*Oxford.*—An endeavour is being made to obtain funds to construct a bridge over the Isis, immediately above Medley Lock, so as to open up the walk by the river side to Binsey, Godstow, Wytham, Wolvercote, &c. The necessary permission has been obtained from the Dean and Chapter of Christ Church and the Thames Commissioners.

*Manchester.*—The preparations for the erection of a new building for the Manchester Royal Exchange are steadily progressing. The sum agreed upon for Newall's-buildings has been paid, and the property secured for the purpose.

*Doncaster.*—The foundation stone of the Infirmary for the town and neighbourhood of Doncaster has been laid by the Mayor, assisted by the Archbishop of York, in the presence of a large assembly. The style is Elizabethan, and it is proposed to build the edifice in red brick, with stone quoins, dressings to windows, &c. The front elevation, which will be towards Whitaker-street, will have the characteristics of a public building. The plan is in the form of the letter H, and is contrived to insure good natural ventilation, all the wards having outer walls, so that the windows can be placed opposite each other. The building is designed to accommodate twenty-five in-patients, in addition to a dispensing department, and accommodation for seeing out-patients, it being in contemplation to remove the work of the present dispensary to the new building. In the east wing of the basement, pantry, larder, and cellars are placed; and in the west wing of the basement will be a *post mortem* and dead-house. On the ground-floor in the west wing is placed the accident-ward, for five beds, with an operating-room and nurse's room in close proximity. In the centre of the building on this floor are two consulting-rooms for one physician and surgeon, with dispensary 20 ft. by 17 ft., and waiting-hall 30 ft. by 17 ft. These are so arranged that patients coming to the dispensary will not in any way interfere with the comfort of the infirmary patients. The east wing of this floor is appropriated to the house-surgeon's residence, with separate entrance; and kitchen, 26 ft. by 17 ft. for the use of the institution. The second floor is approached by two flights of stone stairs at either end of the building, and this floor has four wards, with nurses' rooms, bath-rooms, linen-closets, and other accommodation. All the wards are 14 ft. high. The length of the frontage towards Whitaker-street is 105 ft., and the side elevation next Wood-street is 70 ft. long.

*Gateshead.*—At a recent meeting of the town council, the town-hall committee reported that at the meeting of the council, held on the 25th of November, 1863, it was decided that the cost of the proposed town-hall buildings, inclusive of all contingencies, should not exceed 10,000l.; and that if it should be intended to erect the buildings in accordance with the designs and specifications of the town surveyor, or in accordance with any other design which would involve an expenditure exceeding 10,000l., it would be

necessary to rescind the resolution of the 25th of November, 1863. The actual cost of the building proposed by the surveyor was 16,575l. It was added that there was other work which could either be included or dispensed with, which would make the total cost 22,300l. The town clerk stated that the council had been under notice to leave the present premises for two years. The North-Eastern Company could order them to quit at any time. It was decided that the plans and specifications of the surveyor should be printed for circulation amongst the members of the council, and that the subject, after being considered, should be brought up for discussion.

#### FROM SCOTLAND.

*Dunfries.*—The foundation stone of Maxwell-town free church has been laid. The building was commenced some time ago, and the contractors—Messrs. Crackston & Son—have pushed on the work, and the walls have already attained some 10 ft. in height, save at the south-east corner, where the foundation stone was laid. The church is to be erected in the Decorated style, from plans by Mr. James Barbour.

*Arbroath.*—Contracts have been entered into for the erection of a new church for the United Presbyterian congregation worshipping in Grimsby Church, under the pastoral charge of the Rev. Mr. Johnstone. The new church is to be erected in the corner of Queen-street. The plans have been prepared by Mr. MacLaren, architect, Dundee. The design is Gothic, having the side to Queen-street, and the principal front facing the street to the west. There is one main doorway in the west front, with a four-light window over it, with tracery. There are also doors on each side. There are galleries running round three sides of the church, and the pulpit is placed in the west end. The roof is supported on iron columns, and the principal rafters are visible. The seats are very wide, with ornamental ends instead of doors, and the wood is to be stained and varnished. The church is to be heated for about 850. Provision is made for heating the building with hot water. Attached to the church, at the north-east, is a large class-room, to be used for weekly meetings, as a vestry, and for other purposes. The total cost is expected to be about 2,600l. The contractors are,—masons, J. Gordon, Arbroath; J. Whyte, Arbroath; slater, Mr. Wishart, Frickheim; plumber, A. K. Miln, Broughty Ferry; and plasterer, J. Miller, Arbroath.

*Glenbuckie.*—The new free church here has been opened for divine service. The church is in the Gothic style. The walls outside are of dressed granite, and there is a helpy. The church and school are built uniform, under one roof, but separated by a movable wooden partition within, so that the whole area can be easily thrown open for public worship when necessary. A teacher's house has been built beside the church. The architect was Mr. Henderson, of Aberdeen.

#### YOUTH'S CHRISTIAN ASSOCIATION AND HOME.

The fifth annual report of this Association has been issued. The object of the institution is to provide lodgings and food at a cheap rate for country or other friendless lads in town, so as to obviate the necessity of their living in low lodging-houses. Since the inauguration of the institution in 1862, it is said, nearly 150 lads have been thus provided with the social, moral, and religious benefits of a Christian home. Each youth pays 2s. a week for lodging, which charge includes admission to classes, lectures, addresses, library, and other privileges. If they wish it they can have breakfast for 3d., dinner for 6d., tea for 3d., and supper for 1d. They must be recommended by a clergyman, and must not be out of the home after half-past ten p.m. The Association appears to be greatly in want of funds. Mr. G. H. Jones, of 12, Stafford-street, Marylebone, N.W., is the honorary secretary.

#### TREATMENT OF LUNATICS.

SIR,—In reference to the article on Lunatic Asylums in the *Builder* of last week, I beg to inform you that I lately registered the death of a female who had only left Colney Hatch Asylum a few days previously to death, who complained to her brother bitterly of having been put into a bath which had been previously used by another person.

W. H. BUTTSFIELD, Registrar.

TELEGRAPHIC PROGRESS.

The Atlantic telegraph cable is now on its way, in the *Great Eastern*, to be laid down. A comparison between this cable and the last may here be briefly made. The last had seven wires, and this has seven; but there the resemblance ceases. The seven wires in the one case weighed 107 lb. per nautical mile: in this instance, 300 lb. The insulation in 1858 was by three layers of gutta percha, weighing 261 lb. per knot: the present insulator is in four layers, weighing 400 lb. The external covering then was by 18 strands of the spiral wires; now it is by 10 solid wires with homogeneous iron, each wire "served" with Manila yarn, saturated with a preservative compound. The weight in air then was 20 cwt. per mile: this is 35½ cwt. The weight in water was 13¼ cwt. per mile: now it is 14 cwt. The breaking strain was 3½ tons: now it is 7½ tons; and while the strength of the former cable was 2½ times the strength required for the deepest water, this is 4½ times stronger than is deemed absolutely necessary. Finally, the length shipped for 1858 was 2,17½ nautical miles: now it is 2,300 knots.

The United Kingdom Telegraph Company have announced the abandonment of the uniform shilling rate, after a four years' trial; the public, they say, not having sported it to a sufficient extent. Henceforth the charges are to be, for 100 miles, 1s.; for 200, 1s. 6d.; and for all distances above 200, 2s.

The Anglo-Indian line of telegraph now brings Sydney within 23 days of London. The first message to Australia by this route is stated in the *Railway News* to have been despatched from London on the 20th of March, and received in Melbourne on the 19th of April: it would have arrived as early as the 13th but for the breaking down of the *Malvas*.

The new submarine telegraphic line just laid down from La Calle in Algiers to Bizerte and Marsala in Sicily, has now been opened for public and private despatches. The tariffs are reasonable, being for twenty words between any office in Algeria and any office of France, Corsica, or the Roman States, 6s. 5d.; to Italy, 4s. 9d.; Bavaria, Belgium, Duchies of Baden and Luxemburg, 8s.; Prussia to the west of the Weser, 8s. 5d.; ditto to the east of the Weser, 8s. 9d.; Spain, 8s. 9d.; Portugal, 10s. 4d.; beyond these places the prices vary according to the telegraphic treaties of Berne and Brussels. For every ten words above the twenty allowed by the above rates, the charge is increased by one half.

WAGES MOVEMENT IN THE BUILDING TRADES.

Sir,—As the *Builder* is devoted to the interests of employer and employed, I hope you will think the following of sufficient interest for insertion. It is said a number of employers are willing to give the advance of three farthings per hour at once, but cannot do so, because the rest stand out. It seems that when an agitation is started, the majority of workmen soon become involved in it. The men in the firm I was working at up to Saturday last caught the infection, and sent one of their number to the manager, asking for that which other firms had already been memorialized for. The manager gave the usual evasive answer, and the men were content to wait until something more definite took place. On Saturday, July 8th, he informed the shop that the advance would be given to all on the next Saturday; and the men, as a matter of course, expected he would perform his promise; but on Saturday, only a portion of the men received the advance. The result was, that those who fell short left the employ. It is a fancy idea of those who do the leading articles in the daily and other papers, that there ought to be various rates of wages, and that workmen in the building trades ought to be paid according to their merits. Such theories, I allow, look plausible on paper, but when reduced to practice, there has always been great dissatisfaction. I wish to ask—and perhaps some employer or foreman will give the answer—as to who is to fix the standard; or, to put it more plainly, what is to guide the foreman as to the value of each workman?

I have had some experience of this system of paying men according to their merits, and the result has been that those who were the foremost favorites received, not only the highest wages, but a much larger wage than those who did not court his favour. Saturday's experience is a still further illustration that a system of paying wages as the foreman thinks fit will not work to the benefit of either master or man. One of the men who received the usual rate worked in the firm over nine months, and during that time had seen at least fifty men discharged, through slackness or not sutting, and leaving out the foreman, and he was the oldest hand in the shop; and he received only the usual price, and left with others. It must be evident that the manager had been very remiss in relation to the employer's interests, or he would have found out before nine months that this man was not worth so much by three-farthings an hour as other men, or else he thought he could impose on him to that extent. Workmen are condemned for joining trade societies, but I think the treatment of men, by masters and foremen, is to a large extent the cause. And if, in future, the treatment is to be such as several of us received on Saturday, it will add additional strength to trade societies, and widen still further the breach which separates the masters' interests

from the men's. I hope, Sir, the employers will issue a manifesto of the course they intend to pursue. I intended to append my name, and that of the firm; but I think this letter will attract sufficient attention without them. And as I have no wish for notoriety, I hope you will insert the above with the initials of  
R. W. H.

SAFE GUNPOWDER.

The simplicity and completeness of Mr. Gale's invention for rendering gunpowder non-explosive, and then, *prosto*, restoring it to its original villanous condition (to which we have already referred) are remarkable, and ought to bring the discoverer a fortune. The gunpowder is simply mixed with another powder, cheap and easily obtained, and a slow match may be burnt through it without exploding anything more than the few grains immediately touching it: throw the mixture into a common sieve: one shake; and then, if a light be applied, look out for an earthquake. We have tried it, and we know. It is not necessary to point out the advantages of the discovery promises. There need be no repetition of the Erieh catastrophe. Just one inquiry will have to be made. Does sufficient of the non-explosive powder adhere to the grains of gunpowder, after sifting, to lessen, in any appreciable degree, its explosive strength? We fancy not; but it will have to be tried.

CHURCH-BUILDING NEWS.

**Barnsbury (Leington).**—St. Clement's Church, Barnsbury, has been consecrated by the Bishop of London. The church is situated in Arundel-square, and York-place, Barnsbury. The foundation stone was laid on the 14th of last July by Mr. George Cubitt, M.P., by whom the whole of the expenses of building, &c., amounting to between 7,000, and 8,000, have been defrayed. The church, which is a spacious structure of brick, the nave and side aisles being in the Early English style of architecture, with a lofty groined roof, supported on solid stone pillars, is from the design of Mr. Gilbert Scott, and is calculated to afford seat-accommodation for between 700 and 800 persons. The chancel is approached by a flight of five steps, and over the communion table, at the eastern end, is a window of stained glass. The pulpit is of carved stone, with pillars of polished coloured marble. The organ, which is placed on the left of the chancel, there being no galleries, has been built by Mr. Walker.

**Buckingham.**—During some months past alterations have been in course of execution at the parish church here, according to plans prepared by Mr. Scott. The whole character of the church is intended to be altered. The Duke of Buckingham has offered to build a new chancel entirely at his own cost, and the Duchess has laid the foundation stone of it.

**Henley.**—The new church at Adwell has been opened by the Bishop of Oxford. The whole expense of the church has been provided for by the late Mr. J. W. Newell Birch, of Henley Park; Mr. H. Birch, wardens, of Adwell; and Miss Reynardson; with the exception of the east window (one of three lights in stained glass, representing the "Presentation of Christ in the Temple," "The Crucifixion," and "The Resurrection"), erected as a memorial to their uncle by the nephews and nieces of the late Mr. Birch. Mr. Blinfield was the architect.

**Romey.**—A series of improvements are to be carried out forthwith in the Abbey. The roof of the nave, put on a few years ago, is now being relieved by colouring and gilding, under the personal superintendance of the vicar. It is intended also to restore the transept roof, and to new-roof and restore the chancel.

**Grantham.**—The following tenders have been sent in by six out of nine builders invited to compete for the execution of the church new-roofs:—

Dove, Brothers, London.....	£11,905
Thompson, Peterborough.....	11,884
Jackson & Shaw, Westminster.....	10,715
Halday & Cate, Greenwich.....	10,570
Huddleston, Lincoln.....	10,270
J. B. Hall, Nottingham.....	9,370

The sub-committee accepted the last tender, subject to the approval of the general committee, and conditionally on Mr. Hall's consenting to such variations and deductions on reasonable terms as may be required by the architect.

**Stanton Fitzwarren (Wilt).**—The small church of St. Leonard is now being restored under the direction of Mr. J. W. Huggall. The present furniture of the church is of the worst description: high square pews, an offensive gallery, and a

"three decker" encumber the nave: equally inappropriate fittings are in the chancel. The roofs are much decayed, otherwise the fabric is in good preservation. The church, though small, (the nave being 30 ft. 3 in. by 17 ft. 9 in., the chancel 29 ft. 7 in. by 15 ft.) is interesting as containing vestiges of a Norman foundation.

**Ossett (Yorkshire).**—The new Church of the Holy Trinity, Ossett, has been consecrated. The plan of the edifice is cruciform, having a nave with aisles 83 ft. long inside, a chancel 32 ft. long, and transepts 78 ft. within. Over the centre of the cross rises a tower and spire to the height of 226 ft. The height of the nave is 67 ft. to the ridge of the roof, and that of the chancel and transepts 59 ft. The style is Geometrical. The nave has a clerestory of great height, pierced by two high windows of a Geometrical design outside, which work in with a continuous foliated arcade inside. The shafts supporting the nave arcade are alternately polished Aberdeen red and blue granite. The small respond shafts are of Devonshire marble, all surmounted by carved capitals, alternate foliage, and angels bearing monograms. The tower piers are of stone, having foliated capitals. The recedes, pulpit, and font, and also the rest of the sculpture in the church, have been executed by Mr. Ruddock, of London. The recedes extends across the east wall, having as a central subject the Last Supper, flanked by the Annunciation, Adoration, Our Lord bearing His Cross, and the Agony in the Garden. The pulpit is octagonal, having a canopied figure in each face. The figures represent St. Paul and the Evangelists. The font is circular, and has on the four cardinal points the evangelistic symbols. The east window, of five lights, is filled with stained glass, in memory of Joseph, William, Joshua, and Benjamin Ingham, brothers, all of Ossett, by Benjamin Ingham, of Palermo, son of Joseph. The west window, also of five lights, is stained in memory of Joseph and Mary Whitaker, by their five sons, Isaac, John, Joseph, Joshua, and Benjamin Whitaker. Both of these windows are by Messrs. O'Connor, of London. The tower contains a peal of eight bells, presented by Mr. Whitaker, of Ossett, and Mr. Ingham, of Palermo, designed by Mr. E. B. Denison, Q.C., and cast by Taylor, Brothers, of Loughborough. The weight of the peal is 5 tons; and the tenor bell weighs 264 cwt. These, and the clock, were fixed by Mr. Potts, of Leeds. The organ was made by Mr. Hopkinson, of Bristol. The fixed seats accommodate over 900 adults. The contractors were Messrs. Hampshire, masons, Huddersfield; J. Sykes, joiner, Huddersfield; and Snowdon, plumber. The heating apparatus was fixed by Messrs. Wood & Tomlinson, of Manchester. Mr. Little was clerk of the works; and the architect was Mr. W. H. Crossland, of Leeds.

**Gateshead.**—St. James's Church here has been consecrated. The church consists of a chancel, 32 ft. by 29 ft., with vestry and organ chamber on the north side; and a nave, 71 ft. 6 in. by 29 ft., with a north aisle, 72 ft. 3 in. by 12 ft. 3 in., in which is the principal entrance to the church, screened by a porch on the north side. There are sittings for 534 persons, and provision is made by arches, built into the south wall of the nave for the future addition of a south aisle, which, according to the construction determined on, would accommodate from 130 to 250 persons. The architecture is Early Geometrical. Externally, the nave and chancel are covered with lofty roofs of slates, laid in patterns, with ornamental ridgings, about 55 ft. from the ground; and a simple slated apiret, holding a single bell, is placed near the east end of the nave roof. The north aisle, vestry, and organ chamber are covered by steep lean-to roofs, leaving a small wall space at their heads before the starting of the nave and chancel-roofs. In case of the erection of a south aisle, it is probable that a steeple on the south of the chancel would be undertaken in connexion with it. At the west end is a large five-light lancet window, within an enclosing arch. This window is designed after an ancient example in the county. The aisle windows are plain lancets. The chancel aisle is about 26 ft. broad, and 32 ft. high, and springs from carved corbel and shafts. At the east end is a large five-light window, with geometrical tracery in the head. The lower part of the chancel is lined with ashlar stone, and the rest of the walls throughout the chure are unplastered, the joints of the stonework being simply pointed. The chancel seats, pulpit, and desk are wrought in oak, with carving on the horses, &c. The church is heated by hot-water,

and a large corona in the chancel, with rows of gas jets at the top of the nave walls, supply means of lighting during the winter evening services. Messrs. Austin & Johnson were the architects; and the church has been carried out under Mr. Johnson's personal supervision, Mr. Dryden being the clerk of works. The contractors were,—Mason, Mr. J. Hogg; carpenter and joiner, Mr. R. Sanderson; slater, Mr. E. Beck; plumber, Mr. H. Watson; plasterers, Messrs. Wilkinson & Co.; painter and glazier, Messrs. Wilson & Romanis; heating, Messrs. Walker & Emley; gasfitting, Messrs. Mather & Armstrong.

#### DISSENTING CHURCH-BUILDING NEWS.

**Wolverhampton.**—The chief stone of a Primitive Methodist new chapel has been laid in Dudley-road, at the corner of Derry-street. The proposed new chapel, when completed, will be the largest of five which the Primitive Methodists have erected in this town and neighbourhood within the last eighteen months. The design is by Mr. C. Manton, architect to the trustees, under whose superintendence the works are proceeding. The front elevation is of the Corinthian order, with four partly-detached columns. The side elevation will have white brick dressings. The interior is provided with galleries all round. There will be two large vestries. The chapel will contain upwards of 500 full sittings, and the total cost, including boundary walls, palisading, &c., will be about 1,300*l.* Mr. T. Jones is the contractor.

**Rotherham.**—The foundation stone of a chapel for the use of the Primitive Methodists has been laid at New York, Rotherham. The cost of the chapel building will be about 300*l.* Mr. J. Shaw is the architect; and Messrs. Slamson & Gummer are the builders.

#### RECENT PATENTS CONNECTED WITH BUILDING.\*

**MATERIAL TO BE USED FOR ROOFING OR COVERING BUILDINGS, &c.**—*J. F. Empson.* Dated May 9, 1864.—The patentee claims a material consisting, essentially, of a base or foundation of paper, or other fibrous mixture or material, upon the surfaces of which pounded slate or other gritty material is made to adhere by means of tar or pitch, or a mixture of tar, pitch, and asphalt, or other bituminous matter, or a material consisting essentially of a mixture of gaster, pitch, and asphalt, or other bituminous matter, combined with hay or chaff, waste flax or cotton, or other fibrous or binding material, the said mixture being made into a plastic mass and formed into sheets or slabs, or moulded or pressed in dies.

**APPARATUS FOR MAKING BRICKS.**—*J. Chambers.* Dated May 9, 1864.—The patentee claims constructing machinery or apparatus for making bricks in which the moulds are removable from the revolving table, and are made to pass underneath a box projecting from the pug-mill, in which box a stamper, hammer, or ram, is caused to work up and down for the purpose of pressing the material into the moulds.

**KILNS FOR BURNING BRICKS, TILES, &c.**—*T. M. Gisborne.* Dated May 11, 1864.—The patentee claims, first, arranging a series of kilns burning on the principle of the Newcastle kiln, side by side, in such a manner that the front or combustion end of the one kiln is contiguous to, and can communicate with, the back or chimney end of the next kiln, while the chimney end of such kiln can furthermore communicate either with a chimney common to all, or with a separate chimney. Second, constructing a series of kilns burning on the principle of the Newcastle kiln, placed side by side, and made to taper from the combustion end to the chimney end, the chimney end of one kiln being made capable of communicating either with the combustion end of the next kiln, or with a common or separate flue or chimney. Third, constructing a series of kilns, burning on the principle of the Newcastle kiln, made to taper from the combustion end to the chimney end, and arranged side by side alternately in reversed positions, the chimney end of the one kiln being made capable of communicating either with the combustion end of the next kiln, or with a common or separate flue or chimney.

**CONSTRUCTION OF CAISSONS, COFFER-DAMS, &c.**—*J. G. Jennings.* Dated April 21, 1864.—In constructing coffer-dams and similar struc-

tures according to this invention, the patentee drives, side by side, into the earth, piles or plates formed of corrugated sheet metal. Each pile is composed of two corrugated plates placed together face to face, in such manner that the ridges of one plate come against the ridges of the opposite plate, and where the plates thus come together they are attached together by means of rivets. The corrugations of the plate run vertically in the direction of the length of the pile, and the pile is made of such a length that, after its lower end has been forced into the earth to the requisite extent, its upper edge shall project sufficiently above the highest water-line. The lower ends of the combined plates are furnished with shoes or points for entering the earth, which shoes may be attached to the plates in any suitable manner. On the upper end of the combined plates is also placed a head or block, by which the piles or plates may be driven or forced into the earth. In constructing a coffer-dam or similar structure, after having forced into the earth one of the piles or plates constructed as above described, another plate is forced down, so that the edges of the plate shall be in close connexion with each other. The lower end of another plate is then similarly forced down into the earth, and so on, until the length of dam required is constructed. The joints between the neighbouring ends of two plates may be made water-tight by filling or ramming in the space between two tubes with clay, cement, or other suitable material. In forcing the plates down into the earth they may be guided by piles of timber previously driven in, or they may be otherwise guided.

#### Books Received.

##### VARIORUM.

"Society of Engineers: Transactions for 1864." London: Spon. 1865. This volume contains papers, of more or less interest, on Fuel, by P. F. Nursey; on Coal Gas Manufacture, by A. F. Wilson; on the Cornish Pumping Engine, by A. Fraser; on Elastic Railway Wheels, by V. Pendred; on the Road Bridges of the Charing-cross Railway, by M. Parkes; on the Charing-cross Railway Bridge over the Thames, by M. Parkes; on the Explosion at Erit, and Repair of the River Bank, by L. G. Moore; and on the Water Supply of Towns, by B. Latham. The volume is well illustrated by numerous engravings.—"Fry's Shilling Guide to the London Charities for 1865-6." Third annual edition. London: Hardwicke. Some idea of the extraordinary number and value of the metropolitan charities may be derived from the fact that the mere alphabetical list here given, with name, address, objects, income, &c., arranged tabularly, requires no less than 150 pages, of by no means small size. The volume, being an annual issue, contains the more important charities of a temporary nature, as well as those of a more permanent description. Thus, in this 1865-6 edition, the Surrey Theatre Fund for the relief of persons suffering from the burning down of the theatre is included. The volume is both interesting and useful as a guide to metropolitan charities.

#### Miscellaneous.

**WORKING MEN'S EXHIBITION, GLASGOW.**—This exhibition is managed entirely by working men. It contains works, the production of their leisure hours, and is very interesting.

**THE STRIKE.**—The strike against Messrs. Cubitt & Co. continues, and it seems not unlikely, we deeply regret to say, that a general outbreak on the part of the master-builders of the metropolis may be the result.

**A NEW LADDER.**—An interesting trial was made lately, in the spacious courtyard of the Archinto Palace, at Milan, with what the inventor, Paolo Porta, calls an "air ladder." It consists of several pieces, which, with a sort of carriage as a basis, can be fixed one on the top of another. A height of 90 ft. was thus reached in a very few minutes. The apparatus may be bent down to an angle of 45, and is capable of carrying heavy weights. The principle, it is stated, can be adapted to portable bridges, which can be put together in an equally short time.

**EXPENDITURE ON PARIS.**—According to the *Revue Universelle des Mines*, the grants by the State towards new buildings and improvements in Paris since 1852, amount to nearly ten millions sterling. This is, of course, irrespective of the sums spent by the city of Paris itself.

**THE VALE OF LIANGOLLEN.**—The authorities of this beautiful district are endeavouring to afford its visitors all the facilities and comforts essential to the success of a pleasure resort. A railway is formed through the entire vale, and waterworks for the town are about to be constructed by the local Board, under the superintendence of Mr. Josiah F. Fairbank, C.E. Building operations and projects, we are told, are already actively proceeding.

**PRIZE COMPETITION IN BRONZES IN PARIS.**—The manufacturers of bronzes have announced a competition amongst the artists and workmen employed in that important branch of Paris industry. The prizes to be distributed are to consist of medals and honourable mentions, and the following amounts in money:—For sculptors and ornamental modellers, each 800*fr.*; chasers, 1,600*fr.*; designers, 500*fr.*; founders, 600*fr.*; turners, 400*fr.*; mounters, 300*fr.*

**ROYAL SCHOOL OF NAVAL ARCHITECTURE, &c., SOUTH KENSINGTON MUSEUM.**—The first session of this school terminated on the 30th April. The number of students was twenty, of whom sixteen were sent by the Admiralty, and four were young men intended for the private ship-building profession. Courses of lectures on iron, steam, wood, the strength of materials as applied to ship-building, and other cognate subjects, were delivered by gentlemen of the highest reputation. The next session will commence at South Kensington, on Wednesday, November 1st, two days before which the gentlemen who offer themselves as pupils of the school will undergo a preliminary examination. Mr. Merrifield, as principal, resigns in favour of Mr. Purkies, who was vice-principal. Four Russians and one Swede have applied for admission to the school.

**WATER FOR ROME.**—With reference to this subject, the local correspondent of the *Morning Post* says,—"The restoration of the Marcian aqueduct is now passing out of the region of possibility into that of probability, and its execution will be very much facilitated by uniting the necessary levelling works with those of the Tivoli Railway, the execution of which is now entrusted to the Marquis Lavaggi. The principle adopted is that of bringing the pure water of the Marcian springs to Rome in iron pipes, following the direction of the ancient aqueduct in the upper valley of the Anio, and that of the railway from Tivoli to Rome. Operations are to be commenced in September, and Mr. James Shepherd, the director of the Anglo-Roman Gas Company, has gone to England to organise the aqueduct company, and to order the required quantity of pipes. The high level of this spring will allow of its waters being supplied to all Rome, even to the upper stories of the Quirinal Palace, and its abundance may be conceived by comparison with the Trevi water, whose volume is measured at 180 in., whereas the Marcian water can boast of a flow equivalent to 4,000 in."

**ORNAMENTATION OF GLASS, METAL, &c.**—Professor Kuhlmann, who has been occupied for some time past in researches on crystallogenic force, has recently patented some of his discoveries in this direction. (No. 1,981, 1864.) The patent is for producing ornamentation on porcelain, glass, metal, and other surfaces. The effects, says the *Reader*, are produced by applying to the surfaces saline solutions or other crystallizable matters in a cold state, either alone or mixed with amorphous insoluble substances held in suspension, and in facilitating the formation of large crystalline configurations, by thickening the concentrated solutions with gum, dextrin, or gelatine. Any solid matters, such as mineral colours, coloured enamels, &c., may be held in suspension in these solutions. By the slow evaporation of the water the solid matters will remain deposited on the glass or metal, retaining at the same time their crystalline arrangement, and the "watered" or "frosted" appearance thus produced may be fixed, in the case of glass, by vitrification, and in the case of metals by etching with acid. Impressions may afterwards be taken from the metal plates in the ordinary manner. The specification also contains a description of a new method of engraving upon glass by hydrofluoric acid.

**PRICE OF LAND IN LONDON.**—A piece of freehold ground forming an area of 2,500 ft. in Cannon-street, at the corner of Swinlins-lane, was sold last week at auction by Messrs. Fuller & Horsey for 30,600l.

**IMPORTS OF METALS.**—While in 1854 the computed value of the copper ore and regulus imported into the United Kingdom was 1,236,132l., in 1864 it had risen to 2,054,674l. Unwrought and partly-wrought copper was imported, in 1854, to the extent of 388,090l., while in 1864 the imports were valued at 2,206,525l. In 1854, unwrought iron, in bars, was imported to the value of 528,071l.; in 1864 the corresponding value was 625,283l. The receipts of silver ore were valued, in 1854, at 521,330l., and in 1864 at 251,568l. The value of the tin, in hocks, ingots, bars, or slabs, imported in 1854, was 267,312l., and in 1864, 497,328l. Lead, again, was imported to the value of 254,947l., in 1854; while last year's imports were valued at 611,273l. With the exception of silver ore, every metal is now imported in larger quantities than it was ten years since.

**PRESERVATION OF WOOD BY CHARRING.**—The superficial carbonization or charring of wood, as a preservative means, has long been practised on a small scale, the rationale of the process being the formation of an indestructible skin of carbon, which is, moreover, impregnated with the empyreumatic oils and creosote, produced by the carbonization of the outer layer of wood. About two years ago M. Lapparent proposed to apply it to the timber used in the French navy. Some experiments which were undertaken with the view to determine its practicality have terminated, according to the *Reader*, very satisfactorily; and the Minister of Marine has ordered the process to be introduced into the Imperial dockyards. M. Lapparent makes use of a gas blow-pipe, the flame from which is allowed to play upon every part of the piece of timber in succession. By this means the degree of torrefaction may be regulated at will. The method is applicable to woodwork of all kinds, and the charring, it is said, does not destroy the sharpness of any mouldings with which the wood may be ornamented.

**BEDFORD DRAINAGE AND WATER-WORKS.**—At a special meeting of the Bedford Town Council, for the purpose of receiving the report of Mr. Lawson, the engineer, and of deciding upon the tenders sent in for the performance of the works according to the plans previously accepted, the following tenders were unanimously accepted:—Mr. L. B. Moore, of Newport, Monmouthshire, for the sewerage works, for 17,567l. 6s. 8d.; the decision relative to the tender for the water-works was postponed till the next meeting, in order that some further inquiries may be made. Messrs. Cochrane & Co., for supplying iron pipes and other castings, for 4,603l. 3s. 3d.; Messrs. Guest & Chirnes, of Rothcham, for supplying the sluice-valves and hydrants, for 525l. 15s. 6d.; Mr. T. Crump, of Dorly, for laying and joining pipes, and fixing valves and hydrants, for 1,793l. 18s. 1d.; and Mr. L. B. Moore, of Newport, for making the service reservoir, wells, and other works, for 1,755l. 5s.

**PARSONAGE HOUSES.**—As to the new Act relating to parsonage houses, it may be useful to incumbents of benefices to learn that by an Act lately passed—the 28th and 29th of Victoria, cap. 63, sec. 1—intituled "An Act further to amend and render more effectual the Law for providing fit Houses for the beneficed Clergy and for other Purposes," incumbents are empowered to borrow on the security of the glebe, tithes, &c., for the benefit of any sum not less than 100l., and not more than three years' net income,—1. For the purposes of the former Act—namely, for building, repairing, &c., house or residence. 2. For the purpose of purchasing any lands or hereditaments, not exceeding 12 acres, contiguous to or desirable to be used with the parsonage-house or glebe. 3. For the purpose of acquiring any offices, stabling or out-buildings, or services necessary for the occupation or protection of the parsonage-house. 4. For the purpose of restoring, rebuilding, or repairing the fabric of the chancel of the church. 5. For the purpose of building, improving, enlarging, or purchasing any farm-house, or farm buildings, or labourers' dwelling-houses belonging to or desirable to be acquired for any farm or lands appertaining to the benefice. 6. Out of the sum to be borrowed the charges and expenses of the architect or surveyor and the costs of the mortgage deed may be paid.

**GAS.**—The Jedburgh Gas Company have resolved on a dividend at the rate of 10 per cent. on the year's transactions, and also to reduce the price of gas from 7s. to 6s. 10½d. per 1,000 ft.!

**LEVENSHULME LOCAL BOARD.**—Previously to commencing operations under the Act, the Board, at a meeting, held last week, appointed as their surveyors, Messrs. Whyatt & Redford, of Manchester, and Heywood.

**INK FOR WRITING ON ZINC.**—The following is given as a receipt for an indelible black ink to be used for writing on zinc:—Take 30 parts of verdigris, 30 of sal-ammonia, 8 of lamp-black, 8 of gum Arabic, and 300 of water: dissolve the gum in the water, and pour it over the other ingredients, well mixed and reduced to powder. A quill pen should be used for writing.

**FALL OF TWO HOUSES IN CHANDOS-STREET.**—On Tuesday evening, a fatal calamity occurred in Chandos-street, Covent Garden. One house was formerly known as the White Swan tavern, but had been closed for some time, the lease having expired. The other was for many years an oil warehouse. Both houses had been in course of demolition with a view to rebuilding, and the inner portion of both had been partly removed. It has been said that the front portion was not sufficiently shored. Be this as it may, the whole of the front portion suddenly gave way, and fell forward into the street. Two men were hurled in the *debris*, and killed upon the spot. Two other men are seriously injured.

**EAST LONDON WORKING CLASSES INDUSTRIAL EXHIBITION.**—The exhibition of products of the working classes resident in the east of London has been opened in St. Mary's School-room, Whitechapel-road. The opening ceremony was performed by the Earl of Shaftesbury, and the occasion was honoured by the presence of a large assemblage. The attendance each day since has been numerous. The exhibition is divided into four classes,—fine arts, mechanical productions, models, and miscellaneous. The committee of management have arranged for the gratuitous services of gentlemen, well-known in London as popular lecturers, to deliver addresses twice a week during the continuance of the exhibition. It is contemplated to keep it open only up to the 2nd of next month.

**NARROW ESCAPE OF LEICESTER THEATRE.**—The building was lately opened by an English opera company, and in the course of the first evening the performance was stopped by the sudden appearance of the gallery in flames. It seems that some of the "gods" had kicked or cut a hole into a leaden gas-pipe, thus causing an escape of gas, and that they threw a lighted match to the pipe. Many left the building in alarm. Search was made for the key of the gas-meter, but it could not be found; and an alarm of fire was raised, and the different fire-brigades summoned, but luckily their services were not required, as before their arrival a man of some sense in the gallery took off his coat, and, throwing it over the flames, succeeded in putting them out.

**THE STEEPLE OF ST. BRIDE'S CHURCH.**—A vestry meeting of St. Bride's parish has been held, to consider the report of Mr. Tress, architect, as to the state of the church steeple. The report was to the effect that the steeple and tower, from the top to the bottom, were in a most unsound and unsafe condition, and required immediate and extensive repair. Mr. G. Walter asked the vestry to adjourn the consideration of the question until they had seen the report of their former architect, Mr. Shaw, and which report he made some two years since. Mr. Paterson, a practical builder and stonemason, said that he had made a very careful survey of the tower and steeple, and he was prepared to say, that no immediate danger need be apprehended. It was true that some repairs were necessary, but nothing to the extent stated in Mr. Tress's report. Mr. Hancock ridiculed the notion of the church tower requiring repairs, when it was attended to only two years since. Mr. W. Payne observed that architects were in the habit of getting up great jobs; and he warned the vestry against being led away to spend large sums of money on the steeple and tower. He did not think it at all necessary. He should move that a committee be appointed to inquire into the matter, and report at the next vestry. Mr. Walter seconded the motion, which was unanimously adopted.

**AÉRIAL NAVIGATION AT LAST.**—The aerial vessel invented by M. Delamarne bids fair, according to the Paris correspondent of the *Star*, to realise the anticipations entertained as to the successful application of the vertical helm in controlling the currents of wind by which the courses of balloons have hitherto been guided. The vessel rose to the height of 1,500 yards, and then took a course due south. M. Delamarne, who acted as helmsman, steered the vessel in an opposite direction, and it accordingly sailed direct for Vincennes. To prove her obedience to the helm, M. Delamarne then took a northerly route. At the request of the passengers, without touching the safety-valve, and simply by using the helm, he descended near Nogent, and floated for some time close to the earth. After a sail of an hour and a half, they decided on descending in the neighbourhood of Choisy, which M. Delamarne accomplished without the slightest difficulty, and his passengers landed on *terra firma* as easily as if they had stepped out of an express train. Two results, it is added, are evident.—By the horizontal helm placed in the stern of the vessel, it ascends and descends as the helmsman pleases; and by means of the *héllices* placed at each side, combined with the action of the helm, a horizontal course is obtained.

**AN AQUATIC UMBRELLA.**—Some years since a good deal was said about hail-sticks, for guarding crops from all risk of hail falling where they were set up. Whether the umbrella-stick spoken of by the Paris correspondent of the *Star* be offshoot from the old hail-stick we do not know, but it looks rather like it. The *Star* correspondent says of it,—“The *Gazette de France* devotes two of its columns to the new and startling discovery of an umbrella, the cover of which, instead of being of the texture of Robinson Crusoe's, or of alpaca, or silk, is of the last material any one would guess, namely, rain itself. The steady old Legitimist *Gazette* never having condescended to joke since its creation, A. D. 1630, I firmly believe the statement, which I translate. ‘Any travellers, who, like myself (the correspondent of the *Gazette*), were passing, between two and three o'clock, on the road between Sourdes and Peyrouse, must have noticed a person, who, although unknown in the country, attracted universal attention. The rain was pouring down in torrents. He held a cane about 10 in. above his head. The rain, falling on this magic wand, spread out in the form of an umbrella, under which M. Drulep, the inventor, walked perfectly sheltered from even a single drop of water. M. Drulep will not as yet solve this mysterious problem; but the marvellous effect produced by this stick is reported to be due to a new application of electricity, and that M. Drulep's stick acts on the principle of the well-known *Tourquet Electrique*.”

**THE CHOLERA IN EGYPT.**—On the 20th of June the number of cases of cholera which had proved fatal in Alexandria was upwards of 60. From that date to the 24th the average number of deaths was 85 per diem; making a total of 857 since the outbreak of the epidemic. At this date a violent *chamsin*, or unwholesome south wind, arose, which continued with great intensity till the 7th instant. On the 25th ult. the official list shows the mortality to have been 183; on the 26th, 193; on the 27th, 208; on the 28th, 214; on the 29th, 209; on the 30th, 197; on the 2nd of June, 196; on the 3rd, 228; on the 4th, 176; on the 5th, 118; on the 6th, 132; on the 7th, 142. It is believed that the mortality is much greater than stated by the official reports. It is not doubted that such a rapid spread of the epidemic is to a great extent due to local causes, and principally to the state of the dwellings of the Arab fellahs, which are shared alike by man and beast; to the food of these natives, which, especially at the present time, is insufficient and bad; to the putrid water the Arabs are compelled to drink during the low state of the Nile; to the excessive heat; the want of personal cleanliness among them, as well as among the poorer class of Europeans; and, lastly, to the stupid superstition of the Arabs with regard to epidemics and death. A few instances of cholera have occurred in the European quarters of the town, but the upper class of Europeans have entirely escaped up to the present time. It is roughly estimated that between 18,000 and 20,000 European residents have left Alexandria. At Cairo the choleraic symptoms have shown themselves in a manner which gives rise to the most serious apprehensions.

PRICES IN ADELAIDE, SOUTH AUSTRALIA.—The following are some of the prices of labour and material, as quoted, Adelaide, 20th of April:—Brickmakers, per 1,000 bricks, without burning, 12s.; sawyers, 100 ft. cedar, 11s.; ditto deal, 8s.; bricklayers, 10s. a-day; carpenters, 8s. 6d. to 9s.; galvanized iron-workers, 8s. to 10s.; iron-founders, 9s. to 12s.; labourers, 6s.; masons, 9s.; painters, 8s. to 10s.; plasterers, 9s.; plumbers, 10s.; quarrymen, 7s. to 8s.; Welsh duchess slates, 21l. per 1,000; ditto countesses, 18l.; zinc, 40s. to 45s. per cwt.; bricks, 35s. to 45s. per 1,000; flooring-boards, grooved and tongued, 6 in. by 1½ in., 2½ in., 2½ d. per foot; red deal battens, 7 in. by 2½ in., 4d. per foot.

NEWSPAPER PRESS FUND.—The annual general meeting was held on Saturday, at the Freemasons' Tavern, Great Queen-street, Mr. S. C. Hall in the chair. Mr. H. G. Warren, the hon. secretary of the society, read the report, of which the following is the substance:—"The committee congratulate the society on the steady progress which has been made during the last twelve months. The number of members on the books is 192, of whom 40 are life members and 152 annual members. The number elected since the 30th of June last year is 64. During the year the society has lost three members by death; the widows of two of them have received assistance from the fund. The total receipts during the past year (irrespective of dinner tickets) were 1,957l. 2s. 10d. The society has now 1,500l. stock in the New 3 per Cents., and 600l. on deposit at the City Bank, leaving at the bankers' at the end of the year a balance of 183l. 8s. 4d. The income of the society at the present time may be thus estimated:—From interest on investments, 60l.; annual subscription of members, 156l.; annual donations, 128l.; making a total of upwards of 340l." The report was unanimously adopted.

EXTENSIVE SCHEMES OF TOWN IMPROVEMENT IN LIVERPOOL.—At a recent council meeting, amongst the proceedings of the finance committee, were recommendations to devote 5,000l. of the surplus income towards the erection of a hospital for infectious and contagious diseases, and 1,000l. for the improvement of Park-lane, between Forrest-street and Greetham-street, purchasing 12½ yards of land on the north side of Blundell-street for 300l. Both the proposals were agreed to. The markets' committee recommended application to Parliament for powers to purchase a block of property, bounded on the north by St. John's-lane, south by Charles-street, west by Hood-street, and east by Roe-street, containing 10,640 square yards, at an estimated cost of 87,875l. for the purpose of forming a wholesale fruit and vegetable market. Some discussion took place, and ultimately it was agreed to adjourn the subject for a month. Upon the recommendation of the improvement committee, it was agreed to include in the next improvement Bill a scheme for the widening of Casneau-street and Belle-street, and the construction of a new street from the north end of Belle-street to Scotland-road, at an estimated cost of 42,000l.; and to purchase at once some property required for the improvement of the south-east end of Everton-road, at a cost of 1,300l.

DWELLINGS FOR THE WORKING CLASSES.—The fourth half-yearly meeting of the company set on foot by Mr. Alderman Waterlow, to provide the working classes in the metropolis with suitable dwellings at easy rents, has been held in the Mansion House, Lord Stanley, M.P., the chairman of the company, presiding. The directors' report stated that the subscribed capital, 30,000l., has been paid up, less 150l. The sum of 23,542l. has been expended in the purchase of land and in the erection of buildings, and it is expected that the balance will in a few weeks be absorbed in completing the undertakings now in hand. At Tower-buildings, Brewhouse-lane, Wapping, nearly the whole of the sixty dwellings for families are occupied. The block of buildings at King's Cross-road, Bagnigge-wells, has been named "Colden-buildings." The dwellings there have been occupied for a few weeks, and the shops on the ground-floor are also let. Of the five blocks in Old St. Pancras-road, two were fully occupied in the first week of the present month. It is expected that two others will be ready for occupation in a few weeks, and the fifth will be completed in October. These five blocks, which have been named "Stanley-buildings," provide ample accommodation for 100 families. From the experience of the working

of the company up to the present time, the directors believe that a *minimum* dividend of 5 per cent. per annum may be permanently relied upon. Mr. Alderman Waterlow has recently been in communication with the Government, and has succeeded in obtaining from the Lords of the Treasury a promise to introduce, at the opening of the next session of Parliament, a Bill to enable the Public Works Loan Commissioners to advance money at 3½ per cent. interest upon the mortgage of improved dwellings for the labouring classes; and in order to enable the company to avail itself of favorable opportunities of borrowing money upon security of its property, a resolution was passed authorizing the directors to mortgage the company's property to such an extent as they may deem advisable. A dividend of 5 per cent. per annum on the paid-up capital was declared.

RAILWAY MATTERS.—The demolition of 150 houses in Coppice-row, Ray-street, Vineyard-walk, Wood-street, Exmouth-street, and the intersecting courts and by-streets, was made a very extensive opening in Clerkenwell, and workmen have commenced removing the interior of a large number of houses to the northward of Exmouth-street, and extending as far as Baker-street, Lloyd-square, many of the houses in which have been razed to the ground. The houses to the eastward of Clerkenwell work-house, extending to Wood-street, have disappeared, and preparations are being made for the extension towards King's Cross of the London, Chatham, and Dover Railway, and the widening of the Metropolitan Railway. Nearly 350 houses will have been pulled down in this way. Great increase of traffic is anticipated on the completion of the dead meat and poultry markets.—A great line of railway was to be completed from New York to New Orleans by the 15th of July. Its completion will be the signal for a grand movement of all the cotton and tobacco now stored between Chattanooga and Alexandria towards Baltimore and New York.—The traffic receipts of railways in the United Kingdom amounted, for the week ending the 8th of July, on 12,075 miles, to 710,941l., and for the corresponding week of last year, on 11,674 miles, to 675,792l., showing an increase of 401 miles, and of 35,149l.

MANUFACTURE OF PLATE-GLASS.—A paper has been issued by Mr. Howard, of Plaistow, giving some statistics of plate-glass. It appears that this manufacture amounted, in 1836, to only about 7,000 ft. per week, in consequence of the enormous excise duty which was imposed upon it, which amounted at that time to no less than 60s. per cwt. In 1845 the duty was abolished, and at the same time other materials of a much less costly description began to be used. Sand, the base of the manufactured article, is 8s. 6d. per ton, against the former price of 18s.; labour, formerly 1s. 6d. per superficial foot, is now 5d.; and coal, formerly 1s. 10d. per foot, is now about 2d. The cost is thus reduced to about that of the common window glass of thirty years ago, and in consequence the manufacture has increased from 7,000 superficial feet per week, sold at from 20s. to 25s. per foot, to 140,000 ft., sold at 2s. and upwards, according to quality. The finest qualities are imported from France and Belgium, at the rate of 16,000 ft. per week; but the export of the English commoner make has increased tenfold since 1849. From the opening up of the China and Japan trade, even this enormous increase is by no means the limit which may be attained. The material is, moreover, applied to a variety of purposes, such as flooring and the sheathing of iron ships, so that there appears practically no limit to the development of which the manufacture is susceptible.

CROYDON WORKMEN'S CLUB.—According to the report read at a general meeting, the committee, in completing the first year of the existence of the Croydon Workmen's Club, feel there is fair cause for congratulation to all interested in its prosperity, in the extent to which the institution has answered its intended purposes, and in the cordial support accorded to it by all classes. The amount received for members' subscriptions during the year is nearly 100l., giving an average number of subscribers of about 450. During the winter months, the club has been attended by as many as the rooms will comfortably accommodate; and the privilege of a commodious room well warmed and lighted, and abundantly supplied with newspapers, games, and other means of rational enjoyment,

for the small charge of 1d. per week, has evidently been appreciated by the members. For the convenience of employers wanting men, and of men seeking employment, a registry, on the plan of the houses of call, but open to all branches of trade, will shortly be established at the club, and it is hoped, will prove useful to the members. In the refreshment department, upwards of 100l. have been received during the twelve months. As a large cup of coffee and ½ lb. of cake only cost 2d., on a moderate calculation, 12,000 individuals have patronised this department during the year.

TENDERS

For the erection of a small house at Baldoek, Heris, for Mr. Chalkley. Mr. J. Shilcock, architect:—  
Williamson ..... 2,950 0 0  
Warren & Son (accepted) ..... 245 0 0

For building and completing Minerva College, Stroud Green-lane. Mr. J. G. Turner, architect. Quantities supplied:—  
Richards ..... £3,097 0 0  
Hall & Son ..... 2,679 0 0  
Hawkes ..... 2,950 0 0  
Carter & Son ..... 2,370 0 0  
Williams ..... 2,449 0 0

For alterations and repairs at the Prince of Wales Hotel, Bishop's-road, Paddington. Mr. Isaac Bird, architect. Quantities supplied:—  
Henshaw ..... £2,487 0 0  
Newman & Mann ..... 2,445 0 0  
Ebbs & Son ..... 2,419 0 0  
Brown ..... 2,290 0 0

For erection of house for Mr. Fred. Bigg, Maze Hill, St. Leonard's-on-Sea. Mr. F. H. Fowler, architect. Quantities by Mr. Harris:—  
Hughes ..... £2,559  
Kenwood ..... 2,477

For a villa residence at Farham, for Mr. J. M'Cutchan. Messrs. Egan & Stapley, architects:—  
Geo. Goddard ..... £289 0 0  
Duke ..... 853 0 0  
John Goddard & Son ..... 848 0 0  
Goddard & Wichham (accepted) ..... 788 0 0

For painting and decorating the Downham Arms Inn, Downham Road, Lillingdon, for Mr. George Garrett. Mr. J. S. Goume, architect:—  
Warne ..... £249 0 0  
Ballard ..... 235 0 0  
Bishop ..... 198 0 0  
Vidler (accepted) ..... 155 9 2

For three warehouses, Southwark-street, for Mr. W. Haynes. Mr. Robert W. Edis, architect:—  
Brass ..... £8,987 0 0  
Colls & Son ..... 8,732 0 0  
Hardiman & Sandon ..... 8,539 0 0  
Hewes & Robinson ..... 8,479 0 0  
King & Sons ..... 8,238 0 0  
Sharphington & Cole ..... 8,187 0 0  
Conder ..... 8,050 0 0

For additions to the Royal Berkshire Hospital, Reading. Mr. Jos. Morris, architect. Quantities supplied by Mr. Fred. Wallen:—  
Sheppard ..... £2,742 0 0  
Wheeler & Co. .... 2,709 0 0  
Simmonds ..... 2,659 0 0  
Birks & Martin ..... 2,500 0 0  
Bills ..... 2,500 0 0  
Mathews ..... 2,452 0 0  
Sharphington & Cole ..... 2,444 0 0  
Kenall ..... 2,294 0 0  
Sawyer ..... 2,280 0 0  
Strong ..... 2,175 0 0  
Barnicoat ..... 2,170 0 0  
Wheeler, Brothers ..... 2,132 0 0

For building new infirmaries and covered ways at Hendon, for the Hendon Union. Mr. Rowland Plumb, architect. Quantities by Mr. R. J. Hodgson:—  
Infirmaries. Covered Ways.  
Hart ..... £2,314 0 0 ..... £628 0 0  
Wickes ..... 2,184 1 0 ..... 325 14 0  
Simms & Martin ..... 2,061 0 0 ..... 598 0 0  
Chapman ..... 2,026 0 0 ..... 558 0 0  
Bitton ..... 1,988 0 0 ..... 652 0 0  
Sawyer ..... 1,870 0 0 ..... 574 0 0  
Langmead & Way ..... 1,829 0 0 (accepted) 531 0 0

For additional wards, &c., St. Mary's Hospital, Paddington. Mr. W. Young, architect:—  
Hill ..... £12,000 0 0  
Hill & Keddell ..... 1,189 0 0  
Hart ..... 875 0 0  
Sawyer ..... 850 0 0

For new infirmary at Edgeware, for the Board of Guardians for the Hendon Union. Mr. H. Plumb, architect:—  
Hart ..... £2,942 0 0  
Wickes ..... 2,823 0 0  
Chapman ..... 2,582 0 0  
Bottom ..... 2,550 0 0  
Sawyer ..... 2,544 0 0  
Langmead ..... 2,460 0 0

For new warehouse in Southwark-street, for Mr. J. K. Farlow. Messrs. Wimble & Taylor, architects:—  
Gammou ..... £5,745 0 0  
Brass ..... 8,238 0 0  
Colls & Son ..... 8,242 0 0  
Hill & Son ..... 8,187 0 0  
Gulland & Thompson ..... 7,600 0 0  
Wills ..... 7,580 0 0  
Kibby ..... 7,583 0 0  
Hart ..... 7,670 0 0  
Adamson & Son ..... 7,400 0 0

# The Builder.

VOL. XXIII.—No. 1173.

Florence, from a Sanitary Point of View.

EW cities are so advantageously situated as regards natural beauties as the new capital of Italy, with its enchanting amphitheatre of mountains, sloping down almost to the very gates of the city, and ending in lovely hills, dotted over with villas, in the midst of their *poderi* of graceful perennial olive-trees, vineyards, and cornfields. It has its river, flowing through the centre of the city, its gloriously blue sky, its never-ending beauty of colour and effects.

It is situated between 43° and 44° north latitude; between 11° and 12° east longitude; the height above the level of the sea is 800 ft.; mean temperature, 13° to 14° Reaumur, 62° Fahr.; mean cold, in ten years, 5° to 6° Reaumur, 45° Fahr.; mean heat, 28° to 29° Reaumur, 96° Fahr.; extreme heat, 35° Reaumur, 110° Fahr. In the middle of the day last week the thermometer stood at 40°!

Florence is in one of the most rainy zones of Italy. The winds that prevail are those of the north-east, which pass through the upper valley of the Arno; the south-west, that sweep through the lower valley; and in their order through the east, north, east, north-east, west, south. The east and south winds are tempered somewhat by the heights that surround the city; unfortunately, nothing intervenes to temper that from the north, causing frequent variations that lower the temperature suddenly. Through the predominance of the south wind, arise those humid vapours and frequent dense clouds that fill a sky at times of as deep a blue as that of Naples, and at times as pale as that of Milan.

Taken on the whole, the climate of Florence is not of the happiest. Its changeableness is its principal characteristic. The frequently gathering clouds; the rising mists towards evening; the sultry atmosphere, especially in summer; the burning heats, so unfavourable, even for the native inhabitants. Still, if the difference in the aspect and vigour of the country people around Florence be compared with that of the citizens, it may be attributed more to the habits of the latter, than to the climate, which can vary but so little at so short a distance. Dr. Carriere, writing from a medical point of view, of the climate of Florence, says,—“It may be most healthful for those who suffer from nervous debility, of lymphatic, torpid temperament. For which the exciting air, the bright colouring, the brilliant skies, the walks, the art attractions, the monuments, the surrounding country, sown with villas, are permanent stimulants, that, exciting the curiosity, impel to occupation and activity. The winter and intermediate seasons are the most favourable for such temperaments; in summer to take flight to some cooler region, and do most of the citizens themselves.” In general, the medical men do not find Florence to offer real advantage to the invalid beyond

its pleasurable distractions. She is a tempting Syren for that colony of invalids who flock from every part to Pisa; but oft the invalid, tempted to visit Florence, returns, and pitches his tent there, finding it more gay, certainly, but receiving less salutary benefit, than from the warm, tranquil clime of Pisa. If we enter Florence by one of the gates of the walls forming a girdle round the city eight miles in extent, but which are to be levelled as soon as arrangements for collecting the octroi are made, in order to enlarge the city, and traverse its streets, in general narrow and tortuous, but which are being widened wherever practicable, and pass first through the new quarters of the city, where we find newly-built palaces, aiming in style at something like national architecture, regularly built square piazze, with their straight hy-streets, built wider than those of old, all respond to the needs of modern Florentine life; whereas, if we pass through the old quarters, with their huge old stone palaces, black with age, rising like proud potatoes in the midst of their vassals, the smaller palaces; the wretched old houses of the poor, in close proximity; and see those groups of still more wretched hovels called *Camaldoli*, the habitations of the poorest classes, and enter the palace and the hovel, we are struck with the utter unsuitableness of both to the requirements of modern life in the too large, superfluous space of the one, and the narrow straitened size of the other. There are exceptions; but this will be found to be in general the character of the old parts of the city.

The pavement of the streets is good; but has both economic and sanitary disadvantages. The stone, which is sandy, becomes during the day so thoroughly heated by the sun, that it is a multiplier and retainer of a heat that the freshness of night rarely serves to cool. This makes it particularly painful to the feet and trying to the health when passing from a heated passage to one to which the sun has no access during the whole day. (Thin or patent hoots are unwearable in summer.) Hence, also, is caused an inordinate amount of dust, which, even on calm days, can be seen hanging like a cloud over the city, and covers the pedestrian as it rises with a shower at once stifling and blinding. It is to be hoped, with the multifarious new introductions, a method may be included of cleaning the streets of dust at other times than in the middle of the day, when one now meets a row of men armed with birches, a yard in length, pertinaciously driving heaps of dust before them to a far-off focus, to the detriment of the clothes and sight of the passers-by.

The new piazze of the city are very fine; but in this city of flowers there seems to be a peculiar antagonism to trees, and the largest piazza, “dell’ Indipendenza,” formerly “Maria Antonia,”—the north-west of the city, is like an Arabian desert: no repose for the eye from the glaring white of the houses. Milan and Turin adopt the mode of their French neighbours, and plant trees around all their piazze,—and Florence may with advantage do the same.

The drinking-water, either from the common or artesian wells, is not considered good. From analysis it is found to contain carbonate of lime in the proportion of 610 grains to 100 lb. (Italian 12 oz. to the pound). As a comparison, the Pisan water contains 37 grains to the 100 lb. An aqueduct was made from Pratolino some time since; but the water obtained thence was frittered away in watering, &c., not restricted to the uses of the table; and the supply apparently failing, the people returned to their wells and had, raw water. Could good drinking-water be obtained from without (for which numerous schemes are being now discussed), the city might then afford to adorn its public places with fountains, of which now there are but very few, and those very rarely are seen to play.

The Arno, before it can be of any use to the city, must be greatly modified by art and science. There is a somewhat exaggerated notion in the minds of foreigners about this river. It is almost dry the greater part of the summer, and the exhalations from the stagnant waters are not the most agreeable or wholesome. The frequent inundations in the rainy season, and at the melting of the snows on the mountains, may be added to the detractions of this river. The inundations of last autumn, causing much destruction and misery, have roused the Government to consider what scientific means can be adopted against a recurrence so disastrous. The sufferings from loss of property and disease, incurred by the damp effusions remaining after the waters had sunk, are felt now, and will continue to be felt by many.

In December, the sand taken from the houses in cartloads was thrown into the Arno. In summer, men are labouring at the sand-hanks some 5 ft. high, left dry by the receding of the waters, to remove the sand for building purposes.

There is no system of sewerage throughout the city. The *Luog’ Arno*—that is, the continuous row of houses on each side of the river—has a sewer emptying into the river; the sewerage of the rest of the town is carried away in covered carts, and employed for manure. In one part of the city, *now remote*, but which, in the new order of things, will soon be in the centre, are numerous tanyards and a colony of tanners; the operation of cleaning the skins, &c., is carried on in canals leading into the river. There are also, on its shores, tallow and wax candle manufactories. These, if removed without the city, would add to the salutary condition of the inhabitants. Public decency and morality must go hand in hand, and much must be done to promote the former—more utterly disregarded here than in any city of Italy—before morality and health can flourish.

The Florentine lives sparingly, mostly on vegetables, paste, sweets, as candied fruits, pastry, &c. The parsimony of the Florentine of old was proverbial, contrasting strongly with that of the Roman. The great abundance and small cost of vegetables and fruit in Florence make them the principal food of the inhabitants; but it is a climate that necessitates the use of animal food, to render the body strong enough for manual labour; and this, owing to the importation of foreign meat, is now more generally eaten. The oil, which is of the most delicious and nutritive kind, is plentifully used in the Florentine kitchen. The wines of Tuscany are famous for their excellence—the Chianti, Montepulciano among the rough wines, the Moscato, Malvasia among the sweet.

The habits of the Florentines are extremely inactive: no gymnastic exercises are in vogue. The “Pallone,” a mild kind of football play, and bowls, are their chief games of amusement.

Riding and driving are the *sine qua non* of the Italians, for those who can afford them: for those who cannot, sitting the whole evening in the open air, generally on the parapet of the low wall built by the side of the Arno, serves as a substitute.

This custom of sitting out in the open air as a diversion is not modern only. “L’Osservatore Fiorentino” tells us that, in the Piazza di Sta. Liberata, between the ancient Temple of Mars (now St. Giovanni, or the Baptistery) and the Duomo, there was a staircase of marble, the lower step being wide and spacious, on which the youth of the city were wont to sit in the extreme heats (the white marble retaining the heat less, and there being always a fresh breeze blowing at this spot), to discuss the news of the day. Here also met the learned of that time, the poet, the musician. Mirth and jollity were not excluded; but all was tempered with the most perfect decorum and propriety. These

meetings were common in Naples and other parts of Italy,—in Florence, not later than the sixteenth century.

There is a great want of public baths here now. From the names of many of the streets, *Via dei Thermi* and *Via Sinfia*, baths must have been as numerous and luxurious, we may imagine, as in Rome. This want is to be supplied, among the many requisitions of the new capital.

From the statistical accounts, we fear the abstemiousness we mentioned above does not extend to alcoholic drinks. Drunkenness is scarcely seen; but there is a system, among the poor especially, of having constant recourse to small libations of rum, "rosolio," &c. Failure of the vines, of course, causes a greater consumption of the stronger liquors; for instance, whereas, in 1851, a good vintage, 404,978 quarts of rum only were brought into Florence; in 1854 were imported 1,023,307.

Smoking is carried on to excess. The Government have the monopoly of the manufacturing of tobacco.

The maladies most prevalent among the Florentines are rheumatism, catarrh, tumours of all kinds, especially of the bone, &c. Affections of the eyes are very prevalent, probably caused by the sudden changes of the atmosphere, the glare and dust from the pavements. There are the normal diseases attendant on extreme poverty,—nervous diseases, epilepsy, cutaneous affections, pulmonary complaints, and scrofula in its worst form, especially among the poor, deprived of nourishing aliment, and dwelling in damp houses.

This account might, taken in detail, give a disadvantageous idea of the salutary state of Florence, especially as the statistics of births and deaths, if correct, would prove to the contrary. The particulars stated are, we believe, quite true. The inferences thence must be drawn. There is no doubt of the preference of the present suburbs to the city, in point of salubrity.

The municipality, however, aided by the citizens, are doing everything that can be done for the amelioration of the city, and for providing against the demands of the extended capital. New baths, new markets (those now existing are of the fondest kind), introduction of good drinking-water, examination of food sold, increase of public schools, establishment of hospitals for special diseases, the forming of a Board of Health, arrangements for clearing the city of all accumulations of dirt and putrid matters, common chiefly in the suburbs, strenuous endeavours to be made to decrease intemperance and immorality,—these and many more are the works begun, or about to be begun, in Florence, promising for that city, if successfully carried out, as brilliant a future as ever dawned on the capital of a new kingdom.

## ARCHITECTURAL REVERIES.

### THE ROOF AND THE SPIRE.

ONE of the most strikingly elegant features of the ecclesiastical architecture of central and western Europe in the fourteenth and fifteenth centuries is undoubtedly the spire. Nevertheless, it is but a merely parasitic and decorative adjunct to the tower, which, as a structure devised for the reception of a peal of bells, either as a detached building or as forming an integral part of the sacred edifice, existed many centuries before its spiral completion was realised by the bold and graceful designs of the architects of Germany and France. In Italy, while the Middle-age architect often lavished his choicest devices on the bell tower or campanile, which was generally detached from the main building, the spire never developed itself in its true Gothic glory of tracery and pinnacle, as at Antwerp or Strasbourg. In southern Italy, indeed, even the original germ of the spire, the acutely-pointed roof, seldom developed itself as an apex to the tower; the roof being, as a general rule,

nearly flat, and almost invisible from below. This is the case in the marvellously beautiful detached campanile of the Duomo at Florence, which the Emperor Charles V. regarded as a vast jewel, which, despite its dimensions, should be shielded, like some precious piece of goldsmith's work, by a covering of glass; but further north, as in the campanile of the Piazza San Marco, at Venice, a high and acutely-pointed roof rises from the top of the tower,—and tower-roofs of this kind are, undoubtedly, the germs of the true spire. In Italy, however, the germ appears to have possessed but a weak principle of vitality, and it never developed itself into architectural life; while in central and western Europe,—in Germany, France, and Flanders,—the true germination took place, and plant-like, shot aloft into those exquisitely beautiful ramifications that rival the intricacy and heauty of natural vegetation itself. Whether in leadwork or slate-work, or, more boldly composed of solid stone, the pointed roof may be traced in the Gothic edifices of central and western Europe through every gradation of its progress, from the merely exaggerated roof, as an adjunct and climax to the tower, till it finally assumed the form of the perfectly-defined spire; when it became the chief instead of the secondary feature, the tower, which, in the new combination, sank into the inferior position of a mere base or pedestal to its own ambitious superstructure. The spire must therefore be considered as but a happy exaggeration of an ordinary roof, just as the steeple-shaped head-gear of the ladies of the fifteenth century was a fashionable exaltation of the simple cap of earlier periods; or the high-peaked hat of the Puritan a similar extension upward of the low close-fitting bonnet that had preceded it.

In tracing the history of architectural progress we shall often find that it is in exaggerations of this kind, where some prominent feature of a building has been carried beyond its positive and necessary limits into fanciful proportions, and where those new forms and limits have become dependent on the individual taste of the designer, that some of the most graceful features in the art have been originated; and in proportion to the appropriateness and the grace with which the earlier innovators in any branch of art have invested their innovations, such divergencies have become more or less permanent features in the class of art to which they belong.

Pointed roofs of slate, as they grew higher and higher, under the guidance of the quaint designs of the Flemish architects, offer some of the most remarkable varieties of the steeple form in its transition from the high-peaked roof to the positive spire. After starting with gradual culmination towards a point, these ingenious slaters would, for instance, entirely change the direction of the ascending line, and make it suddenly bulge out, like the capital of a Hindoo column, or the massive shoulders of a Dutch figure, expanding above the scarcely adequate support of a slender waist. The bulge would then, perhaps, be narrowed again, to a second waist, or rather neck, swelling, at last, into the final head, which probably would assume the form of an inverted pear, the narrow part of which being upwards, and terminating, as it were, in the stalk, the staff of the weathercock was thus achieved as the crowning feature of the device; and here we have a high-peaked Dutch or Flemish roof, almost worthy, by the ingenuity of its design and structure, and by the variety of its outline, to be recognised as an actual spire.

But it was only when greater architectural skill and boldness ventured to construct the lofty and decorative roof entirely of stone, that the genuine character of the true spire developed itself; and having once developed itself, blossomed, as it were, into so many forms of beauty, such intricacy, and such complicated and almost endless perforations, that the idea of a mere roof was no longer suggested by its aspect, any more than the rich colonnade and cornice of a Corinthian temple suggest the idea of the timber beams and props of which they are the artistically-developed exaggerations, or, to use a simile from a merely mechanical art, than a power-loom, with all its recent improvements and complications, for stocking weaving, recalls the simple device of the original knitting-pins. This last is, however, not an accurate simile, inasmuch as the developments of the loom have each had their allotted function to perform, neither more nor less; while many if not most of the architectural features alluded to are almost entirely parasitic or decorative.

The humble origin of the spire is forgotten in the contemplation of its varied richness and beauty, and its original purpose, as the mere roof or cap of the building is entirely overlooked, just as in admiring the coronet of a peer, rich with its gold and gems, we are apt to overlook in a similar manner the equally simple fact that, after all, it is but an ornamented cap or hat, which the goldsmith and jeweller have by degrees converted into an elaborate piece of head-gear, in which the original purpose appears so utterly ignored, that it seems to have become a mere decorative object for heralds to paint on coach-panels, as a means of defining various gradations of rank, instead of being of any sort of use as hat, cap, or even helmet.

In art matters, retrospection, especially historical retrospection, is always instructive. By teaching us the original uses of features which the profuse elaborations of inventive design have obscured, or turned to actually new purposes, it forces us to become acquainted with the true spirit of those features, and creates in the mind of the art-student a natural tendency to treat them with that sentiment of their origin and history which is sure to lead to a more intelligent view of design than those impressions and convictions which found themselves upon the mere externals of existing models, without a knowledge of what may be termed their vital principle, and the nature of the germ from which they have sprung. Thus, a young architect fully imbued with the knowledge that the spire was in its origin merely the roof of the tower, will design his steeple or spire with a certain definite feeling arising from his knowledge of its pedigree, that is sure to impart to it a more consistent and appropriate character than he would have given to it if in utter ignorance of its origin. For instance, if he should choose to make his design consist of successive stories, the acmination being rendered gradual by a series of slender pinnacles, and delicately-worked miniatures of flying buttresses, as in the graceful spire of the Hôtel de Ville at Brussels, while, if he should greatly simplify his design, making the acmination continuous to the apex, and only enriched at the ridges by the usual decorations, then, when he proceeds to lighten the effect of the mass by a certain number of perforations, he will give to those apertures the character of dormer windows, which in fact they are; such openings in many of our English village steeples, showing by their character that they were intended to simulate the smaller dormer windows that, whether for use or ornament, are generally found in the high-pitched roofs of Gothic buildings of the fourteenth and fifteenth centuries. Even when the design of a spire is most complicated and intricate, as is that of Antwerp and others that might be cited, the original roof character may still be traced, though not so obviously; and in modern designs it may be asserted as a principle, that in proportion as the original roof feeling is preserved in sentiment, however veiled by the beauties and intricacies of profuse decoration, so the design of a modern spire will have stamped upon it the seal of true art feeling, or the reverse; for mere idle device, not inspired by the life-breath of original purpose, will become tame, and seem wanting in a living something that no idle elaboration can supply, however profusely resorted to.

From the tower-roof that in its richest form developed itself into the spire, the dreamer of architectural dreams, or *reverer* of architectural reveries, is led to the subject of roofs in general, the history of which is not so satisfactory, inasmuch as, after having arrived at a certain degree of development in the principles of structure, and in artistic beauty, that branch of the noble art gradually declined, especially in this country, and the roof, which should be the crowning feature of the edifice as the most intrinsically important feature of all, was made to sink out of sight behind the parapet, or offended the eye of taste by its unsightly aspect and the absence of any attempt whatever at artistic treatment.

In order to fully appreciate the nature of this retrogression, it is necessary to consider the nature and purport of the roof in its original and rudely primary character; and it will appear at first a somewhat paradoxical statement when it is asserted that roofs were built before walls,—that the roof was not only the most important part of the building, but the only part; so that there were, in fact, roofs without walls to carry them, and moreover, never requiring walls to carry them. Not to

be enigmatical, it may be as well to state at once that the earliest known form of a constructed dwelling was the Tent form, which is, necessarily, all roof. Taking it for granted that Central Asia was the cradle of (at all events, for a branch of) the human race, and that all our forms of civilization have travelled to us from thence,—a theory more and more firmly established by the successive discoveries of recent times,—we must accept the Tent as the first form of a constructive human dwelling,—a form in which, as we have seen, the building was simply roof, all roof, and nothing but the roof. As more permanent forms of dwellings developed themselves in the East with increasing population and increasing civilization, the roof remained still, if not the sole, at all events the principal, feature of the more permanent forms of human abode. In the East, it was shade rather than any other form of protection that was chiefly sought, and therefore the roof was carried far beyond the nucleus, or enclosed portion of the dwelling, and supported at its farthest extent by a series of props or columns. So that, without retiring within the walls of the dwelling, which was probably only done at night, shade and comparative coolness might be enjoyed, at all events on two sides of the building, during the whole of the day by means of the far extending eaves of the roof. This was little more than a permanent form of Tent, and was entirely composed of timber, and yet it contained the germ of all the main features of the Greek temple, which, in its completed form, offers one of the most perfect and magnificent results that the art of building has ever produced. In that form of structure, in its highest state, the roof was frequently composed of stone like the walls and columns, and was consequently an important and conspicuous feature in the building; the pediments or gables becoming the field on which those sculptural displays were exhibited, the remains of which are the chief glories of ancient art.

In Roman times richly-decorated roofs are described by many ancient writers, and so conspicuous and important a feature were they considered, in an artistic point of view, that they were frequently composed entirely of bronze, highly wrought with decorative detail, and profusely, or entirely, gilt. Such was the roof of the Pantheon. With the fall of the Roman empire, the art of constructing semicircular or vaulted roofs of stone, or of brick, covered with the famous Roman cement, seems to have been lost; and, in the unsettled periods which followed, the use of bronze for that purpose would have been simply inviting the attack of those wandering hordes who lived upon the plunder of ancient European civilization before they settled down upon their conquests, and grew into those nations who have created a modern civilization more thorough and complete than the one they destroyed, or was ever dreamed of in the palmiest days of Greek or Roman supremacy.

As the modern nations of Europe began to assume form and consistency, the art which their ancestors had destroyed began to revive, and a new architecture suited to the age, combining itself with many of the ancient forms, soon began to display original power. The stone or bronze roof, however, did not reappear. Solid walls, and columns more or less decorative, were simple forms of architectural work which could be achieved by builders who were relearning a recently lost art; but stone vaulting or doming was beyond their skill, and the roof became a flat timber one, with a second roof above to shoot off the wet. The roof had, therefore, fallen from its high estate as the principal part of the building, to be treated as the most conspicuous and the most beautiful feature, and had sunk to the position of a secondary member of the structure. This change of character was partly the result of difference of climate. The north-west of Europe had become the centre of the new civilization, and in those regions other conditions were rendered necessary. In the south and east, shelter from the sun was chiefly sought, while in the new centres of human activity shelter from the keen north wind, the driving rain, and the winter snows were the chief objects sought in constructing either domestic dwellings or public edifices; and so the walls had become fully as important as the roof, inasmuch as the protection of the dwelling was sought inside the walls, and not outside them, as in the south, so that projected eaves supported on columns did not reappear in the modern architecture. The northern roof did not extend beyond the wall, and the ex-

ternal columns of southern and eastern countries were transferred to the interior of public buildings to support the greater expanse of roof between the external walls.

Even in the great churches the roofs were at first of wood, protected outside by the slopes of lead and other contrivances; but eventually the internal roof, or ceiling, was composed entirely of stone by a system of vaulting more perfect in principle, perhaps, than any known to the architects of Greece or Rome; but even when this great triumph of masonry was effected, many of the examples of what are perfect masterpieces both of construction and decorative design—even then, no generally prevalent attempt was made to produce an equally solid, perfect, and dignified external roof. This feature still remained a mere substitute for a true roof, tiles or lead supported on steeply-pitched rafters being the highest form it attained to, even when the interior ceilings of stone or timber forming the support of the shabby external covering of lead or tiles had attained to their greatest perfection and beauty. It is true that the external ridges were sometimes ornamented with a slight crest of ornamental metal-work, but, as a rule, the external roofs, even of our grandest cathedrals, were a poor pretence and temporary expedient, as it were, for a true roof—not much nearer to the real object that ought to have been attained than the temporary rick-cloth of the former is to the permanent thatch of the hay or corn stacks for which it is the momentary substitute.

The roof, then, did not in our sacred structures during the Medieval periods, become the crown and glory of the building, as in the temples and other public buildings of the Classical epochs of civilization: that is to say, as a general rule. A few examples might perhaps be cited of solid stone roofs. We remember, however, chiefly one worthy of being brought forward as an example of anything like a perfect result; but that one is a glorious piece of work, grand, massive, ornamental, and of a form and structure that might have endured almost for ever, as against the wear and tear of the elements; but the more destructive hand of man found means, in one day's work of fire and sword, to reduce the structure to the grand ruin which we now remain. We allude to the noblest of Irish ecclesiastical monuments, the remains of the magnificent church at the Rock of Cashel in Tipperary. The scale of this grand pile of conventual buildings, including the church, is most noble, and the situation, perhaps, unrivalled. The nucleus of the building is probably of as early date as the seventh century, and consisted originally of a small church, around which all the subsequent buildings successively grouped themselves. The curious ornaments of this most ancient part of the building are of the style found in the singularly curious and beautiful Irish manuscripts of that period. The dimensions of this portion of the building are, in fact, comparatively small; and it forms but a kind of recessed altar to the vast and lofty church (of probably the fourteenth century), which was eventually added to it. It is this later portion of the building that is massively crowned with an external roof of stone, of wonderfully skilful structure. The slabs are 2 in. or 3 in. thick, and of a very hard and compact kind of stone, on which the action of the air does not appear to produce the slightest effect. They are alternately toothed and grooved, so as to overlap each other in a very perfect manner; channels being cut down the exposed surface of each, to carry off the great bulk of the rain-fall. The gutters at the foot of the slope are of similar structure, the whole of the massive stone roof being in all respects fitted to resist the wear and tear of a long series of centuries. As almost a solitary instance of a Medieval stone roof of grand architectural character, it is well worth an express trip to Ireland to examine it.

But, while in our sacred buildings, during the Medieval epochs, we did not develop the principle of a decorative external roof, except in the almost solitary example above described, yet, in domestic dwellings and in public buildings of a secular character, much more was achieved in that direction. In the serried lines of street houses, the gable end of the roof was made a highly decorative feature; and if the flank of the roof had to be presented to the eye of a spectator in the street in case of wide buildings, a succession of richly-decorated dormer windows supplied the place of the ornamental gable; and the ridge of the roof, which had in all cases become steeply pitched, to prevent the

accumulation of snow in our northern climates, was frequently enriehed with a crest of richly-wrought metalwork. In public buildings in a more or less detached position, when the great expanse of one or both sides of the high roof were in view, the monotonous effect of so large an undecorated space was agreeably broken up by ranges of prettily-designed dormer windows, the upper rows being introduced, perhaps, only for effect, while the apparent expanse was further reduced by a high parapet, great part of which consisted of rich open work in stone, which was often a very important feature in Medieval buildings of this class, particularly in Germany. At a somewhat later period, in France more especially, the architects of the French châteaux of the epoch known as that of the Renaissance, perceived the value of the roof as a feature by means of which a fine variety of "sky-lines" might be achieved, and great nobleness of general effect imparted to the building.

Of this feature in the epoch referred to, the roofs of the old Louvre and the Tuileries might be cited as well-known examples, though there are many better; and also of somewhat similar kind, though inferior in scale and treatment, some of our own mansions of the reigns of Elizabeth and James. But the roof, in this form, though of imposing general effect, and forming, as it ought, a conspicuous feature in the general design, is yet unsatisfactory, as being of less durable materials than the rest of the building; while, as its crown and completion, it should be of fully equal if not superior character, as to durability and massively monumental aspect.

In some of our vast new London hotels, the Louvre style of roof is being successfully enough adopted; but beyond this there does not as yet appear to be a disposition on the part of our architects to advance. But they must eventually do so. It is well known what would be the arguments used against an advance in the direction required, and that those arguments would refer to "the great weight of such roofs," and the "vast increase required in the thickness of walls," and much more of the same kind. But all this plausible talk will have to be given up, and the real thing done. For, until the roof—which should be to the main building what the capital is to the columns—has become of equal importance, solidity, and permanent monumental aspect, to the main walls of the structure, our architecture will remain in a comparatively rude and incomplete state. In what precise way this may come about is not at present very clear; but that the rick-cloth system, as a substitute for a roof, cannot last, is clear enough. Rafters, clothed with either tiles or slate, will have to give place to something of far more solid and permanent character.

AN ARCHITECT'S NOTES IN AMERICA.

LABOUR-SAVING APPLIANCES.

OUR American cousins, despite their general "tall talk" have certainly set us many examples, from which it would be unwise not to learn the lesson. The dearth of labour and the scarcity of good domestic servants have set the Yankee brain working to lessen the need of "hands" in all the operations of the building craft, whilst Yankee housekeepers have been equally on the alert to point out how the domestic machinery may, as much as possible, be made a thing of mechanical contrivance, so as to get over the work easily, and with independence of bired help. It is no unusual thing to find a large and well-appointed house apparently well controlled by the aid of at most two servants, and still more frequently of but one; whilst every carpenter's and mason's shop, even in a small village, abounds in labour-saving appliances that are almost unknown to this side of the Atlantic, excepting in the yards of our largest contractors, and by no means universally had recourse to even in these.

It is probably doubtful if many of the American machines are really of trans-Atlantic origin; the Yankee is quick at appropriating and adapting, but certainly every one who has had the opportunity of becoming acquainted with American building processes, and has remained long enough in the country to view and judge things as they really are, must be surprised on his return home to find how the world seems to have stood still, and how very slowly good things force their claim upon public notice here.

A brief sketch of the *modus operandi* ordinarily used in the erection of American buildings may be interesting; taking, as an example, a dwelling near some provincial town, and contrasting it with one similarly situated here.

In America, an architect's plans having been procured,—and it should be remarked, by way of parenthesis, that the services of the profession are quite as much in demand there as here,—the contractor would set his brain to work to see whether special machinery could be contrived to aid him in what he had undertaken to do, and very probably some ingenious combination of contrivances would be the result. Of course all his joiner's work would be done by machinery,—his staff previously "kiln-dried" and well seasoned; his doors, skirtings, and all moulded work run through the engine in the rough, and coming out sharp, and clean, and heartily smooth by one passage; all his outline work, such as outside wooden brackets (of which Americans are extravagantly fond) would be cut out in a few seconds by a "jumping Johnny," as a plate sawing machine is called; and as far as the woodwork of the building was concerned, very little would be required but the putting up. For the masonry, the excavations would be rapidly scooped out by a plough and scraper worked by oxen; and a tram-way would be rudely but effectively contrived, with a running or sliding truck to supply the stone and bricks. A head of water would early be sought for, and an effective hydrant brought to bear upon the spot at once; and a mill worked by oxen, by steam, or by water, set up for the mortar, and for driving other machinery required on the ground.

As the work progressed, the visitor would find rough hemlock floors laid immediately the joists were in their place, and the deafening duly filled in between; these floors forming an underlining, the pine floor being laid the very last thing (always in narrow widths, and blind nailed), after all dirt of plasterers had been cleared away. He would remark how much more thoroughly cross-bridged, and how much deeper, the floor-joists were, than are usually to be seen at home; and he would notice that the external walls were all provided with wall-strips for furring off on their inside face. A simple mode for excluding rats and mice would then be remarked, namely, a course of small bits of slate, not necessarily more than three or four inches wide, laid under the first tier of wall-strips, under which cement would be filled in against the wall, and left full to the back of the surbase of the room, continued down between the ends of the joists to a similar strip on their under side.

