whatever portion of that time remains to them, absorbed in following the rather vexatious order of catalogue employed.

However, the catalogue may almost be dispensed with altogether, where it is so easy to identify the painter with his work, as is the case with Mr. J. G. Hook, R.A., and his forcible representation of Britanny peasants overtaken by "The fast-flowing Tide" (55), whilst carting seaweed for agricultural purposes: he has never rendered more truthfully open daylight effect, clear sky, and moving water: the bullocks that so stubbornly insist on going the wrong way appear even small for Britanny cattle, but it may be an objection engendered by apprehensions of the dreadful rinderpest that everybody knows everything about, unless he happen to be veterinary, and an excusable desire to see all available heaves left, as far as possible. Fortunately there was no such occasion as this for deprecating the consumption of veal in Dr. Johnson's epoch, since we have Boswell's authority for knowing his partiality to it made patent by Mr. E. M. Ward, R.A., who illustrates the great lexicographer's susceptibilities to the polite attention of Mr. Wilkes at their first interview (105), when that gentleman appears to have been so assiduous at dinner in his attempts to find the metaphorical short passage to the heart down the throat to some purpose, for "he gained upon him insensibly. No man ate more heartily than Johnson, or loved better what was nice and delicate." The choice morsel of fine veal,—a little of the brown, some fat,—a little of the stuffing and some gravy, with a square of lemon, were the so many assaults to which the doctor's fortification of reserve at last succumbed. "Sir, sir, I am obliged to you, sir," cried Dr. Johnson, "bowing and turning his head to him with a look for some time of surly virtue, but in a short while, of complacency." Mr. Ward excels in delineating character and making perspicuous any amount of story he undertakes to relate; and however comically this episode reflects on the actors, the scene is admirably descriptive of the circumstance, and as admirably painted.

Mr. Calderon, A.R.A., contributes a very cleverly executed work; but he has had to contend with a great difficulty necessarily. In the "Attempted Escape of Mary Stuart from Lochleven Castle" (14), the disguise of the queen in the clothes of her landress is so perfect as to render it too improbable that she should not have escaped. The exception may be nearly as nice as the picture otherwise is; but, with so many

valuable qualities, it is a great pity that a little more dramatic licence has not been taken to elucidate the subject. The figures of the shivering landress and the waiting-woman are excellent. Mr. F. Goodall's "Iver House, in the Time of Charles I." (44), is charmingly pretty, with its group of children feeding snow-white swans, whose home is in the moat, overgrown with water-lilies and sword-flags. Mr. F. R. Pickersgill, R.A., has found a new *pose* for the eternal two of larger growth, which is both natural and elegant, as, reaching from a bank to gather—

"The sweet forget-me-nots  
That grow for happy lovers" (78).—

the cavalier is assisted by the fair one of his choice, who is certainly very lovely, and looks of a nature to be trusted; which is more than can be said of the sparkling little *brunette* Mr. A. Elmore, R.A., has confided to the surveillance of "The Guardian" (31), who may be pardoned some of the austere gravity with which he expresses his sense of such a responsibility in an age, as their seventeenth century costume would indicate, when the care of such a light charge, was heavy enough. As a specimen of Mr. Elmore's exquisite method of painting, this is very covetable, and there the intentions of the author are fulfilled. Similar works of similar purport are furnished by Mr. W. P. Frith, R.A., in (41) "His Likeness," and (42) "The Fancy Fair;" also by 33, wherein a buxom damsel is "Taking an opportunity" of writing a love-letter, and of visibly mentioning Mr. T. Faed, R.A. Mr. G. F. Watts always bears witness to what great effect an inherent feeling for art and didactic knowledge will prevail, and how valuable as a chastening influence these possessions are, compared even with the most extraordinary acquirement of manual power uncontrolled by them. His "Portrait of a Lady" (109), and of "Mr. Hanbury" (107), though with nothing inconsistent in their emulation of Venetian antecedent to lessen their value as representations of contemporary existence, are removed out of all class with the usual production of present days.

Mr. F. Leighton, A.R.A., is also a follower of precept, but of more modern theory. His "Lady with Azaleas" (65) is very fascinating and very French, painted with a combined vigour and refinement that few possess in common with him. The damasked and gold-embroidered drapery is not its least best point.

Mr. Millais, R.A., sends two small studies that are amongst notable items, (76) "Little Red Riding Hood" and a young lady baving her "Attention diverted" from her pianoforte practice (77). Mr. F. Sandys's female heads are remarkable for the precise finish with which they are executed, but appear rather flat and at times out of drawing, or as if they were drawn from an elongated concave mirror; "The Flower" (83), for instance.

"Die Hen Magd" (26), by Mr. W. C. T. Dobson; "Boulogne Fish Market" (49), by Mr. J. Hayllar; "The Casket" (59), by Mr. A. Hughes; "The Grassy Walk" (66), by Mr. G. D. Leslie; "Petitioners to the Young Hen" (74), by Mr. H. S. Marks; and "The Stepping-stones" (113), by Mr. W. F. Yeames, deserve more than a passing comment, though they need no direction to attention.

"The Eve of the Deluge" (96), by Mr. W. B. Scott, is one of this artist's best works, and distinguished by earnestness and many signs of research and study, wins acknowledgment even from those who admire it the least and are the most likely to question its particulars and peculiarities.

Messrs. Yeames, Hodgson, Leslie, Story, Marks, and Wynfield have co-operated in making a series of designs for a dining-room screen, depicting the preparations for a banquet; and its integral success is likely to encourage those who adopt decoration in their dwelling-houses to secure the best means of indulging in so laudable a taste. It is to be wondered at that the plan now introduced (doubtlessly suggested by the South Kensington precedent) has not been called into earlier requisition, and that these painters, and others as capable and ready, should not have employed their off time in improving the style of ornament now so generally obtaining in superior residences.

Mr. J. D. Watson's single figure in fourteenth-century costume, "Preparing a Gudge" (112), will associate him with those from whom better things may be expected. It is very cleverly drawn and coloured. We break off only for a time.

## ARCHITECTURE: A REVIEW OF THE POSITION.\*

Of new buildings that have been completed in the past six months in London, none rank so high as, or are of more importance than, the giant hotels which have reared their lofty heads above the surrounding, comparatively speaking, pigmy houses; and the new hotels of Charing Cross and Langham-place, and the one now just completing in Holborn for the Inns of Court Company, are certainly great improvements upon the plaster palaces which have been before erected, and are more especially noticeable for the almost total avoidance of sham materials. Whether we like or dislike them in an art-point, is simply a question of individual taste; but they are certainly imposing, and free in a great measure from rococo ornament and plaster imitation; and anything in the way of example that may be set for the lessening of the evil of Portland cement, is certainly deserving of all praise, not only from an æsthetic point of view, but also because cement for external work in London seems to be of all material the worst, as can be exemplified by the smoky and abominably dirty appearance of most of the buildings in which it has been used; and it is only after successive and constant coatings of paint that the material in any way is made to look decent at all; and I should imagine that the triennial painting of these plaster palaces must be no small expense to their proprietors. The introduction of terracotta work in the Charing Cross Hotel is especially worthy of our study and imitation.

Tastes differ as regards forms and styles and examples to be imitated; and it is to be hoped that we may never entirely agree, for I cannot but believe that it is this difference of opinion that calls up the constant competition and aim to excel and improve. But the more we seek to insert in our designs, in place of the sham materials which even now hold so much sway, good and true materials, the higher will be the standard of our nineteenth-century architecture, and the more shall we call forth the thoughts and designs of the potter and other art-workmen, and open up and revive much that has been latent in materials and art-manufacture; and, by endeavouring to design our buildings so that their decoration shall not only be constructional and real, but adapted for means that we may have at our disposal, instead of seeking for bad and unreal ornament, we may hope that we shall get manufacturers and others to compete in reviving the old, or in inventing new and better materials for our use; and so form a kind of fellowship with art-manufacturers which shall be of advantage to us as well as to themselves.

To combine with good, skillful, and artistic handicraftsmen must be our aim; and by so doing, I think we may yet hope to have the ancient decorations of the potter in all our buildings, and obtain, at the same time, something that shall not only give colour and effect, and by its plasticity be easily worked to our design, but also an inexpensive material, which in these days of cheapness and competition will be no small matter. Let us hope that the architects of our day may be different from those of the days of that great potter master, Josiah Wedgwood, and that instead of snubbing his suggestions for the use of terra-cotta ornaments and bas-reliefs in the façades and decorations of their buildings, we may take advantage of his suggestions, and not only seek to realise his day-dreams, but also take example by our Medæval and Saxon forefathers, and make use of this and other materials, which their wonderful artistic and manipulative skill, as exemplified by hosts of examples still remaining to us, has converted into so much decorative and practical use.

Let us seek to do our best in all we do, and, to use the words of the able biographer of the life of Wedgwood,—"Even as the men of science purify the atmosphere of our cities and towns, assuredly they will, let our public buildings become, in the best sense of the word, palaces of art, and the interior of our houses shrines of simple taste in ornament and colour. Wall-linings of terra cotta would do away with the barbarous taste of the paperhanger and upholsterer, and floors of exquisite tilework would serve to border the warm embracing carpet. Here would be work enough for the potter and the artist; and in the chastity of colour and the purity of design we

might rival antiquity, whilst true to the spirit of our generation."

I do not believe that this is any romantically conceived idea. Much lies before us, and if we will only earnestly strive to use all that God and nature have given us, and to work in fellowship and brotherhood with our fellow men, we may yet have in our day and generation some national—not, mind, a new—style of architecture, appropriate to modern requirements, which shall save us from the shame of being mere copyists of other men's work. Pray do not think that I ask you in any way to listen to any of the empty and idle talk about a new style, for, as has been written by an eminent art-writer, "the essence of a style, properly so called, is that it should be practised for ages, and applied to all purposes;" but our aim should be, while studying the grand examples of ancient work that are left to us, to seek to design our work so that it may be not a mere pseudo imitation of Mediævalism, but in accordance with present requirements and modern inventions. I think we may, however, fairly congratulate ourselves upon having made some considerable progress in architectural design in the last few years, if in this great city we look at the buildings, both ecclesiastical and civil, that have recently been erected, and compare them with those of twenty years ago. Amongst churches lately built, there is one to which I would especially draw your attention, as being one of the best, if not the best, of them all, and one which exemplifies in an exceedingly good and beautiful manner how much can be done with plain honest brick,—I mean the church of St. Peter, at Vauxhall, by Mr. Pearson.

You will see in this church that everything that has been done, has been done thoroughly; there has been no scamping,—and, moreover, the architect has evidently in a way been bound down by the narrowness of worldly means, and has yet so designed his building, that hereafter, from time to time, may be added such decoration in the way of fresco painting, &c., as means may permit. There has been a careful avoidance of all attempt after "bizarre" ornament, and overflowing of paint and cement inlays. Everything is simple and honest; no notchings, no chamfers, but all is substantial and good.

One great feature in this church, and one worthy of our study and imitation, is the brick-vaulted roof; and another, the large wall spaces or panels that are left, to be filled up hereafter, when means permit, with that best of all art-decoration, figure subjects in fresco; and I cannot but think that we should be right in seeking to imitate this modern example set before us, and in saving the means at our disposal for figure subjects, as proposed here, rather than spending them in unmeaning conventional decoration, and lines, and zigzags, and dots, painted, or inlaid in cement, all over walls and roofs. Surely the power and strength of the decoration is, the more it will be understood and appreciated.

There are many other notable churches lately erected in and around London, in all of which there is much to be studied and thought of, but amongst so many good ones it would be irksome to particularize.

Again, in the City, and in our streets, surely we must admit that great strides have been made towards improvement in the warehouses, public offices, and shops, that have lately been erected; I will not presume to individualize any one of these, but a walk through Lombard-street, Cornhill, Fleet-street, and others of the more crowded streets of London, will surely convince you that there has been "some shaking amongst the houses." Even our engineers are now calling in the aid of architects to design their stations, and in part their bridges; and I think that with the new stations at Charing-cross and Blackfriars, and those now building in Cannon-street and Broad-street buildings, we shall have some reason to consider that our art is taking higher ground.

Even now in this great day of capital and wealth, the great public companies, as well as private enterprise, are boring through, as it were, and destroying their way through the great city, threading their way with quiet, progressive steps through old, narrow, and dirty byways, demolishing much that is ugly and inconvenient, and opening out new streets and new ways, which, so soon as time shall have enabled them to rebuild, will do something, I hope, to overthrow that criticism of our neighbours across the Channel, and convince them that we, in good old England, are not quite so destitute of taste as they would fondly imagine.

The new street through Blackfriars to the

Mansion House that the Metropolitan Board of Works are about making, and the improvements at Piccolo on the Marquis of Westminster's estate, are all steps in the right direction; and some of us may yet live to see handsome streets of honest good buildings, and see them also free from the film of smoke and mist that at present are part and parcel of this great city; for I am sanguine enough to believe that improved skill and science will enable, not only public furnaces, but also private grates, to consume their own smoke, and thereby render us free from this curse and trouble, that makes our city show out so unfavourably compared with Paris and other modern continental towns.

Of course, we may find fault with something, if so disposed; and it is not to be expected that, at once and entirely, we shall shake off the teaching of long years of bad taste; and in much of the new work it may be that there is too much striving after show and effect, rather than simplicity; too much copying of "bizarre" ornament and overlaying of decoration; but I cannot but think that, in due course, all this will rectify itself, and that, as our art-education increases, and our range of examples becomes wider,—and, thanks to the iron way, which modern skill and modern science have interlaced half over the world, and are still interlacing, we are able each year, if we will, to increase our store of Mediæval study, and to see each year more of the art and art-work of our forefathers,—so much the more will our ideas tone down and be simplified; and, also, so much the more will the public, who by the same means can see all that we see, insist on a truer and better kind of art-work, and be satisfied with less ornament and more reality.

Not only in architecture proper, but in all its accessories, must we hope to see continual and increasing progress; and that, by diligently perusing our manufacturers and jewellers, upholsterers and brass and iron workers, and all other trades which more or less have something to do with art-work,—or, rather, should have; for, at present we cannot say much for the art or the work that these gentlemen turn out,—to either obtain the aid of artists to design for them, or, at all events, to employ a designer who shall have been more or less educated to his work, we may hope to get more taste and art design in everything around us.

Within the last few years the art of stained glass in England has been making rapid progress, and the works of many of the manufacturers of the present day may, I think, even bear comparison with some of the best old work. And why we should not be always able to do good glass now-a-days, after all the great improvements that have taken place, and the infinitely greater facility for obtaining materials of all kinds, is a thing much to be marvelled at; but until true artists,—men who not only can draw the figure well and properly, but who also know how to colour,—are employed to design and colour the cartoons, we can hardly expect much improvement in stained-glass design. Some manufacturers have availed themselves of this aid, and in the cartoons of Mr. Holliday for the windows of Worcester College Chapel, at Oxford, which have been ably worked out by Messrs. Lavers & Barrand, we see the great desideratum of employing artists to design. But inasmuch as the artist soon rises above cartoon designing, and as soon as he gets name and fame by some lucky Academy hit, no longer is willing to work at mere decorative work of this kind, so much the more does it become a necessity that our art designers should be educated in figure-drawing and colour to a much greater extent than at present; and by the aid of our Governmental schools (about the only good thing Government has done for art for a long time has been the establishing of these schools), let us hope that a better class of designers and art-workmen may be formed. So much for the design of the glass; and for the glass itself we must trust that manufacturers will eventually be able to give their glass somewhat more of the old texture and colour. Doubtless the glass of Chartres Cathedral windows, and all the other old stained glass, owes much to the hallowing and sobering influence of time, which has toned it down; but let us hope that, ere long, we shall get that exquisite jewel-like appearance and thoroughness, if I may use the word, of colour which the old glass has, instead of the vulgarity, and gaudiness, and crudeness of colour which pertain to so much of our modern stained glass; and from what has been done by several manufacturers, we may fairly hope that we are in the right way to have in our

\* From address read by Mr. Robt. W. Edis, at conference of the Architectural Association, elsewhere mentioned.

day stained glass equal to that of the thirteenth century; and yet see the churches of our time "blazoning with the radiance of jewelled and gem-like arabesques" and coloured crystal, instead of vulgar copies of bad foreign glass, and the still more vulgar commingling of crude and vulgar colours.

Again, with regard to metal work, and the work of the silversmith and the goldsmith, how abominably bad most of it is. We either have heavy unmeaning masses of cast brass ornament, or else flimsy cut brass leafage and scroll-work, with just so much design as the ability of the manufacturer is able to insert. Why must everything we have around us be necessarily ugly? What can be more atrocious than the Brummagem cast bronze, or imitation bronze work, that hangs as gaseliers from our ceilings, or intrudes itself in endless form throughout our public and private buildings and our streets? Is it necessary that work with any design in it shall be dear? Or is our day and time a day of ugliness, that we cannot get design anywhere, and must put up with vulgarity?

In the times of the Greek and the Roman, and in the Medieval days of Gothicism, cheap things were not ugly things. You may take up the commonest and most homely vessel, and you will find that its form is good. If you will look at the examples which have been preserved to us and now find homes in our museums and private collections, you will find the commonest things were beautiful and in good taste. It is not that good art then was any cheaper than it might be now: it was because the appreciation of good detail and lovely form was innate with the people of those times: and they were so accustomed to see everything around them lovely and in good taste, that their art-education was self-taught; and thus each man became, as it were, an artist, and, as such, artistic workmen also.

I know that designed furniture costs no more than other work, when once you have taught your workmen how to make it; and the mould and making for a good design is no more expensive than that for a bad one. There is no necessity that cheap things should be ugly, or decoration vulgar: these things all become a question solely of design, which again, in a great measure, turns upon art-education.

This brings me to speak of a matter that has been engaging the earnest attention of this Association for some time, and one which we shall have to consider and take action upon in some way, I hope, in the coming session. I mean that of "Architectural Examination."

It is now, I believe, some ten years back since this Association determined to take steps to establish a system of architectural examination, whereby a more definite professional status for architects might be obtained, so that, if possible, our profession should cease to be one in which any man, no matter how ignorant or how unqualified, could, if he so pleased, enter. Starting on the broad basis of endeavouring to work some general benefit for the profession at large,—for such we must consider a recognised system of examination would of necessity be,—we were desirous of obtaining for ourselves as architects a similar system of examination, and consequent professional recognition, as that which is necessary for all the other professions.

About a year after this, our Association, I believe, memorialized the higher powers above, the Institute, and after much consideration and talking, the matter was taken up by them, and architectural examinations were inaugurated; but beyond the mere examinations, we have at present got no further, and are practically in the same position as we were ten years back, except that those gentlemen who like to learn a certain number of lessons, and get the examiners of the Institute to hear them, and desire to pass an examination for their sole gratification and pleasure, can, if the numbers be sufficient, do so. Further than this they cannot go: at present, the examination scheme, if I may be allowed to call it so, is a farce, always excepting that there is a certain amount of honour and credit due to the man who passes successfully the somewhat stiff examination; otherwise there is no use in it; we still remain where we were. Any one may now have his name engraved on a plate, and set up as an architect; and the most ignorant and incompetent may still practise as such, and as such must of necessity militate to the detriment, not only of the cause of art and of educated architects themselves, but also to the imposition of the public, for they, the public, must of neces-

sity judge of our art by the work itself; and when we see the result of some of the work of these gentlemen, who have thrown down the hod and taken up the pencil, we may well say that it is time that architectural examinations shall take place. I firmly believe that we shall have the good wishes and assistance of all well-wishers of architecture; but, on the other hand, it must not be expected that the young men of the present day,—who, whether in practice for themselves, or working as clerks or pupils for others, have very often but little time to spare for any ephemeral undertakings,—will devote long months of toil for reading and study to enable them to go up for the examination, simply, as I have said before, to pass it, or mayhap, as last year, to be rejected, not on their merits or demerits, but because the number arbitrarily fixed by the Institute as the smallest quantum to make an examination had not been made up. But let the Institute offer some tangible inducement, and there will not, I believe, be any lack of competitors.

That the Institute, as a body, will give this all-important matter their best and serious reconsideration I cannot but believe; for those who have done so much for the cause of art in the last quarter of a century, and of themselves, to raise the character of architects and architecture, will not, I am sure, be the ones to refuse to help their pupils and their sons in attempting to follow in their footsteps, and in their time from seeking still further to raise the standard of our rank. To them as our masters and teachers we owe much, and I hope we may, therefore, confidently look forward to having their advice and aid. But, on the other hand, let us not turn back: let us look forward, not backward, and not give up the good work which we have commenced; let us not allow what we have done by any shortsighted disgust or despair; but earnestly, manfully, and diligently strive for the object we have in view; still work and study amongst ourselves; and, I believe, in time our end will be obtained. In fact, we have ourselves, by the inauguration of our Life Class, at least shown our great anxiety to aid in carrying out the suggestions made to us by Mr. Scott and others, and I am glad to be able to say that in this we have been successful. Last year we had forty-seven members in the class, of whom more than two-thirds were members of the Association, and under the able superintendence and care of Mr. Poynter, the artist whose services we were fortunate enough to secure, considerable progress has been made, and to him and Mr. Tarver, the honorary secretary, I consider the Association is much indebted. I trust that this year the numbers will be increased, and that members will show their appreciation of the scheme, and their desire also to carry it out, by joining this class forthwith. I feel quite certain that the drawing of the figure cannot be too strongly advocated, and that it is one of the most essential and necessary parts of an architect's education to do this well. If you do not learn now, you will never learn; and I cannot too strongly urge on the gentlemen of this Association the absolute necessity of doing what men a great deal better than I have been urging upon them for some time, viz., learning to be able to draw the figure with ease and facility.

Let us be able to design for the potter and for the decorator, and get them to mould the clay and paint the wall in fellowship with us; but, before we ourselves can even hope to design well for them, it is necessary that we ourselves shall have diligently studied and gathered up the materials of our forefathers; shall have seen how their design and work were done, so as to be enabled to combine such experiences and such study with the necessities of modern requirements and the advantages which modern skill and modern invention have given to us. Do you think for one instant that, if our Medieval forefathers had lived in our day and generation, that they would not have grasped at the many inventions and improvements of this nineteenth century? Do you think we should have small narrow windows, and coarse, bottle-ended knobs, settling like flies amongst them? No, I think not. I think that the men who could so beautifully design and work with the materials and the education they had before them, would have grasped at our modern inventions, and would have thrown some life even into cast-iron girders and plate-glass windows, and not have crossed our rivers and our streets with ugly straight lines of simply mechanical skill and human power. Into human power would have been thrown assuredly some art. They would,

I believe, have done justice to the materials which, by the enlarged scope of invention and scientific skill, we nineteenth-century architects have to our hand; and surely there is no reason why we should not do likewise.

Of all things that tend most to harm the cause of art in this nineteenth century, I cannot but think that that of narrow cliquism is perhaps the greatest; for surely cliquism is merely an extended form of egotism; and he who narrows the limits of his sympathy and help in art-life to the circumscribed circle of the few who think exactly with himself, surely is no well-wisher of art; for we must look on the world of our art from no narrow circle of our own, but from as wide a point of view as our education and minds will permit us; and the more we embrace within our gaze, the more likely are we to perfect the work that we love.

I am quite certain that the more young architects (I say young, because I am speaking to this Association) know of each other, and the more they meet together in good fellowship and friendship, the better it will be for them all. There is no need for all to agree on questions of art; we all probably differ in this matter, more or less, as we do in other things; but why should there be any necessity for constant fighting over the ashes of extinct quarrels, and taking up the gunnelt for designs of centuries ago? Have we no design in us, no hope in us, no brain to work for ourselves, or must we divide into divers cliques, and swear and do battle for the leader of this and that clique, now rushing on to the brightening lanes of the thirteenth-century French school, and now clashing swords with the champions of Early English; now up in arms for the true and original, and national farmhouse and cottage architecture, and now swearing allegiance to the only and real style, the round arch Gothic of France and Italy? We write and talk as if in this nineteenth century we were simply to form parties and opinions in defence of different schools, following out and swearing by different creations of the past; and the war wages bitterly on, and instead of the battle of the styles, we have the battle of the cliques, and when "clique meets clique," then comes the tug of war. Is there no general school? Must we, because we like this or that, say that all else is wrong? Surely not, and I trust this Association will look a little beyond the narrow arena of any so-called clique. There is no reason that our ideas and opinions should all be alike; but if we differ let it be in a friendly manner, and rather than ignore those whose opinions are different, let us strive for interchange of thoughts and opinions, and to enlarge our own views. To compare thoughts and ideas will be, I am sure, to the advantage of us all. We are all students, earnest students, I hope; but the more we study together, and the greater interchange we have of honest opinions,—mind, not opinions taken from other men, but formed from our own honest convictions,—the more good shall we do to the cause we all have at heart.

#### CONVERSAZIONE OF THE ARCHITECTURAL ASSOCIATION.

The session of 1865-6 was opened on Friday evening (the 27th ult.), with a *conversazione* held at the House in Conduit-street.

The rooms were hung with drawings, photographs, and other works of art, and there was a numerous attendance of the members and their friends, including a fair contingent of lady visitors.

The chair was occupied by the president, Mr. R. W. Edis.

Some formal business having been disposed of, the report of the judges on the drawings submitted for the prize in the class of design was read. It recommended that the first prize should be awarded to Mr. Birch, and the second and third to Mr. Florence and Mr. Bailey.

Mr. Penfold read the report on the drawings submitted for the prize offered by Mr. Tito, M.P., for the best design for a railway station for a small town, and which referred, in terms more or less commendatory, to the designs with the signatures "Progress," "Nil Desperandum," "Odd Hours," "Love's Labour," "W" and "Buffer." They recommended, on the whole, that the prize be given to "Buffer" (Mr. Johnson). The president subsequently handed the prize to Mr. Johnson.

The Association's prize for the best essay "On the Materials most appropriate for London.

Exteriors," was awarded to Mr. J. D. Mathews, one of the honorary secretaries. The president, in handing Mr. Mathews the prize, expressed in complimentary terms the gratification which it afforded him to find that it had been awarded to one who had laboured with so much zeal and ability to promote the interests of the Association.

The president then read his opening address, the greater portion of which was printed elsewhere.

At the conclusion, Mr. Godwin having been called upon to address the meeting, said he had really little or nothing he desired to say, except to repent what he had already often uttered on former occasions, namely, the expression of his desire to see the Association prosper. He was not a new friend—he had attended their earliest meetings—and he was glad to hear that the committee were satisfied with the progress which it had made. He hoped that as the students became, in course of time, practising architects, they would in their turn send their pupils and sons to participate in the advantages which the Association afforded. If this were done, the number of members would soon increase, instead of being only about 300 as at present. It was, he thought, to be regretted that the scheme for voluntary examination had scarcely found the favour that might be desired at the hands of the Association. It would, he thought, be a pity, that such an apparatus had been constructed, it should fail for want of material to work on. It was surely surprising that five students should not be found to come forward for the honour of the Association, to avail themselves of the advantages offered, or to show that they had not called for an examination without meaning to take advantage of it. He could understand that candidates for examination would desire some certain reward for their trouble, such as the right to affix to their name, Bachelor of Architecture, or Master of Architecture; but should it not be within the power of the Institute to confer such degrees, still it ought to be in itself an inducement for students to be able to say that they had gone up for examination and had proved deserving. It would, moreover, tell in the world. It was gratifying to see the designs and sketches of the classes exhibited in the room that evening; for although they might not be quite so good, as it struck him, as those of a year or two previously, still, when compared with what had formerly been exhibited, they furnished satisfactory evidence of skill and of power of invention. In his opinion, the value of drawing could not be over-stated. No one could hope to be an architect without a knowledge of drawing, although drawing alone would not constitute an architect. Holding this opinion, he recommended them not to neglect the class of design, nor the sketch-book, nor the country tour. If these were attended to, the student of architecture would not fail to obtain a power for himself, and contribute his quota of good in his day and generation. So far as the elder branches of the profession were concerned, he was sure they would be quite willing at any time to help the Association to realize the objects which it had in view.

Professor Kerr, in moving a vote of thanks to the President for the excellent paper which he had read, observed, that since he had got old himself he had taken an old-fashioned view of architecture. With regard to architectural criticism, if it might be so called, he was of opinion that considerable want of sense had been exhibited in the manner in which the question had been argued. They ought not to forget that it was necessary to look at architecture from a practical and common-sense point of view. He would recommend young architects to look upon themselves as candidates about to make a contract with the British public. They had to live by that contract, and the British public expected the architect not to cover the building with useless and unintelligible ornament, but to make it good and useful, and to clothe the whole with grace and comeliness without an effort. As for Mr. Ruskin's canons of art, if architects were angels of Heaven, they could not do what he required; and even if they could, John Bull would not appreciate it, because he loved that which was practical and to the purpose, and this could always be accomplished without making any sacrifice to beauty of design. Some persons were of opinion that architects could be dispensed with altogether. Some country gentlemen, for instance, thought they could build their mansions without them, and some country clergymen were also of opinion that they could

construet their churches without their aid. He believed, however, that in the end they were generally brought to the conclusion that it would have been better had they consulted an architect. What the public wanted was confidence in architects, and, in order to gain it, the attention of the profession should be turned to practical matters. After some other remarks, enforcing the value of a practical and common-sense style of architecture as opposed to florid, elaborate, and in many instances unintelligible ornamentation, Professor Kerr concluded by expressing his gratification at the spirit of union which had been urged in the paper. This, he said, he entirely approved of, because, however architects might differ among themselves as to style and so forth, it was most desirable that they should always act together against the common enemy,—the ignorant outsider.

Mr. T. R. Smith, referring to some observations which had fallen from Mr. Godwin, said he quite sympathised in the regret expressed by that gentleman that so few members of the Association had shown themselves willing to go up for examination. He did not think that anything in the shape of a diploma should be granted until a sufficient number of students were found fit and ready to receive it. Those gentlemen who were fit ought not, he thought, to hold back in the hope of other inducements being offered, but should consider that priority in the list was in itself a great distinction, which it undoubtedly was. He had listened to the address of the president with much gratification, and had great pleasure in seconding the vote of thanks proposed by Professor Kerr.

The vote having been unanimously awarded, the business of the evening was brought to a conclusion; after which, a selection of music was performed, in which Mr. Alfred Gilbert, Madame Henry Percy, Mrs. Chaplin Henry, Mr. Wells, Mr. Dawson, and others, took part, under the direction of Mr. Alfred Gilbert.

#### PROPOSED CONGREGATIONAL MEMORIAL HALL, LONDON.

At the meeting of the Congregational Union, at Bristol, it was resolved to erect a Memorial Hall in London, at a cost, including the site, of about 70,000*l.* Towards this, Mr. Remington Mills, M.P., has contributed the munificent sum of 10,000*l.*, on condition that four other gentlemen can be found who will each give 5,000*l.* Mr. John Crossley, of Halifax, who was one of the speakers at the meeting, stated that although he was not yet in a position to say whether he should be one of the four, he had no doubt he should be "there or thereabouts when wanted." Another gentleman promised to be one of twenty to contribute 500*l.* each.

#### THE JURORS' REPORT ON THE BIRMINGHAM INDUSTRIAL EXHIBITION.

This report has been published. As was to be expected, the Jurors found that a great number of the objects exhibited were at once excluded from competition; among which they mention a quantity of copies from inferior works of art, many models of architecture and machinery of a perfectly useless character from a practical point of view. With regard to objects of art unconnected with manufacture, the jury report a great deficiency as to quality. In the department of art manufacture, the Exhibition, though deficient in many respects, is reported to have been decidedly more satisfactory. The works in flint glass exhibited, in particular, were remarkable for their general excellence. In ornamental window glass they regretted that only one specimen of leaded work was exhibited. To this work they awarded a first-class medal. In stained glass suitable for domestic purposes the works were, on the whole, above the average in merit.

In ornamental metal-work the number of specimens exhibited was less than might have been anticipated in an exhibition held in a town so celebrated for its metal manufactures, and but few of the works were of the highest order.

Decorative work in cast-iron was also imperfectly represented. The wood-carving exhibited was in some instances executed with remarkable ability; but, unfortunately, the best examples of workmanship were inappropriate in design.

Works in papier-maché were very numerous, and to several the jury made an award.

Carving in stone and marble was a branch of art-manufacture which the jury regretted to find represented by only one exhibitor. In ceramic and fictile ware the Exhibition was also by no means so extensive as might have been anticipated; and the objects exhibited were not such as appeared to call for any particular remark.

The new inventions, varied as they were in their objects, formed a highly interesting feature in the Exhibition.

#### TRIBUNAL OF COMMERCE.—PARIS.

On the island of the city proper of Paris, when the projected designs are carried out, the edifices will consist almost exclusively of public buildings. The Cathedral of Notre-Dame, the Palais de Justice and its new additions, the Sainte-Chapelle, the new Caserne de Gendarmerie, the new Tribunal of Commerce, the Prefecture of Police, and the Hôtel Dieu, have occupied a large proportion of the area of the island. The few remaining private houses must shortly be cleared away for the new Prefecture of Police, now in course of erection, especially when the principal block of the southern façade is commenced. This necessitates the demolition of the ancient Rue de Nazareth and the arcade giving access to the *Chambre des Comptes* (ornamented by the chisel of Jean Goujon), and every private house in the *Quai des Orfèvres*. The new Hôtel Dieu and *Marché aux Fleurs* will clear away the rest.

The Tribunal of Commerce stands at the angle formed by the *Quai Napoleon* and the *Boulevard du Palais* (or *Sebastopol*) and faces the grand entrance of the Palais de Justice. In its halls are regulated all affairs relating to trade, commerce, or manufactures; and in its courts are judged all cases arising from purely commercial transactions,—criminal and correctional justice being administered "over the way."

The council of *prud'hommes*, corresponding in some measure to the guilds of our corporate towns, consists of four parts, each comprehending many branches of industry;—the council of metals, which includes four categories; the council of tissues or woven fabrics, comprehending six subdivisions; that of chemical products, embracing also six branches; and the council of divers manufactures or industrial arts, containing all those specialities not enumerated in the preceding classes.

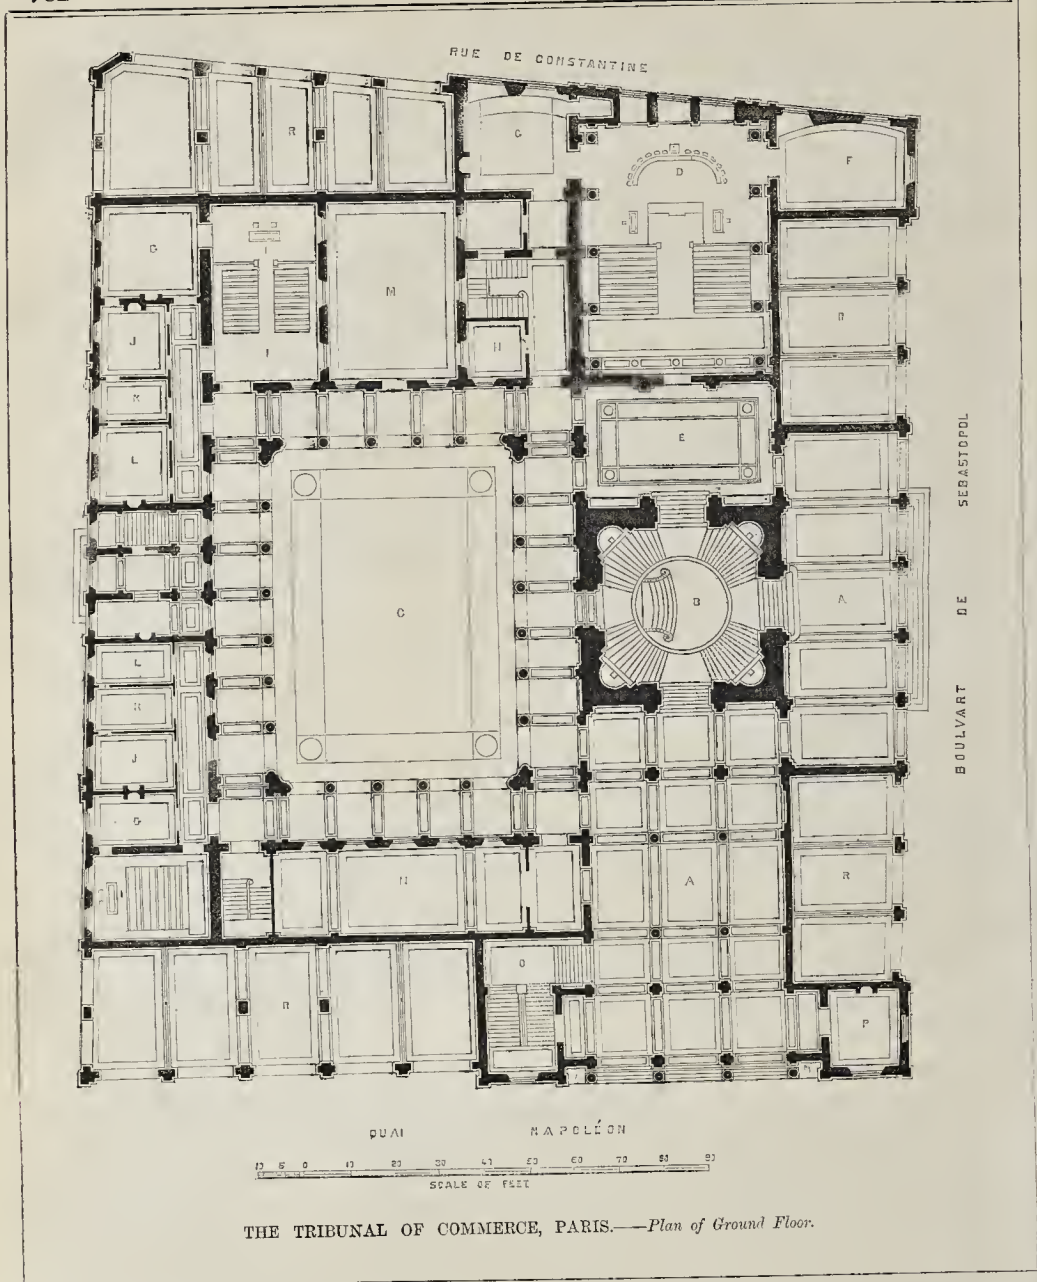

These divisions have in the new building been provided with separate accommodation, containing a president's room, secretary's office, clerks' rooms, and consulting and arbitration chambers for each of the four great classes. Besides these there are waiting-rooms for witnesses, and spacious lobbies. On the ground floor are distributed two of these classes, also the hall of trade marks (*marques de fabrique*); the other two being on the first floor.

There are three façades to the building;—the western or grand front, with state entrance; the north front, furnished with a handsome entrance also; and the eastern, called the façade of the council of *prud'hommes*.

Entering by the western doorway, up a flight of steps, 52 ft. 6 in. broad, we arrive at a vestibule, 75 ft. by 26 ft., from which we can pass either to the judiciary chamber of the *prud'hommes*, at the right hand, to the principal staircase in front, or on the left hand through the northern vestibule (43 ft. by 82 ft.), by which we reach the *cour d'honneur*, or covered court, and thence the several offices. The court of honour, 56 ft. by 79 ft., surrounded by a peristyle, 12 ft. wide, with columns of the composite order, gives light to the adjoining corridors and apartments by means of large windows. It is roofed over with slabs of glass. The court of the *prud'hommes* (D on plan), is the exact counterpart of the tribune of commerce immediately over it, on the first floor. It is ornamented with ten composite columns, five on each side, and the ceiling is profusely gilt.

The grand stairs under the dome commence by an easy series of steps, as far as the first landing, whence an open bay, furnished with a balustrade, looks upon the court of honour. Here the stairs bifurcate, and each of the portions curving round, they meet at the landing on the upper floor. The eight faces of the staircase form as many circular-headed bays, separated by pilasters at the angles. Four of these bays are filled in with statues; the other four, except that giving

entrance to the lobby, are furnished with balustrades, and give a view of the vestibules and the colonnade, which corresponds to the peristyle of the court of honour above. The disposition of the first-floor is exactly similar to that of the ground-floor; the tribunal of commerce, immediately over that of the *prud'hommes*, is lighted wholly from the ceiling, both in day and night, the idea having been taken from the lighting of our Houses of Parliament. There is also some similarity in the ceiling, which is entirely gilt.

The ornamentation of the interior of this building has not been sparingly carried out, yet there is no appearance of heaviness in any part. The flooring of the court of honour, and all the lobbies, halls, and waiting-rooms, is paved with Italian mosaic, in cubes of a little more than a

centimètre each way, set in cement, and forming geometric patterns and borders. The walls of the lobbies and waiting-rooms are inlaid with central marble panels of various colours. The general style of the façades of the building is that of the Renaissance, the doorways ornamented with composite columns and pilasters, and the windows of the first story with pediments, alternately triangular and segmental. On the western façade these are ornamented with sculptured recumbent leopards, and the letter N. The attic story is pierced with bull's-eyes, decorated with garlands. Four statues are placed on the northern doorway; these are due to the chisel of Elias Robert, Eudes, Hyppolite Chevalier, and Jules Sampson. M. Robert Fleury is engaged to execute four vast paintings, illus-

trating commercial history, in the great council chamber. M. Auguste Bailly is the architect of this building.

THE TRIBUNAL OF COMMERCE, PARIS.—M. AUGUSTE BALIXY, ARCHITECT.

## DINNER OF THE BUILDERS' BENEVOLENT INSTITUTION.

The eighteenth anniversary dinner of the above charitable institution was given at the London Tavern, Bishopsgate-street, on Thursday evening, the 26th ult.; Mr. Joseph Rigby (president of the institution) in the chair.

About 200 gentlemen sat down; among whom were Sir John Rennie, Messrs. R. Mallett, Burke, G. Plucknett, G. Ladds, G. Spenser Smith, T. Robinson, T. Ferguson, S. Wood, George Bird, Joseph Bird, G. Stanley Bird, J. Russell Freeman, J. N. Sheffield, Charles Rigby, George Dines, Dove Brothers, J. Passmore Edwards, L. M. Tatham, W. Keddle, J. Kay, W. Freeman, J. Phillips, &c.

The usual loyal toasts having been duly honoured, followed by "The Army, Navy, and Volunteers."

The Chairman rose to propose the toast of the evening,—"The Builders' Benevolent Institution"; and, in so doing, expressed his pleasure at seeing so many gentlemen present to do justice to that institution, the interests of which the majority of those assembled had much at heart; but as there might be many gentlemen who were not sufficiently acquainted with the intention of the promoters and the good they hoped to do, he thought it desirable to state the objects of the institution. It was founded in 1847, for the purpose of giving relief and granting pensions to decayed members of the "various" branches of the building trade and their widows; also for affording temporary relief to workmen in cases of accident. They now had forty pensioners upon their funds, the males receiving 21l. per annum and the females 20l. Notwithstanding the eighteen years that this institution had been established, it appeared that their stock amounted only to 11,570l., 8870l. being for the relief fund, and 2,700l. for the building fund. Upon that condition of their funds, he asked them if they had done all that they ought to have done, hearing in mind the builders as a class. For his own part, he was of opinion that more should have been done, and that there was no trade, considering the many who were engaged with them, who had a greater opportunity of doing good to their poorer brethren—of those who had been exposed to the vicissitudes of fortune, and had fallen under circumstances over which they had had no control. It was for those particularly who had been reduced when apparently in the midst of prosperity that he had then asked for aid. He felt that that institution should be made self-supporting; and after the lapse of eighteen years, and the means the builders had at disposal, he repeated his impression, that they had not done what they ought to have done, while there were yet so many really awaiting and asking for their help—for that small sum of 24l. per annum. There were many thousands of builders in and near London, and he thought, for the sake of the fallen brethren, that more should be done, so that the committee should have a greater power of disposal to those who were anxiously waiting to become the thankful recipients of the benefits of that institution. He concluded by proposing "Prosperity to the Builders' Benevolent Institution."

The toast of "The Chairman and President" having been responded to,

The Chairman next proposed "The Patrons of the Institution," in which he included the names of Sir John Rennie and Mr. E. Mallett, making reference to their well-known engineering skill.

Sir John Rennie acknowledged the compliment. He admitted the principles of the institution. He stated that engineers were a part of the builders, for without the latter they could do nothing. The institution, on behalf of which he had assembled that evening, reflected great credit upon its promoters and supporters, and he hoped and trusted in its further success.

"The Architect and Surveyor" was next proposed, the Chairman remarking that at the present day no one could walk through this city, nor any of the cathedral towns, without admiring the magnificent structures which may be connected either with the ecclesiastical, municipal, or domestic style of architecture. They were not behind their day in architecture. He coupled the toast with the name of Mr. Sancton Wood.

Mr. George Bird, on the proposal of "The Brighton Branch," with which his name was associated, said he was rather pleased at the goodly number of gentlemen before him, but was sorry that they had not expended their money a little more liberally on behalf of the institution. He alluded to the Building Fund, which, after

eighteen years, amounted only to 2,700l. He thought that was a small sum when he considered the immense wealth possessed by the builders. He thought that those who built palaces for others might at least build houses for their poor. He, however, hoped that early next year something relative to these buildings would be done.

"The Press" (to which Mr. Edwards replied), and "The Directors and Stewards" (acknowledged by Mr. Joseph Bird) having been duly responded to, Mr. Harris (the secretary) read over the list of donations and subscriptions, which amounted to about 400l.; and included the following:—

The President, 20l. 5s.; Mr. Charles Rigby, 10l. 10s.; Messrs. Geo. Myers & Sons, 6l. 5s.; Messrs. Lee, Son, & Smith, 10l. 10s.; Mr. G. Spenser Smith, 6l. 5s.; Mr. J. Russell Freeman, 10l. 10s.; Messrs. W. Cahill & Co., annual, 10l. 10s.; Messrs. Lucas Brothers, annual, 10l. 10s.; Mr. Mallett, 10l. 10s.; Mr. Sancton Wood, 6l. 5s.; Mr. Edwards, 10l. 10s.; Messrs. Cheswright, Sheffield, & Co., 10l. 10s.; Mr. William Webb, 10l. 10s.; Mr. W. Francis Webb, 2l. 2s.; Mr. J. Ladds, 5l. 5s.; Mrs. Joseph Bird, 5l. 5s.; Mr. George Bird, 5l. 5s.; Mr. Stanley Bird, 1l. 1s.; Mr. J. Ferguson, 5l. 5s.; Mr. J. Cresswell, Birmingham, 2l. 2s.; Mr. L. M. Tatham, 5l. 5s.; Mr. Wm. Todd, Jun., 3l. 3s.; Mr. G. Anderson, 5l. 5s.; Mr. William Radford, 5l. 5s.; Messrs. Greaves, Kirkham, & Ball, 5l. 5s.; Messrs. Abbott & Hopwood, 5l. 5s.; Mr. J. E. Hobson, 5l. 5s.; Messrs. Jackson & Shaw, 5l. 5s.; Mr. Henry Barrett, 5l. 5s.; Messrs. Dove Brothers, 5l. 5s.; Mr. John Webb, 5l. 5s.; Mr. Jas. Tyler, 5l. 5s.; Mr. Chas. Hack, annual, 2l. 2s.; Mr. S. George Fritchard, annual, 2l. 2s.

## A MONUMENT FOR LEIGH HUNT.

Mr. S. C. HALL, in a "Memory of Leigh Hunt," published in the *Art-Journal*, says,— "He was buried at Kensal Green, but, unhappily, there is, as yet, no monument to record his name and preserve his memory: that is a reproach to all who knew him, and to all who have read, admired, and loved his many works—a generation that reaps the harvest of his labours. His works will, indeed, do both—they will be his monument—more enduring than any of 'piled-up stones'—and they will preserve his name for ever among the foremost men of his age and country. But it is not right that the crowded 'graveyard' which contains sculptured tablets of so many illustrious authors, artists, and men of science, should be without one to this great writer, and I appeal to the thousands by whom he is estimated to remove from England the reproach. It will gratify me much if I can obtain contributions for that purpose, in addition to my own. A large sum is by no means requisite. Such a monument as Leigh Hunt would desire should be unassuming and unpretending, as was his career in letters; and if I am so happy as to receive responses to this invitation, I will set about the work." About 50l. is the sum spoken of as necessary: it surely ought to be a little more; and some 50l. have been already sent to Mr. Hall to carry out his very right suggestion. Are there not a few of our readers who would like the privilege of sharing in so good a work?

## THE WALTER MEMORIAL FOUNTAIN, NOTTINGHAM.

This first stone of a proposed memorial fountain to the memory of the late Mr. John Walter, of the *Times*, and for some time member of Parliament for Nottingham, was laid on the 24th ult. The proposed structure is described to us as of Gothic character, octagonal in form, divided into four stages rising to a height of 40 ft. The diameter at the base is 12 ft. Four basins of polished Aberdeen granite occupy four sides of the lowest stage, the other four compartments being filled in with suitable inscriptions. Immediately above the basins on two sides will be placed medallion profile portraits of the late Mr. John Walter. They will be of white marble, considerably recessed under traceried canopies. The eight compartments are finished with gables having carved finials at the apices, and this stage is surmounted by a trefoil pierced parapet. The flat surface behind the gables is relieved by diaper work. At the eight angles are buttresses relieved with pinnacles; and these are carried up throughout three stages, and add much to the effect of the general outline. The second stage consists of a series of Pointed arches under gables filled in with tracery, the lower portion containing shields bearing the town arms. The shafts in the first stage are of polished granite; in the second, of red Mansfield stone; in each instance with carved caps. The third

stage is of diminished diameter. The second stage is connected with the third by a series of stepping. Here the buttresses are again reduced and finished with pinnacles having carved terminals. The crowning pinnacle rises from a series of eight gables, surmounted by an ornamental cross. The cost is to be 1,000l. The situation will be at the junction of the Lister-gate and Carrington-street, in the broad space which recent improvements have created at this point.

## THE ARCHITECTURAL EXHIBITION.

We perceive that the committee of the Architectural Exhibition have invited, by advertisement, a meeting for the purpose of considering the steps to be taken for the improvement of the exhibition. We must suggest to the committee, that one of the first steps they have to take is to make clear that a supposed representative of the press may enter their rooms without being insulted on the supposition that he has written something that was not agreeable. At the commencement of their last season this occurred publicly in the case of a gentleman supposed to be connected with this journal; and, though the committee after two meetings did regret that "any cause of annoyance" should have arisen to the gentleman in question, and further intimated that the curator "had expressed his regret for any hasty words which he might have used on the occasion," they did not send such an apology as was due. Until this be done, and the committee show they will protect the public against their servants, it can scarcely be expected that the conductors of journals acquainted with the circumstance will subject any gentleman connected with them to the possible repetition of such an unjustifiable affront.

We have no desire to go farther into the matter, if the council will make it clear that their servants will hereafter not be allowed to affront visitors with impunity.

## LAYING THE FOUNDATION-STONE OF THE NEW TOWN-HALL, CHESTER.

The ceremony of laying the foundation-stone of the new Town-hall by the mayor took place on Wednesday last week, the proceedings passing off with the greatest *éclat*.

Although a record of all that has taken place in reference to the new building since the fire of 20th December, 1852, which destroyed the old one, is already contained in our columns, we may here give a brief *résumé* as to the competition, from the local *Chronicle*.

The subject gave rise to many a warm and long discussion in the Council Chamber, some wanting the old building restored, others advocating an entirely new erection on the same site, while a third section of the corporate body strongly expressed themselves in favour of the new Town-hall being built in a line with the new Market. For nearly three years the subject has been a standing one. The site, after full discussion, was decided to be the ground on which the Ecclesiastical Commissioners' property rested, in front of the old Town-hall; and that decision being arrived at, it was determined to advertise for plans for a new building.

Early in 1864 designs for a Town-hall, to cost not more than 16,000l., were advertised for; and in the course of a few months some thirty plans were sent in. The services of Mr. Digby Wyatt, of London, were called in to assist the council in adjudicating upon them, and at his recommendation the plan of "Love's Labour" was adopted, and the first premium of 1000l. paid to its designers, Messrs. Lanyon, Lyan, & Lanyon, of Belfast, architects. Before this decision was arrived at, doubts were expressed that the design could not be carried out for the amount specified, and Messrs. Lanyon & Co., on being appealed to, stated that the building would probably cost from 16,000l. to 20,000l. The tenders sent in far exceeded that sum; and as it was the general wish that the building should be of stone, it has accordingly been resolved that it shall be so erected, and at the last council meeting the sum of 25,000l. was voted for that purpose; but for the present the central tower is not to be continued above the roof. The tower forms one of the most prominent features of the plan. The contractors are Messrs. Clarke & Son, of Wootton Warven, Warwickshire.

## GLOUCESTER CATHEDRAL.

An appeal has been issued by the very Rev. H. Law, dean of Gloucester, to the principal inhabitants of the county, soliciting donations towards the reparation and restoration of Gloucester Cathedral, under the supervision of Mr. Scott. The estimated cost is about 50,000*l.*, and the works will be commenced as soon as some proportionate sum has been promised.

During the last ten years the Chapter have spent, out of their own funds, in the repair of the cathedral, 14,170*l.* 16*s.* 3*d.* The outlay in 1855 was 1,096*l.* 7*s.* 6*d.*; in 1856, 2,130*l.* 3*s.*; 1857, 1,898*l.* 6*s.* 6*d.*; 1858, 1,685*l.* 16*s.*; 1859, 1,799*l.* 17*s.* 11*d.*; 1860, 965*l.* 12*s.*; 1861, 1,779*l.* 1*s.* 9*d.*; 1862, 1,331*l.* 10*s.* 8*d.*; 1863, 472*l.* 0*s.* 3*d.*; and in 1864, 1,312*l.* 0*s.* 8*d.* The capitular body, therefore, appear to have done their part, though we have no doubt they will gladly contribute to any general fund that may be raised. With regard to the money now asked for, a detailed estimate was prepared a few years ago by Mr. Waller, the then architect to the chapter. He considered that 70,000*l.* would be required to restore the cathedral in a manner worthy of its original magnificence. The transepts and some other portions were in a condition which was almost unsafe; the lady chapel, the choir, and the crypt, would need a large outlay. The complete restoration of the unrivalled cloisters alone would involve a cost of 10,000*l.* Deducting the 14,500*l.* spent on the fabric, as above stated, the Dean asks for 50,000*l.* His object is not to spend money in mere decoration, but first, to render the cathedral safe, and then to make it, as it ought to be, one of the most glorious temples in the land.

## CONTINENTAL NEWS.

**France.**—At Paris, Mr. Hanssman's improvements seem endless. The new municipal loan of 250 millions has been raised for the purpose of constructing two new boulevards; one to lead from the Seine to Bagnole; the other from the Quai de l'Évêque to the Rue Leblanc. Both will be opened during the Exhibition of 1867. Besides these works a third is in progress, namely, the new aqueduct from the Dhuys river to Paris. On the occasion of his late visit to the works at Menilmontant and Belleville, the Emperor said, "In less than three years all the fountains in Paris will be supplied with drinkable water." And they will be.—The Imperial Library in the Rue Richelieu is undergoing a complete alteration. A new wing is being added, chiefly consisting of the reading-room, the library, and the room destined to contain the collection of medals. The library is fire-proof throughout, being constructed on the plan of the British Museum, and entirely of iron. It is divided into four stories of galleries, with a central passage open from ground to roof. Each of these galleries is divided into ten groups, having eleven divisions on each side. Each division contains ten shelves, 1 metre in length, which will hold thirty-three volumes each on an average. Hence it follows that accommodation is obtained for 1,161,600 additional volumes. All staircases and floors are of perforated iron, in order to admit as much light as possible.—The tower at Rouen, in which the unfortunate Joan of Arc was imprisoned, is about to be restored according to plans by Professor Morin. The project has been laid before the Emperor for his approval. It was in this tower that she answered her English tormentors with the words, "*Je sais bien que les Anglais me feront mourir, croyant après ma mort gagner le royaume de France; mais fussent-ils cent mille 'Goddams' de plus qu'à présent, ils n'auroient pas ce royaume.*"—At Vichy a new church has been built at the expense of the Emperor. It is in twelfth-century style, and some fine stained glass forms its chief ornament. The windows in the chancel contain the figures of the patron saints of the Imperial Family, namely, Saints Napoleon, Louis, Hortensia, and Eugénie.

**Austria.**—At Vienna two more statues, both described as true works of art, have just been erected. One is a figure of the *Donau-weibchen*, or tutelary nymph of the Danube. It is 6 ft. 6 in. high, and of Italian marble. The other is to the memory of the famous Prince Eugene, and was to be unveiled on the 18th inst.—An Exhibition of Medieval Arts is now open at Innsbruck, intended to show the artistic development of the Tyrol in past ages. The cata-

logue only reaches to 280, but many interesting objects from private collections are included in it.—An immense number of tumuli have been discovered at Rataj, near Behin, in Bohemia, and some of them have been lately opened by a Mr. Hrasche. Most of them contained bronze coins and other objects, which have been forwarded to the museum at Prague; they seem to date from the time when Bohemia was overrun by the Huns about the year 350.

**Prussia.**—The museum in Berlin is about to receive considerable additions in the shape of a large National Picture Gallery. The ground-floor of the building, which was designed by the late Mr. Stüler, is intended for the reception of strictly national pictures, whilst the rooms on the first-floor are reserved for the Berlin Academy, which exhibits every two years.—Copies of all the works of the late sculptor Rauch have been collected, and are now to be seen in the Rauch Museum.—The last colossal group which issued from the studio of Kiss, of "Amazon" celebrity, represents the struggle of St. George with the Dragon, and now stands in the chief courtyard of the palace, on a pedestal 10 ft. high.—A curiosity has just reached this city from Stettin, on the Baltic coast. It is a carved oak column, 10 ft. high, which was once surmounted by a figure of the idol or god Frangloff, and must be at least 800 years old. When Otto, Bishop of Bamberg, visited the island of Wollin, in the Baltic, about the year 1250, in order to preach Christianity in those regions, he caused the bronze figure of the god to be destroyed and coined into money, with which the first church on the island was built. But the oak column on which the figure stood escaped destruction, and has been carefully preserved on the island until now.—The works at the Dom, at Cologne, continue to progress. We have mentioned on a former occasion, that the wretched old houses which a century or two ago were permitted to grow up on the south side, and against the very walls of the cathedral, had been bought up for removal. They have now been entirely cleared away; and as the ground on this side falls very considerably, foundations are now being laid for a retaining wall, together with a handsome flight of steps opposite the south transept. A large park is about to be added to this city, and will be laid out according to the plans of Mr. Mayer, landscape gardener, of Sanssouci, near Potsdam. The project, the costs of which are estimated at 60,450 thalers (about 9,000*l.*), will embrace several villas, a lake, &c., and is to be finished in two years.

**Bavaria.**—At Munich, a national gallery for pictures is also in course of erection, and now in such an advanced state that its completion next year is more than probable. A curious feature is the removal of several curious old oak ceilings to these rooms, taken from various castles and other buildings throughout the kingdom. The celebrated ceiling from the Château of Dachau is amongst the number. Baron Arctin has the supervision over this difficult and delicate job, and has certainly succeeded so far. The Chambers have granted a sum of one million florins (about 83,000*l.*) for the erection of a new Polytechnic College, the present one being found utterly insufficient for the constantly increasing number of pupils.—Our readers will recollect that one of the towers of the church of St. Lawrence at Nuremberg, was struck by lightning early this spring, the accident destroying the spire and causing other damage to the church. No time has been lost in repairing the injury, and the new spire, which is chiefly constructed of iron, covered with gilt copper, is now finished. The beautiful rose window between the two towers was also much injured, and has been covered with boarding all this summer, much to the annoyance of the tourist, as we can testify. This, too, is undergoing a thorough repair.—St. Crassian's Church, the oldest in *Ratisbon*, is in the hands of the builders, and promises to be much improved by the process. It was originally a Romanesque basilica; was subsequently much added to during the Gothic period, but did not escape the hands of the Rococoists of the last century, who mutilated the interior unmercifully to suit their "classic" tastes. All these masses of stucco are now being carefully removed, and the three windows in the eastern apse are filled

in with stained glass.—Professor Carl von Heideloff, the well-known Bavarian architect, died a few weeks ago at the little town of Hassfurt, near Bamberg. He was born at Stintgart, in 1788, but practised in Bavaria, especially at Nuremberg, where he did much for the conservation of its Mediaeval buildings.

**Hanover.**—The Chambers at Brunswick have voted the sum of 985,400 thalers (148,000*l.*) for the rebuilding of the Duke's Palace, which, it will be remembered, was partly destroyed by fire at the time when a court ball was going on one bitterly cold night last winter. 912,400 thalers of this sum are for the restoration of the burnt part of the palace; 37,000 for the erection of the left wing; and 36,000 for a second copy of the celebrated Quadriga by Howald.

**Italy.**—A decree publishes the expropriation of the whole tract of land under which the town of *Herulianum* lies buried, so that we may hope to hear of further researches ere long. The theatre, which was formerly visited with torches, is now lighted with gas (J), and a model of the building is placed at the entrance.—The Museum of Palermo has been lately much enriched in consequence of excavations carried on at Catefano, the ancient Soluntium. Many foundations, columns, and mosaics have been laid bare; and a coin found amongst the ruins mentions a gymnasium. From the great quantities of glass found here, it is supposed that Soluntium was one of the chief places which supplied that article when Sicily belonged to the Greeks.

## WIDENING MANSION HOUSE STREET AND THE POULTRY.

A REPORT on this subject to the City Sewers Commission by Mr. Haywood, their engineer and surveyor, has been printed. Mr. Haywood recommends the widening of Mansion House-street, and the Poultry and Cheapside, on the north side, but points attention to the fact that the proposed new street to the Thames Embankment will cross the traffic east and west, and much increase the confusion; and that the widening of Mansion House-street, as a separate measure is very urgent. The street, he considers, ought to be widened on its north side, according to a plan now before the City Sewers Commission, and it so happens that a portion of the ground is now uncovered, and more is likely soon to be opened, thus affording a favourable opportunity for carrying out this very desirable and requisite improvement which may not again present itself.

## MARBLE AND OTHER MINERALS IN YORKSHIRE.

It is being made known that a gentleman, named Whitehead, who resides in Ilrargate, has for the past two years been investigating portions of the hills and valleys which lie within an area of fifteen or twenty miles from the little village of Lofthouse, to the Wenside mountains on the north-west, and the range of mountains on the north-east. The result of his investigations, it is stated, has been the discovery that the entire district is rich in mineral treasures. Beds of Emericitic grey, black, and other marbles have been found to lie to the extent of 30 ft. in thickness, and covering an area of about ten square miles; they are within 2 ft. of the surface, and so abundant and exposed are they that the rocky channel of the River Stean is composed of marble. The river is choked with large blocks of that material, and its precipitous marble beds, which are polished by the rushing winter floods, are filled with Emericites and other fossils, which peer out in countless myriads along the solid marble faces of the cliffs which hedge in the river. Not only is marble to be had in almost unlimited quantity, but the district is rich in ordinary limestone, in freestone, in lead ore, in ironstone, and in coal. Every appliance required for the purpose of the most extensive commerce exists in that locality, and all that are required are capital and enterprise sufficient to develop the wonderful resources of the hills and dales of Nidderdale, in order to make a hitherto unexploited and lonely valley one of the busiest scenes of commercial industry in the world. These statements evidently come from interested parties, but for all that are quite worth examination. Many "fortunes" yet lie under the sod.

\* Kiss's widow has presented one half of all the models, designs, and drawings, left by her late husband, to the Berlin Academy of Arts, whilst the other half will go to the Mechanics' Institute of this city.

## ARCHITECTS' CHARGES.

SIR,—The question mooted by your correspondent, "X. Y. Z." in your last week's impression, is one which I feel sure will call forth from your experienced professional readers a ready response. As a member of the Royal Institute, and in practice in London for the past twelve years, I have long felt the desirability of the question of "Architects' Charges" being thoroughly ventilated and discussed, and especially now, more so as the matter appears to be brought under your notice by a layman.

With regard to the "Professional Practice and Charges of Architects," as suggested by the Royal Institute in 1862, it will be well at the outset to state that the scale suggested has been found to be inadequate, and its revision is now under consideration. However, it is, I believe, understood upon all hands that the commission is to be assessed upon the *value* of the works, irrespective of their *nominal* cost; and I think my professional brethren will bear me out in thus interpreting Article I. of the schedule. The justice of this must be manifest to every honest man; as, in the present age of indiscriminate competition and unlimited facilities for obtaining credit in the building trade, many unprincipled men adopt that calling at a venture. In confirmation of this, we have only to note that of those who take refuge under the Bankruptcy Law, the members of the building trades form a large proportion—I believe the majority; and even how often it occurs that an honest builder, from one of two reasons, either to obtain a desirable connexion or from lack of work in hand, will send in a tender reduced below the fair value of the works, by sacrificing a per-centage of the profits regularly conceded to the trade.

I am one of those architects referred to by your correspondent who, in order to meet the difficulties and injustice too often arising from competition, have for some time past uniformly adopted the system of assessing the commission upon the average amount of the tenders.

Your correspondent has only looked upon one side of the question, whereas it is our painful experience to feel upon the other. The injustice and irregularity, "to use no stronger term," that may arise to the architect upon the old system, have been entirely overlooked by "X. Y. Z.," for may not equally an unprincipled client arrange with a builder whose tender he has no idea of accepting, and pledges not to accept, to deliver a tender at a ruinously low figure, and thus in proportion succeed in reducing the architect's commission upon the works?

Again, it will be in the painful experience of the profession, that too frequently when a very low tender is accepted, the architect's detective duties in watching and protecting his client from impositions are greatly increased with less remuneration, and which unpleasant duties, were a fair value paid for the work, would rarely arise. Indeed, may not such a system be considered as offering a premium to dishonesty on the one part, at the sacrifice of the architect on the other part. If competition be considered so beneficial and necessary for the interests of the client, surely some recompense is due to the architect for extra care and trouble in obtaining that object.

It must also be borne in mind that under the system of averaging the tenders, should the highest price be accepted, the architect's commission falls short of that upon the cost of the works, and this happens in my experience lately to have occurred; so that the benefit of the system is not all on one side, as your correspondent would infer. In another instance, remarkably similar to that mentioned by your correspondent, the commission upon the average when the lowest of three tenders was accepted, amounted to some 25% more than if assessed upon the accepted one; and this, strangely enough, is the only case in my experience in which this system of charge has been called in question.

My argument then is, that architects must either be paid upon the average amount of tenders, which, with few exceptions, will be found to approximate most to the fair value of the works; or upon an estimated value, reckoned upon a recognised schedule of prices. And I maintain that the system of averaging the tenders, from its being more simple and easy to be understood by the initiated, would be by far the preferable method.

I trust your readers will see how necessary it is that some authoritative and practical solution should be arrived at by the profession at large;

and in the absence of this it has been my practice to deliver to my clients a scale of charges, a copy of which I beg to enclose, thinking you might deem it worthy of insertion with this letter.

THOMAS HARRIS.

## "SCALE OF PROFESSIONAL CHARGES."

## NEW BUILDINGS.

A commission of 5 per cent. upon the whole value of the work executed, with the addition of 2½ per cent. upon the value of any omissions, exclusive of the charge of measuring extras and omissions.

The above commission to include the following:—

- 1. Preliminary sketches.
- 2. Working drawings and specifications sufficient for an estimate or contract.
- 3. Detailed drawings and instructions for execution.
- 4. General superintendence of works (exclusive of clerk of works).
- 5. Examining and passing the accounts (exclusive of measuring and making out extras and omissions).
- 6. Furnishing rough estimate by cubing out the contents (exclusive of taking out the quantities for the builders to form their tenders and upon).
- 7. Providing one set of drawings and one set of tracings, with duplicate specification; it being understood that the use of these only are paid for, they being the architect's absolute property.

The commission to be payable half upon the signing of the contract or acceptance of the tender, and the remainder on the passing of the accounts.

All travelling and incidental expenses to be paid in addition.

The above per-centage charges not including services in connexion with negotiation for site, nor services incidental with arrangements consequent upon the failure of builders whilst carrying up the works; but all such services to be paid for in addition, according to the time employed.

Alterations made in the drawings after they have been prepared to be paid for according to the time occupied thereon.

Should the design have been completed, with plans, elevations, sections, and specification, ready for estimate, and the works not carried into execution, a commission of 2½ per cent. upon the value of the works. If tendered for, 3 per cent.

The charge for services by the day to be three guineas for principal, and for clerks according to the nature of the work upon which engaged.

If tenders are procured from more than one builder, the per-centage commission is to be reckoned upon the average amount of such tenders.

## COMPETITIONS.

*Southwick New Public Hall.*—At an adjourned committee meeting, on Monday, Mr. R. H. Chance presiding, the plans for the new Public Hall were again submitted. The plans of Mr. Yeoville Thomson, of Bennett's Hill, Birmingham, were unanimously accepted. The whole of the architects competing stated that it was impossible to complete any of the halls for the sum of 2,500*l.* each; and, under these circumstances, it was agreed that the committee should increase the expenditure to any sum not exceeding 3,000*l.*

*Wolverhampton New Town-hall Buildings.*—The committee who have been appointed to examine the plans of the proposed new corporation premises met again on Thursday afternoon, and have now left two plans only for future consideration.

*Derby Slaughter-houses.*—The corporation of Derby have awarded the premium for the best design for slaughter-houses proposed to be erected there to Mr. J. Gilbert Marshall, M.A., surveyor to the West Ham Local Board of Health.

## THE MISCHIEF OF ANCIENT LIGHTS.

WE often hear invidious comparisons made between the style of buildings in Paris, and that in London, and we all know the miserable tenements the poor are compelled to inhabit. Any difficulties put in the way of handsome and large buildings undoubtedly contributes to this result. As the law now stands, any one who is rash enough in rebuilding to interfere with the previous enjoyment of light and air of his neighbours, will be made to pay a heavy penalty for his intrusion.

The Supreme Court of New York, in *Parker v. Foote*,\* have declared "that the modern English doctrine on the subject of lights was an anomaly in law, and not applicable to the condition of the cities and villages of that country. The injury resulting from window views was deemed rather speculative, and not analogous to the case of ways, commons, markets, water-courses, &c., where the injury was direct, palpable, and material; and the same rule of presumption ought not to apply to two classes of cases so essentially different."

\* Kent's Commentaries on American Law. 6th edition. 1838. Vol. III., p. 639.

The landowners of London, and, indeed, of all large towns, are greatly interested in this question, inasmuch as their property is deprived of a good portion of its value from its incapacity for having large structures put upon it; and the public are interested by the anomalous state of the law stopping many improvements which otherwise would be made.

There is a large amount of feeling and dissatisfaction on this question. Some time since I suggested to a member of the Government that if a commission of inquiry were appointed, much good might result from it. W. T. WARRE.

*Lights.*—Sir: You may remember, under the Building Act of 1844, a very useful and salutary provision, viz.—that if any one formed or cut openings in an *external wall*, so as to overlook the ground of any adjoining occupier, one month's notice remedied the nuisance. As we are now, no such clause exists, and I am afraid great difficulties and complications may arise; as when an adjoining occupier seeks to build, he finds these improper easements or lights staring him in the face. The difficulty is further augmented by all walls being now deemed external, where they only divide a building from adjoining ground.

A SURVEYOR.

## KAMPTULICION.

IN reference to Mr. Wm. Burnett's remarks as to decay which had taken place in a wood floor, and which had come under his observation, I beg to remark that, in a church which had been erected five years, the floor of one of the pews had been covered with kamptulicion. It had been laid down about the time of opening the church; and, at the end of the period referred to, a sinking was noticed in the surface of the floor; and, on removing the kamptulicion, the entire space of the wood flooring, to the exact extent of the pew (10 ft. by 3 ft.) was found perfectly rotten, and crumbled in the hand when removed. The soil on which the church is erected is a very dry one. There is a good space underneath the flooring, which has a free ventilation throughout; and the flooring close adjacent to the pew referred to, and within an inch or two of it, was perfectly sound, dry, and free from any appearance of decay; the pew spoken of being the only one in the church in which kamptulicion was laid. The matter came under my immediate notice at the close of last year.

D. J. H.

## THE EXPLOSION OF GAS, NINE ELMS.

ON TUESDAY afternoon, as most readers have already heard, an explosion occurred at the London Gas Company's Works, Nine Elms, which caused a serious loss of life, and destroyed much valuable property. The works are situated in Nine Elms-lane, close to the workshops of the South-Western Railway Company. On the eastern side, extending half the length of the works, was a range of low one-story buildings, used as workshops by carpenters, blacksmiths, meter-makers, and also for store-rooms, light offices, and counting-houses. On the opposite side of the yard was a lofty building, used as a retort-house. Between these two ranges of buildings was a large gasholder, some 150 ft. in diameter. Immediately to the south of this was a new building, just erected for a meter-house, 50 ft. in length by 30 ft. in width, with a handsome iron roof. About 100 yards to the south was another gasholder of the same dimensions, each being calculated to hold 1,000,000 cubic feet of gas. A number of plasterers were engaged plastering the interior of the new meter-house. Suddenly, without the slightest warning of danger, the new meter-house became a ruin, and the northern gasholder exploded with a roar like a salvo of artillery, while a column of lurid flame shot high into the air, carrying with it the fragments of the iron plate forming the telescopic portion of the gasometer.

The southern gas-holder afterwards took fire and burnt out, but without further damage. Nine of the sufferers are dead, and about twelve seriously injured.

For more than a quarter of a mile from the gas-works, in a south-easterly direction, every house and building is more or less damaged, while those in the immediate vicinity of the explosion, especially in Harvard-street, Radley-terrace, and Peuton-road, are rendered for a time unin-

habitable. In the first-named street, the doors and windows have been battered in, the tiles torn from the roofs, and the plaster and paper on the walls and ceilings completely stripped: in several cases the ceilings have fallen in.

The way in which the disaster occurred is not yet understood: perhaps it never will be. It is thought by some, however, that the gas escaped into the master-house, through some damage to the governor, and that an explosion there drove in the side of the gas-holder, and permitted a sufficient admixture of air to enable the contents of that to explode also. Another supposition would be, that some defect in the gasholder had allowed of the entrance of air to it; but this does not seem so likely. A full inquiry will, of course, be made before the Coronor.

#### THE TRADES MOVEMENT.

The cabinetmakers in the eastern and northern districts of London are agitating for a rise of wages 10 per cent. per week, on day and picco work, on the ground of increased cost of living. They are proceeding with all due respect to their employers, some of whom have already granted the increase.

The *Birmingham Journal*, a friend to the working-classes, thus narrates a case which has occurred in the building trade at Birmingham:—

"We think we may safely say that in the whole range of our experience, we never came upon more flagrant case of trades-union tyranny than that brought under our notice by Mr. Mault, the secretary to the General Builders' Association, in a letter which appeared in last Wednesday's *Daily Post*. Because a master-builder chooses to submit to the work which union men refuse to do, he is threatened with a withdrawal of the society masons from every building he has in hand. Because he is driven to employ men who are not masons to assist him in setting stone at one of these buildings, he is peremptorily ordered to discharge those men. Because, as a last resource, he turns up his sleeves, puts on his apron, and begins setting stone himself, he is told that "proceedings will be taken to shelve his work for one, two, or three years, as the society may decide." The "wicked lodge of operative masons" have, as it seems to us, achieved the unenviable distinction of inventing an entirely new method of trades-union tyranny. At Cradley missionists cut the bellows of obnoxious employers. At Sheffield they blow them up. It was reserved for Walsall to prevent them doing their work themselves, and Walsall has done it, thereby putting more discredit upon unionism than all the efforts of past years to fix it upon an intelligent basis are likely to balance in the minds of those against whom this latest movement is directed."

The strike of the timber-yard labourers at West Hartlepool has ended in the men resuming work at 1s. below their former wages, instead of 1s. advance, for which they turned out.

The Dumbarton joiners' strike, after nine or ten weeks' duration, is now virtually at an end, the whole of the joiners, with the exception of half-a-score who still hold out, having obtained work elsewhere, or resumed within the last few days, on the masters' terms. This strike is said to have done much harm to the town, as, in consequence of the backward state of the joiners' work, a large number of carpenters, riveters, and other workmen had to be paid off.

#### WHO WILL BUILD AT HANLEY ?

SIR,—Can any of your readers assist the unfortunate inhabitants of a large and important manufacturing town to obtain a decent roof under which they may shelter themselves? I am an inhabitant of Hanley, the chief town of the Staffordshire potteries,—a town containing, at present, about 40,000 inhabitants. You will hardly believe that, in this place, there is not at the present time a single private house of a rental over 20l. a year to be had. There is one under promise, and which may possibly not be taken, at 70l. a year, and that is the only one in the town vacant. It is a matter of the utmost difficulty to obtain houses of a respectable kind, with five or six bed-rooms and two or three reception-rooms. Every such house is eagerly sought for, and is generally built, it is vacant. There is not in all Hanley a single row of middle-class private houses such as professional men can inhabit. Generally speaking, all the good houses have been built by manufacturers or wealthy tradespeople for themselves, and either they or their descendants occupy them. The remaining houses consist of cottages, and miserable little morsels of would-be respectable houses, with two parlours, a kitchen, a pantry or washhouse, and three or four bed-rooms. The rooms are none of them large enough to swing a cat in with any comfort, and are horribly cold and draughty. I am reduced to the necessity of taking two houses, one next to the other. Another medical man in the town is in the same predicament. I have been for three years looking out for a decent house, and have never been in time to get one. Surely it might answer the purpose of some of the London builders to come down here and build us a street of good houses. Every one says they would be taken before a roof was put on. Land is cheap; clay can often be got from the foundations sufficient to build the house with; wages are lower than in London.

Our cry is, Come over and help us, and we will pay you well.

VOX CLAMANTIS IN DESERTO.

#### EDINBURGH.

A NEW Primitive Methodist Chapel has been erected on a vacant piece of ground, in Victoria-terrace, between the Mechanics' Library and Fisher's Close, from the design of Messrs. Paterson & Shiels, architects. The style of the edifice is an adaptation of Italian Gothic, and forms a pleasing addition to this picturesque part of the city. The basement contains a small house for the resident minister and a school-room, and the church is seated for 480 persons. In the front elevation there is an arched doorway, with a projecting canopy, supported by foliated brackets, on either side of which are two light windows, with shafts and plate tracery, above which runs a moulded string course. The main gable has three long windows, with a continuous carved impost: the centre window is panelled a third of its height, as the pulpit is placed against it. This window is divided by a shaft, and has tracery at the upper part: the other two are left plain. A portion of the church projects over the entrance to Fisher's Close, forming a small transept, which is lighted by a shafted window similar to that in the centre of the main gable, and this part of the building is finished by a pierced parapet. The gable has crocketed skewes, is terminated by a curved finial, and is flanked by a bell-turret, in form of a canopy, supported by four shafts, terminating in a steep pinnacle, with an iron finial. The interior is lighted from the south and east sides only; that to the west, against the Mechanics' Library, is broken up by an arcade corresponding to the windows on the opposite side. There is a gallery at the north end, and one in the projecting portion or transept, which may be used for an organ. The roof is wagon-shaped, with moulded ribs, and the pulpit and benches are of deal and plain in character.

The Caledonian Railway Company have been making large purchases of property at the north end of the Lothian-road, for the purpose of erecting a new and commodious station. Among other buildings, St. George's Free Church is to be demolished, and a new building erected in the neighbourhood, at a cost of 25,000l. The loss of the present church is not to be lamented, as it is a very poor specimen of modern Norman.

When such improvements are in progress in this neighbourhood, it is to be hoped the heritors of St. Cuthbert's, the wealthiest parish in the city, may see the propriety of erecting a new church in place of the unsightly barn which they built about fifty years ago, and which is so great an eyesore in the beautiful valley of the Nor' Loch.

The new Sheriff Courts and the Theatre Royal are approaching completion.

#### CHURCH-BUILDING NEWS.

**Eastbourne.**—The foundation stone of the new church of St. Saviour has been laid, the erection of which has been commenced in the open space fronting South-terrace. The church, which will be in the Gothic style, is from designs by Mr. G. E. Street, of London. The material to be employed is red brick, with Bath stone dressings. Mr. Fearless, builder, of this town, is the contractor for the work. The site has been presented by the Duke of Devonshire, and it is understood that the cost of the building will be defrayed by the father of the Rev. R. Whelpton.

**Otham (Kent).**—The parish church of Otham has been re-opened after restoration, and an additional piece of ground lately added to the churchyard. The work of restoration includes a new roof to the chancel. The walls have been partially rebuilt, and new windows inserted. A large stack of pulpit, reading, and clerk's desks, together with the whole of the square pews, also the vest gallery, have been removed. The nave and aisles are re-seated with open benches, the design being taken from an old seat found beneath one of the pews. The chancel has been fitted with oak stall seats and subsele, the sanctuary being enclosed by a rail of iron and wood, the sedilia occupying the south side. The floors throughout are renewed and arranged in pattern. The steps to the chancel and communion, of which there are five, consist of Portland stone treads and encaustic tile risers, the floors to the communion and foot pace being partly glazed and of richer colours than the others. The pulpit stands in the south-east angle of the nave, the steps and lower part being of stone, the upper portion of carved oak. The

lectern is also of oak. The cost of the restoration is about 1,000l., mainly contributed by the rector, the Rev. Tatton Brockman. The work has been carried out from the design, and under the superintendance, of Mr. J. Wheeler, of Breancliff, the builder being Mr. Vaughan, of Maidstone.

**Broad Somerford (Wilts).**—The church of this parish has been restored and re-opened. The work, under the care of Mr. Hakewill, has been going on through the summer, and is not yet completed. The east window is of stained glass, by Messrs. Lavers & Barrand; the spandrels filled with angels and cherubs (the church being dedicated in the names of St. Michael and All Angels); and the four lights with the following eight subjects:—Above the transept, Our Lord blessing Children; Our Lord carrying His Cross; Our Lord celebrating the Eucharist, standing; and St. Michael vanquishing the Dragon. Below the transept, The Sacrifice of Abel, portraying Faith; the Death of St. Stephen, Hope; the Widows showing the Coats which Dorcas made, Charity; and Augustine, bearing the Mission-flag charged with Doves, and preaching the Gospel to the Saxons. The removal of the plaster ceilings revealed the old saddle-back roof in good preservation, as did that of the galleries and other obstructions, the western arch and window of the tower. The roof of the chancel is panelled, the panels coloured in chrome, the ribs and bosses being picked out in gold, blue, red, and white. A vestry is provided by the old entrance to the roof-loft in the south wall. The floor is paved in tiles of black and red, lozenge-wise.

**Ridgehill (Winford).**—The Festival of St. Luke was observed in the parish of Winford by the opening of a new chapel or school church, dedicated to St. James. The rector, the Rev. Henry Tripp, gave a site and 200l. The little church is in the Early English style, with two lancet windows at the west, and a triplet of lancets at the east end. The roofs are overhauling and defined by barge boards, and surmounted by a tapering bell-turret. The church is built of stone. The roof is open, and constructed upon a patented principle. The benches are of stained wood, some being of Lichfield Cathedral pattern, others copied from those at St. Alban's, Holborn. There are Gothic fittings, choir-stalls, desk, lectern, and simple pulpit on one side of the communion-rails.

**Templecombe.**—The church of St. Mary, Abbas Combe, generally called Temple Combe, has been re-opened for public worship, having undergone a renovation and repair. The total cost of repairing the church is 1,309l. 3s. 4d. Additional accommodation has been obtained by rebuilding the north aisle, which was erected about thirty-five years ago, and by somewhat widening the chancel. All trace of the east, west, and south transept windows had been obliterated, and new windows were necessary. In these, tracery of the stylo of the earlier Perpendicular of the beginning of the fifteenth century has been used, but those of the new north aisle have been assimilated to the later Gothic architecture of the church. In the interior the row of pillars and arches which were put up, to form a north aisle some thirty-five years ago, have been retained, but the aisle itself is entirely new. The gallery has been removed, and the organ placed on the floor at the east end of this aisle, at which end there is also a vestry. The roof of the nave, which had become very much dilapidated, has been strengthened and restored without removing any of the old timbers. It was found impossible, however, to retain the roof of the transept or chancel. The church has been re-seated throughout: the seats in the chancel are oak, the rest of stained deal, with the exception of eight or ten old oak seats of the seventeenth century in the nave, which have been restored. At the east end a stained-glass window, by Messrs. Clayton & Bell, has been inserted as a memorial of the late rector. The work has been carried out by Mr. R. Reynolds, of Weymouth.

**Gloucester.**—Improvements are being effected at St. Mary de Lode Church, and at Christ Church, Spa. St. Mary's has been re-opened; the pews have been replaced by open seats of stained deal. Additional accommodation for 112 persons has been gained. The re-seating has been carried out by Messrs. Bassie. The organ has been rebuilt and enlarged by Messrs. Williams & Son, of Cheltenham. The low chancel arch prevented the placing of the organ near the chancel, and it has been re-erected in the western gallery. The walls have been coloured, and ventilators have been inserted in the roof by

Mr. J. Clark, of Kingsholm. The portion of the chancel inside the altar-rail was recently laid with enamelled tiles, of a beautiful design. The chancel has now been further improved. The total cost of the works has been about 3300. The chancel of Christ Church has been extended, and north and south aisles have been added, in the former of which a new organ, now in the course of being built, is proposed to be placed. A new vestry has been erected, and other alterations have been effected. About 150 free seats have been provided, additional room has been obtained for the Sunday school children, and other accommodation secured. The total cost of the works amounts to upwards of 5000, exclusive of the cost of the new vestry, which has been built at the sole expense of a member of the congregation, and exclusive of the structural part of the chancel, which has been carried out by Mr. David Wingate, another member of the congregation, at his own expense.

**Yewell.**—Lufton Church, near this town, has been re-opened. The new building has been erected on the site of the old church, which was in the Decorated style of about 1250. It has been slightly enlarged, but is built in the style of the same period by Mr. Davis, of Langport, builder, under the superintendence of Mr. B. Ferrey, of London. The church has been restored principally at the cost of Mr. J. J. Farquharson and Mr. E. Newman. During the course of the rebuilding a stone coffin, containing human remains, was found built into the north wall. This relic has been replaced.

**Pewsey.**—The church of St. John, Pewsey, which has been entirely rebuilt, has again been opened for divine service. The edifice has been built after the model of the old one, and it consists of a nave, chancel, sanctuary aisle, organ-chamber, and vestry, and a south-east tower and a south porch. The style is Transitional Norman, of the continental type. The structure is built of native stone, with Griershill stone dressings throughout the exterior; and the interior is lined with freestone ashlar, banded with grey stone. The roofs are open and boarded, lined with felt, and covered with Pembrokehire slates. The floors of the chancel and sanctuary are laid with encaustic tiles, from the manufactory of Mr. Godwin, of Lagwardine; and the chancel is fitted with some carved stalls for the clergy and choir, this latter work being executed by Mr. Meyrick, of Hereford. The nave is fitted with open benches of stained deal, which will seat about 300 people. The whole of the work of the church has been carried out according to designs prepared by, and under the superintendence of Mr. Thomas Nicholson, the diocesan architect. Owing to the failure of the builder in the first instance, the cost of rebuilding the church has amounted to 3,232, or about 1,000, more than the original contract price.

**Landisysal.**—The new church here has been consecrated. The edifice is in the Early English style of the thirteenth century. The nave is 67 ft. by 22 ft. 6 in., the north aisle 60 ft. by 11 ft., separated by arcade arches, intermixed with red and white Grinshill stone, springing from polished granite columns; the chancel 27 ft. by 18 ft., and the vestry and organ-chamber 17 ft. by 11 ft. The tower and spire are 95 ft. high. The roof is open-timbered red Dantzic, stained and varnished, covered with Aberliefery and Carnarvon mixed slates, and ornamental Staffordshire ridge, and there are crosses at the angles. The internal arrangements are on the open-seat principle. The nave floor is of Staffordshire tiles, in ornamental design, with heating arrangements underneath. The chancel-stalls are yellow pine-stained and varnished, and the flooring is done with Maw's encaustic tiles. The stained-glass window has for its subject "The Crucifixion." There is a peal of five bells, the old ones having been re-cast, and two additional ones added, by Mr. George Meares, of London. The walls of the church are built of the local quarry stone, dressed, laid in squares and even courses. The dressings of the doors, windows, quoins, spire, &c., are of white Grinshill freestone. The carvings are in the French style of Gothic foliage. The architect was Mr. T. H. Wyatt, of London; the contractors were Messrs. Chester & Co., of Liverpool; and the clerk of the works was Mr. Garland. The records and font were done by Mr. Sansom and Messrs. Burke & Co., of London; the sculpt by Mr. Dodson of Shrewsbury; the eagle, by Messrs. Rattee & Co., of Cambridge; the east window by Messrs. Ward & Hughes, of London; the stone-cutting by Mr. Stockdale, of Liverpool; and the wood-carving by Messrs. Cox & Son, of London.

## DISSENTING CHURCH-BUILDING NEWS.

**Bristol.**—A new chapel has just been commenced by the Wesleyan body, at Redland. It is proposed to accommodate about 800 people. It has a basement in which are placed schools and class-rooms, as well as also rooms for chapel keeper. It is in the Decorated Gothic style, with slightly French detail. The materials will be sandstone, obtained by excavating for basement, and freestone dressings. The architect is Mr. Samuel Hancock, Newport, Monmouthshire, whose design was selected in a limited competition. The contractors are Messrs. Eastbrook & Son.

**Roehdale.**—The United Methodist Free Churches have opened a new chapel in Castle-mere. Externally, the new building, Italian in style, is of brick and stone. The entrance is an arcade of three arches, with four columns and two pilasters, having composite capitals; above the entrance is another arcade of windows, the arches being supported on shafts with composite capitals; and decorative stonework in the tympanum of the pediment crowns the central arcades, whilst string-courses and cornices, uniting with the stone corners, give completeness to the front. Under the chapel, and as large in area, is a schoolroom; and there are several vestries and other rooms. The architects were Messrs. Woodhouse & Poits, of Oldham.

**Charlestown (Stafford).**—A new chapel for the Independents has been opened here. The principal entrance is from the front, through a doorway under the tower which stands at the north-east corner of the chapel. There is another from Trentham-street, through a porch. Entrances are also provided to the vestries in the rear, and these will serve for exit when required. The plan of the structure is rectangular, the internal dimensions being 74 ft. by 42 ft., and the roof is of single span, divided longitudinally into six bays by principal timbers or trusses of hammer-beam construction. The interior is not open to the ridge, but an inner ceiling is provided, with sloping sides. The seats on the ground-floor accommodate 410 adults. There is also an end gallery which similarly accommodates 140 adults. The constructional timbers of this gallery appear below the ceiling, and are stained and varnished. The tower is not yet completed. It is carried up to a level above the slope of the main roof, and covered with a temporary roof. When finished with the intended spire, the total height will be 100 ft. Externally, the walls of the building are faced with Yorkshire parpintois, dressed, and the jambs, quoins, and other features are of Yorkshire stone. The mullions and tracery of the windows are of Bath stone. The style of the structure is Early Decorated. The architects, under whose superintendence all the works have been executed, are Messrs. Paul & Aylliffe, of Manchester. The general contractors for the building were Messrs. Stedman & Sons, of Pendleton. Mr. Tomlinson, of Charlestown, has laid in the gas-piping; and the gas-fittings have been supplied by Mr. Dorey, of Manchester. The quarry lead lights in the windows are from Messrs. Edmundson & Son; and the carving to the stonework has been executed by Mr. Gregg, of Manchester. The building is warmed by Messrs. Haden's warm-air apparatus. The total cost will be 3,400.

## Books Received.

*Illustrations of the New Palace of Westminster* (Sir Charles Barry, Architect). From Drawings by EDWARD N. HOLMES, Architect. Second Series. London, Warrington & Co. 1865.

In continuation of a former volume, Mr. Holmes gives sixteen plates, partly lithographs, partly outline engravings, with a few woodcuts and some brief descriptions. The engravings, very clear and useful, illustrate the Victoria Tower, the Central Tower, and the Clock Tower; the lithographs show the Peers' Entrance, the Royal Staircase, the Royal Gallery, the Commons Lobby, the House of Commons, and some other parts of the edifice. These are scarcely so satisfactory as the engravings, several of them being heavy and without effect. We would except from this objection the view of the House of Commons' Lobby. The book, as a whole, forms an interesting memorial of the remarkable building it illustrates.

## Miscellaneous.

**THE SOUTH-EASTERN INDUSTRIAL EXHIBITION, AT GREENWICH HOSPITAL.**—The ceremony of opening this exhibition, which, by permission of the Admiralty, is being held at Greenwich Hospital, took place on Saturday afternoon last, in the Painted Hall of that building, in the presence of a large company, amongst whom were many of the most influential inhabitants of the district. Viscount Sydney, K.C.B., Lord-lieutenant of Kent, presided on the occasion.

**HESTON CHURCH.**—With the exception of the eastern wall containing the windows of the double chancel, the whole of the body of the interesting old church of Heston has been levelled to the ground. Apparently it is to be extended laterally, as appears by the excavations on the north and south sides of the original building. This has enforced the removal from the graves of the remains of mortality there interred to a further corner of the churchyard.

**PROPOSED NATIONAL MEMORIAL TO LORD PALMERSTON.**—On Wednesday evening a preliminary meeting was held at the School-room, James-street, Bedford-row, for the purpose of taking steps to raise a national memorial in memory of the late lamented Premier. It was unanimously resolved,—"That the eminent services of Lord Palmerston for upwards of fifty years entitles him to the thanks of the country by the establishment of a lasting testimonial to his memory. That the vestry of St. James's, Piccadilly, be requested to grant the use of the vestry-hall for a meeting of the friends of the late lamented Premier, and this meeting resolves itself into a committee for carrying out this resolution."

**TIMBER OF AUSTRALIA.**—*The Inquirer*, Western Australia, says,—"It is perhaps of no very great moment to the persons immediately concerned in the transaction, that an engagement should have been entered into to deliver on board a ship, at Fremantle, 600 loads of mahogany sleepers, for an Indian railway, at 3*l.* 13*s.* 6*d.* per load; for the mere facts are, we presume, that the timber is to be had at the price, and that it is suitable for the intended purpose; nor, if the matter merely rested with the buyers and sellers, would it be worth notice otherwise than as a mere topic of the day. But, in truth, it concerns the whole colony to know that millions of acres in its vast area produce a timber which no other part of the world produces; and because it is virtually indestructible by white ant and seaworm, people will take the trouble to come here and buy it. It is no novelty to us to be told that our timber is good, or that if it can be supplied at a certain price there will be a demand for it; the same is said of everything under the sun which may be comprehended under the general designation of "raw material;" but it does so happen that our colony is the only part of the world where this commodity exists, and where the supply is virtually inexhaustible."

**STEAM CRANES AT BORDEAUX.**—At a meeting of the Institution of Civil Engineers of France, held last month, a paper was read by M. Maldant, "On the Use of Steam Cranes at the Port of Bordeaux." In July, 1863, the Bordeaux Chamber of Commerce advertised for tenders for the right of loading and discharging vessels at that port, by means of apparatus to be supplied by the contractors. Fourteen or fifteen plans were sent in from France and England, based on the application of water-power and of steam, for the purpose. Under the advice of the consulting engineers, however, and after an examination which lasted almost a whole year, all the plans submitted were put aside, and it has now been decided simply to extend the application of steam to all the cranes of the port, in accordance with the experience that has been derived from four of these cranes during seven years past. It is found that the average daily expenses of a 1½-ton steam-crane (1,500 kilogrammes), of 2-horse power, employed in the ordinary discharging of a merchant ship alongside the quay, are 12*fr.* 80*c.*, or 10*s.* 2*d.* per day. If the work of one man turning a winch be taken equal to 6 kilogram-metres per second (2,577 foot-pounds per minute), a machine of 2-horse power will perform as much lifting work as twenty-five men, or about the same work as six hand-cranes worked by four men each. In the presence of such manifestly satisfactory results, it is difficult to understand why the use of steam cranes is not more general.

**ASSISTING NATURE.**—A Swiss invention has been introduced to aid bees in the formation of their comb. Narrow sheets of wax are imprinted by machinery so as exactly to represent the dividing wall of comb between the cells. These strips are attached to the top of the empty hive, before the new swarm is put in, thus enabling the bees to go immediately to work, and also guiding them in making the sheets of comb in the proper direction.

**HOUSES FOR THE POOR.**—The *Pall Mall Gazette* says:—A movement is on foot for building houses for poor people in Westminster. It is said that 2,000 persons were turned out to make room for the new Foreign Office, and now the Metropolitan Union Railway will turn out 821 more. They are of all classes of artisans, but all poor and all pressed by a special difficulty arising from the geographical position of Westminster. If they cannot get rooms near their old localities, they must wander far afield, either crossing the river, or the parks, or Whitehall, thus in many instances losing their occupations, and, in all, seriously increasing the day's work. The Marquis, whose vast property is so greatly benefited by these improvements, should look to this.

**GLASS-BLOWING**, in its simpler adaptations, is very easy of acquirement, and capable of affording much recreation at a small expense. Even cold glass may be worked with a facility known to few. It may be drilled in holes very easily, the only implement needed being a common watch-maker's drill-stock. A steel drill of good quality, well hardened, will do the business perfectly; and even if the edge of the tool should give way before the hole is pierced through, a little emery powder and oil will remove every difficulty; or, with the help of these, the hole may be bored with a copper drill. Not only so,—glass may even be turned in a lathe. Any amateur turner who has operated on either of the metals may chuck a piece of glass in his lathe, and turn it with the same tools and in the same way as he would a piece of steel, only taking care to keep the chips from his eyes.

**THE ASSEMBLY ROOMS, BATH.**—This grand suite of rooms has been undergoing considerable alteration and renovation. The work of decorating the principal rooms was entrusted to Messrs. Green & King, of London, artist decorators. The proprietors have widened the entrance doors, as well as several in the interior of the building, and given additional light to the passages. The cloak rooms have also been rearranged. The vestibule walls are coloured a subdued Pompeian red, and relieved by the full Etruscan buff of the columns, the bases being black, while the entablature and cove which these support, and the lantern above, are enriched with light and delicate colour. In the tea-room, a portion of the old plaster ornaments of the ceiling has been removed, and four bands of colour are drawn right through the cove and across the ceiling. The various panels between these are treated with red lines and scrolls on a blueish-grey ground, the plaster being coloured to harmonise with the other portions of the work. The walls are coloured green, and the columns light ochre, with white capitals and bases. The niches are painted a deep Indian red, and the wall spaces immediately above them are enlivened with colour. The treatment of the octagon is more sombre than that of any in the suite. The prevailing tint of the ceiling is a light buff, which is warmed and relieved by ornamental panelling in red, with a little pale blue; the main lines of this converge towards a rosette of brilliant colour in the centre of the ceiling. The enlaid room remains as painted last year, a rose pink, by a local painter. As to the hall-room, it was part of Messrs. Green & King's original proposition to remove the plaster ornaments on the ceiling and to substitute for them a painted decoration in the Italian style. The proprietors, however, decided to retain the ornaments, which have been treated in light tones on a ground of light blue; this colour is carried down into the cove, where it is thickly studded with gold coloured stars. The columns which support the entablature are treated as statuary marble, the caps being etched with gold, and the festoons between them white on a pale-lime ground. The spaces between the columns are painted with Arabesque ornaments, the niches containing the figures being finished a light Pompeian red. The walls are divided into panels, filled with stencil work in imitation of amber satin damask. The dado beneath is finished in a kind of dead grey buff, to set off the dresses of the visitors.

**ST. LUKE'S NEW VESTRY HALL.**—The foundation stone of this new hall has been laid on the site which adjoins the workhouse in the City-road. The architects are Mr. William Christie and Mr. F. Warburton Stent.

**THE PENZANCE BELLS.**—Eight new bells, cast by Messrs. Taylor, of Loughborough, have been just placed in the tower of St. Mary's, Penzance. The committee engaged the celebrated Amateur Band of Change Ringers from Woolwich, members of the London and Cumberland Societies of College Youths, to open the peal on the 31st October.

**INAUGURATION OF A SCHOOL OF SCIENCE AND ART IN SALISBURY.**—A numerous and influential meeting of the inhabitants of Salisbury and the neighbourhood has been held in the Council Chamber of that city, for the purpose of inaugurating a local school of Science and Art in connexion with the Government Department of Science and Art. The Bishop of Salisbury presided. The Bishop observed that the principal object of the school would be to afford to the working man the means of raising himself to that position to which his talents entitled him. The school will be under the direction of Mr. Thurlow Short.

**BIRMINGHAM ART FOR EGYPT.**—A large and important order for the decoration of a yacht for the Viceroy of Egypt, which is being built by Messrs. Samuda, of London, has just been completed by Messrs. Bettridge & Co., of the Papier Maché and Japan Works, Birmingham. The only instructions received beyond the order, were, that the decorations must be of the finest possible character, without regard to cost. The decorations consist of painted panels, that are oval, circular, and square; and a number of large and small pearl and gold shells; and they are intended for the upper and lower saloons of the vessel. There are twenty-six ovals for the lower saloon, on all of which are painted flowers. Those flowers that are transparent in colour, such as the tulip, iris, and convolvulus, are painted on inlaid pearl; those that are of opaque, such as the rose, cactus, and camellia, are painted simply. Then there are flowers which imitate the two processes, such as the geranium and columbine. Mahrouse, or the Bride of the H3L, is to be the name of the yacht.

**NEW CHURCHES IN LIVERPOOL.**—The following are mentioned as amongst the donors of new churches:—Mr. Thomas D. Anderson commenced, about two months since, a church in Liverpool, at his sole expense; the cost will be between 8,000l. and 10,000l. Mr. J. P. Maither has begun a church at Bootle, at the request of a daughter, lately deceased, the cost of which will scarcely be less than 8,000l. for this church the Earl of Derby has given the land. Mr. William Peck is about to erect a church, at his own expense, in the district of St. John the Baptist; the cost will be from 5,000l. to 6,000l., exclusive of the land, which will increase the amount by at least 1,300l. Mr. James Tyler, a Liverpool merchant, has already nearly finished, at his own expense, a church near the Stratford Railway Station, for the benefit of the railway porters and servants; the cost of the whole, including land, church, endowment, parsonage-house, and schools, will amount to at least 12,000l. Mr. W. Preston, late mayor of Liverpool, is about to build a church, at his own expense, in one of the crowded districts of Liverpool.

**WORCESTER CATHEDRAL ORGAN.**—Another consultation with respect to the site of the cathedral organ has taken place, and we understand that the Rev. Sir F. Gore Ouseley has given his opinion that the best place for the instrument would be the chapel on the south side of the choir, formerly used as a vestry, and recently restored and thrown open; but in that case an additional chamber for the reception of some portions of the organ would have to be erected outside the east end of the said chapel. The *Worcester Herald* says,—"It is felt that wherever the instrument may be placed some sacrifice must be made, nor would the site proposed by Sir Gore Ouseley be free from that objection, inasmuch as the architectural proportions of the chapel in question have been brought out to fine effect, and are now an object of admiration; yet, with the exception of the great south transept, which we still maintain to be by far the best position for the organ, the aforesaid chapel may be the most fitting site, as the instrument would there hide less of the beauties of the cathedral than anywhere else."

**THE CITY GAS MOVEMENT.**—At a recent meeting of the London Court of Common Council, it was resolved to take immediate steps to give the usual notices, with a view to an application being made to Parliament, next session, to enable the citizens of London to take the supply of gas into their own hands.

**THE LEEDS WATERWORKS CONTRACTS.**—In the contracts let by the Waterworks Committee of the Leeds Town Council for 2,588 tons of iron pipes, a French firm contracted within 4l. of the lowest tender. Their estimate was 13,609l. and the contract was let for 13,605l.—*Leeds Mercury.*

**CAB-FARE INDICATOR.**—At the Birmingham Industrial Exhibition, the first prize, of the value of 25l., has been awarded to Mr. Peter Gaskell, inventor and patentee of a cab-indicator, which shows the distance the cab goes, and the amount the passengers have to pay. Two of them are said to have been in use about eight months, and have proved a protection to the proprietor.

**CLOCKS AND BELLS.**—The following are among the turret-clocks recently erected by Mr. W. H. Hughes, of Ludgate-hill:—For Mr. Guinness, M.P., Dublin (for St. Patrick's Cathedral), brass turret-clock, showing time on two 8-ft. dials, striking the hours on 36 cwt. bell, and playing four tunes during the twenty-four hours; for the Government of St. Kitt's, West Indies, brass village-clock, showing time on one 3-ft. dial, and striking hours on 6 cwt. bell; for the magistrates, &c., Rutherglen, near Glasgow, turret-clock, showing time on four 6-ft. dials for illumination, striking hours on 16 cwt. bell, and chiming the four quarters on four bells (for Rutherglen new town-hall).

**SEWAGE IN THE DON: PROPOSED OUTFALL DRAIN.**—The committee appointed by the town council of Sheffield to take into consideration the drainage question, not only as it affects Sheffield, but also the valley of the Don, are taking steps to secure the co-operation of other towns interested. The most feasible scheme is said to be the construction of drains by which the sewage of Sheffield, Rotherham, Doncaster, and other places in the valley of the Don, should be diverted and then utilized. The plan was submitted to Mr. Rawlinson, C.E., who expressed a favourable opinion upon it. Alderman Webster invited the town council of Doncaster to co-operate with the authorities at Sheffield. The preliminary cost, he apprehended, would not exceed from 300l. to 500l., upon a survey made either by Mr. Rawlinson or Mr. Bacon. A resolution was unanimously adopted to join Sheffield in the project, so far as the preliminary proceedings were concerned, on the understanding that the share or proportion should not exceed 100l. The pollution of the Don has long been a source of unmitigated evil, productive of fevers and epidemics of the most serious character.

**THE SEWAGE OF WINDSOR.**—An adjourned meeting of the Local Board of Health has been held, for the purpose of hearing Mr. Menzies' explanation of his proposed plan for the improvement of the drainage system of the Royal borough, and alteration of the sewage, which at present is carried by means of a main sewer passing through the Home Park, near Frogmore House, into the Thames, at a spot but a short distance from the new Albert Bridge. Mr. Menzies (acting as surveyor to the Commissioners of Woods and Forests) stated that he attended the Board in order to lay before them a rough draft of the report which he had prepared to be submitted to the Rivers Commission and Commissioners of Land Revenue with reference to his scheme. Having described the condition of the river in consequence of the amount of filth drained into it from Windsor, with its population of 12,000 persons, Mr. Menzies said he proposed to separate the sewage from the rainfall, and apply the former to the surface of the land. He was not then prepared to say what the expense of the proposed alteration would be, or by whom the sewage would be bought. With regard to the position of the land where the sewage could be applied, there were three or four localities to choose from. It would be best to take it to Old Windsor, on the other side of the Home Park, and apply the sewage to the land between the Thames and the New Cut, or on some adjacent farm. The Board consented to proceed to Broadmore in the course of the week, to inspect and examine the system there; and, having adjourned, its members proceeded, with Mr. Menzies, to the Home Park, to examine the state of matters complained of.

**ST. JOHN'S COLLEGE CHAPEL, HURSTPIER-FOINE.**—We are requested to state that this chapel was commenced in 1861, not 1851, as misprinted.

**EGRESS FROM PUBLIC BUILDINGS IN MOSCOW.**—It has been ordered at Moscow that in all public buildings the doors of the main entrances shall open outwards instead of, as hitherto, inwards. This arrangement is to enable people to have free egress in the event of any accident or panic occurring.

**THE PROPOSED RAILWAY BRIDGE ACROSS THE HUMBER.**—The promoters are taking active steps to carry out the arrangements. An engineer has been consulted; and, after a survey of the site, which is between Barton and Hessle, he has produced a design of the proposed structure. The bridge, which is to be built on piers, will be a mile in length, whilst the land approaches to it, consisting of arched viaducts, will be three-quarters of a mile. The promoters have framed a bill to bring before Parliament in the next session.

**THE BESSEMER PROCESS.**—This process for the manufacture of rails is being adopted at Downais. Experiments are being made with the view of trying the durability of rails coated only with Bessemer steel, and not made entirely of that metal. If this can be successfully carried out, there will be a great saving effected in price, for the cost will be but little more (perhaps 2s. to 3s. per ton) than for ordinary iron rails. As a proof of the superiority of Bessemer steel rails, it has been stated that on the South-Eastern Railway a steel rail was laid down opposite an iron one, and the latter had to be replaced twelve times before the steel rail was worn out.

**FALL OF HOUSES IN BERLIN.—THIRTY PEOPLE KILLED.**—A large house, in Wasserthow Strasse, almost entirely new, and occupied by more than sixty persons, has fallen to the ground. The latest accounts mention that nineteen corpses had been taken from the ruins, with thirty-one persons more or less severely injured; about twelve others still remained to be extricated. Some cracks in the building had been observed on the previous evening, but the landlord declared that there was no danger. He has since been arrested. A large hall in course of building, at Koenigsthor Strasse, has also fallen, by which three masons have been killed and four or five others hurt.

**WATERWORKS FOR DANTZIG, PRUSSIA.**—Mr. Aird, an English engineer, has offered to construct the waterworks at Dantzig on the following conditions:—The Company is to receive a yearly sum of 37,000 dollars, or about 5,500*l.*, from the town, and to be sole owner of the works for forty years. After this time they become the property of the town. The estimate of the expense is 225,000*l.* The Berlin correspondent of the *Star* says, in reference to this: "I have not heard whether Mr. Aird's proposals have been accepted. If they are, it is to be hoped that the Dantzig Water Company will give more satisfaction than the English company of the Berlin waterworks is giving here at present. The water used to be clear, but for some time past it has been very turbid. I suppose the explanation is, that the filtering apparatus is not on a sufficiently large scale to meet the increased demand."

**THE NEW WATER SCHEME FOR Huddersfield.** At a special meeting of the Huddersfield Improvement Commissioners, Mr. Crossland, M.P., on behalf of the Waterworks Commissioners, explained the projected scheme for increasing the water-supply of the town and district. The plan comprises the supply of Longwood, Lockwood, Mold Green, Newsome, and Lindley, in addition to Huddersfield, with water obtained from a catch-ground of over 1,500 acres at Metham, and a reservoir of 84 acres at Black-moor-foot, to store a supply and furnish compensation to mill-owners. The present waterworks, when the mains are full, are calculated to supply Huddersfield township (34,000 inhabitants) with thirteen gallons per head daily; the projected works are calculated to supply the townships mentioned (present population 63,000) with twenty-five gallons a head daily if the population were 100,000. The cost of the scheme is estimated at 100,000*l.* or 120,000*l.*, if two streams be included, and a reservoir made in the Wessenden Valley, which is doubtful. The scheme, as a whole, was favourably received by the Improvement Commissioners.

**HOGARTH'S TOMB.**—The inscriptions on the Tomb of Hogarth, in Cheswick Churchyard, are incised, and have been filled in with gilding or colour; but these have become so much obliterated, that they can no longer be read. A very trifling expenditure would renew them, as well as the faded colour of the armorial bearings above. This ought to be done.

**ABERDOVEY.**—Public meetings have lately been held to consider the question of the water-supply; and the local board of health have taken steps in the matter, and, at their last meeting, instructed Messrs. Gotta & Coesley, engineers of the Oswestry Waterworks, to prepare plans and estimates for a new supply, to embrace the town of Aberdovey and Penhelyg adjoining.

**VALUE OF PROPERTY IN LIVERPOOL.**—An arbitration case, in which the corporation on the one hand, and Mr. Woolfield (the owner of land and premises in Church-street) on the other, are concerned, has been proceeding in Liverpool. The premises consist of a fashionable jewelry and "vorn" shop, now required to complete the scheme of corporation improvements. Mr. Woolfield claimed 70*l.* a yard, or 65,000*l.* odd, and witnesses were called on his side, whose estimates of value ranged from 45,000*l.* to 50,000*l.* On the other hand, witnesses for the corporation were called, whose estimates varied from 28,000*l.* to 31,000*l.* In Castle-street, which is more in the centre of the town, land has been priced at 100 guineas a yard.

**THE PROPOSED NEW HARBOUR AT NEWLYN, CORNWALL.**—At an open-air meeting of the fishermen and inhabitants generally of Newlyn, Mr. Floyd, engineer, described the proposed harbour, which contemplates commencing as a southern arm from the Green Rocks—a few hundred yards south of the old Newlyn pier; while another arm will run out from the Western Green, midway between Alexandra Place and Tolcarne, in a south-easterly direction. These piers will enclose and protect an area of about 80 acres of water, when the tide is in, and will give 15 ft. of water at low-water spring tides at the pier heads. The piers are to be of granite. The estimated expense is 50,000*l.*, which it is proposed to raise in 10,000 shares of 5*l.* each. 500 shares have been taken up in Newlyn and Penzance.

**LIME AND BRICK WORKS, NEW BILTON.**—Mr. G. H. Walker, a landed proprietor associated with an enterprising firm, has commenced the manufacture of lime, cement, and bricks, at the late Victoria Works, Lawford-road. The company has already laid down a line of rails from the large kilns in which the perforated bricks were burned formerly, to the field in which many thousand tons of limestone were stacked. Along this line the limestone is specially conveyed to the kilns, and, when burned, it is ground by steam-power, and despatched by rail or boat in bags and casks to London, to be used in the Thames Embankment, the Underground and other railways, Millwall and other docks, the New Blackfriars and other bridges and works that are being at present so energetically carried forward in the metropolis. Mr. L. M. Tatham, connected with the blue lias lime and cement trade, has great interest in the works now in progress here, and Mr. F. Fullwood, of Clifton. Mr. Fullwood has an improved method of manufacturing white facing bricks. We understand some fifty outcrops are about to be erected close to the works for the workmen.

**RICHMOND THEATRE, SURREY.**—While the audience were in the theatre on Monday night, discovery was made that a beam going from wall to wall in one of the flies had caught fire from a gas-jet immediately below it, albeit the timber was cased with iron. The performance was continued while the manager and his men made efforts to extinguish the fire; but some people in the pit perceived water dripping on to the stage, and their attention being thus excited, the cause was detected, and a cry of fire raised. In vain the manager came forward and exhorted the audience to remain in their seats, as they were not in any danger. A stampede took place to the doors, and the house was cleared; although with much crowding, fortunately without serious accident to any one. The fire was confined to the flies and the back part of the stage, and was almost extinguished before the parish-engine was got up to the rescue. Not much injury was done by the fire, but considerable damage to the scenery was wrought by the water. The theatre is said to be nearly 100 years old.

**EXAMINATIONS OF THE COMMITTEE OF COUNCIL ON EDUCATION.**—According to the reports of the examiners on the examinations which took place throughout the United Kingdom during the month of May last, the numbers of candidates in the year 1864, in geometrical drawing, have increased from 312 to 608; in machine drawing, from 185 to 293; in building construction, from 55 to 74.

**MONUMENTAL.**—The statue of Field Marshal Viscount Combermere, at Chester, which has been uncovered, was sculptured by Baron Marochetti. It is situated opposite Chester Castle-gate. The pedestal is composed of blocks of granite, the height of the column being 12ft., that of the statue being about the same, making the total height from the ground to the top, 21ft. His lordship is represented as sitting upon his favourite charger, in military uniform.

**ART PRIZE OFFERED BY THE FRENCH ACADEMY OF FINE-ARTS.**—The Academy, as trustee of the funds bequeathed by M. Bordin, has offered a prize for an essay on a subject which is interesting when taken in connexion with the coming Universal Exhibition, and is stated in the following terms:—"To examine and demonstrate the amount of influence exercised on art by circumstances, national, political, moral, religious, philosophic, and scientific. To show to what extent the most eminent artists have shown themselves independent of, or affected by, such influence." The prize is, nominally, a gold medal, of the value of 2,900 francs, or 116*l.*, and the essays are to be sent in to the secretary of the Institute on or before the 15th of June, 1867.

**CHILDREN IN SHEFFIELD TRADES.**—A committee has been appointed by the town council of Sheffield to examine the report of the factory inspectors who lately visited the town, and who recommended the application of the Factory Act to Sheffield. The object of the committee appears to be to resist the application of the Act. Several witnesses have been examined, and there are two points in which, according to the report in the local *Independent*, they seem to agree,—that the use of the fan in dry-grinding should be compulsory, and that children under fourteen years of age should be prevented from being employed. Dry-grinding, besides, could be got rid of altogether if the workmen were better paid and prices a little raised, as wet grinding takes longer time than dry.

**THE SANITARY STATE OF MARYLEBONE.**—The monthly report on the health of the parish of St. Marylebone, during August and September, 1865, by Dr. Whitmore, medical officer of health for the parish, has been presented to, and printed by order of, the vestry. It states that for some years past the mortality of the parish in August and September has not been so low as during the two months just terminated. Compared with the same period of last year, the deaths from zymotic diseases have been far less numerous, and none of them can be said to have assumed an epidemic character. The comparatively low death-rate from diarrhoea seems to negative the opinion generally entertained that hot weather and the eating of fruit and vegetables in a state of semi-decomposition are certain to increase the mortality from this disease. Dr. Whitmore gives a sad account of Crawford-place, a narrow court running from Crawford-street into Homer-street, which he remarks is beyond all comparison the filthiest and most deplorably wretched spot in the parish. The report, which excited very strong remarks in the vestry, was referred to the sanitary committee.

**IMPROVEMENTS IN SAWING MACHINERY.**—In the cabinet works of Messrs. John Taylor & Son, at Rosemont, Garsden's Crescent, Edinburgh, according to the *Scottishman*, an ingenious machine for the cutting of logs into boards has just been erected. The patent is held by one of the largest saw-mill proprietors in Germany. This machine, unlike those most in use in this country, works horizontally: the log is placed on a travelling carriage, which is constructed of timber, and made to cut logs of 30 ft. in length by 3 ft. square. The carriage is mounted on wheels, which run on the top surface of rails securely fixed to the stone foundation, whilst horizontal wheels are placed to run against the inside flanges of the rails, and thereby keep the carriage steady on the rails. The log is held securely on the carriage by means of iron clamps fixed in blocks, which work betwixt guide-bars, and are adjusted by screw pins.

**THE CHOLERA AND WATER.**—The Registrar-General, in his return for the past quarter, just issued, says:—"It is gratifying to know that London and some of the other large towns are now in a far better condition to encounter the epidemic than they were either in 1848-49 or in 1853-54, when the disease killed 55,181 and 24,516 persons of both sexes and of all ranks in England and Wales. Cholera, like small-pox, is one of those zymotic diseases which exist in all climates. Under favourable conditions their products assume an active form, capable of inducing in other bodies the same morbid changes by which they were generated. For all practical purposes it may be assumed that the discharges of patients in the epidemic, either casually touching the mouth, or entering in dust and vapour through air or water, induce diarrhoea or cholera in a certain proportion of those exposed to their influence. Now London was supplied with the sewage water of a river by several companies in 1848-49; all except one got their water beyond the reach of the London sewage in 1853-54; and the mortality fell proportionately as the water became purer. At the present time the water of all the companies is comparatively little contaminated by zymotic pollution. The London pumps have also been placed under inspection. The drainage is in rapid progress. Analogy justifies the hope that, as the city is purified, and as the means of diffusion are cut off, the destructiveness of the disease will be diminished. The epidemic has hitherto commenced generally about October, and has only proved extensively fatal in the following summer. Thus all our towns have six months' notice and the whole winter for the preparation of defensive works. Every district in the kingdom should at once appoint its health officer."

**ADVENTURINE.**—The discovery just made by Pelouze, the chemist, of the secret which has hitherto given to the Neapolitan jewellers the monopoly of the peculiar composition called *aventurine*, has been regarded as an event in that section of the world of art to which such things belong. M. Pelouze composes his *aventurine* with chromo. The Venetian workman who first discovered the composition by accident, some years ago, and called it *aventurine*, from the circumstance (*per aventure*, in Italian), kept the secret well enough to enable his master to make a large fortune. He had split some iron filings into a crucible containing glass in a state of fusion. The secret is no longer exclusively possessed by Venice, and M. Pelouze has made his discovery public. His report to the *Académie* describes the composition to consist of 300 parts powdered glass, 40 parts protoxide of copper, and 80 parts oxide of iron, the whole to heat for twelve hours, then to cool by slow degrees. The formula by which an improved result is obtained he also gives: it consists of 250 parts sand, 100 carbonate of soda, 50 carbonate of lime, and 40 bicarbonate of potash. The glass obtained by this mixture contains from six to seven per cent. of oxide of chrome, the half of which combines with the glass, and the other half remains detached under the form of crystal sparks of the most brilliant kind. This *aventurine* is far superior to the ancient invention of Venice. It is, moreover, hard enough to cut glass with the greatest ease.

**DECEPTIVE GEMS.**—A rough and worn surface in gems is no sure test of antiquity, for Italian ingenuity has long discovered that a handful of newly-made gems, crammed down a turkey's throat, will, in a few days, by the trituration of the gizzard, assume a roughness of exterior apparently produced by the wear and tear of many centuries. "In a word," says Mr. King, "though faith may be the cardinal virtue of the theologian, distrust ought to be that of every gem-collector." Here is another species of fraud. Antique stones bearing inferior intagli are worked over again by the Italian engravers, so that an apparently antique intaglio of good style is produced. The safeguard here is to examine the entire intaglio with a lens, when, if a fraud has been perpetrated, some portions of the work will be found to possess a higher and fresher polish than others, while the design will be sunk to an unnatural depth in the stone. Setting aside the question of art, the truest test of antiquity, in Mr. King's opinion, is a certain degree of dullness, like the mist produced by breathing on a polished surface. This appearance he believes cannot be imitated by any contrivance of the modern forger. Another satisfactory proof is afforded when the engraving

appears to have been executed almost entirely by the diamond point. Modern gems have been principally cut with the wheel, a minute disc of copper, rapidly revolving, and charged with diamond dust. In this operation the cutting apparatus is fixed, while the gem to be engraved is cemented on a handle, and is pressed against the wheel. Under the ancient method it remained motionless, like an etcher's plate, while the operator, working with his diamond point, had all the freedom of hand which the etcher possesses.

**FEVER IN MANCHESTER.**—The honorary secretary of the local Sanitary Association again directs attention to the prevalence of typhus in Manchester. He says,—"Manchester is at present suffering from a severe epidemic of typhus fever, and, unless very decided steps are taken to check the evil, there is reason to fear that the disease may prevail here during the ensuing winter as fatal an extent as it did in Greenock last autumn. Typhus fever is a disease of surpassing importance to society at large, inasmuch as its ravages fall most heavily on adults,—not on the children, but the parents—those, in fact, who support the family."

**TENDERS**

For erecting a new Congregational Church, The Grove, Stratford, Essex. Mr. Rowland Plunbe, architect. Quantities supplied:—  
 Sewell & Son ..... £14,435 0 0  
 Hack & Son ..... 14,345 0 0  
 Rivett ..... 13,993 0 0  
 Hill & Keddell ..... 12,361 0 0  
 Killy ..... 11,903 0 0  
 Dove, Brother ..... 11,625 0 0  
 Higgs ..... 11,523 0 0  
 Macey ..... 11,381 0 0  
 Carter & Son ..... 11,338 0 0  
 Perry & Co. .... 11,256 0 0  
 Myers & Sons ..... 10,579 0 0

For factory and copperstalls' workshops, offices, &c., at York-road, King's-cross, for Messrs. Henry Pontifex & Sons, Mr. Charles James Shoppee, architect. Quantities supplied by Mr. D. Cubitt Nichols:—  
 Ashby & Sons ..... £7,610 0 0  
 Brass ..... 7,430 0 0  
 Mansfield & Son ..... 7,400 0 0  
 Paiman & Fotheringham ..... 7,414 0 0  
 Lawrence & Sons ..... 7,430 0 0  
 Browne & Robinson ..... 7,261 0 0  
 Jackson & Shaw ..... 7,250 0 0  
 Macey (accepted) ..... 6,950 0 0

For villa, church-road, Upper Norwood, for Rev. E. Birch. Mr. S. Dyball, architect:—  
 Perrin (accepted) ..... £43,310 0 0

For alterations to the Masons' Hall in Basinghall-street, City. Messrs. Habershon & Co., architects:—  
 Piper & Wheeler ..... £5,033 0 0  
 Kington & Fotheringham ..... 4,329 0 0  
 Henshaw ..... 3,896 0 0  
 Manley & Rogers ..... 3,683 10 0

For additions and alterations to 16, Broad-wall, Lambeth. Quantities as supplied:—  
 Winton ..... £950 0 0  
 Sharp ..... 384 0 0  
 Dobie ..... 333 0 0  
 Sutton ..... 279 10 0

For extension of offices for the Law Union Fire and Life Assurance, 123, Chancery-lane. Mr. Penfold, architect. Quantities supplied:—  
 Brass ..... £1,498 0 0  
 Trollope ..... 1,348 0 0  
 Moulltrie ..... 1,260 0 0  
 Browne & Robinson ..... 1,185 0 0  
 King ..... 1,130 0 0  
 Sanders ..... 1,060 0 0

For taking down and rebuilding No. 27, Noble-street, City, for Mr. J. H. Machee. Mr. R. Parris, architect:—  
 Sutton ..... £1,539 10 0  
 Rolins ..... 1,537 0 0  
 May ..... 1,329 0 0  
 Gillett & Wisbey ..... 1,490 0 0  
 Johnson ..... 1,288 0 0  
 Warr ..... 1,389 7 11  
 Manbridge ..... 1,261 0 0  
 Perry ..... 1,375 0 0  
 Nutt & Co. .... 1,374 0 0  
 George ..... 1,297 0 0  
 West & Morse (accepted) ..... 1,258 0 0  
 Paice & Co. .... 1,200 0 0

For alterations, &c., to St. Saviour's Union Work-house, Blackfriars. Mr. Henry Jarvis, architect:—  
 Nutt ..... £900 0 0  
 Sharpe ..... 829 0 0  
 Mareland & Sons ..... 785 0 0  
 May ..... 735 0 0  
 Glend ..... 714 0 0  
 Baguley ..... 694 0 0

For cooking and hot-water apparatus, &c., at St. Saviour's Union Workhouse, Blackfriars. Mr. Henry Jarvis, architect:—  
 Norris ..... £867 15 0  
 Shand & Mason ..... 718 7 0  
 Jesker & Co. .... 599 6 0  
 Beck & Co. .... 582 0 0  
 Bury & Pollard ..... 510 0 0  
 Benham & Sons ..... 408 0 0  
 Fraser (accepted) ..... 357 0 0  
 May ..... 459 0 0

For completion of mansion, 41, Hereford-street, Mayfair. Mr. J. T. Winpenny, architect:—  
 Moulltrie ..... £1,754 0 0  
 Fish ..... 1,786 0 0  
 Stimpson ..... 1,690 0 0

For a warehouse and workshop building and engine and machine shop, at Erskine-road, in the Regent's-park-road, for Messrs. Hindley, of Oxford-street, exclusive of carpenter's, plumber's, painter's, and glazier's work. Messrs. Leader & Bedall, architects:—  
 Manley & Rogers ..... £1,790 0 0  
 Sharpington & Coles ..... 1,717 0 0  
 Lewis Brothers ..... 1,568 0 0  
 Hill & Sons ..... 1,584 0 0  
 Mansbridge ..... 1,550 0 0  
 Grover ..... 1,550 0 0  
 Mann (accepted) ..... 1,390 0 0

For constructing sewer and forming roadway of Upper West-street, Ryde. Mr. Francis Newman, town surveyor:—  
 Kemp ..... £125 0 0  
 Sharon ..... 375 0 0  
 Meader (accepted) ..... 359 0 0

For villa on the Flowers Farm estate, Pangbourne, Berks, for Mrs. Bredden. Mr. Francis Newman, architect. Quantities supplied by Mr. G. B. Musselwhite:—  
 Brown ..... £1,659 16 8  
 Wiltshire ..... 1,568 0 0  
 Briant ..... 1,480 0 0  
 Sawyer ..... 1,406 0 0  
 Reavell & Sons ..... 1,379 0 0  
 Biggs (accepted) ..... 1,349 0 0

For shop, dwelling-house, and printing-office, Union-street, Ryde, for Mr. H. Wayland, Mr. Francis Newman, architect. Quantities supplied:—  
 Colenutt ..... £1,362 0 0  
 Sibley ..... 1,218 0 0  
 Denham (accepted) ..... 1,195 0 0

For parsonage-house for St. Philip's, Arlington-square, Islington. Mr. William Smith, architect:—  
 Dimdale ..... £1,677 0 0  
 Roberts ..... 1,590 0 0  
 Wiltshire ..... 1,568 0 0  
 Whisen ..... 1,357 0 0  
 Hebb ..... 1,350 0 0  
 Bishop ..... 1,287 0 0  
 King ..... 1,190 0 0  
 Grover ..... 1,168 0 0

For Ragged Schools, Bethnal-green, in connexion with Union Chapel, Islington. Mr. William Smith, architect:—  
 Wiltshire ..... £1,337 0 0  
 King ..... 1,096 0 0  
 Mortar ..... 1,070 0 0  
 Perry & Co. .... 880 0 0

For roads and drains on the estate of Mr. S. Parkin, Camberwell, Mr. William Herriman, surveyor:—  
 For the roads. drains. Total.  
 Low ..... 1,111 1 8 ... 388 19 6 ... 1,500 1 2  
 Peoly ..... 1,179 0 0 ... 490 0 0 ... 1,500 0 0

**[ADVERTISEMENT.]**

**CHURCH, TURRET, and STABLE CLOCKS.**  
 J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 33 & 34, Ludgate-hill, E.C. Established 1749.

# The Builder.

VOL. XXIII.—No. 1188.

## Condition of Aberdeen.

BERDEEN can boast of several engineering triumphs. The approach to the city by the railway is over a viaduct (longer, but not so lofty, as the one at Berwick-upon-Tweed), erected after a design by Messrs. Locke & Errington. It consists, as we counted, altogether of about fifty arches, including land arches. From the nature of the foundations in the bed of a rapid and shifting river, necessitating more than one alteration in the plan, it was attended with great difficulties in its construction. The station is commodious and well appointed, but seems small enough for the conjoined traffic of the Aberdeen and Dee Side Railways. The site of the station lies conveniently enough, in close proximity to the docks.

The harbour and docks of Aberdeen present us with a remarkable example of a successful struggle with natural difficulties. Enormous sums of money have been laid out on them under the direction of the most eminent engineers, such as Smeaton and Ronnie. Indeed the harbour has at length become one of the best tidal harbours in Scotland. In 1813 an Act of Parliament was obtained for the construction of a wet dock, which has been accomplished under the superintendence of Mr. Abernethy, and covers an area of 34 acres. The cost of the harbour improvements of Aberdeen amounts to nearly one million sterling. The pier, which was originally planned by Smeaton and enlarged by Telford, is carried out into deep water. It is 2,000 ft. in length and about 30 ft. in breadth, and including the parapet, stands about 15 ft. above high water. It is built of immense blocks of granite, varying from 5 to 40 tons in weight. We may add here that the revenues of the harbour are now in a flourishing condition. Last year there was a heavy surplus, of which, we believe, there has been some difficulty in disposing to the satisfaction of all parties.

Proceeding from the harbour to Union-street, we observe a large building, of which the Aberdeen people are very proud, viz., the Public Markets. This building, we are told, is the noblest erection of the kind to be seen in any part of the empire; and perhaps it is, for public markets of this description have long gone out of fashion anywhere else. The centre affords accommodation for 200 dealers in dairy produce, with 270 yards of side benches for gardeners; and the alleys underneath the galleries are occupied by fifty-four butchers' shops. The galleries

on each side are well supplied with shops and stalls, containing drapery, hardware, and fancy goods, with a grain market at the east end. The basement floor contains seventy-four shops, 25 yards of benches, and thirty-eight cellars, occupied by dealers in general provisions and poultry. But the most part of the area of the basement is appropriated to the sale of fish—salmon, eel, herring, mackerel, and the far-famed smoked fish termed "finnan haddocks." There is a very handsome fountain of polished Peterhead granite in the centre of the principal floor; and the building is 316 ft. long, 106 ft. wide, and 45 ft. in height, with Gothic roof and open-timber work.

Of course, it is not our business to find fault with the building, nor with its contents; but the idea of this gigantic and omnivorous marketplace is, we suspect, a grand mistake. The practice of congregating butchers' meat, fish, game, fruit, vegetables, and software goods together, in one emporium, is wrong, inasmuch as those separate articles, being of the organised kingdom of nature, have a tendency to putrefaction and decay; and, according to Berzelius's well-known doctrine of catalysis, or even Liebig's equally well-known theory of fermentation, the gases evolved from one body have a tendency to react on the others. The smell of meat is not of itself unpleasant, neither is the smell of fresh onions or fresh fish, nor perhaps is the effluvia of dead game (to some nostrils); but a conglomeration of these smells is highly unpleasant. Again, should one substance,—say the viscera of sheep, or fish, or vegetable refuse,—happen to become putrid, it contaminates the whole, and the resulting effluvia are unpeppably disgusting. Just fancy the delicious bouquet of strawberries impregnated with the oil of salmon! the tincture of red herrings! or the essence of ham! The very idea is insupportable. Finally, this concentration of commodities violates one of the first principles of political economy—the division of labour in the process of distribution. Such a market might do very well in Melbourne or Montreal, but it is antiquated and is out of place in a highly civilized community like Aberdeen.

Our experiences of bad smells in Aberdeen reached their climax as we happened, quite accidentally, to pass the slaughter-houses. We had not the courage to venture inside. Shakspeare's celebrated anathema never rose with greater force to our recollection. There is great need, we suspect, for some extra supervision in that quarter; or rather, there is much need for some radical reform. Why not, may we ask, reform it altogether by building new and cleanly abattoirs? On the subject of bad smells we must point out that the chemical works and the gas works close to the river sometimes give out smells of the most noxious and intolerable character. The gas works in particular are very bad. With that taste for classical quotation for which Aberdeen is distinguished, their office-entrance is adorned with the appropriate legend "*Ex fumo dare lucem*," which is all very well as a speculative principle, we dare say; but which, practically speaking, would work all the better if the fumes were not so pernicious: in other words, if the hydro-sulphuret of ammonia were more effectually neutralised! We commend this subject to the attention of the inspector of nuisances, if Aberdeen is possessed of such a functionary; if not, to the hallie of public health.

In the natural order of our subject we must now proceed to speak of the vital statistics of Aberdeen. The climate is, on the whole, mild and equable, considering the northern latitude of the coast; and hence the winters are not so cold nor the summers so warm as they are in the south. The greatest drawback to the town is its exposure to east winds and the blast of the northern ocean, impregnated as they usually are with dense salt-water mists. The mean

temperature at Aberdeen, as ascertained by nineteen years' observations, made by the late Mr. Innes, is 47° for the whole year; for the three summer months about 10° higher; and the mean of winter as much below. The rainfall averages, as far as we remember, about 28 inches per annum. We are not aware of any systematic determination of ozone.

A consideration of the physical conditions of the town will naturally lead us to the class of diseases which predominate in Aberdeen. The zymotic (epidemic and contagious) class of diseases are lower here than in other of the Scotch towns; Perth and Greenock, for example. But bronchitis, consumption, and even paralysis, occur with startling frequency; and the average of brain disease and heart disease is uncommonly high. It must always be recollected in dealing with the statistics of disease in Aberdeen, that it is the seat of an ancient and most flourishing medical school, and that many of the deaths which occur in the mortality tables should, in point of fact, be attributed to other quarters of the country. It usually happens, too, in the case of a severe epidemic,—such as occurred two or three years ago, when fever was so bad that there was not sufficient accommodation in the Infirmary, and the convalescent patients had to be temporarily quartered in the old Grammar School,—that the proximate causes can easily be traced to the overcrowding of the poorer quarters of the town, the defective drainage, and the insufficient water-supply.

The present supply of water to Aberdeen is obtained from the River Dee, close to the picturesque old bridge, about two miles above the town. For this purpose two single-stroke, or Cornish engines, are employed, about 30-horse power each. Working separately, they are employed on an average about eighteen hours a day, and in that time raise about one million gallons of water. The water is filtered by passing through a bed of gravel into a large well; thence it is drawn by a 24-in. suction-pipe, and then forced up to the reservoir in the town to an elevation, as we could observe from one of Bourdon's patent gauges, of upwards of 100 ft. This reservoir is a curious thing in its way. It is built at the west end of Union-street, that being, we presume, the most elevated part of the city, and concealed by a plain but very neat elevation of granite ashlar, pierced with windows, to correspond with the rest of the buildings in the street. After passing it repeatedly, we were still under the impression that it was a Presbyterian church, until on inquiry we discovered our mistake. It rises to an altitude of 130 ft. above the tide-level. The cistern contains 94,728 gallons, the value of which, if it were whisky, we are told in one of the guide-books, at 4d. a gill, would amount to 50,521l. Query, what would be the additional cost of the ingredients for toddy? And how long would the inhabitants take to consume it?

From this reservoir the water is supplied to the town by the ordinary process. The water-rate is 1s. 6d. per pound of rental; and the management is vested in the commissioners of police. But for many years the supply has been very insufficient; and accordingly the commissioners are now in the midst of a vast and important undertaking to bring a supply, by gravitation, from the river Dee, at Cairnont, about 26 miles up the river. This extension of the Aberdeen water-works—which is of a similar character, and in point of importance second only to the Glasgow water-works—is under the charge of Mr. James Simpson, C.E. Provision is made for an extensive reservoir and filters at Invercairn. There will be an aqueduct to Pitfodels, about 16 miles in length; a tunnel through rock of half a mile; and the rest of the conduit will consist of cast-iron pipes 40 in. in diameter. The maximum supply, it is expected, will amount to five million gallons per day; and the cost of

the works will be about 100,000l. Whatever may be said, therefore, respecting the commodity of bread, there can be no doubt that the Aberdeen water will by and by be made sure.

There appear to be some municipal regulations in Aberdeen as to the supply of water which we do not understand. Unless a street happen to be made of a certain width, the commissioners refuse the supply. But surely this policy is unsound; and for this obvious reason, that the narrow streets are undoubtedly the places where a good supply of water is most imperatively required. It is possible some other reason may be "subtended" in this regulation, but we hope it may be of a more satisfactory character.

It is probable that this scarcity and cost of water at the fire-plugs may be the cause why the watering of the streets is so much neglected in Aberdeen. That implement which we call a water-cart, indeed, seems to be altogether unknown to the northern commissioners. We can speak from bitter experience of the consequences of being caught in a cloud of the pulverized granite which constitutes the Aberdeen dust; and we are perfectly sure that diseases of the eye must, from this cause, be very frequent in the neighbourhood.

With regard to the drainage, our report, in order to be favourable, must be prospective; for with regard to the past and present condition of the city, it is worse than Perth, and that is saying a good deal. We do not know very well how to account for this; for there are certainly few other towns in Scotland so favourably situated for thorough drainage as Aberdeen. Notwithstanding this, it has (with the exception of one or two common sewers built in the most improved parts of the town) no system of main drainage; indeed, the only sewers are the Deu Burn, the little streamlet which intersects the town and runs beneath Union Bridge; the Ferry-hill Burn, which passes the picturesque quarter of Springbank; and the Gilcomston Burn, all of which sewage streams also serve the purpose of water-power to the various mills and manufactories of the town. The Deu Burn, besides, passes through the city in an ornamental channel, and is laid out in cascades; but this channel is often nearly dry in the summer season; at the same time, we have been informed some forty or fifty common sewers discharge into its course within a space of 600 yards. Of course, the bed of the river becomes highly polluted from these sources; for the Dee, opposite the town, has not much of a fall, and is completely tidal; therefore, at low-water it is covered with a thick, fetid, and filthy slime, out of which the poisonous gases may be seen oozing under the action of the hot sun. We need scarcely say the smell is horrible; indeed, we cannot understand how the inhabitants of Ferry-hill (we mean that village close to the railway viaduct) can support their existence within a few yards of such an atmosphere. The fact is, the inhabitants of Aberdeen seem only recently to have become aware of the supreme importance of good drainage; for the best quarters of the town are still only drained into cess-pools in the back gardens. Some houses so drained we had the opportunity of examining, and most of the inmates complained of the insufferable smells which pervaded their houses; and no wonder. The truth is—and the truth is not so generally understood as it ought to be—that the connexion of an inhabited house with a cesspool, by means of a soil-pipe, is one of the slowest indeed, but most certain methods of poisoning, which the perverse ingenuity of mankind ever invented.

But having got thoroughly alive to the evils under which their town was suffering, the Aberdeen people have, with their characteristic energy, set about the work of reform. Somewhere about six months ago, the Police Board remitted to Messrs. Willet & Fulton, C.E., of Aberdeen, to examine and report on the plan which had been previously submitted by Mr. Anderson, C.E., of London, the engineer to the waterworks; and from this report of the first-mentioned gentleman, as published in the local journals of the 21st of July, we gather the following conclusions:—

1. That the existing arrangements are most objectionable; and that no time should be lost in abating the nuisance.
2. That the outfall of the main sewer ought to be placed in such a position as to render available at any future time the sewage matter for the purposes of irrigation.

3. After careful consideration, Messrs. Willet & Fulton reach the conclusion, "that the scheme which has been sketched out by Mr. Anderson, of an intercepting sewer carried round the city, at an elevation sufficient to throw the main volume of the drainage of the town on the Old Town links by gravitation, is the best."

4. That in the event of the irrigation scheme not being entertained at present, there are the alternatives of a discharge at the mouth of the Don or into the sea.

5. That the area proposed to be drained by this project is 1,250 acres; that the probable population is 60,000; and that it includes all the most densely-populated parts of the city.

6. That the total estimate of the cost, including expense of district-draining, intercepting outfall sewer to Old Town links and Don outlet, compensation for land, and contingencies, is 47,521l. 14s.

We have not ascertained whether the commissioners of police have decided on adopting this comprehensive plan. The expense seems heavy, but the necessity is great; and it is certainly the cheapest way in the end to make a good job at the beginning. The proposal of the commissioners to discharge the sewage pure and simple into the mouth of the river Dee is, we must point out, a mere shifting of the difficulty. The Aberdeen newspapers, however, seem to discuss the subject fully and fairly; and we must hope that they will soon arrive at some solution of the important problem. So much for the drainage.

We now come to touch on a question which we would most gladly overlook, did not duty to the public and to the cause of sanitary reform make it necessary that we should always be as careful to point out error as we are to recognise truth. In one word, then, we must state that overcrowding is the greatest blot on the Aberdeen escutcheon, and at present, as it seems to us, the most prolific cause of the social evils under which the whole community labours. The causes of this will be easily understood, if the reader has paid attention to our account of the improvement of the town.\* The process of demolishing, if we may so describe it, which began with these improvements, continued as a matter of course through the whole railway period, and is in full vigour at the present moment. It is possible—though we cannot tell—that the number of houses may not have diminished absolutely during the last five-and-twenty years. But most assuredly they have diminished relatively. Houses have, indeed, been built, but not houses of the same kind that were pulled down. Rubislaw-terrace has sprung into existence, and the Windmill brae has been half-erased. Union-street, which shines so proudly in all its glittering glory, stands on the ruins of a multitude of steep, rough, suffocating thoroughfares, which, nevertheless, were crammed with population, for which no subsequent provision has been made. The consequence has been, that the working classes have been crammed, in the most inexplicable manner, into the remaining houses, to the great injury of their health and morals. And not the working classes alone, but many families of a higher yet humble position, have been ejected from their houses, and are at this moment forced to take refuge in the cells of Bridewell, which, fortunately enough, is for the present unoccupied by prisoners!

As usual, the population is by far the most densely crowded in the closes and courts of the city, of which we are informed on good authority there are no fewer than 60 narrow lanes, and 168 courts or closes, of an average breadth of 7 ft. Even the most cursory inspection of these quarters will reveal at a glance all that we care to know of their condition.† Indeed, if we venture to pass at one time from the fashionable promenade of Union-street and Castle-street to the closes, such as Smith's Close and Peacock's Close, which lie at its eastern extremity, we shall pass at one sweep from the higher to the lower grades of civilization. We do not say the lowest, for there is something lower still in the Gallowgate, and the courts which branch from it. In Beattie's-court, Ferguson's-court, and Watt's-court, we examined a class of houses, of which, having had some experience of such investigations, we may be permitted to say that it would be difficult to find much worse houses, at such high rents, in

\* See p. 705, ante.

† A very common specimen of the old houses was fortunately being dissected in Windmill-brae, during our visit, to make way for a new railway-bridge. The basement story, we could easily see by the exposed section, was 6 ft. in height, two floors, 7 ft., and attics, sloping from the walls to the ridge, 6 ft. The plan we could not examine.

the country. 6s. per month, 3l. 12s. in the year, for a miserable room, 12 ft. by 10 ft. by 7 ft., and small light closet. There was no water, no gas, no water-closet, nothing in the shape of convenience but the bare walls. As for pure air, the high dingy walls of the close, and a huge untrapped gully-hole answered the question. We did not inquire how many persons slept in those two rooms; but we can guess, reasoning from analogy with other cases; nor do we need to be told that these are the pest-houses the cholera first visits when it goes north. On a rough estimate, we are told, there are 6,000 to 8,000 mill girls in Aberdeen, at ages varying from fifteen to twenty-five, living in such dens and hovels. It would be painful to give an account of the manner in which they are huddled together. A constant per centage of them, we may add, are either patients of the Maternity Hospital or preparing to go there!

A higher class of dwelling-houses than those of the Gallowgate quarter may be observed in Gilcomston, which, being originally a suburb, although now dotted with manufactories, has more of the fresh atmosphere certainly. But the ignorant inhabitants do their best to destroy their natural advantages. The low, old-fashioned red tiled houses have usually outside projecting stairs, with a timber rail; and, from the top of this stair, the vigorous nymph project with great skill and precision their slops into the roadway—oblivious, sometimes, of the circumstance that the road was made for the purpose of travelling. Fresh herrings are here gutted, and dried fish hung up with the very same indifference; and the mill-stream which flows past affords a ready supply of water either for washing or for draining (notwithstanding the menacing placard of the police commissioners, who threaten divers fines under sundry Acts of Parliament for the offence). Even these houses are overcrowded to an extent which almost surpasses belief.

In fact, this overcrowding is conspicuous on the very face of the census of 1861. Let us take the population, in round numbers, at 75,000, and the number of inhabited houses at 6,000 (the actual numbers are 73,794 and 5,901), and divide the former sum by the latter. The result will be 12.5, or a ratio of twelve and a half inhabitants to every house—a result so enormous that we are inclined to suppose there must be some confusion in the statistics with regard to the definition of a house. What is a house, in Aberdeen? We are afraid we can scarcely answer the question—there are so many varieties of the *domus*. First of all, there is the well-known self-contained house of four floors, such as we know it in London; secondly, the equally respectable common stairs, with flats such as we see in Edinburgh; and, thirdly, there is an intermediate hybrid, called the half-house, which is neither the one nor the other, nor a combination of both; it is just the half-house, so far as we know, peculiar to Aberdeen; and it has this unfortunate peculiarity in itself, that there is only one water-closet to six families, perhaps. Some other varieties there are, but these are sufficient to warrant the presumption that a house is not by any means a definite quantity in the northern enumeration. If, however, the number of inhabited houses in the Aberdeen census signifies the number of separate dwellings—many of which we have seen are only single rooms,—then the statistics reveal a state of things that is shocking to contemplate.

We might prolong this discussion, but our readers have probably had enough. Of those places which are called "closes" and "wynds" in Scotland, in Shropshire a "shut," in Newcastle a "chare," and in London a "court," Aberdeen has its full share by the original necessity of its construction. By the circumstance of its rapid improvement those poor and unhealthy quarters have been overcrowded to an extent which it is difficult to conceive. From this overcrowding proceeds every now and then a decimation of the poorer inhabitants from cholera and typhus fever; need we add, that this contagion does not always pause at the narrow boundary which separates the dwellings of the rich from those of the poor. Although at first glance, and even on subsequent inspection, we feel inclined to pronounce Aberdeen in many respects the cleanest town we have seen in Scotland, yet we must point to these sanitary conditions of those poorer quarters as a great stigma on its character. The evil is not incapable of remedy, if Aberdeen will take warning from London and other communities, and build houses for the working classes on a large scale, either

by joint-stock companies or by the corporation. If granite be too expensive, let them adopt bricks, if bricks can be got. If not, they must even take Dee-side or Brae Mar Forest timber, as their forefathers did before them.

We have hitherto spoken of this overcrowding in a sanitary point of view; and here, perhaps, we ought to stop; but it is impossible to leave the subject without a single reference to the question of morals. It is unfortunately too notorious that Aberdeen stands higher than all other quarters of Scotland in the statistics of illegitimacy. From twelve to fifteen per cent. of the births annually recorded there are illegitimate. This fact speaks for itself; and we will not at present dwell on it or attempt to analyze it. A Scotch Presbyterian might endeavour to account for the sad phenomenon by the laxity of discipline in the church; an English divine will say that the Scotch church has lost its hold on the affections of the people. On this point we will not venture to pronounce. It is our business, as much as possible, to reduce the question to one of material circumstances, and to give poor erring human nature that opportunity for the practice of virtue which the want of a decent and healthful home must always interfere with.

#### ARCHITECTS, ENGINEERS, AND THE COMING SEASON.\*

It is a relief to your president to feel that the address of 1865 follows upon a year of rest,—a year which, while it has not given birth to any particular reason for exultation, had, up to three weeks since, been equally devoid of any remarkable cause for sorrow and condolence. If there has been a Great Exhibition this year, it was one which was parted from us by St. George's Channel and the Race of Holyhead; and the exigencies of a huddled-up session, followed by a general election, have kept the collective wisdom of Parliament off from the fascinations of any art-crusade, or of any art-harmony,—things which sometimes run somewhat closely up into each other. This fall, temporary as it may prove, may be used by us as an opportunity for reviewing calmly and fearlessly the position of this Royal Institute, as the general exponent and mouthpiece of English architecture, and for considering the condition of national architecture itself as it may be mended or the reverse, according as this Institute acts with unity, vigour, and wisdom.

I am ambitious for the honour and usefulness of the Institute, and, as the result of this ambition, I decline to rest where we are. We are all doing our best, and yet the Institute, with its ample prerogatives, its royal charter, and its royal medal, its powers of examination, and its various prizes, with the distinguished names that belong to it, and the vast mass of most interesting architectural lore which it has conveyed to the world, has not yet risen to the summit of its duties and of its pretensions. The Institute ought to be, without rival and without demur, the central regulating aræopagus of architecture,—of architecture as a science, and architecture as an art; of architecture as practised by its professional votaries, and as studied by the amateur,—as loved by both,—throughout this imperial realm. The time should come when the absence of those letters which denote some grade in the Institute from the name of any one who practises architecture should be as much cause for inquiry as the absence of academic distinction from that of the clergyman who has the misfortune to be a "literate." Do not mistake me, and imagine that I am the mouthpiece of any policy of aggression; least of all that I wish to crush the free art-life which has given birth to so many other architectural and semi-architectural societies, all distinct with the energy which the pure love of science and beauty inspires, and many of them further nerved up by the conviction of a mission to fulfil and a dogma to teach. I wish them all prosperity and all liberty. At the same time I desire that they should all act as members of one system, moving harmoniously round one centre, co-operating as the volunteer forces of the great architectural army, looking up to this Institute, not as the tyrant whom they are pledged to bring low, but as the *Alma Mater*, ready to give all fostering care, at the cheap price of unspicious confidence.

\* Opening address by the president, Mr. A. J. B. Beresford Hope, M.P., at the meeting of the Institute of Architects on the 6th instant, elsewhere reported.

We must not, however, shut our eyes to the difficulties attendant on the realisation of such an idea. I believe that in accepting it we should have to extend our borders, and to create one or more fresh classes of membership for the proficients in arts related to, but not identical with, architecture. This enlargement would of course entail increase of labour; but as it would involve increase of members also, more hacks, no doubt, would be found broad enough and willing enough to hear the honourable burden. There is in particular and emphatically one phalanx which I earnestly desire to see absorbed into our body in larger proportions than they have as yet been. These are the architects who, because the buildings which they construct are pre-eminently massive, because they are buildings mainly devoted to the development of the grand material interests of the nation, because their measurement may be the furlong and not the yard, therefore abjure the name of architect to borrow mistake me, and imagine that one single thought derogatory to the grandeur of those constructions, or to the genius of the men who planned them, crosses my mind while I pen these sentences. The man who he is unworthy of the name of Englishman who was not proud of them. All that I say is that I demur to the appellation under which their constructors have produced them. What is an engineer? I look to Johnson, and he tells me: "Engineer; (1), one who manages engines; (2), one who directs the artillery of an army," with a reference to Shakspeare's engineer hoisted on his own petard. I seek further help from Richardson, but he only provides me with an illustration borrowed from South: "In like manner, as skillful an engineer as the devil is, he will never be able to play his engines to any purpose, unless he finds something to fasten them to." We all know and we all admire what our great civil engineers have done, and we lump all their grand works under one term, and call it "engineering." But it is surely just as incorrect to designate everything that Stephenson or Brunel accomplished engineering, as it would be to call all the works of Michelangelo architecture, or painting, or sculpture. Michelangelo was great in all constructive plastic arts, but the versatility of his greatness did not bring those arts nearer together in themselves than they were before. So the patriarchs of modern engineering have mapped the roadways, invented the rolling stock, and designed the buildings, all of which in different ways go to make up a working railroad, just as an old architect might have built, painted, and carved a cathedral or public hall. The old architect thus showed himself to be architect, painter, and sculptor. So the civil engineer proved himself to be a surveyor in laying out the line; an engineer, properly so called, in constructing the engines; and an architect, in designing viaducts and stations. The name surveyor has no doubt gone out of fashion as applicable to the person who plans any very large works, and if the world prefers to substitute the designation engineer, I do not object. My immediate point is that the world should not continue to deceive itself with the belief that Stephenson and Brunel were not architects—self-made architects, it may be, just as the mathematician Wren and the physician Perrault were self-made architects, but, like those worthies of the seventeenth century, great architects. The notion that because to them architecture came without the usual training, therefore the engineer is for the future to dispense with the trained and learned architect for the construction of buildings whose monumental elevation gives its colour to our age, is a wrong on our whole craft of architecture, against which it is right to make an earnest protest. But you will ask, what is this protest worth, and what is the practical remedy with which you wish to follow it up? How will you mend the state of things by inducing a number, more or fewer, of our civil engineers to join this Institute? Be assured that I propose no such tritivial palliative. I wish the world, eager enough as it is in general for subdivision of labour, to see that in its creation of the new profession of civil engineer it has been false to its own principles, by overweighing the responsibilities of a calling which, growing as it has done with the growth of modern science, may be almost called a new discovery, with those of the old time-honoured one of architect. The mischief of this course is only making itself evident:—

"Decipit exemplar vitibus imitabile."

The great engineers overwhelmed us with the

rough grandeur of their huge style; able but less eminent successors may but stiffen us under the weight of heavy disproportion and unscholarly nakedness of detail.

The question of architect or engineer is not a mere fight of words. There are engineers who will build commendable structures, and architects whose works may be contemptible. But men's merits do not affect the value of principles. Architecture is the calling which, next to that of poet, dives deepest back into the young world's gulf of ages. As it moves on it spins out as part of itself that golden chain of association which ties together the ancient and the new, the foreign and the home-born, the beautiful and the useful. So an architect's education should be based on the broad foundation of history, science, and imagination. The liberal languages and the literature of other lands and times should be storehouses out of which he may bring the treasures with which he makes his handicraft lovable and true. Engineering repudiates the past, or uses it to point a self-exalting contrast. I do not say that engineers themselves do so; but this repudiation is the necessary price at which the constructive part of the engineer's business can any longer be formally divided from architecture.

Is it not, then, more necessary for us to dare to speak the truth, and to believe that our engineering friends will bear to hear that truth. We attack no vested interests, we deprecate no living man's work, when we say that the vast monumental structures of this glorious nineteenth century ought pre-eminently to be designed by men who have, as architects, learned how past great architects grappled with higness; men who have studied Egyptian Thebes and the Colosseum, the Pont du Gard, the Castle and Bridge of Avignon, Conway and Durham Minster. Let it be our office to revindicate for architecture all works of piled material, either containing chambers or else cast in architectural forms, whether they be of arched or trabeate construction. The engineer legitimately claims the level and the gradient, the earthwork, the roadway, the culvert, and the breakwater.

Those considerations lead us to a topic which ought on its merits to be faced within the Institute,—the relation of the society with the Royal Academy. It is one of the questions which it is the fashion to call delicate; but I see nothing delicate about it, if it be handled in candour and good temper. I approach it in the spirit of the utmost good-will towards the Academy, although believing that I best show my good-will by declaring myself a believer in the desirability of certain reforms within that distinguished body, which I desire to see always filling the exalted position to which it has the means of doing justice, so long as it continues to realize that rank and wealth involve responsibility with corporations no less than with men. The dualism involved in a Royal Institute of Architects such as I have foreshadowed, alongside of a Royal Academy of Arts, including architecture, is, I freely grant, at first sight, puzzling; but I flatter myself that I see the way of reconciling with advantage to each other, and to pure architecture, as well as to the mixed arts dependent on it, the continuous co-existence and the progressive development of the two great societies. Consider the broad differences which respectively mark off the constitutions of the two bodies. Both are, speaking generally, elective; but the election at the Academy means the choice of one distinguished man from out of many; while with us it is little more than the safeguard against improper nomination. Otherwise the Institute is in theory the collective body of all architects; the Academy a selected council of artists, among whom architects only form a certain, and I venture to add, too small a portion. But then we may be told, let the number of architect academicians and associates be augmented, and then the Institute might be suppressed. Emphatically *no*. The Academy is a great advantage to architecture—what that advantage is I shall proceed to point out; but the Institute is a necessity. I have just been revindicating for architecture much which it is the fashion to call engineering; but this revindication strengthens the fact that, while architecture is an art, it is also what, for want of a better term, I must call a business or craft.\* It is this perpetual combination of the *utile* and the *dulce*, the perpetual necessity of adapting style, ornament, and proportion to construction,

\* *Profession* applies to the person who professes, and *no* to the thing professed, and will not, therefore, serve my turn.

and of so manipulating construction that it shall not sin against beauty of detail or mass, which makes architecture the peculiarly complicated and scientific thing which it is—an art, and something more than an art. It is that which makes it so fascinating to those who are really embraced by its spirit; while, on the other hand, it deters so many amateurs, who find it very much easier to set up as connoisseurs of painting and sculpture than to risk being discovered as incapable of apprehending the mechanical exigencies of building. Again, the architect has also, as a member of the commonwealth,—charged with care for the life, health, and convenience of its various members,—to make himself at home with sundry legal matters of which an academy of arts could have no cognizance, but which are the legitimate function of an architectural corporation.

Of this mixed craft and art, then, the Institute can be the efficient regulator, as the Royal Academy, a purely artistic body, cannot be. On the other hand, something like the Academy is just what is wanted for painting and sculpture; and being so for these two arts, it was seemly that it should also include architecture, otherwise the exclusion would have seemed like a denial of its claim to be a liberal art. Nay more, at the time when the Academy was founded, and architectural art in this country was passing through a time of great depression, I have no doubt that the step was eminently salutary. I proceed further, and say that even now, when architecture occupies in every way a very different position from what it did in the early times of George III., we are more likely to be the better than the worse for the Ephorship of the Academy. Still, it is well that we should know what the Academy can do and what it cannot. It cannot handle the many professional matters which constantly come before us. It can give lectures on the theory of architecture; it can teach a school of students on the art side of architecture; it can give prizes. We can also do all this, and we do a great deal of it. We shall do more when our School of Technical Teaching, on behalf of which a mixed committee was organized, gets fairly to work, as I trust it may do this session. Moreover, the Academy can, and does specially do, two things, neither of which we are so capable of carrying out. The first of them is not a part of its special architectural functions, but it is of essential importance to the architect. The Academy possesses a life school, in which even the architectural student can acquire that power of drawing the live figure, which I am convinced ought for many reasons, direct and indirect, to form a portion of the curriculum of every one who desires to master architecture as an art, and not as a business.

The next thing which the Academy can and does do, is to hold an Exhibition. No doubt, if we had as large an income relatively as the Academy, we could hold our Exhibition; and no doubt, if the gallery in which we held it were one of the public buildings of London, we could make it a much better exponent of architecture than the Royal Academicians have ever made theirs. It would be affectionate not to say what we all feel, that the architectural portion of the great annual display fails in doing justice to architecture. The best evidence of the shortcomings of the Academy is to be found in the independent Architectural Exhibition, which has been carried on for several years with so much zeal, and has for a considerable time been held on the ground-floor of the building which lodges us. Still we must all confess that this independent Exhibition does not in itself completely fulfil the requirements involved in an annual London display of architectural progress. The reason is not far to seek, and it is no fault of the promoters of that exhibition. Imperfect as our representation in Trafalgar-square may be, it still stops the way; it has prestige and anti-quietly, and so, while defective in itself, it keeps the younger enterprise from filling the void. Accordingly we say, let the Royal Academy, while seeking a new habitation, bear in mind that it can win both honour and popularity by making its Architectural Exhibition each year a vigorous reality, alike for the general visitor and for the student. I am sure if it embarked on this course, it would find no heartier co-operators anywhere than within the walls of this Institute.