As the internal work progressed, a different mode of preparing the walls and ceilings for "hard finish" would strike him; for Americans rarely have their walls papered or painted at first, but prefer a smooth marble-like finish instead, which certainly makes, after a year's use, a beautiful surface for papering or painting. Formerly Americans used to content themselves with the bare dead-white walls thus described, and rarely endeavored them by paper or painting; but a great change may now be seen in this respect, and in New York the rage has run into the other extreme, and painting and elaborate embellishment are found in profusion.

Continuing the observation of the building supposed to be under way, the visitor's attention would be drawn to the large and well-hung sliding doors he would be sure to find dividing the large parlours, and to the cedar-wood closets in the bedrooms, to save the woollen and fur articles from the moth. The perfect supply of hot and cold water to every bedroom, the liberal provisions for bathing-rooms, and pantries would be sure to surprise any one educated in the belief that these appliances of comfort were only to be found in English homes.

Briefly, the inside of the building would be found to abound in labour-saving appliances for the inmates,—servants and family alike;—and the dwelling would be crested by means of mechanism, applied with shrewd judgment and effectiveness, that would save labour, time, and cost.

The appliances in every-day use are, first, the power-driven machinery (generally portable and erected on the spot), consisting of a circular saw, for cutting logs rapidly into any thickness of plank; a planing-machine; one for moulding, supplied with knives made to cut any pattern the working drawings required; a mortising machine, cross-cut-saw, and the universal plate-saw before alluded to.

The implements and tools for hand use are generally better adapted to their purpose than those in use with us. The American wheelbarrow is singularly convenient in form and light in draft, and the "Collins" axes, in endless variety of size and form, from the pretty top-like "Shingle," one of 2 in. or 3 in. blade, to the huge lumberer's broad axe, have a world-wide reputation.

In large land operations continuous cement drains are made with great rapidity, and seem to be of satisfactory durability; and a tar-cutcher, drawn by oxen, may frequently be seen in use, turning up the sod in convenient widths, and cutting it with an even depth unattainable by modes generally in use.

The American builders in town or country use scaffolding much more thorough than with us, and the stages at the different heights are always neatly laid with rough boards securely fastened, so that even a lady would get about (as may often be seen to be the case), with perfect safety and tolerable comfort.

Where so much work is done by machinery, it may naturally be thought that stiffness and tedious uniformity would be the result; but such is by no means the fact, and an architect's details are carried out with commendable fidelity. As an example:—In a Gothic church, under direction of an English architect, the inside woodwork showed all the edges chamfered and stopped, the stops being tolerably elaborate, and considerably varied in outline. As there was a large quantity of panelling so treated, the ends of seats, wall lining, and so forth, the carpenter did not rest satisfied, until he had made his machinery capable of doing this somewhat unusual work, and the result was most truthful and satisfactory.

Woodwork is turned into hexagonal, square, or octagonal forms, nearly as cheaply as circular, thus affording an opportunity of embellished construction, of which designers are quick to take advantage.

Not are these facilities confined to working in wood. Some really wonderful operations upon freestone, marble, and granite, may be seen; and in the recent works at the Capitol extension, at Washington, huge stones are turned into shafts for columns, with a facility and dexterity that are marvellous. The American pick has, it is true, been introduced into many large yards here, but as yet has not become generally used, owing possibly to the want of knowing the secret process by which the tools are tempered to retain their cutting edge. The present writer believes that this secret consists in heating the tool to a dull red heat, and then allowing it to cool in a bath of quicksilver, repeating the process twice or thrice, according to the tough hardness required.

In conclusion, although it is not intended to speak of the ethics of architecture in America, it should fairly be said that much commendable progress has been made in design during the past twelve years, and the profession is pretty well represented in the Northern States. In the appliances to save labour, however, so much exemplary ingenuity has been shown that, now that travel has again peaceably resumed its usual course, we may hope inquiring builders will learn by observation the facts that have thus briefly been called to their notice.

#### THE HEALTH OF THE METROPOLIS. THREATENED EPIDEMIC.

The last week's return of the Registrar-General affords ground for anxiety. The deaths from diarrhoea were 280 in number, and we fear that, if the present heat continue, we shall have a further increase; but at this time of the year the mortality from this disease is usually high. The certificates of medical authorities forwarded to Somerset House announce that the chief part of these deaths have happened to children; and it has been with peculiar pain that we have inquired into the particulars of several that have occurred during the last few weeks. The similarity of the symptoms in all these cases seems remarkable to the non-professional observer, and the conditions of bad air, overcrowding, and indifferent ventilation are common in each. First appears a languid state of the body of infants,—then dullness, heaviness, and paleness of the face to which we have elsewhere referred,—then looseness of the bowels, convulsion fits; a state of rapid decline and utter insensibility and prostration; and then generally death takes place

without seeming pain; in fact, so gently does the great change occur, that it is not easy for the watchers to tell when the end has come.

The bill of health for last week also announces eighteen deaths from cholera; and the situations of the dwellings, and the class of persons who have been attacked fatally, are just what past experience teaches us to expect. Seven of the deaths from cholera occurred at the ages of twenty-nine years and upwards. On the 15th, a garden labourer died at Marsh-lane, Greenwich, aged forty-four years; on the 19th inst., at 34, Prebend-street, Islington, a man aged seventy-seven; on the 17th inst., at Hayes-place, West Hackney, a brush-maker, aged seventy-eight, cholera three days; on the 8th inst., in the workhouse, Westminster, a labourer, sixty-seven years old: this death is certified as being from Asiatic cholera; on the 18th, at 9, Culvert-cottages, St. Pancras, a "glass concluder" in a stable-yard, aged forty, choleric diarrhoea seven days; on the 18th, at 25, Wellington-street, Bethnal-green, a fish-scalesman, aged twenty-seven years, cholera thirty hours; on the 19th, at 15, Cavendish-grove, Wandsworth-road, the widow of an army captain, aged seventy-eight.

In connexion with the deaths attributed to diarrhoea and to cholera, the Registrar-General would do good service to direct attention, somewhat in detail, to the localities in which they have occurred, and to give timely note in case cholera should appear in other neighbourhoods; and it would be also well if the coroners were to make investigation in some especial instances.

At present the death-ratio of London and ten other large towns in the United Kingdom is large. In London, the excessive deaths during the last week in the metropolis were 159. Last week the deaths in London were 25 per 1,000, in Edinburgh 26, in Liverpool (as we have the figures) 39! This is a black number: when will efficient means be used for getting rid of the cellar dwellings there? The deaths at Manchester are 32 in the 1,000, a little in favour of this great town. We have no doubt, however, that when a thorough system of drainage is carried out, when the cellar dwellings and ash-pit system are dissolved, and other social and sanitary improvements are carried out, the death-ratio there will not be more than 20 in the 1,000. There are 36 deaths in the 1,000 in Dublin, only 21 deaths in the 1,000. The expressive figures of the Registrar-General ought to cause the inhabitants of our great towns to get themselves to change conditions which are disgraceful.

The Privy Council, suggesting the adoption of precautionary measures against the spread of cholera or other epidemic disease, has made public a paper of suggestions. The memorandum re-urges the steps we have again and again pointed out as necessary:—

"In order to guard against the harm which sometimes arises from disturbing heaps of offensive matter, it is often necessary to combine the use of chemical disinfectants with such means as are taken for the removal of filth; and in cases where removal is for the time impossible, or inexpedient, the filth should always be disinfected. Disinfection is likewise desirable for unpaired earth close to dwellings, if it be sodden with slaps and filth. Whenever cholera or typhoid fever is in a house, the privy requires to be disinfected.

Sources of water-supply should be well examined. Those which are in any way tainted by animal or vegetable refuse; above all, those into which there is any leakage or filtration from sewers, drains, cesspools, or foul ditches, ought no longer to be drunk from. Especially where the disease is cholera, diarrhoea, or typhoid fever, it is essential that no foul water be drunk.

The washing and lime-whiting of uncleanly premises, especially of such as are densely occupied, should be pressed with all practicable despatch. Overcrowding should be prevented. Especially where disease has begun, the sick room should, as far as possible, be free from persons who are not of use or comfort to the patient.

Ample ventilation should be enforced. It should be seen that window-frames are made to open, and that windows are sufficiently opened. Especially where any kind of infective fever has begun, it is essential, both for patients and for persons who are about them, that the sick room and the sick house be constantly well traversed by streams of fresh air.

The cleanest domestic habits should be enjoined. Refuse matters which have to be cast away should never be left lying within doors; and things which have to be disinfected, or cleaned, should always be disinfected or cleaned without delay."

By taking these and other proper measures, we may prevent altogether an attack of the dreaded pestilence; or if that cannot be done, at any rate the evil will be much mitigated if we are prepared.

The directions of the Council are similar to

\* One who knows assures us that repeated doses of a few drops of clove oil, in which camphor has been dissolved, form an excellent cure for incipient bowel complaints. One pennyworth of the oil will dissolve about a pennyworth of the camphor.

those issued in 1859, and are very simple and much to the point; in fact, many of them are matters which should be strictly attended to, whether we have the dread of pestilence before us or not. Some of the main points are, the necessity of applying, on the threatening of cholera, diphtheria, typhus, and other epidemic diseases, the powers conferred by the Nuisances Removal Act, and the various other laws which are in force for the protection of the public health. These Acts are,—“The Nuisances Removal Act for England, 1855, 18 & 19 Vict., cap. 116;” “Diseases Prevention Act, 1855;” “Nuisances Removal and Diseases Prevention Acts of 1855—Amendment Act.” These Acts give extensive powers to the guardians of parishes, and in some instances to other bodies; and there can be no doubt that if the provisions of those laws were rightly carried out, we should hear of a great improvement in the general health. These enactments can deal with any premises in such a state as to be a nuisance and injurious to health; any pool, ditch, gutter, watercourse, privy, urinal, cesspool, drain, or ashpit, so foul as to be a nuisance and injurious to health; any animal so kept as to be a nuisance and injurious to health; and, in the same way, any accumulation or deposit. (There are some exceptions respecting these.)

Penalties are imposed for disobeying the orders of the justices; for causing water to be fouled by gas-washings; for the continuance of such offences; for the sale of unwholesome food; for carrying on offensive trades; for permitting the overcrowding of residences; for obstructing persons in the execution of these Acts; for obstructing the owner of premises in obeying the provisions of the Act. Section 23, of 24 Vict., cap. 77, provides against the damaging or fouling of any fountain of water; and in various parts throughout these enactments there are forms, &c., of the manner of proceeding, which can be readily understood by persons of ordinary sense. Section 13, of 23 Vict., cap. 77, enables any inhabitant in a parish to obtain an order from the justices for the removal of any nuisance, and empowers the justices to order an examination of the premises, and an entry thereon, as well as to enforce the order, and to charge costs to the party on whom the order is made. This is a most important power, for it enables any person, in cases of neglect by the parochial or other health officers, to obtain redress in instances of sanitary neglect.

In the Government memorandum persons are reminded that artificial disinfectants cannot supply the place of cleanliness, ventilation, and drainage. Notwithstanding, the application of disinfectants must not be neglected. Respecting these the remarks of Professor Miller are valuable, because, in sick-rooms, especially, damage is frequently caused by the improper use of them. We have often seen the polished metals of fire-places, and even glass, corroded and drilled by the fumes of chlorine, when used in too large quantities, and the lungs and throats of delicate persons have also been so seriously affected that the attempt at cure was almost as bad as the sanitary derangement which was sought to be set right. Professor Miller says that the artificial disinfectants most commonly used are chloride of lime, quick-lime, and Condry's manganic compounds, metallic salts, especially perchloride of iron, sulphate of iron, and chloride of zinc; in certain cases chlorine gas or sulphurous acid gas may be advantageously used, and in certain cases, powdered charcoal and fresh earth.

The common solution of perchloride of iron should be diluted with eight or ten times its bulk of water. Sulphate of iron, or the chloride of lime, may be used in the proportion of a pound to a gallon of water, taking care that the water completely dissolves the sulphate of iron, or has the chloride of lime thoroughly mixed with it. Condry's stronger fluid may be mixed with fifty times its bulk of water.

In the ordinary emptying of privies or cess-pools, when disease is present, the use of chloride of lime or lime is recommended; and in using disinfectants in connexion with night-stools, &c., it is the most effective plan to place the disinfectant in the bottom of the vessel before it is used.

In the case of manure or other heaps of refuse which it might at a particular season be considered unadvisable to remove, they should be covered to the depth of 2 in. or 3 in. with a layer of freshly-burnt vegetable charcoal, in powder. Freshly-burnt lime may be used in the same way. Charcoal, is, however, best; but if neither of these can be conveniently had, matters

of this kind may be covered, several inches thick, with a layer of clean dry earth. Professor Miller advises that earth near dwellings, if it has become offensive, should be treated in the same manner as the dung-heaps, &c.

Woolens, bedding, or clothing which cannot be washed should be disinfected by being exposed for two or three or more hours in chambers constructed for that purpose, and heated to from 210 to 250 degrees Fahrenheit.

In the prisons, in some of the London work-houses, and in certain of the hospitals, there are ovens for the disinfection of matters of this kind, and also for the destruction of vermin; and it would no doubt be an advantage in the great parishes of the metropolis, and in large towns such as Manchester and Liverpool, if there was the provision of distinct establishments where operations of this kind could be carried out at a reasonable but moderate cost. In cases of typhus and scarlet fever, small-pox, &c., there should be a power to impound the clothing and destroy it, in case proper means are not used for its restoration to cleanliness.

For fumigating rooms, use may be made of sulphurous acid gas, prepared by burning in the room an ounce or two of flowers of sulphur in a pipkin;—or of chlorine gas, which may be generated by setting in the room a dish containing a quarter of a pound of finely-powdered black oxide of manganese, over which is poured half a pint of muriatic acid, previously mixed with a quarter of a pint of water. Of course, during this process, which is the more effectual the longer it is continued, doors, windows, and chimneys must be closed. This is most useful teaching; and it is also advised that while all classes should take sanitary care, the authorities, on the approach of pestilence, should avail themselves of the best medical advice; and let us hope that they will devote their attention especially to the poorer people in the courts and alleys of towns, and in the labourers' cottages of country districts, to the common lodging-houses, and to houses which are sublet into several small holdings.

#### THE COFFER-DAM, BLACKFRIARS BRIDGE.

The coffer-dam within which the first stone of the new Blackfriars Bridge, designed by Mr. Cubitt and Mr. Carr, was laid on the 20th inst., as notified in our last, differs but little from the ordinary construction of such works. A few correct particulars, however, will be interesting. The dimensions are 110 ft. in length by 50 ft. in width; the beads of the piles are 4 ft. above Trinity high-water; and the intended level of foundation was 27 ft. below. In some parts, however, it was found requisite to excavate 6 ft. lower, or 33 ft. below Trinity high water, in order to lay bare the solid London clay upon which the whole foundation now rests.

The dam consists of a single row of piles of whole balk on the river face and west end; the east end, which is connected with the works of the temporary bridge, is formed of two rows of piles with clay between. The single portion of the dam was put in by excavating a trench about 15 ft. deep down to the clay. Within this trench, the dam piles were driven, and the exterior portion was filled in with puddle. The upper portion of the piling above the ground-line is made tight by calking. This mode of construction has proved successful and economical. The excavation of the trench was rendered requisite from there being a hard bed of conglomerate like concrete some 3 ft. thick, through which it was all but impossible to drive piles.

The land side of the dam is made good with half-halves driven down as the excavation proceeded, the depth of the excavation being 50 ft. below the old surface of road. The cross strutting of the dam is of the ordinary kind, but as the width, 50 ft., is considerable, piles were driven in the middle of the dam, against which the struts abut: each strut is thus divided into two lengths of 25 ft. each, instead of being in one length of 50 ft., which would be apt to buckle.

The foundation now laid in is of blue lime concrete, varying from 8 ft. to 14 ft. in thickness; upon this the abutment of granite, backed with brickwork, will be built. Woodford's patent pumps have been used in this dam, with satisfactory results. Why is it that the patent Flood Pump, of which we gave particulars some long time ago (by its simplicity of construction and absence of valves so well adapted for works of this kind), is not brought more largely into use?

We may mention, in connexion with the ceremony of laying the first stone of the new bridge, that Messrs. H. Piggott & Sons, of Bishopsgate, erected the marquee, and executed all the required decorations. The flags, we may add, were well disposed and grouped.

#### FOGS IN A METROPOLITAN LIGHT.

LAST week parts of London were shrouded in fog. Somewhat unusual in July.

There can be no doubt that the progress of drainage works, both near and at a distance, in all directions around the metropolis, has been a means of preventing fogs from being so frequent as formerly. During the last twenty years, however, we remember London fogs which have caused both inconvenience and mischief, and an amount of expense far greater than might at a first glance be imagined. Some of these fogs have continued without interruption for three or even four days, and each day, as a natural consequence, the atmosphere has become more dense and polluted by the accumulations of soot and other unpleasant and unwholesome matters. During a fog of this description, labour of many kinds is entirely suspended. On the Thames, in the docks and canals, work is almost stopped; the great shops, in order to bear up against the dulling effect of the fog, have to throw on their goods the most brilliant and powerful artificial light; but at the distance of a few feet all this blaze is absorbed by the peculiar kind of darkness which prevails; and so deceiving is the glimmer, that it would not be easy for the proprietors and others connected with premises, or for the oldest inhabitant of a neighbourhood, to distinguish, without some scrutiny, one shop from another.

The “book-worms” who haunt the reading-room of the British Museum, are on these occasions left without the means of pursuing their various avocations. Many of these industrious and useful community leave the beautiful dome, which in this light has a dim, lurid, and somewhat ghastly appearance, and grope their way homeward; a few, more persevering than others, having with difficulty managed to extract the names and particulars of a few books from the catalogue; and in the hope of the air clearing up, sit with patience, waiting until the painting attendants have, in the colossal space of the King's Library, or some of the other mighty lines of book-shelves, by the aid of lanterns, carefully locked and strongly protected with glass or crystal, provided the volumes wanted. But no candle-light, lamp-light, or gas-light can, under present arrangements, be allowed to the student at the national library, although the plan has been tried with so much success at Kensington and elsewhere. As matters are, however, the party who has written for the books wastes his own time and also that of others. And it is to be regretted that, in addition to the hours lost by the casual fogs, there are the long and pleasant summer mornings and evenings, which are also lost to the student. This magnificent collection might be usefully thrown open during the evenings to thousands without risk from fire. An enormous amount of capital has been invested in this public establishment—in which one feels a national pride—and which, taking into consideration the number and extent of its departments, is now one of the world's wonders.

Within Mr. Carpenter's precincts in the Museum building, during the time of London fogs, the wonders of Albert Durer, Rembrandt, Woollett, Strange, and other remarkable men, whose cunning hand-work has been the means of reproducing and multiplying the choice performances of illustrious painters, lie dormant,—a matter to be regretted, when we consider the limited extent of the number of admissions, the short hours at which, in comparison with the Reading-room, the Print-room is open during the day throughout the year, and the long closing in each September.

One of the unpleasant phases of English fogs, especially when they happen in towns, is the indescribable feeling of uncertainty, and optical oppression, which often affect the nerves to a greater extent than the most intense night darkness. It may, however, be noticed that the effect of fogs in many parts of London is both curious and picturesque, as in the galleries of the British Museum, in company with the Assyrian, Egyptian, and other sculptured kings of old.

It is no easy matter to keep a London fog out of art-galleries, churches, music-halls,

theatres, hospitals,—in fact, large buildings of all descriptions; and although the intrusion is not agreeable, the introduction of a certain amount of fog shows some degree of ventilation by the outer air, which will be useful on general occasions. It also, however, gives evidence that in far too many instances the air lodged in interiors is too slowly removed. We have seen the interior of St. Paul's Cathedral filled with fog; and after the outside air had been clear, the atmosphere within the building has remained hazy for several days, especially within the painted part of the dome. Into Westminster Abbey the fog does not seem to make its way so rapidly as into St. Paul's; but even in the former its damp lodgment in parts must have an injurious effect upon a decaying building.

In theatres, the intended glittering effects of transformation and other scenes have often been marred by the fog making an unpleasant appearance upon the stage; and now that there is a growing inclination to erect lecture and concert rooms and places for public meetings on a far larger scale than was formerly thought of, it is worth while to consider if it would not be possible to devise some means whereby, in case a fog should suddenly come on, either during daylight or during gaslight, there would not be a possibility of one-half of the company being invisible to the other.

If we had the means of estimating the cost in the metropolis of a single day's fog, the sum would be found to be enormous. Amongst the items to be considered would be the charge of the entire gaslighting of London for even only an extra twelve hours. There is also the loss to cab and omnibus people,—for even cabs cannot at such times ply with either profit or safety.

No lady would think of going shopping; and so there is a diminished profit in that way. The work of the costermongers is at an end; and carriers and others who are employed in public and private ways, find it difficult to go on, in consequence of the prowling about of shoals of thieves, who, in spite of the police, make a harvest out of that peculiar kind of air which sets at defiance the energies of the moder officers of the law as well as of the gaslights.

Down Bethnal-green way, in Whitechapel, and in other parts in the same direction, a day's fog deprives thousands of families of the miserable supply of food which they usually have. We have recollections of places in the East, where families depending on needle-work, or the making of linen, lucifer-matches, cheap toys, and a hundred other articles that might be mentioned, are deprived of the light which would have enabled them to earn the miserable profits of their work.

Meanwhile, as is the nature of Englishmen, many make a jolly thing even of a fog, going forth for amusement, under the guidance of two or three link-hoys, or by the aid of torches purchased from the oil-shops. Strange are the effects of these fogs, such as the sounding of invisible feet and no less invisible carriage-wheels; and then the flashes of torches, which seem to dash suddenly out of the solid-like air into one's face; and the vain attempts by the nited aid of many lights to read the names of streets at a corner; and then come thoughts of the effect upon health of this compression and defilement of the air, and, afterwards, these jottings, the object of which is to induce all steps that may tend to prevent the recurrence of fogs as far as possible.

THE LENS FAMILY.

CONSEQUENT ON our recent mention of the portrait-painter Lens, some inquiries have been made of us, to which we say,—

Bernard Lens, painter, died Feb. 5th, 1708, aged 77, and was buried in St. Bride's, Fleet-street.

Bernard Lens, engraver, son of the painter, died April 28th, 1725, aged 66.

Bernard Lens, the famous miniature-painter, died at Knightsbridge, in Middlesex, December 30th, 1741. (*Gentleman's Magazine* for 1741, p. 50.)

Lens made two sales of his pictures, and died at Knightsbridge, whither he had retired from business, about 1741. He had three sons, two of that followed his profession, of whom one is yet [178—] living. (*Walpole*, "Anecdotes," Ed. Wornum, p. 751.)

Bernard Lens, the miniature-painter, resided at Knightsbridge, in this parish [Kensington],

and died there in 1741. He is said to have been buried at Kensington, but his name is not to be found in the register. (Lysons's "Environ's of London," iii. 182; adding, in a foot-note, as his authority, "Vertue's MSS. in the Earl of Orford's collection.")

We are not aware of the relationship (if any, indeed) between the Lens family referred to in these quotations, and the late Mr. Serjeant Lens to whom our correspondent refers. Let him consult the wills of the Lens family in Doctors' Commons.

PROFESSIONAL CHARGES OF ARCHITECTS PRACTISING IN MONTREAL.

The following document, agreed on in February last by those who have signed it, is hung in a conspicuous place in every architect's office in Montreal. It is interesting in several points of view:—

	Per Cent.
1. Public buildings and private residences, commission on the cost thereof ... ..	5
2. Block of 2 houses of similar design, commission on the cost thereof...	4
3. Block of 3, 4, or 5 houses of similar design, commission on the cost thereof ... ..	3
4. Block of 6 or more houses of similar design, commission on the cost thereof ... ..	2½
5. Stores and warehouses, commission on the cost thereof of ... ..	4
6. Block of 2 stores or warehouses of similar design, commission on the cost thereof ... ..	3
7. Block of 3 or more stores or warehouses of similar design, commission on the cost thereof of ... ..	2½
8. Items of charge comprised in 5 per cent. commission: preliminary sketches, working drawings, and specifications sufficient for an estimate and contract ... ..	2½
Detailed drawings ... ..	1
General superintendence (exclusive of clerk of the works), examining and passing the accounts (exclusive of measuring and making out extras and omissions) ... ..	1½
9. N.B.—The foregoing subdivision of charges to apply proportionately to stores and warehouses, &c.	
10. For works in the alteration of premises the remuneration to be increased according to the time, skill, and trouble involved.	
11. Taking out quantities from plans for a detailed estimate, commission on the amount thereof of ... ..	1½
12. Measuring and valuing artificers' work done for any amount under \$1,000 ... ..	2
Over \$1,000 and under \$4,000 ... ..	1½
Over \$4,000 ... ..	1
13. For services by time at per day ...	\$10
14. N.B.—All travelling expenses to be charged extra.	
15. No charge to be made for a rough estimate obtained by cubing out the contents. If a detailed estimate be requested by the proprietor, a charge therefor is to be made as above.	
16. An architect is bound under the full percentage charge to provide one set of drawings and one set of tracings with duplicate specifications; it being understood that the architect is paid for the use only of the drawings and specifications, and that these, in the event of his carrying out the works to completion, are to remain his property.

A ROMANCE IN REAL LIFE.

DURING the occupation of Northern Germany by the French in 1810-11, the young Count Londy was a lieutenant in the army which occupied the department de l'Elbe, of which the city of Hamburg was the centre, and where Marshal Davoust, Prince of Eckmühl, reigned with a terror and cruelty which even now is but too vividly remembered by the "oldest inhabitant." Then came the Russian campaign, and the subsequent retreat of the French in 1812. Fifteen years later, a youth of unknown parentage was apprenticed to a Hamburg builder. Step by step he rose, until at last he himself became a master builder, and practised as such in his native city. The terrible fire of 1842, which reduced two-thirds of the place to ashes, brought great activity into the building trade as a natural consequence; and Mr. Londy, combining the work of contractor and house speculator with his profession, gradually became a rich man, and is now one of the most extensive contractors of Hamburg. The young lieutenant of fifty years ago had, in the meantime, become an old man, and is still alive. Happening one day to take up a German newspaper, he found a person bearing his name mentioned as taking an active part in some improvements at Hamburg. His name is an uncommon one, and he was struck with it as occurring in a place where, fifty years ago, he was quartered for several months. Could he have left his name there in a manner which sometimes will occur? The thing haunted him, and at last he determined to find out beyond all doubt. He did so, and the result of his inquiries was that Mr. Londy, the builder, proved to be the count's son. He has since been formally acknowledged as such, and will succeed the rich and hitherto childless old count in his honours, titles, and property. What a subject for a *Scève* to work up into an *opéra comique*! Yet we have a positive assurance that the whole story is true.

FRANCE.

A NEW library has been established in the Ninth Arrondissement, Paris, for placing good literary works, &c., at the disposal of the working classes. The monthly subscription is 50 centimes for men, and 25 centimes for females. The library is open every day from 8 a.m. till 10 p.m., and on Sundays from 10 a.m. till mid-day. Books can either be consulted at the library, or taken home to be read in the family. There are more than 400 subscribers, and 2,000 volumes, a great many publishers, authors, financiers, &c., having assisted this good work by donations of books or money. The library and offices are situated in the Rue Mansart, No. 15.

The present Halle aux Cuir is in the Quartier du Temple, and is to be demolished, to make way for the prolongation of the Rue des Cuir, as far as the Place des Victoires. An interesting architectural relic will be brought to light by the demolition of the ancient Halle aux Cuir. It is built on the site of the Hôtel du Bourgoyne, the ancient Hôtel d'Artois; and, in clearing away the last vestiges of this mansion, the donjon, or square tower, will be brought to light, which Jean Sans Peur caused to be constructed in his hôtel in 1408, after the assassination of the Duke of Orleans, to guard himself against the widow's vengeance. It is hoped that it will be preserved and surrounded by a square, as they have done with the Tour St. Jacques. It is one of the few specimens of the military architecture of the fifteenth century remaining in Paris, and deserves to be spared, if possible.

M. Gouverneur, a Norman journalist, chief editor of the *Ngentais*, aided by Messrs. Butler & Eischelrenner, has invented a very ingenious apparatus for manufacturing gas from the lees or residue of apples and pears, after the cider or perry has been extracted. It gives a perfectly clear light, equal at least to that of coal gas, without smoke or odour, a kilogram of dried lees furnishing by distillation 170 litres (9 cubic feet) of gas. This a substance, hitherto useless and often encumbering, can be utilized as an illuminating power, and even made to supply Lenoir's gas-engine. The entrance to the Industrial Exhibition lately held at Alençon, was brilliantly lighted with this new gas by a simple and economical apparatus. The inventor promises to go farther in the economy of the machine, and cause it to yield gas for nothing. While the process of distillation is going on in

the retorts, excellent residues are obtained, which are of more value than the gas itself, tar and acetic acid being furnished in large quantities and of superior quality.

The railway tunnel under the Pyrenees is being actively pushed forward. There are at this moment more than 1,000 workmen employed between Villejuif and the frontier. Hard granite was the first rock which presented itself; now, the ground has completely changed, and the headings are being driven in limestone, through which also the shafts are being sunk. Hence the work will proceed rapidly.

STATISTICS OF LIGHTNING.

M. BOUDIN, Paris, has published the following notes on accidents from lightning:—During the period from 1835 to 1863, there were 2,238 persons killed on the spot in France by the electric fluid, the annual maximum having been 111, and the minimum 43. In estimating the number of persons injured at double those killed, the total number of victims is, during the above time, 6,714, or 230 per cent. From 1854 to 1863, out of 880 victims to lightning strokes, only 243 persons, or 27 per cent., were females. In England, this proportion is only 21 per cent. In several cases the lightning striking upon groups consisting of both sexes, has particularly struck the male individuals, thus sparing the female portion more or less. In a great number of cases, the lightning struck and killed flocks of more than 100 animals without touching the shepherds, though the latter were in the midst of the animals. There exist many examples of beech-trees struck, so that Mr. Maxwell was wrong in proclaiming the immunity of this tree from lightning, at the Manchester Scientific Congress.

There were at least two instances of persons who had been struck several times during their life; one of these had been wounded twice, on the left foot, within a period of fifteen years; another was visited three times in different dwellings. In 1853, out of 34 persons killed in the fields, 15, or about one-half, perished while taking shelter under trees; from 1841 to 1853, out of 107 killed, 21 were struck under trees. In only estimating at 25 per cent. the proportion of victims struck while under trees, we find that out of 6,714 sufferers from 1841 to 1853, 1,678, or nearly 1,700 persons, could have escaped accident or death by avoiding the neighbourhood of trees during the storm.

LECTURES ON THE SPOT FOR THE WORKING CLASSES.

OBSERVING the numbers of the working classes who visit the windows in Glasgow Cathedral, and look at them with interest, Mr. Wilson some time since proposed to give them an explanatory lecture, supposing that he might gather one or two hundred in the cathedral to listen to what he had to say. A small committee was formed, and advertisements issued, and his surprise, not to say alarm, was great, when he was informed that in a few days about 5,500 applications for tickets had been made, and that before the day of lecture these had increased to nearly 6,000. 1,500 were actually issued; but the lecturer found that his voice, in that lofty nave, did not reach the outer circles of this number, and, by request, subsequently addressed a smaller number.

This experience of the interest taken by the working classes in such subjects has led Mr. Wilson to suggest to us that the idea should be followed up by gatherings in Westminster Abbey and other remarkable monuments. By this means the people would be led to feel an interest and to reverence and preserve the monuments themselves—to feel a pride in them.

With these ideas he suggests popular lectures in public monuments, as Westminster, St. Paul's, the Houses of Parliament, and others, on the architecture and the works of art contained within them, and on the historic ideas and facts connected with them. The lectures should be gratuitous. The committees should be composed of working men, associated with one or two professional men. The lecturers, artists, architects, sculptors, painters, with literary lecturers, to take up the historic questions.

He hopes this will not be considered Utopian. He has tried it, and succeeded.

COMPETITIONS.

THE BELFAST ALBERT MEMORIAL.

Sir,—The Institute has declined to adjudicate in this matter, but has suggested to the Belfast Committee a course which, it is hoped, will lead to a just conclusion.

The publication of my letter to the Institute in your columns has produced from Mr. Lynn, the partner of Mr. Lanyon, a letter, in which he claims to refute some of the statements contained in my epistle. I there put forward a condensed narrative of the proceedings, taken from the speech of a respectable and independent member of the Belfast Committee. Mr. Lynn's additions confirm that narrative, and refute nothing. I suggest that the Belfast Committee, quite unintentionally, had drifted into an equivocal position, and that among them Mr. Lanyon, though unintentionally, was most unfairly situated, as being also a competitor. It had been worth while for me to quote, from what Mr. Lynn considers the overdue newspaper correspondence, Mr. Lanyon's letters to his committee, it would only have shown, as Mr. Lynn's letter now does, that he was sensibly alive to the awkwardness of the position, and anxious to extricate himself and the committee, and that he did everything which could be done to effect this, except taking the one effectual step of retiring from his position as a competitor. Unless it were to repeat my acknowledgment of the fairness of Mr. Lanyon's intentions, I should not have troubled you on Mr. Lynn's letter; but having now before me the subject of the Belfast competition, I venture to suggest a course arising out of it, but referring to competitions in general, which I think would be useful.

In most cases it would be very desirable to limit the number of competitors. It is now eight years since I had submitted a competition design, and so thoroughly have I been satisfied of the almost universal evil of the system, that I had well nigh concluded never again to engage in anything of the kind. Tempted, however, by the proposal of a professional reference, and the idea which I formed that the competitors would not be so numerous as to make the chance more than fifteen or twenty to one, I entered upon this. Probably similar considerations weighed with very many others, so that the number of the competitors was unusually raised, and reduced the chances to seventy-six to one, opposing all upon equal ground. It rarely happens that all can be on equal ground. Those connected with the locality cannot with any justice be excluded, but mechanics near to one, better opportunities of knowing how the wants of the committee are to be fulfilled than those who are remote. Without any suggestion of unfairness, the local men must therefore in many cases be successful. Let then a number of strangers be spared the useless labour of hazarding their loss of time at far more odds than a chance of seventy or eighty to one. A competition advertisement should with this object state that upon receiving the names of architects willing to compete, the committee will select, say ten names.

It seems, however, still further necessary that some authoritative reference for adjudication of designs should be accessible. I should propose that the Institute should appoint three referees to adjudicate on all cases which might be submitted to them, and to advise the committee beforehand as to the nature of the terms to be stipulated. The referees to put forward a scale of fees for their services, approved by the Institute, and to advertise at least for a time, in the competition columns of the building periodicals, the nature of their office and duties. I believe it would soon happen that no respectable projects would be advertised without reference to them; and no respectable architects would compete, unless subject to their arbitration.

GONPOX M. HILLIS.

To get rid of the difficulty which has occurred, a general meeting of subscribers to the Belfast Albert Memorial was held on Monday at the Town-hall, and they unanimously resolved to uphold the opinion of the "Committee of Selection" and confirm their recommendation. The general committee, it will be remembered, reversed the order of merit in which the "Committee of Selection" had placed the designs of Messrs. Lanyon, Lynn, & Lanyon, and Mr. W. J. Barre. The design of the latter gentleman is now to be carried out, in cut stone, at the cost of 1,800*l*.

BRADFORD BATHS AND WASH-HOUSES.

The Corporation of Bradford have converted the old water-works company's offices, in Thornton-road, into public baths and wash-houses, which have just been opened. Externally, the building has not been much altered. A chimney, in connexion with the wash-house boilers, has been erected.

The whole establishment covers an area of about 1,100 square yards, including the ladies' and gentlemen's baths, each first and second class, Turkish bath, washing department, engine and boiler house, and a residence for the superintendent. The ladies' baths are entered from Thornton-road, on the left side of the building, by a hall and staircase 15½ ft. by 13½ ft. The ladies' plunge-bath, occupies a room 24 ft. long by 21½ ft. wide, vaulted over in three bays; the bath itself is 24 ft. long and 13½ ft. wide, and contains when full about 13,500 gallons of water; the dressing closets along the side of it are arranged for six bathers.

The men's baths have a separate entrance and staircase of the same size as before, at the opposite end of the building. The two swimming-baths are placed on the ground-floor of two apartments, occupying together an area

of about 558 square yards, covered with iron roofs of light construction, the upper portions of which are glazed and provided with openings for ventilation, covering about 300 square feet. The baths themselves are 54 ft. long and 24 ft. wide, the average depth of water being about 4 ft. 6 in. Each bath contains nearly 50,000 gallons when filled.

The Turkish bath has separate entrances, and appears to be intended for ladies on certain days, and for gentlemen at other times. The saloon is 60 ft. long and 22 ft. wide.

In the wash-house there are thirteen stands for washerwomen. In the basement below the drying-house are two Cornish boilers, 7 ft. 6 in. diameter.

The architects who designed and carried out the works were Messrs. Milnes & France, of Bradford; and the original contractors were,—for the masons' and bricklayers' work, Messrs. Thornton, Brothers; carpenters' and joiners' work, Messrs. Ives & Son; plumbers' and glaziers' (including all the fittings and baths), Mr. C. Nelson; plasterers' work, Mr. J. Duckworth; painters' work, Mr. N. Taylor; slaters' work, Messrs. Hill & Nelson; ironfounders' work, Mr. Jas. Halliday; and for the engineers' work, Messrs. Lord & Robertshaw. The total cost will be about 7,000*l*.

It is intended to place two drinking-fountains in the entrances, where a draught of pure water can be obtained either before or after bathing. This, we believe, is now considered almost essential to the full development of the healthy properties of a bath.

THE BUILDING TRADE.

IN pursuance of a resolution adopted at the meeting of the masters on Monday last, on Tuesday printed notices were posted by the various firms that on the 25th of August next the advance of a halfpenny per hour would be given to the men on condition that the strike against Messrs. Cubitt's firm was withdrawn by the 29th inst. On Wednesday night a delegated meeting of the carpenters and joiners was held at the Cambridge Hall, Newman-street, to take the above notice into consideration. The delegate from Cubitt's men on strike stated that a meeting of the men had been held that morning, and he was instructed to say that they were willing to resume work on Monday morning next on the understanding that the advance of ½d. per hour be conceded to them at once, with a six months' notice to be given for the other ½d. They did not think, so far as their firm was concerned, they ought to go back to work on the terms against which they had struck. Some few of the delegates were against accepting anything less than the ½d. advance at once; but the great majority were for accepting the offer made by the masters, of ½d. advance on the 25th of August, with six months' notice for the other ½d. After a long discussion, the following resolution was ultimately adopted:—

"That we, the delegates, on behalf of our constituents, accept the advance of ½d. per hour, as offered by the masters, on the 25th of August next, on condition that the other ½d. per hour be given on the 1st of March next; and also provide that Cubitt's men be paid the advance of ½d. per hour upon resuming work on Monday morning next."

It was also resolved that deputations of the men in the respective shops should wait upon the employers this (Thursday) morning, and inform them of the above resolution, requesting a reply by Friday morning.

A deputation, consisting of three of the old hands of Messrs. Cubitt & Co., waited on the firm on Thursday, to ask if they would give 7½d. to all carpenters and joiners who are worth it, at once, and 7½d. in March. The firm replied, that they would give 7½d. at once to all carpenters and joiners who are worth it, but that the other part of the request concerned the whole trade, and was a trade question, to which they could not reply. The three men said that a delegate meeting was to be held on this Friday evening, to hear the answer of the masters, and that they would wait upon the firm on Saturday morning to inform them the result of the delegates' meeting.

The strike of the house-joiners, masons, and bricklayers of Sunderland has terminated by the masters acceding to the request of the men, who asked for the half-holiday on Saturdays after twelve o'clock. The masters have granted the holiday from one o'clock, but as equivalent for the other hour, they have

agreed that the work shall not commence until seven o'clock a.m., instead of six, on Monday.

The Paris stone-masons, who struck for an increase of their pay from 5*l.* 5*0s.* per day to 6*l.* 5*0s.*, with certain other concessions, have returned to their work, the master builders having agreed to advance their wages. All passed off quietly. Others, it is said, are bent on following the example of the masons.

#### THE PAINTERS.

Six.—Will you kindly favour me with space in the columns of your paper, to inform the master builders and painters that the following firms, Mr. Watts, builder, Motcomb-street, Finsbury; Mr. Clarke, builder, Desborough House, Harrow-road; and Mr. Thiele, decorator, Edward-street, Portman-square, have commenced paying the advanced rate of wages, viz.—7*d.* per hour. Other firms have agreed to pay the advance on the 7th of August next. P. DAVIS, Secretary.

#### DEATH IN THE BRITISH MUSEUM.

The newspapers have given very unsatisfactory accounts of the death-rate of the officials of this establishment. Within a very short time a considerable number of deaths has taken place. We have not ourselves the exact rate of mortality of one year or the average over a period of, say, ten years; but what has taken place shows that those figures ought to be forthcoming, and at once laid before the public. Not only the nation at large, but those pent-up men who for so many hours in each week-day labour in the various departments of this great institution, should know the death-rate for the past ten years, the age and length of service of each person who has died, and the complaints to which the deaths have been attributed.

We have at various times directed attention to the state of the atmosphere of this building. We have seen young men come here to duty the very incarnation of health; but soon the colour of the skin has faded, until their faces presented something of the tint of the parchment records which are preserved in the apartments around.

The ventilation of the old reading-room was abominable—enough to kill both readers and attendants, and in other parts the air was and is dry and congested. Take the King's Library, for instance; the smell of leather does not seem to have been moved for years, and it is certain that if the air be good for hawks it is not so for man. We all know how great a boon the new circular reading-room is; but even the planting of this in the open space of the quadrangle is not good for the ventilation of the great mass of the building; nor have we faith in the pumping system of ventilation which is practised here.

It is now more than a quarter of a century since the writer of this first began to study within the walls of the Museum, and never on any occasion, from the heads of the establishment down to the most humble official, has he received anything except the most patient civility and attention; and, as a natural consequence, he has acquired a degree of liking for the people here, and feels it to be but fair to see that they do not suffer avoidably in health while attending to their duty. Of late years extra hours of labour have been put upon them for the advantage of the public. Has the extra pay been fair and honest? We hope that the trustees will not delay in fully inquiring into this matter. We have an impression that too tight a rule has been put upon the officers, which, for the sake of justice, health, and even life, must be relaxed. The public will not begrudge the cost of extra attendance, rather than risk the lives of trustworthy, civil, and attentive public servants.

#### FROM SCOTLAND.

Edinburgh.—The foundation stone of Queensberry Lodge, for the "safe accommodation and reformation of females in a respectable position in society addicted to habits of drunkenness," has been laid by the Lord Provost. The institution is intended as yet only as an experiment. It lies contiguous to the back of the House of Refuge, the front looking into South Back Canongate; and, although it is quite a distinct institution, it will be under the management of the directors of the House of Refuge. The house will be a plain building, three stories high, and in the Scotch Baronial style. It will be about 43 ft. high to the ridge of the roof, 151 ft. 4 in. in length, and 46 ft. 4 in. in breadth. The

works have already been commenced. On the ground-floor are arrangements for working. On the two upper floors there are general sitting-rooms, and arrangements are made to provide a separate private room for each of the patients. On each floor bath-rooms and all other necessary conveniences are provided. A lift or hoist is to run from the ground flat to the top floor. A spiral stair is surmounted by a tower 65 ft. high, running from the ground flat to the top, and conducting to a flat roof, for air and exercise without leaving the house. The estimated cost of the building is 3,079*l.* The architect is Mr. J. W. Smith.

Dundee.—On opening the tenders for the Albert Institute, it was found that, for the first section of the building, the lowest tenders were 2,000*l.* or 3,000*l.* above Mr. Gilbert Scott's estimate, and nearly as much above the funds at the directors' disposal. The external staircase will cost, according to the tenders, about 1,000*l.* The directors have deferred accepting the tenders till they see whether there is any prospect of such assistance being given as will enable them to proceed with the design in its unstinted proportions, the staircase, and all.

Kelso.—An interesting antiquarian discovery has been made about 6 miles south-west of Kelso. A large portion of an ancient stone-paved road or causeway, close to the point where the old Roman road from the south, of which it is evidently a continuation, crosses the Oxnam Water, has been found on the farm of Crailing Hall. It had formerly been buried under gravel to the depth of 5 ft., but this had all been washed away by heavy floods which occurred in Teviotdale last May. It is even still, however, in excellent preservation, the mason work being as solid and complete as though finished only yesterday. A piece of horse-shoe and a portion of a curiously-made dagger, both of iron, were got among the soil on the pavement. They were much rusted, the horse-shoe being covered with a hard incrustation of sand and pebbles. The valley of the Oxnam, we may mention, is rich in remains of Druidical circles and old camps, but its chief antiquarian relic is the old Roman road, which bounds the parish along the whole length of its north-eastern limits. This is still used as a drove road.

Denholm.—There has been a grand demonstration at Denholm on the occasion of opening the new bridge over the Teviot, the road to Hassen dean Railway-station, and that effecting a more direct junction than previously existed with the Teviot-side road, leading by the north bank of the river to Ancrum. The want of a bridge to accommodate the traffic between Denholm and the surrounding districts and the Hassen dean Railway-station was much felt.

#### THE PHILHARMONIC ROOMS, SOUTHAMPTON.

By the enterprise of Mr. F. Strange, a hall for musical entertainments has been provided for Southampton, at a cost of about 8,000*l.* We publish a view of the entrance front, which is faced with stone, Portland being used from the pavement to the first floor, and Bath above. The elevation has on the ground floor, in the centre, a double entrance and slightly projecting portico. Over the double column on the outside are vases, and over the centre one dividing the entrances a figure of Apollo, set up since our view was made. On each side of the portico are circular-headed windows, which light the retiring-rooms. There are key stones to these windows, and also to the entrances, on the face of which are carved Prince of Wales's feathers; in the spandrels over the windows are figures. On the first floor are recessed windows, also with circular heads. The piers between the windows have on their face, from the sill to the springing of arch, raised and moulded panels with carved clusters of fruit and flowers; in the spandrels formed by the arches are medallions, with figures playing on instruments in bas-relief; the frames are moulded and carved; the key-stones are formed of three carved brackets, having the cornice dividing the stories continued round over them on the circle. To the two outer windows, at either end, the angles of the jambs are chamfered, and flower and fruit ornaments introduced. The upper floor has seven windows, under the eills of which are carved in relief some good specimens of the vine, beech, birch, lime, &c. The principal cornice is rich in detail; over the pilasters below are carved figures holding swags of fruit and flowers. The whole is

surmounted with a blocking and balustrade, except the projecting centre, which is carried higher, and has on its face a carved scroll; vases on the centre and angle piers completing the elevation.

Of the interior we would add a few words. In the basement are provided kitchens, stores, cellars, retiring-rooms for the performers, with separate staircases leading from each room up to the orchestra or platform in the hall-room. On the ground-floor, the entrance-hall occupies the centre of the building, the walls being formed into compartments, with columns. On the caps of columns are figures with musical instruments; a richly-carved cornice runs round the ceiling, and which divides the same into panels; in the centre of each panel is a flower ornament, from which is suspended a glass lantern. The whole of the plastering in the hall is done in Parian cement; the floor being laid to a design by Messrs. Maw & Co. with encaustic tiles. On each side of the entrance-hall are retiring-rooms. At the end of the hall is the staircase leading to the club-rooms, which are provided on the two upper floors, consisting of club-room, hilliard-room, smoking-room, &c. Passing the staircase, we enter the hall-room. The walls are divided by piers and arches. On the piers are columns (hinted), carried on carved brackets projecting from the walls; the caps are of foliage, and on the top of each arc well-formed figures, each differing in design, having musical instruments. Over the centre of the arches are placed the heads of composers and authors; and on each side of the same, in moulded panels, are figures of birds. Above this again are panels raised, on which are musical instruments placed to a design. From the cornice immediately above these last-mentioned panels springs a large cove up to the ceiling; through this cove, which is panelled, is obtained the light for the hall, every other panel being filled in with figured embossed glass. The ceiling is divided into five compartments, three of which are the entire width of the level ceiling, and the remaining two are devoted to very large ventilating flowers. Ventilation is also provided for by having an open enriched scroll running completely round the ceiling, just at the top of the tie-beams to the roof, Hartley's fluted glass being used on iron rafter water-bars, to admit light through the cove of the ceiling. A narrow gallery is carried down the two sides of the room, and a deep cove at the end. The front of the galleries is O G in shape, and finished with Messrs. Jackson & Sons' patent composition, the design being wreaths of flowers and fruit, festooned and connected at equal distances to harps and other devices. Figures are introduced on the festoons in various positions. The proscenium and front of the orchestra are also completed in the same materials. The lighting was executed by Messrs. Kent & Dain, of Southampton.

Mr. A. Bedford was the architect; and Messrs. Bull & Sons were the builders.

#### PROPOSED "HOLBORN THEATRE ROYAL."

ALL the necessary arrangements being concluded for the site, the building of the proposed new theatre will be commenced forthwith, with the intention of opening it before Christmas, under the management of Mr. Sefton Parry. The site is that of the old stable-yard formerly known as Warwick Mews, and is inclosed by the backs of the houses of Brownlow-street, those of Warwick-court, and those of Holborn. The dimensions of the land appropriated are 70 ft. in width by 150 ft. in length. There will be an open area round the building, which will be 55 ft. wide, and 120 ft. long.

The theatre will be approached through No. 43, Holborn, and Nos. 1 and 2, Brownlow-mews. The passages will be fireproof, the staircases of stone. Each part of the house will have its distinct access and egress, and both entrances can be made available for either purposes. The plans have been prepared by Messrs. Finch Hill & Paraire, and have been approved of by the Lord Chamberlain.

DUNDALK.—Mr. T. Creaser, of Drogheda, has taken the contract for the extension of Dundalk Barracks for the sum of 6,700*l.* A church is to be erected, as well as quartering for married soldiers. There will also be a parade ground.

PHILHARMONIC ROOM, SO. PARK, N.Y.—MR. A. VICKERS, ARCHITECT.

THE CAUSE AND PREVENTION OF FIRES.

Sir,—On reading the clauses of the Metropolitan Fire Brigade Act, I perceive that no provision is made for inquests to inquire into the causes of fires. I believe that the Corporation of the City of London have power to institute inquests, when property to any large extent has been destroyed by fire (irrespective of any loss of life) : if similar power were given to the Metropolitan Board of Works, very valuable and scientific information would be obtained, and eventually convert the "theories" of causes of fires into facts.

The number of "unknown" causes returned by the officers of the brigades is very large, nearly all of which are to be accounted for, if a scientific and practical person were empowered to inquire into them : the advantages of such a department to the fire insurance companies would be apparent, and the knowledge that certain storages, &c., cause large fires; that certain buildings are only suited to certain businesses, &c., would reduce the frequency of fires. Whatever experience may be gained by the present limited inquiries made by the fire brigades, it is not circulated among those who would gladly guard against a repetition of like dangers, and thus the willing are left in a state of ignorance.

The construction of buildings, the proximity of hazardous businesses, the situations, the probable amount of destruction that would be caused by fire, &c., should be a department under the new bill; and I would suggest that the Metropolitan Board of Works should have power to publicly inquire into all fires that destroyed property to the extent of 1,000l. and upwards, and into any other case that they might think would conduce to the public benefit.

Such fires as those of Gresham-street and New Southwark-street, in which goods were deposited in fancied "fire-proof" buildings, with solid masonry, lofty floors, iron girders, extra thick party walls, fire-concreted arched ceilings, &c., do not seem to teach architects and builders any lesson. Leviathan buildings are daily constructed upon those principles that hinders and others persist are "fire-proof." All buildings are fire-proof, so long as goods are not stored therein; but experience has taught the fire companies that these "fire-proof" (?) buildings burn more furiously, rapidly, and destroy every vestige of their contents (even that which is considered incombustible) than ordinary buildings that are not considered fire-proof; and from the massive and weighty materials used in their construction, they have in every case caused the entire building (from cellar to roof) to be so destroyed as to necessitate rebuilding. It is from such experiences that many evils might be avoided, and large fires reduced to a minimum. I would urge upon the Metropolitan Board of Works and the fire insurance companies, the desirability of conjointly appointing a gentleman, practically used to the devastation of fires, who should survey the dangers of the present buildings, and watch the construction of the future ones; and I believe such supervision would be of incalculable advantage to both bodies. It has often occurred that the injudicious placing of an opening for a door or window during construction has defied the efforts of the fire brigades, and made the insurance companies and the public suffer by losses of thousands of pounds.

LEWIS M. BECKER.

M'INTOSH v. THE GREAT WESTERN RAILWAY COMPANY.

At Vice-Chancellor Stuart's Court, on the 20th inst., Mr. Bacon, for the Company, moved that His Honour would make an order to stay the payment of the sum of 148,000l. to the plaintiff, as there could be no harm done in delaying for a short time the execution of the decree, pending a proposed appeal to the Lords Justices. He also urged that bringing the amount into court would incur a cost to the Company of upwards of 600l. Mr. Malins followed on the same side. The Attorney-General and others were for the plaintiffs, but were not called upon for a reply. His Honour refused the motion, with costs, stating that in his opinion the money had been a great deal too long, upwards of twenty years, in the pockets of the Company. As to bringing the money into court, that was not the order made; the order was, to pay 148,000l. odd to the plaintiff.

ARCHAEOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.

THE programme has been issued for the annual meeting at Dorchester, commencing Tuesday, August 1st, and terminating August 8th.

August 1st.—The inaugural meeting will take place at the Town-hall, and the Rev. C. W. Bingham will give an introductory sketch of the antiquities of the county. At the close of the meeting the Museum will be opened, and a party will be formed to visit the antiquities of the town. Evening meeting for papers.

2nd.—Amongst others, papers will be read by the Rev. W. Barnes on "Ancient Dorset;" and by Professor Willis on "Sherborne Abbey Church." In the afternoon, an excursion will be made to Maiden Castle, where the Rev. W. Barnes will offer some remarks upon its date and construction. Evening meeting.

3rd.—Excursions to Sherborne, where the Rev. Professor Willis will accompany the visitors in the examination of the buildings. Mr. G. D. Wingfield Digby will entertain the party at Sherborne Castle. *Conversations.*

4th.—Papers will be read by the Very Rev. the Dean of Chichester on the "Life of Cardinal Morton;" by Charles T. Newton, Esq., on "Phoenician Art;" and by the Rev. Professor Willis on "Glastonbury Abbey." Evening meeting, when Mr. T. Bond, F.S.A., will read a paper on the "History of Corfe Castle." *Conversations.*

5th.—Excursion to Warcham, Corfe Castle, and Wimborne Minster. Mr. J. H. Parker will discourse upon the architectural features of Corfe Castle, and Mr. E. A. Freeman upon those of Wimborne. *Conversations.*

7th.—Excursion to Athelhampton, Milton Abbey, Bingham's Melcombe, and Walterston. The Baron Hamro will entertain the party at Milton Abbey. *Conversations.*

8th.—Annual meeting of members. Meeting for reading memoirs of interest, for which time may have previously been insufficient.

RAIN GAUGES.

THE vast importance of storing and economizing our rainfall is beginning to be very generally admitted. Many of the Lancashire towns are at present suffering much inconvenience from the scarcity of water, and, should the drought continue, the supply for all manufacturing purposes must be cut off. The question of how much cotton have we in stock will be almost secondary to the question of how much water we have. Every engineer engaged in questions of water supply and drainage has felt the want there is of an organized system of registering the rainfall of the country. There are rain-gauges here and there, but it too frequently happens that in the more rural districts whence the supplies are really drawn, there is no reliable register, and the rain-gauge of the nearest town is often the only guide.

I beg to suggest that every corporation and local board should at once procure and fix in a suitable position a rain-gauge of the best description, and cause a daily record to be kept; it would be easy to record the temperature at the same time. The whole of the apparatus could be procured for about fifteen shillings, and the daily entries on a simple form would cost nothing; but they would be exceedingly valuable, whether in connexion with local questions, or in the aggregate, as giving a somewhat accurate account of the rainfall of the kingdom, which statistics, whether considered in an agricultural, engineering, or commercial view, would be of the greatest value. JOSEPH BRIERLEY.

LINCOLN'S-INN-FIELDS AND THE THOROUGHFARES.

I was under the impression that in connexion with the New Courts of Law to be erected on the Carey-street site, there was to be an opening up of Lincoln's-inn-fields through the stiles to Holborn; and I think this was repeatedly stated by those having charge of the Bills which passed the Legislature. I was therefore surprised in passing through Gate-street to-day to find the foundations of a new house being prepared at right angles with the Messrs. Day's premises, and of course harring the proposed thoroughfare. It was stated by a person living in the neighbourhood that the house was intended as an addition to their premises; and if it be of like

altitude, the cost of its removal will be a somewhat serious addition to the expense of the proposed new street, which, if made at all, ought to be nearly in the direction of the present passage. If this were done at once, before further buildings are erected, the cost would not be excessive. Suppose the curve to commence at the corner of the windowed portion of the Hithographic establishment and end at the corner of the second house east of Mr. Weston's, some four or five houses would require to have the fronts set back from 1 to 20 ft. If to this were added the Telegraph Office on the other side, and some rounding and paring in rear of it, there would then be a fine sweeping roadway of some 40 ft. in width.

I cannot close this note without expressing regret that so fine an open space as Lincoln's-inn-fields is not more regarded. I know of no place in London so capable of improvement. Look at the forecourts on the south and west sides, so irregular and dilapidated, and the access on all sides so poor and mean contrasted with the extent and beauty of the enclosed grounds and the noble hall and other buildings of the Society. I wish my voice could reach the members of that honourable body. I would urge them to undertake a thorough re-arrangement of the whole neighbourhood, which could be made, for a comparatively moderate sum, one of the finest in the metropolis. J. W.

PRIVATE BARS PUBLIC NUISANCES.

BARNETT'S GROVE, STONE NEWINGTON.

Sir,—Can anything be done to lessen the increasing, rather than decreasing, nuisance of private bars? Why, for example, should it be left to the discretion of an impertinent fellow in charge of a bar at the end of the road mentioned above whether or not I am to be forced to go a quarter of a mile out of my way? On some of the older estates, in the W. and W.C. districts, for example, the nuisance is intolerable. It is all very well to talk of private rights; but, as respects the thoroughfares of a great city, the public wants should be considered. Carry out the system of the owner putting a bar at the end of each street over which he has power, and we must all come to a dead-lock. Q.

METROPOLITAN BOARD OF WORKS.

Improvement of the Woolwich Main Sewers.

At last meeting, Mr. Doulton, M.P., said, in reference to the sewage question, the Board had received another plan that morning from Mr. Shields, for utilising the sewage of the south side of the Thames. He did not see that the Board should go out of its way to consider this tender. Mr. Nicholay suggested that no tender be received after the time advertised.

The chairman then opened the following tenders for the construction and diversion of the Woolwich main sewers: W. Dethick, 9,100l.; E. Thirk, 9,349l.; and Messrs. Hill & Keddell, 8,610l. The Board decided that the tender of Messrs. Hill & Keddell be accepted, subject to the usual inquiries.

The Southern Embankment.

A report was brought up from the Thames Embankment Committee, stating "That, after full inquiries, they are not prepared to recommend the Board to accept the tender of Messrs. Ridley & Mearns for the execution of the works of the Southern Embankment."

The report recommended that the tender of Mr. Wm. Webster for the erection of the works of the Southern Embankment, for the sum of 309,000l., be accepted, subject to the usual inquiries.

On the motion that the report be adopted, Mr. Shaw moved that the Board re-advertise for tenders for this work. This motion, however, was withdrawn.

During a discussion which ensued, it was stated that the tender of Messrs. Ridley & Mearns was the lowest by 30,000l., and that no sufficient reason had been given why that tender should be refused.

Mr. Westerton, in moving that Messrs. Ridley & Mearns's tender be received, said he did not see why 30,000l. should be lost to the ratepayers. The amendment, however, was negatived by 16 to 11.

It was then moved that the Board re-advertise for tenders.

Mr. Doulton, M.P., said, in future the Board would be better serving the interests of the public by selecting a certain number of contractors of well-known character, and giving the contract to the lowest tender. The result of re-advertising, he thought, would be that the Board would have to pay considerably more than Mr. Webster's tender. If Mr. Webster's tender had exceeded the estimate of the engineer, then he should say let them re-advertise; but when that tender was 11,000l. below the estimate of the Board's engineer, he did not think that they should do so. It had been said, that Mr. Webster was the favoured contractor of the Board, and that the Board had better adopt as a motto, "Webster, Furness, & Co." Mr. Webster was only favoured because he had done his work well.

Mr. H. L. Taylor said, the right course would be not to accept the tender of Mr. Webster.

After some further discussion, the amendment was lost by 16 to 11.

A resolution that the report be referred back to the committee for further consideration was carried.

## PAWNBROKERS.

UNDER the brilliant lights which glisten in the windows, the sham jewelry, duffing watches, and other articles, although of but trifling value, in comparison with those things that deck the shop-windows of the West-end and City jewellers, look quite as bright to the eyes of the uninitiated in Somers-town, the Borough, Bethnal-green, and other parts of the vast metropolis, and are often attended with as much mischief to those of low degree as are the articles of higher value in more fashionable situations. The tinsel butterflies, designed and wrought in Birmingham, and disposed of by hundreds of grosses in the Minorities and Houndsditch, have as ardent admirers as those which are delicately wrought by cunning artists, in gold and silver, and are set with diamonds, rubies, and jewels of great price. Still, if in the day the sunlight be exaggerated, and in the evening the gas be used in the most scientific and ingenious manner, to our view the shops of the London pawnbrokers are amongst the very darkest of those which are to be met with in the wide area of London. Much has been already written on the subject, but we may, with a sanitary view, glance at it once more, and note one or two of the peculiarities of this trade, which has grown to vast proportions, and in which capital to an enormous extent is invested.

There is no end to the ways in which the means of living in London are obtained, and in pursuing their calling many of the workers have peculiar opportunities of observing important phases of London society. Take, for instance, the district surgeons, the relieving officers, the house-surgeons, the masters and other officials of parishes, the magistrates and their clerks, missionaries, lady visitors, medical attendants, nurses in hospitals, rent collectors, certain members of the police, and many besides; but few of these have greater facilities for the observation of the peculiarities of human nature than the pawnbroker; and when we have seen extracts from the note-books of detective police officers published, we have wondered that the experience of the pawnbroker should have been so long withheld.

From eight o'clock in the morning until eight in the evening, in the summer months, and till seven in the evening in the winter season, the pawnbroker and his assistants have constantly before them a moving and ever-changing series of human forms; and all of these, more or less, impress the visitor who may be allowed the opportunity of seeing them, with sensations of a painful nature. Here, amongst the earliest customers, are mothers or other members of families who are obliged to dispose of some article of small value before the children can have breakfast; there are, also, people who hurry to the pawnbroker's for the means of rushing to the nearest public house,—the articles which are offered being what the assistant, with an ominous shake of the head, calls "miserable pledges;" others are pronounced to be of no value, and with a sorrowful face, which indicates a heavy heart, the owner retires with the bundle either to the wretched home or else to the *leaving shop*, in the hope that a trifle may be obtained there for the articles. The solemn-looking assistant looks upon some goods presented as "cholera or fever pledges," and recommends that they should be taken away and washed; and certainly the danger of infection must be great in those shops, not only to those who are engaged in the business, but also to those who have called for the purpose of parting with or getting back their property.

The place wherein we make the present observations is situated in an important thoroughfare, from which branch several streets of a respectable character; but, hidden from the general view, there are extensive back slums, thickly inhabited by the very poor, and, it is feared, in many instances, persons of doubtful character. As the morning advances articles of furniture, carpets, clothing, &c., are displayed for sale outside the premises; the window is dressed for the day; and the customers become more varied and numerous. Some make as stealthy and bashful an entrance as though they were about to commit a crime, instead of dealing with their own property. Taxes or rent which must be settled is called for, so that personal ornaments, rings, pieces of plate, are brought for the purpose of raising money to meet the pressing occasion. Servants and other persons who may be trusted not only with the articles, but, what is of more conse-

quence, with the secret of the poverty which it is hoped will prove of but temporary duration, come with dresses and more bulky matters. The young medical practitioner, pressed by some sudden call when struggling for that eminence which we trust he will ere long arrive at, leaves his gold watch, ring, or some other valuable, in the keeping of this representative of one of the Lombardy merchants. The truth of the old proverb that necessity brings us into the close neighbourhood of strange fellows, is here verified. In the same coffin-like box where a young and anxious-looking person is unwillingly parting with some books, is a drunken, vulgar-looking woman, who is waiting to pawn her flannel petticoat, of which she has just stripped herself.

The articles which are offered as pledges are of such a varied character, that we cannot but wonder how it is that pawnbrokers are able to estimate their true value. Referring to articles of clothing: the fashions are so ever changing, that in the lapse of twelve months some dresses in London may not be worth the cost of the materials of which they are made. There is, however, generally a market to which such matters as these can go, where the fashion is not especially considered; so that in England, Ireland, and places abroad a purchaser can be found for articles of this description. Moreover, the pawnbroker endeavours to keep himself safe by offering but little more than

Some pawnbrokers understand the value of art manufactures, antiquities, pictures, rare books, and articles of curiosity; but generally those engaged in the trade do not profess this knowledge, and are not anxious to deal in or touch those things, lest their fingers should be burnt.\* Notwithstanding, strange articles find their way into the stocks of these traders, and there will be found those who will make advances upon the skins of lions, tigers, bears, boar-constrictors, the skulls and ornaments of savage people, their weapons, and many other odds and ends; but pictures, especially those of a grey and moonlight effect, are not desirable. "Yon see, sir, a bit of bright colour catches the eye and pleases those who are not judges."

To those who have no knowledge of the dealings of the modern Lombards, the estimate of the value which they put upon many articles causes surprise: take, for instance, little fancy rings, brooches, ear-rings, lockets, &c., which, in the jewellers' shops, have been bought at from a pound to thirty shillings, but would not be considered as a pledge worth more than 3s. or 4s. each. The fashion in jewelry of this kind changes rapidly, and most of the articles are valued at about the price of the gold and silver, or stones which they may contain. Thousands of those things which were highly prized, as being the gift of some long-lost friend, or tokens of affection from those who are far away, are mingled

Close Packing for Man and Goods.

one-half of what he considers the worth of the goods taken in pledge; so that if they are not redeemed, backed for the payment of a sum for three months beyond the term allowed, or the interest paid for another twelve months, and a fresh ticket obtained, he is likely to be still a gainer. Sheets, bed-covers, feather-beds, blankets, table-cloths, shirts, and other kinds of under-clothing, have a more certain value. But many pawnbrokers must have been much puzzled by the changes which took place in consequence of the cotton famine. In Manchester, and most of the towns in the Lancashire district, the premises of the money-lenders were so stocked with the household property of the distressed workers and these who were in various branches of business connected with them, that some were obliged to extend their premises, and several to refuse altogether to take particular articles. To meet emergencies of this kind, to manage business in times when extensive strikes, the scarcity and dearth of provisions, money panics, &c., affect trade and press to a greater or less extent upon the industrious classes of the community, and many other considerations, make it necessary that the pawnbroker should be a man of general intelligence, who is able to look forward, and so trim his affairs, that if his management be hard upon the poor people who deal with him, he seldom fails to secure prosperity, as is shown by the circumstance that but few pawnbrokers appear in the list of bankrupts. Nor is this to be wondered at, when we consider the enormous profits which are gained; and that, if he do not understand the actual worth of goods, he does not offer such a sum as is likely to bring him to harm.\*

up yearly, melted, and disposed of for other uses. We are, however, bewildered by the variety of the people who come, and the number of their wares—the expostulations of those who are dissatisfied—the hurrying of women who have probably left their children crying and weeping for at home—the ribald conversation of those assembled in a large box which contains from twenty to thirty people—the mysterious conversation of the assistants and the principal of cabalistic letters as representations of value. In the meanwhile, higher and higher have the parcels been piled upon the back counters, on the floor, and other parts, waiting to be entered in a book which is at all times accessible to the police, or persons who can show good reasons for making inquiry, under numbers which run consecutively. The ticket and duplicate are filed in with pen and ink, cut in two, dusted with pounce, and the one is attached to the article left and the other taken away by the owner of the goods; and here it may be noted that the names of the parties pledging are not, in the generality of instances, carefully attended to, nor are the addresses of the pledges so distinctly marked as they should be; nor is that useful law which directs, under a penalty, that no article shall be taken from male or female who does not appear to be over the age of 16 years, always attended to.

We have before hinted at the risk of the propagation of infectious disorders by the introduction of the left-off clothing of the dead and sick; and this becomes all the

\* The *Pawnbrokers' Gazette*, a well-directed class journal, circulates amongst the trade, and contains much valuable information.

\* We know the fact that a fine painting, by an old Italian artist, which has since been sold for between 700*l.* and 800*l.*, was offered for 5*l.* to a West-end pawnbroker, and declined; and in other instances, pictures, which have produced considerable sums since, have been valued at less than the cost of the frames by pawnbrokers.

more evident, as we look around in the hot summer weather at the numerous persons who crowd the insufficient spaces, and notice that no care has been taken to provide ventilation in premises where it is so particularly needed. Those who enter by the front will find themselves in a very narrow passage. In the wooden partition there are several doors: one opens to a space near the window, which is generally used by those who are purchasing goods. Further on are the doors of the coffin-shaped boxes; and further still is the large box in which the poorest part of the customers are thickly assembled together. In other parts of what may be called the shop, shelves are placed in every available part for the reception of goods, and this still further occupies the breathing-space. Below the counters there are large numbers of flat irons, copper pans, coal-scutes, sets of fire-irons, and many other articles. Certain small spaces are less closely packed; and here it is that even now it will be found pawn-brokers' assistants are lodged in larger numbers than we like to think of, partly from carelessness of the consequences of forcing young men to sleep in such situations, and from the want of accommodation in other parts of the premises. There is no room for them upstairs, where every inch is occupied by beds, so that the wonder is how others can be packed. But the air has become so bad that although somewhat seasoned by the inspection of similar places, we must go out for the purpose of breathing a little that is fresher; asking, before we go, for some consideration for the health of the pawnbroker's assistant.

#### BORING MACHINE AT CARDIFF.

THE steam artesian well-boring machine, belonging to Messrs. Mathan & Platt, of Manchester, has been at work for some weeks at a Cardiff brewery, in order to procure water for cooling, &c. Day after day passed away without any signs of water, the huge machine bringing up tons of solid rock. After boring to the depth of 290 ft., an apparently inexhaustible supply of water, of excellent quality, was got. Steam-pumps arrived from Manchester, and 160,000 gallons were brought up in twelve hours. The machine's mode of operation is by a circular row of chisels, with an inner row, standing in an oblique direction, and then falling on a mass of stone with the force of several tons, breaking the stones into small fragments, which are then drawn up by an exhausted receiver, and the chisels are then made to work on a fresh surface. The diameter of the hole is regulated by the circumference of the socket holding the chisels. The machine can bore a hole 4 ft. in diameter, but the wider the surface the force is the more diminished. In the present instance the bore was only 18 in. An average of 27 ft. 8 in. of well was sunk per week during the operation of the machine. The cost per foot was 19s. 4d. The cost of the machine was 600*l.*, but it was let, including hoiler, at the rate of 6*l.* a week. In Yorkshire the machine had bored through 40 ft. of hard stone, used as mill-stones. In boring for any great depth, it was found cheaper, after boring 300 or 400 ft., to reduce the diameter from 18 in. to 15 in. The machine has bored wells of 4 ft. in diameter and 50 ft. deep, as at Birkenhead. The cost was not increased in the same ratio as the diameter. If required to sink a pit shaft 12 ft. or 18 ft. in diameter, a series of holes 2 ft. in diameter would be sunk, as the practical limit of the machine is regarded as being 2 ft. in sinking a single hole.

#### PROVINCIAL NEWS.

**Wootton (Isle of Wight).**—At the last monthly meeting of the commissioners of the highways of the Isle of Wight, the plans and specifications prepared by Mr. A. Giles, of Southampton, for taking down the recently-erected bridge at Wootton, and erecting another in its room, were laid before the meeting, the former embracing a temporary structure whilst the latter was constructing, and, after a long discussion, it was agreed that the plans, &c., should be received and adopted, and that tenders to carry out the work should be invited by the next meeting, to be held on Wednesday, the 2nd day of August next.

**Stratford and West Ham.**—A company is now in course of formation for the erection of a music-hall in the High-street, Stratford, on the north side of the road and opposite Charles-

street. It is to be composed of iron, and the proposed outlay is 10,000*l.*—The workmen's hall and club-rooms are now in course of erection, near the north end of West Ham-lane, and contiguous to the site selected for the proposed town-hall and public offices. The building was designed by Mr. J. G. Marshall, surveyor to the West Ham Local Board of Health, who will also superintend the erection.

**Miscellaneous.**—A scheme has been proposed, and steps have been taken, for increasing the funds to erect an idiot asylum for the counties of York, Lancaster, Cheshire, Cumberland, Westmoreland, and Northumberland.

#### CHURCH-BUILDING NEWS.

**St. Leonard's (Shoreditch).**—The district church of St. Andrew's, Hoxton, has been consecrated, by the Bishop of London. The church will accommodate about 980 persons. The style of architecture is Early English, from the design of Mr. Cesar A. Long, of London, and contains chancel, chancel aisles, nave, north and south aisles, organ-chamber, and vestry. The material used is chiefly brick, with coloured arches and string-courses, relieved with stone dressings. The interior is in some parts plastered, the east and west ends and the arches to windows, &c., being brickwork, exposed and pointed. The chancel arch is of gauged brickwork, executed in coloured bricks and stone. The roof is open, and of stained deal. The arches supporting the main roof are also of stained deal, supported on iron columns. The aisles are paved with tiles. The seats are open and of stained deal, as also the pulpit. At the north end corner of the building is a square tower, carried up a portion only of its height, for want of funds. The cost of the building is about 3,200*l.* The builders were Messrs. Hardiman & Sandon, of London; and the gasfittings were provided by Mr. Tilley, also of London.

**Chinor (Oxon).**—The ancient church here has been re-opened, after having been closed for purposes of restoration, for eighteen months. A piece of ground, recently attached to the churchyard, of the diocese, at the re-opening. The church, which dates from the latter part of the thirteenth century, has undergone a renovation, both internally and externally. All the old rough cast which covered the external surface of the walls has been removed, exposing to view the natural flint face of the walls. All the stonework of the buttresses, water-tables, quoins, and parapets, has been restored with Headington stone. The churchyard has been attended to, by the formation of gravel paths, and the partial levelling of grave-mounds. Internally, the old flat roofs of the nave and chancel have been replaced by sharp-pitched roofs of yellow deal, boarded on the top side of the rafters, and having circular ribbed trusses, with carved bosses, all timber being exposed to view. The plastering has been removed from the roofs of the north and south aisles, and the timbers repaired and exposed to view. The old high-backed pews have been replaced with massive deal benches, stained and varnished. The halfy-floor has been raised above the apex of the lower-arch. A vestry has been formed at the west end of the south aisle. All the white-wash has been removed from the surface of the stonework, which has been restored, and the walls stripped of plaster and stuccoed. Two new bells have been added to the peal, and three of the old ones have been spliced, by Messrs. Jones, Bankside. The church is heated by hot water, with apparatus supplied by Messrs. Jones, Bankside. The east window has been filled with stained glass, by Messrs. Clayton & Bell, of London. Two old stained-glass windows have been restored by the same artists, and refixed in the side window of the chancel. The architect was Mr. E. Banks, of Wolverhampton. Mr. Geo. Cooper, of Aylesbury, was the contractor. The cost of restoration is about 2,500*l.*

**Kentworth.**—The parish church, which has lately undergone a restoration, has been re-opened for divine service. The edifice had for many years been in a very dilapidated state. The interior has been refitted throughout with modern pews; there are a carved roof, new organ, and pulpit, and several other new interior arrangements. The edifice itself has undergone considerable enlargement, the new features being a chancel arch, an east window, and a chancel aisle and south transept. The architect, from whose design and under whose superin-

tendence the work has been carried out, was Mr. W. Smith, of London. The builder was Mr. J. Marriott, of Coventry. The total cost of the work has been between 3,000*l.* and 4,000*l.* The enlargement and re-arrangement of the church have increased the number of sittings to 800, of which three-fifths are free.

**Weston (Hampshire).**—Holy Trinity Church has been consecrated. This church has been erected at the sole expense of the Rev. W. P. Hulton, of Barnfield, Weston, on land given by Mr. Thomas Chamberlayne. The design was prepared by Mr. Bedborough, architect, Southampton. Mr. Snook, of Southampton, was the builder. The church consists of a chancel, nave, north aisle, tower, and spire. The paving is laid throughout with Minton's tiles. The walls are faced with Swanage stone and Bath stone dressings. The spire is of Bath stone, and has three heights of lucerns. Internally the windows and doors, pews, arches, &c., are finished in Bath stone. The pulpit and font are of stone and Aberdeen granite. The roofs are open stained and varnished. The windows are all of stained glass, by Messrs. O'Connor, of London. The tracery of the east window illustrates the name of the Holy Trinity. The four-light window illustrates the Nativity and Agony of our Lord; the west window the Day of Pentecost, and the north aisle the Baptism of our Lord; and the tower windows the Blessing of the Children, and Christ disputing in the Temple. The side windows in the nave and aisle are in diaper.

**Hartfield (Sussex).**—In accordance with plans by Messrs. Parsons & Sons, of Lewes, the old-fashioned high pews of the old church of Hartfield have been changed into open seats, the gallery removed, opened out, and three windows brought to view. The south aisle has been re-roofed, the plates and rafters having been found to be in a very dangerous state. The ceiling of the nave and chancel has been removed, exhibiting the roof, which, with that of the aisle, will correspond in tint with the seats, the number of which will be increased by the alteration. The cost will be upwards of 760*l.*, including the expense of warping.

#### DISSENTING CHURCH-BUILDING NEWS.

**Ormskirk.**—The foundation stone of a new Wesleyan chapel has been laid at Blaguenate, Skelmerdale, near Ormskirk. The site of the proposed edifice is at Sandy-lane Head, Blaguenate, near the new Roman Catholic Chapel, being in the centre of this new populous village. The style of the edifice is Grecian, the plans having been supplied by the Rev. R. J. F. Hawksley, of Leigh. The chapel is to be built of brick and stone at a cost of about 450*l.*, and will afford accommodation for about 200 persons. The dimensions are 45 ft. 9 in. by 34 ft. 10 in., the elevation being 17 ft., and the vestry will be 13 ft. by 10 ft., and 10 ft. in height. The contractor is Mr. T. Bridge, of Barsoough.

**Longtown.**—The foundation stone of a new chapel, in connexion with the United Methodist Free Church, has been laid here. It will stand to the right of the road coming into the town from Carlisle, and north and south; the entrance will be from the north side. The inside measurement is 47 ft. long, by 32 ft. broad, and the chapel will be lighted by five windows on either side and two large windows at either end. The work will be executed by Mr. Metcalfe, mason; Mr. Davidson, joiner; and Mr. Nanson, slater,—all of Carlisle; the painting, by Mr. Thos. Hill, of Longtown.

**Manningham (Yorkshire).**—The Wesleyan Chapel has been re-opened. The schools will be formally opened shortly. Originally, a building, about 53 ft. wide and 91 ft. long, contained both the chapel and the schools; now, the whole of it has been devoted to the chapel, and new schools have been built on a plot of ground to the rear of, and connected with, the chapel. The increased accommodation gained is about 118 on the ground-floor and 148 in the gallery. The schools are in the Elizabethan style of architecture, and contain, on the ground-floor (which is nearly level with the basement of the chapel), separate entrances for boys and girls, four good-sized class-rooms, and a band-room; on the upper floor is the school-room, 44½ ft. wide and 49½ ft. long, and 8 3/8 ft. high to the ridge; two eight-light bay windows form prominent features in this room. There are adjoining it one class-room and staircase leading to the

next floor (over the entrances only), which contains a library and singers' vestry. Both schools and chapel are warmed by hot water. The works have been carried out under the superintendence and from the designs of Messrs. Milnes & France, architects. The contractors are as follows:—masons, Messrs. R. Crabtree & Co.; joiners, Messrs. Thos. Taylor & Son; plumber, Mr. John Schofield; plasterer, Mr. S. Laycock; painter, Mr. Wallace; and for decorating the chapel and organ, Mr. E. Hale,—all of Bradford.

#### RAILWAY COMPENSATION CASES.

*Smee v. The Metropolitan Railway Company.*—*The Value of Public-house Property.*—This was a railway compensation case (in the Lord Mayor's court, July 24th), for several houses in Liverpool-street and Broad-street Buildings, in the city of London.

The claim, as presented, was for 36,353*l.*, with 10 per cent. The value of the property was called 33,049*l.* On the part of the railway, the valuation was, with the 10 per-centage for compulsory sale, 14,614*l.*, exclusive of the Railway Tavern. Several surveyors for the company gave the value of the property as between 6,000*l.* and 7,000*l.* The Railway Tavern was let on a lease for 550*l.* a year; and Mr. Ferrow, the proprietor, had laid out 1,400*l.*, and expected a large business, as the termini of four different railways were now in the course of construction. Mr. Cronin, the public-house valuer, was called on the part of the claimant, and considered that the house would fetch a premium of 5,000*l.* with the rent of 550*l.* a year. He had had considerable experience. The value of the tavern was estimated at 10,260*l.* On the part of the company, Mr. Orgill, Mr. Haines, and Mr. Lovjock, public-house valuers, were examined, and were of opinion that the Railway Tavern at 550*l.* was a most excessive rent, and that it could not realise any premium; without the railway, the house, Mr. Orgill said, was not worth 50*l.* a year.

Several witnesses proved the great increase in the value of property, and one of the surveyors declared that property which was worth 2,000*l.* as ground-rent three years ago was now worth 4,000*l.* Property had gone up, and was still increasing in value, and might go on increasing. Numerous witnesses were called on both sides, and the evidence was very conflicting as to the value of the property in question. Mr. Smee had given nearly 27,000*l.* for the property, and had raised 20,000*l.* on it. Some of the houses had been let at very small rentals by the City of London when they were worth considerably more, as stated by the surveyors.

It was urged on the part of the railway company that the claim as presented was quite "appalling," and that if such claims were allowed there was no knowing where they would end.

Mr. Commissioner Kerr, in placing the case before the jury, declared that it was the most extraordinary one he had ever heard, and would become a "model" compensation case. What were they to think of the value of scientific evidence when there was such a difference as more than 20,000*l.* in the evidence of the surveyors and valuers? "What," added the Commissioner, "scientific evidence will come to by and by it will be impossible to say." In this case the valuation was on one hand about 36,000*l.*, and on the other under 1,000*l.* It was certainly a most remarkable case, and the jury must settle it between themselves.

The jury assessed the compensation at 29,650*l.*

#### RECENT PATENTS CONNECTED WITH BUILDING.\*

**MANUFACTURE OF BRICKS, &c.**—*J. Jonas.* Dated April 21, 1864.—This invention consists, essentially, in moulding clays, carths, and other materials capable of being so treated, in a dry, or comparatively dry, state, by passing the material through a furnace, and thence through a machine by which it is moulded.

**ORNAMENTAL BRICKS.**—*F. Potts & C. Harvey.* Dated April 21, 1864.—This invention consists in moulding from suitable clay bricks of any ornamental or irregular shape, and when partially dry, the patentees propose pressing them in suitable moulds, so as to condense and press the clay into a hard and compact mass of the

desired design; or this pressing may be performed with the clay in a dry, wet, or partially wet state, according to the strength or power or convenient means of pressing. Bricks thus formed they propose (after burning in a kiln in some instances) to glaze on the surface with any suitable glass enamel, or any suitable coatings, and these bricks they propose using for garden borders, and other like or suitable purposes to which such bricks may be used or applied.

**BRICK-MAKING MACHINERY.**—*J. M. Pratt.* Dated April 23, 1864.—The patentee claims the construction and use of machinery in which an endless band or chain wheel or carries brick moulds, and a rotating wheel or drum and plate, or two rotating wheels or drums, give pressure to form bricks in the said moulds, as described.

**IMPROVEMENTS IN APPARATUS FOR HEATING AIR, AND IN VALVES FOR ADMITTING HEATED AND COLD AIR, AND REGULATING THE SUPPLY THEREOF.**—*T. Waller.* Dated March 30, 1864.—The first part of this invention consists in the employment of a metal box or case at, or connected to, the back of stoves, with an inlet at the bottom or sides, and with one, two, or more outlets from the top or upper part of the case. The patentee fixes inclined metal plates inside the box to afford additional heating medium, and to cause the air to traverse an extended surface, and thereby become heated before issuing from the outlets. He connects a pipe or pipes to the outlets, and causes the mouth thereof to direct the heated air to any point required. The second part of the invention consists in constructing ventilators to admit and regulate the admission of heated air and cold air, or to shut off either heated or cold air. The ventilators consist of a cylinder held by and free to revolve in a casting, with parts cut away from each cylinder. He places this ventilator at the outlet from a heated air duct, pipe, or flue, and from a cold air duct, pipe, or flue, a division separating the two ducts; or they may enter the ventilator from different points. He connects an open-work plate and handle to the cylinder, which is free to revolve, and by turning the handle the admission of heated or cold air alone may be stopped or effected, or both heated and cold air may be admitted at the same time. Instead of employing an open-work plate, he sometimes uses a solid porcelain or other plate, and admits the air passing through the ventilator into the apartment to be ventilated, round the edge and back of the plate.

**APPARATUS FOR CURING SMOKY CHIMNEYS.**—*J. Capper.* Dated April 2, 1864.—This invention consists of constructing the upper portions of terminations, or parts near thereto, of chimneys, or of chimney-pots, with a large number of small openings or apertures throughout. Such small openings or apertures can conveniently be obtained by making a chimney-pot, say, cylindrical in section and open at both ends, of sheet metal, perforated all over, or by adding or attaching to a chimney-pot a piece of perforated metal of the same character as that above named, and formed into the same sectional outline as the chimney-top to which it is to be attached.

**CONSTRUCTION OF ROOFS FOR SHEDS, RAILWAY STATIONS, &c.**—*T. Bouch.* Dated December 30, 1864.—This invention relates to certain improvements in the construction of roofs for sheds, railway stations, and other similar structures, the chief feature of which consists in the application of a compression bar upon the top side of the ridges forming the roof, and running transversely along them, the bar being fixed to the apices of the ridges by a saddle and bolts, or cotters, or in any other way that may be found suitable.

**CONSTRUCTION OF PUBLIC HOUSES AND OTHER HOUSES OF ENTERTAINMENT.**—*W. Muir.* Dated January 2, 1865.—This invention consists in constructing the whole of the front of public houses, and other houses of entertainment (where men and women mix indiscriminately together), of plate glass, to enable persons outside to see those within. Ingress and egress passages of about 2 ft. wide are provided to admit customers, but to impede and prevent, as far as is possible, the entrance of females wearing steel corinthes (?). A space is left between the front of the house of entertainment and the footpath of not less than 3 ft wide, under which passes a heated flue: this space is intended to afford shelter and warmth to destitute poor during the night. When the house is closed at night, and on Sundays, a public fountain, provided with a filter, supplied with water from the house, is turned on for the benefit of the public.

#### Books Received.

*Report on the Cheap Wines from France, Italy, Austria, Greece, and Hungary.* By ROBERT DRUITT, M.D., &c. Benshaw, Strand, London.

DR. DRUITT, who is medical officer of health to St. George's, Hanover-square, informs us in the preface to this little volume, that the subject of intemperance has for some years engaged his attention; and, feeling desirous of ascertaining whether any, or which, of the cheap wines were good and recommendable for use in diet and medicine, he investigated the subject, and the results he here presents to the public in a separate form, although they first appeared in the *Medical Times and Gazette*. He is of opinion, not speaking of the intemperate here, that "there is a large number of persons who are not well off with beer, or port and sherry; and these are the persons for whose sake we want the wine which France, Germany, Greece, and Hungary supply." As for port and sherry,—the port and sherry get-at-able by the general public at least,—he has a very low opinion of these, and regards them as drugged wines, or rather as disguised drams, which, indeed, they notoriously are. Of the cheap wines which he recommends, the first, he thinks, that deserve attention are those of Bordeaux; and although he speaks highly of many others, these rank highest in his estimation, speaking as a dietist and physician. In fact, he becomes quite warm and eloquent in their praise, under their own genial influence, no doubt, for he wrote of wines with a bottle of each, as he wrote about it, before him, and a glass or two within him. After extolling his favourite cheap wine pretty fully, he says:—

"So much for Bordeaux wine, on which I love to linger. It is such a model of purity and freshness; so little prone to disagree with any one; so well adapted as a beverage for all ages and all conditions. To me it resembles young, fresh, laughing, innocent girlhood. But there is a something beyond even this. We may admire the rosebud and the snowdrop, but there is a place in our affections for something fuller, warmer, ruder, and more voluptuous. As is Aphrodite to a wood-nymph, or the Olympic Jove to Apollo, or Jeremy Taylor to Bunyan, so are they wines, O Burgundy, to those of thy sister Bordeaux."

This is a useful (as well as entertaining) little volume, and not the less so perhaps that it must benefit certain wine merchants whose wines are spoken well of, and whose business addresses are given,—no doubt in the public interest much rather than in the private.

*The Law relating to Benefit Building Societies.*

By W. TIDD PRATT, Barrister-at-Law. London: Longman, Green, & Co. 1865.

THE increase in the number of Benefit Building Societies has led Mr. W. Tidd Pratt, the son of the Registrar of Friendly Societies, to issue a second edition of his digest of the Law relating to them. He has added the various cases affecting them that have been decided up to this time, inserted the clauses of former Acts applicable to these societies, and made a volume that is indispensable to all who are connected with them.

#### VARIORUM.

BACON'S Historical and Archaeological Map of England and Wales will be found very useful by readers of English history. It shows the Anglo-Saxon and Danish kingdoms and Great Britain, and all places of historic interest to the close of the civil wars. The Mediaeval names are placed over the modern.—"Malcolm's Genealogical Tree of the Royal Family," issued by the same publisher (Bacon), commences with the first King of England (827), the first King of Scotland (843), and the first Duke of Normandy (912). Without pledging ourselves for its entire accuracy, we can state that what it says it says very clearly, and that the picture presented is very suggestive and interesting.

#### Miscellaneous.

NEW PROTESTANT CHURCH at ASPINWALL.—The American Protestant Church at Aspinwall was consecrated on the 15th of June, the ceremony being performed by Bishop Potter, of Pennsylvania. This is the first Protestant church ever erected on the isthmus of Panama. It is built of stone brought from the Pacific Railroad Company's quarry on the isthmus, and has been erected at the sole cost of the company.

\* Selected from the *Engineer's* lists.

**GIFT TO THE TOWN OF DERBY.**—The town council of Derby have had conveyed to them 6 acres of the Holmes, for a public recreation ground. The donor is Mr. Bass, M.P. In addition to the cost of the land, 3,000*l.* he is about to set it out and plant it, at a further expense of 1,000*l.*, making the gift to the working classes of this town 4,000*l.*

**ST. ALBAN'S ARCHITECTURAL ASSOCIATION.**—At the annual meeting of this Association recently held, the Rev. O. W. Davys read a paper on St. Helen's church, Walthamstead, which he described as being one of the most remarkable churches in this kingdom. After giving an architectural and historical description of the church, Mr. Davys said, that in restoring it they were endeavouring to reproduce it as at the period of its greatest beauty and perfection; and he hoped the work would be found to have been done in a conservative spirit.

**VESTRY-HALL FOR SHOREDITCH.**—A special meeting of the vestrymen of the parish of St. Leonard, Shoreditch, was held on the 25th, to receive tenders for the erection of a vestry-hall. There were four presented as under:—

Messrs. Eaton & Chapman.....	£21,225
Mr. Haers.....	20,920
Messrs. Simms & Harding.....	20,737
Messrs. John Perry & Co.....	20,250

Mr. Deacon moved that the matter be referred back to the committee to ascertain and report upon the difference between the original estimate of the architect, Mr. C. A. Long—some 17,000*l.*, and the amount of the lowest tender, 20,250*l.* Some discussion ensued, and a formal division was taken, when the motion to accept the tender of Mr. Perry was carried by 34 against 4.

**THE SCIARRA PALACE, ROME.**—We learn by the Italian journals that the Sciarra palace, in Rome, was partially destroyed by fire on the 17th inst., but the picture gallery was fortunately saved. Among the most remarkable paintings in this collection are,—“Vanity and Modesty,” by Leonardo da Vinci; the “Violin Player,” by Raffaele; a “San Scaestian,” by Perugini; a “Magdalen,” by Guido Reni; portraits of Titian and his family, by himself, &c. The Sciarra palace, situated on a piazza of the same name, on the Corso, dates from the commencement of the eighteenth century. Since the death of the Prince Sciarra, the gallery has been closed to the public, on account of a law-suit, now pending, between the heirs.

**THE PROPOSED DIRECT ROUTE FROM ISLINGTON TO THE CITY.**—At a meeting of the City Commissioners of Sewers, last week, a deputation attended with a memorial, presented on behalf of the vestry of the parish of St. Giles, Cripplegate, in favour of a direct route from Islington into the City. The line of the proposed new street was from Essex (formerly Lower) Road, Islington, through Packerington-street, Shepherdess-walk, Bath-street, Bunhill-row, Type-street, and Moor-lane, into Fore-street. It was urged that the new route would be a saving of at least half a mile. The commissioners were asked to give their support to the scheme, and especially to cause Moor-lane to be widened from 40 ft. to 50 ft. at the least. A plan of the proposed new street was laid on the table, and explained by Mr. Woodthorpe, architect. The subject was unanimously referred to the Improvement Committee for consideration and report.

**APPREHENDED SCARCITY OF WATER AT LIVERPOOL.**—At the recent meeting of the Liverpool Water Committee, Mr. Beloe, the chairman, said there was only about four weeks' supply in the Rivington reservoirs, and appealed to the inhabitants of the town to be economical in their consumption. The average yearly rainfall for the last fifteen years has been 47 in., while in 1864 the fall was only 38 in., and for the first six months of the present year only 14 in. The reservoirs had never been so low for six years. The total quantity of water required each week is 40,000,000 gallons from the Sandstone Wells (pumped), 78,000,000 gallons from Rivington, and 60,000,000 gallons for compensation, being a total of 178,000,000 gallons per week. It requires a fall of rain equal to an inch in twenty-four hours to have any important effect upon the reservoirs. The committee agreed to recommend the town council to erect an additional reservoir at Rivington, at an expense of 100,000*l.*, to catch the water which at present runs to waste. The scarcity of water in the reservoirs is caused by the unusual dryness of the last two years.

**THE BRADFORD SURVEYORSHIP.**—The salary of Mr. Gott, the borough surveyor of Bradford, has been increased from 300*l.* to 400*l.* a year. The resolution was carried by a majority of 17 to 8. The entire services of Mr. Gott will thus be retained for the corporation works.

**DANGEROUS ORNAMENTATION OF HOUSES.**—Last week a fatal accident happened in the Strand, through the fall of an ornament from the top of Haxell's Hotel, next Exeter Hall. The top of this house is decorated with large vases, part of one of which fell to the ground, striking a passenger, who was so dangerously injured that he was taken to Charing-cross Hospital, where he died. At the inquest it appeared in evidence that a workman had touched the vase in passing along the roof, which he was repairing. A verdict of “Accidental death” was given.

**THE FATAL FALL OF HOUSES IN CHANDOS-STREET, COVENT GARDEN.**—Mr. S. F. Langham, the deputy-corumor for Westminster, has opened an inquiry at Westminster Hospital, touching the death of Andrew Dawson, twenty-nine years of age, who lost his life by the fall of the houses in Chandos-street, Covent Garden, on Tuesday evening in last week. Mr. Lewis, jun., of Ely-place, appeared for Mr. Howes, the builder, who was taking down the houses in question. After several witnesses were examined, one of whom, a park constable, saw the walls hudge, and the fall instantly afterwards, the inquiry was adjourned in order that a surveyor should be engaged to view and examine the place, and to make such observations to the jury as would lead them to a proper verdict.

**TELEGRAPHIC PROGRESS.**—The shore end of the Atlantic cable has been safely laid, the ocean line united with it, and the *Great Eastern* is now laying it down. The shore end of the cable from the main land to deep water is protected by an arch of solid masonry, to prevent chafing or damage from boats or shingle. In laying the ocean line a hitch unfortunately occurred at the outset, but this was soon put right. When 150 miles were laid, however, some fear began to be entertained that the line, at the rate of its expenditure, would run short; but it is to be hoped the 700 spare miles of line on board will be sufficient.

**PHOTOGRAPHIC PROGRESS.**—We are pleased to observe that a suggestion of ours for the attainment of a true surface for photographs has been realized. The inventor of this special process is Mr. Burgess, who calls it the “Eburneum” process. It is said to produce the utmost delicacy and clearness of tone, with a softness, roundness, and gradation of half-tints, such as have never hitherto been seen in photographs.—The ink-printing process of Mr. Pouncy, of Dorchester, which we have repeatedly brought under the favourable notice of our readers, has just attained for him a prize medal at the Berlin International Photographic Exhibition. French and Scottish institutions long since awarded him substantial prizes and medals; but he seems to be destined, like the prophet, to meet with honour anywhere but in his own country. Doubtless, John Bull regards this denial of his approval as a token of his superior acuteness; but, although we do not quite agree with Carlyle in regarding our countrymen as being “mostly fools,” we certainly look upon this sort of token as one which indicates stolidity much rather than acuteness.

**RAILWAY MATTERS.**—For the Waterloo and Whitehall Pneumatic Railway, Messrs. Brassey & Company's workmen have already begun boring in the enclosed ground on the north side of the Waterloo terminus of the London and South-Western Railway, close to the steps leading to the platform of the Richmond and Windsor branch line. Their purpose is to ascertain the nature of the soil at that spot preparatory to the commencement of the works.—A special assembly of the proprietors of the Thames Tunnel have approved of the agreement entered into with the East London Railway Company, for the sale of the tunnel for 100,000*l.* in ten annual instalments. Power was also given to the directors to apply for an Act of Parliament to wind up the Tunnel Company.—The traffic receipts of railways in the United Kingdom amounted, for the week ending July 15th, on 12,075 miles, to 718,860*l.*, and for the corresponding week of last year, on 11,674 miles, to 697,520*l.*, showing an increase of 401 miles, and of 21,340*l.*

**FRENCH MACHINERY FOR ENGLAND.**—We have been informed, says *L'Industrie*, that M. Quillaecq, mechanical engineer, of Anzin Nord, has received an order to make a powerful pumping-machine for a coal-mine near Newcastle. This will be the first machine of the kind ever sent from France to England.

**PORCHESTER CHURCH.**—St. Mary's, Portchester, one of the most interesting Norman buildings in the country, has been restored to a considerable extent, and was lately re-opened for service. It stands within the walls of the castle, a structure of very early foundation. The four fine arches which sustain the tower are, with their columns, now revealed in all their imposing effect; and the north transept, with its sculpture, is properly seen.

**LIGHTNING.**—On the 10th inst., the Antwerp terminus of the state railway was struck by lightning. After having made a hole as large as a crown-piece in the roof of the goods shed, it followed the cast-iron ribs, descended by one of the telegraph wires, and disappeared in the direction of the Zoological Gardens, which border the station. No one was injured. The building was furnished with lightning conductors; but, as the account says, they seem to have forgotten, on this occasion, to do their duty.

**THE NEW ACT ON ROAD LOCOMOTIVES.**—The new Act for regulating locomotives on turnpike and other roads will come into operation on the 1st of September. Three persons are to work a locomotive, and one is to proceed on foot with a red flag, as notice of the approach of the locomotive.—On a turnpike road, or public highway, a locomotive is not to proceed at a greater speed than four miles an hour; and in a city, town, or village, at not more than two miles an hour. The city of London, the Metropolitan Board of Works, and other local authorities, are to appoint the hours during which the locomotives may pass through the streets. The Act is only to continue in force for two years, and may be regarded as an “experiment” on locomotives in public thoroughfares, both in the metropolis and in the country.

**THE GENERAL ESTATES COMPANY (LIMITED).**—This undertaking has been introduced with a view of acquiring and developing all descriptions of landed property in or near London, creating ground-rents by advances to respectable contractors or builders, and to carry out other matters connected with land which may offer the prospect of a safe and remunerative investment. The directors, in their prospectus, refer to the success which has attended companies formed for similar purposes, one having lately declared a dividend of 20 per cent. The company has already entered into provisional agreements for the immediate purchase of six properties, comprising several blocks of offices, chambers, and warehouses in the City; and some estates in Surrey, within easy access of the metropolis. The capital is 250,000*l.*, in 12,500 shares of 20*l.* each, but the first issue will be confined to 6,269 shares.

**THE ELECTRIC LIGHT AT SEA.**—Some experiments have just been made at Lorient, on board the *Celiguy*, the object of which is to utilise the electric light at sea. By means of a submarine reflector, the water was illuminated to a great depth, so that it was possible to look down from the deck and see the fish, attracted by the light, swimming round the lamp as if in an aquarium. A diving-bell, with a large glass eye in one side, and arranged to supply air to a diver, was also let down to the depth of 38 fathoms. This apparatus is designed to inspect submarine constructions, to fish coral, &c., and recover wrecked property.

**PROGRESS IN JAPAN.**—The *Japan Herald* says:—“A railroad, with a locomotive engine and tender, is in operation on the Bund, at Nagasaki, and excites a great deal of attention among the Japanese, who come from far and near to see it. Prince Satsuma has planted 40,000 mulberry-trees during the past year, a significant fact, which shows his estimation of foreign commerce. He is also making considerable preparations for the improved manufacture of sugar at the Loo-choos, and we are credibly informed, has engaged a Scotch overseer for the works there, and improved the latest improved machinery.” A civil war, it is said, however, has recently broken out, doubtless between the party unfavorable, and the one favorable, to foreign commerce.

**THE PETROLEUM MANIA.**—This mania in America has completely subsided. There are now scarcely any new companies, and the stocks of the existing ones are not in demand. The industry will now come under the usual normal conditions of other pursuits. The yield in 1864 was 87,000,000 gallons, of a money value of 20,000,000 dollars. This amount of crude oil yielded 62,000,000 gallons of refined oil, the value of the refined being 40,000,000 dollars.

**THE BRISTOL SOCIETY OF ARCHITECTS.**—The members of this Society, accompanied by some friends, have made their first excursion for the present season. They visited Mangotsfield, Siston, Packlechurch, Westerleigh, Tormarton, Acton-Turville, and Old Sodbury, at all of which places the churches were inspected. The party then partook of a cold dinner at the Cross Hands Inn, and afterwards visited the old Roman camp at Sodbury, before returning to Bristol. The next out-door meeting of the Society is fixed for Saturday, the 19th of August, when Salisbury and Berkeley will be visited.

**GAS.**—For some years the propriety of removing the Ashford Gas Works to a situation more remote from the town has been mooted. It has now been decided to erect new and larger premises on a site in the Beaver fields, in what is called Bull Meadow. A siding is also to be constructed from the South-Eastern Railway to the gas works. To carry out the proposed scheme, it has been resolved to dissolve the old Gas Company, and to transfer its business to a new one, to be called the Ashford Gas and Coke Company (Limited).—The new Gas Company, at Kingston, which has been formed in order to supply the town with a better quality of gas at a cheaper rate, has commenced its works on a piece of ground near the railway station. The erection of the works is under the management of Mr. Mansfield, of Kingston, contractor.—At Adelaide the price of gas has been reduced to 18s. per thousand cubic feet.

**TOBACCO AND ITS PRODUCTS.**—The consumption of tobacco in France is annually 27,000 to 28,000 tons, or about 800 grammes (1 lb. 12½ oz.) per head of the population. In England the annual consumption was, in 1859, 18,000 tons, or about 700 grammes (1 lb. 8½ oz.) per head on an average. The quantity annually consumed by the whole world is actually 275,000 tons. Between French and English, a cloud of carbonic acid is generated which weighs nearly 100,000 tons; and all countries united produce, according to the calculations of Professor Scheiden, a quantity of carbonic acid from this source weighing no less than 500,000 tons annually. The proportion of nicotine, or poisonous essence of the plant, varies from 2 to 10 per cent., according to the circumstances of its growth. In France, that of the department of Lot is richest of all in the poison, having 8 per cent. in the Nord, it is 6½; in the Pas de Calais, nearly 5 per cent.; in Alsace, the tobacco grown contains only 3½ per cent.; that of Virginia, 6·9 per cent.; Maryland, 3½; Havannah, only 2 per cent. of poison.

**THE LONDON BRIDGES.**—On Friday, May 19th, 99,236 foot passengers crossed London Bridge in the twenty-four hours, and 65,756 persons in vehicles or on horseback. It was a fine day. On Tuesday, 23rd May (morning fine, but raining heavily between 4 and 5 p.m.), there were 91,080 foot passengers, and 72,359 in vehicles. Half the vehicles belonged to railway traffic, rather more than a quarter to railway traffic, nearly a quarter to Tooty-street traffic. In the half-year after the opening of Southwark Bridge toll free, to 7th May, 1865, 2,359,312 foot passengers crossed the bridge. In the half-year from 8th November, 1863, to May 7th, 1864, when there was a penny toll, the number of foot passengers was 257,016. On Friday, 9th June, 48,572 foot passengers crossed Blackfriars Bridge in the twenty-four hours, and 30,141 persons in vehicles: between eight and nine in the evening the number of foot passengers reached 5,096. In the year ending 23rd February, 5,111,368 foot passengers paid a halfpenny toll and crossed Waterloo Bridge. In the eight months from 1st September to 30th April, 1,294,246 passengers paid a halfpenny toll and crossed Hungerford Bridge: the average was 5,348 a day. On 11th June, 47,062 foot passengers crossed Westminster Bridge in the twenty-four hours, two-thirds using the north footway: 13,119 vehicles also crossed. The traffic over Lambeth Bridge, a toll-bridge, is at the rate of about 1,300,000 persons annually.

TENDERS

For erecting a warehouse, in Southwark-street, for Mr. Andrew Dunn, Messrs. Newman & Billing, architects. Quantities supplied by Mr. Young. The prices do not include castings and ironwork:—  
 Dore, Brothers.....£8,379 0 0  
 Hill & Keddell.....5,010 0 0  
 J. & F. Coleman.....5,440 0 0  
 Axford & Co.....5,400 0 0  
 Little.....5,240 0 0  
 Rider.....5,240 0 0  
 Downs.....5,196 0 0

 Thompson.....2,293 0 0

For Primitive Methodist Chapel, at Gooles, Mr. Joseph Wright, architect:—  
 Messrs. Kassell (accepted).....£430 0 0

For new billiard-room, &c., at the Bell Hotel, Driffield, Mr. Joseph Wright, architect:—  
 Berry.....£448 10 0  
 Hawson.....432 0 0  
 Clarke (accepted).....429 0 0

For new homestead and cottages, to Chislet Court Farm, near Canterbury, Messrs. Clinton, architects. Quantities supplied by Mr. Stephen Shrubsole:—  
 Bounett.....£2,557 0 0  
 Shrubsole.....2,498 0 0  
 Eppe (accepted).....2,475 0 0

For alterations and additions, at No. 9, Lower Berkeley-street, Portman-square, for Mr. H. Bosanquet, Messrs. Mayhew & Knight, architects:—  
 Phillips.....£582 4 0  
 Messrs. Bywaters.....559 0 0  
 Rhodes & Roberts.....521 0 0

Accepted for the enlargement of Primitive Methodist Chapel, and erection of schools, Curzon-street, Leicester, Mr. W. S. Burton, architect. Quantities supplied:—

**Bricklayer's Work.**  
 Johnson.....£310 17 6  
**Mason's Work.**  
 Harford, Brothers.....29 8 6  
**Slater's Work.**  
 Shenton.....54 0 0  
**Plasterer's Work.**  
 Southern.....75 0 0  
**Carpenter and Joiner's Work.**  
 Grundy.....469 10 0  
**Plumber, Glazier, and Painter's Work.**  
 Widdowson.....45 10 0

For the erection of warehouse, Globe-street, Wapping, for Capt. Page, Mr. Fritchett, architect:—  
 Hack & Son.....£3,712 0 0  
 Browne & Robinson.....3,610 0 0  
 Kilby.....3,533 0 0  
 King & Sons.....3,448 0 0  
 Eaton & Chapman.....3,327 0 0  
 Meers.....3,273 0 0

For six laborers' cottages, at Grimston, Leicester-shire, for Mr. T. Sharp, Mr. W. S. Burton, architect. Quantities not supplied:—  
 Groves.....£404 6 0  
 Rodkin.....368 14 0  
 Mansor & Hill (accepted).....345 14 0

For house and premises, at Austy, Leicestershire, for Mr. D. Pettifor, Mr. W. S. Burton, architect. Quantities supplied:—  
 Moss.....£397 0 0  
 Russell.....565 0 0  
 Groves.....561 0 0  
 Eagle.....548 0 0  
 Freeman.....555 7 6

 Collett.....483 0 0  
 Middleton.....475 15 0  
 Winkles (accepted).....473 19 9

For house and shop, Humberstone-road, Leicester, for Mr. J. Rimmington, Mr. W. S. Burton, architect. Quantities supplied:—  
 Porter.....£337 0 0  
 Johnson.....299 5 6  
 Beaver.....285 12 0  
 Wakelley.....287 5 10  
 Freeman.....292 10 0  
 Middleton.....288 17 0  
 Flude.....277 8 0  
 Broome.....271 0 0  
 Eagle (accepted).....270 0 0  
**Plumber, Glazier, and Painter's Work.**  
 Freeman (accepted).....50 5 0

For the erection of villa residence, at Down's Wood, Beckenham, for Mr. James Wilson Holme, Mr. R. Roberts, architect:—  
 Colls & Son.....£2,938 0 0  
 Cox.....2,450 0 0

For rebuilding premises, No. 63, Bishopsgate-street, Mr. T. C. Clarke, architect:—  
 Turner & Son.....£2,509 0 0  
 Hack & Son.....2,588 0 0  
 Colls & Son.....2,584 0 0  
 Hill & Sons.....2,577 0 0  
 King & Son.....2,533 0 0  
 Browne & Robinson.....2,513 0 0  
 Forster.....2,497 0 0  
 Brass.....2,485 0 0  
 Scrivener & White.....2,278 0 0

For the erection of two new wings to the House of Correction, Coldbath-fields, Clerkenwell, Mr. F. H. Pownall, architect:—  
 Sawyer (accepted).....£31,749 0 0

For finishing a residence, at Upper Tooting, for Mr. Herbert Taylor, Messrs. Wimble & Taylor, architects:—  
 Ty & Andrews.....£390 0 0  
 Kilby.....387 0 0  
 Adanson & Son.....310 0 0  
 Gulland & Thompson.....275 0 0

For alterations at No. 8, Little Knight-riders-street, Doctors' Commons, Messrs. Wimble & Taylor, architects:—  
 Axford & Co.....£280 0 0  
 Ramsey.....268 0 0  
 Colls & Son.....225 0 0

For the erection of a workmen's club and lodging-house, Old Pye-street, Westminster, Mr. H. M. Eytan, architect:—  
 Biers.....£8,760 0 0  
 Richardson.....6,900 0 0  
 Brass.....5,890 0 0

TO CORRESPONDENTS.

Sol'd Engravings.—A correspondent wants to know the best mode of cleaning sol'd engravings from ordinary dirt. Florence (block has not arrived).—T. R.—Dr. T.—H. F. J.—R. L. R.—S. B.—E. C. H. D.—L. M. E.—Mr. R.—H. C. G.—G. H. F.—J. B.—Messrs. N.—H. C.—W. F.—W. W.—John Faithful.—T. R.—G. W.—P. C.—W. & T.—C. & Son.—J. W. B.—W. S. B.—W. S. M.—L. E. T.—H. F. L. (we shall be glad to hear from him).—P. R. W. (banked).  
 We are compelled to decline pointing out books and giving addresses.  
 All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender; not necessarily for publication.

**NOTE.**—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES only should be sent.

Advertisements cannot be received for the current week's issue later than FIVE o'clock, p.m., on Thursday.

[ADVERTISEMENT.]

**CHURCH, TURRET, and STABLE CLOCKS.**  
 J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 33 & 34, Ludgate-hill, E.C. Established 1749.

ADVERTISEMENTS.

**TWO ARCHEOLOGISTS, ARCHITECTS, and ANTIQUARIES.**—Messrs. COX & WYMAN, having had great experience in the production of every variety of Work relating to Topography, Architecture, and the Fine Arts, their Establishment affords special facilities for the execution of the class of PRINTING, whether illustrated or otherwise, in the best possible manner, with promptitude, and at moderate prices.—COX & WYMAN, Fine Art and Chiseling Printers, 74-75, Great Queen-street, London, W.C.

Just published, price 5s. 6s. or 3s. stamp, post free.  
**THE PRACTICAL GAS-FITTER'S GUIDE.** Giving a comprehensive View of Gas Works and fittings for Shops, Dwellings, and Churches, illustrated with Drawings.  
 By J. MASON, Gas Engineer.  
 Address, J. HILL, 54, Murray-street, City-road, London.

VOL. XXIII.—No. 1174.

Proposed  
Portrait Exhibition  
at the South Kensington  
Museum.

It is proposed, as our readers know, to form at South Kensington, for the London season of 1866,—

"In what far country doth that morrow lie?"—

a Loan Exhibition of Portraits of Illustrous and interesting Englishmen, Scotchmen, and Irishmen no longer in the flesh among us.

When, eleven years ago (1854), that well-informed and pleasant travelling and table companion, Dr. Waagen, "Director of the Royal Gallery of Pictures, Berlin," published his second and enlarged edition of his "Treasures of Art in Great Britain," he had to lament that, with the unusual advantages he had of seeing, or of being allowed to see, whatever (Lord Ashburnham's collection in part ex-

cepted) he wished of England's wealth in accumulated art, having a liberal publisher to pay his expenses, yet he left Dover for Calais with a full sense that he had left much that he would have liked to have seen, unseen.

In cataloguing the Art-Treasures of Great Britain, one of Dr. Waagen's deficiencies was one that would be common to every foreigner. He knew little more than an educated German would know of England's worthies: for instance, he naturally cared more for that marvel in art, Vandyck's so-called head of Gevartins, in our National Gallery, than for Vandyck's twin portraits of Stratford and his secretary, at Lord Fitzwilliam's, in Yorkshiro. Lord Macanlay had no like feeling; Mr. Hallam had no like feeling; Mr. Carlyle would have no like feeling: these great men would appreciate the art, not with Dr. Waagen's knowledge, it is true; but it was the history of the man they read, or would read, on the foreboding brow of Stratford, that would make them linger, "with how sad steps and slow," before that masterpiece in art.

In selecting portraits for the approaching exhibition at South Kensington, the "Committee of Council on Education," under whose control the exhibition is to be formed, will be wise in drawing up certain rules for the guidance of those who are to select the portraits. Authenticity must come first,—art second. Nor should they forget that the likenesses of *infamous* men who acted conspicuous parts in English History would be especially interesting. A contemporary portrait of Perkin Warbeck would attract the eyes of the whole body of the Society of Antiquaries. A genuine Gny Faux would, on the 5th of November day, bring to the exchequer

\* Cowley.

of the Kensington Museum almost countless shillings, and some squibs from our contemporary Mr. Punch. Mrs. Montagu, by Sir Joshua, would bring all the chimney-sweeps of London to the Museum on May Day. A row of the Lord Mayors of London, with a genuine portrait of Whittington, and a still more genuine portrait of his cat, would be sure to carry all the dowager duchesses we have, and all the aged female house-keepers in the three kingdoms to the Brompton Boilers. Old Pa's would look with reverence on old, very old Parr; and old Ma's on the old, very old Countess of Desmond. Then a quiet nook of all the lovely Maids of Honour, ennobled or disgraced, from Anne Boleyn with her eyes of Gospel light, from her (Elizabeth Throgmorton) who won Sir Walter Raleigh's heart, down to Tom Killigrew's Cecilia Crofts,—to Anne Van—

"Yet Vane could tell what fills from beauty spring;—"

and Molly Lepel and Kitty Dashwood, and the charming Lady Fanny Cowper, who still looks "ever looming ever fair" in Leslie's fine picture of Queen Victoria's Coronation, would attract thousands.

Then we would move (make) the Marquis Townshend to let us have from Raynham that roomful of full-lengths of the Elizabethan soldiers who trailed pikes in the Low Country wars under Sir Francis Vere and Sir Horatio Vere. A more interesting English portrait-room for the soldier and the student of Hume is not to be found, and we have seen it with pride and emotion. "The Duke's Flagmen of 1665" now unhappily and stupidly separated at Hampton Court and Greenwich, should be once more united and seen with some of Benbow's men and Duncan's Campdown men, and Nelson's Nile and Trafalgar men.

All the Kit-kat Club portraits should come on loan from that delightful roomful of the portraits of the Kit-kat Club to be seen at Bayfordbury, in Herts. This should be our Queen Anne Room, and all the furniture and fittings and decorations should remind us of Will's Coffee-house, Button's Coffee-house, Covent Garden, and Old Drury. Addison's writing-table, once at Holland House, should have a railed-off nook for itself in the corner of this room. Here Mr. Crace might have undisturbed control. How William Makepeace Thackeray would have lingered in a room such as we desire to see.

There are many fine storerooms of old English portraits from which to ask for loans. We have instanced Raynham as rich, Bayfordbury as very rich. The royal collections, the guildhalls, college-halls, even vestry-rooms, would be found to yield goodly fruit. No one English scholar in art and biography and localities can be supposed to hefully up to the mark of forming such a collection, unequalled as the aspires are under which he will have to seek and doubtless to obtain. What, to some Inigo Jones's favourite language, seems "feasible and conducive to the design" of the committee, would be, to obtain the paid labour of some one person or two in forming a catalogue of wants and of what can be obtained, to set the rough catalogue up in print, for private circulation among skilled scholars, asking for additions, corrections, and hearty co-operation.

Where several or indeed more than one genuine portrait exist of the same person, this rule of selection is to be obeyed. That one should be asked for which carries an anecdote with it. We will give an example. In choosing a portrait of King James II. (1684-5—1688), we should select the famous knee-piece by Kneller of the king, for which he was sitting when he heard for the first time that his son-in-law, William of Orange, had landed at Torbay, and was on his road to Whitehall. The news was bad enough; yet the king continued to sit, for he would not, he said, disappoint his good friend Mr. Pepys. This highly English historical por-

trait was bought in at the Pepys-Cookerell sale at Christie's, some ten years ago. We saw it at Christie's on the occasion, and, remembering the story connected with it, thought of Faversham and St. Germain's. The lineaments are without any trace of emotion, fear, alarm, or abdicatio; on the contrary, they exhibit a determination of purpose unknown to his timid grandfather.

Of the pleasure arising from the contemplation of a gallery of portraits, a striking illustration has been preserved by M. Guizot. The scene of the anecdote is in Kensington, in the gallery of Holland House; the *dramatis personee*, are old Lady Holland and M. Guizot himself. The French minister and historian asks the widowed lady of the house if she ever found herself alone when at home and without conversation. "No, very seldom," was the reply; "but when it occurs I am not without resources; and [pointing to the portraits, she observed] I entreat the friends you see there to descend from above. I know the place that each preferred,—the arm-chair in which he was accustomed to sit. They come. I find myself again with Fox, Romilly, Mackintosh, Sheridan, and Horner: they speak to me, and I am no longer by myself."

That the principle to be adopted and followed rigidly in the "hanging" of the pictures in the coming exhibition should be chronological and historical, and not according to heraldry and the Book of Dignities, seems to us essential to the full educational success of the scheme; and we confess to a surprise at finding Mr. Scharf, the director of the National Portrait Gallery, in favour of a capricious and not a chronological arrangement.

When Sir Walter Scott was collecting pictures for the walls of Abbotsford, he looked for portraits, and portraits alone. The heads of Dryden and Dnndee are to be seen at Abbotsford. Portraits in a profusion of good taste line the galleries of Sir Bulwer Lytton's mansion of Knebworth. The great Lord Chancellor Clarendon's fine house in Piccadilly was "bravely furnished" says Evelyn, "with the pictures of most of our ancient and modern wits, poets, philosophers, famous and learned Englishmen."

"There were at full length," he says in a letter to gossiping Mr. Pepys (to which we referred lately in our gossip about "The Grove," at Watford) "the great Duke of Buckingham, the brave Sir Horace and Sir Francis Vere, Sir Walter Raleigh, Sir Philip Sidney, the great Earl of Leicester, Treasurer Buckhurst, Burleigh, Walsingham, Cecil, Lord Chancellor Bacon, and what was most agreeable to his lordship's general honour, old Chaucer, Shakspeare, Beaumont and Fletcher (who were both in one piece), Spenser, Mr. Waller, Cowley, Hudibras, which last he placed in the room where he used to eat and dine in public." Even better companions, to our thinking, than a "Morning" or "Evening" by Claude Lorraine, a wild landscape with robbers by Salvator, or a castle-crowned distance by Poussin. The Minister, Sir Robert Peel, collected portraits of eminent Englishmen, and assigned the place of honour in his house at Whitehall to the portrait of Samuel Johnson by Sir Joshua Reynolds.

Collectors are difficult to move, and require a great deal of coaxing: no time should, therefore, be lost in forming a list of wants, and of written promises to lend, for the purposes of the "proposed exhibition," when wanted.

In the meantime, we repeat that a catalogue of what can he had is an immediate necessity.

## OUR MUSEUMS AND ART GALLERIES.

QUESTIONS connected with the local habitation of the national collections of art-works, and specimens pertaining to different branches of science, have been long kept undecided: six months at least must elapse before they can be revived in Parliament; but so much entangle-

ment has accrued, that the time is not too much for the consideration due, and which even yet they have not received. Hitherto the questions have been discussed with an appreciation of the interests bound up with them, that has been second in importance to the indulgence of personal and political animosities; and it has been impossible to recognise in the Legislature any definite aim, or the assertion of an accepted principle. Each Government, indeed, has made attempts to provide for the location of a portion of the collections; but it has usually had to "how" to a "decision of Parliament," made in direct contradiction to a decision registered some short time previously. All that can be said in defence of the unsatisfactory position, is that it may be in part due to the manner in which we became possessed of the first instalments of the collections. It has not been till quite recently that the importance in a national point of view, of the several kinds of works and specimens, arranged in galleries or museums, has been felt; and, now, the inferiority of our appliances for study and progress is most evinced by a comparison of those which we maintain in the Museum of Patents—which is devoted to the very matters that there has not been much difficulty in showing are intimately connected with the national welfare—with the appliances as they are in that noble institution the Conservatoire des Arts et Métiers, held up indeed as a model during as many years as we can recollect. The separate institutions of the British Museum, the Jermyn-street Museum and School of Mines, the National Gallery, and the South Kensington Museum and Schools,—the last-named museum embracing a great variety of objects,—neither include the whole domain of the arts and sciences, nor exist as accordant with any classification. Geological specimens are to be found in two places; and works of fine art are in several. Prints, and some paintings, are in the British Museum. One institution, containing objects that, if destroyed, would be irreplaceable, is open on certain evenings; other institutions are not so open, reason given being the impossibility of completely guarding against fire. All the institutions are closed on Sundays; whilst galleries out of London, as at Hampton Court, and even the Painted Hall, Greenwich, are open. For the National Gallery, or the works of the old masters,—to be appreciated chiefly by artists and connoisseurs, and liable to be injured by dust or the consequent cleansing,—a central locality is deemed important; for the South Kensington collections, interesting to all persons, and for the schools offering education to students many of whom must be resident in Islington and the eastern part of London, a similar locality is not thought essential. Connected with some of these circumstances are questions which we do not now attempt to solve; but we mention the facts altogether as showing the absence of system in the conception and maintenance of the institutions, that prevails.

What should be taken as the value of public opinion on any question, after the recent melancholy exhibition in the elections, or what the wisdom of a body of legislators so chosen, we hardly dare to inquire; but now that it is to be hoped there is a cessation of that throwing of eggs, soot, and stones, which appears to be considered part of the cherished liberty of the British subject, we trust attention may be given to some of those questions that concern the welfare of the nation, and for the calm discussion of which Parliament is usually found unprepared. It is merely evident to us, that the whole of the working class is not incapable of dispassionately considering subjects relating to the interests of the community; and there has lately been proof of this in the discussions that have taken place at Exeter Hall, promoted by the Working Men's Club and Institute Union, and referred to by us on several occasions.

The matter of one of these discussions pertains immediately to the present subject. In a recent number we gave a condensed report of the address wherewith the discussion was opened, but only alluded to the speeches which followed. It was impossible to listen to those speeches without feeling the great value of such discussions, for the solution of any difficulty wherein the Government may be placed, animated by the desire to do that which is right, but checked by an unreasoning opposition. All that has been done or initiated by Mr. Cowper, since he came into office, may not meet with approval; but we must give praise to the First Commissioner of Her Majesty's Works, for his intention to open the proceedings to which we have alluded, and

at which, by accident, he could not be present. Mr. Layard was a very efficient substitute; and we should have had no hesitation in saying,—had not he himself said as much,—that he went away from the discussion benefited by, as well as gratified at, the direction it took. The questions submitted by Mr. Layard, it was however plain, would have served for several evenings, and might with advantage have been placed before a larger meeting than could be got together on the occasion. We would endeavour to remedy the defect by recalling them to our reader's attention; and we hope that the result will be some assistance in the questions; which we must in due course revert to. We are not at present disposed to register conclusions on some of them, or at least on one which has been placed in the front, we mean the Sunday opening of the National Gallery and the museums. We avail ourselves of our own extended but unpublished notes as foundation for what we may have to say.

Mr. Layard submitted several questions to the meeting. He grouped them under four heads. They related to opening the British Museum, and impliedly the other collections, on Sundays, to the opening at nights, to the proposed separation of the Natural History collections of the British Museum from the art and archaeological collections and the library, to the interval that should be left between the period of one local industrial exhibition and another, and to the locality for the museum now at South Kensington, and to the maintenance of a distinctive character in that museum as a museum of art.

In his opening remarks, however, he placed the questions more clearly in order than they were stated in the conclusion of his address. He endeavoured to show that there were three classes of subjects to be provided for by museums and galleries, in London, which should demand as many separate kinds of buildings. The British Museum he would devote to archaeology and art historically considered, or to the history of man's development. Natural history and science, or the illustration of the world's development, as totally distinct from the other, he would locate elsewhere. The South Kensington Museum he would, as we understood, devote to the arts applied. The British Museum was already too vast: for logical accuracy, the works in the National Gallery, and those in the British Museum, should be together; and eventually no building would suffice for all the objects. Now we may say, it is much easier to admit difficulty of a sufficient extension of the area of the British Museum, than to accept the distinction here pronounced as existing between nature and science on the one hand and art on the other. Art is indeed nature's work; but applied art, though distinct from nature, is founded upon the latter, and fashioned out of the materials of it: more-over art comes into form by making use of science. Our special art, and all the family of arts belonging to the fitting and furnishing of buildings, as well as those belonging to personal adornment, have their very existence so much in relation with science, that it has always been difficult to say what is purely science and what merely art. The relative proportions of use and structure, and that which appeals to sentiment, vary with the work in hand: sometimes the use will predominate, and a latent grace be suffused with it: sometimes the purpose will be directly the gratification of sentiment. In any case, the requirements of construction, and the conditions imposed by the properties of materials, are such that they must needs either limit the design, or be taken as part of the foundation of the art and beauty of it. The artist-architect therefore will be precisely he who is acquainted with the science of building, and with the materials, whether those of the mineral and vegetable kingdoms, or of the other kingdom falling under natural history. The designer of patterns for furniture, ceramic manufactures, or textile fabrics, will be one acquainted with that which the material and manufacture will allow him to do. Each will produce the best art, because of the combined possession of the knowledge and of the feeling or sentiment. Classification, however necessary, it must be recollected is not defined by lines in nature. There, every object, and every field of man's science or art, exists in a relation with everything else, and is incomplete without it. So that the architect might well approach his profession with awe. Feeble his strength, and infantine his mental grasp, in presence of the demands in that which he presumes to designate as his vocation!

The errors that have been made in art-design

as applied to manufactures, have mostly resulted from some omission of attention to the properties or conditions of the material or vehicle used; and less attention seems to be paid in the teaching of the Department of Art, to such points, than was at one time given. Many of the objects in the South Kensington Museum are rather to be condemned, than taken as models; and some of them would, according to Mr. Layard's principle, be placed in the British Museum, rather than in his museum of applied art. We do not see, however, how the separation is to be effected in either of the museums, between the objects assumed of one class, and those of the other. The recognition of the two principles in the arrangement would be desirable; but to be efficient, objects in each collection should be represented in the classification of the other, by casts or photographs, correctly placed in the series, and bearing a reference to the originals. Supplemented as we have said, the classification shadowed forth by Mr. Layard would be most instructive. Buildings quite as extensive as any that have been proposed, might be necessary; but probably no sum would be too great to pay for the educational and other results accruing.

The arguments which there are in favour of a non-restriction of study on the part of any professor of art or science, to his particular profession, might be taken as showing the desirableness of keeping the natural history collections of the British Museum where they are. But, it must be confessed that the increased and increasing demands of the different collections might result in a building on such an extended plan, that the association in idea would be largely interfered with by a disconnection in fact. Any diminution of the importance attached to specimens of natural history by the decorative artist, or in the view of art by the public, should be striven against; but we are open to argument that the separation might on the whole be desirable. Whether the removal should be to South Kensington, however, is another matter. Before noting how that question stands, we may refer to observations by Mr. Layard on some other points.

Mr. Layard spoke of the opinion of the French artisans, in 1862, of the progress made in art in this country in ten years. As those opinions are frequently quoted, and have been so indeed by ourselves, we should observe that there is danger of attaching too much importance to them. If the French have made sufficient progress in mechanical engineering, to be able to supply this country with locomotive engines occasionally, we have not reason to be satisfied; and we must recollect that the discovery of an advance on our side, in art, is being met with the accustomed alacrity of the French, in the improvement of their already good educational institutions.

Relative to the question of opening the British Museum at night, we have to observe that recent investigation into the causes of fires, has shown more and more, the danger from the desiccation of inflammable material in buildings lighted by gas, as well as the fact that buildings called "fire-proof" are really far from being so, or are in some respects peculiarly favourable to the communication of fire. There are ways, however, of meeting the want.

On the question of a considerable division of the contents of the British Museum, in order to form museums in different parts of the metropolis; Mr. Layard's appreciation of the value of chronological sequence in the arrangement of the works of art, led him to deprecate scattering the works of that class; but he considered local museums desirable, and thought there might be an Ethnological Museum in eastern London, and an Indian Museum south. But he did not advert to objection that might with some reason be raised on the part of the inhabitants of western and northern London, to such location, resembling that made to the position of the establishment at South Kensington. There are strong arguments in favour of special museums; and one of these, devoted to watchmaking, might be well placed in Clerkenwell; but we see no argument in favour of placing an Ethnological Museum out of the centre of London.

Mr. Layard seemed to feel that there was reason in the objection to the distance of South Kensington, repeated by several speakers; and a remark that the middle and upper classes had need of education in art, and that the had need of education in art, and that the interests of the working men required chiefly that there should be such education, might be considered admission of this.

In the course of the discussion, it appeared to

be admitted that in view of the danger from fire, no case could be made out for the immediate opening of the British Museum and National Gallery in the evenings. But it was asked whether there were no means discoverable for lighting, if not by the electric light, by arranging the gas-lamp outside the building, the light coming through the windows. Mr. Lucraft said, the working-classes had no desire to remove the South Kensington Museum, but showed from his experience of the time and trouble of getting to it from Hoxton, the impossibility of their deriving due advantage from it. Speaking in favour of local and special museums, he instanced a naval museum as the right thing for the east of London, and a museum of cabinet-making for his own neighbourhood. As to the proposed Sunday opening, he condemned it, as did several speakers, preferring that efforts were put forth to get the Saturday half-holiday made general.

Mr. Layard, in replying to observations on the subject of the Industrial Exhibitions, much corresponding with those which have appeared in the *Builder*, contended that the working-man should not be confined to his work of trade, and said he would rather promote his employing his spare hours on something else. He also thought that the working-man, fatigued with his labour, would not be able to appreciate the British Museum in the evening. Mr. Layard distinctly expressed an opinion in favour of the Patent Museum being in the centre of London. Mr. Hart, R.A., speaking previously, had observed that paintings could not be properly seen by gas-light, and had remarked on the impossibility for the working-man, of receiving the impressions that objects in the Museums and National Gallery could afford, after a hard day's work.

The question of the designs to be submitted to Parliament, for the proposed Natural History Museum on the site of the building of 1862, has got into a curious position; and the facts are little known. After the competition, the designs which had received premiums were sent to the trustees of the British Museum for their opinion. It does not appear that the trustees had been reconvened before the competition; so that none of the competitors were officially informed of the importance attached to a well-lighted haven, to be used for storage, and by naturalists everywhere for examination of specimens, and having a tramway. Neither does it appear that the judges were prepared by any such knowledge of the requirements. When the trustees received the designs, they looked first at little more than the perspective views; and therefore, we are told, were not disposed to accord with the decision of the judges. But they remitted the whole question to their officers; who, comparing the plans and arrangement of the designs that had received first and second premiums, reported unanimously in favour of design No. 2. The trustees sent the report to the Government with observations of their own. Afterwards the discussion came on in the House of Commons, which we reported in May last. A combination was advised of the external character of the design No. 1, Captain Fowke's, with the arrangement on plan of No. 2, Professor Kerr's. Our readers may be able to say what would be the chance of success of such a combination or whether it could be even made. What immediately came of the suggestion, we do not know; but the Government were soon advising the trustees to reconsider their decision, regarding what Captain Fowke might have to say to them. The trustees replied that they would be willing to hear Captain Fowke, provided they might also hear Professor Kerr. A meeting of the trustees was accordingly held, when the authors of the two designs were called in separately. Mr. Cowper was present, there was no definite result; but, as we are informed, the First Commissioner said that Captain Fowke's design having been accepted in the first instance, it could not be cast aside, and that it would be sent to the trustees, altered from time to time, till it met with their approval. Thereupon, the trustees said that there was a design, No. 2, that met their views, and that the author of it was entitled to consideration. Since that, we are not aware that any progress has been made; but Mr. Kerr has claimed several distinctive principles of the design No. 2 as his own.

The whole of the questions connected with the National Museums and art-galleries, are in a very unsatisfactory position; and much requires to be settled, before a design can have the chance of adoption by the House of Commons.

FOOD FOR THE CONVALESCENT SICK.

ALL who have looked with care at those parts of the metropolis in which large multitudes of the struggling classes of this great community live, cannot fail to have noticed with pain the peculiar and unsatisfactory appearance of the people who are pent up in the ill-conditioned and overcrowded dwellings, which are a chief source of ill-health, imbecility, deterioration of the human physical powers, increased death-rates, and of vice and misery, to an extent which can only be judged of by those who have performed the painful duty of investigating a subject which must, ere long, force itself on the especial consideration of the power and intelligence of the country.

We have no doubt whatever that the condition of the dwellings of the industrious classes, in both town and country, is a main source of mischief; but it would be ridiculous, in the earnest advocacy of reform in this way, to neglect other matters, which are causing serious evil amongst immense numbers of our population, and which, by destroying the strength and intelligence of those upon whose exertions the real power of the nation so much depends, are causing a danger which the statesmen of the present day have not yet sufficiently estimated.

Now is the time when the members of both Houses of Legislature will leave the bustle and whirl of the capital, for their quiet and beautiful rural homes. We can fancy that most of these in the coming months will meet in delightful spots which are pleasant recollections even amongst the countless rows of bricks and mortar, full of pale anxious-looking faces, even in the midst of the most healthy air. In the rural schools, where the children are massed together, the careful observer will notice the extraordinary extent of those low states of health which constitute one of the main proximate causes of fever, cholera, and other pestilence; and we ask those who will exercise such a degree of observation, to take the further trouble of viewing the houses in which those pale-faced children live,—to look into the sanitary state of their homes, and inquire to what extent the earnings of the people are actually sufficient for the proper nourishment of the bodies of those who labour in various ways upon the land. A comparison of such conditions, with others which are enjoyed by persons who are more fortunately circumstanced, and then a thought about the different degrees of health and general appearance of each class, should stir those who are placed in positions of influence, to use exertions for the removal of those causes which are sapping and destroying the national strength, and creating an amount of misery and trouble which is not sufficiently appreciated.

Not long since, we took an opportunity of calling at the Field-lane Infant Ragged School. The time of our visit was about that for the dismissal of the children. Here the experienced eye might have noticed the efforts which had been made under circumstances of difficulty to give the children a neat and clean appearance. The general supply of shoes was better than might have been expected, but there were several barefooted pupils: there were little toddlers hardly able to walk, and infants in arms. Hats, and any other covering for the head, were scarce, and some of the small monitors within the groups by which they were surrounded formed singular pictures of a particular phase of London society. Then the smaller children had to be taken to their homes, through dangerous thoroughfares, by the elder scholars. But what on this occasion, as in other similar situations, struck us was, that although there was a marked improvement in the dress and manners of the children, there were to be seen paleness, a dull, watery, unmeaning expression of the eye, a wasted appearance of the limbs, and other indications which showed the deterioration of the system from slow poisoning by means of impure air and insufficient and improper food. On such materials it does not require the practised eye of the physician to judge how fatally epidemic diseases must rage. In such a school as this, the labour of the mistress and her assistant is a hard one; for the ignorance which is to be encountered is worse to manage in the low state of the strength of the pupils than it would be otherwise. The scholars of this establishment are not so numerous as they used to be: from the streets and courts adjoining numbers have been re-

moved by local changes; but even with a large complement of children the ventilation of this school, plain in appearance and unadorned as it is, is excellent for the purposes of health. We walk with some of those children to the places of their residence. In front of one house, at but a very short distance from the doorway, there are three gully-holes, slaughter-houses and cow-sheds not far off, and the effluvia is at times unbearable. There are the usual accompaniments of short water and extra overcrowding; and we here meet with children in a much worse state than those who have been assembled in the ragged-school,—in fact, the children sent to the ragged-schools seem to be the cream of the juvenile population of very extensive neighbourhoods. In these homes, grovelling in the dirty streets, playing about the gullyholes, lying sick upon shavings and trundle-beds, may be seen, so far as the proportionate numbers go, the future hope of England. The doctor is going his round and pointing to those sick and feeble children; to women who, although unfit for the purpose, are attempting to suckle infants; and to rooms where there is no food in the cupboard, or other comforts which are needed for the sick who live in such rooms. Some of the inmates have been in hospitals and discharged either as cured or incurable. There will he met with people of all ages, the instances of persons of advanced years being a rare exception; "hut," says the kindly doctor, "of what avail is the use of physic here? If we give tonics, they will be of doubtful effect, for there is neither food nor air to follow them up with."

When pestilence is threatening our coasts—when in some of the cities of the East the cholera, or whatever particular kind of plague it may be, is ravaging certain towns in a comparatively mild way, the daily number of deaths, in proportion to the population, would, if we take the people of London at about three millions, be here about six thousand in each day, or forty-two thousand deaths in the week caused by the pestilence, without taking into account other fatal disorders. In Italy and other parts nearer home the authorities are using the doubtful plan of stopping trade and general communication: they would have been wiser by far if they had before now made sanitary improvements and regulations in Tuscany, Sicily, and elsewhere. Nor should we be ourselves blind and heedless, for although much has been done, and is still in progress; when we look at those conditions at which we have once more hinted, we cannot resist feeling much anxiety. If we should be spared from what is threatening, it will be wise to use vigilance and to encourage all those means which are at our disposal for the purpose of checking disease and strengthening those who are predisposed by weakness and constitutional imperfections to those epidemics which spread death and terror around.

So great is the extent of London, so enormous are the requirements which are needed to meet the evils of artificial conditions, that many are disheartened at the magnitude of the task of even dealing with a section; but past experience shows that this should not be so, for by the earnestly-directed exertion of single individuals,—some of them possessed of no great amount of riches or interest,—some of our most useful institutions have been founded and brought into permanent operation. Some day we may find space for notes on the origin and growth of the great metropolitan charities, and make a few observations on their present condition, adding a few notes respecting their future advancement; but just now we will direct attention to a new, and what is yet but a very small, attempt to provide for a great want.

With thoughts of those faces which we have lately seen in the places indicated, we are induced to wander to the south side of New St. Pancras Church; to Woburn-buildings; in various directions through mews; in fragments of Agar Town; about the Brill, and other parts of Somers Town; in St. Jude's district; in Draper's-place, and elsewhere, where there are multitudes of the sick poor. The population of Draper's-place, in proportion to the size of the houses, is enormous.\*

In Woburn-buildings, in front of one of the houses, at the basement, over the door of a shop, is printed, "The Invalids' Dinner-table," insti-

\* It would be well if the officers of health were to direct special attention to this spot, and to regulate the extent of the dwellers in cellars here; to consider how insufficient a cistern of not more than 2 ft. 6 in. square is for the supply of the families who live in each of those houses; and see to other matters of sanitary derangement.

tuted for relieving the sick and convalescent poor. That which had been formerly used as a shop has been neatly fitted with appropriate texts, the word "Welcome," a few prints, an aquarium, and some other things, which make the place look pleasant. At the back there is a nice view of some gardens and green trees; and care has been taken to ventilate this extended dining apartment. From some other regions there comes a most savoury smell of cooking meats; and on a table-cloth, as white as snow, there are laid knives and forks, little drinking-mugs, decanters of water filtered with charcoal, and other preparations for a feast. At about a quarter to twelve o'clock, children begin to drop in and quietly take their places at the table. Mr. G. M. Hicks (who has been the chief means of opening this table), this gentleman's wife, and some ladies who seem most heartily in favour of the movement, also come. Soon in their places there are gathered nearly twenty-five children. One who was rickety had been first carried here to dine; then, in iron, he had with help been enabled to walk; now the boy comes without these aids, and there seems but little doubt that the food supplied here has been a chief means of producing those results. Sickness is marked on the faces of the other guests, and some of the countenances present such an interesting, but also anxious appearance, that an artist could not well resist the inclination of making notes of them in his sketch-book. There can be no possible mistake about the good which is done here. Food of the most wholesome kind, well cooked, is served in ample quantity. Graco is said. The matron, who appears well fitted for the post which she here holds, assisted by the lady visitors, serves the excellent hot roast beef, vegetables, and so forth; and it is as pleasant a sight as can be met with to see how the company enjoy the food. During the dinner a well-tuned musical instrument plays popular tunes; the knives and forks go merrily to "The regular Cur;" and in due time the dinner is finished; and then, with thankfulness, and better in strength, the party leave to be replaced by another company of sick and convalescent poor of different ages, who, having been provided with tickets, can be accommodated at this establishment with a dinner for a week or two. The persons who are to dine are asked to leave the tickets in the morning, so that the matron may know how many persons to provide for. The food must be got from the best and cheapest markets. All must be recommended by a subscriber or some society, and each must pay 2d., the remainder of the cost of the dinner being defrayed out of donations and subscriptions. It is guaranteed that the full amount of the subscriptions is spent on food, without any deduction for rent or for management. The payment of the 2d. gives an idea of the persons who come not actually receiving charity. Every person relieved is known to be deserving, by the personal visitation of those who make it their kind office to see the poor at their own houses.

It is so arranged that, when a larger attendance is secured, all the working expenses, including rent and management, will be defrayed by the persons who are themselves benefited. At present the number of persons who dine, on the average, is about thirty; at the same cost, so far as the management is concerned, fifty persons might be provided for. For the purpose of carrying on the establishment, subscribers are asked to purchase forty dinner-tickets for one guinea. Each subscriber of the above sum receives a book which contains the tickets, which, in food, represent the sum subscribed for distribution. Donations which are made to the institution are also distributed in tickets, which admit either to the youthful or the adult dinner-table; or, in cases where sickness prevents those who need food from coming, it may be taken home from the Wolvern-buildings table. This is, no doubt, in certain cases a useful exception, but in many instances, that which is needed for the purpose of helping one person to health will be so much divided amongst the family that real good will be prevented. There are also arrangements made for the distribution of wine, ironglass, and other things, needful for the sick, which do not come within the arrangements of the out-door relief of the hospitals and dispensaries.

It seems extraordinary, when we consider how much benefit has been done, how small the cost has been. According to a recent annual report, the receipts have been,—donations, 132l. 18s. 6d.; annual subscriptions, 51l. 3s.; invalids' and

poor's pence, 53l. 4s. 4d.; in all, 237l. 5s. 10d. The outlay has been,—for furnishing, &c., about 47l.; rent, 26l.; matron, 15l. 12s.; a balance at banker's, 58l. 12s.; and 3,231 dinners, &c. In order to show how the tickets have been disposed of, it is worth while to mention that the subscribers have sent in 1,059; the district clergy, 712; the district hospital, 308; the medical gentlemen of the district, 125; the Bible mission, 480; and societies for relieving the poor, 547.

We are disposed to hope that institutions founded on the same principle will rise, and that as aids to the medical charities, and even independently of them, they will be of great advantage. The medical attendants of the poor and those connected with the hospitals know how many cases are brought before their notice in connexion with which a dozen good and well-cooked dinners would prove of far more advantage than the drugs which are at their disposal. Moreover, it should not be forgotten that the method of cooking food properly amongst a very large part of the poorer and many of the industrious classes of the community is not well understood; and indeed, as our readers know, the means of cooking are not always available. Besides the purposes of dining, Mr. Hicks has caused the place to be opened in the evening as a working-men's club and reading-room. The charge for admission to this is 2d. a week. Tea, coffee, &c., may be had; and in connexion with the club there are a sick and provident fund, a penny bank, a register for men out of work, and an arrangement for the payment of wages.

#### CLUB CHAMBERS FOR THE WORKING CLASSES IN THE METROPOLIS.

Though many are the forms in which model dwellings have been devised for the benefit of the London working population, I am not aware that any combination has been tried of the nature briefly described in the present paper, which, if you should think it likely to prove suggestively useful, you will perhaps do me the favour to insert in your valuable journal. My view is to meet on a large scale, and by that means on a sound financial basis, a certain portion of the mass of misery entailed on the working classes of the metropolis, by the growing deficiency of suitable dwellings, leaving other portions to be met by other special remedies.\*

I would suggest the formation, under the Limited Liability Act, of "Club Buildings Co-operative Companies," on the following principles:—

1. In order to secure the harmonious working of the club arrangements described further on, numerous companies would be constituted, each for supplying one or more establishments calculated to meet the wants, notions, and jealousies, and thus to secure the patronage and co-operation of a particular category or group of the industrious classes, whether lower, middling, or higher paid, whether or not requiring special accommodation for the parent of their calling, whether wanting urban or suburban accommodation, to say nothing of distinctions of race, denomination, &c. Of course, it would be essential that at the head of each company there should be one person whose names might be a guarantee, on the one hand to the shareholders against fraud and mismanagement, and on the other to the public against all abuse of the power of association for party purposes. The capital and accounts of each company would be necessarily distinct, yet means might be devised for maintaining a suitable connexion between these several branches of one great scheme, so as to secure uniformity of principle and concerted action.

2. Everything would be done to secure the financial participation of the working classes themselves. Thus there might be special working-men's shares of say 1l. each, of which the dividends would be payable half-yearly, or if possible quarterly, to shareholders residing in the respective buildings, to whom would be allowed a certain bonus on the amount of each

dividend, or some equivalent advantages. It has been suggested that legal facilities should be afforded to the working classes for acquiring the proprietorship of distinct tenements in buildings containing a number of them; but independently of the awkwardness which might in many instances result to the workman from being thus bound to a particular locality, it would be next to impossible to conciliate his rights with the due maintenance of sanitary and social regulations for his own benefit and the general good of the establishment. I consider, therefore, that whilst it is very desirable that small houses should be the property of their occupiers, in localities where this does not place them too much at the mercy of their employers, the participation of the working classes in the building movement, as regards tenements built in blocks, would be more beneficial if managed on the proposed plan of co-operation by means of shares in the undertaking, offering a safe and convenient investment for savings and a resource which could be readily realized.

3. Working men would be enabled to content themselves with a small amount of ordinary accommodation for themselves and their families, and to pay a remunerative rent for it by having placed at their disposal all those advantages which a judicious club system might afford, if carried out on a large scale, and with a view to industrial as well as social comforts. I will here only advert to one of them, namely, well-lighted and well-ventilated workshops for those branches of industry which are susceptible of being carried on at home. The importance of accommodation of this kind is beginning to be so well appreciated in this country, that a proposal was lately made at one of the London vestries for its being provided at public expense.

4. Another essential feature would be the supplying of furnished rooms,—a kind of accommodation greatly needed by thousands of families, specially of the poorer classes. In order to overcome the difficulty which there is in preventing the pawning of blankets and other analogous articles, where they are directly supplied by a society or company, and for other reasons, it is proposed to organize a system of sub-letting in its present form. Groups of rooms, with conveniences in common for each group, would be let unfurnished to suitable persons of known respectability who might be called *renters*, and who, occupying a room or two, would sub-let the remainder furnished to tenants. These *renters* would be allowed to bring in any furniture of their own, subject to sanitary control; but the normal plan would be, that they should rent furniture provided by the company, the charge being, perhaps, such, that after a time it would become their property. The company's direct tenants would also have the privilege of renting the company's furniture, provided they were shareholders, or some furniture, provided they were not. One of the advantages of this system would be to favour the adoption by the working classes of furniture more conformable to sanitary and economic principles than that which is now generally found in their habitations.

Other innovations will become apparent as I enumerate in succession the various parts of one of the proposed buildings which, by way of illustration, we will assume to be about 360 ft. long by 36 ft. deep, with five stories above the ground floor, besides the attic. It might be partly on the external gallery system with light iron columns, and partly on that of internal corridors, as adopted in recent buildings by Mr. Darbishire, except that the necessity for sacrificing here and there a certain amount of building space for the sake of affording light to the corridors, might be superseded by a system of oblique mirrors; or again, it might be partly laid out in flats with two three-room tenements in each. The staircases might be constructed in various ways, but they should be fireproof and, if possible, not winding. One of them, at or near the centre of the building, should have a hoist. Two others would be at the two extremities, and by means of the fireproof galleries and corridors, would present a sure means of escape in case of fire, wherever it might break out.

*The Basement.*—To be partly used as a collage for co-operative stores. In a club building for costermongers, whose requirements are the more deserving of attention because their calling is objected to at some of the existing model establishments, accommodation for trunks, donkeys, and stock, might, by good contrivance, be very well afforded in the basement, if space should not allow of it in the yard.

\* Lord Shaftesbury recently stated in the House of Lords that the number of persons who had been displaced in the present year by the railway and other Acts was no less than 20,000, and that the number of houses to be pulled down was 3,600. The persons thus affected consisted chiefly of skilled artisans and day-labourers; and no provision existed either in the model lodging-houses, or in the old kind of houses, suitable to such persons or within their means as dwellings. Indeed, such houses as are at present to be let would not accommodate one-hundredth part of the numbers displaced.—*Builder*, April 8, 1865.

The ground-floor, to be chiefly occupied in commercial thoroughfares by shops, of each of which would be annexed a small tenement on the first floor, with communication by a private staircase. They would be, as far as possible, on the co-operative system, or otherwise calculated to afford convenience or benefit to the inmates of the building, and they should include a chemist's shop, a surgery, and, if possible, a dispensary. The ground floor, and first floor in connexion with it, would also contain the company's offices, the dwellings of the secretary and officials, and the porter's lodge. The latter would be contiguous to the sole public entrance at the centre of the building. The porter would have at his service an errand lad for conveying letters, parcels, &c., to the inmates. A letter-box would be at the lodge.

The body of the building, that is to say, the four stories above the two floors already mentioned, would consist partly of groups of tenements to be let to renters for being sublet, furnished as explained above, and partly of single tenements for being let either unfurnished or furnished to tenants direct by the company. As regards the style and amount of accommodation, the provision which would have to be made in different buildings for different grades of the working population would vary considerably. The art-workman, shopman, or clerk will require his three rooms with scullery, &c., distinct and complete; and, with such inducements as a club building can legitimately offer him, he will find it well answer his purpose to pay a weekly rent, which may equally answer the purpose of the company. The case will be totally different with the ill-paid labouring man. On the one hand, he can with difficulty pay even the lowest remunerative charge for lodging, either furnished or unfurnished, so that it must be necessarily reduced to a single room, with conveniences in common to a group of rooms. On the other hand, he will, in most instances, scarcely care for more; for a single room to himself, his wife, and his children will be quite as much as he has been accustomed to, and singularly strong are the predilections engendered by habit. If the children are small there is no question of impropriety; and if they are big they will, whether boys or girls, be specially provided for in the arrangements which we shall find at the top of the building. As regards breathing space, I have reason to believe, that by means of a peculiar system of ventilation, of which the practicability has been recognised by one of the most competent of the London architects, a room 14 ft. by 10 ft., and only 7 ft. 6 in. high, might be made perfectly suitable for a small family, without any of those direct draughts which are sometimes a reason, and often an excuse, for the closing of ventilators by those whom they are intended to benefit. I am having a model of the proposed contrivance made for being deposited in my Museum of Domestic and Sanitary Economy, where special departments are assigned to the various devices by which the health and comfort of the working classes may be promoted.

The Attic Floor.—It is here that would be chiefly gathered together the resources obtainable by an application of the club principle on a large scale, and by means of which it would be made profitable to the working-man to pay a good price for a small tenement. It must be understood that part of the items of accommodation which I am about to enumerate, would be paid for in the charge for the tenement in the body of the building, though others would be made self-supporting by payments proportioned to the use made of them.

It would equally be in the resources gathered together at the top of the building that we should find a powerful leverage for moral and physical, intellectual and technical improvement. Much valuable co-operation could doubtless be obtained from societies and individuals engaged in propagating useful knowledge and more literature for the proper furnishing of the common rooms, which would contain, *inter alia*—Select books and periodicals; prints and other ornaments, calculated to show how decoration might be at once tasteful and instructive; diagrams and apparatus for lectures and classes; illustrations illustrative of domestic and sanitary economy, natural history, and other useful and entertaining branches of knowledge, formed by the joint exertions of the inmates of the establishment; working men's master-pieces of skill and perseverance, with everything else likely to encourage industry and emulation, and to pro-

mote technical cleverness. I trust that some of the club buildings might well deserve the patronage and support of trades' corporations, of large employers of skilled labour, and of others specially interested in fostering the technical efficiency of our artisans.

Taking the length of the building to be, as I have said, about 360 ft., we shall find it convenient to allot about 160 ft. at one end to accommodations of various kinds for males, and an equal length at the other end for females, leaving in the middle a space roofed over, but open at front and back for exercise and recreation. I will not name all the details given in the drawing which I have prepared, but may briefly state that, beginning at the extremity of the female department, we find in succession an infirmary, a dormitory and infant nursery, and work and school room for young girls; a work-room; a small dormitory, in proximity to the rooms occupied by the matron and attendants; a cook's shop, scullery, and sundry conveniences; a washhouse; a drying-room and four baths. Here comes the central space for recreation, provided with gymnastic appliances. Then, progressing onwards, we find in the male department—A reading-room, at the corner of which would be partitioned off a small office for a savings-bank, accessible from without; a club and lecture room; a cook's shop, &c.; rooms for the foreman and attendants, and a small dormitory for boys near them; a work-room, and work and school room for boys; a dormitory for boys; an infirmary for men and boys.

Lofts.—Above the attic-floor, in the central part of the building, would be two lofts, one for the general depot of the company's furniture, with a workshop for repairs, &c.; the other for the purifying and airing of furniture used during any illness of a suspicious character.

In writing the foregoing, my object has merely been to throw out for the consideration of architects, builders, and capitalists, suggestions which, if found worthy of attention, their special abilities might convert into a practicable scheme, and their joint action might work out into a reality. It is, therefore, not my province to go into detailed calculations of cost and return, which had best be founded on more fully elaborate data; but there are certain conclusions which seem, at all events, likely to be realized. A company formed to supply club buildings for one of the lower paid categories of artisans and labourers, would have to collect at first nearly all its capital among those wealthy and disinterested friends of the working classes who, with a view to a great public good, would be willing to limit the interest on their investments to 5 per cent., whereby the important resource of Government loans, at 3½ per cent., which are expected to be granted on that condition, would become available. The shares taken by the tenants themselves, though a great social stage, and likely to grow considerably in time, would not be of immediate financial importance. But, passing to club-buildings for the higher classes of the working community, we shall find that the financial participation of these will augment as we ascend, and that the profits will increase; and above a certain level we shall find philanthropy unnecessary, and speculation flourishing.

I shall be happy to show and explain the rough drawings which I have prepared, and the information which I have collected, to any person who may wish either to study the capabilities of the proposed scheme as a whole, or to apply separately any of the features of which it is composed to other model buildings, existing or projected.

THOMAS TWINING.

MR. FERGUSSON ON THE HOLY SEPULCHRE.

THE third and last series of arguments by which Mr. Fergusson endeavours to establish his case, consists of those which can be drawn from history and tradition.

Eusebius, while describing the buildings of Constantine and his mother St. Helena, relates how the emperor began the new city opposite to that which had existed in ancient times. Now, in his times, the ruins of the walls and palaces, and great buildings which had been inclosed within them, must have been much more distinguishable than they are at the present day, when time and the hand of man have either destroyed them, or covered them with mounds of accumulated rubbish; yet, even at this time, we are informed by Mr. Fergusson, sufficient

remains to facilitate the decision of the true course of the walls and the bounds of the ancient city; and these have been determined by writers such as Shalitz, Clarke, Robinson, and others, as including the present Church of the Holy Sepulchre, which cannot, therefore, answer to the description of Eusebius in being placed ever against ancient Jerusalem.

The position of the Dome of the Rock is, however, in exact accordance with the words of the historian; since, according to Mr. Fergusson it was without the inclosure of the temple, and the city springing up around it would be opposite to the old city, occupying the slopes of the valley of Jehoshaphat, which bounds the plateau on which the present city stands, dividing it from the Mount of Olives on the east.

A second argument, which has been often brought forward against Mr. Fergusson's views, is that of the position of the Nablous Gate; for the Bordeaux Pilgrim, an ancient writer who visited Jerusalem in the year 333, seven years after the discovery of the cross, while the Church of Constantine was yet in building, states that, while leaving Zion and proceeding to the Porta Neapolitana, he had the Holy Sepulchre on his left, and the Prætorium of Pilate (the Tower of Antonia) on his right. Now, if, as is generally supposed, the Nablous Gate is the same as the Gate of Damascus, the principal entrance of the north wall of the city, situated about half-way between the Haram inclosure and the present traditional Church of the Holy Sepulchre, the words of the pilgrim can only apply to the present building; but this supposition Mr. Fergusson states to be founded solely on the fact that the city of Nablous is north of Jerusalem. If, on the other hand, this gate was, as Mr. Fergusson suggests, one of those on the western wall of the new city, the pilgrim, on entering it, would have the Prætorium of Pilate on his right on the south, and the Holy Sepulchre, or Dome of the Rock, on his left to the north.

Another of the many Mediaeval writers who visited and described Jerusalem from the fourth to the seventh century, speaks of the subterranean communication between the church of Golgotha and the Pool of Siloam. Near the altar of this chapel was a crevice into which if anything were thrown it would be found again at the Pool of Siloam, on the east side of Jerusalem. Now under the Haram have been found rock-cut cisterns, and enormous caverns of ancient date, filled with water in the hottest part of the summer, and a communication between them and the underground passages which connect the upper and lower pools of Siloam has been long suspected, and according to Mr. Fergusson has been recently discovered by Dr. Barclay and M. Pierotti, while no such communication exists between them and the present church of the Holy Sepulchre. Thus only to a church situated within the Haram and near the Basilica and Church of the Anastasia, as placed by Mr. Fergusson, could the words of the writer apply.

The entire destruction of the Buildings of Constantine by fire, during the siege of the Persians, has often been made use of by the supporters of the traditional site; but of the little damage done by this fire Mr. Fergusson finds evidence in the fact that the whole was so quickly restored to its pristine magnificence by Modestus, a simple monk, without riches or any means.

Another negative proof is derived from Arcaulphus, who wrote towards the close of the seventh century, and who has given rough plans of the buildings as they existed in his day; for although he mentions a square house of prayer erected by the Mohammedans on the ruins of the temple, yet he says nothing of the Dome of the Rock, unless indeed it be under the name of the Church of the Holy Sepulchre.

The building which was really erected by Omar in Jerusalem, Mr. Fergusson considers to be the same as that which now exists on the south wall of the Haram, and which forms part of the Mosque El Akshab. In this view he considers that he is borne out by the writings of Saracenic historians. On the day of his entry into the city Omar requested the Patriarch to conduct him to the temple of David, upon which that dignitary brought him first to the Church of the Holy Sepulchre and afterwards to that of Mount Zion, which however Omar knew not to be on the site of the temple; and proceeding to the Gate of Mohamed, which was choked almost entirely with rubbish, he crept in on his hands and knees, and went on till he found the sacred, when he exclaimed, "Allah Akbah! by him who

holds my soul in his hands this is the temple of David." Now this discovery on the ruins of the temple of an underground sacrah, Mr. Fergusson considers totally inapplicable to the present sacred stone standing in the centre of the upper platform of the Haram, and in a part not occupied by the temple according to his restoration. The attempt of the patriarch would have been needless, he considers, unless the church had been near to the true site of the temple.

Such are the principal arguments which Mr. Fergusson draws from history and tradition.

Of the three paths, all leading to the same point, namely, architecture, topography, and history, Mr. Fergusson has attached most importance to the first; but the value of history must not be underestimated; and it is doubtful whether more attention ought not to be paid to it than to the architectural arguments; for so little is known, and there is so much confusion and difficulty in the architecture of the times of which he is speaking, that it is but a faulty guide; whereas, on the other hand, the testimony of history is abundant.

1. With regard, first, to the relative positions of the old and new city, it must be remarked that no ancient remains have been found to the west of the traditional Church of the Holy Sepulchre in such a position as to show that it was ever inclosed within the walls of the ancient city; while Dr. Shultz has discovered remains of a wall excluding it altogether; and M. Vogüé has found the ruins of two different styles corresponding to those of the Haram, namely, the rebated and the Roman masonry, all to the east of the present church. Thus, it is by no means clear that the traditional site is situated within the old city; and it stands in a part of the town which Mr. Fergusson himself says appears always to have been the Christian quarter. On the other hand, what could be more conclusive than the position of the Mosque of Omar and the Golden Gate, in the very middle of an inclosure of ancient masonry, and, as before shown, included in the area of Antonia, if not of the temple—in the very heart of the great citadel of the ancient city. That a new town should arise on this side is almost impossible, for to the west it would be bounded by the walls of the old city, and to the east by the abrupt ascent of Olivet, with the Brook of Kedron forming a natural boundary. On the east there was hardly any ground unoccupied; on the west there was a long flat plateau, uninclosed by the ancient walls.

2. Of all the works of antiquity, roads are perhaps the most durable: new thoroughfares may be made, but the old roads of a country are rarely, if ever, destroyed; and thus, wherever we find a great highway, we may be tolerably certain that it has been the means of communication between one city and another from the earliest times: hence it arises that wherever a road enters a town, the remains of ancient gates are generally to be found on which the present portals have been erected, as is the case in many gates of Jerusalem; and wherever a path is found ending under the walls with apparently no object, it is probable that a gate anciently existed. From the roads the gates took their names, and the roads were named from the cities to which they led: thus, when there is only one communicating road between two cities, it may be safely inferred that the gate through which it enters is the only one that has ever received the name of the city from which the pathway comes.

Now there is only one road which leads from Jerusalem to Nablous, which is the same as that leading to Damascus. It enters the capital through the Damascus Gate, one of the most ancient and important of all which exist in Jerusalem. Thus it is not merely from the fact that Nablous is north of the city that it has been concluded that the Damascus and Nablous Gates are identical. If it be so, the testimony of the Bordeaux Pilgrim is conclusive against Mr. Fergusson's views, since it is impossible that he could have referred to any other building except the traditional church.

3. The subterranean communication between the Temple and Siloam has, according to Mr. Fergusson, been discovered by Dr. Barclay and M. Pierotti. The former gentleman has discovered a great cistern under the Temple, and a communication between the upper and lower pools of Siloam, but has not found any other remains. With regard to the latter, it is, perhaps, not unfair to remind Mr. Fergusson that he himself stated that M. Pierotti has not established his right to be quoted as an authority.

Whatever communication may exist, the description of a rent in the rock near the altar of Mount Calvary is not by any means answered by the mouth of an artificial cistern, which is the only opening to be found within the Haram.

The crevice, or "crepatura," of which the Pilgrim speaks was in the Rock of Golgotha, in which the chapel was cut out; for, although there is no certain evidence that Calvary was really a hill, yet it is indubitable that it was considered to have been such in the Middle Ages. Accordingly, in such an eminence the church was hewn; and the fact that the whole of the Haram is one plain surface is again unfavourable to Mr. Fergusson's views. The traditional Chapel of Golgotha is built on a small hill, and part of it, known at present as the Chapel of Adam, is hewn in the rock itself, supposed to be just under the site of the erection of the cross. This crevice is said to be unfathomable, and to it the tradition in question might well have been attached, while it answers much better to the words of the writer than anything found in the Haram inclosure.