In the evidence which I gave before the Commission which sat in 1863, to inquire into the condition of the Royal Academy, I urged its aggregating to itself associates out of the ranks of working artists. If it should take any such step,

we, I am sure, in no spirit of rivalry, would also consider how we might enlarge our ranks, so as to admit the members of such professions into some regulated membership.

I have adduced instances of the peculiar work which we might wisely leave to the Academy. Let me now refer to two fields of labour of our own, in which we especially can do much good, but which would be quite beside the scope of the Academy. Air and light have an importance at once legal, sanitary, and architectural. That the Institute should have had a committee sitting on this question is a matter of mixed congratulation. Only let me offer one caution—he not content with simply making a report, once for all, on a matter which must be continuously watched through its many ramifications.

The conservation of ancient monuments, on which, also, we have a committee appointed, is happily a responsibility which is now universally recognised. But it is one thing to recognise and another to perform. A former generation destroyed without shame and without consciousness. Our present generation is too often in the habit of changing and spoiling and bedazzling, and then of asserting with a complacent smile that it has only been restoring. Some of us have had our attention lately called to the painful fact that, with the very best intentions, the authorities of Lincoln Minster have lately been flaying alive the surface of that noble structure. Professor Willis, at the late Archeological Congress at Dorchester, laid down, in discharging of Sherborne Minster, the true and exact law of treatment to which churches ought to be subjected—conservative alike of the fabric, and yet respectful of the solemnity and the exigencies of their still living use. The paper put out by our committee takes up the same position. Neither this paper nor the Professor handled the restoration of secular buildings; and so I hope we shall not pause midway, but instruct the committee to give the possessor of every castle, every hall, and manor-house, and every grave, practical and straightforward advice how to live and let live, without damage either to his own health and comfort or to his archaeological allegiance. No doubt this is a much more delicate problem than that of church conservation, where the fabric is either restored within its original unchanged walls, or else merely enlarged by aisle or transept, in accordance with the original motif, while house conservation is complicated by ever varying necessities of family, and social station, of ventilation, drainage, and smoke, for which no law can be laid down which can systematise the amount of necessary alteration; and therefore it is all the more necessary that some code of general principles should, if possible, be provided. The necessity has become more apparent, since, in an ever-increasing ratio, farm-houses situated in counties proximate to the capital, or to chief towns, are snapped up by near railroads and tamed into villas. These houses are frequently interesting specimens of Medieval or seventeenth century architecture, sometimes perfect and sometimes disguised, which the judicious restorer would preserve and enlarge, while in the hands of the ignorant builder they would be doomed to hopeless destruction.

This sketch of the relations of the Institute to external powers would not be complete if I did not comment upon that Ministry of Public Works which has gradually grown up out of the old office of Woods and Forests. It has from time to time been argued, that, in order to avoid the vacillations and inconsistencies seemingly inherent in a fluctuating change of chiefs, there ought to be a permanent head of the Department of Works. I am decidedly opposed to any such arrangement. Not only is a permanent head to a great department antagonistic to our political instincts and traditions, but I believe that in this case the innovation would defeat its own object. The man who is originally appointed must have some notions or other of his own, or else he is palpably unfit to get the place at all. These notions may be good or they may be bad. Anyhow, if he is irremovable, they will be ineradicable, to the discomfiture of all opposing schools of thought. At best we should perpetuate sameness and tameness, at worst ever-recurring clique and manoeuvring. Besides, those who argue for the permanent chief, forget that in all public offices there is an element—often an overpowering one—of permanence in the irremovable second man. My own remedy would be based on the opposite principle, of exalting the attributes of the Minister of Works, treating his post as a necessary component, not merely of the administration, but of the cabinet, increasing his

responsibilities, multiplying his inducements to do well, and withal hedging him round with such constitutional safeguards as a perpetual oversight by the Institute and the Academy, not to mention the still more severe and formal one of Parliament itself.

The Commissioner of Works is sometimes in the cabinet and sometimes not; and whether in or out of the cabinet he is in theory only a subordinate of the Treasury. This is plainly wrong, for it pulls down the importance of the office, and consequently checks young men who are going into public life from really studying art questions as a channel of political advancement, not much inferior, in its openings, to heavy statistics or colonial grievances. Then modern educational developments have accumulated a large amount of mutual responsibilities, more or less referable to architectural art and its cognate pursuits, between the State and the people, which, if imposed upon the Minister of Works, would fill the hands of the office and of himself, and justify the suggested increase of his dignity. But by some freak the wise men, who busied themselves a few years ago in re-arranging the public service, passed over the First Commissioner, and instead created an anomalous semi-minister, under the ambiguous name of Vice-President of the Committee of Council, to divide his time between high art at South Kensington and parochial school squabbles in general over the remaining kingdom. I give nothing but praise to the noble collection at South Kensington, while, at the same time, I say that its wants have no relation to the department of state under which it is placed; and I claim that this museum, with the appendant art-schools, would more congruously be made a function of the Minister of Works than of the Vice-President of Education. Let the departments be thus redistributed, and the need for the latter never very well understood nor popular office falls to the ground. For the purpose of moving the really educational votes in the House of Commons, the Lord President himself, rid of his art responsibilities, would want, and ought to have, a parliamentary under-secretary, but that official need not be of weightier calibre than the Secretary of the Poor-Law Board. If the Minister of Works were expanded, as I propose he should be, into an undoubted and constant member of the cabinet, he should also have assigned to him a parliamentary under-secretary, to move estimates and make explanations; and then the Department of Works might be filled by a peer, if the fitting man turned up in the House of Lords. We should know how we stood towards such a minister, as we do not with respect to the actual First Commissioner. It would then be our duty, in conjunction with the Royal Academy, to see that, in the remodelling of the office, a definite standing should be given to those great societies, as the perpetual attorneys-general and referees of architecture at the bar of the administration. Thus the liability of the office-holder to be changed would check clique, and the fixity of his standing council would obviate fickleness and inexperience.

Let me now say a few words upon a detail of considerable importance to architecture,—the International Exhibition which it is proposed shall be held in Paris in 1867. Many here present to-night, no doubt, recollect the trouble that was taken in this Institute, and elsewhere, to secure an adequate recognition of architecture as the great material symbol of civilization at the London Exhibition of 1862. The result was not all that could have been wished for; nevertheless, much was achieved on the British side,—the only side with which we had to do. Not only a highly interesting and overflowing gallery of architectural designs was furnished, but at various points of the ground-floor, notably in three special courts, and all up the nave, such large fragments of buildings in progress as were noteworthy by reason of form or detail, and even smaller buildings, like drinking-fountains, in their integrity were exhibited. Compensations architecture, as architecture, made itself felt on the British side of the Exhibition, as it would not have done if the professors and the lovers of architecture had not in time bestowed themselves. I turned accordingly with anxiety to the prospectus of the French Exhibition, which has just been reprinted and circulated from South Kensington, to see if it indicated progress or retrogression since 1862, in respect of the due recognition of architecture as an elemental idea in the general arrangement. It is my duty to report that I am filled with grave apprehensions that, if that programme is to be acted upon, we

shall find that recognition even less complete than it was in 1862. Of course, allowance must be made in reading this document for that love of playing at scientific arrangement, which among foreigners sometimes tends towards something not very unlike pedantic fassiness. In one respect, I am glad to say that the Exhibition of 1867 is a marked improvement upon its predecessors; it will be truly universal, by breaking down the geographical divisions which converted its predecessors into what a man given to playing upon Mercator's projection, and by ranging class against class in direct cosmopolitan competition. Here, however, I must pause in my praise, looking at the programme with an architect's eye. The prospectus ranges the exhibition in ten groups, subdivided into ninety-five classes. What an architect might have marshalled together under the great group of architecture is dotted up and down the list as follows:—Group I is entitled "Works of Art," and divided into five classes, of which No. 4 is headed, "Architectural Designs and Models," to be placed in the first gallery of the building, and is thus epitomized:—"Sketches and Details;" "Elevations and Plans of Buildings;" "Restorations based upon existing Views or Documents." I should have mentioned, that in a previous class, termed, "Other Paintings and Drawings," occur, "Cartoons for Stained Glass and Frescoes," while there is another class of "Sculpture and Die-sinking," which may cover architectural sculpture, which has otherwise no distinct place. Class 9, in group 2, introduces us to photographs of buildings. The third group is headed "Furniture and other Objects for the use of Buildings," and includes thirteen classes, which in their turn include a mass of miscellaneous articles which it is difficult to image could not be better subdivided. The "upholstery and decorative work" class starts with "bed furniture and stuffed chairs," and closes with "furniture, ornaments and decorations for the service of the church." The next class is designated "Crystal, Fancy Glass, and Stained Glass," and also runs from the secular to the sacred, from "drinking glasses" to "stained glass windows,"—the cartoons for such windows being, as we have seen, ever so many classes back. After exhausting other materials the classifier seems to have thought that the time for metal had arrived, and with a true system-monger's insight he begins from the beginning with a class of "cutlery—knives, pen-knives, scissors, razors, &c.—cutlery of every description," and goes on to recapitulate in subsequent classes "church plate," "plate for the dining-table," and "statues and bas-reliefs in bronze, cast-iron, zinc, &c." I am sure you will admire the philosophic rigour of the classification, which ranges "razors and bronze statuary" side by side, and calls them both furniture. The anti-climax of the furniture group is a class of leather work and wicker. A long sweep brings us to the eightieth class of "civil engineering, public works, and architecture" (architecture you will note coming after civil engineering) in the large group of "apparatus and processes in the common arts," in which a miscellaneous catalogue tails off with "models, plans, and drawings of public works, bridges, viaducts, aqueducts, drains, canal bridges, &c., lighthouses, and public buildings for special purposes,"—as if there could be a public building without a special purpose;—"buildings for civil purposes; mansions and houses for letting; lodging-houses for the working classes, &c." I ask you, as men of common sense, if this elaborate catalogue, coming where it does, and contrasted with the vague generalities of the so-named architectural class in group 1, does not indicate the subordination of pure architecture to so-called engineering? Another jump brings us to the last class but two, No. 93, which it seems is to be placed in the "Park" and is termed "examples of dwellings characterized by cheapness, combined with the conditions necessary for health and comfort," and is divided into two heads; "examples for dwellings for families, suitable to the different classes of workmen in each country," and "examples of dwellings suggested for factory hands in cities or in the country."

We shall be but guests at Paris, and so neither courtesy nor possibility allows us, I suppose, to make any formal opposition to a scheme already so elaborately prepared and officially published. We can only hear it and make the best of it. As your president I have the honour of being one of the British commissioners, and I need hardly tell you that my most strenuous exertions shall be

devoted to furthering the good cause of architecture. I should advise the formation here at an early date as convenient of an exhibition committee. This committee ought to originate within the Institute; but, I think you will agree with me, that it might well contain an addition of co-operators from the cognate societies. If such were formed it would be my constant duty and pleasure to be the representative of its wishes at the commission. In any case, let every British architect, let every British architectural sculptor, metal-worker, wood-carver, glass-painter, and ceramist, gird himself up for a victory upon a foreign soil.

I must now offer a few remarks upon that which is even more important than the details of architectural administration; namely, the condition among us of that art in whose behalf alone this administration possesses any value. I am glad to be able to speak in a hopeful tone, and I am glad that the improvement which prompts that tone is one upon which I can insist without trenching on that impartiality which the position in which you have placed me demands. To whichever side the victory in the battle of styles may verge, this much is certain,—that the truth of architecture has been made more precious in our eyes, and her fertility of resources has been enhanced in consequence of the conflict. All sides are now agreed that material ought to be real, and all sides are anxious to enlarge the list of real materials. Variety of colour and variety of material in the same building has by this time become a question merely of degree. The sky-line is appreciated and studied; the catalogue of plants available for the working artist's chisel is no longer limited to the acanthus and the honeysuckle; finally,—The painter and the sculptor are, as in great old days, both of them welcomed as brethren of the architect, and co-operators in the broad idea of the completed construction,—not merely as the parasites who are to fasten on the finished pile.

No doubt, with the single exception of the recognition of the sky-line, the acceptance of these incidents does not amount to the demonstration of improvement in that which is of the chief importance in architectural art,—composition. It is possible to conceive the world's noblest design carried out in cement, while the vilest nightmare might be embodied in a façade of marble and serpentine, bristling with sculpture and bedaubed with gold mosaic. Yet, indirectly, the consciousness of variety in his materials, and in his permitted details, and the responsibility thus laid upon him to make his use of all, must strengthen the heart and heighten the intellect of the composer; for opportunities make men, as often, at least, as men make opportunities. As far, also, as truthfulness of material comes into question, a tender conscience in avoiding shams will also breed a manly truthfulness in the composition of the mass; for it is untrue to nature that the man who sees no vice in palming off plaster for stone and marble, and graining for oak, should be very scrupulous about the proportions of the mass, or the purity of his details, should he see a short and easy way open to vulgar popularity through the lavish employment of gaudy and meretricious forms.

If what I have said be true, we may expect to see the fullest proofs of the improvement in London and other large towns. Of the condition of London architecture, I am willing to think more favourably, and anxious to speak more hopefully, than it is the fashion to do in some quarters. Undue depreciation is as little clever or original as undue laudation, while it is, if possible, even easier. No man is more conscious than I am of the infinitesimal amount of lost opportunities which have to be made up in London, or of the ineffectual manner in which these opportunities have too often been taken in hand. But of late years, at all events, London has been shaping itself into that form of beauty, of which alone, from many reasons, foremost of them our civil liberty, she is at present capable—the beauty, I mean, of picturesque variety. We know how, under different political circumstances, foreign cities are forfeiting their old picturesque regularity in order to do the aspect of official regularity. London, on the other hand, is growing out of an irregularity of plan in which, speaking generally, there was no architectural character, into one in which irregularity has become picturesque. Of course, a vast number of the new London buildings will not stand criticism. But in the kind of the large old picturesque cities do we find the majority of the houses really

good architectural composition? It is the ensemble, and not alone the merit of each component, which gives the general effect to cities such as Bruges or Amsterdam.

The first feeling of the stranger who comes unexpectedly upon the sumptuous palaces which are, for example, growing up in that dingy and narrow thoroughfare Lombard-street, is probably regret that they should have been dropped down into a corner, which seems to preclude the appreciation of their merits. On second thoughts he may, however, pluck consolation from the reflection that it was in narrow thoroughfares like Lombard-street that the buildings which give their fame to cities, such as Verona or Genoa were planted; and that the picturesque which the traveller finds to admire in them is in no little degree enhanced, whether truly or in imagination, I do not now concern myself to ask, by the narrowness and irregularity of the ancient streets of these cities. Perhaps in coming time, when London shall house by house have been rebuilt, as we are now rebuilding it, and when a little of the mellowing of time shall have passed over those buildings, the curious traveller from the antipodes may visit London, not to sit upon the broken arch of London Bridge, but to drink in notions of Old World picturesqueness from the houses of Lombard-street and Mincing-lane.

In what I have been saying I have confined myself mainly to the development of domestic architecture upon existing lines of streets. If, for example, I were to speculate upon the razias and rebuildings which follow on the importation of railroad termini into the heart of the town, I should engage you in a maze of conjecture of which I feel that I have no time to seek the clue. The architectural future of the Thames Quay is a problem which ought to fill us with anxiety: the material advantage of the great enterprise is beyond a peradventure; the artistic gain which may be made of it, remains to be gauged. It is a curious reminiscence that when the Thames quay was first advocated in the House of Commons some forty years ago by Sir Frederick Trench—a name to be always had in honour for the courageous and constant zeal with which its possessor continued to advocate an improvement which he was not destined to see completed—it should have been opposed by Sir Robert Peel in the interest of the streets running down to the Thames, and supported by Lord Palmerston. Were I to enter upon the now phase through which religious art is passing in London, as well as elsewhere, I should have still more to say, which, however, I think it better not to say. Were I further to talk of that feeling of respect for the ancient monuments of the metropolis which has prompted so general a restoration of them, my anticipation of London's architectural worth would be still further enhanced. The epoch which witnesses simultaneously the decoration of St. Paul's, of Westminster Abbey, and of St. Stephen's Undercroft; the restoration of the Tower, and Guildhall, of the Temple, Austin-friars, and St. Bartholomew's Churches, and the Savoy Chapel, and the resurrection of Charing-cross, is one in which the spirit of reverence for old forms of beauty must be abroad.

Next year the Archeological Institute holds its congress in London. It is well that we should be able to meet it with a confident spirit in a city which has not been untrue to its inheritance of ancient buildings. The pursuits of this society are to a great extent parallel with our own, and I am sure we shall cordially welcome a gathering of which a main object is the complete investigation of the monuments of architectural antiquity in and around London.

I have been the more anxious to invite your attention to the architectural condition of London, because next session will in all probability decide whether the capital is to be enriched with a great public building of undoubted excellence, or afflicted with one of costly mediocrity. The nation is going to rebuild its Law Courts, and mass them in one pile. I do not now question the site selected. This is, according to the modern phrase, an accomplished fact; and it is enough to say that the area chosen is one well suited for a magnificent and commodious structure. I say nothing, though I might say much, about the method to be adopted in selecting the architect. I do not claim to dictate the style, for I trust that whatever style may be chosen, architectural truth may not be sacrificed. If the building is to be classical, classical must not be interpreted to mean a modern house, with floors below, and chimney-pots above, ill concealed by

barriades of pillars, fencing off light and air from the unhappy occupants. If it is to be Gothic, Gothic must not be handled as the style which enforces narrow casements and diamond panes, turrets that lead to nowhere, and gurgoyles that spout no water. Under any condition, we claim a building which shall tell the tale of its own destination, and indicate the puissance of the nation in whose behalf it has been raised. We claim—what Manchester, out of merely a county's resources, has so generously provided—a palace in which the disposition of parts and the ornamentation spring from the destined use; in which the law courts and the great hall shall stand out from the general structure; in which the corridors shall be lofty and wide, the staircases easy and dignified, the subsidiary chambers many and accessible; acoustics, light, and warmth, and ventilation, all well attended to; and after all these utilitarian requirements have been satisfied, in which proportion and material shall all be of the choicest; in which form and colour, sculpture and painting, shall combine to beautify the pile, and leave it a living chronicle of the great growth of that sublime spectacle—the world's wonder and envy—English law, fearlessly and solemnly administered by English judges without spite and without favour, unbias'd by Crown or mob, or armed battalion. If the building shall fall short of this ideal, great will be the scandal and the misfortune, on whomsoever's back may lie the blame of the miscarriage.

If it were only for the proximate erection of the Palace of Justice, next season would be an important one to us. But in this age of change—full activity it is not needful to look to any one incident as the text on which to preach more vigilance, greater exertion. We are all proud of our Institute; we all acknowledge its importance; we all are conscious of what it has done, and of what it might do which it has not done. Let all of us, then, laying aside self-seeking and mutual jealousy, sloth, and fear, unite with one heart, cheerfully and magnanimously to promote the best interests of architecture as a science and as an art, and to build up this Institute as a guarantee to ourselves and to the world that architects shall respect and the public acknowledge the just claims and genuine character of that science and that art.

#### THE WINTER EXHIBITIONS OF PICTURES AND DRAWINGS.

It is but a step from the little Gallery in Pall-mall, to the larger one of the Society of British Artists, where Mr. Wallis has prepared for all varieties of taste. Unlike Mr. Gambart, of whose collection it may be said that if numerically the smaller, it has the advantage of entire novelty, Mr. Wallis has allowed no restriction beyond that implied by its general worth, to interfere with his object of providing a very extensive and an attractive exhibition. Some may think that in one respect this double intention has not conduced to the most satisfactory end possible; that it was scarcely desirable to have absorbed a considerable amount of what is fresh to leave it, in so overwhelming a mass of productions too recently seen in some cases to be remarkable now, and in others where not quite calculated to fill a position they are not intended to occupy,—portfolio drawings, and very valuable ones considered in that light, are made to hear the huzz of comparison with more finished performances.

On the other side it may be argued that this diversity is an attractive feature,—to those especially who have had no previous opportunity of examining the greater portion of the 619 items constituting the gathering.

There are several of the new pictures painted expressly for this exhibition that would be conspicuous by other reason than that of their first appearance, and with numbers of those that have been seen before, both by British and foreign painters, it will be pleasant and profitable to renew acquaintance. Madlle. Rosa Bonheur's replica of her renowned Cattle Ploughing, (594), "Labourages-Nivernais," crowns with glory that section representative of foreign art; it is like a poem by Wordsworth for elegant descriptiveness of the simplest truth; and the list of English lady-artists includes Mrs. E. M. Ward, Mrs. Benham Hay, Miss M. E. Edwards, Mrs. Robinson, Miss E. Osborn, and other names that are a guarantee of excellence.

Mr. E. M. Ward, R.A., contributes a new pic-

ture of similar importance with that at the French Gallery, "Jeannie Deans's first Visit to the Duke of Argyle" (274), which vividly expresses the description of Scott in the "Heart of Mid-Lothian," and is very admirable for its freedom from affectation as well as for its technical merits.

Mr. Orchardson has not been happy in his choice of subject; and the large scale on which he has illustrated one of the introductory scenes to the "Taming of the Shrew" (wherein the drunken tinker on waking up calls, "For God's sake, a pot of small ale," 238), dispenses the humorous points of the situation, and lays bare all its vulgarity. It is to be regretted that so much power should have been expended to little purpose, as, in spite of the little motive that evokes it, the evidence adduced proves the artist's qualification for taking a very prominent position as a narrator of stories better worth the telling and the language he has at his command. Mr. J. Pettie is another from whom great things may be expected; but his progress is marked too much by increased dexterity of execution, that may ultimately exclude earnestness or very close study. "The Bible and the Monk—an Inquisitorial Visit" (364), hints, with its improvement on former works, that the process of its production was very rapid and easy. In a smaller picture or sketch, for it hardly pretends to the superior domination (229), "The Rehearsal" of some Terpsichorean feat by a little votary of that muse to such unenviable strains as her appreciative instructor is energetically scraping from a fiddle,—this fluent method of workmanship, that is not so strictly imitative as suggestive, is more agreeably displayed; there is great dash and vivacity in the action of the dancing-girl, though it is too much left for demonstration in the ultra-inflation of her nether-garment. Mr. E. Long has painted with great breadth, if less refinement, one of the many ordinary episodes of Spanish existence that are picturesque enough if they can only be invested with vitality; but the occupation of "Matting-making, Granada" (293), according to what is seen of it here, is not a very interesting one apparently, and the mere representation of it secures no great return for the painstaking and observation necessary to its depiction. Mr. J. B. Burgess is more fortunate in selecting a genial subject to help him, "A Spanish Improvisatore" (452), delighting the crowd of listeners grouped around him with some unusually apposite hit of his snuzy witticism, the personality of which is being greeted with uproarious applause by those who recognise the object of it. A promising theme for the artist, and he has employed great skill in dilating on it.

"The Knightly Mirror," by Mr. P. R. Morris, has probably some further meaning attached to it than at first sight is perceivable; perhaps the lady who is turning to looking-glass account the bright breast-plate of a fashionable warrior is significant of a futile attempt on a steely heart; and, making but a superficial impression, she stands reflecting on his hard case and her own.

Mr. T. F. Dicksee paints very pretty faces, though his notions of beauty are based on the artificial rather than the natural; and "Celia" (259), and "Olivia" (280), show his own ideas of them rather than those generally derived from Shakspeare.

Mr. E. C. Barnes has succeeded in conveying some appropriate sentiment into his picture of a disconsolate widower with his young son, in contemplation before his lost wife's portrait. (412) "Never Again" is the burden of all his present recollections, and the title of this clever work.

Mr. J. Sant, A.R.A., whose studies of children are always looked for, has more than the one we particularise, because of liking best "The Walk from School" (439). "A Retired Walk" (360), by Mr. J. D. Watson; "The first few Meshes of the Net" (324), by Mr. J. Hayllar; "Boulogne Cherry Seller" (338), by Mr. E. C. Barnes; "At Bay" (346), by Mr. W. B. Richmond; and "A Dream of the Golden Age" (404), by Mr. W. M. Egley, may be cited as a fair sample of what here abounds, and where nearly everything is note-worthy, not as exceptions at all.

PROPOSED PARK AT PECKHAM-RYE.—A select committee of the Camberwell vestry has been appointed, with the object of acquiring the smaller commons adjoining Peckham-rye, and constituting the whole into a park.

#### THE TRADE AND TRADE CHARGES OF ARCHITECTS.

SIR,—Mr. Thomas Harris, after twelve years' practice, he says, as a member of the Royal Institute of Architects, desires the question of their charges "thoroughly ventilated," and "more so as the matter appears to be brought under your notice by a layman." It is more than twelve years since I began, not as "a layman," to urge in vain the ventilation of this very matter, both in the *Builder*, and by less public channels, confined strictly to technical readers; and it is simply their perfect insensibility to it, that has driven me to claim, in now repeating the attempt, the character of a "layman." If an "architect" is understood to mean a designer and supervisor of buildings on the terms described by Mr. Harris and your other correspondents, I repudiate the name. I have never touched such "commission" or "per centage"; I never will; and I infinitely prefer, if need be, the designation "crossing-sweeper" to "R.I.B.A.," so long as those letters may convey such a meaning.

Will you allow me then, sir, as another layman, for such I am, but having had dealings both with builders and architects, and likely to have them again, to promote the ventilation he demands, by copying for Mr. Harris a few of the words of a few far more learned and accomplished laymen on the matter?

1. Mr. E. B. Denison, in his "Lectures on Church Building," pp. 205-8, "If the problem of modern architecture is how to get 5 per cent. upon a certain—or rather the uncertain—sum of money which is to be paid to a builder, with the least possible trouble" (and I defy you to state the problem better), "no doubt the solution will be a very different one from that of the problem which the old builders thought they had to solve. Just imagine the architect of Lincoln Cathedral or St. Mary's Abbey, sending to some Grand or Provincial Master of Freemasons, to ask whether he ought to be paid for advising that the roof should have the old lead taken off and new put on, by charging 5 per cent. on the value of the new, or only on the amount of the plumber's contract as usual; and receiving for answer, that when old materials are re-used, the architect ought to charge a commission on what their value was or would be when new, and that 'many architects' (one is glad to see, at any rate, not all) 'charge more than the ordinary commission, and with justice, on alterations and repairs.' Possibly you may think all this has no more to do with architecture than the mode of taxing the attorney's costs has to do with the verdict of the jury, or the decision of the judge in a lawsuit. But it has a great deal to do with it. If an artist—and a real architect is an artist of the highest rank—is to be paid like a broker, it lays him under a great temptation" (Adam Smith or Mr. Mill would show him rather *under the strictest necessity*, unless he starves), "to act as a broker, and to treat architecture as if it were the trade of manufacturing plans, and as if he is the greatest man in it who can sell the greatest number in the shortest time."

"And, as I have taken upon me to speak of these things" (he continues), "I will go a little further, and say here in print, what has often been said by others out of print, that nothing tends more to keep down the estimation in which the architectural profession is held by the public than this trading and auctioneer-like system of paying them by a per-centage on the builder's contract. . . . And to these difficulties of their position, there is added the reflection that the best and most upright architect cannot suggest the most necessary alteration, or the most obvious improvement of a building in progress, without exposing himself to the remark that he has just the same interest in suggesting alterations, as the upholsterer who assures you that your drawing-room curtains are getting very shabby, and that he has just received some beautiful new patterns from Paris. And, besides the odium of this stock-jobbing mode of payment, nothing can be more absurd, whether you regard it as remuneration for labour, skill, or any one of the qualities which make one professional man better than another. . . . And when we see the newspaper which is appealed to as the authority for settling questions of professional etiquette, answering its questions in the way I alluded to just now, and telling them that they may—and with justice!—refuse to be content with the ordinary mode of calculating their percentage when it would work out an unpleasantly low figure, they need not be surprised if the

public take hold of the other end of the stick, and say, that if the rule is not to hold when it will not give enough, it is time to put a stop to it where it obviously gives too much. Thus it comes to pass, that builders who act as 'general practitioners,' making their own plans, are already supplanting the 'regular practitioners' from the Royal Institute of Architects;" (as they certainly ought;—what earthly advantage can arise from two heads instead of one, if they have identical interests, and are, in fact, partners?) "Thus, too, have come architectural" (he means architects) "competitions for prizes of 100*l.* or less to be given for designs and working drawings of buildings worth 20,000*l.* or more, which cunning town councils thereby get possession of for next to nothing" (never for a farthing less than their true value, however), "and then employ the fortunate candidate or not, as they please, and get the benefit of seeing all the other plans, and taking from them as much as is convenient for absolutely nothing. In short, I am rather inclined to think that there is some ground for the occasional lamentations in the *Builder* over the apparently wide-spread conspiracy of mankind against the just rights of the profession. They are not likely to accept any suggestion of mine to defeat the conspiracy, neither is it any business of mine to invent one." (Of course not, but it was certainly a business of mine, when editing, three years earlier, such a work as "Dobson's Guide to Measuring," &c., where I took, accordingly, some pains to treat it.) "I will therefore" (Mr. Denison continues) "only add, that some day or other perhaps architects will find out that those of them who deserve it can achieve both fame and money, by charging for their services with some reasonable degree of reference to the character of the work they undertake . . . by no rule to be stated in decimals (like '05 on a building contract), but just as Millais fixes his price beforehand for a picture, or Gibson for a statue, . . ."

2. Lord Denman—(I copy from the *Builder* of December 20th, 1855)—"told the jury that although the architects had all deposed to the existence of a custom to pay a commission upon the outlay, such custom could not bind the defendant, unless at the time of making the original engagement he understood that such were the terms upon which compensation was to be made. . . . It might be custom, he said, but it certainly was not law."

3. Lord Kenyon (the *Builder* continues) "ruled long ago that a per-centage could not be recovered."

4. Mr. Scarlett.—"In Starkie's Reports, it is said relative to this case," Chapman, Gardiner, & Upward, architects, v. De Tastet, 1817, "that evidence was given that this was the usual mode of charging for the description of business done, and that Lord Ellenborough left it to the jury to say whether this mode of charging was vicious or unreasonable. Mr. Scarlett, on the part of the defendant, urged that it was unreasonable to suppose that a surveyor could be entitled to a remuneration fixed upon the amounts of the bills which he himself was to regulate and settle. It became," in that case, "his interest to swell the sum as much as possible, and therefore he contended the plaintiff's demand was not founded on justice." The jury, however, found it was.

Now, before drawing any conclusion from this, I beg to find some grave faults in the page I have quoted from the first of the above lawyers, Mr. Denison. That gentleman, you will have observed, seems to disparage, or thinks he disparages, the "custom" of architects, by three comparisons. It is, according to him, a "broker-like," an "auctioneer-like," and a "stock-jobbing" mode of remuneration—three words chosen, apparently, for nothing in the world but a supposed ugliness of sound. But now, attending to meaning instead of sound, let us inquire what parallel is to be found between any of these and the architect's custom. A broker who collects rents for me, claims a per-centage on what?—on the cost of collecting them? on the expenditure of time or any other means? No: on the result, on the sum he brings me in. But to make any parallel with the "Practice and Charges of Architects," as set forth by either the R.I.B.A. or Mr. Harris, my understanding with the broker should be this:—"Mr. Broker, we know that we cannot recover all these arrears of rent; some portion will necessarily be bad debts. Collect as much of the whole for me as you can, and we agree that your remuneration shall be so-and-so per cent. on the remainder that you fail to collect." When Mr. Denison shall effect that reform—for which I promise him great popularity

among the brokers—then, and not sooner, will his comparison become just. Again, with an auctioneer, if the parallel insinuated held good, I ought to agree thus:—"Mr. Auctioneer, I am in want of just so much money (say 1,000*l.*). I authorise you to sell for me such a piece of my estate as will fetch that sum, and no more. But then, for your remuneration you must sell or keep for yourself another piece. Now, must this be a twentieth of the acreage of the piece sold for me, or a thirtieth, or what per-centage of it shall we agree upon?" But no auctioneer has ever heard of such a system. He is paid a per-centage, not on what he may find necessary to sell to bring in to his client a required price, but a per-centage of what he brings in for a given property. Just the same, I believe, with the "stock-jobbing" agent. So, then, all three are paid in proportion, not to what they sell or spend for their client, but, to the exact contrary, what they bring him in! Their difference from the architects' custom is not simply unlikeness, but diametrical opposition. It is just that which defened us in the days of the "Revised Code," with those years of screaming row between the real and sham schoolmasters, the two principles of payment "according to results," or (as was exaggeratedly pretended) according to time or some other means expended. Only here there is no exaggeration. A whole "profession" claim to be paid according to expenditure, while the three other professions to which it is compared are actually result-paid, and perhaps more simply and rigorously so than any others. They are precisely the three, so far as I know, the most directly contrasted with the one Mr. Denison meant to disparage,—in short, the three unfittest for his purpose.

Instead of disparaging our architects, then, this gentleman has so needlessly, and indeed, unduly exalted them, that I hold it very shabby of their Institute not to have accorded him a special vote of thanks; and, on the other hand, I think Mr. Denison must himself see, on republishing his words, that he unintentionally, but not the less unjustly, by these comparisons vilified three respectable bodies of men—brokers, auctioneers, and stock-jobbers—and owes them all three several apologies.

But now, sir, your correspondent, Mr. Harris, is of the opinion that a jury of Lord Ellenborough's above cited—a jury, I undertake to say, composed, if not of architects or builders, then of upholsters, man-milliners, *et hoc genus*, and of whose successors to-day not one sees anything "vicious or unreasonable" in the custom in question. The first conclusion I draw here is, that Mr. Harris must be precisely the artist for these people; that he and they are made for each other; and, I hope, have plenty of dealings together. Nevertheless, there is something in his language and that of the R.I.B.A. to be complained of. Why do they, and he in particular, persistently speak of themselves as "professional" men, and their customers as their "clients"? I protest against these terms as a mischievous abuse, and one that, if persisted in, must be arraigned before public opinion as a dishonest abuse of language, that can have no conceivable object but to mislead the consulters of a body of tradesmen into the error that they stand to their advisers in the relation of clients to professional men, instead of customers to traders. The two relations are perfectly distinct, well understood, and understood by all rational people to be incompatible. An old book, from which mottoes have been inscribed all over the Kensington Museum, and which "the Church does record for example of life and instruction of manners," tells us,— "Neither consult with . . . a merchant concerning exchange; nor a buyer of selling; nor, &c. . . . hearken not unto these in any matter of counsel." But Mr. Harris, after explaining that he is simply, as regards any particular job, in partnership with the builder thereof, claims to advise, nay, talks of his "detective duties in watching and protecting his client,"—that is, his customer. Protecting from whom? From Mr. Harris's own trade-partner, forsooth! And others of your correspondents talk of an architect being umpire or arbitrator between the contractor and owners of a work,—judge between his own partner and their joint customer!

No wonder things have to be called, then, by false names—a trade a "profession," and customers "clients." I protest against the present use of these terms, sir, as a shabby, shuffling cheat. The Royal Institute of Architects have

declared themselves, by their publication of 1862, tradesmen, the partners of tradesmen, and nothing else. Whatever they might claim to be in Lord Kenyon's time, when it was known that none could, without breaking the law, obtain any "per-centage on outlay," the reversal of that rule leaves the present generation of them without the shadow of a claim to be called a "profession," except in the sense wherein the word is applied to every occupation, from governing to hegging. The distinction of "professional man" from "tradesman" is perfectly established and definite, and has nothing to do with kinds or degrees of learning or skill. Every one understands, for instance, why a physician is a professional man; while the apothecary, who must study precisely the same sciences, and may be known to possess more of them, may even have graduated higher in them, is a tradesman. He is a tradesman who has towards his employer any such contrariety of interests as exists between buyer and seller; or we may lay down a stricter definition, thus:—

Every one is most certainly a tradesman (or has been so) who sees, like the jurors above cited, nothing unreasonable in an adviser or director of expenditure being paid a per-centage on that expenditure. But to every non-trading man, it appears, as it did to Mr. Scarlett and the other lawyers, unreasonable and insane; and I challenge the two Institutes, of Architects and of Engineers, to produce one single person in Europe called professional, out of their own *soi-disant* "professions," who will not consider it the acme of social insanity. When that is produced—and not sooner—I will admit they are something else than tradesmen; and what kind of tradesmen, at present, I forbear to say; for there are tradesmen and tradesmen; and the term is a very wide one. M. Léciaire, I suppose, would call himself so, if among us; and the Institutes named are of tradesmen of another kind; and as trade also means handicraft, a crossing-sweeper is another,—of a respectability intermediate between the two former.

I know of no stranger coincidence than the meeting of the accounts of M. Léciaire, and of the "professional charges" in one identical number of the *Builder*; and it leads me to end this letter with a very practical suggestion. It is this, sir: that though we wait and pray, year after year and decade after decade, for the rise of an English Léciaire, whenever we shall have a school of really professional building artists (for they—the paid "according to results"—must repudiate the name "architects" as long as the paid according to expenditure—the Institute—hold it), then it will be in the power of that school and their clients to initiate,—or to throw on their clients the sole responsibility of opposing,—the most blessed revolution in this age conceivable,—no less than at once and for ever, as regards the building trades, to abolish strikes, by abolishing their sole cause, that monstrous creature of the age, that *reductio ad absurdum* of its "economy," the master-builder. For what, pray, is to hinder a real master-designer and a real client from making the relations between contractor and workmen a part of the specification, a part of the contract? What would prevent a designer, not himself to be the contractor's partner, demanding a Léciaire, specifying one as he specifies a kind of brick or timber, by some *Léciaire clauses* (as I hope they may long be called) in every specification; fixing the ratio to be observed between the final value of a labourer's day, a mason's, a carpenter's, and every other, up to the contractor's,—requiring a strict account of every man's time before each payment to the latter; and that the men's shares (all but the daily market-rate of wages) may be retained till dismissal or the end of the work? We read of a Sesostris claiming the gratitude of Egypt for great buildings, on whose cornice was inscribed,—"*No Egyptian wrought on me.*" Now I would propose a Sesostrian problem for nineteenth-century temple-builders; to aim at rearing such as might bear on their honest brows to heaven such blazing inscriptions as these,—"*No plundered journeyman toiled on me.*" "*No stolen labour here.*" "*No profitmonger won by me.*" Would not that be a feature at once more Medieval and catholic than Pugin ever thought of reviving, and a greater novelty just now than Mr. Harris's latest Victorianism? Will neither Archhishop Manning nor any future Spurgeon try what a Léciaire clause in a specification may cost, and whether it be not, after all, worth more than many mosaic pavements and many painted windows? EDWARD L. GARBETT.

IRON AND CONCRETE CHURCH, VÉSINET, NEAR PARIS.—M. BOILEAU, ARCHITECT.

[See also p. 805.]

IRON AND CONCRETE CHURCH,  
VÉSINET, NEAR PARIS.

IN our last volume we gave some particulars of a church constructed of wrought and cast iron and concrete, the *béton aggloméré* of M. Coignet, that had been erected from the designs of M. Boileau, in the Park at Vésinet, at foot of the terrace of St. Germain. The engravings in our present number illustrate this building. The church of St. Eugène, of which also M. Boileau was the architect, was the first in Paris, in which the application of cast and wrought iron was made to a considerable extent; and when the

design of the Vésinet chapel was being arranged, M. Coignet requested M. Boileau to try the experiment on a large scale, by substituting concrete for stone. This was agreed to, and the result is a church having its walls in one piece, as well as the columns and open work parapets.

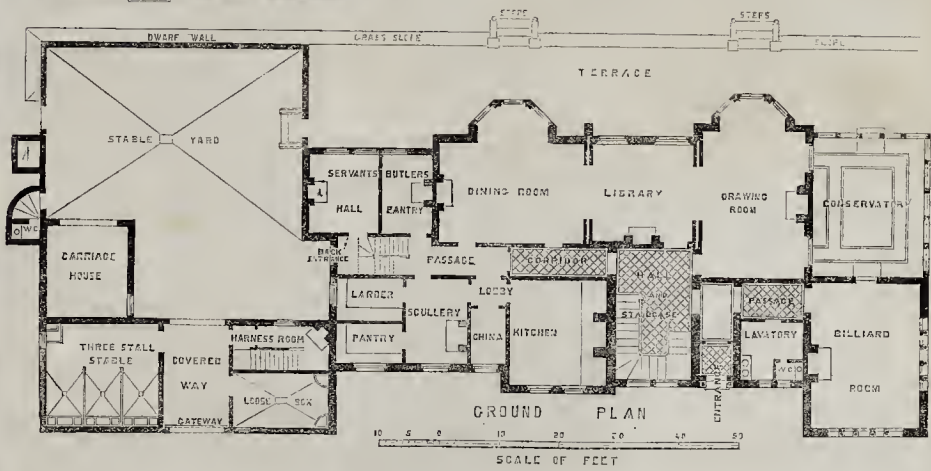

The eastern entrance, with a porch, is surmounted by a tower, and is flanked on each side by a small chapel in the line of the side aisles. The church, which terminates with an apse, is divided into nave and side aisles, separated from it by gronped slender columns of cast iron, which rise as high as the side walls. From these spring

Pointed arches, of iron also, over the nave and over the bays, separating it from the aisle. These arches, carried up to the roof, relieve the walls of the pressure of the arches over the aisles. All the roofing is externally covered with two layers of wrought iron plate, separated a few inches asunder by a hermetically imprisoned layer of air. The length of the edifice is 170 ft. 7 in., the breadth 55 ft. 9 in., and the height to the summit of arches of nave 55 ft. 9 in.; so that the breadth is equal to the height internally. The spire is 131 ft. 3 in. high.

About 300 residences have already been built at Vésinet.

TORWOOD, WIMBLEDON PARK, SURREY.—MR. JOHN GILES, ARCHITECT.

VILLA RESIDENCE, WIMBLEDON PARK, SURREY.

In continuation of the series of illustrations of residences of various degrees of importance we are seeking to afford our readers, we give in our present number a view and two plans of a residence recently erected in Wimbledon Park, from the designs of Mr. John Giles, architect, for Mr. W. Edgcombe Rendle. It includes fourteen bed-rooms and dressing-rooms, three reception-rooms, billiard-room, kitchen, conservatory, and stable. Two of the bed-rooms are on a second-floor, above the nursery, and two of them in the tower. The walls are faced with white bricks and some few red ones, with Bath stone dressings. The roofs are covered with red and blue tiles.

The cost, exclusive of the billiard-room, conservatory, &c., has been something under 5,000.

THE HEALTHFULNESS OF MARGATE.

As we have had occasion lately to point out some local disarrangements and evils existing in Margate, always a healthful resort, we have the more pleasure in printing the following communication from Mr. Edward Motley, who published in 1863 a very remarkable Report on the Sanitary Condition of that town. Mr. Motley dates from Würzburg, in Bavaria.

This sea bath, says the writer, is so extensively visited by invalids, that its sanitary condition is a matter of great interest, and to watch its fluctuations is an imperative duty the corporation owe to the visitors and the resident inhabitants.

The town of Margate is distinguished for its local health; but circumstances not always adverted to, or considered, have brought this quality of the sub-district Margate into question. I twice volunteered to examine the death-rate, believing that the mortality of a region is the only test to its salubrity (where no trade dangerous to health is exercised). I took Dr. Parr as my guide, and humbly followed the path he has so admirably traced out, to lead us to the truth.

I am so convinced of the eminent advantages that Margate presents as a place of winter residence, that I intend to take its mortality during the colder months as one of the principal tests of the value of a region as a place of residences for invalids during the winter. Medical advice and public opinion point to the South of Europe as a place of winter refuge. Statistical inquiry points out certain favoured districts in the North of Europe as the least subject to sudden variation in temperature and an atmosphere singularly pure. These regions, I venture to affirm, are known by their death-rate. The unexceptionally healthy districts are to be recognised, their annual mortality not exceeding 16 per 1,000 living, for a series of years.

I find the mortality of the town of Margate was only 12 per 1,000 (twenty-five years' annual average), and the number dying during the last six months—from October to March, 1864-5—only at the annual rate of 12 per 1,000. I am now employed in collecting the vital statistics of the shores of the Mediterranean, or the most celebrated winter resorts in the south of France and Italy, and the observations of the resident physician on the climate. I will trouble you with only one example, a comparison of Venice with Margate—the “Sea Cybele” with a Cockney watering-place,—a singular comparison, but not without interest:—

Average Population:—Venice, 123,200. Margate, 10,000.  
13 years = 130,600.\*

	Venice.		Margate.		Average per 1,000 living.	
	Deaths.	Living.	Deaths.	Living.	Deaths.	Living.
January	412	179	35	11	35	11

Infant Mortality, without stillborn:—Venice, 857 deaths to 123,200 living. Margate, 347 „ „ 130,000 „

\* The Italian numbers are by Dr. Bertie-Namias calculated with great care, without stillborn. The Margate numbers are from the registers, attested by the district registrar, the sub-district registrar, and examined by another officer.

Infant mortality during the cold months at Margate is exceedingly low. I am not without hope of being able to determine the local health of the principal Italian towns as accurately as Shoreditch or Manchester. Unfortunately the subject is unattractive.

Of course it is understood that no special claim is made for Margate beyond having a mortality of 16 per 1,000. Therefore the same advantages are to be found at Eastbourne, Isle of Wight, Anglesea, the Scottish Isles, and certain parts of Norway, all of which enjoy a temperate climate and low death-rate, and the absence of pulmonary affections.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The opening meeting of the session 1865-66 was held on Monday evening last, at the House, in Conduit-street.

The chair was occupied by the president, Mr. A. J. Baresford Hope, M.P.

The following honorary Fellows were elected:—Lord Elcho, M.P.; Mr. W. Stirling, M.P.; Sir Walter James, bart.; and Mr. John Ruskin.

Numerous donations were announced, including a copy of the address of Professor Hayter Lewis, recently delivered before the students of the London University College.

The President took occasion to refer to the satisfaction which he was sure they all felt at Mr. Lewis's having been placed in a position to deliver such an address. University College had certainly sustained a loss by the retirement of Mr. Donaldson; but it had been compensated by the accession of Mr. Hayter Lewis. The hon. gentleman then announced an important donation of 120 volumes of books, &c., from the late Cambridge Camden Society, now the Ecclesiological Society. As it was no longer necessary for the latter to maintain a library, they had presented these books to the Institute, being of opinion that they could not be bestowed in a better direction.

The Rev. Mr. Wehh (the hon. secretary to the Ecclesiological Society) testified to the gratification which it afforded the Society to know that the Institute appreciated the gift.

Mr. Hayward stated that there were eight volumes of drawings in the collection.

Messrs. Florence, Dillon, and Davis were, on ballot, elected Associates of the Institute.

Mr. Donaldson, referring to the address of Mr. Hayter Lewis, delivered at University College, recommended the curriculum adopted at that institution to the attention of students of architecture, as he believed it would be productive of great advantage, more especially to those members of the Architectural Association who might desire to present themselves for examination to the Institute. Two years devoted to the course of study directed by his friend and successor, would, he was persuaded, amply repay the trouble. Mr. Donaldson also referred to the donation of Mr. Bruton's work on “Ecclesiastical Dilapidations,” which, he remarked, contained a great deal of interesting and useful information for the profession.

Votes of thanks were accorded to the donors of books, &c., and to those gentlemen who had delivered student lectures last session.

Mr. Hayward exhibited specimens of plans printed from the originals by means of prepared paper and light. He considered it would supersede the operation of tracing.

The President having read his inaugural address (which will be found elsewhere),

Mr. Donaldson, in moving a vote of thanks to the President, observed that the discourse just delivered was full of interesting topics, treated in a broad and distinct manner; and he trusted that it would act as a stimulus to the members to follow during the ensuing session the principles laid down in it. The President had referred to the engineers as essentially forming a portion of the architectural body. He was glad to hear the observations which he had made. The engineers had now grown into a body of such importance in a scientific and artistic sense, that they had taken what might be termed a distinctive form. The profession of the architect was an honourable one—even the engineers must admit that; and, indeed, so honourable was it, that famous ship-builders were proud to call themselves naval architects; and they had a perfect right to the appellation. For his own part, he had always been desirous of recognising the engineers as a part of the profession; and

he would like to admit as members of the Institute all those engineers who had built what might be called monumental structures, such, for instance, as great railway-stations and dock-yard works, similar to those built at Plymouth by Sir John Rennie. He was, therefore, in favour of admitting all engineers of repute, whether Royal Engineers, naval engineers, military engineers, or civil engineers—in fact, all who had produced works in which might be regarded as architectural in their character. With reference to the Royal Academy in connexion with architecture, he felt bound to express his regret that the members of the architectural profession had dissociated themselves from the Academy. He had himself been a student of the Academy, and he had derived great benefit from it. He recommended students of architecture to attend the Academy, and to associate with the students of painting and sculpture whom they would find there. It should be remembered that the Institute did not pretend to teach the student of architecture his profession, although it was quite willing to assist, by meetings, discussions, lectures, and the examination of such persons as chose to present themselves for the purpose. Such aids as these it freely offered; but it could not be called an *Academia Artis*, as it had no claim to such a title. With respect to the architectural exhibition, he regretted that anything of the kind had been attempted; it had not proved a success; and he also regretted that the Royal Academy had not found better accommodation for such drawings and designs as the profession might be disposed to exhibit on their walls. He hoped the profession would rouse themselves in reference to this matter, and that such a presence might be brought upon the Academy that it would be forced to give the architects the accommodation they required. The President had also referred to the forthcoming International Exhibition in Paris. This was a subject of great importance, and he ventured to express a hope that a committee would be formed without delay, to put itself in communication with the French commissioners, in order that the architectural profession of England might be worthily represented at the forthcoming contest, and take the position to which it was entitled among the architects of Europe.

Mr. Godwin said he had great pleasure in seconding the vote of thanks to the President, and he would do so in a dozen words. The first half would be devoted to the expression of his gratification and thanks for the catholic, eloquent, and useful discourse which the President had just delivered, and which he was sure they had all heard with equal pleasure; and the second half would be to express his satisfaction at seeing the representatives of the public press again in that room. As one of the earliest members of the Institute, he congratulated them upon a step away from what he regarded as the suicidal policy of secrecy, and in the direction of that policy of publicity for their proceedings to which the Institute owed so much of its position, and by means of which it was beginning materially to influence the outer public in favour of their art. He cordially seconded the proposition before the meeting.

Professor Kerr also expressed the pleasure which he had derived from hearing the address of the President. It struck him forcibly that Mr. Hope had evinced a proper spirit in endeavouring to draw together the architects and the engineers. He was sure they were all agreed as to the view which he had taken of the relations which ought to exist between the two sections of the profession; and he ventured to throw out a suggestion, whether it might not be desirable for the Institute to elect a certain number of members of the Institution of Civil Engineers as honorary Fellows, in return for the election of a similar number of their own members to a like distinction among the engineers. At present architects could only be elected Associates of the Institution of Engineers, and it was questionable whether they would like to join the engineers, in any number, in a lesser rank than that which they held among their own profession.

Mr. Seddon (hon. sec.) thought it would be well if some understanding could be arrived at between the two bodies, with regard to the reciprocal interchange of members; for, as Professor Kerr had already stated, the Institution of Civil Engineers would not admit an architect among them, although he might be a Fellow of the Royal Institute, to a higher rank than an Associate. He was anxious to know whether, if

an engineer were proposed for election into the Institute, it was likely that he would be accepted.

Mr. J. Papworth said he, for one, would decline to ballot in favour of any member of the Institution of Civil Engineers, while their law remained as it was; and to show his sincerity, he begged to state that he had assured one of his own family, who was a member of that Institution, and desired to be elected a member of the Institute of British Architects, that he would oppose him if he were put forward.

The vote of thanks to the President was then put, and carried unanimously.

The President, in acknowledging the compliment, said he felt very much honoured and gratified, and indeed relieved, by the manner in which his address had been received (that evening). He felt that he had a difficult and delicate duty to perform, and it rejoiced him much to think that he had given satisfaction. The address was written in the quietude of the country, and he had sent it to the press without taking the opinion of any one upon it. The manner in which some of the points referred to in it—the Engineers, and the French Exhibition—had been taken up by Mr. Donaldson, had also afforded him much pleasure. He hoped that the former subject would receive from the Institute the attention it deserved; and with regard to the latter, he might state that the subject had already been warmly taken up by the council, and that it stood as an agenda for that evening fortnight, on which occasion a paper on iron-work would be read by Mr. White, a gentleman who had given much study to the subject.

Mr. Scott, Mr. E. M. Barry, Mr. Gibson, Mr. B. Ferrey, Mr. James Fergusson, Mr. Ashpitel, Mr. B. Brandon, Mr. P. Anson, Mr. W. White, Mr. Burgess, Mr. Burnell, Mr. Charles Fowler, Mr. Porter, Mr. Trautric, Mr. Gurling, Mr. Hansard, Professor Lewis, Mr. Marnable, Mr. Roger Smith, Mr. James Thomson, Mr. Henry Shaw, Mr. Gordon Hills, Mr. E. T. Paris, Mr. G. L. Taylor (Taylor & Cressy), &c., were amongst those present.

#### THE ARCHITECTURAL EXHIBITION AND THE INSTITUTE.

In the address with which the president opened the present session of the Institute of British Architects, on Monday last, Mr. Bressford Hope spoke in eulogistic terms of several societies having objects more or less akin to the profession of architecture, and recommended more intimate relations with them. The one architectural society for which he had not a kind word, but only disparagement, was the unfortunate Architectural Exhibition.

Mr. Donaldson, the late president, in moving a vote of thanks, not only echoed all the president had said of the Exhibition, but added expressions which I refrain from quoting, as good taste would probably lead to their modification before they are published. Both these speakers seemed to be influenced by the idea that if the Architectural Exhibition were given up, or if the Institute repudiated all connexion with it, some better terms might be hoped for from the Royal Academy. As considerable misconception seems to exist on this point, I should like to be allowed to say a few words regarding it.

Admitting, for the sake of argument, that the Academy is the best possible form of a society, and composed of the best possible body of men, this does not alter the fact that, from the first hour of its existence to the present day, it is essentially an Association of Painters and Sculptors. To these classes the Exhibition is of vital importance. To individuals it is the only means of exhibiting their works, while to the body it is even more so as their only means of income. Every year the demands on their available space are becoming more and more urgent, and the attractiveness of their works draws a larger number of shillings from the public.

It is true, of course, that architects are tolerated in the body—but how? Three or four men—not always the most eminent—are selected, and are content to remain with a safe majority of nine to one relegated to one room; and their exhibition is relegated to an ante-room, where it occupies one wall, among miniatures, and other refuse of the Exhibition. There seems to be a vague sort of notion abroad that the Academy are going to get a larger space for exhibition, and when this is the case architecture will be better treated. My impression is

that this is a mistake. If the space at their command were doubled to-morrow, they could fill it. The architectural drawings look poor and washy when placed in juxtaposition with oil-paintings. They do not draw a single shilling, and the painters feel that they could occupy the space these fill up far more attractively and more payingly. Where this is the case, it would be paying them a very bad compliment, as men of business, to suppose that they would continue to devote it to architecture.

On the other hand, it has always appeared to me,—and it has several others,—that as a body the British architects are not only numerically, but in social position and architectural rank, quite equal to the painters; and consequently, if they associated with each other it ought to be on terms of perfect equality. It has also occurred to me and others that there is an essential difference between their arts, and the mode in which they are practised, notwithstanding the accidental adjunct of the adjective "fine," which seems the only link between them.

Though perhaps not formally articulated, it was the existence of this feeling which led to the formation of the Royal Institute of British Architects; and the logical sequence would have been that the seceding body should also have established an exhibition of their own. The Institute did not take this view, but a considerable number of the members of the profession thought so, and the consequence was the establishment of the Architectural Exhibition some fifteen years ago.

At any time during that period it would have been easy for the Institute, as a body, or for the members of the profession individually, to have come forward and rendered the exhibition attractive, self-supporting, and worthy of the profession. Many have exerted themselves worthily in the cause; but the Institute has not only held aloof, but on every occasion when an opportunity offered itself, done all it could to discourage the attempt, and throw cold water upon it; and last Monday, the council, through its two mouthpieces, the present and past presidents, went further in this direction than usual. To me it appears that the encouragement of a thoroughly congenial association would have been a wiser, or at all events a more generous policy than begging for the contemptuous patronage of the painters.

The question is now of pressing interest, and I trust the profession will think seriously about it. Those who have been connected with the Exhibition during the last fifteen years are getting tired of this kind of treatment. They have offered architects every facility for having an exhibition worthy of their art; but they cannot accomplish it without their assistance, and if they will not now come forward the thing may drop through. Let us hope for better things; for if this should be the case, and the painters will not take pity on the architects—and they won't—the latter may be left without any proper means of introducing their works to the public. While, however, the Institute is negotiating with the Academy, it will require only a very slight exertion on the part of the profession at large to enable the new committee, in spite of the Institute, to open this year's exhibition with a better show and brighter prospects than any which have cheered it since its establishment. J. F.

#### TIE "SANG-RIËL" OF THE ARTHURIAN ROMANCES.

Str.—In your very favourable and kind notice of my "Handbook for the Pictures in the Westminster Palace," you observe:—

"In describing one of Mr. Dyce's works, by the way, the Vision of Sir Galahad and his Company," derived from the romance of the St. Greal, he [Mr. Gullick] says,—

"We need only remind the reader that, according to the later romance (which appears to be derived from the apocryphal gospel of Nicodemus), the St. Greal is the holy vessel, or 'chalice,' from which Christ drank and gave of the wine to his disciples at the Last Supper, and which is said to have been afterwards used by Joseph of Arimathea, to collect the blood which flowed from the wounds of the Saviour."

This seems scarcely to convey the story. The "true blood" was the *Sang-riël*, and it was the search for this in the vessel described, brought over and hidden, as was supposed, somewhere in Britain, that was the grand object of the institution of the Round Table.

Now it seems to me that this observation may possibly lead to the belief, or at least leave an impression, that I have shown some carelessness

or inadvertency, if not ignorance, in a portion of my book with which I have, in reality, taken the utmost pains. As, I assure you, the passage in question was written deliberately, and only after weighing an antiquarian discussion, the "pros" and "cons" of which would have been out of place in my little book; and as, therefore, I have a defence for my incidental definition, I would,—trusting to your well-known sense of fairness, and the courtesy you have shown on former occasions in opening your columns to me,—ask for space to say a few words in explanation.

It is, then, doubted by many eminent recent antiquaries, whether there is any foundation for the supposition, long and still entertained by many besides yourself, that the words "Saint Greal" are a corruption of the French words *Sang-riël*, of the Norman romances and *trouvures*. The distinguished antiquary Mr. Wright, for instance, says positively, in a note to his edition of the "Mort d'Arthur," that the words "Saint Greal" have been improperly confounded with *Sang-riël*, the "Real Blood." By the way, the theological dogma of the Real Blood or Presence was, I believe, only established long after the date of the earlier romances. But more conclusive, perhaps, is the testimony of the learned author of "Britannia after the Romans." This esteemed authority on the particular subject under consideration says: "The story of the Saint Greal, or Greal, is no romance, but the most extravagant and daring imposture on record, in which it is endeavoured to pass off the mysteries of bardism for direct inspiration of the Holy Ghost." "Greal," he says, "is a Welsh word, signifying an aggregate of principles, a magazine; and the elementary world, or world of spirits, was called the *country of the Greal*. From thence the word Greal, and in Latin, *Gradalis*, came to signify a vessel in which various messes might be mixed up." Perhaps you will allow me to add, that although the history of the St. Greal, in Sir Thomas Malory's compilation of the "Arthurian Romances," is little else than a tolerably intelligible religious allegory, strongly tinged with the monastic ideas of the thirteenth century, and seemingly intended to throw discredit on chivalric greatness; yet the writer above mentioned considers the story to be the most ancient of the "Arthurian Romances," and in its original form to have embodied the religious system which he terms "Arthurism." The date at the commencement of the work is 717, and he attributes the authorship of it to the famous hard Tysilio. As an Arthurian myth, the "quest" may represent the priests of Arthur (*i.e.*, the visible sun) setting out on their journey of initiation into the higher mysteries, which were ultimately to displace the worship of Arthur, the mysteries of that other "sun of no illusory lustre," until whose coming Arthur was to be the sun. See the ancient poem of "Arthur and Ellicold," in the appendix to "Britannia after the Romans." Hence the grief of Arthur, and his declaration that the quest of the St. Greal would destroy the fellowship of the Round Table. Hence, also, the circumstance that, although the Round Table signified the world, and Arthur the sun, he never ventured to place himself in the "perilous seat," but reserved it for him who was to penetrate the mystery of the St. Greal. The meaning of the original myth becoming gradually obscured, the later allegory of the "quest" in the "Mort d'Arthur" may probably be interpreted as primarily representing a number of the great ones of the earth preparing to forsake the world and its honours, to devote themselves for a time to penitence and the offices of religion. Adopting this view of the romance, I also bore in mind the fact that there is no definite statement in the "Mort d'Arthur" that the hood contained in the cup, or "hamp," was the object of the "quest." For these, among other reasons, I only felt justified in stating that the cup was the object of search, tacitly leaving it to the reader to entertain his own opinion, or draw his own inference as to whether the great sanctity of the vessel was supposed to arise from what it had contained or did still contain.

I trust it may not be deemed egotistical to add that the account in my Handbook of Dyce's great works in the Queen's Roaming-room (the substance of which had appeared in the *Illustrated London News*, and which I have again given in the *Art-Journal* for the present month) is the result of much research and thought, aided by private papers of the painter, and copies of his correspondence with the Fine-Art Commissioners, kindly placed at my disposal by

the artist's family. Unfortunately, however, these contain very few allusions to the various personages introduced in the frescoes, and I have only succeeded in identifying some of the minor characters, after careful collocation of many passages throughout the "Mort d'Arthur," and other remains or works in the broad field of Arthurian literature. THOS. J. GULLICK.

\* \* We willingly insert this statement of Mr. Gullick's views, but retain our opinion as to the St. Greal.

#### LORD PALMERSTON'S LONDON RESIDENCES.

We are led to believe that, for "Carlton House-terrace," given as the residence of the late Lord Palmerston between 1813 and 1850, we should have said No. 4, Carlton-gardens, where he was the tenant of the late Mr. Adrian Hope, brother of Mr. A. J. Beresford Hope, who now has the care of the house as executor and guardian of Mr. Adrian Hope's son and heir. On Lord Palmerston vacating it, Sir James Hoag became the tenant, and still occupies it. When Lord Palmerston left Carlton Gardens, he went to Hamilton-terrace, Piccadilly, to the house of Mr. Beaumont, M.P. for Cumberland, and remained there some time before going to Cambridge House. Mr. Beaumont's house is next to the one occupied by the late Marquis of Northampton, and where he held his never-to-be-forgotten soirées as President of the Royal Society.

In speaking of recent burials in Westminster Abbey, we recalled simply some at which we had been present. We may mention, in addition, that of Lord Dundonald, Lord Clyde, and the Duke of Northumberland, in the private vault that belonged to him.

#### THE HORSHAM CHURCH RESTORATIONS.

The restorations in hand are gradually approaching towards completion. The tower has been denuded of plaster, and pointed. The Norman arch of the tower, and the lofty west wall of the church, are being ornamented with coloured designs and reproductions of patterns which were discovered in scraping away the whitewash, during the present and earlier repairs. There are two large cartoons to be sketched here,—one the Annunciation (the church being dedicated to St. Mary the Virgin), which will be so drawn as to obviate in a manner the curious appearance of the tower-arch not being placed in the centre of the wall. Above this will be introduced a representation of the Last Supper. The ribs and bosses of the ceiling were picked out with colour before the present restoration, and it has been the endeavour of the artist to reproduce and enhance the former designs. The tie-beams are now being made to harmonise with the tints of the ceiling. The chancel is more elaborately treated, gilding having been introduced. Here, too, the wall-plate is masked by a curious cornice. Here the tie-beams have angels on the supporting corbels, and on their shields are depicted the emblems of "the Passion." Neither the ornamentation of the west wall, ceiling, nor any of the stained windows, are defrayed out of the public funds entrusted to the committee. The pews are open seats, without doors. Hot-water pipes are carried beneath the pavement. A new organ, by Mr. Willis, of London, is being prepared: it will cost nearly 700*l*. A space has been reserved for it on the north side of the chancel. The pulpit, of carved oak, on a sandstone base, is to be placed against the north-eastern pillar, where the nave and chancel meet. Had the committee more funds at their disposal, the base would have been, according to the architect's design, of Sussex or Purbeck marble; but this must be left, like the flooring-tiles, reredos, spire, and glazing of the windows, for further restoration. It is hoped very soon to see the stained glass of the east window of the chancel fixed in its place, and that of the west window in the tower: the expense of the latter is defrayed by the "labouring classes" of the parish. The artist of both these is Mr. O'Connor, of London, and the upper portion of the east window was inserted some time ago: the ladies' committee had collected 600*l*. for the purpose of embellishing the window. Private individuals have determined to place "memorials" of stained glass in the

cast window of the south aisle, in the south window of the Shelley chantry, and in the several lancets in the aisles: the five western windows of the church are also private gifts. The lighting of the church with gas, for evening services, is effected by pendent corons, suspended between the arches, from brackets, under the string-course in the nave: the aisles are lighted upon a somewhat similar principle, and in the chancel an immense corona, of sixty-five lights, hangs from the roof. The designs are approved of by the architect, and are the workmanship of Mr. Skidmore. The ground-plan of the building has been considerably altered and enlarged, by the addition of another south aisle, and the throwing open the two chantry chapels; while, to economise space in the chancel, and to make sufficient room for the new organ, the ancient priests' door has been built up, and a new Perpendicular entrance opened in the vestry wall. An improvement has been made by levelling the earth in portions of the churchyard, and widening the paths up to the several doors.

#### LLANFAIRISGAER, NORTH WALES.

The new parish church of Llanfairisgaer was consecrated on the 21st ult., by the Bishop of Bangor. The style of the building is Early English. It consists of a nave, 68 ft. 10 in. by 21 ft. 6 in.; transept, 17 ft. by 16 ft. 3 in.; chancel, 22 ft. 3 in. by 19 ft.; vestry, 12 ft. 3 in. by 8 ft., and has a bell gable at the west-end. The church is built of stone from the local quarries, faced with Newry granite, the window dressings, &c., being of Wrexham stone, and will accommodate 285 persons. The several roofs are framed with coupled rafters, stained and varnished. The nave and transepts are fitted up with low open seats, and the chancel, with stalls on each side, for the chorists, and with prayer-desk and lectern, the pulpit being placed at the south-west angle of the nave. The aisles are paved with black and red Staffordshire tiles, and the chancel, with Hawes & Co.'s oncostic tiles, of appropriate design. Over the altar is an ornamental centre piece, with the Commandments, the Creed, and Lord's Prayer on either side, executed by Messrs. Drury & Smith, of Sheffield.

The east window of three lights is filled in with stained glass, the gift of the widow of the late Mr. J. G. Griffith, of Llanfair, in memory of her husband, who was a liberal contributor to the funds of the church, and also gave the site on which it is built. The centre light of the above window has three medallions (surrounded by elaborate tracery), representing the Birth, Crucifixion, and Ascension; the side lights two medallions each, containing the Burial, Pentecost, Passion, and Resurrection, illustrating the sentence in the Litany, beginning, "By thine agony and bloody sweat, by thy Cross and Passion," &c.; the whole executed by Messrs. O'Connor, of London. The font, worked in Caen stone, is placed at the west end, near the entrance door. The church is warmed by a Gill stove apparatus, supplied by Mr. Edw. Firth, C.E., of Rotherham, and is lighted by twelve paraffine bracket-lamps, and with candle brackets on the pulpit, by Messrs. Cox, London. The architect of the church was Mr. G. Weightman, of Sheffield; and the builder, Mr. William Thomas, Menai Bridge.

#### THE METROPOLITAN GAS MOVEMENT.

The struggle which many years since the *Builder*, single-handed, set agoing in the metropolis (as elsewhere throughout the country), between gas consumers and gas producers, is likely to come to a grand crisis in the ensuing Parliament. If the metropolitan gas consumers will now give their powerful leaders—the City Corporation—moral and material support, the tyrannical and overreaching monopolists who have for so long ridden rough-shod over them, will be at their mercy, and little of it do they deserve. The common council of the City Corporation have determined to apply to Parliament for powers to erect gas-works, and to manufacture or contract for the supply of gas, and lay down now or purchase existing gas mains for the distribution of gas to the citizens of London.

The leader of the movement in the Council is Mr. Dresser Rogers, who carried his point by an excellent address on the subject, in which he showed how great a public benefit it had been

to Manchester, Halifax, and other towns, that their respective municipal authorities had taken the supply of gas into their own hands. Mr. Rogers remarked that

"There were no less than fifty-eight towns where the gas was so supplied. Amongst others, at Manchester, Oldham, Rochdale, Stockport, Halifax, Doncaster, Walsall, and they did it profitably. At Manchester, the Corporation, after paying every expense, were enabled to realize profits to the large amount of 59,513*l*. last year, and that was after paying all liabilities, and setting aside 12,000*l*. odd for depreciation of plant and so forth. At Halifax, again, the Corporation has purchased the works of an existing company, by Act of Parliament, and, by the assets published in June, 1864, they find the capital was 123,277*l*. The income during the year was 25,350*l*. 7*s*. and the expenditure, 13,560*l*, leaving a profit of 9,790*l*. for the year. Then, also, they supplied the public lamps at 1*s*. 8*d*. per 1,000 ft., and the private consumer from 3*s*. 2*d*. to 4*s*. Gas was supplied equally cheap at Walsall and other places, and if it could be done there, he said it could be done in the City. Now, as to the mode by which the Corporation should undertake the supply, he did not say that they should manufacture the gas themselves, but rather that they should erect the works, contract for the manufacture of the gas, and supply the consumers. There were plenty of spots in the outskirts of London suitable for the erection of such works, and they could employ a gas engineer respecting the manufacture of the gas, and undertake the supply. He had taken the opinion of a gas engineer himself, who said that 250,000*l*. would be sufficient capital."

As to the question of fair prices for gas, Mr. Rogers instanced the following cases:—

"At Plymouth, gas was 2*s*. 8*d*. per 1,000 ft.; at Whitehaven, Walsall, Newcastle, Birmingham, and Cardiff, it was 3*s*. 6*d*.; at Manchester, where they supplied twenty-candle gas, 3*s*. 2*d*.; Edinburgh, Glossop, Leicester, Liverpool, Macclesfield, Oldham, Preston, Rochdale, Staley-bridge, Wolverhampton, and Wigan, 3*s*. 6*d*.; at Cheltenham, 3*s*. 6*d*.; and at London, 4*s*. 6*d*. It might be said by some that the gas could be supplied at these places cheaper than in London, because coals were much cheaper; but that was a fallacious argument, as he believed he could show, where coals were cheap, the residuary product of the gas, coke, was considerably less in price. At Plymouth, where gas was supplied at 2*s*. 8*d*. per 1,000 ft., the coals were brought from Newcastle, and they there paid ten per cent. dividend, and were getting 15*s*. 6*d*. per chaldron for their coke; and at the south of London, where they were supplying gas, there were three miles from the City, at 3*s*. 4*d*. per 1,000 ft., whilst at Manchester they had to pay 4*s*. 6*d*.; by comparison, a tradesman in Manchester paid 1*l*. 1*s*. for 7,000 ft. of pure twenty-candle gas; in London he paid 1*l*. 11*s*. 6*d*. for the same quantity of impure ten-candle gas."

Should the City Corporation prove themselves capable of opening the gas monopoly within the City boundaries, the League without must soon follow; so that it is for the direct and material interest of the metropolitan gas consumers generally to support to the utmost their leaders within the City limits. It is earnestly to be hoped, therefore, they will make the City question in every respect their own question, and convince the new Parliament that the whole metropolis is at the back of the City Corporation.

#### WOODEN BUILDINGS; METROPOLITAN BUILDING ACT.

At the Clerkenwell Police-court, on the 3rd inst., Mr. George Leech, builder, was summoned before Mr. D'Eyncourt, by the district surveyor of South Islington, for having erected a stable-building, 12 ft. long, 8 ft. wide, and about 7 ft. high, in the rear of house No. 142, Essex-road, occupied by Mr. Henry Hall, butcher, without giving notice to the district surveyor, as required by the Act; also for having constructed the said building of woodwork, contrary to the first schedule, Preliminary Rule 1, and not abating the irregularity when called on so to do.

The surveyor had made many endeavours to obtain amendment, without effect. Leech pleaded guilty on both summonses: he knew he was doing wrong, he said, and had told the employer, Mr. Hall, he would not take the responsibility. Since he left it the building had been put on wheels.

The magistrates said the builder could not avoid the penalty of breaking the law by telling some one else he must take the consequences of the deed. It was to be regretted that the Act did not allow the district surveyor to proceed at once against the owner. With the concurrence of the district surveyor, under the circumstances, the fine was reduced to 10*s*., with 12*s*. 6*d*. costs. On the second summons, the magistrate, who went very carefully into the matter, and referred especially to the case Stevens v. Goulay (29 Law Journal, C.P. 1.), made an order to amend the irregularity by substituting enclosure walls of incombustible materials, and covering the roof with incombustible material. The builder said the owner would probably refuse to let him do it.

It may be useful to mention that, if the magistrate's order to amend he not complied with, the builder, in such a case, incurs a penalty not

exceeding 20l. a day; and the district surveyor may send workmen on to the premises, do what is necessary, and recover the expenses from the owner. The extent to which an owner is amenable to the builder at common law, in respect of the earlier proceedings in such a case, seems to call for inquiry.

SANITARY SUGGESTIONS.

THE not improbable visitation of cholera is stirring up some, and ought to stimulate all, public authorities, to the vital necessity and urgency of the application of sanitary measures. Where in past years works of drainage and water supply have been neglected, it is now of little use for such places to attempt more than superficial measures; that is, such remedies as are most readily applied; and then (once the panic over) it will be for them to say whether they will wrap themselves up in the cloak of a penurious economy and fancied security, until they are once more roused to temporary activity by the recurrence of a plague whose food is dirt, and whose very existence depends upon their negligence; or will they learn the value of a human life, and the immense national importance of the public health.

The coffin goes slowly by:  
Never mind, what care I?  
Rates are easy; no sewer, no drain;  
What did before will do again.  
The wail grows, the children weep:  
In workhouse ward to-night they'll sleep.

Anathy is not by any means, however, the universal rule, as I can attest to the unceasing endeavours of many public authorities to promote to the fullest degree the public health of their respective localities. The following few simple and suggestive ideas have been printed and circulated extensively in several districts, with the most beneficial results. In drawing them up, I had in mind the class of persons they were specially designed for; and their circulation in other places might lead to good results; therefore I submit them to you:—

1st. Perfect cleanliness of the person and of dwellings is of the utmost importance.

2nd. A free admission of fresh air into all apartments, especially sleeping-rooms.

3rd. Abstinence from eating fruit which is over-ripe, or flesh or fish which is not perfectly fresh.

4th. The lime-washing of all rooms, cellars, privies, outbuildings, courts, alleys, and all confined places.

5th. The removal from the neighbourhood of dwellings of all filth, refuse, garbage, dung, or other offensive matter.

6th. The keeping of swine near to dwellings, and the keeping of poultry or pigeons within dwellings, should be at once discontinued.

7th. A free use of chloride of lime wherever there is any offensive smell arising from any close or confined room or place, or from any offensive drain, &c. &c.

With a view to assist poor persons to comply with suggestions Nos. 4 and 7, the Local Board will supply chloride of lime, quicklime, and whitewash. Brushes free on application at the offices of the Local Board between the hours of 10 and in the afternoon of every day except Sunday."

How could a local board or corporation better spend a few shillings or pounds than in the wholesale distribution of information such as the foregoing, and in the providing and supplying free the means of carrying out the suggestions?  
JOSEPH BRIBLEY, C.E.

THE ARCHITECTURAL EXHIBITION AND THE PRESS.

SIR,—Believing that you have the welfare of the Architectural Exhibition at heart, I venture to reply to the passage in the *Builder* of November 4th, and state that the curator, who gave offence to the representative of the press, retires from his duties at Christmas next.

I was not present at the first meeting of the committee referred to; but I am given to understand had the representative of the press attended the committee as requested, a resolution might then have been arrived at, and with reference to the second meeting, I am sure the desire was fully to express regret at the annoyance caused. Being as you are interested in the progress of the art, and the importance of extending the knowledge of architecture to the public, I trust the committee may receive your aid in their endeavours to improve the position of the Architectural Exhibition.  
THOMAS CHAFFIELD CLARKE.

\* A very common practice in Lancashire.

CHURCH AT VÉSINET, PARIS. INTERIOR.

[See p. 830, cut'e.

SCHOOLS OF ART.

*The Coventry School.*—The annual meeting of this school has been held in St. Mary's Hall, Coventry. The meeting was large and respectable; a great many ladies were present. The mayor presided. The mayor said, he had observed with pleasure the improvements which had been made in the designs of ribbons and watches in this city, and they had no doubt been indebted in some degree to the school of art for the improvement in the staple manufactures of the town. He congratulated them upon having such a building in which to pursue their studies as the new School of Art, as compared with what he might call the hole of a building which they formerly occupied. The influence of such a place as the new school must be beneficial to the pupils. The twenty-first annual report stated that the number of local medals obtained at the last examination was twenty-four, and ten received honourable mention. In the national competition, two national medallions and one honourable mention were obtained. The number of medals and medallions obtained has not been so great as in some former years; but as a higher standard of excellence is required by the department, the number compares favourably with that obtained by other schools. The number of pupils under instruction during the year has been 700, and 171 under superintendance. There were distributed on the present occasion two national medallions, besides medals to twenty-five pupils, and a number of special prizes.

*The Bath School.*—The distribution of prizes to this school has also been made. The meeting was held in the Council Chamber, the mayor presiding. The report stated that, in November, 1864, the committee succeeded in engaging a master highly recommended by the Department, who had passed most successfully the highest

class examinations, and they had much pleasure in stating that it was a continual source of gratification to the committee that they had the good fortune to secure Mr. Puckett as the art-master to the Bath School of Art. The receipts from payment for pupils at the school, which for the whole year 1864 was only 67l. 10s. 6d., had in the last nine months amounted to 97l. 6s. 5d.; and the committee had every reason to hope the fees for the whole twelve months would be more than double that of the previous year.

*The Cork School.*—The fifteenth annual distribution, to the students of this school, of the medals and prizes, has taken place in the Rotunda of the Athenaeum, before a very large assembly. The chair was taken by the mayor, who passed a high eulogium on Mr. Brennan, the master of the school, who he said was not merely a thorough master but an enthusiast in his profession, and possessed the faculty of imparting instruction to his pupils with facility, and making their labour an agreeable one—a work of pleasure rather than a task. It was gratifying to him, as the head of the corporation, to think that they were the first municipal corporation to present to a school of design part of the funds at their disposal, and to see that the portion of the funds thus employed was not thrown away or given in vain. Mr. Brennan read the report for the year, from which it appeared that twelve medals were awarded, three students received honourable mention, six drawings were sent for national competition, twenty-eight students passed in the second grade examination in freehand, geometry, perspective, model and memory drawing—many passing in two and some in three subjects. Two national medallions were received at the competition in London in 1864: these were awarded,—as so many of the Schools of Art prizes are,—to ladies, in this case for analyzing floral forms, so as to produce ornament,—a stage in which the school has

always been successful. The department purchased them for examples. In the present year sixteen medals were obtained, thirteen drawings were retained for national competition, four students received honourable mention, and three were again awarded medallions at the national competition; fourteen students passed in free-hand, geometry, &c. This year Mr. John Daly offered prizes amounting to 10l. for designs for Kidderminster carpets. The decision was left to Mr. Wallis, manufacturer at Kidderminster, and he awarded the prizes to Miss Baker, Mrs. Hill, and Miss Elizabeth White. A design for brocadeed poplin, by Miss Baker, was purchased by the Messrs. Pim & Co., of Dublin, and it is at present worked in their loom in the Dublin Exhibition.

#### SUNDERLAND.

SOME little stir has been produced in Sunderland by recent remarks in our pages, and will, it may be hoped, lead to improvements. The Bridge toll is to be lessened forthwith. Even from writers who profess to reply to our correspondent's strictures, comes further evidence of evils that need remedy. Thus the *Sunderland Times*, speaking of one such, says,—“The following extract from our correspondent's letter is interesting, and, we earnestly hope, may help to the adoption of some means to abate the evils referred to, the fruitful source of disease, intemperance, immorality, and poverty:—“I look on the narrowness of the alleys, in proportion to the height of the houses, as the most crying evil of Sunderland, and am sorry to think of its incurability. I have, however, at Nottingham, seen the operations of a corporation in a similar difficulty since I visited you. There, sums of money, up to 200l., have been from time to time, for about nineteen years, paid as bribes to owners to induce them to pull down a house here and there, to make a closed yard, or open the middle of a long lane, and this with great benefit, though not sanctioned by any local Act.”

#### SHEFFIELD WORKMEN AND WORKCHILDREN.

THE proprietors of the *Sheffield Independent* some time ago offered four prizes of 5l. each, and four prizes of 1l. each, for the best and second best essays on subjects chosen to elicit practical information on pending legislation as to the employment of the children and the protection of the life of artisans in disease-producing branches of trade. The prizes for essays on the first subject have now been awarded. Mr. John Wilson, pen-blade grinder, Nottingham-street, wins the first prize of 5l.; Mr. Robert Marshall, Aberdeen-street, wins the second prize of 1l. The other three subjects for essays, on which the same amount will be given, are as follows:—

“II. The Habits of the Artisans and their Families as formed by their Employments: the Difference between the Orderly and Disorderly, the Intelligent and the Ignorant. Essays to be sent in on or before the 15th of November.

“III. The Educational and Industrial Training of Working Children—those employed in Factories and those employed by Out-workers. What is now done by them? Can Legislation improve their Condition in Mind and Body? Essays to be sent in on or before the 23rd of December.

“IV. The Progress of our Artisans in Comfort, Property, Intellect, and Morals since the Adoption of Free Trade, and the Means within their own Power to make still greater Progress. Essays to be sent in on or before the 21st of January.”

#### THE “OLD MEETING,” LUTON.

WITH some of our contemporaries we have been misinformed as to the age of the church at the Old Meeting, Park-street, Luton. The “Church,” as it is technically named, meeting in this place is one of the oldest in Bedfordshire. Mr. Thomas Marsom, imprisoned for conscience-sake in Bedford jail with John Banyan, the immortal tinker, was its first pastor. But the present building was not erected until 1814, when the old chapel, built in 1686, had become too small for the congregation. It was the application of the word “Church” that misled our informant. In the vestry is an old chair, which the present community believe was used by Banyan.

#### THE WAGES MOVEMENT.

*Chelmsford.*—The following communication from Chelmsford shows what has been done in that town.—Recently, the journeymen carpenters and joiners of this town served a notice upon their employers to the effect that, unless an advance of 6d. per diem upon their rate of wages was submitted to, they would cease work after a given day. The master-builders convened a meeting, at which the following resolution was unanimously agreed to:—

“That the master-builders of Chelmsford, taking into consideration the rise of wages throughout the country generally, are willing to meet the request of the carpenters and joiners as far as possible; and in order to introduce a more correct system of payment, agree in future to pay by the hour, instead of, as at present, by the day; and that such payment be regulated according to the respective merits and capabilities of each workman.”

The result has been, the inferior workmen obtained no favour, the better class received an increase of wages, and the threatened strike fell through. It is only fair to mention that the rate of wages in this town in the building trade, judging from other places, is not commensurate with the fair claims of labour. If the character of men and labour here is equal to that which is employed in London and elsewhere (about which I have no doubt), it behoves the masters to act liberally on their parts, and thus avoid giving a plea for a general strike in the spring of the year. THOMAS MOSS.

#### COMPENSATION CASE.

##### PARTRIDGE v. THE EDGWARE AND HIGHGATE RAILWAY.

THIS inquiry was held at Edgware, on the 1st instant, before Mr. Under Sheriff Burchell and a special jury. Mr. Sergeant Parry and Mr. Channell appeared for the claimant, and Mr. Lloyd for the Company.

The Company, it appeared, took a strip of land out of the middle of nearly 18 acres of grass-land, with a frontage to Deans Brook-lane, Hendon, dividing the remainder into two pieces of 6½ acres and 10½ acres; but altering the road, by raising it to cross the railway, so that 500 ft. of the remainder would have no frontage. The witnesses for the claimant, Mr. H. Baker, of Kilburn, Mr. E. Roberts and Mr. R. C. Driver, both of London, valued the land at 250l. per acre, as accommodation and not agricultural land, making, for the quantity taken (adding 20 per cent.) 360l. to 386l., and for the severance and damage 750l. to 800l. The railway would be nearly on a level with the land, and no communication would be given.

The company did not call any witnesses, but relied on a speech by counsel, who contended that the damage was imaginary, and that all necessary communications would be given by two justices; that there was no value in the land beyond that for agricultural purposes; that there would be little or no injury or depreciation; and suggested that 400l. or 450l. would be ample compensation for land and damage.

The jury, after considering for a short time, assessed the value of the land at 850l., and the damage at 500l.; total, 850l.

#### COMPETITION COURTESIES.

SIR,—My attention has been called to a letter which appeared in your impression of the 28th ult., under the signature of a “Competing Architect,” referring to an advertisement in the *Builder* of July last, offering a premium of 20l. for an approved ground plan and elevation for the erection of a public-house on the Birbeck Freehold Land Society's estate at Upper Holloway; and complaining that the award of the said prize had not yet taken place, or that no information or return of the plans could be obtained.

I must, in justice and fairness to the society, request you will be good enough to allow me, through the same medium, to inform your readers that the “unsuccessful” “Competing Architect” has stated what is not correct. That the premium has been awarded and paid is manifest from an advertisement in your issue of the 21st inst., a week previous to the publication of the letter above quoted (*vide back page, middle column*), stating “that the premium of 20l. has been awarded to ‘Perseverance,’ Mr. Geo. Foreman, of 13, South-street, Grosvenor-square; and that a second premium of 5l. 5s. (although not announced in the advertisement of the 1st July last) has been awarded to (Spes) Mr. R. Walker, of No. 10, King's Arms-yard, Moorgate-street. The rejected plans will be returned upon personal application to Francis Ravenscroft, manager.”

Now, as 121 plans were sent in, many of which were considered of a high order of merit, it must follow that some time would be occupied in selecting one to which the premium should be given; yet but a few weeks elapsed ere the award was made, and the money paid; and I may add, that the greater portion of this large number of plans have since, on application, been returned to their respective owners. FRAS. RAVENSCROFT, Manager.

#### METROPOLITAN BOARD OF WORKS.

At the last ordinary weekly meeting of the Metropolitan Board of Works, the report of the Thames Embankment Committee was brought up and read. It recommended the formation of the following approaches:—“From Whitehall-yard, at an estimated net cost of 41,500l.; from Whitehall-place, at an estimated cost of 10,500l.; from Charing-cross, through Northumberland House to the Embankment roadway at Charing-cross Railway Bridge, including a branch leading southward to the Embankment roadway at a cross road from Great Scotland-yard to the extension from Whitehall-place, the widening of Northumberland-street, and the extension of Craven-street, at an estimated net cost of 181,500l.; from Wellington-street to the Embankment roadway at Charing-cross Railway Bridge, including a branch from the same to the Embankment roadway at Waterloo Bridge, at an estimated net cost of 253,700l.; from Villiers-street, at an estimated net cost of 1,400l. from Norfolk-street, at an estimated net cost of 7,000l.”

The Chairman suggested that the report should be adopted without discussion, and referred to the Streets Committee.

Mr. Titc moved, “That in order to form approaches to the Thames Embankment, as recommended by the committee, and to construct an embankment of the Thames at Chelsea, and to widen Park-lane at the Piccadilly end,—all of which, in the opinion of this Board, are desirable improvements,—it is necessary to apply to Parliament for a further extension of the coal and wine duties.”

The motion having been seconded,—Mr. Collinson moved an amendment, the object of which was to separate the Chelsea embankment from the Park-lane improvement, as a long discussion followed, and was lost. Two other amendments were proposed in succession, but they met with a similar fate.

A resolution was passed authorizing the officers of the Board to give preliminary notices to the parties interested, and to prepare the books of reference, &c., and submit them to the Streets Committee.

Mr. Bazalgette's report as to the progress of the Thames Embankment was then received.

#### GOLD DIGGING ON IMPROVED PRINCIPLES.

SOME interesting particulars as to the present state of the Australian gold-diggings are given in *Dicker's Mining Record* of 22nd of August last. In a summary of mining, the *Record* says:—

“The United Extended Band of Hope Company has washed out gold to the amount of 189,641l. 16s. within the space of thirteen months. It has paid to its shareholders dividends to the amount of 110,400l., expended in wages for 6,000,000 lbs. of firewood, and in mining timber, between 11,000l. and 12,000l. in the same period of time, and gives besides constant employment to 272 men. Very nearly 10,000 trucks have been raised weekly, with an average weekly yield of 500 ounces of gold during the past five years. By the introduction of the bundle, fine gold, that until recently was allowed to run away in the sluice, is now saved every week, of the average value about 115l., the cost of the process being only 15l. weekly. A large bath-room and drying-room have been fitted up for the accommodation of the miners on coming up from the mine. Duplicates of all the most important portions of the machinery are kept on the claim to prevent any unnecessary loss of time when any breakage occurs. A new feature has quite lately been introduced in this mine, that of lighting up the underground workings with gas. The length of drive lighted up is about 900 ft.”

Although this is the first attempt of the kind in Australia, it is no new thing in the northern counties of England. In one of the mines in Northumberland the gas itself is manufactured underground, and the entire mine is thus lighted up.

In another of the English mines it is forced up. In another from the surface in pipes, as it is in the case referred to in Australia; water being used, however, as the motive power instead of steam.

#### KAMPTULICON.

SIR,—If every fact necessary for the consideration of the cases mentioned in your last two numbers by Mr. W. Bennett and “D. J. H.” has been laid before your readers, it would appear that this article, though made solely of ground cork and rubber, deprived of all its moisture by heat and pressure, has the astounding property of decaying wood by contact merely. Now, if this be so, how is it that it has been laid at the Houses of Parliament, British Museum, and innumerable public buildings, banks, offices, &c., for long periods, varying from five to twenty years, without developing this property?—I.e., without having in the least degree tended to decay the wood. The truth is, that in the cases mentioned by your correspondents the ventilation under the floor could not have been effective. It is well known to all your readers that if on a floor either damp floors or damp air, like oil-cloth or kamptulicon, prevents the escape of the damp above, without ensuring ventilation underneath, the boards are likely to decay. During many years' experience of kamptulicon the very few complaints we have had of its rotting the floor (not one in the last twelve months) have been where it has been laid on a basement floor with no actual air currents underneath, although there may have been gratings for ventilation. More than that, we have known kamptulicon to be laid on damp boards with this result, that if struck down, as is often the case, the boards in striking have torn the kamptulicon into pieces, exactly as if some one had cut it with a knife between the planks, or if not struck down, the boards have shrunk without any effect on the cloth.

Our object in writing not being to advertise ourselves, but to elucidate the truth, we inclose our card for your satisfaction only.

MANUFACTURERS OF KAMPTULICON.

A HINT TO ARCHITECTS.

Mr. W. P. FRITH, R.A., writes:—

I ask to be allowed to warn the public through your columns against a man calling himself *Wilson Lett*—a perfect stranger to me, who has forged my name as an introduction to unsuspecting persons, whom he has afterwards plundered. His plan is to call on an architect, to produce an address card with my name engraved in full on it, and then, in the most gentlemanly and plausible manner, in reply to the architect's disavowal of personal acquaintance with me, to assure him that his name and works are well and favourably known to me; that only the other evening, when he met me at the Hon. Mr. Blank's, I spoke so warmly of the architect's merit, that he had resolved to rebuild Woodlands,—"an old, time-broken place,"—and this architect, and no other, should do it. The pleasing prospect of a splendid commission, the elegant manners of the proprietor of Woodlands, and perhaps the forged introduction, combine to throw the architect off his guard; and when, just as the swindler is leaving, he produces a crossed cheque, drawn by one of the most respectable inhabitants of Palace-gardens on a well-known London bank, and regretting that his banker being at Maidstone, the cheque is for the moment unavailable, he asks the architect kindly to give him cash for his cheque in exchange for what afterwards proves to be an impudent forgery, it is not surprising that in some cases he succeeds. That he has succeeded in defrauding two gentlemen, one of thirty guineas and the other of twenty-five, is within my knowledge; and if you will make this letter public at once, further proceedings may be stopped.

Books Received.

VARIORUM.

"On Telemeters; or, Instruments for Measuring Distances. By the late Archibald Hamilton Bell, M.A., Lieut. Royal Artillery. London: printed by G. & J. W. Taylor, Gray's Inn-road, 1864." The chief object of this pamphlet is to give an account of an instrument (the hydro-scope) of the late Lieut. Bell's invention, which has been adopted by Government, upon the recommendation of the Ordnance select committee, and is now in use in Great Britain. Engravings are given of one which only costs a few shillings. The instrument seems to be both simple and adapted to its purpose. The inventor had mainly in view the utility of rifled ordnance, carrying missiles with sufficient destructive force to a distance of between two and three miles.—  
"Electrical Communication in Railway Trains. By A. E. Brad. London: Wilson, Royal Exchange." In this pamphlet the causes are considered which have hitherto prevented the successful application of electricity to the purpose in view; and a list is given of the several patents for its attainment, including two invented by the author, of which the specifications, &c., are given. To us it appears that without proper arrangements for the transit of the currents along the trains, either inside or outside the carriages, all of the innumerable projects, electrical and mechanical, for communication between passengers and guards are defective; and with such means of transit they would be nearly all useless. A guard's "heat" along the trains, therefore, is the one essential measure on which the public and the press ought to insist. Some simple bell-ringing apparatus might then be added to complete the trim of trains in transit.

Miscellaneous.

SUCCESS OF THE DUBLIN EXHIBITION.—We are glad to hear that the present beautiful exhibition will prove no loss to the guarantors. On the contrary, a considerable surplus will be the result.—*Freeman*.  
THE INSTITUTION OF CIVIL ENGINEERS.—The weekly meetings of this Institution will be resumed at the House in Great George-street, on Tuesday evening, the 14th instant, at eight p.m., when a paper by Sir Charles Tiltson Bright, M.P., M. Inst. C.E., on "The Telegraph to India, and its Extension to Australia and China," will be read and discussed.  
THE SOUTH-EASTERN INDUSTRIAL EXHIBITION, GREENWICH.—The ultimate purpose of the promoters is to form a permanent museum or similar institution for the benefit of the Industries classes. While avoiding sensational performances in the exhibition hall, they hope to provide recreative concerts and readings, interspersed with a few popular interesting lectures. The prices for admission to the exhibition are,—from ten in the morning to six p.m., 6d.; from thence to ten, 2d.; excepting on Fridays, when the prices will be 1s. in the morning, and 6d. in the evening.

SEWAGE UTILIZATION AT PRESTON.—In our notice of Mr. Newton's plan (p. 778, ante), the want of a point turned 51. 16s. 8d. per acre into 5,168s. per acre. We mention it, but the slip was too obvious to mislead.

WORKMEN'S TESTIMONIAL.—On Saturday last, the employés of Messrs. Millington & Hinton, of Budge-row, presented one of the foremen, Mr. E. W. Pearse, who was about to leave them after a service of nearly twelve years, with a handsome silver watch, suitably inscribed, as a mark of their esteem.

"CLOCKS AND BELLS."—The clocks mentioned under this heading, last week, as having been recently set up for Mr. Guinness, M.P., in St. Patrick's Cathedral, for the Government of St. Kitts, West Indies, and at Ratherglen, were the work of Mr. J. W. Benson, of Ludgate-hill. A list of others lately erected by the same maker would fill a column of our paper.

NEW BRIDGE AT PRAGUE.—On the 19th ult. the foundation-stone was laid of a new suspension-bridge over the River Moldau, at Prague, which is to be named in honour of the Emperor, "Franz Joseph's Brucke." The ceremony was performed by the Governor of Bohemia, in presence of the Cardinal Archbishop of Prague, Prince Schwarzenberg, and many others of the nobility and clergy. The bridge is to be constructed from the designs of Messrs. Ordish & Le Penne, of Westminster, who were successful against eleven competitors from Holland, Austria, Germany, and France.

SERPENTINE.—The fracture of the common serpentine is harsh and brittle, but that of the commercial serpentine is in flakes, like slate. It is adapted for taking the finest carving, and wears even better than granite. Serpentine also retains its polish out of doors. The comparative degrees of strength of serpentine, Portland stone, and Devonshire marble, is shown by the statistics of the test made before the committee of the Institute of British Architects, on the 7th of August, last year. The shafts of each material were 1 ft. in length and 3 in. in diameter. The trial resulted as follows:—

	First Fracture.	Broken.
Portland stone, No. 1.....Tons	7.3	10.25
Ditto, No. 2.....	8.7	8.7
Devonshire marble.....	9.2	10.7
Serpentine, No. 1.....	12.15	16.25
Ditto, No. 2.....	16.92	17.62

The figures relating to the fractures represent the hydraulic pressure applied, and indicate the superior weight-bearing qualities of serpentine. Thus it is shown that in regard to polish, hardness, strength, durability, and beauty, serpentine is a stone that is very desirable for the ornamentation of buildings.

ROYAL SCHOOL OF NAVAL ARCHITECTURE.—The winter session of the Royal School of Naval Architecture and Marine Engineering at South Kensington, in connexion with the Science and Art Department of the Committee of Council on Education, has been opened. Mr. C. W. Merrifield, F.R.S., has been appointed principal, in the room of Mr. A. J. Parkiss, B.A., who was drowned a few weeks since while bathing in the Cam. The course of study, which is calculated to last three years, includes, amongst other subjects, pure mathematics, applied mathematics, theory of fluid and resistance of waves; theory of design, construction, and behaviour of ships.

BRISTOL INDUSTRIAL EXHIBITION.—This exhibition has been finally closed. Receipts of extra days were devoted to the fund being raised in Bristol for the erection of a fever hospital. The distribution of prizes took place at a meeting at which the mayor (Mr. W. Naish) presided, and at which Mr. H. Berkeley, M.P., addressed the successful exhibitors. Mr. H. E. Allen read the report of the committee, from which it appeared that the total number of exhibitors was 763. The number of visitors during the six weeks the exhibition was open was 116,926, and the total receipts were 3,253s. 1s. 11d. Of this amount, a sum of 500l. was placed in the hands of the adjudicators to be distributed in prizes; but the prizes awarded only absorbed 421s. 8s., besides 187 honours and mentions. At a meeting of the committee, however, it was resolved to relax the rules, so as to enable the balance of the 500l., and a further sum of 150l., to be given in additional prizes. After discharging all liabilities, there will remain a considerable surplus, which it is proposed to divide among the principal medical charities and some of the other institutions of the city. The report was adopted.

PENRITH.—Mr. John McIlquham has been appointed town surveyor and manager of water-works for the town of Penrith.

THE REBUILDING OF CONSTANTINOPLE.—In addition to his munificent donation to the official fund for the relief of the sufferers from the late fire, the Viceroy of Egypt has intimated his intention to rebuild, in brick or stone, 200 of the burnt-down houses owned by the poorest of the victims.

ACCIDENTS.—There has been an outbreak of sewage in the Wapping tunnel on the London and North-Western Railway at Liverpool. About thirty yards of the tunnel will have to be reconstructed. Heavy rain is believed to have led to the bursting of the sewer.—A ship, driven by a strong current, has dashed into a railway bridge at Hartlepool, and done serious damage to the bridge. No life was lost, although a train was in peril of crossing the bridge at the time.—A man has been killed at Rochdale by the falling in of part of a sewer covered with large masses of paving stones cemented together by asphalt, through which there were difficulty and delay in reaching him.

THE UTILIZATION OF TURF BOGS.—In a recent number of this journal, says the *Tipperary Free Press*, we directed attention to a new discovery which had been arrived at by two gentlemen of position in this county, and we are glad to learn that the result of their scientific labours will ere long open up a valuable source of commerce, which will be productive of very great advantages indeed. We refer to the utilization of the turf bogs of Ireland, from which, it appears, may be extracted oils of great value, and fully equal in quality to those which have rendered portions of the American continent the centres of vast commercial wealth and profitable enterprise. The principal products of the turf are illuminating and lubricating oils, specimens of which we have seen tested; and these, in vast abundance, can, it is calculated, be brought into the market at a cost considerably less than the present specified value of such commodities.

METROPOLITAN MEMORIAL TO MR. COBDEN.—The general committee for carrying out the erection of a statue to the memory of the late Richard Cobden, to be erected in the Broadway, at the entrance to Camden Town, has had a meeting in St. Pancras Vestry-hall. A report was received in reference to the memorial fund, which stated that to complete a design for a statue and pedestal, 22 ft. in height from base to summit, submitted by Messrs. Wills, Brothers, of the Easton-road, about 100l. more would be required. It was resolved to have photographs of the proposed design taken, and copies sent to the subscribers, with a request to renew their exertions to carry out the object with as little delay as possible: subscriptions to be sent to either the London and Westminster or National Banks, or to the treasurers (Messrs. Lawford & Rohson), or the churchwardens, or the Rev. Canon Champneys, the vicar of St. Pancras. It is most earnestly to be hoped that excellence in the statue will be insisted on.

THE DRINKING FOUNTAIN MOVEMENT.—A drinking-fountain, which has been erected at the cost of Mr. John Ransom, at the entrance to the Avenue, Southampton, has been inaugurated. The design was selected from several submitted to the choice of Mr. Ransom by the town surveyor and architect, Mr. Poole, and the fountain and troughs have been constructed and erected by Mr. S. Stevens, builder. The carving was done by Mr. Sanson, of London. The fountain is designed square on the plan, and is raised on a concrete and brick foundation by three graduated steps. It is guarded by a tessellated or mosaic tile pavement, the basement being a channel rusticated with a weathered plinth, and plain hand. Each side is furnished with a moulded basin supported by marble shafts, with Portland stone caps and bases. The upper portion of each side is decorated with two engaged columns, having entablatures and pediments with acroteria at the angles, and supporting an enriched dome, terminated with a carved four-armed cross, indicative of cross roads. On each face is an elliptical moulded and sunk medallion panel with figure carvings in high relief, representing the four seasons, the festoons over which are also carved with characteristic foliage. The capitals are carved with foliage of a natural type. The water supply will be constant, that the fountain being independent of the troughs for horses and cattle.

**ORPHAN WORKING SCHOOL.**—We are informed, that at a meeting of the committee, on Wednesday last, Mr. A. R. Pite, of Bloomsbury-square, was elected surveyor to the above corporation.

**BORDESLEY ABBEY, WORCESTERSHIRE.**—A history of this abbey, with numerous illustrations, is about to be published, by Mr. R. S. Bartlett, J.P., Deputy-lieutenant of the county of Worcester. Extensive excavations have recently been made, and it is said that discoveries of an interesting character have been the result.

**VALUE OF LAND IN THE CITY OF LONDON.**—The site, in Gracechurch-street, of the old Spread Eagle Tavern, which building was pulled down recently, was sold by auction yesterday. The sale, which was conducted by Messrs. Fox & Bousfield, created an unusual excitement at Garraway's. So many persons appeared to bid that an adjournment to the greater accommodation of the London Tavern was necessary. There the plot was sold. It contained in all 12,000 ft., 5,600 ft. of which were leasehold for a long term, and the rest freehold. The first bid was 50,000l., and the final one 35,000l.

**ROYAL ENGLISH OPERA.**—“Masaniello” was revived on Wednesday evening last, and introduced to the London public a new candidate for their favour in the shape of Madlle. Ida Gillies, who sang the not very agreeable part of *Elvira* with considerable taste and effect. Mr. Charles Adams has taken his place as our second-best tenor. Strange, that we should be able to produce so few. His performance of *Masaniello* throughout was admirable; and in all the chief features of the part—the harcarolle, the duet with *Pietro*, and the sleep song,—be carried away the house. The *divertissements* were carefully danced, and the whole getting up of the opera as excellent as before. Mr. Henry Leslie's new opera “*Ida*” is announced for next Wednesday.

**THE ALBERT MEMORIAL MUSEUM AT EXETER.** The foundation-stone has been laid of the Albert Memorial Museum, Exeter. The site of the building is in Queen-street, adjoining the post-office, and it is to be devoted to the purposes of a museum, library, reading-room, and school of art for the people. The building will be in the Mediaeval style, and will measure 160ft. by 60ft., with a general elevation of 55 ft. It will be built of Pocombe stone, relieved by Bath stone and limestone dressings. There will be a room for the museum of antiquities at one end, with a room for the natural history department above it. The frontage of the building adjoining Queen-street was given by Mr. R. S. Gard, the back portion having been purchased. The architect is Mr. Hayward, of Exeter; and Mr. Luscombe, of Exeter, is the builder.

**A NEWSPAPER-PRESS TRAINING COLLEGE.**—In the belief that a definite course of professional training is requisite to enstain the credit and efficiency of our recently very much extended English newspaper press, a training college has been established at Dorchester, Mr. W. Wallace Fyfe, a gentleman of great experience in journalism, being principal, and assisted by a competent staff of instructors in all the departments,—literary, reporting, circulation, advertising, financial, and mechanical. In this college, according to the prospectus, young men are duly articulated, through a three years' course of professional practice; or, without being articulated, are afforded such special opportunities of acquiring experience, along with systematic instruction, in the different departments, as may appear desirable. “By the course pursued at this establishment,” continues the prospectus, “the attention of the student may be limited to the precise branches in which he seeks to become accomplished. Whether to the literary or to the financial manager, however, nothing will be found more valuable than a sound and comprehensive knowledge of the whole economy of the press; whilst to the newspaper proprietor such knowledge is indispensable. It is also believed, that the proper professional training of its *élèves* will inspire the public with confidence in the character of the press. Observing, in many parts of the country, the success attending duplicate circulations in connexion with county newspapers, means have in this instance been adopted for enabling the students to participate in the actual experience derivable from the working of a considerable series of journals.” The principal of the college certifies competent candidates for appointments on the press.

**MORTISE.**—A medal has been awarded to Mr. William Bissell, of Wolverhampton, by the jurors of the Dublin International Exhibition, for his mortising machine.

**THE PROPOSED WORKHOUSE FOR SOUTHAMPTON.** The design marked “Ait” (by Mr. Skelton), has been at last definitively agreed on and accepted. The proceedings have been marked by great irregularity, to use no stronger word. The gentleman whose design was first selected by the guardians, has reason to say “Defend me from my friends.”

**“THE FREEHOLD LAND AND BRICKWORKING COMPANY, LIMITED.”**—Under this title a company has been formed for the purpose of purchasing a freehold estate in the neighbourhood of Arundel, in Sussex, on which has been discovered a deposit of fine “plastic clay,” well adapted for the manufacture of bricks. It is understood to have special advantages in respect of carriage, both by water and railway; otherwise, there are many fields of brick-earth that might be bought for less than it is to be paid for this land. The directors are so well satisfied as to the results of the speculation, that they guarantee 15 per cent for five years. Mr. Henry Sass is the company's surveyor.

**A CHILDREN'S WINDOW.**—It is proposed that the large north window, in the north transept of the Collegiate Church, Wolverhampton, should have its fifty-two circles filled in, each with a representation of a Bible incident connected with children's life. It is inferred that many persons who could not afford to give a whole window, as a thank-offering for the birth of a child, or for some merrily bestowed upon a child, or for a memorial of some lost child, would be glad to have the opportunity of giving one of these circles, the cost of which would be from 8l. to 10l. The rector has proposed a list of incidents suitable to be recorded, commencing with the birth of Seth, and ending with Timothy, and three circles have been already given.

**THE AMELIORATION OF THE CONDITION OF THE WORKING CLASSES.**—In 1861 Mr. Murphy, who is known in connexion with the first Working Men's Industrial Exhibition, with a few other friends of the working classes, got up Saturday evening entertainments at the Lambeth Baths, the chief features of which were newspaper readings and music. For four seasons,—viz., 61-2, 62-3, 63-4, and 64-5,—these entertainments have been conducted with much success. Every season the numbers in attendance appear to have increased. The season of 1865-66 has recently commenced. The attendance of nearly 2,000 of the working men and their wives and families showed the favour with which the movement is looked upon by those most deeply concerned.

**AMATEUR BELL-RINGERS.**—I fully agree with your correspondent, Mr. Wilson, that it would be extremely beneficial, as well as creditable, if gentlemen would take church bell-ringing into their own hands instead of leaving it to a set of (in many cases) drunken and disorderly men. In the parish of Lewisham a party of young men have recently made the attempt; and although some difficulty was experienced at first, both in learning to ring and the unpleasantness of being regarded with contempt by some persons, they hope in a short time to ring in a very creditable manner. I think nothing can be more disgraceful than the language and conduct that usually go on in a belfry; and a set of good rules have been framed, inflicting fines on all persons misconducting themselves while in the church.—ONE OF THE LEWISHAM BELL-RINGERS.

**THE MEMORIAL WINDOW IN ST. JOHN'S CHURCH, ETON.**—The inscription has recently been inserted in the new east window of this church, extending the whole width of the base. The inscription is in Latin, and runs as follows: “In honorem Dei, et in memoriam com Alheri Principis, tum aliorum quorum opera aucta est hęc parochia, fenestram hanc posuerunt nonnulli ex Etonensibus. A.D. MDCCLXV.” Some slight alterations have been made in the window, by which the colouring of the base has been deepened, the ground of the lower lights having been changed from grey to claret, and the robe of the Saviour, bearing the cross, from scarlet to crimson. As a further adornment, it is proposed to erect a veredee, the designs for which are preparing by Mr. Woodycar, the architect of the new college schools. The veredee, like the window, will be the result of public subscription.

**TENDERS**

For constructing pipe-sewer from Dunstons, Ryde, to the sea. Mr. Francis Newman, Town Surveyor.—  
Tender (accepted).....£279 0 0  
Sharon ..... 275 0 0

For constructing sewer and forming roadway from Trinity-street to Monkton-street, Ryde. Mr. Francis Newman, Town Surveyor.—  
Colecutt.....£197 0 0  
Kemp ..... 168 0 0  
Meadler ..... 165 0 0  
Denham (accepted) ..... 149 0 0

For the erection of part of the George Hotel, Huntingdon, for the Duke of Manchester. Mr. R. Hutchinson, architect:—  
Bridge & Whiteman .....£1,423 0 0  
Balmer ..... 1,326 0 0  
Maile & Richardson ..... 1,295 0 0  
Thackeray ..... 1,287 0 0

For a house and stable, to be erected on Putney-hill, for Mr. A. Calder. Messrs. Chas. W. & S. W. Lee, architects:—  
Ariss & Son (accepted) .....£2,343 0 0

For erection of seven warehouses, at Providence-row. Mr. J. Hammon, architect:—  
Browe & Sons .....£11,629 0 0  
Bishop ..... 10,341 0 0  
Browne & Robinson ..... 10,337 0 0  
J. & W. Sanders ..... 9,739 0 0  
Henshaw ..... 9,648 0 0  
Macey (accepted) ..... 8,639 0 0

For villa residence & stabling, Ryde, for Mr. B. Barrow. Mr. Francis Newman, architect.— Quantities supplied:—  
Langdon .....£3,668 0 0  
Colecutt ..... 3,670 0 0  
Meadler ..... 2,850 0 0  
Hutchings ..... 2,791 0 0  
Sibley (accepted) ..... 2,699 0 0

For the erection of a villa, at Fritton, near Lowestoft, for Mr. F. A. Mendenham Chambers, architect. Quantities supplied by Mr. Banker:—  
Allen .....£3,834 18 10  
Swatman ..... 3,583 16 0  
Rix & Son ..... 3,552 2 43

For the erection of coach-house, stables, &c., at Grenada Cottage, Stockwell Park-road, Brixton. Messrs. Landell & Bell, architects:—  
Colls & Son .....£348 0 0  
Grover ..... 527 0 0  
Mann ..... 498 0 0  
Child & Son ..... 377 0 0  
Hill & Son ..... 475 0 0  
Mansbridge ..... 475 0 0  
Newman & Mann ..... 445 0 0  
Tye & Andrew ..... 443 0 0

For vicarage, &c., Marton, Yorkshire, Mr. John Ladds, architect:—

	House and Offices.	Stables, &c.	Cow-house, &c.	Total.
Freeman	£1417 4 0	£245 10 7½	£129	£1821 14 7½

Advertisements cannot be received for the current week's issue later than FIVE o'clock, p.m., on Thursday.

**[ADVERTISEMENT.]**

**CHURCH, TURRET, and STABLE CLOCKS.**  
J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergyman, architects, and committees, Estimates and Specifications of every description of Horological Machines, especially cathedral and public clocks, chiming tunces on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 33 & 34, Ludgate-hill, E.C. Established 1749.

**NEWSPAPERS and MAGAZINES.**—Messrs. COX & WYMAN, Printers of “THE BUILDER,” and also Printers and Stationers, beg to call the attention of proprietors of Newspapers and Periodicals to the unusual facilities for their establishment presents for the production of the above class of Work, with regularity and in the best style.—Lancaster Lane Stationers' Work, 74-75, Great Queen-street, W.C.

# The Builder.

VOL. XXIII.—No. 1189.

## Cathedral of Sens.

THE Cathedral of Sens has peculiar interest for an English lover of architecture, interest sufficient to carry him to that city in preference to others equally within reach, though his immediate object be a place for the retired pursuit of other studies than architecture. Here we might fairly not be out of hope to find some of the motives that William of Sens brought over seas for the extension and embellishment of Canterbury Cathedral, and even apart from this hope there are temperaments that find additional zest in reflection upon the art in the native place of its dexterous and brave professor. Who now knows not the story, recorded by Gervase the monk, how William succeeded in inducing the churchmen, his patrons, to extend their designs to at least the full length of their purse, and when disabled by a fall from a scaffold—by God's judgment or the devil's malice, Gervase will not decide,—went on with the work from his bed, till hopeless of recovery and further efficiency, he gave up perforce to have a bruised and broken body transported back to Sens?

The genius of the time, however, in this, as in almost every other period of Gothic architecture, dominates the genius of the master, even of a master like William of Sens, just as in the church he served even the genius and energy of a Gregory, or an Innocent,—these seem expressions of corporate rather than outbursts of individual vigour. Sexpartite vaulting, with varied design of the intermediate piers, affection for cylindrical piers paired, grouped, and single, with Corinthian capitals, and almost the normal proportions of columns,—these are points of agreement between Sens and Canterbury, but they may be traced between many other structures earlier and later, at hand and remote; and even should characteristic mouldings have more coincidence than it struck us was the case, we should not be at all surprised to find agreement still closer with monuments at the other extremity of Christendom.

Of a truth, it will often occur to the mind, when we glance over the wider field, that there was as much of concurrence as of sequence in the development of Gothic architecture, and that men felt their way onwards in parallel directions by sympathy as often as by signal and direct imitation. There are very few English cathedrals in which every epoch of the style does not find some illustration, and there is more than one which, standing alone, might be taken to contain proof by what natural and

easy gradations,—after the primary assumption of builders eager for novelty, ardent for improvement, and reckless of precedent as a restraint,—by what leading suggestions of convenience, and through what inviting and soomingly manifest occasions of enrichment, the whole history of the art unfolded itself within the limit of a single ecclesiastical foundation.

As we walk down a nave like that at Worcester, and scrutinize one pier after another, it is not difficult, after a little study, to discern the considerations of effect inducing every change, plausibly, at least, and even manifestly; but we must be cautious in assuming that we are, therefore, without question, at the centre of originality, the exclusive seat of the invention, for we have not to ramble far,—and ramble as we may, we shall find the identical motives recognized elsewhere, lingered upon and sometimes dropped as rapidly, and sometimes retained to the end.

With this reservation recorded, a casual resident or couring tourist, at any rate, may do well to restrict his attention to the case that the monument he visits places before him, and will so make the best of his time, both for notes and observations to be noted. Those who care to read his notes will probably also thank him for sparing them a digest of a local guide-book, and the authorities they are as familiar with, or know their way to, as well as himself. And so we set down our memoranda of effects for good or ill, of natural developments and experimental changes, bappy or the reverse, that struck us in the cathedral at Sens, when we took ourselves thither at spare half-hours, for relief from other thoughts, and the hot sun of the summer of 1865.

The transepts are later and flamboyant, each with rose window and stained glass, worthy of notice by all whom such concern. The exterior of the transepts is in the same curbed style, not guileless of that effect of flimsy unsubstantially relatively to general magnitude of which I accuse Amiens. Of the western towers the southern has been rebuilt at a later date than the northern; western bays of the nave were involved in the same reconstruction and furnish a most interesting case of comparison with the forms that they superseded, of which presently. Varied and interrupted base mouldings on the exterior betray the alterations and also the insertions of portals at a still later date.

The main body of the church seems to have been proceeding in 1160 downwards, which was some ten years before the murder of Becket, a great name at Sens, where he took refuge, or at least whither he retired in the course of his contest with Henry II. The sacristan shows the cope that he left behind him, and seemed to like telling the story how a titular bishop of Westminster of our own times had pleased himself harmlessly with putting it on.

A general character is given to the interior by the prevalence of columns single, paired and grouped, with attic bases and Corinthian capitals.

The first bays on entering the church are not included in the nave proper, but are specially and grandly treated; two octagonal piers of exceptional mass facing attached piers of corresponding plan.

The vaulting is sexpartite in the nave and quadripartite in the aisles; the nave proper consists of three double bays of compound piers placed lozengewise, and intermediate pairs of pillars grouped on transverse axis of plan. The piers which terminate the series eastward are the large piers of the crossing, and the westward are those which provide support for the towers, and between which and the west wall are bays of wider span and distinct vaulting forming an interior porch or included narthex. Although, therefore, the external porches are not very important, we are spared that necre-

monions and blunt, not to say unrecurrent neglect of any intermediate stage between the world without and church within. The choir eastward, again, consists of three such sexpartite compartments, but the intermediate paired columns now receive the addition of a pair of smaller columns in their nooks, and the apse is closed at the end by a pair of such groups with no pier intermediate.

The extra projection of the great piers of the crossing and of the porch, it will be thus seen, form the nave into one apartment of three double bays. A second division is given by the four great piers of the transept crossing, and then in the choir the two first sexpartite bays are again distinguished by the larger size of their more eastern piers; while from these the interval or breadth of choir narrows towards the turn of the proper apse.

The fourfold grouped columns of the choir have a common abacus with projection on each front, the expression of a distinct abacus for each column; the archivolts of the side arches are thus received very agreeably where they are met at a right angle, and the jar of a skew incidence at the turn is at least considerably alleviated. The paired columns in the choir at Canterbury have an abacus of the same plan,—the side projection being supported below by the projection of the combined foliage of the adjacent capitals.

A special distinction is further given to the apse by a modification of the composition of its pair of piers.

There is some very awkward vaulting in the aisle beyond the apse in consequence of the wide spread of the chapel piers relatively to the intervals of the apse; but the perspective effect from the choir is very happy, as the clear light of the Lady Chapel is seen at the end, and through the lateral arches of the apse the pier of many members illuminated from the chapel at its side.

In this general plan, then, we have a very exemplary enunciation of the early Gothic principle to give a very distinct and positive expression to every distinct function. It was in this recognition of function that the architects of the time sought and found the source and secret of expression and the varieties of architectural motive; but time had to go on before they acquired the art of economizing emphasis,—of blending and softening transitions, so that contrast should not induce dissociation, nor variety lapse into confusion. The value in architecture, above all other arts, of large breadths of uniformity was recognised at last, and then repose was conciliated by a greater simplicity of design, by uniformity of piers and less gross diversity of those which still demanded prerogative distinction. The sequence of such changes was by no means always in the same direction; in some epochs of architecture the law of well-balanced expression has to fight its way to light through chaotic contrasts; but sometimes its first difficulties lie with the discerning and marshalling of right distinctions. As regards Gothic architecture, some of its worst and most costly failures have been due to tameness resulting from the obscuring, not to say the obliteration, of all character, the reduction of the style to a more scheme for mechanical application of one all-sufficing pattern.

The system of alternated piers, which is here retained in architecture pretty uniformly pointed, had run its course already in the round style; sometimes in dependence, rational enough, on sexpartite vaulting,—or at least quadripartite,—involving the six piers of two pairs of bays; then retained, as at Durham, to divide quadripartite vaults into pairs; or, as at Waltham Abbey, to be divorced from vaulting altogether, and reconcile itself as it might with a timber roof; then weakly asserting itself in alternation of secondary or merely ornamental details, forms of attached side columns,

idle face columns, or sculpture of capitals, and so dying out; but often only dying out locally, while elsewhere it was flourishing; perhaps reviving, if only reviving for a struggle.

One remainder from these primal arrangements, but partly due also to the affection for large central towers, was the retention of very heavy and projecting piers at the crossing. The contraction of the nave opening, the altered proportion of the arch, the interference with the general view, were disadvantages which some architects of these ages manifestly recognised and fought against; but which have left far too deep and wide a mark.

But we are at Sens, and with Sens we must get on. Let us read the criticism of the re-builder of the western bays, as expressed in the changes he made upon the work of his predecessor. Refreshed and restored as the church has been, we may in most cases rely upon deciphering the handwritings. One technical mark of earlier and later work is to be found in the key-stones, which are, by a very unusual practice, solid in most of the older arches, whether of nave, aisle, or triforium, and double—that is, having a joint at the apex of the arches—in the later work.

The general plan of the piers is identical. There are the same number of attached shafts and columns; but differences are introduced both in their details and their relative proportions, under the guidance of the one principle, to relieve harsh contrasts and soften without obliterating gradations.

The original plan of the half-pier towards the nave shows shafts and columns attached or applied, which may be numbered 1, 2, 3, 4, 5, and 6.

No. 1 is the face shaft, bearing the transverse rib, or rather archivolt, of nave vault, and is about equal in diameter to No. 6, which has the like function in the nave arch. The intermediate shafts are inserted in four nooks of the pier, with the salient angles appearing between them. Shafts Nos. 2 and 5 carry the roll-mouldings of the superarches of Nos. 1 and 6 respectively, and are of the same smaller diameter as No. 3, which corresponds with the nook-moulding over the clerestory window. The remaining shaft, No. 3, has the important office of bearing the grand diagonal rib of the sextapartite vaulting; and, while it is smaller than the face shafts, it is considerably larger than the others, and notably than Nos. 2 and 4, which are grouped alongside of it. Moreover, its plinth, instead of being placed with sides parallel to the sides of the re-entering angles, is parallel to a line joining the salient angles,—that is, is turned to face the direction of the rib that it answers to.

Now, in the revised pier the architect first provided for an easier gradation of inequality between the shafts, and this he effected by leaving Nos. 2, 4, and 5 much as before, and reducing the diameters both of the larger face shafts, and also of the diagonal shaft, No. 3, which now approximates, though still with superiority, to the two smaller shafts on either side of it.

The harsh angularity of the salient angles of the pier-core between the circular shafts is next taken in hand, and each angle is not merely taken off, but channelled or fluted, leaving just sufficient arris on either side to give definition to the cylindrical shafts. Only in one case is this varied from, where an open nook is admitted for the manifest purpose of separating adjacent shafts, Nos. 4 and 5, of like diameter, and marking the distinction between the pair pertaining to the nave arch and the more important group owing allegiance to the vault.

In the earlier pier, the re-entering angles of the adjacent plinths met sharply the salient angles of the pier; but they now come opposite the concave flutes. Moreover, the lines of the plinth of diagonal rib shaft are set parallel to those of the others, and the exceptionally acute angles are thus got rid of. The diameter of the shaft being so much reduced, the acknowledgment of the direction of the rib would be harsh and premature here, and was left accordingly to the abacus, which is still at right angles to its direction. In the new bays under the towers, diagonal bases are still retained.

The sudden contrast between the large plinth of the face shaft and the smaller of the adjacent nook shaft is relieved by cutting off the angle of the larger, to such an extent as to give it five equal sides, and even the reduced angles are relieved by short sinkings at top. This change is not extended to the smaller plinths. Future architects pursued the development, and cut off all the right angles of every plinth, and then

came in still more numerically enhanced polygons. Our present architect, however, has more to tell.

In the original pier the toruses of the bases are contained upon the surface of the rectangular plinths, and throw off a leaf or griff, to cover the unoccupied margin at the angle. These would have been superseded at once by the general reduction of the right angles, but a greater change was made, and the angular surface is covered entirely by sash spread being given to the toruses of the bases, as made their circular plan coincident with the plinths at the angles while intermediately they over-sailed. That the angles of the small plinths were still slightly notched or bevelled, betrays the feeling of a still subsisting harshness of contrast between right angle and round, that generated the polygonal base.

Still, again, in the old pier the mouldings of the bases finish against the wall or the sides of the nooks; in the new they are continuous all round the pier, following and bending about nooks, flutes, arrises, and taking up each base in turn.

The profile of the bases is considerably changed, and with the same feeling for more flowing gradation. The earlier type is much nearer to the antique model in the uprightiness of the scotia, which in the new has that deeper and more recumbent section so much affected by the Goths. The lower torus in either case is sufficiently flat, but most so in the later. The upper torus is modified significantly; the convex swell, in fact, takes a concave flexure upwards, and ends with a narrow horizontal ledge or margin, within which descends the sheer profile of the shaft. The upper torus, in fact, becomes what in the defective terminology of the mouldings is usually referred to as a *cyma reversa*, though here upon a very small scale.

The same variation is found in some of the bases of the remarkable *Salle Synodale*, and it intimates one of those silent workings of the architectural conscience which it is a pity should have been less respectfully listened to here by Medieval architects than in some other instances, where they were more alive to the pricks of the monitor, and found so great reward. This is the nearest approach they ever made, and it is but occasional and equivocal to that softening of the transition from vertical shaft to curved and spreading base that the Greek provided for by the scape or apophyge. At St. Germain des Prés, at Paris, the columns have a bold and well-expressed apophyge, torus, and plinth, of proper Tuscan proportions, but we may search long for traces elsewhere of due appreciation of the tradition. The usual Gothic practice is to bring down the profile of the shaft at a hard angle upon the horizontal surface of the base, and the value of the apophyge is as much forgotten or despised as the entasis itself. The apophyge is a member that no doubt enhances care and cost, if duly executed as part of the lowest drum of the shaft, and it must be worked or finished after, or there is great risk of damage, and much more skill and time are required for reducing it in position. Modern constructors of Greek colonnades surmount these difficulties by working the apophyge out of the same stone as the base, and thus cutting it off from the column by a joint,—a vulgarism in architecture of the same type as the employment of the article *on* instead of *a*, to avoid the responsibility of an inconvenient but incumbent asprate. On the shafts of Italian works, touching the verge of the lower empire, works that are uncertainly or equally of *medivæ* or *infimæ Latinitatis*, we often find a rather rough fillet projecting a little above the base, which derives manifestly from the ill-understood and unworked provisions for the apophyge.

We have a little more to say, but must leave it until next week.

## ON BUILDERS' HARDWARE.

### DOOR FURNITURE.

A QUESTION is just now engaging the attention of the hardware manufacturers of Birmingham and South Staffordshire, of considerable interest and importance to the building trade of the country. We refer to the application of fine art to the manufacturing industry of that district, and more especially to the articles known familiarly as "builders' hardware."

There can be no dispute as to the necessity of

an improvement in this direction, as regards the majority of articles included in the term just quoted. Owing partly to the introduction of machinery, partly to the division of labour system, and partly to the rage for cheap goods, most of the brass and iron ware used in the construction of modern buildings, is of such a character as to be in many cases positive eye-sores, and blurs upon the otherwise pleasing aspect of the edifice.

Improvements in architectural design are everywhere visible, both as regards outward elevation and internal ornament and finish; but in the case of many of the hardware fixtures, without which the most splendid edifice would be incomplete, little or no regard has been paid to decorative art; and, in fact, some instances might be quoted in which the articles now made are much inferior in this respect to those of the last century. They are, moreover, bad in manufacture.

We propose in the present paper to refer more particularly to door furniture, including locks, bolts, and hinges, which will present a striking confirmation of the statement just made.

An architect or a builder in quest of locks usually has to choose between the square box-shaped article, which is a blemish upon a well-decorated door, or the mortise lock, which modestly hides itself inside the panel, leaving nothing but the keyhole visible. Both these are open to objection; the former for its ugliness, and the latter because it weakens and partially destroys the door. *Dead* locks are common enough, but why should locks be *buried* in our doors? Why should they not rather assist the decorator in the completion of his design? Four qualifications are of course necessary in all such articles, viz., utility, durability, economy, and beauty, each of which should be given in due proportion, none encroaching on the domain of the other. But in the case of locks, the fourth quality is altogether ignored. We do not argue for anything incongruous or out of character. We have heard of coal vases in the shape of dogs and elephants, the backs of which were made to open as lids, and the same articles are made with artistic representations of cathedrals and lay-fields. All this is absurd. We want an object of utility properly decorated.

The knobs, finger-plates, and other furniture connected with locks, are somewhat better as regards decoration than the locks themselves. In this case, however, there is a leaning on the part of builders towards the plain brass knob, or the antiquated ring of the same material, tasteful articles in rosewood, ebony, bronze, and china, being seldom purchased except for houses of the first class. Bolts and hinges are proverbially devoid of graceful shape. In most cases the former are stowed in some unseen part of the door, and the latter are usually hidden under successive coats of paint. Yet each of these articles is capable of being rendered pleasing to the eye, without losing its practical strength and usefulness.

Now, the question arises, who is to blame for this condition of affairs, and to whom are we to look for a remedy?

To some extent, of course, the locksmiths must plead "Guilty." Year after year the same stereotyped patterns are supplied to the factors and merchants, and thence distributed among the consumers, who, it may be said, having so limited a choice of selection, can hardly bring about any improvement in the matter. The real truth is, however, that the builders of this country are mostly in fault, and with them rests the duty of taking the initiative. A demand for more artistic workmanship would at once produce a supply, for the district in which locks are principally made—the Black Country—has some of the most skilled art-workmen in the kingdom. We have conversed with manufacturers upon the subject, who tell us that they have repeatedly introduced ornamental locks, bolts, and hinges, at considerable expense, but without the least success. Before us lies a sheet of engraving, representing French door furniture, and the contrast between that and English ware is certainly striking. Scrolls, chasing, and bead-work, give to the articles a pleasing appearance, such as would not disgrace a home of taste.

Another feature in connexion with door furniture, which claims a passing remark in these "notes," is the want of durability. It is proverbial almost, that locks, knobs, bolts, and hinges have a remarkable aptitude for getting out of order. Locks that require the door to be slammed before they will catch, knobs that become loose and turn round, bolts that will not

slide, and hinges that creak, are among the domestic trials common to the lot of all. For this the entire blame rests with the building trade. The cry is, "something cheap," and in order to satisfy the craving, the makers have been compelled to reduce the strength of material, cut down the artisans' wages to the finest point, and produce articles devoid alike of ornament or strength. Any one who has visited the lockmaking shops at Willenhall, where more wretched locks are produced than at any other town in these remarks, will be satisfied as to the truth of the country as low as 7s. 6d. per dozen, including staples. Dead locks are sold as low as 5s. per dozen, and mortice and drawback in like proportion. These qualities are chiefly made for contract work, the purchaser being satisfied if they will just keep in order until the architect's certificate has been obtained. Such a state of affairs is, however, most unsatisfactory. The maker cannot do himself credit, and the artisan has to labour thirteen weary hours per day to earn a scanty pittance. The people who practise such deceits, who lie in iron and brass, should be whipped at the cart's tail. As regards economy, of course such articles are in the end the dearest that can be had. Their average duration is certainly not more than one-fifth of that of a lock double the price. If specifications, contained a description of the locks required, such as "solid ward," "round rim," "bushed key and follower," or (in better class build-ings), "levered" on the principles of Barron, Branch, Chubb, or some other maker of repute, much dissatisfaction would be prevented, and the locks would be alike creditable to the maker and the builder.

It would scarcely be believed that the competition in the ordinary brass-knob trade has rendered those articles almost worthless. The bowl of the knob is not even soldered into the neck, being merely twisted in, by pressure, and there is nothing to prevent it becoming loose after a little wear. The weight of metal has been reduced to a minimum, and the thickness does not exceed that of ordinary cardboard. The necessity for thus destroying the durability of these articles, by paring down the expense of their production, is evident from the fact that the original net prices are now subject to a discount of not less than 65 per cent.

Architects who prefer brass knobs might prevent such articles being affixed as those we have described, by specifying that the knobs should be of cast brass, entire, which, although double cost, are in the long-run the cheapest knobs made. The brass knobs made twenty years ago were, on the average, double the weight and strength of those now in use. The substitution of wood or china knobs for brass is on the increase, as regards superior buildings. Finger-plates, with neat gold borders, are also becoming more general for reception-room doors.

Bolts and hinges have in like manner lost much of their former strength and comeliness in the competition for lowness of price. The original price of iron tower bolts was 1d. per inch net, from which, however, a discount is now taken of 75 per cent., and the price of hinges has been proportionately reduced. Of course, much of this is due to the increased facilities of production; but a portion of it represents the diminution in the strength and durability of the article.

Door furniture is usually regarded by architects and builders as a matter of such trifling detail as scarcely to require notice. In reality, however, it is an important feature in the finishing process of a structure, however imposing in architectural design, or however small and insignificant; and to neglect these minor matters is like "spoiling the ship for an ounce of tar."

We refer to these things because just now the subject is exciting some interest among the producers of these articles in the midland district, and it only requires the co-operation of the architects and builders of the country to ensure a speedy reformation.

In concluding our remarks on door furniture, we may just allude to an improved lock which has been brought under our notice. It is made either as a rim or mortice, and is adapted for both right and left hand doors. All hindlers know from experience, how much trouble is often caused by having locks for the opposite hand required by the doors for which they are intended. By a very simple arrangement this is quite obviated, the latch-bolt has a smoother action, and additional strength is imparted to the fore part of the lock. The inventors are

Messrs. Carpenter & Co., of Willenhall, and the article is known as the "double-handed lock."

The demand this season for locks, latches, bolts, and hinges for the country trade is quite up to the average. English builders always prefer the horizontal movement in the latch bolt of rim and mortice locks; but abroad, the perpendicular action is preferred, so that the home and export branches of the trade are quite distinct. No alteration in the price of locks is likely to take place this winter; but in bolts and hinges an advance is not improvable. In the pottery district of North Staffordshire, the inquiries for porcelain and China lock furniture are more than usually brisk this season, many of the workpeople being obliged to remain beyond the usual hours to keep pace with the demand.

#### THE PREVENTION OF STRIKES.\*

The inquiry into means of averting the now-impending strikes, and constituting in permanency a substitute for the "armed struggle" that has been the ordinary state of the relation of capital and labour to one another, has led us through the discussion of different courses to be taken, and institutions to be set on foot, to a conclusion in favour of an increased establishment of the two forms of association wherein the workman participates in profits, or beyond the wages that he receives for his labour. We have distinctly shown that for every character of man in the working-classes, it would be unsafe to say that either form of association would be suitable, at least for some time to come; but, on the other hand, facts have left us no room to doubt that associations of workmen amongst themselves, and partnerships between masters and their men, would answer commercially, and might prevent a considerable number of strikes even in the concerns left existing under the old relations of master and servant. The conclusions, however, were not ours, so much as those of writers, at once eminent as political economists, and friends to the working-classes, whilst sufficiently removed from what has been called *working-man worship*. It may take some time to convince a large number of masters that their interests would be served by turning their concerns into companies, with limited liability for their workmen; efforts now being made, may not immediately secure the confidence of the men,—as we regret to hear is the case in the instance of the company of Messrs. Briggs, which we have spoken of, for working their collieries near Normanton, in Yorkshire; but the difficulties are only such as are found attendant upon all social changes. From France, every week seems to bring us some fresh publication of opinion, and some addition to the evidence that is tending to the conclusion in favour of co-operative association as the true remedy for the evil of strikes. We have mentioned one journal of the movement: another is announced for appearance on the 15th of this month. It is to be called *La Mutualité*. The French writers claim the liberty of meeting, as essential for the complete realization of results; but as we in England have that liberty, we may take their testimony as favourable to the probability of successful issue of association on this side the Channel.

The recent strikes in France have come to pass notwithstanding the existence of *Conseils des Prud'hommes*. Different explanations are given of the circumstance. One of them is that the strikes have taken place almost entirely in those trades or callings which are not regulated by such councils; and that the occurrences were only the natural reaction, allowed by the new law as to *conditions*, from the previous repression,—an idea that has already been adverted to by us. However, taken collectively, facts are neither opposed to an opinion of the value of Councils of Conciliation, nor conclusive of their entire sufficiency. The proportion of cases which the *Conseils des Prud'hommes* fail to settle without the courts of law, would appear to vary very greatly; still, at all times it is extremely small. But, many callings, indeed the great majority, in which there are the relations of master and servant, must always remain unrepresented in such councils as those of the public character, which there are in France; and where the dispute arises in a trade that is properly represented, the facility with which disputes may be taken before the councils, must be attended with a certain

inconvenience. The writers we refer to, are those who may be reasonably supposed alive to all that there is of value in the *Conseils*; and they it is who have the most to say in praise of the measure which the Emperor has taken in the appointment of the commission of inquiry into the facts connected with co-operative associations.

Without precluding ourselves from a return to these views, corroborative of our own, we proceed to our promised particulars of the partnership-association that has been mentioned so often in our previous articles. It will be recollected that M. Leclaire succeeded at the end of 1841 in forming the first association between himself and his workmen, following upon the formation of a Provident and Mutual Aid Society. That partnership continued according to his original intention, from 1842 to 1863, with the fortunate results of which we have given some idea; and in the course of those years, M. Leclaire was not inactive in the suggestion of means for the diminution of misery, as our last article has shown. In 1863, the twenty years, or more, of success, induced him to think that the establishment might be made to exist after he had passed from the scene of his labours, and on the original basis. He therefore procured the approval of the Provident Society, in conformity with a decree which bore the date of March 26th, 1862. The approbation was given by the Minister of the Interior, on the 27th of July, 1863; and on the 29th of August, M. Leclaire was, by a distinct Imperial decree, named president. The Society had been originally authorized by the Minister of the Interior, in 1838.

Before getting the approbation in 1863, the statutes of the Provident Society were remodelled, principally with a view to the Society's being constituted a partner in the establishment of Leclaire & Company. On the 29th of September in the same year, 1863, by an "*Acte de Société*," or deed of partnership, passed before a certain notary and his colleague, of Paris, a partnership was formed, for fifty years, between Messrs. Leclaire & Defournaux and the Provident and Mutual Aid Society of the Workmen and *Employés* of the *Maison Leclaire*, with the object of carrying out the undertaking of work in house-painting, gilding, paper-hanging, glazing, and the manufacture of mirrors.\* On this occasion, M. Leclaire appeared in his own name and also as the president of the Society.

The "*Acte*," or deed, sets forth that the establishment of M. Leclaire, founded in 1826, had from 1842 been organized on philanthropic principles, having for the object the participation by the *employés* and workmen (who, by various claims might be judged worthy), in the profits of the enterprise; that the results of ten years' experience having been favourable, M. Leclaire had, in 1852, joined with himself many associates animated with ideas like his own, and pledged to continue his work; that in 1857, one of the partners retired from ill health, and six years afterwards another; and that that partnership was dissolved from the 1st of July, 1863. It then mentions the resolve of Messrs. Leclaire & Defournaux to form a new association; and to admit, from the February following the date of the "*Acte*," the Mutual Aid Society of the "*Maison Leclaire*" to participate in the profits, in place of the former partner. The postponement to the following February, of the acquisition of partnership-rights by the Society, was made for reasons which it is not necessary to enter upon; the interval is however made subject, in the "*Acte*," to conditions. After these, the terms of the convention are recited in seven chapters, containing in all thirty-one "*articles*." The chapters relate to the Creation of the Partnership, the combined Fund and Contributions; the Administration and the Duties of the *Associés*; the Books, the Mode of Payment of those supplying goods, and the Balance-sheet; the Division of Profits; the Responsibility of the principal *Employés*, and Security to be given by them; and the case of Retirement of one of the Partners, the Dissolution, and the Liquidation of Debts.

In looking through this "*Acte de Société*," it is apparent, were it not before known, how minute must be the provisions for accidents, and

\* "*Maison Leclaire et Co.*, Rue St. Georges, 11, au Coin de la Rue de la Victoire, 35. Entreprise de Peinture, Dorure, Tenture, et Vitrierie. *Acte de Société* passé par-devant Me. LeClaire de Saint-Maur et Son Collègue, Notaires à Paris, le 29 Septembre, 1863. Paris, Imprimerie de Madame Veuve Bouchard-Luzard, Rue de l'Éperon, 5, 1863." 8vo., pp. 27.

\* See pp. 737, 758, 774, *ante*.

for different states in the existence, of such a form of association; and any one about to commence the formation of similar associations in this country, might advantageously study the Articles. But the importance of the Provident and Mutual Aid Society in the association, and integrally, must not be forgotten. This Society has its own rules; which appear to be very carefully drawn up.\*

The regulations of the workshops are equally important to the accomplishment of the objects of the partnership; and they contain matter of particular value for the improvement of painters' work.† The Society has a library, of which the regulations and catalogue form the matter of another pamphlet.‡ There is yet another feature of the establishment deserving mention and imitation. There are special courses of lectures for those belonging to the establishment, on *hygiene*, painters' work, gilding, paperhanging, glazing, measuring, and the keeping of accounts. These lectures were commenced only on the 29th of January last. The inauguration on that day is the subject of a special report.§

From the articles of the "Acte de Société," or deed of partnership, we learn that the "Maison Leclaire," called by M. Leclaire in his report of June last, to his clients, already referred to, a partnership "en commandite," is more exactly to be described as of that character only as regards one of the three partners, namely the Provident Society. But this latter society being formed of the *employés* and workmen of the establishment, with M. Leclaire himself at the head, each one of these individuals participates in the share. For exact information of the position of each member of the establishment, therefore, the rules of that society, which have for their object merely providence and mutual aid, require to be examined. In the partnership-association, or "Maison Leclaire," the Society is a simple *commanditaire*, or "sleeping partner," receiving advantages, but not interfering with management. It is represented by its president, M. Leclaire. Between M. Leclaire and M. Defournaux (called "Les Associés," throughout the "Acte"), the partnership is of the ordinary kind, "en nom collectif." The partnership is not to be dissolved by death or withdrawal of either of the parties, but is to continue for the fifty years from the 15th of February, 1864. The head-quarters of the establishment, and the warehouses, are designated exactly where situate; and the style and signature of the concern, as under present circumstances, are given; as are also those of the concern as in the future. Eventually, in place of "Leclaire et Cie," there would be the name of "Leclaire and Co.," there would be the name of the oldest partner prefixed to the word *Compagnie*; which latter would always be followed by the words *d'Ancienne Maison Leclaire*.

The capital of the concern is formed of three equal sums, making in all 300,000 francs; that is to say, M. Leclaire contributes 100,000 francs, M. Defournaux a like sum, and the Provident Society, the like. The amount of the Society's contribution has been handed in by M. Leclaire in the Society's name, partly with the Society's own moneys, and the rest with his private funds. These latter he is to reimburse himself from the Society's share of profits as accruing. The contribution of the other two partners ("Les Associés") is made in merchandise, materials existing, and amounts of debts owing to them. We

have not come upon any provision for valuation of these materials and debts. This would seem to be essential in any future case. As regards the "clientèle,"—that is, connexion, or "good will,"—it is stated that no value is set thereon, but that the contribution of it is made gratuitously, and that the property in it will be reserved to the Provident Society,—since that, many persons having interested themselves in the benevolent object of M. Leclaire, and having given him their countenance only in view of the annual partition between himself and his workmen, he would have shown ingratitude in drawing any private advantage from this element of property. Each contribution of 100,000 francs is to produce interest at 5 per cent. (per annum, it would seem), payable on the 15th of February and 15th of August in each year. Each of the three partners has an account with the concern. The balance due to each is to be paid over, as soon as the concern may have the means, in the following manner:—1. The claim of the Provident Society is to be paid before both the others, and by preference. 2. The accounts of the other two partners will be paid in proportion with their importance, and as fast as the means come in. A reserve fund of 100,000 francs is to be formed, by taking annually 20 per cent. of the profits. This fund is to cover losses, and to complete the capital in case of its having been abstracted. In any case, the reserve is to be entered upon only so much as comes to 50,000 francs; and with the following year, restitution of the sum is to commence on the system of the original formation.

The next subject is the management. As to this element of success, it used to be contended in England, by many heads of establishments, that the thing would be irreconcilable with a system of participation by workmen in profits. The articles of the third chapter of the "Acte" before us, first set forth that the partners *en nom collectif*, that is "Les Associés" (Messrs. Leclaire and Defournaux) are to be the managers (*gérants*) and responsible. They undertake to devote all their time and intelligence to the greatest advantage of the enterprise. M. Leclaire preserves the chief direction and control. After his retirement, M. Defournaux will occupy his place; and after him, the direction will belong to the oldest partner. It is distinctly set down that the members or delegates of the Provident Society are not to intermeddle in the management, or even in the superintendence-work of the commercial establishment. The article says,—

"Separately or conjointly, they will not have any justification to demand, not any criticism, verification, or observation to make: they will be bound to be considered as strangers to the commercial association, in order not to injure the relations that ought to exist between masters and workmen."

Each of the two chief partners may use the signature of the firm; but it is expressly forbidden to each to sign notes or engagements that would furnish the groundwork of any action against the concern; and with this view, it is agreed that all materials and articles purchased shall be paid for in three months from the delivery. Next come the regulations for the subordinate of the management, the clerks and foremen. It being first observed that there would be advantage in the residence of one of the two chief partners at head-quarters, the article says that, in any case, one of the principal *employés* should there reside at the expense of the concern. An amount to be allowed to him is stated as not to exceed 1,000 francs. The person is empowered to carry into effect the matters agreed on between the two chief partners: he is to open letters in their absence; and to see persons who may call, out of the regular hours of business. A following article enjoins on the two chiefs, daily conference as to works in hand, or to be done, and also enjoins adherence to the rules and a note of the original concern. M. Leclaire adds a passage on the importance of unity in the direction, and in deprecation of hasty change by any of his successors, from the rules which he had established. Each of the chiefs is allowed for his trouble in management, the sum of 6,000 francs (240*l.*) per year, the payments being made monthly and carried to the account of the general expenses. The principal *employés* are to be paid monthly, at the rate of 4,000 francs (160*l.*) a year. Before this remuneration can be given them, they must be possessed of qualifications that are mentioned in a subsequent article. Another article relates to the cash, and to the manner of drawing money from the bankers of the society.

Next, there are minute particulars as to the

account-keeping and books. To facilitate the asking up the balance-sheet, firstly all the sums due by the concern are to be paid, and the property is all to be repaired and made good, and the expenses discharged, or allowed for as to be paid with the least delay. Then in each year, and on the 15th of February, a balance-sheet of the assets and liabilities is to be made up, the estimation of assets being made on a method which is minutely prescribed.

The division of profits is to be in the following manner. Twenty per cent. of the profits will first be taken to form the reserve,—unless where the 100,000 francs, its intended maximum, shall have been already reached. The remainder of the profits will then be divided thus. A fourth will belong to each of the two chief partners. The half then left, will go, two-fifths of it to the Provident Society, and three-fifths of it amongst the *employés* and workmen who may have rendered themselves worthy of the favour,—the proportions of the shares to be determined by the two chiefs. If from particular reasons, which they reserve to themselves the exclusive appreciation of, the chiefs (*Associés*) should not deem fitting to distribute the three-fifths just now mentioned, and even should the same position be reproduced several times, the portion not so shared between the *employés* and workmen, is to belong to the Provident Society; and under no pretext are the two chiefs to get a share of the profits greater than the 50 per cent. allotted to them as previously explained. The shares pertaining to the *employés* and men, will be given to them when the balance-sheet is closed, subject only to an exception which will be mentioned; and the two-fifths share of the Provident Society will be carried to the account of M. Leclaire, till his advances have been reimbursed; this reimbursement effected, the Society will receive the share belonging to it; only that excepting when there is no cash immediately available, the amount of the share will be carried to its account. As for the profits coming to each of the chiefs, they will be handed to them only when there shall be disposable funds, and after the receipt by the Provident Society of its profits; in the opposite case, these profits will be carried to their account, and they will receive them only as there may be the funds. The principal *employés* to whom may have been accorded a share in the three-fifths of the profits as before mentioned, will receive such share only after the expiration of four years. Their sum of each year, during these four years, will remain in the concern in the form of a current account, but with a special affectation of warranty for the management of the *employés*, that is to say, as security or pledge, conformably with the article 2,073 of the Code Napoléon; but the interest of these sums, at 5 per cent. will be paid to the *employés*. Should the *employé* quit the concern, the amount of his account is to remain with Messrs. Leclaire & Co. during four years afterwards. The *employé* is to share in the year's profit only up to the day of his departure. The *employés* may leave the concern without notice; and Messrs. Leclaire retain the right to get rid of them similarly.

The only Articles remaining to be noticed, relate to the case of withdrawal of one of the partners from the concern, to dissolution, and to liquidation. Each of the two chiefs has the right to retire when he pleases. In case of disagreement, or from any other motive, one of these two parties can be required by the other and by the president of the Provident Society,—these latter together agreeing,—to give his resignation. In both cases, the retirement may be immediate, and without notice from one side or the other. The contracting parties, to prevent all kinds of disputes, have decided that whatever the cause of the retirement, or the period of the year, the retiring one of the two chiefs shall not have any right over the funds in reserve, or over the profits of the current year; but that his 6,000 francs of the year shall be all given to him, and that a sum of 6,000 francs beyond, shall be given; but he will have to defray all registration-dues, and like expenses resulting from or entailed by the change. The original contribution of the partner, and the sums that would be carried to his share-account in the profits, will be reimbursed him from year to year in sixths. Interest, at 5 per cent., of sums remaining due to him, will be paid. The reimbursement will be made by the outgoing partner's successor; and the Provident Society may help the latter. Neither of the two chief partners is to cede his rights to any one. A retired partner is not to exercise the same calling in the Depart-

Médaille commémorative de l'approbation de la Société de Secours Mutuels.

Compte Rendu de l'Inauguration des Cours Spéciaux pour les Ouvriers et Employés de la Maison Leclaire et Co. Paris: Imprimerie de Madame Veuve Bouchard-Hazard, Rue de l'Éperon, 5. 1865." 8vo., pp. 35.

ment of the Seine. The concern will not be dissolved by the death, or the forced or voluntary retreat of one of the chiefs; who in every case is to be replaced within three months following the death or resignation. The successor must be approved of by the other chief, and by the president of the Provident Society; and he must possess knowledge of house-painting and its measurement—so as to be able to make out a bill of painting and gilding, and to make an estimate from a design,—also of the keeping of the books and instructions having relation to the conduct of the business; and finally it will be necessary that he should know in some degree how to draw. The partners replacing Messrs. Leclaire and Deformaux are to have all powers to continue, rule, and liquidate the operations previously commenced; and they will be subjected to the rights and obligations of these latter.

Arrived at the period of fifty years, the concern is to be continued, if possible, on the same conditions as before. But, in the event of dissolution, from whatever cause, the Provident Society will make without indemnity,—1. The "clients," goodwill, or concession; 2. The material, whatever the value, and whether it may have been entirely redeemed or not; and 3, in case the president of the Society should judge it advantageous, the leases, lettings, and bills of sale, if any, of premises and warehouses belonging to the commercial association. The Provident Society will be allowed to dispose of all such matters, or to reform the commercial association. There are other Articles relating to the same matter; but we need only mention as amongst them, one concerning the 100,000 francs reserve. The sum is to be handed over to the Société du Prince Impérial, or to the charitable establishments founded by the present Emperor and Empress of the French.

In his report of June last, M. Leclaire mentions that prior to the "Acte" of 1863, the affairs of his establishment went on much as they are going now, or to profit of the Provident Society,—the only difference being that what was coming in to the Society was placed in reserve by him. But the deed of partnership has allowed the Society to enter into possession of its property; so that, as he says, this year the Society has in the French "Rentés," in deposit in the "Caisse des Retraites," and in the partnership, so much that it is at the head of a capital of 194,810 francs 4 centimes; which is over 7,792. This is a small amount possibly, as compared with what is possessed by each one of several benefit societies in England, that could be named; but it represents the savings of the workmen in but one concern. The reader of our previous articles referring, more especially, to the organization of the partnership, and of the Provident Society, as they respectively existed before 1863, has perceived some of the good effects that were produced in the entire prevention of strikes in the establishment of M. Leclaire (whilst the period was most prolific of disorder), and in the marked elevation of the character of the workmen. We have as yet said nothing of the good done by the Provident Society itself in the direction of its special aims, or little more than would have been known to our readers of the advantages capable of being conferred by such a society. We may however return to the regulations of this society as they exist, and to some statement of what it has effected in conjunction with the partnership association of the "Maison Leclaire." Our main object however, in another article, will be to complete M. Leclaire's details of the position, this year, of his at once composite and harmoniously-working enterprise, and to gather from the printed regulations of his workshops, and from the report of the inauguration of the courses of lectures, such particulars as we can, and that would be suggestive of measures on the part of those English masters, who have a proper regard for those whom they employ, who would effect the so much-needed improvement in quality of work, and who see with us at last, the main direction where to look for means of "the Prevention of Strikes."

**N.W. TOWN-HALL at MANCHESTER.**—The much-expected question of a site for the new town-hall at Manchester was on Wednesday set at rest, after a long debate, by a resolution empowering the town-clerk to give the usual Parliamentary notices for powers to take the town's yard and such properties as may be required in Albert-square.

#### MR. GLADSTONE ON GREEK ART.

The Chancellor of the Exchequer, in the course of his recent remarkable address to the University of Edinburgh, said,—“I venture to suggest that the anthropomorphic spirit of the Greek religion was the source of that excellence in art which has become to after ages a model for imitation and a tribunal without appeal. All are aware that the Greek religion was eminently poetical, for it fulfilled in the most striking manner that condition which poetry above all requires,—harmony in the relation between the worlds of soul and sense. Every river, fountain, grove, and hill were associated with the heart and imagination of the Greek; subject, however, always to the condition that they should appear as ruled by a presiding spirit, and that that spirit should be impersonated in the human shape. A poetical religion must, it seems, be favourable to art. The beauty of form which so much abounded in the country was also favourable to art. The Athenians, however, are stated not to have been beautiful; and at Sparta, where art was neglected, beauty was immensely prized. And, indeed, the personal beauty of a race is by no means usually found sufficient to produce the development of the fine arts; and as to the poetry of religion and its bearing upon art, while a general connexion may be admitted, it is very difficult to define the manner and degree. The practice of image-worship promotes the production of works, first rude and coarse, then more or less vulgar and tawdry. Over the whole continent of Europe there is scarcely at this moment an object of popular veneration which is worthy to be called a work of art. Of the finest remaining works of Greek art not very many, I imagine, bear the mark of having been intended for worship. The great size required for statues like the *Athena of the Parthenon* and the *Zeus of Olympia* seems unfavourable to the exhibition of fine art in the highest sense. In Pansania we find notices of an immense number of statues in and about the temples; they are not commonly, I think, praised for excellence in this respect, and the mixture of materials, to which we find constant reference, could hardly have been chosen by the artist for the sake of his own proper purpose. I have heard Lord Macaulay give his opinion that this mixture in the *Zeus of Phidias at Olympia*, made of ivory and gold, simple as was that form of combination, may probably have been due to the necessity of condescension to the popular taste in connexion with an object of worship. Although, therefore, the highest artists were employed, it does not appear probable that they derived any part of their higher inspiration from the fervour or the multitude of the worshippers in the temples. That many accessories contributed to the wonderful result I do not doubt. But, mainly and essentially, every art and method, every device and habit, in the language of Aristotle, has an end, and is modelled upon the end, at which it aims; and by that end its greatness or its littleness is measured. Now, the climax of all art, it seems to be agreed, is the rendering of the human form. What, then, could be so calculated to raise this representation to the acme of its excellence, as the belief that the human form was not only the tabernacle, but the original and proper shape, the inseparable attribute, of Deity itself? In the quaint language of George Herbert,—

“He that aims the moon  
Shoots higher much, than he that means a tree.”

And again, as Teunison has sung,—

“It was my duty to have loved the highest;  
We needs must love the lowest when we see it,  
Not Lancelot, nor another.”

It was this perpetual presentation of the highest to the mind of the Greek artist that cheered him and rewarded him; and yet, while it cheered him and rewarded him, still ever spurred him on in his pursuit. Whatever he had done, more remained to do,

“Nil actum reputans dum quid superesset agendum.”

The desire of ambition was fulfilled, he had always more worlds to conquer. The divine was made familiar to him, by correspondence of shape; but on the other side, its elements, which it was his business to draw forth and indicate to men, reached far away into the infinite. And I know not what true definition there is for any age or people of the highest excellence in any kind, unless it be perpetual effort upwards in pursuit of an object higher than ourselves, higher than our works, higher even than our hopes, yet beckoning us on from hour to

hour, and always permitting us to apprehend in part. I venture, then, to propound for consideration the opinion, that the fundamental cause of the transcendent excellence of the Greek artist lay in his being, by his birth and the tradition of his people, as well as with every favouring accessory both in idea and in form, and in such a sense as no other artist was, a worker upon deity, conceived as residing in the human form. It is hardly necessary to observe how the rich and many-sided composition of the Greek mythology favoured the artist in his work by answering to the many-sided development of the mind and life of man. Unconsciously then to himself, and in a sphere of almost parochial narrowness, the Greek not only earned himself an immortal fame, but was equipping from age to age a great school of art, to furnish principles and models made ready to the hand of that purer and higher civilization which was to be, and over the preparation of which, all the while, Divine Providence was brooding, like the Spirit on the face of the waters, till the fitness of the time should come.”

#### MR. GLADSTONE AND GREEK ART.

In the present chaotic confusion in which all matters relating to art are, it must be a matter of no small interest to catch a glimpse of the opinions and fancies not only of professed artists, the producers of art-works, but as well—and perhaps it is the more important of the two—the opinions and fancies of non-professionals,—the public; and, above, all of those whose social position and vast acquisitions place them so far above their fellow men. Mr. Gladstone is one of these fortunate people; and we ought, therefore, to be not a little thankful to him, as representative of a class, for going out of his public way and telling us what he thinks of art,—always, it is to be feared, to the public and business man and political economist a childish trifle, worth little more than a compassionate and passing look. Mr. Gladstone has thought over and studied this, to him, trifling matter, and treats it seriously, solemnly, and religiously. Will you, therefore, in consideration of its interest, add once more to past favours, and allow me a few words on it? If Mr. Gladstone be right in all he says, then is he the great art-teacher of his time. If he be wrong, then certainly it is he who stands in need of art-instruction and elementary and primitive school teaching.

Mr. Gladstone's address to the students of the Edinburgh University fills seven columns of the leading journal, and took two hours and a half to deliver; so that in the narrow compass which I can now ask you for, I can preface nothing, but must come at once, though very unwillingly, to his first proposition and art-dogma, though, as he says, “*volumes* might be written with profit to trace the application of the principles touched upon in this address to modern civilization, and even then more would remain to be said than had been said.” Mr. Gladstone's proposition is this:—“I venture to suggest that the anthropomorphic spirit of the Greek religion was the source of that excellence in art which has become to after-ages a model for imitation and a tribunal without appeal.” And again, “I venture, then, to propound for consideration the opinion that the fundamental cause of the transcendent excellence of the Greek artist lay in his being, by his birth and the tradition of his people, as well as with every favouring accessory, both in idea and in form, and in such a sense as no other artist was, a worker upon deity conceived as residing in the human form.” This is Mr. Gladstone's Greek art proposition, got from the positive study of Homer, the negative study of the Bible;—for of the Jew, he tells us,—“though always ready to worship the serpent or the golden calf,—his idolatry never was anthropomorphic. The majesty of deity was thus in the belief of the Hebrew race effectually apart from that one form of lowering association which was by far the subtlest, the most attractive, and the most enchainingly;” and from his determined and most positive refusal to look at the *actual remains* of Greek art itself. This it is that must justify me in saying simply that these propositions, and all that this learned person has founded on them, have no existence whatever in fact, as to be seen in the *works themselves*, and are, moreover, the direct and absolute reverse of the truth. In contradistinction to Mr. Gladstone's theory, I venture to suggest that the anthropomorphic spirit of the Greek religion

had nothing whatever to do directly with that excellence in art, to be seen and found in the actual remains of it, but that it all came of natural taste, wonderful powers of observation, and executive power never surpassed in the artist who executed the work,—the combined result of his fact-observing mind and self-executive hand. I undertake, therefore, to destroy Mr. Gladstone's theory of Greek art in the mind of any reader, and even in Mr. Gladstone's own, if they, or he, will condescend to go to the British Museum, and look at the marbles themselves, but not otherwise. I must confine myself to one particular series for this, and trust a little to the reader's powers of observation and careful study; for to accomplish this work thoroughly is impossible in a few lines.