4. That the Basilica of Constantine was totally destroyed by Chosroës, the Persian, is admitted by Mr. Fergusson, who resorts to the hypothesis that the Church of the Anastasis was held in higher veneration by them than the basilica, and was left uninjured; but M. Vogüé has shown that the church and the basilica were parts of the same building, and, therefore, the whole of Constantine's buildings must have perished entirely. Mr. Fergusson says that they were restored to their pristine magnificence by Modestus, a simple monk; but this pious prelate was already superior of the Convent of Theodosia, and was afterwards made patriarch of Jerusalem. He was aided by John, the Almoner, patriarch of Alexandria, and the churches were raised through the permission of Chosroës, granted at the intercession of his Christian wife, the sister of the Emperor of the East, who in all probability lent her aid in their reconstruction. Even with these means Modestus was unable to rebuild the original church, and was content to replace it by four small chapels, connected by a wall. These are the buildings described by Arculphus, and of them also M. Vogüé has made careful restorations.

5. With regard to the Mohammedan house of prayer, it need only be remarked that the Mosque of Omar would contain three thousand people, and that it is much nearer to a square in shape than the Mosque El Aksah, an irregular building, capable of containing six or seven thousand, which would not therefore be naturally described as containing a number comparatively so small.

6. The smaller mosque, which Mr. Fergusson considers to be the only one erected in Jerusalem by Omar, is an ill-juited edifice (attached to the eastern wall of the Mosque El Aksah), which it may be remarked M. Vogüé has set down as evidently of much later date than any building of Omar's time. In the description of the finding of the sacrah, and the subsequent erection of the mosque, there is nothing which would not apply to the Dome of the Rock; there is nothing to show that the sacrah was subterranean, and much from which it may be inferred that it was not. In the smaller mosque of Omar, there exists no sacrah, and the vaults in which Mr. Fergusson supposes the sacred rock to be found do not traverse any part under the smaller building. Omar entered by the Gate of Mohamed, from which a vaulted passage leads to the upper level of the Haram, about half-way between El Aksah and the Dome of the Rock. This is the only natural entrance into the inclosure from the side of Zion; while the argument that the Church of the Holy Sepulchre must have been near the true site of the temple, is invalidated by the fact that the Church of Zion was also pointed out as the real site. Finally, it may be remarked, that the Dome of the Rock is quite as much in the temple as is the smaller mosque of Omar.

The history of the Church of the Holy Sepulchre is briefly this. St. Helena, an aged lady of eighty, firm in her confidence of the monks, discovered the true site of the cross through the confessions of a tortured Jew. Thus all arguments concerning the judicious choice of the site by Constantine, who was in Europe at the time, must be altogether laid aside. The church he erected was one, as has been proved by M. Vogüé: it was totally burnt by Chosroës, and was replaced by four small chapels by Modestus. Thus the writings of Arculphus do

not refer to any buildings of Constantine's, but only to later restorations.

There are two questions,—two distinct subjects,—which Mr. Fergusson has not separated. First, is the Dome of the Rock the true sepulchre? Secondly, is it the site of the holy sepulchre of Constantine? Concerning the first, it is impossible that the tomb should have been within the temple; concerning the second, the restorations of M. Vogüé leave hardly any doubt when coupled with the words of the Bordeaux Pilgrim.

Mr. Fergusson remarks that if a change in tradition he found, it is immaterial at what time that change took place; but if there is no evidence of a change at any time, and no break where the tradition is lost, it may be inferred that no change has taken place. Now, there is no evidence of any change either in the Christian traditions since the time of Constantine concerning the site of the holy sepulchre, or in the Mohammedan traditions concerning the site of the edifice erected by Omar; or, lastly, in the Jewish and Mussulman traditions of the extent of the ancient temple, and there is no time when such a change could have occurred. It may, therefore, be inferred that no such change has taken place, that the church of Constantine was on the site of the present church, the mosque of Omar on the same spot as the Dome of the Rock, and that the temple occupied the whole of the great platform of the Haram es Sherouf.

With regard to the descriptions of Eusebius, it must be remarked that Mr. Fergusson's plans do not in any way agree with them. In no passage is an octagonal chapel mentioned, or a separate basilica, or a chapel of Golgotha (which was built by Modestus); and the atrium of Eusebius is wanting in these plans altogether.

Finally, a few remarks may be made on the history of the Kubbet es Sacrah. Above the arches springing from the wooden entablature previously mentioned are inscriptions in Cufic characters, giving the date of its erection in the year of the Hegira 72, by the Caliph Abd [Allah El Mamoun]. The words in brackets are a falsification of a much later date, and the original inscription appears to have contained the name of Aïd El Malek. This inscription Mr. Fergusson lays aside, saying that the date may be falsified as well as the name, and ascribing the whole to the time of Saladin; but it is evident that El Mamoun's name is of later date than the rest of the inscription, for it is on a ground of blue of a different shade to the rest, and his full title, containing two more syllables than that of El Malck, is written in smaller letters crowded closely together. That it is earlier than Saladin is evident from other inscriptions stating that the original ones were restored by that monarch. The date is not falsified; and this is the most important part, for, coupled with the architecture and with the descriptions given by Arabian authors of Omar's mosque with the treasury Kubbet es Silsilieh,—the Dome of the Rock,—to the east of it, which was completed in the year 72 of the Hegira, would have been considered sufficient evidence of the date of the Dome of the Rock had not Mr. Fergusson brought forward his present theory.

There are two apparently conclusive arguments on the subject: one fixing the position of Constantine's building, the other the date of the Dome of the Rock. The first is the description of the Bordeaux Pilgrim; the second, the unfalsified date on the Kubbet es Sacrah.

As long as these two remain unanswered, Mr. Fergusson's theory must be considered as disproved. C. R. C.

MONUMENT TO THE LATE SIR JOSEPH PAXTON. A large number of noblemen and gentlemen have formed themselves into a committee, with the purpose of erecting a monument to the memory of Sir Joseph Paxton. Among the names are those of the Dukes of Devonshire and Sutherland, Earl Granville, Lord Palmerston, Lord Egerton of Tatton, the Speaker, Mr. Gladstone, Lord Elcho, Mr. S. Laing, Mr. A. H. Layard, Sir S. M. Peto, and of various artists, literary men, and others well known. They propose to open a general subscription-list; that the memorial shall be a marble statue, which might be placed on a chosen position in the English landscape garden of the Crystal Palace; and that the commission for the statue should be entrusted to Mr. Spence, of Rome, to whom Sir Joseph acted for his bust but a few months before his death. Mr. George Grove, of the Crystal Palace, is the secretary.

APPROPRIATION OF A DESIGN FOR THE PARIS EXHIBITION OF 1867.

In our number for February 16th, 1861, we published a design for an Exhibition Building, with suggestions for method of classifying the contents, submitted to us by Mr. G. Maw and Mr. Edward J. Payne, the main feature of which was the combination of a geographical and general classification; that is, that in one and the same arrangement objects relating to the same subject should be placed in juxtaposition, whilst the various products of the same locality should, as far as possible, also be contiguous.

The designers said,—  
 "It is proposed that the building should be circular, or of some form related to the circle, as the ellipse, although this is not essential to the system advocated; and that, instead of dividing it into courts, as in the Exhibition of 1851, by which a great loss of space was entailed, the spaces actually occupied by the objects shall be narrow blocks of the form indicated by a shading on three quarters of the diagram; these blocks being defined by a double system of intersecting avenues representing the lines of classification; one system distinguished by letters A, B, C, D, E, &c., radiating, which it is proposed to call the geographical lines, in juxtaposition with which objects from the same locality would be congregated. The specific system would be represented by the circumferential lines distinguished by figures, along which objects relating to kindred subjects would be arranged."

Supposing there are sixteen radiating or geographical avenues, they would provide thirty-two sides, or lines, of geographical classification; and supposing every place or country occupied by a single article, they would accommodate thirty-two geographical divisions; but, as each of these lines intersects thirty-four lines of specific classification, representing as many different branches of manufactures, it is evident that the whole length of each radial line will not be occupied by a single town or district, few places producing so great a variety of manufactures, but might be appropriated to six or seven distinct places that do not produce identical manufactures. Thus, Birmingham, producing glass and hardware, might share the same geographical line with Coventry, sending silks, Staffordshire Pottery, porcelain and enamels, cotton goods; each on the proper specific lines without interfering with any other. Again, it is improbable that the whole of one of the specific lines would be required for a single subject, and it might be divided into any number of parts to suit necessity; the only condition being that the whole of the towns or countries producing a particular manufacture shall be placed on the radial lines that are within the range of that part of the circle appropriated to it."

This design, the cleverness of which was admitted at the time, has been coolly appropriated by the French authorities, without one word of acknowledgment either to us or to the designers. "The proposed building for the coming Exhibition," says the *Siecle*,—

"Will have, as already mentioned, the form of a broad ellipse, and will be surrounded by a green sward to cover the whole extent of the Champ-de-Mars. In the centre of the building will be laid out a garden, from which will radiate nerves to the circumference; they being intersected by circular avenues running around the whole building. The radii from the centre will serve to distinguish the different countries, as each nation will have appropriated to it a number in proportion to its importance, while the circular passages will be devoted to products of the same kind. So that to examine the different productions of a country the visitor must pass from the centre to the circumference, or vice versa, while to examine the same products as manufactured by different states—silks for instance—he will only have to follow the circular avenue reserved for that article; he can thus pass in review the display of that kind of goods of all the different countries. As the circular passages become smaller by degrees as they approach the centre, the value of the objects and those which occupy the least space, will be contained in the inner circles, and the passages nearer the circumference will be reserved for the articles of greater bulk. Consequently, the works of art will occupy the first gallery around the garden; and the next will be reserved for artistic manufactures; then will come furniture, next the gallery devoted to articles of clothing, in silk, wool, linen, or cotton, and this will be successively followed by those of raw materials, instruments and modes of production, articles of food, &c."

Mr. Maw and Mr. Payne have made claim for recognition through Lord Cowley, who has kindly interfered for them, and will, we sincerely trust, for the sake of the French Commissioners, obtain it. A more complete plagiarism has been seldom seen.

WAGES IN PARIS.

The Paris stone-cutters having requested the syndical chamber of masonry contractors of the Seine to interfere between them and the contractors, with a view of obtaining a rise of salary and the abolition of task-work, the secretary to the chamber replied in a letter of the 28th ult., communicating its refusal to interfere. He, however, observes, that for the last twenty-five years an increase of wages of building operatives, and especially stone-cutters, has gradually and steadily been obtained without strikes, or the intervention of the syndical chambers, by force of free competition,—that is to say, of offer and demand. From 1840 to 1846 the mean price of the day's work of stone-cutters, was from 3*fr.* 75*c.* to 4*fr.*; in 1847, from 4*fr.* 25*c.* to 4*fr.* 50*c.*; from 1849 to 1856, it was 4*fr.* 50*c.*; in 1857, from

4*fr.* 50*c.* to 4*fr.* 75*c.*; from 1858 to 1860, from 4*fr.* 50*c.* to 5*fr.*; from 1861 to 1864, it was from 4*fr.* 75*c.* to 5*fr.*; lastly, from 1864 to this day the average is 5*fr.* 50*c.* Thus, within the space of twenty-five years the wages have increased more than 40 per cent. The profits of contractors are fixed in principle, in every branch of public works and buildings, at one-tenth of the actual outlay. Therefore the contractors' benefits are augmented according as the men's wages are increased. If then the contractors refuse the increase of wages demanded, it is only because they find it out of their power to augment them at this moment. When the proper time arrives it will take place of its own accord, as it has done during the last twenty-five years.

ROOFS ON THE SUSPENSION PRINCIPLE. SOCIETY OF CIVIL ENGINEERS OF FRANCE.

At a recent meeting M. Lehaitre brought forward a notice of the system of suspended roofing proposed by MM. Lehaitre and de Mondésir. It is very evident that it would be a great improvement to be able to cover large spaces, as market-places, railway stations, hippodromes, &c., without the use of intermediate supports, which represent a host of inconveniences. MM. Lehaitre and de Mondésir have sought the solution of the difficulty in the use of suspending cables.

The principal difficulties which attend the use of cables in suspension bridges completely disappear from their use for roofing. The strain they have to sustain being no longer variable, there is no fear of those oscillating movements which are so dangerous, and which considerably increase the cost of maintenance of the flooring. The roofing cables can always be made fast to open work inside the bearing walls.

MM. Lehaitre and de Mondésir compute approximately that such a structure might be erected at less than half the cost of ordinary market and assembly places. All the estimates would, of course, be lowered if, instead of zinc, freestone, and cast metal, there were employed bituminised pasteboard, and deal for the timber work.

M. Flachet also read, on the same topic, a paper entitled "Considerations on the Projects of Applying Metallic Suspension to Roofs of Large Span."

WELLS IN ALGIERS.

For the last four years the French Government has been actively occupied in the establishment of artesian wells in Algiers, principally in that part of the territory of the three provinces which borders on the desert, and where no water-courses exist.

In the province of Algiers, the borings, up to the end of 1864, have yielded three supplies of water, furnishing about 3,742,000 gallons to 3,962,000 gallons of spring water of great purity, in twenty-four hours, and it may be presumed that the works in progress since last year have doubled the amount.

In the province of Oran three wells have been sunk; that of the grand lake, near Oran, has already arrived at a depth of 389 yards; the second, at Mon-el-gue-touta, on the road from Tiarret to Laghouat, was suspended at the breaking-out of the last insurrection, but is shortly to be continued; the same is the case with the third boring, on the plain of Eghris, near Mascara, which was temporarily stopped at a depth of 280 yards.

The Constantine province has seen more successful than the other two in receiving water supply. Between Biskra and Tougourt forty-seven wells have been sunk, furnishing daily 19,299,000 gallons. At Tougourt and in the oasis twenty-four Arab wells have been completed, yielding for the irrigation of the gardens 1,100,000 gallons per day. Beyond this, towards the south, four wells give 124,360 gallons. Lastly, in the fertile plains of Hodua, celebrated during the dominion of the ancient Romans, for its magnificent cultivation, sixteen wells have been sunk, furnishing per day 1,813,000 gallons. Altogether there have been bored in the province of Constantine, up to the present day, ninety-one wells, furnishing daily 22,000,000 gallons allowed to flow freely over the surface. Some of these are of sufficient yield to irrigate large areas of

\* The Engineer contains a pretty full report of these papers.

cultivated land; but they happen to be situated in a part of the desert where European colonisation is impossible. Nevertheless, the principal end of the establishment of these sources is attained. The desert is perfectly joined to the province of Constantine: the ancient oases are enlivened and new ones created, to the great blessing of the populations.

RAILWAYS IN FRANCE.

The following is the actual state of railway communication in France as compiled from public documents:—From 1823 to the end of 1850, 2,100 miles of railway lines had been conceded; thence up to the end of 1864, 3,149 miles, or, in total, 12,417 miles definitely conceded up to the beginning of the present year. Adding to this 499 miles of lines decreed but not yet definitely conceded at the end of 1864, we have a total of 12,916 miles from 1823 to the end of 1864. Of this total length, 8,113 had been opened for traffic at the beginning of 1865, leaving 4,803 miles not yet constructed; seventy-three miles, however, from Guincamp to Brest (see *Builder*, 13th May, 1865, p. 343), have been added in April last, thus leaving only 4,730 miles to be constructed out of the number conceded up to 1st January, 1865.

Some of the *through speeds* of continental travelling, taken from the time-tables of different companies, are as follows:—Paris to Marseilles, 536 miles; evening express No. 3, in 16 h. 15 m., giving 35.05 miles per hour; express No. 5, in 19 h. 40 m., or 27.27 per hour; express No. 11, in 19 h. 15 m., or 27.86 per hour. Paris to Calais (mail to England), 203 miles in 5 h. 50 m., or 34.8 miles per hour. Paris to Strasbourg, 312 miles; express No. 1, in 10 h. 10 m., or 30.7 miles per hour; mail train, 10 h. 45 m., or 29.0 miles per hour. Paris to Cherbourg, 230½ miles; express in 10 h. 5 m., or 22.86 miles per hour. Paris to Brest, 387 miles; express in 16 h. 10 m., or 23.94 miles per hour. Paris to Rennes (part of Brest line), 231½ miles; express in 8 h. 15 m., or 28.06 per hour. Paris to Bordeaux, 361½ miles; express in 11 h. 30 m., or 31.6 per hour; mail in 10 h. 50 m., or 33.55 per hour. Paris to Frankfurt, 458 miles; express in 18 h. 20 m., or 24.95 per hour. *Through speeds* from London (including sea passage):—To Paris, 304 miles, in 10 h. 35 m., or 28.72 miles per hour. London to Bâle, 635 miles, in 25 h. 15 m. (including two hours' rest in Paris), or 25.14 miles per hour. London to Frankfurt (from 7.25 a.m. till 6.50 p.m. the next day), 762 miles, in 35 h. 25 m., or 21.5 miles per hour, including two hours' rest in Paris (from 6 till 8 p.m.).

RAILWAYS AS VIEWED BY NATIVE INDIANS.

The *Calcutta Engineers' Journal* prints the following translation of an anonymous petition addressed to the Government, as indicating from a native point of view some of the defects of our railways:—

"For the comfort and convenience of the people travelling on the old road, seras, with puras or plains attached to them, have been established at every stage; wells constructed, trees grown on the sides of the road; and chowkees, for the protection of the travellers, appointed, through the kind attention of the Government. Now, however, since the construction of railways in this country, the people, with a view to reach speedily the places of their destination, travel by rail, and have, therefore, deserted the old road which possesses all the advantages described above. Travelling by rail subjects the people to the following three kinds of inconvenience, viz.—

- 1st. That there is no well close to the station from which the travellers can drink water.
- 2ndly. That there is no seras adjacent to the station for the traveller to rest at night.
- 3rdly. That there is no purao or plain close to the station where travellers may cook their meals.

I therefore suggest that the same improvements may be made in the railway stations as have been done in the old roads for the comforts of the people.

The troubles and inconveniences to which the natives travelling by rail are subject may be removed in two ways:—

- 1st. The railway authorities should charge half an anna on every rupee above the usual

fare, and from this income they should have a well constructed at every third station, establish at the distance of every 200 miles a serae, and secure close to it a plain of two acres with some shoddy trees thereon.

2nd. A notice should be issued to the effect that those who may from virtue's sake be inclined to construct wells or establish seraes by the railway stations, shall apply to the railway authorities, who will pay every attention to such applications."

**DORCHESTER CORN EXCHANGE COMPETITION.**

COMPETITION designs for the Corn Exchange and Market, seven in number, were sent in under the following mottoes and devices, and in the following order, viz.—1. Fides. 2. Agate. 3. Experience and Economy. 4. Labor omnia Vincit. 5. Tbis. 6. Free Trade and Protection. 7. Espérance.

Several of the designs were well adapted to the purpose contemplated, and especially that of "Agate," in case a removal of the present Guildhall had been intended; but, as we learn from the town clerk, after a full consideration, the first premium of 21l. was awarded to design No. 6, prepared by Mr. H. Hall, of Duke-street, Adelphi; and the second, of 5l. 5s., to design No. 4, of which Mr. J. Jowett, the borough surveyor, is the author.

**KEIGHLEY TOWN HALL COMPETITION.**

The Board has awarded to Mr. Geo. R. Green, of London, the premium of 20l. for the best design for the town-hall; and to Messrs. Bulmer & Holton, of Dewsbury, the premium of 10l. for the second best design.

**SOUTHAMPTON NEW WORKHOUSE COMPETITION.**

A MEETING of the Southampton Board of Guardians was held on Monday last, at the present house, to select one of the plans submitted in competition. After considerable discussion, the design bearing the motto, "Fortuna Cetera Mando," was accepted, the author being Mr. A. Bidborough, of Southampton.

**THE MEAT AND POULTRY MARKET, SMITHFIELD, COMPETITION.**

The first premium of 300l. for the above was awarded to Messrs. Knightley & New, architects, of Cannon-street; and the second to Mr. Isaacs, of Vernelam-buildings.

An account of the designs was given by us some time ago.

**PROPOSED ST. THOMAS'S HOSPITAL, LAMBETH.**

The General Court of Governors have approved the design by Mr. Henry Currey for the new hospital, and instructed the committee to proceed with the working drawings and contracts. The Metropolitan Board of Works have let their contract for the Southern Embankment of the Thames to Mr. Webster, and a condition in that contract is that the hospital site is to be enclosed with a dry dam in nine months, when operations will be commenced. We recently gave some particulars of the design, but as we now lay before our readers the plans, and a geometrical view of the front next the Thames, it is desirable to repeat partly what we have already said, adding some further details. The pavilions, it will be seen, are placed at a distance of 125 ft. from each other, the centre court being increased to 200 ft. Corridors run the whole length of the hospital on the ground and one-pair stories, and connect the several blocks of wards or pavilions. These corridors are lighted by large windows on both sides; and, in the event of its being deemed necessary to isolate any particular block, it can be done by putting screens across the corridors and removing the sashes from the windows. These corridors are not carried higher than the one-pair story, but the flat roof over forms a means of communication to the several blocks on the two-pair story. The pavilions are placed at right angles to the corridor, from which a passage leads direct to the wards, and on one side of which is the staircase.

The wards are designed to be 28 ft. in width by 120 ft. in length, and 15 ft. in height, and will accommodate twenty-eight beds, giving a cubic capacity for each patient of 1,800 ft. The beds are placed at distances of 8 ft. from centre to centre, and the windows are arranged alternately with the beds, at a level, to enable a patient to look out of them. Small wards for two beds, immediately contiguous to, but not communicating with, the general wards, are provided in each block for the reception of special cases, which it may be deemed desirable to separate from the other patients. These wards also afford a cubic capacity of 1,800 ft. per bed, or of 3,600 ft. when used for a single patient. On the other side of the passage are placed the sisters' room, the ward kitchen, and a room for the medical officers' consultation. The well-holes of the staircases are occupied by large lifts and ventilating shafts.

The water-closets, lavatories, and bath-rooms attached to each ward, are projected from the main building, and are cut off from the ward by intercepting lobbies, with windows on both sides.

The main hospital may be said to commence on the first floor, and consists of three tiers of wards, there being four smaller wards provided on the ground-floor for the reception of accidents. The accommodation afforded is as follows:—

Ground story,	3 wards, 20 each	60
"	1 " 16	16
"	2 " 8	16
One-pair story,	5 " 28	140
"	1 " 16	16
"	6 " 2	12
"	2 " 8	16
Two-pair story,	5 " 28	140

"	6 " 2	12
Three-pair story	5 " 28	140
"	1 " 16	16
"	6 " 2	12
	Total	533

The general entrance to the hospital is placed in the centre, and will be approached from the Palace New-road. The entrance-hall is capacious, forming the sub-structure of the chapel. The steward's, or superintendent's offices, are placed immediately in front of the entrance-hall, so that everything passing in and out of the hospital will be under his supervision. From each side of the entrance-hall branch off the main corridors of communication, connecting all the different departments.

The ground-floor of the first pavilion, to the right, is appropriated to the kitchen department, as being as nearly central as possible. It comprises kitchen, scullery, and cooks' rooms, with larder, bread-room, &c., on the basement immediately under. A serving-place is provided where the patients' food would be distributed; it will then pass along the corridor to the different pavilions, and be conveyed up the small lifts to the several stories or wards.

The ground-floor of the first pavilion, to the left, is appropriated to the matron's department, with a commodious room for linen stores. The basement of this wing is appropriated for matron's extra stores, and for day and dining rooms for the Nightingale probationer nurses.

On the right of the entrance-hall is placed the principal staircase, which leads direct to the corridor on the one-pair story. It communicates directly with the resident medical officers' apartments, which are placed in the central block, and consist of sixteen rooms, including a common room and another for the use of the medical and surgical staff of the hospital, the exact position of which may be hereafter determined as convenience may dictate. Two operating theatres are provided, communicating with the corridors, of ample dimensions, to admit of a large attendance of pupils. A private room is attached to each theatre for the operator, with a second room in which a patient may be temporarily placed after an operation.

The dispensary and surgery are placed in the main corridor (the medicines and appliances being conveyed by the small lifts to the various wards), and the out-patients (who are more particularly referred to hereafter) are supplied from the opposite side. The laboratory, the drug examination, and store rooms, are placed in the basement story, immediately under the dispensary, and are approached from a staircase leading out of the dispensary; external entrances for the receipt of stores being also provided.

All applicants for relief at the hospital would enter at the covered porch in Palace New-road, near to Crosier-street, and would be received in one of the admission-rooms, according to sex. They would be then informed whether they

would be admitted into the hospital, or be treated as "casualty patients" or as "out-patients." If admitted, they would be passed through the hospital corridor to the wards.

The administration block is placed at the Westminster Bridge end, approached from the bridge. The one-pair story, which may be called the bridge level, is designed to provide entrance-hall and principal staircase, waiting-room, counting-house, receiver's room, strong-room, almoner's room, and a suite of unappropriated offices. On the next floor is provided the governors' hall and committee-room, with waiting-rooms, &c., the remainder of the block being appropriated to the treasurer's residence. A staircase leads direct from the treasurer's house to the main corridor of the hospital. The two lower stories of this block are appropriated as residences for three porters, and for the domestic offices of the treasurer's house. A kitchen is also provided for serving the diners to the governors' hall, without interference with the hospital kitchen. A fourth porter's residence is provided in the lower story of the extreme southernmost block.

Four houses are provided for the resident officers, containing eight rooms each, exclusive of domestic offices. They are approached from the Palace New-road, and communicate in the rear with the main corridors of the hospital.

The chapel, in the centre of the building, is designed to give 300 sittings. The museums, school buildings, lecture theatres, &c., are proposed to be placed at the southern end of the ground, but are not shown on the plans. The warming is intended to be effected by open fire-places, aided in cold weather by an auxiliary system of hot-water.

The building is to have fireproof floors throughout, formed with wrought and rolled iron joists, and concrete. The floors will be of oak, and the wall surfaces finished with Koenig's or Parian cement. The terrace towards the river is proposed to be kept 4 ft. above the public footway. This, with the height of the parapet (3 ft. 6 in.), will prevent any overlooking by the public.

The whole building, or rather pile of buildings, will probably be faced with stone, and the cost in that case is estimated at 360,000l.

PROPOSED ST. THOMASS HOSPITAL

OF ONE PAIR STORY.

GROUND STORY

FOOTWAY

RIVER THAMES

THE BUILDING TRADES.

A GENERAL meeting of the men on strike at Cubitt's firm, 400 in number, was held on Saturday, when resolutions of the delegates adopted on Friday evening for closing the strike, and also the decision of the firms to give the Old. Advance at once, were laid before the men. They were highly pleased with the result, and a resolution was unanimously passed to take in their tools on Monday morning, when they accordingly resumed work at the advance rate of wages of 7½d. per hour. About 400 men struck, and about 300 resumed work, the remainder having obtained employment elsewhere. The question as to an additional farthing per hour after six months' notice of course stands over in the meantime, as the masters have not yet agreed to that. Indeed, no official notices as to it have been given by the men to the masters, who have therefore postponed consideration of it in the meantime.

We may here state that we have received a letter from Mr. John Brien, on the part of the Painters' Advance of Wages Committee, reporting the progress made by the painters in their endeavour to obtain an advance; but, as it has already appeared in the daily papers, it is unnecessary for us to print it.

In Huddersfield, a new element has been brought into play for the settlement of differences between employers and workmen. The painters in that borough, who have been on strike since May, have memorialised the council of the local chamber of commerce to take the post of arbitrators, and to this request the council has consented, provided both employers and employed agree to the appointment, and resolve to abide by the decision which may be made. The masons in the same borough have been on strike for three months, and the masters have invited them to a meeting for the discussion of grievances.

The *Wolverhampton Chronicle* inserts a letter from a correspondent, who says—"I wish to give the public a specimen of the tyrannical and illegal manner in which the present strike is being conducted by the Bricklayers' Trade Union. Yesterday morning, a man whom I was employing, was coming from Coatsall to his work, when he was waylaid and stopped by two bricklayers of Tottenham. They took his valuables from him, and forced him to go to the railway station, when his fare was paid, and he was sent off to a distant town. The man was willing and content to remain at my work at high wages, but he is not permitted to do so."

The lamentable results of strikes are forcibly shown by the fact that the loss sustained in the iron trade by workmen in Staffordshire alone during the recent conflict between the masters and their hands is estimated at 500,000*l.*, the loss to the miners being 200,000*l.*, and to the men engaged in the manufacture of iron 300,000*l.* This is known, but there is a vast amount of collateral loss and consequent privation which can never be estimated.

The wood-turners and chair-makers of Lyons were struck for the suppression of a custom whereby a deduction of 3 francs a month was made from their wages for the carriage of their work home. Their wages are from 3*s.* 9*d.* to 5*s.* 6*d.* a day.

THE FALL OF WALL IN CHANDOS STREET.

AT the adjourned inquiry into the circumstances connected with the death of Andrew Dawson, the carpenter, who was killed by the falling of two houses in Chandos-street, previously alluded to, Mr. Dent, the surveyor appointed by the coroner to examine the site, and material, presented his report. After a careful investigation, in making which, he said, he had received assistance on the part of Mr. Howes, he could not assign any reason for the fall of the houses; and, looking to the evidence already given, he thought it would be most unwise to say that there had been any want of care on the part of those engaged on the houses. The coroner said that in an inquiry like this it was very important, both for the public benefit and for the information of those engaged about buildings, that all the circumstances of an accident should be fully sifted, in order to find out if any charge of negligence rested with any one. These inquiries were not mere matters of form; and if inquiry had spent much time in sifting this case, it would doubtless be effected by impressing on those who had charge of works the neces-

sity for providing for the public safety. The jury at once returned a unanimous verdict that deceased met his death accidentally. Mr. Lewis, who attended for Mr. Howes, the builder, stated that his client, though he had no legal liability, had made a present of 100*l.* to the widow, after paying her expenses.

FROM SCOTLAND.

*Arbroath.*—The Directors of the Arbroath Public Buildings Company have accepted tenders for the erection of the new hall, museum, &c., according to the complete plans formerly approved of. The plans as now matured, and about to be carried out, comprise a hall for public meetings, a museum, library, reading-room, and a saloon, which may be used as a supper-room, or for day or evening meetings not requiring the accommodation of large numbers. The whole is comprised in a rectangular block of buildings 148 ft. long and 50 ft. wide, placed with its end to the High-street. The principal entrance is in the centre, but with a side entrance at each end of the front. The hall is an apartment 90 ft. long, 46 ft. wide, and 30 ft. high, and, exclusive of the platform, will seat 800 persons. The hall will be lighted by four large windows on either side, and two on the west, or platform end. On the first-floor is the saloon, or smaller hall, 46 ft. long by 24 ft. wide, and 20 ft. high. This room extends along the High-street front, and is lighted by five large windows to the street, and will form an assembly-room for ordinary meetings. On occasion of the large hall being used for halls, this would form the supper-room. Behind this room are three apartments for ladies' and gentlemen's rooms. Up another flight of the stairs is the museum, which extends to a length of 90 ft., and, by an adaptation of the Mansard roof, it will be divided into a series of bays or recesses along the sides, corresponding to the main copings of the roof, each recess being lighted up by a window, while the centre avenue of the Museum is lighted by three cupolas from above, and a triplet window in the west gable. The front to the High-street presents two stories in height, the doorway being recessed in the centre between Doric columns, with two windows on each side. The whole front is to be of polished ashlar work, with plate-glass windows. The architect is Mr. James MacLaren, Dundee; and Mr. William Scott, Arbroath, is the contractor for the mason work; Mr. James Welsh, writer; Mr. A. Wishart, Friochein, slater; and Mr. D. Batchelor, Arbroath, plumber. The total amount of the contract is about 3,460*l.*

PROVINCIAL NEWS.

*Romsey, Hants.*—At a meeting of the Romsey Board of Guardians, held on Monday last, Mr. Bidborough, architect, attended with a design for the proposed new chapel for the use of the inmates, and which was approved and adopted. The building will be commenced immediately.

*Plymouth.*—The new convent in Wyndham-street has been completed. The building has been erected at a cost of 5,000*l.*, defrayed by the lady superior of the community of Notre Dame. Mr. Joseph Hansom was the architect, and Messrs. Hallett & Jenkin were the contractors.

*Walsall.*—The foundation-stone of the new town-hall, Walsall, has been laid. The new edifice will be the third town-hall erected on the same site: it will cover the same area as the old one, but a much greater accommodation is afforded. The style is Italian, the chief façade being a composition based upon a study of the Doric and Ionic orders. The lower part is Doric, raised upon a rusticated and vermiculated plinth, and presents a centre slightly recessed, with two corresponding wings. The centre is flanked with three-quarter columns, and the wings with tripled pilasters of the same order, supporting an entablature, the whole to be executed in stone. A mezzanine story has been introduced. The walling throughout is rusticated, and also the arches to the windows. The superior order is Ionic, forming an arcade in connexion with the wings of the five arches, the walling being executed in red brickwork. The main columns and pilasters are crowned with clusters of fruit and flowers, and so also are the arcade columns. The archivolts of the windows have moulded keystones, enriched with festoons of fruit and flowers. A niche will receive the statue of Justice from the old town-hall, and

above it will be the borough arms. The façade forming the Goodhall-street front is of the same character, to the extent of an arcade of three compartments: the remainder corresponds with the Free Library, which it is proposed at some future time to connect. The basement is occupied by thirteen cells, stores, heating apparatus, exercise yard, &c. The ground-floor comprises the court-room, witness-room, and the inland revenue office, the mezzanine floor being arranged for the grand jury room; the upper floor comprising the town council room, mayor's private room, town clerk's room, &c. The corporation offices comprise the weights and measures room, police offices, surveyor's offices, &c. The design is the production of Mr. G. B. Nichols, architect, West Bromwich, who designed the Free Library. For the buildings, which will cost 5,083*l.* Mr. Burckett, of Wolverhampton, is the contractor, and they will be erected under the superintendence of the architect.

*Miscellaneous.*—The Duchess of Leeds has just laid the foundation stones of two orphanages at Pennybridge and Bletchingly, near Mayfield. The buildings will contain accommodation for 100 boys and the same number of girls. They are both in the Gothic style, and have been designed by Mr. E. Welby Pugin. The children who are received in these institutions will be provided for by her grace until they have been taught a trade. The cost of the buildings and endowment is estimated at about 70,000*l.*

CHURCH-BUILDING NEWS.

*Hortford.*—It has been determined, on plans prepared by Messrs. Smith & Son, architects, that the present pews in the area of All Saints' Church shall be removed, and replaced by seats erected on one uniform plan, and fittings, at a cost of 900*l.*; and that one-third of the whole number be free and unappropriated.

*Godalming.*—The foundation stone of a new district church to be erected at Munstead has been laid. The church will cost about 3,000*l.*, and we believe the cost of erection will be paid out of the Busbridge estate. Mr. Scott is the architect; and Messrs. Moon & Son, Guildford, are the contractors.

*Freemantle.*—Christ Church, Freemantle, which has just been completed, so far as the funds in hand will permit, has also been consecrated by the Bishop of Winchester. It is composed of a chancel, nave, and north and south aisles and transepts. The exterior is of stone, with Bath stone and red brick dressings; and the interior of white brick, with red brick square piers, arches, and dressings, the capitals being of moulded Bath stone, one being carved with a lily, as a pattern, we suppose, for the decoration of all when funds shall be forthcoming. The roofs are open, of plain deal, and the benches of stained deal. The windows imitate the Decorated as nearly as any of the recognised styles of Gothic ecclesiastical architecture; but the heads present a heavy appearance, and there are no mouldings. The west window in the south aisle is a double lancet light, with a quatrefoil head, having, in stained glass, the Agnus Dei, the lights containing two figures with the text, "I am the Good Shepherd," and "Behold I stand at the door and knock." On each side of the south aisle entrance-porch are two small double lancet windows, containing the figures of St. James, St. John, St. Peter, and St. Andrew. At the end of this aisle, behind the seating of the choir in the chancel, is a double-light memorial window with a sexfoiled head, containing the representation of an angel ascending, with a babe in its arms. The lights have a series of figures, with the text, "Suffer little children to come unto me." There are six clerestory windows, three of a similar pattern on each side. The gas pendants, which are painted blue, hang from the centre of each arch. Seatings are provided for 900 persons.

*Rochford (near Tenbury, Worcestershire).*—St. Michael's Church, Rochford, has been reopened. The edifice has been restored, enlarged, and refitted. Mr. Cutzon, of London, was the architect; Mr. H. Hewitt, of Tenbury, the carpenter; and Mr. G. Page, of the same place, executed the masonry. The church, which is chiefly of Norman work, and dated about 1150, is very small, and has a nave and chancel only, the chancel being separated from the nave by an ornamented arch. The old plaster ceiling has been removed, and in its stead a light open roof now presents itself. The western gallery has been taken away, and the nave extended

some 10 ft. westward, by means of which many additional sittings have been secured, and the church will now accommodate about 170 persons. A new plain glass window has also been placed at the west end. A new open-timbered porch of oak has been erected over the south doorway, and a new timbered bell-turret for two bells has also been erected at the east end, the turret being surmounted by a shingled spirelet. The chancel roof has been renovated and boarded underneath the timbers. In the east wall of the chancel a new window of stained glass has been inserted. The subject is the Nativity of Christ, by Messrs. Morris, Marshall, & Faulkner, of London, and was presented by Mr. Clarke, of Enfield, in memory of his deceased wife. A smaller stained-glass memorial window has been inserted in the south side: subject, St. John the Baptist; executed by Messrs. Heaton, Butler, & Bayne. The old pews are replaced by new seating. The sandstone used was procured from an adjacent quarry, and presented by the vicar; and the woodwork internally consists of stained deal, varnished. The cost of the restoration will be nearly 700l.

*Defford (Worcestershire).*—A new chancel has been added to the church of this place, at a cost of 250l., including a vestry. Messrs. Collins & Collis, of Tewkesbury, were the contractors, and Mr. Snellgrove clerk of the works. The new chancel gives 2 ft. or 3 ft. more length to the building. The old east window—a Perpendicular, three lights—has been reinserted, and one of the old lancets in the north wall, the other windows being all new work. An open timber roof has been furnished to the chancel, and a pointed arch separates it from the nave, supported on dwarf marble shafts, resting on carved corbels. Open seats have been furnished for the chancel and upper part of the nave, and the floor laid with encaustic tiles.

*Pattingham (Salop).*—The parish church, which has for some time past been undergoing repairs and enlargement, under the direction of Mr. Scott, has been re-opened. For the old roof of the nave has been substituted a high-pitched open roof, covered with tiles. In the south aisle, besides the addition of the porch, the roof has been reconstructed; and the side and west windows filled with tracery corresponding in style with that at the east end, which is a four-light. The old stonework throughout has been repaired. The fittings are new, the seats being of the elbow pattern, without doors. The pulpit is partly of Caen stone, and partly of oak, with perforated panels and tracing. In the centre of the base is an octagonal shaft of Derbyshire marble. The aisles are paved with plain red and black quarry tiles, and a system of warming has been introduced. The peal of bells has been re-adjusted, and in part recast, by Messrs. Mears. The whole of the works have been performed by Messrs. G. & F. Higham, builders, Wolverhampton, who were selected without competition.

*Boss.*—Another advance towards the complete restoration of the church has recently been made by refilling three of the windows of the north aisle with tracery. These windows are of two lights each, and are of Early Geometric character. Early in the present century, the mullions and tracery were knocked out of these windows, the lower part built up with masonry, and the aperture thus formed glazed with square panes of clear glass, fixed to iron bars, a mode of restoration which seems to have commended itself so strongly to the parish authorities, that it was unhappily extended to the greater part of the windows in the church. It is fortunate, however, that some small pieces of the mullions and mouldings were left embedded in the wall, as these have been sufficient to give a clue to the original design, and to show that this part of the church must have been built during the latter part of the thirteenth century, in the time of Henry III. or Edward I. The cost has been defrayed by a parishioner, whose name has been withheld, and the work has been executed by Messrs. Pearson & Son, from the designs of Mr. E. Purchas, of London, architect.

*Dulas (Herefordshire).*—The chief stone of a new church has been laid at Dulas, near Pontriilas, at the cost of Col. Feilden. The new church is to be erected on an elevated site, immediately parallel with that of the old one, and about one hundred yards distant. It will be built of local stone, with random rubble workings and Bath stone dressings. There will be an open Memel roof, covered with stone tiles. The church will consist of a porch, nave, chancel, and sacristy; and accommodation will be provided for eighty persons. The seats will be free. Oak stalls

will be placed in the chancel for the choir, and there will also be an altar-table and a moveable rail of the same material. It is intended to have an archway between the chancel and the sacristy in which an organ can be placed; and underneath the sacristy will be a heating chamber for warming the edifice by hot-water pipes. The church will be paved with Godwin's encaustic tiles, and the whole of the interior finished with hammer-dressed stone. The roof will be plastered between the rafters, excepting that portion over the sacristy, which is to be distinguished by a carved principal with a horder of waggon shape on the under side. There will be a bell gable over the chancel arch for one bell. The east window is to be a three-light, and the west window a rose, placed over two small lancets. The windows on the north side of the nave are to be triplets, and those on the south side lancets. The whole character of the church will be Early English—plain and simple in detail. It is intended to restore and adapt some of the furniture of the old church. The font, too, which is Norman, will be restored and used in the new church. The cost of the work will be about 1,000l. Messrs. Elmick, Francey, & Haddon, of Hereford, are the architects, and Mr. Thomas Sautler, the builder.

*Wismar (Herefordshire).*—The church here has been restored and re-opened. The chancel has been re-arranged, and the altar-table raised and furnished with cross and lights. Some colour is given by wall-hangings. The chancel-arch is new. Mr. G. Bodley, of London, was the architect; and Mr. Mansfield the contractor. The cost of the restoration will be met by a loan of 500l., borrowed on the security of rates payable in twenty-four years, and by voluntary contribution.

*Melins (Pembrokeshire).*—The new church here has just been re-opened by the Bishop of St. David's. It is built on the same site as the old one, in a very secluded valley, from the designs of Mr. Withers, architect. The fabric consists of a nave 31 ft. by 17 ft. 9 in.; chancel, with an apsidal end, 20 ft. 4 in. by 14 ft. 6 in.; vestry and south porch, with a small bell gable over west end of nave. The material employed is the local limestone, with Box ground stone dressings. Quebec red pine is used throughout for all carpenters' and joiners' work, simply varnished. The style adopted is Geometrical Decorated. Sittings are provided for ninety adults, and the cost is about 500l. The builder was Mr. Hughes, of Newport, Pembrokeshire.

*Chester.*—The Lady Chapel in the cathedral, which has been closed during the last six weeks (or lower part of the east wall), is now re-opened to the public. The mosaic has been executed by Messrs. Heaton, Butler, & Bayne, of London, under the direction of Mr. A. W. Blomfield, architect. It is 20 ft. long and 7 ft. high, and is supposed to contain nearly a million pieces of small squares of gold and enamel. The subjects (all on gold grounds) are the "Salutation," the "Annunciation," the "Birth," "Adoration," and "Flight into Egypt." The arms of the scene are in the lower centre panel, but these will in time be hidden by the altar.

*Altrincham (Cheshire).*—The new district church of St. John, Altrincham, has just been begun. The site is the plot of land between the east end of the schools known as St. Margaret's, near the Bowdon Station and the Ashley-road. Accommodation is provided for about 950 persons, all of whom, except a few in a small gallery over the western porch, will be seated on the ground-floor. The plan consists of a broad nave of five bays, with north and south aisles, north and south transepts, and a large western porch; adjoining which, on the north, is the baptistery, which is marked off from the north aisle by a small triple arcade. On the south of this porch is the steeple. The chancel is of large dimensions, and terminates apsidally to the east. The seats are all open benches, with sloping seat-boards and backs. Places for hats, umbrellas, and books are provided. The arcades between the nave and aisles are of four arches each, of such width that there are considerably fewer pillars than usual for so large a church. The western gallery is not large, and comes over the porch, so that very few sittings are below it. It is so arranged that it shall not mutilate any window, arch, or other feature. The stairs to it are of stone, and the lower part of the halnstrade is screened from sight from below. The style is Early Decorated. The material is stone, of three or four kinds for the outside, and for the pillars and other similar features inside. The contract

has been taken by Mr. Joseph Thompson, of Manchester, who is proceeding with the work under the direction of the architect, Mr. J. Medland Taylor, of Manchester.

*Blackpool (Lancashire).*—The foundation-stone of Christ Church, Blackpool, has been laid. Sittings for about 1,050 persons will be provided in the new edifice, the contract for which has been taken by Messrs. Knowles & Braithwaite for 3,450l., which includes the steeple and all the fittings complete. There is a broad nave with north and south aisles of two bays only, gabled transversely as a transept; a chancel, also with north and south aisles, the former of which is the vestry, and the latter the organ-chamber. At the western end of the nave is a porch with a wide double door. At the north-west corner is the tower, the basement of which serves as a north porch and as a staircase to the west gallery, which extends over the west porch. At the south-west corner is the baptistery. There are also galleries which do not project into the nave in the north and south nave aisles. Six external doors give ingress to and egress from the church, and the positions of these entrances are so arranged as that in stormy weather the doors to leeward only need be opened. A central and two side tiled passages up the nave give access to the seats, which are all open benches with sloping backs and seat-boards. The style of the church is Early Decorated. The walls are being built chiefly of red brick, with a facing of split granite boulders, and with windows and other dressings of Longridge stone. The east and west ends are lighted respectively by five and four light traceried windows. Elsewhere there are a circular rose window, several two-light traceried windows, and others lancets, single, or in pairs, and groups. The steeple has in its upper stage a belfry for six bells, and is covered with a steep-pitched quadrilateral slated roof. The church was designed by, and is being carried out under the superintendence of, Mr. J. Medland Taylor, of Manchester.

#### DISSENTING CHURCH-BUILDING NEWS.

*Worcester.*—The foundation stone of the new Presbyterian Church to be erected in Castle-street (Salt-lane), in this city, has been laid. The church will be in the Geometrical style. The principal front will have a central gable, five-light window with head tracery, and on the eastern side there will be a tower and spire rising to the height of 110 ft. The area of the floor will be 62 ft. 6 in. by 42 ft. 4 in., and the space will accommodate 460 adults, the galleries 180 adults and 140 children, making a total of 780 persons. At the south end there will be an apsidal recess for the platform and communion, and in the rear of the edifice a lecture-room and vestry. The architect is Mr. Bidlake, Wolverhampton; and the builders are Messrs. Wood & Sons, of this city.

*Chester.*—The Queen-street Congregational Chapel has been re-opened, after having been closed for thirteen weeks, for the purpose of cleaning and enlargement. A large recess has been erected behind the pulpit, over two new vestries, and approached by a short flight of stairs from the door of the deacon's vestry. A new organ is placed in the recess, which affords seats for a choir of twelve or fourteen persons. An arch, with cornice, surmounts this recess. The walls of the chapel, the ceiling, and the front of the gallery are painted French grey, tinted with a somewhat darker shade, and relieved in all mouldings with dead gold. The pews are of grained oak, the pillars are bronzed with annulets of gold, as also those supporting the pulpit. The lighting is by one central and four lesser corner stars. Mr. T. Lockwood, of Chester, was the architect employed.

*Scarborough.*—The new Congregational Church, South Cliff, Scarborough, has been opened. The site, valued at 1,200l., was presented by Mr. Titus Salt, of Saltaire. The contract was entered into at the end of May, 1864, and although a total suspension of the work for a month, in consequence of a strike amongst the workpeople, took place soon after the building was commenced, the whole has been completed under fourteen months. The church, which stands in a very prominent position upon the South Cliff—exactly at the junction of several roads, and upon the highest point of the ground,—is in the Early Decorated style of Gothic architecture. It is built with nave, side aisles, and transepts, with an organ chapel as a continuation of the nave. At the south-east corner is placed the tower and

spire, 175 ft. in height. The side windows are three-light, filled with Geometrical tracery, deeply recessed, with shafts and carved capitals. The transcripts are carried on the same height as the nave. The gables are finished with crocketed pinnacles. The transept windows are five-lights, filled in with moulded tracery. At the north end of the church are placed the vestries. These lower buildings are symmetrically grouped, and connected by an arcade with shafts and carved capitals. The benches are low and open. The roof timbers are exposed, and all the woodwork is stained and varnished. A small gallery over the entrance forms the only interruption to the perspective of the interior, with its moulded stone arches, and circular columns with carved capitals. The church is lighted by large coronas, suspended from the roof principals, decorated in colour, and by standard lights in the aisles corresponding with them. The circular windows at each end of the church, the clerestory windows, and the large transept windows, are filled with stained glass of Geometrical design. The church has been erected from the designs, and carried out under the superintendence, of Messrs. Lockwood & Mawson, of Bradford and London. The white stone is from Bolton's Whitty quarries. The stained glass has been supplied by Messrs. Wailes, of Newcastle; and the gas-fittings by Messrs. Skidmore, of Coventry. Mr. J. Barry, of Scarborough, was the contractor for the whole works; and Mr. Johnstone, clerk of works.

SCHOOL-BUILDING NEWS.

**Highbury.**—The chief stone of Highbury Wesleyan Chapel Schools has been laid, on a piece of ground adjoining the chapel, Holloway-road. Mr. Henshaw is the contractor for the work, and Mr. Quilter the architect.

**Heybridge (Essex).**—Mr. Walter Waring has given to this parish a school-house, as a memorial of his father, who for thirty-six years filled the office of vicar. The building is designed by Mr. W. Adams, of Maldon, architect; will be built of ornamental brickwork; and will be called St. Andrew's School, from the name of the church opposite to which it will be erected.

THE IRON TIES, CHICHESTER CATHEDRAL.

**Sir,**—In your notice of Chichester Cathedral, I observe that you remark that, in rebuilding, "iron bars tie the four arches of the tower together at the springing."

It was the very sagacious remark of Vignola, so long ago as the sixteenth century, "*Che le fabbriche non si hanno da sostenere colle stringhe?*" a truly golden sentence.

I believe that to be a sound maxim, well worthy of the attention of every architect. I apprehend that the old builders would have scorned to erect masonry that needed iron ties to keep it together. Such ties may be all very well when an existing defect has to be counteracted, but to build new masonry in such a way as to need tying, is to act like the Chinese tailor who copied the patches in a European coat, thinking them part of the original tailor's work.

We all know that the spire of St. Bride's Church was nearly overturned by the explosion of iron ties used in its construction. A. Z.

LEAD PIPES.

I beg to call the attention of your readers to the regulations of the New River Company, in respect to the supply of water, which say that the pipe must be of lead. Now their own pipes are iron; and, there is an old adage, that what is good for the big goose cannot be so bad for the little gander. I have had my own pipes stolen twice, and am still compelled to fix lead again.

As this important monopoly supplies a large part of the city of London, it is quite necessary it should be perfectly understood that when you patronise the New River, you are bound to swallow a certain amount of lead with the draught that not inebriates but slowly poisons. I should certainly think that such a monstrous regulation as that is a fit subject for the consideration of the Board of Works.

I beg to add, cases of lead-poisoning can be detected by the blue appearance of the gums immediately next to the teeth.

LEX TALIONS.

CREMONA VIOLINS.

THE recollection of more than one interesting article in the *Builder* on the violin induces me to think that a suggestion for the improvement of the tones of violins may not be inadmissible to your columns. A friend of mine, who is an enthusiast in all that regards music, and amongst his numerous musical instruments has two Cremona violins, tells me that every peculiarity of the Cremona, with one exception, has been imitated, but without the obtaining of the fine tones for which Cremonas are celebrated. That one exception is in the varnish, a peculiarity of which is that it has not a resinous smell when heated, as other violin varnishes have.

Now a little reflection on the subject leads me to think that this last peculiarity of the Cremona violins may also be imitable; and in this way. It is a notable circumstance that frequently, after a violin has been played on, the resinous particles which fall from the bow arrange themselves on the violin in symmetrical curves, reminding one of similar curves in electrical or electro-magnetic experiments. Indeed, the friction of the bow upon the strings must, to a certain extent, develop electricity; and the connexion of electricity with sound is very obvious. Not only is the electric spark always accompanied by its own special sound, but we know that the most tremendous sounds ever heard by human ears are electrical: such is thunder or the sound of lightning.

May not the musical sounds of the violin, then, be to some small extent electrical? and may not the superiority of Cremona violins consist simply in this, that the varnish is not resinous but vitreous?

The electricities, positive and negative, themselves, by the way, used to be called the vitreous and the resinous electricity; and it was in the resinous amber, as every one knows, that electricity first of all was evoked and noticed by man as a special agency.

My suggestion, then, is, that the varnish of Cremona violins may be a flint varnish, composed of oil of flints, silicate of soda or of potash, or water-glass.

That a vitreous varnish will improve musical sounds there was evidence lately given in the *Builder* itself, where it was stated, in an article on church bells, that a peculiar mellowness of the tone of old bells was produced by the oxidation of the surface of the metal, forming a sort of glassy crust over it. Glass insulators, too, are said to improve the tones of pianos.

Not having either time or inclination to experiment on my suggestion, I present it to the public through the columns of the *Builder*, with this proviso, that should some one hereafter discover that a vitreous varnish produces a fine tone in violins, I shall be entitled to claim the suggestion as one that was first published in the *Builder*.

It is one, moreover, which leads to others, such as the probability that certain insulating materials, used where the fingers touch both violin and bow, and where the violin rests on the shoulder, may still further improve the tones of this favourite instrument. J. E. DOVE.

P.S.—Should any one experiment on the subject, it is to be hoped he will inform you of the result.

"RAIN GAUGES."

IN my former communication on this subject there is an obvious error. Instead of the cost of a rain-gauge being put down at fifteen shillings, it should be fifty shillings.

Already the effects of an inadequate water supply are being felt. Several manufactories and workshops in Lancashire are at a stand, and numbers of operatives out of work.

JOSEPH BRIERLEY.

"DIOCESAN ARCHITECTS."

**Sir,**—I wish some of your correspondents would inform us under what circumstances, and by what recommendation, the various gentlemen so styling themselves have been appointed. What powers have they really, and who gave them those powers? When this has been done, I may, perhaps, be led to state my own experience, in two or three cases, showing the result of these appointments (?) to the gentlemen so named, and to architects about them: to make evident, in fact, how "diocesan architects" affect architects of the diocese.

A CHURCH MOUSE.

HOLY TRINITY CHURCH, EDINBURGH.

**Sir,**—Upon reading your paper on "Edinburgh," and the account you there give us of the Church of the Holy Trinity, and the doings of the corporation of that city in relation thereto, the thought occurred to me that it might be practicable for some other community to secure so fine a sample of Mediaeval architecture to themselves and re-erect it in one of the many populous districts where church accommodation is so much and so loudly called for.

The cost of doing so would, of course, somewhat depend on the price to be paid for the stones in the first instance, and the greater or less distance to which they would then be removed; but, presuming the materials to be in a tolerably fair state of preservation, I should say that the expense of putting them together would not be equal to that entailed in constructing a far less commodious and less beautiful church. But, even if the cost of carrying out this suggestion should rather exceed the ordinary limits, we should be enabled to rejoice in the preservation of a very fine building for God's worship and our spiritual good in a time when money is too often little considered in other quarters and in the advancement of other ends.

ROBT. F. H.

LINCOLN'S INN FIELDS AND THE THOROUGHFARES.

IT was my intention to have directed your attention to this subject, but the letter from your correspondent "J. W." renders it now almost unnecessary. Beautiful and noble as are the "Fields," they are comparatively inaccessible to carriages: they can be reached from the West-end only by way of a very narrow thoroughfare—Duke-street—which terminates in a low and still narrower archway, under the Roman Catholic parsonage-house. Neither Duke-street nor the eastern end of Great Queen-street will be wide enough for the increased traffic when the new law-courts shall have been erected, and I was therefore sanguine enough to hope that the cutting through of Gate-street into Holborn was about to become a reality when the site at right angles to Messrs. Day's premises was cleared last year. I hear, indeed, that the site was offered as a free gift by Messrs. Day for this purpose, but that the Society of Lincoln's-inn was against the project. Nobody will blame Messrs. Day for utilising a site which the authorities have refused to accept. Oh, for a little of M. Hansmann's power! How good a little judicious use of it would be in London.

AN IMITATOR OF THE "FIELDS."

PEACE JUBILEE! ANGLO-FRENCH EXHIBITION.

**Sir,**—In the name, and on behalf of a committee of fifty workmen, who have spent much time and money in the promotion of a public undertaking, I respectfully ask your aid in making known the following. The "Golden Wedding" between Franco and England is to be celebrated in two ways. In the channel, in iron war vessels, amidst noise and smoke, with all the "pomp and circumstance of war," one Peace Jubilee (?) is to be held. The other will be at Sydenham, in the loveliest building in the world, where about a thousand skilled workmen are organising a display of the fruits of peaceful labour in honour of the same event. Here are thus to be reviews both of instruments of destruction and implements of production. If the first is appropriate and fitting to the occasion, we venture to think the second is not altogether inappropriate. Instead of going to war for an idea, a French and English committee of working men have, upon this occasion, gone to work for one—and that idea is, "From this time forward, Peace!"

A report has gone abroad which has been very injurious to us. It has been said that the Peace Jubilee at the Crystal Palace is a commercial speculation on the part of the company: an autumnal attraction, a sort of supplementary holiday. Allow me, sir, most emphatically to state that this is not the case. The Anglo-French Exhibition was begun, has been continued, and will be ended, without prompting or extraneous assistance, by men who are, in the usual and general acceptance of the term, working men. From their own pockets have the committee paid all preliminary expenses; and,

beyond a canvass for wealthy names to a guarantee fund—which has been very successful—patronage of every kind has been courteously and firmly declined. The Crystal Palace Company have let us a space, and in matters of detail have been most obliging; but our relations are strictly those of landlord and tenant.

Now, sir, we are anxious to see if the public will ratify the steps taken by the French and English committees, and, by coming to see our display, relieve us from a heavy responsibility. The exhibition will be opened on Monday, the 7th of August; and, without disrespect to the members of any class, we intend to open it ourselves. The English committee, with delegates from Paris, Lyons, Nantes, Rouen, and other French towns, will formally open the portion of the Crystal Palace containing the display at noon on the day named. We shall feel honoured to see public men of all parties present, and gentlemen are respectfully requested to send their cards in at once. Trusting that our efforts in the direction of self-reliance will not be misinterpreted, and that you will forgive the length of this intrusion, I would only add that we are still receiving goods for exhibition.

ROBERT CONINGSBY,  
Secretary, English Committee.

#### ESSEX ARCHEOLOGICAL SOCIETY.

The annual meeting and excursion of this society took place at Ingatstone. The Rev. L. Parkin read a paper on Mediaeval Brickwork in reference chiefly to the Tower of Ingatstone Church; and the Rev. L. Cutts followed up this paper with a description of many of the drawings on the walls of old works in brick. The members then visited the church, where a paper was read by the Rev. Mr. Parkin, on the building; and the Rev. Canon Last in the interior gave an explanatory statement as to the tombs of the Petre family. Omnibuses and other vehicles then conveyed the party to the Hall, the original seat of the Petres, as also the Roman Catholic Chapel, and a curious priest's hiding-place. The next point visited was Thoby Priory, at Mountnessing, now the seat of Mr. Vickerman, where the old monastic remains were inspected, and also some ancient coffins dug up on the domain. The party next proceeded to Blackmore church, where on the ground floor of the curious belfry the Rev. Mr. Spurrell read notes on Blackmore Church. Jericho Honse, close by, described in olden records as one of the houses of pleasure of Henry VIII., was explored, though the opinion was expressed that the present building is not the same as honsed that monarch. Pursuing the tour, a short halt was made at Fryerning Church; and the party then proceeded to the Hyde, at Ingatstone, the seat of Mr. E. Disney, and rich in paintings. The last visit paid was to the curious little church of Margaretting, where the Rev. Mr. Spurrell read notes on Margaretting Church. The party then returned to Ingatstone, and closed the proceedings by dining together.

#### HOUSES FOR THE WORKING CLASSES.

The Peabody trustees purchased the site of a pile of buildings known as Ward's-place, Essex-road, Islington, at that time densely occupied. The old houses were levelled, and the erection of a large structure, which is now rapidly approaching completion, was forthwith commenced. The building is constructed of brick, and is from a design by Mr. E. A. Darbishire, the builders being Messrs. Patman & Fotheringham, who, we are able to say from personal inspection, have executed the work exceedingly well. The buildings consist of four blocks of houses five stories in height, which will be let out in tenements of one, two, and three rooms, at an estimated rental of 2s., 3s., and 5s. per week respectively. Each block will afford accommodation for sixty families, or 240 in the aggregate. The attic of each block is paved with tiles from the Isle of Wight. There is also accommodation for washing, drying, &c., and at each end of the building is a cistern capable of containing 1,750 gallons of water. Everything has been done to render the sanitary arrangements complete in every respect. It is contemplated to erect workshops for the accommodation of the tenants on the east side of the blocks.

#### THE BUILDERS' BENEVOLENT INSTITUTION.

THE eighteenth annual general meeting of the subscribers and friends of the above Institution was held at the London Tavern on Thursday, the 27th ult., for the purpose of receiving the report for the past year, to elect the president and other officers for the year ensuing, and other matters connected with the welfare of the Institution. Mr. Thomas C. Lucas, the president, occupied the chair.

Mr. Harris (the secretary) read the following report:—

"The events of the past twelve months presenting no particular feature of interest to communicate to the friends and supporters of the Builders' Benevolent Institution, the directors content themselves in this report with assuring them that the interests of the charity are progressive and satisfactory. Two elections of pensioners have been held since the last report; the first in November, 1864, when 2 males and 1 female were elected from a list of 9 candidates; the other in May, 1865, at which 4 more were added to the number—3 males and 1 female—from a list of 11 candidates: total, 7 pensioners. The number of recipients is now 40—21 males and 19 females; and the amount paid to pensioners since the commencement of the Institution in 1847 to the present time is 9,814l. 3s. 4d. The directors have the satisfaction of stating that there is an increase in the annual subscriptions of 26l. 5s. 6d., and 859l. 7s. 8d. stock has been purchased in the Three per Cent. Consols, 770l. 5s. 9d. for the relief fund, and 89l. 1s. 11d. for the building fund: total, 10,722l. 18s. For the relief fund 8,102l. 17s. 7d. and 2,620l. 0s. 5d. for the building fund. The annual hall, held in February last, gave a profit of 84l. 16s. 6d., and the directors take this opportunity of thanking the hon. secretary, Mr. Joseph Bird, for his continued, kind, and efficient services. The sum received from this source since the first ball, given in 1848, amounts to 1,808l. 1s. 10d. There are, perhaps, few, if any, trades so subject to vicissitudes as that of the builder, and the directors earnestly appeal to all connected with the interests represented and relieved by the Builders' Benevolent Institution, for their charitable aid in support of their less fortunate brethren, and take leave to introduce for their kind consideration a suggestion made by the president, Thomas Lucas, esq., that a large addition might be made to the funds of the charity, were each of those gentlemen who have kindly contributed upon former occasions, either as subscribers or donors, to obtain 'one new annual subscriber:' by so doing the amount would be considerable, and enable the directors to greatly increase the sphere of their present usefulness, and elect, perhaps, the whole of the present deserving and necessitous candidates. In conclusion, they have the satisfaction of informing their friends and supporters that Joseph Rigby, esq., has kindly consented to become the president for the ensuing year; and avail themselves also of this opportunity to convey to Thomas C. Lucas, esq., their warmest thanks for his generous liberality, and energetic support of the interests of the charity during his presidency of the Builders' Benevolent Institution."

On the motion of the Chairman, seconded by Mr. Plucknett, the report was unanimously adopted.

Mr. Joseph Bird said he wanted to bring before the members a subject which had been under consideration before, and that was respecting the amount standing in the name of the Building Fund. It had been resolved that when the amount reached 2,500l., a meeting of the subscribers should be called to say whether it should be merged into bricks and mortar or into the Relief Fund. Although the figures of the amount stood 2,613l. stock, that at 90, made only 2,340l., something considerably below the amount specified. The public ran away with the idea that they were dilly-dallying with the fund; but, as it had not arrived at the specified amount, they could not deal with it. He should like to satisfy the minds of the subscribers relative to that fund.

A vote of thanks was then passed to the patrons of the Institution, and the name of Mr. J. Hnh. hard added to their number.

Mr. Hall moved that the thanks of the subscribers be given to Mr. T. C. Lucas, the president, for his continued and energetic services during his presidency of the institution.

Mr. Plucknett, in seconding the motion, said

he personally felt indebted to Mr. Lucas for the liberality and spirit with which he had acted towards the Institution. The success of the past year had been owing to his exertions, and for many years the Institution had been indebted to the liberality of Mr. Lucas and his brother. He was not only expressing his own feelings, but the feelings of all present, in hoping that Mr. Lucas might live for many years.

The resolution having been unanimously carried,

Mr. Lucas returned most cordially his best thanks. He had done no more than his duty in supporting the Institution. It was not only an act of duty, but also of pleasure to support an institution which benefited the poorer members of the trade. Whether he was connected with the trade or not, this was one of the first institutions which would have a claim upon him. He would say that the Institution was much indebted to Mr. Plucknett, as no man had done more for it than he had. Whether they pulled together or not, he hoped to see the Institution for years to come as prosperous as it had been in past years.

Mr. Thorn moved that the thanks of the Institution be given to the treasurer, George Plucknett, esq., for his services, and that he be requested to continue his services for the ensuing year. He observed that Mr. Plucknett had served the Institution when his time was of great value to him. He hoped that for many years Mr. Plucknett might continue to be the treasurer to the Institution.

The motion was carried, and Mr. Plucknett said his connexion with the Institution had given him much pleasure and satisfaction.

A vote of thanks was next passed to Mr. Bird, the hon. sec. of the hall committee.

The Chairman said they owed a debt of gratitude to Mr. Bird, the result of his exertions being the addition of a large sum to the fund.

Mr. Bird said, with respect to the case, he thought it was something which should be kept up, as in the summer the gentleman had their dinner and the ladies expected a ball in the winter, which brought a number of subscribers into the fund.

The thanks of the Institution were then voted to the trustees, the directors of the Brighton branch, the auditors, and to the hon. solicitors.

The Chairman proposed that Mr. G. Rigby be the president for the ensuing year, and reminded the subscribers that there was an election coming off in November next.

Mr. Bird said there were now forty pensioners on the funds, which had been their largest number of recipients.

The motion was carried.

A vote of thanks having been passed to the chairman, that gentleman, in responding, expressed a hope that the suggestion he had thrown out last year, that each member would do his best to get at least one additional subscriber to the fund, would be followed out.

The proceedings then terminated.

#### ACTION ARISING OUT OF THE SUPPLY OF "QUANTITIES."

FUTCHER V. CLARKE.

At the Wills Summer Assizes, Mr. Karslake (as reported in the *Salisbury Journal*) said the plaintiff in this case was Mr. Robert Futcher, who had carried on business as a builder for many years past in Salisbury, and the present action was brought by him against Mr. Clarke, who had established himself in Salisbury as an engineer and architect, and was employed by Mr. Robson, one of the guardians of the Earl of Pembroke's estates. The charge brought against him was that he had supplied Mr. Futcher with certain hills of quantities, which, from his want of skill, had not been properly calculated, and from which Mr. Futcher had sustained considerable damage. When the jury came to consider the case, which he would shortly refer to them, they would see that in consequence of the inaccuracy of these quantities, Mr. Futcher had a right to say he had sustained great damage. In September, 1862, by an advertisement which appeared in the *Salisbury Journal*, it was stated certain work was to be put up for public competition, for builders and others, to send in tenders to contract for. The work to be executed was the pulling down of an old and erecting a new homestead, together with a pair of cottages. On the advertisement appearing, it was stated

that applications were to be made to Mr. Clarke, of whom the plans and specifications might be had. When Mr. Bentlif, Mr. Fitcher's clerk, went to the architect's office, Mr. Clarke would not allow the plans and specifications to be taken away from the office, but told the clerk that he always provided bills of quantities himself, which would be found accurate, so as to enable persons to send in estimates as to what they would do the work in question for. Mr. Bentlif said he should like to see the plans and specifications, but Mr. Clarke told him he could not have him in his office, but that he would supply Mr. Fitcher with bills of quantities at a charge of 35*l*. Accordingly Mr. Fitcher agreed to this proposal, and Mr. Clarke sent in the bills of quantities, stating that "these quantities were carefully taken out, but were not guaranteed." Had there been any slight discrepancy, the plaintiff would have had little cause, perhaps, to complain; but the amount was so large that the plaintiff, he thought, was justly entitled to damages. After receiving the bills of quantities, Mr. Fitcher went through them carefully, and affixed against each sum the price which had been given to him, and sent in his tenders to execute the work at a sum of 1,415*l*. At an interview between Mr. Fitcher and Mr. Clarke, subsequent to the sending in of the tender, the latter had pledged himself that the quantities he had given would be found correct, and the contract was signed on the 29th of December, 1862. Some time after the contract was signed, the defendant was appointed architect for the work. The plaintiff at the outset of the work discovered that the quantities were extraordinarily incorrect, and saw Mr. Robson with respect to his going on with the work any further, as he was then working under heavy losses. It was afterwards agreed that the contract should be made out at the sum of 1,624*l*. Instead of this sum meeting the expenditure of the builder, he (Mr. Karstlake) was prepared to show that the prime cost of the work was over 2,350*l*. This action was therefore brought to recover the difference between these sums. As Mr. Clarke had made out the quantities for Mr. Fitcher, and gave out himself as being a skilled architect, and received remuneration for the work, he was liable for the damage which his neglect had caused. It would be a question of great detail; but he trusted they would give it their serious attention, and he would have no difficulty in proving the case in favour of his client.

**His Lordship.**—Mr. Karstlake, do you think you can?

Mr. Karstlake said he could not disguise from himself the difficulty there would be in entering so deeply into these details. He had no objection to refer to it.

Mr. Coleridge would have been ready to agree to that course, but as fraud had been imputed to the defendant, he was bound to go into the case.

It was agreed, after a short conversation between the attorneys and counsel, that the count alleging fraud should be withdrawn, and a verdict for the plaintiff was recorded subject to reference.

**LIGHT AND AIR CASE.**

**ROBSON V. WHITTINGHAM.**—VICE-CHANCELLOR'S COURT.

This case was argued on the 19th and 20th ultimo, when his Honour, Kindersley, reserved his judgment. The plaintiffs, Messrs. Robson & Harris, were the owners of the house No. 17, Took's-court, Curstior-street, Chancery-lane, which they let to a wood engraver, and he underlet to a law-stationer and a boot-closer, himself occupying the first floor, and of course requiring the greatest light that could be obtained, and the others more or less a good light. The defendant was a printer just opposite, the width of the court being some 15*ft*. or 16*ft*. at that point. In August, 1864, the defendant pulled down his house and built a new one in the place of it, as was alleged, to a height of 5*ft*. or 6*ft*. above the original elevation; and not only so, but filled up laterally an open space which had existed to the north of it, a wall only rising 14*ft*. of such space as the erection originally stood. The house being, in fact, built, after some correspondence, this bill was filed for an injunction, necessarily therefore of a mandatory nature,—that is, if any relief was obtained, according to the old practice of this court, involving the pulling down such erection; but,

by the recent rules, being made a question of compensation by damages. A number of affidavits had been filed in the question of the diminution of the access of light and air occasioned by the new building, with plans and a model. The defendant contended that the damage was so inappreciable that it was not a case for damages at all.

His Honour now referred to the facts, and said that he had carefully considered the evidence and plans, with the assistance of the model, and was of opinion that the damage was not trivial; and that, if an action were brought, substantial and not merely nominal damages would be obtained. There must be the usual reference to chambers to inquire the amount of the damage, which, when ascertained, must be paid by the defendant, together with the costs.

**CASES UNDER METROPOLITAN BUILDING ACT.**

**Walls.**—At the Hammersmith Police-court, Mr. Thomas Slatery, of Keith-terrace, Uxbridge-road, was summoned by Mr. Knightley, the district surveyor of Hammersmith. It appeared that the defendant had departed from the original plan in the erection of the building, by adding another story, the Act requiring in that case a different thickness of the walls. The defendant denied that he had built an additional story, as the rooms were only intended as box rooms in the roof; but he admitted that there were windows in them, and that they could be used as sleeping-rooms.

Mr. Ingham made an order for the defendant to make the two end walls and back walls 13 in. thick in fourteen days, and to pay 2*s*. costs.

**Wooden Buildings.**—Mr. H. J. Chesce, of the "Brewery" Tavern, New-road, was summoned for erecting a wooden building in his grounds, contrary to the terms of the Act. Mr. Knightley said the erection of wooden buildings in the district was a source of great annoyance and trouble. He had caused several to be pulled down, and therefore he could not excuse the defendant. He believed it had been put up by the defendant to accommodate persons who used his grounds. He was willing that the building should be retained until the end of the season, and then to be pulled down. It was contended for the other side that it was not a building within the Act of Parliament.

Mr. Ingham mentioned that several cases of the kind had been brought before him, and he held that every structure which was fixed in the ground was a building within the meaning of the Act.

The magistrate then proceeded to the grounds, where he was met by the parties on both sides, and after inspecting the structure, he decided that it was a building, and made an order for its removal on the 1st of November next.

**Penalty for not giving Notice.**—At the Thames Police-court, Mr. William Hayward, builder, of Chandos-street, Covent Garden, was charged, on a summons, with commencing the building of a church in the East India-road, at the corner of Upper North-street, before giving notice to the district surveyor.

Mr. J. H. Goode said the new church which the defendant had contracted to build was in the parish of All Saints, Poplar. Considerable progress had been made in the construction of the sacred edifice, which would be an important addition to the churches of the metropolis. It was being erected under the auspices of the Diocesan Church Building Society. No notice had been forwarded to him by the defendant, in compliance with the terms of the Building Act, and there had not been any inspection.

The defendant's foreman said he had been to the district surveyor's office, and could find no one there on whom to serve a notice.

Mr. Partridge said the defence was one he could not receive. It would have been very easy to forward a written notice by post, or put it in Mr. Goode's letter-box. He fined the defendant 5*l*. and costs.

**Size of Manufactories.**—At the Greenwich police court, Captain Blakely, of the Blakely Ordnance Company, Greenwich Marshes, and Messrs. Aird & Son, builders of the Belvedere-road, Lambeth, appeared to summonses, at the instance of Mr. R. E. Browne, the district surveyor for Greenwich, charging them respectively with erecting certain buildings without party walls, the cubical contents of which exceed 216,000 cubic feet, contrary to the provisions of the Metropolitan Building Act.

The buildings in question consist of the works of the Blakely Ordnance Company, and a re-ort-house being erected by the Messrs. Aird for the Phoenix Gas Company, and it was stated on the part of the district surveyor, that he had only brought the present cases forward in the

strict performance of his duty, as required by the Act of Parliament.

Captain Blakely urged that his worship would consent to adjourn making any order in the case until the Metropolitan Board of Works should be enabled to obtain the passing of an Act in the next session of Parliament, placing it within the power of that Board to sanction such buildings as those now complained of. It was the intention of the company themselves to have obtained such an Act in the last session, but they were persuaded by the Metropolitan Board of Works not to do so, as that Board had then a bill prepared containing a clause which would meet the case, but which bill had unfortunately, through some cause or other, not been introduced.

A gentleman who represented the Phoenix Gas Company made a similar request on the part of Messrs. Aird, observing that prior to 1855 the gas companies had the power of leaving such cases to the decision of referees; and that as it was a question which affected all the great gas companies in the metropolis, he should be prepared, if the Metropolitan Board of Works did not bring forward their proposed bill, to agitate the gas companies, and to obtain a private Act of Parliament of their own.

Mr. Maude said he had been waiting year after year, expecting such an Act of Parliament to be passed. The question had before been brought before that court, and the difficulties in carrying on trade by marine engineers had been found so great under the provisions of the Act of Parliament referred to, that they (the marine engineers) had applied to Parliament, and now possessed, and act exempt them from the particular provision of the Building Act upon which the present complaints were founded. He should have no objection to adjourn the summons, with the consent of the mayor, for the purpose named, and his advice was not for any private Act of Parliament to be applied for and obtained, but that those interested in obtaining an alteration in the law should press their claims upon the authorities in Spring-garden, and thus obtain the passing of an Act applying to the metropolis generally.

The summonses were then adjourned, as understood, sine die.

**BULL'S GARDENS, CHELSEA, AND THE PIGS.**

**Sig.**—There is great rejoicing in Chelsea. Bull's Gardens have been cleared of their pigs! Bull's Gardens-green, and its immediate neighbourhood, should be constantly watched by the inspectors, for such streets as Charles-place, Smith-street, Ivy-street, &c., are anything but up to the mark in sanitary matters, though the pigs are to go. The fear which comes over me is, that the pigs may come back with the cold weather, and that by next year there may be as many as ever; yet Mr. Selfe's decision seems to be conclusive that pigs shall not be kept in Bull's Gardens. Mr. Arnold, on the 14th of May, 1862, ordered the removal of the pigs from No. 14, Bull's Gardens, and yet they came back; and a fortnight since there were no less than fifteen pigs at that one house, in a wretched hovel built out in front. I wish you could spare time to inspect the place.

THE PERSON WHO LODGED THE COMPLAINT.

**THE DUST-HOLES.**

A CORRESPONDENT asks attention to a subject on which we have again and again spoken, the necessity of preventing the accumulation of decaying matter in the dust-bins, often the source of disease in a house. The writer points to the Rag Collecting Brigade as a legitimate medium for the utilization and disposal of these commodities, which are either wantonly wasted, or made the means of unauthorized profit. "Sanitary inspectors" or "inspectors of nuisances" should be empowered to enter premises in order to ascertain the state of the dust receptacles, and report if need be: there is no necessity to deposit anything in the dust-bin but ashes; and, with good management, the kitchen refuse can be disposed of without the aid of the "PIG-TUB DEALER." With a due regard to economy, and a consideration for the wants of the poor, the odds and ends can be used in a variety of ways, besides making excellent soup. At any rate, keep the dust-bin clear.

**ACCIDENTS.**

In excavating recently near Sheffield, a couple of labourers were buried beneath an immense mass of earth which had unexpectedly broken away. The bodies were extricated with all haste, when one of the men was found to be dead, and the other most severely injured. This land-slip is believed to have been caused by the unsuspected presence of a small spring of water.

The building of the South Shields new theatre has had rather an inauspicious commencement, the process of excavating the foundation having resulted in endangering the adjoining building, the gable of which has fallen, while a considerable part of the rest of the house was left in such a state that it might fall at any moment. The foundations had been partially undermined by the excavations.

The accident at the Gateshead Cement Works has been followed by an inquest on the bodies of the two persons who lost their lives by the bursting of the water-tank. Mr. John Lamb, the borough engineer, said the cement was defective, owing to bad sand. The bricks, too, were soft,

but the cement had not set sufficiently. A long waste-pipe had been substituted for a short one, thus increasing the weight of water from 13 to 20 tons, and the pressure burst out one of the sides of the ill-cemented tank. Other evidence was led, and the jury returned a verdict to the effect that the deaths arose through injuries received by the bursting of the tank, which was imperfectly constructed, and gave way under the weight of water put into it.

At a coal-pit, near Wigan, two men were employed in the shaft, when the brickwork that lined the sides began to fall in, and before the men could be hauled up, the weight of falling bricks broke the rope that held the platform on which they stood. The men were precipitated to the bottom, and covered with the fallen material. They were taken out dead.

#### MUSIC AND THE STAGE.

*Royal Gallery of Illustration.*—A third season of Opera di Camera will be inaugurated on the 14th of this month, with two novelties in the shape of an operetta (the libretto by Hamilton Aide) by Miss Virginia Gabriel, and one of the most popular of M. Offenbach's comic pieces. The latter, in addition to a great success in Paris, is recommended to an English audience by a libretto from the pen of Mr. William Brough. The action takes place in the Flowery Land, in which a Scot sighs to return to the Land of Cakes; and the opera is entitled "Ching-Chow-Hi, or a Piece of China."

*Mr. Mellon's Concerts.*—At the Royal Italian Opera-house, Covent Garden, Mr. Alfred Mellon will commence his fifth annual series of concerts on Monday evening next. A special feature will be the production of a grand orchestral selection from Meyerbeer's latest *chef d'œuvre*, L'Africaine. Mademoiselle Carlotta Patti, Mademoiselle Liebhart, Signor Ferranti, Mademoiselle Marie Krebs, Signor Bottesini, and two young female violinists are amongst the engagements.

*The Haymarket.*—Mr. Walter Montgomery has collected a very good company, intending to play the legitimate drama, with burlesque for after-piece. The public were glad to see him and Miss Heath in the "Lady of Lyons."

*St. James's Hall.*—Conjuror Anderson has added to his company a clever mimic and ventriloquist, Mr. Frederic Maccabe, whose performances evidently please, and deserve to do so.

*Mlle. Van der Moersch's Birds.*—And very clever little birds they are. Although the *modus* is simple by which they answer all questions, namely, pecking out the right card from a bundle in a tray, who shall tell, save Mademoiselle, the pains, art, and patience that have been used up in teaching it to them? These birds and their mistress are an additional inducement to visit the Polytechnic.

#### RECENT PATENTS CONNECTED WITH BUILDING.\*

*WINDOW SASHES.*—*W. Holbrook.* Dated March 31, 1864.—The patentee claims the method of controlling the rising and falling of window sashes, wherever applied, by the application of biting rollers on the surfaces of circular or semicircular india-rubber, together with the arrangement of counterbalancing the weight of heavy sashes, as above described.

*MACHINERY TO BE USED IN THE MANUFACTURE OF ENAMEL WARES.*—*B. Baugh.* Dated December 29, 1864.—The patentee claims,—First, machinery in which the powdered glass or enamel is carried in a hopper or receptacle travelling over the articles to which the enamel powder is to be applied, the enamel powder being shaken from the said hopper by a series of blows given to the said hopper; also the modification described of the said parts. Secondly, machinery in which the articles to which the powdered glass or enamel is to be applied are supported on an endless band having an intermittent motion, the powdered glass or enamel being dredged on the articles by means of an inclined sieve, having a vibratory or reciprocating motion. Also the modification described of the said parts.

*IMPROVEMENTS APPLICABLE TO FIREPLACES FOR HEATING APARTMENTS.*—*W. E. Newton.* A communication. Dated November 21, 1864.—This invention consists in making the fire-dogs which

ordinarily serve only to support the fuel, the media for the supply of heated air, and its transmission into the apartment. For this purpose these dogs are made tubular instead of solid, as heretofore, throughout their whole length, and are open at both ends; the air enters cold at one end, and, on becoming heated during its passage under the fuel, issues in a heated state into the apartment, and is constantly replaced by a fresh draught of cold air passing through the tubes to be heated.

*SUPPLYING WATER TO WATER-CLOSETS AND OTHER PLACES IN REGULATED QUANTITIES.*—*T. Thompson and J. Murray.* Dated June 28, 1864.—The water for the time to be used flows from a reservoir or other source to the interior of a spherical or other close chamber, through passages capable of being closed by a sliding cover affixed to the chamber, to which is also affixed the cover of other or outlet passages in communication with the pan of the closet or other place to be supplied. The sliding of the chamber in one direction admits water therein, while the air escapes by a float-valve from this chamber, until it is filled with water, and then the water acts on this float-valve to close it and retain the chamber filled. But on moving the chamber in the opposite direction, the inlet passages for the water thereto are closed, the air-valve and the outlet-passage for the water are opened, and the water flows from the chamber, and so on. The size of the chamber is the measure of the quantity of water employed each time of action, and, as such, the apparatus must be employed with a suitable index to indicate the times of motion for measuring water or other fluids. The chamber may be stationary, and the sliding motion be given to internal supply and outlet tubes, or cover or other valves may have motion given to them simultaneously through the chamber.

#### Books Received.

*A Catechism of the Steam-engine, to which is prefixed an Introduction descriptive of all recent Improvements.* By JOHN BOURNE, C.E. New edition. London: Longman & Co. 1865.

*Recent Improvements in the Steam-engine; being an Introduction to the Catechism of the Steam-engine.* By JOHN BOURNE, C.E. London: Longman & Co. 1865.

BOURNE'S "Catechism of the Steam-engine" is so well-known a treatise, and has passed through so many editions, that it needs no further recommendation as a reliable standard work. In this fresh edition the contents have been revised, so as to include the latest improvements in engineering practice, and the author has added an Introduction of nearly half the size of the work itself, in which he has endeavoured to collect all the most recent and valuable information connected with the steam-engine in its present most eligible developments. Numerous examples illustrative of recent progress in every class of engine have been introduced, so that the woodcuts in the Introduction considerably outnumber those in the original work. This Introduction has also been published separately, under the second of the titles which we have given, so that the possessors of previous editions of the Catechism, who do not desire the newer work, can have the Introduction as a separate treatise.

*Homes without Hands; being an Account of the Habitations of various Animals.* By the Rev. J. G. Wood, M.A., F.L.S. With very numerous illustrations. London: Longman, Green, Reader, & Dyer, Paternoster-row.

This curious and interesting work is now complete. Beginning with the simplest and most natural form of habitation, namely, a burrow in the ground, the work proceeds in the following order:—2nd, those creatures that suspend their homes in the air; 3rd, those that are real builders, forming their domiciles of mud, stones, sticks, and similar materials; 4th, those which make their habitations beneath the surface of the water, whether salt or fresh; 5th, those that live socially in communities; 6th, those which are parasitic upon animals or plants; 7th, those which build on branches. The last chapter treats of miscellaneous, or those habitations which could not be well classed in either of the preceding groups. Mr. Wood has produced a valuable volume. The illustrations,

which are profuse in number, are new designs, by W. F. Keyl and E. Smith, engraved on wood by Messrs. Pearson.

#### Miscellaneous.

*NARROW ESCAPE OF THE LANGHAM HOTEL.*—At the Langham Hotel, in Portland-place, smoke was, one day last week, seen issuing from one of the apartments. An immediate alarm was given. The firemen upon their arrival found that the intense heat caused by one of the sun-reflectors had ignited the ceiling and joists of the first-floor. The fire was happily confined to the apartment in which it originated.

*SANITARY STATE OF BIRMINGHAM WORKHOUSE.*—The recent outbreak of English cholera amongst the inmates of this workhouse has forcibly drawn the attention of the guardians to the evils occasioned by overcrowding, drainage, and ventilation. The official report of the Poor-law inspector, according to the local *Gazette*, confirms the unbiassed testimony of independent witnesses, that the workhouse is not in exactly the state that a model workhouse ought to be. The tramp wards are overcrowded; the probationary ward is not sufficiently ventilated; the main corridor, which is supposed to ventilate several of the dormitories, has not an open roof, and is effectually blocked up—for all purposes of ventilation—by the school buildings at one end, and the infirmary buildings at the other; the fever wards are badly ventilated; the old men's dormitories are overcrowded; and there is a privy in the yard immediately underneath the windows; in addition to which there are closets which discharge their effluvia into the dormitories; the nursery, too, is very much overcrowded, and not well ventilated. The board of guardians now await a report from their architects as to the cost of providing additional accommodation.

*IMPROVED SURFACE CONSTRUCTION OF STREETS.* Mr. Mitchell, C.E., Inverness, has been engaged in a series of experiments for constructing the surface of streets and roads subjected to heavy traffic, and is about to lay down a specimen of an invention of his in London. Mr. Mitchell formerly had the charge of the Parliamentary roads and bridges in the northern counties of Scotland, and has had many years' experience and practical knowledge of this subject. The wretched state to which the streets and thoroughfares of London are reduced in a wet day by mud and slush, suggested the possibility of adopting a material which, while it should be impervious to heat or wet, would retain sufficient resistance for the traffic brought upon it. Mr. Mitchell, therefore, contemplates constructing a solid rock-like road of a composition of broken stones, Roman and Portland cement, and sand, forming a complete road, fit for traffic in twenty-four hours, and not liable, it is alleged, to any disagreeable change from wet, although always retaining enough of dust to prevent slipping either while wet or dry. Mr. Mitchell has secured the right to his invention by patent.

*ANOTHER CHANCE FOR AERIAL NAVIGATION.* A flying machine is in process of construction at Hoboken for the United States Government. It is a cigar-shaped canoe, built of copper, with iron ribs, and was intended for use in the war, but will still be proceeded with. An engine is placed in the centre, with sufficient power to work a screw fan with 20-ft. blades. There are four fans connected with the engine—one below, one above, and one at each end. The upper and lower fans are worked together to produce an ascent; and the terminal fans are made to revolve together or separately in the same direction, or in opposite directions, for the purpose of propelling the craft horizontally. The weight of the whole, fully equipped and manned, is about 6 tons. It is claimed by those upon whose recommendation the machine is constructed, that it can be guided through the air with as much ease as a vessel through the water. This is conditional, of course, to some extent upon the wind. An accomplished Government officer is superintending the work, and hopes to have it done in a month, when the pretensions of the new flying machine will be tested.—The machine noticed on a previous occasion has made an ascent from Cremona, and is believed to have been successfully steered at will, but we have seen no official report as yet of the result. Another ascent is to take place on Monday.

\* Selected from the *Engineer's* Lists.

**WORCESTER MODEL DWELLINGS ASSOCIATION.**  
 The annual meeting of this Association has been held at the Guildhall, Sir Charles Hastings presiding. The report of the proceedings during the last twelve months states that the financial position of the Association was not quite so satisfactory as last year, but the balance in hand would enable them to return a similar dividend, namely, 2 per cent. In October last a malt-house in Westminster had been purchased, and the Association's property thus rendered more complete and valuable. The rents of the tenants continued to be paid with punctuality. The mortality in the buildings had been somewhat larger than usual. The report was adopted, and a dividend of 2 per cent. on the capital for the year declared. Sir Charles Hastings suggested that the Corporation should be invited to cooperate, and that with their aid old and comparatively valueless property might be converted into sanitary dwellings for the poor.

**REPORT ON HOLBORN DISTRICT.**—The ninth annual report of the medical officer of health to the Board of Works for the Holborn district has been printed. In this report Dr. Gibbon says:—  
 "For the past three years, a high rate of mortality has prevailed in our district, as well as throughout the metropolis. In 1862 we had an epidemic of low fever, in 1863 of small-pox, and in 1864 one of measles, which last epidemic carried off 98 persons. On a comparison of the Mortality Tables, it will be seen that the excess of deaths (169) last year over those of the previous one occurred under the following heads:—measles, 77; tubercular diseases, 46; infantile diarrhoea and pneumonia, 21; congenital syphilis, 9. The 1421 deaths were thus distributed: 574 in St. George the Martyr and St. Andrew's, western sub-district; 357 in St. Andrew's, eastern; 272 in the Saffron-hill; 34 in the liberty of Glasshouse-yard. These are in the proportion of 23·8 per 1,000 of the inhabitants of the first-named district, 31·0 of the second, 22·5 of the third, and 23·4 of the last. These rates are only relatively correct. In no previous year has there been such an excess in the mortality of females (742) over that of males (679); last year they differed only by 1, but this they are in the proportion of 23 males to 25 females; while that for all England is 23 males to 21·6 females. As regards the ages at death, nearly 45 per cent. of all deaths were amongst children under 5 years of age. This is about 1 per cent. higher than the proportion for the whole of London, and 5 per cent. above that of England. The deaths under two years of age are more numerous than usual; in 1863 they amounted to 376, this year to 428."

**CHEAPENING OF FOOD.**—A new incubator for hatching the eggs of poultry and game birds, the subject of a patent by Mr. Minasi, is being talked about. The heat necessary for the incubation and rearing of the young chickens in the earlier stages of their growth is derived from gas, or from the combustion of naphtha in a lamp so constructed as not to require attention for many days. The heat so generated warms a reservoir of water, the underside of which is corrugated in a very ingenious manner, so as to support, by the aid of wires, a series of small narrow sandbags, against which the eggs are pressed. The *Field* says:—"The close contact of the whole of the eggs (whatever may be their variation in size) with the warm sand is insured by their resting on cushions of spiral springs; these are contained in drawers or sliding trays, which can be easily drawn out from under the incubator for the purpose of examination. As the eggs hatch they are removed to a part of the apparatus above the reservoir. This is most ingeniously constructed: there is a small tray for the chickens until such time as they are thoroughly dried and strong, when they are passed under a kind of artificial mother, which is peculiarly constructed in imitation of the plumage of the hen: it consists of a number of woollen wicks, each about 4 in. in length; these hang down loosely between the legs of low stools placed over the warm reservoir. The chickens nestle between the pendant locks of wool, which thus form an imitation of the warm feathery plumage of the parent hen. Connected with this part of the apparatus is a large feeding-cage, into which the chickens run for food, water, and exercise." An "artificial mother" is rather a good notion. The invention may, perhaps, be carried farther one day for the benefit of some of the poor children in our streets.

**HISTORY OF COKE.**—The following advertisement, given in *Notes and Queries*, fixing the period when coke first came into public use in this country, will no doubt be acceptable to any future historian of our coal trade:—

"There is a sort of Fewel made by Charking or Calcining Newcastle coals which burns without smoke, without fouling the furniture; and altogether as sweet, and is much more lasting and profitable than Wood or Charcoal; it kindles suddenly, and is useful either for Chambers, Roasting of Meat, Drying of Malt or Hops, Woolcombing, Distilling, Preserving, or any such like employment. His Highness the Lord Protector, with the advice of his Council, have encouraged and authorised the making thereof in order to the preservation of the Woods of the Nation.

If any shall desire to make trial of it for any of the use aforesaid, which will cost little or nothing, the experiment, they may repair to London at *Northumberland Wharff*, near *Charing-Cross*; and according to the satisfaction they receive therein, they may be supplied from time to time with what quantity they shall have occasion to use.

Those that have made trial of it, find it very profitable to all those uses abovementioned.  
 It is also very useful for the Tobacco Pipe burners."—*Public Intelligence*, No. 139, from Monday, August 16, to Monday, August 23, 1659, p. 764.

This advertisement appears also in the succeeding number for August 30, but apparently not in any of the previous numbers.

**REPORTS OF HEALTH OF LIVERPOOL.**—The reports of Dr. Trench, the medical officer of health for the borough, for the March and June quarters of the present year, have been printed. During the March quarter, according to these reports, the total deaths amounted to 4,717, being an increase of 615 on the corrected averages of the corresponding periods of the preceding ten years, and making its death rate equal to 40 in the 1,000 per annum. Of these deaths, 1,771, or 37·5 per cent. were of children under 5 years of age. Zymotic diseases occasioned 1,386 deaths, being an increase of 510 on the corrected averages of the last 10 years; and 372 above the number registered in the same quarter of 1864,—a year of great sickness and mortality. Typhus fever occasioned 735 deaths, or 52·5 per cent. of those from zymotic diseases, being an increase of 553 above the average for the last 10 years. During the June quarter, the total deaths were 3,708, or 31·52 in the 1,000 per annum: 39·1 per cent. were of children under 5. Zymotic diseases occasioned 1,014 deaths. Of these, typhus and infantile fever caused 519 deaths, or 51·1 per cent. Tradesmen, better off than labourers, began to appear very largely in the death register from fever: there were 227 tradesmen and 211 labourers. A surgeon and a relieving officer had died of fever.

TENDERS

Accepted for building five houses on the London-road, South Loveston, for Mr. G. Augustus Bala. Mr. W. Oldham Chambers, architect.

<i>Bricklayer's, Plasterer's, and Slater's Work.</i>	
Rix & Son .....	£654 0 0

We are compelled to decline putting out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender; not necessarily for publication.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

Advertisements cannot be received for the current week's issue later than FIVE O'CLOCK, p.m., on Thursday.

# The Builder.

VOL. XXIII.—No. 1175.

The Anglo-French Exhibition at the Crystal Palace.

HE "Peace Jubilee, 1865," or Anglo-French Working Class Exhibition of Skilled Work, was opened at the Crystal Palace on Monday, with a ceremony of inauguration, which took place in the central transept. The works exhibited are placed in one of the galleries in, and extending northward from, the transept. The arrangements on

Monday were marked by some of that incompleteness which has characterized each of the International Exhibitions; but the ceremony, however deficient in any *prestige* of names, had a peculiar interest: there were plenty of objects in the gallery deserving examination; and the number of these will have since increased,—many of the French contributions, on the opening day, being still unplaced. The Exhibition is stated to be promoted by working men, mainly, if not altogether; though we may say, that in the Paris Committee we find a considerable proportion of literary working-men, *rétracteurs* of journals, and of managers of societies and associations. Considering that the members of the English Committee generally are persons who cannot easily withdraw attention from daily labour, great credit is due to them, as well for the manner in which the conception has been realized, as for the idea itself. They say,—“To celebrate the fiftieth anniversary of peace between two powerful nations, in a manner at once appropriate and suggestive, is an idea for which we have gone—not to war,—but to work!” and judging from what was said on Monday by the few speakers who represented the French working-men, many of whom, however, were present, the idea was fully entered into by them.

The ceremony of the opening was conducted under the presidency of Mr. Herbert Mandley. It took a religious character at the commencement. A prayer was offered up by the Rev. Dr. Emorton, wherein, after our own Queen, the Emperor of the French was named. The chairman then spoke; and the secretary read a letter from Mrs. Cobden, expressive of what would have been her husband's sympathy with an undertaking “designed to support the cause always so dear to his heart, of international peace and good-will, and so honourable to the men by whom it was originated, and by whom it is being carried out.” Mr. Coningsby, the secretary to the English Committee, in remarks following, said that the exhibition had been begun and carried out *bonâ fide* by working men, without patronage from any one; and that he hoped one of the effects of such undertakings

would be to break down the prejudices between classes, which were almost greater than those between nations. We had much to learn in this respect from what was to be seen in France, where master and workman could meet together,—the fault in our country being generally as much on the side of the workman as on that of the gentleman. In one respect, however, he thought the French might well imitate us—namely, in not allowing politics in public life to interfere with private friendships and discussions in social matters. He expressed a hope that all would unite in the proposition, which had been made by the committee, to invite the French exhibitors to a dinner at the Crystal Palace, and that in another year they would be able to organize an Anglo-Franco-American exhibition by working men.

M. Edmond Potonié, one of the French secretaries, and who is also one of the editors of the French co-operative journal, “L'Association,” next addressed the meeting in French as follows:—

“Mesdames and Messieurs,—Je me suis d'abord excusé de ne pas savoir assez l'anglais pour prononcer mon discours en cette langue. C'est avec un bien vif plaisir que nous avons en France reçu la délégation des ouvriers anglais, et que nous avons accepté de prendre part à la fête industrielle et pacifique à laquelle nous étions conviés. Avec les ouvriers anglais les ouvriers français sont heureux de célébrer l'anniversaire des 50 années de paix qui viennent de s'écouler, qui préparent une paix plus complète encore; car il faut espérer qu'avec le temps nous bannirons même la crainte de la guerre et qu'alors les ruineuses et liberticides armées permanentes ne viendront plus comme un nuage assombrir la lumineuse paix de l'avenir.

“Pour cela il faut que les manifestations du genre de celles qui nous réunit aujourd'hui se multiplient, il faut, peuple anglais et peuple français, saisir chaque occasion de vous serrer la main, car nous en sommes persuadés une seule chose est nécessaire pour que vous vous estimiez, que vous vous aimiez, une seule chose est nécessaire pour dissiper toute crainte de guerre future entre vous, français et anglais, et rendre inutile la paix armée qui fait dépenser à l'Europe stérilement des milliards qui, employés productivement, amélioreraient rapidement le bien-être social. Cette seule chose, c'est de mieux vous connaître.

“Voilà pourquoi nous ne saurions trop applaudir à l'exposition ouvrière Anglo-Française, et l'aider de tous nos efforts; car tout en cimentant l'union par l'intérêt, en multipliant les échanges (les échanges qui sont la sauvegarde de la paix) elle donne cette occasion aux deux nations de mieux se connaître, donc de s'estimer mutuellement et de s'aimer. Si nous célébrons aujourd'hui et nous félicitons des 50 ans de *paix armée*, espérons que grâce aux expositions, et à tous les autres rapports que nous pourrions avoir, nous pourrions bientôt célébrer la paix fructueuse et véritable qui n'est pas appuyée sur les dispendieux armements.”

M. Potonié was followed by Mr. Henry Maudsley, who referred to the Dublin Exhibition as an instance of the successful labours of working men, and drew a contrast between the efforts of different nations to construct, at enormous cost, formidable iron-clads, which were a terror to each other, and the peaceful and beneficent labours of the men who contributed to exhibitions of this kind.

There was also a speech in English by M. A. Talandier, of the College at Sandhurst. He said:—

“Few words are necessary when one has merely to express that which every one else feels and thinks. The origin, the aim, the spirit of this undertaking are clear and present

to the minds of all here. This is one of those exhibitions which one of your greatest statesmen, W. E. Gladstone, so happily and tersely styled the ‘festival of labour.’ But this one is something more than a festival of labour; it is also a festival of friendship and amity between two nations who, mostly, in former times, distinguished themselves by the tremendous wars they waged against each other. Rivals, I am afraid, we must be. The very word of rivalry, which etymologically means the state of those who dwell on opposite shores, points to the fact that naturally the position of England and France is one of rivalry. Let us then be rivals; but let that rivalry henceforward exert itself on the fields which industry, science, and the fine arts open to all.”

Referring to some portion of the previous proceedings, wherein he seemed to consider there had been political allusions, he said:—

“We are not met here to celebrate the glory of emperors, but the glory of labour, the glory of the people. Our aim is a perfectly definite one. We are here to celebrate the deeds not of the destructive, but of the creative spirit; not of the slaying, but of the feeding hand. More particularly, we are here, you Englishmen and we Frenchmen, to abjure our national hatreds and our long-standing prejudices, and to declare that the working classes of both countries have resolved never more to raise against each other a fratricidal hand. Long life, then, to this holy alliance, and may it be the harbinger of a still greater and holier one—the fraternal alliance of all the nations of the earth.”

After the translation had been read of a French song written for the occasion, the Hallelujah chorus was played on the organ, and the Exhibition was declared opened.

The Exhibition at present contains about a thousand objects, as numbered in the first edition of the catalogue; but we are told that the French exhibitors alone, at present not much more than fifty as the names are printed, will shortly amount to four or five hundred in number. Furniture, both the English and the French, forms the most conspicuous feature in the gallery; though, of course, the collection does not make up a fiftieth part of the extent of that of 1862. The productions, however, are exhibited by masters, as the French and Swiss manufacturers having establishments in London, rather than by workmen; and they are not good representatives of the French art-manufactures. Mr. Phillip's elaborate piece of work, the “Golden Eagle,” is in the gallery. One of the most interesting groups of objects, for our readers, is the collection of specimens of plumber's work exhibited by Mr. Lovegrove, plumber, of Spring Grove. There are specimens of lead-piping and joints of different dates, including work of the 14th, 15th, 16th, 17th, 18th, and 19th centuries. Mr. Robinson, of Fenchurch-street, exhibits some good enamelled slate chimney-pieces; and with them an arrangement for lavatory-basins, placed in the re-entering angles of divisions, that take a zigzag form on plan. Some capital turned-wood halusters are exhibited by Mr. T. G. Oiley. The illustrative model of Mr. R. B. Greenwood's improved means of preventing accidents upon railways deserves attention. Ordinarily the flanges of all the wheels of the carriages and engines on railways work inside the rails; but by the new system, out of six wheels, two, those in the centre, would have the flanges outside the rail. There is also a modification in the “points” for crossing, and there are other inventions explained by the model, each for a similar object.

The Exhibition will well repay a visit, even considering it apart from those noble aims of its promoters which are just now especially prominent.

## RESTORATION OF CHURCHES IN ROME.

The charm attaching to Rome's ancient basilicas is one felt by the imagination rather than acquiesced in by the judgment or taste. Presenting the only Christian style at all noble or impressive, that has ever been originated in this city, these edifices are, for the most part, plain even to sterility, more or less grievously injured by pseudo-restoration and mediocre artworks, sombre and forlorn in aspect, sometimes bearing the evidence of years of desolation and neglect; yet still so marked by a character of their own that, once seen, they cannot be forgotten; and, as illustrations to Christian history, their importance cannot be overlooked. In several of these old churches have been carried out, within recent years, works aiming at improvement or repair, in some instances (though not indeed always) directed with more intelligence than the wretched attempts of reconciling the ancient with the modern Italian style, whose results must be deplored in the local architecture of the sixteenth and seventeenth centuries. Since the completion of similar works at the extramural basilica of St. Laurence, the most noticeable of such undertakings still in progress are those at two of the more interesting among this characteristic class of monuments.—St. Maria in Trastevere, a basilica whose origin dates from the third century; and St. Prassede, on the Esquiline Hill, dedicated to the daughter of the Christian senator Pudens, the friend and host of the two apostles who founded Christianity in Rome.

The more conspicuous of these two churches, on the right bank of the Tiber, is the largest in that curiously-characterized quarter of Rome, and occupies the site of a primitive place of worship (probably but a small chapel) ascribed to Pope Calixtus I., who is said to have had it built about A.D. 222, after permission obtained from the Emperor Alexander Severus, through that memorable decision mentioned by Lampridius, which determined in favour of the Christians against the suit urged by the *popinarii* (tavern-keepers) for the right of occupation with intent, on the part of the former, to consecrate the ground in question. "*Quem Christiani?*" says that historian, "*quendam locum qui publicus fuerat occupassent, contra popinarii dicerent, sibi eum debere, reservatis, melius esse ut quondam decimus illic Deus colatur quam popinarii adstantur.*" But it is doubtful whether either the founding by Pope Calixtus or the date 222 can be assumed as historical with regard to this primitive edifice. The first authentic notice of a church on its site occurs in the acts of a council held by Pope Symmachus in 499, and under the name *titulus Sancti Julii*, ascribing to Pope Julius I. (337—354) the origin of the Transiberine basilica, afterwards raised to such conspicuous rank. Another tradition that seems, indeed, thoroughly admissible, is that respecting the preference of the early Christians for this site, under the belief in a legend that, in the time of Augustus, when the *taberna meritoria* (military hospice) stood here,—a building, perhaps, confounded with the *taverns* of later origin,—took place a miraculous event shortly before the birth of Christ: a fountain of oil gushing from the ground, and continuing to flow copiously from hence into the Tiber for one day; this being interpreted, as we find in the pages of Eutropius and Orosius, into a heaven-sent prognostic of His coming, who was pre-eminently the "anointed," from whom new blessings were to flow for the consolation of humanity; and to this day the legend has its written record in the actual church.

Whether or not this was the first church in Rome dedicated to the Virgin Mary, it may be held certain that in the year 310, Julius I. either founded or rebuilt it; that that earlier edifice was first restored by Gregory II., about 707, and about thirty years later entirely renewed from its foundations by Gregory III.,—who adorned its interior with paintings,—still, it seems, on a plan limited to a single nave; for we read that the two aisles were first added later in the eighth century, by Adrian I., the tribune and choir raised on steps, and a confessional, or crypt chapel, below the high altar, formed by Gregory IV., about 843, when the bodies of the Popes Calixtus and Cornelius were transferred hither from the catacombs. How defective was the masonry of those ancient constructions, we may infer from the report of Anastasius that, by the year 855, both portico and baptistery had become ruinous, and were rebuilt under Pope Benedict III. The chief restorer of this church was Innocent II.,

who, in the year 1199, shortly after the death of his rival, the antipope Anacletus,—therefore during one of the brief periods of repose enjoyed in his stormy pontificate,—undertook the complete rebuilding, which he did not, however, live to see brought to its accomplishment, though so far advanced as to allow him to consecrate the high altar; the works being subsequently resumed under Eugenius III. (1145—1153), and the entire church for the first time consecrated, perhaps in some details embellished by Innocent III., towards the end of the same century; and it is the structure of this period that still stands, with its distinguishing features and rich mosaic ornamentation, fortunately preserved from the twelfth century, now undergoing a restoration by the architect, Count Vespignani, whose results, seeing what similar enterprises have led to in the present aspects of Rome's churches, we cannot but fear may prove prejudicial to the olden dignity hitherto characterising the Transiberino basilica.

The very interesting mosaics on its apse and façade had suffered much, it is reported, before two successive restorations, one in the year 1702, the other ordered by Leo XII., between 1823—1829, and effected under the superintendance of Camuccini. Under Clement XI. had been carried out other restorations of architectural details, among which the most conspicuous modern addition was the actual portico, built in 1702, by Carlo Fontana, who probably preserved some of the granite columns from the antique compartments corresponding, to re-erect them in their present places.

We may, however, consider those treasures of Mediaeval art still left, essentially unaltered, to this fine old church. Below the summit of the gable-headed façade extends a very curious series of mosaics, begun either under Innocent II. or Eugenius III., and finished in the latter years of the thirteenth century, by the celebrated Pietro Cavallini,\* their subjects,—at the entrance, the Virgin with the Child enthroned, and laterally ten females, of stately bearing and richly vested, some crowned, others veiled, all carrying large lamps, and approaching, five on each side, towards the throne of Mary; immediately beside which are kneeling, two much smaller figures, in pontifical vestments, one with a blue, the other with a red chasuble over the priestly alb; probably intended for the two Popes Innocent and Eugenius; this whole composition reminding of the parable of the Ten Virgins,—yet that such cannot be the subject intended, though perhaps actually the artist's inspiring idea, seems evident in the circumstance that all the lamps are burning, except three, in the vessels carried by this fair company, and that all are alike distinguished by an aspect severely devout as they draw near, evidently for worship, to the Virgin Mother with her Child. Another Madonna and Child, in mosaic, of equal antiquity, occupy a space under a marble canopy at the highest story of the tower, one of those fine examples of the square brick-built campanile, with arcade-windows and terra-cotta cornices, of which there are several in Rome, ascribable to periods between the eighth and twelfth centuries. The interior of this church has a sombre majesty, a gorgeous gloom fraught with memories of the past that impress and fascinate; but we speak rather of what it was than what it is likely to become in the result of the works now disturbing its consecrated repose. With colonnades sustaining architraves, high attics pierced by narrow arched windows, flat ceiling painted and gilt in coffers, elevated presbytery and transepts, isolated, elevated, and mosaic-clothed apse, where stands the antique episcopal throne of marble with Pagan chimere chiselled on the arms, the whole interior has hitherto seemed a genuine monument of Rome's Middle Ages. Twenty-two columns of red and grey granite, most different in proportions, with capitals in part Ionic, in part Corinthian, all alike with the basements, inverted to their shafts, divide the nave and aisles; the architrave above surmounted by a frieze of classic

\* Cavallini, born at Rome, 1279, was a pupil of Giotto, distinguished both in painting and mosaic, and principally engaged in this city; no fewer than 1,200 pictures being ascribed to him by some writers; his best performances in fresco, and among these to be classed, with honourable mention, two of "The Annunciation," on the walls of the atrium of the church above described,—both distinguished by grace and feeling; and in one is introduced the figure of a bishop carrying a banner, seated beside the Virgin; this singular novelty in the treatment of such a subject being explained by the supposition that Pope Calixtus I., as the church's original founder, is here intended.

fragments, alike arbitrarily pieced together, portions of the cornice being all classic, and of the richest description. On the Ionic capitals are singular details, being the small heads of deities (assumed to be Isis, Serapis, and Harpocrates)—which, indeed, seems but conjecture) in relief between the volutes. The pavement, of the time of Innocent II., is among the most beautiful examples of the *opus Alexandrinum*, or *intarsio*, in coloured marbles, porphyry and serpentine the most conspicuous, laid in circles, squares, hexagons, and bands, to be seen in any of Rome's churches; and we much regret to learn that this entire pavement is to be taken up, in order to lowering the whole interior levels, even though the assurance is given that its ancient material will be preserved and design reproduced in the proposed renovations. The mosaics of the twelfth and thirteenth centuries still occupy their original place above the tribune arch, within and laterally to the apse, on that higher surface over the vault, representing the four well-known symbols of the Evangelists, each holding a jewelled book (details set aside by later art); and at the centre, over the keystone, the cross with A. and W.; at the spandrels, the colossal figures of Isaiah and Jeremiah, each holding a scroll that displays words from their prophecies referring to the birth of Christ. Within the apse is the most striking and splendid mosaic group. The Son embraces the Mother with his right arm, and holds in the left hand an open book, showing the words, *Veni electa mea, et ponam in thronum meum*; while she displays a kind of tablet, with the text from the Song of Solomon,—"*Læva ejus sub capite meo*," &c.; and on either side are figures forming a stately group, of treatment admirable indeed, considering how early the art-period. Innocent II. (pontifically vested, but bare-headed, holding the model of his church), St. Lawrence (in rich deaconal vestments, with a back-slung cross), Calixtus I. (with a book), St. Peter (with a scroll), the Popes Cornelius and Julius I. (both with books), and Calepodius, a martyr, whose remains are in the confessional chapel below. In this group the pontiffs are alike vested in embroidered chasubles and stoles, but without mitres; St. Peter, in white robes of classic fashion, with the mystic tau on the hem of his toga-like mantle. Beneath is another series of mosaics, on a smaller scale, all ascribed to Cavallini, and supposed to be of about the date 1290: their subjects, the Birth of Mary, the Annunciation, the Nativity, the Adoration of the Magi, the Presentation in the Temple (or Circumcision), the Death (or, rather, Funeral) of Mary, attended by all the Apostles; at a lower level, within the curve of the apse, another group, comprising the half-length figure of Mary with the Child, SS. Peter and Paul on each side, and below, presented to the Virgin by the former apostle, a kneeling personage, with name inscribed,—*Beroldus Filius Petri*,—this being the portrait of Beroldo, son of Pietro Stefaneschi, who was major-domo to Pope Nicholas IV. at the time he ordered this *ex voto* picture, as well as all the others in mosaic of Cavallini's execution on the lower walls of the apse. In the foreground to that of the Nativity is the subject introduced as accessorial, of the miraculous oil-fountain, which appears gushing from below a river mansion (the *taberna*), and flowing into a river near the foot of a hill, this being explained by one of the lines of the poetic couplets inscribed underneath all those mosaics on the lower range.\*

As to types of countenance in these compositions, the larger heads display a degree of individuality and expressiveness remarkable for the period of the work: the Saviour's head, with dark hair and short beard, sternly characterized; the Virgin's, soft and pleasing, with long fair hair escaping from her jewelled diadem.

To report further on the works now progressing at this basilica, the interesting nature of which alone can justify us in bringing a subject otherwise so far from new before our readers: it was in the last winter this undertaking was commenced by order of Government, and with the designs of the architect so much engaged by Roman authorities. Much remains still to be done, and activity does not seem to flag in the prosecution of the task. Already has the interior assumed quite a new aspect,—less interesting, as it strikes us, than formerly. That beautiful pavement has been in great part re-

\* Much better than in the originals may these minute details be appreciated, in a series of coloured drawings from the principal mosaics of Rome's churches, done by commission of Cardinal Barberini, in 1640, and now at the library of that family's palace.

moved, and the level lowered; a new lighting has been secured, by enlarging and adding to the number of the arched windows along the attics; and above the portals three such windows, instead of the single one formerly in their place, now contribute to dispel the harmonious twilight that used to prevail. The intervening spaces of the entire attics are divided by fluted pilasters and arched aisles, these to be eventually adorned with fresco-painting, not yet in any instance commenced, nor (we apprehend) likely to prove in accordance with the more antique features of this sacred building. The coffered ceiling, one of the most splendid examples of its kind, from designs by Domenichino, is also undergoing some renovation of its profuse gilt and coloured details.

As it is determined considerably to lower the entire pavement, and that fine old *intarsio* work has been already in great part taken up, we now see brought to light an interesting feature of the church anterior to the twelfth century, and at the same time a proof that even at that latter period a modernising taste had begun to sacrifice the distinctive features of Rome's earlier basilicas. Where the *inkisi* marble surface has been removed, near the present choir, are displayed below its level the foundations of the original chancel, advancing from the high altar nearly to the middle of the nave, with projecting wings on each side for ambones,—proof that the construction of this inclosed apartment must have been similar to that preserved to this day, happily unaltered, at S. Clemente, on the Coelian Hill (of the eleventh century), and, no doubt, like the latter, surrounded by marble screen-work with rich chiselling, affording ample space for the *schola cantorum*, in which choristers and clergy were entirely separate from the laity at worship. We may infer that it was in the church of the eighth century these features entered with such conspicuous character into the architectural plan, disregarded, with little of taste or intelligence, indeed, in the restorations of Innocent II.

The actual edifice is rich in sculptured monuments, of dates ranging between the fourteenth and sixteenth centuries. Especially noticeable among them is one, under a canopy, with recumbent statue and reliefs, to Cardinal Philip d'Alençon, nephew of the French king, Philip le Bel, and deceased 1397. This work, together with a richly-sculptured altar near it, erected by the same d'Alençon, in honour of SS. Philip and James, being given in engraving by Agincourt, and referred by him to the sculptor Paolo Romano, of the fifteenth century; though German critics (see the *Beschreibung Roms*) assume the altar to be the earlier, the monument a later and comparatively inferior art-work. Another monument, of the sixteenth century, has a bas-relief on the summit, the Annunciation, and is said to be from a design of Michelangelo; and above this is set into the wall a specimen of very different art, here indeed inappropriate, but intrinsically valuable, two antique mosaics, attached though not belonging to each other; one a marine view with harks, fishermen dragging nets, dolphins, a portico on the distant shore; another representing aquatic birds, designed and coloured with much freedom and effect; both said to have been found among the ruins, or at least on the site, of the *taberna mercatoria*, where invalid soldiers were quartered, and therefore referable perhaps to an early date under the Empire. It is satisfactory to perceive that the various monuments in this church are not likely to be exposed to any danger or disturbance from the works now progressing. St. Maria in Trastevere is a striking example of the somewhat barbaric magnificence and systematic spoliation of the antique, with and by means of which the Medieval popes raised such splendid temples for cathedral-worship; but it may be doubted whether the edifice invested with its characteristic features by Innocent II. will gain either in religious grandeur or symbolic beauty through the renovations under Pius IX.\*

THE ART-UNION OF LONDON.—The Exhibition is now open. It contains paintings in oil and water-colours, and works of sculpture, that deserve examination.

\* In a modern Italian "Guida di Roma" by Melchiorri, the theory is fearlessly advanced that the supposed miraculous flow of oil on this site was a mere natural phenomenon; and to the credit of Rome's censorship, otherwise so utterly indefensible and hopelessly infatigable, it must be recorded that the voice of reason was thus allowed to make itself heard.

FROM ALTON TOWERS.

THE collection of works of art here, in aid of the funds for completing the erection of the Wedgwood Institute, and covering its face with chromo-ceramic decorations, has been open some weeks, and yet there is no catalogue of its most important feature, the assemblage of Wedgwood ware; while the list of paintings and drawings that is published is incorrect and poor. The management evidently has not been fortunate. Still there are many good things collected; and we sincerely hope, for the sake of its object, that the result will be satisfactory in a financial point of view. Amongst the Wedgwood works, Mr. Majoribanks's chimney-piece, composed of plaques of the ware let into white marble, the former wonderfully well preserved, crisp and beautiful, will give pleasure to all examiners. So, too, will the terra-cotta head of Flaxman by himself, and, as illustrating the admirable man at the bottom of the whole, Sir Joshua's picture of Wedgwood, and Fontana's bust of him. Two portraits of Flaxman, one by Derby, the other by the Academician Jackson, are widely unlike each other, but are both good pictures. The Chancellor of the Exchequer has sent a wonderful ewer of crystal and jewels; and Mr. Beresford Hope, who has set his heart on finishing the proposed Institute in ceramics, lends a few of his rare things to aid and brighten the collection. The South Kensington Museum is the chief contributor, and has done right well: some of the works by students, flower paintings, and has yet sent out Mr. Leighton's Nicola Pisano (now executed in mosaics at Brompton), stands out finely; and many of the best water-colours are lent by the Museum.

Most of our readers will recollect that Alton Towers (Staffordshire is the county) is a modern Gothic pile, commenced at the beginning of this century, and continued by Pugin. We were about to say finished by him, but that would not be correct; for, the great hall remains half done, the handsome roof well painted and gilt, the woodwork below, and the fireplaces, waiting completion. The house, for the most part, was dismantled by the antiquator, unluckily, some few years ago; but the rooms themselves are quite sufficiently interesting to justify a visitor in getting admission to them. The time may come, let us hope, when the rooms will be again filled with rare and noble objects. The family motto scattered here and there over the building, says,—"*Prest d'accomplir*." we accept it as an omen.

Touching the grounds, we must use very much stronger language than in the case of the house: they are perfectly charming,—the Eden of Staffordshire. A wonderful irregularity of level, equal to mountain and valley; bright smooth sward and glittering water; a countless variety of exquisite and often rare trees; prim Italian gardens, and elsewhere a glorious wildness of sward and most vigorous nature, conspire to make a whole scarcely to be surpassed. A forest is given on arriving at the railway-station, where an unfinished convent on the opposite side of the valley, high appeared on a rocky cliff, and embowered in foliage, makes a scene more like one on the Rhine or the Danube than in an English county. But the visitor must wait till he reach the terrace next the conservatories, and gaze thence into the valley below and up the sides of the hill above, before he can fully appreciate the beauties of this most lovely morsel of green and leafy England.

CYCLOPEAN MASONRY, AND THE BUILDINGS OF JERUSALEM.

IN the course of the articles that have appeared lately in our pages, on Mr. Fergusson's views concerning the Holy Sepulchre, mention was made of the masonry of the Haram. Some account of the masonry of the same description, and that which is analogous, may therefore be interesting to those who have not at hand, the works of Dodwell and others, and particulars of the researches in Palestine, of M. E. Renan, as given in the *Moniteur* about three years ago, and mentioned by us at the time. M. Renan paid particular attention to the rebated masonry, regarded as Phœnician.

The most ancient masonry of which any remains exist at the present day, is that which is found in the walls of one or two cities of Greece and Italy, unless indeed the Pyramids be ex-

cepted. The fortifications of Tyrus and Mycenæ, places noticed by Homer as famous for their strength, and to which he gives the appellations of *σχυρῆσιμος* and *ρεχαιοσσαο*, are of this style, which has received the name of Cyclopean. The ruins of their walls, which are the only remains, are formed of enormous blocks of uncut stone piled upon one another, the interstices being filled up with others of smaller size, and the whole resembling a dry-stone wall on a gigantic scale.

The great antiquity of these structures is attested by the absence of the true arch, and by the various primitive expedients adopted to compensate for the want of it. The most simple is that which is used at the Gate of Lions at Mycenæ, where the arched form is not even attempted; but two enormous blocks being set on end so as to form the two side piers of the doorway, a third block is superimposed, making a solid lintel, the height of which is double that of any other stone in the surrounding wall. At Tyrus, a second mode was adopted, as is seen in the galleries which form part of the fortifications, where the space from pier to pier is spanned by one great stone hollowed out underneath, in the shape of a pointed arch, while the whole is roofed in with similar blocks cut at an angle of forty-five degrees, so as to form a pyramidal vaulting. At Thoricus is found a gateway cut in this manner, through three courses of stone; and at Arpino, the height of the entrance is equal to five. At Segni, in Latium, a compromise between the two methods is to be observed; and the arched form being given to the stones to the height of two or three courses, the whole is capped with a flat lintel of one block. Last of all these methods must be mentioned that which is found at Missolonghi, where the gateways are cut out of the wall in the shape of an isosceles triangle: and that which is used in Dolos, where the galleries are roofed in with stones set lengthways, and meeting at an angle supported on others standing on end after the manner of posts. This last method approaches that which is used at Tyrus.

In the earliest specimens of this masonry, the art of cutting stone appears to have been almost unknown; and except in the cutting of the entrances and galleries of the walls, to have been hardly ever used. But with the gradual advance of skill in building, it became necessary that this art should be made use of, and accordingly the ancient builders began by degrees to fit the polygonal masses of stone, which they still retained, into one another, so as to form irregular joints, while at the same time the outer face of the block was reduced to something approaching a plain surface. Thus, without losing its original characteristic of the polygonal shape of the stones, and without improving the structure of its arches and entrances, the Cyclopean masonry was by degrees improved by a more extensive use of cut stones.

A second and more improved style is that which is generally known by the name of Etruscan. Though evidently and naturally derived from the Cyclopean, it is yet perfectly distinct, and shows a more advanced state of architectural knowledge. Specimens of this are to be found at Fiesole, Volterra, Cosa, and Populonia, and at Todi, where the masonry approaches nearer to the regular masonry of the Greeks.

It appears as though, when the cutting of stone became more generally used, the blocks were gradually shaped with more regularity, until at length nothing remained of the old polygonal style except in the irregularity of the joints, which were not vertical. Numerous examples of transitional styles are also to be found. At Cosa, the lower *strata* (for courses they cannot be called) are of the Cyclopean character, and the upper ones of a rough Etruscan style, formed of blocks little inferior to the former. At Populonia, the stones are roughly squared, but only partially formed in courses, while small stones are inserted in all parts, of a size which is not greater than that used in building at the present day. At Volterra, and other towns, some of the stones are square, and others have portions cut out of them at the corners, into which corresponding pieces, forming part of other blocks, are fitted. The structure of the entrances and false arches in the Etruscan is still the same as in the Cyclopean work, and the advance from one to the other will easily be seen, if the transitional examples be observed. One instance exists which, though belonging to the general class of gigantic masonry, yet stands almost alone by itself; it is

that of a wall in Peloponnesus, the upper courses of which are of a kind of Cyclopean, and the lower of a style even more advanced than the Etruscan, the joints being perpendicular, and the edges of the stones finished with a broad band of rebated work.

The greater part of the masonry in question is ascribed to the Cyclops of ancient mythology, a gigantic race, who inhabited part of Greece and Italy; and wherever in other countries besides these the remains of similar megalithic masonry is found, there will also be found traditions of an ancient race, now passed away or entirely destroyed, who surpassed in stature and strength the men of later time.

Although it has been doubted by modern architects, to what historical race to attribute the Grecian remains, yet one thing is evident, that they must have been the works of men who had either greater skill or greater strength than those who succeeded them; and the idea of any superior amount of knowledge or skill is precluded by the appearance of the ruins themselves, which, rough and unshaped, evidently belong to the very infancy of art, to a time of the most primitive ignorance; and thus the only means by which they could have been erected is the superior physical strength of their builders.

It might be expected that in Palestine, and especially in the neighbourhood of Jerusalem and Bashan, the stronghold of an historical race of giants, some remains of masonry similar to that already described should have been discovered; and this expectation is increased by the names yet lingering round the capital which connect it with the ancient race of the Rephaim, and by the unusual size of the masonry of later date which is found there, as well as in other parts of Palestine.

The walls of the famous Golden Gate show a curious mingling of masonry of different dates; they descend to the patchwork of the modern Arabs, and they go back to an unknown age; for, on each side of the entrance is an enormous block, more than 15 ft. in height, and with all its dimensions of corresponding magnitude. That these two are of greater antiquity than any works of Solomon is clearly proved by their present appearance, as will afterwards be shown; while in their proportions they throw into the shade all the works of the mythological giants already mentioned.

That the wandering tribes who inhabited Palestine from the times of the early patriarchs to the date of the final settlement of the Israelites, should have occupied themselves in any great architectural works, will only be received on sufficient evidence, and will not be taken for granted; but there are records of a more ancient race, the original inhabitants of Canaan, famous for the magnitude of their buildings and for the height of their walls. The children of Ahiman Sheshaioud Talmai, the sons of Anak, still dwelt beyond Jordan in the days of Moses. The remnant of the Rephaim lingered about Jerusalem and in the country of Bashan. The Emims dwelt among the Moabites, and the Zamzuminis remained in the country of the children of Ammon. All these were people great and strong, whose cities were walled to heaven.

According to the rabbinical writers, who hide under fables exaggerated and often ridiculous, a thread of history or tradition, the first ancestors of these races had become the servants of the family of Abraham; and being first subjugated by Noah, only rebelled against his descendants on their departure into Egypt. It was during this period of subjection of the gigantic race that Jerusalem was first built by Melchisedec, who is supposed to be the same as Shem, the son of Noah; and it is, therefore, not improbable the city was first fortified by the labours of the giants, and that the two great blocks before mentioned are the relics of their work.

It may, perhaps, be argued that it is impossible from so few remains to prove the origin of Jerusalem; yet it will appear but natural that hardly anything should be left of the buildings which existed before the invasion of the Israelites, if it be remembered that they were expressly enjoined to destroy utterly the heathen cities; so that the very scarcity of this masonry would furnish fresh proof of its date as being previous to the time of the exodus.

The history of megalithic masonry is carried on in Palestine until a style is found which connects the Cyclopean with the masonry of modern days.

It has been shown that in the Etruscan, the masonry had nothing left to show its origin, except the irregularity of its joints; and now in

Baalbec, Bashan, Hebron, Passargade, and Jerusalem is to be found the next step towards perfection.

The rebated masonry before mentioned as existing in Peloponnesus, is of this character, and its presence below as species of Cyclopean shows its great antiquity. The stones found in Palestine and the East are of a more finished character, beautifully grained and polished; while all round the edge of each block is a sunk band or border, that which is known by the name of rebating.

The stones are very long in comparison with their height, the depth of each course being less as it approaches nearer to the top of the wall; and in size they rival the Cyclopean. Marks of imperfection are still visible in the unequal lengths of the stones, and in the want of attention paid to the beds out of which they are cut; some being taken out of soft strata, appear to be of a great age, eaten out with the action of the weather, and crumbling in decay, while others, cut from more durable material, remain fresh and untouched, as if only just taken from the quarry. The arch is still either unknown, or at least never used, and the same method for covering the doorways is used as at Mycenæ; for, two great piers being built up are capped by a solid lintel, equalling in height two courses of the surrounding masonry; and in it, as at Mycenæ, the joint is broken by cutting it shorter, about half way up, so as to fit exactly into the stones of the parallel courses: thus the alternation of the joints is preserved, and the displeasing appearance of one long vertical division is avoided.

Thus the rebated masonry of Palestine forms the next step in the advance of architectural skill. It is found at Passargade, in Persia, though of an inferior size, as late as the time of Cyrus; and it is still used in the palace of Hyrcanus, near Bashan, about a century before the time of Herod; but it disappears in the monuments erected in Jerusalem in his time. At Baalbec and Hebron, it goes back to an unknown date; and in the Holy City it is found in the oldest parts of the city and Temple. That it immediately succeeded the earlier masonry found at the Golden Gate, is evident from the presence of false joints made in the blocks, and simulating the rebating, which is the principal characteristic of this third style of megalithic masonry. From its appearance in the walls of the Temple enclosure, it must be referred to one of two periods, either to the time of Solomon, or to that of Herod; and since it disappears from the monuments of Herod's time, and is replaced by another and more advanced style, it can only be attributed to the time of Solomon.

The appearance of the rebated masonry gives two fresh indications of the truth of the theory that Jerusalem is to be classed amongst the cities of the giants. In the first place, it shows the antiquity of the former style, found at the Golden Gate, and refers it to an age previous to that of the Jewish supremacy in Palestine; and secondly, the size of the stones themselves seems to indicate some original gigantic style, from which the present one was copied: blocks of such a size that, as in Solomon's house and in the palace of Hyrcanus, in Bashan (the stronghold of the giants), the whole height of a lofty building was only equal to three courses, were above the strength of the men of Solomon's time, when only a remnant of the giants remained, and these for the most part destroyed by David's mighty men. And here, therefore, skill and knowledge are first found taking the place of human strength.

The great stones were cut and finished in the mountain quarries, moved on rollers, and raised by means of lewis-holes, as is still evident from their present appearance. But if it now required such labour and pains, why were such extraordinary dimensions still preserved? What could have been the reason that such colossal blocks should have been used in Palestine at a time when other nations built their strongest walls of brick, or of stones of ordinary size? Unless indeed the great monarch who first repaired the ancient Cyclopean walls which his father David was unable to rebuild, was unwilling to be inferior in massive grandeur and strength even to the ancient race of the giants.

If Solomon were unwilling to be surpassed by his predecessors, Herod was not less so to be inferior to Solomon. He could not surpass, but he could equal, the enormous size of his works. The beauty given to the walls by the break in the plain surface formed by the rebating was perhaps necessary to the unornamental architecture of the Hebrew masons, who had copied

the works of Solomon, and thus made them the foundation of a Jewish style; but with Herod a new spirit came in, and the rich mouldings and graceful orders of later Roman architecture forming sufficient ornamentation, he did away with the irregular appearance given by the unequal lengths of the stones and the consequent irregularity of distance between the vertical bands of the rebating, and substituted a style of colossal Roman masonry, plainer, indeed, than the Jewish, but more regular in its courses and in its joints.

Thus arose the fourth gigantic style found at the present day at Hebron, Jerusalem, and Herodium, a city entirely built by Herod. The stones of this masonry are nearly square, and some even deeper than they are long. They are all perfectly plain, well grained and polished, and laid in beds of equal depth, and not decreasing as they approach the top of the wall, as in the Jewish style. The joints are nearly at equal distances, and placed alternately in the courses, so that the masonry has reached a state almost of perfection. The clumsy expedients of his predecessors were at the same time laid aside by Herod, and domes and flat elliptical arches, hold viaducts, and vaulted roofs appear in their stead. Roman orders, Roman mouldings succeed the Jewish styles; great towers were built, fit to withstand the battering-rams of ancient warfare, with solid bases, to move one stone of which required the work of many days. In short, the colossal masonry has advanced by degrees until it has attained almost to perfection, and until it is only necessary to reduce its dimensions to find in it the masonry of modern times.

The fall of Jerusalem seems to be the close of its history; and, although Constantine's columns recalled those of the second temple, and the works of Justinian are described as gigantic, yet the walls of the former are only of ordinary proportions, and even the greatest works of the latter fall far short of the masonry of Herod and Solomon.

Thus the history of Cyclopean masonry has been traced from the first rude stone fences of Tyrrus and Mycenæ, through the first advance of the Etruscan to the ornamental character of the Jewish, until it attains its highest point of perfection in the Roman of Herod. In doing so it has been gradually brought out that Jerusalem is to be classed amongst gigantic cities,—a conclusion which is confirmed by the words of Scripture, and which gives additional interest and importance to the after-history of the Holy City.

#### PROFESSOR WILLIS ON SHERBORNE ABBEY CHURCH.

The Archeological Institute has wound up its congress at Dorchester. One of the principal features of the meeting was Professor Willis's description of Sherborne Abbey Church. We give a report from the *Sherborne Journal*.

Professor Willis said, he should bring forward documentary evidence relating to the church, which was a splendid example of the different architectural styles. It had an undoubted Norman tower, Norman transepts; a fine Perpendicular nave, with decorated windows; a Norman porch, with a front containing a *mélange* of all the changes and additions, and ending with a Perpendicular window. There was this peculiarity distinguishing Sherborne Church; at the west end were the remains of a long wall, evidently the side wall of a church, authorising antiquaries to believe that a parish church stood adjoining the present structure; indeed, Hutchings, in an ancient map, indicates the ruins more distinctly, and marks them as "ruins of a parish church," showing that it must have been more perfect in his time. He then said the first documentary evidence was a dispute between the monks and the laity which led to the building of the present Perpendicular church. Hutchings gives another document from the record of Neville, Bishop of Salisbury. This was a mere abstract, and somewhat unintelligible, and he had, therefore, obtained a sight of the document, of which he read an abstract. It was an ordinance made by Neville, Bishop of Salisbury, "between the abbot and convent of Sherborne and the parishioners," dated January, 1436. It related to the well-known quarrel between the monks and the laity, respecting the administration of baptism and the ringing of bells. The bishop went on to say, he visited the town of Sherborne, desiring to be

informed of the matter; and, after investigation, ordered the new parochial baptismal font to be removed out of the church, and the monastery font to be restored to its pristine site and uses." In this document the curious word "clockum" occurred in reference to a *horologium*, or clock. The professor showed that the monks had been tampering with a door, so as to incommode the parishioners, proving that they (the monks) were as much to blame as the parishioners, a fact that had never been brought out before. They were given a twelve-month to enlarge the door; but the new parochial font was ordered to be forthwith removed. There was no doubt the monastery chancel served as the parochial church; but the monks, wishing to get rid of the parishioners, built them another church, but still kept the baptism to themselves, on account of the emoluments. He then quoted Leland in reference to the continuance of the quarrel between the monks and the townsmen, which ended in St. Mary's Church being set on fire and destroyed; here, however, Leland was mistaken, for a document still in existence informed us not that the church was destroyed, but that the fire consumed the choir and campanile. The church was restored by Abbot Bradford, who made the townsmen contribute towards the re-edifying of the church. The next abbot, Peter Ransome, built the west part, which was a complete unfettered Perpendicular composition, not merely a Norman building, cased with Perpendicular work; it was dated, and therefore very valuable. The nave was peculiar, being a Norman skeleton with a Perpendicular skin, and had none of its opposite pier arches of the same size. He then referred to the Norman transepts; there was a Norman chapel, containing Norman arcading of a curious kind. The church, about 1840, began to get into such a hopeless state of ruin, that it was perfectly imperative to get it restored in order to keep it at all. It had now been so restored, that on entering it appears as if it had just left the hands of the builders; and not only so, but all the ancient symbols and marks had been so perfectly preserved, that the different architectural changes could be most distinctly traced. He then entered into a history of the restoration of the church, which commenced in 1849, and was much indebted to the magnificent contributions of Earl Digby, who engaged to double whatever sum was subscribed by the public generally. The restoration of the chancel was also due to the singular munificence of Mr. Wingfield Digby.

Mr. P. Hope proposed a vote of thanks, and Mr. E. A. Freeman made some remarks on churches similar in arrangement to the church of Sherborne.

The Professor then entered into some details as to how Sherborne Church passed into the hands of the parishioners at the Reformation, having been sold by the king for that purpose.

A FEW NOTES ON PESTILENCES.

THERE has lately appeared, as every reader of the daily papers must know, in some of the dairies in and near London, a disease amongst the cattle, closely analogous to, if not the same as, that which has of late years prevailed extensively in Russia, Austria, and the eastern parts of Europe, and called the Cattle Plague, being a species of typhoid fever. The loss of animals caused by it in those countries has been very serious. In 1864, 159,476 cattle were attacked by this disease in Russia alone, out of which 104,714 died. Already 2,000 of our own metropolitan dairy cows have died in one month (July) of the same disease, and it is not only still raging in and about the metropolitan counties, but news is daily arriving in town from various parts of the country of the appearance of this pestilence in some new district. Such is the case, not only in England, but in Scotland also. Government have thought it full time to take up the question, and missives have been issued in which sanitary as well as other measures are urgently advised. In one letter, addressed to the president of the Royal Agricultural Society by the clerk of the Privy Council, it is recommended that "particular attention should be paid to the cleansing of all yards, sheds, and other places where cattle are kept; and this cleansing should be especially insisted upon where there has been any manifestation of this disease. These places should be disinfected by the free use of chloride of lime or other allied compounds."

Adverse as we have always been to the existence of cow-sheds at all in London, we have, nevertheless, often urged the sanitary improvement of those which do exist; and such instructions as those of the Privy Council, just quoted, we therefore hope will be promptly and generally acted on.

The disease made its first appearance in an Islington dairy, where, in a very short time last month, 115 cows died, or had to be killed, from having been attacked by the pestilence. Only three recovered after being attacked. The *Medical Times*, having made inquiries on the subject in Islington among the cow-keepers, states that in one of the largest sheds not a single case has happened, although, in other instances, not only have the dairy people suffered severely in Islington, but in one case every cow was lost. Of one or other of the exceptional cases, where many cows have been collected together and yet kept in health and free from the disease, it is very desirable to ascertain some details, particularly as to the means habitually adopted for keeping the cows in a generally healthy state, and more especially as regards cleanly wholesomeness and ventilation where so many animals are crowded together. That some such means have been long and habitually adopted in such exceptional cases we have not the least doubt.

One writer on the subject, in the daily press, says he believes that "the disease has been generated in the atmosphere, although there is no doubt that it is infectious now." Others blame the foreign cattle imported as having been infected or as having had the disease among them before they left the Continent. One newspaper correspondent considers that "the horrors of the middle passage," by sea, where the fearfully overcrowded cattle die by scores, are sufficient to account for the pestilence, even though the imported cattle quitted the Continent in a perfectly healthy condition; and we know that previously healthy emigrants have similarly suffered and died from virulent fever. Others maintain that the disease originated in the Islington cowsheds themselves. Professor Gamgee, of Edinburgh, however, who was the first to warn all interested of what was coming, and who has got up a new society in London for the prevention of cattle disease, is of opinion that there ought to be a foreign cattle quarantine.

As the disease is of the typhoid class, the serious question has been started, whether human beings may not suffer pathologically in consequence of its prevalence; and one physician writes to the *Star* to state that he knows, from domestic as well as professional experience, that infants fed on cow milk have lately been attacked with the typhoid symptoms, and that he has fed a kitten on contaminated milk from a cow now dead, and that the kitten very soon died with similar symptoms.

Meanwhile human beings in this country have another evil (if it be essentially another) to dread the appearance of,—namely, the virulent cholera. Although, in various parts of Egypt, the epidemic is on the decline, it is still making its appearance elsewhere, as at Constantinople, where it is to be feared it is fully establishing itself. A case or two has even occurred at Gibraltar, and it is alleged that twenty cases a day have occurred at Ancona in Italy, where there has since been a complete panic and flight: it is also reported that thirty cases have occurred at Valencia, in Spain. Without desiring to say anything of an alarmist character, therefore, it is full time we were literally as well as figuratively "setting our houses in order." We have already so fully referred to and quoted the excellent sanitary circular of the Privy Council, which responds so essentially to the sanitary advices we have for years reiterated dinned into the minds of the public as to cleanliness, ventilation, drainage, disinfectants, and as to overcrowding, and various other sanitary points, of importance at all times, but of the last importance at the present moment, that we need say no more just now than that lead.

There is one point, however, on which we have something still to say. We have hinted at the possibility, suggested by some one, that human beings in this country may suffer pathologically in consequence of the prevalence of the cattle disease. Now, whether it was in consequence of a cattle disease having occurred in Egypt within a year or two of the appearance of cholera there, that cholera also appeared, it may be difficult to say; but such is now said to be the fact, that cholera did make its attack upon human beings in Egypt within a year or two after a

pestilence attacked Egyptian cattle; and such coincidences have before occurred, not only with reference to cholera, but other plagues. This cattle pestilence or murrain doubtless resembled our own; and if so, the conjuncture is an ominous one. The cattle disease is said to be typhoid in its nature. If there be a causal connexion between this cow plague and the human one, cholera, therefore,—a sort of connexion which it is not we, be it noted, who have suggested,—there may also be some foundation for what we have heretofore suggested, that human plague and cholera (plague being a disease of typhoid character) were like the hot fit and the cold fit of an ague, too tremendous and awful for mere mortals to be capable of suffering alternately, or both in succession, although it was a known fact that virulent cholera itself was on previous occasions sometimes preceded and sometimes succeeded by states of fever; and not seldom that persons who had survived the choleraic or cold stage were cut off by the subsequent fever or hot stage of reaction.

We do not hesitate to intrude our crude ideas on this subject into public notice under present circumstances, because, considering typhoid or intestinal fever to be within our own province, as sanitary pioneers, we do not regard ourselves as travelling out of that province in again offering our suggestion to those better able to decide than we are as to its merits. We need only add, that if the human cholera and the animal pestilence be causally connected, as suggested by others, and be both typhoid in general character (and, indeed, whether they be so or not), sanitary reformers, medical or non-medical, know at all events how to advise as to essential preventive measures.

CONSUMPTION AND DISEASES OF THE CHEST.

BROMPTON HOSPITAL.—TRADES DISEASES.

THE more that inquiry is made respecting the terrible disorder which the excellent institution at Brompton is intended to relieve, the more are we impressed with its awful extent, and with the necessity there is for greatly increased means, in addition to those at present at hand, for the purpose of enabling the poorer classes and others with limited incomes to battle with a chance of success against the attacks of this dread enemy, which destroys both old and young. Before our life and death statistics had been fairly arranged, as they are now at Somerset House, many thought that consumption was especially the means of destroying young life, at the ages of from about fourteen to twenty-five years. Now, however, it is clearly shown, that in the prime of middle life, at a time when the intellect is at the brightest, there is the largest account of sickness and death from this cause. In a recent report by the Registrar-General, it is stated that of the 65,000 deaths which occur every year in England and Wales from slow and lingering diseases, about 39,000 are probably due to pulmonary consumption. One-ninth of the total mortality of all ages, and more than one-fifth of that of adults, are due to this cause; and, as the average duration of this complaint is about two years, the report says, that almost 78,000 persons are constantly suffering from consumption, being at the rate of four persons in every one thousand of all ages, and more than eight in every thousand adults.

Again, of the 60,000 deaths occurring every year in the metropolis, about 7,500, or one-eighth of the total mortality of the metropolis at all ages, and little less than one-fifth of the mortality of adults, arise from this fatal disease; and upwards of 15,000 persons, being about one in 180 of the entire population of the metropolis, and more than one per cent. of the adults, are constantly wasting away under the attacks of this lingering malady; and, says the twenty-second annual report of the Consumption Hospital,—“Of these 15,000 cases, about three-fourths occur in males, of whom a large proportion are workmen, unable to provide for themselves and families, and uniting in their own persons every conceivable claim to sympathy and assistance. It may be well to add, that many,—very many,—of these poor sufferers are the acknowledged victims of unventilated workshops, over-crowded harracks, ill-constructed dwellings, vitiated atmosphere, long hours of work, and the want of open places for exercise and recreation.” Such are the causes of consumption as they are reported, after wide experience, by the management of this hospital. We do not find among the causes of

this sickness here adduced hereditary predisposition or peculiar malformation, but only those sanitary derangements and neglect which are such a main cause of all disorders, and to which we have for so many years directed attention.

In nine cases out of ten, the cure of this disorder depends on the early application of atmospheric influences, upon the regular provision and use of proper diet, and the use of those means which the medical profession have at their disposal to regulate nervous derangements, and to alleviate the pain and mental anxiety which are more or less attendant on this disease.

In most of the general hospitals in the metropolis there is an objection to receive consumptive patients, and the places in London in which the disease can be fairly treated are not sufficient for the demand there is upon them. We do not wish to detract from the value of the other institutions that are founded for the cure and relief of chest-diseases. We find from the numbers furnished on the Report of the Registrar-General, that there are 15,000 cases of consumption which constantly need cure in London, and we believe that this number is very much under the mark; but, if we admit these figures to be correct, it is probable that upwards of 12,000 of these persons belong to the industrious and poorer classes, to whom hospital assistance is of the utmost importance. We make this statement after long and careful observation and consideration. Let us, however, see to what extent the Brompton Consumption Hospital, which is looked to as the sheet-anchor in chest complaints, is able to afford in-door relief; and this, as we have said, is, in the present condition of so many tenement houses and workshops, almost the only chance of effectual good.

In the hospital, on the 31st Dec. 1861, there were 189 patients admitted; during 1862, 927; in all, 1,116; of whom were discharged, many materially benefited, 814; died, 123; and there remained in the house, on Dec. 31st, 1862, 179. In the year before, there were only 1,096 inmates admitted within the hospital; and it is satisfactory to note that the increase of the relief has been steadily progressive; but it is certain, notwithstanding, that there are numerous distressing cases which are waiting for admission, owing to the want of sufficiently-furnished space, and means for the support of in-patients. Besides, there is a constant increase of the population; and we fear that some time must elapse before we can look for relief from the improvement, to any sufficient extent, of the dwellings, &c., in which the chief part of consumptive cases are found to be working fatal effects. Of out-patients of the hospital, the number in 1862 was 6,019; in 1861 there were 5,786; in 1855 the number of out-patients was only 3,971.

The expenses of in-door relief in connexion with the disease are very great, however careful and discreet the managers may be. Often have we been called to note the patient sufferings of those who are in this way afflicted; and we have, in homes where every endeavour has been made to cause the best appearance under wretched circumstances, seen sufferers, with a degree of melancholy patience which is indistinguishable, bearing up against the actual pain of that hunger which so often accompanies this disease. In workhouse infirmaries, too, we have seen men and women who were wolfishly hungry, but unable to take the ordinary workhouse fare. We have, in the course of our investigation, seen many sad sights; but few of them are more painful than to notice the sick who are not able to help themselves left without the means which would furnish them with the chance of renewed strength.

The revenue of the Brompton Hospital is of large amount, but it is not more than the revenue of many English gentlemen. Here a magnificent charity of princely extent is carried forward with the best medical advice, the most expensive medicine, and nutritious food in sufficient quantities. Moreover, there are many other items of an expensive character, the whole amounting to 21,933*l.* 19*s.* 7*d.*

The annual subscriptions, which are such a main dependence of this and all other establishments of this description, amount to 4,456*l.* 9*s.* 6*d.*, and the donations in the year mentioned realised 2,211*l.* 11*s.* 6*d.* We wish particularly to direct attention to these items; for, as we have shown, the present means of the hospital are insufficient for the immense demand which there is for its aid; and we trust that these notes may be a means of leading especially to the increase of this part of the income.

The demands upon the resources of the hospital, as we have before said, grow from year to year; and extra beds have been put into every available space in the present building; so that, before long, this and the London hospitals which are the more especially devoted to the treatment of lung-diseases, must either be newly built or very much extended.

Here, as is the practice at most of the other hospitals, the payment of especial sums entitles the donors to recommend, in proportion to the amount, in-door or out-door patients. For instance, every minister of a church or chapel who, by preaching a sermon on behalf of the hospital, collects a sum of 31*l.* 10*s.*, has, for every such sum, the power of recommending one in-patient and eight out-patients annually during five years, provided that such patients shall reside within the parish district in which the subscription has been made; and so on. Few London curates who work rightly amongst their flocks can fail to find many who might have been and, at the present time, could be greatly benefited by the means of such recommendations. And it must not be forgotten that it is not alone to the dwellers of the metropolis that the advantages of this institution extend; but many come from other towns or country districts on visits to friends who live here, for the purpose of getting the medical advice of the metropolitan hospitals. Since the establishment of the hospital large sums have been collected in the churches and chapels, but much more might be done in this way. For instance, from January 30, 1859, till the end of the year, the whole of the sermons preached on behalf of this charity were thirty-two; and it is curious to notice the varieties of the sums which have been collected. At St. John's, Paddington, after a sermon by the Bishop of Oxford, the subscription amounted to 221*l.* 9*s.* At another church, in Yorkshire, a ninth part of the subscription, which was sent from a church, was 1*s.* No doubt, however, the intention in the latter case was good. In 1860 the number of sermons preached was twenty-four. In the year ending 1862 the amount from charity sermons was 740*l.* 14*s.* 4*d.*; but far more than this might be gathered for the hospital if its interests were more generally advocated.

We have before directed attention to a series of letters on consumption, published by the daily press; but as this is, to a large number of our readers, a matter of life and death, we will again glean a few notes from these letters. The author refers, — in addition to the production of this terrible disease by the inheritance of a small chest, or by catarrhal disease of the throat, or bronchial tubes, — also to the trades which predispose to consumption by work which cramps and confines the movements of the chest; for, it does not matter how large and well developed our lungs may be, if we cramp the chest and prevent the lungs from being filled with fresh air: they must soon become diseased (this fact, we hope, will not be overlooked by ladies, not only in connexion with their own dresses, but also with those of the children in their care). The purity of the blood, which is the chief means of health, depends on the quantity of air taken into the lungs; and, when the chest is cramped, sufficient air cannot be received to remove the carbon; and unless it be removed, tubercles, sooner or later, follow. From this cause shoemakers, tailors, weavers, and dressmakers, are all very prone to consumption, and all callings followed in close, badly ventilated rooms, are proximate causes of the disease; for it is essential to health of the lungs that the air should not only be received in sufficient quantity, but of proper purity. Its purity depends on its free circulation and frequent removal. The air of the largest counting-house speedily becomes foul unless a constant stream of fresh air is made to pass through it. Even the air of a yard, open to the heavens, when surrounded by buildings in such a manner as to exclude currents, becomes stagnant and unwholesome. The back part of a long room opening on the public street is always filled with impure air, even though the whole front be left open. Merchants and hook-keepers are in this way constantly exposed to its enervating influence, and rendered liable to consumption. All this is absurdly wrong, since, by a simple system of ventilation, the smallest rooms can be kept comparatively pure; while, without it, the largest rooms, even with doors and windows open, become unfit for human habitation. Every room occupied by human beings, or even by brutes whose lives are valuable, should actually

be made to breathe; that is to say, should throw out a steady stream of foul air, and take in a steady stream of pure air. Where this is not attended to, the occupants soon become feeble; their cheeks lose freshness; their blood becomes thick, dark, and carbonaceous; and, ere long, their disregard of the laws of health is punished by a premature decline.

Amongst trades which expose the lungs to direct irritation, are those of stone-masons, miners, coalheavers, flax, cotton, and wool dressers, dressers of feathers and hair, brass and steel polishers, metal grinders and needle pointers, grainheavers, and rice-dressers: all these are particularly liable to consumption. The dusty atmosphere is the cause of this. Dr. Allison, of Edinburgh, says that there is hardly an instance of a mason, regularly engaged in cutting stone in that city, free from consumption at fifty years. Exposed to the inhalation of fine particles of sand, dust, and powdered stone, the masons generally die before they reach forty.\* An immense proportion of the miners of Cornwall, in England, are destroyed at an early age by chronic bronchitis and consumption.

The miners engaged in cutting mill-stones in the great quarries at Waldschat on the Rhine, are all said to become consumptive. The quarrymen at St. Roch, in France, are so liable to consumption, that among them the disease is known by the name "la maladie de St. Roch;" and we are told that in the commune of Meunes it has increased to an alarming extent among the people who are engaged in the manufacture of flint. Sir James Clark says that in the two principal machine factories at Leeds, he only found two filers who had reached the age of forty-eight. The condition of the grinders is still worse. Dr. Knight found in Sheffield 2,500 of those workers: of these eighty men and seventy boys were fork grinders. They grind dry, as it is called, and die at from twenty-eight to thirty-two years of age. The razor-grinders grind both wet and dry; and they die at from forty to forty-five years of age. The table-knife grinders work on wet stones, and they live from forty to fifty years. The employment of flax and hair dressing is generally unhealthy; and in manufactories of this kind, as the atmosphere is more or less affected by the dusty particles, so are health and life of less or greater duration.

We are pleased to notice that medical practitioners of advanced intelligence are attaching more and more importance to sanitary means for the prevention and cure of the most fatal of those diseases which affect humanity; and that, instead of taking the blood away from sickly and weakly people, they are striving to make blood both more pure and more abundant, — not by copious draughts of drugs, but by regimen and by the administration of wholesome air in sufficient quantities.

#### THE SUPPLY OF WATER TO OUR TOWNS.

The subject of the supply of water to the metropolis, and to the different towns, continues forcing itself on public attention. In the metropolis, the quantity is deficient, — very much so indeed from the manner in which it is supplied, — and quality is becoming deteriorated by sewage of towns above the sources of supply. At the meeting of the Metropolitan Board of Works, on the 4th inst., Mr. Peew called attention to the inadequate supply of water to the inhabitants of Camberwell. Sir John Thwaites said the Board had no power to interfere with the companies. Mr. Legg said that a great quantity of water was allowed to run to waste, which, if collected, would remedy the evil; but Mr. Richardson said there was no water supplied between Saturday and Monday, and for forty-eight hours the public were without water.

At Bolton, the corporation have issued a notice calling attention to the low state of the corporation reservoirs, stating that the quantity of water was "now getting into so small a compass as to be quite alarming," and expressing fear that "the next move would be that they

\* It was Dr. Allison's advice to stone-masons, as a preventive of dust-breathing, to wear their beards, especially the moustache, and which was quoted from the *Builder* throughout the newspaper press of the three kingdoms, together with our own remarks and recommendations, then and subsequently circulated in the same way, that originated what we then called "the moustache movement," which other periodicals, but, above all, our *land* became, what it may now be said to be, a bearded nation as of old.

would have to stop the supply for all manufacturing purposes." At present the reservoirs contain 68,000,000 gallons, which is 52,000,000 less than at the same time last year, and it is only equal to a month's supply at the ordinary rate of consumption.

Great efforts, however, are being made to amend a similar state of things in other towns.

The directors of the Sunderland and South Shields Water Company are taking steps to obtain another pumping station. In the company's Act of 1859 powers are given to purchase three additional sites. The company is now supplying upwards of three million gallons of water a day, pumped from the Hambleton, Fulwell, and Cledon Stations. The towns and villages supplied are Sunderland, South Shields, Whitburn, Boldon, Westoe, Jarrow, Jarrow Docks, the manufacturing establishments at Highburn Quay, Southwick, &c., comprising a population of 150,000 people, and immense manufactories. The company have at present a supply more than ample for all demands; but, looking at the rapidly-increasing population within the area of supply, the directors are anticipating the requirements of the next eight or ten years. The new works will be a little to the south-west of the Stockton-road, leading out to Ryhope village, where a shaft will be sunk, and two pumping-engines, of 100-horse power, erected, and a reservoir capable of containing two million gallons of water will be proceeded with. An abundant supply of water exists, as it was met with in the sinking of the shaft of Ryhope Colliery. The works are expected to be completed in two years.

At Hawick the Water-works will be inaugurated in September. The ceremonial will take place at the reservoir on the banks of the Allan, about four miles from the town.

In Kelso, some time ago, a water tank was erected, and water forced up into it from the Tweed, at a cost to the town of about 3,000*l*. A good deal of discussion has taken place in the locality as to the quality of the water; and the Police Commission Board—the governing body—sent to Edinburgh two jars of the water in order to get it analysed by Dr. Stevenson Macadam. At a recent meeting of the commissioners the result of the analysis was made known, which would appear to be of rather an unfavorable character. The water in No. 1 jar, taken from the tank lately built, had of total saline and organic matters dissolved in one imperial gallon, 7.20 grains, and hardness 3". In No. 2 jar, the total saline and organic matters dissolved in one imperial gallon 6.88, and hardness 3"; the water in the last was taken from a pit in the Tweed, on the south-west side of the river. Though Dr. Macadam does not regard the water as positively unwholesome, he says it is "of inferior quality for general household use." In his reports he also alludes to the difficulty of purifying large volumes of water already contaminated with organic matter, and to the great expense of constructing and maintaining suitable filter beds, and recommends that search should be made for spring or at least purer water. Mr. Brunless states that the River Tweed produces a water much softer and purer than many English rivers, but that it requires filtering, and he submits a plan which would cost about 1,000*l*.

In Kirkcaldy a meeting has been held in the Town-hall on the subject of the water supply. The provost at the outset stated that a numerously-signed petition had been presented to him regarding the water-supply so far back as the month of September, 1864. At the time it was believed the water of the Tiel was quite good enough for all purposes, and that the supply to be obtained from that source would be ample. Subsequent investigations, however, had proved this to be a mistake. It was then thought that a supply might be got from Lochgelly; but it was found this water was only second-class. Then the Lothrie scheme had been proposed. This water, flowing in great abundance from the Lomond Hills, had been analysed by Professor Penny, of Glasgow, and Dr. Macadam, of Edinburgh, and had been found very superior to the others; indeed, it was everything that could be desired. The expense of bringing in the Lothrie water had been roughly estimated at 40,000*l*, giving 85 gallons a day for each person in the Parliamentary burghs of Kirkcaldy and Dysart; and the question was, How was this 40,000*l*. to be raised? Whether was it to be done by the formation of a water company, or by assessment? The provost's own opinion was, that it

ought to be done by assessment. After deliberation, the meeting decided in favour of the Lothrie scheme.

THE WELSH MEMORIAL OF THE LATE PRINCE CONSORT.

THE statue raised by the people of Wales in memory of "Albert the Good" is now unveiled, and stands a prominent object at Tenby, on the coast of South Wales. The weather at the inauguration by Prince Arthur on the part of Her Majesty was favourable, and the proceedings of the ceremony went off well. Thousands of people flocked to the town, and arrivals by steamer and train continued to pour in even after the ceremony had been concluded.

The monument consists of a statue of the prince, 8 ft. 9 in. high, carved from a block of the finest Sicilian marble. It stands upon a pedestal 18 ft. high, which is formed of grey marble (the native limestone of the district), and has four engraved panels of Sicilian marble. The figure stands with the head uncovered and baton in hand, attired in field marshal's uniform, and wearing the mantle and collar of the Order of the Garter. The artist was Mr. John Evan Thomas, a native of South Wales, and the work is spoken of as one of the finest of this artist's productions. The likeness is considered to be a striking one. The front panel forms a tablet, upon which the following inscription is engraved in large and ancient characters:—

"Albert Dda, Prifod Ein Gofloffus Frenhines, Victoria (Albert the Good, Consort of our beloved Queen Victoria). This memorial of his Royal Highness Prince Albert was raised by the inhabitants of Wales, and inaugurated at Tenby, by his Royal Highness Prince Arthur, his third son, on the 2nd day of August, 1864."

The statue is placed in an elevated position on the Castle Hill of Tenby, a peninsula jutting out into the sea from the town; and its elevated position brings it on a level with the top of the spire of the parish church. It is, therefore, visible at a great distance at sea and from the land.

A somewhat remarkable coincidence is connected with the ceremony. About 400 years ago the Earl of Richmond, afterwards Henry VII., sought shelter at Tenby, with his mother, after being besieged in Pemroke Castle, and was lodged by Mr. Thomas White, then mayor of Tenby and a wealthy wine-merchant, whose monument still stands in the parish church here. Mr. White provided a vessel for the royal fugitive, which conveyed him safe to Brittany, a service for which he was afterwards rewarded with a grant for life of the king's lands around the town. It is rather a curious fact that, on the present occasion, a lineal descendant of this Thomas White—Mr. George White, also a wine-merchant—is now mayor of Tenby, and thus he becomes associated with another event connecting this out-of-the-way town of Tenby with the national history.

GOVERNMENT APPROPRIATION OF DESIGNS.

A REPLY has been sent, through Lord Cowley, to the claim of Mr. Maw and Mr. Payne for recognition of their authorship of the design which is about being carried into effect in the building for the Paris Exhibition of 1867,—and which design, as our readers were reminded last week, we had published in 1861; but it is regarded as little better than evasive, and showing unwillingness to acknowledge the English authorship. Meanwhile, we are glad to see that Mr. Maw's letter to the *Times* has been given in the *Avenir National*, with a postscript warmly advocating the recognition.

Our own Government is not blameless in its treatment of inventors. A correspondent addressing us on the subject, says,—

"Before censuring the French authorities too much, let us consider the number of instances in which our Government have been guilty of doing the same thing. Take the Board of Admiralty, and the vast improvements and inventions that have been brought out to forward the perfection of our iron-clad fleets. I will mention one case in particular. Your readers may recollect the debates in the House of Commons respecting the state of the bottoms of armour-plated ships. Experiments were tried, and without effect (such experiments as any boy who had learnt at school the rudiments of chemistry would be certain would increase galvanic action to a great extent

instead of preventing it). An invention was brought out, and particulars were sent to the Admiralty; but the inventor was told that the Board did not think adoption of the invention advisable,—reasons being refused, and their lordships at last saying that they did not undertake to point out any particular defects.

Some weeks later, the *Royal Sovereign*, iron-plated ship, was docked, and coated exactly on the system recommended, except as to the mode of fixing. The vessel has made a trial of one year, and the plan is proved to have answered most successfully; yet the Lords of the Admiralty have never acknowledged the inventor, or even thanked him; and I am told that the plan is being used in other cases. Such events as these take place in a country boasting much of education; but what is the use of our annual grants of money to public institutions, our museums, and naval schools of architecture, when the very men who vote for these grants refuse to acknowledge any benefits derived from them, and throw back those who by hard study bring out things for their country's benefit? I say then, can we as a nation charge our neighbours with usurping the rights of others while we are doing the same thing ourselves? Had Messrs. Maw and Payne patented their invention, they would have had no trouble in the matter. I do not think inventions should be patented that are used only by the governments."

A concluding expression, in the letter, of expectation that the French authorities would behave better than our own officials, it will have been seen, has not been yet justified by the experience of Messrs. Maw and Payne. The writer proposes that there should be a committee of scientific men, composed of civil engineers, architects, &c., to protect and help to forward inventions, if for Government or sanitary uses, and likely to benefit the country, in order that the inventors may be recognised and remunerated by the nation, and by those who in some cases claim the credit to themselves.