The celebrated frieze, the triumph of Greek sculptural art, and hand-writing in stone, represents, as is well known, the procession, celebrated every fifth year, in honour of Minerva, the deified goddess of Athens. It completely surrounded the inner wall of the temple, behind the outer surrounding columns. The British Museum possesses about one-half of this, *i.e.*, the original unrestored work, so that we cannot be deceived. The reader must bear in mind that this sculpture is connected one figure or group after another, and shows us the whole order of the procession, for the simple purpose of carrying in great state the *Peplus*, or sacred veil, to be suspended before the statue of the goddess within the temple. It would take too long to catalogue these wonderful figures: it is sufficient to say that every and all the minute details of the procession and sacrifice are shown, the instruments used, and the victims. Nothing but careful looking at can realise this. Greek art is well nigh forgotten now-a-days, so that we must remind the reader also that this procession marched twice round the Acropolis on which the temple stood, and passing through the propylæa, or acropolis gateway, found itself, not in front of the temple, but immediately opposite its north-west angle, thus to see it at the greatest possible advantage, *viz.*, angularly. When near to the platform on which the temple stood, the procession *divided*,—it is important to note this,—one part passing by the north side, and the other passing by the south side, and meeting again at the real front of the temple, the east end; that portion of it bearing the *peplus* doubtless entering the temple where were in all probability those who were appointed to receive it. If the reader will, after looking at the marbles, try to *realise* this procession, he will have no sort of difficulty in doing so; for it is a perfect and literal rendering of it, and, indeed, simple copy of it. "The meanest man can copy." Among these was Thidias, the chief sculptor of this stone manuscript. So *literal* is this copy that the very dividing of the procession is shown at one of the angles, both meeting, as did the procession itself, at the middle of the east end, immediately over the doorway. It will add to clearness to note that, from No. 17 to No. 25, as figured in the museum, all are from the east front, No. 19 being the centre panel. The magnificent seated figures, six on one side and two on the other,—the remaining four being lost,—are considered by the learned and spiritual to represent gods and goddesses, as Jupiter and Juno, Castor and Pollux, and so on; but, if the reader will look at slab 18 more especially, he will see that figures leaning familiarly on each others' shoulders, talking together, and even one of them in the act of hugging his knee, are not likely to have been the gods as conceived by the mind of a Greek, or even by Mr. Gladstone, but are of those privileged few who had seats either in the temple or on either side of the outer platform on which it stood. They simply waited for and received the procession, and perhaps, as slab 18, were the sacrificing priests and soothsayers.

The learning that has been brought to bear on these figures is wonderful and deep, past finding out, but quite thrown away. It would fill a volume. But I am not now trying to prove this, but to show how entirely all this great work, the triumph of Greek art, is not *imaginative*, but *realistic*; not *deified*, but *human*. It is all simply the *copying* in stone of a real and actual occurrence, and not the coining of the brain or the result of invention. Neither is it, nor can it have been, brought into existence by "a sense, such as no other artists ever had, of being workers upon deity conceived as residing in the human form," and for the additional purpose of "furnishing principles and models made ready to the hand of that purer and higher

civilization which was to be," and, we must suppose, now is; but where, Mr. Gladstone should have told us. It is simple copyism, at once instantaneous in the mental impression received from the object itself, consummate powers of drawing and stone-cutting, and the fact—the certain fact—so unlike the work of the modern sculptor, that the artist himself, *with his own hand, wrote on the stone surface*. Seeing all this, what a pity it is that this thoughtful chancellor, timidly speculative in spite of himself, did not first "open his eyes and see." Thus of Greek art Mr. Gladstone knows nothing whatever: he has not yet looked at it; but what a tremendous superstructure of theory and *art practice* has he not built up on it. And this is its art interest, no less than this,—that no artist can ever hope to approach, even at a distance, the might of the Greek work, unless he be impregnated with the idea that the human figure he is trying to copy is *deified*, whatever may be the occupation or action of it; and the same it may be presumed applying equally to the horses and cattle which may be moving along with them; for the victims and horses are as magnificent in form and action as the human figures.

It will be obviously impossible to notice, even by name, the many art thoughts Mr. Gladstone has opened up in this learned address; but one other theory he has built up on his "Greek anthropomorphic" idea. I must ask leave to say a word: it is, that it was and is the great "intellectual factor of the Christian civilization." "Salt," he continues, "is one thing; the thing salted, another." The Greeks were ordained to labour in fine art especially, and philosophy, to fill up a vast unprovided-for vacancy, both working harmoniously together towards a common end. This is the text of Mr. Gladstone's address. But, is it true? On the contrary, every fact is against it. Greek philosophy and speculative thinking, and, I had almost said, Greek art, from the days of Pericles and St. Paul, and St. Augustine, down to the present hour, have been and are *antagonistic*! \* What does not Mr. Gladstone mean?

In these advanced days, it is the fashion to moralize on every text. There is a very profound moral in this; for what is it now all day long see about us? the producers of art, and those for whom it is manufactured. On the one side, is this very learned and "advanced scholar," and future Prime Minister of England, with every conceivable advantage the world can bestow at present on any man: everything is his. The great Greek art was and is produced for him, and such as he,—might I not say for them alone, for they only have time to look at it? Mr. Gladstone has read about it all, speculated about it, refused to look at it,—or, if he has, but with a momentary condescending nod,—and knows, after all, nothing whatever about it. On the other hand, we have the producers of art,—those, as he says, for whom the Greek "left his art as a legacy defying all competition and all appeal;"—those who now in architects' offices and sculptors' studios really work out our modern art, at the wages of common mechanics and policemen. Mr. Gladstone is compelled in the course of his imperial duties to go into the details of corking wine-bottles and measuring tubs; does he know what an "improver" in art means and measures? And

\* I cannot help adding,—and I think Mr. Gladstone's course of reasoning justifies my doing so—a thought which I have not seen elsewhere. It is a very solemn one, and goes to the heart of things. It is this,—that Nature is never still; that in all ages of the world, from the earliest records of history down to the present hour, there have always been two kinds of original and progressive thinkers,—the world following now one, now the other, and perpetually at war as to which of the twin is to have the mastery in its heart and soul. The one are the mighty religious thinkers—those to whom something has been supernaturally revealed. Of such were Moses and Mahomet, St. Paul and Augustine, and the saints of the Church. The other kind are those mighty thinkers who have never professed to have come at their thoughts through a revelation of any kind or from any source, but from whose own minds mature their thoughts have, as it were, bubbled up like the waters of a spring—aided by observation and reflection. Of such were Aristotle and Cicero, Bacon and Galilæi, and generally the reasoners of the world. These two tremendous forces are, and always have been, antagonistic: to hold to and follow the one is to reject the other. Mr. Gladstone says they are working together. Where are they working together? Cicero, in his little treatise, is all along lighting the devices of his day, while the Cæsars stood by and laughed. In our day these two powers are as wide asunder as the poles of the world; no dovetailing of "illments" even seems possible. Will Mr. Gladstone venture to dispute this? Is it reason? In St. Augustine's day, and specially in his own person, was this battle fought, and left to the very last an undecided contest. Augustine was a Christian and a saint; but at the self-same time his inmost soul was Greek and heathen to the last.

where would all his wonderful theories be if he did? These working people are now threatened with extinction, if they do not speedily become "advanced scholars," even like unto Mr. Gladstone himself, ready with quotations from Rousseau, Plato, Lord Macaulay, Buckle, Sir J. Acton, and Homer, and hosts of others, bewildering every name. What this advanced learning has done for this eminent person we see; what, then, shall it do for the working art drudge?

How much is it to be lamented that Mr. Gladstone did not in this vital inquiry cast aside all this learning; throw it from him as an incubrance; gone quietly by himself for a day even, and looked at the Greek art in the British Museum; walked home, looking all the while at modern imitations of Greek art; and then asked himself, "Why does all this?" Then might he indeed with profit have gone down to the modern Athenian University and lectured its students, and left even Mr. Thomas Carlyle a practical and useful and human text to talk about.

C. BRUCE ALLEN.

#### CONSUMPTION AND FRESH AIR.\*

DR. POLLOCK has made excellent use of the large field for observation and practice presented to him as physician to the Hospital for Consumption at Brompton, and has produced an admirable book, which is a valuable addition to the literature of the disease. It will tend greatly to extend the knowledge of it, and it is to be hoped will lead, in conjunction with the labours of others in the same cause, to the discovery of some method of treatment better adapted than that at present known, to the cure, or, at any rate, the prevention, of this national scourge. Much has been written lately in opposition to the establishment of special hospitals; but few have denied the immense advantage of the particular institution to which he is attached; and, if any further proof were wanted, the fact of the publication of this book as the result of a minute and skillful analysis of 3,500 cases in the author's practice alone, would be quite sufficient. The title hardly expresses the scope of the work; for, although valuable rules for prognosis are given for each stage and most of the complications of the disease, it is really a masterly monograph of the pathology and treatment of consumption, and is evidently the work of an accomplished and energetic physician.

As a matter of course, in a book of this character, there are some few statements which rather startle us at first sight, and are likely to provoke discussion; such, for instance, as the alleged immunity of consumptives from liability to catarrh and bronchitis, from atmospheric influences; the opinion of the non-alliance of scrofula and consumption. Indeed, Dr. Pollock gives a chapter, devoted to stumous consumption, almost making it a distinct species, which is certainly not the opinion of most observers; and again the assertion that emaciation *always* precedes the deposit of tubercle, &c., &c.; but the book is written so honestly, and in such a pleasing style, that it is hard to find any fault with it at all.

The chapter on preventive treatment is so excellent that it cannot be too widely known; indeed, the paragraph on ventilation so fully endorses the opinions set forth on the subject in this journal on so many occasions, that we give it entire:—

"The ventilation of sleeping-rooms demands even more care. In winter there may be a fire, and a lounge ventilator 2 ft. square in the door, with access of fresh air from an open window on the adjoining staircase. This should be open day and night, but less open in severe cold weather in winter. The above plan is far better than warming the whole house by a heating apparatus, for it insures change of the respired air, which the latter plan does not. The method of obtaining fresh air in the sleeping-floors of our modern houses by an open window summer and winter, has several advantages. The air so entering is derived from the upper stratum, and not from that on a level with the streets. It also prevents the access of miasmata, and of the fermentation and products of foul drainage, which are derived from the basement. Where the kitchens are below the level of the ground (as does not London), a door should shut off the whole of that floor, and with it all entrance of air from drains. If a house be shut up at all points at night, the air which must enter will find its way from the drains, and down the chimneys in both cases foul and impure. Let us then get rid of prejudice, and let in that portion of the atmosphere which is the purest that is possible to obtain; and this can alone be had from a free opening on the higher floors of the house, and best of all from a window. Temperature in the bed-room is to be maintained by fire in

\* "The Elements of Prognosis in Consumption, with Indications for the Prevention and Treatment." By Jas. Edward Pollock, M.D. London: Longmans, Green, & Co. 1865.

an open fireplace, which is in itself the best of ventilators. Having this provided for warmth and pure air in the sleeping-room in winter, we can secure it equally in summer, by leaving the bed-room window open at the top. Delicate children cannot be too soon accustomed to sleep in fresh air. With warm bed-clothing (a very important matter, this is not only so, but necessary; and, remembering that the organs of respiration are those threatened by the disease we are considering, their vital processes cannot too early be accustomed to pure invigorated air; and this should not be scanty or filtered through warming machinery, but unrestricted in quantity, and as pure as is obtainable. The points to remember about open windows in sleeping-rooms are, that the bed-clothing be sufficient, and that no current of air be directed on the body."

And again, with respect to the influence of occupation, it is mentioned as a remarkable fact that butchers are of all others least liable to consumption, which is chiefly to be attributed to their constant employment in the open air, and not being subjected to the bad effects of crowded and ill-ventilated workshops. Occupation holds the second place after hereditary predisposition in the causation of consumption, and regarding it Dr. Pollock remarks:—

"That which is deleterious in occupations, *per se*, may be referred to the heads of ventilation, confinement of the doors, and other deleterious matters inhaled, and too great prolongation of working hours. Of these, ventilation is probably the most important as influencing the largest numbers; but, if confinement to chambers be added to it, we shall find here the two agents most fertile in the induction of tubercular diseases.

The effect of crowding numbers together without sufficient access of air is well known.

The extinction of a disease by the unwholesome conditions in which numbers live is scarcely less striking, although less known. In their working-rooms and sleeping-apartments, the lower classes of this and of all other countries are deprived of a sufficiency of air to support vital changes in their integrity. It is not sufficient to measure the exact quantity of carbonic acid which may be present without the extinction of life: a far lower quantity of the impure products of respiration added to the exhalations from the human body, is capable of inducing disease in the system which shall ultimately prove fatal. The respiration of impure air directly debilitates the vital powers, enfeebles the nervous system, depresses appetite, deranges the secretions, and leads to the retention of effluvia matters in the blood. The decomposition of the blood is directly lessened by the absence of a sufficient equivalent of oxygen in the respired air, and some\* have even gone so far as to attribute phthisis directly to this cause. And whether the retention of carbon in the system be a proximate cause of phthisis or not, we shall do well to consider the conditions under which its exhalation from the lungs is increased or diminished."

Dr. Greenhow is quoted to show that the preventable cases of consumption in England and Wales amount to the almost incredible number of 45,000; and the inquiries recently carried out in Sheffield and elsewhere go far to prove this correct.

Let us say in conclusion, that we have read this book with much pleasure, and we congratulate Dr. Pollock on the production of this result of his ability and perseverance.

#### THE HEALTHFULNESS OF MARGATE.

THE communication from Mr. Edward Mottley, in the last issue of the *Builder*, bears just tribute to the local advantages of Margate. The equable temperature and dryness of its atmosphere during the winter months should point it out as a most desirable winter residence for invalids. The great complaint of the inhabitants is the shortness of the season; and he who can induce visitors to make more extended trial, and remain during the winter months, will deserve to have his statue erected on the Fort as a benefactor to Margate and his kind.

All that Mr. Mottley states is quite true as to the advantages Margate affords for winter residence: higher authorities than he, Sir James Clark, Dr. Erasmus Wilson, and others, have said the same; and, could the tide of public estimation in this respect once be turned towards the place, there is little doubt the benefit to invalids and to the town itself would be mutual.

But in Mr. Mottley's present communication there is an element which may mislead the good folks of Margate, and which it is the present object to clearly point out. The mortality, according to his statistics, is very low indeed in Margate during the winter months; but, granting this, may it not be urged that the evils of insufficient drainage, of defective sanitary arrangements, of the existence of the intolerable nuisance of cesspools, are less active in their pernicious influence during the winter months; and, to put it still more strongly, that the machinery, imperfect though it may be, that cleansly answers for a population of ten thousand persons in the winter time, may altogether break down when used by forty or fifty thousand in the hot months of July and August?

\* Dr. McCormack, of Belfast, has advocated this view.

The inhabitants must not rest in false confidence because Mr. Mottley's statistics show Margate to be locally—that is, by situation and natural causes—so happily healthful. To deserve support of visitors, no efforts should be spared; and, to lengthen to ten or twelve months of prosperity the present short season of three or four, the following requisites are wanting:—Houses built for winter residence; sheltered promenades for winter invalids; well-situated hotels for winter visitors; and, above all and before all, roads, drainage, and determined sanitary reform. These happily accomplished, Margate will claim the reward of her perseverance; and the not-half-sufficiently-valued old town will be our Torquay, Madeira, and Mentone all in one, with the pure bracing air peculiar to herself, unequalled, and never changing.

#### THE POSITION OF THE ARCHITECTURAL EXHIBITION.

I ATTENDED the public meeting, held on Tuesday, to consider the condition of this institution, expecting that something would be proposed in the form of a new programme, to meet the many complaints which have been made against the management for years back; and I am bound to say that anything more completely unsatisfactory than the proceedings at that meeting I have never experienced. It appears that for fifteen years somebody has been collecting and disbursing a considerable amount of subscriptions, without even that simplest of all the conditions of constitutional management—the annual meeting of subscribers! The gentlemen of the "committee" have taken all the trouble of electing themselves and re-electing themselves; of dismissing and dropping each other; of making and unmaking the regulations of the society; of appealing, complaining, and reporting to the profession and the public; of receiving, paying, and auditing, &c., without a moment's misgiving as to the end of it all. And what, then, is the end, or, rather, the present point of progress thereto? What is the cure proposed for the public dissatisfaction taking its most fatal form when, as in this case, it takes the form of the persistent apathy so lugubriously deplored? What new programme had the "committee" to propose to the great public meeting convened with such a flourish of trumpets? First, the creation of a new order: when empire gets weak in the knees, there is always a growth of dignities. The "committee" elevates the retiring secretary-active to the new title of a vice-president, with the retiring secretary-non-active for his colleague, and Mr. Asphit and Mr. Tite (who, I venture to suggest, have never had anything to do with the scheme) to "float" the whole. The "committee" further elevates itself into the honourable position of a "council;" and beyond these two notable measures I am really at a loss to understand what is to be done. Is this to cure "the apathy of the more influential part of the profession?" I ventured, so far as courtesy would admit, to hint that a clean sweep of the "committee" was the right thing for the circumstances, so that the superior class of architects might be invited to assume what I feel sure would be to them the grateful task of reconstituting the institution on a higher level altogether. What do you imagine was the reply? "We have tried all those gentlemen whom you name, and not one of them has ever been found willing to take part in the management!" To which I ventured to rejoin, that to my mind this fact showed, not the incurable apathy of the superior men (who make no such difficulty about assisting in half-a-dozen other professional undertakings in the same house), but something in the system of management which drives them away. Surely this is a state of things which ought at once to be remedied. If, as is often suggested, the "Architectural Exhibition" is practically nothing better than a combination of the act of a couple of hundred inferior "pretty pictures" by beginners, with the science of a lot of quack cooking-ranges and water-closets, the latter providing the means of meeting the expense of both, then the sooner the simple remedy is applied of calling in the aid of men who can do without such a discreditable scheme the better. If, on the other hand, it is intended that the best works of the best architects are to cover the walls, in co-operation—perhaps even in competition—with the Royal Academy, then again how can it be possible that these superior men refuse their aid unless by reason of some-

thing in the management? When we hear, as we did at the meeting in question, no other apology offered for want of success except denunciations of Mr. Donaldson and Mr. Hope for having spoken disrespectfully of the Equator, and sneers at the entire body of "the principal architects," for their unfeeling and unpatriotic idiocy in failing to perceive the money value of the invitation to have their "best works" exhibited more or less over a patent sphygmoman apparatus at the low charge of 7s. 2d. (with a liberal discount to architects and the trade)—when we find the "committee" so totally incompetent to grasp that simplest of commercial ideas, that if you have been pushing an undertaking uphill for fifteen years, and can't make it hang anyhow, it is time to revise the whole thing,—what will be the verdict of common sense contributors? When I, for one, urged the advisableness of what I called "constitutional proceedings," the answer was, "We have no constitution!" So it appears. Query, therefore, whether it is not the proper time to demand a constitution, and meanwhile refuse the supplies? Pray excuse a somewhat spasmodic style in these remarks, thrown off in a hurry to be in time for the present week's issue of your paper; and let me assure you and your readers that they are dictated only by the deep interest taken in the real cause of an "Architectural Exhibition" by one who can easily be recognised as a steadfast supporter in many ways of the present attempt ever since its origin.

R. K.

#### THE SANITARY CONDITION OF LINCOLN.

A PAPER on the drainage of the city of Lincoln, by the surveyor to the corporation, Mr. Drury, has appeared in the *Lincolnshire Chronicle*, from which we take the following details and remarks:—

"The city of Lincoln is divided by the natural conformation of its site into two districts, viz. Up-hill and Below-hill. Up-hill may be roughly described as that portion of the city north of the river Witham, occupying an extent of about one mile long and 1,000 yards wide, and is built upon the sloping sides and plateau of a hill, rising 210 feet above the river, and the whole extent, with some slight exceptions, might be drained by gravitation. Assuming the present population of Lincoln to be 24,000, the probable cost, calculated at the average, would be 15,000*l.*, which sum might be borrowed, the principal and interest to be paid off in thirty years by an annual payment of 900*l.*, or about 8*d.* per head per annum. The present rateable value of the city is 70,000*l.*, and an 8*d.* rate now levied by the Lighting and Paving Commissioners brings in over 2,300*l.*. An additional 3*d.* rate would bring in nearly 900*l.*; but, as the rateable property assessed under the commission does not include the 6*l.* houses nor the land which would become liable under the Local Government Act, it is reasonably calculated that the ratepayers would actually pay less than a 3*d.* rate additional for the privilege of being able to get rid easily of the offensive nuisances which pervade the whole town; whereas now every effort to that end made by private individuals has to be effected not only at an enormous cost to themselves but to the whole town through the increased contamination of the river or the poisoning of the soil.

"That improvement in health would be gained by good drainage is proved, first, by the return of the County Hospital, which, since the abolition of the cesspools and the adoption of the present very inefficient drain, has become much healthier; secondly, by the reports of towns throughout the Kingdom which have adopted a complete system of sewerage."

The journal from which we quote, in a leading article on the subject of Mr. Drury's paper, draws attention also to the overcrowded and ill-ventilated dwellings of the poor. "Many of these places," remarks the writer, "require re-forming altogether; indeed, some of them are so alarmingly bad that they ought to be 'improved off the face of the earth.' Hence the determined and bitter opposition of their owners to a sanitary reform. We have often advocated the adoption of the Local Government Act on this ground, as well as for the sake of the powers it would confer with respect to the supervision of new buildings and the formation of new streets—a highly necessary branch of jurisdiction in a rapidly growing town like Lincoln."

In a long letter to the editor, Mr. D. J. Garnham, house surgeon *pro tem.* to the local Dispensary, enters into details of the state of the courts and lanes of the city, and the causes of the prevalence of epidemic diseases. It is the old story. Wherever there is most filth, overcrowding, &c., there we find appended such remarks as these: "Fever and smallpox have visited here this month"—"these eight houses have lately been visited with some severe cases of fever"—"the sad details being occasionally modified, however, by such modifications as this: 'I do not know of any illness in these houses, which are fair and well-ventilated residences.'"

ROYAL MASONIC INSTITUTION FOR BOYS, WOOD GREEN, TOTTENHAM.—Mr. EDWIN PEANCE AND MESSRS S. L. WILSON & SON, ARCHITECTS.

## MODERN HOUSES.

SIR,—Long and diffuse as has been the discussion on the decline of domestic architecture, no fair conclusion has been arrived at; the object of every correspondent with journalism seeming to be to decry stucco and cheap domiciles; or to show their travelled acquirements, like "Master of Arts," when he referred to experiences in Rome, Tivoli, and Naples, in Arab tents, Syrian huts, and waggons of Damascus; and complained that in seven months (if the tenant should survive rheums and catarrhs for so long a space), the veneer of his modern furniture peels off, the hacks of his chairs curl up, and the French polish oozes away! Then, quoting from Vitruvius, he invokes Raskin, and imprecates an earthquake—"a good, wholesome, general earthquake," to abate, by a single shock, the 100,000 "lean, shaly, slender, and mangy tenements" which have been crowded together within ten years, near all the railway stations within fifteen minutes of the metropolis.

Others, again, have censured the style of finish bestowed upon all modern townships ranging from 30l. to 150l. a year; the coating of compo, the quality of joiners' work and timber, the frail marble mantels, the plastering, and, above all, the ornamentation in cornices and pateras, condemning all as sham realities, or real shams, and then conclude with the wind-up complaint that the rents of such novelties are too dear.

It is not my object to argue that the quality and style of such modern houses are right or satisfactory to taste, but the requirements of the time demand the erection of houses for increasing multitudes flocking to London, as also for the 100,000 denizens dislocated by railroads and stations, which in all quarters invade, modify, and demolish the old metropolis.

It is well known that these innovations have enhanced the value of every building-site within the twelve-mile radius, and that central positions in trading localities now command ten times the value fixed upon them only ten years back; and also that every acre within three stations of the City is now enhanced to a fourfold value.

That objection should be made to the neat finish of the cheapest houses, say at 30l. or 35l. a year for those of six rooms, or 45l. for eight rooms, even although slight and covered in plaster; or that marble mantels, worked stucco, and sembling grained finish of painting should be decried, because not of the first quality of workmanship, is unreasonable.

Is the occupier of such a house not to be indulged with the idea that his tabernacle should in some degree assimilate to the villas or halls of the wealthy commercialists who settle down in new suburban residences, or who reconstruct demolished warehouses in all quarters of the City, in a style of which even Venice might be proud?

The requirement for houses to lodge the population dispossessed by recent demolitions has caused a competition amongst builders, as well as the owners of land. The rent exacted for any site within a fifteen-miles range by rail, if only 17 ft. by 40 ft., is on an average 5l. a year. With such an incumbrance the speculative builder starts; his outlay upon a six-roomed improvisation must be, exclusive of his own labour and time, 150l. He must hasten to complete, and is forced to raise his capital, story by story, as he proceeds, by giving a bonus of fifteen per cent. to the sagacious lenders. Thus he must expend 22l. 10s. for insurance, and 39l. for his own time (six months), at only 5s. a day, until the "blotch" is finished, and fit for occupation or sale.

This will make, together with 5l. for the first year's rent, in all 216l. 10s.; and to complete such an erection for that amount would be impossible, if the materials and quality of workmanship were such as a surveyor would undoubtedly require on a matter of arbitration or reference.

In this case our constructive adventurer may perhaps get 30l. a year in rent, or may ask 300l., and take 250l. for his good-will and lease.

The tenement is certainly not of that class, in point of construction and finish, which a gentleman of fortune, or retired tradesman, would found on his own freehold; but it is one that suits the City official or clerk, who finds that the proprietorship of a mansion (restricted and meagre though it be) for the use of his family is better than a second-floor in the West-end at the same cost; and that his transit daily by a third-class railway-ticket is only two-thirds of

the charge for four miles by omnibus. If his markets are a little dearer, he has only to regulate his supplies from Leadenhall and Billingsgate, while the pure atmosphere of his abode reduces the expenses of medicine and advice by a large equivalent.

The tirade against flimsy houses, sham architecture, and the pretensions character of those new but humble dwellings is not called for; competition must regulate both the quality and style of the smallest ranges at the junction, or of the mansions and terraces of the park or common. There is ample scope for the display of architectural talent and skill in the City, growing daily more gorgeous, and throughout the counties where the capitalist delights in adorning his hall.

It is well that small houses are multiplied to meet the wants of a population increased to an extent without example; for if the huddling together of houses were to have continued, leaving old London to fester in its swarming slums, a visitation by epidemics might again resume the character of those, the last whereof was enshrined in Smithfield and the precincts of the Charter-house.

The great demand for small and cheap houses near to the various vicinal stations, and their summary occupation so soon as they are finished, give pretty fair proof of their utility and actual requirement; and although a traveller, or gentleman of reduced means and refined tastes, may disdain cheap decorations, and slender marble mantels; still such neat though slender, and comfortable though slight, abodes are an accommodation and boon to the industrial classes.

QUONDAM.

## CHURCH EXTENSION IN BELFAST.

ON Friday, the 27th ult., the Primate of all Ireland laid the foundation-stone of a new church, which is to be dedicated to St. Mary. It is the first of five churches which are about to be erected to supply the pressing need of accommodation for the greatly increasing population of Belfast and its suburbs. The site is on the Crumlin-road, and was presented gratuitously. The scheme has been on foot for some years; but, until certain formalities had been gone through, the committee were not able to commence building. The committee is formed of the most influential men in the town; and their object is to raise sufficient money to endow these churches and purchase sites. The money so raised is met by the Ecclesiastical Commissioners with a sum sufficient to erect and complete the churches themselves. In the case of St. Mary's, a further sum of 1,000l. has been placed at the committee's disposal, by the executors of the Beresford family, who left a certain sum of money to be devoted to this purpose. St. Mary's being the first church, will be built on a more extensive scale than the remaining four. The design is by Messrs. W. Slater & R. H. Carpenter, of London, under whose superintendence, together with that of the Ecclesiastical Commissioners' architect, it is being carried out.

The church will accommodate between 600 and 700 persons. It is cruciform in plan, having a wide nave, with aisles, transepts, apsidal choir, with vestry and organ chamber, on the south side; and a lofty central tower and spire. It is Early Pointed in style. The nave is four bays in length, the columns of which, together with the alternate vousoirs, are of red Carlisle stone. The material generally used is white Scrabo stone. The aisles have lofty gabled roofs, and, there being no clerestory, the lights are large, having two windows, with a circle over, under one wide arch. Red Carlisle stone is used in all the arches of the windows, and tower, and for bands and strings. The roofs, seats, &c., are of deal. The organ is to be over the vestry, and open to the church by arches in the chancel and transepts; and the seats for the choir are on the north and south sides of the chancel. The pulpit will be against the north-east tower pier.

The tower stands on four arches, resting on massive moulded piers, and has an arcaded lantern story, open to the church, for the purpose of obtaining additional light and a lofty effect. The two upper stages have richly moulded arcades, five arches on each face, resting on columns with five capitals. In each arch is a lofty lancet window. The spire rests on a moulded and corbelled cornice. It is of

timber, and slated, having on each of its four cardinal faces lights of oak, surmounted with small slate spires.

The works are being executed by Mr. Henry, of Belfast; and will be completed in about eighteen months.

The site of the second church is not yet finally settled; but the building will be in a very short time commenced.

## BRISTOL SOCIETY OF ARCHITECTS.

ON Wednesday, the 8th inst., a meeting of the Bristol Society of Architects was held at the Fine Arts Academy, Mr. S. C. Frigg in the chair, to take into consideration a notice of motion by Mr. A. C. Ponton (fellow), to the effect that it would be desirable, in order to extend the usefulness and promote the effectual working of the society, to make the alterations contained in the agenda paper, which were in substance the following:—

To drop the exclusively professional character of the society by altering its name to the "Bristol Architectural Society."

The admission of amateur members into the council.

The admission (under certain restrictions) of ladies, who should be present at the ordinary general meetings; and

The reduction of the terms of subscription, and number of meetings.

Mr. Ponton said his object was to try to increase the number of those who belonged to the society. It was found that those who took an interest in its affairs were generally the lay members. The professional members did not attend their meetings or take that interest in the proceedings of the society which was expected; and it appeared to him, as well as to some other members, that their best course would be to try to reduce the subscription and make it a mere trifle, hoping by that means to get those interested in architecture to attend the society's meetings, and thereby greatly extend its influence and usefulness.

Mr. C. J. Phipps (hon. secretary) said he also was an advocate for the alteration of the rules and the re-constitution of the society, for the labour in connection with it had been great, and the results very small. He adverted to the meeting during the past year, which had been well and largely attended by amateur members, students, and visitors; but as to the fellows, or professional members, on an average never more than five out of the twenty-one members attended. Consequently their title and constitution as a society of architects was a pure myth. He felt sure that if the alterations were made instead of seventy members as at present, the society would quickly double the number.

After some discussion, Mr. Ponton proceeded to move the various alterations *seriatim*. The first proposition was, "That the name of this society shall be the Bristol Architectural Society." Seconded and carried.

The second resolution was, "That the society shall consist of four classes,—members, associates, honorary members, and corresponding members."

Mr. Hanson moved an amendment, "That the society shall consist of four classes. First, fellows; secondly, associates, being students and assistants, and gentlemen amateurs; thirdly, honorary members and corresponding members; fourthly, ladies interested in the study of architecture."

After some discussion, the amendment was carried.

The third resolution was, "That the annual subscription for all classes connected with the society should be 7s. 6d."

Mr. Hanson moved, as an amendment, "Fellows, one guinea; associates, half-a-guinea; ladies, 5s." The amendment was carried.

The fourth resolution was, "That the council shall consist of seven gentlemen, chosen from the members, the proportion to be four architects and three amateurs."

Mr. Hanson moved the following amendment,—"That the governing body of the society remain in the hands of the fellows solely." He remarked that if Mr. Ponton's proposition were carried, they would be severed from the Academy, and would not be able to carry on the operations of the society there, as they would have to leave the place.

The amendment was seconded, and carried.

officers of the like limited experience, instead of the qualified civil engineers who were sent out from England? Why, heavy loss, such as has occurred on the Ganges Canal from a similar cause.

Had one or more civil engineers of large experience in canal works been induced to go to India and act as consulting engineers to Government, instead of failure there would probably have been success in that important and gigantic undertaking.

#### WATER SUPPLY IN THE NORTH.

AN extensive scheme has been proposed by Mr. Thomas Dale, C.E., of the Hull Corporation Waterworks, for the supply of water to various towns, from the lake districts of Cumberland and Westmoreland. In this scheme, in laying down the main trunk pipes, he proposes to make provision for the following quantities of water to be supplied daily to the towns enumerated, viz.:

	Gallons.		Gallons.
Lancaster	2 millions.	Keighley	2 millions.
Preston	8 "	Bradford	10 "
Wigan	4 "	Huddersfield	4 "
Deesbury	3 "	Barnley	4 "
Wakefield	3 "	Rochdale	4 "
Liverpool	40 "	Halifax	4 "
Leeds	15 "	Colne	4 "
Binley	1 "	Bury	3 "
Kendal	2 "	St. Iles's	1 "
Bolton	8 "		
Blackburn	6 "	Total	131

There are also many small towns and districts lying contiguous to the line of main trunk pipes, for which due allowance in the capacity of the discharge of the main pipes must be made. From the Ullswater and Haweswater Lakes, in particular, Mr. Dale proposes to take the water. The main trunk would consist of several distinct lines of pipes, laid side by side, so that should repairs or contingencies arise, ample provision would be made to retain a constancy of flow. At all stations where branch supplies were required for towns, &c., reservoirs would be constructed to receive the discharge of waters from the mains. He proposes that the various towns thus to be benefited should combine financially to carry out this project. He is of opinion that the outlay for construction, &c., would not exceed, for the supply of each million gallons of water daily, the sum of from 60,000l. to 70,000l.

#### WOODEN BUILDINGS

##### UNDER METROPOLITAN BUILDING ACT.

On the 31st of October, in the Lambeth Police Court, Mr. J. H. Taylor, district surveyor, summoned Messrs. Lowther, of Regent-street, for building extensive workshops in the rear of their premises in South Lambeth, covering an area of 408 square yards, without notice being given by the builders, of quartering and boarding instead of building walls of brick, stone, or other incombustible material, on solid ground, or concrete, or other solid sub-structure, conformably with the first schedule preliminary of the Act.

Mr. Cameron, solicitor, attended on behalf of the defendants, and submitted that inasmuch as the erections were based on the surface of the ground without carrying them more than one story high, and were an extension of a portion that was formerly erected, they were not buildings within the meaning of the Act.

Mr. Elliott, in deciding the case, considered that the part of the Act which had been pointed out by the surveyor prohibited all wooden buildings, and referred to the case of *Stevens v. Gourlay*, 29 *Law Journal*, C.P. 1, decided in the Court of Common Pleas; and, being a case analogous to the present one, ordered the buildings to be rebuilt agreeably to the Act, to the satisfaction of the district surveyor.

#### VILLAGE HOSPITALS.

THESE very useful institutions are extending. One has been established at Wrington. It is simply a cottage, fitted up with beds and baths, and placed in charge of an experienced nurse. It has five beds for surgical cases and twenty-four for others, and gives advice to out-door patients, while the entire cost of rent, nurses, coals, stimulants, and medicines, was only 102l. last year. Each patient is expected to pay a small sum towards his maintenance, and this is readily given, the sick finding

that they recover far more rapidly than in their overcrowded rooms.

At the second annual meeting of the subscribers to the Walsall Cottage Hospital, the chairman congratulated the meeting on the success which had hitherto attended the operations of the hospital: notwithstanding that the beds (eight in number) had been generally all occupied, and the expenses heavy, the outlay during the past year had been more than covered by the income, the latter amounting to above 500l., while the expenditure had not exceeded 460l. The report advocated the erection of a more suitable building than the one at present occupied. A site had already almost been promised by Lord Bradford, and the committee taking into consideration that upwards of 800l. had been subscribed towards the building fund, advised their successors in office to commence operations as soon as possible. The report was unanimously adopted.

#### SERPENTINE.

HAVING seen a paragraph in your paper of the 11th instant relative to this material, I beg leave to lay before your readers my own experience relative to its utility for out-of-door work.

About two years ago I had several 4-in. pillar-shafts of serpentine to carry the arches of an arcade on the upper story of a building. They were placed in position as the work proceeded, and dowelled at top and bottom to the stone caps and bases; consequently, a certain amount of pressure came upon them, but not more than stone pillars of the same size would have borne with ease. One of the shafts soon showed signs of fracture, splitting diagonally across, and but for the dowels it would have fallen into the street.

The parties who supplied the pillars sent another in its place, which was put up without dowels. This soon fell all to pieces, and some passers-by narrowly escaped being killed.

Upon examination I found that this last had never been a sound piece, but was manufactured of small pieces, stuck together with shellac and wooden pegs or dowels. Several of the other pillars are now in a very dangerous state, and will have to be removed.

I have spoken to persons of experience in the marble trade, and they all say that they cannot obtain serpentine in any quantity or size that can be relied upon to carry weight. It may answer very well where only required for ornament; but whenever subject to a strain, it is not trustworthy. The specimens exhibited are, of course, carefully picked; but it would be impossible to supply equally good serpentine in any quantity without charging an exorbitant price.

E. WYNDHAM TALKIN.

#### FORMATION OF ROADS.

THE concreted macadamization to which we lately alluded is described in a pamphlet now issued by Stanford, of Charing-cross, under the title of "A New Mode of Constructing the Surface of the Streets and Thoroughfares of London and other great Cities, by which Mud and Dust will be greatly diminished, and the Expense of Maintenance and Repair much Lessened. By Jos. Mitchell, F.R.S.E., Civil Engineer." Mr. Mitchell was, at one time, a general inspector of roads and bridges in the northern counties of Scotland, and is a member of the Institution of Civil Engineers. The following quotation describes his proposal:—

"I have found that a cubic yard of broken stone metal, of an ordinary size, screened and beaten down in regular layers of 8 in. thick, is still of such open formation that the vacuities, when filled up with liquid, amount in all to 11 cubic feet. In a macadamized road we have, therefore, in every cubic yard, 18 ft. of solid stone, and 11 ft. of clay or mud, forming a *quasi* cementing matter. Being intrinsically deficient in this quality, however, it is not surprising that it should yield to the pressure of heavy weights, especially when assisted by the action of wet or heat; and hence all the mud, and the greater part of the dust, which is generated on the best macadamized road hitherto made.

To remedy these defects, I propose to substitute for the 11 ft. of muddy cementing matter in the macadamized road, an admixture of Roman or Portland, or other hydraulic cement, or to use each separately according to circumstances, in certain proportions. The stone, when carefully pressed together, and the interstices filled up between with this material, will very rapidly set into a uniform and impervious mass, which will be found wholly unaffected by heat or moisture, either from above or below; while, of course, the total exclusion of moisture prevents the injurious action of frost. We shall thus have bound together the macadamized material, or broken metal, in its original and pristine form and stability, not

crushed down or reduced to a yielding substance, but consolidated and fixed, so as in fact (assuming the cement to hold good) to be liable to no other action whatever than the attrition of the traffic on the surface. Hence this road should resist tear and wear nearly as effectively as a paved street."

A specimen of his concrete macadamization has been laid down, with the Hon. W. Cowper's permission, on the Mall at the foot of the Green Park, St. James's.

Mr. Mitchell also proposes for paved streets the substitution of Portland or Roman cement for the lime at present used in the concrete bottom and joints of the pavement. This he has tried and found to form an excellent street-way.

The matter is of considerable importance, and Mr. Mitchell's mode ought to be fairly tried.

#### THE CARVINGS AT CHATSWORTH.

WE have recently spoken of the beauty of the wood-carvings at the Palace of the Peak. Of their kind they are nowhere surpassed. Mr. W. G. Rogers, carver, having recently examined them, has printed some notes of his visit, wherein he describes them as rapidly perishing. "Silently," he says, "and almost imperceptibly to the general observer, the work of destruction is going on; but to the experienced eye, the peculiar whitish bloom upon the surface tells that all is rottenness within, and that minute but active animal life is feeding on the fruit and flowers of Gibbons." He further asserts that, unless some method be adopted to preserve them, they will not long remain in their present state.

Mr. Rogers ascribes all these carvings to Gibbons. Is he aware that, although all the accounts for the expenditure on the building are preserved, the name of Gibbons scarcely appears in connexion with the works, and that locally the greater part of the carving is supposed to have been executed by Samuel Watson, of Derbyshire, whose epitaph in Hancor Church, referring to the work at Chatsworth, we recently printed?

Let this be as it may, the Duke of Devonshire will doubtless lose no time in taking steps to preserve these admirable carvings.

#### NON-COMPLETION OF CONTRACT.

THE case of *Russell* (clerk to the Merthyr Tydfil Board of Health) *v. Tucker*, in the Court of Queen's Bench, was an action by the local Board of Merthyr Tydfil against the surety of a contractor, to recover damages for non-completion by him in due time of certain works he had undertaken to execute for them. The defence in substance was, that the specification was not duly signed by the Board. The Act required that the contract should be executed by five members of the Board, and the contract itself was so executed; but the specification which was referred to therein, and so incorporated therewith, was not so signed, and this fact formed the basis of the defence set up by the sureties.

The Lord Chief Justice and the other members of the court thought that there was neither a legal nor an equitable defence. As to the equity, it was rather the other way, for the sureties had not, and could not have been damaged. It was not as though there had been no specification drawn up at the time of the contract. There was such a specification, and it was identified, and had been acted upon. What did it matter now that the specification had not been regularly signed? The contract itself had been so signed and referred to, and identified the specification.—Judgment for the Board.

#### DAMAGE BY BUILDING OPERATIONS.

IN the case *Williams v. Golding*, in the Court of Common Pleas, the defendant was a builder, and whilst he was carrying on a building operation the work caused damage to the plaintiff's property, which adjoined. The plaintiff sued for damages, and recovered 20l. The question now was, whether a rule to enter a verdict for the defendant should be made absolute.

The Metropolitan Building Act states that "no district surveyor or other person" should be "in respect of anything done under that Act without having a month's notice of action. No notice had been given in this case, and the point was raised whether the term "other person" was confined to official persons, or included builders." The Lord Chief Justice thought that the rule should be discharged. The Court were of opinion that the term "district surveyor or other person" was intended only to include persons of the same class as district surveyors. Rule discharged.

\* See p. 638, ante.

THE PAYMENT OF ARCHITECTS.

Sir,—The letter of Mr. Edward L. Garbett in the *Builder* of November 11th, upon "The Trade and Trade Charges of Architects," touches upon a very interesting topic. I have laboriously sought the full meaning of his remarks, so as to draw some practical inference for individual guidance, and, taking his own words, I find—what?—that the suggestion is, we should "abolish . . . the master builder," and then—do what?

Following his ideas farther, it would seem that the sequence would be,—the "real master designer" should make "the relations between contractor and workman a part of the specification,—a part of the contract." In other words, the architect should seek a man to provide plant and machinery, and materials and labour; and should define the rate at which such a man should be paid for all; not to mention the intermediary rates at which the labourers also should participate in the profits he was to be allowed. Granted all this; but in what is the real state of things changed? Do we not possess all the practical advantages of this scheme by paying for work by measurement and valuation, instead of by speculative competition in contract beforehand? The real sore still remains; and here I most thankfully agree with Mr. Garbett.

The basis upon which an architect's remuneration is fixed is entirely wrong; and it is surprising, when one comes to think of it, that the system should have been allowed to have remained so long unaltered.

At present, an architect, whether a man of "isms," a Church reviewer, a Victorian exponent, an illustrator of jumbleland, a classicist, or whatever peculiar walk he chooses as his own, is paid, not in accordance with the service he renders, but in proportion to the outlay he directs. This brings up now and then an unpleasant element in the relations of employer and adviser which all men of any experience must have encountered. Permit me a little personal reminiscence by way of illustration.

The Americans are a practical people, and generally look into the *ratatouille* of things; with little reference for "precedent," they accept no axiom until fairly reduced to common sense, and during some years' professional experience among them (and perhaps Mr. Garbett will not object to the term "professional" when he reads what follows), I found a grave difficulty always occurring when the money side of our relations had to be discussed. "Oh, then, the more you make my building cost, the more your fee comes to, eh? No, I guess that won't work, any way you can fix it!" And so I pondered on the rights of the thing, and this was the result in my own case. Upon accepting a commission, I named a price that should cover the expense of all preliminary drawings,—the working drawing, specification, &c.; all in fact, requisite to bring the obtaining of a contract, or the entire erection and finish of the building to a successful issue. Then I named a precise sum for each visit the owner might wish me to make to the works during progress,—so much for time, so much to reimburse travelling expenses,—leaving for him to send for me as often as he pleased, or not at all. This I found most rational in working out, and in every instance, ultimately, much more satisfactory to my pocket than any 5 per centage would have been. Thus there was no incentive supposed for increase of outlay; my time and abilities were wholly at the service of the owner whenever he chose to call me to his side, and whether to direct alterations, explain details, settle disputes, and finally to examine and pass accounts, it made no difference to me: my time and skill were what were remunerated, and whether in so many hours' labour I settled questions involving expenditure of 1,000*l.*, or advised upon the laying out of a garden, or the ornamentation of a boudoir, my services were paid for, not in proportion to the outlay I might advise, but by the estimation in which they were held by the owner, who could keep me one hour, or one week, just as he thought the object under discussion deserved.

These are the principles I would be glad to act upon in practice here, and perhaps Mr. Garbett will, to his "practical suggestion," append in concise terms (if he approve the idea thus offered), a scheme by which some such method of payment for an architect's services may be resolved upon.

I purposely put the question in its plainest light, and after its logical treatment of the evil, perhaps he will kindly help in suggesting an

intelligible remedy,—one capable of immediate use, suited to the ways of the world as we find them, and so truthful in principle as to admit universal application.

G. W.

MASTERS AND MEN IN MANCHESTER.

Sir,—As the plasterers' labourers of this town have turned out, this day, from their employment, I wish to lay the facts of the case before you, so that the public may have an opportunity of knowing the tyranny we are from time to time subjected to by those we employ.

It has been an established custom in Manchester, and, I believe, in all other places in England,—in fact, all over the civilized world,—that where large contracts are taken at a distance, the labour portion is employed on the spot, and paid for at the standard rate of that district, town, village, or hamlet nearest to the work. But the plasterers' labourers of Manchester, at a week's notice, have stepped in, and say this shall not be so, and unless you discharge the labourers now employed at country work, and employ us from this town, paying our travelling expenses to and from and in your time, once a week, two weeks, or a month, as the distance or case may be, together with extra for lodgings, and the additional rate of wages paid here, we shall withdraw our plasterers and labourers from all your jobs now in progress, and which they have actually carried out.

This is the proceeding of the Manchester Amalgamated Association of Plasterers' Labourers. But this is not all: they are assisted and encouraged by the Association of Plasterers, inasmuch as they decline to carry on the work with labourers who may be found to supply the place of the *turn-outs*.

It has been explained to them, that all contracts are based upon the price of labour and material obtainable at or near the place where the undertaking is intended to be carried out, and are, in many cases, not commenced, or far enough advanced for the commencement of our portion or branch of the work, for twelve or eighteen months after the contract has been settled or agreed for; and, consequently, that a serious pecuniary loss to the contractor would be the result if their demand were put in force,—with other conciliatory remarks, all bearing directly on the point at issue, and all having a tendency to induce them to desist from putting in force so pernicious and tyrannic a demand; but to what purpose we now have positive proof.

The tyranny exercised by the operatives in most branches of the building trade towards their employers has been long talked of; but this, I think, will bring matters to a crisis.

AN EMPLOYER.

THE BUILDING TRADES.

London.—In consequence of an intimation given by Messrs. Lucas, Brothers, to their workmen, that they intended to carry out the nine hours' movement during the winter, the men struck, but afterwards returned to their work on a withdrawal of the intended measure, in consequence of a discussion between the parties. Other masters had intended to adopt the same course, but awaited the result of the movement at Messrs. Lucas's.

Newark.—The long-agitated proposal to pay by the hour and leave off work at one p.m. on Saturdays, has been adopted during the past month by the principal builders of Tottenham, Newark. The wages are now 7*d.* an hour for bricklayers; 6*d.* to 7*d.* for carpenters; and 4*d.* for labourers. The men will not, as hitherto, be paid for a whole day's work on Saturday, but only for as many hours as they shall have been employed.

Berlin.—A rather crowded meeting of working men was held here lately, for the purpose of discussing the relations of master and workman, and the position of the latter generally. The most sensible speeches, exhorting to prudence and economy, were not always the best received, according to the *Star* correspondent. A working man, named Born, said that he had lived fourteen years in London, and that he attributed the better position of the English working man, as compared with that of the German, to his greater industry, and the fact that he does not smoke at his work, as the German does, a great part of the day; and also that he lives well.

THE HOLY GRAAL.

Sir,—As the editor of Robert de Borrou's old French romance of the *Saint Graal*, and Henry Lonclich's later English version of it, styled by him *Saint Graal* or *The Sank Ryal* (Roxburghe Club, 4to., 1863-5), I must ask your permission to say that in my opinion Mr. T. J. Gullick is wholly right in his etymology of *Graal*, which means *vessel*, and that the version you adopt of *Sank Ryal* is only a later fancy, introduced or mentioned first, I believe, by Borrou's translator, the said Henry Lonclich, whose MS. you will find in Archbishop Parker's Library at Corpus, Cambridge.

If you will turn to De Borrou's "History," or any of the old Arthur books,\* or any modern philologists' discussions, you will see that there is really no doubt as to the fact that *Graal* is a vessel, the dish in which Christ ate the last supper, and into which the blood from his corpse was put by Joseph of Arimathea.

FREDERICK J. PURNIVALL.

CHURCH-BUILDING NEWS.

Reading.—All Saints Church, Reading, has been consecrated. The church, which is in the Early Decorated style, somewhat French, and which at present is only completed as far as the third bay of the nave, consists of an apsidal chancel of five sides, 33 ft. long, 22 ft. 6 in. wide, and 45 ft. high; a nave, 77 ft. 6 in. long, 22 ft. 6 in. wide, and 55 ft. high, with aisles of the same length by 14 ft. wide, from which it is divided by an arcade of five arches. Transepts project north and south from the chancel, to which, and also to the aisles, they are open. The tower, on the south side of the south aisle, forms the southern entrance, and will face up the eastern side of Downshire-square; it is 20 ft. square and 70 ft. high, boldly buttressed and surmounted by an octagonal spire, 85 ft. 6 in. high, in all 155 ft. 6 in. There is a northern porch on the opposite side to the tower. The vestry, 14 ft. square, is at the east end of the north aisle, to which there is a porch, and a heating vault under. The walls are of blue Bristol stone, laid in courses, and lined with brick. All the dressings are of Bath stone. The contract has been executed by Messrs. Wheeler, Brothers, of Reading; the carpenters' and joiners' work by Mr. Woodroffe, of Reading; the carving, by Mr. Earpe, of London; the iron-work by Mr. Leaver, of Maidenhead; the heating by Messrs. Haden, of Trobridge. The architect was Mr. J. P. St. Aubyn, of London, under whose superintendence the whole of the works have been carried out. The cost of completing the whole will be over 9,000*l.*

Nottingham.—From a circular issued by the vicar of St. Mary's Church, it appears that a restoration of this edifice is contemplated. Mr. Scott has made a survey of the church, and given a rough estimate of what he supposes its restoration would cost. The estimate is as follows:—

For exterior work .....	£2,000
Re-seating in handsome and appropriate oak seats, including floors .....	3,000
Restoring and repairing roofs .....	1,000
New organ chamber .....	500
Gas-fittings and other expenses .....	700
Total .....	£7,500

But a chief feature in St. Mary's of old consisted in its windows, which are so many that it is almost necessary to have at least the principal ones of stained glass. There must therefore be added to Mr. Scott's estimate, the following for windows:—

Chancel windows (seven in number) .....	£1,400
West window .....	1,000
North transept window .....	1,000
South transept window .....	1,000
The rest of the windows re-glazed in cathedral glass .....	600
Total .....	5,000

There will also be needed for the restoration and improvement of the organ .....

The whole estimate will therefore amount to .....

The whole of the church thus restored will henceforth be free. An appeal is now made to the inhabitants of the county as well as the town of Nottingham, to help in this work. Earl Manners has headed the subscription list with a donation of 1,000*l.*

\* May I call your readers' attention to the fact that a society has been started mainly to reprint the English texts relating to Arthur? It is *The Early English Text Society*, Hon. Sec., Mr. H. B. Wheatley, 53, Berners-street, W. Subscription, one guinea a year.

**Thornton.**—The old "bell chapel," erected in 1612, though it has since undergone several alterations, now presents an antiquated and dilapidated appearance. It is at length to be pulled down, and a new church is to be erected in its place. It has been resolved to give instructions to Messrs. T. H. & F. Healey, architects, to prepare the plans of the intended edifice, which is to contain accommodation for 800 persons, and to cost 4,000*l.*

**Cheltenham.**—The site for the proposed new church, situate near Pitville-circus, will shortly be enclosed, and authority given to commence the erection of the structure, which will be designed by Mr. J. Middleton, architect.

**Rhayader.**—The new church at Cwmndandwr, dedicated to St. Winifred, has been consecrated. The style is Early Geometrical, and the edifice consists of nave, with south aisle, chancel, with organ chamber on the north side, vestry on the north-east side of chancel, west tower and spire, and south porch. The extreme length inside is 86 ft.; width 35 ft.; and the edifice calculated to accommodate 296 persons. The nave is lighted on the north side by three two-light windows, with tracery heads, and is divided on the south from the aisle by an arcade of four bays carried on columns, with carved caps and moulded bases. The chancel arch is the whole width of the chancel. The chancel has two windows on the south side, one single, and the other a double light. The east window has three lights, and three circles over them, with tracery in the head, and all these will shortly be filled with painted glass. The tower is placed at the west end of the nave, and divided from it by a large and lofty arch: it is 40 ft. high, and is surmounted by a spire 35 ft. high. The walls are built with stone from the neighbourhood, with Bath stone dressings. The roofs are open timber, and the seats are open: those in the nave are of deal, varnished; and the stalls, altar-table, pulpit, &c., are of old English oak. All the passages and floors, except under the seats, are laid with coloured tiles, by Mr. Godwin, of Engwardine. The heating apparatus is by Messrs. Kimmington; and the lectern and gas-fittings, which are of illuminated iron, have been executed by Mr. Skidmore, of Coventry. The contractor was Mr. J. Mason, of Hereford. The cost will be about 2,200*l.* Mr. Kempson, of Hereford, was the architect.

**Chester.**—The foundation-stone of Trinity Church has been laid. The design is Early Decorated. The edifice will consist of nave, chancel, north and south aisles, vestry, and chorister's vestry, and will be built of red stone. The length from east to west is 101 ft., the width from north to south walls 66 ft. 6 in. At the south end corner there is a tower and spire, rising to a height of 151 ft. One of the chief entrances to the church will be by a moulded doorway through the tower. The nave is lighted east and west by moulded and traciced seven-light windows, the north and south aisles by three and two light windows. The nave is covered by an open-timbered roof; the chancel-roof carved, moulded, and panelled. The seats, which are calculated to accommodate about 900 persons, are to be of oak, and the floors laid with encaustic tiles. The architect is Mr. James Harrison, of Chester, and the builder, Mr. Thomas Hughes, of Aldford.

#### DISSENTING CHURCH-BUILDING NEWS.

**Summingdale (Berks).**—The Congregational Church here has been opened for divine service. Mr. W. F. Poulton, of Reading, is the architect. The entire cost has been about 1,200*l.*, towards which upwards of 800*l.* have been obtained.

**Liskeard (Cornwall).**—The corner stone of a new Independent Chapel has been laid here. The chapel is being built in Dean-street, opposite the post-office, on the site of an ancient structure of humble appearance, in which for nearly sixty years the Independent Church of Liskeard had worshipped. The style chosen is Early Decorated. The length will be 60 ft., and the breadth 36 ft. The basement will be occupied by school-rooms, in order to afford adequate light to which the floor of the chapel will be raised 4 ft. above the ground level. A gable nearly 60 ft. high will face the street. In this is to be a large five-light central window, with traciced head, with a smaller one on each side. With side and end galleries it is calculated that between 500 and 600 persons may be seated. There will be two aisles, and the seats

will be open benches. The roof will be ceiled and partly open timbered, stained, and varnished. The material used in building is a free working drab-coloured local stone, the memorial stone laid being Polyphant. The architect is Mr. Tarring, of London; and the builder, Mr. Sargeant, of Liskeard. The total cost may be estimated at between 1,500*l.* and 1,600*l.*

**Derby.**—The foundation stone of a Primitive Methodist Chapel has been laid in Traffic-street, Derby. Messrs. Giles & Brookhose, of this town, architects, prepared plans for the building, the estimated cost of erection of which was 2,500*l.* The contract was let to Mr. John Gadsby, builder. The old chapel has been pulled down.

**Liverpool.**—The new Presbyterian lecture-hall erected in Prince's-road for the temporary accommodation of the congregation of the United Presbyterians, has been opened with Divine service. As soon as the church is built, the present building will serve as the school; and its architecture is therefore of simple character. The interior is capable of seating about 500. It is built in ornamental brickwork. The cost has been about 2,500*l.*

**Stockport.**—The congregation and friends in connexion with Mount Tabor section of the New Connexion of Methodists in this town, have selected a site for the erection of a new chapel, &c., on Wellington-road South. The edifice is to be in the Corinthian style of architecture.

**Miles Platting.**—The foundation stone of a new chapel in connexion with the Wesleyan body has been laid, in Oldham-road, Miles Platting. The style of architecture is Gothic, and the materials are pressed bricks for the front, with Yorkshire stone dressing and black bricks and encaustic tiles freely introduced into the arches and string courses. Provision is made for 700 persons—364 on the ground-floor, and 336 in the end and two side galleries. The total cost of the building, including gas-fitting, boundary-walls, warming, architect's commission, &c., will be 2,611*l.* Mr. Mark Foggett, of Cheetham Hill, is the contractor for the whole of the works; and Messrs. Blackwell, Son, & Booth, of Manchester, Bury, and Southport, are the architects.

#### FROM SCOTLAND.

**Edinburgh.**—Lady Yester's Church, which has been closed for ten weeks, whilst undergoing extensive repairs, has been re-opened for divine service. The two large windows on either side of the pulpit have been filled with obscured glass, bordered with floral coloured designs. The side windows, six in number, are filled with mottled glass, each having a coloured border. The walls of the church have been lathed and plastered. A large sunlight, having 200 burners, has been placed in the centre of the ceiling. The expense of these and other minor improvements amounted to about 600*l.*—The foundation stone of the Chalmers Memorial Church, Grange, has been laid by the Earl of Kintore, in presence of a large assemblage. The object in view is not only to provide a suitable place of worship for the district, but to erect a monument to the memory of Dr. Chalmers. The edifice is in course of erection on the Grange estate, at the head of the Lovers' Loan, in close proximity to the last resting-place of the leader of the disruption. The plan of the new church will be cruciform, with a tower and spire at the south-east corner of the nave, and a turret on the east side. The style will be Geometric. The tower and spire are not, however, to be proceeded with in the meantime. The area of the church is designed to accommodate 500 people, but should circumstances require it, galleries can afterwards be fitted up to accommodate 500 more. The cost of the building is estimated at upwards of 5,000*l.*, and the architect is Mr. Patrick Wilson, of Edinburgh.

**Commencement of the Bridge over the Forth.**—This gigantic undertaking may now be said to have fairly commenced. The construction of a pier near the middle of the Forth has been contracted for. The pier, though not of the largest dimensions of those proposed, is upon a very great scale, and the foundation will be 45 ft. below the surface. The contractors are Messrs. Gilkes, Wilson, & Co., of Middleborough. The contract price is about 17,000*l.*, instead of 25,000*l.*, as estimated by Mr. Bouch, the engineer. The pier will be finished by May next. The system of founding without piling or cofferdam is to be adopted. This system, which has

been recently applied by Monsieur Kalebott in the Garonne, on a great scale, with success, proves to be a revival of an ancient method which was used in the construction of the old bridge of Westminster. In the lower portion Mr. Bouch uses green beech instead of iron; Mr. Edwin Clarke having found that such wood in the Thames exists in a condition of perfect soundness for an ascertained period of at least six hundred years. Iron, to a certain extent, used under such circumstances, is liable to corrosion. The pier when constructed will be tested by an enormous weight of iron rails. The foundation of the pier will occupy a space nearly equal to one-half of Westminster Hall. The formation of the pier is proceeding in the harbour of Burnt-island, from which at the proper time it will be floated to its own position and sunk.

**Glasgow.**—A meeting of the Glasgow town-council was held last week, at which, among other business, a proposal was introduced by the magistrates which, if carried into effect, will create nearly as great a revolution in the appearance of certain districts of Glasgow as has been made by the Emperor of the French in many quarters of Paris. The proposal comprises the gutting out of the dismal wilderness of unhealthy houses hidden behind each side of the Salt-market, High-street, Gallowgate, and Main-street, Gorbals, and the cost of the improvements is estimated at 1,000,000*l.* to 1,200,000*l.* This would also include the expense of a north-east park. The report was supported by the Lord Provost, and received the favourable attention of the council. It was ultimately agreed to prepare a Bill for Parliament soliciting the necessary powers.—The arrangements for the exhibition of works of art and skill by the working people of Glasgow are going on favourably. Already about 400 applications for space have been received from intending exhibitors. A number of gentlemen have promised to contribute paintings and other works of art. Her Majesty has intimated her intention of sending a bust of Prince Albert, executed by the Princess Royal. The Duke of Argyll is to open the Exhibition.

**Ayr.**—The memorial of the late Earl of Eglinton, of tournament memory, has been inaugurated. The statue stands 12 ft. high, and is placed upon a pedestal about 16 ft. in height, giving a total height to the monument of 28 ft. The earl is represented in his uniform of lieutenant of the county of Ayr. Mr. Noble was the artist. The statue was cast by Messrs. Robinson & Cottam, founders, Battersea, London. The pedestal is composed of a base of three tiers of Aberdeen grey granite, the lowest of which is 13 ft. 6 in. square, and three courses of red Peterhead granite, the first of which forms a truss base to the inscription-block. The pedestal was designed by Mr. Field, of Messrs. Alexander, M'Donald, Field, & Co., Granite Works, Aberdeen. The monument is erected at the west side of Wellington-square, in line with General Neil's Monument, and faces the portico of the County Buildings. The statue is 4½ tons in weight, and the pedestal upwards of 40 tons.

#### ACCIDENTS.

An inquest has been held on a carpenter's laborer, employed on the Foreign-Office works, who met with his death by falling down a "lift," a distance of 36 ft. When he was picked up, it was found that his skull was fractured, and that he was quite dead. The coroner thought that a rail ought to be placed at these openings to protect the lives of the workmen. The jury were of the same opinion as the coroner; and having returned a verdict of accidental death, appended a recommendation to that effect.

At Woolley Bridge, near Glossop, Mr. Ferriand has been enlarging his premises, which he has done by erecting another building similar to the one already erected, and these are joined to each other. In the course of building the second one, the partition wall of the first was removed, which was substituted by a large iron pillar placed in the centre, which transformed the building into one large square room. The south side of the roof of the first building and the north side of the roof of the new one, rested on each side of an immense iron trough, on which were flanges for them to rest. This trough was supported by the pillar before named; and it also appears that the water which fell on these two sides of the roof had to pass down the pillar.

The slaters had nearly finished slating this portion of the building, and, fortunately, had gone to dinner, when, without any warning whatever, the immense east-iron trough broke close to where the pillar stood, and the whole of the roof of both the old and new parts, and most of the wall of the new building, fell, smashing a quantity of timber and slate, besides doing damage to tin and zinc work in process of completion in the shop at the time. Mr. Ferrand and others were on the premises, but, fortunately, they sustained no injury, as the whole of the great weight and mass of the debris fell towards the centre of the floor.

The *Courrier des Alpes*, of the 6th inst., says:—"At the moment of going to press we have received news of a frightful catastrophe. The powder used in boring through the Alps exploded about ten o'clock this morning. Four workmen, who were labouring at the moment of the accident, were hurled to a considerable distance, and their bodies, when picked up, presented only shapeless masses: besides this, a great number of workmen were wounded. At Fourneaux and Modena, more than a kilometre and a half distant, scarcely a pane of glass remains in the houses, and a great number of buildings have sustained much damage. The loss is considerable."

Books Received.

Report of the (American) Commissioner of Patents for the year 1862: Arts and Manufactures. Washington: Government Printing Office, 1864.

This is a continuation of the report on American patent law which we noticed at some length in our last volume (p. 677). The present report, with its volume of illustrations, is for the year 1862. The letter-press consists of 752 pages of abstracts, besides seventy-one pages of index; and the illustrations, which are all on a small scale, form a volume of 446 pages. They run from No. 34,046 to 37,263. The whole, therefore, forms an extensive as well as valuable record; and we wish much that so condensed and excellent an illustrated view of British patents were issued by our own Government.

The Commissioner, in a letter transmitting his report, gives the following amongst other statistical abstracts:—

No. 1.	
Number of applications during the year 1862 .....	5,638
"    " Patents granted, including designs and reissues .....	39
"    " caveats filed .....	3,521
"    " applications for extension of patents .....	41
"    " patents extended .....	22
"    " expired 31st December, 1862 .....	618

Of the patents granted, there were:—	
To citizens of the United States .....	3,438
To subjects of Great Britain .....	39
"    " the French Empire .....	33
"    " other foreign governments .....	11
Total .....	3,521

No. 2.

Statement of money received during the year, viz.:	
On applications for patents, reissues, &c. ....	\$153,818 00
For copies and for recording assignments .....	11,081 50
Appropriation, July 16, 1862, to refund expenses of printing patents .....	50,855 49
Total .....	215,754 99

No. 3.

Statement of expenditures from the patent fund.	
Salaries .....	\$77,494 93
Contingent expenses .....	15,037 83
Temporary clerks .....	4,462 18

Leaving in the treasury January 1, 1863, the sum of .....

By Act of Congress of March 2, 1861, the Commissioner was authorised to print ten copies of the descriptions and of the drawings of the patents issued by the office. After a trial of eight months the work was discontinued on account of the expense, and the section of the law authorising the printing was subsequently repealed. During the year 1862 he ordered well-digested abstracts of the patents to be prepared

by an experienced examiner in the office, with the claims and reduced copies of the drawings attached, which accompany this report. The publication supplies a great want felt by inventors. The reports of 1859 and 1860 were issued in a style which reflected credit upon the office, and were of great value to all interested in the improvements in arts and manufactures.

VARIORUM.

"On the Scientific Investigation of Disease in Animals and Men." By an F.R.S. and F.R.C.P. Harrison, Pall-mall. The author of this tractate proposes "an extension of that system which has been many years in operation both in the Royal Society (Government grant) and in the British Association. It seems probable," he thinks, "that, if the Government would make grants to those who were engaged in scientific researches upon questions of such great public importance as the cattle plague, cholera, &c., great encouragement would be afforded, the number of workers would multiply, and it could scarcely happen but that many new facts would be demonstrated, and, perhaps, discoveries, of which the country might feel justly proud, be made. Grants would not only enable men to enter upon expensive inquiries which they could not otherwise undertake, but would excite a taste for purely scientific inquiry in younger men."—Part VII., for November, of "A Dictionary of Science, Literature, and Art," edited by W. T. Brande, D.C.L., &c., and the Rev. G. W. Cox, M.A. (Longmans & Co.), has been issued. It runs from "Lath" to "Marquess."—"Scientia Scientiarum: being some Account of the Origin and Objects of the Victoria Institute, or Philosophical Society of Great Britain. By a Member." London: Hardwicke. The first object of the Institute, or Philosophical Society, in question is, "to investigate fully and impartially the most important questions of philosophy and science, but more especially those that bear upon the great truths revealed in Holy Scripture, with the view of defending these truths against 'the oppositions of science, falsely so called.'" "The problem of the age," says Archdeacon Hare's "Sterling," is to reconcile faith with knowledge, philosophy with religion; and hundreds, even thousands of years before Archdeacon Hare was born, the grand end of human knowledge was declared to be "the reunion of philosophy with religion;" but whether the establishment of a society of this kind be likely to realize the great end in view, remains to be seen.—The *Gentleman's Magazine* has an interesting and very fully illustrated paper on "The Bishop's Palace at Wells." The *Gentleman's Magazine*, now 134 years old, is for sale.—"Rowland's Reason; or, The Little Cripple," is an interesting little story in words of two syllables, by Mrs. S. C. Hall (published by Seely, Jackson, & Halliday), and is intended as a prize-book for infant schools. It inculcates, in Mrs. Hall's own pleasant manner, self-denial and thought for others, and is prettily illustrated. The circumstance that the profits arising from its sale are to be given to the Cripples' Home, is an additional reason why we should recommend it.—The *Bombay Builder*, of October, gives a view of the proposed Esplanade Native Dispensary, Messrs. Scott, McClelland, & Co., architects. Such merit as it may have will depend wholly on the details. If this journal is to maintain the high price put on it, it must strengthen its staff.

Miscellanea.

HAYMARKET THEATRE.—Very well acted indeed is the new farce (new so far as English words are concerned) called "Who killed Cock Robin." Mrs. Charles Mathews has a part exactly suited to her, and plays it with wonderful vigour; and the same may be said of Mr. Mathews. "Used Up," since it went back to Paris, has proved more attractive here than ever.

THE RUSSIAN CHURCH.—The chapel of the Russian embassy, which was erected and finished under the superintendence, some months ago, of Mr. James Thomson, architect, and of which we gave a view, has lately received an important accession to its embellishments by the hand of Mr. W. Carlo Thomas. It consists of a series of heads, life size, of the Twelve Apostles, in the cupola. These are not copies, but original studies, and are entitled to favourable notice.

TESTIMONIAL TO A MASTER.—The workmen of Mr. Philip Anley, builder, as a mark of their gratitude, presented to him a handsome silver snuff-box at the Three Colts Tavern, London-wall, where they partook of a dinner on Tuesday, the 7th inst.; Mr. Miller in the chair.

ARCHITECTURE AND THE ROYAL ACADEMY.—Sir: The Royal Academy of Arts has just issued the card of admission to the lectures for the session 1865-6;—Anatomy, Mr. Richard Partridge; Sculpture, Mr. R. Westmacott, R.A. Where is Architecture? Is she to be again the "silent sister" she was in times gone by?—C. C.

SOCIETY OF ARTS.—The first meeting of the 112th session of this Society was held on Wednesday evening, in the Society's house, John-street, Adelphi. During the recess, full-length portraits of her Majesty and her children living in 1851, and of the late Prince Consort, were placed in the apartment where the meetings are held. Mr. Wm. Hawes presided, and read the opening address.

A GRACEFUL AND BENEFICENT ACT.—Mrs. Arnott, the widow of the well-known Dr. Arnott, author of "Physics," has signified her intention of endowing two scholarships for the study of Natural Philosophy;—the one at the Queen's College, Harley-street; the other at the Ladies' College, Bedford-square, to be called the Arnott Scholarships, in memory of her late husband.

CITY COMMISSIONERS OF SEWERS.—At the meeting of the City Commissioners of Sewers, Mr. H. Lowman Taylor brought forward a motion that the iron pavement that has for some time been placed in the Poultry, and which was found to be so dangerous and inconvenient to the traffic, should be taken up and replaced by granite. The motion was seconded by Mr. Burroughs, and after a short debate was agreed to.

A GAS COMPANY FOR FRAMBOROUGH, YORK.—The small town of Framborough, with its 300 houses and 1,300 inhabitants, is now making an effort to illuminate itself with gas. A limited liability company has been formed, with a local directorate. It is proposed to raise the modest capital of 2,000*l.*, by the issue of four hundred shares of 5*l.* each—a sum which will no doubt induce many of the inhabitants of that romantic village to make a small investment, and thus encourage a scheme which will bring comfort and improvement to themselves. Mr. J. F. Fairbank, C.E., is the engineer.

LIMESTONE WORKS AT KEYNESHAM.—Our attention has lately been directed to North Somersetshire, where Messrs. Hall, Son, & Co., have reopened the works at Keynesham, near Bristol, which were formerly carried on by a limited company. The limestone on this property produces blue has lime of good quality, and eminently hydraulic; and in addition the Messrs. Hall manufacture Portland, Roman, and other cements and plasters, which will be convenient for the builders and contractors of the West of England and the principalities, who are at present compelled to obtain their supplies from London. On the railways in course of construction in the neighbourhood of Bristol blue has is chiefly used.

ENLARGEMENT OF THE NATIONAL GALLERY.—The Commissioners of Works and Public Buildings have issued their plans for the extension of the National Gallery, preparatory to their being submitted to Parliament. The portion of land proposed to be taken in at the back of the Gallery, on the north side of Trafalgar-square, bounded by Hemming's-row on the north, by St. Martin's-place on the east, by Duke's-court on the south, and by Castle-street on the west. It is proposed by the commissioners to purchase St. Martin's Workhouse, and Archbishop Tenison's Grammar School, which stand on the site indicated.

FAILURE OF THE GREAT LOW-WATER BASIN AT BIRKENHEAD.—This failure has led the Mersey Dock Board to initiate a new plan of dock works at Birkenhead, and it was yesterday resolved to promote a bill to close the Woodside basin, to convert the low-water basin into a wet dock, and to excavate the foreshores at the northern entrances, Birkenhead. The alterations in the basin are estimated to cost 167,000*l.* What the excavations will cost it is impossible at present to estimate, as the foreshore at 14-ft. deep comes upon solid rock; and the last bill obtained by the Board provided for a depth of 17 ft. It is hoped, however, that some modification of the previous Act may be obtained as to depth, and thus an enormous expense avoided.

**LIGHTING OF BOMBAY WITH GAS.**—On the 7th of October, a portion of the town of Bombay was for the first time lighted with gas, which excited the greatest wonder amongst large numbers of the natives. The gas appeared to be of good quality, and burned brilliantly.

**MONUMENTAL.**—It is proposed to erect a memorial of the Marquis of Westminster at Chester. It is suggested that it should consist of a statue of the marquis. A committee has been appointed and subscriptions will be received by the banks in Chester. The amount collected already is 500 guineas.

**OPENING OF THE ALBERT INFIRMARY AT BISHOP'S WALTHAM.**—The 7th inst. was quite a gala day in the little town of Bishop's Waltham, owing to the opening of the Royal Albert Infirmary by their Royal Highnesses Prince Arthur and Princesses Helena and Louise. The approaches to Bishop's Waltham and High-street were gay with all sorts of decorations, triumphal arches, festoons, and mottoes.

**THE PRESTON EXHIBITION.**—This exhibition has now been open about seven weeks, and it has proved highly successful. The total number of admissions for the first six weeks was 70,000, and the receipts amounted to about 2,000. When all the expenses are paid there will be, at all events, a clear profit of 1,000*l.*, and it is probable that this sum will be considerably augmented. The proceeds will be equally divided between the Institution for the Diffusion of Knowledge and the Central Working Men's Club.

**OPEN SPACES (METROPOLIS) PRESERVATION.** It is intended to apply for leave to introduce into Parliament, next session, a Bill for the appointment of commissioners who shall be enabled to accept a surrender of, or to purchase in trust for the public, the rights possessed or claimed by lords of manors, or by commoners or others, in and with respect to all open spaces within 15 miles of the General Post-office; to empower the commissioners and the metropolitan police, or either of them, to superintend such open spaces and to abate nuisances there; to enable the commissioners to prepare a scheme for the improvement of such open spaces by drainage or otherwise; and to recommend the levying of a rate and other powers, for the purposes of the scheme.

**THE SANITARY STATE OF GATESHEAD.**—The public health committee of the town having recommended the appointment of an inspector of nuisances, at a salary of 100*l.* per annum, the town council made the appointment at their last meeting, on which occasion a report by the officer of health, Dr. W. Robinson, was read, which shows that the town must be in a very bad state of health, there having been more deaths than births during the last three months, or 105 deaths to 92 births, although there seems to have been no epidemic prevalent during that time. The report states, however, that typhus fever has now become epidemic, in the same long-neglected localities as ever, and so often complained of. "The town," says the medical officer, "was never in a worse condition to meet an epidemic. The air is impure, dwellings overcrowded, nearly every ashpit in connexion with tenement property is an open cesspool. Some of your thoroughfares are literally middens for the reception of ordure, the inhabitants having no conveniences attached to their dwellings." There are evidently some earnest sanitary reformers in the council, however; and the instant appointment of a nuisance inspector, urgently suggested by the medical officer as well as by the health committee, is a step towards a better state of matters.

**RAILWAY BRIDGE ACROSS THE MERSEY.**—A bridge is now being constructed for the London and North-Western Company, across the Mersey, between Runcorn and Liverpool. It approaches the north-east bank of the river at Runcorn Ferry, which it crosses at Runcorn by a bridge consisting of three wrought-iron trellis girder openings, 305 ft. in width each, and 75 ft. in height, on the under side of the girders, above the level of the river at high water, thus permitting any vessel of ordinary size to pass under it. On the Lancashire as well as on the Cheshire side of the river, these girders are supported by abutments crowned with castellated turrets, rising nearly 40 ft. above the railway level, whilst in the river the girders are supported by stone piers. The railway is carried through Runcorn by a viaduct of thirty-two arches. By this addition to the railway eight miles are saved in the distance between Liverpool and London.

**THE NEW SEA WALL AT YARMOUTH.**—This wall, which was recently erected at the expense of the Government, on the south-west side of Cliff-and Fort, is giving way, the sea beating against it and the heavy rains of late having done it serious injury.

**HARBOUR OF REFUGE AND COMMERCIAL DOCKS AT NEWHAVEN, SUSSEX.**—We observe from the *Surrey Standard and Sussex Express*, that an important and influential meeting of the inhabitants of Lewes and the neighbourhood has been held at the County Hall, for the purpose of receiving Capt. Roberts's address upon the great scheme for a harbour of refuge and commercial docks, &c., at the port of Newhaven. After some discussion of the subject, the following resolution was unanimously adopted:—"That this meeting is prepared cordially to support the formation of a harbour of refuge and commercial docks at Newhaven. That the plans now submitted to the meeting by Captain Roberts, appear to be well adapted for that object. That the members for the borough and the county be requested to use their influence in support of the Bill that may be introduced in the coming session of Parliament, which offers the best plan for a harbour of refuge and commercial docks at Newhaven, including a Government guarantee of 4 per cent. upon the requisite capital for such an object."

**STATISTICS OF THE DUBLIN EXHIBITION.**—In 1853 but one colony (besides India) and seven foreign countries were represented. This year 21 colonies, exclusive of India, and 21 foreign countries have obtained space. The number of works of art exhibited in 1853 was 1,493, while this year they amounted to 2,072. At a rough estimate the value of the industrial objects may be set down at more than 400,000*l.*, and the fine arts at nearly 300,000*l.*, making a total value of 700,000*l.* The Exhibition has been open for 159 days and 51 evenings, and the entire number of admissions of every kind has been a little over 900,000; being an average of about 5,000 by day, and of 3,000 by night. The number of visitors was a quarter of a million under those of 1853; and the total receipts, about 45,000*l.*, are considerably under those of 1853, which amounted to 60,000*l.* But for the Exhibition of that year it was necessary to erect wholly new and special buildings, at a net cost of upwards of 40,000*l.*, while for this year's Exhibition building, erected by a joint-stock company, a moderate equitable rent is all that the funds are chargeable with.

**TENDERS**

For alterations, additions, and repairs to No. 19, Castle-street, City, for Messrs. Tabbs & Lewis. Mr. H. Ford, architect:—

Palmer & Son .....	£1,177 0 0
Rivlin .....	1,000 0 0
King .....	808 10 0
Ashton .....	748 0 0

For extension of the India Rubber Company's Works, Vauxhall-road, Liverpool. Messrs. J. A. Picton & Son, architects. Quantities furnished:—

Tomkinson .....	£6,774 0 0
Hughes .....	6,426 0 0
Rome .....	6,270 0 0
Haigh & Co. ....	6,271 0 0
Mullin .....	6,232 0 0
Jones & Son .....	6,139 0 0
Ray .....	6,084 0 0
Urmon (accepted) ..	5,919 0 0

For rebuilding the North-Western Bank, Dale-street, Liverpool. Messrs. J. A. Picton & Son, architects. Quantities furnished:—

Denton .....	£6,750 0 0
Tomkinson .....	5,688 0 0
Holme & Nicol .....	5,628 0 0
Wells .....	4,999 0 0
Rome .....	4,859 0 0
Haigh & Co. ....	4,520 0 0
Jones & Son .....	4,565 0 0
Urmon .....	4,774 0 0
Ray .....	4,705 0 0
Hughes (accepted) ..	4,750 0 0

For additions and alterations to the Old Rising Sun, High-street, Marblebone, for Messrs. Taylor, Walker & Co. Mr. Chas. Dunch, architect. Quantities by Mr. G. P. Raggett:—

Coleman .....	£2,546 0 0
Perry .....	2,409 0 0
Simpson & Son .....	2,380 0 0
Newman & Mann .....	2,237 0 0

For alterations and additions to Rees and Crown, Biddenstreet, Canning Town, Essex, for Mr. George Wood. Messrs. Wm. Gosling & Son, architects:—

Heritage .....	£1,080 0 0
Finch .....	105 0 0
Thompson (accepted) ..	158 0 0

For rebuilding premises, Wharf-road, City-road, for Messrs. Gilbert, Brencley, & Co. Mr. H. J. Hammon, architect. Quantities by Mr. Charles Bampton:—

Turner & Sons .....	£1,259 0 0
Bishop .....	1,149 0 0
Eaton & Chapman .....	1,085 0 0

For the construction of roads on the Commonwealth Land and Building Company's estate at Northumberland Park, Tottenham. Mr. J. L. Dale, surveyor:—

Balk .....	£400 0 0
F. & F. J. Wood .....	621 0 0
Pound .....	406 0 0
King .....	400 0 0

**CHURCH TURRET, and STABLE CLOCKS.** J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergyman, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 33 & 34, Ludgate-hill, E.C. Established 1749.

# The Builder.

VOL. XXIII.—No. 1190.

*The Dead  
and  
the Living.*

R. HUTCHISON'S liberal determination to erect, in Liverpool, a depository for the dead, previous to interment, at the suggestion of Dr. Trench, and the general advocacy of similar steps elsewhere by the daily press, are encouraging signs to those who have long been urging the necessity for arrangements which should prevent the retention of the dead with the living, and the host of evils, moral

and physical, that follow. If the facts were well known,—if the sickness, misery, and demoralization that result from the practice were fully realised,—the next session of Parliament would probably not pass without such an enactment as should protect men and women, not merely against their neighbours in this respect, but against themselves,—against their own prejudices and feelings; the latter good in themselves, but deadly in their effect. It takes a long time to make the public hear. It is only by continued efforts that it can be done.

Again and again, since then, we have pointed out the evils resulting from the practice, under the circumstances in which the poor are placed, and urged the necessity of some endeavours to prevent it. "Apart from the inevitable consequence of such a state of things being most prejudicial to health" (as Mr. Hutchison truly says in his reply), "the practice of retaining the corpse within the chamber of the living, amidst filth, squalor, and wretchedness, begets a feeling of irreverence and indifference, and the abandonment of those religious feelings which ought to be associated with the obsequies of the dead. Nay, more; it has a positive demoralising and brutalising effect upon the minds of the people, and any scheme which has a tendency to lessen the evil is worth the experiment, even if it should prove abortive. I am fully alive to the difficulty and delicacy that surround the question. The poor feel as acutely as the rich the loss of their friends, and we must not hastily and perforce do violence to their natural feelings even in our attempt to serve them."

Much may be effected by advice and by providing the facilities for safely preserving the bodies of their deceased friends till the time for interment has arrived; but we are disposed to think that nothing effectual will be done till it be made illegal to retain a corpse in a room occupied by the living more than twenty-four hours. At Leeds this question is now being forced on the attention of the magistracy, by the rapid increase of fever in the lower parts of the town, mainly through the bodies of fever patients being allowed to remain for days and days in the confined and ill-ventilated rooms where they had died.

A few weeks ago we took occasion to examine a number of houses in the neighbourhood of Leather-lane, Holborn, chiefly with the view of learning the effect of recent great removals of houses on the population of those that remain,

and we may say, in parenthesis, that generally we found this had been largely increased; rents had been raised; many families were living each in one room, instead of two; and the number of dwellers in each house was consequently larger. Persons who are engaged in French-polishing, at bird-cage and box-making,—tailors, shoemakers, and others who need to have two rooms,—keeping one chiefly for a work-shop,—have only one, in which the operations of eating, sleeping, and working are carried on. The scenes of confusion which some of these places presented were extraordinary. In many instances, the landlord or his agent had increased the rent, in houses which let for about 30*l.* a year, to the extent of 4*l.* per annum (about 1*s.* 6*d.* a week). In some tenemented houses, the price of each room had been raised 6*d.* a week, so that those who sublet made a good thing of the difficulty. Let this pass, however, for the present. We are speaking simply of the retention of the dead in the midst of the living. We had made our way up a narrow and cranky staircase, and were at the top of the house. Entering the garret, we found, in gloom that was nearly darkness, a woman and five children, two of them very ill, a dead child in a coffin on the table, and the corpse of a man on the only bed in the miserable apartment. The man was uncoffined, and in a state of decomposition. The family had seen somewhat better days; and, on coming to this garret, had been forced to sell some of their furniture (a long step towards pauperism), because the staircase was too narrow for it. How the coffin, when it arrived, was to be brought up, did not seem clear. Why it had not been brought before the woman could not explain. We are not making any complaint against the parish authorities; we do not know sufficiently of the circumstances; but, in such a situation as this, the bodies should not have remained a day. Small wonder that the faces of all in the room were nearly as pale and lifeless as that of him who rested so quietly, though so hurtfully, amongst them. The atmosphere was oppressive and sickening: it was a miserable sight.

We give a sketch of the room, for the pencil conveys a stronger impression of such a scene than the pen,—the eye is sometimes more compassionate than the ear,—and it will surely serve as one more piece of evidence in proof of the assertion, that steps should immediately be taken to afford the poor the opportunity, at any rate, to remove the dead from the rooms in which they are forced to eat, work, and sleep.

As the natural consequence of the state of things existing in the neighbourhood referred to, sickness prevailed generally. At the same time, as we are assured on unquestionable authority, there were 200 cases of fever in Brooks Market hard by, and twenty-five of the poor children cared for in the Fox-court Ragged Schools were ill from the same cause. "I feel sure," writes one of the active promoters of this most useful institution (where funds are greatly needed), "that the cause of all this sickness is the wretched state of the neighbourhood, the slaughter-houses and bad drainage. In one part the rats have become so numerous (from the drains), that the boys catch them as we would

*The Dead and the Living: a Room near Leather-lane.*

and physical, that follow. If the facts were well known,—if the sickness, misery, and demoralization that result from the practice were fully realised,—the next session of Parliament would probably not pass without such an enactment as should protect men and women, not merely against their neighbours in this respect, but against themselves,—against their own prejudices and feelings; the latter good in themselves, but deadly in their effect. It takes a long time to make the public hear. It is only by continued efforts that it can be done.

Twelve years ago we gave a view of a room in the Bishopsgate-street district, showing what we had often met with in the course of our perambulations, the dead amidst the sleeping living, and wrote thus:—"In a single room the family sleep, work, eat, and perform the various duties of life in company with the dead, and the evil is increased by the length of time the poverty of parties obliges them to retain the corpse until

fish, by baiting a hook. We are exerting ourselves to alter this state of things, but we cannot expect to do very much, as the ignorance of the poor people is so great, that they will not believe that this fever might have been kept off, in a great measure. However, we must do what we can. We can have dust-hins emptied, can distribute disinfectants, and lime-wash rooms."

Similar accounts come from other parts of the metropolis, showing the existence of frightful evils. In Bethnal-green, almost periodically, juries affirm that the death of the person concerning whom they have been inquiring, was accelerated, if not caused, by the condition of the dwelling-place and neighborhood. Still, nothing, or comparatively nothing, is done to prevent a recurrence of the infamy. Hear what Dr. James Edmunds says in the last Bethnal-green case made public:—

"With regard to the 'house,' it was a dilapidated tenement of two small rooms, with a small shed called a kitchen, behind. The rooms, if such they could be called, were connected by a rickety staircase, so cranky as to be quite unsafe. The roof let in water, and the floor of the lower room, resting upon the earth, was a foot below the alley or court, and in many places the flooring was broken. The chimneys were so imperfectly constructed as to be likely to smoke, and they did smoke, so poisoning the lungs and preventing ventilation. There was a small yard of a few square feet, leading to a dilapidated privy, without water, with a large heap of stinking refuse surrounding it. There were no taps for water, but there were two offices whence the water ran out once a day for twenty minutes, and it ran into a small rotten tub without a cover. The whole yard was overflowed with water; for when the tub, the capacity of which was quite inadequate to the wants of a family, overflowed, there was no place for the water to run off; and the stink arising from the privy and the rotting refuse would be absorbed by the water in the tub, and which was thus rendered unwholesome, if not poisonous. He concluded by saying that the surroundings would account for the death of the child. The coroner and jury expressed their indignation that such tenements should be allowed to stand, and a verdict was returned 'That death arose from natural causes, accelerated by the bad sanitary condition of the house in which the parents lived.'"

Next week a similar disaster will occur, and similar "indignation" will be expressed.

An effort is being made, and wisely, to procure additional information as to the precise localities in our cities and towns productive of disease, or known to foster it. The Health Committee of the Social Science Association have drawn up a series of resolutions having reference to the possible advent of cholera, in accordance with the resolutions passed at the Conference held in August, whereas the Bishop of London presided; and on Monday last a deputation from the committee attended the President of the Poor Law Board, the Right Hon. C. P. Villiers, to obtain the co-operation of the Board. They showed him that the number of deaths in England by miasmatic disease, of which a large proportion is preventable, amounted in 1863, according to the Report of the Registrar-General, to 114,538; and as it is of great importance, for the economical and efficient direction of public effort to ascertain and make known, as early and as clearly as practicable, among what classes, under what conditions, and from what causes—whether of overcrowding, of defective water supply, want of proper ventilation, or otherwise—these diseases are developed and perpetuated, they asked the president to direct the boards of guardians particularly to inquire into and ascertain by their officers the seats of the most rife miasmatic diseases, and to publish them without delay for the information of the ratepayers and others.

What is wanted is, that poor-law inspectors should induce the medical and relieving officers to mark on maps of their districts the places they have had occasion to visit for diseases of the miasmatic class; that union clerks should mark on the same maps the places from whence deaths from diseases of the miasmatic class have been registered; that the medical and relieving officers should make notes and observations on the conditions of the places affected by miasmatic diseases, and the classes of persons who suffer most from them; that the courts, alleys, and other places which are undrained, or badly

drained, and which have no proper water-closets or self-cleansing house drains or sewers, and no proper pavement, should be marked on the proposed district map; that the police having constantly to traverse all districts, and being well acquainted with those which are physically in the worst conditions, should aid the local inquiries; that the marks on district maps should be transferred to general maps; then that maps and lists constructed and marked in the manner recommended should be published without delay for the use of all concerned in sanitary inspection; and further, that local associations should be formed to visit the places pointed out in the maps and lists, and to organise a system of voluntary house-to-house visitation, to ascertain the conditions which require removal or mitigation.

Mr. Villiers appeared to appreciate fully the importance of the steps pointed out, and promised the serious attention of the Board should be given to the request of the deputation. It is to be hoped that immediate steps will be taken in the direction pointed out; expense ought not to be considered for an instant. The money so employed would doubtless prove a most profitable investment. A sickly population is a costly burden to a country, and increases the criminal population, which is more expensive still.

#### THE CATHEDRAL OF SENS.

RESUMING our account of this cathedral,\* we have one more remark on the bases of the columns,—upon the modification of their sub-hases. In the earlier piers, the high plinth below the base proper has a cyma reversa as has moulding, of continuous outline but with intermediate joint, and this rests again upon a shallow plinth, with sides parallel to that above, the whole standing upon the octagonal base of the general pier, of which the upper edge is bevelled. The later architect gives a bolder sweep to the cyma reversa, commencing the curve from higher up, but still leaving the anomalous joint at the point of junction of the curve and the straight; then, to harmonize the profile here with the over-arching torus above, he gives a curved or concave level to the upper angle of the plinth below the cyma. The result is scarcely happy, and the process was scarcely logical; a more daring and consistent modification was soon to follow, by omitting the bevel, and bringing the whole sub-plinth to a plain face vertical to the over-arching moulding.

As regards the capitals, suffice it to mention that they are modified on the same principles as the bases; the Corinthian leafage is made more varied and flexible, the abacus profile is altered, and the corners or right-angles of the confluent abacuses are cut off, so as here also to modify the sharp opposition of angles and points.

But the next pier eastward is also a reconstruction, and exhibits new and very remarkable changes, all manifestly made on reflection; whether all with happy effect in relation to general proportions is not quite so certain.

The coupled Corinthian columns are superposed, and give way to a compound pier-like column. An attached shaft in front carries the transverse rib of the sextipartite vault of nave, and is grouped with a smaller on either side, running up to carry a roll moulding in nook of vault above clerestory. Larger lateral attached columns provide for the archivolt of the nave arches, and another at the back for the vaulting of the aisle.

Some change was clamorously called for. The paired columns of the earlier architect are set with their division on the line of the axis of the intermediate piers, and of their attached columns bearing the archivolt of nave arch; but from their relative dimensions the face of wall above is brought not much in advance of the axis of the front column, which thus, although not advancing nearly so far as the front line of the piers, seems away from its work, and the vacancy of its abacus is but ill filled up, or justified by the small shaft that rises from it to bear the central rib of the sextipartite vault. The new architect manifestly recognised this incongruity, and also that it was inconsistent for the columns composing the secondary piers, for such are the paired columns, to be so glaringly predominant in girth and solidity over the shafts of the chief piers; and

he also took a course to modify at least, though he was not yet prepared to obliterate, the gross contrast of alternate bays.

The coupled Corinthian columns had to give way to a compound pier-like column. This has an attached column at back answering to those on wall of aisle; and others, one on either side, corresponding with the lateral attached columns of piers and nave arches, an attached shaft in front to carry the transverse rib of sextipartite vault, and a smaller on either side bearing the roll-moulding in nook of clerestory correspond to the triple group in front of the altered pier westward. The intervals between the three shafts are, therefore, to complete the correspondence, channelled; and yet—so strong was the striving after improvement, not in exact correspondence—the margin now left is all but invisible, so that the outline of the flutes seems almost returned unbroken upon the convex shafts. The other intervals between the larger shafts are convex, as if the core of the pier were a cylindrical column, an effect enforced by the mouldings of the capital not being continuous with those of the lateral attached pillars. The angle of the abacus of this cor-column receives the moulding of the super-arch, and in the aisle it gives another angle to receive the diagonal vault-rib, not very comfortably—indeed, the capital towards the aisle is not a success. On the wall side, this rib drops upon a carved boss, which makes the best it can of a junction with the return angle of an engaged abacus that is taken somewhat by surprise.

In the base of this pier the next step is already taken to get rid of harsh contrasts of circles and right angles superposed. The architect has cut off the salient right angles of all the plinths, not merely of the largest, as in the former case; and he makes every lower torus entirely oversail its plinth edge, except in the case of the side shafts, where periphery still just ranges with angles; and here, accordingly, the notched sinking is still retained.

The mouldings of the archivolt are changed with the same intention. The angles are still shaped into roll-mouldings as before, but the right lines adjacent to the roll are now replaced by a concave section or fluting.

The view down the aisle from the west is very fine; the pillars attached to the wall are all uniform and of general normal proportions, and convey an impression of the germ of a style never yet thoroughly and artistically wrought out of combining the colonnade and the vault, which causes a sense of regret as we turn to follow the course of development in another direction, promising, fruitful, as this may be; and so, again, it is not without regret that we feel constrained to assent to the sacrifice of the transverse coupled columns, which in themselves have certainly a very grand effect.

One word for the triforium. The arches of this, like the nave arches, are pointed throughout, and in both cases the solid keystones show that the reconstructor of the south-west piers is only answerable for his own division. His changes of the triforium are marked enough. He gave more definition to the roll mouldings of the pair of super-arches; he inserted a blank quatrefoil in the head of each, and for their common central pier with face shaft substituted a triplet of shafts—foliaged capitals taking new forms, of course.

We have still to remark upon one cardinal change in the reconstructed bays,—it is that which we may recognise in the modifications of probably every altered Norman cathedral in England, and almost as constantly on the Continent; it consists in giving enhanced height to the opening of the nave arch. The exposition of the general principle involved in such change, and of the forms and limits of its application, belong to—would constitute—a treatise. It must suffice here to notice that it helped the law of subordination,—it helped the expression of lightness and loftiness so essential to the style.

In this case the new architect did not, as was so frequently the case, interfere with the level of the triforium string-course; but he took advantage of every inch that that limit allowed him, and fairly opens the arch up to a level with the crown of the aisle-vault.

As the line of capitals is also left undisturbed, the nave-arch necessarily becomes more acute. The acuteness is further enhanced by the contraction of the free span of the arch consequent on substitution of pier of broader axis for the coupled columns. Proportions, therefore, are revolutionized in every direction; and if the designer was right in securing at any rate an

\* See p. 809, ante.

hanced height of nave arch, we are still bound to ask whether he made the best compromise or secured the best advantages possible for the disturbances in other directions: the height of the arch relatively to its span, and also relatively to height of columns become changed, and, very important, the proportion between the interval of piers and the width of aisles and nave, and the breadth of piers.

The characteristic expression of the cathedral was indeed threatened to be materially impaired. The unusual width of the nave harmonizes with the free opening into the aisles that is favoured by the paired transverse columns and the broad open span of the original nave arches, both seriously compromised in the new arrangement.

We leave much more to be said, as we left much more to be seen at Sens. We leave the *Salle Synodale*, with its noble apartment for debating theologians above, and its deep pit of a dungeon for others less at ease below; its memories of Becket refugee, and of Abelard on his defence. It is a place that may be pleasantly sojourned to for one of the shorter intervals of a traveller's fits of restlessness. About its sloping streets, with their abundant brooks of living waters, and among its avenues, he may meet from time to time a procession of a newly wedded pair of Galli Senones, doing homage to a custom of their country, by promeneating through one chief street of the city after another, in all the pomp of mauve gloves, and all the pride of white muslin, that is not at times very considerate of the complexities it is matched with; and if he is early he may sometimes recognise the same train on the morrow proceeding together in scarcely diminished decoration, to gather tribute of congratulation at the best frequented *cafés*. Roman remains are at hand for those who are ill content or jealous, either of the present or the future: for ourselves, restlessness had taken its rest, and was revived; and, following the course of Caesar, we departed on the top of a diligence, and arrived at Troyes, with nothing more to record of the journey than finding in "Hudibras,"—"what business had he there at such a time?"—"the ingenious rhyme of "perpendicularers" for "bricklayers,"—and an impression of the perfect satisfaction with political things as they are, conveyed by our driver's comment on some arrangements found more practicable in England than in France,—"*Tous n'avez pas tant de mauvaises têtes.*"

#### "BONNIE DUNDEE."

THE reply that a very blunt Milesian once made to a very consequential Madam, who was wont to boast of her youthful charms, "If ye ever were purty, ma'am, you must have greatly altered," may, in a measure, be applied to "Bonnie Dundee." Whatever the poet may have seen in it of erst its beauty, now-a-days, to me at least, seems very faint indeed. However, if it is not really handsome as a place, it has sundry items that in the aggregate go far to make it agreeable.

Dundee is an irregular, closely-built, and sinuous thoroughfare Scottish town, up to its eyes in business, and chock full of life and animation. Its radial arteries are two or three streets, called the Murraygate, the Netbergate, and the Overgate: the former stretching respectively from the Hill-town and the Eastport, merging in a short wide open called the High-street, and again diverging, their continuations meeting once more at the end of the town on the Perth road. The Overgate, which is the direct outlet of the town in passing from the Murraygate through the High-street, winds its way through the Scouringburn, the Westport, and on to the Hawkhill. The architecture of the streets in general is unrelieved by aught remarkable, if we accept its foci, the High-street and the new street at right angles from the latter, called Reform-street, which, in point of style, is certainly a reform, and is the only thoroughfare in the town properly deserving the name of street. The houses in Reform-street are all regular and apparently well-built edifices, the street level of all being devoted to shop-fronts and public offices. At the upper end of the street is the General Post-office; opposite which is a square piece of ground lately cleared of sundry *débris*, and allotted by the corporate body, for the erection of an Albert testimonial. In or about the High-street are the Town and Public Halls and other offices. *En passant* of halls, I may remark that Dundee, from its size, is not sparse of halls

for public accommodation: they can be had, large and small, tolerably good and cheap. Churches, too, are plentiful, and in variety.

The old staple trade of Dundee, that of weaving, is still carried on extensively; but the hand-loom is fastly superseded by the steam-loom; and the consequence is, that girls are in the ascendant over the men in number and wage, the latter only earning a miserable pittance at a trade which a few years since enabled them to live well, and to appear respectable. The factories and mills of Dundee absorb a vast amount of female labour, and an impression exists with some that the female portion of the population is three to one.

Baxter's mills is one of the largest of this class in the town. The interiors of these large factories, where such a vast amount of human labour, senses, sinews, and thews is at a tension, are a study. The ceaseless din, and whirl, and dust, and indescribable noises that are continually playing, are enough to dull the ordinary perception of the most rugged natures; indeed, I am assured that the necessities of the system and its operations have begot signs and symbols as mediums of communication between the workers and their overseers, as human language is almost inaudible amid such a deafening concert of discordant sounds.

The Scottish carpet trade is carried on extensively in the town; and the recent introduction of jute from the Continent has supplied the place of flax, or is used in conjunction, in the manufacture—not to the bettering of the article, I opine, but to the existence and cheapening of the luxury, I believe.

There are some iron foundries in the town, which do a tolerable trade. The port of Dundee is a thriving one, and considerable shipping interests are connected therewith. It has steam communication with Newcastle and London, and it is also the *dépôt* or rendezvous of some whalers. The dockage, which certainly needed extension, is getting additions made thereto, and will need more, from the growing importance of the town and its trade.

The obstruction in its direct railway communication with the south is likely to be soon removed, it is to be hoped, by the spanning of the river Tay, from Dundee to Newport. When this is effected, in conjunction with that other great undertaking now commenced—the bridging of the Firth of Forth at Burntisland,—the prospects of Dundee will, or ought to be, materially altered for the better.

The hobbledehoy system by which the railway communication through Edinburgh to the north of Scotland is carried on, by the steam ferries called Granton and Broughty Ferry, ought long since to have been abolished.

The practical genius that bridged the St. Lawrence, that spanned the Thames, that lifted the Tyne high-level, that swung the suspension, that cast the tubular, that hung the Boyne viaduct, that ran the underground railway, could have long since bridged the Forth or arched the Tay, with straight or sinuous lines of metal, that knew no termini from King's-cross to Cromarty. Ay, truly, and it will be so. So be it!

There is a vast Irish contingent in Dundee, not less than 25,000 of a population mostly northern Irish. There are two places of Roman Catholic worship; one in Maxwell town, and the other in the Netbergate. It is strange that, as a body, they are entirely unrepresented in any public manner except in a religious point of view. They have no cemetery of their own, although as a class they are strong, and contribute immense sums yearly to the support of their church. A cemetery, I understand, was projected a few years since, by members of their own communion, and contributions were collected for a few years. Land was eventually bought for the purpose, and again resold, and the money pocketed by the principals, and Paddy was minus still a cemetery of his own. How was this? It would be advisable to know; but at present I shall not ventilate what the aggrieved ones circulate about the subject.

The working Irish are not very well housed in Dundee, nor are many of the townspeople either.

The sanitary condition of the town is far from irreproachable, particularly on the Hilltown side, on the north, and the sweltering Scouringburn district on the south. It is a miracle that mortality in the summer time is not greater than what it is in these latter places, for the poor inmates of many of those tenements are, of a verity, "cabineted, cribbed, confined." The

pic is a domestic accompaniment with many struggling tenants on the northern side of the town, not for its agreeable manner, it may be judged, but as a back or provision whereby its sale may meet the half-yearly or yearly wants that are certain to occur. If "only in the regions of the blind the one-eyed become kings," Patriek does not stand alone as a rearer of pigs in the town; Sandy may be met with an occasional grunter also in his safe keeping, of which the civic baillie is not troubled with the knowledge.

I do not know how many scavengers the council thinks it necessary to supply the town with, or whether they have appointed such a personage as an inspector of nuisances (perhaps it is thought such a "bonnie" place does not need one); but it were to be wished that the marks of the rubbish were more visible in the Hilltown and adjacent, and in the Scouringburn and its entries and environs. If the sewerage be sufficient for the town, which I doubt, a flushing-machine might be used in some of the lanes in the southern quarter with advantage, to send accumulating ordure and offal into its proper channel; or, perhaps, what might be better, a more frequent introduction of the shovel and broom, and gutter-cart.

In justice to "Bonnie Dundee," it must be said that its people are a pushing, thrifty, intelligent class, full of the spirit of business, and bent on making money. Where sanitary laws are disregarded, social life and morality must be lax. Drunkenness is rife enough in the town, and the "great social evil" so called, keeps pace with it. Nor is illegitimacy at a discount, either here or farther north.

I almost forgot to mention that the townspeople have the benefit of a very agreeable and tastefully laid-out enclosure, called Baxter's Park, after the generous donor, and which, in situation and in a sanitary point of view, is a great acquisition to the town. C. C. H.

#### ART IN THE PELOPONNESUS.\*

BOOKS of travel are becoming a drug in the literary market. Volumes descriptive of the scenery and inhabitants of every quarter of the globe are to be seen on all book-stalls for sale at ridiculously low prices.

But amongst this cheap and miscellaneous collection there are rarely to be found works which contain valuable information on archeological matter—since these, from their costly, sterling, or, what some would term, their heavy qualities, retain their value through succeeding generations, and remain behind, while the lighter sort of literature is floated down the stream of time into the great gulf of oblivion. In the present day, as travellers are becoming better informed than formerly on antiquarian subjects, this class of books is fortunately on the increase, and many such have lately issued from the press. The travels of Layard, Newton, Smith & Porcher, and Sir Thomas Wyse, will long survive, and form text-books serving for reference to futuro travellers; and, from the exact nature of the archeological matter contained in them, will furnish food fit to be digested by the future historian of art.

Groce, the prime abode of art and literature, and the seat of those superb demmons who have been lately whitewashed by a masterly hand, and with a plentiful brush, has of all countries ever been first and foremost in the affections of the philosopher, the scholar, and the antiquary.

The pilgrims to her venerable shores and deserted shrines have been numerous, and also fully competent to explore and describe them. Amongst the most illustrious on the roll of these names, are Chandler, Athenian Stuart, Leake, and Gell. These have all left behind them interesting records of their researches. Now-a-days the pilgrims are becoming few and the pilgrimages less frequent; for there are few who will risk life, limb, or property in travelling through a country, the government of which is too feeble to put down brigandage. In this respect there has been little or no advance made during the last ten years. At the time of the Crimean war, officers who belonged to the allied regiments, stationed at the Pirous, were actually

\* "An Excursion in the Peloponnesus in the year 1858." By the late Right Hon. Sir Thomas Wyse, K.C.B., H.M.'s Envoy Extraordinary and Minister Plenipotentiary at Athens, from 1849 to 1852. Edited by his niece, Winifrede M. Wyse. Day & Son, Gate-street, Lincoln's Inn-fields, 1865.

neighbouring church, who refused to take it, and referred him to the eparch of the town; who told him, in an indignant manner, that he ought to be ashamed of himself for attempting to deprive the great Greek nation of the works of their ancestors, which were, in fact, the property of the Government. So curiosity-seekers will obtain little from Greece, either by the will of the people or the permission of the Government.

At Egira the walls of the town and the Acropolis could be traced; and at Sicyon the foundations of houses and the street-lines are "more wonderfully preserved than in any other site of Greece."

When the party of travellers came in sight of the columns of Corinth, they felt themselves at home; for, in the vast panorama which is seen from that model Acropolis, the Acrocorinth, the sister fortress of Athens, is a prominent feature. This view is, perhaps, the finest in Greece. It embraces the isthmus, which looks like a mere strip, dividing the Gulf of Corinth from the charming Bay of Salamis; Cape Sunium; the Piræus; Athens and its mountain back-ground, and the island of Egira; and, on the other hand, the plain skirting the gulf in the direction of Sicyon, and the picturesque northern boundary of the gulf. It is beautiful, even in the full glare of mid-day; and we can well imagine what it is in the rich light of sunrise or sunset.

The seven columns of Corinth are noted as being the earliest specimens of the Doric order in Greece. They are the only remains of the ancient city which stood below the Acrocorinth. We consider the columns of the archaic temple of Neptune at Assos to be still older, judging from the form and projection of the columns. Both temples probably date from the sixth century before the Christian era.

What most strikes the reader of travels in Greece is the fact of there being so few remains of its ancient grandeur, such as those described by Pausanias and other competent authorities, still visible; besides the ruins at Athens, the Temple of Basse, the columns of Corinth, the treasury of Atreus at Mycæne, and the walls of some of its cities, all memorials of its cities and magnificent temples have disappeared. There are various ways of accounting for this. The country has been subject to invasions and incursions on all sides, and the conquerors must have not only pillaged the temples and carried away the spoils, but they must have destroyed them, and used the stones for the construction of their fortresses. If we look through Coronnelli's "Memorie de Regni della Morea" we shall find representations of castles constructed or largely repaired by the Venetians at Nauplia, Malvasia or Novemrasia, Cape Matapan, Mistra, Passava, Chialafa, Larinata, Coroni, Modon, Navarino, Tornese, Chiarenza, Patras, and Corinth,—in fact, all round the shores of the Peloponnesus. The stones used in these constructions came from the ruins of neighbouring cities, and their walls would no doubt be rich mines to the antiquary, furnishing inscriptions, mouldings, and architectural members of every description.

In these times of improvements in artillery, these walls would be quite useless as fortifications, so it is to be hoped they may some day be pulled down for the benefit of the literati of succeeding generations; for they,—at least as many of them as we have seen,—are uninteresting as specimens of military architecture as well as inadequate for purposes of defence.

In conclusion, we recommend the perusal of these volumes to all who wish to be instructed as well as entertained;—who prefer substantial food for the mind to the light dainties which are generally alone to be found in the present literature of "peregrination."

#### THE PAYMENT OF ARCHITECTS.

SIR,—The coming together, in the *Builder* for November 4th, of two claims so sharply contrasted, in every way, as that of M. Leclaire, the building tradesman,—"*chef d'industrie*,"—and Mr. Thos. Harris, the "professional" British architect, led me to append to the answer you allowed me to give the latter, on November 11th, a remark on the strangeness of the coincidence; which, I said, led me to venture a "very practical" suggestion; meaning, not one for *immediate practice*, but one whose value and practicability in the nature of things, but *impracticability* while Mr. Harris, and "British architects" in

general, claim their present absurd position, would show forcibly the mischief of that position, and the practical value of overthrowing it. In short, I meant that, having till that last paragraph treated only of Mr. Harris's proposed problem, which might seem, for the general public, far from a "very practical" one (seeing it appears only to affect their dealings with so small a class as the R.I.B.A.), it seemed good now to show, or briefly undertake to hint apocryphally, that this has a hearing, and a very direct hearing, too, however easily occupying the notice of all present readers, on the most practical of all present questions,—even that problem of M. Leclaire (now first obtaining anything like its due prominence in your pages), which is daily more and more loudly declaring itself as the one all-absorbing problem of our century, and making it almost childish to call any disconnected one "practical" at all.

It would perhaps have been better to have suppressed that unlucky final paragraph altogether, than to have it mistaken, as "G. W." now quotes it, for my suggestion of what "we should first" do. On the contrary, as I was vain enough to hope I had made plain, it was a main part of the "real sore" that we can only look to do this last; after the seemingly unimportant, and therefore neglected step, of obtaining,—what, according to "G. W.," the Americans appear to have obtained already,—a class of really "professional" architects: in other words, master-designers who are bound "not to be the contractors' partners." What "we should abolish" first, as I hoped I had clearly said,—or rather, what we must abolish, before the remotest chance of a real architecture,—is this partnership. In short, what we have to do, we—the lay public—is to insist, in the most absolute manner, even more peremptorily than "G. W." says his Yankee clients did, on having architects or engineers willing to reckon their remuneration (like men of all other pursuits) by some approximate proportion to their services;—to insist on a counter-institute, if need be,—an opposition I. B. A., to stand on the mere removal of the Bedlamite R. I. B. A. proposition of 1862. Let all be free to charge, each by his own rule, on his own basis, and his own scale: one, if he please, according to the number of nails in a house, or the number of letters in a client's name, or the number of cats met in a day,—with this sole proviso, that it must not be by per-centago on outlay, or on any tradesman's contract (and I should add, that the architect must not choose or recommend any contractor). The former, I say, must he even more absolutely insisted on than by "G. W.'s" American client; for this reason,—if we are to have any chance of rational architecture, we must go a point beyond that Yankee's "cuteness"—namely, to the point of the art of invention, we can expect no man to invent rational ways of doing things in our building world who has shown incapability of inventing rational ways of charging in his own bills!

That is where I deduce, sir, from "G. W.'s" story, that his client's penetration fell short; and that, if it were a true sample of average Transatlantic smartness, the whole murder is out by Cousin Jonathan, much as his "cuteness" may exceed John Bull's, has not yet been "cute" enough to build less ridiculously. On understanding that the more "G. W." might make his building cost, the more his fee would come to, he guessed that wouldn't work "any way you can fix it." Capital guess; but instead of stopping at it, he should have been led to add, "Britisher, I calculate we want architects with heads, but not the sort of heads into which it ever enters to make gravely the proposal you have entertained us with. Many thanks for your complaisance in determining to 'ponder on the rights of the thing;' but the precise difference between the kind of man we want and the kind of man we don't want for this purpose—between architect and no architect—is that the one ponders 'the rights of a thing' that he undertakes, without being forced so to ponder by any dead-lock or strike; while the other does not ponder them till he is so forced. We have learnt from you all we wished to know, sir. Good morning!"

An architect must be, in the broadest sense, an artist; and "what do we understand by an artist?" asks M. Trélat, in the opening address of the School of Architecture, reported in the French papers this week. By "an artist," says he, we mean to say, that he whom we so denigrate does not necessarily do exactly like everybody; but that whenever he undertakes a

thing, he says to himself not, "*How does my neighbour do this?*" but, "*How ought this to be done that it may be well done?*" Well, this vulgar sense, so generally applied to the epithet, artist,—really, gentlemen, this is the true criterion of the artist." Now, with much deference to American "cuteness, sir, I believe that it will not suffice, nor will British, to procure decent architecture, till it learns at least the above lesson, and reaches to the point of asking, is it likely that men who do not "ponder the rights of" so prominent a thing as the mode of charging their own bills till forced thereto by absolute dead-lock and announcement that their entire business "won't work any way you can fix it," are the sort of men to enter spontaneously into the rights and logic of the innumerable things, great and little, that go to a real building design?

Without seeing any great objection to the method of payment to which "G. W." says he was driven in America, nor any necessity for an agreement of different artists on a common scale, or even a common basis, I am perfectly ready to surrender mine on the suggestion of a better: that basis is interest in the suggestion of a letter: that basis is *superficial area of flooring*. If you take cubical measure, the designer will have a pecuniary interest in loftiness, and he unable to advise disinterestedly the heightening of any story, or room, or roof. So, again, if you take external measures, he will have a trade interest in thick walls. Internal covered floor-space is the final cause of every building, and "payment by results" (as the Revised Code has taught us to say), must therefore primarily include payment by the measure of this. We may divide buildings into these classes:—

1. Warehouses, stables, or such as are neither inhabited nor exposed to public view; for these, a charge per square of flooring alone.

2. The same buildings when exposed in towns, the same charge as above; and added to this (except where the architect puts his name on the exterior), a charge per lineal measure of the external plan of each story, omitting what adjoins other buildings or properties.

3. Inhabited and public buildings; a higher charge per square of flooring, with the same addition as above for perimeter of each story, and a price specially agreed on (after sketch made) for every variation design. Without this last, as the whole charge would be simply like that of "G. W." in America, for "all that was necessary to the completion" of a building; and it is plainly never necessary that there should be more than one form of capital (for instance) or one window-head, or one moulding throughout the whole; there would be no chance of any variety but from the architect's desire to advertise himself, or his pure love of designing, motives that abundant experience has shown us to be insufficient, even with a Pugin.

People would save any charge for external perimeter, by obliging the architect to put his name on the work; for when you force him to do this, you force him to design an exterior that he may not be ashamed of. On the other hand, when you either oblige or allow him to leave it anonymous, you must pay for any external beauty you may get, and not get so good either.

EDWARD L. GARBETT.

#### ARCHITECTS' CHARGES.

In mercantile business, and in some professions, where the profits made upon either a large or small amount of business are pretty nearly at the same rate, the successful man flourishes by means of doing a large amount of business. Thus a broker clears his percentage, and a merchant his profits, at very much the same rate; but a merchant or a broker can deal with a hundred thousand pounds without much more trouble than with five hundred pounds, and consequently the able and successful merchant or broker flourishes through the extension of his transactions, more than through his getting higher rates of profit upon each one.

In those professions, on the other hand, where nothing can be done by deputy, the able and successful man rapidly reaches the limit of work he can actually do, and his future progress is secured by his raising his rate of remuneration; so that those only who need his services very much, or at least are willing to pay for them very highly, get any share of his time. Thus, if I want a painting by Millais, or a statue by

Gibson, I must pay a very high price or I cannot have it.

An architect can, to a very considerable extent, get the routine work of his profession done for him by assistants; and therefore it appears to me fair, that, in all ordinary cases, an able and successful architect should, in the main, be content with that increase in fortune which the increase in the number and importance of the works entrusted to him brings with it, on the commission principle; but the moment he is called upon to render personal or mainly personal services,—i.e., when he sits as an arbitrator, which no one can do for him; or when he designs "works in which the art required is of a high kind and the expenditure mainly for skilled labour,"—then, like the painter or sculptor, he values his time according to his standing, skill, and repute, and is paid accordingly.

There is, however, one step which I should like to see taken by some of the leading members of the profession.

After a time, in some cases, work has been known so to pour in upon an able and popular architect, that even with a very efficient staff he has not been able any longer to confine the portions of work done by assistants to what I have termed "the routine work;" but he is obliged to depute some of the designing, and more of the superintendence than is advantageous for the work, his time being almost wholly taken up by interviews with clients or correspondence. As soon as regular work has increased to this pitch, I should like to see an architect increase the percentage he charges. It would have the effect of increasing his income without overburdening him with a hopelessly embarrassing mass of work which he cannot possibly get properly through. It would sift from his *clients* those who cared for him least, and from his works those buildings he would least desire to have; and it would send to other architects a certain number of works which to them are of importance, while it would effectually mark the standing which any man who could afford to do it has reached.

With this alteration, I believe the operation of the system of commission to be much less open to objection than your recent correspondents seem to consider it. It has several points to recommend it. It is simple of application, generally understood, and, above all, universally recognised. I am not at this moment able to quote cases, but I think I am right in saying that the Institute scale of charges has been again and again produced in court since its publication, and has been uniformly respected.

In its bearing upon the client, the system of commission has always seemed to me very fair. The advantage gained by the employment of an architect is, that such skill and technical knowledge as are wanted to make the building suit the requirements, are at the service of the employer. It may be of more importance to the public that a church should be well designed than a factory; but to the proprietor of the factory bad arrangement, bad lighting, and unscientific disposition of materials, are quite as likely to be ruinous as inartistic design, or ignorant treatment of decoration, might prove to the patron of the church. I hold, therefore, that the requisite skill is an element which may be held to be in all cases equally necessary, and on the whole its value to the purchaser of it may be held to bear a certain fixed ratio to the cost of the bricks and mortar. If this be so, the payment of a certain percentage upon that cost is a mode of meeting the matter which, under all circumstances, is fair to the employer. And I believe this is generally felt to be true by most persons who have been engaged in building in the capacity of employers.

If what I have advanced be correct, it appears that the common consent of the profession to the terms set forth in the Institute paper on professional practice is a matter on which those of us who are, like myself, proud of belonging to a body of which Mr. Garbett "repudiates the name," have cause to congratulate ourselves.

There is no mode of dealing with the subject not open to the objection that a dishonest man may endeavour to use it as a means of fraud, and a suspicious man may consider it open to question. Charge how you will, the rogue will contrive to run up an unjustly long bill; and the man who, instead of employing a man of honour and trusting him, desires to guard against his professional adviser's acting like a rogue, will always have cause, or find cause, to object. It is not so much to any architect's interest to increase outlay to a vexatious degree, in order

thereby to increase his commission, while at the same time he "kills the goose which lays the golden eggs," as it is to go through his work with satisfaction to his employers; and this, I think, a sufficient answer to Mr. Denison's text and the commentary thereon furnished in Mr. Garbett's very remarkable communication.

May I add one word with reference to the charging commission upon the average of the tenders? It appears to me that the objection taken by "X. Y. Z." is quite unanswerable; but, if that be disposed of, an equally serious objection remains behind, and one which I am sure Mr. Harris must have entirely overlooked. Such a custom implies that the architect habitually gets his buildings done by the lowest tenderer, for less than they are worth. To do this intentionally and customarily would be nothing short of dishonest; and yet, if the contract is to be let to one figure and the architect's commission charged upon another, what else can we infer?

T. R. S.

#### CONCRETE FOR THE ISTHMUS OF SUEZ CANAL.

For constructing the concrete blocks for the jetty at Port Said, the contract was made on the 2nd of October, 1863. Since then, the installation of the necessary works has been completed. MM. Dussaud, Frères, have set up the following machinery and plant:—

1st. A set of mortar-mills, comprising ten grinders, put into movement by a 60-horse power engine. Each grinder is able to deliver 35 cubic metres of mortar per diem, or at the total rate of 350 cubic metres, thus producing 35 blocks of 10 cubic metres each. This amount, at the rate of twenty days per month, gives 8,400 blocks per year. The workshops for making these blocks is established on a travelling-crane of large dimensions, connected by an inclined railway with the lime and sand depots, on which waggons are hauled up by another engine of 60-horse power. According as the ingredients are ready for the blocks, they are dropped down by a shoot into other waggons below.

2nd. Platform for the fabrication of blocks. These are arranged methodically in parallel lines, and at present number about 1,900 ready to be dropped in place. According as these are removed to their ultimate destination, their place is occupied by other blocks, newly made, so that the supply of material is constant. The time for setting is about three months; and at the expiration of that period they become sufficiently hard. In capacity 10 cubic metres, and weighing 20 tons each, they are composed of 45 per cent. of hydraulic lime from Theil, and 55 per cent. of sand and sea water.

3rd. The machinery for lifting, transporting, and dropping the blocks. This consists in a number of locomotives and stationary engines, which execute the transport in the most satisfactory manner.

4th. Cantilevers or cranes, for depositing these blocks in the sea, carried by lighters specially constructed for the purpose.

The sand for the concrete is furnished by the dredging of the port, in virtue of a convention passed between MM. Dussaud and the contractors for the excavation of the canal bed.

The jetties will employ in all 250,000 cubic metres of concrete blocks, the first of which was sunk on the 9th of August last. Up to the end of August, 148 had been dropped.

The shipping returns of Port Said, from the commencement of the works up to the 1st of July, 1865, give as traffic for the harbour 2,037 ships, of the total tonnage of 359,548.

#### SUBMARINE DIVING.

ENDEAVOURS were made lately at Brest to float the English vessel *Columbian*, sunk in January last: the experiments are highly interesting as furnishing details concerning the difficulties encountered in deep diving operations. The diver was M. Casimir Deschamps, an experienced man, formerly *détaché* in the Crimean army. Member of the Committee of the Association of Inventors under the presidency of Baron Taylor. Clad in the impermeable dress, and covered with the casque, he descended at 3 h. 30 m., at the same time that the submarine lamp was lowered down the ladder.

At 30 metres (98·4 ft.) the lamp was no longer visible, and the men who held it felt its weight suddenly increased. At 3 h. 40 m. the diver reached the depth of 60 metres (196·8 ft.), when one of the air-supply pipes burst at the joining with the pump. Order was given to continue pumping, while the man was at once hauled up, the pump working while the engineer held the pipe to the pump with his hands hound round with a handkerchief. At 3 h. 44 m. the feed-pipe of the other pump burst also, and the lamp was then carefully drawn up; but it was found completely crushed in by the pressure, which amounted to 6 atmospheres, or 85 lb. per square inch. The cylindrical body of the lamp was macerated and unsoldered, the flat glass had disappeared, and the lens was driven into the interior, where it hung by one screw. The diver came up safe and sound.

Fresh pipes having been put to the pumps, the courageous diver, paying no attention whatever to the accident that had happened, eagerly descended a second time.

At 4 h. 44 m. he commenced the second descent, under the pressure of two atmospheres: at 4 h. 46 m., at 25 metres (82 ft.) depth, the pressure was 3 atm.; at 4 h. 49 m., at 40 metres (131 ft. 3 in.), pressure 4 atm. (here the diver called for *more air*); at 4 h. 50 m. 30 s., at 55 metres (180 ft. 5 in.), 6 atm.; at 4 h. 54 m. 30 s., at 60 metres, 6 atm.; at 4 h. 58 m. 50 s., depth, 60 metres, same pressure; at 5 h. 2 m., the diver gave the signal to be hauled up, which was obeyed very carefully, the pumps working. No air-hubbles were seen to rise on the starboard side. The captain, stationed on the bridge, perceived the diver floating on the surface, and at once sent a boat to his rescue, the pumps working with two atmospheres pressure. The man was lifted on deck in a very exhausted state; having fainted twice, he was ultimately brought round by being rubbed over the body with camphorated spirits of wine, ether, &c. He then slept, and at seven o'clock took some food. It was found that the diving apparatus (an impermeable one) had been broken in the interior, so that the water penetrated into the legs of the contrivance. The state in which the diver rose clearly proved that neither the man nor the apparatus could support with impunity a pressure of six atmospheres, or 85 lb. to the square inch.

#### THE CATTLE PLAGUE IN THE SOUTH OF ITALY.

It is extraordinary that, while so much interest has been excited, and so much has been said and written on the subject of the cattle plague, nothing has yet appeared connecting the present outbreak in England with that of the same character which took place in the south of Italy two years ago.

The passage of the plague has been traced by some from Russia or from Germany, but no one has observed the very natural course which it appears really to have taken from Italy over the coast of Europe to England.

It appears to have prevailed first in the neighbourhood of Rome, and throughout the Papal territories, and thence it is reported to have proceeded south to Naples, being brought by cattle imported from Rome by sea. Owing to the wretched state in which the cattle are generally kept, and the numbers which are crowded together, the disease was much more fatal than it has been in England, while the character of the people, and the constant attempts which they made to defy the vigilance of the officers appointed to superintend the sanitary regulations, made it a much more formidable enemy to the public health.

The symptoms of the plague, as it broke out in the neighbourhood of Naples, were similar to those as they are now to be seen in England. The animal, apparently healthy in the morning, sickened and refused its food before night, and died in a few days under the same circumstances as among our cattle. But in England there is some chance for a healthy animal, while in Italy there was none. The accommodation which they are afforded is most miserable, being penned up together in a small, dark, and unwholesome shed,—out of which they may be said, without exaggeration, hardly ever to come till the day of their death. Unless an animal changes its master, or is to be brought down to the lutech it is never taken from its stall from year's end to year's end; and, when it does come out, it is to be driven along the road by a couple of ropes

and surrounded by men armed with long poles. The feet of the unhappy beasts have, through want of exercise, become a pitiful sight, their hoofs being bent and curled up like a pair of Turkish slippers.

Being thus confined altogether, they had no chance of escape from the disease; and, if one were seized, the whole herd were sure to be destroyed.

Some masters, as soon as the symptoms appeared in any of their animals, did indeed separate them, and sent the healthy part of the herd up into the mountains; but in most cases this was done too late, and the loss was enormous.

The condition and keeping of the cattle rendered them much more liable to attack than in England; for not only were they confined, but their food at all times is most unwholesome. In the whole neighbourhood of Naples no pasture exists of any kind, and the staple of the food during the summer and spring, when the plague prevailed, was the refuse of the mulberry leaves, which are stripped from the trees in great numbers to feed the silkworms, who will only eat a portion of the leaf while it is fresh; and when these fastidious animals had cast them aside, they were considered fit food for the cows.

As soon as an animal showed signs of infection it was sold, conveyed into the hills, and slaughtered. It was then taken, by night, into the market, and the meat sold privately by the butchers as early as possible in the morning. The result was, a constant fight between the sanitary authorities and the butchers, while in some cases these officers comived at the practice, and placed the stamp which was required by the regulations before any animal could be sold, upon meat which either they had never examined, or which they knew to be infected.

This outbreak was in all respects similar to that which is now destroying our cattle, and, from its duration and effects some hints might well be taken. It lasted about a year, and destroyed an enormous proportion of the cattle; but no precautions of any kind were taken, no remedies used, and thus it was allowed to die out of itself, probably having lasted much longer than will be the case in England, with greater care and under more favourable circumstances.

If, indeed, there be any truth in the assertion, that such a plague is a forewarning of some plague about to fall upon the human inhabitants of the country, conclusions may be drawn as to the approach of the cholera in England, from the outbreak which has followed the cattle disease in the south of Italy, and which is now raging among the unhappy inhabitants of Naples.

#### A SHIP OF THE SECOND CENTURY.

"SHIPBUILDERS" said Mr. Donaldson, at the Institute, "are proud to call themselves naval architects," and here is something for them. In the course of digging a trench for military purposes, during the late Danish war, the workmen came upon boggy soil, and at a depth of 5 ft. discovered the remains of a very ancient ship embedded in the bog. The site is now some distance from the sea (at Wester-Satrup, in Sundewitt Bay); but at the time when it was deserted it was no doubt "run up" on the beach. It is of oak, but in so very defective a condition, that it had to be strengthened with iron bands before it could be removed to Flensburg, where it may now be seen. The keel is bent upwards at both ends, after the fashion of a modern gondola, rising to a height of 9 ft. 10 in. in the bows, and 10 ft. 11 in. at the stern. The total length is 79 ft. 10 in. by a width of 11 ft. 10 in. in the waist, by a height of 4 ft. 2 in. There appears to have been no deck, but several lockers were found, some of which contained bones of animals. Besides this were discovered a number of spears, bows, arrows, battle axes, wooden clubs, knives, &c.; but, what was more important, some coins were found, which give the date of the time when this ship floated, not only on the Baltic, but perhaps to the distant shores of Britain. The coins are Roman, and of the second century, A.C.; and there were also bracelets, rings, and other ornaments, besides cooking utensils, &c. All these articles are now in the Archaeological Museum at Copenhagen, but the ship itself the Danes were unable to get away before they had to give place to the advancing Austrians.

#### BERLIN.

The base of the Victoria Column, on the Belle Alliance Place, has hitherto been much in the same unfinished condition as a certain column of our own, not a great many miles from Charing-cross; and the reason is not half so plausible as the necessity of making careful zoological studies: in the Berlin case it is simply neglect. Now, however, the four pedestals are to be filled each with an impersonation of those nations which composed that Belle Alliance, the end and object of which was the overthrow of the First Napoleon. The groups representing England and Hanover are now in hand in the studio of Professor Fischer.

To those who have had an opportunity of admiring W. von Kaulbach's frescoes in the New Museum, it may be interesting to know that the whole collection is now being published by Duncker, in Berlin. The engravings will be copper-plate, and will be contained in ten numbers, beginning October, 1865, and ending October, 1869. Price 10, 18, and 24 thalers. Four large engravings have already appeared, namely, "The Tower of Babel," "Homer," "The Crusade," and "The Battle of the Huns."

#### HAMBURG.

The authorities of this city published particulars to competitors for a new Fine Arts Gallery in December, 1862. The total area was not to exceed 15,000 square feet for the present; but the designs were to include arrangements showing a further increase of 10,000 square feet. Messrs. von der Heide & Schirmacher were the successful candidates; and the building, which, when entirely finished, will have cost about 30,000*l.*, is being carried out under their supervision. The style is Italian Early Renaissance. Terra-cotta ornamentation is freely used with stone and brick, and would be effective but for the weakness and thinness which characterise the mouldings of the German school.

Mr. Scott's Church of St. Nicholas has now been opened for service some time, and the tower has this summer reached a height of 220 ft. A powerful crane and engine, supplied by Messrs. Moltrecht & Co., of this city, raise the enormous blocks of stone, some of them over 5,000 lb. in weight, with the greatest ease. The works are under the management of Mr. Wood, who has been clerk of works for very nearly the commencement of this handsome edifice.

#### THE INSTITUTION OF CIVIL ENGINEERS.

The first meeting of the session, held on the 14th inst., was occupied by the reading of a paper "On the Telegraph to India and its Extension to Australia and China," by Sir Charles Tilston Bright, M.P.

The total length manufactured was 1,234 nautical miles, weighing in all 5,028 tons. Five sailing vessels and one steamer conveyed the mass of submarine cable to Bombay, and the submersion was commenced by the author, on the 3rd of February, 1864, at Gwadur, on the coast of Belochistan, the whole being completed by the middle of May in the same year. The cables were laid for the first time successfully from sailing-vessels towed by steamers, by which a considerable saving was effected, compared with the cost of sending the cable round the Cape in steam vessels.

It was expected that the Turkish land-line, between Bagdad and the head of the Gulf, would have been completed simultaneously with the submersion of the Persian Gulf line. In this, however, much disappointment was experienced, owing to the Arabs, on a portion of the route, in the valley of the Euphrates, being in revolt against the Turks. In consequence of this, the opening of the entire line between Europe and India was delayed until the end of February in the present year, when a telegram was received in London from Kurrahee, in eight hours and a half. This was speedily followed by numerous commercial messages to and fro, and a large and remunerative traffic was now daily passing. The author, however, complained of the delays and errors arising upon the Turkish portion of the line, between Constantinople and Belgrade; the service on the portion of the line worked by the Indian Government, between India and the head of the Gulf, being performed rapidly and efficiently.

#### NEW PEAL OF EIGHT BELLS AT PENZANCE.

THURSDAY, the 31st ult., was a memorable day for Penzance. The lofty tower of St. Mary's was rebuilt, thirty years ago, in the Perpendicular style, of substantial granite masonry, with appropriate chambers for the reception of a good peal of bells; yet nothing but the ding-dong of a solitary bell has hitherto existed for summoning a goodly congregation of worshippers to their parish church, holding about 2,000.

By the active exertions of the incumbent, the Rev. P. Hedgeland, M.A., and the energetic churchwarden, Mr. Walter Edwards, and a committee made up of the chiefs of the town, a noble octave of bells, by Messrs. Taylor, of Loughborough, in E flat, weight 21 cwt., at a cost of over 800*l.*, has been provided; and on the 31st ult., they were inaugurated with all the ceremony which the authorities of the town could provide. The work of the day was well begun by an act of charity at the town-hall, where the mayor, Mr. Francis Boase, distributed the sum of twenty guineas, the gift by H.R.H. the Prince of Wales, for the poor of the town, at the time of his recent visit, and the disposal of which had been deferred till this time, to make the occasion of the opening of the bells a day of special rejoicing. The gift was so doled out that eighty-four aged and infirm persons of both sexes, and of the average age of seventy-three, received 5*s.* each.

A sermon was preached by the Rev. H. T. Ellacombe, M.A., rector of Clyst St. George. After the sermon, the Woolwich ringers ascended the belfry, and the assembled multitude were astonished to hear various touches of scientific change-ringing, such as were never before rung in Cornwall or Devon; for, strange to say, the science of change-ringing is not known below Bristol, though lately there are many clergymen and others turning their attention to it. All that the West-country ringers pride themselves upon is to ring plain rounds and rounds, and ups and downs, for which people who know no better are pleased to offer prizes, to be spent at the public-houses; and while such a practice prevails it is not to be wondered at, that, with a few exceptions, the ringers and ringing, and state of the bells, are in a lower and more degraded condition than in any other part of the kingdom.

After a dinner, the visitors adjourned to the largest room in the town, the Corn Exchange, which was crowded to excess. Over 1,500 persons were present to listen to an interesting lecture on campanology, by Mr. H. R. Trelawny, of Harewood.

In the course of the lecture Mr. Trelawny reprobated the ringing for prizes or money; for while this was practised, ringing would remain at a low ebb. He recommended that young men of respectability and education should be the persons engaged in the belfry, and that ladies should practise hand-bell ringing.

The lecture was illustrated by a marvellous performance on hand-bells, by the company from Woolwich, and at the close they performed a selection of well-arranged music in such a manner as to surprise the audience.

#### PRESTON NEW INFIRMARY.

THE design for the new Infirmary which Mr. Hibbert was requested to make has been adopted, and he has been instructed to prepare the necessary working drawings for the erection. The pavilion for the reception of the sick will be on the west side of the present house, from which it will be separated for sanitary reasons by a corridor, 45 ft. long and 12 ft. wide. The pavilion will consist of two stories, each 16 ft. in height from floor to ceiling, and each floor will be exactly similar in arrangement. The limits of the land available for building upon determine the extent of the pavilion from north to south. The present house fixes the position of the connecting corridor, at the end of which is a spacious staircase ascending to the upper floor of the pavilion. The pavilion comprises on each floor a ward for twenty-four beds, 100 ft. long by 26 ft. wide; a ward for eight beds, 36 ft. long by 26 ft. wide, for casualty or other cases that may be considered desirable to be set apart; two small wards for special cases; nurses' room, and ward scullery, with the requisite baths, lavatories, and conveniences at the further end of the wards. The ground floor will be appropriated for males, and the upper floor

for females. At some future time a similar pavilion and corridor will be erected on the eastern side of the present house. The number of beds provided in the western pavilion will be sixty-eight. "In the deliberations of the committee," says the *Preston Guardian*, "sanitary requirements and hospital hygiene have received the foremost consideration. The recent improvements in hospital construction will be embodied, and the recommendation of the best authorities—Miss Nightingale; Mr. Robertson, of Manchester; the editor of the *Builder*; and the medical science of the locality—have been duly attended to." The floor space per bed averages upwards of 110 square feet, and the cubic space nearly 1,900 cubic feet. The baths, lavatories, and closets are separated from the wards by well-ventilated intercepting lobbies. The ventilation of the wards will be effected mainly by tripartite sash windows, the two lower sashes hung as ordinary sashes, and the top sash hung to a transom. The wards will be warmed by fire-grates, occupying a two-bed space, affording room for resort to patients who are able to leave their beds. The outer walls will have a cavity, and be faced with pressed bricks. Longridge stone will be sparingly used for dressings. The walls and ceilings internally will be plastered with the lime of the district, which is of a much harder and less absorbent nature than the chalk lime of the south. The windows will be glazed with plate-glass, and the boarding of the floors will either be of oak or red deal. The baths, lavatories, and closets at each end of the building, together with the staircase, are crowned with steep crested pavilion roofs, which give a French-Italian character to the design. The cost of the western pavilion and corridor, together with the re-adaptation of the present house, and the new one-story range of buildings in the rear, is estimated not to exceed \$8,000.

#### THE PROPOSED CENTRAL HALL OF ARTS AND SCIENCES.

In the recent address by Mr. Hawes at the Society of Arts, some information was given concerning the proposed Central Hall of Arts and Sciences, which will be erected on the north side of the Horticultural Gardens, on ground belonging to the Commissioners of the Exhibition of 1851. The hall is to accommodate above 5,000 persons, and will be available for the following objects:—For congresses, national and international, for purposes of science and art; for performances of music, vocal and instrumental; for the distribution of prizes by public bodies and societies; for *conversation* of societies established for promoting science and art; for horticultural shows, and for national and international exhibitions of works of art and industry; for exhibitions of pictures, sculpture, &c.; and for any other purposes connected with science and art. It appears that the funds for its erection will be provided, first, by the Commissioners of the Exhibition of 1851, who grant the site, at a nominal rent, for 999 years, the value of which is estimated at 60,000*l.*, and also guarantee one-fourth part, or 50,000*l.*, towards the cost of the building; and, secondly, 150,000*l.* will be raised by the sale of boxes and seats, to be held for the full term of the lease, 260,000*l.* being the entire estimated cost of the land, buildings, fittings, &c. The arrangements are at present under the management of a provisional committee, at the head of which is H.R.H. the Prince of Wales; but the management of the hall, when completed, will be vested in a governing body, under the authority of a Royal Charter.

#### THE CANYNGES SOCIETY, BRISTOL.

The annual meeting of this society, established in 1845 to assist in the restoration of the Church of St. Mary Redcliff, was held on the 15th instant with considerable success. It included a sermon and luncheon, the Lord Bishop of the diocese presiding with great geniality. A report, read by Mr. Chas. Clarke, showed what had been recently done:—

"The west front, so far as regards the nave and body of the church, but exclusive of the doorway and the tower, has been restored. The west door was omitted, it being considered unsafe to proceed with its restoration in the existing state of the tower. The stonework of the large west window has been completed, and is ready to receive the stained glass, kindly promised by Sholto V.

Hare, esq., so soon as the organ has been removed, which removal the committee hope may very shortly take place. The stair-turret, at the south-west angle of the church, is completed. Two windows, at the west end of the south aisle are perfected. Three others on the east side of the south porch are in an advanced state, and the glazing will be completed in a few days. The restoration of the pillars in the north and south transepts will be shortly commenced. Out of twelve pillars, the cost of six has been provided for. One by Mrs. Randall, wife of our respected vicar, and another by his younger daughters; one by the Rev. G. F. Cook, curate; one by Mr. James Bush; one by Sir John Dorney Harding, bart.; one by Mrs. Marshall, of Kingston-hill, Surrey. The window at the east end of the north chancel aisle has been filled with stained glass, by the subscribers to the Handel Commemoration Fund. Another window in the lady chapel will also be erected in the course of the present month, in memory of a deceased benefactor. The committee have also the pleasure to announce that the ex-mayor, Mr. T. P. Jess, during his year of office, promised the handsome sum of 25*l.* towards the distinctive purpose of the restoration of the chancel."

The great object now is to raise money for the restoration of the tower, which is in a dangerous state of dilapidation, and the completion of the internal fittings.

Some very handsome donations were promised, including 100*l.* per annum for five years, by Mr. S. W. Lucas, of Birmingham, who has already given a very large sum; 500*l.*, at intervals, by the Rev. H. G. Randall, the vicar; 100*l.* by Mr. R. P. King; and several others. Mr. Alderman Proctor, to whom so much is owing in carrying on this work, was warmly remembered.

#### COMPETITIONS.

*Liverpool*.—The committee for a Welsh church and schools, to be erected in Princes Park-road, asked for competition amongst local architects, limiting the cost to 5,250*l.*, including seats for 1,200 persons, large school-rooms, and chapel-keeper's house. The premiums were awarded as follows:—1. Messrs. Audley; 2. Mr. C. O. Ellison; 3. Messrs. Duckworth, all of Liverpool. A correspondent asserts that the design to which the first premium has been awarded will cost 19,000*l.*

#### THE POLLUTION OF RIVERS.

MR. RAWLINSON, Professor Way, and Mr. Harrison, the Commissioners appointed by Government to inquire into the pollution of rivers, have held sittings at Reading. The inquiry was attended by the mayor, ex-mayor, town-clerk, clerk to the Board of Health, chairman of the waterworks and gas companies, and a number of the most influential inhabitants.

Mr. Rawlinson explained the object of the commission, and that it was suggested that their inquiry should include selected river basins, illustrating different classes of employment and population; and that the first of these river basins should be the Thames Valley,—both as an example of an agricultural river basin, with many navigation works, such as locks and weirs, and mills affecting the flow of water, and many towns, and some manufactories discharging their sewage and refuse into the stream from which it is mainly derived the water-supply of the metropolis.

Evidence was then taken, from which it appeared that the river Kennett ran through the centre of the town, and communicated with the Thames. Sewage matter from a number of houses fell into the Kennett, the water of which was used for domestic purposes by some of the inhabitants; who, however, were supplied with pure water by the company if they chose to avail themselves of it. It was stated that the Board of Health took measures to avoid new cesspools emptying themselves into the stream, but that the powers of the Public Health Act did not enable the Board to deal with parties polluting the rivers unless the pollution amounted to a public nuisance, when it could be treated as any other nuisance.

Evidence was given to the effect that no thorough and complete system of underground drainage had been carried out in Reading, although there had been several discussions upon the subject, the clerk of the Board stating his belief that if a reasonable scheme was brought forward, and it could be shown that an outfall might be obtained, it would meet with favour.

Mr. Rawlinson gave some practical and valuable advice, the result of long experience, showing that the necessary works could be carried out at a sixpenny rate, and that the sewage could be carried off by engine-power. The idea of an outfall into a river must not be entertained, and the sewage must be disposed of on land.

#### ST. ANDREW'S, CAMBERWELL.

This church has been erected through the instrumentality of the Rev. Daniel Moore, of Camden Chapel, and has been assigned a district out of his parish. It was consecrated a few days ago by the Bishop of Winchester. The interior only is as yet complete, the tower and spire being still in progress.

The arrangement of plan consists of a nave 90 ft. long by 35 ft. wide; a north aisle 45 ft. long by 15 ft. wide, terminating at the east end in a transept 27 ft. in width by 21 ft. 6 in. long; the chancel, which is 24 ft. wide, is raised four steps above the level of the nave, and contains only the stalls for choir and the reading-desks, of which there are two, one on either side, being a continuation of the back row of choir stalls, but differing from them in design. Beyond the chancel is a sacristy, 18 ft. wide, with apsidal east end, and raised one step above the chancel, making the total internal length of the church 125 ft. The height of the west gable of nave is 56 ft., the tower 66 ft., and to the top of spire 140 ft. The organ-chamber is formed in the north-east angle of the chancel and transept, and with an opening into each.

Facing the transept in the south side of nave is a naos or passage, about 5 ft. wide, connected with the nave by two flat arches,—together the width of transept arch,—which affords, by a door at the western extremity, means of approach to the vestry at south of chancel, and exit from the seats at east end of nave.

There is a small west gallery across the nave. The tower is at the north-west angle of nave, and forms the principal entrance-porch, communicating to the west with a western porch or narthex extending the whole width of, and affording access to, the nave, and at the south-west extremity of which is another external door intended for exit only. To the north the tower communicates with a north porch, formed between the tower and north aisle, from which the gallery and north aisle are reached, and by an external door in the north wall, affording a direct means of exit from the gallery, and making, with the one at the south-east of nave, four distinct modes of exit.

The heating is effected by the use of three of Parrett's ground stoves, applied, however, with one or two additions to secure the supply of fresh air and a good draught in the flues.

The building is constructed externally of four varieties of stone, viz., Kentish rag walling, laid in "drop courses," and the joints raked; red Mansfield columns, and vousoirs in some of the arches; the general dressings being of yellow, with a small admixture of blue Bath, and hands of both Bath and red Mansfield stone. The roofs of nave, north aisle, transept, and chancel, are covered with bundled Staffordshire roofing-tiles of a small size, with a bright red ridge tile and cresting of special design; the roofs of western porch, spire, sacristy, and organ-chamber, are covered with blue and pink Bangor "ladies" slates. The hinges, together with the ornamental iron finials, brass altar-rail, and gas-fittings, have been executed from designs of the architect by Messrs. Hart & Son, of Wych-street.

The five windows in the apse are of stained glass, by Messrs. Heaton, Butler, & Bayne, of Garrick-street, and embody one or two novelties of treatment, by which it has been attempted to secure at a small outlay a genuine and unpretentious effect. The success of the attempt is a matter of taste; the cost for the five windows has been 50*l.* inclusive of wire-guards and fixing.

The decorations of the chancel, roof, and front of nave arch have also been executed by the same firm, in the new "water-glass" process.

The subjects of the windows are the four evangelists and St. Andrew. The chancel-roof, which consists of twelve panels, contains in the centre of each the emblems of the apostles, surrounded by a border composed of those of the patron saint, St. Andrew. The nave arch contains amongst other decorations, the text, "The Lord is in his Holy Temple: let all the earth keep silence before Him." Over the organ is the text, "Let everything that hath breath praise the Lord."

The general wall surface inside is of stucco, all the arches, the walls of porches, chancel, and sacristy, and the spandrels over most of the arches, are of yellow malm and white Suffolk brickwork, neatly pointed in white mortar, except plinth 4 ft. high round porch, &c. which is pointed in black. Most of the spandrels and one or two broad bands of this brickwork are executed in various herring-bone patterns.

The choir-stalls, which are of an elaborate design, are of stained deal with columns of polished walnut, and carved capitals, amulets, and bases, of white holly.

The pulpit is of wainscot oak, with columns and other ornamental details of polished walnut, Japanese teak, white holly, and ebony, and will also contain three large pictures of various bright-coloured inlaid woods, representing, in half-length figures of Our Lord, Moses, and Elias, the Gospel, the Law, and the Prophets. This work, together with some subordinate-coloured wood inlay, will be executed by M. Steinitz, of the London Parquetry Works.

Only a limited portion of the carving is at present executed, and no more will be included in the present outlay.

All external columns are of red Mansfield stone, as also those supporting the four main trusses of the roof inside. Those supporting any main wall are, in every case, of polished granite, two varieties being used, viz. the grey and red. The two short columns supporting the chancel-arch are of polished green serpentine; and in the chancel, dividing a recessed arcade of three arches which will contain the decalogue, creed, and Lord's prayer, are two of polished alabaster.

The church will seat 900 adults, allowing 20 in. sitting space for each person, the seats being 2 ft. 8 in. wide. The total cost, inclusive of stained glass, the carving already executed, and the decorations in the chancel and sacristy, the inclosure of the site, and a bell by Warner & Sons, will be about 5,000. The organ was a private gift by two gentlemen on the committee; it is by Messrs. Berington & Sons, has sixteen stops, and cost about 400.

Mr. Bassett Keeling, of Gray's-inn, was the architect; Messrs. Dove, Brothers, were the general contractors; and Mr. Simpson was the foreman of works, there having been no clerk of the works employed.

#### ST. JAMES'S TOWER, TAUNTON.

This fabric, it appears, is doomed. The result of a poll of the parish is in favour of rebuilding, and not restoring, although Mr. Farrey, the diocesan architect, and two others in the profession, were in favour of the restoration. It is to be hoped there are stronger reasons for pulling down the tower than these particulars seem to show. The work is intrusted to Mr. Spiller, of Taunton, who has offered to rebuild the tower for 3,170. Sir P. P. Acland, bart., of Fairfield, has offered to present to the parish sufficient Williton sandstone to complete the work; and that being the case, Mr. Spiller has offered to rebuild the tower for 2,570. Mr. Davies, of Taunton, also tendered for the work, his estimate being 3,170. Mr. Spiller offered to repair it for 1,406.

#### HORSHAM CHURCH.

In a recent notice of the works going on here, we mentioned the new painted glass east window, designed and executed by the Messrs. O'Connor. We now add some particulars of the window. The principal figures are close upon 5 ft. in height, which in glass gives quite the effect of life-size. The arrangement of subjects is as follows:—Lower range of seven large openings: in the first two, Nativity of our Lord; in the second three, Crucifixion of our Lord with the Thieves; third two, Burial of our Lord. Upper range of seven large openings: in the first two the risen Lord appearing to Mary Magdalene; in the second three, the Ascension of our Lord; in the third two, the Descent of the Holy Ghost. These subjects are all enshrined in canopies of correct date, and the niches at their bases contain a beautiful treatment of the "lily," hearing upon the dedication of the Church to St. Mary. In the tracery colour and effect are the chief things attained, the openings being very numerous; the four largest of these, however, are occupied with figures of the four greater prophets; the remaining compartments containing the Twelve Apostles, and an arrangement of the vine and its foliage are intended to render the whole motif of the tracery of this window descriptive of the kingdom of the church. The west window subscribed for by the poor, Mr. O'Connor could not finish in time for the opening day.

A correspondent writes,—"While so much is being done to restore to its pristine beauty the

fine old church, at Horsham, it is to be hoped care has been taken to preserve from injury the one only good brass the church possesses. This brass is of small size, and is sadly mutilated, having now neither head, feet, nor inscription; but it is a very fine specimen, and is highly esteemed by "rubbers," on account of the peculiar arrangement of the robes, and the bold, yet delicate, ornamentation upon them. It is familiarly known as the "headless monk," and its position used to be on the pavement, a little space removed from the front of the altar-railings.

#### ROYAL STRAND THEATRE.

This favourite theatre has been remodelled and much enlarged during the last three months. The old roof has been removed and a new and substantial iron truss roof, 54 ft. in span, carried upon iron struts resting upon solid foundations, has been constructed. New property and dressing rooms are obtained between the queen-posts of the roof.

The new ceiling, which is 10 ft. higher than the old one, is panelled, with ribs of carton pierre, the whole forming an octagon. The panels are coloured light blue, and ornamented with a stencilled border in white and gold; the outline of the octagon marked by a darker stencilled pattern. In the centre of the ceiling a sunlight has been suspended. Over this, is a large iron ventilator rising above the roof, through which the heated air from the auditorium is carried off. Four air-shafts have been constructed, which assist in effecting ventilation.

The entrance from the Strand, which formerly admitted to pit and boxes, has been reconstructed and decorated, and set apart for a box entrance; a new covered pit entrance having been formed in Surrey-street. A new gallery entrance has also been obtained, with a stone and brick staircase up to the gallery. This, as now reconstructed, will seat about 800 persons. The dress-circle and boxes have also been re-arranged, and the old cumbersome partitions removed; and the passage behind is thrown into the dress-circle, which, with the boxes, is prettily fitted up.

New iron columns have been put in front of the circle and pit, with ornamental caps and bases. A proscenium arch, of original design, and dress-circle and gallery fronts, have been formed in carton pierre, coloured in light tints and picked out with gold; and the whole building has been repapered and painted, and refitted so as to insure the comfort of all. Considerable improvements and additions have also been effected on the stage and flies.

The building works were executed by Mr. Foster, of Whitefriars; the modelling and decorating by Messrs. Palby and Bradwell, from special designs by the architect. Mr. Brown acted as superintendent of the building; and Mr. Moore as clerk of the works for the architect, Mr. John Ellis, of Austin Friars, from whose designs and under whose superintendence the whole of the works and decorations have been carried out at a cost of about 7,000.

It is understood that the theatre now gives seats for 200 more persons than it did before. The first night was a great success.

#### ART IN SHEFFIELD.

At the annual meeting of the School of Art, recently held, the statement of accounts read showed that the deficiency of the receipts to meet the expenditure had increased from 266l. 14s. 9d., the balance due to the treasurer last year, to 467l. 18s. 10d. From students' fees, 229l. 13s. 9d. had been received; and from subscriptions, 178l. 6s. The conversation this year figures on the wrong side of the account, its expenses having exceeded its receipts by 24. The statement of accounts was approved, and the reports were adopted. The meeting also passed a resolution acknowledging the efficient manner in which the instruction had been conducted by Mr. Sonnes, the head master. The school has produced some good men; but the state of art in the town seems very low. The Theatre Royal displays some remarkable scenery, as, for example, the Armones in "Arrah na Pogue," wherein a range of mountains standing in a rack are represented as increasing in size as they recede from the spectator. A new drop-scene, representing Chancer's "Pilgrims," and concerning which a printed description is sold, though very well intentioned,

is a melancholy spectacle in a town where art ought to be aiding industry, and where, indeed, if art do not help, industry will, one of these days, find it has less to do.

#### SANITARY MATTERS.

Stone.—Some time since, in consequence of the great prevalence and destructiveness of typhus fever at Stone, special attention was called to its sanitary condition, and it was asserted by medical men that the deaths from the fever were mainly in those parts of the town where the drainage and other sanitary appliances were most deficient. Meetings called to consider the propriety of adopting the Local Government Act, resulted in the expression of an opinion very adverse to the proposal; but a committee was appointed to inquire into the sanitary state of the town, and a numerously-attended meeting has been held, at which it was stated that the committee had no conception before they entered on their labours, which had been very onerous, that many parts of the town were in so filthy a condition as they were found to be. The report described place after place, in which not only were the ordinary decencies of life outraged, but there was a total absence of means either to carry away refuse water, or to deal with the night-soil, and the picture drawn in detailed descriptions was truly terrible. Numerous cases of the blocking up of drains were named, and the accumulations of feces, the putrifying contents of cesspits and stagnant ditches and sewers, formed a picture from which the imagination recoils. The report contained an account of the existing drains in and near Stone, and the opinion of the committee on this point was that, with the exception of some districts, the town was well drained. The committee recommended that a deputation from the meeting be appointed to wait upon the Board of guardians of the poor, to represent to them the urgent need there exists for them to make use of such powers as are by law vested in them, in order to give practical effect, so far as they possibly can, to the suggestions contained in this report; and, further, that the surveyors of the roads be requested to do as much as in them lies to remedy the evils complained of. This was agreed to.

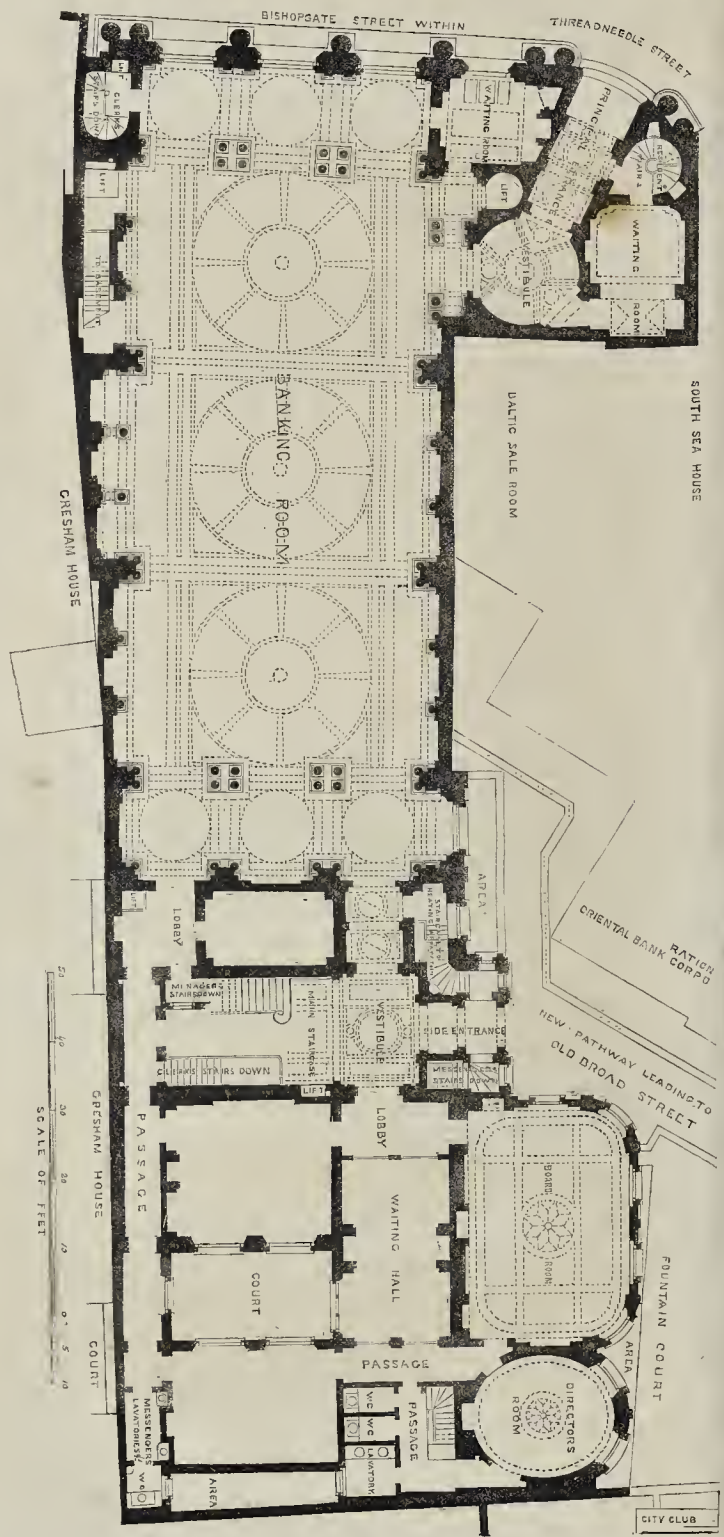

Alvechurch.—At a recent meeting of the Bromsgrove board of guardians, the medical officer of the union at Alvechurch reported by letter to the board that he had been attending ten cases of fever in one row of houses, the drainage of which was in a very bad state; and there was also a letter from Archdeacon Sandford, calling the attention of the board to a large number of nuisances.

King's Saldmore.—A report respecting various proposals that have been made for the more effectual drainage of King's Saldmore by Mr. Grantham, C.E., has been made to the commissioners of sewers for the district. The discussion on these has not yet been concluded.