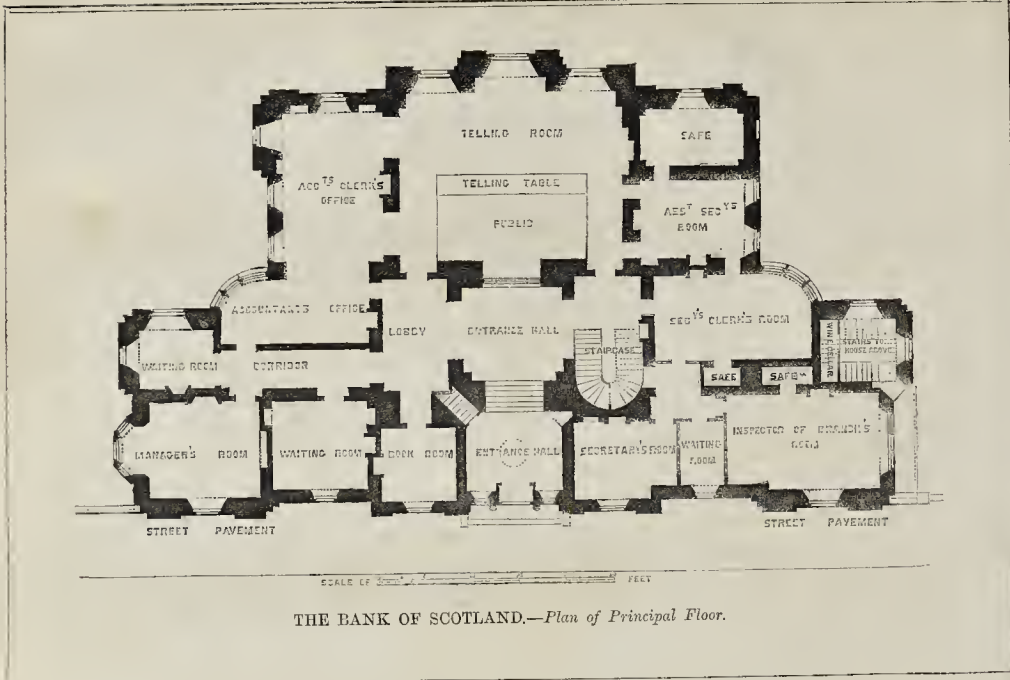

HEAD-QUARTERS OF THE FIRST SURREY RIFLES.

WE are glad that there are indications of the permanence of the Volunteer movement; and amongst them we may place the erection of buildings for the Head-Quarters of the First Surrey Rifles. These buildings were officially opened by the Lord Lieutenant of the county on the 1st of July.

About four acres of ground having been taken by the corps, at Camberwell, upon a long building lease, buildings of a substantial and permanent character were erected at a cost of upwards of 5,000*l*. The designs were prepared by Mr. J. T. Lepard, a member of the corps, who has acted as honorary architect. Mr. Winder was the builder. The internal arrangements are well suited to the object. The external effect of the buildings has been produced by coloured brickwork sparingly introduced. The principal feature of the plan and group is the drill-shed. It measures on plan, 150 ft. by 52 ft. in the clear; and its greatest height is about 40 ft. The roof is constructed with polygonal-framed ribs, semicircular in general form, 12 ft. 6 in. apart, and each of three thicknesses of plank,—one 1½ in. thickness between two ¾ in. thicknesses, in short pieces breaking joint,—and connected with the principal rafters, similarly to the arrangement in the roofs of the annexes of the Exhibition Building of 1862. The common rafters are laid as purlins; and on these the boarding is laid diagonally, the external covering being slate. A lantern-light extends the entire length. There is a commodious gallery for visitors at one end of the building, approached by a wide staircase. The floor of the shed is formed of wood-block paving, laid by Mr. Caray.

The men's room and canteen measure 52 ft. by 24 ft., with bay adjoining. The room overlooks the parade ground; and it has attached to it, the lavatory, a dressing-room with upwards of 400 lockers, and a yard with various conveniences. The plan also includes an armory, with armourer's bench and stands for 1,200 rifles; an orderly-room, a non-commissioned officers' room, quarter-master's office, separate rooms for the secretary and the adjutant, and a room for the committee. There is also an officers' room, with dressing-room, lavatory, &c. attached; and there are residences, with distinct entrances, for the sergeant-major, and the canteen-man, with their families, and extensive

THE BANK OF SCOTLAND.—Plan of Principal Floor.

cellarage. It is intended at a future time to increase the accommodation here mentioned, by the erection of additional committee-rooms, and a concert-room, 65 ft. by 26 ft., with a large balcony facing the parade and drill-ground. The arrangements are well suited to the purpose of the building.

#### THE BANK OF SCOTLAND.

The building erected about sixty years ago, in Edinburgh, for the Bank of Scotland, is being extended and greatly altered in appearance; and we this week give a plan and two views of the structure in its amended form. The original building, by Messrs. Crichton & Reid,—the latter of whom was King's Architect, during many years, for Scotland,—though it presented a tolerable façade to the south, formed a square unattractively mass viewed from the terrace of Princes-street, or from other parts of the New Town. Several of the leading architects of Edinburgh have endeavoured to discover means whereby the old building might be improved in appearance. The late Mr. Hamilton, and Messrs. Peddie & Kinnear prepared elaborate designs; but none of these were acted upon. The business of the bank had, however, lately increased to such an extent that the directors felt that they would require to obtain additional accommodation; and with this they resolved to unite something in the way of architectural effect. Mr. David Bryce, R.S.A., was commissioned some two to three years ago to prepare designs. An architect could scarcely have a more troublesome task than that which was assigned to Mr. Bryce.

While retaining nearly all the stonework, the old structure has been so altered and added to, both externally and internally, that the work will possess, when completed, the appearance and advantages of a new building, and will be an ornament to the city.

The building stands on a quickly-sloping ground, the north side being towards Princes-street and the Gardens; and the south side being in North Bank-street. The north side was founded below the level of the gardens, at least 100 ft. below the level of the principal floor. Meeting with a foundation on the other, the south side, at about 65 ft. below the street, Mr. Bryce was induced to place his main addition, containing new rooms, there, or bounding the street-pavement as shown in our plan. At the erection of the

original building, the ground for the foundation on the north side was discovered to be so soft, that the work was stopped six months at a time, to allow the structure to consolidate and come to a uniform bearing.

The additions to the plan comprise the line of rooms next the street; two square compartments of the plan, containing the waiting-room, and the staircase to the residence; the quadrantal additions, with windows, to the accountant's office and secretary's clerk's room, and corresponding rooms above them; the north wall and windows of the telling-room, which will now occupy two stories, and minor works. The southern line of rooms, however, is partly of one story; above, and in the general effect as shown in the south-east view, there are two wings and a recessed centre. The length of the front is increased by the wings from 105 ft. to 175 ft.

The style and character of the altered building will be as in the original building; but additional ornamentation is to be introduced. In the new design, the windows are flanked by piers and coupled Corinthian pillars, and terminate in ornamented pedimental gables. Behind those gables will be belvederes, consisting of four clusters of shafts united by arches and covered by stone domes, on the apex of each of which will be a single allegorical figure. The unsightly dome of the old building is to be superseded by a cupola of graceful design, and which will rise 30 ft. higher than the old one. The tambour is octagonal in shape, and has its sides decorated with panels, mouldings, and cornices. The lantern upon the dome is surmounted by a statue. The height of the cupola from the pavement in Bank-street will be 112 ft., that of the belvederes 90 ft., and that of the main body of the building 55 ft. The street floor all round the building is to be constructed of rustic ashlar, every alternate course being vermiculated, and broken up by piers on either side of the windows, and Ionic pillars with vermiculated bands on either side of the main entrance. Along the top of the one-story part of the building which lies between the wings, runs a frieze and cornice, surmounted by a stone balustrade, which will be broken up at intervals by pedestals bearing sculptured groups representing Agriculture, Navigation, Commerce, and Mechanics. The part of the old structure appearing in the recess between the wings and over the low building in front, will be altered and ornamented, so as to be in harmony with its surroundings.

The north side of the building, which was its most objectionable feature, is in the central part, to be reconstructed from the ground-level, and will not be recognisable as a part of the old structure. The central windows are to be surmounted by pediments. In the centre of the lower pediment will be an ornamented window; and the upper pediment will be supported by coupled Caryatides, and will bear a sculptured group. The top of the building will be finished with a stone balustrade, having pedestals with groups of figures at the angles. From the nature of the site, the building is of great height at the north side: two sunk floors are hidden by the screen wall. The appearance of the bank, on the south, will be graceful and commanding; and, on the north, as the upper part will rise above all the houses in High-street and Bank-street beyond it, the cupola and belvederes will group with the towers and spires of the Free College and Assembly Hall on one side, and St. Giles's on the other.

The Bank-street entrance will open into a lofty ball, measuring 42 ft. by 21 ft., on one side of which will be a lobby and corridor, and on the other the principal staircase. The telling-room beyond will be much enlarged, and measure 50 ft. by 40 ft.; and in height it will embrace, as before said, two stories, as the old telling-room will be opened up, and incorporated with the large room above. One object of the alterations is to get all the business apartments arranged on the street floor; and this the architect has succeeded in. At the west end of the low portion of the building, in front, the manager's room, with the waiting-rooms, &c., in connexion therewith, will be situated; and at the east end the secretary's apartments and those of the inspector of branches. On the first floor of the present building will be the rooms of the directors, committee, law agent, &c.; and on the upper floor, a commodious dwelling-house for the accountant. All the business apartments are to be richly decorated.

The works were commenced more than eighteen months ago; but owing to the magnitude of the works of the foundations, the superstructure is not now complete; and another year and a half may elapse before the building can be finished.

The masonry and carpenter's work are in the hands of Messrs. Wm. Beattie & Son. Our plan does not distinguish between the new work and the old; but the nature of the alterations will be exactly understood from the description.

THE BANK OF SCOTLAND, EDINBURGH. — MR. DAVID BRUCE, R.S.A., ARCHITECT.

SOUTH-EAST VIEW.

NORTH-WEST VIEW.

**ST. PETER'S EPISCOPAL CHURCH, EDINBURGH.**

Six or seven years ago, the members of the Episcopal Church of St. Peter, in Roxburgh-place, Edinburgh, finding that their place of worship was falling into a dilapidated condition, came to the conclusion that it would be expedient to erect an entirely new church in a more convenient position. They accordingly secured a site on the south side of Linton-place, Newington, and advertised for plans, one of the conditions being that the building should be so planned as readily to admit of future additions. A design of Decorated Gothic character, by Mr. Slater, of London, was fixed upon as the most suitable, and was carried into effect in its modified form, which consisted of a nave and apse; the future additions to consist of aisles and a spire. The design has now been finished in its entirety, with the further additions of a cloister and baptistery at the west end; and the result is that it may now be considered the most complete Gothic church in the city. The original church was seated for three hundred and fifty persons; and the aisles offered additional accommodation for two hundred sitters. In the alterations, the west gable and chancel have been retained, the side wall removed, and the roof (an open timber one) underpinned, and upheld on pointed arches supported by Peter-head granite columns, with holly-carved caps. The tracery, buttresses, &c., have been used in constructing the outer walls. The spire forms the principal architectural feature of the exterior: it is well proportioned, and is a graceful addition to the architectural features of the city, being seen to advantage from several points of view. There are few cities where such features tell so well, and come so often into play, as in Edinburgh. Under the tower is a large and deeply-recessed doorway; and another entrance is formed at the end of the cloisters, leading from which are two arched openings; both of these openings are provided with wrought-iron gates. The baptistery is situated opposite the centre of the west gable-end, and is separated from it by the cloisters: it is octagonal in form, and vaulted in stone. The whole windows of the church are of two lights each, with the exception of those at the ends of the aisles, which are circular. Of these windows, those in the north aisle have been devoted to subjects from the Old Testament, and the south aisle to subjects from the New Testament. The windows of the apse illustrate the history of our Lord; while those of the baptistery will be reserved for the baptism of Christ, and other kindred subjects. The subjects of each window are as follows:—North aisle, commencing at west end.—No. 1. Migration of Abraham; Sacrifice of Isaac. No. 2. Jacob's Ladder; Joseph making himself known to his Brethren. No. 3. Moses with the Tables of the Law; the Brazen Serpent. No. 4. Sannael anointing David; David and Nathan. No. 5. Solomon dedicating the Temple; Elijah taken up into Heaven. Apsé, commencing at north side:—No. 1. Annunciation; Visit to Elizabeth; Nativity; Christ subject to His Parents. No. 2. Sermon on the Mount; Marriage in Cana; Healing the Sick; Last Supper. No. 3. Crucifixion; Agony in the Garden; Descent from the Cross; Entombment. No. 4. Resurrection; Maries watching; Angels and Maries at Sepulchre; Noli me Tangere. No. 5. Ascension; Final Commission to the Apostles; Session; Pentecost. South aisle, commencing at east end.—No. 1. Call of SS. Peter and Andrew; Miraculous Draught of Fishes. No. 2. Transfiguration (SS. Peter, James, and John); St. John taking the Virgin Mary to his own Home. No. 3. Call of St. Matthew; Unbelief of St. Thomas. No. 4. Christ in the House of Martha and Mary; St. Mary Magdalene washing the Feet of Christ. No. 5. Martyrdom of St. Stephen; Conversion of St. Paul. Messrs. Clayton & Bell are the artists employed, and the glass already in place is remarkable as work of that kind in the city, both as regards harmony of colour and mode of treatment. The chancel has been fitted up with appropriate oak-carved benches, by Mr. Forsyth; brass work by Mr. Potter, and tiles by Messrs. Minton & Co. The pulpit, by Mr. Poole, is circular in plan, and is of Caen stone, supported by shafts of Sienna, Devonshire, and Galway marble. A fine organ, by Mr. Holt, has been placed in a chamber to the south of the chancel. The whole interior is being decorated in colour, by Mr. Potts, of Edinburgh, under the direction of Mr. Fry, clerk of works. Mr. Baffin is the mason and joiner.

**THE WESTMINSTER GREAT BELL.**

MR. THOMAS WALESBY corrects a mistake into which many persons have been led respecting the treatment adopted in the case of Big Ben the Second. He says that though the bell is still imperfect, lacking grandeur and richness of tone—a somewhat gong-like sound being first emitted, instead of the proper fundamental note—it has, nevertheless, improved under the treatment of Messrs. Mears. To the question, "What has been done to the cracked bell," has the so-called "drill-and-saw" remedy been applied to it?" he answers, "Certainly not," and gives the following statement. When Big Ben formerly told the hours, he was struck regularly by a monster clock-hammer of about 7½ or 8 cwt., the blow of which produced "a shock enormously greater than that of a clapper, and supposed to be greater than was ever before given to a bell." And thus poor Ben was cracked. Now, the principal crack in the bell was found to be diametrically opposite to the hammer. In order, then, that the metal might be partially relieved from strain at the places intersected by the cracks, Messrs. Mears turned the bell about 3 ft. and substituted a new clock-hammer, not exceeding 4 cwt., for the old one of 8 cwt. The result, he says, unquestionably is, Big Ben speaks out in a more agreeable and continuous tone, though still defective, than he ever did when subjected to the blow of the old monster hammer.

**THE LEEDS CROSS.**

Will you kindly spare me a corner in your valuable paper for a few remarks in answer to the incorrect statements respecting this cross, made by Professor Westwood and Mr. Way in their joint paper read at the last meeting of the Archeological Institute of Great Britain and Ireland, an account of which appeared in the *Builder* on the 15th of July last.

In justice to Mr. Chantrell, architect, who I expected would have answered for himself, I cannot do better than give a concise history of the discovery and fate of this said cross.

In the year 1837, Dr. Hook, then Vicar of Leeds, now Dean of Chichester, commissioned Mr. Chantrell to prepare plans for the re-building of the parish church. During the demolition of the old walls (more particularly the tower) the architect discovered that many of the stones were carved, whereupon he offered rewards to any of the workmen who should find any sculptured stones. By this means he obtained a large and valuable collection of these ancient relics, and had them removed to his residence near Leeds. After clearing off the mortar, and thoroughly cleansing the specimens, he discovered he had nearly the whole of one cross (the one now in question) and the greater portion of a smaller one, &c. &c.

In 1839, he read a paper on the discovery of this cross, before the Leeds Philosophical and Literary Society; and afterwards in London, before the Royal Institute of British Architects, illustrated by drawings, and I believe castings in plaster, from the cross.

Since the discovery, it has been taken the greatest care of, and has formed a pleasing feature in Mr. Chantrell's garden, wherever he has resided. It is now with him in the county of Sussex, not far from Brighton; and, strange enough, the vicar, the cross, and the architect are all located in one county. I only trust, at the proper time, Mr. Chantrell may be inclined to make the Leeds people a present of their own "old cross" (around which, no doubt, the early Christians worshipped, before a church was erected in Leeds), so that it may once more rest beneath the roof of the parish church, after its long sojourn in the South of England.

H. W. CHANTRELL.

**METROPOLITAN RAILWAY MATTERS.**

THE High-Level Crystal Palace line, which has just been opened for traffic, forms an important addition to the London, Chatham, and Dover system, and will prove of great service to the Crystal Palace and to the public generally. The line, as described in the *Railway News*, starts from a point on the South London Railway near the Lyndhurst-road, Peckham, running on the same road, though on a distinct set of rails, as the Brighton scheme of the South London between Brixton and Peckham. At Semaphore-hill there will be a junction with the Greenwich

branch, which on its route will connect itself with the Mid-Kent, North Kent, and Tunbridge lines, thus giving to Woolwich, Gravesend, Beckenham, Lewisham—and all the places, in short, on the South-Eastern system—a communication with the Crystal Palace and metropolitan stations of the Chatham and Dover line. From this point the line runs on by the Nunhead-hill Cemetery, climbing up heavy gradients, as, indeed, throughout, from Peckham. About a mile from the Crystal Palace there is a tunnel through the ridge of the hill, called the Crescent Tunnel, 400 yards in length, and still nearer the Crystal Palace there is another tunnel, the Paxton Tunnel, of 440 yards in length. The station is on a level with the Crystal Palace, and will lead into the building by a corridor beneath the road in front of the palace, the whole ascent not being more than about 20 ft.; and this is accomplished by broad and easy flights of steps. The station building is provided with four platforms, of which two are set apart for the use of first-class passengers only, and will communicate by a separate passage with the first-class entrance in the centre transept, the entrances for second and third-class passengers being nearer the south transept, and all the arrangements for them being distinct from those for first-class passengers. The traffic to the Crystal Palace will be separated from the residential traffic of the district by distinct stations. The passage from the station to the palace is 40 ft. in width, and the roof is supported by groined arches formed of various coloured bricks. There are four stations upon the line, one at Denmark-hill, a second at Peckham, both of which will be available also for the traffic of the South London; a third at Nunhead, and a fourth at Forest-hill. As yet none of these intermediate stations are open to the public. At present nineteen trains run daily each way. The length of the branch is six miles and a quarter. When all the authorised lines of the Chatham and Dover Railway are complete, the new line will communicate directly with the stations at Victoria, Farringdon-street, Charing-cross, Cannon-street, London Bridge, King's-cross, Paddington, all stations on the Metropolitan and Great Northern Railways, and with Clapham, Brixton, Camberwell, Deptford, New-cross, Greenwich, Woolwich, and all stations on the South-Eastern Railway and London and South-Western Railways. The line has been constructed by Messrs. Peto & Betts. Mr. Shelford is the resident engineer; and Mr. Edward M. Barry has been the architect for the Crystal Palace station, which was built by Messrs. Lucas, at a cost of about 100,000l. The Brighton or South London portion was constructed by Mr. Firbank, of Newport, Mr. Jacob being the resident engineer. We may add that the iron roof of the station displays taste. It is enriched with gilding.

At a special meeting of the London, Chatham, and Dover Company, Lord Harris stated that the company's Victoria Station and the approach to it were inadequate to accommodate the traffic; many complaints were made in the public press, and otherwise, of the want of punctuality in the company's Metropolitan Extension trains, not only at the Victoria, but also at the Blackfriars, City, and other stations. The only remedy was to get an independent branch line of their own, and they had accordingly obtained powers to go from a junction near Wandsworth Station across the Thames to the Victoria Station. This would enable them to accommodate the traffic of other companies as well as their own, by which they would be materially benefited. The works were in course of construction; and it was hoped they would be completed in April next. The Chairman, Lord Sondes, moved a formal resolution authorising the creation of 370,000l. capital stock under the Act of 1863, and of 150,000l. under the New Lines Act, 1864, and that these two stocks he called the Victoria Station Improvement Stock. The resolution was adopted. Sir M. Peto, M.P., in reply to questions, said that his firm had been and was carrying on the works vigorously, with the view of bringing into operation at the same time the four lines of rails from Farringdon-street to Herne-hill and the Victoria Station, which he believed would be accomplished by April next.

It appears from the Metropolitan Railway returns that during the half-year just ended, a number of persons equal to two-and-a-half times the whole population travelled upon the underground line, the total number being 7,462,823. The greatest number consisted, of course, of third-class passengers; but a comparison with the figures of the previous year shows

that the proportion of both first and second classes is slightly decreasing, as the third-class passengers increase in a greater ratio than the others. The first-class travellers in the first half-year of 1864 were 12.20 per cent. of the whole, while this year they were only 11.15; the percentage of the second-class in 1864 was 23.25, for the year just ended it was 20.37; while the third-class travellers, who in 1864 formed 64.55 per cent. of the whole, made up last year the larger proportion of 68.48 per cent. The extent to which travelling upon railways may be encouraged by low fares is illustrated by the travelling from station to station. The fares between intermediate stations were reduced this year from 4d., 3d., and 2d. for single journeys, to 3d., 2d., and 1d., for the return journey from 6d., 4d., and 3d., to 4d., 3d., and 2d. The consequence is that in the month of June last as many as 39,403 persons booked by third-class, or 1d. fares, to ride from one station to another on the line; 4,045 travelled second-class, and 2,308 first-class between intermediate stations. The increase during the month consequent on the reduction of the intermediate fares was a total of 29,842, or representing an annual increase of nearly 1,000 travellers per day. The whole of this amount of traffic has been conducted underground, without the loss of a single life or the occurrence of a single casualty to passengers. We understand that the line northward from the Underground Railway will cause the demolition of the house at the top of Upper Baker-street in which Mrs. Siddons died.

#### METROPOLITAN BOARD OF WORKS.

At the meeting of the Metropolitan Board of Works in last week, the cash statement of the Finance Committee was presented, and showed the following cash balances in the hands of the treasurer:—Current account, 297,884. 14s. 4d.; deposit accounts, 200,000.; total, 497,884. 14s. 4d. Government securities, 18,283. 11s. Tenders for works to the Putney and other sewers, and for diverting sewage from a part of the River Wand, were received, as elsewhere mentioned; and Mr. Mozon's tender, for 41,500l., was accepted, subject to the usual inquiries.

#### Proposed Improvement in Park-lane.

Major Lyon moved, pursuant to notice, "That it is incumbent on the Board to make provision for the relief of the traffic in Park-lane; that Parliament be applied to in the next session for an Act for that purpose; and that it be referred to the Streets Committee to consider the details of a scheme for improving and widening Park-lane." He said that while the Board wanted was to provide some remedy at the least possible expense, for the evil that now existed. There was no improvement in London that required so much consideration as the question before them. The architect ought to have as much time as possible to enable him to consider the plans at present proposed. With the exception of an old plan made by Mr. Marriable, C.E., for the widening of Park-lane, he did not think there was any scheme at all practicable. There was a scheme for making a thoroughfare through Audley-street, but that had not received much consideration. He hoped his motion would pass without any opposition.

Mr. Westerton seconded the motion. Mr. Le Breton said that as the Streets Committee would not meet until the first week in September, he would move as an amendment that Mr. Villiamy, the superintendent architect, be directed to make plans for the consideration of the Board.

Mr. Bidgood said, as a private individual living at the West-end, he would hail with delight any plan that would relieve the traffic in any way. He thought the question rested between the Hamilton-place scheme and an improvement at a cost of between 250,000l. and 300,000l. He saw no halting-place between the two, and he was not inclined to incur that great expense. The Board had been most anxious to open up Hamilton-place, but Government and Parliament stood in the way. If Hamilton-place were opened, all difficulty would be at an end.

Mr. Miller, M.P., said that the estimate for widening Park-lane, laid before Parliament, was 104,000l., out of which 84,000l. was estimated for Gloucester House, at the corner. He considered that the Park-lane plan was the best to adopt.

Mr. Newton said he was glad this subject had been taken up by the members for St. George's Hanover-square. He considered that this was a local improvement, and he hoped that Major Lyon would, as they would be separated for six weeks, consult his vestry (St. George's, Hanover-square) as to how much they would pay towards the scheme.

In answer to Mr. Bidgood, Major Lyon said the Government would clear the Marble Arch. Mr. Healey said, the representatives of the richest parish in London (St. George's) said their vestry was not inclined to contribute anything towards the improvement. There were many places in London which required improvement more than Park-lane, and he saw no reason why the Board should incur the expense of going to Parliament for such a scheme.

Some amendment having been made to the motion, the Chairman said, the committee and the architect would be confined to the widening of Park-lane. He thought it would be better if the form of the motion were "For the relieving of Park-lane;" it would then be open. Ultimately Major Lyon agreed to omit the words having reference to an application to Parliament.

#### Improvement in Carey-street.

The Works and Improvements Committee recommended "That the Board do contribute the sum of 4,000l. towards the cost of an improvement estimated at 15,000l., to be effected by the Strand District Board of Works, by setting back the houses on the south side of Carey-street,

Chancery-lane, at the eastern end, and that such contribution be paid to the Strand District Board of Works, on a certificate from the architect of this Board of the completion of the work."

On the motion for the adoption of this recommendation, an amendment was proposed raising the contribution of the Board from 4,000l. to 5,000l., and it was agreed to.

#### The Progress of the Thames Embankment and Main Drainage Works.

The Engineer (Mr. J. W. Bazalgette) presented a report upon the progress of the Thames Embankment works, the low-level sewer north, and the alterations of main sewers, schedule D.

"North Side of the River.—Thames Embankment (Contract No. 1), between Westminster and Waterloo Bridges. The works comprise about 1,910 ft. in length of caisson dam, 660 ft. in length of timber coffer-dam, 140 ft. run of river wall, with low-level sewer and subway by Whitehall, and 1,694 ft. of 4 ft. by 2 ft. 8 in. brick sewer, along the foreshore, for the purpose of intercepting the drains discharged therein; the formation of the foundations, brick-work, granite facings, flushing sewers, and reservoir, with pipes, valves, &c., for flooding the low-level sewer; the paving for recesses, &c., in connection with the Westminster Steamboat Pier, and the river wall in continuation eastward thereof; the filling in of 306,500 cubic yards of materials, partly from the river, and partly from the land, and piling for strutting to coffer-dams, &c., in various stages. The approximate value of the whole of the foregoing, together with the materials and plant upon the ground, is 7,948,854. 13s. 6d. The amount of 13,437l. is due to the progress made in the past month. Of the total amount, the proportionate sum of 63,747l. is for works, 21,079l. for materials, and 75,758l. for plant."

Thames Embankment, Contract No. 2, between Waterloo Bridge and Temple Gardens.—The coffer-dam in front of Somerset House is completed, with the exception of about 75 ft. at the end nearest the bridge. Within the finished portion about 30,000 cubic yards of ground have been excavated, and 700 yards of concrete tipped in for the foundations of the river wall. Within the dam fronting Temple-pier and the east pier, 3,500 cubic yards of concrete have been excavated, and the construction of the river wall sewer, and subway, is as follows:—418 cubic yards of excavations have been got out, and 1,270 yards of concrete deposited; 112 rods of brickwork built, 3,500 cubic yards of granite hedged, and 750 ft. super. of 6 in. York landings laid. The dam at the eastern end of Temple Gardens is in course of construction. The approximate value of the work completed and of the materials upon the ground, is 126,726l., or 6,858l. for the work executed in the past month. Of the total amount the sum of 73,233l. is for works, 10,060l. for materials, and 33,444l. for plant. Low-level sewer.—During the past month 1,180 ft. of the main line, and 535 ft. of the Old Ford branch sewer have been constructed, making in all a total length of about 21 miles of sewers completed under this contract. Within the dam which has been completed in the river Lea, 550 yards of excavation have been got out. The sewer from that river through the marshes is being constructed in open cutting, and is fast progressing, and 550 ft. run of trench having been opened, and the brick invert got in for a length of 150 ft. The total approximate value of the completed works, is 117,458l., of which the sum of 12,165l. is due to the progress made by Mr. Webster in the past month.

Abbey-mills Station.—The excavation for this building is in progress, about 3,000 cubic yards of ground having been got out, and their cost, including the pumps, struts, &c., fixed. The cost of these works, including the pumping, is estimated at 2,500l.

Western Sewers Extension.—The works are now virtually completed, their approximate cost is 17,900l.

Greenwich and Deptford Sewers.—Nearly 1½ mile of these sewers, with about 3,770 ft. of branch pipe sewers and drains, have been completed by Mr. DeLisle, who has also about 2½ ft. of tunnelling in progress. The total value of these and of the incidental works in connexion therewith is 21,190l., or 1,238l. in excess of the amount last reported.

J. W. BAZALGETTE, Chief Engineer."

The report was received and adopted.

#### Utilization of Sewage on the South Side of the River.

Mr. Newton moved "That advertisements be issued stating that the Board will be prepared to receive suggestions and communications in reference to the utilization of the sewage of the river, or to the proposed works on the 22nd of September. He thought that if the Board intended to do anything this year, the course for them to adopt was the motion. It was intimated at the last meeting that none of the tenders had been drawn up in accordance with the conditions advertised, and he (Mr. Newton) thought it was clear that the Board could not receive these tenders. He referred at some length to the circumstances attending the receiving of tenders for the sewage last year, and contended that the course he now suggested was in accordance with the precedent then laid down. Besides, he thought it was only fair to give the persons who had presented tenders, but about the formal drawing up and presentation of which there was some question, an opportunity of tendering again. He did not think the Board was at present in a position to take the tenders in question into consideration. In his opinion, the Board should draw a wide distinction between tenders for works and the purchase of this concession, and he thought that the Board were bound to seek for and accept the best terms offered.

Mr. Doulton, M.P., in moving an amendment, said that he could not see the force of the arguments advanced by Mr. Newton. The position of the Board was totally different from what it was when Mr. Newton was returned. The case had undergone thorough examination; it would be monstrously unfair to the vendors if they allowed conformity with the terms of the advertisement to throw the whole question open again, so as to enable parties who were not prepared in time, but who had now obtained the information they needed to price tenders, and he might be that these tenderers had not strictly complied with the terms of the advertisement; but it appeared to him that the Board would injure themselves very much in the eyes of the public if they allowed the possibility of unfair dealing to exist. They should adhere to the bargain in the advertisement, and before seeking for other tenders they should consider those already received.

Mr. Lovvman then seconded the amendment, and he thought if they were to do anything in the matter they should commence de novo, but before doing so, they should examine the plans sent in. If the committee who were to examine the proposals there was anything in them that they should feel satisfied in recommending, let the general public then get an opportunity of sending in

other plans. He would in that case be glad to consider Mr. Shields' plan, and, if it was found to be the best, to vote for it. As far as he was concerned, he would not pledge himself to any one of the plans; but if they wished to retain the confidence of the general public, he thought they should offer an opinion on them before re-advertising. Although he disapproved of the suggestion of Mr. Newton, still he had no doubt it would be ultimately adopted; but he trusted that before doing so the plans already sent in would be examined. He thought that the various plans should be sent to the vestries and district boards, and they should be considered with great caution in the matter.

Mr. Miller thought they ought to wait till the report of the committee was before them respecting the plans already sent in; and was of the opinion that if they anticipated that report, they would lay themselves open to the imputation that they had some ulterior object in doing so. The amendment, he would suggest, was that the further consideration of the matter be deferred till the report of the committee be laid before the Board.

After much discussion, the amendment of Mr. Doulton was put, and, on a division, was lost by 12 votes to 15.

On the original motion being put, Mr. Miller moved the amendment he had suggested, and it was carried.

#### Plumstead Sewers.

The *Offensive Manufactures below Woolwich and the* A report was brought up from the Main Drainage Committee with reference to the above-named nuisance. It recommended "That a communication be addressed to the Marquis of Harrington to the effect, that the Board entertain no doubt as to the great nuisance which arises from the offensive manufactories below Woolwich, but that owing to their being situated beyond the jurisdiction of the Board, they are unable to deal with the matter; that it must therefore be left to the Government to take such measures as they may be advised, and that the Board will be happy to aid them as far as lies in their power; that the engineer be instructed to examine and report with respect to the open ditches in Plumstead Marshes, into which it is alleged that the drainage of Plumstead now flows; that the Marquis of Harrington be so informed, and that the particulars thereof be communicated to him."

The report was unanimously adopted. Some other questions, elsewhere noticed, were discussed at the same meeting.

#### THE METROPOLITAN BUILDINGS ACT.

At the meeting in last week, of the Metropolitan Board of Works, Mr. Robert Taylor gave notice of the following motion in reference to the fees to district surveyors:—"That it be referred to the Building Act Committee to report generally on the payment of district surveyors by fees; on the extent, value, and convenience of the present districts; and on the expediency of their fusion and re-arrangement. Also as to the advisability of diverting the payment of the fees collected under the Act into a common fund, out of which to defray the payment of a staff of salaried officers devoting their whole time to the public service." He said, that last year the district surveyors were paid in the way of fees 32,000l., and he was strongly impressed that the public should have the benefit to some extent of these fees.

At the same meeting, a report was received from the Building Act Committee, stating, with reference to the recent fire in Southwark-street, that the investigations show the district surveyor fulfilled his duty with regard to the construction of the building; but that it may become a question whether, in any amendment of the Building Act, some provision should not be made as to the use of materials for erections on roofs.

#### PROVINCIAL NEWS.

Cambridge.—At the last meeting of the town council, the report of the market committee recommending the adoption of a plan by Mr. R. R. Rowe for a new Corn Exchange, was referred back for further consideration. The council did not like the plan; but, by the casting vote of the mayor, it pledged itself to a new Corn Exchange, and to Peas Hill as the fittest site for that exchange. The market and guildhall committees will consider the subject jointly.

Teignmouth (Devon).—The first pillar for the new pier to be erected at Teignmouth has been formally screwed down by the Earl of Devon.

Newport (Wales).—The market-place erected at Newport by the Duke of Beaufort is well-nigh completed, sundry fittings up being all that is needed ere it be open for the public accommodation. The more detailed plans and sections of the Alexandra Docks are now being prepared, and advertisements will shortly be issued inviting tenders for the works. Lord Tredegar, upon whose land the docks will be constructed, has subscribed 150,000l. towards the undertaking, being one-fourth of the capital; the Great Western Railway Company has powers to subscribe 50,000l.; Brecon and Merthyr Company, 50,000l.; and the Monmouthshire, 20,000l.;

making a total of 270,000. The remaining 330,000. will be looked for from the public.

**Liverpool.**—At a recent meeting of the town council, Alderman Stewart said the council had some time ago adopted a recommendation that the dwelling-house for the judges should be erected upon the Newsham House Estate. Accordingly, the finance committee had directed the architect and surveyor to prepare plans for such a residence. These plans were now prepared, and had been submitted to the finance committee, and the estimate for the building was set down at 10,000. He moved the adoption of the recommendation. Mr. S. G. Rathbone moved as an amendment that the recommendation of the finance committee be referred back, in order that they might report whether some less expensive plan of lodging the judges could not be devised. Mr. Pictou seconded the motion. Alderman Woodruff said the council had already affirmed the question that the judge's lodgings should be erected on the Newsham Estate; and Mr. Robson was, in consequence, directed by the finance committee to prepare plans, &c., for the approval of the council. The only question now for the council was, whether the elevation was a satisfactory one, and whether they were prepared to go to that expense? They could not deal with the question whether they would go to the Newsham Estate without rescinding the resolution already passed. Mr. Rathbone's amendment was therefore out of order. The amendment, however, was carried by 26 to 16.

CHURCH-BUILDING NEWS.

**Hunstanton.**—The chancel of Hunstanton Church has been re-opened for divine service. The work of restoration has been done under the direction of Mr. F. Preedy, architect. The old low-pitched deal roof has been replaced by an oak one, with a pitch corresponding to that of the church. The walls have been faced with white freestone, the floor raised, and the east part paved with Minton's tiles, and a veranda of alabaster, with painted medallions, from designs by Mr. Preedy, erected at the east end. Of the latter, only part is at present put up, as it was unfortunately broken in its transit from Worcester. A temporary vestry and organ chamber have been erected on the north side of the chancel.

**Aylesbury.**—A vestry meeting has been held in St. Mary's Church, to submit the report and estimate of Mr. G. G. Scott, relating to the external repairs necessary to the parish church, and to discuss how the funds should be raised. It was resolved that the question of raising a certain portion of the 1,500. required for the repairs by means of a church-rate be submitted to a future meeting of the parishioners.

**Upper Heyford.**—At a recent vestry-meeting as to the restoration of the parish church, the rector produced plans and drawings prepared by Mr. Talbot Bury, architect, showing that the characteristics of the old church and chancel will be preserved so far as they are worth preserving. The tower, traditionally said to be the work of William of Wykeham, who purchased the manor and advowson for presentation to New College, is every way firm and good, and requires no very costly repairs, except in the matter of the bells, which are to be restored. When the contemplated repairs are effected, the edifice will consist of a western tower, nave slightly widened from its present dimensions, north aisle, chancel, vestry-room, semi-transcript on the south, and south porch. The resolutions of the vestry were to the effect that the parishioners present approved the proposal to raise 400. by loan from the Public Works Loan Office, and to spread the repayments over five years and not longer. A restoration committee was then appointed.

**Bromley-by-Bow.**—The new church of St. Michael and All Angels in the parish of Bromley-by-Bow, the foundation stone of which was laid by the Countess of Ellesmere on the 29th of September last, has been consecrated by the Bishop of London.

**Leighton Buzzard (Beds).**—The chief stone of a new church, to be named St. Andrew's, situated at the north end of Leighton Buzzard, has been laid by Colonel Hammer, K.B., lord of the manor. The church will be 100 ft. in length, and 50 ft. in width within the walls, with a spire of more than 100 ft. in height. The style is Early Decorated. The material will be stone, with freestone dressings, from Farleigh Down Pitts, Wiltshire. It is calculated to seat 500 persons, all the seats being free. The cost is

estimated at 3,000. The architect is Mr. Joseph Neale, of Bristol; builders, Messrs. Holdstock & Garside, of Leighton Buzzard; stone masonry, by Mr. John Greenwood, of Linslade, Leighton Buzzard; clerk of the works, Mr. J. P. Stevens. **Hawley (Hants).**—The new church, built at the sole expense of Mr. J. Maherley (said to amount to 4,000.), has been consecrated by the Bishop of Winchester. The edifice is in the Early Norman style. The walls are built of the grey rock stone of the parish; the quoins, window frames, and facings of Caen stone, carved in relief; and the tower, with its transversed roof, 100 feet in height, exhibits itself as a landmark over a great extent of country.

**Birmingham.**—St. David's Church, which has just been erected in Bissell-street, on a site of land given by Mr. John Nicholls, has been consecrated by the Bishop of Worcester. The church is built in the form of a cross, in the Gothic style of the Geometric period. It is built of brick, with a small admixture of stone, principally in the traces of the windows. It has a nave and aisles, chancel, and two transepts. The total length is 140 ft., the width in the body of the church 52 ft., and the length across the transepts 90 ft. The height from the floor to the top of the nave roof is about 50 ft. At the west end there is a tower, bearing a spire rising to a height of between 150 ft. and 160 ft. The columns and arches to the nave and chancel are of Bath stone, and the floor of the chancel is paved with encaustic tiles, the whole of the roofs being open-timbered, varnished, and the roof of the chancel slightly ornamented. The sittings are all open, and composed of red deal. On the south side of the chancel there is an organ chapel, in which is placed an organ, built by Mr. Banfield, and presented to the church by Mr. Nicholls. The church will accommodate 1,000 persons, and 750 of the seats are free. The edifice has been erected at a cost of upwards of 4,000., by Messrs. Webb, of Birmingham, contractors, from plans by Messrs. Martin & Chamberlain, architects. The whole of the carving in the stone capitals is the work of Mr. Barfield, of Leicester.

**Hamstead, near Birmingham.**—The new temporary church at Hamstead, on the estate of Mr. John Stubbs, who gave the land for the site, has been opened for divine service. The building is of Gothic character. Its size is 70 ft. by 20 ft., with entrance porch and vestry, and will accommodate 210 persons. The foundation is of stone, having buttresses every 10 ft., and built to receive an iron sill-plate, upon which is placed wood studding, forming the walls of the building. The roof is high pitched, and slated, and is surmounted by a bell turret. The roof principals are framed of wood and iron, and are placed on wood posts, which are supported by iron brackets, placed on the stone buttresses. The church is lighted by one large window, in the gable end, and seven pointed windows in the sides and apse end, which run up and form gables in the roof. There are also four small gabled windows in the roof. The outside of the building is finished in cement, the inside being boarded 5 ft. in height, the remaining height, as also the underside of the roof, being covered with strong canvas whitened, the joints being covered with deal fillets. The whole of the inside woodwork is stained, the ironwork being painted blue. The church is provided with movable benches, pulpit, reading-desk, lectern, sedilia, altar-table, and altar-rail, all of stained deal. The building has been erected by Messrs. John Hardwick & Son, of Birmingham, builders, from the designs of Mr. G. T. Robinson, archidiaconal architect, Leamington. The cost, including all the fittings, is 21. per sitting. The new edifice is within a short distance of the Hamstead and Great Barr Railway Station, in a rural district, some portions of which are about to be offered to the public for building sites.

**Hornsea (Yorkshire).**—A preliminary meeting has been held to consider the restoration of the parish church, and to devise the best means of obtaining the sum required, which, according to the estimate of Mr. Gilbert Scott, the architect, will be 2,000. for the interior restoration only. The chancel stalls are to be in oak, and the other parts in stained fir. According to Mr. Scott's plan, the church will seat upwards of 200 more than at present. A committee has been appointed to receive contributions.

**Asby (Westmoreland).**—The foundation-stone of a new church has been laid in the secluded Westmoreland village of Asby, situated about 5 miles south of the county town of Appleby. Miss Hill, of Castlebank, Appleby, is erecting

the new church on the site of the old one. Messrs. W. & J. Hay, of Liverpool, architects, were applied to, and a design being approved of by Miss Hill, contracts were entered into for its immediate erection. The exterior measurement is 85 ft. by 37 ft., and interior 50 ft. by 32 ft. 5 in. The chancel will be 25 ft. by 13 ft. 6 in., and the porch 12 ft. square. The tower is to be 50 ft. high, and will be surmounted by an ornamental cross. The building is of the Decorated Gothic style, consisting of chancel, nave, south aisle, south porch, and vestry; on the north side chancel, and a bell gable sufficient to contain two bells. The nave is divided into three bays, with round pillars supporting arches in two orders of red and white stone. The south side is lighted with two low windows of ten lights, and a single light opposite the font. The north wall is lighted with lofty decorated windows of two lights each, and a three-light window lights the east or chancel gable. A stone arch, in two orders of red and white stone, separates the chancel from the nave. The interior will be filled with plain benches of pitch pine, and the floor constructed of tessellated pavement. The roof will be covered with green Westmoreland slates. There is also a pent-house between the two buttresses for the use of the bell-ringers. The material of which the building is composed is a warm-tinted stone, found in the immediate neighbourhood. The tenders of Mr. Griswold, of Penrith, for the masonry; Mr. J. Dawson, of Appleby, for the woodwork; and the late Mr. R. Fauset, of Appleby, for the plumbing, glazing, &c. (now being executed by Messrs. Martindale & Jackson), were accepted. The work was commenced early in the beginning of the year, and the exterior masonry is far advanced.

DISSENTING CHURCH-BUILDING NEWS.

**Bermondsey.**—The foundation-stone of a new Congregational chapel has been laid by the Rev. C. H. Spurgeon, on a plot of ground situated in the Drummond-road, Jamaica Level, Bermondsey.

**Great Berkhurstead (Herts).**—The new Baptist chapel has been opened. The new edifice stands at the east end of the High-street, and on the north side. It is in the Decorated style. The materials are white Leighton bricks, with red hands, and white Bath freestone. At the south-west corner are a tower and a white stone spire, the height of which is 90 ft. There is a large window at the south end of the building. The dimensions of the chapel are, externally, 58 ft. by 40 ft., and internally, 43 ft. by 37 ft. It contains sittings for 540 persons. The seats and galleries are of stained deal. The south gallery extends over the entrance-porch to the large window. The floor of the chapel is an inclined plane. There is no pulpit, but a platform with the minister's desk placed on it. The organ-chamber is at the north end of the chapel, with a stone arch, on each corner of which is the figure of an angel. The roof of the chapel is of stained timber, open to the ridge, with white plaster between the rafters. At the rear are large schoolrooms, of a corresponding style of architecture. The architect was Mr. Neale, of Bristol; and the builder, Mr. Toefield, of Tottenham. The total cost of the chapel and schools is under 2,000., including the site. Some of the materials of the old chapel have been used up in the new; and the total expenditure will be about 1,600.

**Leicester.**—The foundation-stone of the new Nonconformist Church, Victoria-road (formerly known as the Occupation-road), has been laid, by Sir Samuel Morton Peto, bart., M.P. The site chosen for the edifice is a conspicuous one. The building will be in the Gothic style, and surmounted by a spire 150 ft. high. It is intended to accommodate about 1,100 persons, and the cost will be 7,000. The schoolroom will be underneath the back part of the building, the size of it being 60 ft. by 36 ft. The cost of the erection will be defrayed almost entirely by the congregation attending Belvoir-street and Charles-street Chapels. Mr. B. Harris alone contributes 1,000. towards the building fund, and other sums have already been subscribed, amounting altogether to 4,300. The architect of the building is Mr. J. Tarring, of London; and Messrs. Neale & Sons, of Leicester, are the builders. Mr. Henry Crocker is clerk of the works.

**Malvern.**—The foundation stone of a new Wesleyan chapel and schools, for Malvern, has

been laid. The plans of the chapel are by Mr. John Tarring of London. The style of the building is Early Decorated, and it is calculated to accommodate 500 people. There are to be a nave, transept, and apse. The length will be 84 ft. 6 in.; width at the transepts, 53 ft.; and width of the nave, 40 ft. Beneath the chapel, in a sort of crypt, are to be the school-rooms, 12 ft. in height, capable of accommodating 500 children. Attached to the school-rooms are class-rooms and vestries, but the minister's vestry is on the ground floor of the chapel. The actual height of the tower will be 84 ft., but the addition of 24 ft. of the pinnacles will make the total height 104 ft. The total cost of church and school-rooms is estimated at 3,000*l.*, of which 2,250*l.* have been already subscribed or promised.

**Chester.**—The new Presbyterian church, City-road, has been opened for divine service. The building is of classic character with a Roman Ionic portico, resting on columns and pilasters, approached by steps. Inside the building the platform has been introduced in preference to the pulpit. The seats are stained in light oak, with mahogany capping, and are all cushioned, except the free sittings. The windows are of stained glass, with amber figures on a white ground. Under the entire church there are large school-rooms, lofty and well ventilated, capable of accommodating three hundred children.

**Miscellaneous.**—At the twelfth anniversary of the English Congregational Church Building Society, held at Leeds, an abstract of the report of the committee was read, which gave a brief history of the movement for the establishing of free churches which had called the Society into existence, and through the operation of which, it was said, there were now tens, hundreds, and thousands of chapels where, 200 years ago, there was not one. The London, Lancashire, and English societies for the building of free churches had been instrumental in the erection of more than 300 churches, of which 237 had been added by the English Society. The total receipts of the latter for the year, including the balance, was 9,019*l.*, being the largest amount yet recorded. The chapels adopted during the year numbered eighteen, making, since the commencement, a total of 237, which furnished accommodation for nearly 120,000 persons; and costing, inclusive of sites, 365,000*l.* The total pecuniary assistance voted by the Society in aid of this object was 62,000*l.*

#### SCHOOL-BUILDING NEWS.

**Monmouth.**—The opening of Jones's Grammar School and the consecration of the chapel, the foundation-stone of which was laid a year ago by the master of the Haberdashers' Company, have now taken place. The old school accommodated 100 boys, but the number will now be increased to 160, the surplus income of the charity being 1,000*l.* a year. The present school premises and chapel are built of local stone, rough-faced, taken from quarries belonging to the Duke of Beaufort. The buildings are in the Tudor style, with Bath stone dressings. The school-room is about 72 ft. long by 32 ft. wide, and is 85 ft. in height. It has an open roof of stained deal, and is fitted up with desks for the masters and benches for the pupils, on each side of the room. It is also lighted by several gas-pendants, and is warmed by Gurney's stoves. There are two class-rooms attached to the school, one for writing and the other for the use of the classical scholars. The dimensions of the former are about 15 ft. by 26 ft., and the latter about 20 ft. by 15 ft. The necessary offices are in the rear, and there is a large yard for the use of the scholars. The chapel is 62 ft. by 25 ft., and has a clock-tower. The clock was supplied by Mr. Moore, of Clerkenwell, at a cost of 100*l.* The chapel is seated with open stained deal benches, and it is capable of accommodating 170 to 180 persons. The roof is likewise constructed of open stained deal. The chancel is not separated from the nave, and this gives a peculiar appearance to the chapel. The edifice is lighted by three five-light windows, one at each of the east and west ends, and one at the south side. There are also ornamental standard gas-lights, each having twelve jets. The floor of the chancel and the aisle are paved with encaustic tiles from the manufactory of Messrs. Codwin, of Lugwardine. Adjoining the chapel is a library and vestry, which is also intended to be used as a board-room. The cost of the buildings is said

to be about 5,000*l.*; and, with the exception of a few alterations, the work has been completed within the contract. Mr. Snooke, architect to the Haberdashers' Company, was the architect; and Messrs. Collins & Cullis, of Tewkesbury, were the contractors.

**Widnesfield Heath.**—The memorial stone of new day and Sunday schools, now being built in connexion with the Wesleyan chapel at this place, has been laid. The new building occupies a site immediately in the rear of the Wesleyan chapel, and consists of a school-room for boys and girls, an infants' school-room, a class-room, and an attached teacher's residence. The mixed school for boys and girls is 49 ft. by 18 ft., and the infant school 36 ft. by 20 ft., the two schools together accommodating 170 children. Large playgrounds, one for boys, the other for girls and infants, adjoin the schools, and are provided with flying swings and other conveniences. The building is designed in a Gothic character of architecture, the fronts being faced with red bricks, relieved with bands of blue bricks and Bath stone dressings. Internally the main timbers of the roofs are exposed to sight, and stained and varnished. The contract for the schools, including boundaries and fittings, has been taken by Mr. Evans, of Wolverhampton, at 1,058*l.* The architect is Mr. George Bidlake, of Wolverhampton.

**Eccles.**—The foundation-stone of a building, to be used as a school-room in connexion with the parish church at Eccles, has been laid. The building is designed by and is to be carried out under the superintendence of Mr. James Medland Taylor. The character of architecture is Gothic. The walls will be of red brick, relieved by bands and patterns of the same material. The roofs will be covered with purple and blue slates. The large roof of the central building will be broken up by five gables, that in the centre being the largest, and surmounted by an open-timbered heltry, which will contain a good-sounding bell. The chimneys, breaking up at several points, will aid in giving variety to the sky-line. In the treatment of the building the endeavour has been made to give it an ecclesiastical appearance, in order to indicate its connexion with the church. The work has been let in several contracts, to builders in the neighbourhood. The principal front will be towards Albert-street, and the total cost, including the fittings, will be about 2,500*l.* The schools cover a rectangular plot of ground. The large room, in the centre, is 74 ft. by 30 ft. At the back of the building will be a porch for the children's entrance, and a more elaborate gabled porch fronting Albert-street. On the north side of the large room will be the boys' school, and on the south the girls' school, each having separate entrances and play-grounds. There will also be three large class-rooms. In the basement will be a kitchen, in which cooking, washing, and other domestic work will be taught to the girls.

**Shields.**—A new building, for the Hill-street Mission School, has been opened. The site is on Carpenter's Hill. The new school is built of brick, with a stone facing. In length it is 43 ft., by 21 ft. in breadth, and 15 ft. in height. Attached to the building is a small class-room, and also a house for the master.

#### RECENT PATENTS CONNECTED WITH BUILDING.\*

**APPARATUS FOR HEATING ROOMS, &c.—J. Grundy.** Dated November 25, 1864.—The patentee employs a stove having at the top a pipe or flue communicating with a chimney, and he places the stove in a chamber surrounded by brickwork, earthenware, or other suitable material, so as to allow a space between the walls and the stove. Near the bottom of the chamber there are apertures in the walls for the entrance of cold air to be heated by the stove when the fuel is in a state of ignition, and at the top of the chamber there is or are one or more pipes for conveying the heated air to any required part of the building.

**KILNS OR OVENS FOR BURNING BRICKS, TILES, POTTERY-WARE, &c.—H. Chamberlain, J. Croven, and H. Weikind.** Partly a communication. Dated June 24, 1864.—This invention relates to improvements for which letters patent were granted to A. V. Newton, December 27, 1859. The first part of the modifications consists in erecting such kilns or ovens in lines, straight or

otherwise, as distinguished from a complete annular or endless form, and with no perfect continuity of action, such kilns or ovens communicating with each other to the extent of their length, and with one or a series of chimneys. The second part of this invention consists in constructing the ovens or kilns with a second or inner annular chamber, by which dry or warm air may be taken from any of the heated kilns to any of the other chambers for the purpose of drying the green bricks or other articles from which it is desired to drive off the moisture. The third part consists in arranging a flue or flues passing from the upper part of the kilns or chambers to the chimney, by which the steam, arising from the materials undergoing the process of drying or heating, may be driven off from the articles under treatment. The kilns or ovens above described may also be worked when desired without chimneys, by using in place thereof fans or exhausters.

#### Books Received.

*A Record of the Progress of Modern Engineering, 1864; with Essays and Reviews.* Edited by WILLIAM HUMBER, A.L.C.E., &c. London: Lockwood & Co. 1865.

This is the second volume of a quarto periodical half-yearly or yearly according to circumstances. It is practically and really what it professes to be—a record of modern engineering—as is evident from the contents, which include among recent works, particulars, with illustrations; as to the Charing-cross Station roof, the Dublin Winter Palace, the new bridge at Blackfriars on the Chatham and Dover line, the Albert harbours at Greenock, low-water basin, Birkenhead Docks, &c., as well as general essays on iron railway-bridges, iron permanent ways, harbours, ports, and breakwaters, coating of iron, &c. More than three-fourths of the volume consist of quarto plates of illustrations, and the whole is preceded by a biographical sketch and photograph of Robert Stephenson.

#### Miscellaneous.

**THE INTERNATIONAL ASSOCIATION FOR THE PROMOTION OF SOCIAL SCIENCE.**—The fourth annual meeting of this body (*Association Internationale pour le Progrès des Sciences Sociales*) is to be held in Berno, from Monday, the 28th of August, to Saturday, the 2nd of September. The questions to be discussed are under the five heads Legislation, Education, Art and Literature, Public Health and Welfare, and Political Economy.

**THE LATE MR. PARNELL, ARCHITECT.**—We regret to have to notice the decease of this gentleman. He became generally known by the Army and Navy Club, in Pall-mall, a work in which Mr. Alfred Smith was associated with him. Later, he was the architect of the London and County Bank, in Lombard-street, illustrated in our pages. The last work to which his name was attached was the Whitehall Club, not yet completed. He died at Baden, where he had gone in the hope of relief from painful illness.

**OBITUARY.**—BRONN ANDREAS VON BAUMGARTEN died at Vienna a few days ago, aged 72. In 1817, he was professor of physics at Olmutz, and in 1823 at the University of Vienna; chief editor of the *Journal de Physique et de Mathématiques*, in 1826; minister of public works under Pillersdorf, he continued in the service of the Austrian Government till 1860, when he retired, and devoted himself to the advancement of the sciences, of which he was president of the academy. Among the various engineering and mechanical works he produced, one of the last was the "Stoker's Guide."

**THE INSTITUTION OF MECHANICAL ENGINEERS.**—The Congress held this year in Dublin has terminated its sittings. Several interesting papers have been read. Amongst them were one "On a Portable Steam-Riveter," by Mr. Andrew Wylie, of Liverpool; "On the Manufacture of Peat," by Mr. C. Hodgson, of Portlinton; one by Mr. George Low, of Dublin; "On his Rock-Boring Machine used at the Roundwood Tunnel of the Dublin Corporation's Water-works;" and one by Mr. Parke Noville, on the works themselves, to which we may refer hereafter.

\* Selected from the *Engineer's* lists.

**THE DRINKING-FOUNTAIN MOVEMENT.**—A drinking-fountain has been presented to the village of Newburn by Mr. Hugh Taylor, of Earsdon. The fountain, which is erected in the upper part of the village, is composed of Aberdeen granite, the centre portion being polished. The designer was Mr. E. Chapman, of Alnwick; Mr. Beale, of Newcastle, having charge of the granite; Mr. Philipson, of Newburn, the mason-work; Mr. Watson, of Newcastle, the plumbing. The whole is surmounted by a lamp, put up by Messrs. Wilkin & Dickman, of Alnwick. The total cost, including the purchase of a supply of water in perpetuity from the Newcastle and Gateshead Water Company, is upwards of 500*l*.

**BRITISH ARCHAEOLOGICAL ASSOCIATION.**—The Congress at Durham, as will be seen by our advertising column, will commence on the 21st of August, and be continued to the 26th, inclusive, under the presidency of the Duke of Cleveland, who will deliver the inaugural address in the Castle. The Rev. G. Ormsby will then give a description of the Castle. At seven there will be a public dinner. The next day will be devoted to a visit to Lumley Castle, the seat of the Earl of Scarborough; to Chester-le-Street, the antiquities of which will be discussed upon by the Rev. H. Blanc; and to Lanchester, and St. Cuthbert's College. On Wednesday, Mr. Gordon M. Hills will lecture upon Durham Cathedral and its monastic buildings, measurements and plans having been recently made by him. The party will then proceed to Finchale Abbey, which will be described by Mr. E. Roberts. Barnard Castle will be visited on Thursday; after which Staithrop Church, which will be treated of by the rector, the Rev. Mr. Hodgson. The Association will then proceed to visit the president, at Raby Castle, which will be described by the Rev. G. Ormsby and the Rev. J. F. Hodgson. On Friday there will be a visit to Tynemouth Priory, to be described by Mr. Sidney Gibson, and to Newcastle-on-Tyne, where the Rev. Dr. Collingwood Bruce will describe the castle, and exhibit antiquities in the museum, and explain the ruins of Friars Monastery. Mr. J. Hodgson Hinde will then receive the Association. On Saturday, Brancepeth Castle and Church, Bishop Auckland, and Darlington Church, will be inspected; and the party will return to Durham, where the concluding meeting will be held, in the new town-hall.

**THE FIRE AT THE LANGHAM HOTEL.**—We have received from the manufacturers of a Ventilating "Sun-burner," a letter referring to a notice in our pages, of the fire at the Langham Hotel, and to the fire as "said to have happened through a Sun Burner Reflector," and making out the notice (as we understand the letter) to be cause of probable loss to them. If the notice had been read with ordinary care, before the letter was written, "sun-burners" would not have been found named or alluded to. The fire was reported to have been caused by the heat of the sun's rays, as reflected from one of the contrivances for reflecting light, and for lighting dark corners or passages in buildings; and this cause of the accident was distinctly referred to by us. The occurrence, however, seems to demand more attention than it has received.

**ELECTRO-TELEGRAPHIC.**—A Warsaw journal announces that the plan for a telegraph line between Russia and America has been approved and signed by the Czar. The Russian Government undertakes to complete the line as far as Nicolajewsk, the remaining portion—from Nicolajewsk to San Francisco—being at the charge of the American Company. The capital of the latter amounts to 10,000,000 dollars, and bonds representing 8,434,600 dollars have already been issued. It is intended that this route shall be finished in 5 years.—At the half-yearly meeting of the Electric and International Telegraph Company it was stated that the net profit for the half-year was 54,696*l*, out of which a dividend was recommended of 4½ per cent. for the six months. The dividend was unanimously agreed to, and the balance of 3,140*l*. ordered to be added to the Trust Fund.—During the hearing of an application for discharge, made by Messrs. Charles Joyce & Co., merchants and underwriters, Moorgate-street, London, who had held a high position in the commercial world, and had failed with liabilities of unusual magnitude, it was stated that by an unfortunate mistake in the reading of a telegram, which led to a large purchase of cotton, a loss of 94,000*l*. had been incurred! At the time of our going to press, no positive explanation of the apparent failure of the Atlantic cable had come to hand.

**SOUTH KENSINGTON MUSEUM.**—During the week ending August 5, 1865, the visitors were:—On Monday, Tuesday, and Saturday, free days, open from 10*a.m.* to 10*p.m.*, 10,572 persons; and on Wednesday, Thursday, and Friday, students' days (admission to the public, 6*d.*), open from 10*a.m.* till 6*p.m.*, 1,676. Total, 12,248. Since the opening of the Museum it has been visited by 5,454,835 persons.

**POPULATION OF OUR TOWNS.**—The Registrar-General gives the population of ten large towns in the United Kingdom in the middle of the year 1865, as estimated at these figures:—London, 3,015,494; borough of Liverpool, 470,368; city of Manchester, 354,930; borough of Salford, 110,833; borough of Birmingham, 327,812; borough of Leeds, 234,025; city of Bristol, 161,809; city of Edinburgh, 174,180; city of Glasgow, 423,723; city of Dublin (and some suburbs), 317,666.

**ROOFS OF THE SUSPENSION PRINCIPLE.**—Sir: Referring to the notice of this subject which appears in the *Builder* of August 5, I may perhaps be permitted to say that, in 1848, I got out plans and working drawings for a circular building 600 ft. diameter, with a roof of iron and wood on the suspension principle.

H. THOMAS.  
\* \* \* We may take the opportunity of remarking that Mr. Hittorf's early efforts in this direction seem to have been lost sight of.

**THE SCOTCH GRANITE COMPANY,** who supplied from their quarries at Mull, the material for the base of the Prince Consort Memorial in Hyde Park, have acquired by purchase the well-known granite polishing works in Paisley-road, Glasgow. The red and pink varieties of granite are principally supplied from the Mull quarries. Polished granite for ornamental purposes is in constant demand all over the kingdom; and the Mull Quarries are exhaustless.

**THE MENAI PARK AND HOTEL COMPANY.**—The prospectus of this Company has been issued. The object is to carry out a contract with the London and North-Western Railway Company for the purchase of a freehold estate on the edge of the Menai Straits, consisting of eighty acres, of which twenty were some time ago planted and laid out by the late Sir Joseph Paxton. A first-class hotel is to be erected, with suitable grounds. Attention is called to the picturesque features and the invigorating climate of Carnarvonshire—conditions which have created a demand for residences there; and it is estimated that a handsome profit will be derived from the hotel and from the rentals of the estate. The capital is 70,000*l*, in 7,000 shares of 10*l*. each, and interest at the rate of 6 per cent. per annum is to be allowed on deposits and calls until the reopening of the hotel.

**FOOD FOR THE SICK AND CONVALESCENT POOR.** The gentleman who established the "Invalids' and Poor Sick Child's Dinner-table," in St. Pancras (a notice of which appeared in the *Builder* of last week), writes to us, saying that our "printer has led us into an error," which makes the furnishing expenses appear nearly double what they really are, and that the details of working expenses, derived from the first Report, do not represent the present usefulness of the institution. We append the amended account. The receipts have been,—

Donations .....	£49 15 6
By sale of tickets .....	87 4 0
Invalids' pence .....	42 5 10
Other sources .....	108 19 10
In all .....	£288 5 2
The outlay has been—	
For furnishing .....	£5 12 6
Rent .....	29 0 0
Matron .....	15 12 0
Balance at banker's .....	63 14 3

The dinners supplied have been 5,075 in number. Subscribers have sent in 1,483 tickets; the district clergy, 1,788; the district hospitals, 472; the medical gentlemen of the district, 181; the Bible Missions, 522; and the Societies for Relief of the Poor, 679; total, 5,075. The balance at the banker's is explained by Mr. Hicks's financial year ending in October, and the subscriptions coming in but slowly between January and April; which enables him to pay his way from year to year. We willingly help him to place clearly before the public the essential part of his scheme, namely, to show how cheaply real and permanent good may be done for the poor, not in pauperizing the working classes, but in helping the poor to help themselves.

**SUSPENSION BRIDGE ACROSS THE OHIO RIVER.** The piers of this bridge are nearly completed, and the wires will be suspended in a short time. The span, 1,057 ft., of the bridge, is called the longest in the United States.

**GAS.**—The Banbury Gas Company have declared a dividend of 7½ per cent., free of income tax, for the past year.—The Gas Products Utilising Company have declared a dividend of 5 per cent. for the last half year, free of income tax, making, with the 5 per cent. for the previous half year, in all 10 per cent. per annum, besides transferring 1,000*l*. to the reserve fund.

**THE ROCHDALE BOROUGH SURVEYORSHIP.**—Mr. A. M. Fowler having resigned, a new surveyor was advertised for, and thirty-five applications were received. This number was reduced to three,—Mr. Parnell, of Wolverhampton; Mr. Walker, of Birkenhead; and Mr. Richardson, of Rochdale. Ultimately Mr. Thomas Walker was appointed, at a salary of 200*l*. per annum. The council then unanimously passed a resolution bearing testimony to the zeal and efficiency of Mr. Fowler.

**SEWERAGE OF MERTHYR-TYDFIL.**—Tenders in the form of a schedule of prices have been received by the local Board of Health for the sewerage works of Merthyr-Tydfil. The surveyor, Mr. S. Harpur, at the last meeting of the Board, reported that the works to be executed, would, at the several prices, amount to the sums undermentioned, commencing with the lowest:—

White .....	£21,677 18 5
Rison & Davies .....	25,528 19 8
Dixon & Slight .....	29,123 6 11
Mackenzie & Abell .....	27,560 12 8
Thomas, Watkins, & Jenkins .....	27,636 6 1
Griffiths & Thomas .....	27,708 6 10
Williams .....	29,092 6 10
Powell .....	45,980 3 4

A letter being read from Mr. White, of Ystalyfera, stating that he had performed similar contracts in Wigan, Burnley, South Shields, Tynemouth, Morpeth, Newport, &c., Mr. Gale asked the surveyor to explain one of the items in which a great difference existed between the several tenders. It was for the 9 in. pipes, which was one of the greatest items. Mr. White was cheaper than all the rest: some were 10s., his was 4s., and the surveyor's estimate was 6s. A considerable discussion took place, and a motion, previously made, for adjournment, was carried. Subsequently, the clerk was requested to make inquiries in the usual way as to the stability of Mr. White and his sureties, and also as to the manner in which he had performed his contracts in the towns named in his letter to the surveyor.

**SAFE GUNPOWDER.**—Experiments have been made at the Horseguards and at Westminster, by Mr. Gale, in order to satisfy the Duke of Cambridge and other authorities, military and civil, of the importance of his invention. The experiments were quite successful. Though ourselves impressed with the importance and utility to engineers, of this simple and ingenious way of safely storing gunpowder, we have suggested that experiments are requisite to prove whether or not sufficient of the non-explosive powder, which, in fact, is simply powdered or ground glass, adheres to the grains of gunpowder, after sifting, to lessen, in any appreciable degree, its explosive strength. Another suggestion has also been made, whether in conveying gunpowder from places to place the one powder will not be partially separated by vibration from the other, so as to uncover the gunpowder to a great extent at one side while the powdered glass collects at the other. There is certainly a tendency in powders, even though homogeneous, to settle or partially arrange themselves, when shaken, according to the fineness of the particles. Mr. Gale, however, denies that even in transport there is any danger of this taking place, at least to a sufficient extent to restore the explosive power of the gunpowder. The same objection does not apply to storing, except where causes of vibration are at work, as from railways or carriage-ways, establishments where steam-engines are used, &c. And even if it should turn out that transport tends to deteriorate the non-explosive arrangement of the particles, the reversal of the barrels or packages, could that be practically accomplished, might, to a great extent, restore the arrangement. Before being stored, for example, they could be exposed to vibratory force, while in the reversed position, for a certain interval, so as to insure their safety when stored.

WORKING MEN'S CLUBS.—Lord Stanley has given a powerful impetus to the multiplication of these excellent institutions, by a speech delivered at Birkenhead, on the occasion of the opening of the Workmen's Hall and Club-house in that place.

LEFRACOMBE HOTEL.—When the list of tenders was given in for this hotel, the tender of Mr. J. Dendle was the lowest; but he has asked to be allowed to throw it up, and the directors have permitted him to do so, taking the next lowest, that of Messrs. Call & Pethick, of Plymouth, for 14,944l. The architect is Mr. M. C. W. Horne, of London and Plymouth. The building will contain over 166 rooms, besides halls and other conveniences. On and over the first floor there are 143 rooms, some en suite, suitable for sitting or bed rooms. The coffee and table d'hôte rooms are each 46 ft. by 30 ft., and over 20 ft. in height. The frontage is about 150 ft., and the average depth 80 ft. The building is described as being in the modern or Victorian style of architecture.

NEW HOTEL, CANNON STREET.—The City Terminus Hotel Company, in connexion with the terminus of the South-Eastern Railway, has been incorporated under the Companies Act, 1862, with limited liability. The capital is 140,000l., in 14,000 shares of 10l. each. 9,000 shares have already been subscribed for, and the remaining 5,000 are now offered to the public. The hotel is being erected at the City or Cannon Street Terminus of the South-Eastern Railway, now in course of construction. The works, which are in progress, have been let to Messrs. Lucas, Brothers, and arrangements have been made which will secure the payment of interest by them to the subscribers at the rate of 6 per cent. per annum on the amount of capital from time to time called up, until the opening of the hotel.

MONUMENTAL.—Mr. A. J. B. Beresford Hope, M.P., in reply to an inquiry as to a statue to the late Confederate General Jackson, states that Mr. Foley is at work on the statue; but as to the site—that, he fears, "is a question to be asked hereafter at Washington." A monument has just been erected in the new cemetery at Worcester, to the memory of a Mrs. Maxwell. It is a square Gothic structure in Sicilian marble, raised in two stages, the lower one projecting beneath the upper. The lower stage has ornamental buttresses at each corner, and on the four sides are shields adapted for the reception of mortuary inscriptions. The work was by Mr. Stephens, of Worcester, sculptor.

"DIOCESAN ARCHITECTS," &c.—Sir: Your correspondent, "A Church Mouse," has certainly asked some simple, comprehensive, and appropriate questions concerning these official (officials?) gentlemen. Shrewd inferences will be drawn by your readers in the absence of a satisfactory answer. I am not in possession of all the necessary information, or it should be at your service, and write now simply to inquire, what is known of a society advertised as "The Incorporated Church Building Society," and whether architects are connected therewith—also, is the manner of conducting business such as to merit public comment?—for the information of the architectural profession generally, and of future church building committees particularly.—OPPOSED TO QUACKERY.

FEVER FROM LOCAL CAUSES IN LINCOLN.—It appears from the last monthly report of Mr. Garrham, the house surgeon of the Lincoln Dispensary, that besides severe diarrhoea more generally prevalent, there is typhoid fever, which is mainly confined to the Castle Dyke neighbourhood, and to that part of the Hill-side which is in St. Martin's parish. These localities, says the reporter, I have on former occasions had to bring before your notice. Whenever any serious illness prevails within our city, in these places may we be sure of finding it in its most formidable character. When houses without ventilation, windows that will not open, open drains, cess-pools, and privies, reeking and stinking in an almost tropical temperature, within a few yards of the only means of airing these wretched dwellings (the open door), are permitted to exist, how can we wonder at disease finding there a fitting hiding-place? . . . As the germ of diarrhoea, cholera, and many other epidemic diseases, is found in the voidings of the affected, can we wonder, under such circumstances, at a disease spreading from house to house?

DECORATIVE GAS-LIGHTING.—Messrs. Defries & Sons write to say with reference to the Philharmonic-rooms, Southampton, of which an illustration and some particulars appeared in our number of the 29th ult., that although the piping may have been executed by the parties mentioned, the lighting generally was their work. The arrangements, which were designed by them, comprise crystal star-lights, surmounted with silver and ruby clusters, and festoons of crystal, with various coloured stars. There are sixteen star lights in the hall, of twenty-four lights each, four chandeliers in the ante-rooms, and at the entrance two large prismatic lanterns, with various crystal brackets, &c., to other parts of the building. Messrs. Defries have undertaken the lighting by gas of the building at Oporto, for the Portuguese International Exhibition. The structure is drawing to completion, and the committee have decided that the inauguration shall take place in September.

TENDERS

For house at Bourn, near Cambridge, for Mr. Samuel Peed. Mr. W. M. Fawcett, architect:—
Turner.....£3,420 0 0
Bell & Sons.....3,190 0 0
Day.....3,155 11 4
Thoday & Clayton.....2,750 0 0
Gray & Son.....2,670 0 0

For vicarage at Ganton, Yorkshire, for the Rev. D. L. Alexander. Mr. John Gibson, architect, Malton:—
Barry (accepted).....£1,100 0 0

For the erection of schools at Pinner, Middlesex. Mr. Thomas Hill, architect:—
Tanson.....£2,406 0 0
King & Sons.....2,357 0 0
Cowland.....2,158 0 0
Beston.....2,180 0 0
Adams.....2,060 0 0
Dove, Brothers.....2,075 0 0
Field & Sons.....1,900 0 0
Young.....1,838 0 0

For workmen's hall at Stratford, Essex. Mr. G. B. Marshall, architect:—
Hill & Keddell.....£1,089 0 0
Norton.....1,032 0 0
Chaffins.....1,049 0 0
Rivett (accepted).....1,033 0 0

For factory buildings and chimney-shaft at the Silk Printing Works, Garret-lane, Wandsworth, Surrey:—
Rivett (accepted).....£3,545 0 0

For covering, &c., the Heathwall, the Lord Spencer, and a portion of the Putney boundary main sewers, and for diverting the sewage through Garret-lane from a part of the Wandale:—
Hill & Keddell.....£50,150 0 0
Webster.....48,304 0 0
Thirst.....47,081 0 0
Dethick.....45,690 0 0
Pearson.....45,609 0 0
Moxon.....41,950 0 0

For alterations and additions to a house, for Mrs. C. Grove, Norwood-green. Messrs. Backhouse & Tivimey, architects. Quantities supplied by Messrs. Eppy & Scott:—
Hanson.....£1,695 0 0
Brown.....1,575 0 0
Walker.....1,525 0 0
Stimms & Martin.....1,420 0 0
Gibson, Brothers.....1,347 0 0
White & Son.....1,259 15 0
Humphrey, Brothers.....975 0 0

For the erection of kennels and helpers' rooms for the Right Hon. the Earl Poulett. Mr. T. Preston, architect:—
Light.....£1,070 0 0
Ellis.....1,029 0 0
Webb.....975 0 0
Butterfield.....974 0 0
Edwards.....955 0 0
King.....899 0 0
Backhurst (accepted).....825 0 0
Duffett.....830 0 0

For the erection of premises, Aldersgate-street, for Mr. Wm. Bradshaw. Mr. N. S. Joseph, architect:—
Conder.....£2,190 0 0
Masera.....2,165 0 0
Axford.....2,050 0 0
Kilby.....1,985 0 0
Newman & Mann.....1,975 0 0
Hardiman & Sandon.....1,947 0 0
Hill & Keddell.....1,929 0 0
King & Sons.....1,927 0 0

For new premises, London and County Bank, Lambeth Brauch. Messrs. Francis, architects:—
Myers & Sons.....£5,519 0 0
Sawyer.....5,590 0 0
Higgs.....5,430 0 0
Hill & Sons.....5,424 0 0
Simpson.....5,417 0 0

For a villa to be built for Mr. H. Branston. Mr. C. Foster, architect. Quantities supplied:—
White.....£2,850 0 0
Richie.....2,528 0 0
Davy.....2,436 0 0
Lanxon & Co.....2,470 0 0
Smith.....2,419 0 0
Warion.....2,416 0 0

For finishing a pair of large semi-detached villa residences, in Hungerford-road, Holloway, for Messrs. Hindley. Messrs. Lander & Beddell, architects:—
Sturges & Coles.....£1,747 0 0
Hill & Sons.....1,700 0 0
Child & Sons.....1,657 0 0
Scrivener & White.....1,644 0 0
Palmer.....1,430 0 0
Grover (accepted).....1,438 0 0

For rebuilding Nos. 27, 28, and 29, Walbrook, for Messrs. Bates, Brothers. Messrs. Wimbale & Taylor, architects:—
Including top If Bath stone and Portland stone of front. Portland.
Piper & Wheeler.....£7,220 .....£7,100
Browne & Robinson.....6,967 .....6,870
Lawrence & Son.....6,840 .....6,870
Myers & Son.....6,895 .....6,810

Colls & Son.....6,180 .....5,860
Hill & Son.....6,057 .....5,872
Kilby.....6,155 .....5,861
Adamson & Son.....6,028 .....5,809
Hardiman & Sandon.....5,528 .....5,294

For building two houses at Clapton. Mr. J. Tanner, architect:—
Fison.....£3,603 0 0
Turner & Son.....2,449 0 0
Colls & Son.....2,414 0 0
Eaton & Chapman.....2,170 0 0
Stableford.....2,078 0 0

For the erection of a detached house, exclusive of bricks, part of other materials, fences, &c., for Mr. At. Flecker, Belvedere, Kent, S.E. Mr. Herbert Ford, architect:—
Vickers (accepted).....£709 0 0

For alterations and additions to Warehouse, No. 5, Canalside, City, E.C., for Mr. A. Wells. Mr. Herbert Ford, architect:—
Palmer & Son (accepted).....£375 0 0

For works at Ealing, for Col. Elsal. Quantities furnished by Messrs. Eppy & Scott:—
Cole.....£555 0 0
Ingewick.....437 0 0
Grover.....410 0 0
Nye.....472 0 0
Gibson.....449 0 0

For alterations and additions to a house on Peckham-rye, for Mr. J. D. Potter. Mr. W. Bertram, architect:—
Thompson.....£1,652 0 0
Super.....1,400 0 0
Watkins.....1,183 0 0
Colls & Son.....1,135 0 0
Tarrant.....1,100 0 0

For the Fulham and Hammersmith sewers:—
The New-road Sewer.
Robinson.....£6,850 0 0

Bowley.....2,890 0 0
P. Still & Co. (accepted).....2,748 0 0

# The Builder.

VOL. XXIII.—No. 1176.

*American Notes: The Use of Timber in Construction; Water-Supply; and Heating-Apparatus.*

HERE are features of interest in the building contrivances, and in the efforts after architecture, of a new country; but it is not often that they receive from the architects of old countries, the attention that they deserve. We propose here to set down a few notes

concerning what may be seen in America.

In a country so well supplied as is America with timber, the lavish use of wood in building may naturally be looked for. Twenty years ago, up to within the last five or six, designs exhibiting architectural character were generally executed in wood. In fact, private dwellings, churches, and railroad-stations, were simply huge full-sized models in wood, imitating, by sanding the surface, or by other unjustifiable process, a material more costly and durable, but not so easily worked. An amusing article might be written upon the absurdities thus perpetrated; amongst which none more deserve ridicule than the stations upon the New York and Erie Railroad, because the engineers and officers of this once extravagantly-appointed line might have been supposed to know better. All of these were huge boxes of the severest Grecian-Doric or semi-Egyptian styles, painted a gloomy chocolate brown, sanded as rough as nutmeg-graters, and as uselessly heavy in appearance as they were frail in reality. Many of them have since given place to better-conceived erections; but the majority have yet an undesirable vitality. These, of course, were all of wood, boxed out into thicknesses that left the joints to open in the intense heat of the sun, to the palpable betrayal of the sham that had been attempted.

After awhile, a better taste prevailing, timber construction began to be legitimately developed. One of its first phases was the expression its use gave to the roofs, verandahs, porches, and other projections from the building. The climate of the Northern States requiring, during the fierce blaze of the summer, equal provision for shade as the residences of the "sunny South," the houses soon assumed a character in this respect which might, it is true, have been more honestly taken advantage of. Unfortunately, nearly all the architects brought into play their European recollections or office-traditions, and only used this facile material to carry out architectural features that properly required other embodiment. In proof of this there are numberless buildings in which the Tudor style has been made use of, with heavy mullions, hood-moulds, gable-copings, parapets, &c., all manufactured in wood, upon brick or even stone walls, and painted and sanded, to mock the eye and tone, as stone. In many country-houses, designed by

the late Mr. Downing, and by his successor, this faulty error has been perpetrated, and with no excuse for so doing.

Passing these defects by, there are many examples of an honest use of timber that would delight our realistic architectural friends. In the Western States the rough log-houses are pretty to read about, and picturesque (sometimes) to sketch; but they are generally clumsily contrived, and badly put together. At first intended as temporary dwellings, time proved so valuable and labour so scarce, that the erection of a better house would be put off time after time, and the original rudo hut would be added to, upon this side and upon that, until it became too large to pull down, and too ugly to attempt to beautify. So it would be left; until, after awhile, the restless family of settlers, having, as they imagined, better prospects elsewhere, would leave it to fall into ruin, whilst they were probably engaged in erecting just such another a few hundred miles further west. Therefore, the rude timber dwellings, quickly thrown up to meet an immediate emergency, must not be supposed to form the type or nucleus of a national American style; but only near large towns, where cultivated minds had thought out the right treatment of the material, must satisfactory timber erections be sought for.

Wooden houses, properly built, are warm, weather-proof, and durable; besides having the advantages of rapidity of construction and facility of removal. This latter recommendation was one of more practical value a few years ago than now, when, especially in the eastern states, it was no unusual thing to meet a two or three story building, on rollers, with ten or a dozen yoke of oxen and a small army of men, ereaking along through the wide country roads, in quest of a more eligible situation than the last; the smoke from its cooking-stove tranquilly curling up to the sky, and the savoury smell of "huck-wheats" showing that the good lady of the house took her fitting very calmly, and was not to be disturbed in her household employments.

The mode in which these wooden buildings were usually constructed, was by framing upright studs and cross bearers upon sills resting on brick or stone foundations, with corner posts spiked thereon, and the roof-plate resting on the top. Mortising and tenoning were avoided as much as possible,—oak pins or iron spikes fastening the framing together so as not to weaken the timbers by cutting into them, as also to prevent the danger of decay. The frame being in its place, the outside, in all buildings of a better class, was first covered with rough hemlock boards, and then with "clap-boards," as they are called, which are clean boards of even widths, cut feathering on their upper edge, and usually rounded on the outer edge, and laid lapping one over the other so as to show the same depth of face; or the rough boards were covered with inch-and-a-half planks placed perpendicularly, the joints covered with battens (generally chamfered or moulded) 2 in. or 2½ in. wide, and nailed through to the framing, which in this case would have horizontal bearers cut in between the studs to receive the planking. The laths for plastering would be nailed on the inner face of the framing; and between these and the outer covering, in all the better houses, the space is filled in either with soft brick on edge or rough mortar,—in all making a really very warm and comfortable wall, the interlining of soft brick or mortar preventing the sun heating the interior, and at the same time serving to retain internal heat and exclude the winter's cold.

In no feature, however, do American buildings show so great a difference from ours as in the roof.