Chorlton and Hulme (Manchester).—The sanitary condition of the townships of Chorlton-upon-Medlock and Hulme was the subject of discussion at a recent special meeting of the guardians of the union. It appears that continued fever is prevalent in the districts adjacent to the river Medlock and the Bridgewater Canal. These streams, which receive the sewage of a large tract of country, are almost stagnant in Hulme and Chorlton, and the consulting medical officer of the union compared the canal to "an elongated cesspool." Other sources of poisoned air are to be found in the narrow courts, the cellar dwellings, the back-to-back houses, and the neglected ashpits of the townships. It was decided that a deputation should wait upon the mayor, who promised that prompt sanitary measures should be taken.

Leeds.—At the Leeds Police-court last week, Mr. Beardshaw, surgeon, appeared before the magistrates for the purpose of drawing their attention to the increase of fever in the town. It was principally owing, in his opinion, to the length of time some of the dead bodies were kept in the houses for viewing, and to the great want of cleanliness in the poorer houses. The magistrates regretted that they had no power to assist Mr. Beardshaw, but hoped the press would make it widely known that the keeping for days together of bodies of persons who had died of fever was really dangerous to public health; that crowding in rooms was bad; and that whitewashing and other means of cleanliness ought to be freely resorted to.

THE NATIONAL PROVINCIAL BANK OF ENGLAND.—Plan of Ground Floor.

THE NATIONAL PROVINCIAL BANK OF ENGLAND.

Above, we give a view of the banking-room, and the plan of the ground-floor, of the new building for the National Provincial Bank of England, which has been erected in the City of London, at the eastern extremity of Threaneedle-street. This work, of which Mr. John Gibson is the architect, has been particularly referred to on several occasions in the *Builder*, both with reference to its external and internal decorative features, which are the result of requisite study, and possess originality, and to certain

structural arrangements in the masonry. In a future number, along with a view of the exterior, and some particulars of the sculptural details, we shall give a description of the building. For the present we must chiefly note that the banking-room, as shown in our view, is a well-considered interior, and that it is also the largest room in the metropolis devoted to such a purpose. Our view, necessarily deficient in colour, fails to convey the effect that is produced by the marbles, and by the coloured glass and gilding in the domes. The marble, excepting a portion of that of the floor, is all British or Irish, the work being executed by Mr. Field. One feature in the

interior, deserving present notice and future explanation, is the combined decorative and structural arrangement of the artificial lighting and ventilation. At the time our view was made, the positions of the desks and counters had not been settled. These features of the interior, however, contribute much to the decorative effect. The masonry is inlaid with ebony. A bust of the late manager, by Baron Marochetti, is to be placed on a pedestal under the central arch, shown in our view, near to the further extremity of the room. The directors of this bank deserve their share of the credit for what is an important addition to the

architecture of the City of London. The total outlay, exclusive of the cost of the site, will, doubtless, exceed £500,000. At present the London business of the bank relates exclusively to the country-branches—1129 in number—and some of the buildings having managers' residences, and some of the buildings having the business will be metropolitan as well as provincial, so that space is required, in the new buildings, for at least 200 clerks. The day of opening is, consequently, decided upon, but will be about the beginning of December. The structure has been erected by Messrs. Trollope & Sons.

THE NATIONAL PROVINCIAL BANK OF ENGLAND, THREADNEEDLE STREET, LONDON.—Mr. JOHN GUSON, ARCHITECT.

## THE ARCHITECTURAL EXHIBITION.

SIR,—I need hardly say how gladly I would be spared answering such a letter as that signed "R. K." in your last number; but, as I fear I must plead guilty to having set the example, I cannot in justice to myself and my colleagues, allow it to pass without protest.

It is astonishing what different views two people can take of the same event. I thought the meeting business-like and suggestive, and felt that good had been done to the cause by calling it; but, perhaps, it is that I am getting old and dull of hearing. I did not hear the flourish of trumpets with which "R. K." says the meeting commenced, nor the "lugubrious deploring" with which it is said to have ended. Still less did I hear the denunciations of Mr. Hope. I only caught his name once when the secretary announced, as a matter of congratulation and good augury, that he and Mr. Raphael Brandon had joined the committee on the part of the council of the Institute, and I feel quite sure that no one connected with the Exhibition mentioned his name otherwise than with respect.

The only thing that caught my ears that seemed to interrupt the harmony of the proceedings, was some very irritating remarks and proposals by Professor Kerr, which led to some rather hasty discussions and expressions, which might as well have been omitted. Among the mildest of his propositions was a "hint,"—I quote from "R. K."—"that the right thing for the circumstances was to make a clean sweep of the committee." To make room for what? The alternative was not expressed, but every one felt what was intended; but somehow or other they did not seem to think it would prove a certain cure for all the ills exhibitions are heir to. But passing this, the meeting did not seem to think that the "clean sweep" was quite the fitting form of testimonial for those that for fifteen years had worked hard in the service, and supported the Exhibition through good and evil times. It was not adopted.—"*Hinc ille lacrymæ.*"

But "R. K." says we have no constitution, and hold no meetings. If he would take the trouble of looking through the minute-books, which have been carefully kept from the beginning, he would probably find that this is not quite the case. While on this subject, I may incidentally mention that, according to our laws, the committee shall consist of twenty members, and no more; and this led to the dilemma which caused the four oldest members of the committee being called vice-presidents, in order to make room for two new members from the Institute and two from the Association.

With regard to meetings, "R. K." seems to have forgotten that a balance-sheet and report are annually submitted to the subscribers, and that it is always usual for the chairman or secretary at the first evening meeting of the session to make a statement of the position and prospects of the undertaking, and to invite remarks and discussion thereon. This has been found to answer. Twice the practice has been departed from.

In the early days of the undertaking a formal general meeting was convened, and the result was certainly not encouraging. The result was held on the 14th inst. As far as internal arrangements were concerned, it was a success; but as the public have only learned what passed from "R. K.'s" highly poetic, but very disparaging, account of the whole concern, it seems probable that the committee would have acted more wisely if they had adhered to their more usual practice.

Turning from this very disagreeable subject to what really concerns the Exhibition, I deny most emphatically that it has been a failure in any sense of the term. It does not owe a shilling to any one. It is established as one of the permanent art-exhibitions of London. For fifteen years it has afforded every architect who wished to avail himself of its advantages the means of exhibiting his works without charge and without favour. There are very few of the leading men of the profession who have not occasionally exhibited on its walls, and as few who have not, at one time or another, been connected with its governing body. It is good, and is doing good; but the committee felt, and feel, that it might be better, and might do more good; and it was with reference to obtaining aid in this last sense that the late meeting was called.

In furtherance of these views two new secretaries have been appointed, who are both able and willing to work, and a new committee or

council has been formed, who, I have no doubt, will work earnestly and harmoniously. If a committee were formed, comprising all the architectural big-wigs in Europe, they could not supply more space, distribute it more fairly, or administer the funds more advantageously, than this committee can, and I have no doubt, will do. The rest must be done by the public outside. The committee can no more make an exhibition without pictures, than the Israelites could make bricks without straw; but, if the profession will only second the exertions of the committee, I have no doubt but that, in a few years, the Architectural Exhibition will be all its promoters could wish to see it, and even "R. K." may be brought to feel sorrow for having written the letter to which this is a reply.

J. F.

\* \* \* We have received a letter to the same effect, signed "J. E.," and numerous other letters *pro et con.*, but cannot give them room. We have, for our own parts, very little reason to think highly of the corporate wisdom of the late committee.

## HERALDRY AND ARCHITECTURE.

## THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of members was held on Friday evening, the 10th inst., at the Horse in Conduit-street; the president, Mr. R. W. Edis, in the chair.

Mr. R. Plimbe (Hon. Sec.) read a letter which had been received from the Architectural Union Company, offering a prize of 5*l.* to be competed for by members of the Association.

The Chairman observed, in reference to this handsome offer, that the subject to form the object of competition would be considered at the next meeting. Meantime he proposed a vote of thanks to the Architectural Union Company.

The vote having been unanimously accorded, the Chairman said, that as no prize was given for drawings of old examples of architecture, he should have great pleasure in placing at the disposal of the committee a prize of five guineas for the best series of original sketches of existing buildings, Gothic or otherwise, in England or on the Continent.

On the motion of Mr. J. D. Mathews, a vote of thanks was passed to Mr. Edis for the prize thus offered.

Various gentlemen were elected members.

The Rev. C. Bontell then proceeded to deliver an address on "Heraldry in Association with Architecture." The Rev. gentleman explained, with the assistance of coloured diagrams, the language of heraldry, pointing out its origin, and tracing its progress from the earliest times to the present. Referring to its connexion with architecture, he observed that unless architecture could speak out, it was not worthy of its name; and that, if it was to have a significance peculiarly its own, it must make use of symbols to express its language. The building itself could not do this. A public building to tell its tale should disclose something of the history of the country; and a private building could in like manner be made to tell something of the family who had raised the pile. Admitting this to be desirable, nothing could so much help a building to speak, as it were, like heraldry. Heraldry originally grew out of the military history of the Crusaders. As the knights who fought for Christendom wore armour which completely covered their persons, it became necessary to distinguish them in some way, and hence the use of symbols by which it might be known who they were. By the use of heraldry architecture might thus be made not only to tell its uses, but to contribute in maintaining unbroken the annals of the country or of individuals. Architecture had, he thought, something to say as well as to do, but if the progress lately made in the science, great as it was, had not led to the development of a national style, the circumstance was to be traced to the fact that we had not paid sufficient attention to heraldry. No such neglect prevailed in olden times. In the interior of Westminster Hall, for instance, the architect of that day had endeavoured to show to whom the building owed its origin, as all round the stringing course might be observed the insignia of contemporaneous royalty,—the helmet, feathers, lion, and stag, the latter more or less reclining, but never in absolute repose, all pointing to King Richard II. There were in Westminster Hall 120 repetitions of these emblems, and so cunningly were they designed that in no case were

two of the stags exactly in the same position. With this fertility of resource in matters of design, the architects of ancient times were singularly endowed, and he had no doubt that if 200 repetitions had been necessary in Westminster Hall instead of 120, the architect of that building would have had no difficulty in executing them. These enrichments of Westminster Hall presented, in his opinion, a fine example of heraldry in association with architecture. Again, at King's Chapel, Cambridge, there were some fine shields of the arms of Henry VI. and Henry VII. At Beverley, too, there were the arms of England with the lions springing out of a shield, but all springing at different angles. Heraldry might be introduced with great effect and advantage in stained glass, similar to the specimens in the north transepts of the cathedrals both of Canterbury and of York, which were among the finest examples of stained glass in the kingdom, and which told in eloquent language the history of the great families of the period. Heraldry might also be introduced into carvings, panels of ceilings and roofs, pavements, &c. As an illustration of the want of knowledge of heraldry even among the most distinguished architects, the reverend gentleman referred to the shields in the new hall at Lincoln's Inn, which were represented on one side of the chamber with a notch on the right side of the shield for the spear of the knight to rest in. This was correct, because in the original the notch could only be made in the right margin of the shield; but in Lincoln's Inn Hall another row of shields was placed opposite to those with the notch in the right margin with the notch in the *left* margin, which of course could not have existed in the original. This, however, was done from a mistaken idea of uniformity. Then, in the case of the Queen Eleanor Cross in West Strand, it was, no doubt, right to put the arms of the queen and of her family in the panels; but he thought it would have been well to have placed one shield with the arms of Queen Victoria, to show in ages to come in what reign the cross had been put up. The best heraldry would always harmonize with the best architecture, just as the best sculpture would do. In conclusion, he recommended the students of architecture, in dealing with heraldic subjects, not to draw animals grotesquely, nor, on the other hand, with too close a resemblance to nature. If, for instance, a lion were to be represented, let it be modified in a heraldic manner. The lion and unicorn over Buckingham Palace ought to operate as a warning to prevent bad drawing.

In reply to questions, Mr. Bontell stated that he had not been able (indeed, he did not believe any one was), to trace the authority under which *Heralds' College* acted. All that appeared to be known on the subject was, that it was endowed by King Richard III., and that on payment of certain fees it granted arms to persons who were able to make good their claim to them.

At the conclusion of the discussion, a vote of thanks was passed to the reverend gentleman for his interesting paper.

## THE BUILDING TRADES MOVEMENT.

*Swansea.*—The operative masons, carpenters, joiners, and plasterers, of Swansea, have made an appeal to their respective employers, for an increase of 6*d.* per day on their present rate of wages, in consequence of the increase in the price of provisions, house-rent, and things in general; also for a reduction of 3½ hours per week, the same to come into operation on and after the 1st day of May, 1866.

*Penrith.*—About six months ago a petition was presented to the master joiners in Penrith, by their workmen, requesting a reduction of two hours per week in their labour. At that time the masters intimated that, owing to the large contracts on hand, they could not then conveniently comply with the request, and suggested that the matter should remain in abeyance for six months. This request was agreed to, and the specified time having terminated, the men have asked for and obtained the required reduction. Hitherto the hours of labour have been seven from in the morning till half-past six in the evening, or ten hours and a-half each day, the extra half-hour entitling them to leave at three on the Saturday. By the new arrangement ten hours each day will be the maximum, Saturdays excepted, when labour will be suspended at four o'clock.

### THE METROPOLITAN SANITARY ASSOCIATION.

The new society to which we briefly referred some time ago has been launched. The sanitary condition of the metropolis and of the country at large, notwithstanding the legislation of recent years, remains, as our readers well know, in a condition which is far from satisfactory. In some respects the law requires amendment; but it is still more important that the existing Acts should be carried into effect with greater intelligence and vigour. The legal power for this purpose, in the metropolis, is placed in the vestries; and without their zealous co-operation little amendment will be really effected. The same applies to the guardians and other local authorities in the country. Much good would result from giving the clergy, churchwardens, medical officers, vestrymen, and others practically engaged or interested in administering the sanitary laws, an opportunity of conference and friendly discussion. They would thus be able to compare their experience; to impart and receive information; their efforts would be better directed; their difficulties solved, and their activity increased. It is to effect these objects, then, that the Metropolitan Sanitary Association has been established, and they may be briefly stated thus.—To promote all practical measures for the improvement of the sanitary condition of the metropolis; but more especially,—

(1.) To aid the efforts of public bodies and individuals, so that the full benefit of existing sanitary laws may be obtained throughout the metropolis.

(2.) Where those laws are defective, or other hindrances exist, to take part in suggesting or obtaining such further legislation as may be necessary, or in removing such hindrances by other appropriate means; and

(3.) To collect and disseminate information as to sanitary matters.

In order to give the advantage of attending their meetings to all, without exception, who are taking part in parochial sanitary work, the subscription for membership has been fixed at 5s. per annum.

We may note, as matter of record, that the first meeting of the Council was held on Wednesday, the 23rd inst., at No 1, Adam-street, Adelphi; Mr. Godwin (in the chair); Dr. Sanderson, Mr. Shaw, Mr. R. Rawlinson, Dr. Whitmore, Mr. Bosanquet, Mr. Rendle, the Rev. H. Whitehead, Mr. Martin Waro (who has acted as honorary secretary up to this time, in organizing the Association), and several other gentlemen, being present. Mr. Thos. Chambers, M.P., Dr. Druitt, and the Rev. Mr. Bailey, also on the Council, were unable to attend. We may add that the metropolitan officers of health, and the members of the committee of the Public Health Department of the Social Science Association, are *ex officio* members of this Association.

We cordially wish it success, and are disposed to anticipate that it will soon take large dimensions. Work, rather than talk, is the object the Association has at heart.\*

### THE PROGRESS OF LEICESTER.

If we may depend on what is told us, Leicester is going ahead. A recent correspondent says,—“In Leicester, forty-five years ago, occasional employment was found for less than a dozen journey men stone masons, at wages varying from 2s. 9d. to 3s. 6d. per day. At this time, thanks, principally, to the formation of railways, the case is materially altered. Neales, Osborne, Porter, Timms, and Johnson employ in the aggregate about 150; while the six or seven minor establishments in the town employ amongst them about thirty more, all at wages from 5s. to 6s. 3d. per day. Palatial factories and warehouses for the manufacturing and storing of immense quantities of shoes and boots, hosiery, and woollen yarns, have sprung up in different parts of the town; green fields have been broken up, and hundreds of dwelling-houses have been built upon them, within a few years, while hundreds of others are now in the course of erection, and, as fast as, and in many instances before, they are finished, become tenanted. A new town-hall, a new Unitarian meeting-house, two new churches, an extensive brewery, and a large building for a banking establishment, are in contemplation, and, no doubt, will in a short time

\* Communications may be sent to No. 1, Adam-street, Adelphi.

be commenced. There is to be a new post-office; the goods station of the Midland Railway Company, and the County Police Offices are immediately to be enlarged, and some thousands of tons of stone from Lath, Attleborough, Casterton, Matlock, Rowsley, Hollington, Wingerworth, Ketton, Mansfield, Bradford, the isle of Portland, and even from Anghny and Caen, in Normandy, annually find their way to the Railway Wharf, for the consumption of Leicester and its locality.

Building-ground in the vicinity of the railway-station, which, thirty years ago, exchanged hands at 10d. per superficial yard, has, within the last two years, been again sold at a fraction less than 20s. per yard. This prosperous town is bidding fair to become of importance.

We have another tale as to the sanitary condition of some parts of the town; but never mind that just now.

### VIEWS ON COMPENSATION.

EX PARTE THE CORPORATION OF LONDON, RE ROBINSON AND BARTRAN.

IN this case the question (which arose upon a compensation proceeding under the Holborn Valley Act) was as to the right to compensation for reinstatement of a trader in other premises. The claimants (Messrs. Robinson & Bartran, Linendrapers) claimed 34,000*l.* of which the sum of 15,000*l.* was claimed in respect of such reinstatement. At the trial of the inquiry before the Recorder it was proved that the claimants had used all proper means for discovering other premises fit for the purpose of carrying on their business, and that they had at last been compelled to take some premises which they had previously refused in consequence of the large price demanded for them, the rent required being 60*l.* a year, besides a premium of 15,000*l.* for the unexpired residue of the lease, seventeen years, and that the new premises would “not be more suitable nor so much so as the old.” On the other hand, it was elicited on the part of the Corporation that the market value of the premises to be taken was 6,815*l.*, and on the part of the Corporation it was contended that the market value only could be taken. The Recorder, however, told the jury, that they might give the value of the premises to the claimants; or, if they only gave the market value, then they might give fair damages sustained by the loss of them; so that, in one way or the other, he left it to them to give full compensation for the injury they sustained, and they had accordingly given 28,000*l.*—that is, 13,000*l.* for value, and 15,000*l.* for damage sustained.

Mr. Hawkins, G.C. (with him the Common Sergeant and Mr. Maurice Howell) moved for a *certiorari* to bring up the inquiry to quash it, contending that the Recorder had given a wrong direction to the jury to assess damages in respect of reinstatement. He urged that the claimant could only recover the market value and the damage proved, and that the expenses of reinstatement in other premises was not an admissible item.

Mr. Justice Mellor, however, said that it was a matter which the jury might fairly take into consideration. The claimants must find other premises, and the difficulty and expense of doing so could hardly be excluded from consideration.

Mr. Justice Lush put the case of a trader who had the residue of a lease (say ten years) worth 10,000*l.*, and unable to find any other premises than some held for the same period, and worth in the market 20,000*l.*, was not the trader entitled in one way or another to the difference?

Mr. Hawkins denied that he would be so entitled.

Mr. Justice Mellor, however, said that he thought the trader clearly would be so entitled. The jury were to assess the value as it appeared to them; and it must enter into the question as to what expense the trader had to obtain substituted premises. The Recorder had not told the jury that they were bound to give the whole difference of expense in respect of the cost of reinstatement; and, on the other hand, as it appeared to him, they were entitled to take it into consideration in assessing the value.

Mr. Justice Lush observed that according to the contention on the part of the Corporation they would give only the value which they got, not the value which the claimant lost. But the object of the proceeding was to assess compensation to the claimant for the loss which he had sustained.

Mr. Justice Mellor said, what the jury had to do was to assess the entire damage sustained. The court were all of opinion that there was no ground for interference. They could not interfere unless there was a distinct misdirection; that is, a direction to the jury to give damages in respect of an item not admissible, or to give damages on a wrong principle. The court did not sit here as a tribunal of appeal from the Recorder. If he had told the jury to give 5*l.* damages the whole amount claimed for reinstatement, there might have been ground for interference. The Recorder, however, had only told the jury that they might consider it in their assessment. That was clearly correct, for beyond all doubt it could not be excluded. There did not appear to have been any misdirection on his part or any misdirection on the part of the jury, and therefore the court declined to interfere, and there could be no rule for a *certiorari* to bring up the inquiry.

The other judges concurred.—Rule refused.

### METROPOLITAN BOARD OF WORKS.

THE SOUTHERN OUTFALL SEWAGE.

At the next meeting of the Board, a report was brought in by the Main Drainage Committee on the different tenders sent in for making an outfall for the sewage on the south side of the Thames. The tenders sent in were five in number, from Mr. Rigby Watson, Mr. Shephard, Mr. Kirkland, Mr. Smith, and Mr. Ellis. It stated that none of the proposals complied with the terms of the advertisement issued by the Board.

Mr. Ellis proposed to conduct the sewage by a brick culvert, 11 ft. 6 in. in diameter from the Crossness reservoir to the river at the outfall at Higham-creek, about two miles below Gravesend, and about thirty miles below London Bridge. This culvert is to have a discharge into the river at the outfall at Higham-creek, and is to take the drainage from Erith, Dartford, and Gravesend on its way. Near the proposed outfall a pump-station is to be erected, and the sewage forced through a culvert two miles in length into a summit reservoir at an elevation of about 280 ft., whence it is to flow by gravitation through pipes to the area proposed to be irrigated, which is stated to comprise about 198,000 acres. At convenient points along the line of pipes the sewage is to be distributed by hose and jet, or by open channels. Mr. Ellis also proposed to take on lease about 4,000 acres of land for the purpose of cultivation, and on which to use any surplus of the quantity of sewage was assumed to be about 3 million cubic feet per diem, or about 89 million tons per annum, which would give 500 tons per acre in the area over which it was proposed to utilize it. Mr. Ellis estimated the cost of this scheme at 1,600,000*l.*, and the working expenses at 112,000*l.*

The committee, after mature deliberation, arrived at the conclusion that the plan of Mr. Ellis, imperfect as it was, contained desirable features, and was, in some respects, capable of being so improved and developed as to meet the ends in view. The most important modification required was in the particulars of the outfall at Higham-creek. The committee was of opinion that the discharge of such an immense volume of sewage as proposed would seriously pollute the river, and at a point only two miles below Gravesend would affect that town. It would therefore be necessary in the event of a concession being granted to Mr. Ellis, that he should construct a reservoir at Higham with pumping power, so that the discharge might take place as at Crossness, soon after high water. The committee, though Mr. Ellis's scheme was best as regarded the general scheme, and recommended that the latter be referred back to them to negotiate the precise terms upon which a concession should be granted to him.

After some discussion, this was agreed to by a majority of 26 to 6.

### CONTRACT TO PURCHASE BY AUCTION.

IN the Court of Chancery, the case *Mortimer v. Bell*, was recently decided on an appeal from a decree of the Master of the Rolls for specific performance of a contract to purchase a freehold estate. The plaintiffs put up a dwelling-house, called Warren House, at Upper Tooting, for sale by public auction. The first condition of sale provided, in the usual way, that the highest bidder should be the purchaser, but no stipulation was made that any person would bid at the sale on behalf of the vendors, nor that any bidding would be reserved. The vendors, however, were determined that the property should not be sold below a certain price, which was ultimately fixed at 3,600*l.* The auctioneer, a member of the firm of Norton, Hogart & Tate, employed one person to bid; but he bid against the person whom he had appointed to bid, all the biddings got up to 3,600*l.*, when the defendant bid 50*l.* No other bidding was made, and the property was knocked down to him at 3,650*l.* The question raised was whether the sale was void for “pulling.” The Master of the Rolls held that it was a good sale. The defendant appealed.

The Lord Chancellor stated it to be his opinion that the courts of law had held that in the absence of any stipulation for a reserved price up to which biddings might be made, it was not necessary to run up the biddings to a certain point. It was said, however, that the courts of equity had held that there might be an implied stipulation for a reserved price, and that there was no fraud in running up biddings to that point, and that the present case came within the meaning of the rule. In the case in question there had been two persons bidding for the vendor, the auctioneer and his agent, and the bidding up to 3,600*l.* was a mere fiction, and, if not intended, to deceive persons who might desire to be purchasers. He could find no case in which, under such circumstances, a vendor could enforce the completion of the purchase, and therefore the bill for specific performance of the contract must be dismissed, with costs.

### A NUISANCE.

SIR,—Knowing that the columns of your journal are always open to any communication that may affect the public health, I have the honor to bring before you the following particulars, at the same time asking your opinion on the subject. In one of the bye-streets leading from the borough-road is a bone-boller's, which, when at work, gives forth a most obnoxious smell, to the great annoyance and destruction of health of the surrounding population, which, as a matter of course, causes a high rate of mortality. It is estimated one in twenty-nine persons dies every year in this district.

Those of your readers who use the Metropolitan Extension of the Chatham and Dover Railway will corroborate me in the statement that I make above; for when they go to work on the line arrive at the Borough-road Station, they at once detect the unpleasant smell I complain of, particularly about midday, which smell is equally injurious to the traveller on the railway as it is to the inhabitants round about.

Some few years since a petition was got up, having for its object the removal of this bone-boller's, stating it to be a nuisance to the neighbourhood. The argument brought forward by the proprietor of the bone-bolling establishment was, that he was there first; and, if parties chose to build about him, they must put up with the consequences. This leads me to ask a question, namely, does this argument hold good at the present time? The answer does, are there any means whereby this nuisance can be stopped? In a matter like this, the public health ought to be studied and looked after.

AS INHABITANT OF THE BOROUGH-ROAD.

## CORPORATION BATHS, LIVERPOOL.

To your notice of the buildings of Liverpool, you might have added mention of the new baths in Cornwallis-street, belonging to the corporation. They are a credit and an immense comfort to the city, and vastly superior to London baths in every respect. I chanced to visit them while at Liverpool, and almost regretted to leave the town in consequence of this special luxury. Each private bath is provided with a shower-bath, in the form of a large watering-pot rose, projected over the foot of the bath; and when the bather has finished his tepid or warm ablutions, a door may be folded back to prevent the spray dashing on the floor, and then by pulling a string he enjoys a capital cold shower to finish off with. The way, too, in which the baths (of zinc, or something like it), are belowered out is admirable. There are no angles or crevices, in which the dirt may accumulate, as in the London baths. I hope we shall some day overtake Liverpool in this respect.

A MABLETONIAN.

With no respect for the baths of his parish since seeing the above.

## NEWCASTLE LITERARY AND PHILO-SOPHICAL SOCIETY.

On the 17th, Dr. Charlton delivered a lecture on "Runic Inscriptions: their Relations to History, Poetry, and Romance." In opening his lecture, Dr. Charlton corrected a common misconception. Runes, he explained, did not form a language, but were simply characters in which many languages had been written; just as shorthand was employed to write either one language or another. With this explanation the lecturer entered upon his subject, and made it, difficult as the enterprise might seem to be beforehand, most agreeable to his audience.

After a vote of thanks, says the *Newcastle Chronicle*, Sir William Armstrong referred to the many traces which exist, near his residence at Rothbury, of the ancient inhabitants of the district, in their camps, cairns, roads, and dwellings. He had lately explored the remains of a Celtic circular hut, but found nothing to reward his search save the charcoal ashes of the hearth. The day before yesterday, however, he had made a more important discovery. It was below the peat and heather, and among the accumulated *debris*, that the men were making their excavation; and at the depth of about 3 ft. below the peat moss, and of 3 ft. 6 in. from the surface, they came to the leaf-shaped bronze sword then lying on the table. It was perfect when found, but they broke it in two; and it had also become jagged at the edges after exposure, by the falling away of the corroded bronze. To one unique feature of this sword, Sir William called especial attention. Loose on the hilt, when taken out of the ground, were three rings of different sizes, the largest of which, and the nearest to the blade, was attached by insertion through one of the small perforated holes, and might have been employed in the suspension of the weapon on the person of the wearer; but what could have been the purpose of the remaining rings, which were loose and unattached?

## FALL OF A BUILDING AT KILBURN.

DISTRICT SURVEYOR WANTED.

DR. LANKESTER held an adjourned inquiry on Monday evening respecting the death of George Riches, who expired from the effects of injuries he sustained through the fall of a house at the corner of a new street in the Carlton-road, Kilburn. It was intended for a public-house, and had a circular corner. Blame had been attributed by the deceased, while in the hospital, to Mr. Finch, the builder, for allowing the men to be on the scaffold when he was aware that one of the piers was dangerous, and had told the foreman it must be watched. Evidence was also given that Mr. Finch had ordered a crack in the pier to be filled up. George Barnes, a bricklayer, of Kensal New Town, who, with a man named Bigley, was engaged on the works, stated that the accident was not caused by the slipping of the foundation; the pier first bulged, and then fell. It had more weight to bear, and ought to have been as strong as the others. John Riches, of Canterbury-road, Kilburn Park, brother of deceased, was called, and positively swore in examination that he was

employed to lay the last five courses on the pier that fell; and that, when he proceeded to do his work, he observed that the pier had been built hollow, and rubbish shot in with a basket. Bigley, who had absconded, had built the defective pier. Mr. Bletchley, the surveyor, being questioned, said that, if the piers were built hollow, as stated, it was most "scampering" and dangerous work. The coroner, in summing up, told the jury that he did not think they could legally bring a verdict of manslaughter against Bigley, as no Act of Parliament had been broken. He thought it was a monstrous thing that, where some 800 houses were being erected, the lives of the public should not be protected because the district was just beyond the metropolitan boundary. The jury returned a verdict of Accidental death, but appended to that the following resolutions:—

"1. That the plans of the architect for the building of the house which fell and killed deceased were deficient in those details which would secure the safety and permanence of the various parts of the building. 2. That Mr. Finch, the builder, has displayed great neglect. He did not superintend with sufficient diligence the building of the piers which fell, and the basement which gave way and let down the rest of the house in Carlton-road. 3. That the man Bigley, who undertook to do the work of the piers, did not build them up in the manner required by the builder, and is open to the most severe censure for his dishonest conduct. 4. That the Act of Parliament which requires the services of a district surveyor for the metropolitan parishes should apply to all the parishes in the kingdom, as the value of life is as great in other parts of the country as in the metropolis. The jury request that the foregoing resolutions be forwarded to the Secretary of State for the Home Department."

## RAILWAY MATTERS.

MANY of the great railway companies, such as the Great Western, the London and North-Western, the Midland, the Caledonian, and others, such as the Bristol and North Somerset, are issuing notices of intention to apply to the new Parliament for powers to form numerous minor railways, such as branches, branchlets, and junctions, all tending to ramify the railway system amongst the lesser towns, villages, and country districts throughout the country. Pneumatic railways in Manchester, and in Brighton and Hove, have been announced in similar notices; as well as a considerable addition to the number of metropolitan lines, including a Hampton, Holloway, and Kingsland line, in connexion with the North London and the London and North-Western; Clapham and London Bridge lines, by the Elephant and Castle, in connexion with a Waterloo and Whitehall extension line from Waterloo to Newington Butts; a Crystal Palace and South London junction line; East London lines—South-Western extension to Deptford, with junctions in Camberwell with the London, Chatham, and Dover, in Bethnal Green with the Great Eastern; and so on.

If any proof were required of the necessity of railway accommodation for the metropolis, and the remunerative character of such undertakings, it would be found in the result of the opening of the North London Railway Company's City Extension line. The published returns of that company for the week ending the 29th October, showed a total receipt from passengers of 1,956l., and for the week ending the 12th November (being the first entire week after the opening of the City branch), 2,957l., whilst the number of passengers is stated to have been 158,935, as compared with 85,982. So soon as the goods traffic of the London and North-Western Company is also conveyed over it, it must prove a highly remunerative branch. The prospectus recently issued for a line in connexion with the North-London to Highgate and Alexandra-park, will secure to inhabitants of the thickly-populated district of Kentish-town, Holloway, and Highgate the advantage of easy railway access to the City.

A new mode of lighting carriages with gas, patented by Messrs. Metcalf & Son, of Miles Platting, is being tried on the London and North-Western line, between Manchester and Leeds. By a small hydraulic blower, worked by a spring in connexion with a small apparatus beneath a seat of the carriage, common atmospheric air is driven through sponges moistened with petroleum or paraffine oil, and then sent to the jets, where it yields a light. This is rather a vapour light, however, than a gas-light; but that does not matter, if the light be good, and without risk, as is also said. The invention is being applied to ordinary dwellings.

The *Moniteur* publishes an imperial decree authorising Messrs. Brassey, Fell, & Co., to esta-

lish a railroad on the imperial road over Mount Cenis, between St. Michel and the Italian frontier, and to work the same by means of steam locomotives, on the system invented by Mr. Fell, until the entire completion of the railway from St. Michel to Suza, through the tunnel of the Alps. The portion of the railway already formed, and on which experiments were successfully made last summer, is about a mile and a half in length, and runs up one of the steepest gradients of the whole road.

The Pacific Railway, on the western side, will next year be extended to the summit of the Sierra Nevada mountains, 104 miles from the city of Sacramento, which is itself 2,700 ft. above tide water. 4,000 men, chiefly Chinese, are now engaged on that railway, and the state of California has donated 2,100,000 dols. for its prosecution. To meet this, the railway on the eastern side of America now extends from New York to 200 miles beyond St. Louis, the border city between Illinois and Missouri.

## CHURCH-BUILDING NEWS.

*Whitbourne*.—The church here, which, according to the *Hereford Journal*, has been closed for eight months, has now been re-opened: the cost of the restorations was estimated at 1,350l. The principal alterations consisted in the taking away a deep gallery, which extended some distance into the body of the church; in throwing out an aisle to the north; in the removal of the ceiling, and so restoring to view a fine old oak roof; and in replacing the high pews, by open varnished seats. The tombstones within the altar-rails have been removed, and replaced with coloured encaustic tiles. The work was carried out by Mr. Hurn, after plans by Mr. Perkins, of Worcester, architect.

*Bootle*.—The consecration of St. John's Church, Bootle, has taken place. The land on which it is erected was given by the Earl of Derby, as also was the stone with which the church is built. The total cost of the edifice will be about 5,000l. Sitting-room is provided for 850 persons, 400 seats being entirely free. The church is built in the Early Gothic style, from the design of Mr. Weightman, of Liverpool, architect.

*Waterloo*.—The church of St. John, Waterloo, has been consecrated. The church is built in the Early English Style, and has 600 sittings, of which 200 are free. A sum of 4,150l. has been raised by subscriptions and collections, and a further sum of 140l. is still needed. Mr. Culshaw, of Liverpool, was the architect.

*Birmingham*.—The repairs and alterations of St. Mary's Church approach completion. The stained window at the east end of the church has been restored by Messrs. Hardman, of Birmingham. The lead-framed windows have been removed, and something more modern introduced. The organ-gallery has been considerably extended, for the accommodation of the choir. The alterations will include a great amount of general repairs not apparent to ordinary observation. Several supporting-beams in the tower were, on examination, found to be in an unsatisfactory condition. The material used in the restoration is chiefly red brick, the dressing-bricks, &c., being in stone. In the lower portion of the tower, which is used as a vestry, is placed a two-light window, the head being filled in with ornamental herring-bone brickwork. Above the vestry and in the tower the ringing-chamber is situated, lighted by three long narrow openings, the jambs being executed in ornamental brickwork. Above these openings a pierced quatrefoil stone panel and cornice are introduced, from which is worked up a weathering, and here again the herring-bone brickwork is introduced. Eight brick buttresses are carried up against the upper portion of the tower, to strengthen the bull-chamber, and between which are placed a corresponding number of lance-headed windows, filled in with slate louvres, and having ornamental stone and brick arches, worked in with the cornice at the top of the tower, from which springs the octagon spire, of Bath stone, with worked and coloured bands, rising to a height of 75 ft., the total height of the tower and spire, from the ground-level, being 130 ft. The spire, with vane, will be about 45 ft. higher than the originals. Mr. James Crumston is the architect employed, and Messrs. Samuel Briggs & Son, the builders.

*Bishop Burton*.—All Saints' Church, Bishop Burton, near Beverley, has been re-opened. The church has been repaired, at a cost of

3,000l., by the high-sheriff. The chancel and vestry have been entirely rebuilt. The chancel-arch is also new, and room has been provided for an organ. The floor of the old nave and aisles were 3 ft. above the chancel-floor, but the pillars have been under-pinned and lengthened, to allow the floor to be lowered. The roofs of the nave and aisles are new. The seating of the church is also new. The whole of the alterations and restorations were designed by Mr. J. L. Pearson, of London. The works have been carried out by Messrs. Simpson & Malton, of Hull. The carpenters' and joiners' work was done by Mr. Brown, of Cave, and the plumbing and glazing by Mr. J. Halliday, of Welton.

**Selby (Yorkshire).**—Mr. Scott is about to prepare plans and estimates of the cost of the restoration of the Abbey Church of this town. He and Mr. E. Akroyd, M.P., have visited the edifice, and made a minute examination of it. It is proposed that the work of restoration shall include the pulling down and rebuilding of the south wall of the nave, the pulling down and rebuilding of the old tower, and the addition of a south transept, and two new towers for the west end, which, when completed, would, according to Mr. E. B. Denison, entitle the whole building to be called "The Beverley Minister of the West Riding." The cost is estimated at from 50,000l. to 60,000l. Mr. Denison, in a letter to the vicar, remarks that few people know that the church is the longest north of the Trent, and indeed north of Boston (except the minsters and cathedrals), or that it is the only one of the ten great Yorkshire abbeys, besides the other northern ones, which is not wholly, or for the greater part, in ruins.—One of the oldest parishioners in Selby, Mr. James Audus, has offered to the archbishop of the diocese to build a new church, at an outlay of 10,000l., which offer the archbishop has accepted. The site fixed upon is some ground now occupied as gardens at the south end of Audus-street, and on the west side of New-lane, within two or three hundred yards of the centre of the Market-place. By this means Selby will be divided into two parishes, one-third of the population being assigned to the new church, which is understood to be called St. James's, and the rest of the population to the Abbey Church, called St. Mary and St. Germain. It is understood that the church will be built in the Gothic style.

**Kilnwick.**—The consecration and opening of Kilnwick Percy new church, have taken place. The old church was in a dilapidated state, although it had frequently been repaired, and at length it was determined to pull it almost entirely down and erect a new edifice in its place. Messrs. J. B. & W. Atkinson, architects, were instructed to prepare plans and drawings for the structure, and these having been approved of, the work of re-building commenced, Mr. Alderman Weatherley, York, being the contractor. Like its predecessor, the new church is Norman in character. The nave is 42 ft. in length by 21 ft. 6 in. in breadth. At the west end is a bell-turret, rising to the height of 45 ft. The whole of the edifice is faced with Bradford sets, with dressings of Whitley stone. The roof is high-pitched and open-timbered. The windows are embellished with zigzag mouldings, and filled in with embossed quarries. The east window is of three lights in stained glass, and is illustrative of the Crucifixion, with figures of the two Marys. In a circular light above, is a representation of the Lord's Ascension. The west window, of two lights, contains figures of St. Peter and St. Paul, and in a circular window above is an illustration of the Flight into Egypt. The whole of the windows have been filled in by Messrs. Hodgson, of York. The staining and varnishing have been executed by Mr. Pearson, of York. The new church will accommodate 130 persons. It has been erected at the sole expense of the Hon. Admiral Duncombe, M.P., the cost incurred being upwards of 1,000l.

**Stowmarket.**—The parish church has been undergoing some restorations of late, and has now been reopened. The total cost of the works amounts to upwards of 2,200l., and the contractors, Messrs. Betts & Rednal, of Stowmarket, have carried them out under the superintendence of Mr. R. M. Phipson, architect, who has endeavoured to restore the edifice as nearly as possible to its original condition.

**Alderton.**—During the last two or three years Alderton Church has been undergoing repairs and restorations of such an extent that it may now be said to have been almost rebuilt, and it is only by the tower, which has not at present been restored, that the present building can be

identified with the church which some three or four years ago was remarkable chiefly for its dilapidated appearance. The services of Mr. A. W. Blomfield, of London, architect, were engaged, and that gentleman prepared plans for the restoration of the church. The first thing which was done was to rebuild the chancel, and accordingly a new chancel in the Decorated style of architecture was built at a cost of somewhat about 1,000l., the work being entrusted to Mr. Brown, builder, Alderton, by whom it was carried out. The chancel was completed and opened many months ago, and the restoration of the nave was shortly afterwards commenced, the work being again undertaken by Mr. Brown; and, it being now completed, the church has been re-opened for divine service.

**Haltwhistle.**—St. Stephen's Church, Copley, has been consecrated. The church is a stone structure, in the Early Gothic style. It will accommodate about 500 persons. The cost of it will probably be upwards of 6,000l.

#### DISSENTING CHURCH-BUILDING NEWS.

**Kentish Town.**—The new Congregational chapel, Gospel Oak Fields, Kentish Town, was opened for divine service on the 2nd instant. It is designed externally in the Byzantine style, and consists of nave and side aisles, covering a space of 80 ft. by 45 ft. internal dimensions. It has a double set of clerestory windows, and these are supported, as well as the gallery below, on wreathed iron columns. The arch at the back of the pulpit has foliated capitals and keystone; the latter is worked out as a dove bearing an olive-branch in its mouth. Externally the building is carried out in Kentish rag, with Bath stone dressings; and a wheel window, 12 ft. in diameter, pierces the west gable. There is a shallow porch as an entrance to the vestibule. The cost of the building is 2,040l. It will seat at present 550 persons, and the galleries are formed, and ready for pews, and when so furnished it will accommodate 724 persons. The architect is Mr. W. Allen Dixon; the builders are Messrs. Manley & Rogers.

**Southend.**—The new Congregational church at Cliff Town, Southend, has been opened for divine service. The new church is in the Geometric style of the fourteenth century. It is built of Kentish rag and Bath stone. The tower and spire are about 80 ft. high. The entire cost is about 2,500l. Mr. W. A. Dixon is the architect.

**Harlow, Essex.**—A new Baptist chapel has been opened at Harlow. The edifice stands partly on the site of the old building, but its front is in advance of the old front about 20 ft. The general plan of the building consists of a simple parallelogram 78 ft. long by 35 ft. outside measure; both chapel and school being contained under one continuous roof. The chapel is 47 ft. long by 32 ft. wide, and is filled up with a deep end gallery, and side galleries of only two seats deep. The total accommodation is for 500 people. The style of the building is of a Venetian character. It was designed and superintended by Mr. R. Moffat Smith, of Manchester. The works were done by Mr. W. B. Nicholls, of Harlow, builder. The cost of the whole has been about 2,000l.

**Walker (Newcastle-upon-Tyne).**—The foundation stone of a new United Presbyterian church has been laid at Walker. Mr. Thomas Oliver, architect, Newcastle, prepared the plans; and Mr. John Dobinson is clerk of works. The edifice will be built entirely of stone, in the Gothic style, and will accommodate 350 persons on the ground-floor, exclusive of an end gallery, sittings being provided altogether for nearly 500 persons. The exterior of the building will present a Middle Pointed facade. The stonework, principally the entrance pillars to the door and those of the windows, will be relieved by red stone from Carlisle. There will also be a tower and a spire, nearly 90 ft. high, at the south-west angle of the church. The contractors for the works are,—for masons' work, Mr. Dodds; carpenters' work, Mr. George Waite; slating, Messrs. Sanderson & Co.; plastering, Mr. Charlton; ironwork, Mr. Donkin; plumbing work, Messrs. Russell & Davies. The total cost of the erection will be about 1,600l., exclusive of the grant of land on lease, kindly given by the Corporation of Newcastle, at one-half of its annual value. The church will be heated by Gill's stoves, whilst the lighting by gas will be by means of star-light jets.

**Bradford Moor.**—The new Wesleyan chapel is now nearly completed, and has been consecrated. The style is Italian, of a plain and unassuming character; the front to Leeds Road presenting almost the only attempt at anything ornamental. The external dimensions are,—length, 81 ft. 8 in.; width, 56 ft., exclusive of a recess at the north end, which contains the heating apparatus in the basement, the vestries on the ground-floor, and, on the gallery-floor, the organ. The height from floor to eaves is 35 ft. 3 in. The warming of the building is attained by a hot-water apparatus, fixed by the Low Moor Company. The following were the contractors: masons, Messrs. Cordingley & Peel, of Undercliffe; joiners, Messrs. T. Taylor & Son; slaters, Messrs. John Thompson & Son; plasterer, Mr. James Duck-wood; plumber and glazier, Mr. John Schofield; painter, Mr. Edward Harland, all of Bradford, under the direction of Messrs. Milnes & France, of that town, architects. The total cost of the building, exclusive of the land, will be about 4,000l.

**Stroud.**—The foundation-stone of a new Congregational Chapel has been laid at Painswick Slad, about two miles from Stroud. The building is to be in the Gothic style, and will be 41 ft. 6 in. by 21 ft. 6 in. internal measurement. It will seat 150 persons, and, with the land, will cost about 400l. The interior will be open-roofed, and externally the front is to be gabled. The architect is Mr. Geo. Bidlake, of Wolverhampton, and the contract has been taken by Mr. Freeman.

#### FROM SCOTLAND.

**Leith.**—The plans of the new dock on the East Sands at Leith, prepared by Messrs. Rendal & Robertson, civil engineers, embrace extensive works necessitating the inclosure of sixty-two acres of the East Sands reclaimed from the sea, and involving an expenditure of 341,000l. The plans, as described by the *Scottishman*, include two docks—an outer dock and inner dock—with locks, bridges, and other constructions; but the outer dock only has been contracted for. The land necessary for this dock will be about thirty-four acres, with nineteen acres of wharfage; and the cost, according to the engineers' report, will amount to 223,000l. Mr. Scott, Kilmarnock, having entered into a contract for the construction of the dock, commenced operations eighteen months ago, since which time he has been carrying on the works with vigour. The whole area of thirty-four acres required for so much of the contemplated docks as is to be made in the mean time has been inclosed by a strong sea-wall, inside of which there has been built a puddled clay wall (5 ft. thick at bottom and 3 ft. at top), to prevent the tide flowing through the breakwater into or damaging the new works. A few weeks hence the excavation will have been commenced.

**Dundee.**—A meeting of the special committee appointed by the directors of the infirmary to confer with the provost, to consider the steps necessary to be taken in consequence of the great increase of fever in the town, has been held. It was stated at the meeting that fever had for a long time been exceedingly prevalent in the town, and that the number of cases were daily on the increase. At present there are 107 cases of typhus in the infirmary, and the fever wards were stated to be not only full, but overcrowded. A memorial embodying these facts was, we believe, laid before the provost by the committee of the directors of the infirmary, praying that he should take immediate steps to carry into effect the provisions of the Nuisances Removal Act, by memorializing the Privy Council to appoint a "local authority" under the Board of Supervision. The provost agreed to call a meeting of the sanitary committee without delay, and to lay the memorial of the directors before them. He also expressed his intention of instructing the clerk to the police commissioners to write to Glasgow, and ascertain what steps were taken there last year when fever raged so extensively. The principal centres of the disease in Dundee are said to be Gillan's Close, Overgate, the Yellow House at Dens-road, the Cats' Close, Scouring-barn, and Fish-street. The whole of these localities are densely populated, and are rarely free from typhus. The house accommodation for the working classes is confessedly inadequate to the population.

**Orkney.**—The Kirkwall Harbour trustees, after much delay and difficulty, have succeeded in raising the funds for a new iron pier, which will

be accessible to vessels at all states of the tide. Messrs. Laidlaw, of Glasgow, are willing to abide by a former offer to complete the works for 10,400*l.*, and the trustees have resolved to close the contract. Messrs. Laidlaw are to commence operations early in spring, and bind themselves to have the pier completed by the beginning of October next.

### Books Received.

"TABLES for Workmen's Wages." By Henry Laxton, C.E. London: H. Laxton, 34, Arundel-street, Strand. These very useful tables contain upwards of 7,000 calculations, simply arranged. They are published in plain covers, at 1*s.* for workmen, and in boards at a small additional cost, for masters and others. They show the amount of wages per hour, day, week, month, &c., at various rates and in various ways.—*The London and Continental Times* (4, Ave Maria-lane, London), gives information for provincial and foreign visitors to London, and time-tables for travellers on all the great railway thoroughfares in Europe. The form is that of a full-sized journal, thus obviating the necessity of turning over many small and confusing pages, and the tabular arrangements are simplified and easily available for reference.

### Miscellaneous.

HOUSE, WIMBLEDON PARK.—We are asked to add to our notice the intimation that Messrs. Ariss & Son, of Putney, are the builders of Torwood, in Wimbledon Park.

PAINTERS' BRUSHES.—A correspondent writes to extol foreign manufactured painters' brushes, and says,—“The inferiority of the class of goods made in England, and the high prices charged for the same, do not add to the national credit; and if not at present, it is to be hoped there shortly will be an importation of articles of this kind. I am sure there would be plenty of purchasers among the thousands of painters and builders in this country.” We give his observations for what they are worth, with a view to stimulate improvement.

"GREAT NORTHERN BRICK COMPANY."—Considering the price of bricks, and the immense demand for them, it is not to be wondered at that several companies are being started to manufacture them. The company named at the head of this paragraph is formed to purchase the well-known brick-fields at Arlescy, near Hitchin, successfully carried on for many years by Messrs. Dennis & Son. They consist of about twenty acres of freehold land, containing a supply of the finest clay, 200 ft. in depth, it is asserted. The bricks made from it are of the first quality. A line of rails connects the kilns with the Great Northern Railway, by which means the bricks are readily removed to the London or other markets. There is a wharf at King's-cross Station connected with the works, and the trucks run direct from the kilns to the wharf, at special rates, avoiding all cartage and unloading in transit. The directors have subscribed a large portion of the required capital. It certainly seems to us a promising speculation.

BUILDING ABOUT WORCESTER.—Among the country residences now in course of erection, in the vicinity of the city, is a mansion, which is being built by Messrs. Wood & Son, for Mr. C. W. Lea, on the east side of the Hallow-road, close to the two-mile-stone. The local *Herald* says:—"As it would be, of course, necessary to convey a large quantity of stone and other materials from Worcester, Messrs. Wood endeavoured to come to terms with Mr. Burch, the lessee of the tarpike tolls, and offered him 200*l.* for the right to convey all necessary materials through his gate, while the house in question was in course of erection; but Mr. Burch said he could not do it under 300*l.* He did not think of the river: the builders, however, did; and accordingly have adopted the easier and more economical plan of conveying all necessary materials by water. A brickfield stands on the opposite side of the river, and there trolleys are loaded, floated across in a barge, and hoisted by a derrick on to a tramroad to the river's bank, whence, by an easy ascent, the waggons are taken up to the house. Mr. Burch is thus a clear 200*l.* out of pocket."

THE VOLUNTARY EXAMINATION CLASS, ARCHITECTURAL ASSOCIATION.—The next meeting will be held on Monday evening, the 27th inst., at eight o'clock. Subject, "Mason," by Mr. Arthur Ashpitel.

TREATY FOR THE ST. PANCRAZ WORKHOUSE.—The treaty for the sale of this workhouse to the Midland Railway Company is re-opened. Mr. Lockyer is acting for the parish, Mr. John Clutton for the Railway Company.

THE NORTH STAFFORDSHIRE INFIRMARY.—The joint designs, by Messrs. Lynam, of Stoke, and Nichols, of West Bromich, having been awarded the 100*l.* premium, these gentlemen agreeing to act together and re-arrange the plans, tenders were advertised for, and that of Mr. Alfred Barlow, of Dresden, near Longton, being the lowest, to erect the buildings and execute the engineering and other works for 26,964*l.*, was accepted by the building committee.

BURSTING OF THE WALSALL RESERVOIR.—A correspondent writes to us as follows:—"The embankment of the reservoir of the South Staffordshire Waterworks Company gave way about seven o'clock on Thursday evening. There was a breakage in the bank of about one yard in width, and the water poured in a stream towards a small village called the Pleck, covering acres of ground belonging to the Parks farm. The steps in the town were all turned on and so arrested the progress of the current in a great degree. Owing to the prompt measures taken by the officials no further damage was done."

WORKING MEN'S COLLEGE.—His Royal Highness the Prince of Wales has contributed, through Lieut.-Gen. Knollys, the sum of five-and-twenty guineas towards the erection of a new building at the Working Men's College, Great Ormond-street, which is intended to provide a meeting-hall and better accommodate the rapidly-increasing art-classes. We have before now said that this institution deserves the assistance of our readers. On the 18th inst. Mr. Ruskin delivered an address, at the College, as against mechanical art, in which he inveighed at some length against competition.

COMPETITION AT ADELAIDE.—The South Australian Government lately advertised for designs for the erection of a general post-office and telegraph station, in one design, but separate internally, the designs to be sent in by the 1st of January, 1866. The amount proposed to be expended on the whole building is 20,000*l.* The premium for the best design is to be 300*l.*; for the second, 150*l.*; the two designs becoming the property of the Government; and any of the other designs may be retained as the property of the Government for the sum of 100*l.*

RE-OPENING OF SPROTROUGH BRIDGE.—The bridge across the river Don and the canal at Sprottrough have been closed from the 1st of September last, in order to effect repairs as well as to add further improvements. Sir Joseph Copley, bart., took the opportunity of making several alterations in the bridge and roadway. The centre arch had always a rather unfinished look, but has now been rendered more attractive by the introduction of ornamental lattice-work tracery into the spandrels. The balustrade was originally much too light, both in appearance and apparently in security. It is replaced by one from the Thorncliffe Iron Works. The alterations will cost 1,000*l.* The work has been carried out from plans, and under the direction of Mr. B. S. Brundell, C.E.

RE-OPENING OF THE RELIGIOUS AND USEFUL KNOWLEDGE SOCIETY'S HALL, at NORTHAMPTON. This lecture-hall has been re-opened, after having undergone a process of restoration and decoration. The lower part of the walls, as high as the surbase, is painted a deep maroon colour, the skirting being black, with a green edge. The surbase mouldings are a combination of blue, buff, red, and green, quietly toned, the colours of the wall being carried down into the base. The arcade round the walls is of a dark cream colour. The mouldings round the arcade are picked out in blue, red, white, and green. The walls are of a much lighter maroon than the lower portion. The domes and the groined work round the angle of the ceiling are tinted, the panels being of the same tint as the arcade on the walls. The painting has been done by Mr. Tozer, and the colouring by Messrs. Banks, under the superintendence of Mr. E. F. Law, of Northampton, architect.

MEMORIALS.—It is proposed to erect a statue of the Marquis of Westminster in the central square of the city of Chester. A committee, however, has been appointed to consider and arrange as to the form of the memorial, &c.—A church, with schools and parsonage-house, as a memorial of the late Canon Stowell, is to be erected in Manchester, and the memorial is also to include certain exhibitions to the University of Oxford.—A memorial of Lord Palmerston, at Tiverton, has been resolved upon, and a committee appointed to consider as to the form of it.

THE NEW SUBWAYS AND THE WATER COMPANIES.—The Metropolitan Board of Works, it seems, cannot prevail upon the Southwark and Vauxhall Water Company to make use of the new subway along the new thoroughfare from Southwark to Blackfriars. The company have so long been habituated to the destruction of the roadways, that they evidently feel indignant at this new-fangled endeavour to deprive them of the privilege of exciting a ferment every now and then amongst shopkeepers and cab and omnibus drivers. Quietly to lay their mains in a convenient subway, out of sight and out of mind, seems to be quite inconsistent with the self-asserting importance of a great water company. The Metropolitan Board have sent an account of the affair to every member of the new Parliament, and it is to be hoped this will put a spoke or two in the wheels of the movement for establishing an improved water-supply to the metropolis.

IMPROVEMENT OF ABERYSTWTH.—A scheme for extensive improvements at this watering-place, is being promoted by Mr. J. P. Seddon, who proposes the formation of a company to carry out these works, which he believes would render Aberystwith one of the finest of our watering-places. In the prospectus, amongst other improvements, Mr. Seddon proposes "to first fill up the gap between the Queen's Hotel and Craiglais, with a crescent of modern and noble houses, the ground for which he hoped the council would concede on fair and liberal terms;—to start a half crescent of villas on the rising ground from the Queen's Hotel to the North Gate;—these residences are proposed to be of a superior character, so as to induce permanent residents;—to purchase, from time to time, as the leases may fall in, or earlier, if practicable, the possession of the Marine-terrace, with a view ultimately to raise the existing houses, and substitute others, standing further back, of corresponding elevation to those to be first erected north of the Queen's Hotel;—also to erect a market house, public slaughter-houses, a laundry, and bath-house," &c. A church is also proposed to be built. The local authorities and inhabitants generally, appear to have entered into the spirit of the proposal, and have passed a resolution that it merits the utmost support of the town.

THE SITE OF CAMBODUNUM.—In 1824 the remains of a Roman building, buried under the soil, were uncovered at Slack, near Oudane, the site of the ancient Roman station Cambodunum. Since then, a society was formed, named the Huddersfield Archaeological Association, chiefly with the view of making excavations. Recently a number of men have laid bare the walls of a building, 68 ft. in length by 64 ft. in width, the outer walls of which are nearly 3 ft. in thickness. There are several internal walls, and there is also a paved court. In the space between the inner paved court and the front wall of the building, a gold ring was found, very much worn; and in what appears to have been the centre of the inner chamber were found a silver coin of Vespasian, and another of Nerva. Heaps of broken Roman pottery have been found, and a large quantity of bricks and tiles have been turned up. Some of them bear the inscription "COH III BRB." This shows, in the opinion of the council of the association, that this was the site of the garrison of the 4th cohort of the British legion. Excavations adjoining those described have led to the discovery of a hypocaust. The roof is of concrete; the side walls are of stone, supporting pillars of tiles; and the floor is of red tile, all in excellent preservation. Other cuttings have laid bare the outer wall of the camp, the funeral pyre, and the dark stratum of calcined bones and charcoal; also another hypocaust, in one corner of which was found, enveloped in wool, a large mass of galena lead ore. By the side of it were the remains of a human skeleton.

**A NEW THAMES TUNNEL AT DEPTFORD.**—Notice has been given of an intention to apply to Parliament for power to form a sub-way for vehicles, animals, passengers, &c., across the Thames, from Deptford-green to Clyde Wharf, Poplar, and to make new approaches to the same on both sides of the river.

**CRYSTAL HOUSES.**—The *Monsieur du Soir* informs us that in Nevada (America) a quarry has been discovered in a valley named Surprise Valley, containing immense blocks of crystallized gypsum, perfectly transparent, and breaking of itself into cubes so regular in size and so smooth as to require neither the action of saw nor plane to prepare them for building purposes. A series of crystal houses are about to be erected without windows, seeing that light will penetrate the transparent walls.

**ISEL OF THANET NEW STEAM FLOUR MILLS.**—These mills have been completed and set to work. They have been erected near the premises of the South-Eastern Railway Company. The edifice has some architectural pretensions. Mr. F. W. Pugin was the architect. The practical carrying out of the building department was entrusted to the firm of Messrs. Smith & Son, of Ramsgate. The most prominent external features of the building are recessed arches and brick corbelled jambs. The arrangements of the interior proportions of the building, construction of steam-engine and boiler, machinery and fittings, have been planned and completed by Messrs. Whitmore & Son, of the iron works, Wickham Market.

**LIVERPOOL ARCHITECTURAL SOCIETY.**—The fortnightly meeting was held at the Royal Institution on the 15th instant. Mr. Boulton in the chair. The president handed to Messrs. Beaumont and Mitchell the prizes awarded to them by the council for the sketches of St. Francis Xavier's Church, and to Messrs. Josiah Barlow, Rodwell, Dodd, and Parsons for their specimens of modelling. The prizes consisted of books. The secretary announced that the council, with a view to exercise the students in designing details and enrichments of various descriptions, had resolved to offer a prize, to be awarded at the end of the session, to the students who were most successful in the greatest number of subjects during the session. The council made it a condition that there should be at least two competitors on each occasion. Mr. H. H. Vale read a paper "Notes on some of the Castles of North Wales, with Notices of some other Buildings."

**BURNS'S MARBLE PUNCH-BOWL.**—The *Times* of Tuesday last announces the death, on the 18th inst., at Cheltenham, of Lieut.-Colonel James Glencairn Burns, the youngest son of the great Scottish poet. The colonel's claim to any mention in our columns is that he was the grandson of a master-mason and the son of a Freemason. His grandfather wrought with his own hands the well-shaped and famous Inverary marble punch-bowl, bequeathed in 1865 to the British Museum by the late Mr. Archibald Hastie, M.P. A correspondent writes,—"Is the bowl to be seen? is a question I have often heard asked; and perhaps, Mr. *Builder*, through your columns, I may obtain an answer. I have drunk out of it at Mr. Hastie's hospitable table on many anniversaries of Burns's birthday (25th of January). There is not a mason who reads the *Builder* but would look with interest and emotion on the marble bowl wrought by the Mauchline mason for Scotland's greatest poet. Some people, I suspect, would prefer seeing it to seeing that marvel in art, the Portland Vase."

**PHOTOGRAPHIC GLASS ROOMS.**—At the last meeting of the Photographic Society of London, held at King's College, Mr. Mayall, photographer, read a paper on the construction of photographic glass rooms. He stated that if a silver globe were placed at one end of a room, and light were then admitted from one side only, the lights and shadows of the globe would be so marked and distinct, that to the eye, and in the camera, it would appear to stand out in all its roundness. If, however, light were admitted from all sides, the confused lights and shadows would destroy much of the stereoscopic effect, and on the photographic plate it would appear more like a plain surface. The principles that regulated the correct lighting of the sphere also held good in illuminating the human figure. He, therefore, recommended a high side light, and a broken top light of corrugated glass, the top light to fall on the sitter in the same direction as the side light.

**KAMPTULICON.**—We have received several other letters concerning this material, *pro and con.*, but consider enough has been said to show that in certain situations it should not be used without care.

**THE MODEL LODGING-HOUSE MOVEMENT IN NEWCASTLE-ON-TYNE.**—It has been resolved to form a limited company in Newcastle and Gateshead, for the erection of model lodging-houses and improved dwellings for the working classes. The movement originated with the Rev. Mr. Street, whose lecture "On the Night-side of Newcastle" has already been noticed in the *Builder*.

**A NEW CENTRAL STREET FOR LEEDS.**—The town council have adopted a report from their Parliamentary committee, recommending that, for the purpose of providing a direct communication with the east part of the town, a new street be formed in a straight line from Wellington-street to the Corn Exchange, and that the buildings known as Quebec and the Rotunda of the Coloured Cloth-hall be scheduled, for improving the western approach to the street.

**ACCIDENT.**—The new wing which had just been added to the King's Arms Inn, North Walsham, has fallen. Fortunately, no lives were lost, though several of the men were at the top of the building, which was between 30 ft. and 40 ft. high. Had the accident occurred ten minutes later, several men must have lost their lives, as they were preparing props to place against the part which gave signs of being insecure. The principal cause of the disaster appears to have been the great quantity of rain that had fallen during the time of building.

**THE WEST DERBY UNION NEW WORKHOUSE, WALTON, LIVERPOOL.**—This new workhouse, which is being erected from designs by Mr. Culshaw, architect, is on a scale of considerable magnitude. The style is Italian. The front elevation, which is 457 ft. in length, 42 ft. in height to the top of the cornice, and consists of three stories, is built of grey brick and red brick arches, with white Stourton stone dressings. In the centre there is a tower, which rises to a height of 130 ft. to the top of the vane. The roof is ornamented by six ventilating shafts. At each end of the main front elevation there are two wings, which project forward to a distance of about 35 ft. The north wing is intended to be set apart for male inmates (in addition to the space in the other portion of the building), and the south wing will be appropriated to the female inmates. The governor's house, and the general in-door officers' apartments are in the centre of the main frontage, under, and at the back of the tower. When completed, the establishment will accommodate 1,000 inmates. The general board-room and offices, in which the business of the guardians will be conducted, are intended to be separate and distinct from the main building itself. They will be erected on a site immediately adjoining a road in the vicinity of Walton Church. It is expected that the establishment will be fully completed and ready for occupation early in the ensuing year.

TENDERS

For villa residence for Mr. F. Stacey, Victoria Park, Sheffield. Messrs. M. E. Hadfield & Son, architects. Quantities by Mr. C. J. Innocent:—  
 Reynolds..... £2,100 0 0  
 Carr..... 2,089 10 0  
 Wade..... 1,907 0 0  
 Rodley..... 1,902 0 0  
 Wilson (accepted)..... 1,899 0 0

For new schools for Rev. A. R. Campbell, M.A., at Aston, near Rotherham. Messrs. M. E. Hadfield & Son, architects. Exclusive of stone and leading:—  
 Rodley..... £522 0 0  
 Chadwick & Co. (accepted)..... 355 0 0

For certain additions to St. Joseph's (R.C.) Reformatory, Howard Hill, Sheffield. Messrs. M. E. Hadfield & Son, architects. Quantities by Mr. C. J. Innocent:—  
 Warehouse, &c. Lodge.  
 Wilson..... £1,417 0 0 ..... £253 17 0  
 Butler..... 1,405 0 0 ..... 263 0 0

# The Builder.

VOL. XXIII.—No. 1191.

The Familistery, or Workman's Home,  
in Guise, France.

NOT long ago, Mr. Tito Pagliardini brought to the notice of the English public, in our pages, an establishment founded in Guise by M. Godin-Lemaire.\* In our present number we give a view and plan of the buildings;† and, that the undertaking may not be unexplained to those who are unable to turn to the previous account, we print the substance of a brief paper read by the conductor of this journal at the Sheffield Congress of the Social Science Association.—

Every earnest and well-considered attempt to provide for the working classes healthful and proper homes, is entitled to recognition and the most considerate attention. How much more so, then, an undertaking which professes, and with evidence of success, to add

to this advantage the means of cheap living, of wholesome recreation, and the education of the children; with, further, an interest of 6 per cent. on the capital employed to bring about this most desirable end. How the last result is obtained is not obvious to those who are acquainted with the proceedings of societies in this country, who have sought to provide for their fellow-countrymen only a portion of those benefits; but such is the assertion of M. Godin-Lemaire, who has built a handsome structure for his workmen and their families in Guise, near St. Quentin, France.

M. Godin-Lemaire is a large manufacturer of stoves and ranges, employing more than 700 men, and has realized a fortune. He desired to let his workpeople participate in his success; and the step he took with that end in view was the erection of two handsome and substantial structures, to give a strictly private home to each workman, and combining with it a nursery, where his wife, while engaged at work, may deposit her infant; an infant-school, where his children, between the ages of two and five, may be gradually prepared for the school, properly so called, in which their education may be carried on till the age of twelve, fitting them not only for their industrial calling, but for the right fulfilment of their other social duties; play-grounds, where, by healthful exercise, their physical development shall be insured without necessarily exposing them to the baneful influences of the street; stores, where provisions and garments may be procured at wholesale prices; reading-rooms, baths, wash-houses;—all, in short, that can render home healthy, attractive, and pleasant.

Another pile to be put up presently, and inclosing with these already erected a vast court, will complete the work. The buildings externally are architecturally designed, ornamented with coloured bricks, and made to take a dignified character. The principal block forms

the side of a square, and has in the centre of it a court about 145 ft. by 66 ft., covered with a roof to form a playground for the children, and having special means of ventilation. The gallery-plan, as we term it, with internal staircases, is adopted to give independent access to each set of apartments, and seems to be less known in France than here, as it is described as a novelty by those who have given particulars of the Familistery. The galleries are termed by them "hanging streets." They are formed in this building simply by carrying the joists of each floor about 5 ft. beyond the walls; boarding and a light iron railing at the edge complete them. It is a Medieval plan exemplified in many of our ancient Inns, and to which we returned some few years ago, when the movement was first made in England towards obtaining decent lodgings for the labouring classes of the metropolis.

Water is provided on every floor, allowing of the daily consumption per head of 18 quarts. Each set of apartments has store closets, with drawers and shelves; a shoot to the dust-hole below for the refuse, which is removed every day, and the use of a vault below the building. The fireplace in each room is supplied with air from without, and all the partition walls are of brick, so that one neighbour may not overhear another. On each landing are English water-closets. Liberty, privacy, and cleanliness are three of the chief points aimed at in the establishment. May God aid us and man he favourable, was M. Godin-Lemaire's invocation on laying the corner-stone of the building. He desired to give his workmen a home which should raise their self-respect, developo their personal dignity, and he has nobly carried out his desire.

Many further advantages, as I have said, are afforded; the wives are enabled to employ some of their time profitably in the general cleaning, apart from that required in their own apartments. A nursery, which he calls the *pouponnat*, is provided for children from their birth until about two years old, for such mothers as may desire at times to make use of it; a preparatory school (the *bambinat*) for children between two and five, and a more advanced school for those between five and twelve. The wives and daughters supply the nurses, and a highly educated young lady, a relative of the proprietor, has the general superintendence of these and of the school. A visit to her house on Sunday is one of the great rewards of the scholars. The school is carried on by a young professor from Paris. No one is bound to send his children to the school any more than he is bound to live in the establishment. The school and nursery cost the parents nothing, being included in the rent. And now what is the rent charged for these advantages? The unfurnished apartments are let at the rate of 3s. 9d. per calendar month for each room! A furnished room for a single man, containing an iron bedstead, two mattresses, chairs, table, wash-handstand, slop-pail, looking-glass, two clean towels a week; the bed linen changed twice a month, the bed made and room set right every day, costs 6s. 8d. a month. While a separate bed in a dormitory attached can be obtained at 1d. a day!

How, then, say those who have built houses for working men and cottages for their labourers in the country, can any interest at all on capital invested be obtained, still less six per cent. as stated? The solution of the problem would seem to be at any rate aided by this; that on the ground-floor are retail shops where for a sum including a small per centage above the wholesale prices butcher's meat, vegetables, ready-made clothes, in fact every thing required by the tenants, can be obtained. The workmen are given fully to understand that nothing is gratuitous; they pay for all they have; but through good arrangements get comforts cheap,

and yet give the proprietor good interest for his money. I should add that there is a *restaurant* where the unmarried men can get his meals at the cost of from 8d. to 1s. per day. Baths and washhouses can be used at a small charge; a medical man calls every morning, paid by a mutual benefit society established amongst themselves; while a musical association of eighty of the tenants contrives to the general enjoyment. The picture is so charming that were it merely of what might be many would hesitate to admit the probability of its realization; but when we find that it represents what has been going on for four years, all must admit that it deserves, at any rate, to be further examined. It has been suggested that a deputation of members of the Association, who would make a journey to Guise, and report fully the result of their inspection and inquiry, would do good should their report confirm the truth of the statements that have reached us, by leading to the formation of similar establishments in this country. Meanwhile, let us do honour to the noble endeavour of M. Godin-Lemaire to elevate the condition and promote the well-being and happiness of those who, by the right discharge of their duties, contribute in their turn to his own prosperity.

## THE PREVENTION OF STRIKES.\*

In our last article, when we gave particulars of the provisions in the subsisting deed of partnership between M. Leclair and his workmen, we alluded to the organization of the Provident and Mutual Aid Society, to a system of industrial education,—or for painters' work, and matters connected therewith,—and to printed regulations of the workshops and the works in hand, as all requiring to be taken into account in an estimatory view of the co-operative relations of intellect, capital, and labour, in the business-undertaking in question. Therefore we give here a portion of the necessary particulars of those several members of the structure or machinery of the "*Maison Leclair*."

It may be said, there is nothing to be learned from France in the matter of Friendly Societies. That, however, might be a hasty opinion. It has been remarked in a recent work by M. Emile Laurent ("*Les Friendly Societies Anglaises*") published in Paris by Guillaumin, that some of the earliest of the societies in England were due to Frenchmen. One society was established by refugees, on the revocation of the edict of Nantes, under the title of "*Société des Parisiens*;" and in 1703, a society was established in Bethnal-green, the "*Société Normande*," said to exist still. M. Laurent, indeed, does not omit to speak of the immenso growth of such societies with us; and he ascribes much of it to the national habits and character, to an inherent spirit of association; to the disposition to calculation, order, and economy; and to the perseverance in enterprises once commenced. Towards the amendment in management, needed for some of the societies, he proposes admission of honorary members, and abandonment of the practice of meeting in public-houses. But, both suggestions he might have derived from the system of the Society of M. Leclair's establishment. The second suggestion he has been anticipated in here. He adds a recommendation of the French practice of meeting in some public building, in a room lent for the purpose. With a proper development of working-men's clubs, there would be none of the present need of resort to the public-house. M. Laurent finds that the French friendly societies have realized better than the English, the ideal of such a Society,—which, as he regards it, is a union of organization for two different objects; but he admits that the French have much to learn from us.

The importance for our present subject, of the Society formed in M. Leclair's establishment, is comprised in the fact that that Society is made up of persons who belong to a single concern, and are otherwise bound together,—the contrary system being that of the majority of the English societies. As our previously published particulars have shown, the members of the

\* See p. 689, ante. † See p. 635.

\* See pp. 737, 738, 774, 811, ante.

French Society have not applied, or thought of applying, any portion of its funds to strikes; but the Society possesses a library, and forms the bond in the educational system to which we have adverted as part of the constitution of the trade-establishment. M. Leclaire himself being the president of the Society, thus places himself in a position such as English masters have talked about for themselves, but, as far as we know, have not yet assumed.

The present rules of the Society were drawn up by M. Leclaire, in virtue of powers unanimously accorded to him by a general assembly of the members.\* The approval by the Minister of the Interior, and the appointment of M. Leclaire, by Imperial decree, as president, took place, as we have said, in 1863. In the following year, 1864, certain slight modifications were proposed and submitted to the Minister.

The fifty-three clauses, or "Articles," into which the rules are divided, relate to the designation, duration; and composition of, and admission to, the Society; the resources; the help offered by the Society to all its members, and the formalities to be observed for obtaining the same; the retiring pensions, or annuities; the pensions to widows and orphans; the indemnity to be given to a member of the Society leaving the house-painting establishment, or dismissed from it; the administration, including the president, honorary members, council [*conseil de famille*], vice-president, secretary, treasurer, and visitors; and to discipline, and other matters. The Society is designated—"Société de Prévoyance et de Secours Mutuels des Ouvriers et Employés de la Maison Leclaire." Whatever modifications the title of the firm or trading-partnership may undergo, the title of the Society is not to be changed so long as the house-painting establishment exists. The duration of the Society is not limited: only, on the breaking up of the business-concern, the Society would take a designation referring to house-painters in general, of the Department of the Seine—the rights of members who had been of the Society that was connected with the establishment, however, being reserved. The chief partners (*Associés*) in the house-painting establishment are, of right, members of the Society, but honorary, or other persons are to be named as honorary members, by the president; but only the workmen and *employés* can participate in the benefits. The men are not required to belong to the Society. The original conditions (afterwards slightly modified, as will appear) say, that when a workman or *employé* may wish to belong to the Society, he is to address a demand to its vice-president, who will send him a copy of the rules. The candidate is next, in the course of a month, to deliver, first, a letter from the heads of the establishment, showing that he has worked there for five years continuously; second, his certificate of birth; third, a certificate of his freedom from the military service; fourth, a certificate from the physician, showing the absence of any chronic complaint, and that he is neither infirm nor sickly; and fifth, the treasurer's receipt for 20 francs (16s.), his admission fee. These documents are to be produced a month before the meeting of the council. The council, after an investigation into the conduct and morality of the candidate, will admit or reject him, as their duty may require. Members may belong to two societies, including the one under notice. Persons who have undergone, or become liable to, judicial proceedings of a damaging sort, are excluded. Each member has a little book [*livret*], stating the date of his admission to the Society, the date from which will be reckoned his time for establishing his right to retirement, the payment of his admission-fee, the fines that he has paid; the gratuities that clients of the establishment, satisfied with the works executed for them, may have given, without being asked; the sums that he may have cost the Society; and the assets of the Society at the end of each year, the time of the general meeting.

The resources of the Society consist of,—1. The share granted it (as mentioned in our last article) in the profits of the business of house-painting, paper-hanging, gilding, glazing, and looking-glass making, of the establishment founded by M. Leclaire; 2. The gratuities given to the workmen, as above alluded to; 3. The fines inflicted on those of the members who do not observe clauses of the rules; and 4. the 20 francs that each member has paid for his admission. There is no contribution, he it observed, by the

members, to the funds of the Society, beyond what has been stated.

The next clauses relate to the help offered by the Society to all its members, in case of sickness, accident, or death, and relate also to forms to be observed in obtaining the assistance. When a member is ill or wounded, he can, in case of urgency, apply to a physician or surgeon other than the officer of the Society; and the Society will pay 3 francs for the one visit. In an ordinary case, the invalid sends a notification to the vice-president, and to the physician, in twenty-four hours. The vice-president, on his side, writes to the physician; and also he addresses to the visitor then acting, a visiting paper [*feuille de visite*] indicating the name and address of the invalid, as well as the day of his declaration of illness; and he at the same time desires the visitor to immediately commence his visits. The assistance that the Society accords to each invalid member claiming the same, consists of,—1. The visits of the Society's physician; 2. The medicines prescribed (the dispensing chemist, to get payment, making out his bill upon the physician's prescription); and, 3. Pecuniary assistance, by a graduated scale, namely,—during the three first months of illness, two francs a day; during a year following the three months, one franc a day; and beyond that time, a similar allowance, or a modification of it, or the admission of the member to the position of an annuitant, as the council may determine. A member treated at the public hospital, has a right only to the help in money. A member of two societies will receive only one franc during such time as he may be in receipt of help from the other society. Should the other society diminish its contributions owing to the long duration of the malady, the *Société des Ouvriers Peintres de la Maison Leclaire* will increase its assistance correspondingly with the diminution, only not so as to exceed the total allowance previously mentioned. The cost of medicine and advice would be shared equally between the societies. A member taking a physician unconnected with the "*Société de la Maison Leclaire*," to attend upon him, has no right to help in money unless he be engaged on work at a distance from Paris: this case is provided for further on.

In the case of illness lasting less than five days, the Society pays for the medicine and advice, but does not help in money; but if the illness lasts over the fifth day, there is help in money starting from the fourth day; and if the eleventh day be passed, the money-help is given counting from the day of declaration of the malady. Every member is bound not to quit his chamber during his illness, unless having obtained the physician's permission to go out, to hasten the cure; and that permission has to be dated, and given in writing upon the visiting-paper, and countersigned by the acting-visitor. Going abroad without the authority; taking medicines without knowledge of the physician, or diet contrary to his orders; or following a lucrative occupation calculated to hinder or retard the re-establishment of health, will deprive the member of further help. When two attacks of illness occur, one a fortnight after the other, the second is considered as a relapse; and the pecuniary assistance due is estimated accordingly.

The Society, "seeking to attain a moral at the same time as a benevolent object," gives no assistance in maladies produced by debauchery, or from drunkenness, and none for wounds received in a brawl where the member was the aggressor. The physician is bound to state on the paper, the malady that he is called to treat. Moreover, if from any of the causes above referred to, the member should become so infirm as to be unable to gain his living by work, he will not only have no right to the pension, but he will be dismissed from the Society.

On the death of a member, a vice-president, two members of the council, and twelve members of the Society, taken in their turn, are required to be present at the funeral; and those who do not perform "this sacred duty of confraternity," or who present themselves in a state indecent, or of drunkenness, will be liable to a forced retribution of 4 francs. The two members of the council are charged with the maintenance of order. The vice-president and the acting-visitor arrange with the family of the deceased, the ordering, at the expense of the Society, of the hearse of the last class but one, and the letters of convocation. If the family wish for a funeral of a superior class, the extra expense is borne by them. The reader may here be reminded, that funerals in Paris are

conducted by an authorised company, whose charges are rigidly prescribed. All that is necessary is to select the class of interment. The Society attached to the "*Maison Leclaire*," in the case of its deceased members, places a cross upon the grave; but it does not always necessarily end its duty there. Widows receive allowances; and are interred, as the members, at the expense of the Society.

The retiring pensions, or life-annuities, are granted to all the members of the Society under the following circumstances:—1. Every member prevented from gaining his living, whether through an accident whilst working for the establishment, or through infirmities, has a right to the pension: 2. Every member turned fifty years of age, and who can prove that he has remained twenty-five [since reduced to twenty] years, without discontinuance, attached to the establishment founded by M. Leclaire, has a like right, whatever the changes in the designation of the concern: 3. Every workman not a member, who in working for the establishment may have received a severe wound, making it impossible for him to gain his living, has a right. The pensions are:—

For the ordinary workman, and the chiefs of the first [or, rather, what we should call the lowest] class ...	300 (12l.)
For the chiefs of the second class ...	350 (14l.)
For the chiefs of the third class ...	400 (16l.)
For the <i>employés</i> whose remuneration is 1,500 francs (60l.) and under ...	350 (14l.)
For those of 2,000 francs (80l.) and above 1,500 francs ...	450 (18l.)
For those of 3,000 francs (120l.) and above 2,000 francs ...	600 (24l.)

The chief or *employé* not proving that he has been elapsed ten years, has right only to the pension of the class below that in which he finds himself when claiming his retirement. Members claiming their annuity after the fifty years of age, and twenty-five [or twenty] of service, will have to prove the facts. The pensions granted to each member, or one half of each amount, are reversible to the widows of members, and to orphans under age, as is mentioned in a subsequent division of the rules. The annuitant members, widows, and orphans, do not receive help of any kind in case of sickness: moreover, the members referred to, cease to have right to certain advantages mentioned in the rules for the workshops. They are not called to perform any duty; but if they attend the annual meetings, they may vote. Should an annuitant member who had been ill, or had received an accident, recover his powers, so as to gain once more his living, he would cease to receive his pension, and would have to acquire the claim to it afresh.

The pensions for widows and orphans are granted in amounts which are the halves of those to the workmen and *employés* themselves, thus,—1. To the widows of members who were annuitants, or who at the time of their decease would have been entitled to be pensioned; 2. To the widows of workmen and *employés*, whether members of the Society or not, having lost their lives whilst working for the concern; 3. To children of both the classes of parents mentioned, under age, and having neither father nor mother; and, 4. in reversion from a widow to her children left minors. All these pensions are regulated as will be here explained. The widow, without children, and having lived legitimately with her husband during the twenty-five [or, as now, twenty] years that would have given him the right to the retiring pension, or annuity, has a right to half such pension. But if the widow have so lived only during twelve years and six months, she can claim but one quarter of the pension, although her husband's engagement in the establishment may have endured the full required time. The pensions to widows placed between these extremes, are assessed in due proportion. The widow of a workman or *employé*, member or otherwise, who may have lost his life in working for the establishment, has a right to half the retiring allowance of the chiefs of the second class.

Where at the death of an annuitant, there are children under age, the moiety of the pension is paid, at the proper times, to the widow, without regard to the duration of her marriage; but on the majority of the youngest child, this half-pension will be assessed on the principles adopted for the pension of the widow without children. Should a widow, the mother of children, die before these have attained their majority, the half-pension that had been given to the

\* "Règlement de la Société," &c. &c.

mother to assist her in bringing them up, is continued to them to the time of the majority of the youngest, if a girl; or to the period of the age of seventeen for a boy, if the youngest be a boy. There is a similar provision for children of an annuitant who may have been a widower; and the rules affecting children apply to those of non-members of the Society who may have lost their lives in the service of the establishment.

The pensions are paid out of the interest of funds invested in the State *Rentes*: the capital is not to be touched. Should the amount incoming be insufficient, the actual sum will be divided in proportionate shares, as far as it will go. The pensions, or annuities, commence from the first of the month following the decision of the council,—the necessary documents having been furnished to the vice-president, a month prior to the meeting of the council; and the amounts are paid at the counting-house, or treasury, of the Society, on four specified days in the year. In case of the annuitant having to send some one, with authority to receive the money, the treasurer can require a certificate of the annuitant's living a regular life.

Should a member die before having obtained his pension, or annuity, there will be given to his widow, 20 francs for each year that he had been attached without cessation, to the establishment; and the 20 francs contributed by the member on entering the Society, will also be returned. Children under age, losing their mother, have the same help given them, without regard to the number of the children. The rights are to be established within a month, a widow producing her certificate of marriage, and the minors their certificates of birth; the president, and he alone, may grant a delay of one month; but after that the Society will be free of all engagement.

Every member quitting voluntarily the establishment of the "Maison Leclaire," and by that reason the Society, will be reimbursed, first, the 20 francs, his admission-fee; and, second, 10 francs for each year of his connexion with the Society, without reference to the duration of his connexion with the concern of Leclaire & Company. But he must claim the amounts within a week after his time of leaving. Each member dismissed will be indemnified in the same manner; excepting that nothing can be claimed by those who are dismissed for dishonesty.

We should mention that the modifications, submitted to the Minister of the Interior, include this important addition,—that every workman, or *employé*, fifty years of age, who can show that he has been attached for twenty years uninterruptedly to the establishment, and who, from whatever motive, may not have been admitted into the Society, will be allowed to come into the Society in order to obtain the retiring pension to which he would have been entitled had he been previously admitted.

The offices of the Society are administered by a president named by the Emperor, (and who, at present, as we have said, is M. Leclaire himself,) and by the council ("*Conseil de Famille*") of eighteen members. The latter include a vice-president, chosen from amongst the chief partners ("*les associés*"); a second vice-president, chosen from amongst the members not honorary; a secretary, or keeper of the documents, and a secretary, "*adjoint*," both chosen from the non-honorary members; a treasurer, to be always one of the "*Associés*;" a treasurer, "*adjoint*," chosen from amongst the members not honorary; and twelve members of the Society, taken turn by turn from amongst those not honorary, to perform during the year the duties of visitors. The offices of the vice-presidents, secretaries, and treasurers, are submitted every year to election; but the holders of the offices are re-eligible.

The president is the representative of the Society with the public authorities. Questions of the interpretation of the clauses, or "*Articles*" of the rules, are submitted to his decision. He appoints the physician. A statement of the questions to be submitted to the council, is sent to him a week before each meeting; and, within forty-eight hours after the sitting, a copy of the *procès-verbal* should be sent. Similarly before the annual meeting, the *agenda* are communicated to him; and he makes the modifications that he thinks necessary. He presides at the general assembly, or annual meeting; or he appoints some one to represent him,—a member of the Society or not; and the proceedings are reported to him, as in the

other case. Decisions of the council, and of the general assembly, are not valid without his sanction. A financial statement accompanies the *procès-verbal* of the annual meeting; and it shows the amount of the share of profits in the establishment of the "*Maison Leclaire*," that is coming to the Society. The president will intervene as the acceptor of donations and legacies. Proposals for modification of statutes require his sanction. Finally, should he resign, he proposes his successor.

The honorary members are called the natural protectors of the Society. They are not liable for any subscription or fine. They are convoked to the general assembly; and their functions seem to be comprised in the giving advice.

The council meets every three months, or oftener. It admits, or rejects, candidates for the membership, after examination of the claims as submitted; and it verifies and passes the treasurer's accounts, and performs the other duties of such a body. The duties of the principal vice-president, and of the other vice-president in the absence of the first, have been in part alluded to. The office is about the most important in the Society. The holder of it receives the applications and papers of candidates for membership, and the declarations of illness; he transmits documents; convokes meetings, and arranges the business; and generally watches over everything. The secretaries' and treasurers' duties need not be specified.

The twelve visitors, besides their duties as members of the council, are charged, each one for a month, with the watching over and visiting of the invalid members,—but changing places with one another, as they may find necessary,—only always keeping the president aware who is on duty. On the first notice of illness of a member, the visitor is bound to visit the invalid within twenty-four hours, and see that the succour is promptly administered. He ought to renew his visit at least once every two days; and make a note of it, each time, on the visiting-paper which is left with the invalid. He will present to the treasurer the physician's report, and receive the pecuniary help due to the invalid, and bring the same to him within twenty-four hours, inscribing the payments and their date on the paper. He may renew his visit as often as he may think desirable for consolation of the invalid, or prevention of abuses. Especially, he is expected to redouble his *surveillance*, after having heard from the invalid that the illness is approaching its end. He is to be admitted immediately, and without difficulty, to the invalid; should he experience interruption, or perceive some abuse, he is at once to make the vice-president acquainted therewith. On the expiration of his functions, he is to communicate requisite information to his successor.

Under the heading "*Dispositions Générales et Disciplinaires*" in the code of rules, are some recommendations that might well deserve to be considered by workmen in this country. The "*Article 40*" says,—

"The workman who sufficiently esteems himself, ought to shun everything that can bring damage [*porter atteinte*] to his dignity. One understands that the father of a family, who, in want of work, has not bread to give his children, may put all susceptibility aside, and extend his hand in order that he may nourish those who are dear to him; but the man who has work should blush to beg drinking-money, or Christmas boxes; which most frequently have for their consequences, expenses that bring trouble into households."

The "*pourboire*" in France may not invariably be what the word would imply, and "*à tremes*" (the other word used) are presents given on New Year's Day; but M. Leclaire's meaning has a melancholy applicability to what passes on this side the Channel. Monies not obtained for work done, or services rendered, are regarded by the recipient as so so much that he may spend on indulgences. When the working classes, here, begin to see the matter of Christmas-boxes, and treats, in the true light of a degradation, as M. Leclaire well puts it, there will be hope of a position for them, and an appreciation of them, such as now they do not in general conceive the idea of.

The members of the "*Société des Prévoyances et de Secours Mutuels des Ouvriers et Employés de la Maison Leclaire*" prohibit themselves from any such proceedings as we have alluded to, in their relations with the clients of the establishment; and, when offers of the kind are made to them, they are bound to state that they are quite disposed to accept with thanks the gift offered, not under the colour of *pourboire* [drinking-money] or *tremes*, but for the account of the

Society "*de Secours Mutuels*," &c., of the "*Maison Leclaire*."

The entire payment of the sums received, into the hands of the treasurer, is to be made in a week, under penalties afterwards mentioned,—unless the member should be working in the country; in which event, the payment must be made within a week after his return.

A member having complaints or demands to make, or measures to propose in the general interests of the Society, is to address them to the vice-president, to be submitted to the Council; whose decision will be made known to him.

When a member working in the country is taken ill, and cannot be removed to Paris, an indemnity may be accorded to him for the medical assistance that he has required; and the pecuniary aid will be given on production of the certificate of the physician called in, authenticated by the mayor of the district. In case of death, the interment will be conducted as before described, excepting that the members of the Society will not be called to attend.

Every member who at the time of his admission may have knowingly deceived the Society by a false declaration, or who may not have paid faithfully and entirely to the treasurer the sums pertaining to the joint fund; or who, during his period of belonging to the Society, may have obtained pecuniary assistance by fraud; or who in his quality of visitor may have knowingly rendered himself party to such fraud, will be excluded from the Society, and struck out of the registers; and he will lose his rights to the pension and to all indemnity.\*

#### ARCHITECTURE AND ORNAMENT.†

With a view rather of affording motives for fresh design than models for reproduction, Mr. Waring has on sixty plates brought together a large number of sketches from buildings of several styles in many countries, ornamental carvings, statuary, and metal work; and, on ten other plates, drawings of plants, suitable for application in carved work. There are in all, as we count them, more than 400 sketches etched on copper by the artist himself. Though treated picturesquely, being intended to convey impressions of effect, they are for the most part beautifully drawn, and the book forms, we do not hesitate to say, a storehouse of suggestions of great value. Fifteen or sixteen of the plates are devoted to Romanesque work, and include some elegant and suggestive bits. Some of the iron-work is quite fresh and very good. Each plate is accompanied with brief descriptive letter-press, which contains many interesting notes. In defence of one of these, to which exception has been taken by some of his critics, we allow Mr. Waring to speak for himself, and add for ourselves that we agree with him as to the influence in the rise and development of sculpture exercised by Nicolo Pisano, truly a great genius.

The author of the book before us, whose ability in particular lines must be known to many of our readers, as well from his published works as from his labours in connexion with more than one of our great industrial-art exhibitions, makes some observations with reference to professional success which suggest inquiry. Arago has written that,—"*En Angleterre, un médecin, s'il ne veut pas perdre la confiance du public, doit s'abstenir de s'occuper de toute recherche scientifique ou littéraire qui semble élargir à l'art de guérir*;" but as touching architecture Mr. Waring goes much farther, and would have it thought that the pursuit of the very studies which are necessary to form an architect serves to retard his progress in the practice of his profession. When pointing out the importance of obtaining an acute sense of the peculiar beauties of outline and character observable, for example, in fruit, flowers, and leaves, he says,—"*In fine, though my own studies have proved a drawback to employment in my profession, which being generally regarded with jealousy by men in the same business, and with distrust by the uneducated public, still there will remain to all who can afford, or who care to make, the sacrifice, the pleasure of a consciousness that they have done well in loving Art rather than Money, and Improvement rather*"

\* To be continued.

† "Illustrations of Architecture and Ornament." Drawn and etched on Copper by J. B. Waring, Author of the "Arts connected with Architecture in Central Italy," &c. &c. London: Day & Son (Limited), Gate-street, Lincoln's-inn-fields.

than Success." And at the close of his preface the author writes that,—"In the present volume he gives various notes, made in the hope of some day being enabled to apply the lessons taught by them to buildings of his own design; that hope is now passed, and he presents them to his fellow-architects for such use as can be extracted from them." This assertion of failure in a desired object naturally interests, especially as made by one known to possess in an eminent degree some of the requirements that go to make an architect. It is, nevertheless, not to be hastily inferred because one known to be a superior draughtsman, and possessed of considerable antiquarian knowledge, has failed to obtain employment as an architect, that it was because of these studies. Before any safe opinion on the subject could be arrived at, it would be necessary to inquire what evidence of his power of design, of his knowledge of construction, of his business habits, and of half a dozen other requisites, he had given the public. In the present case we shall not make that inquiry, or, indeed, permit its discussion; preferring to consider that the want of success complained of has in this particular instance resulted in spite of the possession of all the requisite qualifications. But in the face of the general assertion and challenge thrown out by Mr. Waring, we were forced to say what we have said to prevent any of our younger readers from supposing that they are likely, by obtaining a mastery of the pencil and making a diligent study of the beautiful forms of Nature, to lessen their chances of success in their profession. They must do that; but they must also do much more.

#### ECCLESIASTICAL DILAPIDATIONS.\*

WHEN a clergyman becomes the happy possessor of a new benefice, one of his first duties is to make a claim for dilapidations from his predecessor, or, if deceased, from his nearest representatives, often his widow and orphans. This apparently harsh necessity is, in fact, as fair and just an arrangement as can be made under the circumstances. There would be scores of ruined parsonage-houses if it were not for the law of the land, that requires that the possessor of the benefice should leave the dwelling-house in thorough repair. Absentees, the incumbents of small livings with expensive families, could easily suffer serious damage to accrue without much scruple, and their successors would find a decaying fabric to repair, instead of a comfortable house to step into. The law is, however, clear upon this point: it requires that an incumbent should leave his dwelling-house in thorough repair. Five hundred years ago, Edmund, Archbishop of Canterbury, ruled, "If the rector of a church, at his death, shall leave the houses of the church ruinous and decayed, so much shall be deducted out of his ecclesiastical goods as shall be sufficient to repair the same and to supply the other defects of the church. If the rector has expended his ecclesiastical revenues in improving his own patrimony, or if he has attended too much to his own patrimony, or if he has attended too much to his own worldly affairs, and neglected his ecclesiastical affairs, to the injury of the church, his private property is liable for dilapidations." A much more modern authority, Burn, in "Ecclesiastical Law," says, "A bishop, as soon as he is installed, and a rector or vicar, as soon as he is inducted, ought to procure persons skilled in building to view the dilapidations, and write down for what sum a workman will or may rebuild or repair (I would say reinstate) the same; for after this inspection shall be made, such bishop, rector, or vicar, may commence his suit for dilapidations when he pleaseth." Should an incumbent therefore, from ignorance of this fact, or want of professional advice, overlook any decay, he makes himself liable for that condition as much as for any fresh damages that may accrue in his own occupation. The late Lord Campbell very lucidly explained the intention of the law, in a celebrated judgment to which we shall hereafter refer, was that the parsonage and glebe, provided for the decent and suitable residence of the incumbent, should be maintained out of the revenues of the benefice; and that a deceased clergyman leaving his house at all out of order, is supposed

to have committed a wrong, for which, owing to the peculiar holding of the property, no one can sue him, but for which his heirs or representatives are answerable. The case of Bishop Aylmer, tried in the Court of Arches, who suffered his palace and cathedral to fall into dilapidation, that a large fortune might accumulate for his son, shows that even a mitre cannot always shield against the temptation to parsimoniously withhold needed repairs; and a statute of Queen Elizabeth speaks of ecclesiastical persons who had allowed their buildings to become so decayed that they were falling to the ground. Everyday experience proves that the holders of livings still fail in many scores of instances to preserve the fabrics entrusted to their care with due solicitude. The octogenarian possessor of a rich living, in an exposed position in the northern counties, long located in a snug parish due south, can scarcely be expected to pay much attention to his estate's report that his floors in the north are getting shaky and his roof leaky. The least possible expense is incurred, just to keep the rain out, till time at last sends down a new vicar to take possession. It is obviously incorrect that the new comers should find the house too rickety to live in for the mere reason that the last incumbent deputed a curate to perform his duties, and lived hundreds of miles away. Again, the principal landowner in a parish, once a younger son, but rapidly promoted by death to the head of his house, sometimes becomes both squire and vicar. He resides, of course, at the Hall, and the old parsonage-house is let at a low rent to any quiet tenant he can get. A quiet tenant never mentions such words as "damp," rotting woodwork, loose slates, cracks, &c. He may ask permission to build a lean-to for cows against the vicarage wall at his own expense, but that is all. The little place becomes as unecclesiastical as it will can be, and as out of repair as neglect can make it; besides this, it is saddled with the cowbyre, which does not belong to the next vicar, but to the person who built it. If the law insisted upon a tierrier with plan of church property being kept in every parish, and copy deposited with the dean and chapter of the diocese, such abuses as the last-mentioned could be easily rectified.

Mr. E. G. Bruton has been at some pains to give, in a little handbook, a definite idea of the broad principle which governs the question of ecclesiastical dilapidations. Those not already familiar with the subject can learn, without further reference, the main points of departure between these and ordinary "tenant's repairs," as well as the priority given to dilapidations so shortly summed up by Sir Simon Digge in the sentence,—“As the common law prefers the payment of debts before damages for dilapidations, so the ecclesiastical law prefers the damage for dilapidations before the payment of legacies.” Mr. Bruton, however, does not confine himself to this explanation. He proposes, as the Archdeacon of Oxford had done before him, a scheme of insurance to meet the expenses of dilapidations. In the Bill introduced into the House of Lords, 1861, by the Bishop of London, and subsequently abandoned, proposing a periodical inspection of parsonage-houses and chancels by surveyors appointed for the purpose, provision was made for compulsory assurance against fire. Mr. Bruton suggests insurance against fires and dilapidations as a mode of providing against the only real difficulty in the way of the law, namely, the frequent inability of the representatives of deceased clergymen to meet the claims of the new incumbents. Provide a fund by a small annual sacrifice, and the great nightmare of many a poor clergyman's dread is disposed of. Mr. Bruton makes a calculation, based upon the University Life Assurance tables, in which he shows that a young clergyman, aged twenty-five, could assure 1,000*l.* in case of fire, and 800*l.* as compensation for dilapidations, for 11*l.* 2*s.* 9*d.* per annum; or a person of a more advanced age, say fifty-five, could make the same provision by the annual payment of 20*l.* 1*s.* 6*d.* Should an incumbent repair or rebuild his premises, he could have recourse to a new valuation, and his policy amended. Mr. Bruton would have these surveys decennial, as well as at every change of incumbency, and conducted by a specially appointed surveyor, whose fees should be paid by the insurance office. He urges that as the uncertainty that pervades all matters dependent upon the duration of human life would cause the surveyor to take due care that his estimate was sufficient to cover the contingency, any sum over and above that required when the actual claim

was made could be handed to the assured or his representatives. The only difference between this plan and that of ordinary life assurance beyond that of a specific purpose for the sum assured, is that, should the presentation of a better living call for the vacation of a somewhat ruinous dwelling-house, the insurance money is then, and there available, though how this would be calculated for by the companies is not very clear. The amount having been approximated, the retiring incumbent need not be at the expense of further advice, unless the claim disagrees with this approximation very materially. Mr. Bruton considers a decennial visitation less vexatious than the inspection every fifth year proposed by the bishop; and the linking of the survey with the incumbent's own interest, namely, the scheme of insurance, likely to facilitate the arrival at a fair estimate. The removal of heavy pieces of furniture, and taking up of carpets to inspect timbers, can be easily effected with the owner's co-operation, but would be always a delicate task without it.

Concerning emblems and their exact nature (the right of spiritual persons to emblems was established by a statute of Henry VIII.), Mr. Ferard is laid under contribution for a piece of definite information. In the crops on a glebe there are some things that are emblems and some things that are not. "It is now fully established," says Mr. Ferard, in his "Law of Fixtures," "that not only corn and grain of all sorts are emblems, but everything of an artificial and annual profit that is produced by labour and manurance. And hops also, although they spring from old roots; because they are annually manured and require cultivation." An exception is made against grass being considered an emblem, or clover, after the first crop. To remove these profits of the soil, the law gives a right of entry,—egress and regress,—to cut and carry them away.

But among the cullings of Mr. Bruton, after those setting forth the unmistakable intention of the law that all clergymen leaving the houses of the Church in decay are liable for dilapidations out of their private property, the most valuable are the various actions that have arisen out of the questions, what are fixtures, and by what rule are dilapidations to be estimated? We must give two of these as highly luminous. One of them is an old case, *Wiso v. Medcalf*, 1829, but it is supposed to contain within itself an exposition of the whole law of ecclesiastical dilapidations. The defendant was the executor of a deceased rector; the plaintiff, of course, his successor. For the defendant, it was urged that he was only bound to do such repairs as an ordinary out-going tenant would have to perform, the cost of which was estimated at 75*l.* 11*s.* For the plaintiff, it was argued that the premises ought to be left in the condition in which they ought to be kept, including painting, paper-hanging, and whitewashing: the amount of this estimate was 399*l.* 18*s.* 6*d.* A second estimate, of 310*l.*, was furnished by the plaintiff, which only compassed such repairs as would be claimed from a lay tenant, bound by covenant to leave his premises in good and sufficient repair: the paper-hanging, painting, and whitewashing were excluded in this sum. The jury awarded the largest estimate, 399*l.* 18*s.* 6*d.*, subject, however, to the opinion of the court. The learned judge, after looking at the matter from every possible point of view, came to the conclusion that though bound to maintain the parsonage and chancel in good and substantial repair, even restoring and rebuilding when necessary, the deceased rector was not bound to supply or maintain anything in the nature of ornament, such as painting (except where necessary to preserve exposed timber from decay), paper-hanging, and whitewashing. It being referred to the Master to calculate the damages upon this principle, they were estimated by him at 369*l.* 18*s.* 6*d.*, and judgment entered accordingly.

The second case we select as comprehensive in its bearing is, that of *Martin and Another v. Roe*. In this the former position of the disputants is reversed; the executors of a deceased rector being the plaintiffs, and the new incumbent the defendant. The late incumbent (called *Mathews* in one place and *Martin* in another, somewhat confusingly, as *Martin* is the name given to the contending executor), the late incumbent indulged his horticultural tastes by the erection of two large hot-houses in his garden, at some distance from his house. One measured 72 ft. in length, the other 47 ft., and both were laid on low brick walls, on which mortar was spread. All the glasswork slid up and down

\* "Ecclesiastical Dilapidations: a few Words on the Law thereof, with Suggestions for its Amendment. By Edward G. Bruton, Architect, F.R.S.A., and Surveyor to the Dean and Chapter of Christ Church, and All Souls' College in Oxford. Oxford and London: John Henry & James Parker, 1865."

the wooden framework on pulleys. The cost of them both was 600*l*. At his death, his executors removed these frames of glasswork as carefully as possible; doing no damage except to the layer of mortar on the low brick walls on which the frames had been laid. But the new rector demanded them as his property. When taken into court it was found that no previous case of a similar nature could be quoted; so Lord Campbell considered it, he declared, on principle. "In the first place," he said, "it seems clear that had the testator in his lifetime done what the plaintiffs have done since his death, the defendant would not have had a claim for dilapidations; the character of the building would have justified the incumbent in removing the whole of it; only he must have restored the garden to its former condition if in the removal he had occasioned any injury to it amounting to waste; for the duties of the present and the right of the succeeding incumbent, as such, are reciprocal; and as to any matter of needless expense, or luxury, or ornament, by which the present incumbent has gratified his own taste or increased his own comfort, he is not only not bound, but he ought not to transmit it to his successor. If the successor may recover damages from the executor after such things have been removed by the testator, there can be no doubt he in his turn must maintain it, and if he must maintain it he must also restore and even rebuild when decayed; so that the benefice might become permanently saddled with a useless burden. Hot-houses, pineries, and conservatories, do not in this respect differ from observatories, menageries, and aviaries, which are equally in contravention of the Constitution (of Edmund Archbishop of Canterbury) of 1236, and are called *impense voluptuose*, as distinguished from *necessarie*."

After leaving considerable stress on various points,—such as the unsuitableness of hot-houses, nearly 70 ft. in length, as permanent fixtures on a small benefice; the fact that had the deceased left them out of repair, the defendant could not have claimed dilapidations for them, nor would he have been obliged to keep them in repair; that the testator had committed no waste; that he had merely left on the glebe that which he might have removed, and which being left imposed no duty on his successor, and which, if he had removed, would have reverted to his personal estate, or gone to his personal representatives,—his lordship gave judgment for the plaintiffs.

It used to be, in a limited sense, an open question whether perpetual curates were liable for dilapidations. An argument was used in their favour, to the effect, that as actions for dilapidations were sustainable by the common law of England, which was founded upon immemorial custom, and perpetual curates had originated within legal memory, they could not be deemed liable by immemorial custom. The case of the curate of Orpington assumed curates at will from liability. The Court held, that being but a curate at will, and not instituted and inducted, he was not an incumbent, nor liable to dilapidations. And the case of the perpetual curacy of Marrick as definitely decided the liabilities of perpetual curates, who occupy the church-property and are not removable at the will of the patron. It was argued that if the buildings and lands belong to the curacy, his interest in them is in right of the curacy; and if he cannot be removed he has a freehold interest, and may properly allege that he is seised: and, being seised, he becomes liable.

Mr. Bruton makes a good note to the effect that it is a common practice for an incumbent to choose a surveyor,—or, more commonly still, a valuer,—from his immediate neighbourhood, regardless of his qualifications, from an idea that a more experienced person brought from a distance would make a higher charge. In point of fact, much of the legal and structural knowledge required by such persons. To what extent the walls, floors, or ceilings have suffered during the occupancy of the last tenant requires some nicety of judgment; and, whilst saving a few shillings in expenses, an employer of an inexperienced person may be, in the end, the loser of a great many pounds. It will thus be seen the little work is intended for the clergy as much as for the professional man; and, there is but little doubt, that should the Bishop of London's Bill be reproduced in an amended form, several of Mr. Bruton's suggestions will be utilised. With regard to his scheme of decennial visitation of church property, we must differ from him so much as to say that a more frequent authorised

inspection would be better to preserve careless persons' premises in repair. A few loose slates, defective spouting, stopped-up drains, overflowing water-buts, with no water-channel, may do a great deal of mischief if not attended to; whereas a stitch in time would save a great many more than nine.

#### ON BUILDERS' HARDWARE.

WINDOW FURNITURE, CASEFITTINGS, AND FIRE-GRATES.

RECENTLY we attempted to point out the importance of paying due regard to the efficiency and beauty of door fixings. Not less important is it that our window furniture should possess the characteristics of security and durability. The professional burglar selects the window as the point of entrance to a building, almost as frequently as the door, and it is notorious that in many instances the window presents little or no obstruction to his nefarious designs. Everybody knows what a burlesque on security is the common sash-fastener. A square inch, cut skillfully from the window pane with a diamond, is sufficient to enable an outsider to open the sash, and effect an entrance, with much less trouble than attempting to pick the lock of the door. What is there to prevent the more frequent use of sash locks, or some other contrivance which may render our windows quite secure? We notice with interest in a recent communication from America, that our Transatlantic cousins have preceded us in this respect, an invention having just been patented there for a new sash-fastener, which acts also as a lock, and thus renders the window on which it is fixed free from intrusion. As regards ornamentation in these articles, the same remarks will apply which we made respecting locks, no attempt at artistic design being apparent except in the fasteners made for French windows, some of which are suitably decorated. As a rule, however, sash-fasteners are inadequate to their important use both as regards their contribution to the security of a building, and their adaptation in a decorative point of view to the conspicuous portions of the erection to which they are affixed.

Sash pulleys, as commonly used, are made of cast-iron, and consequently most liable to rust, the results of which are painfully familiar to us all. There is neither ornament nor durability connected with these articles. The former is not, perhaps, of much consequence, seeing that the pulley is imbedded in the sash-frame, but the latter is of the greatest importance. The cost of having a good brass or wrought-iron pulley, is so slight an addition to the outlay in erecting a building, that we wonder at so much patient endurance of inconvenience, resulting from the very inferior articles which are being poured into the market, and as eagerly bought up by ironmongers and contractors. How frequently occur wholesale smashes of plate-glass in consequence of the sash-frame being supplied with a pulley which after a few months' wear ceases to work! This is only an addition to other instances of the "penny wise and pound foolish" principle, so common in this age of competition.

Respecting gasfittings, our attention has been called to a little hand-book containing many valuable suggestions on this subject, not only for the gasfitter to whom they are mainly addressed, but also for the builder and general public.\* Gas mains, Mr. Mason properly observes, should be buried in the earth at least 18 in., to insure them from damage by vehicles passing over them. [We have before now suggested that some such regulation as this is also desirable for the branch pipes of water-works, to prevent their being frozen up, and thus stopping the supply of water to our homes.] Gas ventilation is a subject to which we attach importance, and which mainly concerns us here. Burning gas without making provision for carrying off the effluvia is as imprudent as making a fire without a chimney to carry off the smoke. Modes of effecting it we have often pointed out.

Chandeliers, as now constructed, are the great redeeming feature in gasfittings, both as regards decoration and suitability. Designs are certainly creditable to the skill of the producers, and form an exception, in point of excellence, to many other departments of builders' hardware. This proves the theory that a demand for art in

union with manufacture will insure an adequate supply. Every year the popular appreciation for the combination of beauty and usefulness in gasfittings has been made more prominent.

In coming to the question of fire-grates, we approach a subject second to none in importance, as relating to domestic comfort and convenience. "A smoky chimney and a hawthorn wife" are said, by a shrewd observer of men and things, to be the greatest domestic trials which can afflict humanity. Whether or not a fire burns briskly is of course due in a great measure to the construction of the building, but it is also determined in part by the style of the grate. During the past few years considerable improvement is manifest, in the design of domestic fire-grates, both in their appearance and service. The old Bloomsbury grate, that sent all the heat up the chimney, and all the cold air into the room, has been superseded by grates which act on the reverse principle. All sorts of contrivances have been submitted to the test. We have had the Romford stove, the rotary grate, grates for putting on coal from beneath, grates to blow the smoke down, and grates to pull it up; the *Builder's fire* ignited at the top, and fires which only require feeding-once a day. After much loss of temper, and much sacrifice of comfort, during which all these have had a fair trial, Patent-fans can at length rejoice in the possession of a grate whose ornamental appearance and cheerful service render his fireside complete in its attractiveness: but to get it he must exercise discrimination.

The back and sides of the fireplace should be filled in with firebrick, terra cotta, porcelain encaustic tiles, or majolica, thus reducing the ironwork of the grate, absorbing less heat than polished steel, reflecting heat equally well, giving less trouble in cleaning, and being less expensive. The present cumbersome form of grate might profitably be reduced to much smaller proportions, without in any way interfering with its efficiency. The general arrangement of the fire receptacle should be that of a dish-form in firebrick. The length of the bars should be regulated by the size of the room; and the depth within the bars should depend upon the coal likely to be used.

We cannot help expressing the hope that the subjects to which we have briefly referred will receive more attention than hitherto on the part of the building trade. We have touched only a few leading examples, to prove a theory which applies as a rule to all branches of builders' hardware, viz., that it is not keeping pace with the progress of art and science as applied to manufacturing industry. There is much which is cumbersome, and requires simplifying; much which is too simple, and requires additional security or strength; and much which is lamentably deficient in grace and elegance, usefulness and durability. It requires only an effort on the part of consumers to remedy these defects, by demanding superior articles; and they may thus contribute simultaneously to their own credit, to that of the producer, and to the increased comfort, safety, and gratification of society at large.

#### SANITARY REPORT ON EDINBURGH.

THE medical officer of health for the city of Edinburgh, Dr. Henry D. Littlejohn, has prepared a Report on the Sanitary Condition of the City, which has been presented to the council and printed. It extends to 120 pages royal octavo, besides 72 pages of appendix, chiefly in the form of statistical tables.

Edinburgh, says the Report, has never been regarded as an unhealthy city. Its death-rate, although subject to considerable annual variations, will bear favourable comparison with that of other large towns, which do not labour under its special disadvantages. It is, however, peculiarly exposed to the ravages of epidemic diseases of all kinds, on account of its dense and badly-housed population; and whether the epidemic be cholera or fever, the poorer inhabitants living in the crowded districts of the Old Town suffer in a marked degree. During the last five years, the health of the community has been good, and among the working-classes food and work have been unusually plentiful. The average death-rate for that period was 24 per 1,000.

The district most liable to attack by epidemics is the Grassmarket, where fever, however, has been far more prevalent in past years than cholera, on account of the overcrowding, chiefly by poor Irish, among whom fever always first

\* "The Gasfitter's Guide," by James Mason, London: John Hill, 51, Murray-street, City-road.

appears. The lodging-houses, however, are not so crowded now as they once were, and epidemic fever is, therefore, not now so deadly as in former years. The following table gives the mortality per cent., in 1863, from fevers, diarrhoea, and dysentery, in six Scottish towns:—

FEVER.					
Leith.....	24	Perth.....	15		
Greenock.....	22	Paisley.....	11		
Glasgow.....	17	Edinburgh.....	09		
DIARRHOEA AND DYSENTERY.					
Perth.....	1	Paisley.....	07		
Greenock.....	08	Edinburgh.....	07		
Glasgow.....	07	Leith.....	06		

The condition of the poor and their miserable dwellings has engaged the attention of the charitable in Edinburgh.

"The movement which originated in London,—that centre of all noble schemes,—for erecting suitable houses for the working classes, has extended to this city. In 1851 the first block of houses was built, and named Ashley-buildings, after the nobleman who had taken such a prominent part in the operations of the Metropolitan Association. No better site could have been obtained for the structure in question. It was placed in the Iron district, in which overcrowding prevails to a great extent, and on all sides it was surrounded by decaying houses, tenanted by the poor. It not only afforded to the industrious workman a greatly improved habitation, but, from its situation, formed an example to surrounding proprietors and tenants of the manner in which such houses should be built and kept in a permanent state of cleanliness. To secure a site, old property had to be removed; and thus, while benefiting the working classes, the Association directly ameliorated the condition of the Old Town by the erection of houses in its midst, built according to the most approved sanitary plans.

The average rent in the whole of these buildings is from 6s. 10s. to 7s. Such a sum is a good index of the class which has been benefited by such associations. It was that of the well-to-do industrious workman, who, how much soever he may have suffered from the imperfect houses in the Old Town, could not fail to be an acquisition to the neighbourhood in which he lived, from his notions of cleanliness and propriety. When attracted elsewhere for a dwelling, a vacuum was left, so to speak, in the Old Town, which was quickly filled up by the freemasonry of poverty, and, without exaggeration, may be affirmed that the locality was left worse than it was before. Rents necessarily fell, and a poorer population crowded in to supply the places of the former inhabitants. That the working classes, as a body, have been greatly benefited, there can be no doubt; but the question is forced upon us,—Is a class which can afford to pay such rents not capable of being provided with suitable accommodation on the ordinary principle of supply and demand? . . . . A noble example was shown by Dr. Foulis, years ago, of what was required, and the best method of helping the poor and the poorer localities. He took a close in the Grassmarket, gutted it, cleaned it thoroughly, and repaired it, in no expensive manner, but in such a way as to afford comfortable housing for the poor. This close,—the Warden's Close, No. 139,—has thus been reclaimed. It is placed under such supervision that the inhabitants are taught cleanliness; and should a new comer not be susceptible of the lesson, after patient trial, he quickly leaves. To this hour, the close in question stands out an oasis amidst the wretchedness and filth that ars to be met with in the other closes of that well-known locality."

An interesting question connected with the distribution of the population of Edinburgh, is the heights above the sea-level at which the inhabitants are found grouped in the largest numbers, and the effect of elevation on disease, whether sporadic or epidemic. There are remarkable inequalities in the ground on which Edinburgh is built; and, in a table given by Dr. Littlejohn, the whole of the population within the Parliamentary boundary, numbering 168,121 persons, has been arrayed in successive elevations from 50 ft. up to 450 ft., according to their residence. In parallel columns the mortality for the year has been distributed in a similar manner, as also that caused by fever and diphtheria during 1863, and two epidemics of fever and cholera, along with the calculated results per 1,000. This general table, it appears, was constructed at a considerable expense of time and trouble. Each district was taken separately, and a similar plan was followed in the enumeration and calculation. From the nineteen separate tables thus prepared, the one given was arranged. From this table, it appears that as we proceed from a lower to a higher elevation, there is a regular diminution in the death-rate of 1863, and also in the rate of cases per 1,000 of the population affected in the great epidemics of fever and cholera. The character and respectability of the population vary, however, with the height at which they live, and there is a marked difference in this respect between that portion of the Cowgate included in the district of St. Giles, lying at a comparatively low level, and the higher localities of the High-street, Castle-hill, and the Castle, where the inhabitants live in greater comfort and enjoy life under better hygienic conditions.

The cesspool nuisance in Edinburgh has become so clamant as to demand a thorough remedy. In reference to this system, Dr. Littlejohn says:—

"From one of its worst effects,—viz., the contamination of water for domestic use, from the soaking of the soil,—we are luckily preserved. We have no private wells

into which the drainage from our defective cesspools can escape, to contaminate, in the most insidious manner, the water,—even communicating to it an attractive sparkle, but at the same time poisoning the system, which never becomes habituated to its use."

Builders and architects, however, still uphold the necessity of cesspools, even in crowded cities; but their reasoning is, in my opinion, fallacious. That the system should find favour amongst smaller traders is not to be wondered at. The cesspool demands planning and material, in addition to the skilled labour required for its construction. The laying of a few tubular drains, with a direct communication with the main sewer, is comparatively a cheap operation."

The irrigated meadows in which the sewage is made use of are regarded in the report as a source of disease.

"When spread over the land, the sewage quickly disappears; and this part of the process, unless the weather be warm, is attended with little inconvenience. But if the privilege he claimed of monopolizing the sewage of a city like Edinburgh, it is surely incumbent upon proprietors to diminish, by every means in their power, the evils attendant upon irrigation, especially when carried on in the immediate neighbourhood of a dense population; for Edinburgh, from its situation, is peculiarly exposed to suffer from the effects of the emanations from these meadows. The easterly are our most prevailing winds, which pass across these meadows before they sweep over the New and the more elevated portions of the Old Town. And it has been plausibly conjectured that the insularity of these winds depends largely on this contamination. But, at any rate, a city surrounded by swamps cannot be regarded as in a sound sanitary condition; and it is highly probable that a great part of the mortality of the Abbey, and some of the poorer districts of the Old Town, is, in a great measure, owing to the unhealthy character of these breezes, which blow so continuously during many months. It is difficult otherwise to account for the high death-rate of the district of the Abbey, in which there is little overcrowding, and where only a small proportion of the population can be said to belong to the poorest class."

Dust and solid refuse are removed from the houses twice a day, and the corporation derive an income of 7,000*l.* a year from this source. The system adopted was described by Mr. Littlejohn in a paper "On the Cleansing Operations in Edinburgh as compared with other Towns," which was read before the Social Science Association in 1863. The author of the paper recommends the system for adoption in other towns. In Edinburgh, it is a matter of comparative necessity, from the prevalence of the "fat" system of dwellings, and the want of space for dust-bins.

The following are the suggestions offered in the Report for the sanitary improvement of the city:—

1st. The satisfactory paving and draining of the closes.

2nd. The improvement of the house accommodation of the poor, by insisting on the introduction of water and gas, the cleansing of common stairs, and the performance of necessary repairs.

3rd. The diminution of overcrowding of the population, by limiting the number of persons in each apartment, by lowering the houses in height, and by removing all tenements in a ruinous condition.

4th. The opening up of the worst localities by the widening of such contracted thoroughfares as the Cowgate and St. Mary's Wynd, and by the formation of new streets, which should pass at right angles to the long and unwieldy closes, and give increased facilities for their thorough cleansing. Such new communications would also afford sites for improved dwellings for the poor where they are most required, and would form an era in the sanitary history of Edinburgh."

#### PROPOSED MUSEUM IN ATHENS.

THE want of an archaeological museum has long been felt in a city and neighbourhood where every inch of ground is of historical interest, and where scarcely a trench can be dug, or the soil of a garden turned, without bringing to light some remnant of ancient Greece. The Archaeological Society of Athens, now some twenty years in existence, has done much in preserving and clearing the Acropolis, the Temple of Theseus, and other monuments, of the rubbish and ruins caused by the war against the Turks, and have set up in their proper and original positions many objects found amid the debris. But many things of extreme interest and of great antiquity have from time to time been found to which no such places could with propriety be assigned, and here the want of a museum was chiefly felt. Mr. Bernardaki, a rich Greek merchant, residing at St. Petersburg, was the first to take an active step in the matter, by offering the sum of 200,000 francs to begin with, promising a like sum if the building were actually commenced. This handsome donation, together with subscriptions expected from others residing and

trading in London, Paris, &c., gave promise of a speedy execution of the project, and in 1859 a competition amongst architects was advertised. But the Academy of Arts at Munich, to whom the awarding of the decision was referred, reported unfavourably of all the plans submitted. Then Professor Lange, of Munich, sent in a plan not based upon the "instructions," but on his own experience and independent ideas. This plan was approved of, but still delays took place, chiefly on account of the question of site. Then came the revolution and the flight of King Otho, and the whole scheme seemed utterly abandoned, when, on the 24th of February, 1865, came a decree ordering the commencement of the Museum forthwith, granting a site on a hill known as that of St. Athanasius, and ratifying the approval of Prof. Lange's plans. The building, which is partly three stories high, is nearly square on plan, each side measuring about 300 ft. The ground-floor, which contains sculpture, is entered from a peristyle, running along the entire chief front; and the arrangement of the various objects exhibited is such, that the visitor, by turning to the left on entering, can pass successively through the different "periods." These are the heroic period; next, that of Phidias and Praxiteles; then the Macedonian; the Roman; and, lastly, the Byzantine periods. Side-rooms contain the casts of such works as are possessed by foreign museums. The centre is occupied by the grand staircase, having a large glass-covered court, about 100 ft. square, on each side. The first-floor is divided into smaller rooms and cabinets, to contain collections of coins, vases, ornaments, weapons, &c. The central portion only is to be carried up to a second floor, and is intended to receive an archaeological library. There are also various offices, store-rooms, unpacking-rooms, and work-rooms, where restorations, &c., can be effected.

#### WATER COLOUR SOCIETY'S SKETCHES.

THE Winter Exhibition of "Sketches and Studies" by the Society of Painters in Water Colours consists of 416 specimens, and includes, it is scarcely necessary to say, many charming works. We might especially name some by John Gilbert (34), E. Duncan, J. Nash (a series from Canterbury), F. W. Topham, E. Lundgren (65 and 363), Carl Haag, Josh. J. Jenkins (some charming landscapes), G. H. Andrews (114), Brittan Willis (really "sketches"), Jas. Holland (with the same note), S. P. Jackson, F. Taylor, F. F. Shields ("The Orphans"), Birket Foster, and G. P. Boyce. Some of Mr. Burne Jones's heads have much beauty as sketches.

Many of the works exhibited are neither one thing nor the other: they are not sketches; and they are incomplete drawings, not so good as the artist could make them, prepared purposely for this second opportunity for sale. And herein lies the danger of the scheme. The public, nevertheless, enjoy it.

#### THE LATE MR. T. J. PETTIGREW, F.R.S.

WITH unfeigned sorrow we record the death of Mr. T. J. Pettigrew, which took place at his residence, in Onslow-crescent, Brompton, on the 23rd ult., after a long and painful illness, during which he had been attended in a singularly exemplary manner by his daughters, Lady Dillon and Miss Pettigrew. Mr. Pettigrew was born on the 28th of October, 1791, so that he was in his 75th year, and had passed a most active and industrious life. Of late years he had devoted himself mainly to archaeology, and had been most heard of in connexion with the British Archaeological Association, of which he was the moving spirit. The "Bibliotheca Susserriana," published in 1827 and 1839, "the Medici Portrait Gallery," completed in 1840, and his history of Egyptian Mummies, are amongst his earlier and most esteemed works. We may find an opportunity to give an account of his career as an archaeologist. We lament him personally as a friend.

WATERWORKS FOR SHOREHAM.—SAVES are being made for the purpose of supplying Shoreham with water by a company. The supply is to be derived from a spring near the town, which, it is said, will yield a million gallons a day.

NATIONAL PORTRAIT EXHIBITION  
IN 1866.

SIR.—Lord Derby's proposed National Portrait Exhibition at South Kensington—that is, in London—in the season of 1866, is now happily an accepted fact, and the world is quiet. Arms are inimical to Art. The Exhibition will unquestionably open under the auspices of her Majesty's Committee of Council on Education—the direction, control, and presidency of the Earl of Derby; and in better hands it could not be, for full guidance to success, than in those of Edward Geoffrey Smith Stanley, Earl of Derby, K.G., counsellor to King William and Queen Victoria—a great orator and a "noble author," in a sense beyond Walpole's aristocratic interpretation of a questionable title.

The exhibition is based, we are told, upon suggestions made by Lord Derby in a letter dated so recently as the 6th of May last. As the words of the Chancellor of the University of Oxford run direct to the point, I ask permission to reproduce them:—

I have long thought that a National Portrait Exhibition, in its scope and range, might not only possess great historical interest by bringing together portraits of all the most eminent contemporaries of their respective eras, but might also serve to illustrate the progress and state of various periods of British art. My idea, therefore, would be to admit either portraits of eminent men, though by inferior or unknown artists, or portraits by eminent artists, though of obscure or unknown individuals. I have, of course, no means of knowing or estimating the number of such portraits which may exist in the country, but I am persuaded that, exclusive of the large collections in many great houses, there are very many scattered about, in castles and towers, and in private families, the owners of which, though they could not be persuaded to part with them, would willingly spare them for a few months for a public object.\*

Of this there cannot be a doubt. "On Stanley, on," continues thus, and still direct to the point:—

The question of one, two, or three exhibitions in consecutive years would, I apprehend, be mainly decided by the result of future inquiries as to the probable number of pictures which could be obtained, and the space which could be found for their exhibition. But whether the period over which exhibitions (if more than one) should range, be longer or shorter, the point on which I should set the greatest value, in an historical if not an artistic point of view, would be the strict maintenance of the chronological order.

I shall be very happy if any suggestion of mine should lead the Committee of Council to take up seriously and carry out, with such alterations of detail as experience might suggest, a scheme which, I think, could hardly fail of being generally interesting, and I should have much pleasure in placing temporarily at their disposal any portraits from my collection at Knowsley which they might think suitable for their purpose.

Lord Derby's sensible letter determined the Committee of Council on Education that the exhibition should take place. A committee of some 150 noblemen and gentlemen were at once named, and Mr. Samuel Redgrave, to whose valuable labours the successful formation of the collection of British miniatures is chiefly due,\* was requested to take "special charge of directing the exhibition."

In many ways Mr. Redgrave's appointment is extremely satisfactory. He has, however, a heavy though a pleasant labour before him, and not much time to know in full what he should ask for, what he can get,—how to remove, how to hang, and how to catalogue. I know by bitter experience at Manchester—for my proposition (and it was mine alone, as Mr. Deane well knows) of a British Portrait Gallery in the Art Treasures Exhibition of 1857 in that Lancashire city was not taken up by the cotton lords in the same historical spirit that the lord of "Knowsley Hall, near Prescott, in Lancashire," and the fourteenth earl of his house, has "long" viewed it, and has now given to it in the "imprimatur" of his illustrious name. But a better testimony (Lord Derby will possibly pardon me) to the interest sure to be felt in the National Portrait Exhibition than this is to be found in an *illustrated* letter from Sir Walter Scott to Mr. Harding, of the firm of Harding & Lepard, the publishers of "O'Logde's Portraits."

Sir,—I am obliged by your letter, requesting that I would express to you my sentiments respecting Mr. Lodge's splendid work, consisting of the portraits of the most celebrated persons of English history, accompanied with memoirs of their lives. I was at first disposed to decline offering any opinion on the subject; not because I had the slightest doubt in my own mind concerning the high value of the work, but because, in expressing sentiments, I might be exposed to censure, as if attaching to my own judgment more importance than it could deserve. Mr. Lodge's work is, however, one of such vast consequence, that a person attached, as I have been for many years, to the study of history and antiquities, may, I think, in a case of this rare and peculiar kind, be justly blamed for refusing his opinion, if required, concerning a publication of such value and importance.

Mr. Lodge's talents as an historian and antiquary are well known to the public, by his admirable collection of

ancient letters and documents, entitled "Illustrations of British History," a book which I have very frequently consulted; and have almost always succeeded in finding, not only the information required, but collected a great deal more as I went in search of it. The present work presents the same talents and industry, the same patient powers of collecting information from the most obscure and hidden sources, and the same talent for selecting the facts which are the rarest and most interesting, and presenting them to the general reader in a luminous and concise manner.

It is impossible for me to conceive a work which ought to be more interesting to the present age than that which exhibits before our eyes our "fathers as they lived," accompanied with such memoirs of their lives and characters as enable us to compare their persons and countenances with their sentiments and actions.

I pretend to offer no opinion upon the value of the work in respect to art; my opinion on that subject is literally worth nothing in addition to that of the numerous judges of paramount authority which have already admitted its high merits. But I may presume to say, that this valuable and extended series of portraits of the illustrious dead affords to every private gentleman, at a moderate expense, the interest attached to a large gallery of British portraits, on a plan more extensive than any collection which exists, and at the same time the essence of a curious library of historical, bibliographical, and antiquarian works. It is a work which, in regard to England, might deserve the noble motto, rendered with such dignity by Dryden, —

"From hence the line of Alban fathers come  
And the long glories of majestic Rome!"

I will enlarge no more on the topic, because I am certain that it requires not the voice of an obscure individual to point out to the British public the merits of a collection which at once satisfies the imagination and the understanding. By the pencil how the most distinguished of our ancestors looked, moved, and dressed; and informs us by the pen, how they thought, acted, lived, and died. I should in any other case have declined expressing an opinion on the merits of an almost interminable manner; but I feel that when called upon to bear evidence in such a cause, it would be unmanly to decline appearing in court, although expressing an opinion to which, however just, my name can add but little weight.

I am, Sir, your obedient servant,  
WALTER SCOTT.\*

Sir Walter's letter contains a noble testimony to the value of Norroy Herald's work. Nor, I will here remark, should the accompanying Memoirs be overlooked. They are written with accuracy, animation, and grace. Lord Derby's national portrait biographer might take a lesson from them.

Wishing heartily well to the coming Portrait Exhibition, I have thought that, through your columns, I might, from time to time, point out places but too little known, where good portraits are, and possibly are to be had on loan, and—on Lord Derby's terms. In the county in which I now live,—pleasant Lord-High-Chancellor-Parked Hertfordshire,—we are rich almost to excess, in national portraits. Witness Hatfield, Gorhambury, and Cassiobury; Lord Clarendon's, at the Grove; Lord Cowper's, at Panshanger; the late Lord Palmerston's, at Brockett; and Mr. Baker's, at Bayfordbury, Middlesex alone (we will not except Berkshire, with its Windsor) can surpass in portrait treasures uncounted Hertfordshire.\*

Finally, I should like to know on what principle of selection or rejection Lord Derby and his fellow-committee-men propose to proceed. I have a longing to see Jauze Shore and Noll Gwyn; Perkin Warbeck, Guy Fawkes, John Felton, and Titus Oates; Peg Nicholson, John Bellingham, and Arthur Thistlewood; and with the questionable hero of the political Cato-street conspiracy I would stop.

PETER CUNNINGHAM.

## IRON SHIP BUILDING.†

The first iron-built vessel was probably a canal-boat about the beginning of the present century. There were such in Staffordshire in 1812 and 1813; and from that time to the present iron boats have been successfully employed on canals. The first sea-going iron vessel was the *Aaron Manby*, which was built by the Horsley Company and sent to London in sections, reconstructed in one of the docks, and navigated across the British Channel to Havre, whence it sailed up the Seine to Paris. The late Admiral Napier had the distinguished honour of navigating this first iron sea-goer across the Channel. In 1830-1 Mr. Fairbairn was employed in improving iron canal boats; and about the same time an iron vessel, the *Manchester*, 81 ft. long and 14 ft. beam, with recessed paddles on the stern, was built in Manchester and navigated

\* The Marquis of Hertford and the Duke of St. Alban's are both careless and houseless in Hertfordshire. The Duke of Marlborough, as Baron Sandridge, has property in Hertfordshire, but no house in the county in which he resides.

† Treatise on Iron Ship-building; its History and Progress." By William Fairbairn, C.E., LL.D., &c. London: Longmans & Co. 1865.

through the locks of the Mersey and Irwell Navigation to Liverpool, whence it sailed by sea to Greenock. This is believed to have been the second iron vessel intended to take a sea voyage; but a light iron boat, the *Lord Dundas*, performed the same voyage in 1830. The *Manchester* was employed as a coaster in carrying goods and passengers between Port Dundas, Greenock, and Dundee. About the same date, 1830-1, or shortly after, Messrs. Laird built the *Albatross*, a small iron vessel, which was taken out to Africa, with the Landers and Mr. Macgregor Laird, for the exploration of the Niger.

"The strength and sailing qualities of the whole of these vessels," says Dr. Fairbairn, "were confirmatory of the great superiority of iron over wood as a material for ship-building; and we have only to refer to the extensive use and enormous increase that have taken place in its application, not only in this country, but in every maritime state of the globe, to be convinced of the soundness of the principle, and the great superiority of the iron ship."

Great improvements have been of late years made in the construction of iron ships, and in these improvements Mr. Fairbairn took a prominent part. He removed this department of his Manchester establishment to Millwall, near London, where he built upwards of a hundred iron vessels, some of them above 2,000 tons burthen, but he afterwards personally retired from the business. Since then, as he remarks,

"Great and varied improvements have taken place in the construction of iron ships, and it has been clearly shown that vessels of large tonnage and great magnitude may be safely constructed of iron. For the extent to which this application has been carried we are indebted to the late Mr. Brunel, Mr. Scott Russell, of London; Messrs. Laird & Co., Mr. Vernon, of Liverpool; Mr. Robert Napier, and several other eminent builders, of Glasgow. To the Clyde builders may be referred some of our most important constructions, and there is probably no part of the United Kingdom where greater energy and enterprise in this branch of industry is displayed."

Notwithstanding that thirty years' practice in iron ship building must have improved the principle of construction, numbers of vessels have been built and are now building of inferior material as well as defective in principle, thus impairing their security and rendering them unfit for service on the open sea. Much has yet to be done to rectify these mistakes, to raise the character of the iron ship-builder, and ultimately to establish in the public mind perfect security in the strength of vessels of this description.

With regard to ships of war, as Dr. Fairbairn, in his treatise "On Iron Manufacture" remarks, "The future destiny of nations seems to be involved in the consideration of iron, and its application to an entirely new system of construction in vessels of war, calculated to unite with equal facility the powers of attack and defence." To combine this force and power of resistance in one construction, is a desideratum not yet attained; but every effort is now being made by the Government of this and other maritime nations, to approximate as nearly as possible in the construction of ships of war to that desirable object.

The work under notice treats mainly of the history and progress of iron ship-building as comprised in a series of experimental researches on the laws of strain; the strengths, forms, and other conditions of the material; and an inquiry into the present and prospective state of the navy, including the experimental results on the resisting power of armour-plates and shot at high velocities. The results of his analysis of experiments on the strength and other properties of plates, angle-iron, &c., are chiefly taken from his own experiments, published in the "Philosophical Transactions," part ii. (1850), p. 677, and of which an account has already been given in our columns, as well as of those of the late Professor Hodgkinson, to whom Dr. Fairbairn also acknowledges his obligations in the work under notice. These experiments embrace almost every known mechanical property of iron,\* and the knowledge thus obtained has furnished data for the construction of ships, and other structures employed in the useful and industrial arts. The ultimate powers of resistance of iron to tension, compression, torsion, &c., are taken from the same source.

The joining of iron plates, and the form of joints required in ship-building, is another important question. The author has endeavoured to show what kind of riveted joint is requisite in order to attain the maximum powers of resistance in the longitudinal and transverse joints. A single defective joint may endanger

\* Mr. Kirkaldy published, a few years since, a detailed series of experiments on iron and steel, in which will be found much useful information on the strengths and other properties of these materials.

the safety of a ship; how much greater, therefore, must be the danger if the principle throughout be unsound, and the whole of the joints of an imperfect character!

It has been found that the union of plates by riveting is far stronger and more durable than by bolts, as the rivets are generally put in hot and then hammered, or, what is decidedly preferable, compressed by the riveting machine into the holes prepared for their reception. A good rivet requires a bend on each side, the same as a bolt and nut; but there is this difference,—that the rivet becomes, when carefully inserted, part and parcel of the plate; and, when they are duly proportioned as to size and number, become equal in strength to the plate itself, minus the parts punched out for the rivets. It is therefore desirable, in every case where plates have to be joined, that they should be united by rivets.

On this subject the author says,—

"In the pursuit of the foregoing inquiry I was naturally led to the consideration of the best proportions and best forms of riveting plates together. I investigated this subject with great care; and, from my own personal knowledge and that of others, have collected a number of practical facts, such as long experience alone could furnish. From these data I have been enabled to compile the following table, which for practical use will be found highly valuable in proportioning the distances and strength of rivets in joints requiring to be steam or water-tight."

Table exhibiting the strongest Forms and best Proportions of Riveted Joints, as deduced from the Experiments and actual Practice.

Thickness of Plates in Inches.	Diameter of Rivets in Inches.	Length of Rivets in Inches.	Distance of Rivets from Centre to Centre in Inches.	Quantity of Lap in single Joints in Inches.	Quantity of Lap in double-riveted Joints in Inches.
.15	.28	.80	1.25	1.25	For the double-riveted joint add two-thirds of the depth of the single lap.
.25	.30	1.00	1.50	1.50	
.31	.32	1.08	1.63	1.88	
.38	.35	1.63	1.75	2.00	
.50	.41	2.25	2.00	2.25	
.75	.44	2.75	2.50	2.75	
.87	.46	3.25	3.00	3.25	
1.12	.50	4.00	3.50	4.00	
1.50	.56	5.00	4.50	5.00	
2.00	.63	6.25	5.50	6.25	

The figures 2, 1.5, 4.5, 6, 5, &c., in the preceding table are multipliers for length, and distance of the rivets, also for the quantity of lap allowed for the single and double joints. These multipliers may be considered as proportional to the thicknesses of the plates to the diameter, length, distance of rivets, &c. For example, suppose we take 3 plates, and require the proportionate parts of the strongest form of joint, it will be—

- .375 x 2 = .750 diameter of rivet, 3/8 in.
- .375 x 4.5 = 1.688 length of rivet, 1 1/2 in.
- .375 x 5 = 1.875 distance between rivets, 1 7/8 in.
- .375 x 6 = 2.250 quantity of lap, 2 1/4 in.
- .375 x 5 1/2 = 2.063 quantity of lap, 2 in.
- .375 x 6 1/2 = 2.438 quantity of lap for double-riveted joint, 2 1/2 in.

.75, 1.68, 1.87, 2.06, and 2.43 are therefore the proportionate quantities necessary to form the strongest steam or water tight joints on plates three-eighths of an inch thick."

In the construction of iron ships, Dr. Fairbairn strongly urges the advantages of the cellular system as first exhibited in the construction of the Britannia and Conway tubular bridges, and more recently in her Majesty's ship *Bellerophon*. This system, together with a double bottom, renders a ship so constructed a

really unsinkable ship; and there is a reason for the adoption of such a system in iron ships which Dr. Fairbairn might have also urged,—namely, that such ships do not float for any time when seriously damaged below water-mark, as wooden ships frequently do; but sink precipitately, to the far more serious loss of lives and property.

In shielding our ships of war from the effects of an enemy's shot, the author confesses that,—taking into account the progressive improvements in the power of guns, which have kept pace with the increased resistance of plates,—we are now, as nearly as possible, in the same relative position as the navies of this and other countries were fifty years ago; and, as it appears that we cannot cover and protect the whole of a ship with a sufficient thickness of plates, the next best thing to do is to take our chance, and let the shot go right through. This, under certain conditions, he has recommended to be done; but with a saving clause, that the vessel should be protected by a line of thick armour-plate above and below the average line of flotation, and that exclusively for the safety of the ship.

Although Dr. Fairbairn regards iron, from its superior tenacity and susceptibility of being worked, as decidedly preferable to any other material with which we are acquainted for the construction of ships, he is of opinion that dur-

tile steel of uniform quality will entirely supersede the use of that material.

"We are of opinion," he says, "that steel must eventually supplant the present manufacture of iron, establishing in its place a very superior quality of material, which, applied to ships, boilers, bridges, and other similar constructions, will give nearly double the strength with the same weight of material."

As the complete iron-clad ship is a ponderous and sluggish mover, as well as a plunger at sea, the Admiralty, it seems, intend to try the principle of a modified system of protection, by a narrow belt of thick armour-plate above and below the water-line, so as not to embarrass or retard the speed of the ship; and with that view they intend building four swift vessels, with heavy armaments,—not armour-plated, but trusting entirely to their speed; or, as Lord Clarendon calls them, an "improved class of *Alabama*, calculated to outstrip every other description of vessel carrying the same number and weight of guns."

THE KEMNAY GRANITE QUARRIES.

ABOUT sixteen miles north of Aberdeen, and on the immediate line of the Great North of Scotland Railway, stands the village of Kemnay, famous for its granite quarries. Kemnay enjoys a delightful situation on the slope of the valley of the River Don, which murmurs quietly and dreamily at its foot. Overlooking the river towards the north, you have Bennochie, rising majestically to a height of 1,410 ft., and inclosing a landscape which might have charmed the soul of Claude or Turner. Little more than half-a-dozen years ago, Kemnay was a rude, insignificant hamlet, containing only a few scattered cottages, and a purely agricultural population. Its post-town was Kintore, four miles distant, and, we believe, it could boast of neither a grocer, a baker, nor a butcher's shop. To quote a common Scottish saying, "There was really nothing doing in the place." It must indeed have been a stagnant locality, if we may credit the following anecdote which is related of it:—

A tourist, struck with the woeful aspect of the village, halted at the "smiddy" (blacksmith's shop), and put this question to the smith,— "My good man, this is a confoundedly slow spot; do you ever by any chance see anybody here at all?" "Weel," replied the rustic Vulcan, "it's-nae sae dull after a'. There was a horse an' cart passed about an hour ago, and

we had twa o' them yesterday." Now, however, Kemnay is one of the most flourishing, as it is one of the most picturesque, villages in Aberdeenshire. Not only can it boast of having its baker, its grocer, its butcher, and its postmaster, it may be said to have reached the period of ease and luxury, if the presence of a doctor, a chemist, a watchmaker, a station-master, and a village librarian within its borders, may warrant the term. Indeed, the ambition of the inhabitants will be satisfied with nothing short of streets, which, we are told, already exist on paper. The first thing that strikes the visitor to Kemnay is its bran-new appearance. There is not an old erection to be seen,\* much less a dilapidated one. The "and clay higgins" have all disappeared, and in their stead have sprung up, and are fast springing up, modern cottages of tasteful design, and semi-detached two-storied houses of commodious and substantial structure. It was satisfactory to learn, that many of the quarrymen of Kemnay

\* We except Kemnay House itself,—a grim old mansion, which has been the family residence of the Barretts of Kemnay for three or four centuries. The grounds surrounding the house appeared to us to be in a very neglected state; but the front approach to the mansion lies through a magnificent avenue of elm trees,

"whose boughs are moss'd with age,  
And high tops bald with dry antiquity." This is said to be one of the finest avenues in Scotland.

are taking advantage of the immense facilities which the district offers for building, with the best possible material at the lowest possible price, and are building their own houses. The house accommodation is at present infinitely insufficient for the requirements of the place, numbers of the workmen having to walk several miles to their homes; but as every inducement is held out to the men, by Mr. Fyfe, their employer, as well as by the proprietor, to build, this inconvenience is only temporary. The houses, which are, of course, built of granite, present a remarkably fresh and cheery appearance, each with its white "harled" walls, blue-tiled roof, and small garden plot.

All these changes, as we have said, have taken place during the last six years, and are due to the opening of the quarries in the neighbourhood.\* The principal quarries in the vicinity of Aberdeen were, until recently, the Rubislaw and the Dancing Cairns. Both, however, are now pretty well exhausted; and the Kemnay Quarries may be considered amongst the largest and most important of the Aberdeen granite quarries. They have this other important advantage, that while the stone found here is equal in grain and durability to any other granite, it can be laid down at Aberdeen at a lower cost than either the Rubislaw or the Dancing Cairns stone, though the latter place is but four miles, and the former only two miles from the Granite City. This is owing, we believe, to the very favourable terms on which the quarries have been leased. The quarries are situated on an elevation known as Paradise Hill, about half a mile north of the village, and occupy several acres of ground. At present they employ two hundred men as quarriers and masons, but this number will be increased as the works progress. The hill has been opened in two separate places, forming a larger and a smaller quarry. The one has 40 ft. of a working face, the other 70 ft. These cuttings are being worked into one another, and will ultimately have a working face of 100 ft. There are five steam cranes continually in operation, each capable of lifting ten tons weight; and it may be mentioned as a proof of the quality of the rock here, that blocks of granite, measuring 30 ft. in length, and weighing 100 tons, are occasionally met with. Twelve hundred tons of granite, principally for the London market, leave the quarries every month. The stones consist of curb and paving stones, and building stones. We were informed that at this and other quarries in the district, as many as 700 hands are regularly employed in making stones for the streets of London alone. We were also shown a number of beautifully finished pieces of coping and pillar work, intended for the balustrade of the Thames Embankment. It may be added that Mr. Fyfe has expended many thousands of pounds on his machinery and plant, which seem to be in excellent condition, and that the supply of stone can be exhausted only by future generations.

We cannot take our leave of the pleasant little village of Kemnay, without remarking that it is a singular exception to every other village of similar size in Scotland, inasmuch as it contains neither inn nor public-house. "Whiskey, whiskey everywhere, and not a drop to drink" at Kemnay. When we consider the general character of the class which forms the staple of its population, as well as the nature of their occupation, the circumstance is indeed a singular one. Thrifty souls, who may be inclined to fiddle, must go four or five miles to find the waiter; and it might be questioned if even a Scotsman's proverbial preference for a dram be sufficiently ardent to induce him to undertake such a journey for such an object. But he this as it may, so far as we could learn, a fondness for "Kissing the Baby," as the Americans say, is far from being a "national vice" in Kemnay. The quarrymen, as a class, are as sober as they are industrious. If they be not all teetotalers,—which it would probably be too much to assert—

\* Kemnay has undergone changes in more directions than one. The new Established Church is a very fair edifice, as country churches go in Scotland. The former building, however, for a long time was in a most wretched condition; a fact which, perhaps, could not be better illustrated than by the following incident. The swallows, as in the days of the psalmist, "therein had built their nests," and were in the habit of making their entrance and exit through the roof. One Sunday the minister (the late Dr. Mitchell) was much annoyed by the snoring of a country fellow who had fallen asleep in a pew directly opposite to the pulpit; his head had fallen back, and his open mouth was directed upwards. The anecdote had continued some time, when a swallow, in leaving its nest, loosed part of the clay, which dropped into the open mouth of the sleeper, who started up "with a snorer's amusement."

they certainly must, like the Baron of Bradwardine, carry their drink discreetly. However, we understand that the true cause of the absence of a public-house in the village is a disinclination on the part of the laird to sanction one. If those specially interested do not feel aggrieved, it is not for anybody else to quarrel with the arrangement; quite the reverse. All we shall say is, may Keonway continue to flourish after her own fashion.

#### NEW PUBLIC BUILDINGS FOR ABERDEEN.

THREE or four years ago, in consequence of the extremely unsatisfactory accommodation in the present court-houses of Aberdeen, they were examined by Mr. Matheson, of her Majesty's Board of Works, and on his report the Commissioners of Supply resolved to have a new building, and invited Mr. Mathews, Aberdeen; Mr. Smith, the architect of Balmoral Castle; and Messrs. Peddie & Kinnear to prepare competing designs. When these had been examined, the plans of Messrs. Peddie & Kinnear obtained the preference. Before steps were taken, however, for carrying out the building, a project was brought forward for erecting new municipal and county buildings, and it was proposed to take advantage of the necessity for new court-houses to erect a large public building which would contain accommodation for all these objects. This scheme being resolved upon, Messrs. Peddie & Kinnear were instructed to prepare designs. The site selected is the finest in the city, being at the east end of Union-street, having a frontage of 200 ft. to that leading thoroughfare, and of 115 ft. to Broad-street. The main object of the architects, in the external plan, seems to be to make the building resemble, in general character, the town-halls of Belgium and France, the style used being Gothic, but strongly impressed with the well-known characteristics of the old Scottish architecture, although generally it is of the French type. The building is treated severely in the details, in consideration of the granitic material of which it is to be composed, but its great mass and extent, with the picturesque arrangement of the parts, will, it is thought, secure it against that flat and tame appearance which so much strikes one in the modern buildings of Aberdeen.

The most striking feature of the building will be an immense tower, 28 ft. square, standing at the angle of the building forming the intersection of Union-street and Broad-street. The tower rises, without a break, to the height of 72 ft. At this height, four corbelled-out turrets at the angles rise to a height of 36 ft., where the masonry of the building terminates. The turrets are surmounted by high-pointed conical roofs, lighter and more acute than is usual in old Scottish buildings. From the same level from which these roofs spring, the roof of the tower tapers upwards to a height of 27 ft., from which altitude springs a lantern gallet, pierced with double lights on each of its four sides, and having a high-pointed roof over it, terminating in a vane at the height of 190 ft. from the ground. The front towards Union-street, which terminates in the tower at the west end, terminates at the other end in the existing old tower and gateway of the court-house, which it is intended, on account of its antiquity, to retain. The front to Union-street exhibits a line unbroken, except by projecting turrets which divide the length into three portions, of which the centre one is the larger. These turrets are supported on shafts rising from the ground, and extend to the line of the roof, where they finish in conical roofs. The portion of the building between them is appropriated to the great entrance to the building, on the ground-floor, and above it, to the great hall common to the town and county. This hall is 76 ft. long by 46 ft. wide, and will be 48 ft. high, from floor to the apex of the roof, which is to be of open Gothic timber-work. It will accommodate about 700 people. The frontage towards Broad-street is finished at each angle by a corbelled turret. The whole extent of the front to Union-street and Broad-street, with the exception of the entrance-gateway and the great towers, presents an arcade formed of columns attached to the wall, and standing about 12 ft. apart. Above this, and forming the first floor of the building, is a long arched range of smaller arches, separated from each other by small piers, the arches being about 3 ft. in width. Except where the great hall is situated, the rest

of the frontage is divided into two stories, the lower one having square-headed windows of a plain character, and the upper having windows with arched heads. The hall is lighted by arched windows equal in height to the two stories, the tops being filled with cusped tracery. The roof is relieved by a range of ornamental dormer-windows, corresponding in number to windows below. Behind the building just described, there is the court-house proper, connected with the front building by a grand staircase about 40 ft. square, leading in double flights to the hall. The east prison of Aberdeen stands immediately behind the court-house, and there will also be cells for prisoners in connexion with the new police office.

The cost of the whole building, inclusive of the site, is estimated at 60,000. The requisite Parliamentary notice has been given for powers to acquire this property needed, and for powers also to raise the money required, by assessment.

#### THE NEW THEATRE ROYAL, HULL.

This building is now rapidly approaching completion; its opening is fixed for Boxing-night. The theatre stands upon the foundations of the old one, and will have its principal front in Humber-street. It is not intended to complete its exterior decorations this year, as the coming winter would interfere with the work. The front will be in the Italian style, with arched portico over the main entrance, above which is a saloon fronted by a balcony. The entire area to be occupied by the theatre, including auditorium and stage, is 101 ft. by 72 ft.; this space, however, will be surrounded by staircases, retiring-rooms, shops, scene-room, workshop, dressing-rooms, &c., forming a block of building 140 ft. by 72 ft. The theatre is approached by five distinct entrances. The box-entrance is in Humber-street, with portico and vestibule, and stone staircase. The pit and upper box staircases are on either side of the box-entrance. The pit has two exit corridors into Humber-street, and one into Wellington-street at the back. All are paved with stone, and have stone steps. The stage and gallery entrances are in Wellington-street. The latter is of ample width, opening to a stone staircase, divided into short flights, with large square landings. The diameter of the circle is 25 ft., with a depth of 55 ft. from the proscenium wall to the back of the pit. The length of the stage is 43 ft., the width of the proscenium 27 ft. There is room above the stage to take up a whole scene if necessary, and equally good facilities for sinking in the cellar below.

#### THEATRE ROYAL, EDINBURGH.

The new Theatre Royal, on the site of that which was burnt down a year ago, is now almost completed, and the lessee is to enter into occupation this month.

The exterior does not possess the characteristics looked for in a building of this description; it is tame and ineffective, though not devoid of a certain *neatness* in the principal elevation. The architect, Mr. David Macgibbon, has concentrated the whole architectural effect on the eastern facade, towards Broughton-street, leaving the side elevation towards Little King-street as a plain wall pierced here and there by a few windows. The better course to have followed would have been to have made the angle at the junction of those two streets the principal point of decoration, seeing that it is the most prominent part of the building as viewed from the broad expanse of Leith-walk. The chief feature of the Broughton-street elevation is a portico, supported by four pillars, of plain Italian character, which forms the entrance to the boxes; on either side of this are two small shops, and at either angle the entrance to the stalls and amphitheatre, the entrance to the galleries being on the south side. The remaining decorations of the east elevation consist of pilasters, with decorated capitals, arched windows, and four niches, in which it is proposed to place allegorical statues of Tragedy, Comedy, Music, and Dancing; above this is a frieze, pierced with mezzanine windows and circular panels, in which are to be placed medallions of Shakspeare, Moliere, Goethe, and Scott. The wall-head is finished with a cornice and balustrade.

The interior arrangements are a great im-

provement upon the former building; and the decorations are very elegant and effective. The ceiling is formed into a circular dome, having a rise of only 3 ft., and is divided into twelve panels, diminishing towards the centre, from which depends a large cut-glass chandelier; the coloured decoration consists of a blue ground, spangled with gilt stars; and surrounding the dome is a cornice with groups of Cupids. The spandrels formed by the junction of the dome with the proscenium are filled in with musical trophies, masks, &c. The front of the upper gallery is decorated with the acanthus and laurel; that of the amphitheatre, which is sogue in section, is covered with a raised diaper, with acanthus-leaves superimposed, mingled with flowers, and is finished with a bold cable enrichment. At intervals groups of Cupids support crystal gaseliers. The box front has a rich scroll running round the centre of it, divided at intervals by circular panels having alto-relievo groups of Cupids, the remaining portion being a raised diaper similar to that on the amphitheatre. Fixed to the lower edge of each of those galleries is an imitation fringe, which will be very liable to injury, and is the least tasteful of the decorations. The prevailing colours used are blue and gold, and the effect is rich and harmonious.

There are no private boxes, except four in the proscenium; on the side of these, next the stage, is a pilaster ornamented in low relief; and on either side of the boxes is a spiral column, round which runs a band of laurel-leaves; life-size figures on each side of the lower stage-boxes support the upper tier. The soffit of the proscenium is enriched with scroll-work, having the Royal arms in the centre.

Precautions have been taken to guard against fire; an iron shutter is provided for shutting off the stage from the audience part of the house, and the different stairs are of stone.

#### ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.

At the opening meeting of the session 1865—66, held at the rooms of the Institute, 212, Great Brunswick-street, on the 23rd ult., the following officers were elected for the ensuing year:—Patroness—The Queen; Vice-Patron—His Excellency Lord Wodehouse; President—Charles Lanyon, R.H.A.; Vice-Presidents—Jacob Owen, G. Wilkinson, Park Naville, C.E.; Council—Sir Thomas Deane, R.H.A., Sir John Benson, C.E., F. V. Clarendon, J. R. Carroll, J. M'Curdy, J. M'Carthy, R.H.A., W. G. Murray, R.H.A., G. C. Ashlin, E. H. Carson, W. F. Callbeck; Honorary Secretary—James H. Owen, M.A.; Assistant Secretary—Charles H. Brien; Treasurer—Sandham Symes; Auditors—W. Fogarty, Charles D. Astley.

The hon. sec., Mr. J. H. Owen, then read the annual report of the Council.

The routine business having been disposed of, Mr. Thomas Drew, fellow, said that at the first meeting of the class of architectural study, the proposed study for the evening would be an exercise in a design for a mortuary chapel or mausoleum, or a churchyard cross or lych gate. Some discussion ensued, in the course of which Mr. Charles Geoghegan and others expressed a doubt as to the propriety of beginning a course of instruction with an exercise in design, and advocated the study of free-hand drawing in preference. In reply, it was urged that for a time at least the working of the Association would be of so experimental a character that an exercise in design in subjects admitting of so varied, and, at the same time, so elaborate or simple a treatment, as those proposed, would be the most practicable way of making a beginning.

Mr. Wilkinson expressed a wish to address to the Institute, on a future occasion, some practical remarks on the soundness and durability of white fire-brick and other white bricks, an inquiry into which was much called for, he conceived, in consequence of the extensive use which was being made of this material. He referred, as an instance of its successful application, to the spire recently erected at Castleknock Church.

IMPROVEMENTS IN GLASGOW.—The City Corporation of Glasgow intend applying to Parliament for powers to form no less than thirty-five streets, besides widening, altering, &c., about ten or eleven more; and to build, let, and sell houses for the labouring classes, lay out public parks, &c.

REFERENCES.

- A.A. Drinking-fountains on each story; the water is raised by steam-engine in the cellars.
  - B.B. Shafts for dust and refuse, communicating with receptacles outside the building.
  - C.C. Closets on each story for men and for women; and sink supplied with water.
  - G.G. Communication from one building to the other.
- The glazed roofs of the inner courts are seen above the other roofs. The low building at the side, of which part only is shown, contains the school.

## THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of members was held on Friday evening, the 24th ult., at the House, in Conduit-street.

The chair was occupied by the president, Mr. R. W. Edis. Various gentlemen were elected members.

Mr. J. D. Mathews (honorary secretary) announced that the committee had decided that the subject for competition for the annual prize accorded by Mr. Tite, M.P., should be the elevation of a shop-front and house (not corner), to be five stories in height, and to be erected in a street 40 ft. wide.

The prize of 5l. offered by the Architectural Union Co., and a prize of 3l. offered by the Association, would be given for the best and second-best designs for a pair of dwelling-houses, the cost of which should not exceed 700l.

The President's prize of five guineas would be awarded for the best drawing of any public building, either in the United Kingdom or on the Continent, of a date anterior to 1700, either Gothic or Classic. The drawings to be sent in between the 1st of March and 30th of September next. Some other prizes have been promised.

The Chairman observed that the Association would have more prizes to give away in the current session than on any previous occasion since its formation, and that he hoped there would be a greater number of competitors than ever, in order to show that the prizes were really appreciated by the members of the Association.

Mr. Lacy W. Ridge then read the report of the committee on the proceedings of the Association during the last (the twenty-third) session. It stated that 71 members had been admitted during the session, making the total number on the books 316. The attendance of members had also been more regular; and the average number present at each meeting showed a satisfactory increase as compared with former years.

The Chairman, referring to the voluntary examination class, expressed his opinion that it had not been as successful as was to be desired; at the same time he hoped the members would not give it up, because they could not get all that they wished from the Institute. The Association had done all it could to obtain for the younger members of the profession some recognition, in the shape of a certificate or diploma, of their ability to practise their profession; but the circumstance that the examiners might be of opinion that the time had not yet arrived for conceding what was asked to meet for mutual instruction and advantage. They should remember, that in preparing themselves for examination, they were not only labouring to qualify themselves for a diploma, but they were also working with the view of improving the status of the whole profession. For his own part, he believed that the diploma would sooner or later come, but they must wait until perhaps their numbers were greater and their influence wider. In the case of the doctors, they had asked for a diploma long enough; but when they became 500 strong, and went to the Crown, and urged the absolute necessity of a diploma, in order to keep out the quacks, they made so strong a case that they got what they wanted. If the members of the Association would persevere in like manner, the probability was, that the justice of their demand would also be admitted and conceded.

Mr. R. O. Harris urged the desirability of giving a certificate, and ultimately a diploma. He agreed with the chairman as to the desirability of continuing the voluntary examination class, as a valuable means of assisting those who proposed to present themselves to the Institute for examination.

Mr. J. Lemon suggested whether it might not be desirable to do away with the voluntary examination class, and merge it in the class of design. He did not, however, give any notice of motion on the subject.

Mr. T. R. Smith called attention to the library of the Association, expressing a hope that members would, when possible, present donations to it. He also suggested whether it might not be possible to make additions to it by the purchase of books out of the common fund.

The report was then read and adopted. Mr. J. D. Mathews presented the annual statement of receipts and expenditure, which showed that 111l. 17s. had been received, and 131l. 2s. 4d. expended; and that the Association, so far from being in debt, as in former years, had a balance in hand of 10l. 14s. 6d.

Some discussion ensued with reference to arrears of subscription, in the course of which a suggestion was made by Mr. Lemon, either that there should be an entrance fee, or that the annual subscription should be doubled.

Mr. Ridge and others, however, objected to either alternative, and after a short debate the subject dropped, the feeling of the great majority of the meeting being against disturbing the present arrangement.

Mr. Judge read the report from the class of design, which stated that the number of sketches submitted during the session was 135, contributed by thirty-one members.

Mr. C. H. F. Lewes read the report on the library, announcing that eighteen new subscribers had joined, and that the library had been open twenty-one evenings during the session.

Mr. T. R. Smith read the report of the delegates from the Association to the Architectural Alliance, in which it was stated that the scale of charges, as sanctioned by the Royal Institute of British Architects, had been generally recognised wherever the influence of the Alliance extended; and that, in the opinion of the delegates, much advantage had accrued from the annual meeting of representatives from the associated societies.

In reply to a question, Mr. Smith stated that the diploma question had not been mooted at the meeting of delegates.

Some formal business having been disposed of, the meeting adjourned.\*

## THE ARCHITECTURAL EXHIBITION.

THERE is nothing remarkable in the circumstance that the parties who have hitherto managed this adventure to so little purpose should romonstrate against any interference with their prerogative of harmonious repose; and this especially when they are disturbed in the very act of crowning each other with fresh honours. Neither is there any reason why the present controversy should be an exception to a certain universal rule—the weaker the defence, the more violent the indignation. I only regret that the champion of *let-alone* should be a gentleman whose powers are worthy of a better cause, and who, I am sure, would agree with me in every particular were it not for a chivalrous feeling, which is, of course, honourable to him.

But the question remains. It is a matter of business, and let us deal with it as men of business. Is it desirable, and if so is it possible, to establish amongst the annual art-exhibitions of London an *Architectural Exhibition* worthy of the name? There are some who hesitate to admit that it is desirable. There are others who fear it is not possible. But there are many whose minds are fully satisfied on both points, and who differ only on the means to be adopted. This difference now turns on one palpable pivot, namely, the precise policy which has hitherto been pursued. Some half a dozen persons, whose policy it is, are the defendants; I may say all the world else (except J. F.) are the assailants.

First let us understand distinctly what is the acknowledged position of affairs. I quote from the "Report" published by way of invitation for the notable assembly of the 14th ultimo:—

"Notwithstanding these favourable circumstances, the committee cannot conceal from themselves that the Exhibition has not of late years received from the profession that amount of support to which they think it is entitled."

It will be the business of the meeting to consider any proposition that may be made for increasing the attractiveness or usefulness of the Exhibition, or for rendering it more worthy of the noble art which it professes to represent."

In plain words, the adventure has failed; and, in order to put the acknowledgment of failure in the most substantial form known in such cases, we are told, that "some change will probably be deemed indispensable, in consequence of the present secretaries having announced their intention of resigning."

Now there are three particulars which seem to me to be essentials of success in such an undertaking;—No. 1, an adherence to constitutional principles of administration; No. 2, an exalted, or at any rate unabashed professional aim; No. 3, an executive composed of men who can command the public confidence.

As regards the first of these, let us quote from the letter in your last number,—“In the early days of the undertaking a formal general meeting was convened, and the result was certainly

\* The next meeting of the Voluntary Examination Class will be held on Monday evening next, subject, "Estimating Artificers' Work," by Mr. T. M. Rickman.

not encouraging. The second was held on the 14th instant" (after an interval of nearly fifteen years) "and it seems probable that the committee would have acted more wisely if they had adhered to their more usual practice." That is to say, if they had continued to conduct the business of a public institution supported by annual subscriptions without any sort of periodical account of their stewardship, as doubtless they would have continued to do for an indefinite time, but for the awkward circumstance that the secretaries desired to be relieved of their hopeless task. I venture to say, that if such a principle has been positively accepted by the committee, this of itself, in its indirect effects, is quite enough to account for the want of support complained of. The annual general meeting, of universal English custom, may often appear to be of little service; but the want of it can only produce disaster sooner or later.

Secondly, with reference to the unabashed purpose to which the undertaking ought to be severely confined. Is it, or is it not the fact, that hitherto the real working receipts of the "Architectural Exhibition" have come from exhibiting the wares of advertising tradesmen? In the absence of periodical accounts duly audited, much mystification may be thrown about this question; but one thing which ought to be insisted upon is, that if "the noble art which it professes to represent" cannot depend upon the liberality of its own professors and friends for the insignificant expenses of such a display as the Conduit-street Rooms will hold, it should at least be no longer held up to reproach as the poor cousin of Higgins's patent kitcheners, Wiggins's syphon pans, and Diggins's drain-pipes.

Coming, lastly, to the third point, I must premise that it is a difficult one to handle. When we speak of an executive to be composed of men possessing the public confidence, it is certainly an ungracious thing to say to any one that, although he is very well in his way, he does not yet command such confidence; but every one understands the practical truth of the suggestion. Even a militia man must be 5 ft. 2 in. The strength of a structure is the strength of its weakest point; and the weight of a committee of management, in the balance of the public confidence, is the weight of its inferior numbers. When I ventured to say as much on the 14th, the rejoinder afforded a very good illustration of this. The meeting was informed that certain eminent architects whom I proposed to nominate for the new council had all been tried and had all "refused to work." Even I myself had been tried, and had refused to work. The speaker remembered one day when I had attended as a member of the hanging committee, and, finding my colleagues engaged in their shirt-sleeves, had speedily disappeared. The deponent did not further state whether my colleagues had tucked up their shirt-sleeves, or whether they were sustaining muscular effort by the use of a pewter pot; but he glared openly in the display of linen, as the true test of good service. Now what I beg leave most respectfully and reluctantly to suggest is, that if we are to possess an architectural exhibition worthy of our profession, the managers ought to be of the class of gentlemen who do *not* work in their shirt-sleeves. I know I shall be told that the list of the committee contains a good half of well-known names; but this is no answer; as some one very prettily put it on "the 14th," when returning thanks for the honour of vice-president conferred upon him for his services as secretary during fifteen years,—“he had done nothing to deserve it, for he had only lent them his name." Perhaps it is the least he can do now to lend them his pen. But will he permit me to say that if he would lend them a little of his plain common sense, this would be at the present moment a loan the best of all?

I hope I am not to be led any further into a paper war about this matter. I only offer a suggestion, in all humility; and here it is, in few words. Let such gentlemen as I named at the meeting be intrusted with the formation of a new administration; and I feel sure they will easily succeed in accomplishing the following results:—

1. The divorce of the architecture from the syphon-pan business.
2. The abundant supply of the best exhibition material in future.
3. The proper collection of funds.
4. The desired attraction of visitors.
5. The acquisition of unreserved public confidence by constitutional dealing.

## GUNPOWDER IN HYDE PARK.

The fact that, under the wisest human agency, a sudden combustion of gas may destroy large and valuable ranges of buildings, and extinguish human lives by wholesale, will doubtless occasion strenuous efforts by the affrighted public to remove all gas-factories to less populous places.

There are, however, other and more perilous stores of highly-inflammable material, which have at various times exploded, and dealt ruin around. Powder magazines at Erith, at Hounslow, and elsewhere, may be cited as examples of what has happened, and may again occur, either through inadvertence, mismanagement, accident, or natural causes. If, then, exception be taken against the location of gasworks in cities, how much greater is the necessity for withdrawing all stores and magazines of gunpowder and explosive materials from the densely-peopled districts of London?

There is a magazine in Hyde Park, the choicest centre of London. It is protected by lightning conductors and military guards; but were a spark unhappily to fall within its chambers, it is fearful to contemplate the havoc that must ensue.

Perhaps there may be only a few tons of powder in store there, and that only the sergeant's guard and the ranger's house might suffer; if so, then so small a quantity could easily be supplied from Hounslow, or some 15 miles off on any side; but if there should be a store—a reserve equal to that at Erith, then were to the mansions and palaces,—and they are many,—within less than half-a-mile distant.

That there is no necessity for any powder magazine, nor, therefore, for any sergeant's guard, in the centre of the people's park, is as manifest as that the space they occupy is so much abstracted from this the most valued liberty of all our citizens; whereas the endless growth and spread of London needs rather the enlargement than the further restriction of recreative grounds. In fact, no portion of Hyde Park ought, under any pretence or for any purpose (even the most popular), to be withdrawn from this invaluable and rural range of public recreation and enjoyment. Besides that, the concession to the people of these inclosures in the most retired position of these incomparable sylvan reserves, might be more than an equivalent for any outlying or border appropriations, which might repay the Governmental authorities for the removal of old and galling blots on the park.

Marginal spaces are peremptorily required to widen Park-lane, and mayhap, also, to enlarge the narrow defiles of the Knightsbridge and Kensington roads. These could be spared, if the unhappy inclosures within the park were thrown open. The care bestowed by the Chief Commissioner in embellishment and tasteful plantation attracts increasing crowds, and makes unsightly inclosures only the more palpable.

Q.

## ON WATER SUPPLY TO VILLAGES.

Mr. J. BAILEY DENTON, member of the Institution of Civil Engineers, read a paper, last week, on "Water Supply,"—especially to small towns and villages,—at the Society of Arts, Adelphi. The remedy he recommended for the present objectionable condition of the water-supply in their small towns and villages, in summer, was the storage of water discharged in winter. If the quantity of rain which had been allowed to run waste in October last, in the midland and south-eastern counties, had been stored for the use of next summer, the quantity collected would have alone afforded sufficient provision against a repetition of drought.

There are few small towns and villages, he remarked, which have not in their origin had some reference to the existence of water, in the shape of a spring or a stream. When the relative height of the brook and the town will not allow of a reservoir being filled directly by the former, recourse can be had to a wheel or ram, to raise, in winter, the summer supply. The best-formed hydraulic rams, made by Messrs. Easton & Amos, or Freeman Rowe, with an available fall in the stream of 7 ft., will raise to the height of 30 ft. one-eighth of the quantity that sets them in motion; and assuming a reservoir formed above the village, to receive the water raised, a stream discharging twenty-three gallons per minute, during the winter and spring, will be sufficient

to raise, in 180 days, 720,000 gallons, for use during the summer and autumn. A turbine or an overshot wheel might take the place of the ram with advantage when the quantity of water to be raised is greater than that stated. But, of course, the expense of either ram or wheel and attendant works would be saved in those instances where water can be brought from a height and conducted into the service reservoir, with an overflow to discharge the excess when the reservoir is filled. But in many instances, even where streams exist, a better supply may be obtained by the under-drainage of land in the neighbourhood; and if we resort to it we have data which will quite satisfy the most fastidious inquirer, showing that the minimum discharge will afford a sufficient quantity of the very best water, if the area of drained land be sufficient, and it is surprising how few acres will suffice.

Assuming the average population of rural villages to be 400, and that each inhabitant required ten gallons of water per diem, it would require a supply of 480,000 gallons for the summer. That quantity was taken on the assumption that for 120 days, or four months in the year, there would not be a supply from ordinary sources. To secure that net quantity a considerable allowance should be made for waste by evaporation, and 50 per cent. on the quantity required should be added to meet this loss. A reservoir, or basin, to hold 720,000 gallons would, therefore, be required, and the quantity of water should be stored. He calculated that the total cost of the reservoir would be 240*l.* Iron pipes from reservoir, with stop-cock, well, and brickwork, 155*l.*; four stand-pipes and taps, 20*l.*; total outlay, 415*l.* Assuming the figures to be correct, the cost per person would be 1*l.* 0*s.* 9*d.*; and the cost per house, assuming the number of houses to be 100, would be 4*l.* 3*s.*

In course of the discussion which followed, Mr. Rawlinson said he had listened to the paper with pleasure, but also with some degree of disappointment. He regretted that Mr. Denton had not taken notice of the labours of persons who had gone before him. Mr. Denton might have fairly stated that the Government had not altogether ignored the question, but had directed their attention to the pollution of the waters of rivers by sewage and dyeworks. The state of their villages was worthy of attention, and during the last summer the inhabitants of many of those villages had to go to a distance to obtain even stagnant water. Although the reservoirs proposed by Mr. Denton might not give water that was altogether unobjectionable, they would certainly give them water in more abundance and of better quality than they could now obtain. He thought Mr. Denton's estimate of the cost was far too low.

Mr. Benjamin Shaw urged the propriety of communicating with Government for the purpose of inducing them to direct an inquiry respecting the supply of water in villages and small towns.

Mr. Denton, in reply to Mr. Rawlinson, said he was quite aware there was a Government Commission to deal with the purification of rivers, but it did not deal directly with (however indirectly it might reach) the supply of towns and villages with water.

Mr. Rawlinson: The Commissioners are directed to look to the supply of pure water. Mr. Denton proceeded to add that he did not ignore the existence of wells where they could be obtained cheaply. He merely proposed that the conservation of water in reservoirs should supersede deep wells. It was better to have a reservoir of 7½ ft. than to obtain the supply of water as at present. He would rather increase the depth hereafter than now make a proposal too expensive to be adopted.

## PROVINCIAL NEWS.

**Presteign.**—The new market here has been opened. The new building has been erected at the corner of Broad-street and Hereford-street, at a cost of 1,500*l.* The building comprises an open market-hall, about 40 ft. square, over which is an assembly-room of the same size, with a recessed orchestra in addition, attached to which is a retiring-room. The assembly-room is approached from the street by an independent entrance or vestibule, over which rises, to the height of about 50 ft., a campanile, the summit of which is decorated on the four sides with ornamental tablets, for the reception of clock

faces. There is constructed above the roof of the campanile an octagonal open turret, for an alarm or fire bell. In addition, there are ladies' and gentlemen's retiring-rooms, and the area of the market-hall is vaulted underneath as store-room accommodation. The style is Venetian Gothic. The building is brick built, with free-stone dressings, the vousoirs of the arches of the arcades and windows being constructed with pink, white, and grey bricks. A stringcourse and cornice surround the building, and a decorated niche is contrived at one corner, for a drinking-fountain. The works have been carried out from the design and under the superintendence of Mr. Thomas Nicholson, of Hereford, architect, by Mr. Bowers, builder.

**Liverpool.**—The new hospital for the treatment of cancer and skin diseases at Islington-flags has been opened to the public. The new building will afford accommodation for nearly 900 out-patients, and about twenty beds can be made up in five wards. On the ground floor there is a large well-lighted operating-room, a consulting-room, and a waiting-room. At the back of the building is a plot of land, containing 400 square yards, upon which additional accommodation may be provided as occasion may arise.

**Blackburn.**—The foundation-stone of new public baths has been laid at Blackburn. The building will cost from 4,000*l.* to 5,000*l.*, and will contain one large swimming-bath and forty-two private baths.

**Hartlepool.**—The foundation-stone of a new Mechanics' Institution has been laid at Old Hartlepool. A plot of ground was presented to the managers by the late Duke of Cleveland, which is said to be worth 5,000*l.* Messrs. Pritchard & Sons, of Darlington, were chosen as the architects, and prepared suitable plans. The design will be made complete for about 2,000*l.*, inclusive of fittings, furniture, &c.

**Scarborough.**—The foundation-stone of a new gaol for the borough of Scarborough has been laid by the mayor. Mr. W. B. Stewart is the architect, and Mr. Thomas Petch the builder.

**Newcastle-upon-Tyne.**—The Newcastle Savings Bank, in Westgate-street, has just undergone the process of an interior decoration and cleaning. In the course of erecting the scaffolding, &c., a few months back, some portions of the flooring showed evident signs of decay, to so great an extent, indeed, in some places as scarcely to bear the weight of the scaffolding. An examination was at once made, when it was discovered that the whole of the flooring was more or less affected by dry rot, the cause being ascertained to have arisen from an entire stoppage of the ventilation, coupled with its being covered with kamptulicon, so that this case illustrates what has been recently said on the subject in the *Builder*. A partial repairing of the floor was found to be out of the question, and the consequence was that the whole of it, together with the joists,—many of the latter being eaten completely through,—was taken out and replaced with new. The work was done by Mr. Hardwick, and the ventilation is now free. The extensive bank hall ceiling and its panels, beams, mouldings, and the various members have been illuminated in colours and gilding. The prevailing colour of the panels is a rich tint of apricot, the mouldings being variegated in a combination of tints, producing a prismatic effect, the quantity of gilding used aiding the general effect of the ceiling. The arched beams fall on the trusses, and these having a share of gold and colours aid in uniting the ceiling to the walls. The plasterers are painted in imitation of Siena marble, the mouldings being in white, whilst the bases are painted in malachite. The colour of the walls is a warm neutral tint, the angle mouldings to the window arches, &c., being coloured a tint of apricot with lines of red to separate them forcibly from the wall colour. The basement is painted rose-coloured granite, having a portion in relief of grey granite; whilst the plinth of the basement is painted porphyry. The decorations were done by Messrs. Richardson & Co., of this town.

**Pendleton.**—The chief stone of a new town-hall for Pendleton has been laid near St. Thomas's Church. The building will contain on the ground-floor the various committee-rooms and offices for the transaction of the district business, including the police department. The principal entrance will be from Bronghton-road, with another entrance in the Broad-street front, the entrances communicating with corridors leading to the grand staircase. These corridors will be paved with encaustic tiles, and the walls will be lined to a height of 4 ft., form-

ing a dado of the same material. The principal staircase will be approached through a colonnade of arches, carried on polished Aberdeen granite columns, with carved capitals. This colonnade will support the landing above, leading into the large assembly-room. The staircase will be constructed with a centre flight, and continued right and left. The ceiling will be divided into panels, having a cornice, with centre flowers and pendants for sunlights. The staircase will be lighted by a large semicircular-headed window, which will be filled with medallions, having the arms emblazoned in coloured glass of the principal corporate towns of the county; the centre compartment having a figure of the Queen in full regal costume, as Lady of the Manor of Salford and Duchess of Lancaster, the royal arms and supporters emblazoned above. On the first floor the principal apartment will be the assembly-room, measuring 85 ft. by 99 ft. 6 in., and having a clear height of 30 ft. The ceiling will be panelled. At the Broad-street end a movable platform will be constructed, and a wood dado will run round the room, all the woodwork being stained and varnished. The whole of the basement will be celled, and here will be situated the large kitchen, heating apparatus, lavatories, &c. A feature in the design will be the circular-headed coupled windows and pilasters, with carved caps supporting the cutablature with frieze, and carved festoons and medallion heads. In the spandrels over the coupled windows will be medallions, with a variety of shields. Springing from the cornice in the centre of the Broughton-road elevation, will be an attic story, surmounted by a pediment containing the corporate arms, &c. The apex of the pediment will be crowned by an allegorical figure, carved in stone, and the acroteria will have vases, also in stone. Over this pediment will rise a domical roof, sustaining a clock-turret, with balcony round. The roofs will be pitched high, and have turrets surmounted with cresting at the four angles of the main streets. The principal entrance doorway and portico will have coupled Corinthian columns on each side, and cornice with circular pediment filled with carving. The design has been drawn by Mr. A. Darbyshire, architect, and is in the Anglo-French and Italian style, freely treated. The contractors are Messrs. Cochrane & Co.

#### MIDDLE-CLASS CO-OPERATION.

The various co-operation stores, especially those in the manufacturing districts, appear for the most part to prosper, and are not only the means of cheapening the food of the working classes, but also afford a source of yearly profit to the shareholders. While these establishments have been attended with so much success, it seems strange that the plan has been but little supported by persons of more education, and who appear to hold a higher position in society. There are thousands of persons in the metropolis alone—curates of districts, clerks in the post-office and other public establishments, wood engravers, artists of various kinds, and a host of others, who have families to support, and whose incomes are not more than from 100l. to 150l. a year: many have not so much even as this: and to this class every shilling is of consequence. To this portion of the population, co-operation in the purchase of food and other necessities of life would be of great value. We are glad, therefore, to learn that a movement is being made in London. The persons who have chiefly directed their attention this way are Government clerks and other officials. They have not opened stores, as in Manchester and elsewhere, but associated together in considerable numbers. They communicate with respectable tradesmen, for the purpose of buying their goods at co-operative prices. As a single instance of the advantage of this, we are told that members have been supplied with hats, by a West-end tradesman, for 18s. each, which under ordinary circumstances would cost 23s. Notwithstanding, the tradesman is not left without a profit. We should have thought, indeed, that perfectly good hats might be had for less than the lower price named. In the matter of clothing, butchers' meat, and various other articles of food, there can be little doubt that a saving of not less than 7 per cent. may be made, especially in the western parts of the metropolis; and still the shop-keepers will not come to ruin, particularly if the abominable plan of paying fees to servants be done away with.

#### REVIVAL OF SCULPTURE IN EUROPE DURING THE THIRTEENTH CENTURY.

As some misapprehension appears to have arisen relative to my remarks on Nicolo Pisano, as the reviver of the antique, in my late work, "Notes on Architecture and Ornament," I am anxious to say a few words in explanation. On looking over what I wrote in that book, I find Nicolo described as the reviver of sculpture throughout Europe, when I should have restricted his influence to Italy; but that does not affect my opinion that the revival of sculpture both sides of the Alps, in the thirteenth century, was due to the influence of antique models. However ingenious the idea of Messrs. Crowe and Cavalcaselle may be as to Nicolo being of Southern Italian origin, and as to a good school of sculpture being already in existence in Apulia at the time Nicolo commenced work, it does not alter the admitted fact of his Pisan naturalization, of his genius and his influence on subsequent works executed by his scholars and descendants in various parts of Italy. I cannot enter into detail; for to do so properly and with effect would form a little treatise. Regarding the rise of a good school of sculpture this side of the Alps, it must be admitted that so early as the close of the twelfth century fine examples of a style widely dissimilar and greatly superior to the lanky, rigid, close-robed figures of the Byzantine school—those prevalent in France and Europe generally—are to be found, among which the statues of the English monarchs at Fontenay present notable proof. The earliest of these, Henry II., was carved in the year 1189, and the latest (Isabella) in 1218. Good examples also are to be seen in the Temple Church effigies, executed between the years 1220-II. It will be remarked that these are Norman; and proper investigation would educe the fact, I am convinced, that the Pointed style, and this revival of sculpture, are both due to Norman influence and patronage, originating, as I believe, from their connexion with their fellow countrymen in South Italy and in Sicily; and that antique models, as regards sculpture, were the source of their artists' style and evident superiority in conception and design—broad, simple, and massive. There is an unmistakable impress, to my mind, of the influence exerted on their sculpture by Greek and not Roman models. That influence formed a school, which gradually spread throughout Northern France and England; throughout the lands occupied by the Normans, or adjacent to them, as may be seen by the fine works of Northern France,—especially the sculptures on Rheims Cathedral (thirteenth century), in which we may note close reproductions of good Grecian models, both as to attitude, costume, and style; the Phrygian cap even of ancient Greece being retained. The same remark applies to the fine sculptures in the spandrels of the choir at Lincoln, where the style is clearly of good Grecian character, though the faces are which originated with the French school which overspread the country. I feel sure that every impartial mind will allow, on comparison the striking similarity of style and general character between the best sculpture of the twelfth century in Northern France and England, and the examples of ancient Greek art which are now so well known to us. Indeed, no two styles in the whole history of art bear so close a resemblance to each other; and that similarity, I hold, was not fortuitous, but may be reasonably supposed to have arisen from the later development being founded on the old models, many of which were still extant, and were more likely to be known and appreciated by the Normans than by any other people of the time.

J. B. WARRING.

#### PROPOSED UNIVERSITY DECREES TO STUDENTS IN ARCHITECTURE.

WHILE our universities are conferring degrees in music, to the great advantage of that noble art, it does not seem to have been urged that similar results might be secured, by similar means, to students in architecture. Architecture, not only as an æsthetic science, but as a necessary practical art, now occupies a large share of public attention, and will certainly continue to do so in the age on which we are entering. The large number of cathedral restorations, as well as the ever-increasing amount of new churches, seem like a call to our universities to give a right

direction to the study, and encourage and promote the art itself, independently of the boon which would be conferred on real architects, as distinguished from mere pretenders or tasteless builders. For the degrees in music at Oxford, it is understood that all persons are eligible who can produce a certificate signed by two or more trustworthy persons, stating that the candidate has devoted himself to the study of that art for seven years, whether at the university or not.

Why may not a similar arrangement be made in behalf of that large class of able young men who are now pursuing the study of architecture, Gothic or Classical, to enable them to obtain degrees in that important science, including not only the history of the art and its practical development, but also construction and figure drawing? If, in addition to this, a scholarship or prize could be founded, after the example of the Hulsean prize at Cambridge, for the best dissertation on the subject, confined to those who are candidates for a degree, or who have already taken a degree, no doubt such an arrangement would secure for architecture what the Hulsean prize has for theology. It would stimulate the industry of the slumbering and draw forth the latent talent of the studious. There could be no difficulty in appointing from among the architects of the day a competent Board of Examiners; and as to the mode of examination, the fees to be paid, and other subordinate details, all this may be safely left to the university authorities. G. G. J.

#### ART IN SHEFFIELD.

SIR,—My attention has been drawn to a short but severe article in your last issue, headed "Art in Sheffield." I think it scarcely just that the authorities of the School of Art should be accounted responsible for the quality of the scenery at the Theatre Royal. For a long time previous to the last two seasons, we have been accustomed to witness very fair scenic productions at that establishment, and the only reason I can give for the remarkable deterioration which has taken place in the pictorial department is, that lack of support has not only compelled the lessee to reduce his prices of admission, but at the same time necessitated the substitution of cheapness for quality as regards the scenery.

I, for one (as a Sheffielder), am extremely obliged for your fearless and outspoken criticisms on our manners and tastes, but I consider you are in fairness bound to give the *bright* side of the picture as well as the reverse. At the theatre which was burnt down here some months ago (the Surrey), scenic illustrations by Telbin and Fenton were placed on the stage, and were fully *appreciated* by us "semi-barbarians;" and at the present moment the music-hall in which the principal meetings of the Social Science Association were recently held (the Alexandra), exhibits a most lovely picture as an act-drop.\* This is also the work of Mr. Telbin, whose position in London as an artist should be a guarantee of the correctness of our taste in admiring the excellence of the production, which alone has drawn crowds to witness it during the last few weeks. A SHEFFIELDER.

#### LADDERS.

SIR,—According to the papers,—

"On Saturday, James Joyson, a painter, was at work on a ladder at Newington-respect, when it suddenly snapped in two, and he fell upon the spikes below, the points of which penetrated his body. He was conveyed to the hospital, where he remains in a dangerous state."

The cause of ladders "snapping" in two is very easy of explanation; and the sooner our makers of ladders are enlightened upon the subject, the safer will it be for those who are compelled to use them.

Ladders, by the pressed manufacturers, are made of a pole cut down the middle; each side is then bored for the insertion of the rungs, and the rungs being in their place, the ladder is knocked together; holes are bored through the thick part of each side right through the rung, and a pin is then driven in to tie the ladder together. Now, in this last boring lies the mischief; and if ladders were made without these borings and these pins, and were simply tied together at intervals by small riveted bolts placed under the rungs, I feel sure fewer accidents from the "snapping" of ladders would result. W. H. C.

### THE ROOD-SCREEN AT THE PRIORY CHURCH, CHRISTCHURCH.

PART of the committee directing the works at the Priory Church, Christchurch, desire to remove the stone rood-screen erected in the reign of Edward III., and the Earl of Malmesbury, as lay-rector, writes a strong letter of protest against the act. In 1848 the screen was restored at the cost of £600. —

“Seventeen years after this decision and onlay on the part of the subscribers, many of whom are still living, you propose to demolish their work. Who will say that if we were to act upon your present views another committee seventeen years hence will not have the screen rebuilt? A protest against playing with our ancient monuments in this capricious manner.

I felt this so strongly that I wrote to Mr. Ferrey, the distinguished architect who has hitherto superintended our restorations, putting to him questions the sense of which you will easily guess from his replies, which I now quote from his letter.

He says:—“The subject on which you write (the removal of the rood screen) is one of great interest to me, and one upon which I hold very decided opinions. I will not attempt within the compass of a letter to state the several reasons I could urge against its demolition, but for the present purpose will content myself by answering the questions suggested by your lordship in the order you have placed them in:—

1. The architectural appearance of the church would not be improved by the removal of the rood-screen. There are very awkward parts in the construction of the contracted piers of the chancel where they are corbelled over, which are admirably masked by the screen as it stands.

2. In an archaeological sense it would be a most culpable act, and utterly destroy the ancient arrangement of the church. There are but few examples of such stone rood-screens in this country, and certainly none in design superior to the one at Christchurch.

3. I believe that the screen as now built into the piers of the centre tower does afford strength to the piers and arches, and could not be removed without some risk.

I know well the admiration of Christchurch as a complete building of its kind, and the desire of all archaeologists that it should be preserved intact. There seems to me no sufficient reasons whatever for desiring the destruction of the screen.”

It should be added, that both the Society of Antiquaries and the Ecclesiological Society have entered their protest against the suggested removal of this screen. The peculiarities of its construction and connexion with the lantern piers, are well described by the Rev. Mackenzie Walcott, B.D., in a guide to the Priory Church published in 1862.

### RESTORATION OF WINCHESTER HIGH CROSS.

WYKEHAM'S STATUE.

STR.—On more than one occasion observations have appeared in your columns about the faulty statue of William of Wykeham. Nearly four months have passed, yet the architect, though repeatedly asked, has not favoured us with his report thereon. I complain that, having had this fact brought under his notice by Mr. Baigent, who is a most competent authority on the point at issue, he has not moved in the matter.

At our late civic banquet, the Warden of Winchester College expressed a hope that this question would speedily be settled. This hope has not yet been realised, though the warden and fellows, our Wykehamite friends, and our many supporters and fellow-citizens, know full well that I shall not let this question slumber. HENRY MOODY.

The Museum, Winchester.

### SUB-FOOTWAY AT REGENT CIRCUS.

STR.—Owing to the large carriage-traffic at Regent's Circus, Oxford-street, foot-passengers experience much difficulty in crossing at any point there. A remedy may be applied by making a sub-footway, 6 ft. wide, round the Circus; the footway to be open outside the present footways, and covered at the crossings; the walls to be lined with white glazed tiles, the bottom paved with York paving, and a drain and gas-jet placed at the centre of each covered portion; the open parts to have strong dwarf railings, with gates at the entrances, which may be open from eight a.m. till ten p.m. daily, and a policeman to be always on duty. Persons entering the footway at any point would walk right or left down the open part, through the covered portion of the open part, and out on to the present footway opposite. A similar plan may be adopted at other places in the metropolis, where the crossings are dangerous from the traffic. JOHN PHILLIPS.

What about the sewers, water-pipes, &c., &c.?—Ed.

### THE FALL OF A HOUSE, KILBURN.

SIR,—I was on the jury summoned to inquire into the cause of the death of a poor man who was killed, as already mentioned in your pages, by the falling of a new building in Carlton-road, Kilburn, not in Paddington parish, although it is eastward of Kilburn Gate. I feel sure that, if the evidence given on that inquiry were made public, it would do much good in enlightening the public how they get bad houses, and would also astonish good builders how fearfully bad work can be done. Evidence was given that the pier which gave way was hollow, and only filled up with rubbish, and, although built in cement, was erected on a haemest wall with straight joints, built in common mortar; and that, although a round-cornered house, the ends of the breastsummers resting on this pier, and which had to carry about 50 ft. of brickwork, were not secured by any iron dogs; neither did the surveyor think any were requisite. The public will be surprised to find that this spot, within a threepenny ride of Charing-cross, is without a district surveyor, although some thousands of houses are being built. Nay, more: that the surveyors for the freeholders who visit the buildings constantly to certify the value per measurement of the work these speculative builders have put on the ground, so that the freeholders can advance three-fourths of the value, look rather to the quantity of the work than the quality; so that, virtually, the buildings are carried up by an ignorant of the principles of the building art, and without any supervision of a practical nature. I do trust, sir, you will agitate this important subject, and that Government will take immediate action and have all buildings in this neglected parish subjected to a rigid and proper inspection.

ONE WHO DOES NOT INTEND TO RESIDE IN WILLESDON PARISH.

### DISTRICT SURVEYOR WANTED.

THE remark, a “District Surveyor Wanted,” caused by the accident at Kilburn, is applicable to other parts outside the metropolitan districts. Just beyond Highbury New Park quite a new town is springing up, but there is no district surveyor to look after the interests of the public. Now that nearly all the districts are filled with houses, and town can be reached by railway from any part, it is highly desirable that, as habitations are extended, so should the Metropolitan Board of Works increase the number of districts and appoint surveyors thereto. X.

### BRITISH ARCHAEOLOGICAL ASSOCIATION.

At the meeting at No. 32, Sackville-street, Piccadilly, on Wednesday evening, the 22nd ult., some leaden seals were exhibited by the Rev. E. Kell, considered by him to be Roman merchants' seals, and found at Gurnard's Bay, in the Isle of Wight, along with undoubted Roman pottery, and with a beautiful little bronze-gilt figure of Mercury, which he also exhibited. The same gentleman read a paper on a series of about 140 Roman coins, collected by the late Mr. Drayson when employed on the Tiche Commutation Survey; and, from the occurrence among them of about twelve Greek colonial coins, all from the Isle of Wight, and of the lead seals above referred to, he endeavoured to show that a trade, carried on by Greek merchants, had been conducted between that island and the Continent. Mr. Syer Cuming read a paper on “Superstitions connected with the Cure of Diseases of Cattle,” which was listened to with much attention, and was full of curious information. Mr. Gordon M. Hills read a paper on “Croxden Abbey, Staffordshire,” illustrated by a set of drawings made by Mr. Redford of Manchester, for one of the prizes offered by the Institute of Architects in 1864. He drew an almost complete history of the erection of the buildings from a hitherto unpublished manuscript in the British Museum (Cotton MS., Fanstina, B. 6), and produced a restored plan of the abbey according to this authority. The loftiness and simplicity of the lancet windows of the church, the richness of the doors, the apical end to the church, and other peculiarities, made the subject one of much interest.

### METROPOLITAN BOARD OF WORKS.

VESTRIES AND DISTRICT BOARDS.

THE streets committee recommended that the chairman be requested to address a communication to Sir George Grey, in reply to his letter, respectfully intimating the opinion of the Board that, although there may be some matters on which the appellate jurisdiction of the Board might be advantageously extended, the Metropolitan Local Management Act has, on the whole, worked well, taking into consideration the many difficulties with which the several vestries and district Boards have had to contend, and the shortness of the period during which their powers have been exercised. The Board is therefore of opinion that a consolidation of the vestries and district Boards is uncalled for. The report was adopted by large majorities in the face of two amendments.

### “LIGHT AND AIR” CASE.

EQUITY COURTS, SATURDAY, NOVEMBER 25TH.  
CLARK V. CLARK.

THE facts of this case appear fully in the Lord Chancellor's judgment.

Mr. Giffard and Mr. Everett appeared for the plaintiff; Mr. Amphlett and Mr. T. H. Terrell for the defendant.

The Lord Chancellor said that this bill was filed in September, 1864, to restrain the defendant from erecting or continuing to erect a building so as to obstruct the plaintiff's light and air. It appeared that the parties were neighbours, at 27 and 28 in the same street, and the building was of wood, in the garden of the defendant, to about the height of 16 ft., and the same distance from the garden wall, which rose to a height of 7½ ft., the ground being of a sloping character. There were always questions of degree, difficult to deal with, depending on the special circumstances of each case, and impossible to be dealt with generally. Persons in towns could not expect the same amount of light and air as those who lived in the country; and the steady spread of building gradually but surely obstructed the light and air. On the evidence, the window in question was a lofty one, 10 ft. or 12 ft. high from the ground, with a south-west aspect upon a garden, 25 yards by 5 or 6 yards, and the sun must therefore shine over the left-hand wall, so that the building obstructed the sun until it got high enough to shine over it. It appeared that the only complaint was in winter, and Mr. and Mrs. Kelly, and Miss Kelly, made important affidavits, namely, that whereas the sun shone theretofore continuously, from eleven to half-past one, in winter, it now only did so for twenty minutes, at eleven and one o'clock; and Mr. Kelly at first said that he could not read or write as formerly, but in a subsequent affidavit, with a winter's experience, he did not repeat that.

His lordship thought that this did not entitle the plaintiff to what he asked: it might render the room less cheerful, but the obstruction was not such as to cause a nuisance, and the room was not shut out from the open sky, so as to necessitate the use of reflective light. There was no such interference with the ordinary occupations of life as to make the court's interference requisite. This was not a case of a building opposite the window, but standing obliquely, although, no doubt, that did not prevent the question of obstruction arising. The scientific evidence had not much bearing on the question, because it was a question of ordinary convenience. The bill must, therefore, be dismissed with costs.

### NON-LIABILITY FOR ACCIDENT TO WORKMAN.

In the case of Brown v. The Acerrington Co-operative Cotton Spinning Company (Limited) the company had commenced erecting by contract a mill and manufactory, and appointed a clerk of the works to see that the contractors carried out their contract. The plaintiff was engaged to work on the building, as a stone-mason, by the day. The original plan of the building had been altered by the clerk of the works, and the building, by his direction, was carried two stories higher, whilst the pillars on which it rested were made of smaller dimensions and of weaker materials than the engineer who

designed the building had originally planned; and it was alleged that, in consequence of these changes, and also of some of the pillars not having been set "plumb" by the clerk of the works, a floor of the building fell in on and injured the plaintiff, who was then at work therein. It was held by the Court of Exchequer, on the above facts,—there being no evidence bringing home personal negligence to the company, or to any person acting under their orders, for which they were responsible, either by their having given specific direction how the work was to be done, or by their having reason to suppose that the clerk of the works was incompetent to perform the office of superintendent of works,—that the action was not maintainable.

#### THE STRENGTH OF SERPENTINE.

A CORRESPONDENT sends the following notes on this subject by the late Mr. C. H. Smith:—  
The unsmoothness of serpentine marble is no unusual occurrence. At the Museum of Economic Geology, Jermyn-street, there is a great quantity of serpentine in small plasters, entablatures, &c.; and I really believe there is not a specimen but what has been in pieces and stuck together, and cramped in various ways. This is the case with almost all coloured marbles; and it is rather vexatious that generally those marbles which are most beautiful are also most subject to cracks and other defects. Irish green, Devonshire, and Derbyshire marbles are, for most purposes, expensive and troublesome to work, on account of their being so very unsound, full of cracks, and liable to come to pieces—probably just as the workman may have completed his job. Unless at a very great sacrifice—probably as many broken as sound—I do not imagine that anybody could undertake to supply even small work of any kind in some coloured marbles without many defects; and if they are well mended, the fractures are not observed. The French specimens at the Great Exhibition of '51 were mostly very choice, and selected with great difficulty: the same remark applies to what may be seen at the Jermyn-street Museum; these are rare specimens. If you were to give an order to the same party who exhibited, they would not be able to furnish you with a quantity equal to the examples exhibited.

There is a carefully-written paper on the subject of coloured marbles by Mr. Smith, in Hunt's "Handbook of the International Exhibition, 1862."

#### CHURCH-BUILDING NEWS.

**Sydenham.**—The foundation stone of the new district church of St. Saviour's, Sydenham, has been laid by Lord Eliot. The land upon which the church is to be erected, together with the parsonage-house and schools, has been given by the Earl of St. Germans. The church will contain nearly 1,000 sittings. The cost of construction is estimated at 4,000*l.*, which amount is being raised by contributions.

**Teddington (Middlesex).**—The new church, dedicated to St. Peter and St. Paul, at Teddington, has been consecrated by the Bishop of London. It is built of yellow stock bricks, with red moulded bricks in cornices and strings, and Bath stone used in arches, piers and windows, &c. The nave is paved with tiles from the Poole architectural pottery, the chancel with Minton tiles intermixed with white marble and yellow Mansfield stone. None of the walls are plastered in the interior. The style is Early Pointed, and the design was furnished by Mr. G. E. Street. Mr. G. Jacklin, of Twickenham, was the builder; and Mr. Maplesden, of London, was clerk of the works.

**Burton Latimer (North Hants).**—The re-opening of this church has just taken place, after the completion of the first part of the contemplated works, viz., the re-building of the tower and spire. The church is of various dates, but the greater part is First Pointed; and of this date is the tower. It is rather low in proportion to the church, and has three stages. The middle stage has on each face an arcade of three arches. The upper, or halfy stage, has on each side two windows, with deeply-recessed and moulded arches resting on clustered columns. The filling-in of these is Third Pointed in character. The parapet and the lofty spire were added in the fifteenth century. The tower has been, from the first, in a defective state, owing to bad founda-

tions; this had caused the sinking of the stair-turret, which had almost detached itself, and consequently dislocated the walls. When the spire was added, it was built on very insufficient squinches, which, thrusting laterally, had not only failed themselves, but pushed out the walls, and thus had rendered the condition of the whole extremely dangerous. It was considered absolutely necessary by the architects, Messrs. Slater and Carpenter, to take the whole of the spire and tower down, and rebuild it on solid foundations. Every old stone of the arches, windows, columns, strings, angles, &c., and the whole of the spire, were arranged in order, and numbered, and finally reinstated in their old positions. No new-out stonework has been used except where absolutely necessary, such as the upper few feet of spire; this is of Keiton stone. The walling generally is of Weldon stone. Bonds are introduced of red ironstone. This stone had been inserted as before. The work has been executed by Mr. Henson, of Kettering; Mr. W. Thompson is the clerk of the works. Contracts are now being made out for the complete restoration of the chancel. The restoration of the nave and aisles is not yet undertaken. The roofs are of rich Third Pointed character, and all the old timbers will be preserved and replaced where practicable. The seats will follow, to some extent, the type of some of the old benches which remain; very fine early wall paintings remain in the south aisle, illustrative of the life of Solomon; these will be preserved; and the original Early Pointed windows will be restored.

**Maidenhead.**—The corner-stone of St. Luke's Church, North Town, has been laid. The church is designed in the Early English style. It will consist of chancel, vestry, nave, north and south aisles, north and south porches, and tower, and will accommodate 800 persons. It is intended at present to erect only the chancel and a portion of the nave and aisles (unless sufficient funds be forthcoming for carrying on the work towards completion). The walls will be faced with Bath stone. The roof will show the timber framing, and be covered with red and grey slates. The staining will be open. Mr. G. R. Clark, of London, is the architect; and the builders are Messrs. Griffiths, of Eldersfield, Worcestershire.

**Wyton.**—The church has now undergone all its contemplated improvements. The nave has been restored, with a new timbered roof, open and lofty, designed with arch ribs, springing from fluted corbels up to the collar-beam. The walls, stonework, and carving have been divested of the old plaster and whitewash. The floor is laid with red, black, and hmf tiles, in an ornamental pattern. The pews are of solid oak, with moulded hacks, and panelled ends filled with tracery. The south porch is new, and of open wood, with stone benches. The pews are all open, and at least four-fifths of the sittings in the nave are free and at the service of the poor. The whole work has been done according to the plans, and under the superintendence of Mr. R. Hutchinson, architect, Huntingdon.

**Cambridge.**—The rosettes which has just been erected in the University Church, by the Rev. J. B. Lightfoot, D.D., Hulsean Professor of Divinity, consists of a centre and two wings, under canopy work. In the centre is our Saviour on the Cross, at the feet of which are laid the emblems of science; on the right is St. Paul preaching at Athens; on the left, Samuel in the School of the Prophets. The carvings are executed in alabaster by Mr. Armistead. The rest of the work, in white stone, is by Mr. Farmer. Coloured marbles are inlaid here and there.

**Haytesbury (Herts).**—The ancient collegiate church of this town is about to undergo a renovation; but the original plan of the building and style of architecture will be adhered to. An aisle is to be added to each side of the chancel; new windows are to be made, and old ones, that have been blocked up for centuries, opened. The galleries are to be pulled down, and the old-fashioned high-backed pews are to give place to modern seats. The tower will be entirely re-constructed, and the arches will be widened so as to admit a view of the chancel and east window from the west end of the nave. The present roof of stone and lead is to be superseded by one of slate; and, in fact, the church will almost be re-constructed. The estimated cost of the work will be about 5,000*l.*, most of which sum, we understand, will be given by Lord Heytesbury, the lord of the manor.

Mr. Butterfield is the architect; and Mr. Wm. Strong, of Warminster, the builder.

**Dudley.**—After many months spent in the work of restoration and alteration, the district church of St. Edmund's has been re-opened. The Earl of Dudley has given 500*l.* towards the alterations, on certain conditions. One of the stipulations, to which the congregation assented, was that the high pews with doors should be cut down and thrown open, and this being done, the church is now seated in a uniform manner. The fabric of the church, roofs, &c., has been examined and renewed: all the plastering has been removed from the walls and ceilings which have been replastered by Mr. Z. Round. The beams on the under-sides of the galleries have been removed, and a complete set of new windows introduced. The new window of stained-glass, presented by Mr. John Fisher, is the work of Mr. Wailes, of Newcastle-on-Tyne. It represents the Appearance of the Angels to the Shepherds announcing the Birth of the Saviour. The cost exceeds 200*l.* The organ has been removed from the west gallery to the nave, and is now placed in a chamber on the south side of the chancel. The chancel is scated with oak stalls, and the whole floor is raised above the nave. Mr. Bourne was the architect, and Messrs. Hollands the holders engaged.

**Cheltenham.**—Mr. Middleton has been directed to prepare plans for a new church, in the Early French style. Land has been purchased in a central situation, and the conditions exacted by the Ecclesiastical Commissioners have been complied with, in reference to the transfer of the ground. The church will be built to accommodate more than 1,000 persons.

**Southmolton.**—The old parish church has been re-opened, after having been closed for sixteen months, for the purpose of restoration, at a cost of about 3,000*l.* The church had fallen into a state of decay, many of its seats were dilapidated and practically useless, while the galleries were unsightly, and the roofs disproportioned to its size, with hideous skylights, through which the rain often found its way. Two stained memorial windows, with designs from Scripture subjects, are being prepared by Mr. Bero, of Exeter, to be placed at the east end of the chancel aisles, the gifts respectively of Mr. J. E. Pearso, of Southmolton, and the Rev. J. Thorne, of Bishopnympton, and Mr. and the Misses Thorne, of Southmolton. The architect employed was Mr. C. E. Giles, of London.

**Churston Ferrers (Devon).**—The church at Churston Ferrers has been re-opened, after considerable works of restoration, including new roofs of the cradle form, new windows, and a rearrangement of the seating, with entirely new woodwork, excepting some old oak hemb ends, which have been adapted to the chancel and chancel aisles. The work is chiefly Perpendicular, and the old windows and other details have been followed. A new vestry has been built. The bells have been re-hung in a new cage. There is a new window, by Mr. Wailes, to the memory of the late Lady Buller; and some old heraldic glass has been formed into another window by Mr. Bero, of Exeter. The outlay is about 1,700*l.* Mr. Ashworthy, of Exeter, was the architect employed; and the works have been carried out by Mr. Chudleigh, of Newton Abbot, builder. Hegret has been expressed that three curious screens—a roof screen and two parclose; the latter illuminated—have not been restored. A rosettes on the east wall having texts and the decalogue, have been executed by Mr. Welsh, of Bovey Tracey.

**Hackworthy.**—The church of this parish, after having been entirely rebuilt, with the exception of the tower, has been consecrated for divine service. The old fabric was in the year 1863 found to be in a very dilapidated condition, and it was resolved to pull it down, and erect on its site a new and commodious edifice, capable of accommodating an additional number of persons. The church is built in the Early English style, by Mr. Davis, of Taunton, and contains a nave and side aisle, with oak pews, stained and varnished. The roof is light, and the chancel is divided from the body of the church by a Gothic arch. At the east end is a stained-glass window, on which are portrayed scenes in the life of the Saviour, the centre piece representing the Crucifixion. The tower is open to the body of the church.

**Liverpool.**—The scheme for extending churches and schools, as propounded by the Rector of Liverpool, progresses with a degree of rapidity and success for which we were hardly prepared. In a single week the subscriptions mounted up to

32,325l.; and it is thought not unlikely that they may reach 50,000l., or near that amount, by the close of the year. Thus far the sums are in general large ones; but there is no doubt that many sums of 50l. and under will yet be given.—The foundation-stone of a new chapel has been laid on the north side of, and in connexion with, the Northern Hospital, which is to be erected at the sole expense of Mr. J. Pemherton Heywood. It will be in the Gothic style, with an open roof, and apsidal chancel, and will accommodate eighty persons. The architect is Mr. G. E. Grayson, and the builders are Messrs. Roberts & Robinson: the estimated cost is 500l. The chapel is expected to be completed in about four months.

#### DISSENTING CHURCH-BUILDING NEWS.

*Llanely (Carmarthenshire).*—Park Congregational Chapel has been opened. The chapel is in form a parallelogram, 58 ft. 6 in. long, and 38 ft. wide (inside measurement), exclusive of the lobbies in front and the apse in the rear. On the lower level there is a school or lecture-room 44 ft. long by 38 ft. wide. In the rear of this lecture-room there are a deacons' vestry and an infants' room. On the upper level is the chapel, having for the main feature a central tower and spire, under which is the principal entrance, 5 ft. 6 in. wide and 10 ft. high. The accommodation at present to be provided on the ground floor will be for 366 adults, and in the gallery 112, besides 60 children, making a total of 538, with opportunity for two additional galleries holding about 150, exclusive of space for organ and choir. The form of the ceiling is waggoo-headed. The style is Early Decorated, and the materials used are furnace dressed rubble, with Bath stone dressings. The spire is formed chiefly of rubble, relieved with bands and quoins of Bath stone, surmounted by a finial, the whole 104 ft. high. The architects were Messrs. Lander & Bedells, of London; and the works have been executed by Messrs. Joseph Douglas & Co., of Llanely, for about 2,200l., including boundary-walls, paths, &c. The gas-fitting was done by Mr. George, of Llanely. An organ, by Mr. Robson, has been placed in the apse, with case of appropriate character.

*Wombwell.*—The foundation-stone of a new Congregational church and school, to be erected at Wombwell, has been laid. The building is to be geometrical. It will be 58 ft. long by 45 ft. wide, and, with an end gallery, will be capable of accommodating 560 people. The roof in the interior will be of open timber work, and the exterior of blue slates. The walls will be of local stone, with Bath stone facings. Owing to the character of the site, which, selected at the junction of what is called New-street with Wombwell main street, has a fall from back to front of several feet, it is found convenient to provide the school-room on the ground-floor, with an entrance from Wombwell-street, and the chapel on the upper story, which having a separate entrance from New-street, on the higher level, will require but a slightly-raised approach. The architects are Messrs. W. G. Habershon & Pite, of London; and the contractors Messrs. Pullen & Smith. The cost of the building is estimated at 1,650l., and the land has been purchased for 240l.

#### ROMAN CATHOLIC CHURCH-BUILDING NEWS.

*Abingdon.*—The church of St. Edmund and St. Mary has been opened for divine service. The edifice has been recently completed, at the sole expense of Sir George Bowyer, bart., at the extremity of whose estates, adjoining Abingdon, it is situated. The architect of the edifice, or rather group of buildings, the presbytery, cloisters, and church being all in connexion, was Mr. Goldie, of London; the builder being Mr. Samuel Simpson, of London. The cost of the whole has been about 5,000l., and the buildings have been completed without any items for extras. The church consists of a chancel, lady chapel, chapel of St. Joseph, nave, and aisles, the style being the Decorated Gothic of the fourteenth century. The high altar is only temporary, and will be replaced by one of stone and marble; but that of the lady chapel has some carved finishing, and the chapel is ornamented with a statue of the Virgin Mary. The stone has all been obtained from quarries on Sir George Bowyer's estate.

*Swansea.*—The foundation-stone of a new church, about to be erected at Greenhill, in this town, immediately adjoining the existing convent, has been laid. The new church will be in the Norman style. All the ornamentation will be within, the exterior of the building being as plain as possible. Internally it will be a simple parallelogram, 100 ft. long by 36 ft. broad; the height of the ceiling, 36 ft. Underneath the church is a large hall, 100 ft. by 30 ft., intended to be used as a school-room, lecture-hall, &c. The total cost of the building will be 1,200l., toward which amount the sum of 500l. has been contributed by Count Torlonia, the Roman banker. The architects are Messrs. Richards & Bucknall, of Swansea.

*Birkdale (near Southport).*—The foundation-stone of a new church has been laid on a site presented by Mr. T. Weld Blundell, in York-road, Birkdale. The edifice is to hold about 500. Mr. Pngin, of London, is the architect, and Mr. Livesey, of Scarsbrook, the builder.

*Halifax.*—St. Marie's Church, having been renovated and restored at a cost of 2,000l., has just been re-opened. Its appearance is entirely altered. The church has a square parochial tower, adapted for a peal of bells. The lantern over the organ has three traceried windows, intended for stained glass. The roof is entirely new. The stained-glass memorial windows east and west of the altar are the production of Messrs. Edmundson & Sons, of Manchester. There is a new stone and alabaster altar, designed by Mr. G. S. Bentley, of London, and executed by Mr. Earp, of London. The decorations of the altars and organ have been carried out in gold and colours, by Mr. Edwin Taylor, of Halifax. The general contractors for the several works were Messrs. Aughton, Ambler, Walsh, and White. The architect employed was Mr. Ralph Nicholson, of Halifax.

#### STAINED GLASS.

*Dunmow Church.*—A stained glass window, by Messrs. Clayton & Bell, has been placed in the south wall of the chancel of this church, as a memorial of the late vicar. The two compartments have a bold quatrefoil above, displaying an angel holding a crown of glory. The eastern compartment shows St. Peter kneeling, and receiving his mission from Christ. In the western compartment is represented the day of Pentecost, the Holy Ghost descending like a dove upon the Apostles, who appear each with a cloven tongue, as of fire.

*Witham-on-the-Hill Church (Bourn).*—A stained glass window has been placed, as a token of respect to the memory of the late General W. A. Johnson, in the chancel of this church, the funds for which have been subscribed by the tenants and friends of the deceased. The window is one of three lights. In the first compartment is represented the "Adoration of the Magi;" in the second, the "Crucifixion;" and in the third, the "Resurrection." The work is by Messrs. Heaton, Butler, & Bayne, of London.

*All Saints' Church, Enscote.*—The windows of this little building have just been enriched by the addition of a figure of St. John the Baptist, with a subject representing the Baptism of Our Saviour, the tracery above being filled with angels hearing emblems, scrolls, &c. The work was executed by Mr. Drury, of Warwick, to whom the other decorations of the church were entrusted.

#### SCHOOL-BUILDING NEWS.

*Nottingham.*—The foundation-stone of St. Saviour's Church Schools has been laid. Mr. Sutton is the architect of the building.

*Newmarket.*—The committee for the erection of congregational schools received seven tenders from tradesmen in the town and neighborhood. The highest was 981l., and the lowest 750l. The latter (which was accepted) was from Mr. Thomas Whitmore, of Gazeley, and Mr. Thomas Andrews, of Newmarket. Mr. Richard Arher, of Newmarket, has undertaken the stonework. The tender next to the lowest was from Mr. Mills, of Cambridge, 777l.

*Worsley.*—The school chapel of "The Holy Rood" has been opened. This building, which has just been erected by subscription, stands amidst a cluster of houses in the Old-lane, near Worsley. It will seat for divine service about 290 people, and accommodate, when used

as a school, nearly 200 children. The contract was taken by Mr. Grundy at 514l. The outline of the school is a parallelogram, with a boiler-room, coal-house, and offices projecting from the north wall, at its eastern end; and from the south wall a brick-built porch with openings pierced at its sides, and finished in front with an overhanging barge-board. On a week day, whilst the building is being used for school or other secular purposes, the chancel is screened off by a curtain. Outside is an open timber belfry containing two bells; one for church and one for schools. Mr. J. Medland Taylor has designed the building and superintended its erection.

*Ongar.*—New school and lecture rooms have been built and opened in connexion with the Congregational church, in Ongar. It had long been felt by Mr. Conway and his people that for the due accommodation of their much-increased Sunday school, for their week evening services, and for various other purposes, a much larger and better building was required than the old one which had formerly existed. A design was gratuitously furnished by Mr. J. C. Gilbert, of Nottingham, architect, and the execution of it was intrusted to Mr. F. Noble, builder, Ongar, by whom the work has been carried out. The buildings are erected in the rear of the chapel, and occupy the whole of the available space afforded by that portion of the chapel property which is there situated. The Gothic style has been adopted as the basis of the design, but it is treated in a free manner. The building is of grey brick, with red brick bands and dressings. The main room is 34½ ft. by 21 ft., with a semi-octagonal apsidal end, in which are placed the library, the superintendent's platform, and a reading-desk. The main entrance is at the south end, and over it a porch, with bell gable, &c., has been placed. On one side of the building are three class-rooms; the centre one, the largest of the three, being 16 ft. by 9 ft., and so constructed as to be capable of being thrown into the main room when required. One of the smaller class-rooms is to be used for the minister's vestry. The total cost was upwards of 400l.

*Prestwick.*—The chief stone of new national church schools has been laid here. The buildings will consist of boys' and girls' school and library. The dimensions of the boys' school will be 32 ft. by 60 ft.; and of the girls', 30 ft. by 55 ft.; of the library, 22 ft. by 45 ft. There will be two ample class-rooms, of 22 ft. by 20 ft. each. The boys' school-room will also form a public lecture-room, and beneath it is a heating apparatus, by Messrs. Haden, of Trowbridge. The building generally will be of red brick, with Yorkshire stone dressings, and will be in the Early Pointed style. The library will be somewhat recessed from the road, and at the angle of the girls' school-room there will be a square brick tower, with a high-pitched slate roof. The architect is Mr. A. Waterhouse; and the builder, Mr. Joseph Robinson, jun. The cost will be about 2,800l.

#### PATENTS CONNECTED WITH BUILDING.

FORMATION OF EMBANKMENTS, SEA WALLS, BREAKWATERS, &c.—*W. E. Newton.* Dated 10th February, 1865.—The patentee claims the formation of embankments and other similar works, such as those above stated, by means of shallow open frameworks placed and secured one upon another from time to time as the sand accumulates therein, so that the sand and other earthy matters may be caught and retained within the frameworks as they are built up, and thus in time form a solid embankment up to high-water mark, as set forth.

APPARATUS FOR HEATING AND COOLING ATMOSPHERIC AIR AND OTHER AERIFORM BODIES, AND FOR HEATING OVENS, &c.—*L. Perkins.* Dated 7th March, 1865.—The patentee claims the use of tubes sealed at both ends, and containing water or other volatilizable liquid, in heating and cooling atmospheric air and aeriform bodies, in heating ovens, and in heating and ventilating buildings, as described.

IRON DOORS ESPECIALLY ADAPTED FOR USE IN ORDINARY BUILDINGS.—*J. T. Harris.* Dated 9th March, 1865.—Apertures to suit the size and number of panels desired are cut out of flattened sheets of plate iron of any required thickness, leaving the stiles and rails defined as in ordinary framed doors. Each plate thus prepared is riveted, or otherwise secured, to sufficient angle iron, of a dimension equal to about

half the desired thickness of the door when completed; any number of panels, as may be arranged in first cutting or stamping through the plate, are formed with the pieces then cut out, or other similar pieces, which are also riveted or otherwise secured to angle iron suitable to the required depth of the panels. Cast or wrought mouldings, of any requisite pattern, are dropped into the panels, and the whole firmly attached to the stiles and rails by screws or rivets put through the plate panel and angle iron into the moulding from the back. Two entire pieces thus panelled and prepared are placed together and held in position by two or more riveted pins, passed through four or more pieces of angle iron attached to the muntins and rails inside; and then the two complete plates, or entire half faces of doors, are thoroughly secured by a continuous band of hoop or other iron, screwed or otherwise attached to the angle iron around the entire outer edge of the stiles and rails. Hollow stiles, rails, and panels are thus formed to each door, which may be filled with fire-resisting composition when desired. The panels need not necessarily be sunk, but may be flush with the face of stiles and rails. The doors may be fitted with mortice or rim locks and furniture, as ordinary wood doors, and may be hung folding or otherwise, or made to slide. The doors may be hung in wood, iron, slate, or other frames, as desired. These doors may also be made with a cast ground or framework.

### Books Received.

LETT'S "Rough Diary or Scribbling Journal" gives good room for each day, with blotting-paper between the leaves. The paper composing it could scarcely be bought for the eighteenth penny it costs.—Farrington, of Doctors' Commons, publishes a penny Monthly Remembrancer or Diary, useful for the waistcoat pocket.—The first number of "The Argosy," with contributions by Charles Reade, Alexander Smith, Miss Isa Craig, and others, is certainly cheap at 6d.—Smiles's "Lives of Bonilton and Watt" (Murray); "Flemish Relics," by F. G. Stephens (A. W. Bennett); "The History of the City of Rome," by Thomas H. Dyer, LL.D. (Longmans); and several other books, wait for notice.

### Miscellaneous.

THE ALBERT MEMORIAL IN HYDE PARK.—The Albert Memorial in Hyde Park is moving again. A quantity of granite is now on the ground, and a steam-engine has been set up to work the machinery for polishing it. A number of columns of red granite, and a quantity of other pieces, have been forwarded from Scotland. The whole of the brickwork and masonry connected with the lower portion of the work has been completed.

ST. MARTIN'S SCHOOL OF ART.—The annual distribution of prizes to the students of the St. Martin's School of Art took place on Wednesday night, at the Institution, Castle-street, Long-acre. Some highly creditable specimens of the works of the students were exhibited in the room in which the distribution took place. Mr. R. Westmacott, R.A., F.R.S., presided, distributed the prizes, and addressed the meeting. Votes of thanks to the head master (Mr. William Casey) and to the assistant master, concluded the business.

MONUMENTAL.—We understand that Mr. W. D. Keyworth, jun., of London, has been commissioned to execute the statue of Andrew Marvel, to be presented by Mr. Councillor Winship to adorn the new Town-hall at Hull. Mr. Winship, with a view to assist him in his final determination, has, it is said, been in London consulting some of the most eminent artists of the day, all of whom assured Mr. Winship that he might with safety place the statue in Mr. Keyworth's hands.—The subscribers to the Leeds memorial of the late Sir Peter Fairbairn have resolved to accept the offer of Mr. Noble to execute a bronze statue for 1,000l. The statue will be the same height as that of the late Sir Robert Peel, near the Post-office. Mr. Noble was the sculptor of the statues of the Queen and the late Prince Consort, in the vestibule of the Leeds Town-hall.

PROJECTED REMOVAL AND EXTENSION OF ST. PAUL'S SCHOOL.—The Mercers' Company have given notice of their intention to apply to Parliament next session for a bill to enable them to enlarge and improve the education of St. Paul's School. Among the principal objects are the acquisition of powers to sell, pull down, or remove the existing school premises in St. Paul's Churchyard, and erect new school-houses in or out of the metropolis, or to enlarge the existing school premises.

THE CO-OPERATIVE SYSTEM IN VICTORIA.—The Union Fishermen's Institution of this colony lately held their first anniversary. We learn from the *Society of Arts Journal*, that this Association was organised twelve months ago, in the face of many difficulties and disappointments. There are now about ninety members, and their fishing extends from Port Arlington to King's Island. During the year they sold about 5,000l. worth of fish. The men get the full advantage of open markets in Ballarat and Melbourne, and each receives the full benefit of his own efforts. They are paid at least 25 per cent. more than under the old system; the middlemen are put aside, and the fishermen and public are the gainers. The boats, nets, &c., are so improved as to be worth at least 3,000l.

PROPOSED EXTENSION OF THE UNIVERSITY OF OXFORD.—At a meeting held in the hall of Oriel College, to consider the question of the extension of the University, with a view especially to the education of persons needing assistance and desirous of admission into the Christian ministry, various propositions were made, one of which was, that a separate college or hall should be built capable of accommodating 100 students, and that a sum of 100,000l. be raised for the purposes of purchase of site, building, and endowments, by public subscription; and another, that the University, out of their own funds, build and endow a college, giving a sufficient number of exhibitions and scholarships to enable young men of very limited incomes the opportunity of graduating free of cost. The meeting was unanimous in resolving,—"That a committee be appointed," and, "That each college and hall have power to name one member from each to form a committee, with power to add to their number, to consider what steps shall be taken with a view to the extension of the University."

DISCOVERY OF ROMAN REMAINS NEAR WINDSOR. An interesting discovery has just been made upon the Crown lands near Old Windsor. While a number of workmen were engaged in some drainage works upon the farm of Tykeshead, they came upon two large Roman tombs, the chambers of each forming a cube of about 4 ft. The remains were about 2½ ft. below the surface of the soil, and when the first of the tombs was discovered, the drainers took it for an old drain, and the top of it was broken to pieces. This tomb contained a fine glass bottle of elegant form, charred human bones, but no urn. About 18 in. from the first tomb, another of a similar description, but quite perfect, was found; and on its being opened it was found to contain an earthenware cinerary urn of half-baked clay, with charred human bones, while by the side of the vase were the fragments of a fine terra-cotta bottle. Both the tombs had been placed in positions, due north, east, south, and west. Neither of the tombs contained any inscription, coin, or ornament, but the remains are supposed to be between 1,500 and 1,600 years old, the site upon which they were discovered being probably on a Roman by-way leading from the camp on Bagshot-heath through Bracknell and Datchet.

CARLISLE SCHOOL OF ART.—The annual meeting of subscribers to this school has taken place. The mayor opened the proceedings, and the secretary read the report, which was of a very favourable character. The school was increasing in number, especially in the junior students; but the morning class for young ladies was not so well attended. For the whole, the committee congratulated the subscribers on the healthy state of the school, which they believed was principally owing to the unremitting attention and earnestness of the master, Mr. Lees. The regulation reducing the number of medals given to successful drawings, the committee thought would have a very discouraging tendency. Through the kindness of Mr. Potter, however, the committee had been able to offer valuable prizes to the students. At the last examination of works held in London, the Carlisle pupils obtained twelve medals.

GAS.—The Oriental Gas Company have held a meeting at which, out of an available balance of 6,596l., a dividend at the rate of 8 per cent., free of income-tax, was declared.

CAERHUN SLATES.—A new company has been formed under the title of The "Caerhun Slate Company, Limited," with a capital of 30,000l. in 10l. shares, for the purpose of purchasing and working a portion of the Cwm Eirfa Slate Property, situated near Bangor, in the parish of Caerhun, Carnarvonshire, North Wales. The quarry is side by side with, and forms part of the same vein as, that now being worked successfully by the British Slate Company, who have been, for some time past, it is said, paying their shareholders handsome dividends.

SALISBURY CATHEDRAL AND MUNICH STAINED GLASS.—Mrs. Campbell Wyndham lately proposed to set up a painted glass window in this cathedral, and some correspondence has passed on the subject as to the character and style of the painting. The donor, who is prepared to bear all the expenses, would desire—in fact, makes it a *sine qua non*—that the work should be done by a Munich artist. The authorities, on the other hand—that is, the dean and chapter—are in favour of the work being executed by an English artist, and chiefly for this reason—that in the opinion of their architect, whom they are bound to defer, the Munich glass painting is out of harmony with the architecture of the thirteenth century, of which the cathedral is an example. So matters stand, the architect having declined to give his sanction to the introduction of a Munich window.

ALARMING ACCIDENT AT A PAPER STAINING WORK.—An accident of a very serious nature occurred at Messrs. Potter, Snape, & Co.'s paper-staining works, Livesey-fold, Darwen, on Thursday night. In the stock-room, on the second floor, were stored about 100,000 pieces of stained paper, and on Thursday night the beams gave way, and the floor went down with a sudden crash, breaking the main gas-pipe, which threw the whole works into complete darkness. A man, named George Entwistle, and George Pinder, a boy, were in the room at the time and had a most miraculous escape, neither of them being materially hurt. A large number of work-people had only left the room about ten minutes before the floor gave way.

THE BALLAST OFFICE, DUBLIN.—Extensive alterations and improvements have lately been completed at the Ballast Office premises, in Dublin, the whole of the interior on the ground-floor having been remodelled, and the hall, waiting-room, passages, and staircase, thrown into a spacious public office, communicating with private offices, strong-room, pay-office, new stairs to board-room, and offices in upper floors, besides other improvements which have also been made. The new system of framed shoring, invented by the architect during the building of the Royal Bank, is said to have been found effective during the removal of the internal main wall, 28 ft. long, for the introduction of beams and columns, the works having been carried on without interruption to the Board, who held their ordinary meetings during the process of shoring and setting the beams, &c., in the story under the board-room. The contract has been carried out by Messrs. Beardwood, under the direction of the architect, Mr. Charles Gheoghan.

FURTHER DISCOVERY OF STONE KISTS OR COFFINS IN SCOTLAND.—Mr. Hinchison, of Carlisle, who, about two years ago, discovered a large number of ancient stone coffins near the "Cat-stane," and who some time later found, on Craige-hill, the remains of an old city, has come upon two other kists in the vicinity of his own house. One of the kists presents similar features in construction to those lying around the Cat-stane. The other coffin found is what is termed a short kist, and points to a more remote date than can be assigned to the other one. It is composed of the same rude freestone slabs, placed edgewise, so as to form walls around the body—which would appear from the measurement and shape to have been doubled up together in it, as is known to have been the custom at a very early age in this country. It is an interesting circumstance that the lid, which was a good deal broken, shows the remains of several series of incised circles. Similar ones were found inscribed on a kist long overhanging the road to Cromand in the cutting through the Cloven Cliff of Craige-hill, and which, for the safety of travellers, had to be removed last year.

**BIDEFORD.**—The Local Government Board of this ancient and much-frequented place have resolved to procure a supply of water for, and to serve, their town under the direction of Mr. Baldwin Latham, C.E., of Croydon.

**THE DRAINAGE OF HASTINGS.**—The St. Leonards' Commissioners and Hastings Town Council have amicably agreed on appointing Mr. Bazalgette consulting engineer for the proposed new drainage of the two towns. No tender for any contract will be accepted except upon his recommendation.

**POOR-HOUSE ON DOCKS.**—By a recent decision of the House of Lords, the Mersey Docks have been adjudged liable to poor-rate, and the amount of the parish claim against the Mersey Dock Board (swelled by arrears) is between 20,000*l.* and 30,000*l.*

**CHISENHALE BRIDGE, LIVERPOOL.**—The foundation-stone of the new bridge across the canal at Chisenhale-street, in Vauxhall Ward, Liverpool, has been laid. The new bridge, according to the *Journal*, will be built of parohold stone and cast-iron girders, and will have a roadway of 28 ft., considerably more than double that of the old one, and the incline from the middle towards each end will be so easy as to be scarcely perceptible. It will be a single arch, with a span of 39 ft., and the cost under contract will be close on 4,000*l.*, but, including the land and approaches, it will amount to 4,500*l.* Mr. Wells is contractor for the mason-work, and Mr. Sampson Moore for the cast-iron work.

**FALLING IN OF A RAILWAY TUNNEL.**—A mishap has occurred in the tunnel running underneath the Old Tiverton-road, near Exeter, on the London and South-Western Railway. The tunnel is about 400 or 500 yards in length. A heavy fall of rain is said to have burst through the brickwork, all but destroying the whole structure. The tunnel was blocked up by some two or three hundred tons of *débris*, and the traffic suspended.

**RAILWAY MATTERS.**—Amongst the projected metropolitan lines, as we may term them, are a "Metropolitan, Wimbledon, and Richmond Railway," from Kingston to Putney, Wimbledon, and Richmond; and a "City, Kingston, and Richmond Railway," from Streatham and Clapham to Kingston-on-Thames and Petersham, with short connecting lines with other railways.—The Pneumatic Despatch Company intended applying for power, *inter alia*, to purchase and use cellars and vaults under the public streets, without the necessity of purchasing the houses or buildings with which they are connected.

**THE PROPOSED PURCHASE OF RAILWAYS BY GOVERNMENT.**—This subject was introduced on Wednesday night at the Society of Arts, Adelphi (Lord Lytton in the chair), by Mr. W. Hawes, F.G.S., the chairman of the council. The attendance of members and visitors was numerous. The paper (a very lengthy one, which if printed *in extenso* would fill too many of our columns) controverted "the proposition that Government should purchase and take the management of the railways," and, taking the recent publications of Mr. Galt and Mr. Chadwick as "embodying all that can be said in its favour," was in fact a reply to those gentlemen. Mr. Chadwick, as one of the persons attacked by the paper of Mr. Hawes, moved the adjournment of the debate, in order that he might have an opportunity of replying, which was agreed to.

**NEW RAILWAY STATION AT YORK.**—The station at York is condemned. The directors of the line have come to the conclusion that the entire plan of the structure is radically wrong, and that the proper form of station for their purpose is not the *en face* standing east and west, but a structure built on the line of the direct route outside the city walls. The new edifice is, with its belongings, to cost 200,000*l.*: its platform is to be 1,200 ft. in length.

**REGULATION OF THE CITY TRAFFIC.**—It is understood that the City authorities are about to apply to Parliament for a new Bill to regulate the traffic of London, the Act of 1863, although useful as far as it went, having been found too limited to effect the various reforms demanded by the public. The new Bill will include a clause authorising the construction of foot-bridges over the most dangerous of the street-crossings. Thus a suggestion repeatedly made in the *Builder*, at first many years since, appears at last likely to be realized.

**VALUE OF PROPERTY IN ENGLAND AND WALES.**—The union valuation lists of property in England and Wales from the Poor-law Board have been issued. In the revised lists for Middlesex the value is 963,661*l.*, being an increase of 63,367*l.* on the preceding year. The largest increase is in York. The value in 1864 was 3,245,177*l.*, and last year 3,542,550*l.*, being an increase of 297,468*l.*

**EXTENSION OF THE NATIONAL GALLERY.**—The Commissioners of her Majesty's Works and Public Buildings have effected the purchase of the land required for the contemplated enlargement of the National Gallery, situated on the north side of Trafalgar-square, bounded by Hemming's-row on the north, by St. Martin's-place on the east, by Duke's-court on the south, and by Castle-street on the west. The purchase includes St. Martin's Workhouse, with Archbishop Tenison's Grammar School, and the sum the parish of St. Martin is to receive for the concession is 86,000*l.*

**SAFFRON WALDEN.**—The operation of reducing the hill in High-street so as to make the approach to the railway station more gradual, has been begun. The main drainage work has lately commenced near the market under the able superintendence of Mr. Ford, the town surveyor: the work is performed by labourers residing in the town, which acts thus beneficially in providing some with employment during the winter season when there is often a slackness. We have no doubt that the drainage, when completed, will be a boon to the town, and although the rates may be heavy on the ratepayers for a time, yet in a few years there may be found a lasting benefit accruing therefrom.

**THE PARIS EXHIBITION: UNIVERSAL INDUSTRIES.**—The Commission say they hope to present to the view of Europe, Laplanders making fishing-tackle; Ural Tartars employed in the preparation and ornamentation of skins and carpets; the Kabyles of Algeria making the glazed pottery of Bjerdjera, carvings in the wood of the fig-tree, ornaments in silver and coral, and carpets of Oran and other districts; natives of Morocco weaving silk, cotton, and woollen fabrics, making fez caps, saddles, and arms, and preparing shagreen; negroes of Soudan producing cotton cloth, morocco work, and pottery; the half-castes, or *Petits Blancs*, of the Isle of Bourbon, making sacks for sugar and coffee; Anatolians weaving Smyrna carpets, silks, and cloth of gold; Syrians fabricating tassels and arms of Damascus, Aleppo, and Lebanon, mother-of-pearl work of Bethlehem, and gold work of Beyrout; Persians at work on Kirdestan carpets, silk embroidery, Kirman shawls, and silks and cottons of Yerd, enamelled tiles, and damascened arms; Indians weaving muslins, embroidering cashmires, engraving ivory and wood and twisting threads of gold into bracelets and other ornaments; Cambogians fabricating boxes and toys from sandal-wood; Siamese carving rhinoceros horn; and, perhaps, Chinamen carving a nest of ivory halls; Japanese painting their incomparable lacquer wares; Mexicans turning their perfumed pottery; and red-skins composing head-dresses of feathers and bead-embroidered mocassins.

**LABOUR-SAVING MACHINERY IN AMERICA.**—The manufacture of newly-invented machinery, known as harvesters, mowers, reapers, and headers, gives employment to a large amount of capital and labour. The introduction of this class of machinery has brought about a revolution in labour as applied to agriculture, and pending the war released a large proportion of the farming classes to hear arms. Last year, the number of reapers and mowers made in the United States, according to the *New York Journal*, was not far from 89,000; but of the stock of machines on hand at the opening of the present season, fully one-quarter, and perhaps one-half, remains unsold. This year, at least 100,000 machines have been made. There are two principal patents in the United States big in favour among farmers. One is the "open finger" guard, from which the patentee secures a royalty on every successful machine, say 2 dollars 50 cents each, or an income estimated at 200,000 dollars per annum. The other is the "hinged floating finger bar." The income from the latter is between 100,000 dollars and 200,000 dollars. There are about 225 manufacturing firms solely engaged in making agricultural machinery, and they are pretty evenly distributed through the country.

**CARVING IN SHREWSBURY.**—At the Roman Catholic church, the whole of the carving has been lately executed. The church was built about eight years ago, from the designs of Mr. Pugin, and the sculpture has now been carried out under his direction. In the nave capitals are carved natural flowers and foliage, arranged conventionally, such as the primrose, ferns, lilies, roses, the oak, the passion-flower, the apple, &c.; and in the foliage to chancel are introduced the Tower of David, the Gate of Heaven, the House of Gold, the Ark of the Covenant, the Star of Bethlehem; and in the side chapel, in the foliage are arranged the Pelican feeding her Young, the Lamb of God, the Loaves and Fishes, the Manna from Heaven, &c. Over the chancel-arch is placed a statue, nearly life-size, of our Lord on the Cross. The corbels supporting the roof are also carved in foliage, and the heads and bosses to all the doors and windows are about 150 in number. The whole has been executed by Mr. Boulton, of Worcester, sculptor.

**PATENT METALLIC GLASS HOUSES.**—Mr. Beard, of Bury, according to the local *Post*, has at the Victoria Works, a large conservatory, on his patent principle, the temporary erection of which, previous to its removal to its destination in South Wales, has just been completed. The dimensions of the house in question are,—length, 35 ft.; width, 16½ ft.; height, 13 ft. to the apex. The lines of its roof are curvilinear in form, being in segment of a polygon in a circle, surmounted by an A-shaped ridge, the sides of which form the upper ventilators. The lower ventilators run along the sides next the floors, both series being opened and closed by the end-less screw, which forms a feature in Mr. Beard's patent top and bottom ventilation. At Beard's patent top and bottom ventilation, each of the angles of the roof the lower vertical sash-bars are made with a shoulder, against which the upper pane of glass rests. This ensures a firm and weather-tight junction of the squares, while at the same time the evils of overlapping panes are obviated, since the upper forms an angle with the lower, which it overhangs. A process of covering the ironwork with enamel-paint, so as to reduce the cost and trouble of repainting to a minimum, completes the structure.

**TENDERS**

For the sewerage works to be done for the Plumstead District Board of Works, being Contract No. 3 for the sewerage of the parish:—

Peerson	47,003 0 0
Bloomfield	5,197 10 0
Hill & Keddell	5,173 0 0
Breston & Routledge	4,557 0 0
Lewis	4,267 0 0
Loneragan	4,250 0 0
Mathews	3,978 0 0
Tongue (accepted)	3,539 0 0

For the erection of a warehouse, 3 and 4, Little Love-lane, City, for Messrs. Charles & Thomas, Mr. H. Ford, architect:—

Fairman & Fotheringham	43,485 0 0
Hardiman & Sandon	3,412 0 0
Adamson & Son	3,410 0 0
Rawlin	3,353 0 0
Meyers & Son	3,281 0 0
Hill & Son	3,255 0 0
Henshaw	3,208 0 0
Browne & Robinson	3,073 0 0
Brass	2,937 0 0

For a Baptist chapel, in the Birkbeck-road, Holloway. Mr. J. W. Reed, architect:—

Williams	2,333 0 0
Lamble	617 0 0
Carter & Sons	573 0 0
Watson	639 0 0

For sewers, Wandsworth Parish, Wandsworth Board of Works. Mr. A. Dobson, surveyor:—

Wainwright	425,600 0 0
Beaman, Routledge, & Co.	21,000 0 0
Detlich	18,600 0 0
Thirst	18,300 0 0
Hill & Keddell	17,698 0 0
Ribson	17,753 0 0
Robinson	16,770 0 0
Niblett	16,500 0 0
Blackmore	15,750 0 0
Crockett	15,000 0 0

**TO CORRESPONDENTS.**

J. P. C. N. A. J. R. Messrs. H. A. C. H. V. R. L. B. S. F. Mr. P. C. C. H. T. J. B. W. F. L. L. C. B. W. P. L. S. W. S. H. M. J. S. J. W. A. T. W. P. C. R. J. R. W. P. & K. W. H. (if tenders be obtained, no certainty that there would be an difference.—L. M. R. (the sewer would interfere with each tunnel).—In type, "The Gates of Wales."

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

Advertisements cannot be received for the current week's issue later than FIVE o'clock, p.m., on Thursday.

# The Builder.

VOL. XXIII.—No. 1192.

*The Development of Norman Architecture.*

DISSERVICE done to the world by the Vandalic treatment of Mediaeval remains in the last generation, almost on a par with the defacement and destruction of the works them-

selves, has been the inducement of a reactionary worship of all antiquity without discrimination. The conscientious preservation of remains as venerable has been with many excellent consequences so persistently inculcated that the possibility of a distinction between the venerable, on account of age and historical testimony and associations, and the admirable, in virtue of beauty and of truly artistic treatment, has been almost lost sight of. So far as this unqualified respect has conduced to the preservation of the ancient, there is little to be regretted. Experience has taught us how difficult it is to keep restoration from sliding into substitution—how dangerous are the risks of the lottery that decide the details of modification so soon as we concede the principle. But Mediaeval antiquities are not alone objects to be admired; and even from this point of view it is no slight disaster that sensibilities should be blunted or depraved, and that they have also become models of imitation, precedents for practice. Nothing but severe and unceasing criticism can save us, in this case, from having the crude and the sophisticated reproduced with aggravation, and what our fathers were up as mistakes and were ashamed of, coming back in dire veneration upon their sons long after the canonical tale of generations.

In architectural criticism, therefore, of whatever age, as in other matters, we must ponder boldly, and give in to no base abandonment of reason, unless we are willing that technical archaeology should finally stifle all the efforts of invention of which the essence is independence, no postulate the admission of innovators. The desire of the student and the aim of the professor must be for more than registering criticisms for distinguishing styles and determining dates and ages; they must venture boldly—student and professor together—into the ocean of inquiry; be eager to rejoice over discovery, no less eager and prepared to discern and declare in their discoveries the limits of the good and the evil.

No modern can be a severer critic to the Mediaeval architects than they found among each other. Each was prepared to make such a change in continuing or repairing a cathedral as was pointedly condemned his predecessor. We shall usually do both injustice if we suppose such changes were made simply in obedience to style taken in the sense of fashion; they were for the most part commenced on the basis of taste, of a theory very often but by no means infallibly and universally right, of a failure in effect in the earlier design, and of the most apt correction of it. Critical correction opened the door that led to competitive development; and then it often occurred, from the surprising luxuriance of invention, that a style of great power and promise was superseded rather than corrected and perfected. The alterations applied brought in new suggestions and motives that carried the suc-

cessor far away indeed from the original, and still more frequently the immature unity of a design was still further impaired, was sacrificed, by the intrusion of changes by men who had it not in their power to remodel all, and had it not in their natures to suppress the novel conception that was urged upon them from within. Thus we have many a single bay of a design far finer than the completed design, where it has gained place as an interpolation. And generally there are, perhaps, finer things in the germ in Gothic architecture than ever were executed, conceptions that were still not beyond recovery, if we are prepared to give that full value to the best inspirations that binds us to resolute appreciation of the less happy; and if, moreover, it must be added, we can only succeed in rendering refined theory,—especially of proportion, again as ancillary to taste as once in the world's history was done in Greece.

To exemplify these remarks. No round-arch, or so-called Norman catbedral exists; none, so far as appears, ever has existed, and it is just possible that not one was ever designed which realized all the sublime effect of which the style was certainly susceptible. By such an enunciation we are not bound to the flaws and faults, and vagaries that belong to particular examples, to bad masonry, coarsely-executed ornament, or clumsy proportions: we should not be, though Norman remains did not exist, exempt from all these unhandsonenesses.

The main constructive basis is as uniform through all the styles of Gothic as the type of the skeleton common to all the vertebrata, and it was received as directly from the Roman Empire as the Latin element of modern languages. We have but to look at the elevation and pass under the arcades of the Coliseum to recognise the leading elements, motives, and combinations of half the catbedrals of Christendom; while such a church as that dedicated by Justinian to St. Vitalis, at Ravenna, goes far to give an account of the other half; and indeed, if history did not interfere with the nomenclature of art, would scarcely escape from the category of Gothic churches. The pier, simple and compound; the columns, single, grouped, or attached; the arch, the successive orders of arcuation, the arches grouped under the super-arch, the groined vault, and the transverse archivolt at least, if not the diagonal rib, these are the features which were varied in arrangement, and freely modified in proportion by the Mediaevals, till their originals would own them no longer; but their antique origin is still self-evident. Architectural forms, of developed elegance and settled type, were treated with no more scruple than the traditional elegances of language in pronunciation and inflections. But in either case the primary requirement, the initial impulse that had generated elegance, and distinctness, and order before, was not annihilated, but was active still to preserve the cardinal combinations from entire resolution, and to reduce all at last to an operative arrangement.

The rudest forms to which architecture found itself reduced in the course of transition, are probably to be seen among the Norman churches and catbedrals that were built in such abundance and on such a scale all over England within a century of the Conquest. A certain motive for unwieldy massiveness existed in the feeling that a church, no less than a private dwelling, might have to answer the occasions of a fortress. Beyond this, there certainly was the feeling for mass as essentially dignified, as well as being the one source of distinction under command; and, lastly, the very indifferent workmanship that could in many cases alone be counted on, not only compelled renunciation of finished detail, but led to attempts to give stability by that bulk which too frequently defeated its own object. The Norman towers that are now standing bear

but small proportion to those that have fallen; and even when, as at Winchester, the fault was sought to be remedied by better masonry, the masonry was still in excess.

More worthy workmanship was, however, sooner or later, forthcoming. So in the piers at Hereford, a stone of solid quality is employed in courses which, though not quite uniform, vary but little in height, and have horizontal joints close and continuous through the entire piers and their attached shafts. In the same cathedral, the plain voussoirs of the nave arches are uniform, and there is a joint in the old work between each several zig-zag, a refinement neglected with manifest ill consequence in the restoration.

Construction, distribution, proportion, and ornament, these are the heads under which the characteristics of a structure may be arranged. In ordinary Norman construction, the employment of the round arch must be considered essential. It is no doubt the fact that Pointed Norman arches occur unquestionable as to date,—occur so positively, that we are not disposed to yield the zig-zagged Pointed arches of St. Bartholomew-the-Great as modern reconstructions from old materials. But without quite excluding a possible variety of Norman in which pointed and round arches should concur, it is clear that the predominance of either would make a distinct variety; and that the pointed variety of the Norman has never been consistently elaborated, is an illustration of our primary assertion of the undeveloped resources of the style. In the style as it prevailed, therefore, a pointed arch is intrusive in character, and is to be marked as a lapse of the architect, not adopted and recognised as a feature of the style. Brilliant as may have been the anterior results of the infringement, from the earlier point of view we must adjudge artistic superiority to the architects who did not fly to the pointed archivolt, but succeeded in a harmonious union of narrow stilted semicircular arches when occasion arose to make them range in height with others of broader span, and who kept in check both lust of novelty and temptation of facile execution for the sake of unity.

It would be perfectly fair to say in support of our thesis, that most of the characteristics that illustrate later Gothic are susceptible of being carried back into Norman, and of receiving Norman treatment; but, in truth, if we look narrowly, most of them are already there,—most of those that admit of full transference, while of the rest we find the unmistakable germs.

It is too true, again, that most of the English cathedrals of this period were built to receive wooden roofs, warned by defectiveness of masonry, invited by plenty of timber; and in so far as this was the case, the architects were parties to the infringement of unity at the most vital point,—to an incoherency and contradiction. But vaulted roofs are not only found recognised as appropriately available, but the plain groins of coriolar vaulting even received enriched moulded ribs. That smaller intervals should be elaborately bridged by arches, while the larger are crossed by plain aid of timber, cannot but be a gross breach of conformity, and the display of such construction aggravates the insult which it would be a mark of grace to resort to artifice to modify or conceal. The most objectionable cases are those in which the structure of the walls is so ponderous, that when left unloaded by a vault, they look meaningless, idle,—at once arrogant and *otiose*.

In the small chapel in the White Tower, London, we have a plain barrel vault,—in other examples, as in some Spanish churches and French, which belong to this style, or to its period, we have the barrel or wagon vault crossed by transverse flat band ribs. There does not appear to be much artistic, that is expressive, value in mere flat band ribs on a barrel vault in

any case, whether descending upon plain wall, corbel, or capital of pilaster. They may relieve the eye by dividing large blank space, but the eye is but ancillary to the reason in matters involving constructive responsibilities, and reason is checked and disappointed when they stand alone.

The strengthening of such transverse hands does not in any way indicate a transference of strength to the intervening sections of the wagon vault, and in so far only intimates a suggestion of the requirement of it. When the intermediate space is groined, they become consistent; but then consistency immediately demands that the lines of the groins should also be emphasized by ribs or bands.

The grand feat of such structures is the covering of the nave; and with the scheme, whatever it may be, that is applied here, the rest of the analogous architectural feats should harmonize. Thus, if the principle of subarcuation be applied in the pier or side arch, so much the more should the like system, even further enhanced, be applied to the transverse arch of nave; or, taking the order which should be that of reflection instead of construction, if systems of ribs which are subarcuations be not required for the vault of the nave, construction helping itself otherwise,—by this otherwise it will do well to provide for the subordinate exigencies of the pier arches, and so avoid suggesting a resource which it has no need or intention to lean upon.

All the varieties of vaulting apart from the detail of the point, are as available for Norman as for any other Gothic. Even fan vaulting,—not fan tracery, which is another matter entirely,—nay, we are disposed to think fan vaulting especially, from its pronounced circularity, and it may be said its proclivity, to the ponderous,—would harmonize with the Norman style.

On the expression given, failed to be given or misgiven, to the dependence of the vaulting of the nave and aisles upon the vertical support, depends generally the most important effect of all. The sheer vault may fall upon the sheer wall surface, or ribs or groins may descend on corbels, or upon capitals of attached shafts, longer or shorter, that rest upon corbels, or string-course of clerestory, or of triforium, or on capitals of triforium-grouped shafts or of nave pier, or that descend in front of nave pier, and have proper base on the common plinth.

The latter system, no doubt, of the vaulting-shaft continuous from pier base to spring of rib, is the most expressive, and susceptible of most beauty; when it is applied, the side shafts of the nave arches that answer to subarcuated mouldings, are vindicated in their significance, and the foundation is laid for most effective gradation. This motive, however, was very curiously taken up, lost again, and then again resumed, treated timidly, bravely,—and of course at last abused.

The cathedrals and churches of Spire, Worms, Mentz, St. Germain-des-Près, exhibit a feeling for this propriety; and in early churches in Normandy it is still more remarkably pronounced,—in the Conqueror's churches of St. Stephen and the Abbaye des Dames, at Caen;—and compare St. Saturnin, at Toulouse. The scheme appears to have developed itself more freely in those forms of Gothic which were developed from piers with attached columns, than from the cylindrical or columnar pier. But our own cathedrals are full of incoherencies at this point. At Rochester, we see the nave pier with a face-shaft, on which is superimposed another, somewhat smaller, that reaches the triforium string-course, which rings itself to make way,—but there terminates.

At Peterborough and Ely, face-shafts rise consistently from base upward; but only to pass even beyond clerestory windows, and so to be disappointed of the vault, which it seems was never intended to be conferred upon them, as they continue to wall-plate at higher point than an arch would spring. At Hereford, there are paired face-shafts attached to massive cylindrical piers, which at present stand idle and unshined, matching, no doubt, the pair that are towards the aisle, that are scarcely to be seen in combination with them; and, if so seen, would but shame them by displaying due reception of a function, though in subordinate position. Wyatt, it seems, obliterated these shafts when he warded with the nave generally; but it does not appear that he found any answering shaft above them, to warn him from the wickedness as done, not only to archeology, but to art. It might be imagined that, like the paired shafts

on the face of the piers at Bayeux, they were intended originally to receive another suit of mouldings to the pier arch. The enormous cylindrical piers of Gloucester have no preparation whatever for vaulting shafts.

The small shaft descending upon the pier capital was often adopted, but has certainly an effect of harsh contrast; and this, perhaps, caused it to be renounced on trial at Hereford, while still no better contrivance occurred by which to alleviate the harshness. For this end it was above all things necessary that the face vaulting shaft should be the architect's standard of commencement, and that he should bravely modify all other details and magnitudes that fought with it. For this even the builders of the Early English did not find themselves readily equal; at Lincoln the shafts come almost within reach of the face shafts of the piers, but are uncomfortable in projection, and finish timidly on a foliated corbel, and so the nave loses half the effect of even what height it has. At Lichfield certainly a bolder man carries a triplet shaft from base to spring; but he was still embarrassed by the contrast of its slenderness with the large blank spandrels it had to cross, and he did a had thing in endeavouring to cover up the shame by an applied quatrefoil circle.

The Cathedral of Durham presents an effect already half achieved, that might have disclosed the value of a better principle. It is truly vaulted in quadripartite divisions, but with hold transverse ribs between the alternate pairs of diagonals, not as in sextipartite vaulting proper through their intersection. Each of these cross springers then, with its associated diagonals, descends upon the capital of a group of face shafts which rise without break or hand from their bases on the pavement, and correspond with the similar but larger groups that end the nave at the porch and at the crossings. The intervening pair of diagonal ribs finish on a corbel, and the alternate nave piers below them are mighty cylinders, of varied surface carving, with no attached shafts. The same scheme is continued into the choir.

The principle of varied alternate piers is consistent when two bays of the nave are comprised in quadripartite vaulting, of which no division answers to the intermediate pier, or when in sextipartite the alternate piers are charged with additional responsibility of a pair of diagonal ribs instead of a single cross springer; but neither of these reasons—which themselves were soon found better dispensed with—applies at Durham, and the scheme is therefore to be marked as so far inapt and anomalous.

The Norman Waltham Abbey church is very similar in scheme to Durham, in its alternation of piers and cylinders. Here the piers have attached pilaster strips, which run from base to springing, and break the string-courses. One of these pilasters bears a complete face-shaft: of the other, the face-shaft terminates somewhat below the string of triforium, either cut off from below or it never descended further. In the intermediate spacing there is an attached shaft which descends, and finishes upon the triforium string-course instead of on a mere corbel, as at Durham, and in so far has a heter justification.

Compare also Lindisfarne Church, Durham, and St. Peter's, Northampton.

The Norman part of Romsey Church (Britton) has face-shafts on each pier, embraced by carved moulding of triforium string-course, and diminishing upwards telescopically; that is, in broken stages and unhappily. Abundant instances, and worthy of all laud, occur of the tall attached shafts, single or paired, that run up without a band or break to carry the archivolt of the great arches under the tower of the centre or of that between the western porch, hay, and nave.

In the churches of the Conqueror at Caen, a face-shaft is assigned to every pier for the service of the transverse ribs of the vaulting; and even the diagonals have in some cases like consideration.

The awkward elongation of such shafts, even as attached, when they appeared alone or in a less degree when paired, was no doubt a cause of their renunciation by architects, who should have appreciated their propriety too highly not to have preferred making attempts to resolve the discord that marred its due effect. Nothing can be worse than the piled-up shafts,—the stories of columns individually conserving normal proportions, but disabled for joint co-operative expression,—which Gothic construction was so long in getting clear of. The discord was

finally reduced by the architects, who either grouped several tall and entire shafts together, making each a member of a mass normally proportioned, or attached one or a pair to piers or pilasters with margins and projection of such decision as to enhance the value of the shaft. Many and instructive are the experiments we may trace to adjust the conflicting claims of contrast and gradation; and though many, no doubt, were the failures, successes were brilliant.

We will carry on the subject in another article.

#### THE PROPOSED PALACE OF JUSTICE.

At a recent meeting of the Social Science Association, Mr. Thos. Welch, Q.C., read a paper on "The Site, Approaches, and Arrangements desirable in the Proposed New Courts of Law." Some of his remarks may be found valuable with reference to the designing of Law Courts generally; and we, therefore, print portions of the papers. The steps to be taken for obtaining a design will have to be settled by the new Government.

##### Situation and Area of Site.

Within the district bounded on the north by Carey-street and Lincoln's-inn, on the south by the Strand and the Temples, on the east by Bell-yard and Temple-bar, and on the west by New-inn and Clement's-inn, is the site on which the Palace of Justice is to be erected, and the Courts and Offices of Judicature are to be concentrated. Its clearance will be commenced forthwith. The approaches and appropriation of the site are the questions in which the public and the profession are now most interested. The site, when cleared, will be found to be about 20 ft. higher on the north, or Carey-street, than on the south, or Strand side, and to have a gradual inclination from the north-east, at the corner of Bell-yard, towards the south-west, at the church of St. Clement's Danes,—a circumstance not to be disregarded in considering the approaches to the palace, as it is from the south-west side alone that we must look for an approach terminating in the Palace of Justice, and presenting a *coup d'œil* worthy of the subject. It is too much to hope and expect that this opportunity may not be lost, but that the fullest advantage may be taken of it,—that the noble example of the Emperor of the French may be followed; that, while the citizens of Paris rejoice in seeing their principal buildings placed at the end of newly-created and imposing thoroughfares, the citizens of London may not be denied a similar satisfaction. The approaches from the north and north-east, though capable of great improvement, can not be adapted to an approach of the kind suggested, without an interference with a property already exclusively devoted to the profession, and extremely valuable; as, for instance, Lincoln's-inn, the New Record Office, and Rolls House; Sergeant's-inn, the Law Institution, and other buildings in Chancery-lane. A good access to the Palace of Justice from the level of Chancery-lane for carriages, and over and under Chancery-lane for passengers, may be obtained; but a grand approach, such as may be presented on the south-west, is peculiarly impracticable on the north-east side; and its attainment would render the site a great thoroughfare for traffic having no occasion to resort to the Palace of Justice. The difference of 20 ft. in the levels of the ground between the north and the south may be taken advantage of to afford an extra floor on the southern portion of the site, and a saving of 20 ft. in the ascent to the principal story,—the floor of the Great Hall of the Palace of Justice,—from the northern and western side.

##### Level of the Site and of the Thames Embankment.

The relative levels of the site and of the Thames Embankment, present advantages not to be disregarded. The Strand at St. Clement's may be taken to be about 30 ft. above the level of the roadway of the Thames Embankment, below which, at a depth of say 20 ft., are the Metropolitan Railway and the Low Level Northern Sewer.

##### Subways under the Strand, Fleet-street, and Holborn.

This access may be obtained to the basement of the Palace of Justice, and, by an easy incline to the level of Carey-street, by a subway under the Strand in the neighbourhood of St. Clement's Church, and the traffic to and from the Palace of

Justice may be separated and isolated from the traffic between the level of the Strand and other parts of the metropolis. Thus the great stream of traffic using the Thames Embankment *en route* to or from other places than the Palace of Justice, and the traffic to and from the Palace of Justice may be rendered independent the one of the other, and prevented obstructing the approaches to the Palace of Justice from the north-west, north, and north-east. Such approaches from the Thames Embankment may be connected with the approaches from the west and north on the western side of Lincoln's-inn-fields; from Covent-garden on the west, and Holborn on the north; they would remove one of the greatest plague-spots in the metropolis, lead to the purification and improvement of the district of Clare-market, and the territory almost unknown, except to those who pass between Lincoln's-inn and the west, lying between Great Queen-street, Lincoln's-inn-fields, Drury-lane, and Clement's-inn.

#### Appropriation of the Site.

The appropriation of the site must depend on various considerations, amongst which the area to be dealt with, and the requirements of the courts, are the most prominent. The area of the site may be taken at 7½ acres. The difference of levels of Carey-street and the Strand will give an extra floor of about one-half that area, without extra excavation. Let us start from the level of Fleet-street and the Strand, at the Temple-har entrance to the Palace, and assume the basement of the building to be 20 ft. below that level, or 10 ft. above the level of the road of the Thames Embankment, or 30 ft. above the level of the rails of the Metropolitan Railway, and of the Low-level Sewer in that embankment. This basement of 7½ acres (without deducting the space necessary for areas for lights and passages), has been proposed to be appropriated to strong rooms, for the preservation of original wills and other documents of value. For the wills alone it has been said that towards of three acres will be required. To this basement access may be had by subways under Fleet-street and Chancery-lane, so as to connect it at once with the Temple, Serjeants'-inn, the Rolls, and new Record Office. The basement will have a depth of about 40 ft. next Carey-street, or on the north side, should it be thought expedient to carry it throughout at that level; and if Carey-street can be relieved from the through traffic by which it is now encumbered, by reason of the obstruction at Temple-har, the arch of which is too low to permit the passage of the high-loaded vans and waggons, a portion of that street may be made available to widen the area for the lights to the basement. The ground-floor of the Palace, or that on the level of Fleet-street, at Temple-har, would be about 20 ft. below the level of Carey-street; and assigning 20 ft. for the height of the rooms on the ground story, and 20 ft. for the height of the next, we arrive at the level of the floor of the Great Hall, about 40 ft. above Fleet-street, and 20 ft. above Carey-street.

#### Arrangements of Courts and Offices about the Great Hall.

In the arrangement of the courts on the sides and at the ends of or around the Great Hall, the principles of separation and isolation are essential for the convenient and economic administration of justice. In this respect it may be well to imitate the arrangements of the new Assize Courts at Manchester, in which those principles are applied to the extent there required.

The precise arrangement of the courts will be matter of detail for after-consideration, but the general principles may be indicated.

For the purpose of illustrating the arrangement of the courts and offices in connexion with the Great Hall, let us suppose a series of four concentric circles, the inner representing the Great Hall; that in the space between the circumference of the first and second circles are arranged the courts and offices immediately connected with them; that the space between the second and third circles is a passage or corridor, for communication with the courts and offices arranged between the first and second circles; and that the offices are located between the third and fourth circles. Access to the courts will then be obtained from the Great Hall on the one side, and from the corridor between the second and third circles. Access to and from the Great Hall will of course be open to all, but access by the corridor will be strictly confined to the judges, officers, jurors, professional men,

witnesses, and parties actually engaged in the business of the courts, or passing to and from the offices located between the third and fourth circles.

Thus the general public and parties engaged, or whose attendance is necessary to the conduct and progress of the cause, may be separated and isolated from each other, but able to intermingle in the Great Hall, and entering and leaving the courts by different routes.

The courts and offices immediately connected with the courts as the retiring-rooms of the judges and the jury, will be arranged in the space between the first and second circles, each court with the offices immediately connected with it presenting substantially the same arrangement, but differing only in details according to the requirements of the business to which it is devoted. The interval between each court, or each set of courts, will be available for access between the Great Hall and the great corridor, by rising, as in the courts at Manchester, to a level above the level of the floor of the Great Hall. This elevation, of say 4 ft., will give the means of access to the hench and the retiring-rooms of the judge, and to the jury-box and retiring-rooms for the jury, while a descent of 4 ft. will give access to parties and witnesses engaged in the cause, and afford the means of separating the witnesses on either side from each other, in convenient waiting-rooms immediately accessible to the court. This level of the floor of the judges' rooms, which may be conveniently designated the level of the bench, forms a most important feature in the new courts at Manchester, and in the arrangements hereafter mentioned, especially in reference to the suggested entrances to the courts. The indiscriminate manner in which the witnesses on either side are permitted to intermix, during the progress of a cause, with each other and the general public, and the difficulty with which they are introduced into, and withdrawn from, the witness-box, are serious defects in our administration of justice; and any scheme for the courts in which this was not amply provided for, would be most seriously defective. It is of the greatest importance also that the jury should be provided with accommodation wholly independent of the access of the public, and that their retiring-rooms should be convenient for communication with the judge.

The offices of the Masters of the several courts should be in immediate connexion with and contiguous to the several courts, and it may be sufficient to have indicated and illustrated by their location on the level of the Great Hall and courts, while the floors immediately below that level will afford space for the Writ and Record Offices, with convenient accesses to the offices of the Masters of the respective courts. The contiguity of the several Writ, Record, and Judgment Offices to the Masters or the courts is of less importance than bringing them all into as close contiguity as possible with each other, with the view of a general consolidation and concentration of such offices for all the courts.

#### Internal Arrangement of the Courts.

The construction and internal arrangement of the Courts would appear to have received little consideration, many being most inconveniently large or small, and none presenting that separation and isolation by which the convenient administration of justice may be so much facilitated. In many, the position of the witness here is so inconvenient as to lead to its abandonment, and to placing the witness in some new position more convenient for the judge and jury and counsel, but most inconvenient to the witness. The inconvenience of ingress and egress, and the manner in which all parties are intermixed with each other and with the public, is matter of universal complaint whenever circumstances of interest give rise to a crowded court.

To the relative position of the judge with a jury-box on either side of the court, arranged with three seats holding four each, and of the counsel, no exception can be taken. The great defect is in the position of the witness-box, and the difficulty of ingress and egress for the witnesses, professional men, and others necessary for the progress of the cause. Accommodation for jurymen in waiting, for students, short-hand writers, and reporters, must form an essential part of the arrangement. The witness under examination naturally turns to the counsel by whom he is examined; the reply to the question will be naturally addressed to the same counsel; and consequently, according to the arrange-

ments adopted in many of the courts, from the judge and jury, by both of whom the witness should be heard and seen. The witness, if placed near to, and a little below and on the right hand of the judge (assuming the jury to be on the left of the judge), that is, on the opposite side of the judge from the jury, will speak across the judge, be seen by the jury, and heard equally by the jury and examining counsel; from whom he will be about equally distant. The position of the witness-box in the Courts of Queen's Bench, Common Pleas, and Exchequer, is an illustration of this; but the witness might with advantage be nearer the judge than in any of those cases. If the witness be placed between the judge and jury, his back will generally be turned on one or the other, and he will sometimes get engaged in conversation with some of the jury, a most objectionable and inconvenient practice. None of these courts present convenient or isolated ingress or egress for the witness, who must struggle and be intermixed with the general crowd, with whom he is intermixed both before and after his examination. Nor are the jurors, counsel, attorneys, or parties any better off, as the experience of those attending the courts at Westminster, and other courts in the metropolis, will affirm.

This may be wholly avoided by a passage under or on either side of the seat of the judge. Assume the floor of the judicial bench to be 4 ft. above the level of the floor of the court, by steps descending to a level of 4 ft. below the floor of the court, ingress and egress may be obtained with suitable separate waiting-rooms, in which the witnesses of either party, prior to their examination, may be kept together, ready to be called as required. The witnesses, after examination, may be permitted to pass into the court by a passage under the upper seat of either jury-box, and intermix with the general crowd. This ingress and egress under the floor of the hench may also be made available for counsel, attorneys, and other parties immediately engaged in the cause. The floor of the court between the bar and the hench would afford (the witness-box by which it is usually encumbered being removed) ample space for short-hand writers and reporters, with seats and small desks under the jury-box; the centre part being kept clear for ingress and egress and the exhibition of models and plans, in the introduction and exhibition of which great inconvenience is frequently experienced. The seats reserved for students might be immediately behind the bar, the access to the first and second row of bar-seats being from the floor of the court under the hench, and to the third and other rows at each end next the jury-boxes by passages under the upper seat of the jury-boxes, or direct into the Great Hall; the seats for the public being behind, at either angle, with entrances only from the Great Hall. Thus the angles of the rectangular courts would be utilised, and the hearing improved; and it would suggest whether the shape of the courts should not be rectangular and hexagonal in all cases; the part occupied by the hench and jury-boxes being rectangular, and the other part three sides of a hexagon. The seats for the bar and the public should be slightly raised, so that every person may be able to see and hear without difficulty; for, unless this be the case, it is almost hopeless to attempt to preserve the quiet of the court.

#### THE PREVENTION OF STRIKES.\*

It will have been already understood, that the member voluntarily ceased to work for the concern founded by M. Leclair, or dismissed therefrom, will not form part of the "Société de Secours Mutuels" &c. on the day of his leaving. The causes of a dismissal from the concern, and consequently from the Society, are: 1, drunkenness; 2, bad execution of work; and 3, the making claims for time badly employed, and as though legitimately due; also all causes calculated to be of prejudice to the concern or to the Society. But, ordinarily, before the delinquent is sent away, these penalties are inflicted.—1. A warning, or caution (*avertissement*); 2. A second warning; 3. After the two *avertissements*, a fine of five to ten francs; 4. After the former fine, one of from 10 to 20 francs; 5. The final dismissal of the individual. In the extraordinary case of dishonesty clearly shown, the dismissal takes place at once; and the indi-

\* See pp. 737, 758, 774, 811, 843, ante.

vidual, as before stated, has no claim to be indemnified his admission-fee. Mention is made on the Society's registers, of the date of the dismissal, as well as in the *procès-verbal* of the following sitting of the council.

Every member changing his residence is to make a declaration to the secretary, in forty-eight hours afterwards, on pain of a fine of 1 franc 25 centimes, should he be the holder of any office; and of a fine of 75 centimes, if otherwise. Members of the Council not present at the opening of a sitting, pay each a fine of 1 franc 25 centimes; and their *adjoints* duly called to replace them, if absent during the whole sitting, pay each 2 francs 50 centimes instead of the other fine. However, in the latter case it is mentioned that there are legitimate motives of absence, such as known illness, works at more than 10 *kilomètres* from Paris, and the service of the national guard. A visitor is fined 1 franc 25 centimes for each dereliction of duty.

Each member has the right, and it is at the same time specified for him as being a confraternal duty,—to visit a comrade who is on the bed of pain, to fortify him in his sufferings, and console him in his affliction. But the extra-official visitors are to record their visits upon the paper.

Every infraction of the rules, and all injury done, by one or many members, to the interests of the Society,—as all prevarication on the part of a functionary,—against which there is no penalty clearly set down in the rules, is submitted to the Council; who may inflict a fine of 50 centimes to 4 francs.

The general assembly, or annual meeting, is convoked on the last Sunday in March, or first Sunday in April, to receive the report of receipts and disbursements. Respecting meetings of this character, held on the Sunday,—as they are very commonly,—it should be observed that the "desecration of the Sabbath" is not exactly the offence that it would be with us; since there are religious services every day, in the churches. On the occasion of the meeting, the requisite documents are handed to annuitants; and the vice-president, secretary and treasurer, and their *adjoints*, will be elected. The ordinary members and visitors not attending, will be fined 2 francs; or the superior members of the Council, 4 francs.

Finally, under "*Dispositions Particulières*," after mentioning what has been already referred to about the non-dissolution of the Society, whether by the death of M. Leclaire, or the extinction of the concern founded by him, there is the "*Article*" reserving the rights of the workmen and *employés* of the establishment, and of their widows and orphans.

The "modifications" of the rules, submitted in 1864, refer to some seven or eight different matters, and chiefly to some that have not before been mentioned. By these modifications, recompenses in the form of medals would be granted by vote of the general assembly, to the workmen, *employés*, or apprentices, members of the Society or not. To these medals would be attached, exceptionally, allowances of money,—whether each in one sum, or as an annual subvention, or annuity; of which the *minimum* would be 10 francs, and the *maximum* would not exceed the amount of the pension to which the individual would have had a right had he been a member of the Society. Medals of this kind would be given to a pensioned member, having at his charge a family for whose wants his pension would not suffice; to the widow of each member, should he die; and to the children, become orphans; also to a workman, not a member of the Society, who after long services given to the establishment, might find himself unable to work, before having reached the age that would have given him right to the pension; and, finally, to apprentices distinguished for their good conduct and capacities.

The same document mentions eighteen years of age, as the time whence the years of service giving right to admission to the Society could be counted. It states that the workman or *employé* called to serve his country, would not be considered as having quitted the establishment,—his time of absence being simply deducted from the years giving right of admission. It also specifies the register of marriage as sufficient for the admission; whilst it still requires for bachelors, the register of birth. The president of the Society, after M. Leclaire, proposed to, and named by, the Emperor, is to be a stranger to the house-painting establishment.

The document also mentions the library,

formed for the Society; and from which, all the members, as well as workmen and *employés* of the establishment not members of the Society, can have books for home-reading. This library contains about a thousand volumes. Some of them were given by the Minister of the Interior and other persons; but the general number were purchased following the catalogue of a society, the *Société Franklin*, called after the founder of popular libraries; and which has for its object the propagation of these institutions in France. The library is situated in the Rue Cardinet, No. 54, in the seventeenth *arrondissement*; and there, have been commenced the courses of lectures and instruction, already spoken of; and to which we may again refer.

A tabulated statement before us, gives an exact picture of the results of the Society's operations. Thus there were last summer, fourteen persons, including one widow who had been attached to the "*Maison Leclaire*" for more than twenty years, who had become pensioners; and there were ten others, members of the Society and non-members, who had acquired the right to the pension, but had not claimed it. It results from the rules of the Society, that all workmen of the establishment are not necessarily qualified to belong to it; but there are rules, nevertheless, giving to the individual, not a member, who has injured himself in the service, a certain assistance, and to one who has exhausted his strength, having remained attached to the establishment for twenty consecutive years, and having reached fifty years of age, the same right to a pension as if he were a member: only in case of illness, the latter would not receive the two francs a day, the medicines, and the visits of the physicians.

Amongst the fourteen pensioners, "*ventiers*," or annuitants, there is first the widow, "*Madame Venne Poulain*," of the "*Rue du Chemin de Roude de la Gare d'Ivry*," 78. Her half-pension, 200 francs (8*l.*), was granted on the 23rd of January, 1862, after the decease of her husband, whose pension was of 400 francs. Then comes "*M. Esnu*, *Rue de Chevreuse*, 3, à *Issy*," whose pension, of 300 francs, was granted on the 1st of March, 1862, (he being infirm prior to the age giving him a right to a pension); whilst it is stated that his wife having become powerless at the date of the 27th of May last, there had been temporarily voted a supplementary pension of the same amount, or so as to make in all 600 francs (24*l.*). "*M. Boutry*, *Rue des Sept-Voies*, 3," having been (masters and workmen, pray note the fact.) thirty-two years in the service, a pension of 400 francs (16*l.*) was granted him in 1862; and being no longer able to work, a supplementary pension of 400 francs was voted temporarily, or making up equal to 32*l.* The next two on the list, after twenty-eight years of service each, continue working: one has a pension of 300 francs, and the other of 450 francs. A workman named Couerhe, after the same length of service, received a pension of 400 francs on the 1st of February, 1864; but as he was not in possession of all his faculties, a supplement of 400 francs was voted temporarily. We need mention only another instance, that of *Mademoiselle Lise Hatine*, cashier,—for, in France, a woman can earn an honourable livelihood by something else than needlework and teaching, and has a head for arithmetic; this lady, after twenty-seven years of service, had a pension of 450 francs (18*l.*) granted her on the 1st of August, 1864. She has now retired from her duties. The ten workmen having the right to, but who had not in June last claimed, the pension, have been at work in the establishment for periods ranging from twenty-five to twenty years. Some of them are not yet fifty years of age. Each year, other workmen will arrive successively in the position of having the right to the pension.

We will not examine to the bottom of a question that may have presented itself to some readers, in going with us through the particulars of this Provident and Mutual Aid Society that is constituted of the members of M. Leclaire's establishment,—namely, whether the power which the benevolent founder of the Society has felt obliged to retain in his hands, would in this country be deemed not of the colour of constitutional government. The Frenchman, it has been well said, demands first, and before either sort of government, to be governed: if there be a manifest governing, he is tractable; and, truly, where aims and judgment of the acting powers are good, he cannot fail to reap some benefit from the state of things. The Englishman, on the contrary, has to think for himself: he is edu-

cating himself in the course of the thinking; but he is apt to take wrong courses,—in the prosecution of his ignorance. We therefore cannot yet say whether M. Leclaire's rules could be exactly applied here. In the view of the immediate "*Prevention of Strikes*," we might wish they could: in that of the training of men, we might be told that the longer course, not free from stambling-places, could present the most material of self-improvement to be gathered by the traveller that way. Still we cannot help thinking, that there is a light of suggestion in which M. Leclaire's regulations are to be regarded. The almost absolute power of management, both in his own establishment, called the "*Maison Leclaire*," and in the Provident Society, has been accorded to him by the workmen, in a correct view of the individual master, and of their interests. Do the facts tell both ways in the question as to co-operation as a remedy for the evil of strikes? The inquiry must be answered by our readers, for themselves. The head of the Leclaire establishment has multiplied the guarantees for good conduct of his workmen; but probably never since strikes were invented, were there instances of men attaching themselves to a master, and being so much elevated by their relations to and with him, such as the instance we have here. The men must surely have felt satisfied with their position. That position allows them to receive something out of profits, beyond what they receive as wages; and, above all, it establishes, in every way, a bond with the master, instead of a prospect of being cast adrift. What have been some results of the position, apart from the absence of strikes,—or results on the men themselves,—the testimony to M. Leclaire, heretofore quoted by us, has shown. The tendency of all the particular rules is to allow no place for men of inferior character or skill; but much of the effect must be due to the co-operative principle. The old relation of master and servant may exist, and be required for long time to come; but the inferior workmen will be found in establishments preserving that relation, and the superior in those of another class, just as Mr. Mill has predicted.

#### NOTES ON SOME OF THE CASTLES AND OTHER BUILDINGS OF NORTH WALES.

That branch of the antiquary's research which has for its object the examination of our ancient edifices, is one that is closely allied with the pursuits and studies of the members of the architectural profession; and for the archaeologist, few districts possess greater attractions than that which lies between the cities of Conway and Carnarvon, along the shores of the Menai Straits, with Druid Anglesey on the one hand, and the wild passes of Penmaen Mawr on the other. One word here, however, respecting archaeological studies; the true value of which appears to me to consist not so much in supplying architectural standards from the works of the ancients, to be copied line for line in the buildings of to-day; as in the power they possess of giving a proper direction to art-labour, and eliminating those grand and unchanging principles upon which all true architecture depends; for the mere abject copyism of forms and outlines can never impart new life to modern art; but the gentleness, the vigour, the patience, the suitableness of means to their ends, that may be derived from such studies, are the elements which should invest them with a living interest and practical value. In our ancient buildings there exists a delightful element of self-ahnegation that is truly refreshing; and who does not love to linger in the old aisles, and shadowy cloisters, and on the lichen-bannered castle ramparts. Do not the grey walls and the green soft garb delight and refresh the wearied vision after the peopled city and its flaunting streets? How much might be done for our modern towns by the infusion of some little of the ancient art-spirit into them! How very charming, even in decay, are all our old Gothic cities; for when the law of self-preservation compelled our forefathers to reside within their walls, and suburban villas were an impossibility, the thoughts of the architect were directed to the great aim of rendering the street forms which were ever before the eye pleasing and lovely, honest and true; and these remarks have special reference to the garrison towns founded in Wales by King Edward I., and also to the lordly castles erected by him for his own and their protection. While leading the Crusades

in the East, Edward had become imbued with an enlightened passion for architecture, and a desire to liberate it from the severities of the feudal ages. An intense morose selfishness characterizes most of the earlier strongholds; and the English castle had heretofore been made to possess as grim an aspect as the situation would permit: from the portcullis, with its spiky teeth, to the frowning watch-tower, with its spectral heacons, all was alike heavy and forbidding. With Edward I. the tendencies of the age became more municipal, and art, whose movements had in England up to this time been regulated by the narrow principles of feudalism, dawned with a brighter promise, and began to flourish, as she ever does, with and for the liberal and the free. In founding the towns of Conway, Beaumaris, Carnarvon, and building their stately castles, with their beauty of outline and dignity of aspect, Edward I. broke through the ancient barrier and inaugurated a new era in the architecture of our country. He had not yet returned from the Crusades, and in the act of destroying had learned the art of building a more commodious description of castle than that of which Roman, or Saxon, or Dane, or Norman, had left the vestiges in our island. And although a great English had addressed Edward's memory in the words,—

"Ruin seize thee, ruthless king,  
Stout Gloster stood agast in speechless trance,"

we architects must, at least, do him the justice to say, that for his castles in Wales, and the beautiful crosses in memory of his queen, the devoted Eleanor, we owe the memory of this monarch a lasting tribute of gratitude and praise. Foremost among these structures is the glorious Castle of Conway (anciently called Aher Conway). As we approach it, the effect produced upon the imagination is peculiar and overpowering; one seems to be suddenly borne back to an earlier age: that grey-green tone of colouring which invests it, made up of lichen and ivy, and the cranny-loving wallflowers and graceful dancing ferns; the arching and almost unbroken enclosure walls of both castle and town, ramping, as they do, boldly from slope to slope; the great birds alighting confidently upon the nodding turrets; the soft fallow grass of the terraces; and the quiet vastness of the whole, speak to the mind otherwise than of modern hurry, modern noise, modern meagreness of conception and smallness of endeavour. And is not the contemplation of such structures calculated to exalt the mind to loftier standards of thought and purpose? They are, indeed, like the old cathedrals—vast, absorbing, inspiring, profound. To sit down here, in student fashion, and sketch these noble towers and gleaming turrets,—these shadowy window ranges, giant corbels, and vast, deep gateways, cannot fail to bring one's art feelings into sympathy with the great elder brethren of our glorious craft.

Conway Castle and city form a vast group, still possessing intact all the characteristics of a strong military station; the enclosing walls are a mile and a quarter in circuit, with four gateways and twenty-one small towers, built at bow-shot range apart, the whole being encircled by a deep wide fosse. Let your imagination supply the drawbridge and portcullis, and enter the castle with me, by the great western gateway, and, *en passant*, observe the little salient opening into the fosse, or ditch, of the balium. King, in his interesting work on ancient castles, informs us, that sometimes the sly old castle builders inserted in their outer walls the imitation of an old hocked-up doorway, or sally-port; and that, in a position where the walls were in reality the thickest, strongest, and best protected, so as to mislead their assailants, who, supposing that they had there discovered a vulnerable point, brought their moveable towers, catapults, petards, hattering-rams, war-wolves, and saw-machines, to bear upon the quasi-doorway, while the besieged were gaining time within, and strengthening the really weak and unprotected portions of the fortress. We pass the enormous malcolated and embattled gateway, telling of showers of molten lead and huge stone missiles hurled down upon the assailants; and the first tower or outwork we come to is the barbican, transposed, no doubt, from an Eastern word "harziane," in the mouths of the Crusaders. This tower, built so as to command the approaches to the place, had wide stone seats for the warders, and those keeping what was called "castle guard." Here, in the walls of this outwork, were crenelles, or eyelets, for the discharge of missiles, most of which openings

were deeply splayed inwardly, and some curiously constructed, so as to arrest the whizzing arrow's barb and brazen featherings.

Suddenly we come upon the spacious terraces with their softest carpeting of fallow turf, enamelled by the peeping "eyes of day." That gateway and those terraces were traversed in their turn by Edward I. and the fair Eleanor; by the hapless Edward of Carnarvon; and afterwards, by the still more hapless, and soon afterwards crownless, Richard II., flying from Henry Bolingbroke. At this period the Castle of Conway was kept, we are told, by fifteen men-at-arms and six archers; and here, after the lapse of ages and the change of dynasties, the Round-heads, under Mytton, raised their stern shouts of victory and sang their wild hymns of praise. Samtering along, we come to the remains of the spacious banquet-hall, planned to follow the curving rock whereon it stood. The dimensions seem to have been 130 ft. long by 30 ft. wide, and from 25 ft. to 30 ft. high, with three vast fireplaces, where the giant yule-logs blazed. In this great hall Edward and his queen kept Christmas in 1290, only six years after the building of the castle.

This hall was lighted by nine windows, of goodly proportions; the three opening to the court-yard being, as was usual, much larger than those which were in the outer walls, and so exposed to attack. Underneath the great hall were the vaulted cellars, cool, deep, and reverberating, where the mighty vats were tilted, and the giant sirloins hung.

The noble towers,—one called the King's Tower and the other the Queen's Tower,—must be in turn visited, and, in order to realize their prodigious proportions, measured, examined, and surveyed. Here, also, are the remains of other stately apartments; and above, that charming little groined room called Queen Eleanor's Oratory.

On the outside of the castle we counted eight enormous towers, having their specific appellations; as the Tower Llewellyn, the Broken Tower, &c., &c. The towers are circular on plan, 40 ft. diameter, with walls from 12 ft. to 15 ft. in thickness, all grouted and as compact as adamant; the overhanging tower near to the King's Tower is unsupported, and owes its preservation entirely to the tenacity of its materials. The keep or donjon, always the last refuge of the besieged, is in the second tower on the south side adjoining the great banquet-hall, where doubtless many a captive pined within hearing of the sounds of revelry and mirth.

At the east end of the inner court stood the reservoir, 20 ft. deep and 15 ft. in diameter. When we take into consideration the skill shown in adapting the castle to the peculiarity of the site, the sumptuousness of the outline, and the many strategical excellences it displays throughout, we are forced to the conclusion that the designer must have been not only an accomplished engineer, but also an artist of no mean ability. After standing the brunt of four centuries, the impetuous charges of the Welsh under Llewellyn and Madoc, the wars of the rival Roses, and the hating of the Parliamentary army under General Mytton, the castle suffered its chief spoliation at the hands of the Royalist Earl of Conway, who, in 1665, took away the timber and the lead, under the pretext of repairing some of the King's castles in Ireland. Had Cromwell melted the lead into bullets to slay cavaliers, as was his wont, we should not have wondered so much; but certainly such an appropriation of the materials was neither creditable to the Earl of Conway nor to his master. But, ruin as he left it, it is still a delightful place to spend a summer's day: to repose on the velvety grass, and transfer the castle's wondrous outlines to one's sketch-book, to look over pleasantly in quiet hours hereafter, is in itself an occupation calculated to impart a poetic affluence to even the most prosaic of minds.

The city of Conway has also much to interest: the Plas-mawr, with its great turret, built in 1585; the college; the church, with its decorated screen and "font-stone;" and the graveyard, and its strange inscriptions; and, more wonderful still, Telford's gossamer bridge, and Stephenson's marvellous tube, the descriptions of which have already formed the subject of many a long and elaborate paper.

Between Conway and the Ormshead are scattered many interesting remains. Dyganwy Castle, the home of the early Princes of Wales, and afterwards the site of a fortress built by Hugh Lupus, Earl of Chester, demolished in

1262 by Llewellyn: the lines of the moat may still be traced, and also the positions of the walls. There is Llanrhos Church, cruciform, with oak roof and carved font. Gloddath House, on the territory once belonging to Grifydd ap Rhys ap Grifydd ap Madoc Gloddath ap Madoc ap Jerwerth Goch of Creiddyn. There are also Capel Trillo, and the ruins of Gogarth Ahhey, on the Great Ormshead, once the residence of the bishops of Bangor. In fact, this neighbourhood is overflowing with archeological treasures, and must at one time have been a great centre of civilization and political activity.

A not very difficult ascent from the fashionable watering-place of Llandudno, which is again peopling this long-deserted corner of Wales, brings us to the ancient church of St. Tudno. Here, perched on the edge of the wave-worn cliffs, this little mountain-oratory carries us back to those days when, as a modern writer has said, "The chalices were of wood, but the priests were of gold." The dimensions of this little church are 67 ft. by 16½ ft. Although there are some portions of earlier work, that of the fifteenth century seems to predominate, as in fact it does in most of the ecclesiastical structures along the shores of the Menai Straits. Small and unpretending though they may be, they have all a history, and some marked characteristics, well worthy of the investigation of the archaeologist.

In sailing from Llandudno to Beaumaris, where we shall find another of King Edward's castles, we pass Priestholme or Puffin Island (called from a migratory bird that name). *Punch*, in his cruise, calls it a C. J. Upon this island stand a solitary tower, and the ruins of a church. There exists a tradition that anciently there was a ford at this point across the Lavan Sands from Carnarvonshire to Anglesey, and that portions of a paved way have been discovered at low tide. On the Anglesey shore, as we sail towards Beaumaris, may be seen several ruins; the most conspicuous being the Monastery of Franciscans, called "The Friars," now partially restored. It is said to have been erected by Llewellyn the Great over the grave of his consort, the Princess Joan, daughter of King John of England; there is also Penmon Priory, founded by Maelgion Gwynedd, Prince of Wales, in the sixth century.

The stone used in the suspension and tubular bridges was obtained from the quarries of Penmon. As we approach Beaumaris the scenery is very grand, and looking around we are constrained to exclaim, "How very appropriate the ancient name of Beaumaris," which was "Beau Marais," or beautiful marsh; as also was the name of Teg-Eingl, or "Fair England," applied by the British to the country about Abergelwy.

In 1295 Edward I. built the castle of Beaumaris; it is surrounded by a massive breastwork, having a walk on the top called the Gmner's Walk. This wall has ten circular towers at intervals, looped and embattled; within this wall was a fosse encircling the castle, with the usual accompaniments of drawbridge and hinged portcullis. A carpet of verdure now covers this fosse, where many a hand-to-hand fight occurred of yore, and the arrows flew briskly from the bristling loopholes. Upon the eastern side of this breastwork, it is said, supplies for the castle could be landed by means of a canal communicating with Beaumaris Bay, upon the shore of which, the castle stands; and there is still an old rusty hawser-ring for mooring ships, to be seen near the great eastern, or "sea-gate," as it was called. The castle proper, which stands within the fosse, does not possess either the altitude or picturesque quality of outline that characterise the castles of Conway and Carnarvon, about halfway between which it is situated. Respecting these ancient fosses, there was an ordinance to the effect, "that every man should make a good substantial faggot 13 ft. long, without leaves, for crossing the castle ditch, and that every seven gentlemen, or men-at-arms, should make a good and sufficient ladder, on pain of being chastised at our lord's will."

Beaumaris Castle has huge circular towers at the angles, and intermediate ones of somewhat less dimensions, though any of them appear to have been of the kind that might have "laughed a siege to scorn."

The great banquet-hall is 70 ft. by 23 ft., but from the elliptical shape of the heads of the windows, that light it from the court-yard, it would appear to have undergone alterations at a date posterior to the Edwardian period.

The chapel has a solid-looking groined ceiling,

the only one left in the castles built by Edward I. in Wales (excepting that to the little oratory at Conway); there are lancet windows, one in each bay, of three sides of the octagon; the details are much mutilated. There are clustered shafts in the angles, and a moulded string running around the chapel, about 5 ft. from the level of the floor; between the string and the floor is some decorated arcading with trefoil spandrels. There is one peculiarity here: where the entrances to the chapels are opened through this arcade: the string-course is slightly raised, so as to give additional headway at this point.

There were at the Castle of Beaumaris, when garrisoned, a captain, whose pay was 12l. 3s. 4d., and twenty-four soldiers; the constable's annual stipend being 40l., and the porter's 9l. 2s. 6d. Close to the castle is a street called Rating-row, because the market people used to bring the provisions to the garrison here before offering them for sale in the town. If the sellers were not dwellers in the town, they could demand immediate payment; if they were, it was customary for them to give credit for a period not exceeding forty days. There can be no doubt that Henri de Erlenton, the architect employed by Edward to design his Welsh castles, possessed not only excellent constructive skill, but also much taste, as evidenced by the use of the variously-coloured stones forming bands and quoins, battlements and embrasures relieving the stern monotony of the strongholds. This is the case at Beaumaris; and, glancing for a moment by anticipation at the massive and really grand piers of the suspension and the tubular bridges, one feels disposed to regret that there had not been a little more of Henri de Erlenton's spirit infused, when the materials were at hand and the directing eye of taste alone wanting. The Castle of Beaumaris is now the property of Sir Richard Bulkeley, whose ancestor held it for Charles I. in 1643; and it stands upon the confines of his domain, Baron Hill, and forms a foreground to such a picture as Nature only produces when in her happiest of moods: the shadows of the vast fleeting clouds of autumn seeming to chase one another over the hills, and revel in their wild deep gorges, which here face us on the opposite side of the straits, where arc the sister-hills of Penmaen-hach and Penmaen-mawr (literally, the greater and the lesser stone-ent), and between them the beather-clad frontlet of Voel Lwyd.

Baron Hill House, by S. Wyatt, is situated upon sloping ground in the rear of Beaumaris Castle, backed up by gorgeous woodlands. "A centre and wings" are its chief architectural characteristics; but owing to the grandeur of the site it has a somewhat imposing aspect. In a little temple near the mansion, under the shadows of the spreading oak-trees, is to be seen the stone coffin which once contained the mortal remains of the Princess Joan, in 1195, buried at Llanfaes, as before stated, but which is said subsequently to have served as a watering-trough for cattle; but what of that?—

"Imperial Cesar, dead and tarr'd to clay,  
May stop a hole, to keep the wind away."

There is a charming *bijou* at Nant, or Lady Bulkeley's fairy cottage. You enter by a trellised porch (covered with beautiful climbing plants) a small vestibule, from which opens a pretty room, having its walls and ceiling lined with flowered chintz of exquisite design. This apartment bears the commonplace title of dining-room, though we thought that the fairy dictionary should have afforded a more appropriate designation. This room is furnished in good taste, and looks deliciously cool and *inviting* (all perfectly appointed rooms ought to look *inviting*); but the second room you come to is, *par excellence*, the gem: it is also lined in chintz, the ceiling having a curved form, and running up to the apex of the roof of the one-storied cottage gives the appearance of space and lightness to these apartments. They are crowded with a rare collection of genuine majolica and Sèvres wares, Manheim glass and clear Venetian, sparkling little cabinet pictures, with a vast number of art's loveliest toys, brought together from many a far-off land, to grace this sweet domestic shrine; and flowers, gay flowers, all around. A French casement opens under a rustic arcade, upon which the windows of the rooms look; outside these windows have dressings of bright glossy-green ivy, rooted in vases bracketed upon each side. There is a beautiful garden beyond the arcade, with a glittering fountain lavishing its cool and sparkling showers

over a tazza filled with exotics, approached by a light, fairy-looking bridge; the parterre, if you go in summer or autumn, is a blaze of colour, and hedged round by dahlias and stately bolly-hocks, with their halls and ropes of fire.

Returning to the town, where we will spend half an hour before proceeding to the other great Edwardian castle at Carnarvon, and on the way shall find many interesting remains to visit.

In Beaumaris there is a curious old building, called the Hen Blas (or old palace or place), it was once the mansion of the Bulkeleys, but is now let off to families of poor folk, at a rental of about twenty shillings per annum. On a beam at the entrance to the Hen Blas is the motto, "If God be with us, who shall be against us?" as if to say, more potent safeguard at our portals than the fourfold portcullis or the bastion-towers of a former age.

There is a very peculiar ceiling in one of the apartments. It is formed of wood and plaster, and Elizabethan in character. It has pendants, from which rise curved coxes, slightly emulative of fan-tracery. These are in rows over the whole plafond,—or, rather, they were so until recently, for, not many months back, the present denizens of the Hen Blas were alarmed by half the ceiling coming to the ground with a fearful crash in the night, with a sound like an army of pent-up goblins. The falling of the ceiling has revealed the original roof timbers, consisting of oak principals, which, being well moulded up to the apex, 6 ft. or 7 ft. above the level of the plaster ceiling, suggests the idea that this apartment had originally been a chapel to the mansion, afterwards, in "plaster-and-white-wash age," ceiled as described, and turned into a banquet-hall for the Bulkeleys; and the little cusped Early Gothic windows in the wall, and arched entrance doorway, built up with masonry, add force to this conjecture. The room is now used by a carpenter as his shop; and if his carpentry turns out half as good and strong as the oak roof above his head, he will have laboured to some purpose in the old Hen Blas.

Beaumaris Church is called in a local "Guide-book" "a chaste and elegant structure." Alas! alas! for the proprietaries of local criticism!

It is a grey old square-towered and embattled building, the windows at the east end painfully flat-arched, with rigidly perpendicular tracery. Like most old parish churches, it is rich in the memorials of the generations that have departed, both inside and out. The chancel is crowded with monuments; and in the vestry is a well-preserved tomb, with two sleeping figures recumbent, and lined round beneath with coats of arms in bold relief. By heralds it is supposed to have been erected to the memory of Sir Richard Bulkeley, Chamberlain of North Wales, and Lady Bulkeley, of Elizabeth's time. The church was anciently called "the Chantry of our Lady of Beaumaris." On a plain stone near the east entrance into the churchyard, we noticed this inscription:—

"MEREDITH DAVIES,

Who has been our parish clerk  
Full one and thirty years, I say;  
Must here, alas! lie in the dark,  
Benombed for ever and for aye."

From Beaumaris the road leading to the village of Menai, following the windings of the straits, abounds in the most luxuriant woodland scenery, every turn revealing some new beauty. There are steps raised, and "clearings" formed at such points along the road, as are considered locally to possess the greatest attractions for the tourist; but every lover of nature will discover for himself many others of equal loveliness: several handsome and costly mansions have been here built on the margin of the straits, between the midway road and the shore; they do not all, however, appear to belong to the scenery, as all really successful and characteristic buildings ought to do. One, however, we noticed, that appeared to satisfy this condition, and when afterwards viewed on our way to Bangor, along the opposite shore, it seemed to group boldly with those jutting beather-clad rocks and rich hanging woodlands; its grey stone walls, high-pitched and quaintly domerped roofs, circular-angle turrets and shining vanes, salient oriels, and timbered galleries, seemed thoroughly *en rapport* with its surroundings, and unlike the incubi that one sees springing up hideously along the banks of many a fair English lake, and shining Scottish river, looking unlike homes of taste, comfort, or common sense.

After tracking four pleasant miles of this

road, with many a long loitering and fond-looking back, we arrive at the pretty little village of Menai, with its cottages having their walls and roofs whitewashed. It is a lovely, straggling, hill-side village, with here and there between the houses a bold heathery frontlet of rock, peering down into some deep and shadowy ravine, and the views it affords both up and down the straits are superb. Here we see the suspension and tubular bridges in all their magnitude, but ere crossing over Telford's Marvel, let us pay a visit to the little primitive church of Llandysilio: it is built upon an islet of the Menai Straits, and approached by a winding pathway through a thicket of sombre fir trees, then across a ford which, being dry at low tide, changes the island into a peninsula; but when the waters of the straits have risen, all communication excepting by boats is cut off. Tradition reports, that on one or more occasions a bridal party have been tide-bound in this sequestered little shrine of Llandysilio. Though originally the parish church, it is now used as a mortuary chapel; our guide, a bright-eyed Welsh girl of thirteen summers, insisted upon this edifice being 1,300 years old, and after a careful inspection, we felt how much more easy it would be to believe than to dispute our pretty little guide's authority. This church possesses a very characteristic (or, as the geologists would say, typical) roof, but of extremely simple construction, having deep principal backs resting at foot, upon the walls, with neither corbel nor hammer-beam; they have a slight cusp at the apex, and a collar cut out of the solid (some giant oak it must have been) to a curved line, the ends radiating and dropped down into notches in the backs, and looking like enormous keys to a semi-circular timber arch; the whole is secured by oak pins. All the edges are chamfered, with little square pyramidal-shaped blocks, or wooden nail-heads, left at intervals of eighteen inches along the chamfers, and taking away the monotony of the lines. The east end has a two-light decorated window, being very much buckled, and seeming very much out of square with itself and everything besides, suggests the idea of its having been from the spoil of some demolished neighbouring church, inserted here by the hungry and unskilful hands of the spoiler.

H. H. VALE.

#### RESTORATION OF THE CHAPTER-HOUSE OF WESTMINSTER.

THE meeting which was held on the 2nd of December, in the Chapter-house of Westminster, at the summons of the President of the Society of Antiquaries, will not readily be forgotten by any of those who had the privilege of being present. The worthy object of the meeting, the appropriate character of the spot where it was held, the numerous and noteworthy audience, and the unusually happy character of the speeches, were such as in every way to justify the vote of thanks which was so cordially given to the First Commissioner of Public Works for the loan of the venerable building, and to the Very Reverend the Dean of Westminster for the manner in which he presided.

Dean Stanley opened the proceedings by a clear and succinct *proleis* of the history of the building in which the meeting had assembled, the restoration of which to its original architectural magnificence was the object contemplated. Eight hundred years have passed since the original chapter-house was built by King Edward the Confessor, and the existing walls, or, at least, as much of them as does not consist in the unsightly walling-up of the ancient windows, are of the time of King Henry III. The spot has been the cradle of the English Constitution, the meetings of the House of Commons having been held therein from the first existence of that branch of the legislature as a separate chamber, exactly 600 years ago, to the time when the suppression of Monasteries rendered the vacant chapel of St. Stephen available as a more convenient site.

The Act of Supremacy and the Acts for the Dissolution of Monasteries were passed in this

The church was dedicated on Innocent's Day, 1068—"*Sancti Edwardi cum basilicam S. Petri apud Westmonasterium, dedicari fecit in die S. Innocentii*," &c. The first assemblage of the Commons as a confirmed representation, took place in 1265. Coke asserts, however, that the first parliament was used even as early as 1041. The first clear account of a partial representation of the people (by twelve persons) is dated 1254.—Ed.

very chamber. On the constitution of the new Chapter of Westminster, after the dissolution of the monastery, the chapter-house was not made over to that ecclesiastical body, but remained in the custody of the Government, the meetings of the new chapter taking place in the Jerusalem Chamber. The Chapter-house then entered on the third period of its history as a storehouse for public records, and the late removal of the records to a more appropriate place of safety has left this ancient building in a state of decay and dilapidation, for which, not the Dean and Chapter of Westminster, but her Majesty's Government, are responsible.

Mr. G. G. Scott gave an interesting description of the architectural features of the building, and exhibited a view of the proposed restoration, concerning which and the present condition of the building we have often spoken. So much may be traced of the old work as to render the renewal of the building not a question of opinion, but of care and labour alone; nothing except the details of the parapets and the buttresses being left to the fancy of the architect. Beneath the present building, the walls of which are 5 ft. thick, is a crypt with walls of the enormous thickness of 17 ft. From a straight joint which separates the lower wall into two concentric portions, Mr. Scott is of opinion that the bulk of the subterranean masonry is of the date of the Confessor, the foundation having been enlarged for the new chapter-house of King Henry III., which was co-eval with the Sainte Chapelle in Paris.

Lord Stanhope moved the first resolution, deploring the neglected state of the edifice, and explained that as a national, not an ecclesiastical property, the Chapter-house should be restored by a Parliamentary grant. The Dean of St. Paul's very eloquently and very heartily seconded the motion, and referred to his own association with the precincts, and so long a canon of Westminster, and to the vision which he had long cherished of the restoration of this noble edifice in the character of the vestibule of a *campo santo*, which the Chapter in his time was not indisposed to originate. He said that our two great metropolitan churches were now so full that there was not room for another monument, and that, in the belief that our race of great men was not extinct, it was for the nation to provide a place in which to record the memory of those yet to come.

Mr. Bessford Hope warmed the deserted and chilly structure by his usual genial good humour. He spoke of the objections which, in this utilitarian age, the economists would be likely to raise even to such an expenditure of public money as was necessary for the decent preservation of this cradle of the House of Commons. "But why," said he, "do individuals economise? Public economy must be of the same nature. Is it that they may be misers? or is it not that they may have money to spare for proper uses? Let the financial reformers, then, economise from any source they can a sum of 20,000, or 30,000, for the perfect restoration of a national monument of such unrivalled interest."

Sir W. Page Wood recalled an anecdote which Dean Stanley had mentioned, to the effect that, on the night of the fire which consumed the old Houses of Parliament, Sir Francis Palgrave and Dean Ireland were anxiously watching the progress of the conflagration from the roof of the Chapter-house. At a moment when the flames seemed to threaten to turn in that direction, Sir Francis besought the Dean to let him take at least Domesday Book from its unsafe repository, and place it in the Abbey. The Dean replied that he must write to Lord Melbourne for permission! Sir William spoke of the intense anxiety that was evinced by the crowd of spectators, among whom he was one, when the flames seemed to threaten Westminster Hall, and of the cry that rose on such occasions,—"Oh, save the Hall!" The same feeling, he doubted not, would pervade the whole people of England when they knew that they were called on to preserve, and to hand down in its pristine splendour to their posterity, a building sacred to all who prized constitutional liberty or spoke the English tongue.

Mr. Tite, M.P., and the Dean of Chichester having spoken,

Lord Lyttelton wound up the series of very pointed allusions to the presence of the First Commissioner of the Board of Works which had been made by preceding speakers, by saying that the gratitude which was expressed, by the resolution which he seconded, to that gentleman, was of that class which was the reward of future

favours; and that, now the right hon. gentleman had learned his duty from that meeting, he had only to go and do it.

This called up the Honourable William Cowper, who said that, if he had attended the meeting in his official capacity, he should, no doubt, have been as cold and unresponsive as the walls themselves. He was glad that the building should have been made useful for one day in the year, by being lent for this occasion to the Society of Antiquaries. As a private individual, he took a warm interest in the restoration of the edifice, for which he trusted that some means would be devised; but he counselled the committee who were about to bring the subject before her Majesty's Government or before Parliament, to endeavour to connect its restoration with some purpose of practical utility. He thought a Medieval structure unfit to be the repository, or the vestibule to the repository, of modern monuments; and he thought the proposals to make the restored Chapter-house the casket for containing some of the few priceless records of the past, such as Domesday Book, or the place of meeting of learned bodies, would not induce the House of Commons to vote the requisite funds. If, indeed the public intelligence, or that of the House of Commons, were sufficiently advanced to recognise the value of great public monuments as an important part of public education, the object of the meeting would be victoriously attained. But whether this was the case, the right hon. speaker could not say. The meeting, however, separated under the evident conviction, which was expressed more or less freely by every speaker, that the time had come when, by one means or by another, this most interesting public monument should cease to be a national disgrace.

That this feeling will be contagious with every man of cultivated mind who becomes acquainted with the facts laid before this most respectable meeting, there can be no doubt; not a single expression of dissent or difference of opinion disturbed the cordial unanimity of the speakers and of the audience. To this end, however, we must be permitted to add, that one circumstance was highly conducive. The curious inspection of these precincts, usually so strictly concealed from the public gaze, of which many attendants at the meeting seized the occasion, some of them sketch-book in hand, to avail themselves, took place after the close of the proceedings. Had it been made at an earlier date, there is one remark which some speaker could not have failed to make, which would have rendered the position of the Very Reverend Chairman somewhat less enviable. All honour to Dean Stanley for calling on the Government and on the nation to repair the ancient Chapter-house of Westminster, which has so long passed from the jurisdiction of its predecessors. But in whose charge and custody are those equally ancient and equally neglected cloisters to which a groined and vaulted passage yet leads from the octagonal hall where the meeting was convened? The curious visitor who strayed from the scene, his mind full of enthusiasm for the noble design of Mr. Scott, and of indignation at the vandalism of so many successive Governments, and of the unnatural disregard of the House of Commons for the very cradle of their rights, passed through a vaulted passage into the damp and neglected courts of a building of co-eval date and of equal architectural interest to that which he had been summoned to defend. The doorway which opens from this vaulted passage into the cloisters is of the utmost beauty and very highly enriched. It is probably the gem of the cloister. But it is left in a state worthy of the filthiest monastery of Southern Italy, corroded with the sulphureous smoke of centuries, a reproach, a humiliation, and a shame to whomsoever it may be that is its custodian. Let not an appeal so just and so worthy as the present run the risk of temporary rejection by the invitation of some utilitarian member of Parliament that the House should inspect the cloister of Westminster before they reply to the summons of the Dean, and the meeting over which he so worthily presided, to restore the Chapter-house.

PROPOSED HAMPSHIRE MONUMENT TO LORD PALMERSTON.—At an influential county meeting in Romsey Town-hall, it has been resolved to erect a monument to Lord Palmerston at Romsey; and a committee has been appointed to carry out the purpose of the meeting.

#### COMPETITIONS.

*New Congregational Church, Halifax.*—A new church is about to be commenced on a plot of land near the People's Park, above the new residence of Sir Francis Crossley, bart. A limited competition took place between Messrs. Paul & Ayliffs, of Manchester; Messrs. Pritchett & Son, of Darlington; Mr. James, of London; and a local architect. The design selected was that sent by Mr. Joseph James, the architect of Square Church, Halifax, erected seven years ago, and a view of which appeared in a former volume of the *Builder*.

#### MANCHESTER ACADEMY OF FINE ARTS.

The annual meeting was held on the 30th ult., in the Royal Institution, the president (Mr. W. K. Keeling) in the chair. The chairman said the council had great pleasure in presenting a report which gave unmistakable evidence of steady improvement in the general character and working of the Academy. Some little dissatisfaction had been evinced by some of the students on account of nude models not being provided for their study. The council had considered the question, and were making such arrangements as would remove all cause of dissatisfaction. The honorary secretary (Mr. S. Rothwell) read the report. In it the council stated that the position of the Academy indicated continued success. The number of students had increased during the year, and greater interest was being manifested by artists and architects of this city in their respective professions. The treasurer's account was in a condition more satisfactory than any former year's had been. The adoption of the report was moved by Mr. O. Mercier, who said the Academy's influence might extend if lay members were admitted into the council. After many years' experience, the Liverpool Academy of Art had adopted that plan, and by so doing, had introduced into the council a business element which proverbially artists did not possess. He would suggest that an opportunity should be given for the enlargement of the funds of the Academy, by the admission of annual guinea subscribers as in Birmingham. The chairman said the council would consider the suggestion.

#### THE CONDITION OF THE PUNJAB EXHIBITION BUILDING.

WHEN the Punjab Exhibition had terminated, and the building been emptied of the rare articles with which it had been stored, it was made over to the committee of the Lahore Museum. The *Lahore Chronicle* now says,—

"Two years have elapsed since that event, and in that time the curator has had to re-arrange his specimens no less than five times, sometimes having to remove them partially from the building altogether, in order that it might be repaired, or rather patched up. Upwards of a lac of rupees have been expended on the building from first to last, and yet it is not habitable. The last item of expenditure was Rs. 20,000 to make the 'Hall of Wonders' water-tight and weather-tight, and an entirely new roof was accordingly substituted for the original, which having necessarily been put on in a hurry, was not warranted to keep out rain; but the new roof, although constructed at leisure, leaks to such an extent that during the past rains it was feared it would tumble down in a heap, when the building and all its contents would have been carried away by the flood. Until a roof of corrugated iron be put on the top, we recommend that everything of value be removed back to the old Museum, which, although a mere mausoleum hundreds of years old, is both dryer, stronger, and safer than the Palace of the Great Exhibition Building of the Punjab."

A correspondent from India calls upon us to inquire under whose professional superintendence the faulty structure was erected; and one in London having apparently received the same complaint by the same mail that brought it to us, writes,—"This does not reflect much credit on the Punjab railway engineer who designed and superintended its erection, but is another of the many instances, in India particularly, of the ignorance among railway engineers of the ordinary details of construction. It is a pity, also, to think that such a sum should have been wrung from the pockets of the native population for such a trumpery work."

MATLOCK BATH CONGREGATIONAL CHURCH.—MR. W. HULL, ARCHITECT.

MATLOCK BATH CONGREGATIONAL CHURCH.

This church, now being erected in the immediate vicinity of the numerous hydropathic establishments of Matlock, is to meet the requirements of a large and rapidly increasing population. The old church, situated near Matlock-green, being unsuited to the altered condition of the district, as well as in other respects exceedingly defective, will remain for school purposes.

The new church, as shown in the accompanying engraving, will accommodate 440 persons on the ground-floor, and 100 in the gallery, allowing ample room to each, the internal dimensions being 72 ft. by 34 ft., and the transept adding 23 ft. by 10 ft. on each side. There will be a large meeting-room under, with approach through lobby in the lower portion of the tower. The gallery is approached by staircase in the upper portion of the tower. The church is built of local stone (known as Derby grit stone), with dressings to doors and windows, and all mouldings and tracery are similar stone, of a superior quality.

The principal entrance is from the raised terraco at the south end, the doors opening into a large lobby, and communicating with aisles. At the north end will be a stained-glass three-light window. There is a carved stone pulpit, near to the right of which is the minister's vestry. The roof timbers, gallery front, and pewing will be of Petersburg red picked deal, varnished.

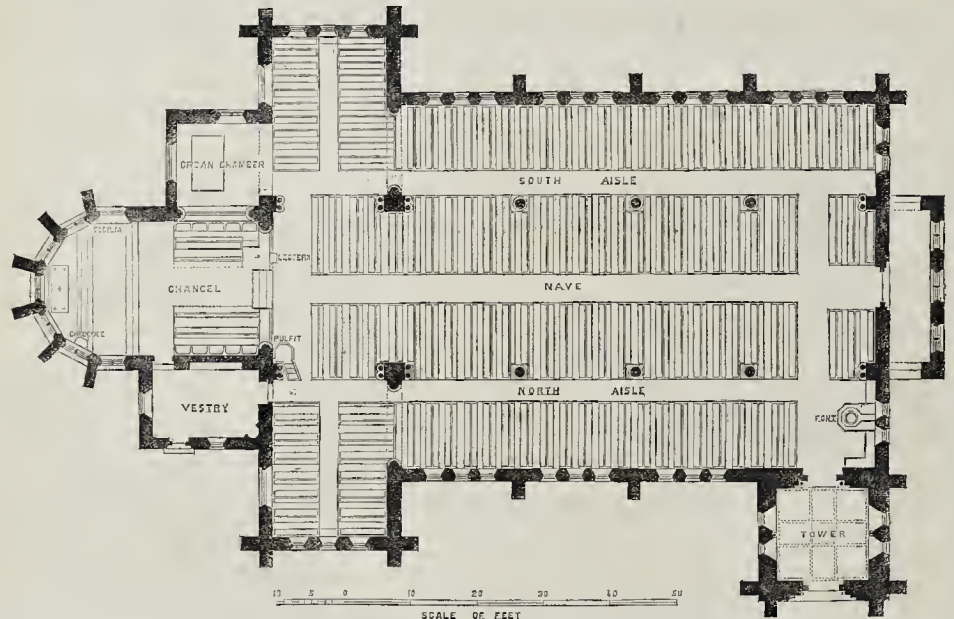

The lighting will be by star-burners, and the warming by apparatus of Messrs. Blake, of Coventry.

The cost of the works, including all usual charges, will be about 2,100*l*.

Mr. W. Hull, of Northampton, is the architect.

ST. JOHN'S CHURCH, MIDDLESBROUGH.

This town, situated at the mouth of the river Tees, has in thirty years grown from three houses to a population of upwards of 25,000. This rapid increase is owing to the discovery of ironstone in the Cleveland hills, and to the erection of extensive ironworks. But, as is usual in such cases of rapid growth, the accommodation required for the spiritual wants of the town has not kept pace with the increase of population. There was but one church in the place, contain-

ST. JOHN'S CHURCH, MIDDLESBROUGH.—Plan.

ST. JOHN'S CHURCH, MIDDLESBROUGH, YORKSHIRE.—MR. JOHN NORTON, ARCHITECT.

In witness's room the flooring was laid level on the ground; there were no rafters. The floor was the height of a table beneath the level of the yard. Three children were the greatest number she ever had living at one time. The jury, after medical and other evidence, returned the following special verdict:—"That George Anson and his wife, Margaret Anson, died from typhoid fever; and that the filthy condition and overcrowded state of the premises engendered such fever; and the jurors further say, that more prompt measures ought to have been taken with respect to the said premises by the district authorities."

In the course of the evidence, Dr. T. Sarvis said that he was called in to the two deceased persons on Saturday week, and found them both delirious in one bed. They had typhoid fever. There was an accumulation of vegetable and other refuse outside the door; the passage and stairs were extremely dirty, the walls dilapidated and filthy; the closet was in a disgraceful state, and the flooring was partly destroyed. The water was quite unfit to drink, through the foul exhalations from the drain and closet. The two persons ill were so surrounded by unhealthy influences that he considered there was not a chance of their recovery while they remained there. Mr. Turner cross-examined Dr. Sarvis with a view to show that it was an actual advantage not to have a dust-bin on the premises, as the rubbish, being thrown into the street, would be removed when the streets were swept three times a week. The witness said that as a matter of fact the same heaps of rubbish were seen by him in the street near the front door unremoved from Saturday week until Thursday last. Dr. Letheby also testified to the filthy and insalubrious condition of the place. The inmates informed him that the water could only be used for washing purposes, and there was no tap to the old tar-barrels, which they had themselves supplied. Mr. Isaac Bateman, assistant-inspector under the Whitechapel Board of Works, said that he had served a notice some time back upon a Mrs. Wearing with reference to this house; but it turned out that it was Mr. H. F. Wearing, of 150, Hackney-road, who was the owner of the property. He was served with a notice on the 24th of October, and with a compulsory notice on Thursday last. There were four house-owners named Wearing, and they gave much trouble. He had served them with nineteen notices since the 16th of August last. Dr. John Liddle, medical officer of the Whitechapel district, said that he had three inspectors under him, and that every house in the district was visited and inspected. Grey Eagle-street was the worst place in the district. Fever and diarrhoea prevailed much there. He had to complain of the conduct of Mr. Wearing with reference to the state in which he kept his house property.

As to overcrowding, this is a most material point in every such case; and they who promote overcrowding are morally inclusive amongst those who commit this wholesale manslaughter which is going on. Railway companies are amongst the greatest of these criminals at the present time. They have of late years been demolishing hundreds of the dwellings of the poor without replacing them, although they might do much to mitigate the evil were they compelled to do so. And why should not they? By the compulsory erection of an equal number of such dwellings, with proper railway access to them, a great deal of overcrowding would be prevented. As it is, the already overcrowded become still more overcrowded; and we need not be surprised if a fearful pestilence break out in the east of London which will rapidly embrace the west itself in its skeleton arms. In Naples, during the prevailing pestilence, members of the highest classes of society have been attacked as well as the lowest, and isolation was found to be impossible, almost every third house having had its patient.

The clerk to the Board of Works for the Whitechapel district, in a letter to the *Times*, says:—"Fifth and overcrowded houses unfortunately abound in all parts of London, and it is almost impracticable to get rid of the one or prevent the other. To do so would require more frequent visits of the sanitary inspector than of the rent-collector; and I am not exceeding the fact when I state that in many parts of this district the attendance of the one at times is as constant as that of the other."

Why should so many visits be requisite? This must surely be from want of power or want of will on the part of the authorities. What we more especially wished, by this quotation, to point attention to, is the fact that, although, unfortunately, fifth and overcrowded do abound "in all parts of London," west as well as east, it is notorious that Bethnal-green and Spital-fields are by far the worst parts of London, as

our own personal examination of these, as well as of many other districts, recorded in the *Builder*, has long since proved.

We cannot conclude without advertising to yet another of those death-dealing causes which require a heroic remedy. Why should the rich in the west end of London sit at ease in their pauperless parishes, while the poor in the pauper-teeming east are left, not only to "bury their dead," but to support their living? Why should it be the poor who support the poor, and not the rich, who should be compelled to do it? Why should not the pockets of the rich Belgravia be relieved a little by the relieving officer of poor Spitalfields? Till this be done, the deaths of thousands of those who expire in their miserable homes in the east rather than go to a workhouse, lie, partly at least, at the doors of the elegant mansions of the west end of London. And this, too, is an evil which, like various others but too intimately connected with our subject, urgently demands legislative interference.

#### THE BUILDERS' BENEVOLENT INSTITUTION.

A GENERAL meeting of the friends and subscribers to this charitable Institution took place on Thursday (30th ult.), at the London Tavern, Bishopsgate-street, for the purpose of electing three pensioners, two males and one female, on the funds of the institution. Mr. Joseph Rigby (the president) occupied the chair.