A favourite, cheap, and durable material is the white oak shingle. This consists of thin oak slabs, cut frequently into ornamental forms and

laid as slate would be. The shingle is about five-eighths of an inch thick at bottom, feathering away almost to nothing on the top, laid lapping, and fastened with copper nails. These will last for many years, and are so light that a very economical scantling of roof timbers is admissible. Unpainted, they are remarkably durable; but all attempts to render them more lasting by painting, or by any other covering, have been failures. This experience corresponds much with that of the treatment of park-palings in England. The shingles swell with the rain, and remain tight and weather-proof, if left in their natural state; and, after some years' exposure, they are found to have acquired a coating from nature's own laboratory that renders them impervious to wet.

Examination, in a large number of instances, would practically confirm a theory that wood exposed to the atmosphere will last longer unpainted than painted, provided the surfaces are rough. This idea is by no means new, or claimed as original; but it has not received the attention it deserves. A church that was erected in the year 1848, in a very exposed situation in one of the American North-eastern States, and entirely of timber construction, was left almost as the material came from the saw and unpainted; and in 1860 there was no appearance whatever of external decay, and none of any damage from the wet penetrating into the interior. The external surfaces seemed to have become almost silicated, so hard and perfect was the shell that had formed thereon.

Where shingles are not used, tinned plate is generally employed. In the dry atmosphere of the Northern States, despite the contraction and expansion that must occur in such extremities of intense heat and severe cold, this material lasts extremely well. The sheets are laid upon a rough boarded surface, at a slope that may be very considerably less than that permissible with slate, and are fastened by rolls over the edges of the plate, which are turned up, and also soldered where the upper sheet overlaps the under. Copper nails are also sometimes used; but the more independent the tinned sheathing of the roof boarding can be left the better it will stand, as the contraction and expansion are not interfered with. A curious fact is that nearly all the material thus used comes from this side the Atlantic, and is manufactured of special dimensions and thickness, and with the edges turned up by machinery, exclusively for the American market. Whether there are well-founded objections to its introduction for the same purpose here, it would certainly seem worth while to inquire.

The tinned roofing is generally coated with some paint, of which there are many patented compounds: the common earth paints, found in such abundance throughout the country, seem as durable as any, and are very cheap. Under the roof thus clothed with plates, it is not uncommon to find a layer of cork slabs or felt; and when these are used, the upper rooms are not unpleasantly affected by the transmitted heat.

Slates are beginning to be used for roofing purposes to a rapidly increasing extent, but tiles are rarely seen.

Whatever the material for covering may be, the nearly universal practice, particularly in the longer-settled states of New England, is to frame the roofs, as was the custom here in olden times,—namely, with principal, purlins, and common rafters. The timbers are always deep and of good scantling; and, with all the lightness and thrift of material of an American building, the roofs are well built and scientifically laid out. Tie-beams are generally used where they do not too much interfere with the headway, and a continuous bond is given to the whole interior framing of the building by connecting cross pieces from the tie-beams to the floor-timbers of the floor below, and these again with the one

under, and so down until the sill is reached, thus greatly strengthening the whole fabric.

The wooden "truss" bridges of America are well known; their safety in principle has made engineers rash; and the cheap manner in which railroads are constructed forbids attention to the state of their repair, so that more than one fearful accident has been the result. In all American constructions, as in the principle of these bridges, weight of scantling is made secondary to depth, and the result will bear inquiry. Some large roofs of really enormous span are models of timber construction: one especially, over a large railroad station in Connecticut, has an unsupported span of about 96 ft. from wall to wall, and is formed entirely of timber, with iron suspending-rods, and framed so as to be entirely free from tenon or mortise. The deflection in this roof is represented as scarcely appreciable; and it has stood for nearly twenty years. A peculiar feature consists in the manner in which the iron rods are made to do their duty without piercing the timbers, being constructed so as to pass through shoes above and below the timbers to which they are tied. The roof of the Academy of Music for New York is exceedingly well contrived for the large space it is required to span.

Though the Americans, in their tricky use of wood as a means of embellishment, are scarcely examples to follow, it is due to them to observe, that in other building operations they are laudably free from shams. In all the large cities, stone and marble are lavishly used, and stucco, cement, or artificial material, in guise of stone, is almost unknown. Iron, it is true, may be seen used in a faulty manner for purposes of cast enrichment; but both within and without, American city buildings are remarkably honest and substantial.

In one respect they are far beyond our usual limit of attainment, and that is in the completeness of their arrangements for water supply, and in their various apparatus for heating. It is a common practice in estimating, to allow one-fourth of the gross outlay for the plumber's work of an average private house in New York, Philadelphia, or Boston; whilst many houses considerably exceed that liberal limit.

Master plumbers complain, in many of our towns, that their best hands leave them for the "States;" and it is certainly the fact that the workmanship to be seen there, is such as to justify the belief that the highest skilled labour must be greatly in demand. In all the large towns, the abundance and purity of the public supply of water renders every householder desirous to secure his share of the benefit. The Croton aqueduct, that supplies New York, does its duty magnificently; and though complaints of waste have obliged the authorities to be somewhat more sparing of the flow than heretofore, London is at present far behind its Yankee rival in this respect. New Yorkers claim great praise for their sewerage system also; but upon this it is not now proposed to dwell.

Every house of even moderate pretensions has at least one bath-room, well supplied with hot and cold water; and if every bedroom be not similarly supplied, at least all upon the principal floor are so. Usually the pipes are all in sight, neatly finished and fastened upon an oak, walnut, or mahogany strip, with the joints and holdfasts japanned, and the pipes themselves clean and bright; this arrangement of course is made so as readily to get at and repair leaks, which the capricious frosts of early winter make somewhat probable. To guard against such, however, various contrivances, more or less successful, are resorted to, none seemingly more efficacious than an arrangement by which a continuous circulation throughout each length of pipe is obtained, with at the same time such a plan adopted of laying out the work, that all nearly horizontal pipes have a dip towards the outlet, so as readily to empty themselves; and by allowing no bends to be of such a curve as to retain water when it is required to have them free.

The hot-water supply is obtained by a simple apparatus, which seemingly is not known commonly to our plumbers. In describing it, it will be necessary first to remark that all houses have a receiving cistern in the upper part of the building, to render the pressure on the pipes equal, and the supply steady.

From this a cold-water pipe descends to the kitchen, beside the range in which the apparatus for heating the water is placed. This consists of a large upright copper cylindrical boiler, generally containing thirty to forty gallons, and sometimes considerably more, the water within

which is kept at nearly boiling-point, by being coupled with the fountain, or water-back, at the back of the range. In this upright boiler a coil of pipes is compactly laid against the inner surface, and this coil, connected as it is with the cold-water pipe, receives cold water at the upper end, passes it through the coil to the bottom of the boiler, and then repeating the curve passes it up again in the shape of hot water, ready to be drawn wherever needed, a hot-water pipe connecting this with the bath-room, &c. &c. The water in the coil, by thus slowly circulating, becomes of the same temperature, nearly, as the water within the boiler by which it is surrounded; all that is necessary being to observe that the cold-water or supply pipe and the coil must be greater in diameter than the return hot-water or exhaust pipe. The cistern being at a proper elevation, the hot water will rise to as high a point as the natural law allows; and the advantage of this simple plan is, that the upright boiler being open, no steam is generated, and there is no danger in its use. This system also gives a large and constant supply of hot water ready to be drawn for domestic use on the spot.

The boiler is, of course, self-feeding; and it is an excellent feature of the best American cooking-ranges, that they heat this large supply of water without increased consumption of fuel.

For the supply of cold water for drinking purposes, a hydrant is attached in some one of the kitchen offices, connecting with the main, and passing the water through a filtering apparatus, which is generally connected also with the large refrigerator that contains the daily replenished stock of ice; thus giving the luxury of cooled water in abundant flow.

In some respects all these conveniences of plumbing have been over-done, and visitors are often fairly hotheaded in some houses and hotels with the niceties of the apparatus with which their lavatories are to be rendered easy. Frequently a marble slab basin or an enamelled bath is seen with invisible inlet or outlet for water, and only a fancifully enriched plated knob, perhaps over the centre of the affair. In perplexity this is pulled at, but it will not draw out. A lucky turn to the right sends a rush of hot water streaming into the basin or bath. This is soon too hot, and you look in vain for some friendly tap of a cooler element. Another turn of the knob, and, with a gurgling swirl, the water as quickly disappears, and all is empty, whilst vexation and embarrassment disturb all ideas of comfort. At last the mechanism is mastered; but the toy is so perplexing, and proves so costly to keep in repair, that the sturdy old hill-cock, sooner or later, makes itself warmly re-welcomed.

The Americans are "great" on heat. The abominations of red-hot stoves in taverns and railway cars are past all description; and, much as may be said in favour of the economy of labour from the system of heating their buildings from one apparatus placed in the cellar, the evils are so great and numerous, that on the whole it is conscientiously thought that their houses would be better left unwarmed. Where one is healthily warmed and ventilated, ninety-nine are unhearable. The air is parched and dry, the heat stifling, and the danger from throat affections and colds positive. And yet there is much that is very convenient and valuable in some of the systems employed, and which would make them well worth a brief description.

The modes that are peculiarly American are those by which hot air is passed into each apartment and hall, through metal registers opened or closed at pleasure. This air is first brought from without the building into a large chamber, there heated, and passed into wide-tinned pipes into the several rooms. This, briefly, is the general system, though the details are varied. But the whole comfort of the result depends upon how the atmospheric air is heated. The various plans are by a furnace, from the dome of which pipes are coiled and twisted about so as to obtain the greatest possible radiating surface; as it is by bringing it in contact therewith that the air is heated in passing through the chamber. The difficulty is, that to get cheaply a great amount of heat, the castings are made very thin, the air-chamber and hot-air pipes small; and, as a result, a hot, desiccated, poisonous air is discharged into the room, so unpleasant to new arrivals as invariably to set the lungs coughing and the head aching. Where the air-chamber, however, is large, the furnace very wide and shallow, and its dome high, with the radiating surface largely extended, and

the external cold-air shaft spacious, this mode of heating is excellent. No apparatus of its kind ever surpassed the old Boston furnace, first invented by Chilson, and since so greatly improved by his successor in New York. In the "Boynton furnace," as it is called, the shaft bringing in the cold air is very large—frequently 4 ft. wide and 2 ft. or more deep; and the air-chamber and pipes are also of considerable size. In the air-chamber a small jet of water is kept playing to restore the natural moisture to the air. Numbers of houses, churches, and large public buildings, have been cheaply and successfully warmed by this apparatus; and where the conditions have been attended to that health requires, the result has been good. Anthracite coal is used; and for an ordinary house, a ton would be sufficient supply for nearly three weeks. No other fires, excepting that in the kitchen-range, are usually seen, although it is becoming the fashion to have, in addition, brightly burning bituminous coal, for its cheerful appearance in the sitting-rooms.

Hot water has been used for the same purpose; but although there are many costly arrangements that find more or less favour, an impartial observer would naturally arrive at the conclusion that they are only more expensive and less efficient methods of obtaining the same result as is certainly cheaply gained by the improved kinds of hot-air furnaces.

Ventilation is more attended to than might be supposed; and such simple methods as consist in the provision of spare flues of ample size; to each of the sitting-rooms and bed-rooms, to serve as air-shafts, are commonly in use.

The use of anthracite coal and the absence of fire, save in the furnace and kitchen-range, enable American housekeepers to keep their houses, both inside and out, much cleaner than we can,—to which happy result the bright atmosphere greatly assists. If, however, bituminous coal comes, as it threatens to do, into more frequent use, our Yankee cousins will soon share with us the annoyance so graphically described by ladies as "the blacks," and will better appreciate the clever sketch in *Punch*, made when poor Lincoln was president.

#### CURIOSITIES OF ARCHITECTURE.

At this season of the year, many of our readers who are free to choose will visit celebrities in the way of architecture, such as our cathedrals and castles; and, deterred by their magnificence from all attempt to make drawings of them, will return to their ordinary duties unenriched by a single sketch. To these we would say, there are, scattered in every county, minor objects of which we have but scanty account, and of which collections of sketches would be at once valuable and curious. We might instance as curiosities of architecture, whispering galleries, secret chambers, garrets, fortified church towers, chancery, market-crosses, wayside chapels, crypts, lych-gates, holy-wells or lady-walls, town gateways, hermitages, the various ancient British remains, and tombstones with their crosses, shears, keys, horse-shoes, chalices, hands, lambs, haws and arrows, horns, fishes, and other mystical devices; and, as curiosities of detail, leper-windows, hagioscopes, fonts, half-timbered churches, wooden churches, single spires, &c. It is remarkable how little is known of such objects, and how few residents in one county know of similar curiosities in any other. The term garret, for instance, conveys to most minds only the idea of a room immediately under the roof of a house; but dwellers on the border country can still point to small towers, called garrets, built upon castle walls, and to places called *garrets* because in old times they possessed similar towers for the defence of a garrison. We have only to run through the list we have named to see how much information remains to be accumulated. A student preferring to cover a great deal of ground in a tour could take one class of object and pursue it, exclusively, through the country.

Whispering-galleries are curious as being links in the chain of endeavour to lessen distance by artificial contrivances; and which, after germinating in man's minds for, at least, two thousand years, have sprung forth in the advanced form of the telegraph. The Romans did a little pioneering work in this direction, by the transmission of sound through pipes, laid in the long length of *Vallum*, known as the old Roman

wall, which, by the way, is a most wondrous curiosity of architecture itself. Medieval whispering-galleries appear to have partaken more of the nature of alcoves. In Stuart times, the "whispering place" in Gloucester Cathedral was considered one of the wonders of the land. It is thus mentioned by Edward Phillips, the nephew of Milton—"A remarkable curiosity in the cathedral of Gloucester, being a wall built so in an arch of the church, that if a man whispers never so low at one end, another that lays his ear to the other end shall hear each distinct syllable." The whispering-gallery of Sir Christopher Wren, in St. Paul's Cathedral, may be said to be the only well-known example of this type of curiosity. The semi-cupola recesses on old Westminster Bridge have gone.

Secret chambers abound in old mansions of a certain age; and when we learn where they are to be found, or what varieties of form they present, we are met with the obstacle of insufficient information. We have recently given some account of secret chambers in the old houses in Edinburgh; and "The Book of Days" affords a description of some others; but a general account, with measurements and sketches, is not in existence. Here is an unexplored field for the curious.

The fortified church towers in Cumberland have met with a little more attention; but not so those of Northumberland. Lysons mentions the towers of Newton-Arlosh, Burgh-on-the-Sands, and Great Salkeld; but more recent observers have not added to the number; and, as we have hinted, there has been no attempt to string together those of the Northumbrian border. Their sturdy walls, arrow-slits, and embrasures are unnoticed, save by the local antiquaries. Many a missionary must have wished that the tower of his church was capable of defence; and we might learn from these the expediency of some modified strength for our outlying colonial edifices for the protection of those who teach in them, although we are no longer in need of similar contrivances at home. As companions to these curiosities we might class the rare examples we possess of wooden churches, reared comparatively not long after the days when our own land was the resort of the Christian missionary. Of these, Greensted in Essex, and Stock, in the same county, possess two well-known specimens. The half-timbered churches, too, such as those in Cheshire, would add further interest to the collection. The way-side chapels that once greeted the wayfarer on all sides, are fast disappearing; but there are still several left worthy of study. That on Wakefield Bridge has been doubtfully restored, without, unfortunately, any sufficiently explicit drawing having been made to show its former condition. Such loss of information would be spared us, if students made sketching the constant practice we would recommend. In the matter of chantries, it is a question whether various buildings pointed out under that name are more in reality than the residences of the chantry-priests appointed to serve chantries in the parish churches; but looking at them only in a constructional point of view, they are curiosities. Crypts are worthy of more attention than they have hitherto received; for they frequently contain details of much significance; and our principal Saxon remains are crypts. Going northwards through Derbyshire, Yorkshire, and Northumberland, four celebrated specimens might be visited by the way,—Repton, Ripon, Hexham, and Bamborough; and others might be sought out.

But it is, perhaps, in foreign travel that we should find ourselves embarrassed with riches of this description. Architectural curiosities may be met with abroad for which we have not even names. Roadside crosses, oratories, wells, meet the traveller's eye on all sides; droll landing-places, quaint recesses giving access to picturesque courtyards, sculptured portals, niches, external staircases of much grace and movement, covered balconies, "bits" that it is impossible to pass without staying to admire, are common surprises at every turn. As in our own country these are constantly being displaced by the needs of the day. Many objects are to be seen depicted on old tapestries that are no longer in existence. The curious *fourches patibulaires* are cases in point. In the neighbourhood of the principal abbeys and residences of the most powerful nobles, were erected quadrangular stone buildings formed of tiers of arches for the express purpose of hanging malefactors in chains. In some cases they assumed structural proportions. The tapestry of the Hotel de

Ville shows the enormous gibbet that once existed at Montfaucon, capable of holding upwards of eighty unfortunates at a time. The base is of masonry enclosing a chamber, into which, perhaps, the bones were thrown when they could no longer hang together. A flight of steps gave access to the platform from which the tiers of niches arose on three sides. Some of these niches were wide enough to take two bodies, others only admitted one. M. Viollet-le-Duc, who gives an illustration of this remarkable object in his "Dictionnaire de l'Architecture Française," remarks that its hideous aspect, and the pestilential odour emanating from it, did not prevent the establishment of canteens and places of amusement in its vicinity. We are far from indicating the selection of this class of curiosity for the sketcher's industry; for, it must be borne in mind, that the benefit to be derived from sketching is twofold. Not only does the artist gradually put himself in possession of valuable material, but he, as surely, acquires a facility of drawing which will do him as "apples of gold in a picture of silver," and imbues his creative faculty with a sense of beauty which will be to him a safeguard in design.

#### EXHIBITION OF ARTS AND MANUFACTURES FOR NORTH-EASTERN LONDON.

THE North-Eastern London Exhibition, in the Agricultural Hall, Islington, of Arts and Manufactures, was opened on Wednesday last, by the Lord Chancellor, assisted by the Lord Mayor. The exhibition, last year, was made prominently one for the working-classes; but this one, we believe, is put forth as the first of a series of local but general exhibitions, such as have been suggested for the different parts of London, and preparatory to the formation of local museums. In the scheme as published in March last, a classification into "Arts and Manufactures," "Fine Arts," and "Loan Collection" was adopted, the first of these being divided into six sections and twenty-three classes. The classes "Minerals, Metals, and their compounds," and "Civil Engineering, Architectural, and Building Contrivances," with which we should be chiefly interested, are not now very extensively represented in the Agricultural Hall; but under "Philosophical Instruments, and processes depending on their use," "Photographic Apparatus," "Works in precious Metals, and their imitations, and Jewelry," "Glass," and "Educational Works and appliances," there is much that is interesting. The paintings, part of the sculpture, the engravings, and the photographs, have been placed in the galleries. Architecture, though not thought of sufficient importance to constitute a Class, is represented by a few drawings, amongst which are some by Messrs. Owen Jones, Goodchild, Cockerell, and Blomfield, all of which have been mentioned on previous occasions in our pages. The whole Exhibition, speaking from recollection of the last display, and whilst a catalogue of the present Exhibition is not procurable, is less extensive than the other, but the majority of the works seem to be of a higher class; and the arrangement is better. The Loan Collection is chiefly composed of objects lent from South Kensington.

Amongst the paintings and drawings, as before, there are a considerable number of works having but slight claim to art. Some of the works by amateurs may be suggestive to artists, of subjects or even treatment; but of the majority, it is difficult to say that good is done by their exhibition. One of the best pictures is that entitled "An Episode;" it is by Mr. McDonald. There is a good work by Albert Ludovici, representing Faust and Mephistopheles; and there is a landscape by Doddington. The sculpture, some of which, in the gallery, has been well arranged with draped background,—and some of which on the ground floor is, when the sun shines in the afternoon, spoiled by shadows from the building,—has been contributed chiefly by Messrs. Foley, R.A., Bell, Lawlor, E. G. Papworth, and Abbott. The last of these has contributed his two huts, or rather half-figures, Juliet and Ophelia, which were in the Royal Academy Exhibition. Both are beautifully designed and modelled; and the latter has been said, by one medically competent to judge, to be exactly expressive in the features of the madness portrayed by Shakespeare. Some of the huts were unfortunately broken on the day of opening.

Messrs. Rosher's manufactures in artificial stone and other materials, Mr. Robinson's

enamelled slate, Messrs. Moore's clock-dials, with their clear lettering; Messrs. Harland & Fisher's church furniture and decorations, the latter including specimens of a method of diapering in fresco, capable of being made very effective; are nearly all the objects specially pertaining to building that we can call to mind. We may, however, mention Mr. S. Harrison's Self-acting Preserver Valve, for extinguishing fires. The contrivance includes a rose or water-spacer, which is to be repeated at distances of 6 ft. in the length of a pipe, extending for the width of a ceiling. Similar pipes would be placed 6 ft. apart, for the whole length of the ceiling. The pipes would be kept charged with water. The rose is fitted with a valve that is carried by a piston-rod, which last is encircled at the bottom by a ring of fusible metal. Should fire occur, it is supposed that the metal would quickly be melted; when the piston would descend, and the water would flow into the rose, and be ejected through the orifices. The roses or pendants could easily be made ornamental. The inventor argues that water is the only true fire-annihilator; and that as by the contrivance, when in action, the wood-work would be kept cool, it would be impossible for fire to extend, as from one floor to another. He proposes that the flooring in each story should be caulked watertight, and that there should be guttering and a down-pipe to each floor. What would be the arrangement at the staircases, does not appear. A further contrivance is suggested for ringing an alarm-bell.

The photographic cameras, with rotary motion, for taking views extending over 130°, manufactured by the Pantascopic Company, with the photographs, are interesting; as the latter, however useful some of them, illustrate the laws of perspective,—the distortion in several being evident, and showing that the picture should be bent similarly to the arc described by the lens.

Small but choice collections of objects of ancient art are comprised in one or two of the cases. We have omitted to mention that there are some drawings of model dwellings. To this department of the exhibition, development might with advantage have been given.

At the opening ceremony, a prayer was offered by the Archdeacon of London. The Old Hundredth Psalm, the Choral composed by his late Royal Highness the Prince Consort, the Hallelujah Chorus, and the National Anthem, were most effectively sung by the National Choral Society, augmented to 1,000 voices, and under the direction of Mr. G. W. Martin; and the band of the Hon. Artillery Company, and the great organ made by Messrs. Willis, played at intervals. The Lord Chancellor made an admirable address. In the course of it, he dwelt particularly on the disadvantages of the position of the South Kensington Museum, for the inhabitants of North-Eastern London. Indeed, the promoters of the Exhibition are strongly influenced by the desire, to use their own words, "of seeing established in the midst of the immense manufacturing population of Finsbury, Clerkenwell, and Shoreditch, a permanent local Art-Museum;" and the present effort is viewed as the first step towards such an institution. Recognizing the importance, if not necessity, of these efforts, we should be glad to see similar movements in favour of local collections of those aids to knowledge which can be duplicated, and can be made useful in each locality, instead of being drawn to one at the loss to another,—to wit, such aids as books; for, movement in favour of public libraries stagnates just now sadly.

#### LONDON PLAGUES OF FORMER TIMES.

THE connexion between pestilent preventible diseases, and certain outward causes for their occurrence, is a subject of very great importance, and one which has not yet received so much attention as it deserves: for instance, there is a close connexion between pestilences amongst human beings and fatal disorders among animals which in so many instances have preceded the excessive death-rate of human beings,—a subject of but too absorbing interest at the present moment, when our cattle are dying by hundreds from a pestilent typhoidal disease, while virulent cholera looms in the distance and may any day reach our shores. A glance over the pages of history, and even a recollective thought of circumstances which have occurred within the personal observation of many individuals still living, will show how often the epidemics of

animals have been followed by those which have spread death among the human population. It would seem as if animal life was more readily affected by the derangements of the air (if such there be) than is that of a higher order. There is also a close proximity to be often noticed between famine and plague. The day will perhaps soon come when those matters which materially affect life will become as certainly established as is the fact that sanitary provisions check, and will, if thoroughly carried out, prevent a large part of the mortality which arises from fever, cholera, and other disorders of a kindred class. But at present, notwithstanding the various opinions which have been formed, that mysterious state of the atmosphere, if it be such, which intensifies sickness and multiplies death, *under neglected conditions*, is one of those problems which yet requires to be clearly solved.

When lately glancing over some of the histories of London, we noticed that from the most remote dates, since the historical records of the great metropolis can be in any way depended on, there has always been an intimate connexion between murrain of animals, scarcity of crops, and plague. It is now two centuries since the greatest plague of which we have record raged in London, and it may not be without interest to give a note of some of the visitations which have occurred within the last few centuries.

In 1543 so great a mortality raged among the horned cattle, that meat became excessively dear; and to remedy this, the lord mayor and common council made a sumptuary law for preventing luxurious eating, which ordered that the lord mayor should not have more than seven dishes, either at dinner or supper, the aldermen and sheriffs no more than six, the sword-bearer four, and the mayor and sheriffs' officers three, on the penalty of 40s. for every superfluous dish; and, by the same authority, it was enacted that the mayor, aldermen, sheriffs, &c., should not, after the ensuing Easter, buy cranes, swans, or bustards, on the penalty of 20s. for every fowl so bought. In the same year the plague raged so violently in London, that a great number of citizens died, and the term was adjourned to St. Alban's.

In 1548 London was again visited by a plague which carried off large numbers; and just three years after the above date (or in 1551), the sweating sickness broke out in London, and, say the historians, "carried off a great number of its inhabitants;" and it is remarked, that not only was this illness fatal at home, but Englishmen especially perished to a considerable extent from this cause, even abroad, which is a very singular circumstance, and would seem to indicate the action of external causes on constitutions modified by habitual local or native influences. As is now the case with the filthy and ill-conditioned cities of the Holy Land, Egypt, Turkey, India, &c., pestilence seems to have been a constant guest in the London of 1556. A malignant fever then raged in London, and "took off a great number of citizens." Amongst these deaths were seven aldermen. During the year before there had been a great scarcity of corn, which must have pressed heavily upon the poorer classes.

There is no especial account of more than the usual number of deaths from disease, until 1563, when the plague broke out with great violence; and, by command of the queen, the master and wardens of the clerks were appointed to inquire the number of those who died in their respective parishes, and to make a certificate thereof, and that the curates and churchwardens should give notice to them of such houses where the plague appeared, and to forbid every person in such house coming to church for the space of one month following after the plague had been in it, and to fix a blue cross on the door of every house, with a writing underneath, signifying that the infection was there, and to avoid it. It was ordered that bonfires should be made three times a week, on Mondays, Wednesdays, and Fridays, until the infection should cease. In the beginning of August, the lord mayor issued a proclamation for killing all dogs that should be found in the streets, either by day or by night. The number of people who died of the plague and other diseases in this year amounted to 20,972. At this time the citizens were reduced to great misery, in consequence of the scarcity of provisions. The population of the metropolis at this date was under 300,000. If we compare this mortality with that which would occur in the present state of the population, the deaths in a year, in London, would

amount to about 203,000, or not far short of the total population of 1563.

Only six years after this outbreak of pestilence we have accounts of another plague, which was so violent that it was necessary to adjourn the Michaelmas term to that of Hilary; and the lord mayor gave orders that all idle persons should be prevented from straying about, who might spread the disorder amongst the citizens. They also adopted some sanitary precautions, which were more likely to prevent the evil than the confinement of poor distressed wanderers.

In 1603, another terrible outbreak of the plague occurred, which carried off in that year 30,578 persons, 3,090 of whom died in one week. If, for the purpose of roughly showing to modern London the extent of this mortality, we use the same proportion already taken in a former instance, and for the increase of the present population of the metropolis multiply the population of 1603 by ten, the deaths in one week would be 30,900.

Another attack of plague occurred, when great preparations had been made for the reception, in London, of Charles I. On the death of James I, the lord mayor and aldermen repaired to Ludgate, where Charles I, having arrived on horseback, was there proclaimed, as well as at all other places in the City; but the joy was changed to mourning, for the plague raged so violently, both in the City and the suburbs, that it carried off 35,470 people, besides upwards of 18,000 who died of other distempers. On account of this calamity the coronation was postponed to the 2nd of February; this was in 1625. In 1635, the plague carried off 10,400 citizens, and, in consequence of its occurrence, the fairs and other large places of public assembly were stopped.

There are many other accounts of pestilences of various kinds which have visited Old London; and amongst the records in the British Museum and Guildhall Library, there will be found many accounts of visitations which have not been especially noticed by the London historians; but there might be useful knowledge gained by an examination of this most important subject,—more in detail than has yet been done.

In 1665, however,—exactly two hundred years ago,—about the beginning of May, the greatest plague of which we have record in England broke out in London. It swept away 68,596 persons, which, added to the number of those who died from other disorders, raised the bills of mortality in that year to 97,306. Even at that time we do not think that the population of London was so much as one-eighth of the present. If, however, we take this estimate, the deaths in London from a similar plague now would number 558,768 (upwards of half a million human beings). From other disorders than the plague, the death-rate was heavy; and the deaths in London, if we compare the past population with the present, would be in all 778,448.

But as are many of our present conditions, and great as is the necessity in these our own days for improvement, we ought to be thankful for the change which has been made; for we can now, notwithstanding the large amount of preventible deaths, scarcely form an idea of the terrors which must have attended the great plague of Charles II.'s time, when, in the month of July, most of the houses were shant up, when the streets were deserted, and grass was growing in those thoroughfares where the traffic had been the most busy; when great fires were lighted in the vain attempt to purify the air, and coffins, and pest-carts, crosses with the inscription of "Lord, have mercy upon us," met the eye in all directions, and there were heard cries of "Pray for us," the clanging of the watchman's bell, and the melancholy sound of "Bring out your dead."

## THE CATTLE PLAGUE.

### HEALTHY COWSHEDS.

SINCE writing our notes on pestilences last week, we have endeavored to ascertain a few particulars as to the way in which some cow-keepers have kept their stock in health, previously to the breaking out of the epidemic amongst their neighbors, so as to have enabled them to resist its ravages. The result is just as we anticipated. On the one hand it appears that in a well-known instance, wherein scores of cows died of the plague, the health of the

animals had previously been grossly neglected, and the sheds in which they lived were kept in a filthy and unwholesome state. On the other hand, in a similar establishment, not far from the one in question, where not a single case of virulent fever or plague has occurred among sixty cows, the utmost attention has *always* been given to the health and strength of the animals, and the wholesomeness of the sheds. For years, not a day has ever been missed in the clearing away of dung, with the exception of Sundays (and it is a pity, we think, that even Sundays should be excepted in such a case). Carbolic acid, or McDougal's powder, has of late years constantly been used, to the extent of a hundredweight a month; and four times each year the whole extent of the sheds is lime-washed. The animals are carefully cleansed, combed, and brushed, the master always himself seeing everything done. The drains are kept in good order, and all of them are trapped. The sheds are ventilated, especially by the roof, and to any extent. The proprietor is rightly of opinion, that the practice of keeping the cows warm in winter by excluding fresh air is pernicious and wrong, as also is the opening of the sheds at one end only while the roof is close.

These sanitary measures are habitually reinforced by attention to food, and especially by the free use of bean and pea meal. A little medicine is also occasionally given, consisting of nitre and a few other simple ingredients, such as treacle as an aperient. The allusion to nitre reminds one of Lord Bacon's encomiums on the wholesomeness of nitre to the human economy; but we do not suppose that Bacon had the merit of suggesting its use in the present instance. There must have been practical evidence of its efficacy no doubt, which has led to its repute and its occasional use.

The means of keeping milch-cows in a healthy condition, in town sheds, as here described, it must be noted, are not merely measures instigated by the fear of the moment, but the steady and continued practice of years; and the experienced and intelligent tradesman who has adopted this practice not only reaps the benefit of it in a demand for his certainly the superior milk, beyond his power to supply it; but he must now have the additional satisfaction of finding that while other tradesmen are losing stock to a hundred times the outlay requisite for the habitual adoption of sanitary measures, he is now being repaid for that outlay by the avoidance of any such loss.

There is one circumstance, however, which gives uneasiness in the case referred to. Adjoining the cowshed is a butcher's slaughter-house, where all sorts of beasts are killed; and, as our informant believes that, in two instances with which he is acquainted, milch-cows were attacked by the plague in open fields adjoining one where foreign cattle were put to graze; the infection having been carried, as was supposed, by the wind, one day to the one field, and another day with a changed wind to the other field; he fears that, in spite of his best endeavours, something similar may occur in the case of his own cows. We advised the free use of chloride of lime in this case, between the slaughter-house and his cowsheds, as being more likely, from the volatility of the chlorine, to seek out, as it were, and seize any infectious matter while in transit through the medium of the air, than carbolic acid, although the latter seems better adapted to the interiors of cowsheds.

The railway companies have been communicated with by the Government as to the cleansing of cattle-trucks, and the City authorities are seeing to the adoption of like measures in the cattle-market.

We shall return to the subject of metropolitan cowsheds and the cattle disease.

## THE DUBLIN CORPORATION WATERWORKS.

AT one of the recent meetings of the Institution of Mechanical Engineers, a paper by Mr. Parks Neville, the engineer in chief of the Dublin Waterworks, now in process of formation, was read, descriptive of the works; which on a subsequent day were inspected by a large party of the members. The paper stated that in 1775 the water-supply from the River Dodder, for several centuries the source for Dublin, was found so bad and insufficient that the Corporation arranged for obtaining what was then considered an ample supply from the Grand Canal. The Royal Canal was the source for the

north side of the city, and the Grand Canal and City Watercourse for the south side. The water obtained from the Dodder was of a soft quality, and would be very good for domestic use, were it not for the pollutions received from paper and other mills. The water from the canals, however, was hard, and was also liable to great pollution. In consequence, for many years the want of a really good supply of soft water was strongly felt, and numerous plans were proposed for obtaining a new and improved supply. At length, in 1860, the whole question of the water supply to Dublin was referred to a royal commissioner, Mr. Hawkslaw, who recommended the obtaining a supply of water from the river Vartry. An Act was obtained in 1861, for the purpose of carrying this into effect, and the work was commenced in November, 1862, the amount of the contract for the whole being 274,000. The water is collected entirely from a clay slate district, and is peculiarly soft and clear, during the greater part of the year quite free from all colour, and almost identical in analysis with the Loch Katrine water, which supplies Glasgow. Roundwood was the place selected for the storage reservoir, situated about 7½ miles below the source of the river. At the point where the great embankment for the reservoir was constructed, the bed of the river is 520 ft. above the highest part of Dublin, the drainage area above this point being 13,992 acres, or 22 square miles, and the area of the reservoir being 409 acres, capable of containing 2,400,000 gallons, or 200 days' supply. The quantity calculated upon would supply a population of 400,000 with 25 gallons per head per day, and leave a surplus of 2,000,000 gallons per day for manufacturing and other purposes. Having referred to the construction of the reservoir, the manner in which the water is conveyed into the distributing-basin, and subsequently into the filter-heads, was explained. The two pure-water tanks which received the water from the filters were capable of holding 2,730,000 gallons of water each; and from these tanks it was intended that the water should be carried for a distance of about 700 yards in a cast-iron pipe, 42 in. in diameter, laid with a fall of 6 ft. per mile, until it reached a tunnel, into which it was to be carried for a length of 120 yards, so as to get to the solid rock. At the lower, or Dublin end of the tunnel, it was proposed to have a relieving tank and measuring weir, where the water passed down for the supply of the city would be ganged daily. From this tank the water would be conveyed to the distributing reservoirs at Stillorgan, which were supplied with self-acting stop-valves at their junction with the tank, to prevent flooding in the event of a pipe bursting.

On the occasion of the inspection, the reservoirs, near Stillorgan, were first visited. They are two in number. The total water-area is 18 acres, the average depth 20 ft.; and they will contain 90,000,000 gallons. The surface levels above the Ordnance datum are in one case 274 ft., and in the other 271 ft. Adjacent to these reservoirs is a large stone chamber, in which the water will be filtered through copper screens. The arrangement of the mains and valves will be such that the water may be introduced into this chamber, and thence to the main leading to the city, either from the adjacent reservoirs, or direct from the Vartry main. In the latter case the water, being less exposed, would be delivered colder and purer. From these reservoirs to the city there is a double line of 33-inch mains, which are supplied with the before-mentioned valves, to guard against a rush of water in the event of a pipe bursting between the reservoirs and the city. The Roundwood reservoir has been formed by stretching an embankment 2,000 ft. long, across the extremity of a valley, through which the little rivulet, called the Vartry, flows down from the mountains to the sea at Wicklow harbour. It is in a great measure, therefore, a natural basin. Its boundaries are now marked by a wall, which extends from the two extremities of the embankment round the slopes of the hills on either side. The stream at present is allowed to flow through on its course to the sea; but as soon as all the works are finished, the passage will be stopped; and the embankment being thus converted into a dam, the reservoir will fill. The embankment, which is 25 ft. wide at the top, and 320 ft. at the base, takes the line of the old coach-road across the valley; and the road will in future extend along its summit. It is now almost complete. Its greatest height is 66 ft., and the greatest depth of the reservoir which it will form, will be 60 ft. In the Sheffield reser-

voir, the main pipes for conducting the water out of it were simply laid through the puddle-wall and earthwork. The consequence was considered to be that the water penetrating between the edges of the pipe and the embankment, injured the latter so that its destruction ensued. The great outlet-pipes of the Roundwood reservoir are built into a tunnel of stone and brick. One of these pipes is 48 in. in diameter, and will be used chiefly as a sluice for lowering water, whenever it may be in excess in the reservoir. The other, 33 in. in diameter, is that through which the supply to the city will pass. The latter leads into a tower built within the precincts of the reservoir; and opening into the tower from without, are pipes at different lengths to enable the supply to be taken at different levels, the exterior of the tower being submerged to a certain height. By means of these pipes at different heights the clay side of the lower water on the upper heated water will be avoided. The 33-inch pipe leads from the tower to a system of filtering beds and tanks on the other side of the embankment. The other larger pipe is connected with a "by-wash," which leads from the reservoir to the course of the Vartry below it, and which will be used to let off any excess of water from the reservoir. In part of the distance between Roundwood and Stillorgan, it was necessary that a tunnel 4,376 yards, or nearly 2½ miles long, should be pierced, for the mains, through a mountainous mass, of the most part of Cambrian rock, of an extremely hard description and difficult to work through. The level of the bottom of the Vartry river, which will be the bottom of the storage reservoir at Roundwood, is 632 ft. above datum, or 520 ft. above the highest part of Dublin, as before stated. If the water were brought direct to the city from that elevation, the pressure would be far too great. In order to reduce it, a series of relieving tanks are in process of construction, by which a succession of levels is obtained.

WATER SUPPLY.

In the evidence just published, which was taken before the Commons' Select Committee of last session on the Thames water, it was mentioned that Cricklade, Lechlade, Oxford, Abingdon, Wallingford, Goring, Streatley, Pangbourne, Reading, Wargrave, Henley, Marlow, the Wycombe stream, the Ray mills (near Maidenhead), the Taplow gasworks, and Windsor, with most of the mansions and houses on the banks of the Thames, discharge their sewage and refuse into the river above the Metropolitan waterworks at Hampton Wick and Thames Ditton. The ponds locks, however, at various points of the river—thirty between Oxford and Staines—turning the river into a series of ponds, stop the sewage to a certain extent. In all of them a deposit is found, which has to be taken out, and is thrown upon the land; otherwise the ponds would in many instances be completely choked, and the locks would not work. Windsor Castle is supplied from Romney pond.

The Liverpool town council have resolved to construct a new reservoir, to purchase the composition water of the River Roddlesworth, to purchase the diversion of the River Douglas, and to make (if powers can be obtained from Parliament) such other extensions of their works as will provide an additional supply sufficient for 150,000 persons, or about 25 per cent. of the present population within the boundaries of the supply. The cost of these new works and purchases is estimated at about 130,000. It is probable that much larger extensions of the sources of supply will have to be made shortly, as the population is increasing at an almost incredible rate. During the last three years, 10,863 new tenants, representing at least 50,000 new inhabitants, have required supply of water. It is a question likely to occupy a great deal of attention whether the additional supply which must be sought before long should be obtained from the Welsh or English lakes, or by distillation of salt water. Mr. Rawlinson, in 1848, reported to the then corporation of Liverpool on a proposed scheme of water supply from the River Dee, in North Wales, with Bala Lake at its head. This report, with appendices, surveys, plans, sections, details, and estimates, is in the possession of the corporation. Mr. Rawlinson now calls the attention of the present water committee to these papers. The Rivington Pike, he remarks, was to have supplied 25,000,000 gallons of water per day—17,000,000 for use, and

8,000,000 for compensation. Mr. Duncan has, over and over again, reported the actual yield, which has been far below these figures. The North Wales, or river Dee area of gathering ground at command, he says, is 289 square miles, or about 184,960 square acres, nearly twenty times the available area at and around Rivington. There is Bala Lake, a ready-made reservoir, 3½ miles in length by some half mile in width, and containing some of the softest and purest water in the world. The elevation of the river Dee, above Llangollen, is sufficient to deliver water at the highest points of Liverpool and its suburbs, and the intermediate country is singularly easy for the formation of an aqueduct to Liverpool, far easier than the Dublin works, or than the Glasgow works. Liverpool might now be enjoying thirty millions of gallons of pure water per day, at a far less cost than has been expended on Rivington and in pumping. Mr. Rawlinson asks for a full examination of his deposited plans and estimates, and advises the water committee to stop all further expenditure of money on works at Rivington.

A correspondent of the *Shrewsbury Chronicle*, Mr. T. P. Blunt, F.C.S., calls attention to the impurity of the water supply as a cause of the high mortality. He says the town water supply on examination, "gave evidence in every case of the presence, in greater or less quantity, of nitrates, an unerring sign, in this country, of the habitual contact of the water with decomposing animal substances. This state of things [he continues] is attributable, in great measure, to the disgraceful condition of the drainage of the town, which permits refuse animal fluids to percolate the soil to a large extent, and to come freely in contact with the springs. These facts bear a terrible significance, and may in part serve to account for the high rate of mortality shown by Shrewsbury. This at least seems to lie beyond a doubt, that, in a town so healthily situated, we must ascribe the large proportion of deaths—about one-third above the average—to avoidable causes. Unfortunately we have not to look far for these: as long as flagrant nuisances are allowed to fester unchecked in the very heart of the town, and at the same time the most common precautions for removing the filth produced by them are neglected, we may expect typhus and the diseases allied to it to revel in the territory thus lavishly provided for them."

The public well at Stoke-row, in the parish of Ipsden, Oxfordshire, is the gift of his Highness the Maharajah of Benares. In India, to sink a well for the benefit of the wayfarer and of the poor is considered an especially meritorious act; but the idea of extending such beneficence to a distant land is a novelty. He had often heard that in certain districts of England, in several parts of the Chiltern range, wells were almost unknown, and that the poor inhabitants, generally dependent on ponds by the roadside, were reduced in seasons of drought to absolute distress. He therefore availed himself of the return to England of his old friend, Mr. Edward A. Reade, of the Civil Service, who has retired to that neighbourhood, to express his wish that a public well should be sunk at his expense, and furnished with such appliances that all persons, especially the poor, should be able to supply themselves with pure water free of cost. The common land of Stoke-row, one of the highest points in the Chilterns, was then under the operation of the Inclosure Act, and the commissioners readily granted a site. The undertaking was commenced (an auspicious day being necessary on those occasions), by the Maharajah's direction on the wedding-day of the Prince of Wales, and was completed as far as reaching the water and fixing the drawing apparatus, before last summer, when its utility became manifest, especially to those who remembered that, in previous droughts, water had to be brought from the Thames, distant 7 miles, at a heavy expense; and that, to eke out the scanty supply, water already used in cooking actually passed, from cottages to cottages as long as possible, for repeated use. The daily yield of 600 to 700 gallons, during this dry season, has been duly appreciated by the people of Stoke-row and for miles round; their sense of the boon being shown by their persisting,—perversely, shall we say?—to call "the Rajah's well" "the righteous well." This well is 358 ft. deep, passing through 25 ft. of clay and gravel into chalk, and at a depth of 128 ft. and 228 ft. respectively, through belts of sand each about 8 ft. in depth, the securing of which by masonry has been a work of much difficulty. Below this, at 300 ft. from the sur-

face, the pure chalk rock has been pierced to the depth of 5 ft., under which chalk, interspersed with shells, continues to the bottom. The drawing-machinery consists of two buckets, the one ascending as the other descends, each capable of containing nine gallons. These are fastened to a galvanised wire rope, passing over a central wheel fitted with sprockets, which close on the rope as it rises and releases it as it descends, the motion being communicated by a main wheel easily turned, and requiring the strength of an ordinary lad to draw up the full bucket in five or six minutes. The superstructure is an octagon, on a stone pavement, ascended by steps of the same. Its material is iron, but the apex is gilt.

Belfast has of late been in the midst of a "water famine." The hot summer lowered the wells; the town had built no reservoirs; and the people had nothing to drink except water brought in barrels, carried on donkeys, from the environs. This water has been sold as if Belfast were Seville, and many trades have been suspended from want of their supply.

#### MR. J. H. PARKER ON THE EARLY CHRISTIAN CHURCHES OF ROME.

OUR article, last week, on the Restoration of Churches in Rome, was in type when there reached us a corrected report of an address on a similar subject, by Mr. Parker at the first evening meeting of the recent Congress, at Dorchester, of the Archaeological Institute. Mr. Parker has been spending some time in Rome; and his own particulars of his researches will be considered interesting, although in part going over ground already dug into by the *Builder*. We have incorporated with the report other particulars by Mr. Parker, since published.

Mr. Parker said, at Dorchester, of the early Christian churches of the first millennium of the Christian era, a period of which we have scarcely any remains in England or France, that there were not less than fifty now remaining in Rome. The earliest were those which were originally Pagan temples, and were afterwards consecrated to Christian worship. Among these he included the Pantheon, which was generally considered to have been a temple, although now it was a church dedicated to All Saints. The original circular building was erected before the first century, with a portico and two side wings added about that time by Agrippa.\* The rotunda supported a dome, which was open in the centre. The next series to which he alluded were the small burial chapels in the catacombs, to which much importance had been attached. He did not believe that these were commonly used as churches, but rather for the purpose of the burial service. Nor did he believe that the catacombs were places of refuge for any length of time, but only for a few hours in times of persecution. The next series were the churches made in houses. Indeed, many of the great basilicas of the time of Constantine were originally halls within the large palaces. One of these was the original church of St. John Lateran, which stood within the walls of the Lateran Palace. The present church had been rebuilt since. He next referred to the church of St. Croce, which was erected within the walls of the palace of St. Helena—sometimes improperly called the Empress Helena, the mother of Constantine the Great. He then described the form of the ancient Roman basilica, with its nave and two side aisles, and its apse at the end, where the judge sat; which place, when these edifices were converted into churches, was occupied by the bishop. Again, the Church of St. Peter's was originally a hall in the palace of the Vatican. Another class was the monastic churches, several of which were very early. Several of these edifices were fortified, and they were nearly all erected on the plan of the basilica, or hall of justice. In all the primitive churches the altar was at the west end, but this did not interfere with the turning to the east during worship, as the altar was low, and the bishop could look over it. He considered this custom of turning towards the rising sun, as an emblem of the resurrection, was nearly as old as Christian worship itself. He then alluded to the church of St. Pudenciana, which, according to the "Annals of the Christian Church," by Baronius, was in existence in the 160th year of the Christian era, having been consecrated by Pope Pius I., as stated in a

\* The rotunda of the Pantheon is usually regarded as having been a portion of the Baths of Agrippa.—Ed.

letter from him which says,—"I have made a church in the Baths of Novatus, and have dedicated it in honour of his sister Pudenciana the Martyr;" and which church is still called, on an inscription in the edifice, "The Mother of all Churches." It was originally in the house of Pudens, which was a well-known place for the reception of the early Christians.

Mr. Parker has elsewhere reminded us that Novatus and Pudenciana were two of the children of Pudens, the Roman senator, and his wife Claudia, who were amongst the earliest Christians in Rome, and all of whose children were among the martyrs of the Christian Church. Both Pudens and Claudia are mentioned by St. Paul as friends, at the end of the letter to Timothy, written from Rome. The Baths of Novatus were made in his father's house, about A.D. 90, and the house was then commonly called "The Baths of Novatus." Pudens, the senator, was a person of considerable importance and great wealth; and his house was thrown open for the reception of all foreign Christians coming to Rome, as is mentioned in the history of the martyrdom of Justin Martyr, in the second century. This house is also said to have been the earliest place of assembly for the Christians of the Gentile Church at the same time that the house of Priscilla and Aquila was for the Jewish branch of the Christian Church; but the authority for this statement is rather doubtful. It is certain, however, that the house of Pudens was a large and important family palace, occupying an ancient site, and, like all the ancient palaces of Rome, had been originally fortified and surrounded by a deep fossa, or dry ditch. The road, or via, was originally at the bottom of this fossa, as was the case throughout Rome; but in process of time, this roadway was raised to the level of the second story—probably when the palace was rebuilt, in the first century of the Christian era. There were then two stories below the level of the street, as is the case with many of the ancient houses in Rome, partly owing to the very uneven ground, which made it convenient to raise the level of the road across the valleys. In these underground chambers all the early churches in Rome were made, until the time of Constantine, when new and larger churches were commonly built over the old ones, which were either destroyed or preserved as crypts under the new churches, as was the case with St. Pudenciana. But the church occupied only a small part of the palace in most cases, as notably in the instance of the great Basilica of Constantine, which was made in the Lateran Palace, and is now called St. John in the Lateran. That palace was probably larger than the House or Palace of Pudens; but the one illustrates the other, and in the Lateran Palace were made a convent, a hospital, and a palace for the Pope, and still a portion was left for the Lateran family, some of whom continued to reside there as late as the fourteenth century, as appears by inscriptions on their tombstones in the church. Somerset House, in the Strand, Mr. Parker observes, is the building which gives Londoners the best idea of an ancient Roman house or palace; and the original church would be not in the lowest story, which consisted of cellars only, but in the one immediately below the street; and, in the instance of St. Pudenciana, the clerestory windows appear to have opened into an area just below the level of the ground.

The nave had been rebuilt over and over again; but the choir has an apse with a mosaic of the fourth century, and behind this is a flat brick wall of the first century, and he believed that the lower part was a portion of one of the earliest churches. Mr. Parker, at Dorchester, detailed the results of excavations which he had made on the site of this edifice, and explained the character of the architecture which pointed to such an early date. The existence of this primitive church had been entirely forgotten until his recent investigations. It is filled up with loose, dry earth, evidently thrown in from above through its clerestory windows; and this is said to have been done in the beginning of the sixteenth century, at the time of the revival of "paganism" in art, when the old Christian churches were utterly despised, and called Gothic by way of contumely. This filling up with earth is said to have been done by order of the Pontifical authorities in order to keep out the brigands, who had used it as a hiding-place. Mr. Parker applied for permission to empty out the earth, but the Pope refused to sign the order granting this permission when presented to him for his signature, which is usually considered a mere formal act. Mr. Parker thinks that the

Pope might have been annoyed that a member of the British Church should pretend to make such a discovery, because the house of Pudens is closely connected with the early history of the British Church, which is very palpable at Rome. He adds, in the *Illustrated London News*, that according to the British legends, this house was not only the earliest place of assembly of the Gentile Christians, but also went by the name of the British Palace in the first century of the Christian era, having been the residence of Caractacus, and the whole of the British royal family, during the seven years that they were hostages in Rome. Claudia, the wife of Pudens, was the daughter of Caractacus, and there is no improbability in the tradition that Pudens received the whole family into his house or palace. St. Paul is also said to have been a constant visitor in this house, and the whole family to have been among the early Christians. St. Pudenciana herself, as the granddaughter of Caractacus, was a British princess, and, with her sister St. Praxedes, and her brothers Novatus and Timotheus, has as much claim to the title of the earliest British martyrs as Roman. The British legends further state that when the rest of the Royal family returned to Britain, they took Christianity with them, and that Britain was the first country in which Christianity became the established religion. It is certain that British bishops were present at the earliest council of the Christian Church long before the time of Augustine, who converted the Saxons, and taught them to be subject to the Bishop of Rome, which the British bishops refused, and were massacred in consequence, as recorded by Bede. These legends receive considerable confirmation from contemporary writers. Tacitus, in the twelfth book of his "Annals," records the taking prisoners of Caractacus and the whole of the British royal family, and their lives being spared. Martial mentions Pudens repeatedly in his epigrams, one of which is written on the occasion of his marriage with the British Princess Claudia, of whom he says that, "though born of the painted Britons, either Rome or Athens might be proud of her;" from which it appears that the British ladies were as celebrated for their beauty in those days as they are now. Another epigram is written on the birth of their first child, and another on the death of Pudens, showing that the poet continued always on friendly terms with the family.

Mr. Parker commented, at Dorchester, on several other churches, and observed that they exhibited a decay of art from the fourth down to the tenth century. The walls of Rome were remarkable to those who did not know them; they were about ten miles in circuit, and in some places were now quite 50 ft. high.

Mr. G. G. Scott asked if there were any stone benches in the chapels of the catacombs which might have been used for the placing of coffins previously to interment.

Mr. Parker replied in the negative, but said there were small seats which might have been temporarily used for teaching. As far as he could see, he did not think these edifices were generally used for the performance of service, but merely for burial purposes. He had another remark to make with reference to the early churches of Rome, and that was, that the interiors had been very much altered and plastered over from time to time; but, if the outside could be got at, the whole history developed itself. Another point of some interest, and but little understood, was that of the alterations that had taken place in the level of the city. The general tradition was that this had been occasioned by the burning of the place by the Normans in the twelfth century, and that the ashes had thus raised the level. He believed, however, that this was a mistake: the difference of level had only been occasioned in the lower parts by the inundations of the Tiber, as it was evident the hills were about the same level as previously. After explaining the characteristics of the ancient walls, the lecturer observed that the campaniles were objects of interest; but none of them were earlier than the twelfth century, though perhaps built after an earlier type. The mosaics were exceedingly interesting. They belonged to all periods, from the fourth to the ninth centuries, and then there was a break to the twelfth century. It was apparent by comparison that they were much more durable than the frescoes. One of the finest was that at the end of St. John Lateran, and was threatened with destruction; and, because the nave had been "paganized," they were going to "paganize" the choir as well. By Roman antiquaries

everything after the fifth century was called modern, and consequently despised. He also alluded to the destruction of a fine porch of the Cosmatii, (which was of the fourteenth century, and ornamented with beautiful ribbon mosaics on the capitals and bases), in the Church of St. Lorenzo, as an instance of the destruction committed by architects in the present day. Thus St. Paul's, for which money had been collected all over the world, was called a restoration; but every vestige of the old building had been destroyed, and a pagan temple had been erected in its stead.

Mr. Scott said the reason he asked the question he did was, that in Wales the porches were often used as mortuary chapels, and there were stone benches on which the coffins would be placed prior to interment.

Mr. E. A. Freeman asked if there were such a thing known as the consecration of a Christian church in the second century? Were those churches standing up above ground in a state to be consecrated at that period? No doubt there were churches standing in the third century. What was the evidence that there were churches standing above ground in the second century fit to be consecrated? He asked Mr. Parker for the evidence that churches above ground were consecrated as early as 150 or 160.

Mr. Parker said that his authority was the "Annals" of Baronius; and the architectural features were confirmatory of the statements made in that work.

Mr. Freeman did not think that much reliance was to be placed in a writer who lived so many centuries afterwards. Where was the evidence of the consecration of this room in the house of Pudens?

Mr. Scott remarked that St. Paul speaks of "the church that is the house" of some one.

Mr. Parker observed that Justin Martyr mentioned the house of Pudens as a refuge for foreign Christians.

Mr. Freeman said that that proved nothing whatever. It would not do to patch up things out of Baronius. Mr. Parker was too cautious to do the same thing with regard to English architecture. He would not go to Hutchins's "History of Dorset" to ascertain the date of a structure, but he would examine the style in the spirit of an archaeologist.

The Chairman (Sir John P. Boileau, bart.) said it was evident Mr. Parker and Mr. Freeman were of totally different opinions, and he did not think there would be any use in prolonging the discussion further.

The *London News* gives a view of a chamber in the Baths of Novatus, and one of the interior of the Church of St. Pudenciana. The chamber seems to have been made out of a house previously existing, and has plaster and painting of the end of the first century over both old walls and alterations: the church was formed in a chamber of the baths; and one of the hot-air flues is left in the wall in one corner.

OLD CHURCHES WITH GALLERIES.

THERE are some people to whom the very name of a gallery is an abomination, and who, immediately they hear the word mentioned, conjure up in their minds a church disfigured with wooden pen-like erections, supported on stilts, thoroughly uneclesiastical, and inartistic in appearance; and, I am sorry to say, in most cases they are correct in their judgment, at least so far as modern churches go. I can, however, mention two new churches which are honorable exceptions to this rule,—they are the new Jesuits' church at Amsterdam, where the galleries are carried all round the church, like a large triforium, with remarkably happy effect: the architect is Mr. Cuypers;—and the new Roman Catholic church at York, where the western gallery is vaulted and supported upon columns, and really forms the most beautiful feature in the whole building: the architect is Mr. Goldie. Another error into which people fall is that of supposing that galleries are a modern invention. Now, I hope, by referring to several old specimens still existing in Germany, to dispel both of these prejudices.

The earliest gallery that I know of is in a church, or chapel, called, "Der alte Dom," attached to the cloisters of Ratisbon Cathedral. This building is said to have been the original cathedral, and is at least as early as the year 300. It is in plan a parallelogram, about 60 ft. by 20 ft., with a blind aisle at the east, and a

deep gallery at the west end. The gallery is supported upon two semicircular arches resting upon a square pier and square responds attached to the sides of the building. It is vaulted underneath, but is like the rest of the building, entirely devoid of ornament. The material is rough stone plastered over.

Another very early Romanesque example is to be met with in the church of St. George, at Prague. Here the gallery is at the west end, and projects about 40 ft. into the nave of the church: it is vaulted, and supported upon a number of short thick columns. A late Romanesque example exists in the cathedral at Andernach, and a very singular one in the chapel of the Castle at Nuremberg.

The two most remarkable examples that I have ever seen are, the church of St. Ulrich, at Ratisbon, and the chapel of Castle "Transnichts," at Landsht. They are both about the same date (early in the thirteenth century). The church at Ratisbon is a most beautiful example of First Pointed work, and is entirely surrounded by galleries; in fact, it will be seen, by referring to the plan (fig. 3), that above two-thirds of the church is covered with galleries at the west end. The gallery projects about 30 ft. into the nave (see the view, fig. 2). The arrangement at the east end is very picturesque (fig. 1). These galleries are all beautifully vaulted, and supported upon short pillars, with most gracefully carved capitals. The approach to these is by circular staircases in two towers; one on the north and the other on the south side of the church. The whole arrangement of this church is well worth studying, though the interior is greatly injured by the flat plaster ceiling. It is probable that the vaulting of the nave has never been constructed: perhaps the width of the nave frightened the builders. The exterior of this interesting church has suffered very much from modernization; but two beautiful doorways

remain with capitals very similar to those in the west doorways at Rouen Cathedral. The tower is erected, and there are remains of a narthex erected about the year 1600. The church has been closed since the beginning of this century; but is now being restored.

The other example is the chapel of Castle Transnichts. It will be seen by referring to the ground-plan (fig. 4), that this chapel is nearly square; the style is early thirteenth century. Originally it possessed galleries at the east and west ends only, both of which are supported upon pillars and semicircular arches, and are stone. The gallery on the north side is of wood, fifteenth century work. The great peculiarity is the gallery over the high altar; its front, which is supported upon three semicircular arches, is richly ornamented with statues sitting in an arcade of trefoil-headed arches. Immediately above these, partly suspended from the roof and partly standing upon the parapet of the gallery, is the great roof of wood, painted and gilt: it is fourteenth-century work. At the back of this gallery is a small apse (see plan, fig. 5, a.) containing an altar. The arch leading into this apse is flanked with two fine niches (the canopies of which are made to represent small churches), occupied by large statues of St. Catherine and St. Barbara. In the tympanum above the arch is an early fresco. This singular chapel is vaulted in brick, and contains several curious old pictures and altars.

The smaller church of the Abbey of "Seil-

gengenthal," in the same town, contains a very large wooden gallery, of the fourteenth century work. It projects over three quarters of the nave, reaching within about 10 ft. of the chancel arch. The front of this gallery is ornamented with a series of small statues in niches, all carved in wood, and beautifully decorated with colour. It is supported by huge oak beams, which rest upon corbels attached to the walls, and a square stone pier in the centre.

In the fourteenth and fifteenth century churches, galleries are frequently to be met with in Germany. A good example occurs at Kitzingen: it occupies the entire length of one aisle, and returns across the west end of the nave; and another in the Angustinian church at Cologne, which has galleries in both aisles. In both of these examples the galleries are of stone, and are vaulted.

Western organ or choir galleries are very common in late German churches. Fine examples occur at St. Stephen's, Vienna, and St. Mary's, Würzburg, both of which are carried across the nave upon one bold arch. All these galleries are beautifully ornamented, and made architectural features, so that there can be little doubt that those who built them were not ashamed of what they were doing, but looked upon them as most useful appendages to a church, and a portion of the building really deserving thought and study. I have little doubt that the great "triforium" of Norwich, Peterborough, and Ely cathedrals, and the chapel of the White Tower, were nothing else but galleries, and were probably intended to be used on great festival days, or at other times when the churches might be overcrowded.

CONTINENTAL.

**Florence.**—An extremely full municipal council has confirmed, by a unanimous vote, the concession for the enlargement of Florence, as recommended in the report of the former Minister, Peruzzi, and embodied in the contract of the Gonfaloniere with Messrs. Alfieri, Carmichael, Crosswell, and Broda.

**Wiesbaden.**—The English church, the foundation stone of which was laid about two years ago, has now been dedicated, under the title of St. Augustine of Canterbury, by the Primate of Ireland. There was a large attendance. The building is in the Decorated style, with nave and apse, and is calculated to hold 250 persons.

**Tunnel through the Swiss Alps.**—According to the *Italic*, the commission appointed by the Italian Government, to weigh the comparative advantages offered by the St. Gothard, the Splügen, and the Lukmanier for a tunnel through the Swiss Alps, is to finish its report so as to enable the Ministry to bring a Bill into Parliament at the commencement of the next Session. It is reported that the St. Gothard is likely to be preferred by the Commission.

**Berlin.**—According to statistical returns, there are in Berlin 12,000 cellars inhabited, in 6,300 of which different trades are carried on. The thirteenth part of the population, or 46,000 persons, inhabit those dens.

**Prague.**—We assist in making known an invitation addressed by Mr. Vojta Náprstek to "ladies and gentlemen from England, Scotland, and the United States of America, passing through Prague," to inspect a collection of views of 100 buildings devoted to institutions of a moral, educational, and charitable character, erected chiefly in this century, by philanthropic associations, or by the munificence of individuals, in Great Britain, India and Australia, and the United States. The views are executed on a scale of 90 in. by 50 in., and 50 in. by 36 in., by Mr. A. Stindlka, an artist expressly engaged for the purpose. The collection was publicly exhibited in the large hall on the Sophia Island (Zofínský ostrov) at Prague in April, 1865; and public lectures on English and American philanthropy of modern times have been delivered (in the Bohemian language) in the same hall. The collection may be seen now daily—Sunday excepted—from 12 to 2 p.m. at Mr. Vojta Náprstek's private residence, No. 269 betlemský plac, u Halánku, Prague. It

\* See p. 530.

has been formed with the intention to show the citizens of Prague "the mighty and noble influence of liberty on the public spirit of men in a free country," and "what a great number of magnificent works have been achieved by enlightened public spirited communities, by the activity of associations, and by the legions of those self-made men, and by kind-hearted, benevolent, and magnanimous women, actuated by the noblest generosity and purest principle, whose labours and fortunes have been devoted to the sacred cause of humanity." Amongst the subjects are the Froo Public Library, Norwich; the Derby Arboretum; the Manchester Free Library; the School of Art, Sheffield; the Temperance Hall, Birmingham; the Mechanics' Institution, Holbeck; Working Men's Institute, Lower Norwood; Mechanics' Institution, Halifax; Plymouth and Cottonian Library, Plymouth; Travellers' Club House, London (this last may be a "moral" but is not a charitable institution); Eastern Counties Asylum for Idiots, Colchester; Hunterian Museum, Glasgow; British and Foreign School Society's New Training College, Stockwell; Haberdashers' Alms Houses, London; Gordon Hospital, Aberdeen; Peabody Dwellings, London; Aston Park, Birmingham; Cancer Hospital, London; Chalmers's Hospital, Banff; Minton Testimonial Museum, Stokes-on-Trent; Licensed Victuallers' School, London; and others, equally varied as to the objects of the buildings.

*St. Petersburg.*—The Czaritch has commemorated his taking of the oaths by gifts for the relief of distress in Russia, and by a gift of 6,000 roubles as a contribution to the fund for the construction and decoration of Greek churches in the western provinces.

*The Ruins of Girgenti.*—According to the *Athenæum*, Professor Cavallari is actively engaged in excavating in Sicily, and has brought to light some interesting relics—amongst them a number of portions of columns of the Temple of Castor and Pollux at Girgenti, a plan of the temple itself cut in the rock, two columns which formed part of the northern peristyle of the Temple of Jupiter, and the steps of the Temple of Hercules in perfect preservation, besides a large portion of the ruins of the entablature of the same building.

#### PARIS.

The interior decorations of the Odéon Theatre are being completely renewed and much improved. This theatre, says the *Sibde*, erected on a portion of the site of an hotel inhabited by the Princes of Condé, was first opened in 1782, and was the only really comfortable establishment of the kind in Paris, benches having been introduced into the pit, which had been previously only an open space for the spectators to stand in. In 1784, oil-lights were substituted for the ancient candles, by the invention of a lamp by a whitesmith named Quincet, from Soissons; hence the term *quinquet* applied in France to all oil-lamps. In 1790, play-bills and placards announcing the names of the performers were first exhibited at the Odéon. The last innovation there was the lighting by gas in 1822, when it was tried for the first time in a Paris theatre. The Odéon has been twice destroyed by fire, in 1799 and in 1818, in both instances nothing being left but the four walls. Beaumarchais, on the 26th of April, 1784, here represented the "Mariage de Figaro" for the first time, in presence of the Queen Marie Antoinette. So great was the attendance of nobility on the occasion, that the carriages extended in double line as far as the Pont Neuf. Casimir Delavigne also made his *début* here in the "Sicilian Vespers" and the "Paria."

M. Silbermann, brother of the late much regretted M. V. Silbermann, conservator of the collection in the Conservatoire des Arts et Métiers in Paris, has just published a pamphlet in which he proposes novel arrangements with regard to exhibitions in general, and applies them to the forthcoming Paris one of 1867. Owing to the steadily-increasing development of every department of industry, besides the creation of new branches, almost every year, by the progress of science, it will before long be utterly impossible to write in one building, however spacious, a collection representing the art and industry of all nations. He therefore proposes to spread the different branches of art and manufacture over the metropolis, by placing them in separate quarters, so as to convert Paris into a vast mart of the whole world. For

instance, he would place on the Boulevard Richard Lenoir, near the Saint-Martin Canal, all the raw produce; natural and artificial stones; pottery; iron, wood, and zinc work; also the necessary tools for working the above materials. These would occupy fourteen pavilions erected along the gardens. Similar buildings M. Silbermann also proposes to install in the Rue de Faubourg du Temple (enlarged), the Place du Château d'Eau, the exterior boulevards from Belleville to Moneaux, &c. The fine arts are to be placed in the Palais de l'Industrie, in the Champs Elysées; the show of horses in the Avenue de l'Impératrice, the "Rotten-row" of Paris; naval constructions in the Cours de la Reine, along the river side; war materials and implements in the Champs de Mars; flowers and agricultural produce in the Luxembourg, &c.

A Dutch speculator, M. Bischoffshelm by name, in endeavouring to discover the secret which will solve the problem of how to enjoy a theatrical performance while Fahrenheit marks 90° in the shade, has conceived the idea, which he is in the course of carrying out, of a subterranean theatre in Paris. An excavation for this building is commenced at the angle of the Rue Scribe and the Rue Neuve des Mathurins, behind the new opera. This theatre will cost M. Bischoffshelm the trifling sum of three millions of francs, or 120,000 sterling, the purchase-money of the ground being included in that calculation. The theatre will not be completed for two years. The pit is to be 24 ft. below the surface of the ground; the stage will measure 100 ft. in length and 60 ft. in width. There will be a pit and two galleries, which will accommodate 700 spectators. The atmosphere of the pit is to be cooled by several jets d'eau. Five tiers of boxes will rest on the capitals of the iron columns. The façade will be in the style of the Grand Hotel.

#### COLONIAL.

*South Australia.*—Labour is still wanted here. New roads, new railways, new buildings, together with harbour improvements, and a thousand other necessary things, are loudly called for. There is a scarcity of hands even for the everyday work of the colony. The Government wants to import as many as two shiploads of immigrants per month, and the Parliament is quite willing to supply the necessary money. It rests, then, with the emigration agent and his officers to send out the kind of labour needed. Well-to-do people in England, who often see around them wretchedness and want, would be astonished to find what perplexities are felt by governments in Australia to get anything like the supply of useful labour which they require. Free passages to a prosperous country, with a fine climate, are offered to men and women who can work.

*New Zealand.*—The annexed tenders for building a four-roomed cottage, at Auckland, New Zealand, were recently sent in:—

No. 1	£300 0 0
No. 2	250 0 0
No. 3	250 0 0
No. 4	246 0 0
No. 5	226 0 0
No. 6 (accepted)	217 0 0

It will be seen that, like such things at home, the tenders vary considerably in amount. A large public building, in Queen-street, Auckland, in course of erection, and nearly finished, has fallen down. Want of proper ties and bond is said to be the cause.

#### MONUMENTAL.

ACCORDING to statements made at a recent meeting of the Prince Consort Manchester Memorial Fund, the total amount of subscriptions received up to the present time is 3,711. The balance in the bank was 1,943, but the contractors (Messrs. Paterson & Son) having presented a claim for 800. as a first instalment in accordance with the contract, the sum in hand would be reduced to 1,100. The expenditure up to this time had amounted to 1,569, and the contract was 2,639. for the upper part of the stonework and pillars. This made 4,208, and the subscriptions having only reached 3,711, a sum of 500. would be wanted for that portion of the work alone. To do the ornamental part of the work justice, they would require at least other 2,500.; they therefore wanted 3,000. raised. The original estimate for the memorial

proper was about 4,000. The cost of the canopy was estimated at from 4,000. to 5,000. The architect had to go to a considerable depth for the foundation. It was an exceptional case, and 1,000. more had been spent on the foundation than had been expected. Arrangements are being made for a more extensive canvass for subscriptions.

A monument has been placed in Belton Church, to the memory of the late Mr. Cust. The design is an alto-relievo of the "Call to the Ministry" adapted from Raffiello's cartoon of the "Call of St. Peter." Below is the application of the subject to the deceased, who rendered himself remarkable in his ministry for liberality and benevolence. Mr. William Theed was the sculptor.

The statue of the Queen at Aberdeen is making steady progress. The contract has just been entered into for the erection of the pier and pedestal. The statue is to be erected at the corner of St. Nicholas-street, on the west side of the Town and County Bank. A granite pier is to be erected there flush with the pavement. On this pier the pedestal—which is to be of polished granite, Peterhead and Aberdeen—is to stand, rising to a height of upwards of 10 ft. A considerable improvement will be effected in the corner by the erection of the statue, as the pavement will be widened. The height of the statue above St. Nicholas-street will be above 20 ft. The sculptor is Mr. A. Brodie, of Aberdeen.

A statue of the late Right Hon. James Wilson, to be sent to Calcutta, has been completed by Mr. John Steell, R.S.A., her Majesty's sculptor for Scotland, who had executed from life a bust of Mr. Wilson for the Royal Scottish Academy, which bust is now deposited in the Scottish National Gallery. The figure is a little larger than life, and has been cut from a fine block of Carrara marble. Mr. Wilson is represented in the act of expounding some of his schemes. The attitude is erect, the left foot slightly advanced, and over the shoulders is loosely thrown a cloak, which falls in folds to the ground behind. Two fingers of the right hand rest upon the palm of the left—an arrangement which all who knew Mr. Wilson would recognise as a characteristic one. A movement has for some time been on foot in Hawick, Mr. Wilson's native town, for the purpose of obtaining a public statue of the deceased; and the object, according to the *Scotsman*, is likely to be carried out, a copy in bronze of Mr. Steell's statue being the form of memorial chosen.

The foundation stone of a monument to the late Duke of Athole has been laid, with Masonic honours, at the top of a hill in the neighbourhood of Logierait. The monument, which will be visible from a great distance, is to be in the form of a Celtic cross. Mr. Whyte Melville, of Benochy, Grand Master Mason for Scotland, presided. The design was produced by Mr. R. Anderson, architect, Edinburgh; it consists of a massive subbase or mound, the base proper being divided into several stages, the socket of the cross panelled on the four faces, and canopied niches at the corners. From this rises the cross, consisting of a shaft 20 ft. high, 5 ft. broad at the bottom, and 2 ft. 6 in. thick; the head 9 ft. 6 in. high; the arms measuring 9 ft. across; and the nimbus or circle 7 ft. in diameter. The front panel of the socket is to be filled by a bronze basso-relievo, by Mr. John Steell, representing deer-stalking. The panel on the back will be filled with another bronze, representing the Athole Highlanders; and the side panels with bronze plates; with the dedicatory inscription in Gaelic and English. On the front and back faces of the shaft are six panels, to be filled with figure subjects illustrative of the pursuits of the late duke. These will probably be masonry, agriculture, otter-hunting, cutting, Highland games, and fishing. The whole remaining surface of the cross will be covered with the ornamentation peculiar to Celtic monuments. The cross and base are to be of Redhall stone, and the foundation of stone from a neighbouring quarry. The cost of the monument, exclusive of the bronzes, will be about 1,500.

A statue of Christine Lalaing, Princess of Epinoy, who defended Tonray against the Prince of Parma, in 1581, and did but capitulate when three-fourths of the defenders had fallen, has been placed, says the *Athenæum*, in the Grande Place of the city she served so well. The figure wears back and breast plates and a short tunic; the head is bare. The execution of this work is a little heavy, after the fashion of modern Belgian sculpture.

THE BUILDING TRADES.

On the principle that no news was good news, everything had been proceeding smoothly in the metropolis for the last week or two, but some of Messrs. Cubitt's laborers and excavators have now struck work for 1d. an hour advance; 1d. only being agreed to; the remainder also threaten to strike. — The *Fortnightly Review* has been urging, on the one hand, the worse than uselessness of strikes, and the very doubtful utility of trades unions; while an advocate of both strikes and unions, on the other hand, has been upholding the utility and advantage of both to the working men; but we need not re-enter on these often-discussed questions just now.

On Saturday evening a meeting of journeymen pattern-makers was held at Wilcock's Assembly-rooms, Westminster-road, to take into consideration the propriety of memorializing the master engineers for an advance on the present rate of wages—36s. per week. About 400 men were present. A report was read from the provisional committee stating the present movement to have originated from a united meeting of society and non-society men connected with some of the principal engineering firms. After some discussion, a resolution was adopted unanimously declaring it to be the opinion of the meeting that the time had arrived when an advance on the present rate of wages had become necessary. A second resolution was also adopted—that the advance to be asked for should be 8d. per day, which would make the standard wages of the trade 27. per week. A memorial to be presented to the employers was then read, setting forth the reasons inducing the men to ask for the advance; amongst the most prominent of which were that wages in other trades requiring less skill were generally advancing; the high price of animal food, and other provisions; and the increased cost of house-rent, &c. This memorial was unanimously agreed to, and a committee was appointed, with instructions to present it to the master engineers at once, and to request a reply by Saturday, the 26th instant. The meeting then adjourned to the 26th, to receive the reply. The proceedings throughout were conducted with order and unanimity.

*Norwich.*—A meeting of the delegates of the carpenters and joiners has been held, in order to consider the present low wages in Norwich as compared with other large towns; and it was unanimously agreed to apply for an advance of 1/2d. per hour, viz. from 4 1/2d. to 5d. Circulars have been sent to the masters.

*Shrewsbury.*—The journeymen plumbers are out on strike. They seek a reduction in the hours of labour from fifty-four to fifty-two hours per week, having, it is said, received a written assurance from their masters in autumn last, when the hours per week were reduced from fifty-nine to fifty-four, that the further reduction now sought would be granted when a contemplated reduction sought by the joiners and carpenters should be obtained. Such a reduction has since been got. The bulk of the master plumbers decline to concede any further reduction, on the ground that the deputation representing them in the autumn went beyond their authority in making the promise of a conditional reduction.

*Huddersfield.*—The strike among the masons still continues. A meeting of the operative and master masons—convened by the latter—has been held, with a view to settle the strike which has now existed for three months. Masons' labourers were not admitted. It was stated that the masters had conceded nine out of the ten demands which had been made upon them, but though they had conceded the demands with regard to the regulation of time, the amount of wages, the payment of wages, &c., they could not concede the tenth request or regulation, which was, "No master to have more than one apprentice to five journeymen masons that he employs on an average." Very strong opinions were expressed against this clause, and it was even alleged that if the workmen in every other trade in Huddersfield enforced a like regulation, there would be something like 3,000 youths in Huddersfield who would not be allowed to learn any trade. The meeting ended without having arrived at any decision. A meeting of the Master Painters' Association has also been held, to consider what reply should be given to a letter from the Operatives' Association in reference to the strike, which has also now lasted for three months. The letter from the operatives stated that they had written to the Chamber of Com-

merce, offering to submit the dispute to the arbitration of the Chamber, and had received a reply to the effect that the Chamber would act in the matter if both parties in the dispute consented to abide by their decision. They now wrote to the masters to know if they would accede to that mode of terminating the dispute. The decision of the masters' meeting was, that present circumstances do not admit of arbitration—firstly, because they have sufficient men for the work now in hand; and, secondly, because the amount of work for the rest of the year is likely to be inconsiderable. A letter, stating this decision, has been forwarded to the Operatives' Association in reply to their communication.

*The Nailers' Strike.*—A number of the nailers on strike have gone to work, at the reduction proposed by the masters, of 10 per cent. on their earnings. The strike is therefore considered to be at an end, in effect, if not in fact.

*North Wales.*—A strike has taken place of quarrymen employed at the Penrhyn Slate Quarries, belonging to Colonel Pennant. Five hundred of the men have left their work, and 3,000, it was said, would be out before the close of last week. The men are holding public meetings, and they complain of having had to suffer great hardships.

*Paris.*—According to Government reports, the strikes of the various trades have ended in Paris and other large towns of France. In most instances master and man have come to an arrangement by compromise. The increased price of food and lodging was a legitimate excuse for the workmen of many trades to demand increased wages; and the masters were reasonable, and took these pressing facts into consideration.

THE PROPOSED BUILDING FOR ST. THOMAS'S HOSPITAL, LAMBETH.

In answer to a request for the dimensions of the total length and depth of the buildings and site of the new St. Thomas's Hospital, which dimensions were not given in our recent description, and only some of which could have been conveniently shown on our plan, we now supply sufficient information. The ground terminates next Lambeth Palace in a point; and the total length between this point and Westminster Bridge is 1,700 ft. This is made up of three dimensions, 151 ft., 942 ft., and 607 ft. The first dimension belongs to the administrative block next Westminster Bridge; the next or largest dimension is the hospital proper; and the last dimension provides the site for a museum, which was not included in our plan. The boundary of the ground in Palace New-road and Crosier-street is very irregular; but the depth of the ground in the centre of the 942 ft., or where the building with the entrance-hall is, is 257 ft.; and the depth at the Westminster Bridge end is 220 ft.; whilst it is 190 ft. at the opposite or southern end of the hospital proper.

THE RIVER THAMES.

The report of the select committee on the Thames, together with the proceedings of the committee and the minutes of evidence, has been issued. The total income of the Thames commissioners for the past year was 3,173*l.*, and their expenditure 3,200*l.*; and it is added, that unless the requisite funds be provided to improve the navigation, and the traffic be encouraged by low, uniform tolls and otherwise, the income must continue to decrease, and this important navigation be shortly closed to traffic. "The maintenance of the navigation is," it is discovered, "a benefit to the large water companies of London, to the water supply of Windsor Castle, to many mills and manufactories, to landowners, and others." Engineers of great eminence, who were examined before the committee, have all agreed that a sum of 20,000*l.* should at once be expended upon the works. The difficulties of the case can, it is remarked, only be met by legislation. The report concludes as follows:—"Your committee have examined many competent witnesses as to the future management, improvement, and maintenance of the navigation of the river, and have agreed to the following resolutions:—1. That the maintenance and improvement of the upper navigation of the River Thames is important, and that all prac-

tical steps ought to be taken to render it self-supporting. 2. That the navigation of the Upper and Lower Thames should be placed under the same management. 3. That this management should be in the hands of the 'Conservators of the Thames,' with such addition to their number as a due regard to the proper representation of the local interests of the upper navigation may require. 4. That no tolls or charges shall be levied on the upper navigation which is not applied to its support. 5. That all existing works, rights, and charges injuriously affecting the upper navigation shall be put an end to upon such terms as to compensation as Parliament may determine. 6. That separate accounts shall be kept in respect of the upper and lower navigations, and that power should be given to make the revenue arising from the lower navigation a collateral security for moneys raised for the purposes of the upper navigation. 7. That all fishing rights be so exercised as not to interfere with the navigation of the river. 8. That powers be given to raise the money necessary for the above purposes, such money to be the first charge on the revenues of the upper navigation; such powers being given for compounding with the existing bondholders as Parliament may determine. 9. That a bill be introduced by the Board of Trade to give effect to the above recommendations."

TOWN-HALLS.

*Chester.*—The town council, at their last quarterly meeting, after a long discussion, adopted the report of the Town-hall Committee, recommending the carrying out of Messrs. Lynn & Lanyon's design, "Love's Labour," and the acceptance of the lowest tender (Messrs. Clarke's) for carrying out the design. The committee having recommended that the design be carried out without the tower, the drawings exhibited on the walls which included the tower were removed before the discussion commenced. The question of the new town-hall has now been between two or three years before the council.