The Chairman, in opening the proceedings, stated that they had been called together to elect three persons from a list of seven candidates, and regretted that the funds did not permit them to elect all the applicants on that day. That was not his good fortune, but he trusted that some future president would have the pleasure of knowing that there were sufficient funds placed at the disposal of the committee to elect all the applicants for relief from that institution. Having referred to what had been done by the Institution, in promoting in some degree the happiness of declining years, he asked the friends of the institution to exert themselves to the utmost in finding out those who had not yet subscribed, and advising them to render help to the good work which had to be done. Amongst the various branches of the trade, consisting, he believed, of about 16,000 persons, there were numbers who had not associated themselves with the Institution, and he therefore thought that the building trade had not done its duty. He had expressed on a recent occasion that the Builders' Benevolent Institution should be self-supporting, and that the resources should be ample for the exercise of the committee in the careful carrying out of the good work they had at heart; and it was desirous that none who applied for the benefits should go away unsuccessful. Unfortunately that day, of the seven candidates only three could be elected; but he hoped that those who lost on this occasion might be elected on the ensuing, which would be in May next; and he urged upon them the necessity of exerting themselves individually, for no person could plead so well as the person in such a case affected. There were several gentlemen, he said, who, he thought, might very reasonably be invited to assist them, for they really were connected with the building trade. He meant civil engineers and architects. Having further referred to the large resources of the trade, he again urged that renewed exertions should be made to obtain new subscribers; and, after some cheering words to the candidates, he concluded by declaring the poll open.

The following were the successful candidates:—Joseph Treveltham, aged 71, carpenter and builder. He was incapable of working through paralysis, and was entirely dependent on relatives and friends for support.

Joseph Seaman, aged 68, builder, &c. Age, infirmity, and loss of business caused his distress.

Lydia A. Goodwin, aged 74, widow of a late pensioner. She was unable to work from inward disease.

Mr. George Keyes, in the absence of the chairman, announced the result. He congratulated the Institution on its present position, and referred to the comfort which it afforded to the recipients of the benefits. He spoke of his being connected with a company that had almshouses; and two of the pensioners on the Builders' Benevolent Institution, a man and a woman, were inmates; so that from the combined benefits they were exceedingly comfortable. He wished the Institution every prosperity, and hoped that, through the energy recommended by its worthy chairman, they would obtain a large number of new subscribers.

Mr. Joseph Bird having returned thanks on behalf of the successful candidates, the usual complimentary votes were passed, and the proceedings closed.

#### ARCHITECTS' CHARGES.

Sir.—On turning over my file of *Builders*, after prolonged absence, I have been amused and instructed on perusing consecutively the correspondence relating to architects' charges. An insinuation appears to have been thrown out by some anonymous correspondent that the practice of charging on the average of tenders, instead of on the lowest, was not perfectly right according to the universally accepted rule which governs all architects' proceedings. Where upon Mr. T. Harris candidly states that he charges on the average of tenders; what is more, justifies it; and moreover, wishes the question of architects' charges to be thoroughly ventilated. Thereupon, Mr. E. L. Garbett occupies four columns with quotations from books, and lawyers, and auctioneers, and brokers, with much intensely virtuous indignation of his own as to the verbiage (verbiage, by the way, in a double sense) of "professional" men, and "clients," and "traders," in contending that architects should charge, not according to the expenditure and the trust implied by such expenditure,—not according to the market value, which regulates other matters (even a "Paradise Lost" by 51 instalments), but according to the proposed or actual (query which) "results," no criterion whatever being given by which the employer and employed could do otherwise than agree (considering what gratifying harmony prevails in artistic estimation) in the valuation of the "results" as they do in that of the per-centage on cost. Well may "G. W." write:—"I have laboriously sought the full meaning of his remarks, so as to draw some practical inference for individual guidance," and ask for "an intelligible remedy,—one capable of immediate use, suited to the ways of the world as we find them, and so truthful in principle as to admit universal application." To which Mr. Garbett gravely replies:—"Let all be free to charge, each by his own rule, on his own basis, and his own scale: one, if he please, according to the number of nails in a house, or the number of letters in a client's name, or the number of cats met in a day,—with this sole proviso, that it must not be by per-centage on outlay, or on any tradesman's contract; and, I should add, that the architect must not choose or recommend any contractor." Further, he suggests his own scale "the superficial area of flooring;" and with this luminous conclusion, arrived at by merely using another phrase conveying virtually the same meaning (technically a sophism of equivocation), that a per-centage system, or what amounts to such, is, after all, the best and his own system.—I leave Mr. Garbett with the hope that some competent person may be tempted to throw a little of what my Lord Bacon would call "dry light" on aught that is unsatisfactory in architects' charges.

EDWARD L. TARBUCK.

#### ARCHITECTS' ACTIONS.

*Peachey v. Allan*.—This was an action brought by plaintiff, an architect, to recover 46l. 14s. 4d., the balance of an account due to him for services rendered. Mr. Brown, barrister, instructed by Mr. Nixon, appeared for plaintiff, and Mr. Robinson for defendant. Plaintiff stated that about four years ago he was employed by Miss Allan to prepare plans, specification, &c., for building a large house for her. Mr. Peachey told her his commission would be about 60l. This was according to the usual charge of 5 per cent., as his estimate was 1,200l. Miss Allan objected to this sum as being too much, and 55l. were at last agreed upon. This was for the building of the house alone. Afterwards Miss Allan decided on adding a stable, coach-house, and other things, and these extras cost 354l. 6s. 9d. For this she charged 19l. 4s. 4d., making the total of his due 74l. 4s. 4d. Of this he had received 27l. 10s., leaving the balance he now claimed.

Mr. J. P. Pritchett proved that the charges were according to the usual scale. The defence was that the plaintiff had neglected his duties. Miss Allan stated that when she made the agreement with Mr. Peachey, she required him to attend well to the work. She considered that he did not do this, and, in November, 1862, she told him to make out his bill and she would pay him. At that time she paid him 27l. 10s., and considered that she was no more in his debt. She told him then not to come any longer. In the specification it was provided that Memento kind was used.—Mr. R. Litigge, jun., who had been clerk with Mr. Peachey, said he had heard Miss Allan complain of inattention on the part of Mr. Peachey.—Mr. Robinson, builder, said he was told by Miss Allan that he had not to have any more dealings with Mr. Peachey,

High-street, Southwark, to a point west of Southwark-bridge-road, for the Southwark and Vauxhall Water Company. From Southwark-square gas mains had been laid down by the Phoenix Gas Company, and in both instances, in crossing, the arches of the subway had been cut through, and one of the pipes protruded from one to two inches from the under side. In both cases the concreted arch foundations had been broken through, ruining the paving, which he stated would not now last one-fourth the time it would if it had not been disturbed.

After some discussion it was resolved that a copy of the engineer's report be sent to the gas and water companies, and that the subject be referred to the Streets Committee to take such steps as they may be advised to protect the interests of the Board.

#### Parliamentary Schemes.

The chief engineer presented a report stating that the Parliamentary deposits for the coming session of Parliament were unusually heavy, no less than fifty-seven railways and other schemes affecting the metropolis having been deposited with the Board in compliance with the requirements of the Standing Orders; most of them being for projects of an extensive character would require much careful investigation. He suggested that the usual arrangements should be made to enable him to collect materials for the preparation of his report upon these plans.

The recommendations were agreed to.

#### Metropolis Sewage and Essex Reclamation Company.

Mr. Legg moved, pursuant to notice:—  
“That the engineer report to the Board what deviations and additions are proposed to be made to their scheme by the Metropolis Sewage and Essex Reclamation Company, as mentioned in their application to Parliament for the proposed to be raised by them, and how such alterations and additions will affect the interests of this Board.”  
This motion was unanimously agreed to.

### ON STRENGTH OF TIMBER BEAMS.

WHILE studying Barlow's "Treatise on the Strength of Timber," fifth edition, 1851, I accidentally noticed the preface, wherein is mentioned a very important alteration made in the original text by the editor of this new edition. The principle of this alteration runs through many of the pages of the work, not being confined to the page to which the editor refers in the preface. The principle is stated in the following paragraph of Barlow's fourth edition, 1837, page 83; and I have underlined the words most affected in the question I shall put subsequently.

"Hence, then, we conclude, that the deflection of a beam fixed at one end in a wall, and loaded at the other, is double that of a beam of twice the length, supported at both ends, and loaded in the middle with a double weight; that is, the strain being the same in both cases; consequently, when the weights are the same, the deflection in the first instance is to that in the second as 4:1. And when the length and weight are both the same, the deflections will be to each other as 1:32."

The following extract is the way in which the paragraph stands altered in the last edition of 1851, pp. 79-80, as revised by the editor; and I have likewise underlined in it the words most affected:—

"Hence, then, we conclude, that the deflection of a beam fixed at one end in a wall, and loaded at the other, is equal to that of a beam of twice the length, supported at both ends, and loaded in the middle with a double weight; that is, the strain being the same in both cases; consequently, when the weights are the same, the deflection in the first instance is to that in the second as 2:1. And when the length and weight are both the same, the deflections will be to each other as 1:16."

It will be at once perceived that this is a most important alteration. It also causes one to reflect that Barlow must have had valid reasons for permitting his statement to remain in his editions up to 1837, especially as the experiment can be tried very easily. I have done this myself in a rough way, on a small scale, with the result of one finding the strains equal; several times 1:1½; and several times double. I wish to inquire if any of your readers can refer me to any actual experiments on a large scale, elucidating the point in question, or if there be other means of so doing.

A STUDENT.

### CHURCH-BUILDING NEWS.

**Datchet.**—The parish church of St. Mary, Datchet, has been re-opened for divine worship, after having been closed for about five months, in order to carry out sundry additions and improvements. The north aisle has been taken down; two north aisles erected; the nave lengthened about 15 ft., and a new organ-chamber added on the south side of the chancel. The

church may now be considered complete as far as the structure is concerned. Out of nineteen windows only four remain with plain glass; the rest are all filled with coloured glass. The east window of the chancel, one in the south aisle, the west window of the small north aisle, and the vestry window, were all put in by public subscription, in memory of the Prince Consort. These were executed by Messrs. O'Connor, as also was the two-light window in the north transept, which was inserted to the memory of Mr. Crake, who during his lifetime took a warm interest in the rebuilding of the church. The large west window was by Messrs. Lavers & Barrard, and were also five other windows. The two first contracts for the rebuilding were carried out by Messrs. Dove, Brothers, of Islington; and the last was executed by Mr. Harley, of Slough. The style of the rebuilding is Early Decorated. The whole of the works, from the commencement of the rebuilding in 1857, have been executed from the designs and under the superintendence of Mr. Raphael Brandon, of the firm of Messrs. Brandon & Freshwater, architects, London.

**Bradley.**—Bradley Church, near Feckenham, has been consecrated by the Bishop of Worcester. The old church being small, and of very mean architectural character, a new one was projected, and Mr. Hopkins, architect to the Diocesan Society, was entrusted with the arrangements for the new building, the foundation-stone of which was laid by Lady Georgina Vernon on the 20th of April last. The church consists of chancel, nave, and north porch, with tower and spire at the north-west angle of the chancel, into which the lower stage opens so as to form a vestry. It is built externally and internally of a stone from Inkborough, and affords accommodation for 190 persons, and costs £2000. The nave roof consists of plain truss rafters; that over the chancel has arched principals springing from carved stone corbels, and pierced trifolios between the upright rafters above the wall-plate. The chancel arch is simply chamfered. There is an ascent of three steps into the chancel, two to the sanctuary, and a foot-pace for the altar. The sill of the easternmost window on the south side is lowered to form sedilia. The east window, as in all the churches designed by Mr. Hopkins, is kept high up in the wall; it is of three lights, with geometrical tracery, and its inner arch supported by detached shafts. The side windows throughout the church consist of trifoliate-headed lancets, arranged either as complets with a simple piercing between the lights, or as single lights, except on the south side of the chancel, where there are three lancets under one rear-arch. At the west end, set within a deeply-recessed external arch, is a large wheel window of elaborate tracery. An ornamental band of inlaid stonework runs beneath the windows of the chancel and round the tower both externally and internally; also under the west window, but on the outside only. The heltry-stage of the tower has two single lights in each face, and the stone broach spire rises to a height of 90 ft. from the ground. The internal fittings comprise open seats in the nave, stalls and prayer-desk in the chancel, and screen across the vestry arch, all of deal; a plain stone pulpit, iron lectern, and standards to altar-rails, and oak altar-table.

**Clifton.**—The corner stone of Emmanuel Church, Clifton, has been laid. The site of the church is in College-road, adjoining the Clifton College. The edifice will consist of a nave, two aisles, and an apse, and is intended to accommodate from 750 to 800 people. Although the foundation of the whole building has been laid, it is not intended to complete it at present: when the nave and aisles are completed, which are calculated to afford accommodation to 450, it is intended to open the place for divine service, leaving the remaining portion to be completed afterwards, unless sufficient funds are obtained in the meantime to finish the whole. It will be constructed of freestone and red sandstone, the latter being quarried upon the spot. The services of Mr. J. Norton, architect, of London, were obtained for designing the church, and the building has been given to Messrs. Davis & Son, Kingsdown.

**Copley (Halifax).**—St. Stephen's Church, Copley, which was recently consecrated by the Bishop of Ripon, is situated on the banks of the river Calder, and at the foot of a wooded hill, close to the picturesque village of Copley. The entrance to the churchyard is by a lych-gate of wood, covered with a slated roof, and surmounted with a gilt cross. The plans of the church were

drawn by Mr. W. H. Crossland, of Leeds (a pupil of Mr. Gilbert Scott). The plan comprises a chancel with sanctuary, ending in a seven-sided apse, a clerestoried nave of five bays, with two aisles, the porch being formed out of the western-most bay of the north aisle. A sacristy, with organ-chamber above and heating chamber below, is added on the south side of the chancel. The chancel is groined, having enriched stone ribs dividing the vaulting spaces, and supported on dark-brown Devonshire marble shafts, with carved caps. Shafts of red marble carry the inner window arches, and are grouped with the groining shafts. The reredos and pulpit are of Caen stone, enriched with coloured Venetian mosaics, designed and inlaid by Messrs. Heaton, Butler, & Bayne, of London. The floors of the nave and aisles are laid with black red, buff, and grey tiles, arranged into various designs. The chancel is laid with enamelled encaustic tiles by Mr. Godwin, of Lugwardine. All the windows are filled with stained glass from Messrs. Hardman & Co.'s, of Birmingham. The decorations are by Messrs. Clayton & Bell, of London. The carving and sculpture throughout are by Mr. Samuel Ruddle, of London. The church is lighted by a gas corona, entirely of iron, and decorated, suspended from the chancel groining, two standards for the choir stalls, and ten in the nave. The standards are of brass and iron. The church, it seems, will accommodate 450 adults and 220 children.

### DISSENTING CHURCH-BUILDING NEWS.

**Ipswich.**—The new chapel, erected by the congregation hitherto meeting in Salem chapel, Globe-lane, has been opened for divine worship. The chapel stands at the junction of High-street with Crown-street, and is faced with white bricks, with stone dressings relieved by coloured bricks, forming strings, cornices, and arches over the openings. The south front, which is towards Crown-street, consists of the principal gable of the building, which is coped with stone, and has a carved crocket at the apex, finished with iron finial, and a vane rising 56 ft. from the ground. In the centre is the principal entrance, leading through an open porch, with stone arch 15 ft. high, surmounted by a gable and carved finial, to the floor of the chapel: on either hand are similar entrances, but of smaller dimensions, to the staircases leading to the galleries. The wings contain the galleries. On each side elevation there are five double-light windows of stone, 15 ft. high, with tracered heads. The north wing in the High-street front is formed by the gable of the school projecting several feet in advance of the line of the elevation of the chapel. The doorways, windows, copings to the gables, and weatherings are of Caen stone. The roofs are covered with slates and ornamental crests to the ridges. A light iron railing and gates, with ornamental brick piers, enclose the two street fronts. The interior has the roof divided into three spans transversely, with ribs of timber formed into a Gothic arch for the centre span, and hammer-beam trusses over each side span, and five bays longitudinally formed into arches on each side, corresponding with the centre arch, and supported by rows of iron columns. The ceiling is plastered and open to the ridge, 43 ft. from the floor, and is divided into panels by the principal timbers which are stained and varnished. A gallery extends round the four sides, the south end over the porches being devoted to the children, where there are seats for 150. At the opposite end is the pulpit, behind which is the organ gallery and vestry below. The total number of sittings is about 800, in plain open benches of deal, stained and varnished. At the back of the chapel, and attached to it, is the school-room, 60 ft. by 22 ft., and 20 ft. high, and space for two good sized class-rooms. The contract was taken by Mr. Gibbons for 2,040l., from the designs prepared by Mr. Frederick Barnes.

**Wolstanton.**—The corner-stone of a new Wesleyan chapel has been laid in the increasing village of Wolstanton. The plans and designs of Mr. R. Dain, architect, of the Syth, Burslem, have been selected, for a Gothic chapel, of brick—pressed ones to be used for the external faces—with Hollington stone dressings to the principal front. The internal dimensions will be 60 ft. by 33 ft., exclusive of vestry, and orchestra over. There will be accommodation for 280 adults and 160 children. In the centre of the principal front will be an open arcade, communicating with lobbies on each side, leading to the

body of the chapel and to the staircase to the children's gallery, which will be over the entrances. The interior fittings and the roof below the plastered ceiling will be of deal, stained and varnished. The building is intended to be heated with hot water; and the cost of the erection, exclusive of fence-walls, heating, and lighting, will be about 1,300. The contractor is Mr. John Walker, of Tunstall and Wolstanton.

interested in sanitary reform and anxious for its speedy practical realization amongst the poorer order of the industrial classes.

VARIORUM.

Fraser, for December, contains a charming little essay, by A. K. H. B., "Concerning Roadside Stations." His stations, however, are moral ones,—the views and feelings and helics as to which we fancy we have reached the terminus, while, in fact, we have only stopped for a little while at a roadside station! With what a sharp pang the knowledge of this sometimes comes to the heart!—The Christmas number of *London Society* has no fewer than twenty-five engraved recollections, some of them capital. Miss Emily Osborn has joined the clever bevy of lady illustrators who use their pencils for the gratification of *London Society*. Some of the stories, too, are very good.—"Cholera Prospects": compiled from personal observation in the East." By Tilbury Fox, M.D., London, Hardwicke, Piccadilly, London, 1865. We have here a thoughtful treatise, on a subject of unfortunately too great interest at the present moment, by an experienced medical man, already well known as an author, and of good repute in his profession. Were we to regard ourselves as anything like an authority in a question of this sort, we should probably reserve our opinion on some points in which we rather incline to differ with the author; but the treatise is an able one, and will no doubt hold a prominent place in the elaborate discussions and records. The treatise was read in abstract before the Harveian Society, on the 2nd of November, 1865.—F. Warne & Co. (Bedford-street), have published another shilling volume of "Penny Readings in Prose and Verse," selected by J. E. Carpenter, and seemingly very well adapted for their purpose. Mr. Henry Marston contributes some very sensible and useful suggestions to readers and orators under the heading "Elocution considered as an Art." The volumes are not numbered or otherwise distinguished: this misleads buyers, and so is a mistake.—*The Art Journal* closes the year with a very good number, including illustrated papers on Embroidery by the Rev. E. I. Cutts; and Kaulbach by Mr. J. B. Atkinson; Mr. L. Jovitt treats of the Yorkshire Potteries; and Mr. and Mrs. Hall's "Memories" are of George Crabbe. Amongst the engravings is a sparkling presentation of Poole's "Gipsy Queen."—The illustrations in the 1865 volume of "The Children's Friend" (Society & Co., Fleet-street), are even better than they were in the last. It makes an attractive and instructive little volume, sure to be appreciated by the young folks.

Books Received.

*The Municipal Government of the Metropolis.* By a Londoner. Hardwicke, Piccadilly.

The author of this pamphlet proposes to arrange the whole metropolis into a certain number of cities or boroughs, subdivided into wards and parishes, doing away with the division into "districts" altogether. The initial letter of the name of each city and borough, he remarks, would serve to distinguish the separate divisions of the police, and might also be used for postal purposes, viz.:

- |    |                     |    |                |
|----|---------------------|----|----------------|
| C. | for City of London. | H. | for Hackney.   |
| W. | Westminster.        | T. | Tower Hamlets. |
| K. | Kensington.         | L. | Lambeth.       |
| M. | Marlyebone.         | S. | Southwark.     |
| B. | Bloomsbury.         | G. | Greenwich.     |
| F. | Finsbury.           |    |                |

The boundaries of the cities of London and Westminster would be almost identical with those now recognised. The borough of Kensington would comprise those portions of the metropolis that are included within the Kensington division of Middlesex. The boroughs of Marlyebone and Bloomsbury would comprise those parishes that are included in the Holborn division. The borough of Finsbury would be re-named so as to be co-extensive with the metropolitan parishes of the Finsbury division; and the boroughs of Hackney and the Tower Hamlets would comprise the Tower division.

In respect to sub-divisions, the author says:—

"In arranging a new system of sub-division, we should endeavour to make the wards more similar to one another than the present sub-districts are, both as regards their extent and population; to make each ward as compact as possible, and to preserve all well-known local names.

In many cases, two small sub-districts might be formed into one ward. In other cases, a large sub-district might be divided into two or more wards. In a few instances, intricate boundaries might be rectified, without occasioning nearly so much inconvenience to the stationers, as must result from the wholesale demolition of house property for railways and other metropolitan improvements. Having fixed the boundaries of the wards, we should divide them into parishes and combine them into municipal and parliamentary cities and boroughs; and then, abolishing all other modes of sub-division, adopt one simple system for all local purposes whatever."

The proposed eleven boroughs would thus be subdivided into ninety-nine wards; and the parishes new and old would constitute the diocese of London, co-extensive ecclesiastically with the municipal and parliamentary limits of the metropolis.

But if extensive changes are to be made in metropolitan affairs, why not centralize the whole in a mayoralty and corporation co-extensive with the limits of the metropolis, neither superseding the City corporation, nor allowing it to remain as it is, as "A Londoner" proposes; but electing it from the whole of the population instead of from a small though central part of it. Of old the Lord Mayor and Corporation were appointed and intended to represent the entire metropolis. Why should it not be so now, by the mere extension of the limits of election?

*Ladies' Sanitary Association: What can Window Gardens do for our Health?* By ELIZABETH TWING.

"Mrs. Fynnday's Tea Party," or, *Duties of Mother, Mistress, and Maid.*

Published by the Ladies' Sanitary Association, 14A, Princes-street, Cavendish-square; and by John Morgan, 10, Paternoster-row, London.

We place these two titles at the head of this brief notice simply to show that the Ladies' Sanitary Association are still actively engaged in their good work; these being only a specimen of the instructive and entertaining little tracts which they have published since our last notice. The Ladies' Sanitary Association is a most important agent in the promotion of sanitary knowledge amongst those who most suffer from want of that knowledge, and access to whose minds and hearts is difficult to sanitary pioneers without the aid of this admirable Association, which ought to have the material support of every one

ARCHITECTURAL INSTITUTE OF SCOTLAND.—At the annual general meeting of the Architectural Institute of Scotland, held in the Hopetoun Rooms, Queen-street, Edinburgh, on the evening of Monday, the 4th instant, an address was delivered by the Very Rev. Dean Ramsay, "On Fluctuations in Architectural Taste, as especially applicable to Great Britain.

FALL OF A RAILWAY VIADUCT.—The viaduct between Brookholes and Thongsbridge, near Holmfirth, on the Lancashire and Yorkshire Railway, gave way early one morning, causing the railway traffic to Holmfirth to be wholly suspended. Originally the bridge was a wooden structure, but, as it became rotten and insecure, the company resolved to replace the woodwork with stone, and the rebuilding was commenced about twelve months ago. The viaduct consisted of about thirteen arches, and was 200 yards in extent. The masonry was on the point of completion, platelayers were laying the metals, and it was expected that the new double line would be opened for general traffic in a few days. This expectation, however, will not be realised, for, about a quarter to six o'clock on Sunday morning, the viaduct in the centre and the whole of the arches, from one end to the other, fell in with a tremendous crash. It is most fortunate that the viaduct succumbed at this time, the first train to Holmfirth being due at Brookholes at seven o'clock. It is supposed that the foundations of the new viaduct had been weakened by a rivulet which runs through the middle of the arches.

SEWAGE OF TOWNS: DECISIVE JUDGMENT.—In March last a miller at Bailiury, named Spokes, obtained an injunction to restrain the Local Board of Health from continuing, after the 1st of July, to permit the sewage of the town to flow into the river Chertwell, so as to render the water near the plaintiff's mill injurious to the health of the persons resident there. The Board of Health immediately began to take the opinion of eminent analytical chemists as to what could be done towards establishing a system by which the sewage should be deodorised and carried away without making use of the river. Their counsel, however, says, that there are peculiar difficulties in the case, and that no solution of them has yet been found. The plaintiff has now applied for a writ of sequestration against the Board. Vice-Chancellor Wood asks, is a man who throws his sewage into his neighbour's yard, when he is ordered by the court not to do so, to be allowed to come with a story that he has consulted the most eminent analytical authorities, and that no means can be devised for deodorising the filth, and that he cannot help throwing it on his neighbour's property? His Honour says it makes no difference whether the wrong is done on behalf of thousands of persons or of one only. The order was plain and distinct in its terms, no human being could misunderstand it, and it must be obeyed to the letter. He accordingly ordered the writ of sequestration to issue.

MEMORIAL OF THE LATE EARL OF CARLISLE.—An influential meeting of noblemen and gentlemen has been held at York for the purpose of arranging as to the steps requisite towards the erection of a monument to the late Earl of Carlisle. Earl Fitzwilliam occupied the chair, and the meeting was addressed by the chairman and by the Earl of Zetland, Earl Cathcart, Lord Wenlock, the Archbishop of York, Lord Houghton, Lord F. Cavendish, and M. Gaskell. Lord Houghton, in the course of his speech, said:—"They were met to make a memorial for Lord Carlisle. What was the meaning of this memorial? It was that they should raise to his memory something which should carry the recollection of him, and suggest that recollection when they were all passed away. It was the province of art, and of art alone, to perpetuate in this way the memory of great men. Philanthropy stood upon its basis; but for this purpose philanthropy failed. It was art, and art alone, which, in its self-sacrificing nature, and apart from other motives and principles of humanity, perpetuated the memory of distinguished men. He thought they deviated from the just principles of human association on this matter; and if they connected the name of any particular man with any other object, with any other memorial, in a short time that other object or memorial would leave the man, and the memory of the man would pass away." Appropriate resolutions were passed, but no special form or site for the monument was decided on.

Miscellaneous.

ARCHITECTURAL ASSOCIATION.—The next meeting of the Voluntary Examination Class will be held on Monday next, December 11th. Subject, "Plumber, Painter, and Glazier," by Mr. Edmeston.

THE INSTITUTION OF CIVIL ENGINEERS.—At the meeting on Tuesday evening, the 5th of December, Mr. John Fowler, V.P., in the chair, the first ballot for the session 1865-66 was taken, when fifteen Members and twenty-five Associates were duly elected.

THE LATE CAPTAIN FOWLE, R.E.—We content ourselves now with mentioning, with very great regret, the decease of this gentleman, which took place on the 4th inst., at the South Kensington Museum. He was but forty-two years of age. Eminently what the world calls "a lucky man," his death, at this early age, and when the way to fortune seemed straight before him, might be made to point instructive teaching.

ENGLISH OPERA, COVENT-GARDEN.—A charming performance is Miss Pryn's *Angela* in the "Domino Noir." Amber's sparkling music suits her entirely, and, as has always been the case when she has played the part, her audience were delighted from first to last. Miss Thirlwall well contributed on Wednesday to the general success, and Mr. J. G. Patey, who is justly rising in public estimation, sang the part of the gross convent porter to perfection. A new opera in one act, by Mr. C. Deffell, entitled "Christmas Eve," probably intended to go with the Pantomime, is announced for the 13th.

**PLANS FOR PRIVATE BILLS.**—Yesterday the list of plans deposited at the Private Bill Office of the House of Commons was issued. The number deposited to the 30th ult. was 450, of which 334 related to railways.

**PROPOSED PNEUMATIC RAILWAY UNDER THE MERSEY.**—It has been resolved to form a pneumatic railway 25 ft. below the bed of the river Mersey, between Liverpool and Birkenhead. Sir Charles Fox recently gave an explanation of the project to a numerous and influential meeting at Liverpool.

**LANTHONY ABBEY.**—The clergyman calling himself Father Ignatius has, it seems, obtained the consent of the proprietor of the ruins of Lanthony Abbey, in Monmouthshire, to a transfer, by purchase, of the ruins and some land surrounding them, in order that the abbey may be restored!

**THE METROPOLITAN SANITARY ASSOCIATION.**—The new society intend to hold their first conference meeting on Thursday evening, December 14th, at the Rooms of the Society of Arts, John-street, Adelphi. Mr. Thomas Chambers, M.P., will preside, and Dr. Druitt will deliver an address on "The Defects in the existing Sanitary Laws, with Suggestions for their Amendment," after which, discussion on the subject will be invited.

**DESTRUCTION OF DR. TYNG'S CHURCH AT NEW YORK.**—St. George's Episcopal Church is that of the Rev. Dr. Tying, who is known to a large circle in this country. The edifice was commenced in 1846 and completed in 1848. The cost of the ground and building together was 250,000 dollars. The interior was decorated in the most costly manner, and ornamented with various designs in fancy wood work. It would accommodate about 2,000 persons.

**DEMOLITION OF THE COLLEGE, DOCTORS' COMMONS.**—The necessary preliminary steps are now being taken by the Metropolitan Board of Works of granting compensation to the advocates, proctors, and other persons resident, or having a vested interest in the College, Doctors' commons, previous to the early demolition of the ancient building, the site of which is required for the formation of the contemplated new street from Blackfriars Bridge to the Mansion House.

**OPENING OF STRATFORD WORKMEN'S HALL AND CLUB ROOMS.**—This building, which has just been erected in West Ham-lane, near to the Swan Hotel, has been opened by a *soirée* and public meeting. The building is from a design presented gratuitously by Mr. G. B. Marshall, the surveyor to the local board of health. It contains five rooms, to be used separately for reading, chess and draughts, and bagatelle; and at the back is a large hall, fitted up for lectures and public entertainments. In front, just previous to the opening, were planted some choice shrubs, including two *Willingtonia gigantea*.

**THE ANGLO-FRENCH EXHIBITION AT THE CRYSTAL PALACE.**—This Exhibition has been closed. Nearly 200 persons met at dinner, after the closing, at the Freemasons' Tavern; Mr. William Hawes, the chairman of the council of the Society of Arts, presiding. The guarantors, it appears, will have to be called upon to make good a pecuniary deficiency, but otherwise the exhibition seems to have been regarded as successful, and the chairman at the meeting said he hoped the committee which had managed the Anglo-French Exhibition, and the meeting that evening, would try and perpetuate what they had commenced so well, and would go on year after year in their efforts to bring English and French workmen together.

**ST. BARNABAS'S, EDGWARE-ROAD.**—The Bishop of London has now consecrated the church, erected during the present year in Bell-street, Edgware-road, and named after St. Barnabas. The church is capable of accommodating 700 persons, and consists of nave, aisles, and chancel, with an aisle for children, and vestry. The building stands north and south, instead of east and west, but this is owing to the peculiar form of the site. Over the altar is a metal cross, affixed to the wall, bearing in its centre a circular mosaic representing the Lamb, on a gold ground. Above the chancel arch is a figure of the Saviour seated, painted in fresco, and the north window is of stained glass. The cost of the church, exclusive of warming apparatus and decorations, amounted to about 3,600l. Mr. Arthur W. Blomfield was the architect, and Mr. C. N. Foster the builder.

**PLASTERING.**—"R. T." suggests that, in certain cases, the refuse of cocoa-nut fibre might serve, in the absence of hair, to mix with "coarse stuff" as a binder.

**WORKING MEN'S COLLEGE.**—The building fund has nearly reached 400l. in amount, but they help will be found? The number of students is now 509.

**THE PRESTON EXHIBITION.**—This exhibition, which has been eminently successful, was to be publicly closed on the 7th instant. The total number of admissions has been upwards of 160,000, and the receipts amount to about 4,300l.

**ST. MARTIN'S HALL.**—Arrangements have been made with the proprietor of St. Martin's Hall, Long-aere, for the large hall, which will be fitted up as a theatre, to be let for amateur performances only. The floor should be looked to.

**THE SHEFFIELD SCHOOL OF ART.**—The effort now being made to relieve this institution of the pressure of debt has met, it seems, with considerable success. The donations already amount to more than 800l. A respectable addition has also been made to the annual income of the school. We trust the effort will be persevered in until the debt shall be liquidated.

**DEVIZES SCHOOL OF ART.**—At the *soirée* of the Literary Institution recently held at the Town-hall, the prizes to the students of the School of Art were presented by Sir Thomas Bateson, bart., M.P., and the first report of the School of Art was read by the Hon. Secretary (Mr. Wittey). The school commenced on the 4th of May, 1864, and is held in the Grand Jury-room of the Assize Courts. The number of students is eighty-five.

**DUNSFORTH CHURCH, BOROUGHBIDGE.**—The roof of this new edifice has recently exhibited signs of giving way. It appears that the design submitted by the architect necessitated the roof being covered with very heavy stone slating or slabs, said to weigh between fifty and sixty tons; and that this weight has eventually cracked the north wall, which is now a little removed from its perpendicular. The outer walls have been wedged up by heavy timbers, and the stone roof is being removed, to be replaced with one of much less weight. It is said that the cost of repairing the roof will be between 600l. and 70l.

**AN "ANAGRAM."**—"What is an anagram?" writes "Juvenis;" a question that any dictionary would answer for him. But as we happen to have a good one, *à propos* and, we fancy, not generally known, we step down to reply to the question. The word anagram, then, Master Juvenis, compounded from the Greek *ana*, back, and *gramma*, a letter, signifies a transposition of letters so as to form other words:—

"Live, vile, and evil, have the self-same letters,  
He lives but vile whom evil holds in fetters."

But the curious example we would give is this, that the letters in "Henry John Temple Viscount Palmerston" make exactly these words!—Only the Tiverton M.P. can help in our mess!

**RAILWAY COMPENSATION.—Cadbury and Others v. The London and South-Western Railway.**—This was a compensation case, in the Sheriff's Court, for land at Hammersmith. The value of land had greatly increased in this neighbourhood. Witnesses were called on both sides, and the case occupied the day. Mr. Hawkins, Q.C., was for the claimant; Mr. Lloyd and Mr. Gadsden for the company. The claim on one side was 8,569l., and on the other 3,900l. Mr. Under-sheriff Burchell summed up the evidence, and told the jury to exercise their own judgment in the matter. The jury awarded 5,500l.

**MASTER AND SERVANT.**—A carpenter in the employ of the Vale of Neath Railway Company was going up a ladder to a scaffolding erected close by a turntable, when an engine, which was being turned round on the turntable, struck the ladder, and he was thrown to the ground and much injured. The accident was owing to the negligence of the porter who had the management of the turntable. The carpenter brought an action against the company, but the Court of Exchequer Chamber has decided that the plain-tiff and the porter were servants in a common employment, and that therefore the case came within the well-known principle that a master is not liable to one servant for injury done to him by another who was engaged in a common employment with him.

**BORING QUICKSAND.**—The Rybope Coal Company, in sinking their second pit, have again succeeded in passing through the quicksand, 72 ft. in thickness, underlying the magnesian limestone in the county of Durham.

**A HINT FOR LARGE TOWNS.**—The inhabitants of Crantham have determined upon planting trees along some of the principal approaches to their town. Fifty trees are to be planted immediately, to begin with, and more will come in due time.

**BELLS FOR PHILADELPHIA.**—A few weeks ago, Messrs. Mears cast a peal of eight bells, at their foundry, in Whitechapel, for St. Mary's Church, Philadelphia. The bells were inspected by Mr. Thomas Walsley. The weight of the tenor is 22 cwt., and its note E flat.

**MALDON, ESSEX: RESEATING AND RESTORATION OF ALL SAINTS CHURCH.**—This fine old building, which has to accommodate two parishes, is about to undergo some considerable internal alterations, in the removal of the whole of the old-fashioned pews, for which open seats will be substituted. Mr. W. Adams, architect, of Maldon, has prepared the plans, by which additional sittings will be gained, and the structural beauties of the church, which are considerable, will be brought into view. The row of sedilia, and the entrance to a crypt, will be especially striking. The plans will be carried out immediately, the subscriptions for the restoration being very liberal. The indispensable comforts of warmth and artificial light, which have never been scientifically managed, will also receive due attention.

**GREAT EASTERN RAILWAY.**—The committee appointed by the shareholders of the Great Eastern Railway Company, on the 29th August last, have issued a preliminary report, wherein they say that,—"The 'borrowing powers' (subject to the sanction of the shareholders) have been largely exceeded during the past three years; in fact, to such an extent, that the committee cannot conceive any condition of circumstances which could justify, or render even temporarily necessary, so grave a departure from all commercial principles." They are nevertheless prepared "to recommend that the shareholders should sanction the borrowing of the several sums of money mentioned in the directors' advertisement, upon the distinct understanding that, for the future, no such irregular borrowing shall, under any circumstances, take place; but that when the Parliamentary Powers are required to be exercised, the previous sanction of the shareholders shall be asked and obtained." The committee "express their conviction that the small dividend proposed to be paid to the shareholders at the last general meeting had not been earned, and, therefore, in their opinion, ought not to have been even suggested by the Board of Directors."

**TENDERS**

For alterations to Greno House, Messrs. M. E. Hadfield & Son, architects:—

Wilson	£630 0 0
Charr	600 0 0
Rodley (accepted)	578 0 0

For ten cottage houses at Barber Nook, near Sheffield, for Mr. Mitchell, Messrs. M. E. Hadfield & Son, architects:—

Byron	£1,250 0 0
Rodley	1,188 0 0
Butler (accepted)	1,068 0 0

For the erection of a new building, corner of Jewry-street and George-street, Aldgate, for Mr. Robert Heley. Quantities supplied:—

Marsland	£5,900 0 0
Wells	5,171 0 0
Wills	5,153 0 0
Dudley	5,149 0 0
Rider	5,149 0 0
Adamson	5,120 0 0
Hill & Keddell	5,050 0 0
Hart	4,908 0 0

For villa residence, at Surliton Hill Park, for Mr. W. S. T. Sandilands. Mr. R. Roberts, architect:—

Rider & Son	£3,380 0 0
Piper & Wheeler	3,352 0 0
Axford & Walker	3,253 0 0
Sharrington & Cole	3,214 0 0
Colls & Son	3,138 0 0
Coleman	3,010 0 0
Jackson & Shaw	2,965 0 0
Brown & Robinson	2,847 0 0

For alterations to premises, No. 35, Coleman-street. Mr. W. Dawson, architect:—

Conder	£1,496 0 0
Colls & Son	1,423 0 0
Palman & Fotheringham	1,384 0 0
Patrick & Son	1,194 0 0
Woodward	1,111 0 0

# The Builder.

VOL. XXIII.—No. 1193.

Foreign Building Investments.

**H**IEF among the characteristics of the year now so swiftly drawing to its close is the financial position in which it leaves almost every portion of the civilized world. Public debt, everywhere, with one happy exception, more vast in its overgrown proportions than at any former period of its existence, is also everywhere more rapid in its growth, more impudent in its demands, and more certainly menaced by the gigantic and inevitable sponge that will carry ruin and desolation to so many leinthsides.

Turn which way we will, our eyes are met by demands for money, by offers of high terms for loans that are never to be repaid, and the proceeds of which are, in great part, destined to pay the interest on other loans, alike irredeemable.

The names once most venerable in Europe—those of the Emperor and of the Pope,—head the long list of thriftless spendthrifts, differing, it is true, in this respect, that the secular prince possesses indeed a high revenue, but carries on an expenditure on a scale of at least a third in excess; while the ecclesiastical sovereign, shorn of the greater part of both income and subjects, cannot pretend to any certain revenue adequate to meet the most modest requirements of the Roman Court.

Nor is the desire to improve the wonderful discovery of William of Orange—the possibility of borrowing without even the promise to pay, which has involved Europe in public debt to an amount exceeding four thousand millions sterling, and enabled the sovereigns and ministers of our time to keep under arms more than four millions of men,—confined either to the old world or to the pale of Christendom. The rapid growth of the debt of the United States, in a period of little more than four years, to a point at which its annual pressure equals that involved by the colossal obligations under which so many years of foreign war have laid Great Britain, is a phenomenon altogether without precedent in the history of the world. And eastward, by the waters of the Golden Horn, that sovereign who, if he cease to be caliph, can hardly expect to reign as king, is eagerly violating the law of which he is the supreme administrator, in his haste to acquire the civilization of debt.

The demands of pope or of sultan, of emperor or of king, for more money, for a fresh loan, to set everything straight, and for which, by way of showing how straight matters are on the point of becoming, they will begin by paying the fortunate contributors a safe and certain 10 per cent. per annum, are not, however, matters which very specially concern ourselves. But in the universal eagerness to borrow, nets are spread of every size of mesh. Finance companies promise to work miracles, and to enrich their shareholders by a magic performance which few of the expectant members can even dimly understand; and as food and sus-

tenance to the finance companies, sharing in their prestige, and affording a presumed basis for their gains, is the daily increasing number of companies for foreign enterprises, for rebuilding the cities of the continent of Europe, or for stretching long lines of railway over countries sure to be densely populated in the future, if nothing should happen to prevent it.

To schemes like these the prudent man will give more than casual attention before he adopts them as investments. It is not to be said that all English schemes are sound. Nor will we say that all foreign schemes are to be avoided. Far from it. But in any *bona fide* English scheme the subscribers have at least the certitude that they are acting within the pale of the English laws, which, if they do not themselves understand, they can, at all events, have explained to them in their own tongue by able English counsel. How different is the case with regard to the most promising foreign concession those who have most experience in these matters can best tell. But it is not to these men that the Concessionnaire is likely to address himself, nor are the names of persons experienced in foreign undertakings those most conspicuous among the promoters of the various schemes (limited) for deriving large English dividends from the rents of foreign towns. The names of respectable professional men do indeed appear in some of these schemes; but it will be seen on examination that, although the mere association of these names may lend so much weight to a project as to allow it to come before the public with some chance of success, the details to which they pledge themselves are, for the most part, extremely meagre, amounting probably to little more than the statement, that if A, B, and C—foreign gentlemen all—carry out their engagements, the Englishmen who find the money to enable them to do so may expect very remunerative terms.

To those who, with their eyes open, will risk their money in schemes of which they can themselves know nothing, and of which no one whom they know can tell them anything to justify their confidence, we have little to say. If they subscribe, as is generally the case, not with a view to carry out the enterprise and to reap the fruits, but in the hope of selling their shares at a premium, the limitation of the shares will be that of their actual loss, unless they be further tempted to throw good money after bad. But the most ready and most pitiable victims of companies that carry on their foreheads the menace of speedy dissolution, or of lingering impecuniosity, are not the would-be clever speculators, but the persons of limited income, and of equally limited knowledge of the world, who think it absurd to draw a safe and modest 3 or 4 per cent. on their capital, when they may so readily receive 9 or 10 per cent. from the new and excellent undertaking to which they see Mr. So-and-So's name attached. It is the modest provision of the widow, the savings of the governess or the school-mistress, the store of the country clergyman against a rainy day, that most surely find the way to the pockets of the promoters of highly-promising companies.

Speed the trowel, indeed! Success to the industry of the builder! Honour to the skill of the architect! It is well to see palaces displacing ruinous hovels, and noble avenues ent through the crowded alleys of ancient continental Europe; but we must be excused for wishing to see our neighbours do their own work, and for cautioning our readers that investments, like charity, should begin at home. Let those of our neighbours who prefer the municipal to the autocratic system emulate the activity of their northern brethren, replace their mouldering fortifications by spruce boulevards, and pierce their historic palaces with glass arcades. The questions of taste, comfort, advantage in every way are for them to decide, not for us. All that wo-

have to say in the matter is, *Let them do it themselves.* Let them find their own money, and spend it, as they are pretty sure to do, however it is found, according to their own notions of right and wrong. We offer no advice to the mere speculator; but on the investor such as we have described, who seeks, and naturally seeks, for the most remunerative employment of his or her capital, we are anxious to impress a rule that is not only general, but, within certain limits, universal, that increase of income from a given amount of money is equivalent to increased risk in its employment. It is true that risk is not loss, but it is the ready and tolerably sure road to it. Persons may be pointed out in those countries where the lottery is still one of the favourite methods of raising the revenue of the State, who have won, and have received large sums from the lottery; but it is hardly necessary at the present day in this country to warn clergymen or widows against investing their savings in a lottery-ticket, even if they have the good fortune to dream of the number that is destined to win the prize. Let them regard in the same light as the purchase of a lottery-ticket the subscription to foreign undertakings of which they can know nothing, unless it be the fact that if those who do know their merits were so convinced on that point as they wish the public to become, they would not fling freely to the foreigner the golden chance.

If any readers such as we have mentioned should still wish to try their fortune in some unusually promising scheme, let us assure them that their money will be very courteously and promptly received, and kept so carefully, that, with the exception of that portion which for a time may be returned by way of interest on the remainder, they are never likely to see its colour again. We can further promise them in return a large instalment of a commodity that is often purchased very dearly by those who despise good advice. They will gain valuable experience,—some knowledge, it may be, of the operation of foreign law, and a much more distinct appreciation than they formerly had of the conventional nature of morality,—or, at least, of the very different point of view from which questions of *meum* and *tuum* are regarded by members of nations differing from one another in habits, in laws, and in speech.

## THE LATE CAPTAIN FOWKE, R.E.

On Saturday last (the 9th instant), Captain Fowke was buried in the Brompton Cemetery. There were gathered round the grave, besides his family, Major-General Sandham, Major-General Matson, Colonel Sir J. Wm. Gordon, K.C.B.; Capt. Du Cane, Capt. Decie, Capt. Andrew Clarke, Capt. Donnelly, Capt. Festing, Lieut. R. O. Jones, and many other officers of the Royal Engineers; also Mr. Henry Cole, C.B., Mr. R. Redgrave, R.A., Mr. S. Redgrave, Mr. Seymour Haden, Sir W. J. C. Robinson, the Rev. A. M. De la Mare, Sir W. Dilke, M.P., Mr. Moffatt, M.P., Mr. Owen Jones, Mr. Digby Wyatt, Sir F. Sandford, MacLeod of MacLeod, Mr. Godwin, Mr. Stephenson, Mr. George Wallis, Mr. George Forrest, Mr. R. Smith, Mr. Thomas Lucas, Mr. T. C. Owen, Mr. A. S. Cole, Mr. Snell, Mr. Burchett, Mr. Sandham, and many more.

The Rev. Dr. Irons, who had known the deceased intimately, read the service most impressively, and in the pulpit of Brompton Church on the following day spoke in strong terms of his character and qualities. Captain Fowke was a devout man, and had concerned himself considerably in parish charities. A touch of melancholy and reserve in his character seems, now that he is gone, to have foreshadowed his early death, the cause of which we may term consumption, ending in the unexpected bursting of a blood-vessel. He was born in Belfast about the year 1823, educated at Woolwich, and received his first commission in the Engineers in 1842, when he was sent to Bermuda. On his return he built the Raglan Barracks at Devonport, which are well spoken of. In 1853, Captain Fowke was made inspector of the Science and

Art Department. In 1854, he undertook the charge of the machinery sent by the English to the Paris Universal Exhibition of 1855, and was, at a somewhat later period, appointed secretary to the English Commission attached to it. In connexion with that Exhibition he wrote two reports: the one on "Civil Construction," we reviewed at length at the time.

At that same Exhibition he conducted a series of valuable experiments on the strength of colonial woods, which, in the colony of Jamaica, had the effect, it is said, of increasing the annual exports of lance-wood spars fourfold, and raising mahoganies from 4,869 ft. to 39,474 ft. After the Paris Exhibition he became the engineer of the South Kensington Museum, and made many additions, not all successful, to Sir William Cubitt's ugly iron building, which all the world now knows by the name we gave to it before a morsel of it had been prepared, in our endeavour, the drawings being before us, to prevent its erection as designed.

The picture gallery designed by Capt. Fowke, in conjunction with Mr. Rodgrave, R.A., for Mr. Sheepshanks's gift of pictures, answers its purpose well in most respects. In this he applied a novel principle to the lighting of picture galleries by gas; and, by the use of ingenious machinery, many thousand gas-burners are lighted every evening in a few minutes. The Vernon and Turner galleries of the South Kensington Museum were built by him, with fire-proof floors, in the course of eight weeks, in December, 1858, at a cost, we are told, not exceeding 3½d. a cubic foot, certainly a very low rate if correctly stated.

Capt. Fowke was appointed, in 1858, a member of the International Technical Commission; when he made, independently, a Report on a scheme for the navigation of the Danube. In 1859, he designed the Industrial Museum, Edinburgh, of which the first stone was laid by the late Prince Consort in October, 1861. A view of the building will be found in our volume for 1862.\* In 1860, the designs for the new buildings for the South Kensington Museum were produced; these, as afterwards improved by their author, are now being carried out, and have been described by us at different times; once, not very long ago, when we touched with candour on their weaknesses as well as on the merits they display. The Dublin National Gallery was remodelled and added to by him. He gave the first general plan for the Royal Horticultural Gardens, which was subsequently modified by Mr. Nesfield. The design for the conservatory, and the design for the south arcades of the gardens, were made by him. In the latter, he introduced terra-cotta with good effect, as he has since done in the Museum buildings. The interior of the conservatory, of which we gave a view in our volume for 1861,† is exceedingly effective; in fact, it is one of the best things of the kind that we know of. While these larger works were going on, various matters were struck out by him which show the activity of his mind. Collapsing pontoons, which are thought to possess considerable merit,—a folding india-rubber bath, a camera, a collapsing umbrella, improvements in a fire-engine, and a travelling scaffold. Then came the large and costly building for the 1862 International Exhibition, a work sadly deficient in the artistic element, but which nevertheless displayed great qualities. We were not of those who lavished unmitigated abuse on its designer, and we still think that the demolition of the noble range of brick-built picture galleries was a foolish waste of money. Illustrations of the building will be found in our volumes, as well as more particularly one of the Machinery "Annex," a very clever piece of economical construction. On a somewhat similar principle he built a drill-shed, for the use of the 1st Middlesex Engineer Volunteers. This was constructed with semi-circular ribs covered with felt; it measured 100 ft. long by 40 ft. wide, was upon brick foundations, and cost, it is said, only 100l. He employed the same principle of construction in the several entrances to the Horticultural Gardens, where they may be seen. It has been asserted that a similar arrangement of woodwork had been previously set forth in a French hook on engineering, but into this we have not examined.

Much of Fowke's work was tentative; he was not afraid of trying; not afraid of new materials or new modes. He was gradually, too, improving his taste; acquiring a better perception of beauty in form; and the last thing he did was the best.

We allude to his design for the Natural History Museums proposed to be built on the site of the Exhibition Building, and of which a plan and view will be found in our volume for 1864.\* This design, it will be remembered, was submitted anonymously in open competition.

In reviewing the designs we at once pointed out the *projet*, found afterwards to be Captain Fowke's, as prominently deserving of reward, and the judges ratified that opinion by afterwards awarding to it the first premium. We may not, however, longer dilate. Suffice it to add the expression of our sincere regret that a career promising so brightly should be prematurely ended.

#### RESTORATION OF CHURCHES IN ROME.

THE Basilica, dedicated to S. Praxedis, daughter of the Christian senator Pudens, and said to be on the site of her house, has pertained since the year 1198 to the Vallombrosan Order, who have here their only monastery in Rome. This church,—*Italic*, S. Prassede,—situated among obscure streets in the Esquiline Hill, has succeeded to another of primitive and almost unknown antiquity, in existence at least as early as 499, under which date it is mentioned in the acts of a council held by Pope Symmachus—the sole reliable notice of it. In the ninth century that antique edifice was fated to disappear by the determination of Pope Paschal I., who had been one of its officiating clergy, and who not only rebuilt, but transferred to different sites the church that still retained its former dedication. A liberal patron of the arts, and promoter of public works, the above-named Pope seems to have particularly encouraged the mosaicist's labours; and in three of Rome's ancient churches are still preserved examples of their art dating from his pontificate—S. Cecilia, S. Maria in Domnica and S. Prassede,—in each of which we see the figure of a *spasmodic* nimbus,—sign of his being among the living when these works were wrought. As to style all these mosaic compositions present, indeed, unmistakable evidences of an epoch of advancing decline in art; but those at S. Prassede possess a certain religious grandeur that strikes the imagination. From the ninth to the fourteenth century, it seems, the building so dedicated stood, with its main features unaltered; but, like many other churches, fell into decay during the papal residence at Avignon; and was restored, about the middle of the fifteenth century, by the architect Rossellini, under Nicholas V., a pontiff who energetically applied himself to the repair of the numerous sacred buildings become ruins through the neglect of his predecessors at about the same epoch. Unfortunately the basilica in question was subjected to restorations of a later and (as to the arts) a much worse period, by order of its cardinal titular, the saintly Carlo Borromeo. Then was built the present meaningless façade, and a staircase leading from the street to its level. The transepts were sacrificed by the formation of a lateral chapel and two galleries, supported by antique columns laterally to the choir; and a canopy resting on four porphyry pillars was raised over the high altar. The ancient windows were walled up, and larger ones, of unsightly appearance, opened in their stead. Still less in accordance with the antique, are later novelties introduced here by another cardinal protector, Mirandola, in 1730; and the frescoes, by different artists of the same century, which now clothe the attic-walls, illustrating the story of the Passion, with colossal angels and apostles in alternate spaces, are altogether insignificant and mediocre. As to the exterior, the only details that can be referred to Pope Paschal's church are the cornices, or rather string-courses of terra-cotta mensole, the heavy quadrangular tower, now overcapped by a modern-pointed roof, and the porch, a good specimen of ninth-century construction, with high-hung arch resting on two lateral architraves and two massive columns of granite with Ionic capitals. Also may we notice in those rounded windows, arched above with large tiles, now all filled up, the characteristics of Early Medieval building. As to the interior, it is only in the elaborate mosaics on the apse and triumphal arch, and clothing the walls of a lateral chapel, besides the still untouched architecture of that same chapel, dedi-

cated to the "Holy Column," that we recognise the works of Pope Paschal. The general aspect is sombre and chilling; even the harmonies of melancholy effect are impaired by the intrusion of modern art utterly uninteresting and commonplace. In the colonnades dividing nave and aisle, several of the granite shafts have been built up within heavy square pilasters, so that only sixteen of those ancient columns are left visible; their rudely-chiselled Corinthian capitals singularly adorned with sculptures of birds, the eagle, the cock, and the dove, in high relief against the abaci. A peculiar feature is the division of the nave into five compartments by four great arches that spring from flat pilasters almost to the height of the ceiling, which is of woodwork in coffers, but without either gilding or any other than chiaroscuro colouring. A flight of steps, each a monolith of *rosso antico*, leads to the elevated choir, beyond which opens the apse with stalls; and on each side of the choir are marble columns, fluted and chiselled with acanthus leaves (no doubt of antique origin), supporting those loggia that form a novel feature quite inappropriate.

The Vallombrosan monks of the adjacent cloisters undertook, during the last winter, a restoration of this interior, still in progress; but it seems they want means for carrying out this work to any extent of splendour,—nor does that hitherto accomplished bear any high promise. One improvement effected is the throwing of a vault instead of a flat-coffered ceiling over the choir; its surface blue, studded with gilt stars; and the remainder of that woodwork in the nave is now receiving similar decoration, in blue and gold, together with the addition of gilt bosses and palm-leaves, diverging in starry form, at the spaces between the panel-angles. The now dingy surfaces of the attics are to be cleaned—we conclude whitewashed, and their frescoes restored. Some examples of monumental sculpture are among this church's interesting contents, and fortunately not exposed to detriment through these had works, the most rich and beautiful being the tomb of a Cardinal Ancherà, deceased 1286, and here represented in sculpture that seems of about the same period, as a recumbent figure, pontifically vested, upon an isolated marble couch, exquisitely chiselled and decorated, with colonnettes, mouldings, and inlaid work of coloured smalt. A Gothic insertion, now to be seen in the cloisters, records the donations of this cardinal to the church, *i.e.*, a golden cross and silver candelabra, under condition of a daily mass for his soul, and a perpetually burning lamp in the chapel, where he reposes in his magnificent tomb. S. Prassede is famous for its relics—the Holy Column, and many others exposed, with pomp, from a balcony at the Vespers of Easter; few, indeed, entitle to one iota of the credence or respect one may pay to the unquestionable memorials of such a man as Carlo Borromeo, whose wooden throne, as well as the table at which he used daily to feed a certain number of poor, are left visible in the chapel dedicated to that saint.

We may allow ourselves a glance at those mosaics on the apse and above both the inner and outer archway of the choir, which fortunately need no touches from presumptuous restorers, and retain their olden characteristics, though not without damage, as is said, through a renovation here attempted in 1832. Above the triumphal arch is the heavenly Jerusalem, encircled by walls of gold studded with gems. Within, at the centre of this mystic inclosure, stands the Saviour holding a globe and cross, between two archangels; while the gates of that city are guarded by other archangels in white vestments; and approaching on either side are numerous groups with crowns in their hands; the two figures nearest to one entrance recognizable, by the type of heads, as SS. Peter and Paul, between whom stands another white-robed angel. Lower, in formally-disposed groups on each side, are other companies of the faithful offering leafy crowns or waving palms, as on their way to the beatific city. But we have to deplore the Vandalism that has in part sacrificed both these groups of the composition in order to the opening of the tabernacles for relics, with galleries in front; and still more inappreciable is the intrusion of the present baldacchino over the high altar, a heavy and unsightly structure, date 1730 (not that placed by S. Carlo), which obstructs the view of that mosaic-clothes a sanctuary from the nave! On the apse is the principal mosaic group, colossal in scale and imposing in effect, however inferior the technical

\* See p. 841.

† See p. 497.

\* See pp. 394, 395.

execution it exhibits: centrally, standing amidst bright clouds, at higher level than the other figures, the Saviour, in gold-woven vestments, with cruciform halo, the right arm raised in commanding action, the left hand holding a scroll; above Him, issuing from the clouds, a hand stretched forth to place on his head a golden diadem set with a single gem; at each side, on a lower level, three figures: Saints Peter and Paul, each presenting to the Saviour a young and magnificently-dressed female, S. Praxedis and her sister Pudentiana, both wearing diadems and offering crowns, their costume probably that of noble Roman ladies in the ninth if not an earlier century; beyond these, at one side, the Pope Paschal I., offering a model of his church, with square halo around his head; at the other side, a young ecclesiastic holding a richly-bound volume of the Gospels, supposed to be St. Zeno. The Jordan, typifying baptism, flows at the feet of these figures; and palms, on the branches of one of which stands the phoenix—symbol of Resurrection—terminate the composition at each end. Above the archivolts of this apse appears the Lamb of God between seven lighted candelabra, seated on a jewelled throne beneath the cross; four angels and the winged symbols of the Evangelists, each with a bound volume, on the same level; and below, the four-and-twenty elders, dressed uniformly in white, offering their crowns in adoration. On a frieze below the group in the apse, is again introduced the Divine Lamb accompanied by twelve sheep, typifying the Apostles; at the extremities the mystic cities, Jerusalem and Bethleem; and underneath are inscribed in gilt letters, verses regarding the constructions and the piety of Pope Paschal. In this whole composition the artistic character is decidedly reflected from antiquity,—the draperies in long massive folds, the quiet dignity of attitudes, and general formality of arrangement reminding one of sculptured relief. The most interesting part of the church's interior is that much-frequented chapel of the "Holy Column," whose walls and vault are entirely encrusted with marbles and mosaics on gold ground—works of the ninth century; and the effect of which gorgeous sanctuary, in the dim light alone admitted, has a mysterious splendour that inspires awe. From its profuse magnificence it used once to be called the "Garden of Paradise;" but was originally dedicated to St. Zeno; afterwards to the Virgin under the invocation, "*Libera nos a penis inferi*," and finally to the column, its precious relic, which, we are told, in an inscription here to be read, was brought from Palestine to Rome under Honorius III., A.D. 1223. The upper part of the walls, as well as the vault, are covered with those antique mosaics that have fortunately preserved all their original character. On their golden ground at the four sides we see,—SS. Peter and Paul standing before the apocalyptic throne, on which is the cross, but no seated figure; of those apostles, the former holding a single gold key,\* the latter a scroll; St. John the Evangelist, with a richly-bound volume, SS. James and Andrew near him; the two daughters of Pudentis and S. Agnes, all in rich vestments, and holding crowns; the Virgin Mary (a veiled matronly figure), and S. John the Baptist standing beside her; again, under the arch of a window, the half-figure of Mary, with three other females, all distinguished by the nimbus, one crowned, one with a square halo round her veiled head, to indicate a person still living; above these heads, the Divine Lamb, on a hill, from which stream the four Paradisaical rivers, and stags (the symbol of desire for celestial truth) drinking of their waters; above the altar, under an arch, the Saviour, between four other saints, without names—figures in part sacrificed (with incredible outrage against their artistic claims) to a modern tabernacle, with pediment and colonnettes, surmounting the mensa; on the vault, a colossal half-figure of the Saviour, youthful, but severe in aspect, with cruciform nimbus, the whole surrounded by a large circular halo, that seems supported by four archangels, solemn figures in long white vestments, with uplifted arms, that stand finely distinct in the dim light. Within a niche over the altar, usually covered by a veil, is another mosaic of the Virgin and Child, with the two daughters of Pudentis, as to which

Ramohr (*Italienische Forsch.*) observes that its ruder execution seems to indicate origin later than the ninth century. The entrance to this chapel is flanked by two columns of rare black and white granite, supporting a beautifully-chiselled marble entablature, evidently antique, above which opens a high-arched window; and around this are carried two tiers of mosaic heads in circlets, the outer comprising the Saviour and the twelve apostles; the inner, the Virgin Mary between SS. Stephen and Laurence, besides eight female saints (all either crowned or veiled). Above, laterally to the higher series, two aged heads, supposed by Ciampini to be S. Pudentis and S. Pastor. The effect of this whole elaborate art-work is not improved by the addition of two heads of ancient popes, in fresco, imitative of mosaic, placed below that earlier ornamentation. In architecture this chapel is so singular as to be well worth studying. Its groined vault springs from four granite columns at the angles, with unequal shafts and gilt Corinthian capitals, each supporting a caho-formed architrave and massive cornice of white marble, partly gilt, showing the transition before the final disappearance of these members, after both had become already useless to the constructive whole. On the pavement of fine marble entarsio is an immense disk of porphyry, said to mark the spot where Paschal I. deposited the bodies of forty martyrs, transferred hither from catacombs. This chapel is deemed so sacred that, through one of those strange ecclesiastical arrangements of Rome that seem to have no correspondence with Christian ideas, females are never allowed to enter except on the Sundays in Lent! As to that relic whence it takes its now popular name, the legend is the following:—Cardinal Giovanni Colonna, titular of this church, was sent as legate of the Crusade to Syria, A.D. 1223. Having left the camp for a pilgrimage to Jerusalem, he fell into the hands of the Saracens, who cruelly tortured him, and were about to saw his body asunder, but were deterred by a miraculous appearance; the countenance of the victim becoming radiant with celestial light, whose beams dazzled and terrified. Their hate changed into awe and reverence; their captive was not only released, but received from them a precious donation,—the column (or rather its lower portion only) to which the Saviour was bound for scourging. Some writers, indeed, state that the same cardinal obtained this relic among the concessions stipulated for by the Crusaders, as the price of peace, on the taking of Damietta; and of the miraculous additions to this tale none are given in the learned and curious work by Padre Davanzati ("*Storia di Santa Prassede*," published in the last century). At all events, since the return of Cardinal Colonna from the Crusade, here the column has remained in the place where he deposited it. Three palms in height, it is seen with a lamp perpetually burning before it in a niche encrusted with precious marbles. The preciousness of its material forms one objection to its claims; but it has been erroneously described as jasper, being in reality syenitic granite, of the species distinguished by vivid black stains on a white ground,—hence the term adopted by Italian mineralogists, *granito della Colonna*, for this species generally.

Below the high altar of this basilica we descend, through a grated portal, into a dark crypt, consisting of three corridors, that once communicated with more extensive subterranean, passing (it is said) under the entire area of the edifice, but closed, by order of the authorities, some century ago. That part still accessible has a ceiling in one corridor arched, in the others flat; the whole incrusted with large slabs of different marbles. Near the entrance stand two great sarcophagi, one containing the bodies of SS. Praxedis and Pudentiana; the other, various relics brought hither from catacombs by Paschal I., each sarcophagus adorned by a frieze of coloured intarsio, and one with Christian sculptures in about the earliest style. An altar in this crypt, said to be the identical one consecrated in the house of Praxedis, presents one of the most beautiful examples of Mediaval intarsio, with richest variety of coloured stone and profuse gilding in circles, triangles, bands, &c.\* Above this is a fresco on the wall, which Italian critics ascribe to the twelfth century; others, we believe, to the eleventh century; its subject, the

Madonna between the two Daughters of Pudentis, who both wear and hold in their hands the crown so frequently introduced as alike the sign and the offering of sanctity, the countenances of these figures delicately marked and full of sweetness, the costumes gorgeous with profuse jewelry and cumbrons embroideries that remind of Byzantine details.

The campanile, a square brick tower, which may be ascended by a rickety wooden staircase, seems in the state of incipient ruin; its arched windows, built up so as to conceal the marble tracery now only visible from within; a dreary, ghost-like place, where one might fancy oneself in some ruinous abbey far from the haunts of men; and on the walls we may perceive the faint traces of almost obliterated frescoes, just the outlines of figures and nimbus-crowned heads, from which the colours have completely faded. The masonry of this tower is rude and irregular; perhaps the inference is admissible that both the building itself and those all-but-lost paintings belong to the ninth century; and assuredly the restorers of Rome's modern school might have deemed it worth while to preserve from destruction such records of an epoch but little known through any examples of its pictorial art among Rome's monuments.

A marble patera (erected in its place, within the nave, 1688), is said to mark the spot below which St. Praxedis used to deposit the blood of martyrs who had collected with sponges. Of these witnesses to the truth, it is asserted by the tradition read in two inscriptions on those walls, that 2,300 repose here. St. Carlo Borromeo used to spend hours of the night in meditation above the spot where they are laid in that chapel of the holy column. But other very different memories attach to this sacred building, reflected from the periods of Mediaval violence when no sanctuary was secure, and Rome's annals presented such tragic scenes in the struggle between ecclesiastic and aristocratic power. Pope Gelasius II. was celebrating mass here, shortly after his election, 1118, when the adverse faction, headed by Cencio Frangipane, who supported the interest of the emperor against the pontiff, entered with armed force, seized the person of the royal priest, and with cruel maltreatment, throw him, chained, into prison. A combat took place at the door of this church between the Frangipane faction and the nobles who defended the cause of their pontiff. That illustrious prisoner was soon released, thanks to the fears of his lawless jailer; but, after a few weeks, Gelasius had recourse to an expedient repeated in recent story, a flight to Gaeta, in order to escape from his domestic and foreign enemies, whilst the Emperor, Henry V., was approaching to elect an anti-pope in his place.

The Monastery of S. Prassede was founded by the same pope who built the church, and first occupied by Basilian monks. In its interior that pontiff had erected a chapel to S. Agnes, with mosaic-adorned walls, of which remains not a trace. An inscription still extant states that the cloisters were built by a cardinal titular, in the time of Gregory VII.; but in the architecture actually before us, a quadrangle of arcades, with square pilasters, round a pleasant garden, is no detail stamped with the character of the eleventh century. Mediaval splendours have disappeared from the Roman Valombrosa.

The works that have been in progress for not less than nine years at St. Agostino, the great church of the Augustinian order, erected 1488, are not with a view to any changes in the architectural plan, but for adornment of all principal surfaces, walls, and vault, with frescoes, entirely by the same artist, Gagliardi, who will, it is expected, be here engaged for three years more before his task will reach its final term. In the tribune behind the high altar, in the two lateral chapels nearest, and in the chapels forming the transept extremities, also on the cupola, this adornment is finished, the subjects of the paintings now exposed to view being the Vision of the Deity to Adam and Eve after their Fall; the Coronation and Assumption of the Virgin; the Baptism of St. Augustine; and several scenes from the lives of two Augustinian saints, Thomas di Villanova and Nicholas di Tolentino. Others, in which St. Monica (in the chapel containing her body) appears with her saintly son; and, on the cupola, the twelve apostles, the evangelists on pendentives below. On the vaults of the nave (not yet re-opened) we see David playing his Harp, and the Sacrifice of Abraham; along the attics, six illustrious women of the Old Testament. An arabesque ornamentation,

\* Ciampini ("*Vetera Monumenta*") gives an engraving that shows this figure without the key; a detail, therefore, to be ascribed to the restorers of modern times—surely neither a justifiable nor judicious departure from antiquity.

\* If for the building of the present church a new site was indeed chosen by Paschal I., and the primitive church entirely demolished, this tradition as to the house of Praxedis must of course fall to the ground.

filling interstices on the attics, is very graceful and rich in character. Among the single figures those of the apostles are most dignified. In their technical skill and freedom of design, these paintings generally may be said to display the best qualities of the actual Roman school (one we cannot undertake to eulogize in any high terms); as pertaining to an architectural whole, their effect is striking; but we do not recognise in them the higher attributes of spirituality or serene religious sentiment; and among the various miracles chosen for representation, some are startling to a degree almost offensive; one (a scene where appear two self-moving images amidst a theatrical procession) quite below the dignity of art. One cannot, however, withhold praise from the energies, science, and vigour of imagination undoubtedly possessed by Signor Gagliardi.

At S. Nicolo in Carcere, — a church remarkable for the ruins of three temples, of Hope, Piety, and Juno Sospito, partly comprised within, partly buried beneath it, whose antiquity (we speak of all those Pagan fanes) ascends so high as the Republican period, — the works, commenced about nineteen years ago, are still continuing in slow progress, notwithstanding that we had to report in our pages, about two years ago, their expected completion within the next ensuing season. In its leading features a basilica, on the Early Roman type, this edifice is not to be deprived of that character, though renewed in all decorative details, through the restorations so languidly carried on.

#### THE PREVENTION OF STRIKES.\*

We have more than once referred in our previous papers descriptive of the organization of M. Leclaire's house-painting establishment, to the existence of certain carefully devised regulations other than the provisions of the deed of partnership, and the statutes of the Provident and Mutual Aid Society. In these regulations is embodied what is not the least instructive feature in the organization, namely, the system for the observance of the workmen and employes of every grade, in the workshops, and the execution of work in hand.† It is important, not merely in connexion with the immediate subject of these papers; it is suggestive of means of the production of a better quality of artificers' work than is now to be secured generally, whether from workmen themselves, or the master-tradesmen. M. Leclaire, as we have seen, considered that it was essential to success of his undertaking, that the public should be made acquainted, as far as possible, with the means of recognising, or preventing, frauds; and should be able to estimate the comparative advantages of inferior work, low-priced, and that of the better quality, costing more, but having greater durability. We have seen, moreover, not only from the facts referred to in these papers, but from his researches mentioned on several occasions in the *Builder*, that M. Leclaire's exertions extended to the improvement, in many ways, of the processes entering into the craft of house-painting, and to the introduction of new ones.

It is scarcely possible to do entire justice to the general subject that now concerns us, without some reference to the regulations in that aspect of them which pertains to artificers' work of the particular kind. We must, however, mainly, limit ourselves to what might be adopted in any branch of work connected with building, — only remarking that regulations appropriate to the kind of work should be framed in each case, of whatever trade. The quality of work common in house-painting, has already occupied our attention; and we may have to revert to that subject.

The regulations of which we have spoken, are printed, and are bound up with the statutes of the Provident and Mutual Aid Society, — there being one general index. They extend to rather more than fifty pages; and bear date, 1st July, 1864. We have alluded to regulations which their author had drawn up many years previous; and to which, results, attested as we have seen, of his exertions for his workmen, may be in part attributed.

The regulations now before us, are preceded by a short address from M. Leclaire to the workmen and employes. In the course of it, — after

alluding to the results, which were mentioned in our last article, of the operations of the Society, as regards annuities, — he says: —

"This considerable fact should gladden us all, and give to each member the assurance that the sublime words that our commemorative medal bears, — 'No more poverty for the ailing workman, nor for him whom age has condemned to rest,' — will be shortly, for the workmen of the *Maison Leclaire*, a reality.

This reality is in your hands: its accomplishment depends on you.

Workmen and employes, members of the Society or not, all should say to themselves: — The lot of our families is here; let us then work with courage; let us instruct our children; let us direct them so that one day they may make good fathers of families, good citizens.

Let us teach them all, the respect that one owes to others if one wishes to be respected one's self.

Let us teach them that the liberty of each step towards the liberty of others begins to be touched; let us teach them that the liberty of all is the respect, scrupulous, absolute, for the rights of others, the constant fear of coming into collision with the persons with whom one has relations of interest or not; in fine, that liberty for one's self, as liberty for the others, is no other thing than the putting in practice of that divine precept which says, —

Let us not do to others what we would not should be done to us; and which adds, in tracing for us our duty, — Let us do, on the contrary, to others, all that we would that they should do to us!

The personal, in general, the goodness of the establishment is composed, in general, of our children; let us teach them promptly their business; let us make them comprehend that they owe gratitude to all those who show them how to work; and that, when we would not carry our debt, they are bound, by a good employment of their time, to contribute to sustain the men whose forces begin to give way.

Let us make our education for ourselves; let us act with civility: no divisions between us; no uneasiness in our relations.

Let each one teach the others, by his example, to well do their duties. Let no contradictions be against the established regulations: they have but for object, order and economy of time in operations.

Let us have constantly in thought, that we owe a profound gratitude to the men who direct us; let us encourage them by our efforts to well fulfil our duty; let us facilitate for them, the accomplishment of their mission, by our agreeable relations with them.

They have not need of us; and we have need of them: we should be much disappointed, if at the end of a year, the day after a balance of accounts, they should declare that they terminated their functions.

Their task is heavy, difficult, and delicate: good administrators do not improvise themselves; time is necessary to form them; and, again, all individuals are not apt to well-administer.

It ought not then to escape from our mind that our interests depend entirely on theirs; and that when one has relations of interest with some one, one owes respect mutually; one is bound especially to avoid putting in motion questions of self-interest, the solution of them is always more or less troublesome.

Let our exactitude in work prove to the chiefs of the establishment, that *Saint Monday*, and of old date, is never made a holiday; and that only unavoidable circumstances prevent the Sunday being always observed.

In fine, let us have conscience of our dignity; let us conduct ourselves so as to merit the esteem of persons in whose houses we work. Such are the reflections that I would prevail upon each one to make to himself for himself.

The members of the *Société des Secours Mutuels* are no longer simple day-labourers, who act mechanically, and who quit work before the clock may have sounded its last stroke. All are become partners who work for their own account; in this aspect, nothing to the workshop should be indifferent to them; all ought to look to the care of the tools and merchandise, as if they were specially the guardians of them; and even if disorders, having for result to compromise the interests of the establishment, occur in their presence, they must not refuse them immediately, unless by hierarchical respect they prefer to refer them to those in authority.

The disloyal arms of fraud, which are employed sometimes to sustain competitors, are not our enemies. The more we have to sustain is only more severe in consequence. It is, then, only with a better employment of time in work, and by a good management, that we can offer to the public prices as low as our competitors.

We possess an organization that leaves nothing to be desired. Amounts of capital, intelligence, patronage, nothing is wanting to us; with energy, we can then produce cheaply, well, and quickly, and obtain good results.

In our general assembly of the 13th of March last, I have acquainted you with the ambition that dominates me. At the age at which I am, one is in haste to enjoy. In consequence, if you wish that I go out of this world with a contented heart, it is necessary that you have realised the dream of all my life: it is necessary that after regular conduct, and assiduous work, a workman and his wife be able, in their old age, to have the means that to live tranquil without being at the charge of any one."

The rules, or "Articles" of the "Règlements," relate to the Customs of the Establishment, the Apprentices; the Staff ("Noyau"), the admission to it, and the advantages (including preference as to work in winter) granted to those forming part of it; Conditions to be observed in work, Works in the Country, Regulations for the Foremen, and numerous other matters.

It is observed, that, from the first employé downwards, each one ought to do his best to make up for any omissions of the head of the establishment. If any errors be committed, they are not to be hidden: conviction is expressed that no false step is taken intentionally; but, it is said, he who fears to avow a slight fault, gives ground for the supposition that he commits more serious faults than he hides.

The first "Article" relating to the customs of the establishment requires each man newly engaged to work at the head-quarters, to give

in his little book (*livret*) in which his entrance on duty will be inscribed. Should he have no "livret," a certificate will be given him, to get one. On the first day of the hiring, the "Chef d'Atelier," or shop-foreman, makes him acquainted with the first division, now under notice, of the "Articles." If the workman does not agree to conform to those particular "Articles," he merely completes the one day, — the foreman giving him, at the end of it, a note entitling him to be paid what is due.

Usually, work is suspended on Sundays, and the principal *fête* days. The day is of ten hours; for which the ordinary pay is 5 francs (4s.).

An ordinary journeyman painter in London at present gets 6d. per hour, or 5s. 5d. for ten hours: in some instances, 7d. per hour, or 5s. 10d. for ten hours, would be the rate, — grainers being able to make still more. So that a French workman, coming to this country, might benefit in one respect by the change, — the possibility of which we have hinted at for the consideration of those who are agitating for increase of pay. Indeed we happen to know that M. Leclaire himself has been lately executing work in this country; although he has employed English as well as French workmen. The work of long days begins at six in the morning, and lasts till six in the evening, — two hours being taken for meals. Time occupied in work after six in the evening is not counted as night-work, unless the meal have been taken after six, and work been done afterwards. In case of Sunday-work, one meal only is taken; and the work ceases an hour earlier. Men attached to the division of the "*petits travaux*," which perhaps we may interpret *jobbing-work*, take but one meal a day. The long day, "*la grande journée*," commences and finishes at the hours stated; but there are also the "*noyenne*," and the "*petite*," days, or of middling and short length, according to the seasons and the demand of work to be done. The duration of night-work is eight hours, or from ten in the evening to six in the morning, including an hour for a meal, — the workman finding his provisions.

Night-work is paid for at the rate of 95 centimes (9½d.) per hour; and time in the evening, when not the continuation of daytime, is assessed at the same rate. The English workman would be paid "time and a half" in the evening, or up to nine o'clock; whilst for night-work he would get double the day rate, or say 13d. per hour. The pay-day is once a fortnight. The fortnight commences with a Saturday; and the workman is paid on the morning of that day, for the previous fortnight, ending on the Friday night. Each Friday before the pay-day, or in Paris, the workman on arriving in the morning gives in, on a note printed in form, to the foreman of the workshop, the number of hours he has made in the fortnight, but including the time of the Friday, and his "*faux frais*," or literally, *idle expenses*. The sum total of the latter is placed beneath the total of the hours; but the detailed statement appears on the back of the note. The note is signed by the workman. The foremen, the glaziers, and all the men who have the right to wages of a higher rate than has been stated, have to enter upon their notes, additionally, the number of hours for which they claim this right.

The foremen send all requisite papers to the head-office before noon on the Friday. The glaziers, polishers, decorators, and some other workmen, deposit their notes on the Friday morning in the box at the office. A workman quitting the establishment in the course of the fortnight, receives his money only on the pay-day following the day of his departure.

One of the "Articles," after remarking that in certain circumstances, works are of a disagreeable character; that in others, much activity, and frequent change of workshop, are required; that there are cases where workmen cannot finish what they have commenced; and that there are other cases where it may be necessary to go into the country for a single day, says that these circumstances being independent of the will of the master, and burdensome to him, each one ought to lend himself to such arrangements with a good grace, and without expecting an augmentation of the day's pay. Should the workman not accept such position, it is said, not only will he be regarded as of an uncomplying disposition, but as giving ground for doubt of his qualifications, since the least capable workmen are not those who give themselves few airs, and who bend themselves the most easily to the circumstances of which one is not master. And a following "Article," — perhaps addressed to the case of one

\* Vide pp. 737, 738, 774, 811, 845, 867, ante.  
† "Règlement à observer dans les Ateliers," &c. &c.

who has pride in real skill (a feeling that we could wish were common in England),—says, that when a workman is chosen to do work that is not agreeable to him, his duty is to conduct it to a good end, without seeing in the selection of him anything but a mark of confidence, and without supposing that he is judged incapable of doing better; but that should he have any doubt on the point, he would be bound to ask explanation,—which would not be refused; and that this manner of acting is better than that of losing the day,—like men without principles, who forget that they have a family to support.

The next division of the rules relates to Apprentices; and, as much as any other portion of the "Règlement" it deserves the attention of British workmen. The children of foremen, and of workmen of the "noyau" (or staff), are admitted into the establishment in preference to others. To be admitted, they must have made their first communion (equivalent to confirmation in the English Protestant Church); and they must know how to read, write, and work in arithmetic. They are paid, from the first day of their apprenticeship, or in proportion with their age and intelligence. Each year, commencing with the time when the "grande journée" begins, their pay is augmented proportionately with their deserts. Orphans, and those who form part of a large family, may be paid more than the others; and it is observed that the others should not regard this as injustice, but should on the contrary approve. There is no condition as to the duration of the apprenticeship: the apprentice may be dismissed by the head of the establishment, or be removed by his parents, at any time. A distinct "Article" says that the head of the concern attaches much importance to the apprentices being treated with kindness and discretion, and to their receiving only good examples.

"Each workman is bound to consider them as his own children, . . . to encourage them by varied labours, especially to recompense them by something which it is agreeable to do, after having occupied them with dirty and disagreeable work; otherwise they are out of conceit with themselves, become dissidents, disobedient fellows; whilst, in treating them as men, in doing the part of youth one can obtain of them good results, and render them service the while."

It is added that they should not be sent about with heavy weights.

M. Leclaire observes, in a note, that sometimes, in workshops, the apprentices are subject to brutality; and that it is shameful in men to presume on inexperience,—since thus an influence of the most unfortunate kind will be exercised upon the character of the children, and on the direction which their minds will take in their growing up. Faults on the part of the apprentices are punished by the individual being "mis à pied" (that is, his work is suspended) for one or more days. To those who have conducted themselves well, medals are given each year, by the "Société de Secours Mutuels" at their general meeting; and to these there may be added, in exceptional cases, an annual sum in money, which is never less than 10 francs (8 shillings).

The next division of the "Règlement" relates to that section of the workmen called the "Noyau"—the newel, or staff of the establishment. A note explains that this portion of an industrial establishment is composed of workmen, intelligent, and of good morality; and who are picked men, through whose aid all the exigencies of the particular business can be satisfied, and great perfection be attained. When work is not abundant, these men are employed in preference to the others. The idea, however, in M. Leclaire's establishment, seems to resemble that of the military "cadres," or framework for the contribution of force of men in reserve. For admission to the "noyau," merit, rather than length of services, gives the title: but, there are particularly specified as necessary,—1. The having good morals and regular conduct; 2. The having given proof of ability as *endouleur*, varnisher, and polisher; 3. The being acquainted with the regulations for the workmen in the shops, so as to be able to reply upon all the "Articles" if interrogated; and, 4. The having obtained a letter from the head of the establishment, bearing an ordinal number indicating that the workman fulfils the before-mentioned conditions, and that there is ground for admitting him. There are two ranks of admission to the staff: the first comprises the foremen-painters, and the foremen of all the branches of work connected with painting, as well as many workmen of each of these latter branches: the second is composed of the ordinary painters, of workmen of the other branches, not in the first rank, and the apprentices; and

the letters of admission of the two ranks bear different series of numbers. The men of the staff, besides having preference in the grant of work, can receive during winter an advance of 50 francs,—should they need such help,—returning it in the summer; they can receive some amount of money, to be fixed by the head of the establishment, out of the profits, in accordance with a provision of the deed of partnership which we have mentioned; and, finally, he who has worked for the establishment during five years without interruption, can demand admittance into the Society "*de Secours Mutuels*." In winter, the foremen of work in hand remain at their posts till the works are completed; but the rest of the workmen take turn in the order of their admission to their rank of the staff, a fortnight at a time,—the first turns being taken by the men of the first rank. Each man works a fortnight; and when every one of the first rank has worked his fortnight, the men of the second rank come in their numerical order; and when they have all worked, the turn of the first rank recommences. The men attached to what we have regarded as the jobbing-work are excepted: they remain always at their post.

Then follow rules to be observed in the execution of work. The first of them relates to the safety of workmen, as on scaffolds. The foreman is bound to see that such things as cords and ladders are perfect; and should they be otherwise, he is authorised to destroy them, and to send back the fragments to the warehouse, demanding replacement. He is to see generally that the workmen are not exposed to danger. Should he omit any portion of the duty referred to, all the workmen are authorised to refuse to make use of the ladders or other things in an unsafe state. If in spite of precautions, an accident should happen, it is the duty of the foreman to give instant help, and not to hesitate at any expense; and to lavish [*prodiguer*] upon the wounded man, the necessary care, and to cause him to be conveyed to his dwelling by trusty men, workmen; and, finally, the foreman is forthwith to give information of the accident at head-quarters, that the man may be attended to.

A special article directs workmen, when an inquiry is made of them by a proprietor, architect, or other person, to desire the individual to address himself to the foreman.

#### GUSTAVE DORÉ'S BIBLE ILLUSTRATIONS.

A WELL-KNOWN publishing house in the City has for some time past announced the publication of the English Bible, illustrated by the pencil of Gustave Doré, and has invited visitors to inspect the illustrations themselves, which are gratuitously on view in the Belle Sauvage-yard, on Ludgate-hill. It must be remarked, however, that the engravings which are there to be seen are all lettered in French. No specimens of plates evidently intended for an English edition are to be seen. The question, therefore, forcibly suggests itself, whether the English illustrations are to be taken from worn or good blocks. A difference of 3l. in the price of the French and the English Bible is a further reason for raising the question, whether this unrivalled work of art is to be placed in the hands of the English subscribers in that state of perfection which the character of the artist demands.

Of the work itself, it is difficult to speak in terms that do not appear to be overstrained. No previous work of Doré's is to be compared to his Bible. In fertility of imagination, in local truth, in grandeur of treatment, and often in a subtle appreciation of the sacred text that is evinced in a perfectly new handling of subjects that have been the study of the greatest Christian artists, Gustave Doré must rank as *facile princeps*. Let any one who is on his way to visit the Belle Sauvage-yard, pay a previous visit to the shop window of Dominic Colnaghi & Co., in Pall-mall East, and look at the lovely coloured plates from Raffaele's Bible which are now to be seen there. With these conceptions of the painter of the Transfiguration in his memory, let him see how Doré has treated the same subject, and the result of the comparison will be the conviction that while Raffaele has given us the fruit of a rich Italian fancy, the scenes drawn by Doré are more like those of the sacred text itself. No commentary ever written has the instructive value of these illustrations.

The points left for adverse criticism are few in number. To note them is only another mode of saying how much there is to admire. The first feeling of regret that occurs to the mind is the observation that Doré has evidently not visited Jerusalem before illustrating the grandest scenes in the history of the Holy City. It is true that the reference which he has shown in many instances as to the architectural details of buildings long overthrown, and overthrown without leaving trace or record of their peculiar architecture, is in itself a mark of true artistic judgment. Where other artists have called on their imagination, or consulted their sketch-book, for incongruous towers and domes, the great Frenchman has concentrated the interest of the scene in its human actors. But enough yet remains of the buildings of the city of Herod and of Solomon to show us that the walls and towers of the city were not like the castle of St. Angelo or that of Rochester; that they were not faced with stucco or with Roman cement; and the two or three scenes which give this idea of the fortifications of Jerusalem evince a want of truth in this respect, that even a consultation of De Vogüé's works, to say nothing of photography, would have enabled the artist to avoid.

The contrast to the want of local truth as to the masonry of Jerusalem, is the wonderful rendering of the Egyptian and Assyrian architecture. The walls have all the texture of stone, and the incised hieroglyphics seem to tempt the touch to verify the relief of the slab. The halls unearthed by Belzoni, by Wilkinson, and by Layard, are re-peopled by the magic pencil with the forms that filled them three thousand years ago. The quaint beads and wigs of Egyptian sculpture become the possible costume of living people before us,—and not living only, but living in the full vigour of Oriental passion. The mingling of the unchanging features of the scenes, the lurid glare of the African sun, the expanse of the desert, the national types of the Jew and of the Arab, the obstinacy and fury of the camel, with the past and buried types of the dynasty of the Pharaohs, is a marvellous triumph of the human imagination. It is true that the artist might have given to Pharaoh his actual features, as we may this day trace them in the gigantic portraits transported to the British Museum; but the form driven by fear, by wonder, and by wrath *up* those massive steps into the presence of Moses, is one that will long haunt the memory like the recollection of an actual fact.

The only instance, perhaps, in which the artist in striving for the wonderful has fallen into the impossible, is in the illustration of the death of Sampson. The architecture here is incongruous, the effect of the possible displacement unmechanical, and the relation between cause and effect painfully unnatural. But to atone for this trip, how wonderful is the scene where the vexed strong man holds out his sacred locks to his sulky mistress. You see at once that if this is not the very portrait of Dalilah, it is that of such a woman as she must have been. The attitude is life itself—the life of the traitress.

One instance of the manner in which the very pith and marrow of the sacred story is seized on by the artist, may be taken from the story of the old prophet slain by the lion. Often has this been represented, and the moral of the punishment of disobedience has been drawn from it by preacher and by painter. But how would the intelligence of the event have struck on the ears of those to whom the tidings came—a man killed by a lion!—the lion to be seen—there! there!

Such is the reading of Doré. On a low hill, looming against a dark and stormy sky, sits a mighty lion on its haunches, with its back to you, the spectator, just attracted to the spot by the fearful tidings. The lion has not seen you, or he would either have retired or prepared to attack you,—you come so near to him behind, and against the wind. Tumbled at his feet is the carcass of the old prophet, slain by a blow of the mighty paw, but undisturbed by the avenger; and by him, each leg and each ear planted at a different angle, a compound of terror and of fidelity, is the ass, while the prophet whose unadvised hospitality led to this terrible catastrophe is slowly advancing towards the spot.

Yet one other instance of the manner in which this gifted artist regards a familiar scene from a novel stand-point. Who has not heard of the Pharisee and the Publican? who has not learned to recognise afar off the pompous pride of the

one and the modest humility of the other? Is it so indeed? If the lesson had been so trite and obvious, would it have been one selected by a Teacher who speaks as never man speaks?

It is not thus that Don has read the lesson. He has looked at the suppliants from the human point of view. Scrupulously exact in his dress, handsome in his person, winning, polite, devout, the Pharisee is performing his devotions, so that with the mass of his countrymen you admire the worshipper whose prayer you cannot doubt to be acceptable to the Lord of the Temple. Hard by, squalid and disgusting, the Publican reminds you of an Italian beggar. God must be good indeed to have mercy on such as he. And then further on, through an open door of the temple, you catch a sight of the great Teacher, who looked on the scene with other eyes. For He regarded the heart, and therefore it was that he saw with other eyes a scene of which the great painter has truly shown the human and obvious aspect.

It is hard to tear oneself from the contemplation of these marvellous sermons, not in stones, indeed, but in outlines that linger in the memory. The slaughter of the prophets of Baal, the mingling of man and beast in the strong parental instinct as shown in the Deluge, the Egyptians watching the first miracle of Moses, the long line of Nicanor's elephants, the mitre dropped by the youthful widow, are among the *chefs-d'œuvre*. It will be matter of sincere satisfaction to find that the English edition is equal to the French one; that in all the subordinate details, which are matters, not of art, but of trade, full justice is done to a genius which has not feared to meet the great Italian masters on their chosen ground, and which has not been worsted in the contest.

#### THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of the members was held on Friday evening (the 8th inst.), at the House, in Conduit-street.\*

Mr. R. W. Edis, the president, occupied the chair.

The following gentlemen were elected members of the Association:—Mr. John Adams, George-street, Greenwich; Mr. M. H. Merrick, Camberwell New-road; Mr. W. H. Jewitt, Leighton-road, Camden Town; Mr. C. Merrin, Bow; and Mr. F. Hammel, Brixton.

A letter from Mr. Godwin was read by Mr. Plumbo (hon. sec.), offering a prize of five guineas for the best essay on either of two subjects proposed by that gentleman. This communication had been considered by the committee of the Association, who had selected the following subject:—"Suggestions for improvements in the artistic design of locks, door-furniture, grates, stoves, gas-fittings, and ironwork generally, applicable to domestic purposes, with sketches illustrative of the objects recommended."

Mr. Riddett brought under notice the wants of the lending library, which he said contained but 100 volumes strictly bearing on professional subjects, a number which was far below the wants of the Association. He expressed a hope that the members would either subscribe so as to enable the stock of books to be enlarged, or make donations of suitable works.

Mr. Tarver made a statement respecting the class for drawing from the human figure, which he represented to be in a prosperous condition. The attendance of members was good, and considerable interest was displayed by them with regard to its future success. It had been proposed to increase the evenings of meeting to three per week; but as the proposition had come from those members of the class who were not members of the Association also, it was his duty to lay the matter before them. If a greater number of members of the Association were to join the class, he had no doubt that the proposal could be acceded to.†

Mr. T. R. Smith then read a paper on "Study as a Preparation for Practice." The paper

\* The next meeting of the Voluntary Examination Class will be held on Monday evening next, subject, "Heat, Light, and Ventilation," by Mr. R. O. Harris.

† Mr. E. B. Ferrey, the hon. secretary of the class, writing to us on the subject, says,—"that, although we have scarcely room for any more students from the living model, yet, at least, twelve more members could draw from casts, and a system of alternate studies from both is recommended by our teacher, Mr. Poynter. The increase afforded to the funds of the class by the addition of ten members would enable us to meet three times instead of twice a week, a point strongly urged by a majority of the present students."

might be considered as supplementary to others in cognate subjects read on previous occasions. He observed upon the position of an architectural student in this country, and on the habits and tastes which were essential to professional success. He expressed his regret that the number of Oxford and Cambridge men in the profession was so small, and considered that the absence of everything like an artistic education in public schools and colleges was a main reason why architecture had fewer attractions than other callings for university men. Before a student began his life as a pupil, he should devote one year chiefly to drawing; and before the termination of that period, he should be able to draw the human figure from the round well enough to procure for him admission to the antique school of the Royal Academy. The majority of young men, however, did not enter the profession with such advantages fully developed. But still there was no reason for them to despair, as, by resolute, well-directed effort, they might overcome this drawback. With regard to the most practical way of learning the elements of the architect's profession, he considered that on many points a pupil could obtain better information from companions in the office, or from foremen of works and on the building, than he could from his master. In the office alone, however, but a very incomplete education could be obtained. Even so simple and necessary an accomplishment as perspective, for example, could not always be picked up there,—much less any complete scheme of the art and science of architecture. Supplementary aids to education were, therefore, of essential importance. In London there were more public facilities than were to be found in the country. Attendance at a good evening drawing-school (figure as well as landscape) would be found extremely useful; as also the knowledge of the French language. The next desideratum was an acquaintance with the history and the general forms of past styles of architecture, and the theory and practice of construction. He recommended all students to attend Professor Hayter Lewis's course of lectures at the London University College. Two evenings a week might be devoted to these for the winter months of two years. Another course of lectures on the arts of construction was also delivered annually at King's College, by Professor Kerr, the value of which could not be over-estimated. The class of design at their own Association, as also the voluntary examination class, were likewise valuable agents in the acquiring of knowledge. After other suggestions, Mr. Smith referred to the advantages offered by the Royal Institute of British Architects, which he thought were not sufficiently appreciated. The Institute had, he thought, done great service to students, by putting into their hands a compendium of the books and subjects likely to be most valuable to them, as also a specimen examination paper. The voluntary architectural examinations were likewise most important, as they afforded students an opportunity to satisfy themselves of their proficiency and to declare to the world the nature of their attainments. Having referred to what the student of architecture might do for his own advancement by private study, sketching tours, &c., Mr. Smith concluded a long paper by reminding his auditors of the answer of Demosthenes to the question, what were the first, second, and third essentials of an orator? The Athenian philosopher replied to all three,— "Action, action, action." In a similar sense it might be said that the grand essential of architectural study was drawing.

Mr. Ridge proposed a vote of thanks to the lecturer, and in doing so suggested the advisability of acquiring a more thorough knowledge of the past styles of architecture, as, he observed, it was too often the practice to neglect this part of education. He thought they neglected to consider the principles on which the old masters worked; their work, indeed, was more a matter of principle than of detail. After a short discussion the vote was agreed to.

#### THE BRITISH ARCHEOLOGICAL ASSOCIATION.

At the meeting on the 6th instant, Mr. Thomas Wright, M.A. in the chair, the proceedings were commenced by the chairman, who, in a feeling address, referred to the loss the Association had sustained since their last meeting, in the death of Mr. T. J. Pettigrew, their treasurer from the first, and a vice-president. He sketched

a history of the difficulties which had beset the Association at its foundation, through which it had been piloted mainly by the skill and the resolution of the friend whose loss they now deplored. Of the value of those services Mr. Wright spoke with the more confidence, as he was himself the founder of the Association, and he knew probably better than any one else the magnitude of their early difficulties. Their late friend continued for more than twenty years the chief regulator of their proceedings, and left them prosperous and prepared for further usefulness. The meeting fully sympathised with the sorrow expressed by the president at the decease of Mr. Pettigrew.

Mr. Wimple exhibited some Roman remains dug up in Winchester-street, a piece of Samian ware, a part of a well-wrought bone stilet, and an iron knife, or perhaps rather a Roman razor, almost exactly like but rather larger than that given in Mr. Roach Smith's catalogue, p. 72.

The Rev. H. V. Le Bas forwarded two little objects found in the course of work lately executed at East Bedford Church. One of them, which appeared at first to be imperfect, was ingeniously put right by Mr. Syer Cuning, and pronounced to be a boatswain's whistle of the fifteenth century, on the clearest evidence, furnished by that gentleman.

Mr. G. Wright, F.S.A., exhibited a bone implement, a specimen of a class very numerous found lately in London, but the use of which is at present unknown. The Rev. S. Simpson undertook to produce other specimens from his own and Mr. Cato's collections. After various other exhibitions,—Mr. J. R. Planché, *Rouge Croix*, V.P., read an elaborate paper "On the Paintings at Lumley Castle and the Effigies at Chester-le-Street." These remarkable specimens of painting and sculpture purport to be portraits and monuments of the ancestors of the Lumley family: the mistake which has been prevalent concerning them is the belief that they were contemporary with the personages to whom they refer. Mr. Planché demonstrated that the paintings and most of the sculptures were executed at one time in the seventeenth century, but that attempts were made to give a chronological succession by copying costume, &c. from other paintings. Only one of the fourteen effigies which presented so imposing an array of monuments in the Church of Chester-le-Street, could be considered a real Lumley effigy, and contemporary with the person represented.

#### LEICESTERSHIRE ARCHITECTURAL SOCIETY.

At a meeting of this Society, held recently, plans for the restoration of Elmsthorpe and Peckleton churches, and for the erection of a tower and spire to the church now erecting at Tur Langton, were submitted to the Society.

Mr. G. C. Neale called the attention of the Society to the importance of having lightning conductors properly affixed to all large public buildings; conductors being mischievous from the fact of their being placed in position by persons not understanding the aptitude or otherwise of the various metals, &c., to attract and conduct electricity. It was strongly recommended by the committee, that no lightning conductor be affixed to any church or other public building, unless under the direction of a competent scientific person.

Mr. R. B. North exhibited a *fac-simile* drawing of an interesting mural painting lately discovered in Whissendine Church, Leicestershire. The painting, which measured 8 ft. 8 in. by 1 ft. 10 in., formed the credos of the high altar in pre-Reformation times, and was uncovered during a recent restoration of the east window of the chancel. The subjects depicted were those usually found placed upon the roof-lob, viz.,—the crucifix in the centre, with St. John on the one hand and the Virgin Mary on the other. To the right and left of these appeared St. Andrew with his cross, and St. Margaret treading under foot the dragon,—her special symbol; whilst at the four corners were placed the evangelistic symbols. The stones upon which this curious painting was depicted were obliged to be removed during the late works, and are now placed for the inspection of the curious in the south transept. The painting, although sufficiently clear to declare its meaning, was much obliterated and defaced in the removal of the colour-wash from its surface.

## ECCLESIOLOGICAL SOCIETY.

At the last committee meeting the Rev. H. L. Jenner was congratulated on his designation to the bishopric of Dunedin, New Zealand; and the committee proposed to present him with a pastoral staff, to be executed in ivory and ebony. It was announced, that at a late meeting of the Canterbury Diocesan Church-building Society, the Archbishop of Canterbury in the chair, it was resolved that grants should be made to churches fitted with movable benches or chairs. It was agreed to apply for space in the Paris Exhibition of 1866. From Messrs. Clayton & Bell the committee received a careful full-sized drawing of the Last Supper, as intended to be reproduced in Dr. Salmiati's mosaics for the crevices of Westminster Abbey. The committee regretted the selection of that subject for an altar-piece; and doubts were expressed whether mosaic could produce the refined and delicate drawing of the cartoon. The president announced that the officers of the Ecclesiological Society would be added to the joint committee appointed by the Royal Institute of British Architects, to watch the interests of architectural art in the approaching Paris Exhibition. The president read a letter from the Rev. Mr. Nash, about the retention of the chancel-screen in Christchurch Priory church. It was agreed that the committee could not justify its removal. Mr. Wadmore's proposed restoration of St. Helen's, Bishopsgate, was discussed, and it was agreed to support the president's recommendation, that the old arrangements in the nuns' choir in the existing north aisle should not be disturbed. The Rev. J. C. Jackson brought a rejected fragment of stone-carving from Lincoln, in order to show the original "scum," and the extreme danger of removing it.

## CONTEMPLATED IMPROVEMENTS IN NEWCASTLE-UPON-TYNE.

It is a somewhat singular circumstance that Newcastle-upon-Tyne, only four years ago pronounced perfect by the corporation officials, in contradiction to our statement of its lamentable condition in a sanitary point of view, has recently procured the royal assent to an Improvement Act, which actually came into operation upon the 10th ult. The singularity of the circumstance consists in the great difference of opinion which the lapse of a few months must have wrought in the mind of the curious corporate body of the borough of Newcastle. The perfection of 1861, by some strange transmutation, becomes undeniable imperfection in 1865: suggestions that were utterly repudiated as uncalculated for 1861, are complacently adopted in 1865. Thus the new Act makes various commendable provisions connected with the public health and safety, as we will enumerate, but perversely or blindly ignores that which is now found to be the most important of all.

The new Act empowers the corporation to borrow a sum not exceeding 150,000*l.*, in addition to a sum already borrowed, and still unpaid, amounting to 54,741*l.* 9*s.*, to meet the expenses of laying out a dozen new streets, and widening and otherwise improving about ten existing roads and streets, all of which works are to be completed within ten years, as the power granted by the Act is then to expire, except as to so much of the works as is then finished. Any street or court formed or set out either before or after the commencement of the Act, that is not sewered, drained, levelled, flagged, and paved or macadamized, is brought under a provision which requires the respective owners of the buildings and lands in such streets or courts to perform these various operations after an order to do so is published by the corporation for three successive weeks; and any owner refusing to comply with this order, or not commencing within a month, or not proceeding with reasonable despatch after he has commenced, brings himself under a provision which enables the corporation to complete all these works for him, and recover the expense. We are glad to see that the municipal body, while obtaining power to set up posts, pillars, rails, bars, or chains, for the protection of foot-passengers, on the pathways and in the carriage-ways, have also made provision to place fountains in convenient parts of the public ways. We hope, in the multiplicity of its municipal duties, it will not forget to do so.

No new street within the borough is to be less than 30 ft. wide, unless it communicates solely with the backs of houses, when it is to be at least 20 ft. wide. The front elevations of the houses in all new streets are to be subject to the approval of the corporation; but in case of any slothful neglect to notify the determination of the municipal body in these matters, architects or builders may take it for granted that their plans are approved if they do not bear to the contrary within a month after depositing their drawings. Henceforth, therefore, the architectural propriety as well as sanitary legislation of Newcastle are municipal matters. Let us urge upon the rate-payers to elect as their representatives men of sound judgment and wide views; not mere talkers.

It does not appear that any proposal has yet been entertained to utilize the sewage of this densely-packed borough, but power has been obtained, subject to a restriction of the contract to a period of thirty years, to enable the corporation to accept any offer that may hereafter be made to them by any company to manufacture or utilize the sewage, and permit the erection of the cesspools, tanks, receptacles, reservoirs, apparatus, machinery and works requisite for the reception and storage, or lifting, or disinfecting, sewage matter, without rendering the corporation, or any member of it, liable as partners with any such company by reason of the profit that might arise from the manufacture or sale of manure. The corporation has, however, evidently turned over the idea of manufacturing the sewage as a municipal undertaking, and have included power to erect the necessary apparatus for collecting and distributing the same on their own account, either on lands belonging to the body or to any purchaser with whom they may strike a bargain. One of the tricks of the Newcastle builders is to drain their houses into disused shafts, coal-pits, and quarries. This reprehensible custom has been strictly prohibited under a somewhat incommensurate penalty of 40*s.*, and a further fine of a sovereign a day after notice has been given that the practice must be discontinued.

Full powers, too, have been obtained to make any new sewers for the effectual drainage of the borough, even to the carrying of the said sewers through and across underground cellars or vaults under any streets. We trust, therefore, all the dens we pointed out will be now properly drained and sewered; and the disgusting night-cart, with its shuddering bell, be numbered among the curiosities of the dark and dirty ages.

The Corporation rightly make a dead set at underground dwellings. Any subterranean apartment they consider unfit for human habitation they may compel the owner to discontinue letting. We have seen an ingenious attempt to trace the etymology of the word "borough" to the earliest agglomeration of dwellings, mostly underground or semi-subterranean, in which the aboriginals of the land used to burrow; and we cannot but be struck at the pre-historic and continued tenacity with which the inhabitants of this particular borough cling to their burrows. We must therefore the more commend the present efforts of the Corporation to unchurch them. Any person letting or suffering to be occupied one of these underground homes, after receiving due notice that he ought to discontinue doing so, is liable to a penalty not exceeding twenty shillings for every day the offence continues, or until he shall have given such tenants notice to quit, or have ceased to receive any rent for its occupation. The Corporation are down, too, upon any persons letting as a separate dwelling, or sleeping-room, any room built over a privy or cesspool, asphalt or midden; but, as we said before, they quit and altogether ignore one of the deadliest of sanitary sins, namely, overcrowding.

Now, too much importance cannot be attached to the great evil of overcrowding. A recent report of the surveyor to the Alnwick Board of Health, less than forty miles north of Newcastle, in the same county, shows that sewerage, drainage, and water supply do not diminish the death-rate if overcrowding be permitted. That town was one of the first to place itself under the Local Government Act, and to lay down sewers and lay on water; close their churchyard and lay out a cemetery a mile away. But to the astonishment, puzzle and disappointment of all concerned, the death-rate by no means diminished. Nearly every successive autumn an epidemic has occurred and kept the rate up. At last it was suggested to make a house-to-house visitation, and ascertain the number of inmates to each tenement. The surveyor, taking 400

cubic feet as the space every adult requires to breathe in, laid it down as a round rule that all cases where more than four persons occupied a one-roomed tenement were cases of overcrowding. As he went from house to house he perceived, when the number of inmates exceeded four to each room, the peculiar foul smell of oppressive and vitiated atmosphere; and as the number of inmates increased, the foulness of the air was intensified. A hundred and thirty-one cases of overcrowding were thus unveiled; quite sufficient, it will be allowed, to account for the epidemics. Another fact the surveyor ascertained was that, in proportion as overcrowding existed, the people got so enfeebled that they are unable to bear the least ventilation, and stuff rugs into their windows to exclude every breath of fresh air. This is information for the Newcastle magistrates to reflect upon, and endeavour to utilize. We should like to know how many cases of overcrowding there are in Sausdgate and the Chares?

## THE WESTMINSTER CAMPO SANTO.

At the meeting held in the chapter-house, Westminster Abbey, of which you have spoken, the Dean of St. Paul's suggested that it might become, when restored, an appropriate vestibule to a Campo Santo.

The removal of the monuments which encumber the Abbey, to the disadvantage of its fine architecture, into what is called a Campo Santo, has been often the subject of a proposition. This involves the erection of an extensive building at a great expense. Dean's-yard has been suggested; but there are several difficulties besides that of the private residences on every side of it. There is a tolerably large piece of ground abutting on College-street to the south, and on the north to the chapter-house, which appears to be the most eligible. There would doubtless be great opposition on the part of the minor authorities of the abbey; but surely, as the residence of the Dean is totally unconnected with it, the opposition might be got over in the usual way by a compensation.

Now, I venture to propose that the vast space of Westminster Hall would be a most appropriate place for a National Wallahalla or Campo Santo. In the vestibule to the House of Commons, which has been recently erected there, are placed statues of eminent men, distinguished in the history of this country; and as several of the monuments erected in Westminster Abbey are to men not buried therein, there can be no profanation or desecration in removing their representative statues or monuments, such as those of Shakspeare, Addison, Watt, Sir Isaac Newton, Sir Robert Peel, Sir W. Follett, Judge Mansfield, and many others. Westminster Hall offers an immense space for the re-erection of these monuments. They would adorn a vacant interior, and effect a good clearance in the aisles and transepts of the Abbey. It would, however, be a great pity to remove the monuments of the sovereigns who are buried in the Abbey; and it would not be desirable, as they are in the various chapels at the eastern end. Some of the monuments to persons of lesser celebrity, or of none, might be removed to the cloisters, where plenty of space would be found by a re-arrangement of the tablets to obscure individuals. By the preceding proposal, if it could be carried out, the interior of this famous edifice would offer an effect of unparalleled grandeur and sublimity when viewed in its entire length from the western entrance. IDLER IN LONDON.

\*.\* The removal of monuments is a subject to be treated with the greatest caution. To provide for future erections is another matter.

## DONALDSON TESTIMONIAL.

The subscribers (following the precedent set by those who carried out the Stone Testimonial in the year 1835) have resolved to present a gold impression of the medal bearing his portrait, to Mr. Donaldson. They have also resolved to entrust the dies and residue of the fund to the Institute of British Architects, in order that a silver medal may be given annually, or at other intervals of time, to students in architecture. The subscribers have put on record their particular desire that in determining the appropriation of the medal, the Council of the Institute should adopt, at their discretion, such a course as would give pleasure to Mr. Donaldson.

The medal, which has been executed by the brothers J. S. and A. E. Wyon, of Regent-street, bears on the obverse the portrait of Mr. Donaldson, with the legend, "Thomas Leverton Donaldson, Ph. D. Emeritus Prof. Univ. Coll. Lond. 1865," and on the reverse, between wreaths of laurel, the inscription, "To commemorate long and zealous services in promoting the study of architecture."

The form which the testimonial has assumed is in strict accordance with the desire of Mr. Donaldson, that one of a more personal kind should be avoided. The occasion which has given rise to it is, it may be recollected, his retirement, after three-and-twenty years' service, from the Professorship of Architecture at University College, London, in which he has been succeeded by Professor Hayter Lewis.

#### NEW CONGREGATIONAL CHURCH, RUGBY.

It is proposed to erect a new Congregational Church at Rugby, in accordance with a design prepared by Mr. Joseph James, of London, architect, of which we give a small view.

An eligible site has been obtained in the new street leading from the railway station.

The plan consists of a nave, 63 ft. by 36 ft. 8 in., with an apsidal end for organ, vestries, &c., and transepts. The main gable will be surmounted by a small bell-turret, with a porch on each side. The total accommodation will be for 785 sitters, and the presumed outlay will be 2,500l.

#### THE NEW FIRE-BRIGADE FOR LONDON.

On the 1st of next month this new force for the better protection of London and its nine hundred millions of property, under the management of the Board of Works, comes into operation. It is to take the title of the Metropolitan Fire Brigade, and will not only embody the whole of the present force and engines of the London fire establishment, but be doubly strengthened to render it efficient for all purposes. The plan decided on is that of Captain Shaw, who has been appointed its chief superintendent. The force will consist of chiefs and 350 officers and men, 4 steam floating-engines, 4 large land steamers, 27 small land steamers, and 37 large manual engines, with horses, drivers, &c. These are to be distributed among 33 large and 56 small fire-stations, protecting an area of about 117 square miles. Compared with the present fire-brigade, the increase is 72 additional stations, 219 extra firemen, 2 large floating and 2 large land steamers, 21 small land steamers, and 61 manual engines.

The cost of its maintenance is not to exceed 50,000l. per annum. This will be partly contributed by a public rate of  $\frac{1}{4}$ d. in the pound, 10,000l. contributed by the various metropolitan fire-insurance companies, and 10,000l. from the Government.

There are nearly 500 parish engines in the metropolis, but not more than 20 are considered to be sufficiently efficient to be accepted in the new force.

#### A LITERARY SQUABBLE.

Under the heading, "Various Pronunciations of 'Ough,'" *Notes and Queries* prints "A Literary Squabble on the Pronunciation of Monckton Milnes's Title," with this introduction from a correspondent:—

"The following *jeu d'esprit* illustrating this subject has been shown to me as the production of our late premier, Viscount Palmerston. Whether this be the case or not, as I have never seen it in print, I think it is worthy of preservation in the pages of *N. & Q.*"

If the erudite and excellent J. T. who rules over *N. & Q.*s had read his *Builder*, he would have known that these capital lines were written by Mr. J. R. Planché, printed first in one page, with reference to the Leeds Congress of the British Archaeological Association,\* and thence copied into various newspapers and serials. The lines, with this curious misappropriation, are now being quoted from *N. & Q.*; and the error, notwithstanding this denial on our part, will be certain to crop up again and again; and, ultimately, some resolute biographer of the late premier will settle the question by printing them as positively his, and thus deprive the accomplished *Rouge Croix* of his rights.

\* Volume for 1863, p. 847.

NEW CONGREGATIONAL CHURCH, RUGBY.—MR. JOSEPH JAMES, ARCHITECT.

#### VALUE OF LAND IN COCKERMOUTH.

On the 9th inst., an arbitration case came off before Mr. Lumb, under-sheriff, and a jury. The plaintiffs were Mr. W. Wood and the Rev. Jos. Wood, and the defendants the Local Board of Cockermouth. The trial was to decide the value of a piece of land at Cockermouth, required by the Local Board for the site of their waterwork reservoir, the property of the plaintiffs, and for which they demanded 1,500l., which the defendants refused to give. Mr. Moorcliff, for the plaintiffs, called witnesses to prove the value of the land, when the following valuations were given:—

Mr. Dixon, Whitehaven .....	£1,064 10 2
W. Job Bentley, Kendal .....	884 10 11
Mr. Robinson, Workington .....	883 10 6
Mr. Fearon, Embleton .....	883 18 6
Mr. Eaglesfield, Maryport .....	871 4 0
Mr. Wm. Heskett, Plumpton .....	826 17 6

Mr. Dawson, for the defendants, called Mr. Lawson, C.E., who described the position of the proposed waterworks. Mr. H. R. Wyndham, a member of the Local Board, bought a piece of land, in conjunction with two other members of the Board, from Mr. Steel, which was situated close to the plaintiff's property, for 1,000l., the dimensions being 5 acres. The following valuers were also called, and gave in the valuations attached to their names:—

Mr. Jos. Richardson, Halton .....	£775 2 0
Mr. James Clarke, Carlisle .....	462 18 4

The jury unanimously awarded 378l. 16s. as the value of the land, and added 10 per cent. for compulsory purchase, which made the total

value 416l. 13s. 6d., the amount being 1,083l. 6s. 6d. less than the sum claimed by the plaintiffs. It was agreed that both parties pay their own costs.

#### HOLBORN VALLEY IMPROVEMENTS.

At the meeting of the Common Council on the 7th inst., Mr. Deputy Fry, as chairman of the Holborn Valley Improvement Committee, said that it would probably be remembered that the Holborn Valley Improvement Committee had placed in the hands of the City architect the plans both for Parliamentary reference and those contemplated for execution. They had advertised for tenders, but they were so high and extravagant that they could not be accepted. In this dilemma the committee had sought the advice of Mr. Hayward, and the City architect, with a view to ascertain how far the tenders exceeded the Parliamentary estimates. A consultation had taken place between Mr. Hayward and Mr. H. Jones, and those gentlemen had dissented, feeling there was some difficulty in the matter, and at last the committee had called in the aid and advice of Mr. Cubitt, who was a perfectly disinterested individual, and whose judgment might he relied upon. The plans were before Mr. Cubitt at the present moment: Mr. Cubitt was engaged upon them, and the committee entertained the hope that in a short time they would be furnished with that gentleman's report on the matter.

## THE PRECIOUS METALS.

Mr. G. W. HASTINGS is delivering a course of (Cantor) lectures at the Society of Arts, on "The Effects of the Discovery of the Precious Metals on Modern Civilization." In his second lecture, on the 4th, he said,—That there has been a rise in the prices of ordinary commodities around us needs no demonstration; but how far this is owing to any fall in the value of the precious metals is another question, and one which can only be fully answered by the future; but the local nature of the rise in many cases must suggest doubts, seeing that any real fall must, in the present state of intercommunication, operate pretty equally over the whole European market. M. Chevalier, in his able work on gold, predicted that a change in value quite as great as that which happened in the sixteenth century would be the result of the new supply, and he has uttered an emphatic warning to his own Government and other nations. In this volume he described France as the parachute which was breaking the fall of gold, on account of the temporary demand made for that metal by the French Government during the substitution of gold coin for silver. Looking to the date of Chevalier's work, and the subsequent teaching of experience, it is impossible to resist the observation that the parachute is a long time coming down. In fact, M. Chevalier seems to have underestimated the various retarding influences, several of which are quite as potent as the change in the French coinage. No doubt, the fluctuation in relative value produced by gold discoveries is great, even enormous, when applied to limited areas, because in such cases there can be no fresh demand adequate to balance the sudden and inordinate supply; \* but in the market of the world the want of one district drains the abundance of another, and gold, like water, finds its own level. Why did not prices rise between 1492 and 1545? Because the twenty-eight millions imported only filled up the vacuum previously existing,—only slaked, as it were, the thirst of European commerce. No doubt, so soon as the saturation point had been reached, the further supply at once began to tell, and with what results we know; but there are many causes which will retard the reaching of that point at the present day. France is not the only country in which gold is being substituted for silver for currency purposes; our Indian empire will long create a demand, and there are states in Europe, such as Austria, which are almost destitute of a metallic medium. The extension of public works, such as railways, in so many parts of the world keeps up a demand for specie, and it is difficult to exaggerate the effect of the present increase of trade, manufacture, and population in so many quarters. There is also a self-acting check on gold production which has been too much overlooked: all the best gold-fields are situated at a considerable distance from Europe, and in thinly-populated countries, where labour is in great demand; consequently, a very moderate depreciation in the value of that metal will suffice to bring down the remuneration of the diggers' labour below the rate of wages earned by manual work around them, and, therefore, to check the supply. Under any circumstances it may be considered certain that no sudden shock will be felt, and that the evils of change of value will be consequently mitigated. In connexion with that part of the subject, the soundness of Adam Smith's opinion that it did not matter whether the precious metals were of high or low value, may be questioned. If they are of high value, or, in other words, if their amount is small relative to other commodities, that value is likely to be disturbed by every discovery, however slight in its nature, of any new supply; whereas, if the amount in the market be large, that is, if their value be low, a small increase will not operate to any appreciable degree, and even a large increase will be much less felt.† It is satisfactory to reflect that the evils of the change, whatever it may be, are temporary, while the good effects of gold discovery remain.

\* As in the instances mentioned by Strabo of the effect caused in his own time on the prices of Italy by the discovery of some gold diggings on the south slopes of the Alps. The almost total disorganisation of the labour market in Australia, which for a time ensued on the gold discoveries, is still more remarkable.

† Chevalier's arguments in favour of the substitution of silver for gold as the standard, are based on the supposed greater fixity in value of the former metal. But can this be relied on? The production of silver depends in a great measure on the price of mercury; and the recent discoveries of large deposits of mercury in California and the adjacent Mexican provinces, suggest the probability of a largely-increased supply of silver.

## ROYAL SURREY THEATRE, LONDON.

On "Boxing Night," the new Royal Surrey Theatre will open for the season, under the management of Mr. R. Shepherd. We give a section taken through the entire length of the theatre. Looking first to the matter of exit ways, we find spacious corridors, and good stone staircases leading to box entrances, and gallery. The pit entrance is level with the roadway; all the walls are built in the most substantial manner. The tiers of boxes are supported upon double iron columns and girders, and the gallery with strong trussed girders and heavy iron supports, so that whatever the weight or strain that may be placed upon them, the constructional parts would seem prepared to receive it. The whole of the roofs are iron, and no rooms of any kind are placed in them, thus avoiding all danger of fire, which caused the destruction of the old theatre, and of many others, the conflagration commencing in rooms formed in the roof. On reference to the section, it will be seen that the architect has placed the dangerous rooms, viz., carpenter's shop and painting room, at the back of the building, separated from it by a thick wall and fire-proof doors. Should a fire take place in these, we may suppose it would soon burn itself out, and that the main building would remain untouched.

The height of the proscenium is 38 ft., and the stage, with its large scene docks, will be the most spacious in London, with many improvements in the adaptation of mechanical means to secure scenic effect. The largest set scene required can be entirely sunk beneath the stage.

The lighting will be effected by a large sunlight burner, and the heat from it will be carried through the roof by an 18 in. iron tube; round this tube is a wrought-iron jacket 7 ft. in diameter, with the view of effecting thorough ventilation, which is also sought for over the stage by a long length of louvre ventilators.

The girders of the flies are constructed of wrought iron, and approached by cast iron spiral staircases on either side, which also run down to the mezzanine floor. The green-room is a spacious apartment, as also are the refreshment and retiring rooms, ballet-room, dressing-rooms,

property-room, wardrobe, offices, and treasury.

We shall give in an early number a view of the interior, and a plan, with full particulars. Suffice it as present to say, that it has been erected at the sole expense of Lieut.-Colonel Temple West (who is owner of a great part of the property in this neighbourhood), from the designs and under the superintendence of Mr. John Ellis, of Austin-frairs, architect.

## SHIPBUILDING AT SUNDERLAND.

At Sunderland, a vessel of improved construction has been recently launched by Messrs. G. S. Moore & Co., of the Bridge Dock Yard. She is built on what is termed the composite principle, which claims to be free from some serious objections urged against vessels composed exclusively of wood or of iron. The frame of a wooden vessel is subject to dry rot, whilst ships with iron plating prove unsuitable for long voyages from the certainty of the fouling of their bottoms; this cause operating most disastrously, impeding progress, and greatly increasing the duration of the voyage, some of the slowest passages on record have been made by iron vessels. The best partial preventive to fouling has been found in a sheathing of copper or yellow metal, which is only applicable to vessels with a wooden skin or covering.

It is obvious that a vessel capable of being thus protected possesses a decided advantage. The combination of an iron frame and wood plating Messrs. Moore think includes the best features in both systems, and upon the principle thus broadly described the vessel in question has been built.

It may be interesting to our readers to have a short description of the main points of detail in this principle.

The keel, stem, and stern-post are of wood. The frame and floors are of iron. The former are riveted to an iron plate on the keel, which plate extends a sufficient width to take in the garboard strakes which are bolted through the keel and also through this plate and the frame. The frame is diagonally trussed on the outside with flat iron bars, extending from the sheer to

the bilge strake (both of iron), to which they are riveted, 8 ft. apart, and secured by rivets to each frame. (See Fig. 1.) The beams are of iron, supported by iron pillars. Longitudinal iron tie-plates run on each side of the hatchway and on top of the beams, which are secured to the frames by horizontal stringers of iron, laterally connected by diagonal tie-plates, and forming a complete net-work of iron.

The inner stem and stern-post are of iron, running in connexion with the keelson, and form an inverted arch at either end. The arrangement of the stem and sternson is represented in Fig. 2.

The rigidity of the frame is complete before any planking is added. The planking, 5 in. in thickness, is then fitted, having been grooved to admit the diagonal straps, and allow the planks to fit closely to the frames. Yellow metal screw-bolts secure the planks to the iron ribs, the heads being sunk and levelled with the surface by cement. The bottom, inside, is also thickly coated on either side of the keelson with cement, which most effectually excludes the bilge-water. The vessel is thus enabled to carry any description of cargo, which would prove detrimental to others, from the absence of internal covering, having only cargo battens attached to the frames, which allow a free current of air to pass over the inner surface of the plank, the inclosure, as in wood ships, being a fruitful source of decay, and the iron frames can be kept perfectly clean, and coated as often as may be required to prevent corrosion.

Messrs. Moore & Co. have patented an ingenious contrivance, consisting of a collar of an incorrosive metallic substance, which fits tightly into the hole in the frame through which the bolt is to pass. A capsule of the same composition as that through which the bolt is driven is fitted over the end of the bolt, and soldered to the collar beneath, so that no external action can affect the bolt thus hermetically sealed.

The distribution of strength is mechanically arranged in this vessel, with a view to the scientific maxim that "nothing is stronger than its weakest point."

Vessels thus built have peculiar advantages in buoyancy, and consequently in dead-weight capacity, over vessels entirely of wood or iron, besides giving equal space for stowage as in an iron vessel.

This mode of construction presents great simplicity, economy, strength, durability, freedom from the chance of internal decay, and all the qualities desired in a good ship.

The comparative immunity from decay strongly recommends it to shipowners. Repairs, when required, can be completed at a tithe of the expense at present incurred in vessels entirely of wood.

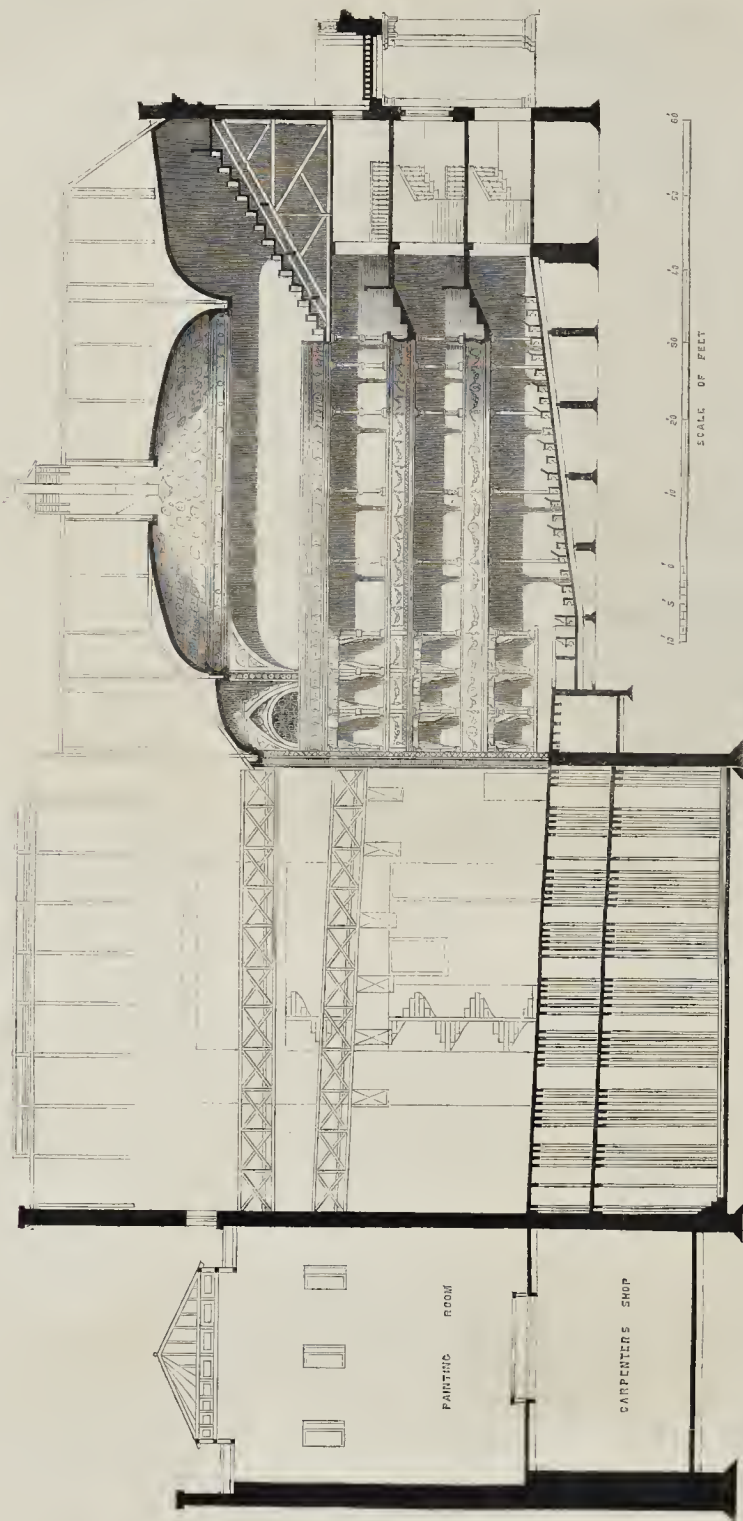

During the Newcastle meeting of the British Association, a number of the leading naval members visited Messrs. Moore & Co.'s yard, and inspected a vessel then building, when they unanimously expressed their approval of the principle as practised by them.

The original promoters of the combination system, are Mr. William Watson, of Dublin, who some thirty years ago patented and adapted it to vessels suited and ever since in use in river and canal navigation, and Mr. William Morgan, of Hyde Park, who built two large ocean-going steamers, one for Austrian Lloyd's, at Trieste, and both vessels are still in existence.

Messrs. Moore deserve the credit of having revived and improved the practice of this mode of construction, which had entirely fallen into desuetude some five years since, and they have continued to build such vessels. At the present time many of the first builders throughout Great Britain have adopted the same course, and some of the most influential shipowners are investing capital in this property, whilst Lloyd's have accorded them their highest classification.

The vessel was named the *Lennox Castle*, and is of the following dimensions:—Length between perpendiculars, 175 ft.; extreme breadth, 30 ft.; depth of hold, 18 ft. 10 in.; measuring 751 tons, and of about 1,200 tons burthen. She is classed 14 years A 1, at Lloyd's; is owned by Messrs. Thomas Skinner & Company, of Glasgow; and is to form one of the *Castle* line of packets trading from Glasgow to Singapore, Batavia, and China, for which she has been specially designed, and is the second ship supplied by the builders to this firm during the present year, and the twelfth of the line. The prow of the *Lennox Castle* is adorned with a well-executed figure, by Messrs. M. & J. Allan, Glasgow, of the present Countess of Lennox.

ROYAL SURREY THEATRE, BLACKFRIARS ROAD.—Mr. JOHN ELLIS, ARCHITECT.

## THE GRAPHOTYPE.

Artists engaged in drawing for engraving have long felt the want of some easy and direct method of reproducing their works without the impress of another hand. Numerous endeavours to obtain this have been made, but none at present has proved entirely successful. The last invention in this direction is called the Graphotype, and was described by Mr. Henry Fitz-Cook, at the Society of Arts, on the 5th instant, Mr. H. Cole, C.B., in the chair. We give a part of the paper to explain the process:—

"The discovery of the principle on which the Graphotype process is based was not the result of design or calculation, but entirely accidental and unprepared. It is due to Mr. De Witt Clinton Hitchcock, one of the foremost draughtsmen as well as engravers in the city of New York.

In the summer of 1860, whilst engaged in the pursuit of his art, the discovery was made in the following manner:—In the course of making a drawing on box-wood, he found it necessary to alter a portion of his design by crasing it, and re-whitening the exposed surface of the wood. The material used for this purpose was the enamelled surface of an ordinary visiting card, softened by water and a brush, a method known to most draughtsmen on wood. This card happened to be one printed from a copper plate, and after the removal of all the enamelling, as described, the artist discovered that the printed letters were undisturbed, and standing up in bold relief.

The first trial was upon a piece of chalk 1 in. in thickness, sawed from the ordinary lump, and smoothly surfaced by scraping. The ink used was silicate of potash, commonly termed liquid glass, coloured with indigo; with this and a quill pen, a drawing 4 in. by 6 in. was made.

The inventor well knew that the application of water to his chalk block would undermine the lines, and consequently destroy the drawing; he therefore departed from the method used with the visiting-card, and, with the aid of a tooth-brush, pulverised or disintegrated the surface of the chalk not immediately drawn upon.

The lines of the drawing being literally composed of stone, withstood the assault of the tooth-brush, but the intervening particles of exposed chalk succumbed, and vanished in a cloud of snowy dust, leaving the impregnable lines standing in relief, inviting a proof of their strength by printing on paper. This could not be done until the whole mass of chalk was changed into stone, by saturating it with the liquid glass, and in half-an-hour the chalk engraving or block was inked and printed in the ordinary way on paper by burnishing.

Sawing and surfacing the chalk block, preparing the ink, making the drawing (quite an elaborate one), brushing it into relief, petrifying the block, and printing thereon, occupied only four hours,—a bappy four hours for the inventor.

The new process now needed a name. It was a living fact, but the dead languages must be exhausted for its appellation. It was christened Graphotype, literally signifying a type made immediately from a drawing.

Prior to a second experiment, it was thought necessary to use a substance of a finer and more uniform quality of grain than common lump chalk; so a cake of French white powder, used by ladies for improving their complexions, was obtained, and the result was highly satisfactory. The fact that these cakes of white beautifying powder were compactly formed by hydraulic pressure, suggested a valuable improvement to the process.

No time was lost in manufacturing the necessary steel dies or boxes, and procuring the use of a powerful hydraulic press; with which, blocks 12 in. square by 1 in. thick, were formed of pulverised and finely-sifted chalk. These blocks were then subjected to a heat of 700 degrees, which, expelling all moisture, gave them much greater strength. The drawings on these blocks were made with steel and quill pens, and the brushing process for relieving the lines was carried to the depth of one-eighth of an inch. These blocks were printed at the ordinary hand printing-press; but the material, though very strong, was too fragile and uncertain for constant use.

The next necessary improvement was to duplicate the original by means of stereotyping or electrotyping. The latter proved perfectly practicable, but alterations or corrections of the design—which need hardly tell you must necessarily often occur in any process—all of which

could readily be done on the stereotype, could not be satisfactorily made through the copper surface of the electrotype, notwithstanding Mr. Palmer's directions on the subject already quoted. Valuable improvements were the result of this new addition to the process. It would be tedious to listen to an account of all the experiments which followed this alteration—the disappointments, hopes deferred, and discouragements from friends which the inventor suffered for the space of eighteen months.

Great difficulties arose; the labours of a month were often lost in a minute, and steps retraced to the first principle, which stood always unchanged; its constancy was beyond suspicion. The ink-line, once drawn, remained unalterable, and ever ready to reward the operation of brushing, and this portion of the process has never been altered.

In making the stereotyper's moulds from these blocks, they were found to absorb too great a quantity of oil; the new block, or, more properly, the new plate, was then composed and adopted, and has been in use, without material alteration, to the present time.

It was a well-known fact that the silicious ink spread on the plate, and produced a line somewhat thicker than was drawn. This was certainly detrimental to the process, but the existence of the fault could not be denied; for as the chalk was naturally porous it would absorb the ink laterally as well as vertically. It remained for a brother artist of the inventor, a Mr. Day, to make the improvements required in the graphotype drawing ink now so successfully used. I may also mention that Mr. Edward Roper, a London engraver, materially aided in improving the practical details of the process; and no doubt its success is to be attributed to the fact that none but those practically acquainted with art or engraving have been connected with its development.

With the approval of the original inventor, the European patents were granted to Mr. Day, and I will now give a general description of the whole process, as specified in the letters patent:—The best quality of French chalk is finely ground and precipitated in water. This precipitate is again pulverized and sifted. Thick sheets of zinc or other metal are cut to the required sizes, upon which the prepared chalk is re-sifted through wire cloth having 10,000 holes to the square inch. This is subjected to hydraulic pressure of 120 tons, the chalk receiving a gloss from the surface of a highly-polished steel-plate. In this condition the thickness of the zinc-plate and compressed chalk is about that of an ordinary stereotype-plate. The surface of the chalk is then made nearly non-absorbent by receiving a strong 'sizing,' which prevents the ink from penetrating, and, consequently, from spreading.

The ink, which, as I have said before, took two inventors months of labour to perfect, is, after all, nothing more than a very careful composition of glue and lampblack; and, partaking as it does of the nature of varnish, it remains upon the surface, acting merely as a guard or protection to the chalk beneath the lines while undergoing the operation of brushing. In a like manner to drawing upon wood, the artist makes a red chalk tracing on the plate, and with sable hair pencils of various sizes draws his design line for line exactly as he desires it to appear when printed, the subject being, of course, reversed, as upon wood. The ink, which is black, dries instantly on being applied to the plate, so that one series of lines of any thickness may be immediately crossed by others.

The drawing is now ready to be brought into relief, or engraved, which is effected by the same means of disintegration as were first adopted by the inventor, not with the same tooth-brush, but with brushes composed of fitch-hair. Fine silk velvet is also used in connexion with the brush. The chalk is then petrified with the liquid silice, and is ready for the stereotyper, who may, without injury to the original, make from it any number of moulds.

The process is so delicate that the impression of the thumb wetted with the graphotype ink, skeleton leaves, feathers, and other objects to which nature-printing has been applied, can be made to give beautiful impressions from the type press, whilst the finest hair-line that the artist can make will stand equally well with the boldest work.

The graphotype process is also applicable to making the blocks or dies—usually cut on brass—with which the bookbinder embosses the covers of his books, and this conclusively proves, if anything were needed to do so, the depth

obtained by the process, as at least three times the depth is required for this purpose as for printing at press.

In mechanical drawing the graphotype process cannot at present compete with other methods, inasmuch as the compass and rule are incapable of being used without damaging the chalk surface, and the absence of these aids very materially increases both the labour and cost of the drawing. This difficulty, however, no doubt will be speedily overcome when any one shall think it worth while to lay himself out for it."

Mr. Holman Hunt writes me, said Mr. Fitz-Cook, as follows:—"I regard the process of drawing for book illustrations, called graphotype, with which 'Watts's Hymns' have been illuminated, to be the best yet adopted. The merit of the modern wood-cutters is very great, and the care which they bestow upon the blocks they cut deserves, oftentimes, the greatest thanks of the designer of the work; but, even under the most favourable treatment by the cutter, much of the original character of the drawing must necessarily be lost. Your new invention will preserve every peculiarity of style. A first experiment is scarcely a fair test of the capability of the process, but it has convinced me that when the tools are familiar to the draughtsman he will find a means of expressing his ideas which he never had before except in etching on metal, which, of course, cannot be used in type printing."

Something more will have to be done before we shall venture to speak with similar confidence. We have seen several inventions that went equally far as this; yet never went far enough.

## CONDITION OF EDINBURGH.

The newly-elected Lord Provost of Edinburgh (Mr. William Chambers) made a statement to the town council of the results of the inspection he had made of the closes and wynds of the Old Town, and of his proposals for the opening up and purifying the densely populated and poor districts. He proposed, first, that diagonal streets should be formed, cutting across the closes; also widening St. Mary's-wynd, and other narrow streets of the lower Old Town. In the second place, he proposed that there should be broad passages opening from the High-street to the diagonal streets. He did not propose to break the prominent line of houses in the street, but would have communications by archways here and there through them. A third improvement would be to remove half-rinnons tenements, and form on their sites open courts paved with flagstones. A fourth step would be the removal of wooden fronts from the older houses in the closes. In the ground-floors the dwellings were dark, even at noonday, and the inhabitants might literally be said to live in "the Valley of the Shadow of Death." He had a confident expectation that these and some subsidiary operations would give a new character to the Old Town without injuring its picturesque appearance. At present, the death-rate in the districts mentioned was from 30 to 35 per 1,000 of the population per annum, or nearly double what the rate was elsewhere. In all probability the improvements now suggested would lower the death-rate one-third. Dr. Littlejohn, the officer of health, said that the lowering of the death-rate in the Old Town to 25 per 1,000 would effect an annual saving of 312 lives. What were to be the benefits in a moral and religious point of view he would not stop to particularize. But while they were destroying, it was pretty certain they must also build, and they must have due regard to the recent humane statute which prohibited a general destruction of dwellings for railway or other purposes, unless new houses be erected for the dispossessed inhabitants. His lordship then sketched his financial plan,—namely, the purchase of old and building of new houses by the public, or by private persons, or associations going in with the scheme, and by a rate of a few pence per pound, extending over a series of six or seven years. The new houses to be erected must be neither of grand nor costly architecture, but houses for the middle and working classes, of from 6l. to 12l. or 15l. annual rent. He proposed to procure statutory authority in the Session 1866-7:—1. To prevent the overcrowding of dwellings; 2. To exclude cow-houses from any part of the city, except under certain regulations and by license of the magistrates; 3. To give the town council the entire charge of all streets, roads, and pavements

within the bounds of the municipality; and, 4. To restrain speculators from running up insufficient buildings.

If Mr. Chambers succeed in bringing his scheme into action, he will be Edinburgh's chief benefactor, and earn for himself an enduring reputation.

#### ODDITIES IN ARCHITECTURE.

DURING my wayfarings and residence in several parts of Great Britain and Ireland, for some years past, I have been in the habit, whenever I have seen anything that peculiarly interested me, or those with whom I have been associated, like Captain Cuttle, of taking a note of it. My architectural musings, although unpretensions in either their prose or their more poetical forms, have been a source of some pleasure to me.

Among my recollections of strange places and strange faces, in old towns and cities, those antique sun-dials, faint stone tablets, sculptured lintels, emblematic cornices, memorial panels, and heraldic crests and devices, betimes have interested me. There are some worldly-wise folk who pretend to read a man's character by his handwriting; whether this can be done or not I am not sufficiently cognizant of caligraphy to vouch; but I would venture to say that a man's character may often be read, or that of his ancestors, in the style of edifices they have constructed and that survive them.

During the Elizabethan era, and in the reign of Queen Anne, builders, or those for whom they constructed dwellings, were in the habit of inserting stone tablets in the interstices betwixt the second, third, and fourth stories, commemorative of the year or the founder's name. Sometimes these memorial tablets were inserted on the top, in the centre of those crow-foot gables, and sometimes in the tympanum of the pediment over the hall-door below. In some instances a crest or coat of arms appears, with the year, in Roman characters; in other cases single letters, on either side of crest, autograph style, with date underneath; on either side subdivided, as 17—06. Except where assisted by the aid of local history, in many places it is impossible to say whether the names are those of the builder or those for whom the house was built. Where a single letter on each side occurs, they are generally the founder and his wife's Christian initials, such as C + E, signifying Charles and Elizabeth conjointly. Interlaced capitals, like Gordian knots, were very common, and are difficult betimes to decipher. This custom in building, very common even through the eighteenth century, appears to have decreased, and altogether disappeared in the dawn of the nineteenth. Its resumption recently in its plainer phases in houses and public buildings, is like the return to former fashions in dress long obsolete, but still considered appropriate for adoption.

My attention was first drawn to these memorials in stone several years ago in Dublin, and since in those other places which I shall mention. The old age-work houses of the Irish metropolis, so common in the Earl of Meath's Liberties in the old city, have all disappeared for many years. Almost all of them had carvings and tracery on their main lintels and beams, indicative of their owners' occupation and name. But numerous brick houses, very early in the eighteenth and some of the seventeenth century, in Elizabethan style, still remain, preserving an epitome of their origin in their very legible stone tablets, ranging from 1670 and 1690 to 1750. In Pill-lane, behind the Irish Four Courts—a great leading thoroughfare and place of trade once—I remember seeing three or four of these old houses, which are probably standing yet, bearing the accustomed capitals, with the dates 1711 and 1712. Over the doorways of some houses in Stephen's-green interlaced letters in stone appear; and in one house in Dorset-street the whole name in English characters, with the date 1745, may be seen; as also in the same street a row of brick houses, with the uncommon insertion of small square blocks of grey stone in the middle of their fronts, on which the number of each house is sculptured. Near and over the remains of the public fountain erected in Dublin two-thirds of a century ago and upwards, copious evidence still exists of this armorial emblematical architecture so frequently brought into requisition for decorative purposes and posthumous celebrity. Beside Merion-square, and in James-street, once beautiful but fast-crumbling structures attest it.

In Irish provincial towns scattered through the four provinces, numerous examples occur. In Cork, Galway, Derry, Antrim, Drogheda, Kilkenny, and Waterford those autographic inscriptions and architectural fancies are innumerable.

Passing through England, leaving well-explored London aside, in the midland and northern towns I find those stone records of the past plentiful, in Birmingham, Sheffield, Chesterfield, Leeds, Liverpool, Newcastle, and in Sunderland. In the northern towns they appeared to me to be more marked and expressive in design and execution. This might be attributed to the leaven of the Roman element, once so powerful in its sway in and about Northumbria and the Borders.

In Wales I had not much opportunity of ascertaining; but, doubtless, similar manifestations of the fashions in the art of building occur.

Again, in Scotland, north and south, many a weird device and complex inscription attracted and fascinated me, coupled with vagaries in architectural design and construction which only a disciple of Scamozzi or Palladio in Bedlam could perpetrate. Yet they were all suggestive and entrancing.

In old Aberdeen, on gateways and walls, I have looked upon them; and in Aberdeen proper, in and about the Nether Kirkgate, and off the Broad-street, and adjacent streets I cannot now recollect, rustic and classic examples of memorial stone tablets, with letters, dates, and other figures, may be still seen.

In Dundee a few scant evidences yet exist, and in and about the main street in Cupar-Fife.

Edinburgh, once rich in this species of memorial architecture, retains much of it. In the old town, scattered here and there in its narrow and sinuous wynds and closes, a close observer will find them, and he interested in their discovery and inspection. In the Canongate, the High-street, the Grassmarket, the Westport, and in the antique and polyglot Cowgate, the antiquarian student and literary inquirer will find them in divers shapes, more or less complex and comprehensive.\*

*A propos and en passant* of Edinburgh, I may remark one or two things. At the side of John Knox's house a couple of houses fell two or three years ago, burying some persons, who narrowly escaped. Among these was a young lad of about twelve years of age. He was missed, and instant efforts were made to extricate him. The men employed worked for several hours before they came across any trace of him. At length a faint voice was heard calling out. The men redoubled their efforts, and at last came to some broken timber debris, under which was a large timber beam. Immediately under this beam the voice was heard to call lustily out,—“Heave away, boys; I'm not dead yet.” It is needless to say, the men did “heave away” with hearty good will; and soon had the pleasure of extricating the gallant young boy from his living tomb.

The house that was erected soon after, on the site of this occurrence, has a projecting corbelled window, underneath which is a carved bust of the boy whose life was saved, with the words which he uttered attached. Report says, that some gentleman, growing interested in the lad, had him sent to St. Andrew's, to be educated.

To this example of memorial architecture, I shall add that of an architectural owner in the environs of Edinburgh, who has built a house composed of stones from “all nations,” so report says. I looked upon the edifice, with its numerous varieties, and I am inclined to think that our friend paid too dear for his whistle. The suburban folk say he was tired of his taste before it was finished, from its expense, the masons being only too glad to gratify his whim. Whether his temperament is as various as the stone of which his house is constructed, I cannot say; yet, I would venture to hint the dwelling must be partly the reflex of the owner.

Returning,—Glasgow, in its old quarters, has many armorial bearings, curious devices, commemorative corbels, and stone sun-dials, scattered here and there, over its ancient edifices. The progress of this commercial city for the last quarter of a century, however, has removed many of those old inscriptions and symbols; so that very few remain, except those of church and mural tablets and sculpturings. In the crypt of the High Kirk, numerous grotesque,

beautiful, and incomparable stone effigies of saints and bishops, are lying about, scattered and broken, with ancient Latin and English letterings and cypherings. But these mural memorials are common to many places in Great Britain, and are not much dissimilar in character.

I have said in the beginning something anent men's character being interpreted by their works. I might have added, also, that men's professions and avocations are often exemplified in what they invent or construct. In building, this has been more manifest than in other things, from the fact that there are few business men but like to dabble a little in the building way, if they have made some money. Clergymen are much given to building, as well as speculative laymen, though not exactly for the same reasons. Literary men are remarkable for their peculiar fancies in the architectural line; and printers and publishers have sometimes as much perpetuated their name and their fame by the houses they have built, as by the works they have printed and published. The fame of Swift's printer and publisher, the celebrated Faulkner, still lives in the house he built at the corner of Essex-street, Dublin. It was well and durably built; and though of brick, it will outlast the best of those that may be constructed of the same material for half a century to come. Faulkner's dwelling was designed, I believe, by himself. It is a corner house, and in the centre of one of its fronts a niche was formed for the reception of a bust of the witty Dean. The house was finished internally and externally with the exception of the staircase, for which no provision seemed to be made, even when all else was completed. This singular occurrence gave rise to some talk among the Dublin wits at the time, one of whom remarked to another's interrogation, that Faulkner did not require it as he had but one leg, and therefore was unable to climb.

I remember an Irish bishop of the Establishment who began the building of his dwelling at the top. His house is likely to perpetuate his name longer than his sermons. The way in which he carried out his strange construction was in this manner. Wanting to make some alterations and improvements in the top story, he had a portion of it shored up from the story underneath. When completed he fancied that what was underneath was out of keeping with what was above, so he removed portions of the second story after shoring it up, as before, from the next story below. His increased additions continuing to be out of proportion with those immediately below, he still continued to shore up and pull down until he reached the basement story; so that when it was completed, the house had become an entirely rebuilt one, and rebuilt, too, from the top downwards. It is, probably, the only existing specimen of building houses downward in the Old or New World. It even lies completely Brother Jonathan in the art of building.

Well-designing men have often been unfortunate in their designs. Their impulsiveness have led them to attempt what was far beyond their means to accomplish, though not beyond their genius and talent to execute had assistance been rendered. Cook's Folly, in Bristol, and M'Anaspie's, are not the only individual examples that could be cited of architectural abortions,—examples are numerous through Great Britain. From the building of the Tower of Babel, to the building of that huge Georgian Folly, that fell through on the Calton Hill, Edinburgh, individual and associated attempts are numerous whereby men have attained posthumous fame when their otherwise sterling merits were overlooked and denied them. The brothers M'Anaspie were really clever, particularly the elder; and his schools and practical workshops of design were a hold idea; but, alas! how far beyond the power of men not possessed of capital or sufficient patronage to carry them through. They failed, as others failed, and a cold calculating world calls the skeleton they were unable to clothe a “Folly.”

Artificers and tradesmen, apart from the building branches, are more or less given to the embodiment of features belonging to their own trade in whatever they build or construct. I have noticed this speciality in the members of different crafts in different places. Coopers, whenever they build, were given to round or circular work; and they carry out this fancy in many ways—in walls, windows, and doorways. Smiths, and men in the iron way, are not only fond of superseding timber by iron, but they

\* Sketches of a few inscriptions and some remarks on them appeared not long ago in our pages.—Ed.

are prone to introduce it in every conceivable way, for decorative as well as useful purposes. I have known retired leather merchants and boot and shoe manufacturers to dispense with brass and iron fastenings in many cases, when they built for themselves, and to substitute leather for hinges and sash appliances, shaped in novel ways, still believing in the old proverb, "There's nothing like leather." I have found tailors who were well to do to have a most insatiable desire to be dahbling at building; and I have never known one of them to rest content, but to be eternally altering and re-altering what he first built. Dressing-case manufacturers I have known to build extensively; but their dwellings, like their work-boxes, were indeed a study to examine. Such apartments and compartments, nooks and niches and cranies, I never before witnessed. Undertakers, &c., coffin-makers, — I have known them also, twice or thrice, to try their hands extensively at public and private buildings — and may I never witness the sight again. In one instance it was a public hall, and in the other a large public square. They were sepulchral-looking edifices indeed, fit only for the habitation of living *dead men*. One of the greatest men that ever lived, thundered from the dais in the one, while the water-rats swam about and held carnival, while he spoke, in the kitchen below; and as for the public square, before the shrubs had well taken root in the parterres without, the houses around had changed their tenants by the development of "the great social evil." The undertaker's building speculation was a *grave* affair, in sooth.

The list could be extended to other trades, were it necessary, showing the various characteristics growing out of each trade, and almost inseparably connected therewith. But we can now perceive that man is voluntarily and involuntarily given to perpetuate his name and fame, or frailty, in his manual as well as his mental works.

Whilom as now men have built, and vestiges of what they raised show us that their works were ornamental, useful, and otherwise. We can endeavour to read antiquity by its architecture, and we shall be interpreted, notwithstanding all our strange devices and vagaries, hundreds of years hence, by that unborn posterity which we vainly try to puzzle.

A descriptive and illustrative series of those stone memorials, with their devices, alluded to in the opening of this paper, would be useful and interesting. It is by the gleaming and uplifting of such waifs and strays as yet remain in the land we may penetrate labyrinthic long inaccessible, and let light in on architectural history and its wayward changes. C. C. H.

#### POISONOUS MUSHROOMS.

EVERY year, with the advent of the autumn rains, we read in the newspapers of numerous deaths, by eating deleterious mushrooms; and whilst remedies and preventives are constantly published for the various classes of accidental poisonings by vitiated air and otherwise, warnings to prevent, and remedies to counteract, the evil of accidental poisoning by mushrooms, seldom or never appear in print. For this there are various strong reasons. For instance, after the mushrooms are eaten, there is great difficulty in positively ascertaining the particular species that worked the evil; but the greater and by far the most potent reason is, that among our botanists, we may number by units, the few who have any really sound and systematic knowledge of this class of plants. There is but one book in this country that pretends to give any precise information regarding them, whilst the various popular books that treat of the subject (with one or two exceptions), may be dismissed as worthless, being simply compilations from previous works, copying facts and fallacies alike. Some of the articles, written by amateurs for the weekly periodicals on this subject, are still worse, for were their false descriptions and absurd directions followed, fatal results would constantly happen.

Many residents in the country, who think they know the meadow mushrooms quite well, occasionally suffer considerable inconvenience, after partaking heartily of this plant, when a little previous knowledge of the things themselves, or the state they should be in when eaten, would have prevented the evil. We consider the subject of sufficient social interest to publish a few observations and warnings regard-

ing this obscure but gastronomically valuable class of plants.

When, as sometimes happens, a dangerous species has been gathered and eaten by an educated person (who knows the mushroom), in mistake for the true form, it is simply because the individual in question was unable to distinguish minute differences between one thing and another; and in this consists the whole secret of so many deaths by eating poisonous roots in mistake for horse-radish, &c., and many similar things that will occur to the mind of every reader. In being safe against this evil lies one of the very great advantages of a knowledge of some branch of natural history that necessitates minute observation; for, when the mind is once well trained to detect obscure and small differences in the aspect of certain objects, mistakes will seldom be made in substituting one thing for another, either in the special object of study, or in any business through life; but, in many of the cases of poisoning that occur to ignorant persons, it is owing to the grossest want of knowledge. Instances repeatedly occur where some stupid man goes out and gathers a basketful of all the fungi he can see, great and small, growing on trees or rotten palings, of any form or colour, or in any situation or condition. He then takes them home, and prepares them for the table, and poisons himself and family. This type of man never knows what a mushroom is; he knows it is a thing with a stalk and a top, and this ends his knowledge.

Evil consequences frequently follow the consumption of the true mushroom if it is kept too long after gathering. To have a full appreciation of its really delicious flavour, it should be brought direct from the meadows to the kitchen. After it is once gathered a certain chemical change soon takes place in its nitrogenous composition, that renders a valuable and delicate object of food a dangerous poison. To eating stale and semi-putrid mushrooms a large number of poisoning cases are to be referred.

In various popular books that touch on the subject of mushrooms as food, certain rules, more or less imperfect, are given for the detection of dangerous species; but there is *no rule* that can be prescribed for the recognition of esculent species that will not include some of the dangerous ones; and, on the other hand, typical forms of poisonous species are frequently closely allied to some of the most valuable ones as food. To add to the difficulties of the matter, some of our edible mushrooms frequently have a poisonous ally in company with them, that requires a sharp eye to detect. It is clear, from the foregoing, that there is no royal road for acquiring a knowledge of fungi as food, without study and devoted attention; and no mushroom should be eaten unless the consumer has a positive certainty of what it really is. Any mushroom that appears doubtful in form or colour, or that may have lost its freshness, should be laid aside.

Some species are well known to be always highly poisonous in all stages of growth, whilst others are only occasionally so; many are doubtful or suspicious; but, without doubt, the majority of species that grow in this country would form a nutritious and delicate addition to the table of rich and poor alike; but till the knowledge of distinguishing one from the other is acquired, it behoves every man to be cautious what members of a suspicious group he consumes for food. W. G. S.

#### THE PAYMENT OF ARCHITECTS: PUBLIC COMPANIES.

Sir, — The subject of architects' remuneration, already so well ventilated in your columns, is not one in which I have any personal interest, either as a builder, architect, or employer of architects; but as a moral or philosophical question I have given some attention to its discussion in your influential journal, and I am sorry to say I feel as far from land as ever. Most cordially do I hold that the laborer is worthy of his hire, and that a man's pay should be in the ratio of his merit; but the difficulty in this case is to apply these principles. A determinate result or a cast-iron rule seems unattainable, at all events, until the public come to the rescue, and come it will ere long. But as matters now stand, I presume that in the absence of any special agreement, any architect can legally claim a commission of 5 per cent. on the gross value or cost of any buildings, with what

ever disbursements may have been incidental to his surveillance.

If the job is a small one, probably a jury might award a round sum, instead of a simple per centage; and if it is a very large one, something less than the usual rate might be allowed; but, as a rule, I suppose the 5 per cent. commission would prevail. For my own part, I see nothing to complain of in the architect's commission, provided he really gets it, and that he is not also in the pay of those over whom he is set as a watch. The architect has a high and holy mission to perform, and, like Caesar's wife, he should be above suspicion. He ought to be a man of unbending honour and exquisite sensibility, as well as master of everything relating to the safety, convenience, or picturesque quality of buildings, and *in fact* of the proper cost of work and material. He must be a man of moderation and tact, not apt to find fault; while, at the same time, he neither intelligently connives at nor is culpably ignorant of false work. It is true we may have an institution for the purpose of giving him his proper status with the public, and destroying the adverse influences with which he has to contend; and, as a protest on his behalf, I am not insensible of its value. But I have no faith in its entire efficiency to remove the grievance referred to, and I am not without fear of its fostering false causes of taste, and ostracising the very men that should take the lead. The greatest purists in their professional relations with the trade will of course flock to its standard. But we all know how easy it is for architects to receive bribes without the possibility of detection, or the most censorious having the slightest handle against them; and it is equally notorious how apt the spirit of persecution is to take possession of anything in the shape of an establishment, and how liable are those who do battle for the truth, to get tabooed as heretics. If the Institute referred to be something more than a mirage in the desert, or a real evil in disguise, its members will have to exercise great jealousy over themselves and each other, lest the insolence of wealth, and the toadyism of those who wish to get on, shake hands, and thus reach its aim.

The question of architects' charges does not stand alone, and must be taken in connexion with the one as to his real position, whether, in fact, he is the builder's foreman, agent, or partner, instead of the exclusive servant of the public. It seems to be a different rendering of the old issue, "Cunning versus Straightforwardness." Before the era of railways and limited companies, builders and contractors had really a hard time of it, frequently doing a great deal for little, or reaping ruin where they should have had a living. But the case is far otherwise now; it is amply testified by the princely fortunes which they have achieved, and the meagre dividends that are received by shareholders and clients. The course of truth is deeply indebted to you for the space you have given to this discussion, and I hope you will continue to give the subject an occasional airing. There can be no doubt that a pure and independent body of architects and engineers will, ere long, be insisted on by public companies as well as private individuals. HONESTAS.

#### DEFLEXION OF BEAMS.

THIS subject, on which "A Student" asks a question, in your last paper, has received much attention from mathematicians since Barlow's Treatise was published. In his "new edition, revised, 1845," I find the same statement which "A Student" quotes as appearing in the edition of 1837. I also find on the next page a statement that, *because the strain on a beam produced by a weight distributed is only one-half what it is when acting at the centre only, therefore the deflexion is only one-half*. This is reasoning from false premises, as it assumes that the deflexion varies as the strain.

The whole subject is thoroughly investigated (mathematically) in "Fenwick's Mechanics of Construction" (noticed in the *Builder*, 1861, p. 673), to which work I will now refer.

"A Student" has, however, misunderstood the question when he says that it can be easily verified by experiment, as his own experiments, in fact, show the contrary. From the very nature of the investigation (to understand which requires a knowledge of the differential calculus) experiment is out of the question, for the formula is deduced on the hypothesis of the deflexion being *very small*, and certain quantities are

consequently neglected. If we get beyond very small deflections, the formula ceases to be of any practical value, the object really being to ascertain what weight may be laid on a beam without producing any perceptible deflexion, which is the practical question.

The formula deduced in Mr. Fenwick's work for a beam of length L supported at each end, and loaded by a weight W in the centre, is (deflexion in the middle equals)—

$$D = \frac{W \cdot L^3}{48 \cdot E \cdot I}$$

And for a beam of length, l, fixed at one end, and loaded by w at the other,

$$\text{Deflexion} = d = \frac{w \cdot l^3}{3 \cdot E \cdot I}$$

Now let  $L = 2l$ , then  $L^3 = 8l^3$ ,

$$\therefore D = \frac{W \cdot l^3}{6 \cdot E \cdot I}$$

So that if  $W = w$ , then  $d = 2D$ ; and if  $W = 2w$ , then  $d = D$ ; and also, if  $W = w$ , and  $L = l$ , then  $d = 16D$ .

Hence it will be seen that the editor of the last edition of "Barlow" was right in his correction.

If the weight W is uniformly distributed over the length of the beam, supported at both ends, then the deflexion in the middle is five-eighths of what it would be if W were applied only at the centre.

If the weight w is distributed over the length of the beam fixed at one end only, the deflexion is three-eighths of what it would be if w were applied at the other end.

Lastly, if the beam is firmly fixed in the wall at both ends, and loaded in the centre, then the deflexion in the middle is one-fourth what it is when the ends are only resting on supports.

The same formulae apply to beams of various materials, the only variation being in the value of E found by experiment.

E. WYNDHAM TARN, M.A.

has been pronounced a success, and works in the most perfect manner.

We fitted the Theatre Royal, Glasgow, with our patent revolving shutters, to divide the theatre from the carpenters' shops and property rooms; but as the public do not see them, and are not aware of their existence, they would only be beneficial in saving the theatre.

CLARK & Co.

THE SEWAGE QUESTION.

MR. M'DUGALL, whose "powder" and whose application of town sewage to the cultivation of land in the neighbourhood of Carlisle are well known, has, we are informed, taken upon lease some land near Penrith, called the Westmorland Holmes, adjoining the Eamont, and is about to promote its fertility by the application of the sewage from the town of Penrith. Instructions have been received by Mr. Geo. Watson, architect and surveyor, of that town, to prepare plans of the works, which will be on an extensive scale. The sewage will be conveyed through earthenware tubes to near Carlton Hall, and thence by means of iron pipes through the river. No pumping will be required.

The committee appointed by the Tewkesbury Board of Health to report upon the plans presented in competition for a premium of 10l. offered by the Board, received three plans,—from Mr. McLandsborough, of Cheltenham; Mr. W. W. Moore; and Mr. T. B. Holder, of Tewkesbury. The first was approved. During last summer the drains from the Barton-street side of the town to the Swilgate caused an abominable stench. It was feared disease would be the result; and a premium was offered for the best plan to obviate the nuisance by the construction of a proper sewer. Mr. McLandsborough proposes to do this by making a sewer of glazed pipes, 15 in. in diameter, at an estimated cost of 584l.; and to do away with any chance of the work costing more, Mr. McLandsborough would be willing to execute it for that sum. In the event of future legislation preventing the discharge of sewage into rivers, the plan provides for the construction of proper receptacles for the sewage, from whence it can be used for irrigation of manure. Mr. Moore's plan comprises a brick culvert, 2 ft. in diameter, running a somewhat shorter course than Mr. McLandsborough's, and emptying itself into the river higher up, the estimated cost being 588l.

SANITARY MATTERS.

Northampton.—At a recent meeting of the local Improvement Commissioners, a letter from Dr. Barr was read, urging the necessity of completing the drainage, cleansing cesspools, and improving the water supply within the next few months, otherwise cholera may find the town totally unprepared to resist its ravages. The commissioners have had a discussion on the subject, and have resolved to request the medical gentlemen of the town to communicate to the Board what parts of the town it was desirable their attention should be directed to in the mean time, and they have appointed a special meeting to consider the subject in all its bearings.

Croydon.—The local Board of Health have resolved to act upon several recommendations laid before them by Dr. Carpenter, with reference to houses without cisterns to the closets connected with the sewers; drains on made ground instead of on concrete; ventilation of closets, sinks, and drains; flushing the sewers, &c. There is an unusual amount of sickness in Croydon, it appears, at present.

Brighton.—A letter to the Brighton Herald, by Dr. Douglas Fox, gives a sad account of the narrow streets, alleys, courts, and small houses in the town, and urges the appointment of a medical officer of health. The council are appointing an inspector of nuisances, with a salary of 2l. 10s. a week, and are taking other steps to remedy the state of things complained of. The plan for town drainage is now before the authorities in London, and an order has been given to proceed with the drainage of one district,—that of Pimlico.

Leeds.—Dr. Hunter, one of the medical inspectors of the Privy Council, has been reporting on the health of Leeds, which the returns of the registrar-general had shown to be exceptionally

bad during the past summer. After stating that he knew of no other town in England with which to compare Leeds, and that when he saw it in August, it reminded him of the condition of many English towns twenty years ago, he says:—"Thousands of tons of midden fill filled the receptacles, scores of tons lay strewn about, and hundreds of people, long unable to use the privy because of the rising heap, were —. Notwithstanding this state of things, the means adopted for the removal of the nuisances were altogether inadequate. Even where the nuisances were removed, the soil was deposited in immense quantities in a locality not far from the centre of the town, thus becoming a permanent cause of fever." Had the local authorities at Leeds given heed to our remonstrances on this subject, instead of trying in vain to controvert them, the state of the town and of its health might now have been very different.

Newcastle-upon-Tyne.—The members of the Northumberland and Durham Medical Society have memorialised the town council, with a view to the prevention of the spread of the serious epidemic of typhus fever, which is now affecting many parts of the town and of the neighbouring borough of Gateshead. The fever is not only widely-spread, but extremely fatal, and of a very infectious type. The facts that in one house no less than twenty cases of fever have occurred—that there are now under one roof eight persons "down" with the disease—and that in several instances father and mother have been swept off, leaving their orphans (unconscious of their loss) suffering from the disease transmitted to them from their parents, are considered by the memorialists to be enough to justify the most stringent measures on the part of the local authorities. Action, it is said, has already been taken on this subject, and a small committee of the Medical Society is acting with the Town Improvement Committee as a public health committee. Nuisances referred to are being dealt with, and the fever in the town is said to be assuming a milder form, with fewer cases.

It would be well for all our municipal authorities to consider that virulent cholera has been known in former times to be preceded by fever as well as diarrhoea; and its connexion with fever, both preliminary and subsequent to the choleraic attack, even in individual instances, was a noted peculiarity of this epidemic in its former visitations. In short, as we have before said, the state of collapse appears to be the cold stage merely of a tremendous ague-like fever; and cholera is essentially of a typhoidal nature, as was the plague of Old London itself, as well as of the East in modern times. The cattle disease is quite analogous in its nature also; and we all know how close the connexion is between foul localities and fever.

CONGREGATIONAL SCHOOLS, LISCARD, NEAR LIVERPOOL.

The materials used for the exterior walling are Flaybrick Hill stone, in scatched ashlar, with bands, quoins, and other dressings of red stone. The interior walls are finished in white fire bricks, with bands of red at the level of window-sills, springing of arches, and feet of principals.

The schools provide accommodation for 250 pupils; and, when thrown together for a lecture-room, will seat about 400 persons. The whole of the timber is stained and varnished. The roof is open-timbered and counter-ceiled. The turret is used for ventilation. The total cost of the building is 1,200l., including boundary-walling, railing, gas, heating, &c., &c. It has been erected from the designs of Mr. H. A. Vale, of Liverpool, architect; Mr. Campbell, of Liverpool, being the builder.

PROVINCIAL NEWS.

Basingstoke.—The extensive alterations and repairs which have been going on at the town-hall for the past few months, are now nearly completed. The space underneath the Assembly-room, which since the opening of the corn exchange has been entirely useless, has now been converted into two rooms, the one for use at petty sessions, and the other for small assemblies. The large room is painted in light-blue panels. The graining and marble painting were contracted for by Mr. Glover. The masonry part of

DISTRICT SURVEYOR WANTED.

Sir,—The necessity for a district surveyor for the parts beyond Highbury New Park, as stated by your correspondent "X," I can bear testimony to; for, at Hornsey, Wood Green, West Green, &c., houses are springing up like mushrooms, both as regards quantity and quality. At Hornsey not only is a district surveyor wanted, but a sanitary inspector is required; for, in the lowest parts, ditches, or rather open sewers, are to be met with in every direction, sometimes on both sides of the public highway, poisoning the otherwise pure air; and, should we be visited with the cholera next year, as prophesied, these contagion spreaders would prove very fatal, as most of the small houses are filled with lodgers, being principally the workmen of the Alexandra Park and Great Northern Railway works. W. E. B.

NEW THEATRE ROYAL, EDINBURGH.

Sir,—In your account of this theatre, your correspondent only casually notices the introduction of a fire-proof curtain, and the improved construction of the building.

As we are the original inventors of this plan, which was suggested to the architect of Covent Garden Theatre, when it was about to be rebuilt, and have endeavoured to get it introduced for years, we will feel obliged by your allowing us to explain the principle.

The Edinburgh Theatre is divided by a wall 2 ft. in thickness, at the line of the proscenium, which wall passes up to a height of 8 ft. above the roof, dividing the theatre into two distinct buildings. In this wall is an opening of 30 ft. by 32 ft., which forms the proscenium; this opening is closed by one of our patent revolving shutters (the largest in the world) in one sheet of steel, coiling above; it is raised and lowered by an hydraulic apparatus, which receives its power from a head of water supplied by a tank at top of building, which tank also supplies the fire-mains throughout the theatre. The shutter or curtain is raised or lowered in forty seconds, by simply opening or closing a valve.

It has long been a desideratum how to provide for the safety of the audience in the event of fire. Wide passages and good staircases, no doubt, are of great importance, but if the auditorium is cut off from that portion of the building where fire always originates, thus calming the public mind, and giving them ample time to escape, it will be more effectual than the widest passage that can be afforded in any theatre.

The fire-proof curtain at Edinburgh has been tested by the architect, Mr. D. MacGibbon, and

the contract was done by Mr. Budden, and the whole of the alterations have been carried out under the direction of Messrs. Salter & Wyatt, architects.

**Birmingham.**—The foundation stone of a new wing to the General Hospital has been laid. The growing requirements of the town and neighbourhood having made additional hospital accommodation necessary, this addition to the existing buildings was imperatively required.

#### MIDLAND RAILWAY STATION COMPETITION.

DESIGNS have been sent in for the Midland Railway new Station and Hotel by eleven architects, invited by the directors to compete, and are now exhibiting in Derby.

Good judges of such things assert that the drawings sent represent an outlay of at least 2,000*l.* irrespective of the value of the principals' time.

Amongst the eleven are Mr. E. M. Barry, Mr. Darbshire, Messrs. Hine (Nottingham), Mr. Owen Jous, Mr. Lloyd (Bristol), Messrs. Lockwood & Mawson (Bradford), Mr. G. G. Scott, Mr. Walters (Manchester), &c.

Some of the competitors contemplate an expenditure of 200,000*l.* Nearly all of them make the hotel only prominent; Mr. Owen Jones, on the contrary, makes the hotel subsidiary to the station.

#### CHURCH-BUILDING NEWS.

**Waterfoot (Manchester).**—St. James's Church, which is erected in the midst of a thickly populated and increasing district, has been consecrated by the Bishop of Manchester. The church has been erected by public subscriptions, one of the principal contributors being the late Mr. James Crabtree, of Manchester, at a cost of from 4,000*l.* to 5,000*l.* Messrs. Robinson & Stephens, of Derby, were the architects.

**Wrexham.**—It is proposed to restore the parish Church of Wrexham, erected by Henry VII., and acknowledged to be one of the finest Perpendicular parabolic edifices in the kingdom. Its length from the eastern to the western window is 175 ft. The pillars and arches forming the nave arcade are massive and plain, but of fine proportion, and support a lofty clerestory. The trusses of the panted roof rest on bold carved corbels of grotesque design. The magnificence of the interior of the church is much injured by the heavy unsightly galleries (erected about forty years ago), fixed between the pillars along the whole length of the building. It is the object of the parishioners to remove these galleries, as well as to clear away from the floor below all the irregular pews, and to substitute in their place open seats, by which arrangement 300 additional sittings will be obtained in the body of the church. The cost of the restoration is estimated at 4,000*l.*, 1,800*l.* of which have already been subscribed, the principal donors being the Bishop of St. Asaph, 100*l.*; Sir W. W. Wynne, bart., M.P., 500*l.*; Mr. T. L. Fitzhugh, 100*l.*; Sir R. A. Cunliffe, 100*l.*; Rev. Canon Cunliffe, 100*l.*, &c. The architect to whom the work is entrusted is Mr. Ferrey.

**Taynton (Oxfordshire).**—The chancel of the parish church of Taynton, near Burford, has been restored under the direction of Mr. W. F. Poulton, architect, Reading. The building, which is a particularly pure specimen of Early English, was in such an unsafe condition that it was found necessary to take down the whole of the walls and roof; and it has been re-erected on precisely the original plan. The work has been carried out, under contract, by Mr. Cowley, builder, of Oxford, at a cost of 370*l.*

**Evenwood (near Bishop Auckland).**—The foundation-stone of a church has been laid at this village by the Bishop of Durham. Great opposition was raised by the inhabitants to the erection of a church, and formation of a burial-ground on the village green; and the cry of "Clerical intolerance" was raised by both metropolitan and provincial newspapers a few weeks ago; but all asperities, we are told, have been smoothed down by the abandonment of the burial-ground scheme, and simply inclosing as much of the green as will afford protection to the church. The style of the building is Early English, and the edifice consists of nave, apsidal chancel, porch, and vestry, with sittings for about 270 adults and eighty children. The west

gable is surmounted with a turret, to contain two bells, and the whole built of freestone from quarries in the neighbourhood. Messrs. S. & R. Adamson and Mr. Armitage, of Darlington, are the builders. The architect is Mr. John Ross, of Darlington.

**Barnham (Sussex).**—The church has been re-opened, after having undergone repairs and restorations. The edifice is of the Early Norman style. The chancel is contemporary with the first possession of it by the Priory of Boxgrove, which is still apparent in the windows. At the suppression of monasteries the north aisle was taken down, in which the chantry was celebrated, which had been founded by John le Taverner, one of the most ancient bailiffs of Chichester. The lay rector, Mr. Rickman, of Empshott, Hants, his Grace the Duke of Richmond, Mr. Richard Cosens, and other landowners of the neighbourhood, and the vicar and his friends, have subscribed towards the restoration, and the Diocesan Association have also rendered aid.

**Romsey.**—The restoration of the Abbey Church, which has occupied some considerable time and involved a very great expense, is, for the present, nearly completed. The painting of the western roof was carried out by Mr. Henry Brown, of this town, house decorator. The north transept has been railed in unison with the other parts of the building which were done 800 or 900 years since. Mr. Geo. Whicler was the builder employed.

**Evenley (Northants).**—The Church of St. George, Evenley, built at the cost of the Hon. Mrs. Pierrepont, of Evenley Hall, has been consecrated by the Bishop of Peterborough. The style of the church is Early English in its later development. The ground plan consists of nave, aisles, north and south transept, tower, and chancel. Of these the north aisle is entirely new, the remainder of the building being erected on the old foundations. The tower is surmounted by a bronched spire of shingles, which has excited some controversy, as having the effect of extinguishing the tower. During the progress of the works, a robin redbreast built her nest within the porch, unharmed and unfrightened. The incident has been sculptured on either side of the porch doors, where the robin appears on the one hand cherishing her young, and on the other bringing them food. The church is seated throughout with low open sittings. The capitals of the nave, the various bosses and corbels, are carved in foliated style, and the windows, for the most part double lancet lights, have interior columns of Forest Dean stone supporting the bords, the piers of the nave being of the same material. The east window, by Messrs. Hardman, contains in the upper part of the central light a representation of the Crucifixion. The window in the north transept was by the same artist. It was erected by Colonel and Mrs. Campbell as a memorial to Mr. Pierrepont. The subject is "The High Priest Blessing the People at the Dedication of the Second Temple." The architect was Mr. Woodyeer; and Mr. Denery, of Rugby, was the builder. Mr. Bridger was clerk of the works. The stone carving is the work of Mr. Nichols, of Lambeth; and the building is warmed throughout on a system patented by Mr. Rimmington, of Shipton.

**Gorton.**—The Bishop of Manchester has consecrated a church, dedicated to St. Mark, which has been erected at West Gorton. Mr. C. F. Beyer, of Gorton Foundry, whose firm employs a large proportion of the workpeople in the locality, besides giving 1,000*l.* towards the Church Building Fund, has also at his own cost built new schools for 400 children. Towards the endowment his partner has given 1,000*l.* The total cost of the church, churchyard, and fittings amounts to upwards of 4,000*l.*; the estimate for the building, irrespective of the approaches, heating and lighting, being 2,760*l.* Towards this a large proportion has been collected amongst the poorer classes of the congregation and residents in the neighbourhood. The site of the new church is a large open plot of ground in Clowes-street, the gift of Colonel Clowes, the proprietor of a large portion of the district in which the church is erected. The edifice is built of common bricks, with colored banding and stone dressings, and contains a nave, 65 ft. 7 in. by 24 ft. 2 in.; north and south aisles, each 67 ft. 7 in. by 13 ft. 9 in.; and chancel, 21 ft. by 19 ft. 2 in. There is a north-western porch and door, and a north door projecting slightly from the wall. The building is in the Early English style. The pulpit and other fittings are of pitch-pine, also stained and varnished. The building has

been constructed to accommodate 600 persons, and 302 seats are free. The architect was Mr. Isaac Holden, of Manchester; and the builders, Messrs. R. Neill & Son, of Manchester.

**Haverstock-hill.**—The Bishop of London has consecrated another large and important metropolitan church. St. Martin's is situated between Haverstock-hill and Kentish Town, in a rapidly increasing neighbourhood, lately known as the Cospel-Oak-fields. The church will accommodate 1,000 persons, who will all have an almost uninterrupted view of the chancel, reading-desk, and pulpit: 400 sittings are free. Carved columns and a window by Messrs. Clayton & Bell, enrich the chancel. The tower is an ornament in a part of London which has but few objects of architectural interest or beauty; it contains six bells of deep tone. The church, with its parsonage, was built by Messrs. Dovo, from designs by Mr. E. B. Lamb; and the entire cost, together with the endowment, amounting to 15,000*l.*, has been defrayed by one gentleman.

#### Books Received.

*A History of Architecture in all Countries. From the Earliest to the Present Day.* By James Fergusson, F.R.S. In three volumes. Vol. I. John Murray, Albemarle-street. 1865.

We simply announce the publication of the first volume of Mr. Fergusson's *History*, which, although containing the "Handbook of Architecture" is in reality a new work. The topographical arrangement has been abandoned, and a historical sequence has been introduced in its place; the advantage of this, for popular teaching, is evident. Much new matter has been introduced and many additional engravings. For example, the number of illustrations in the chapters of the Handbook comprised in this volume is 441; in the volume itself they are 536, and in the second volume, which will be published before the autumn of next year, the ratio of increase, the author says, will probably be even greater. The book is a monument of industry, ability, and knowledge.

#### VARIORUM.

THE Council of the Art-Union of London have issued their annual Report and their excellent little Almanac; the former (already printed in our pages) testifying to the continued prosperity and greatly extended operations of this, the first established of existing institutions of the kind in England; and the Almanac containing a large amount of information relating to societies connected with art and science not to be found in any other work. The following is an interesting list of—

#### "INSTITUTIONS.

Bodleian Library, founded .....	1610 July 19.
Ashmolean Museum, founded .....	1679 May 16.
British Museum, founded .....	1753 April 6.

—"Proceedings of the London Association of Foremen Engineers." King & Co., Printers, Queen-street, E.C. These proceedings contain the report of a paper "On Foremen and their Associations," read by Mr. Joseph Newton, the president, on the 4th of November, and well deserving publicity.—"Gutch's Literary and Scientific Register and Almanac, for the year 1866." London: Stevens, 421, Strand. This is the twenty-fifth yearly volume of Gutch's Almanac, which is distinguished by the multiplicity of its information; in fact, it is a kind of compendium of all sorts of knowledge, astronomical, mechanical, statistical, historical, horticultural, &c., and is in the form of a convenient pocket-book, covered with leather.—"Dietrichsen & Hannay's Royal Almanac for 1866." Cleaver, 63, Oxford-street, London. Another

\* Removed to Trafalgar-square, 1337.

id-established almanac; this being its twenty-ninth issue. It also contains a great deal of information, but more political, commercial, and social, than scientific. There is a useful abstract of the more notable occurrences in 1864.—"The British Almanac and Companion" (1866), is still *facile princeps*, and should be in every library and counting-house. The "Companion" includes papers on Ocean Telegraphy, the National Art Collections, Forests and Open Spaces round London, the Sun, Working Men's Exhibitions, and its usual review of Architecture and Public Improvements illustrated.—Mr. Murray has published the promised volume of "Memoirs illustrative of the Art of Glass-Painting," by the late Chas. Winston, illustrated with numerous engravings. A biographical memoir of the lamented writer is appended, and the whole forms a valuable book.

### Miscellaneous.

**CHURCH AT TORONTO DESTROYED.**—St. Stephen's Church, Toronto, and the adjacent parsonage, have been totally destroyed by fire. The church was built at the sole expence of Mr. R. B. Denison.

**PROPOSED CONVERSION OF THE GRAND JUNCTION CANAL INTO A RAILWAY.**—At the last half-yearly meeting of the proprietors of the Grand Junction Canal the following important resolution was unanimously adopted:—"That, taking into consideration the existing and threatened competition by railway companies, it is the opinion of this meeting that some steps should be taken for the protection of the company's interests, and for this purpose they authorise the select committee to procure a preliminary survey of the canals between London and Birmingham, with a view to their partial or entire conversion into a mineral and goods railway."

**THE GAS-WORKS AT MOSCOW.**—The City of Moscow Gas Company have issued a special report of the progress made by the contractors of the company since its formation. The site for the works was obtained in June, and during the three succeeding months, before the approach of winter put an end to any further progress, great efforts were made to advance the works as much as possible. The result has been, that the lighting of a very considerable extent of the city may be commenced before the winter of 1866. Properly managed, this ought to be a very profitable undertaking.

**THE PROPOSED PIERS FOR HASTINGS AND ST. LEONARDS.**—The plans of the two piers proposed for this town have lately been deposited at the Custom-house. That which is brought out by the Harbour Company is to be called the Alexandra Pier, and the promoters contemplate placing it on the centre of Warrior-square. The plan does not furnish details as to the degree of ornamentation or style, but a pier-head, of about 150 feet width, is shown. The site is adjacent to or over the present drainage outlet, and the limit of deviation extends only as far as each side of the square. Sir John Rennie is the engineer for this scheme. The other plan has been prepared by Mr. Birch, the late engineer to the Harbour Company. The site proposed is opposite White Rock-place, but the promoters are desirous that the limit of deviation shall extend from the east end of Carlisle-parade to the slipway opposite Grand-parade.

**CARLISLE CATHEDRAL.**—The proposal to remove the parish church of St. Mary from the nave of Carlisle Cathedral, and build a new parish church, has been brought before the parishioners at a vestry meeting held in the Cathedral frater. Dr. Gloss stated that he had no doubt the Dean and Chapter would contribute 500l. towards the cost; and if the two projects—the restoration of the Cathedral and the building of the church—were carried out together, many contributions would be given towards the undertaking. After some discussion it was resolved: "That in the opinion of this meeting it is highly desirable that measures be taken for the removal of the present Church of St. Mary from the Cathedral, and for the erection of a new parish church by voluntary contributions on some suitable site." A large and influential committee was afterwards appointed to carry out the two schemes.

**OPENING OF THE FORESTERS' HALL, AT COWES.** This hall has been opened by a public dinner. The hall is about 60 ft. long by 26 ft. in breadth, and 23 ft. in height. On either side of the lobby is a waiting or cloak room, and above these and over the entrance a gallery. At the upper end is a narrow platform across the room. Dressing-rooms and other accommodations will be constructed at this end of the building, and the platform widened.

**FEVER RAMPANT.**—It is stated that more than 200 children in the London Orphan Asylum at Clapton are ill of typhoid fever, and four have died. A letter in the *Times* attributes the disease to the fact that at the back of the building, and within 100 yards of it, there is a large heap of filth, consisting of farmyard manure, town sewage, and decomposing vegetable matter, all of which emit most powerful and noxious effluvia.

**GIFT OF 30,000L. FOR A NEW CHURCH.**—The old parish church at Bolton has for some time past been in a dilapidated condition, and a magnificent gift has just been made by Mr. Peter Ormrod, of Halliwell Hall, cotton-spinner, to defray the entire expence of the erection of a new one. Mr. E. G. Paley, of Lancaster, architect, has prepared plans for the new structure, the general style of which will be Decorated Gothic. The new edifice will be much larger than the present one, and will provide sitting accommodation for 1,300 persons on the ground-floor alone.

**SCHEME FOR IMPROVING THE TOWN OF DOVER.** The dilapidated state of the pavements and the dreadful condition of the roads, arising from an insufficient amount having been expended on them during the last few years, have been the source of much animadversion. It is now proposed to raise a loan for a compulsory scheme for putting all pavements and roads in thorough repair. To do this, 10,000l. will be required, which will be paid off in thirty years, over which time a rate of a penny in the pound would pay. It is calculated that, when this is done, another penny rate per annum would do for the ordinary repairs; and that, by this means, a rate of 2d. in the pound instead of 3½d., as now, would only have to be levied, while the town would be put and kept in good condition.

**PETROLEUM IN YORKSHIRE.**—It has recently been found that the shales of unctuous clay overlying the iron-stone deposits of the Yorkshire moors, in the North Riding, like those in the West of Scotland, can be made to produce a mineral oil, similar to petroleum, at a cost of 6d. per gallon. From the fact that these shales crop out to the surface in almost all the valleys, the discovery is expected to impart a wonderful degree of activity to those hills, unpeopled since the days when Roman legions held them in military occupation, and worked both the iron and coal deposits. This last discovery, coming quickly upon that of coal and iron-stone, has raised the value of land. Most of the moors are Crown lands, leased.

**A PUMPING APPARATUS AT KENDAL.**—A pumping apparatus has been erected, and is now in use, at the brewery of Messrs. Mark & Co., Highgate, Kendal, which is thus described:—There is a well in the New Inn yard which has been leased to the proprietors of the brewery, and which is said to supply the purest water in England. This is, however, situated 300 yards from the engine-room, and 510 yards from the tank, besides which, the tank is about 100 ft. above the level of the water. To obviate this difficulty, the services of Mr. Henry Rishon, of Kendal, plumber, were employed. Lead piping, lined with block tin, has been laid across the street from the brewery to the well, through which the water is pumped. This is said to be the longest suction-pipe in the north of England. There is a rise of 21 ft. from the well to the brewery, which necessarily increases the difficulty. On reaching the brewery, the water has two courses which it may travel,—the one to the holers in the building, and the other and more important one to the tank built on Garth Heads. To reach this, piping has been laid in the same manner as from the well to the brewery, and the water is forced a distance of 240 yards, and up an incline of 80 ft. A steady stream of 2 in. diameter then falls into the tank, which is built of stone and lined with cement, and it contains 14,000 gallons of water. The working of the apparatus is said to be quite satisfactory.

**DESTRUCTION OF A THEATRE BY FIRE.**—The theatre of Angers has been burnt down and totally destroyed. The costumes of the performers were alone rescued. Nothing has been ascertained as to the origin of the fire.

**ROYAL ACADEMY MEDALS.**—The Lambeth School of Art under the teaching of Mr. Sparks, has carried off all the chief medals given by the Academy this year; Mr. Perceval Ball a young sculptor, and Mr. Calthrop, historical painter, being the principal recipients.

**GLASGOW INDUSTRIAL EXHIBITION.**—On Tuesday an Industrial Exhibition was formally opened in Glasgow, by the Duke of Argyle. The exhibition has been got up under the auspices of the Central Working Men's Club. The number of articles exhibited by working people is nearly 1,500, and there are upwards of 400 exhibitors belonging to the purely industrial classes of the Glasgow population.

**VALUE OF PROPERTY IN BROMPTON.**—On Wednesday, at the Sheriff's Court, Red Lion-square, in a compensation case (which occupied several hours), "Kerr v. The Metropolitan Railway," a claim was made of 2,450l. for a house in Alfred-place, Brompton. The company had offered 1,700l. The jury awarded 1,860l. as compensation.

**THE NEW WORKHOUSE FOR ISLINGTON.**—At a meeting of the Islington Board of Trustees a Report was read from the new workhouse committee, who advised the Board to proceed without delay with advertisements for plans from architects, and that a plan of the land, together with the levels, be procured immediately. They further recommend that premiums be offered for the three best plans; namely, 100l. for the first, 30l. for the second, and 20l. for the third; the three plans to be the property of the Board; and if the architect receiving the premium should be employed by the Board, the premium to merge into his commission. An amendment was put with the view of restricting the competition to nine architects, but the original proposal to throw it open to architects generally was carried.

**ROYAL HORTICULTURAL SOCIETY.**—The International Fruit and Vegetable Show opened at the South Kensington Gardens on Saturday. The exhibition consisted principally of apples and pears. There were, however, some fine pines, and numerous good specimens of dried and preserved fruits. The following medals, amongst many others, were awarded: 1. The gold medal of the Society, awarded to the best collection of fruit and vegetables produced in the garden of a Sovereign,—to Mr. Thomas Ingram, gardener to Her Majesty the Queen, Windsor. 2. The gold medal of the Society for the best collection of fruit and vegetables grown by any botanic or horticultural society in any part of the world,—to the Horticultural Society of Copenhagen. 3. The gold medal of the Society for the best and most complete representative collection of fruit and vegetables from any of the colonies,—to the Fruit Growers' Association of Nova Scotia.

**THE ROMAN REMAINS AT CAMBODUNUM.**—The hon. secretary of the Huddersfield Archaeological Association, who are making it their main object to unearth the ancient Roman Cambodunum, writes to the *Sheffield Independent* on the subject. He says:—"Slack, where our excavations are being made, is not in Greenfield, but in Longwood, in the parish of Huddersfield, and is four miles distant from the last-named place, and lies to the south of Greenfield. The hypocausts we have found are plainly a series of public *thermae* for the use of the camp, being built at the south-eastern end, and lie altogether. The series comprise, as usual, the *topidarium*, the *sudatorium*, and the *frigidarium*. The last is in an admirable state of preservation. We are now clearing out the *fifth* hypocaust, and so far it appears to be the most perfect of the lot. I believe there are some others adjoining the *suite*, which proves they were for the use of the camp; and the absence of buildings adjacent proves that they were not warming apparatus for Roman houses. We have cleared out the foundations of a house in an adjoining field, which I believe is only one out of many similar quadrangles, but it is too far off to be affected by the hypocausts I name. The work has become (as it ought) a national one. We are endeavouring to dig out from its hiding-place for ages, Cambodunum, and we shall be glad to receive aid."

**WHIST-MARKERS.**—Mr. Chappuis has registered a neat and ingenious little whist-marker, about the size of a visiting-card. It seems well adapted for its purpose.

**THE OASTLER MONUMENT.**—Mr. J. Bernie Philip, the artist, has succeeded, after much labour, in producing a model of the "Factory King." The group consists of three figures. Mr. Oastler is represented in a standing attitude. A factory boy and girl are the other figures of the group. In six months the statue will be cast in bronze, and ready for erection. At the suggestion of the artist, the committee have resolved that the figures shall stand on a massive granite pedestal. Bradford has been chosen, as the central town of the West Riding, for the erection of the monument.

**THE REPEWING OF ALL SAINTS CHURCH, HERTFORD.**—At a numerously attended vestry, which met to consider a correspondence between Mr. Lucena, solicitor to Mr. Chas. Collins, of this town, and Mr. Armstrong, on the part of the vicar and churchwardens, in reference to the proposed contract for reseating and warming the church, after a lengthened discussion, it was unanimously resolved,—"That Mr. Collins's claim of 200 guineas, for damage he alleges he has sustained from the delay that has taken place in not being allowed to proceed with the works, be rejected by the vestry; that the alterations made by Mr. Collins's solicitor in the proposed agreement, differing very materially from the original specification on which Mr. Collins made his tender, be also rejected; and that Mr. Armstrong be and is hereby directed to transmit the resolutions to Mr. Collins's solicitor."

**THE RESTORATION OF BATH ABBEY.**—A public meeting has been held in the Guildhall, Bath, for the purpose of receiving a report from the Abbey Restoration Committee, and also a statement from the treasurer in reference to the present position of the work. The bishop of the diocese presided. The report of the committee stated that the sum of 5,280l. had been raised, of which 3,900l. had been paid to the contractors, while work to the value of 1,898l. 1s. still remained to be executed. The entire cost would be 5,000l., for two-fifths of which the committee have made themselves responsible. The committee appeal to the public for subscriptions for the furtherance of this work. The report and accounts were adopted and ordered to be printed and circulated. The bishop recommended that an endeavour should be made to obtain a faculty to remove the tablets and monuments in the nave.

**DEMOLITION OF THE METROPOLIS BY PROPOSED RAILWAY SCHEMES.**—An excited meeting of the representative vestry of St. Marylebone has been held for the purpose of receiving a report from the vestry clerk as to the number and character of the various new railway projects of which notices had been given for Bills in the next session of Parliament. The clerk reported that there were five new projects affecting Marylebone; viz., the Metropolitan Railway, additional powers to take property along the Marylebone-road by wholesale;—Metropolitan and St. John's-wood Railway, to extend its previous limits of deviation; to take all property fronting or property in the Park-road, entirely removing Park-place, Blandford-place, and Tanton-place;—Kilburn Railway, to run a line from Baker-street by the side of the St. John's-wood line, as far as St. John's-wood road, taking the whole of the property on the west side of Upper Baker-street to Allsop-place, the west side of Park-road to South-bank, &c.;—Metropolitan Railway Station collecting lines; viz., a line through Baker-street to Orchard-street, taking a vast amount of property on the east side of Baker-street, and property on the east side of Orchard-street, from Lower Seymour-street to Oxford-street;—another line from Portland-road station through the Portland-road across Oxford-street to Argyle-street, taking property between Portland-road and Balsolver-street, including the School of Art, &c.;—Mid-London Railway, which proposes to interfere with the carriage-way of Oxford-street, from Edgware-road to Hereford-street, then taking a southerly direction in the parish of St. George, Hanover-square. The consideration of these projects was unanimously referred to the Parliamentary Committee with a view to opposition. At St. Pancras Vestry, the clerk announced eleven new schemes, and they also were referred to a committee to oppose.

**LEIGHLIN CATHEDRAL, IRELAND.**—The old cathedral of the diocese of Leighlin has shared in the improvements recently effected in many of the churches in the same county. The Hon. and Ven. Archbishop Stoford has commenced the work of restoration, and already the side aisle, heretofore in a state of comparative ruin, has been newly roofed and restored. One other part of this ancient building, however, still remains in a roofless and almost ruinous state, but a subscription is about being commenced to have this portion of the cathedral put in repair.

**JUDGES' LODGINGS, LIVERPOOL.**—As a recent meeting of the town council, a resolution of the finance committee to build the judges' lodgings on the Newsham estate, was carried by a majority of sixteen. The Newsham estate is at the east side of Liverpool, and is about to be converted by the corporation into a public park. The new judges' lodgings will thus form one of the villa residences on its margin. An unsuccessful endeavour was made to pass an amendment, with the view of having the lodgings erected in Upper Parliament-street.

**A PALMERSTON MEMORIAL IN SOUTHAMPTON.**—The inhabitants of Southampton, at a public meeting, have unanimously resolved, on the motion of Mr. Manockjee Cursetjee, to approve of the resolution of the council "for erecting a lasting memorial of the late Lord Palmerston in one of the public parks in Southampton, and pledges itself to give full effect to such resolution." The meeting appointed a committee to carry out the purpose of the resolution. The members of the town council have already promised 160l.

**NEW ALMSHOUSES IN MAIDSTONE.**—At an expense of nearly 12,000l., Mr. T. R. Outhush has just built and endowed a block of six almshouses, in Church-street, exactly opposite the church of Holy Trinity. The foundation is one above the class usually associated with the idea of almshouses, not so much as to the buildings themselves, which are, however, substantial, and furnished with every convenience, as to the endowment of their occupants. The sum to be paid to each holder of a house is 52l. a year, or 1l. a week. The objects of the bounty are to be "decayed tradesmen or journeyman mechanics, who have lived or carried on business, or been employed in Maidstone for twenty years." The founder has specially directed that the widow is to continue the occupation of the house after her husband's death. The management of the charity is vested in the hands of trustees.

**GLoucester School of Art.**—The annual exhibition of the works of the students of this school has been held in the rooms of Longsmith-street. The school has been founded six years, and has made such sure progress that it is now regarded as being superior to the average of art-schools throughout the kingdom. The works shown were not of a mere elementary character; there was a large number of capably executed paintings in water-colours, by pupils both of the Gloucester and Stroud Schools. The report of the committee stated that the school had gained in the local competition fourteen medals and two honourable mentions, and in the national competition two medallions and one honourable mention. There had been an average attendance of forty students in the night class throughout the year. The progress of the school was shown in the fact that in 1860 it was awarded two medals; in 1861, ten; in 1862, thirteen; in 1863, thirteen; in 1864, ten local medals and two national medallions; and this year, fourteen local medals and two national medallions. This was very creditable, when it was considered that there were ninety-three rival schools in the country, and that in all only 108 national medallions were awarded. Mr. Gambier Parry distributed the prizes, after delivering a practical discourse chiefly relating to the Gloucester and other local schools of the district.

**TENDERS**

For three pairs of semi-detached villas, Camberwell. Mr. Nicholas Lake, architect:—	
Wood & Munn	£7,800 0 0
Wills	7,335 0 0
Thompson	6,850 0 0
Wilson	5,660 0 0
Sharp	5,100 0 0
For alterations to the Fox public-house, Castle-street, Southwark. Mr. Nicholas Lake, architect:—	
Sharp	£230 0 0
King	210 0 0
Wills	187 0 0
Harrison	165 0 0

For additions and warehouse, Old-street, for Mr. Hatley. Mr. H. J. Hammon, architect. Quantities supplied by Mr. Charles Hampfield:—	
Brown & Sons	£1,130 0 0
Turner & Sons	1,037 0 0
Bishop	1,020 0 0
Henshaw	1,008 0 0
Eaton & Chapman	984 0 0
Chessum	958 0 0

For building house and shop for Mr. Blackwell, at Herrow's Green, Leytonstone, Essex. Mr. John M. Dean, architect:—	
Ingham	£645 0 0
Reed	635 0 0
Harris (accepted)	631 0 0

For rebuilding premises, No. 1, St. Paul's Church-yard, Messrs. Wimbale & Taylor, architects:—			
	Allowance for old materials	Extra value of Bath stone	
Hack	£2,957 0 0	£350 0 0	£239 0 0
Adamsou	2,900 0 0	50 0 0	383 0 0
Sandou & Co.	2,870 0 0	180 0 0	70 0 0
Marsland	2,675 0 0	40 0 0	375 0 0
Stewart & Mann	2,645 0 0	25 0 0	273 0 0
Hart	2,612 0 0	50 0 0	284 0 0
Wills	2,579 0 0	70 0 0	297 0 0

# The Builder.

VOL. XXIII.—No. 1194.

The  
National  
Provincial Bank  
of  
England.

IN a recent number, we published a plan and a view of the banking-room of the new building, erected in the City of London, of the National Provincial Bank of England, and intimated our intention of giving descriptive particulars of the design and structure, with some illustrations of the exterior.\*

We now carry into effect the intention. Our view shows the principal front;† of which the greater portion, or all excepting the entrance to the building, is in Bishopsgate-street Within. The principal entrance, which appears in the view, is in Threadneedle-street; and there is a second entrance from the same street, through the archway of the Oriental Bank, and into the new pathway that has been provided for an access from Old Broad-street to a side-entrance to the building. This latter entrance, besides giving one mode of access to the banking-room, leads to that part of the building which contains some of the chief offices of the upper floors, the managers' rooms, the principal residence, the board-room, and the directors' room.

The arrangement of the entrances was essential to the realization of the maximum business-value of the site, both as regards real accessibility, and the allowing the address to be properly in Threadneedle-street, as it is; and not the least important part of the merit of the architect's work in connexion with this building, is that part which is associated with the provision of the entrances. It has required, beyond skilful planning, considerable tact in negotiation: indeed, taking into account extraordinary difficulties of the site, comprised in the claims for light to numerous adjacent properties, the conflicting objects to be attained in this work have called for the exercise of ability of a kind that is almost the last to get reflected in public appreciation, and ability here that seems to have adequately responded to demands of a magnitude and a varied character unusual even in the city of London; as we may have said in previous notices of the design. Since it is seldom that we have so good a chance of showing to the general public, what are often the mechanical impediments to be surmounted in the production of good architecture, we take this opportunity of giving a summary of some of the conditions and circumstances which influenced and attended upon the preparation and accomplishment of the architect's design in the present case.

The plan that we have published (and which the reader would do well to place before him in following this notice,) shows that the building, as executed, occupies a piece of ground of about 220 ft. depth, and 90 ft. frontage, having con-

siderable irregularity at the sides, (or especially, one of them,) and a want of rectangularity of the longer lines with the line of the principal front, entailing difficulties in the decorative treatment of the banking-room,—which the plan indeed shows, but that can be appreciated only by the practical architect. From want of space, the engraved plan does not show the western access from Threadneedle-street, but shows only a portion of the pathway from Old Broad-street. Also, omitting indication of a portion of the line of frontage of the original premises, it does not serve to show what was the exact nature of an arrangement that was made by negotiation with the South Sea House, by which (something being given up to the street,) the main entrance in Threadneedle-street was obtained. And it could not show the positions of windows in adjoining properties, overlooking the site; and one of them at the trifling height, from the ground-line, of less than 16 ft. The sill of this window became the datum for the height of the building in that portion of the plan which comprises the banking-room. The roof-covering of this division of the structure, (just discoverable in our view,) starting from the level of sills on each side, and without interfering with the access of light, of course could not be sloped at a greater angle with the horizon than 45 degrees; and the architect's difficulty whilst submitting to this restriction, was to get sufficient internal height for the banking-room, as well as a proper depth for strength in the supporting members of an arrangement of conical-lights in the ceiling of a room having a breadth of about 47 ft. The case was not so bad, as regards the banking-room, on the west side as on the other; but as to the general building, the rights of adjoining properties, to be considered, were numerous and varied.

The ground occupied by the new building includes the sites of the well-known Flower-Pot tavern and booking-office, of a shop that adjoined in Bishopsgate-street, and of the premises up to the time occupied by the National Provincial Bank. The latter comprised a building of some importance, known as the Old Mansion House, at the back, a forecourt, and some low office-buildings next the street, with a central carriage-entrance way.

The adjoining owners, lessees, and others who had to be dealt with, were the Commissioners of the Sowers of the City of London, who claimed some kind of right over ground in the three or four feet depth recess of the old front of the bank-premises,—and with whom and the adjoining owners, the arrangement for rounding off the corner next Threadneedle-street had to be made; on the west side, the proprietors of the Baltic and South Sea House Chambers, and of the Baltic Sale-room; the Oriental Bank Corporation, and the City Club; on the north, the Marine Insurance Company; and on the west, the proprietors of the extensive pile of buildings, called Gresham House, and the owners and occupiers of other property, including the shop No. 109, Bishopsgate-street.

One object in rounding off the angle formed by Threadneedle-street and Bishopsgate-street, has been alluded to; and the carrying into effect of the measure has comprised what is an important public improvement at that crowded spot in the City. If the angle of the new building had been left like that of the Flower Pot, (that is a right-angle on the ground,) two objects would not have been, as now, attained; and had the angle been *splayed* off, the architectural character of the building would have been very inferior to what it is. We should mention that the necessity for arrangement with the City authorities, might have arisen under ordinary circumstances: since power is given to the City to require buildings to be set back, on compensation to the owners. Ultimately it was arranged, between the architect of

the new building, and the engineer to the Commissioners, that any right of the City to the recessed ground, which they had paved, should be waived; and that a certain amount in compensation, should be given by the City, for the little bit of ground next Threadneedle-street. Before completing this arrangement, it had been necessary to make one with the representatives of the South Sea House and Baltic Sale-room, the owners of half of the bit. These parties gave up their half, which had formed a very acute angle to their property next the Flower Pot; and they allowed the frontage of their entrance to be made in line with the main building of the South Sea House; they partly waived their right to restrict the height of the new building,—by which arrangement, the present elevation was obtained,—though a height running to five or six stories would still have been prevented; they gave up ground measuring some 9 ft. by 7 ft., which projected beyond the general line of division right into the portion of the site which is now occupied by the banking-room; whilst the Bank gave up ground next Threadneedle-street,—but with a stipulation that their cornice should project,—and ground next the low building of the Sale-room; and also gave a sum in money, part of which had come from the City. The Oriental Bank Corporation got a right of way to a piece of ground, of about 100 superficial feet; they had certain windows altered for them, from one wall which would have the new building immediately opposite, to the northern aspect where there would be good light; and they had built vaulting, which had to form the substructure of a portion of the way from Old Broad-street. The Oriental Bank leased the right of way from the public passage between Threadneedle-street and Old Broad-street, to the National Provincial Bank, and gave assent to various arrangements as to height of the rear-buildings of the latter bank; but which involved the requirement of setting them back. The datum of height of the banking-room on the west side, was given by the Baltic Sale-room; and the arrangements with the Oriental Bank allowed a side-light to be got to the end of the room. The City Club proprietors were understood to be allowed by lease with the Oriental Bank Corporation, to build on a portion of Fountain Court. The reservation, in this event, of light-and-air space for the National Provincial Bank, together with the arrangement of the way to the side-entrance, induced the adoption of the quadrant-corners with windows in them. The doubt about the future led to the further provision of ceiling-lights to the board-room and directors' room. The rights of the Marine Insurance Company, at the north, required that the buildings of the Bank for some five or six and thirty feet, should be only of one story in height above ground. Further than that distance, or where the old building had been, the new building is carried up four stories above ground; but, on the side facing the Oriental Bank, a portion of the top story may be said to be cut off, by sloping the roof down to a lower point,—this latter arrangement having still the object of not interfering with light to opposite premises. The small courts of Gresham House did not happen of themselves to restrict much the arrangements of the National Provincial Bank; but the really serious case of the "ancient lights" to premises nearer to Bishopsgate-street, has been already referred to. The whole matter of these restrictions relating to light, should be in a better legal state than it is. The negotiations connected with site occupied much time, in this case; and each one of them involved numerous interviews with the surveyors or legal advisers of the parties concerned.

The architect received his appointment in 1862. In February of that year he was first asked to advise respecting the site; and towards the latter part of the year, he took plans of the

\* See pp. 834, 835, ante.

† See p. 900.

old buildings. These last were taken down in the summer of 1863: in the autumn of that year, the Flower Pot was taken down; and the excavators' work and the putting in of concrete, to a general depth of 3 ft., and an occasional one of 8 ft., were commenced. The drawings were at this time being prepared for a building of a different character to that now erected. Such were the difficulties as to the adjoining properties, that the first design was cancelled after tenders had been obtained; and a new design was made; which the firm that had sent in the lowest tender, ultimately carried into effect on the basis of a schedule of prices which had been sent in. The building now has its own entire walls, external, or on every side. The brickwork was commenced in February, 1864; so that, inclusive of the concrete, the building may be said to have occupied about two years in its erection.

The building provides, on the ground-floor, the banking-room; the principal entrance, circular vestibule, and waiting rooms; the board-room; directors' room, for taking luncheon; two managers' rooms, not named on our plan; a safe or strong-room, a waiting-hall, and the principal staircase and side-entrance, besides various lifts, secondary stairs, and lavatories and conveniences. On the basement, the whole space below the banking-room is appropriated for storage of books. There is also a strong-room, similar to that above; and there are a clerks' luncheon-room, storerooms for stationery, apartments for one of the resident messengers; and extensive lavatories and conveniences, at each end of the building, for the clerks. On the basement is the only communication that there is, except that through the banking-room, between the front and back portions of the building. The upper portion of that part of the building which appears in our view, contains one of the residences, besides a large space, comprising a room 49 ft. by 15 ft., available on the probable event of extension of business. In the rear main-building, on the one-pair story, which forms a mezzanine to the banking-room, are offices for the secretary, and advance departments, and for the securities, and a third strong-room. In the floor above, there is an office, 49 ft. by 20 ft., for annual meetings and future extensions; and there are offices for an inspector, and for the advance-ledger department, and a kitchen and scullery for the resident clerk, approached by a private stair. The top floor is set apart, entirely, for the resident clerk's dining, drawing, and bed rooms.

The banking-room measures about 118 ft. in the clear length, and about 50 ft. in breadth, including the recesses. The height to the soffit of the girders, is 27 ft.; and that to the highest part of the domical light, internally, is 38 ft. The circumstances of adjoining property have led to the decorative features which chiefly give the architectural character of the room. These include the projections from the side-walls, carrying the main-girders, the bracket-formed member rising from each of these piers to the soffit of the girder, and the very bold cove which springs from the cornice of the order. The line, at the angle of 45°, before referred to, ruled this last-named feature. Then, as to support for the girders: on one side of the building, the external part of the wall had to be kept down; and to get proper support, the thickness had to be projected internally. The brickwork of the piers had to be carried, straight up, to support the ends of the transverse or main-girders. These are of boxed plate-iron; and are 2 ft. 6 in. in depth, and have a span of about 41 ft. The main-girders carry longitudinal plate-girders. On these latter, the bracketing of the cove rests. Each one of the three squares produced by this arrangement of the transverse and longitudinal girders, is formed into an octagon by diagonal bridging girders; and this octagon-framing (afterwards finished as a circle, in plaster) carries the cast-iron ribs of the domical light. These last are bolted at the top, to a ring which carries the pendant of the ventilating and artificial-lighting system.

In this last feature of the design, a skillful application of art is made, to well-conceived arrangements for the ventilating. A large tube or pipe carries the foul air above the roof; and in the centre of this is the ventilating-tube; so that the arrangement differing from what is now general, is chiefly in what belongs to decorative character and detail. There are sun-barners in connexion with the ceiling-lights in the board-room and directors' room; but whilst the glazing there has an elegant character, the

connexion between the glazing and the lighting-and-ventilating contrivances is not made in the same artistic manner as in the banking-room. An iron-framed and glass-covered curb-roof, hipped at the ends, is carried externally over the whole space comprised by the three domical lights,—doors being contrived in it, so that entrance may be obtained to the space between the external and internal glazing for the purpose of cleansing. The glazing of the domes, which is in coloured glass, is fixed in framework-bars of zinc; of which material also is the intricate pattern-work of the pendants, open for ventilation. This latter work was executed in Paris for Mr. Tyler, who had the contract for the whole of the zinc-work. The domes measure 29 ft. 6 in. in the clear diameter; and they rise 7 ft. 6 in.

The difficulties of construction to which we have adverted, that were imposed by the restrictions from adjoining properties, seem to have entailed almost the only defects,—and they are after all trifling,—that are to be noticed in the architecture of this really fine room. One of them is the slightly-unsymmetrical appearance of the intercolumns of the recess at the main entrance to the banking-room,—where the angle of the Baltic Saloon has come in the way; nevertheless that part of the composition is effective. On the piers, the columns attached to their angles present themselves as half-columns, instead of three-quarter columns. Half-columns are not elegant. The pedestals to the columns are finished of mahogany and ebony, instead of marble, as intended when our first view was made. At the junction with the soffits of beams, of the brackets from the columns, there was when we were at the bank, a break in the continuity, instead of an easy sweep of the curve into the horizontal line. This has resulted entirely from the difficulty of getting a harmonious junction between the columns and girders, that would not be discordant with the curves of the arches at the ends of the room. No one would discover the origin of the defect (which perhaps will be corrected,) without it were explained to him. Our own appreciation of the difficulties that the architect has overcome, would have been less complete, had we not detected the one or two matters where he has been rather too heavily weighted. The shafts of the columns are of Ippelen, Devonshire, marble; and are in one block, 12 ft. in length: the bases are of Irish black marble. The space in front of the counter, for the public, and which forms a passage-way between the two entrances, is paved with Sicilian marble, and Irish black, the former in squares with quadrants cut out of the angles, and the latter in filling-in circles or dots. The whole of this marble work was executed by Mr. Field, as before stated. The circular vestibule of the entrance is paved with yellow Mansfield and Hopton Wood stone, and Bangor slate. The capitals, in the banking-room, are of Huddleston stone; which is cream-colored. The architect has, on consideration, substituted a plain space,—or block, as it appears, over a group of columns,—for the usual arrangement of frieze and architrave. The *loggia* of three arches, with their clustered columns, make each end of the room a most effective feature of the entire composition. Next the street, mirrors are placed at the opposite ends of that part of the room; and they produce capital effects, not only inside, but as the room is looked into through the windows, from the street. Much ornament is introduced in the plaster-work. The ordinary modelling was by Mr. Garland. Generally, the plastering is in Keene's cement. But, perhaps, the most important ornamental details of the room, are the architectural and sculptural decorations of the panels which there are between the columns. The figures and emblems on these, are intended to represent the growing riches of the land, and those found in the waters. At the sides of the room, the composition in each case is made up of a wreath, festoon, or similar form, representing corn, flowers, oak-leaves, or other vegetable production, or shells and sea-weed, enclosing a circular space for the emblem, and having as supporters the figures of children in various attitudes. Thus, the plough, the hive, the spinning-wheel, and the ship appear in some cases; and the children hold the sickle, the hammer, the shuttle, the fishing-net, or other implement. The four panels at the north end of the room show the production of gold, and its coinage, with the business of banking: one long panel, with nine figures of children, illustrates the finding and washing of the

gold; another, with a dozen figures, shows smelting and operations connected with it; a third panel portrays Coining; and the last is Banking. There is considerable merit in these works; which are partly in high, and partly in low, relief; but the outlines have been in some cases injured in painting the grounds. The groups were modelled by Messrs. Bursell, and John Underwood. The bust of the late manager by Marochetti, and not a very superior work, is now to be placed on a bracket under the panel in the centre of the north end of the room. The walls and ceiling are decorated in polychromy. The whole of the fittings of the room seem to be perfect in contrivance; and, with those in other parts of the building, are in good taste.

Particulars of the exterior of the building, or the portion comprising the principal front, are given to great extent by our view, better than they could be in verbal description. All views, however, fail as to the effect produced by architectural details that have been studied as these have been.

As the work is executed, there is not a single ornamented moulding in the entablature; the main features are the dentils, and block-mouldings. This treatment seems to us not wholly accordant with the somewhat rich, studied, and certainly in parts very original, character of the details of the rest of the front; but the architect has throughout considered his work more than we have for the purposes of this notice. It has now, we believe, been decided to place upon the frieze in bronze letters, gilt, the words "National Provincial Bank of England." This may go to supply the want. The names of the branches are cut on the wide reveals of the entrance, and fill a part in the performance.

The front is about 53 ft. in height. The columns, attached, are 30 ft. 10 in. in height; and are placed on pedestals, and a subbase, which together rise 9 ft. 8 in. from the pavement where the ground is lowest. The shafts, cubed the entire height, are 25 ft. 8 in. in height; the capitals, of Composite character, but freshly designed, and each with a lion's head in the centre between the volutes, are 3 ft. 6 in. in height; and the bases are 1 ft. 8 in. The entablature is 7 ft. 8 in. The blocking course is 2 ft. 10 in. The figure, or group, in each case, is about 9 ft. 3 in. in height, with its pedestal, or 8 ft. without. The windows in the main front are 15 ft. 6 in. in height to the crown, and 6 ft. 9 in. in the clear width. Each is glazed with a single sheet of glass. The architectural carving was executed by Messrs. Colley.

Sculpture in groups, single figures, and panels, has contributed largely to the effect of the exterior. The groups are over the coupled-columns; and the single figures are over the single columns. Commencing from the farthest point on the rounded end of the building, we have Mauchester, represented by a female figure,—and having as "supporters," seated, a negro with raw cotton, and a workman with a bale of goods: next we have England, represented by St. George, and supported by Britannia holding a wreath and shield, and by a female figure to represent Navigation: next comes St. David of Wales, with an old harper, and a miner with his pickaxe: the next is a single female figure, representing Birmingham, and having the hammer and anvil: then there is a figure with a tazza, emblematic of Newcastle and the pottery districts: next is Dover, with a mortar and shot; and lastly is a fourth group, which represents London, by a female figure with a mural crown, and holding a key,—this figure being supported by one of old Father Thames, and by a female figure, with fruits of the earth, to typify Abundance. Two of these groups ("England" and "Wales") we represent.

The six panels, following the same direction, are filled with subjects representing the Arts, Commerce, Science, Manufactures, Agriculture, and Navigation.

The whole of the subjects of the panels were modelled by Mr. John Hancock; and they were carved by various hands. Three of the groups at the top of the building, and one single figure, were modelled and carved by Messrs. Bursell and John Underwood; whilst one of the groups, and two figures, were modelled by Mr. Miller, and carved by Mr. James Underwood. The circular panel of the entrance-doorway is filled with the arms of England and Wales. The architect has acted judiciously in rounding off the angles of the podium at the entrance.

Taste is shown in the window-reveals and chimneys of the four-story portion of the building, and scarcely the less so that the treatment

is plain. The doorway of the side-entrance exhibits originality, as well as taste, in the treatment of its carved archivolt.

The ventilating arrangements, extending to all parts of the building, including the basement, have been carried into effect with the assistance of Mr. W. W. Phipson, the principle being stated to be the same as that adopted in recently-built hospitals on the Continent, and known as the *Système Van Hecke*. The blowing-apparatus is worked by a small steam-engine. In the board-room, and some other rooms, Boyd's stove-grates are used. The general gaslighting is by Messrs. Strode. Mr. Jennings has supplied the fittings of lavatories. The general contractors were Messrs. Trollope & Sons, as already stated; and they made all payments for special work of whatever kind.

Mr. John Gibson, the architect of this building, has produced what, as we have said more than once before, is an important addition to the architecture of the City; and, besides the credit due to him for freshness of study, and the proper use of models, which have resulted in a good whole, and good details, there is something due to him for the attempt, the nature of which was explained by us some time ago, to prevent that rapid discoloration of stone-work which is so inimical to the effect of architecture in London.

#### THE DEVELOPMENT OF NORMAN ARCHITECTURE.\*

STYLES are limited by their peculiarities, which may be relative defects as between style and style, but have a propriety and consistency as associated and amongst themselves. The exclusive affection for the round arch is a limitation that favours when it does not enforce several others; taken in conjunction with the strength of materials, it enforces in structures of large scale a comparative solidity and close spacing of piers and supports in order not to encounter risk from the great weight of the flat portion of a large semicircular arch. Hence the lighter effects, though not excluded from the style, are to be gained only in the smaller constructions.

Other limitations under which the style grew up were comparative simplicity, not to say rudeness,—certainly artificiality of mouldings, and then a general though not absolute and still less necessary exclusion from ornament, of vegetable forms in any degree approaching even to conventional types, much less to natural.

It is quite open to an artist to elaborate a round arched style of architecture without these limitations, but also within them; and to this latter, the historical form and exemplar, we confine ourselves.

The usual Norman ornaments were such as could be wrought with the axe, with small aid from the finer chisel. The variety of these is not a little remarkable; and the ingenuity and invention displayed deserve respect and often genuine admiration, both in variation of primary types and also in alertness of following out the hints produced by development in application. The chevron or zig-zag is, of course, one of the favourite types, plain or enriched with a series of lines, and flat surfaced or rolled. When such an ornament is disposed round a circular arch, half-diamonds will be left at the edge of the intrados, which are often completed by resumption of the chevron on the under-side and the remainder from one pattern becomes motive of another. Then the zig-zag is variously presented with points horizontal or vertical. This is but an example of the developments that might be followed out through each primary type of ornament.

We are much disposed to think that the predilection for the zig-zag ornament was dependent originally on associations of symbolism; to speak our own impression plainly, while admitting that we cannot claim descent from others, we feel no doubt that it was at first adopted and understood as typical of water, of the water of baptism especially, through which the world without was admitted into the church, and then of the holy water,—the horror of the powers of darkness and malignity. It was going too far back and too suddenly to refer immediately to the Egyptian designs of kings consecrated by purifying priests, from whose vases descends the stream of Nile water in a curve of conventional zig-zag; yet the step is thence but short

to the symbol of the water-bearer in the Zodiacal series which was familiar enough, and favourite too, with the masons and sculptors of the Norman doorways.

The general pavement of the Baptistery at Florence is a sort of mosaic of marble tiles set edgewise in various patterns, for the most part wavy or zig-zag in alternating and contrasting lines of white, black, and dullish red. When the central space was occupied by the original great font these wavy patterns reached up to its very base or margin. In the Baptistery at Pisa we still see the fine polygonal font with round deep basins at the angles,—on the same model, no doubt, as that at Florence, which Dante is so careful to explain that it was by accident he broke, in saving a drowning child. The font itself is remarkable for its combination of angular mosaics, floral sculpture, and coloured slabs; the large central part is inlaid at the bottom, black upon white, in an elegant wavy pattern that recalls the Florentine floor, and confirms the meaning ascribed to its decoration.

Other illustrations from Medieval painting are available, but these may suffice.

The sequence of inventive modification displayed in a fuller series of well-arranged engravings than is yet obtainable, would furnish much instructive study. This sort of invention, it must be said, is not in itself and in its rudiments beyond the reach of barbarous nations. We are familiar with it displayed in carvings of canoes and paddles and war-clubs, in the bordering of shawls and patterns of carpets of very uncouth peoples. It ceases, however, to be barbarous, and attains the dignity of the barbaric, and even something more, when executed with a certain grandeur, and with such a feeling for contrast in proportion and in sequence as we meet in Norman arches, and especially in Norman doorways. There is still another stage of development,—the epoch of the last purification and refinement which the Norman never quite reached, and which is seen best exemplified in a comparison of Greek transmutations of commonplace Assyrian details, into the honey-suckle, the guilloche, the volute. The Gothic styles that succeeded the Norman treated its decorations to a considerable degree in the spirit of the Greek—witness the affiliation of the dog-tooth and ball-flower,—though they discarded altogether far more than they undertook to develop and refine.

Capitals, string-courses occasionally, and the faces and angles of recessed archivolts were the usual recipients of these carvings, which seem to have been ordinarily executed after the stones were fixed. The same members, carved or uncarved, comprise the chief of the quasi-mouldings or modifications uniform in section of the mere plane surface.

The ordinary Norman style accepted here also, a very severe limitation, or only acquired by degrees the art of getting beyond it. The architects indicate but little appreciation of the essential function of the most characteristic of all mouldings, the projecting cornice or hood moulding, and still less of the specific contour of the drip moulding, the very eye of the entire organism. Hence there is often a default in making the upper members duly project in profile beyond the lower, or in giving to the upper the drip-undercutting; or when this feature is better provided for, the importance of it does not receive recognition in subordinate reappearance.

In the recessed doorways the uniform depth of the archivolts is constantly relieved by variation of the carving, and then by some of the square edges being rounded off, and the roll completed by a sinking on either side; but the limit is soon reached here.

When both edges of a vault rib are rolled, a flat band is left, more or less wide, between them, according to their magnitude, which receives a limit, in one direction at least, by the projection of the rib. Then, in a narrow rib, the entire soffit may be formed into one large roll; and, by the application of such narrower ribs upon the flat bands of broader systems were built up, and so onwards. In the treatment of arches of several orders, which are in principle the same as these systems of ribs, many experiments were tried to give effect and variety; and in such instances, as in the nave at Hereford, we can observe how the Norman shifted the successive-order of roll and zig-zag until he recognised principles of grouping which his successors the early English builders had to learn over again for themselves. In the most western pier arches the innermost archivolts

edges are roll-moulded, and the two superior zig-zagged. A little further on, the architect has discovered that distinctness and effect are consulted by placing the roll-moulding intermediately; and that the change would expose his earlier error, was one of those considerations which in those days were allowed no weight at all. The principle of right articulation of ribs, capitals, and piers was one of those that were missed, and found and lost over and over again.

As regards the proportions of Norman buildings, they are, no doubt, often clumsy enough; but clumsiness is no inveterate essential of the style. Dignity on the one hand and grace on the other are not only within reach, but were from time to time successfully achieved.

These architects had at least made one of the greatest, and certainly the indispensable, discovery, about proportion, inasmuch as they fairly appreciated its importance, and had lively sense of many of its resources. The schools and generations that succeeded them were in sympathy with them on these as on other points, with the additional advantages of more skilled labour and wealthier patrons; but the key-note of the movement was already struck. The Norman builders and their patrons were already athirst for novelty,—for novel beauty to be sought in novel forms,—sought boldly, sought confidently, sought independently. The future,—their own present,—it is clear that they believed was great with discoveries equal at least to any that had gone before; and each successful architect had his work scrutinized by a successor with eagerness to appreciate,—to appropriate success, no doubt, but still more hopefully eager in search for hints that remained but hints,—for new difficulties growing out of new combinations that might have been manfully struggled against, but still awaited their last solution.

Proportions of plans, elevations, sections, were as eagerly re-cast and re-combined as ornaments, distribution, constructive adjustments; and examples were given that builders in succeeding styles might have saved themselves much time and labour by taking wiser note of.

The men, like the style, had their limitations, no doubt; and these were sometimes in both cases essential to self-consistency. When the limitations of certain predominant types and undisturbed assumptions began to be broken through, it could not be too soon that a vehement change should follow, should press on, and new men come in with imaginations otherwise prepossessed. A great break was welcome, and it came no whit too soon albeit that after perusal of the remains and ruins of Norman architecture it seems to us that the style never had the chance of quite doing its best; and our minds are haunted by imaginations that hover between broken remembrances gradually dissipating, and germs of conceptions of a finer Norman cathedral than the world ever knew, that ever seem gathering and ever dispersing again round centres that shift and settle, that blend and disappear, as in the uneasy delusion of a fleeting dream.

The prevalence of this style in its various phases as rude and severe, enriched and refined, may be liberally included within the century and a half preceding the murder of Thomas à Becket in 1170, in mid-reign of our first Plantagenet or the great third Crusade in 1183. There was, as there always will be, a notable overlap of styles; but the annals and monuments of Canterbury evince the vigour of the contrasted fashion that was pressing to the birth; and the progress of Lincoln Cathedral under St. Hugh before the last years of the twelfth century were out, declares how resolutely it went onward to its maturity. The rapidity and decisiveness of the break of taste is a mark of many things besides the development of architecture. No doubt, population had increased, skilled workmen were more skilful and more numerous, and wealth was more at command; but civil, which in truth in these days was military government, and ecclesiastical government were developing in themselves and in relation to each other; and so were speculation and dogma, theology and thought. The leading names and careers of the century mark a group of great men, all manifestations, that are as defined in comparison with those that succeeded as the architectural groups of round-arched structures, whether on the Rhine, in Burgundy, in Provence, Normandy, England, or Spain, that belong to their period are in contrast to those that illustrate the next. The masculine self-reliance and reliance on nature and nature's

\* See p. 895, ante.

truth that belong to the age, speak in the lives and utterances of such men as Bernigarius of Tours, Peter Abelard, and Arnold of Brescia; scarcely in a less degree in the conscientious speculations and candid controversy of a Lanfranc and an Anselm, boldly tentative, not doggedly conclusive, and frankly expectant of truth yet to be drawn out of the depths by persevering and resolute daring, that would deserve to be matched with any point that ever yet was won. From the Abbey of Cluny, on the other hand, of which the church (dedicated 1131) was one of the most important works of the age, came forth first Hildebrand—Gregory VII.—intent on increasing the power of the Church by subjugation of its unruly members, and especially by enforcement of grimly-accepted celibacy; and then Bernard, of Clairvaux, anticipating the centuries in his recognition of the danger to the Church from unlicensed thought, and his resolve, without regard had to thought in any way, to suppress it. Discipline and organization were marching on in the Church, while with parallel advance a military peer, like William the Conqueror, was building up the loosened ruins of the Saxon fabric into a stern and stalwart empire. The two systems rose together like the feudal castle and monastic foundation that symbolize their contrasts, and also scarcely less their cognate genius, and by the end of our period they were ready to come into collision. The murder of Becket is typical of the contest and its results. His blood stained the stones of the ancient cathedral, and the offerings that poured in to the shrine of the martyr raised the elaborated and glorified fabric of the new. This is but a single sign of the general fact that the Church now had founded its power, and felt its competence to guard and exercise it for good and ill. The result is seen in the great works of the next century, which gives us again a typical Pope in the domineering Innocent III.; again a characteristic development of thought in the monumental systems of the orthodox schoolmen, Albertus Magnus, Aquinas, Bonaventura, Scotus, and the equally yet scarcely more thoroughly harmonized architectural systems of the cathedrals included in the Early English style of our own country and that marvellous parallel array in France that crowd the annals of the thirteenth century.

#### THE FRENCH ARCHITECTS' GAZETTE.\*

We have before us the current numbers of a journal devoted to architecture and building, edited by the son of M. Viollet-le-Duc, in conjunction with M. A. Baudot, and published at Paris every fortnight. We are so accustomed to see leading places taken by our French neighbours in most matters relating to taste, that we are somewhat disappointed at the contents and style of this gazette, now in the third year of its existence. After turning over the pages, very little more remains upon the mind than an impression of the excellence of the paper, the width of the margins, and the large size of the displayed type. Indeed, these are the three features of the publication. The artistic and literary contents are of short measure. One number illustrates a school for young girls, in three plates, consisting of seven elevations, sections, and plans; recommends, in a second article, twenty lines long, the employment of the stone of Souppes; gives a letter from Florence; then devotes seven columns of the largest type to a list of the individuals who obtained prizes at L'École des Beaux-Arts; notices the prospects of subterranean railways in Paris; and concludes with some remarks upon the proposed Exhibition of 1867. And this costs 25 francs per annum, or a franc for each number. Assuredly we manage some things better in England than they do in France. The extraordinary diffuseness with which the designs are reproduced is not to be accounted for on the ground of the originality displayed. The girls' school just mentioned is externally nothing more than a detached villa, toned down to a warehouse severity, without any chimney-stacks; and internally, the principal freedom of treatment consists in apportioning a large *salle* to two purposes; the one being religious exer-

cises, the other a playground in bad weather,—the altar being railed in with a *grille* for protection from the young ladies while romping on these occasions. Nor are the other numbers of more startling interest. No. 12 illustrates a manufactory at St. Denis, by M. Sainlucier, on four sheets of plans, elevations, and details, introduced by a few preliminary remarks from M. Baudot. If these are addressed to professional readers, it would appear that our neighbours are a long way behind us, for there are few English architects who require to be told now-a-days that economy is not incompatible with taste, and that it is possible to give character and effect to the plainest materials. In the same number we have more about the proposed Exhibition, with a plan; another letter from Florence; a notice of a paper on the responsibilities of architects, by M. Le Bégué; a long list of the local committees in the section of the fine arts in the proposed Exhibition; and a *Revue de la Quinzaine*, or gossip of the fortnight, which consists principally of the names of persons who have won prizes or obtained honourable mention for art-work, each in a separate paragraph of large type. Looking more particularly at the notice of M. Le Bégué's *brochure* on the responsibilities of the profession, we perceive that the work in question deals with a hardship in a regulation of the Code Napoleon, and another of the Council of Civil Buildings, in which both the responsibility and charges of architects are regulated. The first says, that if a building given out at contract prices should fail, in whole or in part, by fault of the foundations, the architect is responsible during the time regulated by prescription; and the other sets forth that if an edifice constructed at contract prices fails, in whole or in part, by fault of construction, or by fault of site or foundation, the architect and contractors are responsible for ten years. M. Le Bégué points out that works by contract are thus placed on a level with work by measurement, and proceeds to consider the subject under eleven headings, in the course of one of which he shows that some French architects content themselves with 1½ per cent. on the cost of large works, whilst others enjoy 5 per cent. We do not gather exactly when it was that M. L. Mouton laid his plan for a subterranean railway before the Minister of Public Works; we perceive, however, that his project comprised a main artery running from the Boulevard Mazas to the Hippodrome of the Bois de Boulogne, having at its central point, situated between the Seine and the Palais Royal, five diverging rays communicating with the various lines of railway. The formation of a tunnel under the Seine will be, M. Mouton expects, but child's play to French engineers after the execution of the Thames Tunnel by Brunel. The cost, he believes, will not exceed, in round numbers, 80,000,000 francs. He then enters into a few mathematical and technical particulars to show his readers that the project of a subterranean railway is not an eccentric or adventurous proposition. Those in London, he adds, are very popular and much frequented, and yield such good profits that companies are being formed for the construction of others.

As a leading article for No. 13, we find an attack upon L'École des Beaux-Arts, which is at least vigorous; like all the other papers, the name of the writer is attached to it, by which means much of the power of the charge is lost. M. Stanislas Ferrand remarks, that France has but one school,—that of Paris,—which has become the university of the arts. The school of architecture is more than a school, it is a national institution, which holds in its hands the destinies of art. A people is grand, he continues, in little paragraphs, each one sentence long, by its art as by its industry, by the genius of its artists as by that of its men of letters and legislators. The school has a large task to perform: has it accomplished this grand work?—No. Does it seek the means to be able to accomplish it?—No. It would be irrational to see a Greek temple at Memphis, or an Egyptian temple at Athens, and it is equally irrational to see in Paris houses and monuments graining the features of those of Greece and Rome. Architecture has philosophical rules, as well as a high moral mission. She ought to be true and positive. A theatre ought not to resemble a barrack; nor a national library,—the sanctuary of intelligence,—be like a concert-hall. The fruits of the School of les Beaux-Arts are sad. They prove that the teaching of the school is bad, its organization is bad, and that

L'École is bad. No. The school that holds in some measure the destiny of art has not yet understood the importance of its mission. She teaches neither the true science of architecture, nor its history or philosophy. Whilst we are French in spirit, in our manners, our laws, our politics, and our religion, we are Greeks and Romans in art. The laws of beauty are not immutable. Egyptian beauty is not Greek beauty, nor is Greek beauty Chinese beauty. Art is beautiful when it is superior to traditions, and equal to its time and country. Why do we not wear Greek vestments as well as use Greek art, for they are superior to ours in form? They do not conform so well with our manners and climate. It is the same with Greek architecture. Art follows the great march of humanity; it descends when humanity descends, and elevates itself when humanity does the same. It was not for nothing that Christianity upset the Druidism of the old Gauls and the polytheism of Greece; it was not for nothing that we have had wars and revolutions, empires and republics. In these convulsions France has been regenerated, and has come out of the past with another language, another literature, another art. L'École, continues M. Ferrand, on pain of passing ignorant of history, cannot deny this generation of art. At what conclusion have we arrived, he inquires, and immediately answers for himself. We conclude that the results of L'École des Beaux-Arts are bad. The school is bad; its studies are false and incomplete; its aim, instead of being the elevation of the arts, has been their degeneracy. We conclude that the classical dogma is not convenient to our wants, our ideas, our genius. There is a French art which ought to be the affirmation of our progress. It is for us, artists, *savants*, thinkers, to seize, to develop, to fructify and accomplish this grand work of our social destiny. We will not damp the ardour of M. Ferrand by suggesting that an entirely new phase of art, belonging exclusively to the present day, may be difficult to find, but will take it for granted that there is a French art of the nineteenth century only wanting to be properly presented at court, and then continue our glance through the white pages of the *Gazette*. The illustration of No. 13 is a seven-storied house in the Boulevard du Prince Eugène. It has two tiers of shops, and each story has seven windows in the principal façade. M. Beswillwald is the architect. Details of the windows of the *entre-sol*, the balconies, and the *porte-cochère* are given on a large scale, and show considerable versatility, but no new style. We then come to another letter from Italy, some further remarks upon the arguments of M. Le Bégué, and find ourselves face to face with all the subdivisions of the organization of the municipal service of public works, followed by similar details concerning the municipal works; long lists of the jurymen of certain sections of the Central Union of Beaux-Arts applied to industry, 1863; and a fragment of an article on the capacity of contracting parties, by M. Emile Jay, avocat; concluding with a letter addressed by the Préfet de l'Oise to the mayors of his department, relating to public works and the *honoraires* of architects. Monsieur le Préfet is good enough to point out to the mayors that, inasmuch as there is an unusual quantity of municipal work going on, it behoves them to exercise extra economy with the funds. He considers that the practice of paying architects a per centage upon the whole cost of the works, whether it be 3 per cent., as in the case of the architects of the *arrondissements*, or 5 per cent. in the case of *free* architects, had the effect of inducing them to run up the cost beyond that first decided upon; and he pointed out an antidote to this evil, in an order which set forth that no architect should receive any commission upon supplemental estimates, unless it could be shown that they arose from causes over which he had no control. The Préfet does not insinuate that honourable men are always preoccupied by a pecuniary feeling; but he asserts that it is difficult for them to resist the fascination of their art, or to refrain from developing the perfection of their work; and it is, moreover, always a grave inconvenience to place agents between their duty and their interest; so he prays that the mayors will see that the order may be strictly carried out, and that they will receive the assurance of his most distinguished consideration.

We will look at one more number of the *Gazette*. This contains further details, with a plan, of the first floor of M. Beswillwald's enormous mansion on the Boulevard du Prince Eugène; as well as two plans, an elevation, and two sections of a

\* "Gazette des Architectes et du Bâtiment." Journal bi-mensuel, publié le 5 et le 20 de chaque mois, sous la direction de M. E. Viollet-le-Duc Fils et A. de Baudot, Architecte. Bureaux, 13, Rue Bonaparte. A. Morel, éditeur. 1865. Nos. 10, 11, 12, 13.

*chapelle funéraire*, by M. Collard, architect, which is but a meagre little affair, such as cover family vaults or cemeteries, of no particular style. Over a semi-circular headed entrance-door starts a small column, just above the cap of which is spread out a scroll, and over that is piled a shield, with a crown beneath a semi-circular label terminating in two heads. From the gable rises a Medieval cross. This tiny chapel is lighted by a small narrow light on either side, with the addition of a cusped circular one at the end. The letter-press tells of more prizes. L'École des Beaux-Arts offers a grand prize for the best design for a vast hotel for travellers, and enters into all the requirements of the programme; and M. Baudot proceeds to criticize, in a wholesome kind of mode, the drawings sent in by the competitors. He will not stay to examine each project in detail, for that would be to enter into repetition without end; in all the same defects exist. Difficult Monsieur de Baudot! M. David Sutter, peintre, contributes an article on aesthetics. Another letter from Florence tells us more about the well-known Florentine palaces; and we come to the review of a *brochure* on strikes, by M. Stanislas Ferrand.

Our author treats the subject with a vigour similar to that spent upon L'École des Beaux-Arts. He inquires of workmen, in a series of short sharp questions, like rifle practice, whether they know a better way of developing activity, address, general aptitude, and intelligence of execution in a workman, than setting him to piece-work? Whether they know of a more equitable mode of remuneration than that founded upon quality and quantity of the work done? A radical, just, and equitable reform is easy to put in operation. M. Ferrand sees this in a methodical classification of the different kinds of stones used in Paris, with a price per size for each kind. By this means a grave cause of disorder in piecework disappears,—the discretionary power of foremen. M. Ferrand denounces the foreman as a little despot, who has elevated himself above his comrades, and surrounds himself with them as the chief of a state surrounds himself with courtiers. His favourites are enabled to earn as much as 300 francs per month, whilst others can manage to gain but 100 or 150 francs in the same time.

But with the classification M. Ferrand points out this power would fall to the ground, the Liberty of labour would be complete, and the rights of every one respected. Nor would it be difficult to make. Ten delegates might be appointed by themselves to effect the classification and establish the tariff, which could then be presented to the masters, who, M. Ferrand is sure are clear-sighted, and comprehend their own interests too well to refuse to the workmen "une entente cordiale." This is followed by further particulars relating to the committee of admission of the *Exposition Universelle* of 1867, another "Review of the Fortnight," and a long complimentary account of a visit to the ateliers of MM. Baudouville & Bourbon, ornamentists. There are no legitimate advertisements in the *Gazette*, but we cannot shut our eyes to the fact that the last-mentioned account bears a remarkable likeness to those businesslike expeditives. An artist has been visiting Tonlon, and he addresses thence a letter to the writer, M. J. Berlioz, from which he extracts passages in praise of the ornamentation of the theatre there entrusted to Messrs. Baudouville & Bourbon, of Paris. This letter of the artist induces M. Berlioz to visit the ateliers in question, and he is equally penetrated with the sentiment, the artistic fitness, the elegance of conception manifested by the ornamentists named. The material used is *carton-pâtes*, and the objects produced are bas-reliefs, figures, statues, allegories, &c., all of which expose to the profound taste presiding over the re-establishment. Some ornamental sculptors content themselves with reproducing the *chefs-d'œuvre* of all time and all schools, and adapt them, with more or less skill, to all edifices, with, however, considerable sameness; but the Messrs. Baudouville & Bourbon employ their imagination with the happiest result, as the reader may view for himself either at the Hôtel de la Rue François I., or in the salons of the Jockey Club, two of their most recent works.

Before closing these notes on the *French Gazette of Architecture and Buildings*, we will quote a programme of the dates set apart for the completion of the different operations appertaining to the proposed Exhibition of 1867, as exemplifying French system:—

Before the 15th of August, 1865. Nomination of the committees of admission for the French section, and notification to the Foreign Commissioners of the space afforded for the products of their nations.

Before the 25th of August, 1865. Constitution of the committees of the departments; announcement to the French exhibitors, and notification of the space attributed in the French section, to each of the classes of products denominated on the system of classification (piece B).

Before the 31st of October, 1865. To send to the Imperial Commission the applications for admission (piece C), and the claims concerning the admission of French exhibitors.

Before the 31st of October, 1865. Completion and despatch to the Imperial Commission, by the Foreign Commissioners, of the plans of the stalls of their nations, to a scale of 0.002m. per mètre.

Before the 31st of December, 1865. Completion of details of plans of stalls to a scale of 0.020m. per mètre, for the French section, and notification to French exhibitors of their admission.

Before the 31st of January, 1866. Completion and despatch by the Foreign Commissioners detailed plans of the stalls of their nations, to a scale of 0.020m. per mètre, and the particulars destined for the official catalogue.

Before the 1st of December, 1866. Completion of the constructions of the palace and park.

Before the 1st of January, 1867. Notification to French artists of their admission.

Before the 15th of January, 1867. Completion of the special stalls of exhibitors in the palace and parks.

Before the 6th of March, 1867. Foreign goods are to be admitted at the ports and frontier towns.

From the 15th of January to the 10th of March, 1867, packages are to be received and unpacked in the enclosure of the Exhibition.

From the 11th to the 28th of March, the unpacked goods are to be arranged on the stalls for which they are destined.

On the 29th and 30th of March, there is to be a general clearing-up in all parts of the palace and park.

On the 31st of March, a revival of the whole of the Exhibition.

On the 1st of April, the opening of the Exhibition.

On the 31st of October, the closing of the Exhibition.

From the 1st to the 30th of November, 1867, the removal of the goods and stalls.

BRITISH ARCHAEOLOGICAL SOCIETY  
IN ROME.

The British Archaeological Society founded in the last spring at Rome would have resumed its proceedings earlier in the present season, had the foreign concourse, on which so many interests of this capital depend, begun to infuse new life at the ancient centre as early, or in the same numeric force, as usual. But such has not been the case; and the failure of that annual movement from other lands towards Rome, is this year the theme of general lament among her citizens, being attributable partly to the visitation of cholera in the south, partly perhaps to apprehensions of political disturbance. Notwithstanding discouragements, however, the British archaeologists have not forgotten their engagements with their co-nationals here; and those members of the committee who are resident have taken steps towards the ordering of the Society's operations in the winter; two preliminary meetings having been held at the English Consulate, with assistance just sufficient to form a quorum, and on the last occasion with that of the Hon. H. Walpole, one of the Society's vice-presidents. At these meetings, on the 27th of November and 2nd of December, various questions were discussed as to what should be done or left undone; and it was advised that another programme should be drawn up some what fuller than the one first circulated, explanatory of aims and method, a draft of which new edition was presented and approved on the 2nd instant, one of the few additional clauses being designed to indicate the unpretending and suggestive, rather than didactic, character assumed by the Society, as not an exclusive assemblage of savans, but an organization for carrying on studies and assisting those interested in like studies at this centre of

art and antiquity. It was decided that, contrary to the original project, the exclusively national character should be preserved, none but British residents and visitors admitted; though, if such be the desideratum at any time, it might be allowed to invite the co-operation of Italian archaeologists in supplying papers on suitable subjects, to be translated and read before the Society in English. A range of subjects to be treated during this or ensuing seasons was proposed: Mr. Severn, our consul, pledged himself for some notices of ancient fresco-painting; Mr. Shakspeare Wood, the Society's secretary at the Vatican Museum; and it was agreed to invite Father Mallooly, of the Irish Dominican convent, S. Clemente, to explain the very curious paintings in the subterranean church discovered there through his meritorious exertions, by way of entertainment and study for the inaugural meeting of the season, on which occasion the auditors will be invited to repair to that church, lighted up for the assemblage. The Society's reunions will occasionally be for the object of excursions to historic sites in the Roman vicinity, as well as to scenes of antiquity within this city's walls, to museums, or public galleries. Up to the present, the number of members is thirty-four; of associates, fifty-three; the former subscribing 3 scudi a year, the latter paying for monthly tickets at 1 scudo. Ladies are admitted in both classes. It was determined a second time to apply, through our consul, to the authorities, in order to secure the distinct sanction, without, of course, any demand for official recognition from the Pontifical Government. More than this we are sorry not to be, as yet, enabled to report respecting the labours or merits of the nascent British Archaeological Society.

The opening of the exhibition illustrating the "Divina Commedia" in some forty to fifty large pictures, shown by artificial light—that "Galleria Dantesca" so ill-received in England—has been announced by the Chev. Gentilucci, the originator of the needless speculation, in a long advertisement of the trumpet-flourish style, comprising a letter to and answer from the celebrated Listz (now an abbe), in reference to the performance of his grand *cantata*, known as the "Sinfonia Dantesca," which the public are promised with execution by 100 musicians, instrumental and vocal, for inaugurating the new campaign of the Dantesque Exhibition in Rome. We may ask whether the successes of one art, however brilliant, can be of the slightest avail towards securing those of another; and we put in our protest against the claim of this mediocre collection to represent at all worthily even the actual school of historic painting in Rome or elsewhere in Italy.

HERTFORDSHIRE TREASURES FOR THE  
KENSINGTON PORTRAIT EXHIBITION  
OF 1866.

The truly noble translator of "Homer," the Earl of Derby, has promised by letter (to which we have already directed attention), to be aiding, abetting, and assisting in the formation of the National Portrait Exhibition, to be opened at the South Kensington Museum in the fast-approaching spring of 1866.

The treasures of Knowsley, in Stanley and other illustrious portraits, are to leave Lancashire on loan for the temporary Museum in Middlesex. Lord Derby's influence (and it is great) is freely tendered, and will turn to good account. Knowsley Hall and No. 36, St. James's-square, London, will be stripped, if needed, for the requirements and demands of the Exhibition,—nay, more, Oxford will be induced by its Chancellor to lend liberally from her Bodleian Gallery, her colleges, and her halls. Few, if any, will be found to say "No" to a request made for a public purpose by a nobleman so deservedly esteemed as is Edward Geoffrey Smith Stanley, Baron Stanley of Bickerstaffe, and Earl of Derby.

First of all let us name *what* the Lord-Lieutenant of Hertfordshire is to be asked for. Lord Derby must induce, persuade, or talk over the Earl of Verulam to let him have on loan the only genuine picture in existence of the great Lord Chancellor Bacon. It is a three-quarter piece, and by, it is said, Vansomer, though some judges differ; and some persons' "doubts" are of greater value than other people's "certainties." The viper-like eyes of Bacon are con-

spicuously characteristic in the portrait to be asked for. Then, failing Wilton or The Grove, we would like to take (*convey*, the wise it call) to Kensington for the season of 1866 the famous son of "Sidney's sister," William Herbert, Earl of Pembroke, the elder and abler of the two noble brothers to whom the first edition of Shakspeare's Plays is dedicated by the Players. His lordship might be talked over, or teased into lending the full-length of Sir Nicholas Bacon—painter, sculptor, &c.—by himself. He was half-brother to the Chancellor, and possibly or probably the sculptor of the celebrated *sic sedebat* statue that marks and protects the grave of Bacon. Getting this, we would be emboldened into asking for other temporary loans: we should coax to be allowed to carry to Kensington (using Mr. Samuel Redgrave's most persuasive manner of speaking), the unique full-length of Frances Howard (of Overbury fame), Countess of Essex and Countess of Somerset. Then we would solicit to obtain for a London-season loan (gaining or failing our request), the fine Vandyck full-length of Lord Treasurer Portland (it is better, we agree with Waagen,\* than the Gorbambury picture); and the finest portrait we have, and his lordship has the luck to possess, of Catherine of Braganza, Queen of Charles II., as St. Catherine. Courage renewed, we would hint a wish to have, to be taken every care of, the Lodge-engraved portrait of Ileana George Finch, Earl of Nottingham and Lord High Chancellor,—the most illustrious of all the "black, funeral Finches;" modestly concluding our "askings" with a request for the loan of Will. Chiffinch of the Bedchamber to the King, known to every reader of "De Grammont," and of Sir Walter Scott's "Peveril of the Peak."

Well pleased with what we had done at Chancellor-shaded Gorbambury, we should drive to "The Grove," in time to catch Lord Clarendon at home; sadly missing the advantages we enjoyed on a former occasion of having the late Sir George Cornewall Lewis and the late Lady Theresa Lewis for our well-informed guides.

"Beggars must not be choosers," says the proverb; but, armed in a good cause, and backed by Lord Derby's all-influential name, we will ask boldly and largely. "Lord Chancellor Clarendon would have lent," we reason with ourselves as we hurry "Jehu-like" along, and "Secretary Lord Clarendon will lend."

His lordship is "at home," and,—

"Happy to catch him *not* at dinner-time,"—

will "see and receive." We have a baker's dozen of requests, and gain (in a dream), after a little hesitation, what we wish.

First of all, we ask with boldness for the large and magnificent picture of "The Derby Family," James Stanley, seventh Earl of Derby, his countess and child, to our thinking (and we have long studied Vandyck) the finest Vandyck in the world. It is little known, far less known of course than the Windsor and Petworth Vandycks, and well merits to be better known. Imagine the flush of delight that reddens the face of the asker when the request is at once complied with. What would the Earl of Derby give for this noble picture?—but Lord Clarendon cannot, would not, part with it, though Knowlesley is its proper home, not "The Grove."

With a becoming modesty we cannot gain confidence to ask for another Vandyck or two from "The Grove," though sorely tempted. Our requests at Lord Clarendon's hands are therefore confined to the head of Fletcher the dramatist (Beaumont's associate); to the half-length of the far-famed Lucius Cary Viscount Falkland; to Sir John Mordaunt, the wit; and to the Sir Peter Lely (to the knees) of the great Lord Chancellor Clarendon. These, indeed, would be and will be additions of moment to the coming exhibition of 1866.

From "The Grove" it is a pleasant walk to the adjoining estate or park of "Cassiobury," the Hertfordshire seat of the Earl of Essex. Here Mr. Samuel Redgrave must come and secure the very noble full-length by Vandyck of Algernon Percy, Earl of Northumberland; the very curious portrait (head-size) of King Henry IV., once at Hampton Court, in Hertfordshire, and some half-dozen more prizes, with foremost among the number, Prior, and Pope, and Gay, and Horace Walpole's Kitty Hyde, Duchess of Queensbury, in blue, with a lamb, and deliciously charming, though Charles Jervas

was the painter. It was a picture that deservedly attracted attention in the British Portrait Gallery of the Art-Treasures Exhibition at Manchester, in 1857.

Of houses in Hertfordshire famous for pictures, Professor Waagen, the deservedly-esteemed director of the Berlin Gallery, has seen only two out of eight or nine. He describes Panshanger (Earl Cowper's) and "The Grove" (Lord Clarendon's); but his four large volumes are wanting in visits to Hatfield (the Marquis of Salisbury's), to Gorbambury (the Earl of Verulam's), to Cassiobury (the Earl of Essex's), to Bayfordbury (Mr. Baker's), to Ashridge (Lady Maria Alford's), and to Brocket, the Hertfordshire seat of Prime Minister Lord Melbourne and Prime Minister the late Lord Palmerston. Hatfield House is full of rare and valuable portraits of Queen Elizabeth and the Cecils of four peerages—Burlington, Salisbury, Exeter, and Wimbledon; while Bayfordbury, with its Kit-Kat Club portraits and its Dryden, with the laurel-wreath in his hand, by Kneller, is rich without a rival.

And having said thus much by way of Hertfordshire's wealth in English portraiture, I will conclude with a story.

In a wild belief that the coming Kensington Exhibition will contain, at least, one portrait of Field-Marshal the Duke of Wellington, I will here express a hope that the Sir Thomas Lawrence Waterloo portrait of "The Duke," painted (1825) for the Minister Sir Robert Peel, may be one of them. I derive my anecdote from my friend (for such he was pleased to look upon me) the late Right Hon. John Wilson Croker, whose sought-out and acknowledged assistant I was in his last edition of "Bowell's Life of Johnson," and with whom I wrought for years in the long-announced, and still looked-for, edition of the works of Pope.

Here is my memorandum:—

"April, 1853. West Molesey.—Mr. Croker told me that Sir Thomas Lawrence's noble full-length Peel portrait of the Duke of Wellington, so finely engraved by Consins, represented originally the Duke with his watch in his hand, as if waiting at Waterloo for Blücher to come up. 'I had no watch in my hand!' (exclaimed the Iron Duke somewhat angrily), 'it was something else with me than—time.' The watch was changed to a telescope. The picture is in Staffordshire, at Drayton Manor."

Another shire in another communication.

PETER CUNNINGHAM.

#### ARCHITECTURE IN LIVERPOOL.

It has been observed by thinking minds that architecture, of all the arts, is the one most intimately interwoven with our deepest and most cherished thoughts, habits, and feelings. While it is the oldest it is at the same time the most comprehensive, the grandest, and, in proper hands, should be the most plastic and impressive. Unlike painting and sculpture, it is not in its origin an imitative art; and when we are recommended to study nature, it is with the object not of copying her, for then, unless in the decorative portions, nought could be acquired that would in any way assist us. Through the whole range of the arts, whether it be painting, music, poetry, or architecture, there exist certain leading constructive principles analogous to those upon which the beauties of nature depend for their influence upon the human mind. It is to an instinctive perception and close study of these principles, only fully appreciated and felt by those practised in the arts, that all successful art-work owes its most elevating and refining influences—not that any code of rules can be laid down for our guidance; art is far too intangible for that, and anything in the form of canons of taste only defeat the object for which they are framed. The highest art is the product of a finely-organised creative mind, guided by an educated and refined taste,—a correct taste, more especially in architecture, in which we cannot apply to nature direct for instruction, is the result, if we may so express it, of a continual *testing* of the emotions; it is a tentative refining process, by which all the solid good is extracted, and the gross and baser metal rejected. The mind must be continually on the alert, and so infinite is art that a whole lifetime may be, and is by great artists, profitably expended, not alone in creating but in assimilating, and rejecting, and holding fast to and embodying that which is good. The creative faculties are those that supply from the mind's store the materials and

fashion them into form; the directing taste may be likened unto the delicate touch by which all the harshnesses are detected and softened down. Nature is full of analogies, and so sensitive and certain do the operations of the mind become, that what at first, when the faculties are in a coarser and duller condition, may afford pleasure, with the more educated organisation—the result of combined observation, reasons and associations—will probably be found to be, if not utterly bad, still in the nature of a jarring discord.

To those who, perhaps, possessing some sympathy with art, have neglected to educate their taste, and are not fully alive to the advantages of refined culture, it may appear to be a foolish business to render the skin so thin, the optics so sensitive, that the usual surroundings are likely to create more of pain than pleasure. This is what may be called the *comfortable* doctrine. Let us remain as we are. Such a thing may not be in the highest art, it may not be of an elevating nature, it may be crude and ill digested; but it answers the great end of all things, it *pleases me*. But, my dear friend, though it pleases you, though it may be called handsome or pretty, it might, at no more expense, be made capable of fulfilling a far higher function. Let us illustrate it from your own business, and the common relations of life. Is there not such a thing as integrity, honour, honesty? Do you not pride yourself on your word being as good as your bond? Is not acting in a gentlemanly manner usually considered *the thing*? These are homely comparisons, but none the less to the point. Now try and abstract your mind, and look at the governing principle, and say if such a code of morality does not recognise something loftier than self-interest, and a human sympathy wider than personal pleasure? So it is with art. *Art is for all*; and one of its grandest characteristics is that, while affording pleasure in its production, its influence is not confined exclusively to the gratification of the possessor, but it sheds a beneficent lustre upon all within its compass, and by so much as it takes a man from the base and greedy objects of life, so much does it raise him above the level of the beasts of the field; and, in the rather hackneyed words of the poet, which have been brought into disrepute by the penny-a-liner, "a thing of beauty is a joy for ever." So far introductory.

It would be impossible to properly understand or appreciate the architecture of Liverpool without taking into consideration the influences which have moulded it into its present shape. The ideas of the preceding age strongly affect the character of the times we live in, and in architecture as much, if not more,—in Liverpool at all events,—is due to such a transmission of habits of thought. With examples constantly before their eyes, and living recipients of the ancient lore practising most extensively on all hands, it would be strange, indeed, if the town could rid itself entirely of the baneful effects of the architectural perpetrations of what is now called the *dark ages of art*. The strong conservative tendencies of the town, combined with the indiscriminate employment of rapidly-increasing wealth, have placed it in its present unsatisfactory position; and if we can lead to the demand for a higher style of art, and an honest, fresher purer character of decoration, and more tasteful distribution of ornament, our aim and object will have been attained.

With the exception of the Town-hall and Old Exchange, the public buildings of Liverpool, up to the period of St. George's Hall, owe their character to what may call the *genius* (?) of Mr. John Foster. As was pertinently observed by a witty native artist, art in Liverpool was, at that period, too much *fastened*. How Foster attained the reputation he did, is a thing we could never fathom, excepting it arose from the petting and cherishing of a rich corporation. His was an age of town dues and other comfortable monopolies, liberally expended in sustaining other monopolies. It was said, we know not with what truth, that Rickman, the systematizer, classifier, and analyzer of Gothic architecture, in despair of obtaining work in the face of Foster the Magnificent, had to leave the town. So it is with all art-talent in Liverpool. We can retain few things but "hard hitters," "merchant princes," "damaged and shoddy men," "measurers," "valuers," and "builders,"—all very worthy and useful in their way; but, with the exception of a few of the "princes" of decidedly unartistic tendencies: a dullness of apprehension, optically considered, seems to pervade

\* Waagen, ii, 458, ed. 1854.

the place. An atmosphere of mental morphia floats over everything; and so stagnated have we become by contemplating the grandeur of Foster, that since his date, having attained perfection, we have quietly gone to sleep over it. But rouse ye, rouse ye! The dormant life in the artistic winter of our existence will soon, we hope, give place to the genial warmth and all-pervading sunlight of a happier summer, when those who have been overcome will stretch their legs, yawn, rub their eyes, and give other well-known signs of a return to consciousness.

One of the great advantages possessed by Foster, in addition to his local influence, was the halo shed over him by his travels and studies along with Cockerell in Greece. But how differently each used his opportunity! In Cockerell's work there is a lasting pleasure in the perfection and refinement of the details; and though he fails somewhat, at times, in breadth of effect—though sometimes guilty of grave errors of taste—though in the carving he is specially ineffective—even an ordinary observer cannot help feeling impressed with the conviction that his work is that of an educated mind—that his master of his subject, and that failure, if there be any, cannot have occurred from a slovenly slurring over, or artistic fading of the subject.

Every moulding bears the stamp of careful study; while, on the contrary, Foster, it is well known, was of that indolent disposition which cannot abide the drudgery of work. If we examine either the Branch Bank of England, in Castle-street, or the Liverpool and London Chambers, by the Exchange, it will not require much penetration to discover that Cockerell had constantly before him the problem of adapting the antique form to the exigencies of modern wants, and that in the process he has discovered some decided originality of treatment. Though drawing his inspiration from the same source, Foster, whose mind was of another and less thoughtful stamp, shows a wonderfully leaden dullness and want of imagination. Doubtless some discount must be taken off our censure to the credit of the haneiful influences that then overspread the whole country, and from which it would, perhaps, have been difficult for him to have entirely detached himself; but we cannot rest while his lineal descendants, mentally speaking, but lacking even his force of character, go about cranking up and flourishing him in the faces of the "youthful members of the profession." The versatility of humberg is truly wonderful, for while the last phrase conveys the idea of a lofty condensation—a stooping down of patronage—the praise of Foster is usually qualified by a few touching words of pity for the ignorant influences which must have affected him. Foster was a wonderful man, *considering*; but we live in a more enlightened age. He was very good, in *his way*; but *us*, his successors, he could not be expected to equal, for has not the cloud dissolved from our vision? and do we not now see things in their real light? This is the *how* we are continually doomed to hear, and is very characteristic of the style of mind we have to put up with. Such remarks are clever, in their limited way; for, do you not see, two birds are killed with one stone—and while apparently praising others we are continually chanting hymns to our own glorification? A little freedom from affectation—a few words betraying a genuine sympathy with architecture for *itself*, would do more for the tasteful adornment of the town than the whole gigantic labours of the Architectural Society, and the bandying about of compliments which regularly accompany them. We may be considered harsh, but we feel strongly and deeply that in Liverpool such genuine sympathy is as rare as strawberries at Christmas.

## LIVERPOOL.

## REFRIGERATION OF BUILDINGS.

M. CHARLES TELLIER, inventor of the ammonia ice-producing machine, and the ammonia engine as a motive power, has proposed an apparatus for the refrigeration of public buildings or crowded saloons, theatres, &c. General Morin in a note communicated to the Academy of Sciences, proposed four methods towards cooling the air in the interior of buildings—first, the cooling of the air by means of pulverized water or spray; second, by the contact with refrigerated surfaces; third, by a supply of external air, cooled down as well as possible; fourth, by the constant watering of the roofs. The last plan seems to be the

favourite with the General. He moreover stated that by experiments made at the Conservatoire des Arts et M<sup>ét</sup>iers, it requires 1 kilogram of ice to cool a cubic metre of air, an astonishing waste, when we consider the slight amount of refrigeration required for practical application.

M. Tellier's plan is based upon another principle, viz., that in a vacuum vapours are produced instantaneously and in direct proportion to their previous condensation. Thus, if the condensation be powerful, the vaporisation will be energetic also; and as the vaporisation cannot take place except under the strict condition of the absorption of caloric, if a machine be so disposed that the air to be cooled pass through it, the quantity of heat abstracted from the air will be proportional to the said vaporisation.

By applying ammonia, a variation of 10° centigrade only, between the temperature of vaporisation and condensation, will produce a difference of more than two atmospheres in the pressures corresponding to each temperature. In fact, the energy with which the heat is transported by these vapours may be compared to the force developed by the escape of steam into the open air from a steam boiler, under a pressure of three atmospheres.

The apparatus consists of a cylinder, completely closed, and filled with ammonia liquified under pressure. It is traversed by a series of tubes similar to those of a locomotive boiler, through which the air to be cooled is made to pass. The cylinder communicates by means of a pipe with a coil tube, or condenser, placed in a vessel of water maintained at 10° centigrade. The operation is as follows.—The air entering through the tubes parts with its caloric, which is absorbed by the ammonia in the cylinder. The ammoniacal gas formed passes into the coil tube, is there condensed, and returns, through another pipe, to the cylinder, either by a natural fall or flow, or by aid of a pump. The effect is very simple, and the loss of heat through radiation but little, if care be taken to surround the cylinder with a non-conducting substance, such as felt, flannel, &c.

NEW EYE AND EAR INFIRMARY,  
BRADFORD, YORKSHIRE.

This building being one of the first ever erected in the county for the special treatment of diseases of the eye and ear, considerable care was necessary in its arrangements, so as to obtain the accommodation required in the most suitable manner, and to facilitate as much as possible the economical working of the institution. On the ground-plan is an entrance vestibule opening through glass screen doors into a spacious hall, 50 ft. by 20 ft. This entrance is for residents, visitors, and the medical officers, and is a central feature in the front.

On the left are placed the rooms devoted to outdoor or non-resident patients and the dispensary. The outdoor patients enter by a covered porch, on the west side of the building, into a waiting-room, 34 ft. by 20 ft., communicating with the consultation-room to the front, 27 ft. by 20 ft., and in connexion with which is the ophthalmoscopic-room, alcovatory, cloak-rooms, and every convenience. After consultation the patients pass into the dispensary waiting-room, and thence from the building by a separate doorway. This dispensing and consultation are thus conducted without confusion, and also without entering into that portion of the institution devoted to residents. On the left of the hall are placed, to the front, the convalescents' ward, 35 ft. by 20 ft.; and at the back the kitchen, scullery, &c., with a distinct entrance for the servants. Lifts are provided, for coals and food, from the basement and kitchen to the first-floor. The principal staircase opens out of the entrance-hall, leading to a landing on the first-floor, 30 ft. by 20 ft. The nurses' rooms are placed in the centre of this floor, and upon each side, and completely separated, are the male and female wards;—two large wards, 35 ft. long, and 20 ft. wide, to the front, and two smaller wards, 25 ft. long and 16 ft. wide, to the back. Bath and store rooms are also provided. At the back of the building is placed the operating-room, lighted from the north and with large top-light, surrounded with denfined walls and doors. Accommodation is given upon this floor for thirty resident patients. The rooms are lofty, and the windows arranged with hanging

shutters, so that the light can be regulated in any part of each room or altogether excluded.

Both on the second and first floor, the corridors, hall, and passages are heated with hot water, and the rooms by open fireplaces. On the basement are placed the coal-cellers, pantries, and larders; and there is also a large washhouse, vaulted in brick, and with a separate outside entrance.

The exterior is executed with cut wall-stones, and ashlar bands and dressings of light-coloured stone.

The hospital had its origin in a private clinical institution of Dr. E. Bronner, of this town. Subscriptions were obtained; the foundation-stone was laid on the 29th of March, 1864; and the hospital inaugurated on the 30th of June last, by the mayor of Bradford, Mr. Charles Lemon, with the gratifying announcement that the cost of land, building, and furnishing, amounting to about 6,000*l.*, was entirely covered by voluntary donations.

The building has been erected from the designs, and under the superintendance of Messrs. Lockwood & Mawson, architects.

THE ROAD TO THE THAMES  
EMBANKMENT.

The road to the Thames Embankment proposed to be formed by the Board of Works over the site of Northumberland House would be a step towards realizing a scheme proposed in our pages some years ago for connecting the district on the other side of the river with the Strand and West-end generally by means of a very wide bridge from that point. We shall greatly regret the loss of Northumberland House as an interesting relic of Elizabethan London. The London of the past is fast disappearing. It cannot be helped; new wants must be supplied; fresh facilities to moving millions must be afforded, but we may nevertheless whether or not equal improvements may not be effected without destruction. An extensive erecment is spoken of stretching from Hungerford to Waterloo Bridge. Adelphi-terrace would have to come down, and much property adjacent.

## PROVINCIAL NEWS.

**Leeds.**—Four carved stone lions are to be placed on pedestals in front of the Town-hall, which at present has a naked and unfinished appearance. The corporation has granted a sum of 600*l.* for the purpose.—The new building for Messrs. Beckett's bank will form one of the architectural ornaments of Park-row, and will be furnished in the Gothic style; the work has been entrusted to Messrs. Marsh & Jones, late Kendell & Co., of this town.

**Wakefield.**—The foundation-stone of a very extensive glass-bottle manufactory has been laid here.

**Bradford.**—Some of the oldest parts of old Bradford are fast disappearing. Workmen have been demolishing the buildings which adjoined and covered the Old Foundry ground, and including the ancient residence of a notable inhabitant some thirty or forty years ago, "Parson Atkinson." The continuation of Market-street will intersect the site. Similar demolition has for some time been going on on one side of Westgate, on the Bee-Hive Inn estate, for the purpose of carrying a street thence into Thornton-road, and also in Well-street and at the bottom of Lower Cheapside. The re-arrangement of Bradford streets has long been needed.

**Doncaster.**—The town council have resolved "That a wing be built at the south end of the market, uniform with the one at north end; and that the proposed new corn-market building be erected in the centre." The resolution, in fact, is that the improvements should be in accordance with the original design of the markets; upon a plan Mr. Butterfield has already submitted to the council. It was also resolved,—"That the council invite competition for the best design for an extension of the markets; and that in addition to a corn exchange and a new wing of the market-house, such improvements shall comprise covered vegetable and fruit markets, and a public slaughter-house; also that a first prize of 100*l.* and a second of 50*l.* be offered for such plans as the council may select."

**Rotherham.**—It has been resolved to erect a people's hall for Rotherham, Masbro', and the district thereabout.

Sculptured Groups surmounting the Front.

## INDUSTRIAL EXHIBITIONS.

*The South-Eastern.*—This Exhibition, which was opened by Viscount Sydney, at the Dining-hall, Greenwich Hospital, has been highly successful, the official returns proving that in seven weeks upwards of 70,000 visitors have been admitted.

*The Birmingham Exhibition.*—The surplus of this Exhibition is now, to some extent, defined. The total sum received was 4,126l. 7s. 8d. The expenditure had been 3,055l. 9s. 3d., so that there was a balance on the right side of 1,070l. 18s. 5d. As 360l. had been voted to the hospitals, there remained a sum of 770l. 15s. 5d. to be disposed of. What was to be the destination of this money did not transpire.

*The Glasgow Exhibition.*—This Exhibition was, on Tuesday in last week, formally opened by the Duke of Argyll. The Exhibition has been got up under the auspices of the Central Working Men's Club. It is held in the Macintyre Buildings, Argyle-street. The interior may be described as a large hall, having three spacious galleries, one above the other, running round the walls. The Exhibition in its general features is similar to those that have lately been so frequent in England. The number of articles exhibited by working people is nearly 1,200, and there are upwards of 400 exhibitors belonging to the purely industrial classes of the Glasgow population. The address was postponed till the evening, that working men should hear it. The Duke, in the course of his remarks, said:—"I am told that out of 500 total exhibitors, there are upwards of 400 who belong to the working classes. Now, I need hardly say that in some points of view it may be said that the whole Exhibition has come from the hands of working men. I could not help being struck by the large comparative development which is given in the Exhibition to two great branches of human inquiry. The first is natural science, and the second is those abstract sciences which are applied principally to mechanical invention. Those I think are undoubtedly more fully represented than any other things in the Exhibition, and I can understand how these two great departments of inquiry should have

had special attractions for the working men. As regards the natural sciences, I think it is impossible not to feel that in the hurry and bustle of our daily life it is an immenso refreshment to have our minds brought face to face with the light of nature. In the main the face of nature is a face of happiness and of peace. And I conceive that Wordsworth has really touched in a single line upon the real secret of the power which is exerted over us by the natural sciences, when he has referred to nature as

'Abodes in which self-disturbance hath no part.'

But then, gentlemen, with regard to the other great department, which is so well—I might say so magnificently, as it is—exhibited, I mean the department of mechanical invention—that also is one of the greatest and most fruitful departments of natural inquiry. Why, the world is one great storehouse of mechanical invention. Our very bodies—these frames, of which it is said they are fearfully and wonderfully made—they are specimens of supreme mechanical invention. And I think that the study of mechanical invention has a great charm in this respect also, that it gives us an immense sense of power, and yet a sense of power which, in my opinion, can never tend to pride; but should always be, and very generally is, connected with true humility of mind; because we feel on the one hand the inexorable natural laws which we have to deal with—we feel, on the other hand, that by skill, by steady and by careful fitting of means to ends, we can make those very laws, apparently so involved and so inexorable, the subtle instruments of our own purposes and of our own intentions."

*The Dublin Exhibition.*—Although this exhibition of manufacturing industry was not explicitly called an Industrial Exhibition, it was so essentially; and we may here note that at a special meeting of the Royal Dublin Society held in Dublin, for the purpose of considering the report of council relative to the deficit for which the guarantors of the Exhibition were held responsible, the report, which set forth resolutions adopted at a meeting of the guarantors, in which they offered the society the sum of 1,000l., in addition to the buildings erected for

exhibition purposes in the Shelburne-yard, in lieu of all claims against the guarantors, was adopted. The council recommended the "acceptance from the guarantors of a sum of not less than 1,000l., within three months, provided the balance remaining due be collected by them within the same period, and that the sale of the buildings in Shelburne-yard, &c., be postponed until the result of said subscription be ascertained; but without prejudice, nevertheless, to the legal rights secured to the Royal Dublin Society by the guarantors deed."

## THE MAIN DRAINAGE OF LONDON.

On Saturday in last week, the members of the Metropolitan Board of Works, headed by Sir John Thwaites, paid a visit to the Plaistow Marshes, for the purpose of laying the foundation stone of the Abbey Mills pumping station—a building which is to rival the works at Crossness, and in which will be the means of raising the sewage of the Low-level to the great High and Middle-level Sewers.

On arriving at the ground, the party immediately descended some 40 ft. below the surface, and 12 feet below the bed of the River Lea. The company passed through some of the completed sewer, which, in its length of five miles from the Tower, has to go under two branches of the Lea, and under the river itself. The subterranean passage, which is about 12 ft. high, was brilliantly lighted, and led to the site of the station.

Mr. Bazalgette, the engineer, read a statement, which was engrossed for insertion in the stone, showing that the sewer, of which this was the mouth, would drain 253 square miles, and would have to raise about 5,000,000 cubic ft. of sewage a day, and that the engine power, about 1,140-horse, was provided for the raising of 15,000 cubic feet per minute, so that all storm rains could be safely carried off.

Mr. Freeman laid the stone, making an interesting address.

The works are being carried out by Mr. Webster as contractor, under Mr. Edmund Cooper, resident engineer.

NATIONAL PROVINCIAL BANK OF ENGLAND, THREADNEEDLE STREET, LONDON.—MR. JOHN GIBSON, ARCHT.

## A HORIZONTAL SMOKE VOMITORIUM.

We have received a communication from Dr. D. O. Edwards, of which we print sufficient to explain his views:—

"The ascent of the nascent gases arising from combustion may be impeded by two different causes. First, in a still and humid state of the atmosphere, chimneys are filled with a body of air very nearly saturated with vapour, and, consequently, so conditioned as to resist, instead of aiding, the first feeble pressure of the rising smoke or heated gases. This hindrance, however, is only temporary. It can only exist during a perfect atmospheric calm; and is easily overcome by the intrusion into the shaft of an ignited torch.

The most frequent and pertinacious impediment to the easy escape of smoke consists, secondly, in the disturbing effects of air currents upon the chimney funnels, which are generally terra-cotta pots, or contorted zinc tubes. It is a law in pneumatics, the necessary consequence of the universal force of gravitation, that large and strong currents of air overrule and attract to themselves all minor breezes. The impulse of wind is simply its local weight, but a degree of rarefaction is produced on the edge of every current, which causes an influx of the adjacent quiet air. A strong gust or heavy torrent of wind approaching an ordinary stack of chimneys, of course displaces the lighter atmosphere round about, and, descending into the flue, drives down the ascending smoke.

When undisturbed by such moving columns of air, the tranquil atmosphere permits the ascent of smoke or rarer air, which obeys the law of gravitation as implicitly as all floating bodies on the surface of water. It is by the lateral pressure of the colder air that the heated products of combustion are made to shoot upwards to the sky.

In order that the column of smoke should disengage itself freely from its channel of escape, the chimney, it is necessary to prevent the approach to, or rude contact of the wind with, the immediate vent of the flue; and this result is perfectly secured by the subdivision of the current into minute rills of air, which tranquilly commingles with the lighter reservoir of atmosphere retained in and around the chimney-pot or other funnel.

To prove that the safe issue of the smoke may be thus effected, I have constructed a simple apparatus, consisting of six moderator lamps placed in a row, and having their chimney-glasses terminating in an iron tube or oblong chamber, the calibre of which must be four times as large as the sum of that of all the chimneys. The top of each glass projects to the height of a few lines into the interior of this receptacle, which I have named the "vomitorium." Each end of the vomitorium is obturated by a perforated door, of which the apertures are of such a diameter as will suffice to permit the free exit of the products of combustion and yet annihilate the disturbing atmospheric current. My little contrivance shows the practicability of this double effect.

The tube or "vomitorium" should be closed at each extremity by a kind of honey-comb door, which permits the smoke freely to escape through the upper apertures, and admits the outer air to enter in dribbles and course quietly along the floor of the tube. All jets and draughts being minutely subdivided in this way, no force disturbs the separation of the hot current from the cold, which currents move steadily in contrary directions, and are totally unaffected by any aerial movements outside of the vomitorium.

In the hands of the architect this vomitorium would take the form of an arched substitute for the prevalent stack of chimneys. This arched would extend from the front to the back parapet of the building, and into it each flue should open, protected by a collar or rim a few inches in depth. Each end of the arched or tunnel should be closed, upon the principle already explained; and as this perforated or partially-shut aperture of the air sewer at each extremity would open on opposite aspects of the house, the air within would be always in motion, and the state of chimney arising, as described, from stagnant moist air, would be prevented.

A careful observation shows us that the aerial phenomena exhibited in my apparatus occur as follows:—The jet of smoke issuing into the vomitorium rises to its roof, and gradually flows outwards through the outlets provided; the external air enters through the inferior holes and moves inwards along the floor of the tube, thus

keeping up the atmospheric equilibrium; and the combustion of the fuel is maintained in perfect regularity. Two further disadvantages may be obviated by the adoption of this invention; it will be no longer necessary to raise low chimneys to the level of lofty ones, as the vomitorium is effective at all heights; and a portion of the great percentage of heat now lost might be saved by inserting vomitoria between the floors of houses instead of at the top, and thus warming by radiation some portions of the building.

The sure expulsion of the products of combustion is one important means of ventilation, but not the only one; it is equally important to find an *aditum* for fresh air as an *exitum* for impure vapours. It is necessary, however, that this supply of oxygen should be so introduced as not to lower the temperature of apartments too much."

We should expect a rapid accumulation of soot in such an arrangement, and a considerable liability to the passage of smoke from one flue down another. When we have seen it in operation we shall be better able to judge.

## THE STRENGTH OF PORTLAND CEMENT.

At the Institution of Civil Engineers, December 12th, Mr. McClean, President, in the chair, the paper read was on "Experiments on the Strength of Cement, chiefly in reference to the Portland Cement used in the Southern Main Drainage Works," by Mr. John Grant.

This communication related to an extensive series of experiments, the results of which were recorded in voluminous tables forming an appendix to the paper, carried on during the last seven years, with a view to insure, as far as possible, that only cement and other materials of the best quality should be employed in the Southern Main Drainage Works, of which the author had charge as resident engineer.

As a preliminary step, samples of Portland cement were obtained from all the principal manufacturers for the purpose of experiment. The average weight of these samples was found to be 108.6 lb. per bushel, and they sustained breaking or tensile strains, at the end of a month varying from 75 lb. to 719 lb. upon 2½ square inches. A clause was then inserted in the specifications to the effect that the Portland cement to be used in the works should be of the very best quality and ground extremely fine, weighing not less than 110 lb. to the stricked bushel, and capable of resisting a breaking weight of 400 lb. upon an area 1½ inch square, equal to 2½ square inches, seven days after being made, after being immersed in water for the whole of that time. The standard was subsequently raised to 500 lb. on the same sectional area, which was that used throughout the experiments. During the last six years 70,000 tons of Portland cement had been used in these works, which extended over a length of 18 miles and had cost 1,250,000l. This quantity of cement had been submitted to about 15,000 tests, at a cost of only 1½d. per ton. The machine devised for showing the tensile strain was a lever balance, constructed by Mr. P. Adie, and its first cost was from 40l. to 50l. It was so simple that an ordinary workman could be trusted to test the cement, and the cost for labour did not exceed 80l. per annum for each machine.

The manufacture of Portland cement required extreme care in the admixture of its two simple and well-known ingredients, clay and chalk; it being necessary to vary the proportions according to the quality of the chalk; thus, in white chalk districts, the clay formed from 25 to 30 per cent. of the whole bulk. The manufacture was carried on almost exclusively on the banks of the Rivers Thames and Medway; the clay, which should be as free from sand as possible, being obtained from the crests and bays between Sheerness and Chatham. Long experience now enabled the clerks of the works and others to detect the qualities of the cements by colour and by weight. Very strong Portland cement was heavy, of a blue grey colour, and set slowly; in fact, the longer it was in setting, the greater was its strength. Quick-setting cement had generally too large a proportion of clay in its composition, was brown in colour, and turned out weak, if not useless. In the first schedule of prices 2s. 3d. per bushel was inserted; but this was far above its present market value.

But the tests were not alone sufficient. It was essential that constant supervision should

be exercised to insure that only clean and sharp sand should be mixed with the cement; that the cement was only supplied with sufficient water to reduce it to a state of paste, which was best accomplished by means of a perforated nozzle at the end of a pipe or watering-can; that the bricks or stones were thoroughly saturated with water, so that in setting the cement might not be robbed by absorption of the moisture necessary for its perfect hardening; and that a current of water was prevented from passing over the cement, or through the joints, during the process of setting, as this would wash away the soluble silicates.

The results as a rule were the average of ten tests, the samples being immersed under water from the time of setting to the time of testing. The tables show that, during the last six years, 1,369,210 bushels of Portland cement had been submitted to 11,587 tests, and that the cement was found to be of the average weight of 114.5 lb. per bushel, and to possess an average tensile strength of 608.6 lb. upon 2½ square inches, being 5½ and 21 per cent. in excess of the two specified standards. It was also ascertained that, provided Portland cement be kept free from moisture, it did not, like Roman cement, lose its strength by being kept in casks or in sacks, but rather improved by age,—a great advantage in the case of cement which had to be exported. Experiments, conducted over periods varying from one week to twelve months, with Portland cement weighing 112 lb. to the imperial bushel, gauged neat and mixed with varying proportions of different kinds of sand, showed that neat cement was stronger than any admixture of it with sand; that mixed with an equal quantity of sand (as had been the case throughout the Southern Main Drainage Works), the cement might be said to be, at the end of a year, approximately three-fourths of the strength of neat cement; that, with two, three, four, and five parts of sand to one of cement, the strength was respectively one-half, one-third, one-fourth, and about one-sixth that of neat cement. Other experiments showed that, at the end of twelve months, neat cement kept under water in a quiescent state was about one-third stronger than that which was out of water, both indoors and exposed out of doors to the action of the weather; that blocks of brickwork, or concrete, made with Portland cement, or kept under water until required for use, would be much stronger than if allowed to remain dry; and that salt water was as good for mixing with Portland cement as fresh water. Bricks of neat Portland cement, after being made three, six, and nine months, withstood a crushing force of 65, 92, and 102 tons respectively, or equal to the best quality of Staffordshire blue bricks; and bricks of cement, mixed with four and five parts of sand, bore a pressure equal to the best picked stock bricks; while Portland stone of similar size bore on its bed a crushing weight of 47 tons, and against its bed somewhat less; and Bramley Fall stone sustained on its bed 93½ tons, and against its bed 54½ tons. Portland cement concrete made in the proportions of one of cement to six or eight of ballast, had been extensively used for the foundations of the river wall and the piers of the reservoirs at Crossness, as well as for the foundations generally both there and at Deptford, with the most perfect success. It was thought that it might be still more advantageously used as a substitute for brickwork or masonry, wherever skilled labour, stone, or bricks were scarce, and foundations had to be made with the least expenditure of time and money. Whenever concrete was used under water, care must be taken that the water was still, as a current, whether natural or caused by pumping, would carry away the cement and leave only clean ballast. Roman cement, though about two-thirds of the cost of Portland, was only about one-third its strength, and was, therefore, double the cost when measured by strength. It was, besides, very ill adapted for being mixed with sand.

In conclusion, the author, whilst recommending Portland cement as the best article of the kind that could be used by the engineer or architect, warned every one who was not prepared to take the trouble, or incur the trifling expense of testing, not to use it; as, if manufactured with improper proportions of its constituents, chalk and clay, or improperly burnt, it might do more mischief than the poorest lime. Further experiments were desirable, on the strength of adhesion between bricks and cement, under varying circumstances; and on the limit to the increase of strength with age; on the rela-

tive strength of concrete made with various proportions of cement and ballast; and on the use of cement in very hot climates, where, probably, extra care would be required in preserving the cement from damp, and keeping it cool until the process of setting had been completed. On these and other important points, the author trusted that all who had the opportunity would record their observations, and present them to the Institution.

The general meeting was held on the 19th instant.

#### NEW METROPOLITAN TRAMWAYS.

A RENEWED endeavour will be made in Parliament to obtain powers to lay down improved tramways for omnibuses, also of a much-improved character. The top edge of the rail will be flush with the pavement, very narrow, and will present no obstruction to wheels; and those adapted to it can readily go off or on to it. The projected company will be bound to maintain a strip of the road 7 ft. in breadth for each line of rails, although no exclusive right to travel on these will be reserved. The company will be competitive with the General Omnibus Company; and no doubt this itself will constitute a strong recommendation to Londoners, who desire to supersede, by an English Company, the French association which at present overrides the citizens with their bad, draughty, omnibuses and their broken promises. If otherwise unobjectionable, tramways would promote the regulation of traffic, and obviate the necessity for demolishing some hundreds more houses by running railways through various parts of the metropolis.

#### A NOTE ON THE MANUFACTURE OF MARBLED PAPER.

ON one side of the area of Red Lion-yard, Clerkenwell, there are several workshops. One of these is occupied by Mr. F. Hitching, a manufacturer of marble, granite, and wainscot wall-papers. A look into it enables us to notice the process by which this kind of house and shop decoration is prepared. The premises in which this work is executed are of considerable extent, and present a very picturesque appearance. The space needed for drying the paper and for the various operations of staining prevents the overcrowding of the workpeople, who, for the most part, are youths, and very young boys.

On reaching one apartment there are to be noticed quantities of paper made of the usual width of wall-papers, and in pieces which are of the length of about 12 yards. In some instances the paper is tinted so as to form a ground-work for the grain of the material which is needed to be imitated. Near the entrance of the room there is a tank several feet in length, and of a width sufficient to admit a breadth of wall-paper. In this tank there is water to the depth of from 2 in. to 3 in., and at the bottom there is a heavy white deposit, which, even after the water has been disturbed, sinks rapidly back to the bottom. Close at hand are pots, which contain various colours, prepared with turpentine and oil, in which are brushes of a suitable form. When the surface of the water in the tank is still, the artist who superintends this department of the work, and who is now about producing imitations of marble, takes the various pigments, and, as though he were painting on a more solid surface, he marks the veinings of the marble on the still surface of the water in various colours; and it is curious to see how the different forms and colours deposited,—which we should think, but for the gathering-up effect of the next process, form one of the faintest of all pictorial effects,—assume the exact appearance of marble, granite, or other of the very hardest of the earth's substances,—the artist working on water in somewhat the same way as if he were engaged on wood. As he goes on, the colours rise to the surface, and he soon completes a remarkably truthful and clever picture of a slab of the kind of marble mentioned. The light upon the water gives a bright and peculiar glaze, and the white deposit at the bottom of the tank adds to the effect. During the process the artist clears parts of the surface by a deposition of turpentine, acids, or other means which are magical in their effect, and give an air of verisimilitude and refinement to the picture.

The marble picture on the water cannot wait long, or it might lose its crispness and melt away. The paper, however, is prepared to gather up the marble pattern from the unstable surface, and by means of rollers and pulleys, the nature of which could not be well described without illustrations, tinted paper, of the length of the tank, is let gently into it, and is allowed to float for a short time on the surface of the water, whence it is raised by simple machinery, turned picture-side upwards, and laid on a flat slab; when the impression taken from the water is improved in various ways and toned, and blended together by means of tints applied by brushes. In due course the paper is varnished, dried, and flattened, and then we have a well-known material for wall covering, which is capable of being washed when it has become dirty.

In parts of the manufactory, wood and other surfaces are being imitated. The pieces of paper are laid on tables, and by a methodical process the men and boys apply the needful colours. For instance, a boy with a brush filled with a suitable tint makes certain marks; others follow; and, with considerable rapidity, the slips of paper begin to assume the appearance of the material to be imitated. Meanwhile a more skilled workman moves about, touching here and there, and giving emphasis where needed, darkening or lightening, and blending in the parts required. For the covers of school-boys' copy-books, and in other ways, the use of marbled papers, some of them of a very beautiful kind, was more in fashion a few years ago than it is at the present time.

#### ARE THERE ANY OLD ARCHITECTS, OR THEIR WORKS?

Will you kindly allow me to ask a very great personal favour, through the *Builder*,—where it must be seen by everybody in the least interested or concerned?—it is, that the *tumber* which at present exists, in the shape of empty record-cases and rotten flooring, may be carted away from the Westminster Chapter-house, so as to enable me or any other solitary who may feel interested to see, and study, and read the handwriting on the walls of that hitherto preserved ruin of a good thing. It will cost nothing, for anybody dealing in old wood will cart it away free of expenso for firewood. Nothing can be done with the building itself till Parliament grants the money for the sponging out of the old writing; but biding that event, and between now and then, let us be privileged to see all that is left of it in its original unrestored, or rather unutilized, state. This will guide us to an understanding of what an *old* architect was, and did; and thus, perhaps, in time, to what a *modern* architect ought to be, but is not;—a most interesting question just now, for is not the world asked through its great speaking trumpet, "What is an architect?"

Let us all recollect, too, that this ruined remnant of the work of an artist-architect and architect of the works is now unhappily the *only*—I must repeat the word, the *only*—hit of stone MS. left in all London, as it was written without either sponging out or smudging over. The Abbey, of which it was once a part in the good old ignorant days, is fast disappearing, bit by bit, colour and all, and is getting bran new.

Pray, sir, help, and get us the privilege of a glance at the Chapter-house walls and hollow spaces for a few short days, and then good bye! Vanity of vanities!—all is vanity!

C. B. A.

#### PLAYGROUNDS.

SOME years ago you were good enough to insert a letter from me advocating the formation of playgrounds.

Since then, country local boards have taken up the question vigorously, and most moderate-sized towns have provided parks.

London, from its size, is an exceptional case. Parks have been established; but, from their distance, must be useless as playgrounds to the majority.

In my opinion, the local boards of each district should buy a piece of land, to be set apart for the public playground; and should look upon the necessity of this as being nearly as urgent as good drainage. London spreads at a nearly equal ratio annually. By a little foresight, land could be secured cheaply for this purpose in

spots over which buildings at this rate must come.

Take, for instance, Forest Hill, or Sydenham, or Croydon: all the land is being rapidly turned into streets; in a few years there will cease to be the country. Then the better class will go further off, and the locality go down. Thus the householders or owners suffer, as well as the inhabitants; and the question is, would it not pay in the long run for all to be made to join in providing open spaces where a mother could send her children to play out of harm's way, and all classes could play in the evening at cricket, quoits, &c.? I know it would; but I suppose it is the old story, "Everybody's business is nobody's."

Again, what objection can there be in turning the City churchyards into playgrounds? Also those parts of underground railways which must be covered over, yet cannot be built on?

The good influences arising from such a measure are too many to be compressed into a note like this, and will at once suggest themselves to your readers.

J. P. WATERSON.

#### SCHOOLS OF ART.

The *Stowbridge School*.—The annual meeting of this school was held at the school, Lord Lyttelton, lord-lieutenant of the county, presiding. For two days prior to the meeting there was a public exhibition of works of students. A considerable quantity of engraved glass was shown. The Chairman, in opening the proceedings of the meeting, said, that having read the report of the council, and the report of the head-master to the council, he was glad to find that the prospects of the school were steadily improving. In a district like that, it was obvious that the arts of design and drawing must be of much greater importance than they were in many other districts. In the glass-works, the iron-works, and hardware-works of various kinds carried on in that neighbourhood, they were of more importance than perhaps they were in any other. There had been a steady increase in the attendance of the students, and in the distinctions attained in the school, ever since it was opened; and, relatively, this year was better than any previous year. The report stated that the number of students had, in every year since 1857, maintained a steady increase, rising from 89 to 113 in the past. The report then went on to state, that if forty students could be added to the number attending, the school would be in a position of freedom from all the disturbing financial influence of the last three years. There is a mortgage debt of £400, upon the building.

#### ARBITRATION IN THE BUILDING TRADE AT WOLVERHAMPTON.

The first dispute in Wolverhampton since the new rules between the master builders and the carpenters were framed was amicably settled by arbitration. The builder who has the contract for erecting the new circus, a temporary timber building in Darlington-street, employed some of his men part of the day in the workshop and the other part upon the circus, which both parties agreed was an unprotected building. By rule 1, it is provided that "men working on unprotected buildings shall be paid one halfpenny per hour additional (to the 5*d.*) for six weeks before and six weeks after Christmas Day." By rule 5, "the shops and works shall be open from six o'clock in the morning till half-past five o'clock in the evening, for the first five working-days of the week, . . . allowing one hour and a half per day for meals; but from six weeks before till six weeks after Christmas Day, workmen on unprotected buildings shall work from seven o'clock in the morning till five o'clock in the evening on the first five working-days of the week . . . with one hour per day allowed for meals." The men were dissatisfied with the construction put upon these rules by their masters, and called for an arbitration under rule 1. The umpire, Mr. Rupert Kettle, appointed Monday last, at the Swan Hotel, at seven o'clock, for the arbitration meeting, and our reporter was admitted. The whole of the delegates from the masters and the men, under rule 1 (six of each), were present, and also the masters and two delegates appointed by the men from the establishment in which the dispute had arisen.

Both sides having stated their case, the umpire decided in favour of the men.

ARCHITECTS' CHARGES.

Sir,—Before noticing Mr. Tarbuck's remarkable discovery, will you allow me to correct one mis-statement in your article of the 9th inst. I wrote in your columns "contending that the architect should charge, not according to the expenditure, and the trust implied by such expenditure; and "not according to the market value, which respects other matters (even a "Paradise Lost," &c.)." Now, I certainly derided the former proposition,—the more you trust me the more I will charge; but that I say about market value? Your readers can see, p. 729, "G. W." wrote the next week, p. 831, that in America he simply made every job a matter of special bargain, i. e., of market value; to which I replied, p. 832, that I saw "no great objection" to his method, meaning (as the context will show), no objection *as far as it went*; but it was deficient, in not providing for artistic variation of details; accordingly, in giving him my method (for which he asked), I added, that every varying detail I simply made (as he made the whole job) a matter of market value. Well, then, who contends against market value, or who has accepted it—I, or Mr. Tarbuck?

Now for his notable discovery, that "area of flooring" is "another phrase conveying virtually the same meaning" as outlay. It seems to me, that should Mr. Tarbuck have a customer who sees the *Builder*, that customer may find some practical use in the discovery. Observe, that Mr. T. says "universally accepted rules govern all" architects' fees; consequently, what those rules are, or would have been, in Mr. Tarbuck's case, would be regular also for Mr. Tarbuck in that case. Now, we have been told, in Capt. Fowke's obituary, last week, of a defunct, covering forty squares, and costing 200*l.*, for which, therefore, by the rates of the Medes and Persians, a F.R.I.B.A. should have received exactly 5*l.* Mr. Tarbuck, I suppose, will not deny that. But he also tells us it is a "synonym of equivocation" "to suppose my rule really different from his. It conveys "virtually the same meaning,"—so that it cannot matter which is applied. Well, then, let the customer apply his rule, and let the architect apply Mr. Tarbuck's. The latter would have been 2*6d.* per square, let 2*5d.* for each square of flooring in Mr. Tarbuck's building he paid him. If this goes for more, as the custom of architects, as proposed by the late Capt. Fowke, is the plaintiff's own printed letter be producible, to show that according to himself, this rule "amounts to such," and has "virtually the same meaning" as outlay, I am at a loss to know what to say.

P.S. "Honestas" must be, indeed, a disinterested looker-on, to fancy he can separate the question of an architect's payment from that of "his position, whether he is the architect's partner or servant," or of the building owner's. What on earth does "Honestas" suppose can make or define which he is, but his basis of payment? If his fee is proportional to, and reckoned from, the builder's receipts, then he is the builder's partner, the servant of none else, and none else ought to pay him. It is this proportionality which constitutes partnership, and even in the case of the law, I question if it matters a straw by whom the architect's partner or servant, or of the building owner, a talismanic virtue or vice imparted to the coin by its last bandler? If I took per-centage at all, I should always take it from the contractor who pays it willingly, instead of direct from the building-owner, who, unless a fool, will always grudge it. But if you can get it, like engineers, from all sides, and all parties concerned, that is another matter. If public companies bargain to pay their architects, not in shares (and those made untransferable), but in hard money, and that a percentage on the outlay; and if they or any one let their architects choose their partners for them; and if poor animals without understanding, an apostle says, are "made to be taken and destroyed"; pray what will any one tell me such companies or owners are made for, but to be fleeced? Let "Honestas" consider whether they and their cash be not best apart, and whether whoever helps effect that separation be not a public benefactor. E. L. G.

STRENGTH OF TIMBER BEAMS.

PERMIT me to offer many thanks to Mr. Tarn for his attention to my inquiry; but I am not satisfied with his reply. Allow me to state my reasons?

Barlow, as I premise, puts a straightforward deduction apparently without a reservation. But Mr. Tarn says,— "From the very nature of the investigation, experiment is out of the question, for the formula is deduced on the hypothesis of the deflexion being very small. If we get beyond very small deflexions, the formula ceases to be of any practical value, the object really being to ascertain what weight may be laid on a beam without producing any perceptible deflexion, which is the practical question."

Mr. Tarn thus assumes, first, that the deflexion mentioned in Barlow's statement is very small; and, secondly, that the inquiry is after an imperceptible deflexion. But is this Barlow's inquiry? Mr. Tarn also assumes that Fenwick has explained the matter by the formula, in his reply. But how did that author arrive at them? By copying the altered edition of Barlow's work of 1851? Fenwick's formula is the same in proportion, 1-16, as stated in that edition. But from whence derived are the figures 3 and 38 adopted in the formula? Obtaining this information may probably decide which of the two authors is correct.

Fenwick, fortunately, puts a case in point.— "A bar of elm, 10 in. square, projects 10 ft. from a building in which it is firmly fixed; find the greatest amount of deflexion which it would

sustain by suspending a weight of  $\frac{1}{2}$  of a ton from the extremity, the modulus of elasticity being taken at 700,000." From his formula, Fenwick gives the "answer, 1-65 in." Surely  $\frac{1}{16}$  in. thus obtained in a length of 10 ft. is a sufficiently appreciable deflexion to be found by experiment.

My question is, in fact, this:—If in the above case the deflexion is 1-65, will the deflexion of a similar sized beam, double the length, supported at both ends, and carrying  $\frac{1}{2}$  ton in the centre, be 1-65 or 825? Surely even  $\frac{1}{2}$  of an inch in 20 ft. is an appreciable deflexion to be found by experiment. Has it been tried?

There are several points in connection with Mr. Tarn's reply, to which I should have been glad to advert, but they would have led me astray from the subject of inquiry.

A STUDENT.

A NOBLE FOUNDATION, AND POOR ALMSHOUSES.

Sir,—Her Grace the Duchess Dowager of Leeds is now instituting an asylum and place of education for 100 boys and 100 girls, at a total outlay, including buildings, doubtless much minor here to endowments, of 70,000*l.* "May she show us the best" in this world, with hope beyond; and her memory

"Smell sweet, and blossom in the dust!"

About the "poorest almshouses in England" now are believed to be those ostensibly founded by the Russell family at Woburn, Beds; actually, however, "founded in exchange" for charity and town lands, partly given by Sir Francis Staunton, a native, early in the seventeenth century. The same rather singular plan of "charity by exchange" appears to exist at Tavistock. At Woburn, twelve poor folks had, about 100 years ago, per contract at the time, is, a week only each, which has never been increased, although the subject has not been mentioned by the press, nor certainly absent from the thoughts of inhabitants or visitors. These distressed persons, some of whom have "seen better days," are so poor that sometimes, but for the charity of a neighbour, they have had to "dine" off three or four potatoes,—of course, washed down with water. They have no other privilege than the solitary sabbling over the other poor; and, of course, the inmate is obliged to eke out their alms-money with some small allowance, actually to keep them alive.

In justice, however, to that county, it may be mentioned that there are honourable neighbouring contrasts at Dimetstap, Ampthill, and Leighton. At the latter, eight almshouses, founded about 250 years ago by a commoner, Matthew Wilkes, who also "augmented the poor viageage," have, now, from increased revenue, 8*s.* a week each besides some fuel and clothing. Might not a powerful wealthy family, or some plying stranger, help some, at least, of "the poorest almshouses in England?"

OUTRAGED.

SOANE'S SARCOPHAGUS.\*

THE history of the discovery of this sarcophagus in 1815, by Belzoni, the traveller, is well known. The entrance to the splendid tomb, in the Valley of Kings' Tombs, at Thebes, which contained it, lay covered up under 13 ft. of rubbish in the very bed of a water-course. And yet that tomb appeared to have before been broken into and rifled. The tomb, with its corridors, halls, staircases, pits, cells, and other excavations, was cut entirely out of the limestone rock. The greater portion of it lay beyond a pit or well, 30 ft. deep, right in the way, and all had been closed up by masonry on the farther side of the pit. Nevertheless, some former intruder seemed to have broken through the masonry a hole less than a yard square, through which he had passed, after descending and ascending the walls of the pit by rope-ladders, the remains of which were found by Belzoni. The descent proceeded in different gradients, more or less steep, with staircases and pillared halls on the way, leading farther to a splendid double hall, with columns and a vaulted roof, under which stood the sarcophagus. The lid had been violently opened and broken to pieces, and no vestiges of a body were found in it. Out of the last hall six passages led to smaller rooms. In some of these wooden statues were found, and in one the mummy of an apsis, or sacred bull, and innumerable fetish-like small wooden and clay figures of mummy shape. The total length of the passages is 320 ft. and their perpendicular depth 180 ft. From the floor, beneath where the sarcophagus stood, descends another staircase, 300 ft. in length, but so blocked up with rubbish that it has never been explored to the end: so that here may be more mysteries which some day may be cleared up. The body of the king itself may here be found, after all, since no vestige of mummy-case or body existed in the

sarcophagus; and the original riflers of the tomb may have only explored it for valuables of another description. It would even be in accordance with the cunningly-devised schemes of the ancient Egyptians, to secure the eternal repose of their mummied kings, if the whole idea of an already rifled tomb, an empty sarcophagus, and a rubbish-choked final excavation, were an ancient "sell," to secure the extreme end of the tomb from exploration.

The sarcophagus is of translucent alabaster. It was formed of two parts,—the kist and its lid. The material was probably dug out of the quarries at Alabastron, a town on the east side of the Nile. The lid was found broken into numerous pieces, of which there are seventeen in the museum. It was a hollowed block itself, and added 15 in. to the chest when laid on it. The form of the whole is shaped slightly to the form of a human body, or rather of a mummy-case for holding the body; and it is thought that the two solid blocks were first laid one upon the other, and out outside to the required form, and afterwards hollowed within. The whole, inside and out, is sculptured with the well-known hieroglyphics and symbols of Egypt, the principal of these being the form of the king on the outside of the cover, and that of the Queen of Heaven, or Neith, on the floor of the interior of the kist itself.

A small round cavity near the back of the head of the goddess Neith, at the bottom of the chest, betrays the manner in which the mason worked. It is about the sixteenth of an inch deep and seven-eighths of an inch in diameter. It was made by a drill, but made unfortunately rather deeper than it should have been. The reason, having cut the outside of the block to its proper size and shape, would seem to have drilled a number of holes downwards, into the body of the stone, to a given depth, and thus he may have lessened the risk of splitting the alabaster with his chisel. Had he attempted to hollow out the sarcophagus with no other tool than chisel and mallet, the danger of splitting the stone would have been very great. The foot or end of the chest is perfectly flat, having been cut by a saw; and at the lower part of the end there are the traces of the fracture, the rough portions left when the other piece of stone broke away, called by the masons "the saw-break."

The stone is so far brittle that it must have required no little skill for the makers to place the heavy lid upon the chest without injury to the edges. To guard against such an accident they would seem to have shielded the edges of both chest and lid with a thin plate of copper.

In the volume under notice, Mr. Bonomi gives, with his careful pencil, a most minute idea of this far-famed sarcophagus. The plates, eight in number, present a complete face-simile of the profusion of sculptures on it, outside and in; and there is a formal letter-press description of every plate according to the views of Mr. Samuel Sharpe, who has certainly shed some special light of his own upon the mysterious subject of Egyptian sculptures; but into this we cannot here enter, although much might be said both *pro* and *con*. in reference to these views.

SCHOOL-BUILDING NEWS.

Shetleston.—On the evening of the 24th ult., a *soirée* was held, on the occasion of the opening of the new subscription schools here, at which nearly 250 persons were present. The chair was occupied by Colonel Garrick Buchanan, of Drumpellier. Due praise was awarded to the architects, Messrs. G. P. Kennedy & Dalglisb, Glasgow, for the work. The Rev. Mr. Johnston and other gentlemen afterwards addressed the meeting.

Huddersfield.—The Lindley National Schools, near Huddersfield, with detached schoolmaster's house, built of the native stone, with outside, are now completed. The schools contain a boys' room, 63 ft. by 20 ft.; girls' room, 65 ft. by 20 ft.; infants' room, 23 ft. by 20 ft.; and class-room, 18 ft. by 17 ft.; all 16 ft. high to the ceiling; with all necessary appurtenances. The house has the usual accommodation. The design is Geometrical, and one of the gables has a pierced bell-turret, with buttress. The cost of the buildings, including boundary walls, beating apparatus, &c., was 1,360*l.* Mr. James N. Crofts, of Liverpool, was the architect.

Hatfield (Lincolnshire).—About two years ago, the school and chapel building being very much out of repair and insufficient to accommodate the increased number of scholars, the trustees determined to add a new school and classroom to the old building, and to re-fit the latter and appropriate it exclusively as a place for divine worship. The whole of this programme has now been completely carried out. Sufficient

\* The Alabaster Sarcophagus of Omenophth I., King of Egypt. Now in Sir John Soane's Museum, Lincoln's-inn-fields. Drawn by Joseph Bonomi, and described by Samuel Sharpe. London: Longmans & Co.

\* This is not exactly correct: no per-centage is fixed by the published scale for buildings costing that amount.

school-room has been provided, and the old part—of which the most prominent features externally consisted of a pantile roof and pointed wood arches, and internally of two or three square pews, a crowded assortment of backed school forms and desks, a pair of globes on the altar-table, an ugly loft, and a brick floor—has been transformed into a church. The old tower, which shows signs of having been erected in the twelfth century, has been dignified by a parapet, and the tower arch repaired and opened out. The whole of the new work is of the Geometric period of Gothic architecture, and has been done under the superintendence of Mr. Drury, architect; the school part by Mr. Barker, of Lincoln; and the chapel part by Mr. Lovelec, of Branston. Mr. C. Seely will give a stained-glass window at the east end in memory of his mother.

#### WEEKLY TENANTS AND RAILWAY COMPANIES.

##### THE RAILWAY EVICTIONS IN SOMERS TOWN.

JUDGMENT affecting the weekly tenants removed by the Midland Railway Extension from Somers Town was given in the Bloomsbury County Court, December 15.

Mr. Merriman (of the firm of Merriman & Buckland, No. 33, Poultry) appeared for numerous poor people, the plaintiffs in equity and the defendants in ejectment; Mr. T. C. Jarvis (instructed by Messrs. Walters & Gush, of Basinghall-street) represented the defendants in equity and the plaintiffs in ejectment.

The case had been before the Court three times, and involved many intricate points of equity and law which may be thus summarised.—It was admitted on both sides that the law gives no compensation to weekly tenants, but Mr. Merriman contended an equitable interest had been created by the transactions between the landlords (Mills and Perry), and the Midland Railway Company. These persons (plaintiffs in ejectment), contracted with the company to sell their large property in St. Pancras for 19,500*l.*; but subsequently, by a letter produced, offered to clear the people out for a further sum of 2900*l.* This latter offer the company accepted for reasons given in the evidence of Mr. Besle, their solicitor, who stated "that if he had not so arranged with the plaintiffs in ejectment he would have given their tenants small sums by way of gratuity." Upon this evidence Mr. Merriman, who quoted a number of authorities, contended that an implied or constructive trust in the 2900*l.* had been created in favour of the persons whom it was sought to turn out of their homes and shops, for which many of them had paid premiums and expended money in fixtures and improvements. He therefore prayed an injunction under the "New Equitable Jurisdiction" of the Court to restrain its own legal process until the hearing of his suit in equity, on the 16th of January next. On behalf of the plaintiffs in ejectment, Mr. Jarvis contended that the 2900*l.* was a payment for the services of his clients to the company, and that the tenants had no right or title to any part of the money.

The Judge, Mr. Russell, having taken time to consider the matter, gave judgment on Wednesday last on the equities of the case. He said he must dismiss the petition for an injunction, but at the same time he felt the hardship of the tenants' case, and expressed his regret at the decision he was compelled to arrive at.

#### CHURCH-BUILDING NEWS.

**Arlwick.**—The parish church of St. Thomas, Ardwick, has been re-opened, after having been closed for alterations about four months ago. The entrance chiefly used was at the eastern end, close to the altar rails, which were high and uncomfortable. These and other evils have been remedied, and improvements effected. New passages for access to the seats have been formed, and the new seats have been constructed almost entirely out of the old materials. In doing this it was discovered that the greater part of the flooring-boards, and also the joists which carried the floor, were so decayed as to make it wonderful how it contrived to support the Sunday's congregation. A new vestry for choristers has been built, and that for the clergy enlarged. The organ has been brought down from the west gallery to the south-east corner of the church, to be near the choir. The western gallery, which had been added to at different times, has been reduced to more moderate dimensions, and fitted with seats for the school children. In doing this it was found that the pillars that should support the gallery had given way, and that in all probability within a few months the west gallery must have fallen. Besides this re-arrangement and re-fitting, the church has been painted and decorated throughout. The builder employed was Mr. Wm. Clark; the painters, Messrs. Ward & Harwood; and the architect who designed and superintended the alterations was Mr. J. Medland Taylor.

**Aylesbury.**—The ceremony of consecrating the new chancel which has recently been added to Walton church was performed on the 5th instant, by the Bishop of Oxford. The character of the building is designed for utility rather than for architectural display. The work has been carried out by Mr. D. Brandon, of Berkeley-square, architect; and the builder is Mr. G. Cooper, Aylesbury. The new chancel is 25 ft. long, and is built of flint and brick. The form of the windows is Early English, with plain chamfered mouldings. The east window is filled with painted glass, in Early English style. A vestry and chancel aisles have been added, the north aisle being appropriated to the organ, while the south aisle is made available for additional sittings, to the number of about forty, besides additional seats for ten choristers. The original contract was for 277*l.*, to which some extras must be added.

**Idle-hill.**—The newly-erected church, in the parish of Idle-hill, has been consecrated by the Archbishop of Canterbury. The church is in the Geometrical style, with an open roof, supported by six arched principals, and consists of nave with north porch, chancel with recessed arch for organ, two small transepts, vestry on south side, and tower on north, 60 ft. high, surmounted by an oak-shingled spire of 30 ft. more. There are in all eight stained-glass windows;—the east windows and two small side lights presented by the representatives of Bishop Porteus; the west window, presented by the Dowager Lady Rycroft, in memory of her husband, the late Sir Richard Rycroft, and their youngest son; three on the south side, comprising one by the Rev. J. Woodhouse; a second in commemoration of the day (St. Andrew's); and the third by Mrs. Woodhouse, in memory of her mother, Mrs. Osenden. There is also one on the north side, by the Rev. J. Woodhouse and Sir Nelson Rycroft, jointly, in memory of the bishop. The church has also received much internal decoration. The builder was Mr. J. Kirk, of Woolwich. The architect was Mr. Charles H. Cooke, of London.

**Weybread (Suffolk).**—The church here has been re-opened. The edifice had been disfigured by pews. These have now been replaced by oak benches, restored from poppyheads on some of the old pews. The west gallery is also cleared away; so that the whole of the nave is now seen to the best effect, and the entire length of the church is increased, and several of the windows have been restored. The roof of the nave is entirely new; it is of deal, stained and varnished. The ribs are continued down the walls through a cornice, and are finished with corbel heads of stone. Those next the chancel represent St. Peter and St. Paul, and the others the minor prophets. These heads were executed by Mr. Barrett, of Norwich. The roofs of the aisles are of oak, and during the recent alterations they have been entirely restored and re-loaded, and all the windows are now glazed with cathedral glass. The chancel roof has also been restored and re-loaded, and three new windows have been inserted. These windows are in the Decorated style, and the east window will be filled with stained glass, by Messrs. O'Connor. A new vestry has been erected on the north side of the chancel, and immediately contiguous to it an organ chamber, which opens upon the north aisle by a pointed arch, and upon the chancel by another, somewhat smaller. The latter is fitted with a carved oak screen, in the Decorated style, by Mr. Cornish, of North Walsham. The pulpit and reading-desk are of carved oak. The organ chamber is occupied by one of Messrs. Bovington's organs in a Gothic screen case of deal, stained and varnished. The church is now entirely floored with tiles except the benches, which are boarded and raised a few inches from the floor. The building is warmed by Gidney's apparatus, placed beneath the floor in the centre of the nave, and the chimney shaft is carried up inside the tower. The font is not yet fixed, but a new stone one is in course of preparation by Mr. Vine, of Eye. The works have all been carried out by Mr. R. M. Phipson, of Ipswich and Norwich, architect. The benches, the roof, and the general work were contracted for by Messrs. Botwright & Grimwood, of Bungay and Weybread. The carving of the benches was done by Mr. Stopler, of Ipswich. The total amount expended in these works was about 1,500*l.*

**Great Hautbois.**—The church has been lately decorated by Mr. Huggins, of Norwich, at the expense of the rector, who has already contributed largely to the building of the fabric. The commandments have been written on the east end,

while the space below them has been filled with stained work of different patterns. The roof, both of the nave and chancel, has been painted, and the panels of both decorated with gilt stars. Several texts are inscribed on the walls. Five stained-glass windows have been put in by the rector's friends, and another is about to be ordered of Messrs. J. & J. King, of Norwich, for the south chancel window, similar to one lately put in by them at the west end of the south aisle, in memory of a late parishioner.

#### STAINED GLASS.

**Worcester Cathedral.**—The memorial of their deceased "brother," Mr. Joseph Bennett, erected at the cost of the Freemasons of this city and county, in the north-eastern part of the nave of Worcester Cathedral, by permission of the dean and chapter, has been placed *in situ*. The artists were Messrs. Lavers & Barrand, of London. The window is one of three lights, with geometrical tracery in the head. The base is composed of three panels, representing Masonic emblems of different degrees. Above the emblems the principal portion of the lights is occupied by figures, representing Faith, Hope, and Charity, under canopies, with the legends "Fides," "Spes," "Caritas;" and in the heads of these lights are small groups of the Nativity, Crucifixion, and Resurrection of our Lord. The connexion between these subjects and the principal figures is understood to be,—Faith in the coming of Christ to redeem mankind; Hope in the sacrifice upon the cross; and Love for Him "who is risen from the dead, and ever lives to make intercession for us." The tracery lights are occupied by a figure of our Lord in glory, surrounded by the four beasts, emblematic of the four evangelists, and by the Heavenly Host.

**St. Mary's, Reading.**—The stained-glass east window in this church, by Messrs. Clayton & Bell, has been completed. There are six lights filled with stained glass. The subjects depicted are numerous; comprising, on the north side, the Annunciation—Salutation—Nativity—Flight—Christ found in the Temple—the Miracle at the Marriage Feast—and medallions of SS. Peter, Andrew, Simon, John, Philip, Jude, James, Barnabas, and Matthew. On the south: the Woman a Sinner—the Issue of Blood—the Woman of Canaan—Martha and Mary—Bearing the Cross—Mary Magdalene—and medallions of SS. James the Less, Thomas, Matthias, Mark, Paul, Luke, Stephen, Bartholomew, and Timothy.

#### DISSENTING CHURCH-BUILDING NEWS.

**Peasley-cross, St. Helen's.**—The new Congregational Church just erected at Peasley-cross, St. Helen's, has been opened for divine service. The site of the building is at the junction of the present highway and a proposed new street almost adjoining Peasley-cross railway-bridge. The edifice is built entirely of stone, the walling-stones or parapets being from Rainford Quarry, and the ashlar dressings and more ornamental portions from Rainhill Quarry. The structure, which comprises a nave and aisle, with porch and tower and spire, is in the Middle Pointed style. It is of an ornamental character, broken up by a clerestory and by buttresses, ashlar bands, and the tower and spire, diapered and carved. The front gable is pierced by a five-light window, nearly 25 ft. high, the upper portion of which is filled with tracery. This window will light the children's end gallery, and the sittings below will be lighted by a triplet window, which extends to the width of the five-light window above. The entrances are by the tower and porch, with separate porch entrance attached to the tower to the children's gallery. The doorways are deeply splayed, and of large size, with moulded labels and carved bosses. The clerestory is carried on polished red granite columns, with carved caps of Caen stone. At the end of the nave is the communion place and chancel. The chancel is a semi-octagon, with groined plaster ceiling, coloured blue, recessed. On either side of this are vestries, convocations, and room for preparing hot water; and below the latter is the boiler-house for heating the building. The roof from the inside presents a somewhat semicircular appearance, with divisions for cusplings, which form a ceiling about two-thirds the height of the principals. Stained glass has

been introduced into the clerestory and the east and west windows from the manufactory of Messrs. Pickington, of St. Helen's. The accommodation is for 600 adults and 150 children. The contract has been completed by Mr. William Harrison, of St. Helen's, for between 3,000, and 4,000. Mr. Thomas Oliver, of Newcastle-on-Tyne, was the architect.

**Woolton (Liverpool).—**The Congregationalists of Woolton and the neighbourhood have succeeded in erecting a chapel, the formal opening of which has taken place. The building is of a plain character, and was designed by Messrs. Hay, of Liverpool, architects. It is in the Gothic style, has a small belfry, and in its construction red sandstone has been employed. The internal arrangements are also plain. There is a light open roof of imitation oak. At one end of the building, and contiguous to the entrance, a small gallery has been erected for the choir, whilst at the opposite end is the communion-table, the body of the chapel being divided by two aisles, upon either side of which are ranged the pews, of imitation oak. Lancet windows, of modern dimensions, admit light into the building; over the gallery is a circular window, and at the other end are two windows of stained glass. A pulpit, of Caen stone, forms perhaps the sole attempt at internal ornamentation. It is hexagonal in form, rests upon a series of small pillars, the sides being ornamented with carvings descriptive of Scriptural subjects. The pulpit which, with the fittings, cost 70*l.*, was presented by Mr. Alison. A bell for the belfry was also given by Mrs. Alison. The building, which is intended to accommodate about 420 persons, has been erected at a cost of about 3,200*l.*, the whole of which has been raised, with the exception of about 800*l.* The chapel will, for the present, be in direct connexion with Wavertree Congregational Chapel.

### Books Received.

*"The Life of Man, symbolised by the Months of the Year, in a Series of Illustrations."* By JOHN LEIGHTON, F.S.A. With Passages selected from Ancient and Modern Writers, by RICHARD PIGER. Longmans, Green, & Co., Paternoster-row, 1866.

SOME of our readers will remember, as having been exhibited, the dozen larger drawings with which Mr. John Leighton sets forth, with much thoughtfulness and skill, the life of man and the progress of a tree; but still they will have no notion of the book in which, carefully engraved, they now appear. Extracts from 300 authors, maxims, proverbs, initial letters, and a world of small illustrations, fill 238 quarto pages of fine paper, the whole beautifully printed and elegantly bound. The smaller illustrations cannot be fully appreciated without a magnifying-glass, so full of quips and cranks, quaintnesses and inventions, are they. The selections from the poets are admirably made, and will never tire. When Mr. Leighton says, as he does, quoting Caxton at starting,—"This Booke is not for every rude and uncomynge man to see, but for clerkes and very gentylmen that understande gentyltye and scyence," he does it injustice; for there is something in it to suit all moods, conditions, and minds. An unlucky slip of grammar in the last line of the dedication (to Lord Houghton), "are" for *is*, should be remedied in any unbound copies by a substitute leaf: the book is worth it, and the blot is so ugly.

*Scenes from "The Winter's Tale."* Illustrators, OWEN JONES and HENRY WARREN. Day & Son, London.

MESSRS. OWEN JONES and Henry Warren have coalesced to produce a handsome bookful of illustrations of "The Winter's Tale," something after the manner of the antique vases, with the words illustrated on the opposite page on a gold ground, and all surrounded with pattern borders exceedingly diverse, and in some cases very beautiful. For our part, we get more pleasure from the last page, with its simple markings of red, blue, and gold, telling the names of the illuminators, and that the designs were drawn on stone by Mr. A. Warren, than from the more elaborate productions. That page being perfect so far as it goes. Not only, however, for the publishers, there is an illumination-loving public that thinks differently, and to that we commend the volume. The binding is very elegant, as all that Mr. Owen Jones does in this way is.

*"An Alphabet of Monograms."* Designed and engraved by HENRY LILLIE. London: Day & Son.

At the present moment, when a rage for monograms prevails, this little volume will doubtless be found of service by die-engravers, silver-smiths, and others. It runs through the alphabet, each page giving a single letter with a dozen combinations. Some are very ingenious, and others, almost as a matter of course, are less easily decipherable than is desirable.

### Miscellaneous.

**METROPOLITAN SANITARY ASSOCIATION.**—We have before us a full report of the proceedings at the first Conference of this Association, but are forced to delay dealing with it.

**FRENCH ARCHITECTURAL WORKS.**—Messrs. Cassell, Petter, & Co. have on view a large collection of foreign architectural works, to which we think it useful to direct our readers' early attention.

**THE INSTITUTION OF ENGINEERS IN SCOTLAND.** At a meeting in the Hall, George-street, on Wednesday, the 20th of December, Professor Rankine's paper, on "The Tenacity of some Fibrous Substances," was discussed; and a paper on "The Construction of Iron Vessels," by Mr. James Lally, jun., Sunderland, was read; with others. Endeavours we would willingly help are being made to increase the number of members.

**THE THACKERAY AND LEITCH MEMORIALS.**—On Monday were erected in the corridor leading to the chapel of Charter House, two tablets, appropriately placed side by side, to the memory of two distinguished old Cartusians—William Makepeace Thackeray and John Leech. The *City Press* says,—"They are plain stone tablets let into the wall, and bear Latin inscriptions, of which the following may be given as translations:—"To William Makepeace Thackeray, a Cartusian, Cartusians have had this monument erected. He was born 1811, died 1863, was a scholar 1822 to 1827." "To John Leech, a Cartusian, Cartusians have had this monument erected. He was born 1817, died 1864, was a scholar 1825 to 1832."

**DAMAGE TO THE WOLF ROCK LIGHTHOUSE.**—The Wolf Rock Lighthouse, says the *Cornish Telegraph*, is built up as far as four courses of granite blocks will raise it; but these four only just elevate the structure above the natural hollow, somewhat enlarged by blasting and quarrying, in the rock itself. Thirty-two stones of the fifth course were laid, every stone joggled and dovetailed to its neighbours, laterally and vertically, secured in its place by cement as hard as iron, and bolted to the course below by powerful metal bars. This fifth course was just a little ledge, which offered some opposition to the sea, in addition to the rock itself. The sea, moved to fury by the recent gales, has swept away every stone of the fifth course, and in a day the summer's work of sixty men is undone. This labour of one favourable season is valued at 1,500*l.* Every exertion is being made by the Trinity workmen, to repair the damage with the least delay.

**THE PRINCE CONSORT'S MAUSOLEUM.**—At the late anniversary of the lamented Prince's death, part of the mausoleum was shown. Since the last anniversary some progress has been made with the internal decorations, but the greater part of this was concealed from the gaze of the visitors, portions of the hoarding being still up. In one of the recesses or chapels abutting upon the central chamber seen, the arched ceiling is decorated with a painted picture of Christ bearing the Cross, while two of the side panels are ornamented with sculptured bas-reliefs of white marble, the subjects being the "Expulsion of Adam and Eve," and "Moses lifting up the Serpent in the Wilderness." From the ceiling depends a brass chandelier, with several lamps attached to it. The other recesses are, it is said, also in a forward state. The ceiling of the dome (which is lighted by windows) is of a blue colour powdered with gold stars, the centre being occupied by an ornament. The marble floor beneath the centre of the dome has yet to be finished, and till this is completed the granite sarcophagus cannot be used for the reception of the Prince's remains. The builder engaged on this structure is Mr. Dines.

**ABERYSTWYTH SEA WALL.**—At a special meeting of the town commissioners, held recently it was determined to carry out Messrs. Gotto & Beesley's plan for the proposed new sea wall and terrace. The work is to commence at the new promenade pier, and following the general curved line of the Marine Parade wall, terminate at the existing wall, opposite Terrace-road.

**BELLS FOR ST. MARTIN'S, KENTISH-TOWN.**—A peal of six bells has been set up by Messrs. John Warner & Sons, at the new church of St. Martin's, Kentish-town. The tenor bell is 40*l.* in diameter, note G. Weight of the whole peal, 49 cwt. 3 qrs. 4*lb.* The bells bear the following inscriptions:—1. "Time flies." 2. "I call to prayer." 3. "I call to praise." 4. "Live to God's glory." 5. "Let all be thankful." 6. "John D. Allcroft gave us." The same firm has recast the celebrated "Sherborne Bell," presented by Cardinal Wolsey. The weight is 2 tons 6 cwt.

**DEATH FROM GAS POISONING.**—The coroner for the City and Southwark has held an inquiry relative to the death of a woman who, it was alleged, had lost her life in consequence of a quantity of gas having permeated the earth underneath her dwelling-house. The jury returned the following special verdict:—"That the deceased lost her life in consequence of an escape of gas from one of the mains of the Phoenix Gas Company, and the said death was accidental; but the jurors further say that the work of laying the main from which gas escaped was negligently done, and without sufficient intelligent supervision."

**THE LEATHER-LANE DISTRICT, HOLBORN.**—Dr. Gibbon, medical officer of health, has examined the houses in Dove-court, Leather-lane, where there have been some cases of fever. He states that those on the north side, viz., 1, 2, 3, and 4, are in a dirty state; Nos. 2 and 3 have their basements occupied in contravention of the law; No. 2 is overcrowded, in consequence of the basement being tenanted by seven persons. In four small rooms there are twenty persons. Dogs are kept in two of these houses, so as to be a nuisance, and injurious to health. Our readers will recollect our own revelations of this neighbourhood, not long ago.

**SANITARY STATE OF MARYLEBONE.**—The monthly report for November of Dr. Whitmore, the medical officer of health for the parish, says:—"The deaths in the parish during the four weeks of November amounted to 310; the consecutive weekly numbers being 61, 75, 96, and 75; showing an annual death-rate of 247 per 1,000 of the population. This return gives a slight increase upon the mortality of the previous month, but a decline of 40 as compared with the corresponding month of last year, and 10 deaths below the average of November for the past nine years. Amongst diseases of the miasmatic order, measles have been the most fatal; whilst, in the northern districts of the parish, sickness from the same disease appears to have been exceedingly prevalent. The mortality amongst infants and young children has been most excessive, and comprises upwards of one-third of the whole number of deaths. Diarrhoea, both in sickness and mortality, has considerably declined; and no single death from cholera or choleraic diarrhoea has been registered."

**WOOD.**—The British consul at Sarawak (Borneo), writes to the Foreign Office respecting the wood of that country as follows:—"A demand has lately been made by a house in Bombay for a cargo of timber. This, I believe, the first time the merchants of India have had recourse to this country for such produce. The Indian Railway Company would do well to look to Sarawak for the sleepers and various kinds of timber which they may happen to require for the furtherance of their works in India. It may be mentioned also that the 'bilian,' or iron wood found in this country, is perhaps the only wood which is impervious to the attacks of white ants: when immersed in either fresh or salt water it is never known to have decayed; indeed, though under water for many years, it remains as hard almost as stone. An engineer, who has resided here for the last five years, assures me he has never seen such a thing as a rotten piece of 'bilian wood.'" We have been glad to observe that a cargo of camphor-wood from Sarawak has been imported into Sunderland, and that it is a wood which, it is expected, will be of great value in shipbuilding, particularly for the keels and keelsons of vessels.

ARCHITECTURAL UNION COMPANY.—The dividend declared at the last general meeting was 4 per cent, free of income-tax, leaving a balance in hand of 140l. 7s. 10d.

THE BUILDING TRADES.—The masons in the Halifax district have commenced a movement to have the hours of labour reduced to fifty-two and a half per week.

LIFTING A BUILDING.—In Chicago, a building, 80 ft. by 160 ft., five stories high, and weighing 27,000 tons, has recently been raised 2 ft. from its original foundations. It was done by means of 1,580 screws, placed underneath the building and turned simultaneously. The work occupied three days.

THE FUTURE OF PECKHAM RYE.—The South London Chronicle says:—"The Camberwell vestry have endorsed the recommendation of their select committee, that 100 acres of land must be, if practicable, acquired for the extension of the area of Peckham Rye and its formation into a park. The situation, say the committee, is beautiful, and affords a panoramic view of about 30 miles; and it will form the finest site for a park in the metropolis."

THE RIGHT OF A GAS COMPANY TO CUT OFF THE SUPPLY OF GAS.—A case has been argued in the Baccp County Court, in which Mr. Richard H. Penny, auctioneer, sought to recover 2l. as damages from the Rosendale Gas Company, on account of their having, as alleged illegally, cut off his supply of gas. The company had claimed from the plaintiff 7s. 6d. for gas consumed by a former tenant, who happened to be his brother. The plaintiff declined to pay the bill, alleging that he was not liable, and the defendants ceased to supply him with gas.—His Honour (Mr. Greene) gave judgment for the plaintiff for 10s. and costs.

WHO SHALL BE THE ARCHITECT?—"An estimable fellow-townsmen," says a correspondent of the Banner of Ulster, "a member of the Established Church, recently deceased, left by his will the sum of 4,000l. to build a church in the neighbourhood of Belfast. His pastor, to whom he was greatly attached, has a son who is an architect, to whom the deceased gentleman stood in the relation of godfather, and he left it as a dying injunction that this young man should be employed to build the church, prov' d for in his will. He appointed several trustees, some laymen and some clergymen,—to whom his dying request respecting the employment of his pastor's son is well known; but it appears that, as one of the trustees is an architect, his co-trustees contemplate, or have really resolved, to disregard the express wish of the testator, and engage their co-trustee's services. . . . I understand the testator's god-son is a young gentleman of accomplished ability, and in all respects qualified to carry out creditably his god-father's wishes." Perhaps the trustees do not really contemplate the employment of their co-trustee. The testator's family, it appears, are particularly anxious his last wishes should be honourably carried out by the appointment of his god-son as architect.

CARPET ARCHITECTS.—A correspondent of the Society of Arts Journal, writing from Smyrna, says,—At this season the small carpet-makers of Ooshak, Koolab, Abiediz, &c., from the great Turkey carpet districts, come up to Smyrna to sell their year's produce of carpets, prayer-carpets, and rugs. One of these men having a rug with a well-balanced pattern, I tried to learn from him who was the designer; but, partly from suspicion, and partly because I could not lit upon the right word in Turkish, he held me at bay for some time, and said that the women of his family did it. At length, in the course of conversation, gaining his confidence more—for he was proud of having served with the English in the Crimea, and of having sent carpets to England—he told me that a dervish was the maker; that is, "architect." Of course I had tried every artistic word without thinking of this. Maker is not a bad word, for the style of and many of the carpets is that of the arabesque ornaments of the mosques and stained glass, having the characters of a school. I have never yet come across an ecclesiastical maker, but I have seen recent works of theirs in decoration which attest their living taste. I should like to learn more of this decorative school, which showed many interesting works of the Imperial Ottoman Exhibition in Constantinople in 1863.

EXPERIMENTS ON ROLLED IRON GIRDERS.—On the 19th inst. some experiments were performed on the Patent Solid Flange Girders, at Mr. Kirkaldy's testing works, Southwark, in the presence of a considerable number of persons, and will require further notice. Unfortunately want of care in the arrangement of the machinery led to much waste of time and patience.

THE SIR TATTON SYKES MEMORIAL.—The memorial erected to perpetuate the memory of the lato Sir Tatton Sykes, bart., on Garton-hill top, has just been completed, the top stone having been set a few days ago in the presence of Sir Tatton Sykes and several other members of the family of the deceased baronet. A view will be found in a previous number of the Builder.

CAB REGULATION IN PARIS.—All the Paris cabs are now provided with one of those instruments which show the distance travelled by the cab in the course of the day and the time occupied in each journey. The object of this instrument is to protect the cab company against fraud on the part of the cabmen; but if it works well it ought also to protect the public against extortion. Such instruments, however, were known years since in this country, but have never yet come to anything here. The one in Paris may be a new and improved one.

COMPENSATION CASE: THAMES EMBANKMENT. On Tuesday last, at the Sheriff's Court, Red Lion-square, a special jury assembled under the presidency of Mr. Under-Sheriff Burchell, in the case "Sant and Others v. The Metropolitan Board of Works," to assess the compensation to be given for property required for the Thames Embankment. Mr. Hawkins, Q.C., Mr. Lloyd, Mr. Prentice, and Mr. Mellor appeared in the case. The claim as made was 12,493l., and on a second notice from the Board of Works it was reduced to 10,048l. for the property and for the deprivation of a waterway. The claimants were the trustees under the will of Mr. James Sant, and the property was connected with wharfs along the river where the embankment was being formed. The property had been taken under the Thames Embankment Act, and the claimants demanded a special jury, under the Lands Clauses Act, to ascertain the sum to be given. There was no view of the property, and a settlement was effected without a long investigation. Under the direction of the Under-Sheriff, 9,237l. were awarded for the property, and 811l. for injuriously affecting the other property, making the verdict 10,048l.

For erection of public-house, Mostyn-road, Brixton, for Messrs. Smallman & Strong. Messrs. Hammack & Lambert, architects:—
Wood & Son ..... 2,378 0 0
Webb & Son ..... 2,600 0 0
Nixon ..... 2,175 0 0
Hedges ..... 2,457 0 0
Cook ..... 2,265 0 0
Newman & Mann (accepted) .. 2,250 0 0

For two warehouses, in Bernmoodey-street, Bernmoodey, for Mr. Richard Heald. Mr. Joseph Gale, architect:—
Sewell & Sons ..... 23,310 0 0
King & Sons ..... 3,192 0 0
Newman & Mann ..... 2,995 0 0
Hill & Son ..... 2,965 0 0
Wells ..... 2,920 0 0

For warehouse in Bernmoodey-street, Bernmoodey, for Mr. Cyrus Legg. Mr. Joseph Gale, architect:—
Sewell & Sons ..... 21,280 0 0
King & Son ..... 1,180 0 0
Hill & Son ..... 1,060 0 0
Newman & Mann ..... 1,225 0 0
Wells ..... 920 0 0

For taking down old buildings and erecting six new houses and stable buildings, in Montpelier-street, Brompton, for Mr. R. Lathbury. Mr. Isaac Bird, architect:—
Lawrence & Sons ..... 21,467 0 0
Brown ..... 4,295 0 0
Gammob ..... 4,213 0 0
Williams ..... 4,190 0 0
Newman & Mann ..... 4,105 0 0
Stenson ..... 3,965 0 0

For completing two semi-detached residences, at Forest-hill, for Mr. James Bell. Mr. H. F. Hooper, architect:—
Evans ..... 4,330 0 0
Rowley (accepted) ..... 320 0 0

For marine residences, Dover, for Messrs. Sutton & Potter. Mr. Rowland Rees, jun., architect. Quantities supplied:—
McKenzie ..... 25,530 10 6
Sims & Marten ..... 5,688 0 0
Stiff & Co. .... 4,746 0 0
Matthews ..... 4,500 0 0

For alterations and additions to a warehouse, in Silver-street, City. Mr. Herbert Ford, architect. Quantities by Mr. J. W. Dennison:—

Table with columns for contractor name, quantity, and allowance for old materials. Contractors include Sandon & Co., Patman & Fotheringham, Dove, Bros., Brown & Robinson, Myers & Sons, Bradley, Brass, Hill & Sons, Henshaw, Rawlins.

For the erection of a new warehouse, in Princess-street, West Hartlepool, for Mr. Matthew Rickinson. Mr. John Tilman, architect:—

Table with columns for contractor name, quantity, and allowance for old materials. Contractors include Hirst & Sons, Suggitt, Johnson, Wright, Tuke, Marshall, Stafford, Thompson, Tuke, White, Windross, Salmon, Wright, Excavator, Bricklayer's, Plasterer's, and Ironfounder's Work.

For the erection of a new lunatic asylum, adjoining the Union workhouse, Hylton-lane Eisleypwearmouth, Sunderland. Mr. John Tilman, architect:—

Table with columns for contractor name, quantity, and allowance for old materials. Contractors include Jackson, J. & E. Hirst, Riddell & Moir, Elliott & Harper, D. & J. Ranken, Marshall, Excavation, Drains, Roads, Masonry, Bricklaying, Plastering, &c., Hodgson, Stafford, Armtage, D. & J. Ranken, Preston, Dawber & Son, Plumber's, Guffitt's, and Ironfounder's Work, Tonkinson, Williams, Whitham, Bannett, Stifford, Wood.

For St. Peter's Schools, West Bromwich. Mr. Smallman Smith, architect. Quantities by Chadwick, Bros.:—

Table with columns for contractor name, quantity, and allowance for old materials. Contractors include Hartland, Cox, Thompson, Stonehewer, Stockton & Son, Yadin & Son, Barker, Fisher, Haflner (accepted).

Accepted, for the erection of a drapery establishment, in Gateshead. Mr. J. E. Watson, architect:—

Table with columns for contractor name, quantity, and allowance for old materials. Contractors include Kyle (masonry, including old materials), Sauderson (carpentry and iron-work), Haste (slating including old materials), Glaholm & Sons (plumbing, including old materials), Wilkinson & Co. (plastering), Firbank & Sons (painting and glazing).

Accepted, for enlarging Marlborough-green Chapel, Newcastle-on-Tyne. Mr. J. E. Watson, architect:—

Table with columns for contractor name, quantity, and allowance for old materials. Contractors include Kyle (whole of the work), Wood, Plowman, Donne (accepted).

For part of farm buildings, at Hendon, for Mr. J. H. Heal. Mr. E. Roberts, architect:—

Table with columns for contractor name, quantity, and allowance for old materials. Contractors include Sanders, Stevens (accepted).

For villa at Basset, Southampton, for Capt. P. M. Woolcott. Mr. Henry Hall, architect:—

Table with columns for contractor name, quantity, and allowance for old materials. Contractors include Sims & Marten, McKenzie, Stiff & Co., Matthews.

For sixteen cottages, for the Metropolitan Association for Improving the Dwellings of the Industrious Classes, upon their estate at Penge. Mr. Fred. Chancellor, architect:—

Table with columns for contractor name, quantity, and allowance for old materials. Contractor: Brown (accepted).

# The Builder.

VOL. XXIII.—No. 1195.

## The Surrey Theatre.

**B**URNED down: built up. Such are the two constantly recurring statements in the history of our theatres. The burning may be delayed, but come it does, for certain. The first theatre where now the Surrey stands, in the Blackfriars' road, was called The Royal Circus. Its projector and proprietor was Mr. Robert Hughes, with whom the elder Dibdin was afterwards associated. The old theatre and its appurtenances covered a considerable space of ground, extending to a lane at the rear—in after years the southern end of the Waterloo-road—and including the space on which the "Equestrian Tavern" to the south, and the

"Flowers of the Forest" to the north, now stand. To the right of the latter house were some large panelled carriage-gates, leading to the stables and riding-school of the Circus, that existed until within a few years, when they were replaced by iron-work. In an old engraved view of the spot is seen an inscription on the front of the house to the right hand, announcing "Hughes's Horsemanship by his Majesty's Guard." This house was the residence of the proprietor. The Circus, in its entertainments and character, was in rivalry with "The Amphitheatre," in the Westminster-road, then in the zenith of its prosperity under its founder, old Philip Astley, the ex-dragoon of William of Cumberland at Culloden. The New Circus, "opened on the 17th November, 1782" (under a lease granted by Admiral West in that year), with "a combined entertainment of horsemanship, rope-dancing, songs, and music;" these last required the licence of the magistracy, under the 25th George II. It says something for Mr. Hughes, that the programme included "a species of amusement perfectly novel in its kind, consisting of paintings, statues, and heterogeneous objects, properly explained and elucidated."

After a few years the elder Dibdin withdrew, and, under several proprietors, the Circus met with varied success. Melodrama was introduced, and among the celebrities of the Circus was John Palmer, the comedian, who played here while a prisoner for debt in the King's Bench. The large sums he received, and his reckless mode of squandering them, suggested the clause in the old "Debtors' Act," by which all places of public amusement and licensed public-houses were declared "out of the rules," or prescribed limits in which those who could pay for the privilege were permitted to reside, when arrested and imprisoned for debt.

In 1798, Mr. J. C. Cross, whose first wife was an actress at this theatre, Covent Garden, and elsewhere, having married the daughter of the then

proprietor, Mr. James Jones, greatly altered the character of the representations. To Mr. Cross was due the re-modelling and re-building of the theatre in 1799, when Mr. Robert Wright Hodson was added to the firm of proprietors. Six seasons of successful management followed, and amongst the performers we find Mr. and Mrs. Wallack, Mrs. Wybow, the elder Bologna, Ridgway, Parsloe, Mons. D'Egville, Laurent, Bradbury, and Grimaldi. And now its time was come, and on the 12th of August, 1805, in the twenty-third year from its first opening, it was utterly destroyed by fire.

With the structure perished an extensive wardrobe, a large quantity of scenery (much of it by the elder Greenwood), and a voluminous collection of MS. music, by Reeve, Hook, Sanderson, Weippert, and other composers. The insurance was 3,000*l.* only, scarcely one-fourth of its value. The building was said to be provided with tanks and stop-cocks, but no water was laid on: a pond was the only resource, and this of course proved of no avail.

The fire would appear to have been a severe blow to Cross, for we find that it was late in November before Mr. Donaldson, the builder, commenced the reconstruction "from drawings by Mr. Cabanall, junior."

The new theatre opened on Easter Monday, 1806, "under the control of Messrs. Holloway, Evans, Wilby, Lant, and Woodward, trustees," who are characterised by Mr. Cross, as "gentlemen of worth, honour, and integrity;" at any rate, they appear to have found the means to re-build the theatre.

In the second season the "New Royal Circus" was advertised for lease or sale, and Robert William Elliston, on the 23rd of February, 1809, the day before Drury-lane Theatre was burnt down (Covent Garden Theatre then lying in ruins, having been burnt in the preceding September), sent in proposals, and ultimately became lessee for seven years at a rental of 2,100*l.* per annum.

On the 23rd of March the papers contain the announcement that "The Royal Circus will open on Easter Monday (1809) under the sole direction of R. W. Elliston, esq." The auditorium was almost reconstructed: the boxes were altered in form and increased in number, the pit was raised, and additional private boxes were enclosed; it was, moreover, tastefully decorated.

Elliston being at this time under engagement at the Lyceum was prevented from appearing at his own house until the 16th of June, when he made his first bow in a "barletta-melodrama," in three acts, founded on the "Beggars' Opera," wherein he personated *Captain Macheath*.

Elliston soon found himself crippled by the restrictions of his licence, which forbade spoken dialogue without a musical accompaniment, and on the 5th of March, 1810, Sir Thos. Turton presented a petition in the House of Commons from R. W. Elliston, praying that he, the petitioner, might be permitted "to exhibit and perform in the said theatre, the Royal Circus, all such entertainments of music and action as are commonly called pantomimes and ballets, together with operatic or musical pieces, accompanied with dialogue." The House rejected the petition, on the ground that "it would go to alter the whole principle upon which theatrical entertainments are at present regulated within the metropolis and twenty miles round." We have seen this question since disposed of.

It was in the next season, which commenced on Easter Monday, 1810, that the name of the theatre was changed from "the Circus" to "the Surrey," as celebrated in "The Rejected Addresses:"—

"Bass Bonaparté, fl'd with deadly ire,  
Sets one by one our playhouses on fire.  
Some time ago he pounced with deadly glee on  
The Opera House, then burnt down the Pantheon;  
Nay, still unsated, in a coat of flames,  
Next at Millbank he cross'd the River Thames;

Thy Hatch, O Halfpenny! pass'd in a trice,  
Boiled some black pitch, and burnt down Astley's  
twice;  
Then buzzing on through ether with a vile hum,  
Turr'd to the left hand, fronting the Asylum,  
And burnt the Royal Circus in a hurry,—  
'Twas called 'the Circus' then, but now 'the  
Surrey.'"

With this alteration came the abolition of the amphitheatre, which merged into the pit; while the stables were decorated to form retiring saloons.

Tom Dibdin was at this time Elliston's author and adapter, and when Elliston made himself lessee of the New Drury-lane Theatre, Dibdin became his successor at the Surrey. He has left a minute account of his prospects, position, and progress during the seven years he held the managerial reins—from 1816 to 1822 inclusive. The rent was agreed on at 1,000*l.* a year, with one-third of the clear profits obtained, to Mr. West, the landlord; the lessee to expend 4,000*l.* in repairs, &c., and to insure the building for 9,000*l.*, and his own property for 3,000*l.* more. The premiums on these policies were 360*l.* a year.

On the 1st of July, 1816, Dibdin opened his house with a strong company. In 1817 a great hit was made by Moncrieff's burlesque of "Don Giovanni." "Kenilworth," "Ivanhoe," "Guy Mannering," "The Heart of Midlothian," and other pieces from Scott, were produced, and were well supported by Huntley, Egerton, Bengough, T. P. Cooke, Copeland, Mrs. Egerton, Mrs. Fitzwilliam, Mrs. Chatterley, Mrs. Gomersal, Miss S. Booth, Miss Tree, and many other well-known performers.

The expenses, however, were too great for the receipts. Dibdin retired in October, 1822, relinquishing his licence in favour of Mr. Watkyns Burroughs.

After the theatre had suffered evil fortune, Elliston again took command, and in the autumn of 1828, Weber's earliest operatic work, "Sylvana," was produced, with Mrs. Fitzwilliam as the heroine, Henry Phillips, and Miss Graddon. Afterwards came a great hit, Douglas Jerrold's "Black-Eyed Susan," which was first played June 6th, 1829. Elliston died early in 1831, leaving his position to his son Charles. Then came Osbaldiston, whose first year began at Christmas, 1831. Osbaldiston afterwards migrated to Covent Garden.

In 1833, Mr. George Bolwell Davidge became lessee, and made the Surrey prosperous. After nine seasons Davidge died in 1842, and left the house to his widow, Mrs. Davidge, who carried it on for some years, and then sublet it. In December, 1848, Mr. Richard Shepherd and Mr. Osbaldiston became joint-lessees; but Mr. Osbaldiston soon afterwards returned to the Victoria; and Mr. William Creswick, the tragedian, became co-lessee with Mr. Shepherd. After nearly fourteen years of management, Mr. Creswick retired, and Mr. Shepherd associated with himself Mr. James Anderson, the tragedian.

And now the theatre's natural enemy was again at its heels; and, on the night of Monday, the 30th of January, 1865, the Surrey was burnt to the ground in a few hours. When we visited the ruins the next morning, the only thing that retained form and colour was a tin breastplate, lying in the midst of the large area that was covered with charcoal mixed with pieces of twisted iron, and inclosed by tottering walls. Persons of all classes exerted themselves to mitigate the distress thus brought upon numbers connected with the theatre; foremost amongst whom should be mentioned in any record of the event, Mr. Henry Hill, F.S.A., and Mr. Ridge, two gentlemen of the Stock Exchange,—the readiest body in all England to do promptly an act of munificent kindness,—who, with much personal exertion, gathered together a large sum of money, and forwarded it to the committee.

What we have further to say belongs to—

THE NEW THEATRE,

Which was opened to the public on Tuesday evening last. Soon after the fire, designs were invited from several architects for the rebuilding, on behalf of Lieutenant-Colonel Temple West, who is the owner of the site, and the choice ultimately fell upon the plans of Mr. John Ellis, architect, of Austin Friars, London.

In the beginning of April the excavations were commenced, and great difficulties were encountered, both from the nature of the foundations and the bursting in of water while forming the cellar under the stage. The first thing done was to sink a well 6 ft. in diameter on the north side of the excavation, into which the water rushed and rose to a considerable height; in this well was fixed a 6-in. suction-shaft, attached to a double-action pumping engine; and after constant working night and day for three months, the level of water gradually began to fall. While this was going on, the foundations of the main walls forming the sides of the large cellar and carpenters' shop behind, as also the foundations of the main building, were excavated in trenches 6 ft. in width, and some 40 ft. in depth, where the stiff clay stratum was reached. Upon this the architect commenced the superstructure by a bed of concrete 3 ft. in depth and 6 ft. in width, upon which were placed walls, built in Portland cement, and 3 ft. 6 in. thick, puddled at the back with 12 in. of stiff clay. After great labour the ground-level was reached; but still the water rose and fell in the well, although constant pumping was carried on. The next step was to remove all shoring and excavate the earth enclosed within the walls of the cellar and shops, forming a mass 100 ft. long, 70 ft. wide, and 40 ft. deep. This completed, the bottom was still full of water, which afterwards lowered to about 6 in., when some tons of stone-lime were thrown in, and simultaneously worked up with the gravel left in for this purpose to a thickness of 5 ft. After some days of labour, and mixing together, this entire mass of concrete was levelled down and set; since which time no water has appeared,—and thus the cellar and foundation works were brought to a successful issue.

We have already given a section of the building; we now add the ground-plan and a view of the interior.†

The site of the new theatre is irregular; about 260 ft. in its extreme length, and about 110 ft. in width; fronting the Blackfriars-road with a façade of 62 ft. It covers a much larger area than the former, and most of this increased space has been added to the stage. The main entrance is by a tetrastyle Ionic portico, 62 ft. in width by 30 ft. in height, projecting 13 ft. from the main wall. The centre doorway leads to the box-entrance lobby by a stone staircase. On the right hand is the pit entrance, placed on a level with the roadway; on the left hand, the entrance to the gallery, by a stone staircase, 7 ft. in width, without winders, very properly.

The auditorium is horse-shoe in form, 68 ft. in length, from the curtain to the back wall of the pit, and 62 ft. in width. Two rows of stalls are provided. The floor of the dress-circle is raised on the average 10 ft. above the pit level, supported upon iron columns and girders. The first tier of boxes is 9 ft., and the second tier 10 ft., in height from floor to ceiling; these are supported upon handsome iron columns, brought forward to the front of the circle. The fronts to the boxes and gallery are enriched and modelled in *carton pierre*, with medallions and wreath decorations. The colour of the ground is light, and the enrichments are gilded.

The outline of the proscenium opening is elegant and of good proportion; the upper part is decorated.

The auditorium is covered with a coffered dome (each panel containing a rosette), 50 ft. in diameter, rising 10 ft. in the centre, and is 55 ft. above the level of the pit floor; it is ornamented in gold and delicate tints upon the blue groundwork of the coffers. In the cantabular at its base appear the names,—Shakespeare, Ben Jonson, Dryden, Beaumont and Fletcher, Massinger, Wycherly, Vanbrugh, Farquhar, Dryden, Congreve, Steele, Cibber, Addison, Goldsmith, Fielding, Rowe, Coleman, Garrick, O'way, Byron, Sheridan, Macklin, Sheridan Knowles, Douglas Jerrold, and Bulwer,—in all twenty-six. In the centre of the ceiling, which is of

moulded *carton pierre*, is fixed a large sunlight burner, which illuminates the entire house; the heat arising from this is carried away by an iron tube, 18 in. in diameter, round which is fixed a wrought-iron jacket, 7 ft. in diameter, both going through the roofs into the open air. The roofs are constructed of iron; that over the auditorium in eleven trusses, each 65 ft. span; and that over the stage in ten trusses, each 72 ft. span. The flies are supported by four lattice girders, each 60 ft. in length, thus leaving the stage perfectly clear and open from side to side. Spiral iron staircases, 6 ft. in diameter, communicate from the scene-docks to upper flies, affording the quickest possible access to all the working machinery of stage and barrel loft, as also for the development of large transformations and other scenic effects.

The carpenters' shop and painting-room are placed, as we mentioned in our previous notice, at the back of the stage. Three frames can be painted at one time, the whole being under the control of the principal artist engaged in preparing any scenery required, and these rooms are separated from the theatre by iron doors, so that the dangerous part of the theatre may be kept completely without the main building—a great consideration in the case of fire.

The designs for the modelled ornamentation and coloured decoration have been supplied by the architect himself, and the architectural effect of the whole is certainly satisfactory.

The stage is 60 ft. in depth, and 70 ft. in width between the scene-docks, which are each 15 ft. deep, making a total of 100 ft. for working room; beneath this is a large cellar, capable of receiving the heaviest set scenes that may be required. Care has evidently been taken that this part of the theatre should be unexceptionable, judged of under our present lights.

The green-room, refreshment and retiring saloons, dressing-rooms, ballet-room, property-room, wardrobe, treasury, and numerous offices, are all convenient.

The carcass was erected by Mr. C. N. Foster, of Whitefriars; the iron roofs, girders, and columns were made by Messrs. Rankin & Co., of Liverpool; the modelling and decorations were by Mr. E. W. Bradwell, of Great Portland-street, and Mr. Parly, of Rathbone-place, from designs by the architect; the iron staircases by Mr. Pountney, of Blackfriars-road; the gas fittings by Messrs. Jones, of Bow-street, Covent Garden; the furnishing was by Messrs. Green, of Mortimer-street; the sunlight by Messrs. Strode, of St. Martin's-le-Grand; the slating by Messrs. Squires & Owen, of Oak Wharf, City-road; and the iron doors by Messrs. Clark & Co.

Mr. John Hurley superintended the builder; Mr. Bilborough acted as foreman for the excavations and brickwork; Mr. Joseph Derry, as foreman of carpenters; Mr. Mesher, as foreman for Messrs. Rankin. The whole of the stage was entrusted to the care of Mr. William Mather, and the portico to Messrs. Bellman & Ivey.

We may add in conclusion, that the total expense is estimated at about 25,000*l.*, and that Mr. Shepherd will pay a rental of something like 2,500*l.* a year for the remainder of his term, after which a larger rent will probably be obtainable.

AND here, in the theatre, we to-day drop the curtain on the year 1865, with all its good and evil,—its successes and shortcomings,—“things incomplete and purposes delayed.” We have played our own small part on our own small stage at least with earnestness and good intentions; and we have many reasons to be thankful for the reception graciously accorded. When the bell “rings up” next week, for 1866, the manager will be found, as of old, at his post, and the company ready to show “the very age and body of the time, his (architectural) form and (constructive) pressure.” We shall not disdain “sensation” in our sanitary efforts, if good is to be gained by it. Our scenic artists will do their best; beating, lighting, and ventilation will, of course, be attended to; and even the orchestra, representative of beauty translated from seeing into hearing, will not be neglected. We will listen to good prompting, come from what quarter it may; and will let every supporter we have, from far and near, take a part in producing a whole which shall show all the

doings of the sister arts in the three kingdoms; and somewhere beyond. With thus much by way of epilogue, we make a grateful bow to all kind friends before and behind the curtain.

GEORGE GODWIN.

MODERN ART IN ROME.

WITH November opens a season when certain public works suspended during the summer, particularly those in subterraneous places, recommence in Rome. Catacomb-excavations are now again in progress, under the direction of the Chevallier de Rossi, though we understand that funds are so low as to prevent the Archaeologic Committee responsible from undertaking much in this walk for the present. On the Palatine, the works ordered by the French Emperor, and directed by Signor Rosa, continue without interruption, though not in any late instance rewarded by discoveries of special interest; while those in the crypt-church of S. Clemente, not yet completely disencumbered, are also kept up through the whole year by the zealous father-prior, Mullooly, who had the merit of first reopening this long-buried basilica, probably of the fourth century. In other directions, on the Quirinal and Esquiline hills, we have to notice labours that are much altering the aspects of those classic sites, as the formation of new streets (in their hitherto state merely roads, without houses) and the central railway station near the Diocletian Thermæ; also the improvement of the steep approach to the papal palace, which has already changed the entire level of the Quirinal on one side, and as to the architect's plan been much criticised; nor does it, indeed, appear that 100,000 scudi, the sum voted, will be compensated for by any results characterized by beauty or imposing features; the amount of 83,000 scudi spent (we are assured) in the sole task of demolition, with sacrifice of certain edifices built by Bernini, being to all appearance most exorbitant. Restorations of churches, St. Paul's, S. Maria in Trastevere, S. Angelo in Pescaria (close to the Octavian portico), and S. Nicolo in Carcere, continue at the usual slow pace. The principal undertaking in sacred art now progressive is the series of colossal mosaics, from designs by Consoli, on the façade of the Ostian basilica,—their subjects, the Saviour enthroned between St. Peter and St. Paul; on lower level, the Adoration of the Lamb, from the Apocalypse, with the mystic cities Jerusalem and Bethlehem; and below, between the windows, four major prophets,—altogether a grandly-conceived and appropriate composition, that far surpasses all else contributed by modern art (in painting at least) to this great new church. For an altar-piece in the same temple is now being prepared, at the studio of mosaics in the Vatican, a magnificent copy, in the same art-form, of the “Assumption,” by Giulio Romano and Penni (from Raffaele's design), a picture in the museum at that place, to supersede the indifferent altarpicture in oils, by Camiccini, that now hangs in a transept of the basilica.

It is rarely that we hear of any memorable addition to the sacred art adorning other public buildings than churches in Rome; but in every way entitled to regard is a large fresco lately finished by Minardi, in a throne-room (not well lighted for its display) at the Quirinal Palace, its subject, “The Propagation of the Faith,” treated in a manner indicating a high order of imaginative powers, as well as great technical skill; in the upper part of this fine picture being seen the Saviour triumphantly floating in air, amidst adoring saints and angels, with the banner of victory in His hand; Abraham in the act of his intended sacrifice, and Moses, with the legal tablets, immediately at His feet; under their figures, a symbolic river, from whose waters are drinking lions and lambs (type of evangelical concord); lower, on the plain of the foreground, the Apostles, St. Peter in the midst, about to start on their sacred mission for converting the world, a group admirable for the character of calm heroic resolve in the heads, and the incipient movement, expressing the moment of departure, in the figures. Externally to these groups, in far distance, majestic forms of “sworled seraphim” driving away the Demons of Error and Discord. The work gives a high idea of the undiminished powers of an artist whose reputation dates from at least half a century ago; and Overbeck's fresco of “The Escape of the Saviour

\* See p. 930, ante.

† See pp. 924, 925.

from the Jews by passing over the brink of a precipice" (to represent the invisibility stated in the sacred narrative), on the ceiling of another room in the same palace, appears cold and feeble when we examine it immediately after admiring Minardi's picture. The studio of the last-named artist is little known to the tourist world in Rome, nor does it seem to be his desire to lay himself much open to their visits. Designs in crayon, and finished drawings in water-colours, are there seen in much larger number than oil-paintings, or any others beyond the incipient stage; but the immense variety, the vigour and feeling manifest in subjects of the most opposite walks, classic and romantic, historical and devotional, leave an impression of astonishment after a visit to Minardi's studio. On some of his sketches may be observed dates so far back as 1812, 1817; and, among those of latest origin, we noticed to admire "Dante's Virgil in the Elysian Fields," "The Comitat of Borletta," the invading "Gauls on the Forum," "St. Paul dictating an Epistle in Prison," "Ugolino and his Children;" the last, a treatment of the story quite terrific in pathos. His "Holy Families," and other evangetic subjects, are pleasing, but comparatively feeble, at least where the artist has confined himself to long-heaten paths; where rapid action, complex grouping, or romantic grandeur is aimed at, his success is eminent; and, amidst a school so fallen as is assuredly that of Roman painting at present, Minardi outshines all competitors.

Consoni has also displayed much power in the walk peculiarly his own, and never, perhaps, more strikingly than in the two series he is now engaged on,—the cartoons for the mosaics above noticed, and others for sacred groups to adorn the mausoleum of Prince Albert, ordered by our Queen: the subjects of the latter, a Crucifixion, with many figures finely grouped; the four Evangelists for the spandrels of arches; also (these not yet among the cartoons visible), the Nativity, Resurrection, and Ascension,—those hitherto prepared being of high merit, and the separate figures, both for the mausoleum and for the mosaics, of genuine majestic character.

Consoni's talents has already been made known in England by other works commissioned by our Queen,—“The Hours and Loves” in the State Ball-room at Buckingham Palace; and he has been one of the artists engaged on a decoration in continuance for about four years past, the frescoes and stucco reliefs in the porticoes of the Vatican Loggia, his contribution here consisting of thirty-two small pictures, *quadrati*, illustrative of the evangetic history, which, together with stuccoes alike of sacred subjects by the sculptor Galli, adorn the compartment now called by a new name, “Loggia Pia.” Another, known as the “Loggia dei Zucari,” from the artists who once decorated it, has been restored with new paintings, similar in character and subject, by Mantovani, whose work was of about three years' duration. The Vatican Palace, under Pius IX., has indeed become renovated.

Coghetti and Gagliardi are the two painters most esteemed in Rome, after the above-named, both actively employed at present; the former, who excels in battle-pieces, subjects from Roman history, having lately sent to Vienna one of his most admired and original pictures, “Brutus addressing the People over the Body of Lucretia in the Forum;” the latter being still, after about nine years' occupation on the same series, daily at work on his frescoes at S. Agostino,—Scriptural subjects and others, from the lives of Augustinian saints already reported upon in our pages.

The modern pictures presented (according to usage) to Pius IX. after acts of beatifying or canonizing, illustrative of those individuals' lives who have received such honours, now form a collection in a hall of the Vatican, to which access is obtainable. Few of these can claim a high place; others are scarce above mediocrity. “The Virgin and Child appearing to the Beata Maria degli Angeli,” by Rubens, a German artist settled in Rome, struck us as in purity and sentiment superior,—indeed, poetic. “The Saviour appearing to the B. Maria Alcolocque,” by Podesti, is theatrical and glaring. “St. Giovanni del Britto and the Japanese Martyrs,” by Gagliardi, has some dramatic power; and the work of a young artist Francasini (lately become eminent), the “Beato Pietro Canisio,”—a Jesuit, addressing Charles V. who is seated in company with a cardinal, has justly been praised, being an example of vigorous conception and well-toned colouring. We may notice, by the same artist, a fresco lately

finished, over the chancel-arch, of the S. Lorenzo basilica, “The Virgin and Child enthroned amidst Saints;” also distinguished by a feeling and skill that confirm his title to stand high among Italian competitors in one walk.

Returning to the Vatican, we have to observe that Podesti's frescoes illustrative of the Immaculate Conception dogma, are not yet made public, though accessible; and that an antique mosaic has been laid on the pavement of the same hall, containing that series, which we do not find improves on further acquaintance; for it is precisely where the aim is highest,—where spiritual grandeur is demanded,—that the artist proves unequal to his task. The pomps of worship at St. Peter's, the synod of cardinals and bishops, are indeed well composed and striking; but the celestial vision, seen hovering above, fails in every attribute we look for in so sublime a range. There is, generally speaking, an academic affectation and coldness in this Roman school, of which Podesti is a recognised representative; and its peculiarities are such as remind us of the hired model or the *tableau* on the stage, rather than of Nature or Truth. For the above-named series, that artist was to have received 18,000 scudi; and one new trait of the generosity of Pius IX. is the augmentation by 3,000 scudi, ordered as token of his satisfaction with the performance.

We believe the Roman sculptors were generally disappointed at the results of the Dublin Exhibition, where few of their works were sold, except a colossal statue of the Pope, and a small group by Lombardi; and we were surprised to find, among those sent back, the admirable bust of Cardinal Wiseman, by Bonzoni. Visiting the studio of the latter, in the marble, his large group of the “Flight from Pompeii” (the mother and child protected by Giannone, as in the well-known Romance), this being one of Bonzoni's most able and original works, highly dramatic, and conveying the terror of the catastrophe with a truthful pathos. But is it a subject suited for sculpture in its higher aims? Tenerani's fine monument to Pius VIII., has not yet appeared, though all is ready in its place at St. Peter's, where, it seems, no other appropriate spot will be left for such colossal memorials after the erecting of this last; and it is understood that Pius IX. desires to have his monument in the splendid “confessional,” lately finished before the high altar of S. Maria Maggiore. Another monument has been projected, and subscription towards it set on foot, by the Irish ecclesiastics here, to a well-known theologian and writer, their countryman, Wadding, the historian of the Franciscan order, of which he was a member, who lived and laboured long at the convent of S. Isidoro, where he died in 1657; and the community of which convent—in fact, a college for theological studies rather than a house of cloisteral retirement,—set on foot this project, giving the commission to an artist of great abilities, Jacometti, who has prepared a very pleasing design. After all that has been said and done respecting the new church at the English college, in Rome, the subscription for which has been long in progress, after the announcement of this decision for a Gothic type in architecture, and the all but decided commission of the work to Mr. Pugin, we hear the plan has undergone considerable modification; that the Gothic has been abandoned, and the Byzantine style preferred; and that no English architect, but a Roman, Count Vespignani, long engaged by this Government, and the author of many church restorations in this city, is chosen for the undertaking desired to be conspicuous for scale and splendour.

#### A WALK IN “CANNY NEWCASTLE.”

I HAVE just had a survey of Newcastle, on my journey south. It is not my first visit to the town; but it is the first time I have had an opportunity of seeing through it. If the capital of Roman Northumbria is not a “canny” place, certain I am that its people are: so the name is not misapplied. Unless accommodated by some circumlocution for a half an hour skyward, I should fail to convey to the reader its contour; but I will content myself, hap-hazard, by saying that it is a most up-and-down, in-and-out, eccentric-looking place.

I was certainly struck with surprise each time I looked upon the Tyne, whose water for miles is dotted with such a wealth of shipping, and its banks studded with such a mine of wealth, that

the quays of such a river (if quays I can properly call them) should be so dingy, despicable, and dilapidated-looking. With a coal trade of two centuries' standing, and an iron trade rivaling that of the Clyde, not speaking of its chemical and other kindred branches, here is Newcastle this day, with a worse landing-place for its import and export trade than any town with half its pretensions that I wot of. Speculating landlords, and speculating and philanthropic builders and citizens, and self-made engineers as self-made men, have done much for Newcastle that she can never forget; but her corporations, old and new, must have been woefully remiss, for they have been and must be undeniably rich, to neglect the evident and essential improvements that the town required. However, they are talking of attempting these now.

Newcastle possesses a few good streets; Grey-street, for instance, at the head of which stands the Grey Testimonial, a not unhandsome column, surmounted by a statue of the earl. Grainger-street and Clayton-street are also fine streets; but the majority are merely so-so. Leaving the quay-side, you pass up a thoroughfare called The Side. It is an antiquated, if not the most antique street in the town. The old gate-work structures in it and its approaches remind you of Elizabeth's or Queen Anne's time. Cross-steps gables and projecting windows, while the shop-fronts recede beneath, are still characteristic of the Newcastle side. Half-way up the Side, at the foot of Dean-street, a noble stone arch, cutting obliquely at a great altitude, carries the North-Eastern Railway above the level of the highest houses in this street. You may pass up Dean-street, which is the modern route, at once into the heart of the town; or, if you choose, you may pursue your way, with your hand on your knee-cap, up the remainder of the very steep Side, which will bring you up to St. Nicholas-hillside, the approaches to the Stephenson High-level Bridge, spanning the Tyne (a roadway and railway both) from Newcastle to Gateshead.

Overhanging the river, at the entrance to the High Level, is the old castle, whose wall in thickness covers as much as it encompasses. Within the castle is the Antiquarian Museum, and the Society of Antiquaries meets there. It contains a very good collection of diverse antiquities, and is well worth a visit. A time-gun surmounts the castle, and at one o'clock (Greenwich) each day, it rattles and shakes, by its report, the old musty tenements of the Castle Garth and crumbling Side.

The steeple of St. Nicholas Church, daintily and delicately poised by the springing of flying buttresses from either angle of the tower, is a miracle to the amazed beholder, who looks up from below, and is puzzled to divine by what subtle art and cunning hand it was raised there.

In “Old” Aherdeen, at the College, the Imperial Crown is somewhat similarly supported, but St. Nicholas surpasses it.

The new public buildings of Newcastle do not betray much architectural taste internally or externally. The Central Exchange rooms are spacious enough for the purpose, but it strikes me that the interior arrangement might have been better.

The Town-hall might have assumed another shape, to the benefit and beauty of the town. Its large public room is ill adapted to the wants of either hearer or speaker. I speak independently of mere accommodation and inner embellishment.

The Central Railway Station is a commodious one, and covers a large extent of ground. It has a very fine and wide approach, and a very railway-like appearance. If it lacks taste in any way, this is compensated with what the public need most,—usefulness.

Crossing direct from the Central Station, a few yards will bring you face to face with vestiges of the Roman wall that anciently surrounded the town. If you have a keen sight and an insatiable desire, by condescending to a little humility and inquiry, you may trace the circuit of the wall, and the town also; and you will, I doubt not, be repaid for your trouble by the pleasing reflections, and the immemorial echoes that will break upon your ear.

From the end of Clayton-street you are carried out to the Scotoswood-road along to Sir William Armstrong's iron and ordnance manufactory.

The Scotoswood-road side is of recent growth. Like a succulent fibre, it shows the offshoot of the new town creeping out, still out, clasping the fresh loam and the green meadows in its gripe.

There is a public common called the Leazes, somehow or other vested in the hands of the "freemen" of Newcastle. This common is a great acquisition to the town. It answers as a place of recreation and walk for the townspeople on Sundays or other days when time permits. There is another large common further out of town, called the Moor, where the "Newcastle races" are held.

Notwithstanding the existence of these large tracts of ground, Newcastle, with all its trade, cannot boast of a public park. Why, Sunderland, though not very sweet-scented, has begun to deodorise filth in her foul lanes, and develop a public park.

A reverend gentleman has lately told some wholesome truths under the heading of "The Night-side of Newcastle;" but, saving for the charm of alliteration, he might as well have written it the Dayside of Newcastle.

I have strolled in midday and twilight down its sooty Sandgate, up its shadowy Sandhill, and through its ominous Ouseburn; and I have seen the self-same pictures of poverty, filth, and abandonment. The whole panorama was a struggle for life and living. And who was to blame? Not the ill-housed, but those who overcrowded those houses, and stigmatised their inmates for causing the contagion that they themselves created. Windows cobwebbed and muffled with layers of dust; back-yards minus ash-pits or urinals; or, where existing, perches for privy-seats, through surrounding filth, inaccessible. Yet hereabouts Sin and Shame hide their faces, and revel within, while the policeman walks without in the name of "Law and Order."

This is Sandgate in Newcastle,—who shall gainsay it?

There is a large contingent of an Irish population in Newcastle, and some attempts were made lately to fasten upon them the fever and filth-producing cause. This was most unjust: *à la* Irouside in Sheffield—some one ashamed of his name, said, "It's Paddy's fault;" but the terror-stricken censor grew scared, and abandoned his charge.

In justice to the Irish element in Newcastle, I have visited the districts where they most congregate, and I find the charge unfounded. Many of the worst spots in Newcastle and Gateshead contain scarcely an Irish person, and some of the places very few.

Rigid inquiry and inspection have convinced me that the dirt, and plague, and cholera of Newcastle and Gateshead are proverbial and chronic. In the year 1831-32 the Irish element was very sparse indeed—there were perhaps a few dozen,—and yet what havoc disease made in the town. Even two-thirds of a century since, the filth and dirt of Newcastle were terribly censured by an Englishman, and I believe a north countryman.

Collier, in his "Essay on Charters," thus speaks of "canny" Newcastle:—

"While our lower classes of females and children, and even males, during hard frost, absence of ships, or roughness of weather, stand starving, begging, or stealing for want of employment; and, not having been taught the value of time, nor tasted the sweets of industry when young, they wallow in the two extremes of poverty and filth, excess and extravagance in their middle age, and become useless and chargeable to their old. Their wives are dirty, shiftless, and indolent; their children lazy, ragged, and thievish; themselves rude, saucy, and debauched; their parents uncomfortable to themselves, useless to their families, and a burthen to the public; and thus our streets swarm with beggars, our alehouses are crowded with sots, and our parishes saddled unmercifully with poor."—P. 94.

This terrible picture of Newcastle about 1780, I must say, is not all true of it in 1865, though much of it would stand comparison.

The streets certainly are not crowded with beggars, but the alehouses are crowded with ninking working men; and the natural sequence is, that the workhouses are swarmed with premature old age, and the public are burthened in consequence. Trade having revolutionized the capital of the North, and the learning of trades been so much facilitated of late years, none need have an excuse for idleness; and few are altogether dependent. But the filth that Collier saw and complained of has quadrupled, and become chronic, in sooth, in several places, within Newcastle and without it, along the Tyne-side, in this year of grace.

What on earth the corporation of Newcastle thinks in the face of all its plague spots and

fever dens, and putrid cesspools betwixt Sandgate and Ouseburn, Heaven only knows; while they are privity to the existence of such neglect, rotteness, and ruin, the part they play is little short of moral assassination.

The severage of the town in those districts under review is woefully deficient and defective. Slops and suds may find a channel for themselves: at the doorsteps of many of those wretched tenements, or form stagnant pools for the barefooted children to dabble in, for scavengers' visits in these quarters are "few and far between."

The town lacks sufficient public "stopping-places," even contiguous to its leading thoroughfares; and a few public fountains might be erected; their sparseness is conspicuous.

The General Post-office ought to make a more frontward, or shift its quarters elsewhere, if not inclined to dress up and improve.

Between Newcastle and Sunderland, the Tyne and the Wear, a little factious spirit of rivalry exists. It is mostly confined to the shipping interests of the respective ports; and their growing capacities. So long as it takes its present direction, it can be productive of nothing but what is good. The Wear has certainly improved apace these last fifteen or twenty years, but there is a deal to be developed and utilized in connexion with both rivers. The ferry station and approaches on the Tyne are certainly rough and uncouth, and the banks on each side of the river are as broken, as jagged, and as ungraceful as can be.

The press of Newcastle need a passing remark. They are doing all they can to make public the crying evils of the town; but the civic Solons seem to be members of the "stand-still movement," and are invariably standing upon the ceremony of doing, instead of acting, in sanitary matters.

While Newcastle is getting old and wealthy, her working population,—a main source of her greatness,—are dropping into premature graves. These are truths anent the boasted capital of the North. Who shall gainsay them,—Answer.

C. C. H.

#### ARCHITECTURE IN LIVERPOOL.\*

It would be impossible to thoroughly appreciate the character and position of architecture in Liverpool without exhausting the subject of Mr. John Foster; and, while making allowances for the bad art that then generally prevailed, we cannot forget that before he commenced his labours there existed in the town at least one architectural monument of considerable excellence,—we allude to the Town Hall. Things ought not to have been so universally bad, when minds had existed in the previous period that could conceive a building which, if not ranking among the highest efforts, continues to this day, from the simplicity, taste, and correctness of proportion which it displays, to attract the attention of the cultivated, among whom it is generally considered to be one of the best buildings in the town. To all who have seen Bath it bears the stamp of its origin, and we are denied the privilege of boasting of it as emanating from native talent. Contrasted with the new public offices, the Free Public Library, the Custom-house, the police courts, it certainly carries the palm; and why so? Because it was not designed by a corporate official, one who, in this department, is usually chosen, not from his architectural ability, but from influence, and a presumed knowledge of the art of valuation, and other mere common practical abilities, which may be found amongst most shrewd men. Shrewdness, and what is usually called a practical mind, will not help us one tittle towards the production of good architecture, but perhaps the reverse. The true architect must be somewhat of the poet, enthusiastic and earnest; above all, earnest. Architecture, instead of being practised as an art or science, has, in Liverpool, become a mere trade, and none but the pure business-man has much chance of success. We need only, in confirmation, point to James Murray, perhaps the only Liverpool architect really and justly distinguished,—and he, poor fellow, to the eternal loss of his art, died when little over thirty. Ye grave and reverend seigniors, and masters of the mysteries of the tape and rule, what do ye say to this "youthful member of the profession?" When, in Liverpool, we possessed such talent, why did we not cherish it? Why was so promising a man permitted to go, if not actually sent, to

Coventry? Coventry may be thankful, but Liverpool should weep. Had we but a little of the Murray taste for the picturesque in some of our leading streets, the force of so beautiful an example would have gone far towards correcting the evil influences of the measurer, the builder's draughtsmen, the quantity-taker, and the practical official. There is a dead weight, an incubus, a night-mare afflicting the place which we seem never to rid ourselves of. Architecture is become a matter of seniority, and until a man be past his prime, used up, or bowed down with years, he has no chance. Enthusiasm, we suppose, is considered a dangerous thing, and not until a man's imagination is weakened by age can he hope for scope for any abilities he may possess. The spirit of trade infests everything; and, though we may sell 200,000 bales of cotton in one week, the money so obtained, if partly expended in building, is pretty sure to develop mere display and coarse taste. If we turn to other provincial towns, we find in most, at least, one distinguished man, among whom at the moment we can at once name Waterhouse, Manchester; Brodric, Leeds; Hadfield, Sheffield; Paley, Lancaster; and, if necessary, a host of others. Now, mark this,—Waterhouse, Brodric, Murray, are, or were, when they first achieved their position, very young men. On the occasion of the competition for the Leeds town-hall, Sir Charles Barry, who was called in to report to the committee on the plans submitted, most strongly recommended that of Brodric; and when it was objected—mind, this is always the dodge—that he was but a young man, not long out of his pupillage, to the eternal credit of the profession, Sir Charles informed the committee that he considered any one who had talent to produce so excellent a set of plans was quite competent to carry them into execution. Oh! for a Barry in Liverpool when a competition empire is required; then and not till then, good bye to the miserable dodge by which the Free Public Library dropped into the maws of the officials. Unfortunately, a miserable, carping jealousy exists amongst the profession in the town, and those who are in good practice are averse to admitting others to share it. Cannot all this be cured? We fear it will be a herculean job to eradicate the weeds springing up from the seeds sown in the time of Foster. Example is the only thing. But how are we to obtain it when, by a miserable conservative feeling of monopoly, talent is debarred the privilege of producing it?—and the evil is so prolific that it settles down in direct line of descent from master to pupil. It is only in the case of a remarkable mind like that of James Murray that the thraldom can be overcome; and we may safely venture to assert that hardly a pupil in Liverpool is properly educated to a correct appreciation of the beauties of the art. Money-getting is the aim and curse of all, and the system is so rank that it were hardly possible for an architect, the real Simon Pure, to exist. No; peradventure he has taste; but, say the public, he is not a practical man; and so the profession degenerates into the architectural-clerk-of-the-works type. Feeling, as most young men do, that bread and cheese are more important in renovating the destruction of tissue than designing castles in Ayrshire, while waiting for commissions, in self-defence they take to measuring, and settle down eventually into the comfortable architectural-duffer tribe.

Our thoughts have carried us into a digression, but it is a digression calculated to bring us to a true conception of the false position of the profession in Liverpool. In the metropolis an architect possesses a proper social position, but in Liverpool his position is very indeterminate, and he feels, in most cases, quite unable to say whether he is any more than on a level with a builder. There are, at this moment, men practising in the town who have done more towards lowering the social status than can be well imagined. This is much to be deplored, and those most anxious to preserve the true dignity, without which no professional man can possess the necessary influence over his client who, in the case of architecture, naturally being ignorant, wishes to impose restrictions and prescribe the style, finds himself impotent for good, if not actually compelled to make arrangements that are quite injurious and unprofessional. Strange, that every one considers he knows more of architecture than the architect he employs; but it would seem; and the fights that an architect of honest convictions has nearly always to make against huge abominations, handsome cornices, architraves, lamp windows that an

\* See p. 908, ante.

omnibus "full" could be driven through without turning a hair of the horses, how windows with flat tops, ogee gutters, wooden dressings in imitation of stone, scrolls, or very properly in the language of working men, *scrolls*, preposterous height of rooms, and story above story, often finishing with an attic and blocking. All these, and many other abominations that could be named, are thrust forward, one by one, as more than suggestions, until, unless the architect be a man of stern purpose, for the sake of peace and quietness, he usually gives in. That giving in to a client, on a point of *conviction*, is one of the most demoralising things that an architect can do, and should not be entertained, if at all, until every means of persuasion has been exercised. From our own experience, the most inveterate supporters of these shams, who are really generally very worthy people—indeed, most worthy—can be turned from his purpose by firm and earnest representation; and when real good, solid, substantial work is carried out, we generally find that the client is better satisfied than if his own intentions, which are born of a total misconception of the true spirit of all art, had been attended to. This is a result for an architect to look back upon with honest pride in this rescuing another mind from the eternal perdition of a false style of art. Formerly, building meant something honest and honourable; now it means contracts with architectural policemen on the watch, and hurling workmen dodging, lying, and generally *doing you* on all hands. Alas! what is the remedy? Where is the cure? It is difficult to say, but it certainly does not lie in the perpetration of shams.

The principles of design on which much of Foster's work is founded are these—Choose your *order*; and, having fixed on the scale of your columns,—and mind the proportions and arrangement of parts will be the same, whether your building is intended to be 15 ft. or 100 ft. high,—you arrange them to form a noble portico "in antis;" that is, crushed in between two ugly blocks, usually styled wings; or, if it be intended to attain the highest flights, stuck on to your main block and surmounted with a pediment, usually containing *no* sculpture, and planted on the top of a grand array of, perhaps, 100 steps, to enable the guide-books to say that this noble building is approached by a magnificent flight of steps, which my Lord Tom Noddy, in his "Travels through Europe," declares are unequalled in the whole world. If your columns are meagre and thin, then be sure they will be called elegant; if the whole is devoid of the slightest relief in the form of decorative treatment, then the world will say it is chaste. The George's Baths are *chaste*. If the shafts are thick, ugly, and well swollen, the capitals like puddings, the architraves a plain lintel, and the cornice a large mass of projecting stone, held down by cramps, then, probably, some man of taste will say that, for "simple solemnity and true dignity, combined with a pervading classic spirit so seldom met with, this noble edifice stands unrivalled." Excepting to point a moral in teaching what to avoid, such work is not worth even a passing notice. What can be more unsatisfactory substitute for a real building than the present front of Lime-street Station? And now it is, if anything, more sensible than formerly, for at present it *does* perform the usual purpose of a screen-wall, while, according to the original design, it merely hid a number of low station buildings at the back. It was intended to be a grandiose sham *façade*, but even in that proved a failure. Murder will out; and the openings for light, or what is called the fenestration, at once betrayed the true character of the building. Why all this straining after unrealities? Why this perverse disposition on the part of architects to be discontented with the object for which their designs are made? Would a hat look any better if it pretended to be the shell of a nautilus; or top-boots made to resemble canoes, with a prow at each end? Would a lady's dress—and this was actually done—prove irresistible if covered all over with Corinthian capitals? No, certainly not. Then, why, by all that is simple, honest, and true, is it considered necessary to make so common a thing as a railway station like a series of arches of triumph, with gates that never open, of a proportion so colossal that it would puzzle even a second Samson to walk off with them? Why all this affectation of grandeur? Can we not be contented to take things as they are? Can we not arrange the plans of our buildings first, and, taking advantage of the natural picturesque which a good plan usually dis-

covers, arrange and combine the masses in the most natural and simple manner, with an eye to an agreeable variety of form which shall at once explain the nature of the internal arrangements, be pleasing in light and shadow, pure and unaffected in detail, and thoroughly well studied throughout? It is an Englishman's boast that he calls a spade a spade; but, strange inconsistency, he usually dares to persuade himself that his houses have no roofs, else why should he be at such great pains to conceal them? But more especially in the public buildings is this the case, for where John Bull wishes to be grand it is considered essential to spread a thin disguise over everything. We are unfortunate in most of our public monuments—the Wellington Column, to wit; and we may here ask, why should we send all the way to the canny North for the necessary description of talent when the spirit of ugliness runs riot among our native artists? We Englishmen, who are so blunt, so frank, so open, so honest—or, at least, persuade ourselves that we are so—in the matter of taste are now quite below our proper level, through nought but the want of applying the same principles to our work that are in the relations of life considered moral axioms that all should try to act up to. It is not from any innate defect of organization, but simply because the true principles have been lost sight of, and swamped by the spirit of trade. There was a time when the meanest cottage partook of a picturesque character, when the simplest details exhibited taste, when all were so imbued with the right spirit that they seldom went wrong from actually not knowing how. Though we may use the same style, still our so-called Gothic is infected by the same affected spirit; and, in this age of competition, the most sensational design is usually the favourite. Sensationalism is as bad in its way as dullness: both are artificial and wrong; and, to break up a design into small masses for the express purpose of making it picturesque, is a distortion of the great guiding principle that should animate our designs, which is, that all the principal beauties should arise from the inherent nature of the plan and arrangements.

LIVERPOOL.

## WASTE LANDS OF IRELAND.

LONG A prey to internal commotions, the improvement of this island was retarded, and the natural increase of population repressed, whilst the advance of commercial interests shows but feebly in comparison with those of the other internal portions of the British empire. In extent exceeding a fourth part of the United Kingdom, having a fertile soil, fair mineral resources, and a climate most favourable for agriculture, the whole area may be computed at 21,000,000 acres, of which nearly 13,500,000 are arable and pasture, nearly 500,000 acres are covered with lakes, and about 8,000,000 acres,—more than one-third part of the whole surface,—are waste land or bog, the latter being estimated at 6,610,680 acres.

Possessing great and varied mineral resources, fine harbours, and open to the advantage of teeming hays and pteuous fishing-grounds, the productive energies of a population notably industrious in all other countries whither they emigrate, have never been evoked in their native land.

Notwithstanding all these natural advantages, we find that the population, which in 1847 was 8,000,000, has dwindled to little over 5,000,000; and that the great exodus caused by the year of famine was directed chiefly towards America,—a less favoured land, where the strong arm of labour, and that only, could assure subsistence to the crowds who there have since wrought out an independent subsistence.

It would be useless to investigate the causes which conducted to this wholesale emigration of one-fourth part of the population in ten years, or to ascribe their condition to the want of trade, or manufacture, or education; and equally so to reflect upon the turbulent and factions social state of the country, which has been chronic since Edward II. held the first Parliament in Ireland, A.D. 1327.

In the year 1641 the population of Ireland was recorded at 1,456,000, at which period that of England exceeded 7,000,000; and notwithstanding the grants of lands forfeited by successive rebellions, to settlers and English soldiers, still, in the year 1702, there was a diminution in numbers returned by the census of that year of 136,000,—the total number being 1,320,000; and again, in 1785, the whole population only numbered 2,845,952.

In the year 1800 the consolidation of the two kingdoms was accomplished, and the Act of Union passed, since which the population increased at a rapid rate, the returns for 1805 fixing the numbers at 5,937,356, or more than doubled in twenty years!

It would be fallacious to argue that the increase to 8,000,000, in the year 1847, a period of only forty-two years, was a proof of prosperity; the famine of that year, the desolation and emigration that followed, clearly demonstrated the inability of the island to meet the awful visitation; yet we find, that despite the want and misery of the masses, the trade and commerce of the country had wonderfully advanced, and that year by year the imports and exports, the customs and excise duties, continue steadily to increase, even up to the present date: not only is the status of the better classes much elevated, but the condition of the cottiers, called here the working classes, is also ameliorated; they are now better clothed, better fed, and better educated.

There have been in this century, it is too true, futile attempts at rebellion; one in 1803, which may be enumerated as the fifty-third that had been suppressed within the lapse of three centuries under British rule, and a futile attempt to assert Irish independence in a cabbage-garden, anno 1848, when Smith O'Brien and his accomplices were transported; but these had small sympathy from the enlightened inhabitants of the land who had tasted the sweets and the security of British protection and legislation. As to the recent Fenian fanaticism, although the complicity of a large section of Irish refugees in the American Republic may lead to it the semblance of support from a powerful and free people, the fanciful development of such futile treason, and its disavowal by all that is respectable in the United States, as well as by the Roman Catholic Church in Ireland, expose the mischievous attempt only to the contempt of all sentient men.

If this last commotion has prejudiced the interests of Ireland, and disturbed the national equanimity, it has also afforded abundant proof that all that is respectable in the land, together with four-fifths of the whole population, are not only averse to that wild and wicked conception, but they are loyal to the Crown and Government of the State; and what is of still greater value, it unmistakably discovers that the hierarchy and pastors of the Romish Church view their fiendish plots as inimical to law, order, and religion.

Thus a new era has dawned upon Ireland, and the time has arrived when the Legislature may with confidence adopt measures for the restoration of order, for the improvement of the condition of the people, and for the extension to the sister island of a share in that prosperity which England so eminently enjoys.

The great evil and the crying plaint of the Irish peasantry have always been that nature had made their country fertile, but that there was no place left for them to till; that the lands were one-fourth part waste, but that there existed no provision authorizing them to reclaim and cultivate it; that while the ox was fattened, and the land teemed with sustenance, they were left to starve; the cottiers were evicted; and yet there was no labour market open to them. Is it then to be wondered at that, when the fore-runners of emigration tasted in America the fruits of labour and industry rightly applied, they lured their kinsfolk across the Atlantic to participate in results which persevering industry obtained in a less genial clime, from a soil even inferior to their beloved Erin?

It has been proved from undoubted statistics, that there are vast tracts of bog and waste easily reclaimable; that there is a redundant and unemployed population amounting at least to a million, whilst three millions of acres remain, and have been for ages, in a state of utter desolation! If this were a new discovery, it might be thought a providential interposition; but these facts have been palpable, and have been often announced by various writers, for fifty years: Sir Matthew Barrington, Sir Richard Griffiths, and Mr. R. M. Martin (author of the "History of the British Colonies"), have often forcibly proclaimed them.

As to the feasibility of reclaiming such vast tracts, and dedicating them to agriculture or pasture, there are abundant evidences; as also as to the value of the soil when so reclaimed; examples are cited by Mr. Martin of bog land in Limerick, with a depth of 20 ft. of peat, which was not worth 2s. 6d. an acre, but which on being drained and warped, was worth 30s. an

acre per annum; and also of mountain and waste lands in the counties Monaghan and Galway which repaid by the second year's crop the whole outlay of reclamation. What is required is not the fencing in of mud lands from the sea or from lakes, but only the reclamation of bogs and wastes by drainage, dressing, warping, and fencing.

Such wastes and such bogs are spread over every county of Ireland; but as arterial ducts and canals on an extensive scale would be required to carry off the water, and as these would influence many square miles of country vicinal to the line, private enterprise could not cope with the difficulties and expenses of works which, when effectuated, would serve as outfalls for large tracts above their drainage levels, but not subjected to their operations. There would also arise difficulties in obtaining the concurrence of great proprietors, unless, by Act of Parliament, and the favour of Government to such a project, all bogs and waste lands coming within the influence of amelioration and drainage by such means were made liable to an acreable charge for the expenses incurred; or that the great and motionless proprietors should be obligated to lease them to farmers, under the Commission, at a rent proportionate to their former *unimproved value*.

Whilst Great Britain imports from abroad so large a quantity of daily pabulum for her growing multitudes, the acquirement in Ireland of even one million acres of pasture land would be a gain to the whole community; whilst such a consummation would give employment and comparative independence to a million of our fellow-subjects, at present without an acre for spade cultivation, and houseless except in those instances where a acre and a novel are rented by them at 5*l.* a year!

The production of butcher's meat alone on two millions, or even one million acres of rich pasture, would thus be a boon and an indemnity to the population at this side of the Channel, as it would be a work of mercy to the Irish people, hitherto snuffed to pine in indigence, to plot rebellion against the Government, which appears so regardless of their condition, or to scrape together so many shillings as may transport them to distant and free lands, unreclaimed and wild, where there is an open market for willing labour.

The writer has for some time endeavoured to establish a company of mixed organization, consisting of Irish notables and English capitalists, to carry out such a project upon an extensive scale; but although numerous M.P.s and proprietors favoured the idea, and still cherish the hope of success, none could be embodied without Government support. The recent condition of Ireland has not been favourable enough to induce capitalists to hazard money on investment of Irish *terra firma* or Irish bogs; but if an Act of Parliament were obtained, and a guarantee by Government of only 3½ per cent. upon reclaimed lands, it is hard to suppose that valid security so near home should not command support at least equal to investment in foreign railways or other commercial schemes.

The success of such a project,—and under the aegis of Government there could be no doubt of it,—would at once change the whole face of the island, and the character and condition of its inhabitants, while their natural faculties would be brought out. It might not at once stop the exodus, nor would it be desirable to thwart the tendencies of emigration amongst an overcrowded, a dissipated, and destitute people; but it would form the basis for a more contented and prosperous regime, and substitute loyalty for the germs of discord. Happily the subsidence and total failure of the Fenian folly, and the manifest loyalty of nine-tenths of the population, including all that is respectable and industrial, augurs well for our national prosperity. What benefits Ireland must benefit England, and the industry which rescues millions of acres from desolation, converting sterility into teeming abundance, would amply repay the outlay, so comparatively small, by supplying to millions the products of the reclaimed wastes. As to the erection of small but suitable homesteads, which the Irish peasant never had, the increased value of reclaimed lands might justify hereafter the advantage of funds in aid to secure so important a provision. T. H. H.

THE BRITISH MUSEUM.—A refreshment-room has just been opened at the British Museum, for the convenience of visitors to that establishment.

#### THE LATE SIR CHARLES EASTLAKE.

CHRISTMAS, in Queen Victoria's reign, has been Campo-Santo-mooded "towards and about" Carthusian scholars. Thackeray and John Leech have been newly taken from among us,—the former at Christmas-tide 1863; the latter at Christmas-tide 1864. Both lie

"A little interval between."

And now Christmas-day, 1865, has brought to London, on electric wires, the not unexpected news (shall we call it?) that the representative in presidential person and Italian arranged palette of English art is no more.

The lines (the words, rather) are to the purpose:—

SIR CHARLES EASTLAKE,  
died  
at Pisa,  
December, 1865.

Telegraphs are quicker than they were some quarter of a century since (1841), when they carried to Sir Peter Laurie—Union Bank—word that Sir David Wilkie died on the Mediterranean, and was buried in it. What art in England has lost in Sir Charles Eastlake we will not attempt to guess; what our Royal Academy of Arts, in Trafalgar-square (London's centre), has lost it is easier to tell. Sir Charles Eastlake—beyond his art—was a conciliatory gentleman; proud with purse and without purse; one well read in books, and in spite of nature, educated in art as he was, well read in mankind.

Sir Charles was wrapt up in his art,—his soul was in his calling,—what he attempted he did to the best of the powers allotted to him. But wise Mrs. Jameson said, that the race,—or succession,—(to use a longer word) of Virgin Mary painters went out with the Reformation.

Whilst St. Paul's is open we must indulge rather in regret than in idle sentiment or needless panegyric.

It has been seldom found that a painter cares much about a sculptor, or, indeed, an architect; Reynolds did not enter into the poetic soul of Banks; West looked upon far-soned Flaxman as an undrabbed Quaker; Sir Thomas Lawrence, liking what he did not understand, for the sole sake of peace or forbearance, threw himself into the *paid* hands of Keeper Fuseli.

To unange forty men, to leave the ruck, and to keep them within themselves, is an art which Sir Joshua did not care to understand,—and Sir Charles did understand. To replace a president like the gentleman and the bland "courtier" we have lost (and must miss) will not be an easy matter of "circumlocution" or detail. The question of his successor will be a difficult one.

That the name of Eastlake will be spoken of hereafter with honour by future Walpoles, Waagens, and Wornams, we have no doubt.

#### THE PREVENTION OF STRIKES.\*

The demeanour of the workmen when occupied with their duties, is the subject of several "Articles." Thus, it is said that the place of work once arrived at, in the morning or after the meal-time, the workmen ought not again to go away,—as men do sometimes, the foreman at the head, to get "a drop" without any necessity other than the passion for drink; for, besides that the work suffers, there results a very bad impression against the establishment, on the part of those who witness such occurrence. To smoke in the place of work is forbidden to the workmen and *employés* of each class, not only because it has had consequences in one respect, but because joined with the smell of paint it is disagreeable to those visiting the works,—the persons being often ladies. A stranger is not allowed to come upon the works, on any pretext. No workman, in the absence of the foreman, is to enter the premises where the work is in hand, without a line in writing, signed, the day of his presenting himself, or day before, by the head of the concern: this writing he has to show to the door-porter of the premises. Ordinarily, careful workmen deposit things belonging to them in rooms or cupboards, of which they keep the keys: this, the rules say, ought not to be the practice; since, in case of accident, people might suffer wrong imputations. The keys, ticketed, should be deposited in the warehouse of the colours and utensils, or with the door-keeper. When work is about being done where there are

valuable articles lying about, the workmen ought to desire that the things be locked up, or that some one be set to take care of them. And it is said:—

"The honour of a workman being his entire fortune, he cannot too much guard against the accidents that might injuriously touch it."

Every workman late in the morning, or after the meal-time, is expected, that every evening, to say at the office, or to send, a word stating the time lost. If he be obliged to absent himself for the day, he is to give notice beforehand to the establishment, and to acquaint his immediate superior, or he will be considered as having left altogether; and on re-entering, he is to apply for orders, to the office, and get his instructions; or the foreman will refuse him. No workman is to go to execute orders without being sent by the foreman; and the workman is not to quit the office without inquiring if there is anything to say where he is going.

In a note, M. Leciaire refers,—as he had in the rules, of earlier date, noticed in our last article, of the Society,—to the asking for treats and drinking-money. He says,—

"We lay down no *Articles* with a view to interfere with the keeping 'Monday'; it might have been thought for our workmen; who at all times have understood, like ourselves, that this day is devoted to work."

The introduction of an *Article* to forbid demands for drink-money, was not necessary, more than the other. Our workmen have all alike understood that these descriptions of demands are not only humiliating for him who makes them, but moreover offensive to those to whom they are addressed; they are, besides, sufficiently reprobated with their dignity of man, to know that everything ought to come to them from work.

When illnesses, or some unforeseen misfortunes, place them in the necessity of accepting the succours that may be offered them by a gentle philanthropy, it is not already sufficiently hard for them,—without their proceeding to humble themselves, to demand, in some sort, alms, when they are in full vigour, and when jobs are not wanting to them?"

He repeats, however, the admission, that there is a distinction between a "*pourboire*" asked for, and a gift offered: he intimates that to refuse the latter might be a want of respect,—the act not being one of charity, but a testimonial of satisfaction, which the workman would accept for the Society, as directed in its rules, feeling that the destination could be only approved by the giver without ever humiliating the receiver.

There are modified regulations applicable to the case of works in hand in the country. The wages are paid one day later, and the workman makes out his note a day earlier than in the town; and he includes in the note his travelling-expenses, and advances that he may have received. Arrangements are made for the workmen getting more remunerated time per day, than can be got in Paris. The *écages* are the same as the town-rate, namely, 50 centimes (4*d.*) per hour; whilst one franc a day, additional, is allowed for expenses, whatever the season or length of day. The hours of work cannot be changed by the foreman without authorization. The expenses of the journey, from and to Paris, are paid: also, time during the day, spent in the railway-carriage or diligence, is paid for; but time so spent at night, is not. When the journey is long, and by railway, the workman may be authorized to make use of the second class. Exception is made to the payment of return-expenses, where a workman does not wish to remain in the country during the entire duration of the works, or is dismissed for misconduct. But the return-expenses are paid in case of illness, certified by the physician of the district. The time spent on the journeys, and that of the first and last days, is paid for at the same rate as days in Paris. When the workman leaves for the country, he is specially directed as to the course to take so that money may be paid to his order in Paris. His wife, or other representative there, can receive no money on his account without presentation of the order from his hand, countersigned by his foreman. The foreman receives the papers, or *bons*, from Paris, with the amounts of the salaries, and hands them to the workman as money. Before leaving Paris, the workman squares accounts at the office; and there are given to him, besides the price of his fare, five francs in advance. The foreman holds money that may further be required. Before starting, the workman furnishes himself with his *livret*, visé by the commissary of police. This measure is merely in obedience to the French law; which requires every workman to be in possession of the *livret*, the little book that serves in place of the passport of ordinary travellers. It is pointed out that country-inkkeepers and dealers have generally an opinion of the workmen of Paris not favourable to the latter, and that to reas-

\* Vide pp. 737, 768, 771, 811, 845, 867, 884, *ante*.

sure those parties, the men should pay their expenses daily. When a workman comes back to Paris, he hands in to the office the documents having relation to his claim, countersigned by his foreman: what is due is paid to him on the following Saturday; or, in case of necessity to fix another day, he receives something on account: though, should he have again to go to the country on the day even of his return, a settlement takes place before his second departure. The workman is bound to take charge of, on each journey, tools and goods to the weight that the railway or diligence company will allow.

Certain special regulations have to be attended to by the foremen of works in the country. There is handed to the foreman on his departure, in exchange for his receipt, a sum from which he is to pay his own fare and the amount for excess of weight of the materials and things taken by himself and his companions. His receipt is handed to him when accounts are balanced on his return. The foreman also takes with him, 1. A letter of installation and introduction; 2. The itinerary of the route to the destination, with the hours of departure; 3. Documents, relative to the works in the country, prepared specially on blue paper; and 4. Tools and materials in sufficient quantity for use to the time when he may demand in writing a further supply. On receipt of these latter, he sees if anything has been damaged; and if so, he specifies the loss to those who were charged with the carriage,—availing himself, if necessary, of witnesses, and of the form of summons by the proper legal officer. On arrival at the locality of the works, it is the duty of the foreman to inform himself, and send particulars to head-quarters, concerning the cost of materials in the neighbourhood. Thus, for painters' work, he ascertains the cost of linseed oil and turpentine per 100 kilogrammes; and if there be distemper work, he ascertains the price of white. He also ascertains the quickest and cheapest modes of transport, and whether the journey can be made by night; and the readiest means of sending the money for wages, giving the address as exactly as possible. He is to send a weekly report of the state of the works, and has to conform to special regulations mentioned further on.

The accounts for the workmen in the country are kept, in Paris, from the documents or papers (*feuille d'attribution*) connected with the particular works, and from the notes of declaration of time, that the foreman sends every Thursday, having verified and signed them; the notes, having been delivered to him on the Thursday morning, by his men, but inclusive of the Friday, and not omitting mention of the expenses and advances. The documents should be received in Paris and remitted to the foreman, with money, so as to enable him to pay on the Sunday, and again send the documents to Paris. Each workman paid signs his name. Should time happen to be lost during the Thursday and Friday, that had been marked beforehand, the foreman keeps back the proper amount for it; and gives notice to the officer at head-quarters, in order that the account may be corrected at the next time of payment. If the foreman is sending men back to Paris, he makes out an account of their time, and sets down the money that he gives them. No workman is sent back, so long as he owes anything in the locality; but should he be short of means, by reason of his having to be sent back in the period between two pay-days, the foreman would pay for him, and give notice to head-quarters. The "*Articles*" says that the head of the concern attaches essential importance to there being nothing that can give ground for malevolent reports against the persons in his employ. In consigning things to the care of a returning workman, the foreman gives to him a list of them; which the workman has to deliver at the office of the establishment on arrival. When he sends things back by other means, he makes out two lists, one of which he gives to the carrier; and the other (on which is noted any price agreed on for the carriage), he sends by post, so that it may arrive first. The directions to be observed on the foreman's return, are equally precise. Thus in sending back a ladder, he is to put the direction on each arm, or pole, of it, even when the two arms are tied together. Having sent off everything, and not till then, the foreman returns to head-quarters; where he delivers the certificate of the proprietor or architect, attesting that the works have been done in accordance with the orders, and also delivers the documents having relation to the accounts.

The foremen, and their duties, form the subject

of the most considerable section of the "*Articles*." The foremen are divided into three classes. A foreman of the "first," or rather the lowest, class, receives during the time that he is in direction of works, for each day, 50 centimes above the pay of 5 francs: he of the next class receives, in like manner, 75 centimes; and the foreman of the "third," or highest, class, receives 1 franc. The extra sums, beyond the pay of the ordinary workman, are given to the foreman only at the end of December and on the 15th of February of each year, unless he should be leaving the establishment: in that event, payment is made as soon as he has given in his accounts and fulfilled his engagements. The workman adopted as foreman receives a basket of tools belonging to the establishment, and becomes responsible for everything. He only resigns some of his immediate functions to foremen of particular branches, who direct their own men: but he would interfere were there apparent necessity. In short, the special foremen are to come to an understanding with the general foreman; whose decision is to be taken under all circumstances. The general foreman is expected to understand that those who come for short periods of time, to help, on his works, require to have their labours facilitated as much as possible: he will therefore be ready with ladders, tongs, and materials of all kinds that they may need. When the special foremen do not remain on the spot, the general foreman will take their instructions and execute them. The foreman of the works of external painting or plastering, has generally more reason to be aided in his works, than any other. The hints that the latter has to apply are to be prepared by the foreman-painter. It is observed that the greatest harmony should reign between all the foremen,—since they work all for the same head of an establishment; and when there are several works going on in the same neighbourhood, mutual assistance should be given with tools, materials, and men.

"Every difference between comrades should rest at the door of the workshop. The duty of the foreman consists in acting only with the greatest justice towards all the men who are under his surveillance,—in having regard neither to nation, nor country, nor honour of each; but only to the good conduct and aptitude of the individual: he ought in giving his orders, especially to deal tenderly with his self-love of the person,—to incline rather than command,—the head of the establishment exacting nothing but the accomplishment of the reciprocal duties, and the exact execution of the regulations.

Every injustice on the part of the foreman ends but in compromising the interests of the concern: it is for the just man to do to others only that which he would wish should be done to him.

The foreman knows by experience, how it is little agreeable to publicly receive imperious orders: he knows, besides, that at the point of civilization where we are; it is not fear that inspires men with respect and obedience, but voluntarily resign.

In fine, when a workman comes to work for some hours in a place of work, the foreman ought to give him by preference, work of an agreeable sort.

The foreman is authorized to select a workman to second him, or, if necessary, to replace him. In the latter case, the workman's responsibility becomes as that of the foreman; yet he is not to demand the extra pay, unless after having received a letter from the head of the establishment to the effect that he is accepted as foreman, or under-foreman; in which case he will get the pay of the foremen of the lowest class.

When the importance and extent of the works require more than ten workmen at once (as in the case of works, mentioned afterwards, to be executed in a short space of time,—as in a single night), the foreman ought to divide the whole body of men into groups of ten men to each group,—demanding at head-quarters, the help of a foreman for each group; and each foreman of ten men being under the direction of the chief foreman in the case. Orders given by the head of the establishment are to be executed scrupulously, without discussion of results; otherwise, defects ensuing would have to be made good at the cost of the offender.

The foreman being called to represent the concern, his appearance ought to be befitting the work; and he ought to keep up his rank.

"Charged with the direction of the works, no one but he is responsible; and the faults of the men under his orders are considered as his personal faults. If he were not severe on those who swerved from their duties, he would have to render account of them."

The foreman also is responsible for lost and broken tools, and materials that have got mixed. Certain regulations following, as to the commencement of works, are similar to some that have before been referred to. There are given to the foreman:—1. A letter to acquaint the architect, or proprietor, with the foreman's name

and mission; 2. A paper on which he is to set down day-work of the men and apprentices, and the time of the measurer,—which paper is to be inspected by the head of the concern when he visits the place; and, 3. A paper of instructions relating to the works. He demands tools and materials, and then men. When the works are finished he gives in, on the very day, his last statement; in which he will mark if the works have been measured; and if there are remaining, tools, or something to be done. If the importance of the works is not such as to require measurement, he states what materials have been employed. Lastly, if observations have been made to him by the proprietor or his architect, he mentions them. In case of decorative-painting, he has generally to give a separate statement for each matter, and not omitting the name of the person who has executed the work, besides information whether the latter is *artiste* or pupil.

He is never to absent himself from the works in hand: but if he wants materials, he is to send one of the workmen, in the morning, to head-quarters; or if he wants anything in the day, the man sent is to note down the object of his coming, in a book, that is kept at the office, and to affix his signature. When circumstances require a larger supply of the things wanted, the foreman is to make use of printed forms mentioned afterwards. When he receives the materials, or tools, he signs a receipt for them on the original order-paper remitted with them.

On the first day at a fresh place, after giving to the *concierge* his name and that of the concern,—so as to avoid delay in receipt of letters,—the foreman, with the assistance of the architect or proprietor, examines the condition of the premises, noting down such things as chimney-pieces, and panes of glass, broken, and bells out of order; and on the termination of the works, he makes a similar survey, noting the state of everything, before locking up and delivering the tools. In painting or colouring the fronts of houses with the aid of the contrivance which is suspended from the roof, the foreman ought not to go upon the roof at first, without having with him the chief man of the roof-covering branch of the business of the concern, who is to give the foreman a note of the price of the reinstatement of defects then appearing; and when the painting is finished, the same functionary is to be again called,—that is, to value the new defects, and give a memorandum thereof; which the foreman preserves. In default of these formalities, the cost of reparation of the roof-covering is to fall on the foreman. When works are suspended, the foreman returns his *feuille d'attribution* and *état de travail* (papers already alluded to) to head-quarters of the establishment, and notes down the state in which the works are left, the day and the cause of the suspension, and the date when they should recommence.

Some suggestions in reference to the saving of expense in details, apply so exclusively to painters' work, that we put them aside. But with these are observations that may be quoted. M. Leclaire says:—

"When there are in progress works in an inhabited house, the foreman watches that no injury be done in the rooms where work is not going on; he does not in the least permit that the workmen rest there during the hours of refreshment; and in the evening, on quitting the place of work, he takes care to close the windows, or at least the shutter-blinds (*persiennes*), so that the wind or rain may spoil nothing during the night.

He takes care, besides, that the staircases are not in any degree dirtied; that neither dust nor dirty water is spread in the courts; and that dirty water or refuse are not thrown into the closets.

If in spite of the precautions taken, some injuries occur, the foreman will cause them to be repaired at the cost of the establishment.

Finally, if observations be made as to certain portions of the work being executed otherwise than the parties would have desired, he will execute those works over again, if the individuals require it. He will avoid observations tending to prove that the person is in error; for, the best reasons can never justify a defect."

The next "*Articles*" of the "*Règlement*" concern the relations of the foreman with proprietors, and architects, and with actual occupiers of premises. We must treat of these in another paper.

ST. JAMES'S TOWER, TAUNTON.—The churchwardens have been stayed in their intention to proceed with the entire rehailing of this tower, by an adverse vote of the vestry. It is to be hoped they will not endeavour to proceed further without special guidance by professional advice.

ROYAL SURREY THEATRE.—Ground Plan.

ROYAL SURREY THEATRE, BLACKFRIARS ROAD, LONDON.—MR. JOHN ELLIS, ARCHITECT.

[See p. 918, ante.

## THE ARCHITECTURAL ASSOCIATION.

The usual meeting of members was held on Friday evening (the 22nd inst.), at the House, in Conduit-street.

The chair was occupied by the president, Mr. R. W. Edis.

The following is the scheme of prizes for the session 1865-66, as arranged by the committee:—The Association prize, of two guineas and a half and one guinea and a half, respectively, to the designers of the best and second best series of sketches contributed during the session; a prize of the value of two guineas, for the best summary of the subjects treated at the meetings of the class; a prize of two guineas for the best series made by members of the figure-drawing class; a prize of two guineas and a half for the best essay on the influence that the works and practice of architects of former days should have on the architecture of the present day; the president's prize of five guineas, for the best set of sketches from existing buildings in England or abroad, of date anterior to 1700; the Architectural Union Company's prize of 5*l.* for the best design for a pair of dwelling-houses, the cost not to exceed 700*l.* the pair; the Association prize of 2*l.* 10*s.*, for the second best design on this subject; Mr. Tite's prize of 5*l.*, for the best design of a street elevation, with details of a shop front; Mr. Godwin's prize of five guineas, for the best essay on improvements in the artistic design of ironwork generally for modern domestic purposes, with sketch designs illustrative of the subject.

Messrs. Charles F. W. Whitley and J. W. Kennedy were elected members of the Association.

Mr. Plumbs read the report of the sub-committee appointed to consider the best means of obtaining the publication of the transactions of the Association, which, after a short discussion, was agreed to.

Mr. J. D. Mathews (honorary secretary) then read the prize essay on "The Materials most appropriate for London Exteriors," and submitted specimens, including stone, brick, tiles, terra-cotta, artificial stone, &c. His opinion on the whole appeared to be that the best stone for the London atmosphere was Portland, when well selected.

Mr. Blashill, in moving a vote of thanks to Mr. Mathews, observed that, in his opinion, any material for London exteriors which required frequent painting was wholly inadmissible. All porous stones might, he thought, be avoided; and that the great object should be to get a stone which would polish, or rather rub, like the Mansfield stone,—something, in fact, which would not absorb the smoke, nor be affected by the injurious acids incidental to the London atmosphere. While on this subject he suggested the desirability of steps being taken to cleanse the street statues and monuments from the accumulation of filth upon them.

Mr. Lemon pointed out objections to the use of terra-cotta, except in combination with brick-work; and, observing on the best stone for London buildings, said that he believed Portland would last much longer than it did if means were taken to have it properly cleansed from the accumulation of deleterious matter to which it was subjected.

A member inquired whether Mr. Mathews had found any bricks of less than 3 in. in thickness? Bricks of 1½ in. or 2 in. thick, were used with very good effect at Rotterdam, and other cities of the Continent.

Mr. Mathews said, he did not know of any brick being manufactured of less thickness than 3 in., except the glazed ones made in Antoin.

Mr. Colling advocated the use of terra cotta, on the score of durability, and explained that the great difficulty in dealing with it, was to procure it without twist in it.

Mr. Ridout suggested whether slabs of tile with conventional ornamentation, might not be appropriately used. Such slabs might be fixed by means of projecting grooves of brick. They could also be used for the reveals of windows instead of cement, which often decayed, and required periodical painting. He suggested also whether it might not be possible to introduce mosaics, such as those made by Mr. Rust.

The Chairman observed, that he had had some experience of terra cotta, but that he had been obliged to abandon it in consequence of its twisting. He did not think that an artist who put his thought and feeling into the design for ornamental work, could possibly get them faithfully reproduced in terra cotta. Then with re-

gard to stucco, too, he might say that he did not approve of any medium which could be used to gloss over defects. He had also had some experience of marble for London exteriors, but he could not recommend it, as the polish soon became obscured with dirt, and the marble resembled common stone. He thought the Association was much indebted to Mr. Mathews for the great care which he had devoted to the preparation of his very interesting and useful paper.

The vote of thanks was unanimously agreed to. It was then announced that the next meeting would be held on the 5th of January, when Mr. Britton would read a paper "On Fir and Pine as used in modern Buildings."

The class of design will re-assemble on the 12th of January, when the subject will be the west window of a cathedral.

## THE INSTITUTION OF CIVIL ENGINEERS.

The annual meeting was held December 19; Mr. John Robinson McClean, president, in the chair.

The report said, there seemed to be no reason why, at this time, any limitations should be introduced, or any restrictions be imposed, tacitly or otherwise, which might operate to render less comprehensive and complete the perfect embodiment of the profession in the Institution; and in that view efforts should be directed to consolidate all branches under one corporation, and thus to add materially to the power, influence, and importance of the profession at large.

The tabular statement of the transfers, elections, deceases, and resignations, showed that the number of elections had been 142; of deceases, 21; of resignations, 5; and of ceasures, 8; leaving an effective increase of 108, and making the total number of members of all classes on the books on the 30th of November last, 1203.

An examination of the statement of receipts and expenditure showed that, during the year ending the 30th of November last, the receipts from subscriptions and fees alone amounted to 3,950*l.*, as against disbursements of all kinds of 3,511*l.*; while the income account was further increased by the dividends upon trust-funds amounting to 353*l.*, and upon other investments (not being in trust) of 400*l.*, as well as by miscellaneous receipts to the extent of 350*l.* The realized property of the Institution now comprised—1. General Funds, 12,510*l.* 3*s.* 6*d.*; 2. Building Fund, 2,502*l.* 5*s.* 5*d.*; and 3. Trust Funds, 9,970*l.* 12*s.* 7*d.*; making a total of 21,983*l.* 1*s.* 6*d.*, as against 22,541*l.* 5*s.* 6*d.* at the date of the last report.

The Benevolent Fund, established in connexion with the Institution, twelve months ago, had since been fully organized, and a committee of management appointed, who would in due course have to report to the subscribers to the fund. It might, however, be stated, that the donations actually received amounted to 22,782*l.* 17*s.*, and the annual subscriptions for 1865 to 712*l.* 16*s.*

The following gentlemen were elected to fill the several offices on the council for the ensuing year:—Mr. John Fowler, president; Messrs. Joseph Cubitt, C. Hutton Gregory, T. Hawkley, and J. Scott Russell, vice-presidents; Messrs. James Abernethy, W. Henry Barlow, J. F. Bateman, Nathaniel Beardmore, J. Brunel, T. Elliot Harrison, G. Willoughby Hemans, John Murray, G. Robert Stephenson, and C. Vignoles, members; and Messrs. Joseph Freeman and John Bell, M.P., associates.

## GLASGOW INDUSTRIAL EXHIBITION.

The building in which the exhibition is held at 99, Argyle-street, contains four large floors or flats, with ante-rooms. The ground floor of the exhibition contains upwards of one hundred models of stationary and locomotive engines of varied and novel construction, ingenious mechanical apparatus, extensive collection of coloured and photographic mechanical illustrations, specimens of artistic relief, works in malleable iron, &c. Then in the first gallery, in addition to the bust of the Prince Consort, and Messrs. Wylie & Lochhead's drawing-room, there are groups of stamary, richly inlaid cabinet and glass work, collections of Chinese and other foreign ornaments and curiosities, valuable contributions of articles of *verru* in gold, silver, enamel, and alabaster, and ladies' fancy work of all kinds. The second gallery embraces an extensive collection,

illustrating to a very minute and admirable degree the sciences of geology, botany, zoology, mineralogy, and ornithology; also, microscopes, aquariums, illustrations of chemical products, electric clocks, and illustrations of the mechanical powers. The third gallery contains contributions from gentlemen possessing the finest art collections in the west of Scotland, and others; also portraits and busts of eminent gentlemen, and paintings, drawings, and designs by working men. In the photographic gallery are specimens of the art from the best-known firms in the profession; also interesting private collections. Ante-rooms are set apart for operatives engaged in the manufacture of needles, glass ornaments, brushes, weaving of plaids, &c.; also, two large glass engines are in constant motion. Arrangements have been made for exhibiting George Cmikshank's great painting "The Worship of Bacchus."

## BUYER AND SELLER.

LINDSAY V. PRICE.

This was a suit before Mr. Commissioner Kerr, in the Sheriff's Court, to compel the specific performance of a certain agreement for the sale of a house in Elliot-court, Old Bailey, for the sum of 400*l.*

Mr. Everitt, for the plaintiff, produced the contract, duly stamped, and also a receipt for 25*l.*, paid as deposit, stating that, although every effort had been made by the plaintiff, defendant refused to complete the business. Plaintiff had sold the property to a Mr. Cox, who was a sub-purchaser; but in Chancery it was usual to make the first purchaser the party to be sued.

After evidence as to the absolute sale to plaintiff, Mr. Vigors argued for defendant that he had merely offered to sell the house, and there was no binding acceptance of the offer. It was simply an offer signed by the seller, but not by the purchaser; and if it had been signed by the purchaser, no doubt it would have been binding.

Defendant, who appeared to be very infirm, said: I am eighty-three years old, and was the owner of the house in question. I ceased to be the owner a few days ago. I sold the house then, and got 500*l.* for it, though it is worth more. I was paid for it by a 500*l.* note. I do not know the gentleman who bought it, nor even his name. I never understood that the 25*l.* were a part of the purchase-money, but only a loan.

Upon this evidence his Honour ruled that defendant had failed in his answer, and that plaintiff was entitled to a decree as prayed.

## FROM SCOTLAND.

Edinburgh.—Queensberry Lodge, intended for the safe accommodation and reformation of females in a respectable position in society, addicted to habits of drunkenness," is now, according to the *Scotsman*, rapidly approaching completion, and will be opened in May next. The building is situated in the south back of Canongate on the grounds of the House of Refuge, and has been designed by Mr. James W. Smith, of Edinburgh, architect. It is in the Scottish Baronial style. The cost of the entire building has been estimated at 4,500*l.*; but only 3,100*l.* will be laid out at present.

Leith.—The new wet-dock works are progressing. A breakwater, nearly 3,500 ft. in length, now stretches from the east shore, adjoining the glasshouses, to the pier which forms the east side of the entrance to the harbour. This bank encloses an area of 36 acres, of which the new wet dock will occupy 10½ acres, and the basin and lock about 3 acres more, leaving about 22 acres for quays, wharves, roads, &c. It has to serve for a coffer-dam, when the excavation for the dock and entrance-basin is taken out behind it. The bank is a mass of loose rubble, pitched with large square stones, founded for a depth of 2 ft. into the sand. The stonework is rendered watertight by means of a bank of puddled clay 8 ft. broad at the base and 4 ft. broad at the top. A row of cast-iron sheet-piling, tongued and grooved into each other, is driven for a length of 2,800 ft. into the centre of the clay puddle, from the level of the ground to the strata of natural clay beneath. The clay puddle is sufficiently protected by a bank of sand filling behind. The breach which had been left in the bank for the flux and

reflux of the tide has been successfully closed. At the present time, there are about 65,000 cubic feet of stone facework ready-dressed for setting in the walls of the dock. The greater part of the stone has been procured from the quarries at Craigmillar Castle, on the property of Mr. Little Gilmour. The total cost of the whole undertaking is estimated at 22,45,000. The old quay-wall having given indications of decay, the dock commissioners are at present constructing a new wall from the lower drawbridge to Broad-wynd, a distance of 220 ft.

**Jedburgh.**—Mr. Leslie, C.E., Edinburgh, has visited Jedburgh for the purpose of examining the Blackburn springs, which have been offered by Mr. Fair, of Langlo, for the use of the burgh. Mr. Leslie came to the conclusion that the various springs available would yield about 54,000 gallons per day. There are at present 3,500 inhabitants in the burgh.

**Dunbar.**—A stained glass window has been placed in the parish church, in memory of the late Admiral Hay, of Belton, and three of his sons. The window is one of the two large ones in the east end of the church, and one on the right side of the pulpit has also been fitted with stained glass. Both these windows are large, being about 23 ft. in height by 9 ft. in breadth. The artists were Messrs. James Ballantine & Sou, of Edinburgh. The subjects in the three upper compartments are—“The Raising of the Widow's Son at Nain,” “The Angel appearing to the Marys at the Tomb,” and “The Raising of Lazarus.” In the lower compartments the subjects are—“The Centurion's Faith,” “The Visit of Nicodemus,” and “The Lifting of Peter from the Waves.” The space at the top of the window, consisting of a good deal of open work amidst ornamental mullions, is filled up with scrolls emblematical of peace.

**Alcoa.**—The new county buildings and sheriff court-house, for the county of Clackmannan, at Alcoa, have been formally opened. The building, which fronts to Mar-street, is in the Flemish Gothic style of architecture. The sheriff's court-room is a ball on the upper floor, capable of accommodating 500 or 600 people. The entire cost of the building is about 8,000*l.*, half of which sum has been defrayed by Government.

**Greenock.**—The large east triplet window of the Old West Church, and two single lights, also in the east elevation, have been filled with stained glass, the former illustrating “The Last Supper,” the centre light containing our Saviour with St. John, and the side lights containing the remainder of the Twelve Apostles. This window is presented by Sir Michael R. Shaw Stewart, bart. The two single lights are memorial windows. These windows, along with the other stained windows in the church, were designed and executed by Messrs. James Ballantine & Son, Edinburgh.

**Dunbarton.**—The Burgh Hall has been formally opened. The style of the hall, and the academy immediately in front, is French Gothic. The building presents a frontage of 133 ft., having a central tower 145 ft. high. The public hall will accommodate about 750 persons, and the total cost of the building will amount to about 7,000*l.*

ETIOLOGY OF THE CATTLE-PLAGUE.

THE cases which occurred in the establishments of Lord Granville and Miss Burdett Courts are supposed, with others, to have shown that cleanliness was no great preventive—that filth was no predisposing cause—of cattle-plague. In what we have frequently said in the *Builder*, not only filth, but overcrowding, and not only overcrowding, but want of ventilation, were explicitly pointed to, before the cattle-plague appeared, as all of them but too probable elements of some future plague; and after the plague did appear, we still dwelt upon these elements as probably comprising amongst them the predisposing cause of the disease. Some farther light upon this subject appears to have been shed at a recent meeting of the Cattle-plague Commissioners, when Dr. Ballard, the medical officer of health for Islington, presented a statistical table, containing a list of the cowsheds in England, arranged in the order of their attacks, showing the cubical capacity of each; the cubical space allotted to each cow in the several sheds; the habitual cleanliness or dirtiness of the sheds; the source of the water-supply; the situation of the dung-pit, whether within or outside the shed; the number of cows habitually kept; the number of cows attacked and dead since the

outbreak of the plague; and the results of disinfection. Most of the results deducible from these statistics were given *in vivo* in the evidence. *The Medical Times*, in giving an account of this table and of the evidence, says:—

“Taking the cleanly and habitually-neglected sheds, the outbreaks have been about the same proportion in each. Dirt alone does not appear to have generated the disease in the establishments in Islington. There are, however, three conditions which Dr. Ballard's experience seems to show have exercised some influence in predisposing to the outbreaks in the sheds. One of these conditions was the *crowding of the cows* within the sheds. The cubical space allotted to each cow in the sheds which had become infected was on the mean 606 ft.; while in those which had remained free up to the end of November, the mean space per cow amounts to 1,000 ft. and upwards, four sheds, or 44 per cent., were attacked; out of twenty where the cubical space per cow amounts to from 600 to 1,000 cubic feet, fourteen, or 70 per cent., were attacked; and out of forty-four sheds, varying in capacity from 200 ft. to 600 ft. per cow, thirty-five were attacked, or a proportion as high as 79.5 per cent. Another condition which appeared to favour the outbreaks in the sheds was the custom of some cowkeepers of *staring their dung in a pit situated within the shed itself*. . . . The third condition referred to is the *source of the water supply*. . . . Similar proclivity to suffer from lung disease was manifested in 1857 in sheds which were crowded, and where the dung was stored within the shed; and deduced from this that the influence exerted by these conditions were not to generate the cattle-plague poison, but to predispose to its operation.”

*Disinfection*, by means of lime-whiting and the free use of chloride of lime, is shown by the table to have been efficacious as a preventive.

“These observations,” continues the *Medical Times* “are important not only on account of the light they throw upon an obscure point of etiology, but also because they show that similar conditions operate in promoting allied maladies in man and in the animals which he keeps for his service, and that similar rules of sanitary administration are applicable to both. . . . The influence of crowding, fermenting fecal accumulations, and contaminated water (in the case of cholera and typhoid especially of contaminated well-water), are recognised facts in human etiology.”

From Dr. Ballard's statistics it would appear that cattle-plague, in his opinion, partakes of the nature of typhus.

LEEDS LADIES' SANITARY ASSOCIATION.

The annual meeting of the Leeds branch of the Ladies' Sanitary Association has been held in the Philosophical Hall, Leeds, the Bishop of Ripon in the chair. The report read by the hon. secretary stated that “amongst the operations of the Society was the diffusion of sanitary knowledge by means of tracts, about 3,000 of which had been distributed, and the beneficial effects of which had been very great. They had also granted quantities of sanitary articles, including some cwt. of soap, and a great number of brushes, pails, flannel, floorcloths, lime, &c. It was not, the Association thought, foreign to their objects to ask why Leeds people should die earlier and in greater proportion than the inhabitants of many other large manufacturing towns, or why a murky, dense atmosphere should be allowed almost at all times to cast its gloomy mantle over us, depressing the spirits, sowing our persons, damaging our furniture, and soiling our abodes?” The Bishop, while expressing his strong interest and approval as to the doings of the Association, recommended an advance of the controversy which at present exists on the subject of sanitary matters in Leeds. A resolution, however, was passed to the effect, “that as the undue mortality of the borough of Leeds is to a certain extent to be attributed to its defective sanitary condition, tainted atmosphere, overcrowded dwellings, and want of cleanliness, it becomes the bounden duty of all classes to unite with the authorities in the removal of these evils.”

CONCRETE HOUSES.

As you have already given a brief description of my invention, I beg to add, that the two cottages now erected at Bexley Heath for public inspection are built of concrete the proportions of which, in cubic yards, are as follows:—

80 of gravel stone, through 1-in. sieve,	
at 5 <i>l.</i> per yard . . . . .	£3 15 0
3 of Portland cement, 16 bushels to the	
yard, at 2 <i>s.</i> . . . . .	4 16 0
6 of drift or river sand, at 5 <i>s.</i> . . . . .	1 10 0
	£10 1 0

Thirty cubic yards will build 120 yards of 9-in. work, at a fraction over 1*s.* 8*d.* per yard.

The preparing of the concrete can be done by a four or six horse power portable engine, which will crush the material, mix the concrete, and lift the same up to the cost of labour must depend upon the ingenuity of those who build, *having a licence*. From my own experience I find labour will not cost more than 9*d.* per yard; at the same time you will perceive there are many advantages my mode has over brick-work. The chimney-flues being round, the draught is much sharper, doing away with smoky chimneys; also being quite smooth, the cove being turned round when required to be raised higher, it acts like a plasterer's steel trowel, and they can be swept perfectly clean, as it is the shape of a sweep's brush. I may also mention, for fixing joiners' work, small blocks of wood, to form a dovetail, are simply put inside the apparatus: the concrete, running round the block, brings it flush with the work, thereby making good fixing for skirting, stairs, and other work. Also, upon the above principle, blocks are inserted, and afterwards redrawn, to form indentations to receive the joists for each floor. I may also add, the walls are quite impervious to damp, and are fit for occupation in three months; therefore I trust you will deem my work of importance, especially for the working classes.

JOSEPH TALL.

EASEMENTS: COMPENSATION.

Sir, The following novel doctrine of easements was propounded at the Sheriff's Court, Red Lion-square, on the 15th instant, in a compensation case, *Balls v. The Metropolitan Board*. Mr. James Knight, attorney to the vestry of Mile-end, Old Town, said on oath (it may, therefore, be presumed that he was serious), that the defendants having constructed a tunnel through the claimant's freehold ground, and under a part of his dwelling-house, without leave or license, to occupy the same for all time, and as the claimant is prohibited by the 18th & 19th Vict., c. 120, from building over the said tunnel, he is entitled to compensation at the rate of one shilling per cubic yard for the clay thus removed, which in this case, he said, was 100 yards; 5*l.* was therefore the proper sum to be awarded. This opinion may be a benefit to the public generally, and to the profession in particular; I hope, therefore, you will give it a place in your columns. A WITNESS IN THE CASE.

THE CROZIER QUESTION.

CITY CROSS, WINCHESTER.

THE last of the correspondence in our columns on this subject appears to have struck the keynote of the final decision of the question, whether the crozier in statues should be held in the right hand or in the left, for it is quite in accordance with the conclusion come to from Mr. Scott's explanation on this question,—a “momentum” one at least to the contractors for the restoration, and others, the settlement of whose accounts was delayed in consequence of the statue of William of Wykeham having represented him as holding his crozier in the right hand, with a book in the left. Mr. Scott's defence of his design is, that there is no rule at all,—unless, indeed, it be that in just such a case as that in hand, the crozier is rightly held in the right hand, while a book is held in the left; but that the crozier appears in either hand, according to circumstances. Mr. Scott gave a numerous list of examples of the crozier in the right hand, among which are the following:—

- Winchester.*—Bishop Fox's window. St. Swithin is shown with the crozier in his right hand.
- Another in the same.*—Supposed to be William of Wykeham, and believed by Winston to be in *stat.*
- Winchester, St. Mary's Chapel.*—Wall painting. Bishop carrying crozier in right hand.
- Norwich Cathedral.*—In the cloisters, south side, crozier in right hand and model in left.
- Ely Cathedral.*—On one of caps under the lantern. Bishop reading funeral service over St. Auldy. Crozier in right hand; book in left.
- Lincoln Cathedral.*—Sculpture on exterior of choir screen. Two bishops with croziers in their right hands.
- Wells Cathedral.*—Upper niche in north-west tower. Bishop kneeling, crozier in right hand.
- St. Cross, Winchester.*—In the west window. Ancient glass surmounted by modern work. In the central light is a bishop, holding crozier in right hand and book in left. Southern light of same tier has a mutilated figure, showing lower part of crozier in right hand; book in left.
- Cologne Cathedral.*—Reclining effigy on altar-tomb, fourteenth century. Crozier on right shoulder.
- Magence Cathedral.*—Twelve bishops, in alto-relievo, life-size, fixed against pillars of nave,—thirteenth, fourteenth, and fifteenth centuries. Croziers in right hand.

*Worms Cathedral.*—An old diptych of the Romanesque period, representing St. Peter, St. Paul, and two other saints, one a bishop, carrying his crozier in his right hand.

*Freisingen Cathedral.*—Sepulchral effigy of bishop; crozier in right hand; hook in left (Heffner ii. pl. 43).

*Carcesone Cathedral.*—Fifteenth century.—Tomb of bishop; crozier under right arm.

*Geford Autelchapel, or New College Chapel.* in painted glass of Wykeham's date.—Four bishops, with croziers in right hand.

*Reverez.*—Stained glass. A bishop, with crozier in right hand, open book in left. Also a bishop, with crozier in right hand, and closed book in left. Both fifteenth century.

*Florence.*—Panel painting. Bishop seated; crozier in right hand; book in left. Fifteenth century.

*Santa-Croce.*—Bishop standing; crozier in right hand; book in left. Stained glass. Fourteenth century.

*Rosen.*—The archbishops in the windows of one of the churches, one with staff in right and the other in left.

In such cases as those of the act of blessing, the crozier is held in the left hand. Authorities, Mr. Scott found, differed entirely, some insisting in all cases on the left hand, and others on the right; but the examples show that, in fact, there was no rule.

The committee resolved, "that Mr. Scott's report be inserted in the papers; also, that Mr. Scott's charges be paid as soon as the assets are realised; and that an application be made to the Council for payment of any balance relating to the restoration of the Cross."

### A CATHEDRAL CLOSE, AND THE CLOISTERS.

"THE Precinct of a Gothic Minster" was the title of a lecture delivered by the Rev. Mackenzie Walcott at the Architectural Museum last season. This is now published in a pamphlet form,\* and we take from it the information supplied under the headings of the "Close," and the "Cloisters:"—

*The Close.*—A wall, gates, and a system of fortification were indicated in ancient times. The manors and churches of the Border had their strong towers. Durham Palace was one of the impregnable castles of the period, and Wells was moated and crenellated. Not only in Ireland, in the thirteenth century, were Holy Abbey, in 1210, and the cathedral of Elphin, in 1235 (Eccles., xii. 22), assailed; but in England, Wherwell, in the reign of Stephen (Mon. Angliæ, 2d edit., 257; Bayham in 1302, and Peterborough in 1693 and 1694, suffered great loss in war-time; and so in 1327 and 1381 Bury S. Edmund's, Ramsey in 1149, Coventry in the same year, and Dinham in the reign of Henry III. (Spelman's Hist. of Sacrilege, 129, 131, 143), were attacked. In the thirteenth and fourteenth centuries sea pirates and land robbers rendered it necessary to fortify Tyne-mouth and Bridlington. Cashel has a tower at the west end, and Michellam Priory is defended by a moat and drawbridge. Bradshaw thus describes Chester:—

"Compassed with strong walls of the west parvis, And on the other side with walls of the town, Closed on every side with a surs postern, In south part the cemetery environed round about For a sure defence cometh to hold out."

Worcester, Westminster, Durham, Hexham, and Beverley possessed the right of sanctuary within their precincts. At Bury and Beverley the limits were marked by crosses. At Norwich the Tomland, at Bury and S. Alban's the Romeland, extended in front of the west end, and may have formed the tower-cum-gate at S. Alban's the great gateway stood on the north, and the gatehouse still standing on the west led into a quadrangle or base court, 400 ft. square. At Worcester, Norwich, and S. Paul's there was a preaching cross on the north, and at Hereford on the south of the church. That of the Dominicans still remains in the latter city. The precinct at Chester was crenellated in 1380; Thornton, 6 and 12 Rich. II.; Peterborough in 922; Exeter, c. 1204, owing to the murder of one of the captives in the close; Lincoln in 1246, in consequence of the danger accruing to the canons crossing to the church at night; Salisbury, c. 1321; Hereford, 1340; London, from the presence of footpads and robbers, 1287; S. David's, 1330; Lichfield, with four large towers and gateways, 17 Edw. I.; Wells and Canterbury in the fifteenth century; whilst Chichester from the first was built within the line of the city walls (comp. MS. Harl. 6973, fo. 1).

The secular canons of cathedrals had private houses built round the close in the twelfth century, in which they were bound to maintain a household (*familia*). One of the old chapels of this period of early date remains in a prebendal house at Chichester. The dignitaries had their private chapels before 1262 (*congregatio parochialis*). The following rule was made at their first settlement in New Salisbury, where every canon had a private chapel:—*Statutum quod primum tantum edificatores tunc canonici quibus vicarii decedentes percipiunt duas partes justis precii pro superedificata, tertia parte cedente solo. Remaneant in prebendis omnia solo coherentia appendicia, omnia fixa, unam etiam mensam ad minus, cum tripodibus, et scilla prebende remaneant eisdem.* (Stat. Salsbur. MS. Harl. 6985, fo. 17.) The buildings included in a close a chapter-house, library, school, gatehouses, a vicar's close, and a cloister at Hereford, Chichester, Salisbury, Wells, S. Paul's, S. David's, Exeter, Lincoln.

At Chichester the Canon's Lane is entered by a gateway; along the south side are the precentor's house or chantry, the residentiaries' houses, and the deanery. The east end is closed by the rance gate. At the north-east end of the lane were the gateway, the vicar's college, and hall, four houses of which only remain. On the north-west side of S. Richard's Wyne, connecting the lane with the Cathedral, is the treasurer's house, facing the houses of Bishop Sherborne's prebendaries. Along the south alley were the Mortimer chantry-priest's lodgings, and

the chapel of S. Faith eastward of it. The chapter-house is attached to the west side of the south arm of the transept; the chancellor's house stood at the west end of the cathedral. The east gate faced the market cross. The various houses of the dignitaries remain in a line at the north end.

At Wells there are three gates to the close; on the north-west is the deanery; at the east end are the precentor's and organist's houses; on the north is the vicar's college. The archdeacon's house is on the north side of the main. There is no north walk to the cloister. Over the eastern aisle is the library; and above the west walk are the library and school, schoolmaster's house, and the chantry. The chapter-house is on the north side of the church. In the treasurer's house the bishop at his first reception robed for mass.

At Lincoln the office of the clerk of the works and the canon's common chamber remain on the north side of the church. Two gates remain in the close. On the south side of the church are the precentory and subdeaconry; on the east the chantry; on the north the deanery; and on the south-east side the vicar's college.

At Durham (D.), in the east aisle of the cloister, was the slype leading to the cemetery, and serving as the monks' parlour, with the library over it; the chapter-house with three prisons on the south side; and the usher's door leading to the prior's lodge. In the north alley were the carols for readers. Near the west alley was the dormitory, built over the treasury, song-school, and common-house; behind it the vicar's college; and on the south side of the north alley was the refectory, and near it the bench for children at the Maundy. On the south-west was the kitchen. Between the dormitory and kitchen was the cellar's choir. At S. Helen's, in Bishopsgate, the dormitory was on the east side. In the base court on the east was the gatehouse and chapel, adjoining the almonry; on the west were the kin and guest-house; on the north was the chapter-house, the almonry, and the south that of the terrar. The mill and watergate still remain. At Lacock, the dormitory and cellars were on the west, the refectory on the south, and on the east the chorister and chapter-house. At S. Helen's, in Bishopsgate, the dormitory was on the east side.

Beaulieu furnishes a good specimen of Cistercian arrangement. The cloister is to the south. Between the abbey and the east end of the cloister are the kitchen, refectory, running north and south, with the kitchen on its east side. On the east side are the large auditory for books (Orth. Hist., p. 11, p. 11). On the west side, the slype to the cemetery, and over them the dormitory, with stairs into the south wing of the transept; and extending again westward, over cellars. The abbot's gateway, the choir of the church, and a king's house on the south-west, detached.

Austin Canons: Bristol.—The cloister is in the usual position; on the west was cellars with the dormitory over; on the south, reckoning west to east, the oblong kitchen, refectory, and parlour; on the east, from south to north, the calefactory and chapter-house. In a second range, south of the hall, were, west to east, the abbot's gateway, the choir of the church, and a king's house on the south-west, detached.

Clymington: Wenlock.—On the south was the refectory, on the east, running east and west, furthest from the church, was the dormitory of the lay-brothers; next to it the oblong chapter-house, possibly it communicated with the south arm of the transept over the chapter-house, and by a passage along the west wall of the south wing, below which are three arches opening into the trispartite, arcaded recesses, parlours for business, or waiting places of the Cistercians, assembling before chapter (see Martene de Ant. Mon. Rit., lib. ii. p. 395; iv. 130); or they may, like the niches in the same position at Norwich, have been used during the Mass, or as a place for the abbot to read the annals for books. On the inner wall of the transept are three blind arches, with niche brackets, possibly a portion of a shrine. On the west was the dormitory, and a chamber over the south end, or a vestry for the library or a vestry for the day robes of the monks. On the south-east is a two-storied abbot's house, with a double gallery opening on his chambers and private oratory. To the south is the infirmary.

Premonstratensians: Eastly presented a very irregular ground plan. On the east side of the cloister were the sacristy, chapter-house, and the kitchen; on the west, the refectory, and the kitchen and dormitory on the west, with the sub-prior's lodge and guest-house, in two parallel lines westward. On the north side of the transept were the abbot's hall, and chapel.

Carmelites: Hulse comprised in its cloister court on the east side of the dormitory and chapter-house, and kitchen, on the south the refectory, on the west the prior's lodge. In a parallel line with it, but detached, were the great tower, infirmary, chapel, and base court gate, and at right angles to these on the south, running east and west, were the porter's lodge and guest-house.

Dominicans: In the Dominican Friary of Norwich, the cloister was bounded on the west by cellars, on the north by the kitchen, on the north-west by the refectory, and on the east from north to south, by the dormitory and chapter-house, behind it were the vicar's college, and a detached chapel of St. Thomas. On the south side of the nave was the preaching yard.

Franciscans: Muckross.—On the west was the prior's house; on the north the refectory, over the east end of the kitchen adjoining, between which and the prior's house was the entrance-slype; on the east were the garbouse and dormitory over cellars. A chapter-house and sacristy in one bay northward of the choir, approached by a slype.

Cloisters took their origin in the porticoes, surrounding the Basilican forecourt. They were sometimes called the *Parvus* or *Paradise*, because the trees were planted in them. In the parvise Simeon of Durham says a priest sang mass before the laymen came to church (p. xxxv); cloisters are wanting at York, Lichfield, Ripon, St. Asaph, Island, and Manchester, &c.; they have been introduced since the Reformation at Winchester, Ely (thirteenth and fifteenth centuries), Carlisle, Peterborough, Exeter (thirteenth century), Rochester, At Bourne, Newley, Kirkstall, and St. Alban's where they were enclosed in alleys, which in the latter were added about the twelfth century, to afford a dry passage to the monks, and easy means of communication. In the period of the monks commenced the east alley; Trumpington, 1241–45, added wooden cloisters with an external trelliswork, to prevent the intrusion of strangers into the garth. Each alley was

under the charge of an obedientiary, whose office or checker adjoined it, the guest master, chamberlain, infirmarer, and kitchener. The great quadrangle, 150 ft. square, was bounded by the principal buildings of a monastery, the bastionary, the kitchen, the choir, the dormitory on the north, the chapter-house, and alms, and dormitory on the east for easy access from the church, the refectory on the south, in order to remove noise and smell of the kitchen, the bastionary, the choir at Lincoln, dormitory on the west. Provision was thus made for combining the entrances to the chief buildings, securing privacy, and forming a grand central space for air, light, and recreation. The cloister was divided into the choir, the garden of Paradise, the name at Winchester and Chichester, either from being filled with earth from Holy Land, or as the resting-place of the faithful departed; but the palm court at Wells, as connected with the ceremonial of palm bearing on the Sunday before Easter-day, and the laurel court at Peterborough. At Hereford there was a chapel of our Lady Armour over the vestibule of the chapter-house used for masses of requiem for those buried in the garth; there was also a double chapel on the south, sometimes visited at night. In the eighth century abbots were buried in the centre of the cloisters. (Martene de Ant. Mon. Rit., iv. 272.) The cloisters were exceptionally on the north of the nave at Canterbury (B), Chester (B), Gloucester (B), St. David's, Tintern (C), Sherborne (B), Malmesbury (B), Milton Abbas (H), Ely (B), Exeter (B), on the north side of the choir, and on the south at Rochester (B) and Chichester. There were only three alleys at Hereford, Chichester, and Wells. There is a second cloister at Hereford, leading to the prior's college; at St. Paul's there was a double-storied cloister.

The dates and dimensions of cloisters—Canterbury (Perp.), 1300, 1412–149 ft. by 144 ft.; Winchester, 1300 ft. by 144 ft.; Ely (Perp.), 1412–149 ft. by 144 ft.; Salisbury (E. E.), 140 ft. by 140 ft.; Peterborough, 138 ft. by 130 ft.; Worcester (Perp.), 127 ft. by 120 ft.; Norwich (Dec.), 177 ft. by 175 ft.; Durham, 1083–147 ft. by 108 ft.; Exeter (Perp.), 147 ft. by 90 ft.; Hereford (Perp.), 115 ft. by 115 ft.; Westminster (temp. Hen. III.—Rich. II.), 141 ft. by 137 ft.; Chester (Perp.), 110 ft. by 110 ft.; Bristol (Perp.), 90 ft. by 84 ft.; 1083–147 ft. by 108 ft.; Exeter (Perp.), 147 ft. by 90 ft.; Hereford (Perp.), 122 ft. by 122 ft. A procession was made daily through the cloisters, coming from the church through the eastern and returning through the western doorway, and also before and after the choir, and to the cemetery. At Winchester, the monks, thinking themselves aggrieved by the bishop, their natural protector, took to their own hands the consecration of the cloister crosses reversed, to show that the state of things was out of order. There was a large conduit in the centre of the garth at Chester and Durham. The turn remains at Canterbury, in the east alley, the wall through which the prior's permission a cup of wine was handed from the cloister to a tired monk. There was also one at Winchester. In the east alley at Canterbury the holy fire was kindled on Easter Eve. The south and west walls at Chester were occupied with carols, from the Norman carols, a screened enclosure, the southern at Winchester and Gloucester, and the northern at Durham, Beaulieu, Canterbury, 1472–94, and Exeter. Two or sometimes three such pews or texts were arranged in each bay, to serve as studies between dinner and evensong. Opposite to their doors were ambrises for hooks (Martene de Ant. Mon. Rit., iv. 272). The south and west walls at Chester were occupied with carols, from the Norman carols, a screened enclosure, the southern at Winchester and Gloucester, and the northern at Durham, Beaulieu, Canterbury, 1472–94, and Exeter. Two or sometimes three such pews or texts were arranged in each bay, to serve as studies between dinner and evensong. Opposite to their doors were ambrises for hooks (Martene de Ant. Mon. Rit., iv. 272). The south and west walls at Chester were occupied with carols, from the Norman carols, a screened enclosure, the southern at Winchester and Gloucester, and the northern at Durham, Beaulieu, Canterbury, 1472–94, and Exeter. Two or sometimes three such pews or texts were arranged in each bay, to serve as studies between dinner and evensong. Opposite to their doors were ambrises for hooks (Martene de Ant. Mon. Rit., iv. 272). The south and west walls at Chester were occupied with carols, from the Norman carols, a screened enclosure, the southern at Winchester and Gloucester, and the northern at Durham, Beaulieu, Canterbury, 1472–94, and Exeter. Two or sometimes three such pews or texts were arranged in each bay, to serve as studies between dinner and evensong. Opposite to their doors were ambrises for hooks (Martene de Ant. Mon. Two or sometimes three such pews or texts were arranged in each bay, to serve as studies between dinner and evensong. Opposite to their doors were ambrises for hooks (Martene de Ant. Mon. Rit

of the Widow of Nain. At the head of each compartment is a canopy, and at the foot some tracery. The tracery is occupied by figures of the twelve disciples, each carrying his distinguishing emblem: they are arranged in two rows, containing respectively eight and four. The glass was supplied by Messrs. Heaton, Butler, & Bayne, of Covent-garden, the artists by whom the great west window and that at the east end of the north aisle were executed, and it has been fixed, in new stonework, by Mr. Jackaman, of Bury, hndler. The cost was defrayed by public subscription.

**Pulwood Church, Sheffield.**—The windows at the east end of this rural church have been filled with stained glass by Messrs. Heaton, Butler, & Bayne, of London. The central window, which consists of three lancet lights, without tracery, contains some eighteen or twenty figures, arranged in six groups, in panels of Early English foliage, and illustrative of the Acts of Mercy, viz.:—"Sheltering the Stranger";—"Clothing the Naked";—"Visiting the Sick";—"Feeding the Hungry";—"Giving Drink to the Thirsty"; and—"Visiting the Prisoner." The other windows are filled with grisaille work of geometrical design. The centre light is given by Mr. Bennet Woodcroft, and the remainder by subscription.

#### CHURCH-BUILDING NEWS.

**Milton Ernest (Beds).**—The church has been re-opened, after restoration, under the superintendence of Mr. Butterfield, architect. The work in the nave and aisles has consisted chiefly in cleaning off about twenty-five coats of whitewash with which successive generations had overlaid it, pointing the walls externally, and replastering them internally, restoring the windows and a sepulchral recess in the north wall, within which has been placed a monumental slab, with cross in relief, discovered beneath the floor. The altar stone, marked with the usual crosses, which was accidentally broken in taking up, has been set as a base for the parish chest in the north aisle. The western arch into the tower has been opened, and separated from the nave by an iron rail, formerly in front of the altar, which has been re-coloured. The west wall, through which a doorway had been cut in latter times, has been made good; and the window above filled with stained glass, representing St. Michael and the Dragon. The font has been repaired, and placed near the south door, and all the monuments have been preserved. Porritt's underground stove, with open grating above, has been introduced, at the joint expense of the farmers of the parish. A high screen, crossing the north aisle (which formerly made one side of a chapel at the east end), has been re-coloured, and adapted to enclose a space for a vestry. The benches are of various designs, in oak; the pulpit of open work, in oak, overlaid with walnut. The floor is paved with red and black tiles. The chancel (which is separated from the nave by a low iron railing, the gift of Mrs. and Miss Starey) has been rebuilt on its former foundations, with the addition of a small organ-chamber on the north, and covered with Colley Weston slate, small portions of the north and south walls having been left standing and incorporated with the new work, for the sake of preserving two small Early Norman windows. The double-arched head of the curious angle piscina has also been kept *in situ*. The walls are relieved internally by horizontal, perpendicular, and zigzag lines of black, buff, and red bricks. The roof above the sanctuary is panelled with gold stars, and is also coloured westward with a pattern on a blue ground, divided by lines of red and white along the wall-plate. The floor is formed of encaustic tiles in buff and red, alternating with the white and black marble of the former pavement. The east window is filled with stained glass as follows:—north light, "The Offering of the Wise Men;" centre light, "Our Lord in the Stable at Bethlehem;" south light, "The Adoration of the Shepherds." The north window, representing in its two lights the first two Evangelists, is the offering of the vicar's family; and the south window, containing the Evangelists St. Luke and St. John, of Mr. G. Hurst. The two Norman windows are filled with mosaic patterns, and a small square light, preserved in the organ-chamber, with King David bearing the Harp, at the expense of the choir. All the painted glass has been executed by Mr. A. Gibbs, of London, under the superintendence of the architect. The contract for the

works, amounting to 1,364*l.*, was taken by Mr. Osborn, of St. Neots.

**Whitmore Reans.**—On St. Andrew's day, the first portion of the new church to be erected for the inhabitants of this district, and dedicated to the apostle St. Andrew, was formally opened for divine service. The church will be well warmed, and it is lighted by two large ornamented gas pendants, the gift of Mr. Henry Rogers. In the centre is a carved font of Caen stone, with four granite pillars, the design for which was furnished by the Rev. W. H. Lowder, M.A., of Leek, the newly-appointed curate-in-charge for the district. The remainder of the building will be proceeded with when the necessary funds are forthcoming; and, when completed, the church will accommodate 650 adults and 218 children, at a total cost of 2,800*l.* The architect is Mr. E. Banks; and the builder is Mr. H. Lovatt, of Wolverhampton.

**St. Columb.**—The church here is about to be restored.

**Blackley.**—The church of St. Andrew, situated in Cran-lane, Blackley, has been consecrated by the Bishop of Manchester. In October, 1864, the foundation stone of the new church was laid, the cost of which is about 2,000*l.* The site was given by the Earl of Wilton. The style of the church is Decorated. Three of the more conspicuous windows are filled with glass in two tints in ornamental patterns, and the others are plain diamond-shaped lead lights glazed with tinted glass. Coronae in the nave, and brackets elsewhere are provided for the gaslight. The heating apparatus was from Mr. Hadley. The general contractors were Messrs. D. Butterworth & Son, of Blackley. The architect was Mr. J. Medland Taylor, of Manchester.

**Weston-by-Welland (Northamptonshire).**—The parish church has undergone a restoration. In the spring of 1864 the work was begun, owing to the dilapidated state of the church generally, but especially of the chancel, which was pronounced unsafe. The tower had been for some years much out of the upright, from a sinking at the north-east angle, and by its settlement had caused serious distortion to the adjoining parts of the fabric. The tower has, therefore, been entirely rebuilt from the foundations, the original stonework replaced, and the exterior is an exact reproduction of the old structure, except that the door to the stairs is put on the outside, and small windows have been made towards the north to give light to the ringers' room and clock-chamber. The whole of the nave and side aisles (excepting a very small portion of the western end of the north aisle) has likewise been rebuilt, but the main features of the former building have been preserved throughout. The church has been paved throughout with tile of ornamental pattern, from Messrs. Ward & Co., of Broseley, Salop. The windows throughout the church are enriched with stained glass, from the works of Messrs. Ward & Hughes, of London. Branch staircases are provided for lighting the building, those in the chancel being made of brass. The whole work of restoration has been carried out under the superintendence, and from the designs, of Mr. R. C. Hussey, of London, architect; and the works have been done by Messrs. Stanon & Son, of Market Harborough, and Mr. Loveday, of Kibworth. To the three bells in the former tower have been added two new ones, cast by Messrs. Taylor & Son, Loughborough. A new clock, in place of the old one, has been supplied by Mr. Whitehead, of Market Harborough.

**Darlington.**—The church of St. Cuthbert, which has recently undergone considerable alterations, has been re-opened. The structure, which has shown symptoms of decay, has now been rendered sound, and at the same time attention has been paid to its appearance. All the stonework in the interior has been restored, the plastered ceiling has been removed, and the roof is consequently considerably higher. The old family box pews, as well as the galleries, have been taken down, greatly enlarging the area of the church. The chancel was under the direction of Mr. J. P. Pritchett, of Darlington, architect. The nave was under the supervision of Mr. G. G. Scott. The pillars have been restored, and everything done that was calculated to strengthen the building. The pulpit is of Caen stone. Several stained-glass windows have been given by Mr. R. H. Allan, Misses Forster, Miss Robinson, Dr. Haslewood, Mr. Thomas Bows, Mr. Burlison, and others. They all represent Scriptural subjects.

**Portsmouth.**—The Garrison Chapel is to be restored. The building has been surveyed by Mr. G. E. Street, architect, and his designs for its restoration have met with general approval. The architect has separated his scheme into parts, each of which can be executed in order, according to its importance, as funds become available. They are as follow, viz.:—1. New roofs to the chancel and nave, new windows, walls cleaned and repaired, at a cost of 1,620*l.* 2. Rebuilding of the west front, and adding one bay to the length, thereby increasing the internal accommodation, 500*l.* 3. Renewing the floors and seats, 700*l.* 4. Building a bell-turret, 500*l.* 5. Placing a fencing of proper design around the graveyard, 200*l.* Total, 3,520*l.* The Secretary of State for War has intimated that he will be prepared to consider the propriety of inserting the sum of 1,500*l.* in the estimates for 1866-67, in aid of the object desired, "provided the sum subscribed reach such a sum as, when added to the 1,500*l.*, will suffice to restore the church in a suitable manner." The building is of great antiquity, having formed a part of what was once called "God's House Hospital," founded by Peter de la Roche, Bishop of Winchester, A.D. 1220.

**Upton-on-Severn.**—The new cemetery for this town has been consecrated by the bishop of the diocese. The cemetery stands upon commonable land, adjacent to the railway station. It is about 14 acres in extent, one-sixth of which has been set apart for the Nonconformists of the town, and in the centre of the ground has been erected a chapel in the Early English style, composed of blue lias stone and Bath stone dressings. One portion of the building is for the use of the Established Church and the other for Dissenters, the two portions being divided by a low tower, and a turret containing one bell. The interior of the episcopal chapel is capable of holding about forty persons. One of the chancel windows is of stained glass, inserted in memory of Miss Cooper, of this town, and contains a figure of Our Saviour. The roof is an open one, and composed of framed principals resting upon stone corbels, and there is a southern porch. The building intended for the Nonconformists is of similar dimensions to the other. The floor is laid with Godwin's encaustic tiles, and the roofing is covered with Broseley tiles. The western side of the cemetery is fenced in by a low wall, of the same material as the building, and surmounted by iron railings; and it is intended that, eventually, the whole of it shall be so enclosed. A small lodge at the western entrance, for the residence of a superintendent, has been erected. Mr. G. B. Clarke, of this town, was the architect; and Mr. J. Griffiths, Eldersfield, the builder. To raise the necessary funds for defraying the cost it was determined to mortgage the poor-rates, the amount required being over 1,500*l.*

#### THE PROPOSED METROPOLITAN MEAT-MARKET.

At the Court of Common Council last week, a report from the Markets' Improvement Committee was read. It set forth,—

That on the reference the committee had directed the City architect to prepare plans and estimates for the new market. Plans had accordingly been prepared, and the trade had been invited to inspect them, and four days had been given for that purpose, and it had been decided by the committee that the new market should not be constructed as an open market. This was after two designs had been proposed, one with an open frontage with shops, and the other having no such frontage. The committee had been attended by a deputation of the inhabitants of the ward of Farringdon Without, who had expressed an opinion that the market ought to be open free and unrestricted, and therefore that the market ought to be constructed with an open frontage. The report added that the committee, having carefully considered the subject and the objects for which the market was required, were of opinion that it was not for the benefit of a mere district, but for the whole metropolis; and that the market should be enclosed, but with every facility, not merely to the trade but to the public generally, to be carried on within the market walls. From the estimate supplied by the City architect, it appeared that the expense of the erection of the market proper would be 161,700*l.* That would not include the cost of the construction of the roadway, which was estimated at 3,000*l.* more. After detailing the area which in superficial feet was to be devoted to the new market, the committee concluded by recommending the outlay proposed.

Mr. H. Lovman Taylor moved the adoption of the report.

Mr. R. N. Phillips moved as an amendment that the market be constructed for an open, free, and unrestricted market.

After a protracted discussion, the original motion was carried by 67 to 34.

## "ORPHEUS IN THE HAYMARKET."

THE wit and elegance that characterize Mr. Planché's version of *Orpheus and Eurydice* are his own, and as apart from mere word-playing and word-breaking as it is possible to conceive. We may get "Burr the Styx," and Apollo may make an *apolo-gy*; but, as a rule, puns are avoided and wit substituted. Read the answer of *Public Opinion* (one of the characters), when asked, "And what about the piece, sir, if you please?"

"Ah, there I pause! In matters such as these, *Public Opinion* is, I must confess, Very much guided by the public press; So, as the Judge says, when his wig he's shook at 'em, I'll take the papers home with me, and look at 'em."

And again. Despise Posterity—and you a poet, asks *Public Opinion*. "A poet!" replies Orpheus,—

"—If there be a soul on earth  
To whom Posterity is nothing worth  
It is the poet. Left 'mongst fellow-men  
To live—that is, to starve upon his pen;  
And when in death his glorious eyes are dim,  
Leaving Posterity to feast on him!  
To crown with laurel his unconscious bust,  
To raise a pompous marble o'er his dust,  
Out of the harvest by his genius sown,  
Giving to him who wanted bread, a stone."

The music, as every one knows, is charming, and it is very well sung by Miss Louise Keeley, Mr. Farren, and part of the company; another part being overweighed. Miss Helen Howard represents *Public Opinion* with piquancy and effect, and Mr. David Fisher "plays the fiddle like an angel." The Throne-room in the Palace of Pluto, and the last scene, the Temple of Bacchus, are very well painted and set by Mr. Morris. We need scarcely add that "Orpheus in the Haymarket" is a brilliant and legitimate success. Mr. Southern repeats his finished personation of "Brother Sam," and Mr. Euckstone and Mr. Compton well help on the fun.

## GUSTAVE DORÉ'S BIBLE ILLUSTRATIONS.

Sir,—Your reviewer, in the very able and commendatory notice of these illustrations, which appeared in a recent number of the *Builder*, raised the question, whether the English edition would be taken from worn or good blocks,—a question which we feel quite sure you will do us the favour to set at rest at once.

We beg to inform your readers and the public most distinctly that the illustrations to our forthcoming English edition will be printed from new casts taken from the uncut, original wood blocks, and will be in every particular equal to the impressions which were on view in Belle Sauvage-yard. CASSELL, PATER, & GARDNER.

## DISSENTING CHURCH-BUILDING NEWS.

**Everton (Liverpool).**—The chief stone of a Wesleyan new chapel has been laid in the rapidly increasing neighbourhood of Everton. The site is in Whitefield-road. The exterior will be in the Early Decorated style, with windows in the gables, the side windows being of a plain description. The whole is to be built of stone, with rough-faced walling and tooled dressings. Tooled stone bands are introduced, so as to connect some of the principal architectural features. The interior will be as follows:—extreme length 90 ft., extreme width across the transepts 72 ft., and width of nave 44 ft. There will be seats for 800 persons, including a gallery in each transept. The principal feature will be large and lofty arches at each end of the nave, with traceried fire-light windows. The nave and transepts are to have open-timbered wagon-headed roofs, with moulded and stained timber; and the chancel ceiling is to be panelled and moulded for coloured decorations hereafter. All the fittings, gallery-front, &c., will be stained, and the ornamental panels in the latter filled in with crimson cloth. The plans, which are by Mr. C. O. Ellison, were chosen from a number sent in competition. They are to be carried out by Messrs. Nicholson & Ayre, the contractors.

**Brecon (South Wales).**—The Presbyterians of Brecon have commenced a new chapel and school, in the Early Decorated Gothic style. At one angle of the building will be a tower and spire. The chapel will be ceiled in below the roof outline in somewhat of an arched form, and will be divided into panels with timber ribs. The accommodation is for about 400 adults. The architect is Mr. W. F. Ponton, of Reading. Messrs. Williams & Son, of Brecon, are the contractors, at the sum of 2,652. 14s.

**Hulme (Manchester).**—The foundation stone of a new chapel for the Methodist New Connexion,

has been laid. The site is in Boston-street, Hulme, adjoining the Sunday and day schools which were erected for that district three years ago. The internal dimensions will be 63 ft. long by 40 ft. wide, and it will be a brick building, with Yorkshire stone dressings. The chapel is intended to accommodate 750 people. Messrs. Shaw & Webster, of Manchester, are the architects. The contract for the whole of the works when complete, exclusive of the heating apparatus, has been undertaken by Mr. Thomas Clay, of Audenshaw, at a cost of 2,430l.

**Newcastle-upon-Tyne.**—The recently erected United Presbyterian Church, at Tow Law, has been opened. It is a stone structure, designed in the Norman style of architecture. A projecting tower, surmounted by a slated spire, graces the north-east angle. Accommodation is provided for about 250 persons. It is proposed to erect both a bell and a clock in the tower. Mr. Thomas Oliver, of this town, was the architect.

**Redhill.**—The chief stone of a Baptist Chapel has been laid here. The site is on the London-road. Mr. W. J. Matthews, of Reigate, furnished the plans, and the contract was entrusted to Mr. Shepherd, of Redhill, the total cost being about 1,400l.

**Sowerby.**—The opening services in connexion with this chapel commenced on the 1st instant. The chapel, which is a Gothic structure, capable of seating about 200 persons, was designed by Mr. Bonrue, architect, of Thirsk and Ripon. The cost, including the site, has been 820l.

**Sydenham.**—A new Congregational church, Early Gothic in style, is in course of erection in this suburb, and will consist of a nave, side aisles, and a small apsidal chancel. The principal entrance will be at the west end, under a double-arched opening, the arches springing from clustered pillars, the central ones being of Aberdeen granite. The porch is recessed from the main front and open, the doorways within, leading to the body of the church, being at the sides. There will also be external doorways to the galleries. Over the western porch will be a sculptured figure of the Good Shepherd, under a canopy, and resting on a corbelled shaft; on either side a single-light window, and in the gable above a large circular and pierced window. The aisle windows will be all single-light, with deep reveals and angle beads. The walls are to be faced with Box ground stone, with occasional bands and arches of red Mansfield and grey Reigate stone. The internal arrangements will be such as are most usually adopted in Congregational places of worship. There will be galleries in the aisles, set back from the nave pillars, as well as a west-end gallery. The pews will be all open and low, and there will be a slight inclination in the floor of the church towards the chancel. The chancel and porch are intended to be paved with encaustic tiles, and the chancel-windows filled with stained glass. The chancel and nave arches are to be of Bath stone, the latter resting on cast-iron columns with wrought foliated capitals. The pulpit is to be of stone. The roofs are to be partly open; the nave roof, when ceiled, segmental in form, the curved braces showing. The church is to seat 650 persons, and will cost, exclusive of boundary walls, about 4,000l. Mr. James Hine, of Plymouth, is the architect; and the works are being executed by Mr. Warne, of Penge, builder.

## Books Received.

*The Temple and the Sepulchre.* By S. SMITH, M.A., Vicar of Lois Woodon, and Rural Dean. London: Longmans & Co. 1865.

THIS volume contains a reprint of several letters in the *Reader*, and a manuscript not included with the letters in that journal. The author supports Mr. Ferguson's views. He has visited Jerusalem and examined the site. Having already given our readers an account of these views, we need not re-enter on the subject here; but we may say that Mr. Ferguson has in the Rev. S. Smith an able advocate and second of his ideas; and it may be considered whether or not the question, as between the site of the church heretofore called "the Church of the Holy Sepulchre," and standing within the ancient city of Jerusalem, on the one hand, and that of the Mosque of Omar and the Dome of the Rock outside the ancient walls on the other, be not now regarded as settled entirely in favour of the latter as by far the more probable of the

two sites to have been that of the sepulchre of the Saviour. That the Dome of the Rock is the much more probable site of the two, however, does not seem to us to clear away a doubt and mystery on this subject. The argument in favour of the Dome of the Rock may be said to stand, not on a Christian, but on a heathen basis. This was the site of an ancient temple of Vennus, which Helena, the mother of Constantine, and those whom she employed to search for the holy sepulchre, believed to have been the true site they were in search of, mainly because there they found a cell or sepulchre in a rock; but when we consider that cells, shrines, kiosks or sepulchres, and crypts, beneath or within heathen temples were no uncommon thing, we are still left in a state of perplexity as to whether this may, after all, have been the true site of the Holy Sepulchre of Jesus. That it partook of the nature of a holy sepulchre, and that its site would to a certain extent accord with what is said of that of the Holy Sepulchre may be admitted; but the very fact of its having been regarded as holy by the heathen in ancient times militates, perhaps, as much against as for the idea that this was the new sepulchre of Joseph of Arimathea; especially when we also consider that the locality had the reputation of still greater antiquity, as the sacred site of Jacob's dream,—"the very spot where God spoke to Jacob,—the spot of the Petra, which was called by Jacob, *the Gate of Heaven*, but by the Israelites the Holy of Holies; and it is *the centre of the earth*, and was the sacrum of the Israelites, who greatly revere it, and turn their faces to it in prayer, wherever they may be." Such was the tradition as given by Sophronius to Omar, when the spot on which he might erect his mosque was pointed out to him. This was, in a general sense, the vacant site of the ancient Jewish temple, or of its Holy of Holies, with the sepulchre of the rock lying in a corner behind the Holy of Holies, and adjoining the temple cloisters,—an unlikely locality, surely, for the Jewish authorities to allow a Jewish "malefactor" to be buried in. The sacredness of the locality to the Jews must have even been all the greater if, as appears, there was a tradition that this also was the spot where Abraham offered his son Isaac as a sacrifice. To all this concentration of sacred traditional ideas, also, we must add such concordant circumstances as *that the cell in the rock at Cumme, the City of the Dead*, where the prophetic Sibyl lay when consulted by Æneas, appears to have been regarded as *the way to the Shades*, and that wherever a heathen oracle (such as the prophetic Sibyl were) existed, whether in cell or in sanctuary, that spot was called *the centre of the earth*, just as the locality of the Holy of Holies of the Jewish temple, with its adjoining temple cloisters and cell or sepulchre, was called, according to Sophronius, *the gate of heaven and the centre of the earth*,—not because of "the mystic passion of the Cross," but because of its being the spot where Jacob lay in a deep sleep with his head upon a stone, while heaven (within him) was opened to his spiritual eye.

The builders of the Temple of Vennus on the spot, we hold, must have regarded that spot as sacred, so that desecration, as Mr. Smith thinks they had in view, of a spot they abhorred, is scarcely admissible. That the drain in the floor of the sepulchre may have been intended for the blood of sacrifices to run into, one can readily admit; but even that was sacred in the eyes of the heathen, however much it might desecrate the supposed sepulchre of the Saviour.

Notwithstanding the mystery, however, which still surrounds the subject, even though we admit that the probability of the sepulchre in the Dome of the Rock, at the Mosque of Omar, having been the Holy Sepulchre of Jesus, is greater than that the present "Church of the Holy Sepulchre" within the city, was the true site; this conclusion appears to be a decided step onwards towards the final settlement of the question, and Mr. Smith has well put the case in the volume under notice.

*Flemish Relics; Architectural, Legendary, and Pictorial.* Gathered by F. G. STEPHENS. Illustrated by Photographs by CUNDALL & FLEMING, London. A. W. Bennett. 1865. THIS is amongst the handsomest and most interesting books of the season. It includes fifteen photographic views of well-known buildings in Belgium, each described at some length by Mr. F. G. Stephens, who prefaces the whole with a succinct history of Flanders. The places that

afford subjects are Tournay, Villers la Ville, Ghent, Ypres, Bruges, Brussels, Louvain, Mechlin, Antwerp, Liège, and Audenaerde. Of the cathedral of Notre Dame, at Tournay, Mr. Stephens speaks, as it well deserves, in enthusiastic terms. Little had been said in England of this building when the conductor of this journal, then a student, gave some particulars of it, and of the works that were being carried on there under M. Renard.\* Many years have passed since then, but the effect produced on the writer by the first sight of this remarkable structure, in parts dating from the tenth century, with its forest of towers, is still fresh in his memory. At the time alluded to the town was further remarkable for several houses of very early date. Mr. Stephens intersperses some valuable notices of pictures by Memline and the Van Eycks. The book is dedicated affectionately to W. M. Rossetti.

**Historic Scenes in the Life of Martin Luther.** Described by J. H. MERLE D'AVIGNÉ; illustrated by P. H. LABOUCHERE. Day & Son, Gate-street.

This is a re-issue, and needs but a few words. The story told by M. D'Avigné is of the deepest interest; and M. Labouchere, who is known in England by the engraving after his excellent picture, "Luther, Melancthon, Pomeranus, and Cruciger translating the Bible," illustrates it closely. The drawings are in parts weak; but they are, at any rate, compositions,—inventions,—which cannot be said of the work of the majority of English illustrators nowadays, who seem to think a couple of lay-figures variously disposed are sufficient for all purposes, and fancy that the careful rendering of a silk dress will amply compensate for want of expression and story.

#### VARIORUM.

NEWCOMB'S "Farmer's Pocket-book" will be found to supply the place of an ordinary pocket account-book, and also to contain, in a portable and compact form, many useful tables for farmers, such as the "Breeder's Calendar," "Harvest-work Ready Reckoner," "Ready Reckoner for Thatching, Hedging, Ditching, and Under-Draining, Land Measuring, &c.," with a list of fairs, and a quantity of other useful matter.—"The Midland Counties' Almanac and Rural Handbook for 1866," contains a large quantity of matter of interest and utility to the farmer, gardener, and housewife.—"Blackwood's Shilling Scribbling Diary for 1866" (Lovell's-court) does not give so much space for each day as one we mentioned recently does, but, on the other hand, has an almanac and a postal map.

#### Miscellaneous.

ROYAL ACADEMY MEDALS.—The gold medal for the best architectural design was awarded to Mr. Alfred Ridge; the silver medal, for an architectural drawing, to Mr. Charles Bennett.

REDUCTION IN THE PRICE OF COPPER.—The price of copper was on Monday reduced 10¢ per ton. Present prices are now—best selected, 108¢, and tough ingot 106¢ per ton.

VIADUCT AT PENNSYLVANIA.—The scaffolding for throwing over the first arch in the viaduct for the North Somerset railway is nearly completed. The viaduct will consist of sixteen arches, and be upwards of 90 ft. high from the level of the Chew river.

IMPROVEMENT OF THE PORT OF MONTREAL.—A gigantic work has just been completed which renders Montreal a port to which vessels of the largest class now in use for ordinary mercantile purposes may resort. This work is the construction of a canal 300 ft. wide, 9 ft. deep, and 32 miles long, through the shallows of Lake St. Peter, which have now a uniform depth of 20 ft. at the lowest summer level. The formation of the canal has extended over a period of fifteen years, and during its progress 4,500,000 cubic yards of material were removed. A large laden vessel, drawing 19 ft. 8 in. of water, has already passed through the canal.

INDUSTRIAL EXHIBITION AT HULME WORKING MEN'S INSTITUTE.—An exhibition has been inaugurated by the Mayor of Manchester, at the City-road Institute. The majority of articles contributed are the products of skilled and thoughtful labour, in hours stolen from that time of repose to which even the humblest has a right after his ordinary day's toil has ended. The rooms in which the exhibition is held have been fitted up by the committee in their leisure hours; and during the morning, vocal and instrumental music was performed. On the basement floor there is a collection of needle and fancy work, in what is called the ladies' room.

RAILWAY MATTERS.—A fatal accident has occurred, through the fall of a railway bridge. At the inquest it was stated that deceased was a "tipper" for excavators. He was with the wagons, on the temporary bridge crossing the turnpike-road, at a place called Oford, at Sevenoaks. One witness was close to the spot, when he heard a loud crack, and observed the bridge falling. It was a timber bridge, and was in compartments, supported upon trestles. It was intended to make a permanent bridge across the turnpike-road. Deceased fell with the bridge a depth of 27 ft. The cause of the accident, witness believed, was through deceased spragging the wagons, that is, suddenly stopping them. The verdict was "Accidental death."—For the week ending the 9th inst., the traffic receipts of the railways in the United Kingdom amounted, on 12,209 miles, to 644,578£, and for the corresponding week of last year, on 11,889 miles, to 608,164£.

MADRAS IRRIGATION.—Sir: An important pamphlet has just been published for the information of the shareholders of the Madras Irrigation and Canal Company, which shows that the board of directors have found the selection made by them, some years since, of Col. H. C. Cotton to the post of chief engineer to their works unsuccessful. Although not possessed at that time of satisfactory practical experience, they were under the belief that he would prove an apt and competent officer for the onerous and responsible duties of laying out the works and superintending the professional operations of the company. They cheerfully gave to Col. Cotton, during several years, their entire confidence and support; and it was only after a most mature and impartial inquiry, when it was brought home to their convictions that the course pursued had seriously endangered the object and the interests of the company, that they were led to instal an engineer of more practical experience. Thus we learn the useful lesson that in future, the administration of onerous and responsible duties should always be devolved upon men of practical experience combined with theoretical knowledge.—S.

"THE BUILDER'S FIRE" APPLIED TO PUDDLING FURNACES.—The principle, now well known as "The Builder's Fire," from having been first suggested in our journal, has been applied to puddling furnaces, by Mr. E. B. Wilson, at Barnsley, and it is said with great economy of fuel and superior result as regards the puddling process. The Leeds Mercury, in reporting the result of an experiment with the furnace in presence of several Leeds gentlemen, says:—"In the ordinary process of burning coal on fire-bars, these gases pass immediately from the hottest part of the fuel through the cooler coal lying on the top, and thence to parts of the furnace of a still lower temperature, the result being that the greater portion of them escapes into the chimney unconsumed. By Mr. Wilson's method, again, the gases pass from a cooler stratum of coal into one in a violent state of combustion, and are in consequence completely burnt, thus adding immensely to the heating power of a furnace. What with the utilisation of the gases, and the thorough combustion of the coal, a saving of one-half is effected in the quantity of fuel consumed, while the degree of heat obtained is all that can be desired. Samples of iron were shown from the furnace of very superior quality, which is believed to be the natural consequence of this new system of combustion. Mr. Wilson's invention can, we understand, be applied at a trifling expense to furnaces generally." In order to burn the fuel from above downwards or inwards, furnace bars are entirely dispensed with, and a "mixing chamber" is provided, with an inclined plane down which the burning fuel slides, leaving room for the green coal. The description, however, is not very clear.

THE FEMALE SCHOOL OF ART.—The new sculpture gallery lately erected for this school is to be opened on Wednesday evening next, the 3rd of January, when Professor Westmacott, R.A., will preside, and Professor Donaldson will deliver an address.

METROPOLITAN BOARD OF WORKS.—At the last ordinary weekly meeting the chairman read the following tenders for the construction of the Isle of Dogs branch of the Northern Low-level sewer:—William H. Rowe, 53,884£. 10s.; William Webster, 79,700£.; William Detbick, 82,000£.; Mason, Hill, & Kettle, 86,000£.; Thomas Pearson, 87,000£. The tender of William Webster was accepted, subject to the usual inquiries. It was decided that the Board decline to approve of the plan of the railway company, which proposed to make a railway under the Thames Embankment, and that the railway company be so informed.

THAMES EMBANKMENT.—On Friday evening last, at the Lambeth Baths, the men employed on the works carried on by Messrs. Ritson & Furness were entertained, along with their wives and children, at a substantial tea. They mustered strong, nearly 800 being present. Among visitors who attended on the platform, and walked down among the guests, were the Dean of Westminster and Lady Augusta Stanley, the Hon. A. Kinnaird, M.P., the Rev. Canon Conway, the Rev. T. Robinson, L.C.M., Messrs. G. M. Murphy, J. McGregor, M. S. Walshe, and many others. Various addresses were made.

ST. PANCRAS WORKHOUSE AND VESTRY HALL AND THE MIDLAND RAILWAY COMPANY.—The Midland Railway Company having proposed to the Vestry of St. Pancras to appoint a valuer to meet Mr. Clutton on the part of the railway company to agree upon the price to be paid to the vestry by the railway company for the workhouse, vestry-hall, and grounds, comprising nearly five acres, Mr. Lockyer was appointed by the vestry for that purpose, and he has made a report to the vestry, from which it appears that he values the buildings and land at the sum of 211,000£, being 131,000£ more than the sum offered by the railway company some time ago.

MANCHESTER ARCHITECTURAL ASSOCIATION.—On the 20th the opening meeting and *conversazione* for the season of the members of this Association, was held at the Cathedral Hotel; Mr. H. Booth in the chair. A liberal contribution had been made by members and friends of designs, drawings, and other works of art. The articles shown included three drawings of the morning, noon, and night of architecture, by Mr. Redford, the illustrations being severally an Australian log-hut, a view in Venice, and the banks of the Irwell after sunset. Dr. Clay exhibited an asserted newly-discovered portrait of Shakespeare. After tea, the Chairman read a short address. Mr. A. Darbyshire, the honorary secretary, read the report of the past session, in which the council congratulated the members on the success of the Association. A change had been made in the constitution of the Association by the division of the members into two classes,—practical architects and associates. Addresses were delivered by Messrs. J. Lowe, G. Aitken, Bowman, J. Bonit (Liverpool), Dr. Clay, R. W. Aitken, and others.

NEW BLACKFRIARS-BRIDGE.—Last week the committee of the Bridge-house Estates made an official inspection of the works of the new Blackfriars Bridge, at the conclusion of which the first stone of the river piers was laid by Mr. William Hawtrey, the chairman. The piers of the new bridge are being put in by means of wrought-iron caissons, six to each pier; four are rectangular, 36 ft. in length by 18 ft. in width, set side by side; these receive the foundation of that portion of the pier which carries the roadway. Two triangular caissons, one at each end, will carry the cutwaters or pointed ends of the piers, which project beyond the width of the roadway. The caissons are 46 ft. in depth, and consist of 15 ft. of ironwork, riveted together, sunk into the bed of the river and permanently left there, the upper 28 ft. being merely used as a temporary gan, which will be removed as the work proceeds, in such a manner as to allow of the masonry of the pier being built continuously in one solid mass throughout. The caissons are sunk well into the solid bed of the London clay. The first 10 ft. is filled with concrete made with Portland cement, the next 8 ft. with brickwork. Upon this brickwork, 18 ft. above the real foundation, and 2½ ft. below Trinity high-water mark, the stone was laid on the present occasion.