*Hartlepool.*—The foundation-stone of the new Borough Hall at Hartlepool, including police-offices, covered-in market, &c., has been laid. The new erections front Middlegate, and the Borough Hall, as they are entitled, is a structure of red brick, with stone facings and moulded dressings, after the modernised Italian style of architecture. In the centre of the buildings is a tower, 16 ft. square, surmounted by a spire, and at an elevation of 100 ft. from the ground, under which is the main entrance both to the market and hall. In the spire there is provision for an illuminated clock and a peal of bells. There are eighteen conpled windows in the front of the building, and they are relieved with ornamental headings. Accommodation is provided for both superintendent and sergeant of police, a police-office, six cells, and a large yard. Above, there is a justice-room, 55 ft. by 27 ft., with ante-rooms and offices for magistrates' clerk; also a large Board-room, with several offices, for the local Board of Health. Behind the building is the market, which is 100 yards square, covered in with three glass roofs. There are sixteen large shops, and there is an entrance from Union-street. The total cost of the works will be 5,000*l.*

*Gateshead.*—The members of the town council seem to be puzzled about their new town-hall. They all agree that a building of the kind is required; indeed, any doubt on that point has been set at rest by the council having had notice for the last two years to quit the premises they now occupy. At first it was intended, that the building should be erected at a cost not exceeding 10,000*l.*, the desirability of doing the work as economically as possible having been forcibly impressed upon the members, at that time, from what they had seen of town-hall building in Newcastle. By-and-by, a change of site was determined upon; and, with a change of site, came a change of plans; and, after a great deal of higgling, the project assumed such proportions, that to carry it out would entail a probable expenditure of 30,000*l.* In the meantime, the foundation has been dug for the new building, and the total outlay up to the present time has been about 4,000*l.* In order that the enlarged plan might be proceeded with, an attempt was made, at a recent meeting of the council, to dispose of the resolution restricting the cost, but it met with such opposition that, in the end, the proposal was rejected.

FIG. 2.

OLD CHURCHES WITH GALLERIES.

FIG. 1.

W. B. WOOD.

ENGINE-HOUSE, CROSSNESS: OUTFALL OF THE SOUTHERN METROPOLITAN SEWERAGE.  
ERECTED UNDER THE DIRECTION OF MR. BAZALGETTE, ENGINEER OF THE METROPOLITAN BOARD OF WORKS.

**THE ENGINE-HOUSE AT THE OUTFALL OF THE SOUTHERN METROPOLITAN SEWERAGE.**

We publish this week a view of the Engine-house which is erected below Crossness Point, at the Outfall of the Sewerage of Southern London. In the same view, a portion of the boiler-house appears; but there are other buildings for purposes of storage and residence; these are grouped around a garden, which is laid out in the area over the reservoir. As may be gathered from the view, there is considerable effort after decoration in coloured brickwork, and carved and incised stone-work. Whether the general character, and the detail, are the best adapted to the site, may be a question on which there would be opposite opinions. The work, both in the building and the chimney, has been admirably well executed by Mr. Webster, under the direction of Mr. Bazalgette, and his assistants Messrs. Grant and Houghton. The buildings at the Northern Outfall, comprising chiefly the penstock-house and residence, have much less elaboration of detail than those of the Southern Outfall. It will be recollected that there, there is no pumping machinery. We contemplate completing shortly our particulars of the London sewerage, and then we shall be able precisely to explain what are the arrangements of the reservoir, outfall, and pumping machinery for the southern division of the metropolitan system.

**THE THAMES EMBANKMENT.**

PEOPLE are looking forward with much interest to the time when this great work will be thrown open for the public use; and if it answer present anticipations, it will then become one of the most popular of the lungs of the metropolis. The Rev. Sydney Smith said, "Blessed is the man who builds a red brick house," and our climate may perhaps require a slight dash of colour, whilst, in sultry climates, a building constructed of white stone, with small openings, deep porticos, columns and colonnades, and overhanging cornices, is a positive luxury to look at in the bright sunshine.

Passing the embankment the other day in a steam-boat, I observed a small portion, near Whitehall, open to the river; and the idea then occurred to me that, even now, in this warm weather, the effect was unsatisfactory. The muddy Thames has itself, at all times, a sombre aspect, unless where it flows between green banks and spreading trees; but the cold grey granite has no contrast to relieve the eye; it appears like a solid continuation of the water, and will, by the wash of the tide, more and more assimilate to the colour of the water.

It is too soon to say anything about the street; but when formed, I trust its ample width will afford space for a double line of trees, which ought to have provision for growth in a strip of gravel along the footway, some 3 ft. from the kerbstone. The footway ought to be at least 20 ft. in width. J. W.

**RAILWAY MATTERS.**

The directors of the Great Northern Railway Company state in their report that the through route between the Great Northern and London, Chatham, and Dover Railways, will very shortly be opened. The gross traffic receipts for the half-year ended June 30, amounted to 910,335l., against 833,814l. for the corresponding half of 1864, showing an increase of 76,521l. The gross expenditure amounted to 479,404l., against 441,453l., showing an increase of 37,950l. The excess of receipts over expenditure amounted to 430,931l. for the past half-year, to 392,361l. in the corresponding half of 1864, showing an increase of 38,570l. The balance available for dividend on the original A and B stocks was 151,558l., against 134,721l., showing an increase of 16,837l. The balance would yield dividend at the following rates, viz.—On the original and new ordinary stocks at the rate of 5l. 10s. per cent. per annum, giving on the half-year 2l. 15s. to the original stock, 3l. to the B stock, and 2l. 10s. to the A stock, leaving a balance of 373l.

The belief is general among the commercial and trading community of Hull that a proposal has been made for the transfer of the Hull Docks to the North-Eastern Railway Company. The principal ship-owners and merchants view this

with great alarm, and the town council has referred the matter to a committee to inquire and report to the council how far any such transfer will be for the advantage of the trade and commerce of the town.

At Crewe the London and North-Western Company are erecting a building near the rolling mills, to be used as dining-rooms and baths by their workpeople. An iron church, the gift of one of the shareholders, is being put up on the Edleston-road; and the directors contemplate the erection of another church of a more spacious and suitable character.

The traffic receipts of railways in the United Kingdom amounted, for the week ending the 5th of August, on 12,154 miles, to 766,285l.; and, for the corresponding week of last year, on 11,801 miles, to 742,205l.; showing an increase of 353 miles, and of 24,082l.

Is a railway a building or an erection? was one of the questions in the case of Lloyd v. the London, Chatham, and Dover Railway Company, where the company, for the purpose of constructing its line, entered into an agreement with the plaintiff for the purchase of certain lands belonging to him, and in the conveyance covenanted not to raise "any building or erection" of more than a certain height within a certain distance of the plaintiff's property. The agreement contained, after the words "building or erection" the words "except the said railway," but these latter words were not in the deed of conveyance. It was, however, held by the Lords Justices that the railway itself was within the terms "building or erection."

It appears from official statistics relating to French railways that the viaducts over which they run, taken altogether, are more than seven leagues in length. One of the most remarkable of these viaducts is that of Val-Fleury, near Mendon, built in 1840. It is 140 yards long, 31 yards high, and cost 600,000f. The viaduct of Chaumont, on the Strasburg line, is the first in point of expense, as it cost 5,800,878f. There is a remarkable viaduct at Mirville, on the Western Railway, which cost 2,300,625f.; and the viaduct of Brunoy, on the Lyons line, which cost 1,540,000f. The tunnels of all the railways in France are 366 in number, and would, if combined, measure 37 leagues in length. The longest tunnel is that of the Nerthe, near Marseilles, on the Lyons Railway, which cost 10,500,000f.; that of Blaisy, on the same line, cost 8,900,000f.; and that of the Credo, between Lyons and Geneva, 6,500,000f. The entire cost of the bridges, viaducts, and tunnels on the various French railways amounts to 432,651,953f. The Government and the railway companies have expended on the railways now worked a sum of 5,500,000,000f. The cost of bridges, viaducts, and tunnels amounts to 8 per cent. on the whole.

SIR,—I have just seen it stated in your last number, that I am the architect of the new High Level Station at the Crystal Palace. I shall feel obliged if you will allow me to correct this error. The new station has been built from the designs of Messrs. Banks & Barry.

EDWARD M. BARRY.

**EAST LONDON EXHIBITION.—CLOSING CEREMONY.**

THE working classes' industrial exhibition, which has for some weeks past been held in St. Mary's School, Whitechapel-road, was formally closed last Saturday afternoon. During the time the exhibition remained open it was extensively patronized by the industrial classes of the surrounding districts; and all connected with the exhibition are well satisfied with the results.

On the occasion of the ceremony on Saturday, the large room in which the exhibition has been held was quite crammed with visitors. The Tower Hamlets Engineers and their band attended. The Earl of Shaftesbury was to have presided, but was prevented attending in consequence of the death of the Dowager Countess of Shaftesbury. Mr. Ayrton, M.P., took the chair.

The proceedings having been opened with prayer,

The Rev. Mr. McGill gave an interesting sketch of the origin and results of the exhibition. They would have a balance in hand, although it might not be very large. The amount contributed to the prize fund would nearly cover the price of the thirty silver and hundred bronze

medals which would be distributed, as well as the expense of the die, manufactured specially for the occasion by Messrs. Pinches.

Mr. Webb, honorary secretary, read a short report. It stated that the total number of working people who visited the exhibition was 40,000.

Mr. Ayrton, M.P., previous to distributing the prizes, delivered a brief address. He referred to the great good which the industrial classes' exhibition movement had accomplished throughout the metropolis. There was no doubt about the interest which the working classes took in such exhibitions, and the effect produced upon them had been of a most gratifying kind. He only hoped that these fruits might be of some service in teaching the trustees of the British Museum and other similar institutions how beneficial it would be to the working classes if the national collections were allowed to be open to the public during the week evenings. When so much good had been accomplished by means of these district exhibitions, it was natural to suppose that if the working classes were allowed to spend the hours they had at their control during the week evenings in such a place as the British Museum, it would be productive of immense advantage to them in many ways. He trusted, therefore, that the success of these local exhibitions would have the effect of opening the doors of the national collections to the working classes of the metropolis. After explaining that the medals about to be distributed were to be awarded to amateurs engaged during the day at hard work, and who devoted their spare hours to the cultivation of fine arts, mechanical productions, models, and other matters, Mr. Ayrton proceeded to present the prizes to the successful competitors, amongst whom were several ladies, and in every instance delivered a few well-chosen words of congratulation and encouragement.

A vote of thanks to Mr. Ayrton and to the secretary (Mr. Webb) concluded the proceedings. The exhibitors were to dine together on Thursday evening.

**THE EXHIBITION ERA.**

INDUSTRIAL exhibitions, after having long laid claim to historical notice, may be fairly said to have become the exponents of modern history. It is somewhat singular that the nation in which they first originated, and the age upon which they dawned, were warlike. Napoleon was caressing the astronomer Oriani, at Milan, when the Marquis d'Arveze began to inspect the factories of Paris. On visiting the French manufactures at this time, most of the workshops were found deserted. The artisans had been in a starving condition for nearly two years, while the warehouses were full of the results of their labours; and no commercial enterprise came to relieve the general embarrassment. In 1801 Napoleon, who was then the First Consul, as a member of the Institut, accompanied by Berthollet, Monge, and Obaptal, visited the workshops and great factories of Paris, Rouen, Lyons, Milan, Brussels, Liège, and Aix-la-Chapelle, stimulating all to progress, and distributing rewards.

In keeping with the reign and character of Napoleon, everything that was undertaken at this time concerning the promotion of art and manufactures, was intended only to give France a sort of pre-eminence above the other nations by which it was surrounded; and genius began to confer all those qualities upon the country, which nature had not given to its people. There was, however, at the same time abroad, a spirit of love and activity, whose desire was not to confine the destinies of men within certain boundaries; but, striving to animate all with a fervid identity of thought and feeling, instead of a project for the separation and exclusion of races, it sought, without self-interest, to call all the orders of society together. Napoleon succeeded in pulling France up to a standard of civilization that had already been reached and passed by other nations; and to one it was reserved to watch and restrain others in their path: thus when Napoleon was carrying out sound measures tending towards the general prosperity of his country, he received encouragement from all sides; and it was only when, forgetting what was permitted by history, his motives became of a personal character, that it appeared he could no longer be safely entrusted with the fortunes of men. In 1851, Prince Albert, who was then President of the

Society of Arts, at a banquet given by the Lord Mayor of London to the municipal authorities of the United Kingdom for the purpose of promoting the first International Exhibition, delivered an address the spirit of which must move mankind until the wishes from which it originated are realised.

"Gentlemen," said the Prince, "I conceive it to be the duty of every educated person closely to watch and study the time in which he lives, and, as far as in him lies, to add his humble mite of individual exertion to further the accomplishment of what he believes Providence to have ordained. Nobody, however, who has paid any attention to the particular features of our present era will doubt for a moment that we are living at a period of most wonderful transition which tends rapidly to the fulfilment of that great end, to which, indeed, all history points, the realization of the unity of mankind,—not a unity which breaks down the limits, and levels the peculiar characteristics of the different nations of the earth."

Such is the only spirit that could bring about important and desirable changes in society; and, whatever was wrought by the French Revolution in the shape of humanity and brotherhood, it was less than could have been effected by that strength and kind of genius which called up and made the Exhibition of 1851 a reality. Here it was that the prejudices of race began to subside, and the light of a new revelation commenced to break over the world. Whatever religion or philosophy had not as yet succeeded in rendering intelligible, was made more clear by contemplating the inequalities of nature which were met together.

In 1834, M. Boncher de Perthes, president of the Société Royal d'Emulation of Albeville, proposed an *Exposition Universelle*, in a paper read by him before that society; but the policy of France seldom honestly extended beyond its own boundaries, and it was seldom of a nature that would incline the country to make any concession to foreigners. After the first Great Exhibition in 1851, came the Cork Exhibition in the following year. Two were started in 1853,—one in New York and one in Dublin,—both of these being universal or international exhibitions. The New York Exhibition was a private speculation, and was not a commercial success, owing chiefly to a long delay in the opening caused by the building not having been finished. In 1854, a splendid Exhibition building was erected at Munich; and the character of the structure, differing widely from all the buildings hitherto used for the same purpose, may be worthy, perhaps, of a passing observation. Generally, an immense dome, formed of curved groin ribs, filled in with glass, was erected, so as to form some portion of the roof; but, in the Munich Exhibition, scarcely a curved line could be anywhere detected. The doors through which ingress was had to the building were plain vertical parallelograms; but in the Paris Exhibition, which took place in 1855, the entrance itself was capable of re-awakening some of the grave and beautiful recollections of antiquity. There was an Exhibition in 1857 in Manchester, and one in Florence in 1861, which brings us to the period of the last Great Exhibition in England in 1862. An International Exhibition is now open in Dublin, the building being probably the most modern and extensive structure of the Victorian style of architecture. The Amsterdam Exhibition building, which is constructed in the same manner, and by the same engineers (Ordish & Le Penve), although not yet open, was fully erected and ready to be opened last year. There is now contemplated a magnificent exhibition in Paris, for 1867, which is intended to eclipse all its predecessors. FIELD MEAGHER.

#### ROYAL STRAND THEATRE.

THE roof of this theatre having been found to need repairs, a new roof is now proposed to be carried over the entire span, so as to render the auditorium some 10 ft. higher than at present; also the galleries and boxes are to be partially rebuilt and improved, and the whole of the interior is to be cleaned, painted, and re-decorated, preparatory to reopening the house at the end of September. Mr. C. N. Foster, of Whitefriars, is the builder; and Mr. John Ellis, of Austinfriars, is the architect under whose direction the works are about being carried into effect.

#### SCIENCE AND ART.

STRIPPED and swift is the progress of Science,  
She, scattering prejudice, nature explores;  
With the purest desires of the mind in alliance,  
She scans the unseen and Time's fathomless shores.

In vain superstition, with fetters enchaining,  
Would shackle her footsteps, or limit her course;  
In the conquests of intellect reason is calling,  
And knowledge and wisdom are one in their source.

And Art has her triumphs, as mighty and splendid  
She gathers the products that industry bore;  
And, induction's long chain of experiments ended,  
She brings forth a beauty not obvious before.

In Art and in Science exists no dissension;  
As the hilt to the sword, as the cord to the bow;  
Nor Science is lovely where wanting is Art:  
So Science and Genius unite in communion.  
Both facts to elicit and grace to bestow.

There is harmony ever, unseen, unsuspected,  
In the forces of Nature, the powers of the mind;  
And when by the counsel of talent directed,  
The soul of the student that union shall find.

Nor Art without Science has risen or flourish'd,  
Nor Science is lovely where wanting is Art:  
They are flowers of one stem, by one influence nourish'd,  
Twin rays from one sun, of one system a part.

Man makes by his ignorance, folly, or daring,  
A seeming repulsion, where Nature has none;  
Each chord of the spheres in one key note is sharing:  
The notes of creation are concord alone. W. R. COOPER.

Working Men's College.

#### ON THE NEW CROSS AT CHARING.

DEAR to the shareholders, this cross  
Uplifts its head on high:  
"Why stands it there?" the critic asks,  
And Echo answers, "Why!"

"Carissima croce! che fatte là?"  
"Non so, car' amico, en verità." Q.

#### CHICHESTER CATHEDRAL.

SIR,—Your correspondent "A. Z." in his remarks on the "Iron bars which tie the four arches at the springing," seems to be under a misapprehension in supposing that they are intended to be permanent. Will you allow me to correct this impression? The tower and spire, in its reconstruction, are built alone and without any of that lateral support which in a new building would be afforded by the walls of the nave and transepts to the abutments of the main arches. These ties, then, have been introduced at the springing in order to give additional security to the work; and when the junction of the walls uniting the new with the old work shall have been effected, these ties will be removed. Again, he may be under no fear as to exfoliation, as the ends of these ties, which are cramped into the stonework, are made of wrought copper, these cramps being connected with the iron ties by means of dovetailed ends or notches, thus allowing of their easy removal without the least disturbance of the stonework. The masonry is most admirably executed, and not the slightest settlement can be detected in any part of the work.

I do not see that the comparison of the Chinese tailor is at all applicable in the case of the ties; but, sir, if we go back to the previous number of the *Builder*, and read the strictures of "F. S. A." on the reconstruction of the tower and spire, the comparison is most apposite. I rejoice to find that your own protest is entered against what may truly be termed Chinese copyism. All lovers of the glorious remains of the Gothic period left to us in trust for future generations by our forefathers, must admire the conservative spirit which has actuated the eminent architect in the numerous restorations entrusted to his skill; but, sir, I am not so clear that future generations will view with equal favour the reconstruction of our cathedral tower and spire. Restoration and reconstruction I venture to look on as differing very widely from each other.

Nothing could be more beautiful than the general effect and exquisite outline of the spire as seen from all points of the surrounding country; but surely there could be no reason why the general effect, and all the beautiful features of the old work, should not have been preserved without adopting a slavish and servile copy of the former building; servile, indeed, even to the extent of reproducing manifest blunders of the old craftsmen. Your own remark that the "carved ornaments would be the better for a little extra force," refers, I presume, to the exterior; and now that some of the worst features of the old work (viz., the battlemented parapet and the four corner turrets) have

been reproduced in all the nakedness of new stone, your remark applies with additional force. "F. S. A." invokes your influence to withstand the resolution to carry the same Chinese ideas into the interior, and to prevent the reconstruction of the vaulting under the lantern. I am pleased to find that this question is seriously entertained by some members of the committee; but I fear their influence, without other additional pressure, will fail to overcome the strict laws of copyism adopted by the few into whose hands the management of the work has merged. The eminent architect would, in all probability, plead his instructions; but surely, sir, in placing the work in the hands of one who stands deservingly in the very front rank of his profession, we might have expected something which would have stamped the work with some features of originality, and shown to future ages that a master-mind had directed the work. I can scarcely think that this servile copyism can be any more to the taste of the great master of Gothic, than being compelled to design a Palladian Foreign Office. I know that, his multifarious occupations render it impossible that all his works can receive his personal attention; but, then, rather than take a course only to be defended on the supposition that we have no architect in our day capable of producing aught but a copy, let the work pass into the hands of some talented but less occupied *conférite*.

It is too late to alter what has been done; but the idea of leaving open the lantern is far too valuable to be lightly rejected. Contrast in the mind's eye the crude nakedness of the projected vaulting, and the feeling of depression produced by the long, unbroken line, with the lofty grandeur of the tower, vaulted over or ceiled at its full height,—the walls, perhaps, covered with mural enrichment,—the windows filled with stained glass, "showering down its radiance" on the marble floor beneath,—and, sir, if we have (and I know that we have) some fully capable of making this contrast, let them give expression to their feelings; and if they succeed in saving us from further copyism, they will be entitled to the thanks of the citizens and of all future visitors to our small but beautiful cathedral. Give us, also, your valuable assistance; and you will add to the debt already due to you for giving the matter the publicity afforded by your journal.

You ask, "Where are the pictures which formerly lined the walls of the south transept?" They were much, and I fear irreparably injured by the fall; but the remains were carefully packed away, and their restoration will be a matter for future consideration.

CIVIS CICESTRENSIS.

#### SHERBORNE ABBEY CHURCH.

In our last number we gave a report of Professor Willis's paper, read at Dorchester, on "Sherborne Abbey Church." On the following day the members of the Archaeological Institute visited Sherborne; when Professor Willis pointed out the features of the building in the structure itself. Commencing outside, and opposite the great west window, he said, as reported in the *Sherborne Journal* and other local papers:—

They would remember that he had told them there were traces and fragments at the west end of the church that indicated the existence of an older church. They would see on the face of the wall fragments of what appeared to be piers, with a wall connected with the lower part of the sills of the window, in a way that was rather peculiar to this district, and of which he should have to show them specimens inside the building. At the west end was a manifest remnant of an arch, with highly decorated mouldings; another, though not so perfect, was to be seen near; on the other side of the great west door there was a third; and finally there was a fourth; and although these responds were not apparently connected with the wall, yet if they went on the other side they would see there was originally a pier-arch passing through the wall, so that he was emboldened to think that was the remnant of an arch opening into some kind of turret. These indications authorised him in saying, that we had here a church with three aisles, of which the centre one was a continuation from the minister, and of six bays. He next pointed out a doorway, which was originally bounded by a Norman arch, and led into this church of All-Hallows; but it was now bounded by a pointed arch, which had reduced its width; and this coincided exactly with the grievances of which the parishioners complained, and which led to the great quarrel and riot which he spoke of in his lecture yesterday, and which resulted in the burning down of the east end of the church and the tower. That, he explained, had been rebuilt; and subsequently the nave, which did not appear to have been damaged by fire, was also rebuilt, and so brought into harmony. The perpendicular windows and doorway were the result of that rebuilding. The first difficulty which would strike them was, how such a window and door could have been introduced in the west front when he had been telling them that the church was terminated by a chief central aisle.

that estimates had been taken for the execution of the building according to Mr. Gilbert Scott's plan. The work had been divided into three sections. The first, containing the free library, and great hall and entrance-hall, had been offered for 15,485*l.*; the second section, containing reading-rooms for ladies and gentlemen, and the private library of the Institute, 2,257*l.*; and the third, the external staircase to the great hall, 1,212*l.* The report having been read, the chairman produced a letter which he had received from Mr. Edward Baxter, of Kincaldrum. In this Mr. Baxter stated that, presuming the shareholders would sanction the proposal of the directors to proceed with the first section, his sisters and himself would undertake the payment of the external staircase, which he considered very necessary, with the carving on the door of the great hall. The estimated cost of these is about 1,250*l.* Mr. Sturrock then proposed that the report of the directors should be approved of, although he would have preferred to see the whole works carried out and the building completed. The proposal was agreed to. Sir David Baxter proposed that a committee should be appointed to obtain additional subscriptions for carrying out the entire work. He did not think there would be any difficulty in raising the additional 3,000*l.* still required. The motion was agreed to, and a committee appointed for that purpose.—Extensive additions to the Tay works of Messrs. Gilroy, near the prison, have been erected. The new additions have a frontage of about 210 ft., and this will be considerably added to when the old mill, which stands between the new building and the large mill on the north, is pulled down, and another rebuilt on the site. At present the new building has the appearance of a long range, with a wing at the end. This end, however, will be the centre of the new structure. In the centre of it, on the ground flat, is a large arched doorway for the entrance into the court. The shape of the arch is elliptical, with a carved keystone. On each side of this are two windows with segmental arched heads. Above these run a moulded string cornice. Starting from this are the windows of the second floor, which are square-topped, with friezes and pediments above. Small pilasters are also carried up on each side, finished with ornamental trusses, around which the lower members of the cornices are broken. The upper windows have raised margins, and semicircular tops. The windows, however, are square-topped, the semicircular part being filled in with carved shells. Surmounting the whole is the cornice, from which a pediment is raised, the tympanum measuring 45 ft. long by 12 ft. high. This is to be filled in with elaborate carving. The site of what used to be the terminus of the Newtyle Railway is also fast being built upon. This is also to become part of the Messrs. Gilroy's works, and is to be employed as a warehouse. It will extend from Ward-road to West Bell-street, and will be in the form of the letter L. To give some idea of the size of this warehouse, we may mention that each flat will be considerably larger than twice the size of the Corn Exchange Hall. On each of the ground and first flats there will be 110 iron columns. One of the rows of these is carried to the top to support the roof, which will be M shaped, the water from the gutter in the centre being carried down inside the iron columns. The stone blocks for numbers of the iron columns will be founded on piles.

#### FROM IRELAND.

*Sligo.*—The contract for a town-hall for Sligo has been given to a Dublin builder.—According to the local *Champion*, this town has the misfortune to be ruled by life-elected commissioners; and one result is, that the utmost neglect prevails as to all sanitary requirements.

*Derry.*—Property to the value of about 15,000*l.* has been left by the late Mr. James Brooke, of Brookhill, near Derry, for the establishment of a people's park in the vicinity of this city.

*Kells (county Meath).*—A writer in the *Meath Herald* calls attention to the disgraceful state of this town. With regard to sewerage, he remarks, "I found house-drains universally absent, cesspools being the only means for the deposit of refuse, and even these were only in the better premises; for in the poorer there were no arrangements whatever for the deposit or removal of refuse, the ground at the rear being shockingly foul, and filth being heaped before the door as abundantly as before any Connaught hovel. All the sewers lead to the north-eastern

end of the town towards the river; but instead of running thereto, they discharge into open gorges surrounding the town within some twenty or thirty yards. The water supply is entirely by pumps, sunk very superficially; and in the case of that on the Fair Green, merely as far as a large mass of stagnant water near the surface. Health, of course, suffers, and fever prevails." Sewerage and water supply, therefore, are urgently requisite; and it appears there is not want of means.

*Navan*, according to the same writer, is but little better; but as the town is hilly, and the Boyne and Blackwater course through the town, there is a system of natural sewerage. Lanes of hovels and lodging-houses are more numerous than in Kells, and epidemics of fever are severely felt. Its annual death-rate for the first quarter of this year has been fearfully high, namely, one in every thirty-five of the population. In the Trim superintendent registrar's district, which includes two or three large towns, the rate has been one in every forty-nine of the population. If other Irish towns are circumstanced similarly to those in county Meath, there seems to be urgent necessity that the Government should procure the extension of the Public Health Act to Ireland; or that the Board of Works should be empowered to conduct the sewerage of Irish towns in which official inspection or death-rates indicate that it is imperfect.

#### MINIATURE OF CROMWELL.

As supplementing our recent article on portraits of Oliver Cromwell, we give the following from *Notes and Queries* :—

The Exhibition of Miniatures leads me to inquire if any of your correspondents can give information respecting one of Cromwell, of which I heard West, the president of the Royal Academy, speak with the highest enthusiasm. The anecdote relating to it was to me curious and interesting, and must no doubt be known to many, who may be able to correct mistakes, and apply the blanks which I make, as I write from memory after the lapse of many years. West, when painting, I think, the "Dissolution of the Long Parliament," was most anxious to see authentic portraits of Cromwell. He heard of a miniature in the possession of — (one of the Russell family). She was an old lady, very infirm and bedridden; but Lord — Russell offered to mention his desire to the lady. Great objections were made, and many communications took place; at last the lady consented, on the specific condition that all present should be in court dress. "This," West said, "was to me a serious difficulty, as from national feeling I have a special aversion to that costume; but the condition was absolute, and rather than lose a sight of the portrait, I consented to put on the sword and other paraphernalia. On the appointed day I found that the carriage had been sent to the bankers', where the miniature was deposited, the servants being put in full costume, as if going to court. When I arrived at the house, I was ushered with great state to the room, where I found the lady propped up in bed, with her head dressed with plumes and jewels, as if going to a drawing-room." The box was opened, and she gave him the miniature. After some remarks, he expressed his admiration of it, and said it was by far the most expressive portrait of Cromwell he had . . . Upon this the lady stretched out her arm, seized the miniature, and covered it up. The first impression of West was, that the lady was seized with a fit of derangement; but he begged to see the portrait again: she was evidently much excited, and positively refused. Lord — Russell then endeavoured to persuade her to allow another view of the miniature: all in vain. At last, partly exhausted, partly relenting, she consented, while saying, "You must know that in my presence he is never to be spoken of but as *My Lord Protector*." West said that he had the miniature in his hand for a good while afterwards, taking special care to speak frequently of the Lord Protector.

Not long after the lady died, and he inquired of the executors about this portrait. He was told that the box had been received from the bankers, but the miniature was not in it; and when West spoke to me about it, he said it had never been discovered. He added, that probably it must have been sent abroad, but that the execution was so beautiful that it would certainly appear again.

#### CHURCH-BUILDING NEWS.

*High Easter (Essex).*—The parish church, "the Cathedral of the Roothings," which has recently undergone improvements and restorations, at a cost of 2,200*l.* from designs by Mr. F. Chaucellor, of Chelmsford, has been re-opened. High Easter Church consists of nave, chancel, north aisle, tower, south porch, and vestry. The original church, which probably included only a nave, chancel, and tower, was of the Norman era, the only portion of this work which remains being the nave, and this has been so altered by the addition of a north aisle and the introduction of decorated windows in the south side, as to leave only portions of the walls to represent the original work. The restoration has at present been confined to the nave and north aisle and roof of the chancel having been restored some few years ago. In effecting these restorations the object in view has been to restore the body of the church to the condition it assumed after the works of the latter part of the fourteenth century had been carried out, with the exception of the roof, as from certain remains in the tower it is believed that the nave had then a steep roof without a clerestory. Many of the oak timbers of the roof being found in a frightful state of decay, they have all been replaced with new ones, the old decorations being adhered to, and the whole has been re-covered with lead. The windows of the clerestory, which are of moulded red brick, have been restored, the red brick jambs and mullions showing inside. The lower parts of the nave walls are of rubble, the external slating having been removed and the original rubble work of the Norman period exposed to view. The windows on the south side of the nave, which had been patched up with wood, cement, and mortar, have been restored in stone and re-glazed; and the walls and buttresses of the north aisle, which had been patched up with brick, have been renovated, the stone parapets and steps having been removed, and the sarape, which had been destroyed, restored. In the interior, the whole of the modern pews have been cleared out, and the entire area has been re-benched in oak. The design of one of the original benches has been obtained, and the new benches have been restored in accordance therewith. The oak screens, including what is popularly known as Carnet's Chapel, at the east end of the aisle, have been restored, and form now the organ chapel. The parishioners have taken in hand the tower and remaining portions of the church. Since its construction a wretched little spire has been added, which to a certain extent mars it, but it is to be hoped that this disfigurement will be removed in the course of the restorations which are in hand. The gallery which formerly blocked up the west end of the nave has been removed, throwing open the tower arch, which forms a frame to the west window.

*Wycombe and Chadwell (Leicestershire).*—The church belonging to these joint parishes is about to be restored. Situated in a sheltered spot, away from any public thoroughfare, but few people are aware of the interesting specimen of Norman and Early English work which are embodied in this church. The north sides of the nave and tower are Norman, and the remaining portions of the church, including the chancel, are Early English. The works included in the scheme for its restoration include new window on south side, throwing open the tower, removing the coiling of the chancel, new benches, pulpit, and reading-desk, cleaning and restoring the stonework of the interior, and some necessary repairs to the exterior. The plans have been prepared by Mr. R. W. Johnson, of Melton Mowbray and Leicester, architect, and the works will shortly be commenced.

*Randwick.*—The parish church of Randwick, which is a village within the borough and close to the town of Stroud, in Gloucestershire, has been re-opened by the bishop of the diocese, after having been for some time closed for repairs and alterations. The nave has been almost rebuilt; a new window has been put in the chancel; the whole church has been repewed with modern open seats; and a new porch has been added; the total expens being over 400*l.*, which sum has nearly all been raised by subscription. The architect was Mr. W. B. Baker, of Stroud; and the builders were Messrs. Wall & Hook, of Brimscombe.

*Siddington.*—The parish church of St. Peter, Siddington, having become dilapidated, a lady, interested in the church, determined to have it restored. The work was undertaken by Mr.

Restall, of Bisley. The nave and south aisle have been rebuilt, while the north aisle, which is of a different order of architecture from the rest of the building, has been extended to the entire length of the nave. A vestry and tower with octagonal spire have been added, and the chancel has been repaired so as to harmonize with the whole.

**Horsley.**—The new Chapel of Ease, built on the site of the old poorhouse, at Shortwood, in the parish of Horsley, has been opened for divine service. The chapel is in the Gothic style, and accommodates 200 people. The work has been done by Mr. E. Clayfield, of Horsley, under the direction of Mr. Clissold, of Stroud. The cost of the building, including the purchase of the site, is 900*l.*, of which about 800*l.* have been collected.

**Clutton (Somerset).**—The parish church of Clutton, dedicated to St. Augustine, has been re-opened. The edifice was in a very dilapidated condition, and it was feared lest some day the old-fashioned high-backed pews might be hurried by the falling roof. At the same time increased church accommodation for the parishioners was pressing wanted. Mr. G. C. Norton, architect, of Bristol, was therefore called in, and he prepared plans for the rebuilding of the church, and for adding to the site occupied by the nave a north and south aisle, a vestry and chapel, and for increasing the original size of the chancel. The plan was approved of, and the work intrusted to Mr. T. Dives, of Glastonbury, who, about a twelvemonth ago, set about the work of demolishing the old building and erecting a new and larger one. The tower was allowed to stand, and there have been joined to it the buildings mentioned, whereby the sitting space has been increased so as to accommodate 672 persons. The high pews have been removed, and low oak ones substituted; and by the removal of the organ from the tower a stained-glass window has been brought to light. Stained glass is also to be placed in the east window, over the communion-table; and the organ, which is now undergoing reparation, will in future be located near the vestry. The window in the tower was put there in 1815, when some restoration work was also executed. The new church is built of grey Pennant stone, faced with Bath stone dressings, and blue lias archings over the windows and doors. The roof, an open-timbered triple one, is partly supported by two rows of three freestone pillars, with foliated capitals, standing on each side of the nave, and separating it on either hand from the aisles. The porch and the chancel are paved with Minton's encaustic tiles, and the pulpit (stone) and lectern are also both new. The chancel arch and the font are the only portions remaining of the old building; both of the Roman type. The church is heated by Haydon's heating apparatus. The total cost will be nearly 1,800*l.*, which includes the fencing in and preparation of the additional burial-ground, architect's charges, &c.

**Monkland (Herefordshire).**—The parish church of St. John the Baptist has been restored and re-opened. It is of stone, in the Early English style, and is believed to be a very ancient building, the parish register dating as far back as 1590. The chancel was rebuilt about the year 1825, but in the vilest style of that period. By the liberality of the present vicar, the Rev. Sir H. W. Baker, bart., that eyesore has been removed, and the church generally put through a restoration. The vicar laid out 500*l.* on the chancel. The parishioners (about 200 in number) sanctioned the borrowing of 250*l.* on the parish rates, to be applied to the general restoration of the church; the Diocesan Church Building Society made a grant of 40*l.*, and, with these funds, increased by some voluntary contributions, the work was started, Mr. G. E. Street, of London, being engaged to prepare the plans. Upon these, it is calculated that the total cost will be not less than 1,000*l.*; and the sum over and above the special grants and gifts will be defrayed by subscriptions raised through the exertions of Sir Henry Baker, who has made himself responsible for any deficiency. The new chancel is approached from the nave by two steps, and is separated therefrom by a demitstone screen. On the north side are the vestry and the chamber organ. The roof is divided into panels, and highly relieved in colours, the groundwork being purple. In the compartments over the sacrum the monogram "I.H.S." is inserted; foliated crosses being the ornaments introduced: the remaining compartments are studded with gold stars. The cornice is a combination of high colouring and gilding. The east window represents the glorification of our Lord,

and is the work of the Messrs. Hardman, of Birmingham. The upper compartments of the window represent the heavenly praise of our Lord—"To Thee cherubim and seraphim continually do cry;"—and the lower ones, the earthly praise, the praise of the terrestrial and the rational creatures. This window is the gift of Sir Henry Baker's co-compilers of "Hymns Ancient and Modern." Over the altar and beneath the window is a surdus, depicting Christ's crucifixion, with the three Marys and St. John weeping at the foot of the cross, the whole chiselled on Caen stone. The background is mosaic work inlaid with Salvisti's gold. The body of the church has been re-fitted with open oak benches. The nave itself has been entirely rebuilt; and in this work the object of the vicar has been to conserve the old characters of the building to the minutest detail. Every stone occupies its original position, or very nearly so, and thus the nave stands an exact reproduction of the old one. The plaster which has so long hidden an old fourteenth century roof has been cleared off, and the space between the rafters ceiled: the floor has been laid with Godwin's encaustic tiles, and the walls of the ashlar work and the windows have been restored. The old method of lighting the church has given place to a more modern and ornamental one, which comprises a chandelier suspended from the roof, and a number of two-light brackets affixed to the walls. The west window is filled with coloured glass, to the memory of Mr. Humphrey Smith, of Overton, near Ludlow—subject, "The Raising of Lazarus."

**Cemaes (North Wales).**—The church of Cemaes, in the parish of Llanbadrig, has been consecrated by the Bishop of Bangor. The church is situated on a gentle elevation, a short distance from the town of Cemaes. The site is central with regard to the population. It was the gift of Mr. Wm. Jones, Buarth-ty-foel. The building was designed by Messrs. Kennedy & Rogers, of Bangor and London, architects, in the Early English style, and comprises a nave, 52 ft. 6 in. long and 17 ft. 6 in. wide; a chancel, 24 ft. long and 14 ft. wide; a roking-room or vestry, 12 ft. square, placed on the north-west angle of the chancel, and made of these unusually large dimensions to suit the wants of the parish vestry meetings. There is also a porch at the extreme south-west angle of the nave, and a one-arched bell-turret on the western gable. The walls, which are throughout 1 yard in thickness, with a hattered plinth, are built 10 ft. high to the eaves, and are pointed with Portland cement in the joints, and afterwards painted, in order, if possible, to resist the violence of the storms. The dressings throughout are of Anglesey Limestone, and form a contrast with the masonry of the walls. The nave is lighted in the north with one four-lighted and two three-lighted windows, lancet in form, bordered by a square set in in the walls, having cubical blocks along the top of the recess. There are two three-light and one two-light windows in the south wall, of similar design. The chancel, which is attained by stone steps through an arch, is lighted by an eastern triplet, trifoliated, and handed together outside by a face arch of large dimensions. There is also a small foliated lancet window in the south side of the chancel. The vestry has a two-light window. The roof, which is covered with Carnarvonshire slating, and Yorkshire copings, is of timber, stained and varnished. The floor of the passage in the nave is of Yorkshire flagging; that of the chancel, up to the altar step, of a design in encaustic tiles, by Messrs. Maw & Co.; and that within the altar space is boarded and covered with carpet. The church is calculated to accommodate 184 persons. The seats are all open and free, and are stained and varnished. The works were commenced by Mr. Thomas Davies, builder, Llanerchymedd, but have been finished off under the immediate supervision of the incumbent. The cost of the whole undertaking has been 720*l.*

#### DISSENTING CHURCH-BUILDING NEWS.

**Sevenoaks.**—The foundations of a new congregational church on St. John's-hill, the contract for the building of which was taken by Mr. Potter, of this place, have been commenced. The building is to be erected from designs prepared by Mr. J. Tarring, of London, and is intended to accommodate about 480 persons. The walls and the spire (130 ft. in height) are to be of Kentish rag stone, with Bath dressings, and there are to be ten stone tracery windows

on each side of the building. The seats and fittings generally are to be all of deal, stained and varnished, and the roof will be partially ceiled, and a portion of the timbers also stained and varnished. A gallery for the organ and choir will be erected at one end, and a warming chamber will be constructed beneath the building. The total cost of building and ground will be under 3,000*l.*

**West Bromwich (Staffordshire).**—The Wesleyan chapel here has been re-opened after being repaired and decorated, and class-rooms erected, involving an outlay of about 1,500*l.* The work has been carried on by Messrs. Trow, builders, from the designs and under the superintendance of Mr. Bidlake, architect, Wolverhampton.

**Tipton.**—The chief stone of a new Wesleyan chapel has been laid here. The edifice, in course of erection, is in the Geometric style, and consists in plan of a nave roofed in a single span, with an apsidal end arranged as the organ gallery. The building will be of brick, with Box ground stone dressings. The principal front consists of centre gable, with entrance doorway to the ground floor, and large tracery-headed windows. A tower rises on the north side of the centre gable, and will be used, as also a wing on the south side, for the staircase to the galleries, having separate entrances thereto through all the main entrances, which will communicate by internal lobbies. The side front will have two tiers of windows, lighting respectively the ground floor and galleries, and divided into bays by buttresses. The area of the chapel is 70 ft., on the ground floor, by 48 ft., and the height from floor to ceiling 38 ft. Under the organ gallery are two vestries and offices. The accommodation to be afforded is for 1,015 persons. A basement extends under the whole building, securing light and air to all the rooms, consisting of infant school, 47 ft. 6 in. by 32 ft.; also three class-rooms, and chapel-keeper's residence. The designs were furnished by Mr. George Bidlake, of Wolverhampton, architect, under whose superintendance the building is being carried out, at a cost of 4,957*l.*, including the value of the old materials. The contractors were Messrs. Trow & Sons, of Wednesbury, builders.

**Liverpool.**—The chief stone of Trinity United Presbyterian Church, Cloughton, has been laid. The new edifice will be in the Decorated style of architecture, and will accommodate 850 persons. It will be joined to the present lecture-hall, and, like it, will be built of yellow Stourton stone, with red hands, and red and white arches over the doors and windows. The plan will consist of nave and aisles, with shallow transepts, the west end having an engaged tower and spire at the north-west angle. A large entrance-doorway, with moulded jambs and archways, will lead to a vestibule, some 30 ft. long by 14 ft. wide, paved with encaustic tiles. Right and left there will be entrances to the body of the church, and staircases to the gallery. The nave will be separated from the aisles by arcades of three, supported on cast-iron pillars with wrought-iron fluted caps. From these pillars will spring laminated arched principals supporting the roof, with intersecting arches of the same over the nave and transepts. The roof will be open half-way up, where it will be ceiled, the ceiling joists being still seen. The whole of the carpentry and joinery work will be varnished. A gallery, two seats deep, will extend along each side of the edifice, with a deep gallery at the west end, extending over the entrance vestibule. The body of the church will be provided with open benches, and the pulpit will be in the form of a raised desk on a platform at the east end of the building. Besides the large entrance at the west end, there will be north and south doors, as well as one at the east end, communicating with the present lecture-hall, for egress. The exterior will present a lofty spire at the north-west angle, three-gabled windows over the aisles, large transept, with smaller transept and apex of the present lecture-hall. The contract has been taken by Messrs. J. & W. Walker, builders, Birkenhead; and the cost of the whole building, including the present lecture-hall, will be about 7,000*l.* The designs have been prepared by Messrs. W. & J. Hay, of Liverpool, architects.

**Whitby.**—The foundation-stone of a new Primitive Methodist chapel has been laid at Fishburn Park, Whitby. The architect is Mr. W. Falkingham, and the builders are Messrs. Harrison & Graham. The cost of the chapel, including site and minister's house adjoining, is estimated at about 800*l.*, and the chapel will seat about 350 persons.

## STAINED GLASS.

*Currey River Church (Somersetshire).*—A stained window has just been put up in the tower of Currey River Church, from designs by Mr. Penrose, architect, as a memorial to the late Miss Piny, of Somerton, by her brother, Colonel Piny.

*Trinity Church, Birchfields (Birmingham).*—This church, which has lately been built, has been recently embellished by the erection of two stained glass windows in the chancel, to the memory of the Rev. Henry J. Ramsden, formerly curate of Handsworth, by his college friends of Cambridge and Wells, as set forth by a memorial plate. The windows consist of two lights each, and tracery, and the subjects are respectively the Raising of Lazarus and of the Widow's Son, with scrolls, containing texts. The whole has been carried out by Messrs. Hardiman & Co., of Birmingham, in accordance with the style of the architecture, viz., which is in the manner of that of the early part of the fourteenth century.

*Christ Church, Colne.*—A large painted glass memorial window, in three lights, has recently been erected in the chancel of this church, the artists being Messrs. Lavers & Barrand, of Manchester and London. The illustrations forming the bottom tier are Ezekiel's vision (chap. i.) of the four living creatures, Hannah presenting Samuel to Eli, and Abraham's sacrifice of Isaac being intercepted by the arm of the angel and the substitution of the Lamb. Those forming the upper tier, and in much larger panels, are the Saviour hearing His Cross, accompanied by the centurion and his four soldiers; Jesus blessing little children, three mothers presenting their infants; and our Lord's Ascension, the Apostles being around Him and beholding His departure. The subjects are introduced upon a coloured Early English mosaic background.

## COMPENSATION.

WARREN V. THE METROPOLITAN AND ST. JOHN'S WOOD RAILWAY.

THE second inquiry on this line took place before Mr. Under-Sheriff Burchell, on Monday, the 14th instant, at Red Lion-square. Mr. Serjeant Parry and Mr. Gadsden appeared for the claimant, instructed by Messrs. Allen & Son; and Mr. Horace Lloyd for the company, instructed by Messrs. Hargroves & Fowler.

The material contest was in respect of the decorations in the interior of the house. It appeared from the evidence of the claimant, who is the well-known decorator of Soho-square, that he took an under-lease of the house No. 45, New Finchley-road, for a term of thirteen years, in 1863, and laid out 700*l.* in alterations and repairs, of which sum 350*l.* were for extraordinary decorations, such as gilding and curchising. The surveyors for the claimant, Messrs. Edward Roberts, Driver, and Henry Baker, agreed in valuing the rental at 140*l.*, which, with 10 per cent., gave 35*l.*, and 350*l.* as a premium for the extra decorations, and which sum, in fact, he has to expend in another house; 280*l.* (two years' value) for removal and loss on furniture; 234*l.* 10*s.* for fixtures; 80*l.* for rent and expenses of lease of new house: total, 1,329*l.* 10*s.* There was a further demand for extra costs of the inquiry, and also for a probable renewal of the lease, which was, after discussion, agreed to be separated.

The surveyors for the company (Messrs. Miller, Toplis, & Rushworth) valued the rent, including decorations, at from 125*l.* to 130*l.*, and with 10 per cent., at about 280*l.*; fixtures, 130*l.* to 143*l.*; but it was elicited on cross examination that a bath and fittings, which cost 70*l.*, was valued by one witness at 15*l.*, and by another at 30*l.* Mr. Lloyd suggested that 746*l.* was the utmost injury the claimant could sustain. The jury, after considering about an hour, gave 1,265*l.*, and nothing for the contingent renewal.

*Evidence in Compensation Cases.*—At the Lord Mayor's Court recently, in a railway compensation case, "Smeo v. The Metropolitan Railway Company," a claim was made for some houses in Liverpool-street and Broad-street-buildings, in the City, exceeding 33,000*l.*, which, with the customary 10 per cent., for a forced sale would exceed 36,000*l.* On the part of the company the valuation was, with the 10 per cent., under 14,000*l.* There was a railway tavern on the property, which was let at 550*l.*, and as it is near four different railway stations, it was stated to be worth a premium of 5,000*l.*

On the part of the company, the evidence was that the rent was excessive, and that it would fetch no premium. Without the railways the house was not worth more than 50*l.* a year. Other evidence was given as to the value of property in the City of London, and it was stated that it was still increasing. Further, it was stated, that ground-rent which three years ago was worth only 2,000*l.*, would now fetch 4,000*l.* Mr. Commissioner Kerr, in placing the case before the jury, declared that it was an extraordinary case, and would form a model compensation case. What were they to think of the value of the evidence in such cases, when there was such a remarkable conflict? The jury retired, and at six o'clock returned with a verdict for 29,650*l.*

## GAS.

At Crowland, great complaints are made by the consumers of gas, the price being 7*s.* 6*d.* per 1,000 ft., while in other towns of a similar population the price is only 5*s.*, and a discount allowed for prompt payment. The high price deters many from using the gas, and many that did have discontinued its use.

The report of the directors of the Bakewell Gas Company states that the heavy expenses incurred in 1863; by the erection of new purifying and condensing apparatus, were now entirely paid off. The directors recommended a dividend at the rate of 8 per cent., free of income-tax. A reduction had been made in the price of gas, which is now 5*s.* 6*d.* per 1,000 cubic feet. The report was adopted.

In Cork, the price of gas has just been reduced 3*d.* per 1,000 cubic feet, by the consumers' company, owing to onward pressure, which makes it now 3*s.* 9*d.* per 1,000. The company was started in 1853, and although they have been supplying gas for 4*s.* per 1,000, and individuals have been made rich out of the management, it has paid the shareholders 8 per cent. per annum ever since, which absorbs 4,680*l.* each year; and yet, after all the dividends were paid at the last half-yearly meeting, there was still on hand an unappropriated balance of 3,930*l.*, an increase of 639*l.* on the reserve.

The late rapid growth of the town of Coleraine, and the consequent increase in the number of gas consumers, have necessitated a corresponding enlargement in the street gas mains. Pipes of double the capacity of the old ones are being laid, from the works to the waterside, and from the works to the outer limits of the town, on the south side, to provide light for the workhouse. This is one of the many signs of progress in Coleraine at present.

Speaking of the gas companies, and more especially the metropolitan, the *Daily News* says,—We do not observe that any of them, save one, have failed to make a profit sufficient to give more than the 10 per cent. dividend. There are in almost all cases surplus sums amounting frequently to from one-fourth to one-half more, and sometimes almost to an equal amount with that dividend, which are disposed of in conformity with the statute, by either making up deficiencies of 10 per cent. dividend in previous years, or by being carried to the credit of the reserved fund or of next year's dividend. Thus the fortunate shareholders are in actual receipt for the current year of dividends in no case less than 10 per cent., and in some of 15 or 20 per cent. As, with a view to save the operation of the six years' limitation, the back dividends paid (when the year is mentioned) appear all to be of the year 1858, the lucky persons who have purchased shares since that period obtain a totally unexpected benefit by the losses of their predecessors. But there seems to be another way,—doubtless also perfectly legal,—by which the profits are considerably enhanced. Many of the companies appear to have been worked with a proportion of borrowed capital, on which they paid an average interest of 5 per cent. This is now in process of being paid off by the issue of new shares, which will be entitled to the 10 per cent., and all other privileges. It is obvious that when a company has made up its 10 per cent. on every possible item, it has no motive to pursue economy or introduce improvements which would bring it no further profit. Its motive will then rather be to increase its expenses of management and manufacture, so as to give its own servants or contractors the benefit of its surplus profits rather than the public. And the accounts disclose how easily this may be done. We can by law succeed in

preventing competition, but it does not seem at all certain that we can by formal enactments secure either goodness or cheapness at the hands of those to whom we have given a monopoly.

## MUSIC AND THE STAGE.

*Royal Gallery of Illustration.*—The Opera di Camera has commenced its third season successfully with the two operas "Widows Bewitched" and "Ching-Chow-Hi." Miss Augusta Thompson sang charmingly in both, and her acting showed a versatility such as is not often to be remarked on the English stage. Mr. Whiffin has an excellent tenor voice; and Miss Emily Pitt, Mr. J. A. Shaw, and Mr. R. Wilkinson deserve something more than a second place in our appreciation of the members of the little company. It is one advantage of the entertainment to which Mr. German Reed has dexterously adapted Nash's Gallery, that every note and word can be heard; so that, with good and varied music, like that by Miss Virginia Gabriel, and the burlesque by Offenbach, which has been cleverly adapted by Mr. Wm. Brough and Mr. Reed, and has been put on the stage in a manner that would be creditable to any theatre, there is not a more satisfactory place to spend an evening devoted to music, than just now the Gallery of Illustration.

*Covent Garden Theatre.*—Mr. Mellou's concerts, under his careful leading, still draw crowded houses every night. Who would not undergo the process of being *not-pressed* to listen to the programme, so well carried out by his orchestral assistants? On certain nights the first part consists solely of the deep-studied pieces of our composers, so that the public may pick out the evening to listen to their favourite, and compare the writing of one author with another. When each evening is so well attended, it is a difficult matter to ascertain which is the public favourite. We see that the selections from the opera of "L'Africaine," are promised for Monday next, the 21st instant.

## Books Received.

"FIFTH Annual Report of the Society for the Acclimatisation of Animals, Birds, Fishes, Insects, and Vegetables, within the United Kingdom. 1865." We are glad to observe from this report, that the Acclimatisation Society is still actively progressing with its useful measures; and, although the fish-hatching department at Twickenham has been discontinued, the process is now in progress at South Kensington. Various mammals, birds, &c., have come into the possession of the Society since last report, and an account of these is now given in appendices to the report just issued.—"The Education of the Deaf and Dumb practically considered, with an Illustrated Method of Articulate Speech." By S. E. Hull, Esq., Edwards-terrace, Kensington. Anything promotive of the happiness and the intellectual culture of those isolated and interesting fellow-beings, deaf mutes, well merits consideration. Mr. Hull has partially succeeded in restoring speech to a young person of this class, by teaching her how to use her organs of speech so as to produce sounds approaching to the normal, even though not herself hearing what she utters. Engraved illustrations of the different positions of the tongue, &c., in the utterance of vocal sounds are given. Mr. Hull has been so comparatively successful that he has been induced to try a second experiment of the same kind.—"The Search for a Publisher; or, Counsels for a Young Author." Fifth edition. London: Bennett. Although one very material object of this volume is to "invite attention to our method of doing business," it contains some matter that young authors might find to be useful in their dealings with any publisher.—"Psychoneurology; a Treatise on the Mental Faculties," by R. T. Stothard (Harvey, St. James's-street, London). Should any of our readers have a curiosity to know what kind of physiognomics Noah, Shem, Ham, and Japhet, Homer, or even the primitive Briton, or the ancient Pict, possessed, Mr. Stothard is here ready to show them up. He is also learned in noses, months, eyes, and ears: in short, this is a curious but we cannot say a reliable treatise on physiognomy, and may at least amuse if it do not instruct a leisure hour.

## Miscellaneous.

**THE ROYAL EXCHANGE.**—Mr. Tito, M.P., has presented a model of this building to the University College, London, for the use of the class of Architecture.

**WORKMEN'S FESTIVALS.**—At this season we usually receive accounts of many festivals of masters and men in the building trades. We have no space for reports of the proceedings, or give names; but we are glad to receive the particulars. Much good results from these annual meetings.

**THE HERBERT MEMORIAL.**—A report of the Herbert Memorial Committee states that, as being "likely to be suitable for the site of a convalescent Home, a piece of land has been leased upon at Bournemouth, and the purchase of it has been completed." An elaborated plan prepared two years ago, under the direction of Miss Nightingale, by some of the civil servants of the Crown employed by the War-office, has been put into the hands of Mr. Wyatt to be adapted to the locality.

**THE ROCILDALÉ PROPERTY AND GENERAL FINANCE COMPANY (LIMITED).**—At the first annual general meeting of shareholders, held in Rocildale, on the 31st ult., the directors reported a dividend of 10 per cent., leaving a balance equal to 14 per cent. to be placed in reserve. The statement of accounts up to the 30th June, 1865, showed that, after paying the current and one-fifth of the formation expenses, and providing for the rebate of interest on mortgages, bills, &c., not yet matured, there remained for disposal a sum equal to over 2½ per cent. During the past year a plot of land has been leased at Dearthley, on which it is the intention of the Board to erect cottages, which are much wanted. If, hitherto, however, the building department has had to give way for a more lucrative business, money on mortgages being in great demand.

**ENGLISH FRIENDLY SOCIETIES.**—M. Lanrent traces the origin of the modern friendly society to the example of the master-artificers, those guilds and corporations gave the hint of a similar organization to their workmen, but directly to the development of industry, the spirit of association inherent in English manners, and disposition we manifest to calculation, order, and economy, and to the steadfastness with which we carry out an enterprise once commenced. He points out, however, that the credit of establishing some of our very earliest friendly societies is due to Frenchmen. Upon the revocation of the edict of Nantes, the French refugees in London founded a society for mutual help, under the title of the Société des Parisiens. In 1793 a similar society was established in Rochdale-green, which still exists as the Société Rochdale. Since then, so rapid has been the progress of friendly societies in Great Britain, that the numbers they enrol are not far short of half the whole male adult population.—*The Builder.*

**TOWNS' IMPROVEMENTS.**—Mr. Rayner, town clerk of Bradford, has struck out the idea of a system of open loans to municipalities, substituted for the usual loans by contract. He suggests that when money is wanted by a borough it should be received in small sums from working men, whose deposits should bear interest at the rate of 3½ per cent., and be exchangeable when they reach 50*l.*, for borough debentures at 4*l.* per cent. The workmen would thus have an excellent opportunity for investing their savings, the town would borrow money cheaply, and the whole population would be directly interested in the security of the municipal revenue. The ratepayers being also the bondholders, repudiation or bankruptcy would be nearly impossible. The only objection yet to the plan is one which may be said to have been shown by experience in France, namely, the danger of too much success; the workmen provoking the councils to borrow money faster than the town really requires. It might be necessary, too, to fix a maximum rate of interest, to prevent corporations borrowing money at rates considerably dearer than the rate of their securities would warrant. It would only remain to enable the boroughs to issue little exchangeable bills to make their financial organization perfect—a little too perfect, it might prove, for the comfort of ratepayers.

**THE LATE SIR W. J. HOOKER.**—We greatly regret to have to record the death of Sir William Jackson Hooker, Director of the Royal Gardens, Kew, whose management of the gardens and museum was of a character to show him to be a real friend to the industrious classes. He died on the 12th inst., aged eighty years. He was a knight of the Hanoverian order, a fellow of the Royal and Linnean Societies, a D.C.L. of Oxford, and a Corresponding Member of the Institute of France. We have been indebted to him for information given in our journal.

**OPENING OF TUMULI AT CASTLE HOWARD.**—Examinations have been made of the British burial mounds on the Earl of Carlisle's estate, at Castle Howard. As was the case last year, the excavations were under the direction of the Rev. William Greenwell, canon of Durham, and vice-president of the Sirtees Society. A large number of burial mounds have been opened, all proving to be round barrows of the cremation age, but exhibiting peculiarities indicating various modes of burial to have been practised by the successive generations of Britons who entrenched the escarpments of the Howardian range, at the foot of which their graves are so profusely scattered. In the centre of one barrow and on the natural surface, besides the deposit of burned bones and charcoal, some description of cement was found compacted into a hard substance, resembling a mass of solid concrete. In another tumulus, 32 ft. in diameter and 3½ ft. high, in the same vicinity, containing the burned body, charcoal, and burned earth, was found among the bones a small incense cup, ornamented by four horizontal cord lines, but not perforated. This was the first vessel of the kind discovered in the district. An urn, some flints, &c., were found in others of the barrows.

**THE BRITISH ASSOCIATION MEETING.**—South Staffordshire is making arrangements to receive the Association in a hospitable manner. Invitations have been received from Malvern, Coalbrookdale, and Benton. The local committee are making arrangements for excursions into South Staffordshire. It is proposed to devote Thursday, September 14, almost entirely to the Black Country. As many members as choose to go will proceed to Dudley early in the morning, for the purpose of visiting the caverns (which the Earl of Dudley will have illuminated for the occasion), and the thick coal open workings, near the Wren's Nest Hill. One section will be taken by Wednesday, and will visit the leading works in the town and neighbourhood. Another will go to Stourbridge, to inspect the iron, fire-clay, and glass works. A third will be taken in charge by Mr. McLean, and conducted to the Cannock Chase Collieries, and will probably take Walsall on their way. A fourth will go to the Round Oak and Woodside Works, while a fifth will remain in the vicinity of Dudley, for the purpose of examining the geological features of the district. No doubt other places of interest, such as Wolverhampton, Oldbury, and Spon-lane Works, &c., will be visited.

**TELEGRAPHIC.**—The Telegraph to India Company (Limited) have met for the purpose of declaring a dividend for the half-year ending the 30th of June last. Sir Macdonald Stephenson, who presided, made a statement, satisfactory on the whole, as to the operations of the company, and the condition and prospects of the various lines of telegraphy in which they are interested. Notwithstanding the drawbacks that had occurred, and the large sums of money that had been expended, the chairman thought that a great problem had been solved towards the completion of a system of international telegraphic communication throughout the world. A dividend at the rate of 5 per cent. per annum, free of income-tax, for the half-year, was declared, and the report generally was unanimously adopted.—We regret to learn that the *Great Eastern* has returned without having laid more than two-thirds of the Atlantic Cable. When the partial loss of insulation took place, in consequence, we presume, of the magnetic storm pointed out at the time by Professor Airy, those on board the *Great Eastern* appear to have attributed the defect to a fault in the cable six miles from the ship, and in attempting to lift it the cable broke. Four attempts were made to hook it up, and three times it was partially lifted, but the rope broke each time. The spot was therefore marked by buoying, and the *Great Eastern* has returned for stronger ropes.

**PHOTOGENE GAS.**—In answer to our correspondent, "W. F. C.," we have received the following from Paris:—"I have been for the last eight months occupied in aiding to develop a gas generator (Millé's patent), whereby air spontaneously passing over petroleum spirit (of specific gravity, 650 to 700, water being 1), is converted into a dry inflammable gas. There can be no danger with this apparatus, as the generator is far away from the burners. It is at work in several establishments in Paris, and is only half the price of street gas."—C. H. D.

**BATHS AND WASH-HOUSES.**—From a parliamentary return just issued, it appears that the Baths and Wash-houses Act has been adopted in only eight parishes and united parishes in the metropolis, viz., All Saints (Poplar), St. Marybone, St. Margaret and St. John (Westminster), Bermondsey, St. Giles-in-the-Fields, and St. George (Bloomsbury), St. George (Hanover-square), St. Martin-in-the-Fields, and St. Pancras. The last to adopt it was St. Pancras, the date given being 2nd March, 1865; and the return states that no expenses of any kind in respect thereof have yet been incurred in that parish. The Act has also been adopted in twenty-nine provincial cities and boroughs.

**DISCOVERY OF THE COFFIN OF CANUTE'S DAUGHTER.**—In proceeding with the restoration of the old Saxon Church of Bosham, in Sussex, some excavations were made in order to lay bare the bases of the columns supporting the chancel arch, which are on a much lower level than those of the arcade separating the nave from the aisles. In laying bare these bases it was thought advisable to extend the excavations a little, for it was just in front of this arch that tradition has uniformly stated that the youthful daughter of the Danish King Canute was buried. Just below the level of the old floor a slab of stone was discovered. Carefully the excavation was carried on, and soon it was found, as had been already conjectured, that this stone covered a small stone coffin. The coffin was afterwards opened in the presence of the Rev. Henry Mitchell, F.S.A. (the vicar of Bosham), his son, Henry Godwin Mitchell, Mr. C. Stanges Jones (surgeon, of Chichester), and Mr. Edgar J. Varley, artist. As soon as the lid, which was 7 in. thick, was raised, the form of the child could be distinctly seen. The figure was 3 ft. 9 in. in height. The bones, although reduced to a white dust, could be very clearly traced. No jewelry was found, and it is thought the child was too young to be buried with any personal ornaments about her.

**CHANGES IN THE CITY OF LONDON.**—Nothing shows more clearly the extraordinary changes, and, at the same time, the almost total migration of residents from the City proper of our own days, than the recorded anecdotes connected with its early musical entertainments. It is pleasant to turn over the pages of the anecdote-loving Sir John Hawkins, who will accompany us through a variety of now dingy, now palatial thoroughfares, of which all associations have long since departed, save those connected with limited liability companies or monetary investments. For instance, it is absolutely difficult now-a-days to conceive a private concert periodically held in the shopkeeping unromantic Chiswell-street, and "so contrived as to fall on that particular Thursday in the month nearest the full moon, in order that visitors might walk home in safety when the performance was over." Then were the operatic music of the giant Handel, the manly strains of English Purcell, and the sweeter and more equable melodies of Italian Corelli, much beloved by those less fashionable but more really music-loving audiences; in whose minds, however, the probability of the insecure walk home must have alternated disagreeably with the calm inspired by such excellent performances. It is not so very much more than a hundred years since this picture of the City and its suburbs would hold good, a period when the "Devil" Tavern, near Temple-bar, the "Castle" in Paternoster-row, and Stationers' Hall, not to mention divers nooks and corners eastward, such as Change-alley, Cornhill, each possessed some concert-giving associations of their own, since faded from the recollection even of the "oldest inhabitant." In the common but ostentatious modern public concert is true music always or often the gainer? Let the ghosts of the departed residents in the nightly-deserted City houses tell us.—*Musical Standard.*

**THE APPROACH OF CHOLERA.**—The National Association for the Promotion of Social Science have held, this Thursday, a conference of medical officers of health, members of the Epidemiological Society, parochial clergy, and others interested in the sanitary condition of the metropolis, and of the kingdom generally, to consider what steps should be taken, at the present moment, in view of the threatened epidemic. The Bishop of London was in the chair; and some important resolutions were passed.

**CHURCH BELLS.**—Mr. Cattley's bells for Worcester Cathedral will be ready for the tower as soon as the tower is in a position to receive them; and, if the anticipations of an authority on bells,—Mr. Denison, Q.C.,—be realised, Worcester will possess one of the finest peals of bells in the kingdom.—The old bells of the Hereford Cathedral are at last to be put in ringing order. The architect, Mr. Scott, has given his consent; the dean and chapter have sanctioned the scheme; and all that now remains to be done is to raise 230l. to execute the repairs. A committee has been formed to receive subscriptions.—A new peal of bells for St. Mary's, Penzance, has been cast by Messrs. Taylor & Co., of Loughborough.

**PETROLEUM IN EUROPE.**—It is stated that petroleum has been discovered in Hanover, and capital is being privately subscribed in England to raise the oil from the wells, which are reported to be numerous. The constantly increasing importance of the trade in mineral oils at Marseilles, too, attracts attention to the oil deposits of Europe. It is now considered certain that, in a period more or less short, the old continent will not be tributary to America for mineral oils for lighting. Every day new natural reservoirs of petroleum are discovered; and at the same time geologists are beginning to understand oil-fields better, and the manner in which they are distributed over the globe. Among the localities which already export petroleum is Moldo-Wallachia. Havre is the principal French market for petroleum. The *Marseilles Semaphore*, however, is of opinion that Marseilles is destined to become a large market when the European reservoirs shall be worked on a large scale, and when it can receive the mineral oils of Asia by the Isthmus of Suez. There is an intimate connexion between the reservoirs of petroleum in Galicia and in Moldo-Wallachia. These two oil regions, in fact, only form one, which corresponds to the general line of the Carpathian mountains.

**TENDERS: ABBINGTON.**—We have received a letter involving an allegation of unfair treatment on the part of the authorities of Abbingdon, of builders who lately sent in tenders for the new police cells and residences in that town. The writer says:—"Four tenders were sent to the town-clerk, properly endorsed; three were sent before his office closed for business, and one afterwards to his private residence, the latter one being successful. It being noticed by two parties that the successful person sent his tender to the private residence of the town clerk instead of his office, I thought all was not right. I at once wrote to a contractor, at Oxford, who had sent in a tender, to come over the next morning early, and ask for his tender, merely to see if the tenders had been opened. He came, when, on his tender being handed to him, the envelope was missing; and it could not be found. I then wrote to a member of the committee appointed to receive the tenders, and in reply to my question, he said the town-clerk opened them, but that no one else knew the contents of any of the tenders. I again wrote asking how he knew the town-clerk opened the tenders. He replied, 'The tenders were all opened by the town-clerk before the meeting of the committee; your note was read, and then the town clerk said that he opened the tenders because they were directed to him.'" Our correspondent uses strong language to characterise this reply; for, he says, that his tender was directed thus:—"To the Worshipful the Mayor and Corporation of the Borough of Abbingdon, Tender for Works, &c.;" and that the other builders tell him that their tenders were properly endorsed. On these grounds, he asks, "whether the corporation ought to let such conduct" pass over (since the tenders were opened by the town-clerk a day before they were to be received by the committee)? and whether there be no means of obtaining compensation for the trouble the unsuccessful competitors were at in getting out quantities?"

**SCHOOLS OF ART.**—The council of the Sheffield School of Art have commenced a vigorous effort to remove the debt on the building, which now amounts to 2,000l., and also to augment the subscription list by 200l. a year. The withdrawal of the Government aid has made it imperative to do something, if the institution is to continue to exist.—In this year's competition between the schools of art, two students of the Gloucester school have been successful, national medallions having been awarded to Miss C. Mansell for a shaded drawing from the east, and to Mr. Capel N. Tripp for a drawing from the De Bohm tomb at the Cathedral. An "honourable mention" was also obtained by Miss W. Kemp for a study of historic styles. The results of the examinations held in this school last April have been communicated to the master. The following students and others passed in the different subjects indicated, 16 for Freehand; 7 for geometry; 1 for perspective; 10 for model drawing; 3 for memory. The committee have offered the following prizes to be competed for by the students of the evening classes:—Architectural drawing: subject, "the Treasury," north transept, Gloucester Cathedral; 1st prize, 2l.; 2nd, 1l. Mechanical drawing: "Machine from actual measurement," 1st prize, 1l. 10s.; 2nd, 10s. Ornament shaded from the east; 1st prize, 1l.; 2nd, 10s. Elementary architectural drawing: prize, 10s. At the Strand school, medallions were awarded to Miss Emily Bird, for flower painting from nature; and Miss Rose E. Stanton, for a design for a silk hanging. Honourable mentions were made of Miss Rosa E. Stanton, for a group in colour; and to Miss Emily R. Stanton, for a design for a silk hanging.

**TENDERS**

For residence for Mr. Good, at Woodford, Essex. Messrs. Reddall & Cumber, architects:—  
 Perry & Co. .... £1,435 0 0  
 Flint ..... 1,398 0 0  
 Kiddle ..... 1,393 0 0  
 Masers ..... 1,375 0 0  
 Kilby ..... 1,359 0 0  
 Browne & Robinson ..... 1,302 0 0  
 Eaton & Chapman ..... 1,273 0 0  
 Patman ..... 1,239 0 0

For building a villa residence, at Haverstock Hill, for Mr. A. J. Compton. Quantities not supplied:—  
 Wheeler ..... £398 0 0  
 Glens ..... 2,450 0 0  
 Williams ..... 869 0 0  
 Dickenson ..... 650 0 0

For first contract for alterations to Broadfield, Crowley, for Mr. Thomas Viner. Mr. E. Roberts, architect. Quantities by Mr. F. W. Stent:—  
 Myers ..... £3,456 0 0  
 Sawyer ..... 2,450 0 0  
 Lawrence & Sons ..... 2,435 0 0  
 Fabian ..... 2,343 0 0  
 Nicholson (accepted) ..... 2,180 0 0

For sundry works at the St. Pancras National Schools, Lancing-street, Euston-square. Mr. J. Dent, surveyor:—  
 Moultrie ..... £209 0 0  
 Robson ..... 147 0 0  
 Southall & Watson ..... 135 0 0

For sundry works to be done to roofs of the premises of the British Artists' Society. Mr. F. H. Forster, architect:—  
 Manning ..... £264 0 0  
 Cooke ..... 260 0 0  
 Beard & Dent ..... 245 0 0  
 Moultrie ..... 238 0 0

For taking down the old union workhouse, Morphett, and using materials in building a new workhouse, for 150 inmates. Mr. F. R. Wilson, architect:—

*General Tenders.*  
 Wylie ..... £5,470 14 0  
 Scott & Son ..... 4,207 14 0  
 Middlemass & Stafford ..... 3,813 10 0

*Mason's Work.*  
 Wylie ..... £2,814 0 0  
 Yeaman ..... 1,960 0 0  
 Hudspeth ..... 1,857 0 0

*Joiner's Work.*  
 Wylie ..... £2,011 0 0  
 Forster ..... 1,302 0 0  
 White ..... 1,249 0 0  
 Hudson\* ..... 1,188 0 0

*Slater's Work.*  
 Dixon\* ..... £243 10 0  
 Wylie ..... 80 14 0

*Plasterer's Work.*  
 Wylie ..... £200 0 0  
 Fairbairn ..... 180 0 0

*Smith's and Plumber's Work.*  
 King ..... £264 0 0  
 Wylie ..... 235 0 0  
 Wilkin & Dickman\* ..... 175 12 0

*Painter's and Glazier's Work.*  
 Wylie ..... £130 0 0  
 Bowman & Son ..... 99 12 0  
 Wilkin & Dickman\* ..... 78 16 6

Total ..... £3,722 18 6  
 Sum ordered to be spent by the Poor-law Board ..... 3,908 14 0  
 \* Tenders recommended to the Board of Guardians.

For building a detached villa, at Highbury New Park for Mr. Henry Rydon. Mr. Chas. Hambridge, architect. Quantities not supplied:—  
 Glenn ..... £2,400 0 0  
 Waters ..... 2,380 0 0  
 Nutt & Co. .... 2,239 0 0  
 Gillett & Wisbey ..... 2,050 0 0  
 Stevenson ..... 1,874 0 0  
 Ashton ..... 1,829 0 0  
 Palmer ..... 1,900 0 0  
 Webb ..... 1,865 0 0

For alterations at 399, Mile-end-road. Mr. Wm. Smith architect:—  
 Page ..... £385 0 0  
 King ..... 331 0 0  
 Bradley & Esq. .... 295 0 0  
 Whelan ..... 290 0 0  
 Woskett ..... 261 0 0  
 Willshire ..... 229 10 0

For sewerage at West-end, Hampstead, and Kilburn:—  
 Hill & Reddell ..... £3,500 0 0  
 Niblet ..... 6,500 0 0  
 Moxam ..... 6,390 0 0  
 Carter ..... 5,550 0 0  
 Watts ..... 6,375 0 0  
 Crocker ..... 4,900 0 0  
 Row ..... 4,649 0 0

For villa and stabling, to be erected on Caterham Park Estate, Caterham, for Mr. G. H. Cooke. Mr. Thomas Harris, architect. Quantities not supplied:—  
 Dawson (accepted) ..... £3,139 0 0  
 Cabitt ..... 2,764 0 0

For an Italian villa, to be erected on Caterham Park Estate, Caterham. Mr. Thomas Harris, architect. Quantities not supplied:—  
 Dawson ..... £4,637 0 0  
 Carter & Sons ..... 3,770 0 0  
 Hearle (accepted) ..... 3,550 0 0

For side shops and galleries, in the new Market-hall, Derby. Mr. G. Thompson, architect:—  
 Stoddard ..... £1,066 0 0  
 Humphreys (accepted) ..... 995 0 0

**TO CORRESPONDENTS.**

C. H. O.—W. C.—Johnny—G. J. H.—J. F. (if photograph be sent we may indicate—F. M.—J. F.—and if explanation to us)—O. M. H.—R. W. M.—J. W. F.—D. R.—H. C. (thanks)—J. S. (will send an answer in present number)—T. J. (thanks)—J. T. J.—L.—Stalby—J. D. F.—W. G. S.—R. H.—W. R.—L. D.—G. F. Correspondents are compelled to decline putting out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender; not necessarily for publication.

**NOTE.**—The responsibility of signed articles, and papers read at public meetings, rests, of course with the authors.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

Advertisements cannot be received for the current week's issue later than FIVE o'clock, p.m., on Thursday.

**[ADVERTISEMENT.]**

**CHURCH, TURRET, and STABLE CLOCKS**  
 J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees Estimates and Specifications of every description of Horological Machine, especially cathedra and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 33 & 34 Ludgate-hill, E.C. Established 1749.

**TO AMATEUR AUTHORS, &c.**—Messrs. COX & WYMAN execute every description of PRINTING in the best manner, with promptness and punctuality, and at moderate charges.—COX & WYMAN, General, Classical, Fine-Art, and General Printers, 74-75, Great Queen-street, Lincoln's Inn-fields, W.C.

**HOW TO BUILD A HOUSE.**

Now ready, 2nd Edition revised and enlarged, with numerous Views and Plans, 8vo. 5s.

**THE GENTLEMAN'S HOUSE; or, HOW TO PLAN English Residences, from the Parsonage to the Palace.** With Tables of Accommodation and Cost, and a Series of Selected Plans.

By ROBERT KERR, Architect, Professor of the Arts of Construction, King's College, London.  
 "Mr. Kerr is thoroughly alive to the requirements of a home fit for a gentleman's habitation, and all the other adaptations which may be conducive to the health and enjoyment of his family. A very useful book it is, and we recommend it cordially."—*Times*.  
 "A book which practically and efficiently fulfils all that it undertakes to do."—*Standard*.  
 "This is a genuine book, in which the author has worked out his object thoroughly, regardless of time and labour. It is characterized by unity of design, with clear arrangement and just subordination of parts. We can cordially recommend it."—*London Review*.  
 "The volume contains a number of valuable suggestions which all will do well to consider, and to attend to in any house they may hereafter build. If only they can find an architect able and willing to carry them all out."—*Charleston*.  
 "Professor Kerr's volume is a practical treatise that every man should study who is about to build a house, whether he proposes to spend on its construction one thousand or forty thousand pounds. It is lavishly supplied with plans."—*Economist*.  
 The author's name is respected as a most valuable contribution to the literature of our profession. It is a work of great importance to students and we venture to prophesy it will become a text-book for those who are more advanced."—*Builder*.  
 JOHN MURRAY, Albemarle-street.

# The Builder.

VOL. XXIII.—No. 1177.

*The Approach of Cholera.*

HERE is just now no difficulty in deciding which of the subjects that are under our attention, claims the position of prominence in the week's number of the *Builder*. The condition of health of our towns has been shown to be improvable by such works and measures of a structural and practical character as have been accomplished since the cholera last visited us, and are commonly placed under the head of engineering; and we have taken some share in the demonstration of the necessity which there is for more that way to be done. We might have gone yet further, or repeated oftener what we have said several times, that even the decorative part of architecture is capable of aiding in the production of that frame of mind, that harmless enjoyment or self-satisfaction, which, consistent with the highest moral as well as intellectual state, may combine to ward off attacks of disease. The readers of the *Builder*, of whatever class, are, in short, rightly to be considered as taking immediate interest in the questions that now prominently occupy public attention; and which, in some respects diverse, all belong to the comprehensive subject of the health of the people.

Cholera, if not already with us, is unmistakably so near upon us, that there is occasion for adoption of all measures that may lessen the mortality that is to be apprehended. We are already suffering from a considerable deprivation of the food of the people, through a cattle-disease which has had its counterparts in cattle-diseases that many times in history have preceded attacks of plague. Just as it is certain that the diseases of the human subject, those which cause the chief mortality, a mortality even greater in an ordinary year, than that of the cholera in a year of its visitation, could be ascribed entirely to the unsanitary state of the dwellings of the people; so, in like manner, it is probable, nay certain, that the cattle-disease is produced by the defective condition of the sheds or buildings in which the cattle are kept. Whether this disease be considered as brought originally from abroad, or as generated at home, seems to us of secondary importance. The state of places in which, as we read, the animals are housed in some of the countries whence we import cattle; the condition in which the cattle must be on a voyage; and the state of cowsheds, too generally, in this country, or especially in the case of sheds in towns, are only different aspects of the same fact. Than the arrangements adopted in London, if cattle should be there at all, nothing could be worse; but as we treat of this matter, and that of the disease in general, elsewhere, we need not here allude to that branch of our subject, further than in saying that a diminished vitality through any smaller consumption than there is at present, of animal food, by the hard-working portion

of the community, will constitute an unfavourable position for them as to power of resistance to attacks of disease.

In our last number we briefly noticed a meeting that had been held, presided over by the Bishop of London, at the rooms of the National Association for the Promotion of Social Science, to consider what steps should be taken in view of the threatened epidemic of cholera. In a statement of the sub-committee of the Standing Committee of Health, read by Dr. Greenhow, the fact was referred to that diarrhoea, a precursor of cholera, had been excessive in the metropolis. It is true that the Registrar-General's return for last week speaks of a great decrease of the mortality from diarrhoea. In each of the two first weeks of this month, the deaths from diarrhoea were above 200; whilst in last week they declined to 116. The average number for the corresponding week in the last ten years is, with a correction for increase of population, 200. In the week that ended the 20th of August in 1859, the deaths from diarrhoea were 240; in the same week of 1864 they were 242. But we doubt whether the decline, commenced last week, will continue.

Amongst the more important passages in the statement read to the meeting last week, were some alluding to the almost entire immunity from attacks, enjoyed in well-managed public establishments, though comprising the lowest classes of the population; "while the most dire slaughter," the statement said, "was upon people in places under removable conditions, in respect to which timely, clear, and express warnings had been given to guardians and other local authorities charged with them." It said:—

"The attacks were, as forewarned, the most severe on the like places and people in the like conditions as those who now suffer from the foul-air diseases—from typhus, from dysentery, from diarrhoea, and from the eruptive diseases of the zymotic or fermenting class; which diseases are almost entirely unknown amongst the lower inmates of well-conditioned public establishments, of well-conditioned orphan asylums, refuges for the destitute, or among the inmates of well-constructed and well-managed union-houses and prisons; which diseases are comparatively few and slight in improved common lodging-houses or in model dwellings, and are rare in the houses of the well-to-do classes, but are never absent among the wretched classes living in crowded ill-drained courts and alleys, ill-supplied with pure water, and ill-cleansed, close, filthy, ill-ventilated, and foul aired, and which slay nearly 100,000 per annum of men, women, and children in Great Britain alone."

In the preventible slaughter, a considerable proportion of the lower middle-classes, shopkeepers, who are kept in doors in foul air from cesspools and drains, is included. It has been long known to medical officers of health that common fever, in particular spots, was apt to assume the typhoid character, and that scarlet fever, measles, and small-pox, would become malignant under certain atmospheric conditions. Dr. Wagstaffe, the medical officer of Lambeth, when examined before the Metropolitan Sanitary Commissioners, speaking of those conditions, made use of these important words:—"For example, when I arose in the morning and found the atmosphere warm and moist, I could always foretell that there would be an increase of malarial disease of some sort in these places, and that they would be more intense in degree; so that in this state of the atmosphere I always knew I should have more to do in these low, close, undrained, and crowded places." The same gentleman said, that the localities in which fever constantly prevailed were precisely those in which cholera raged in 1832; and that the diarrhoea and dysentery prevalent even at the time of his examination, had all the characteristic symptoms of Asiatic cholera. The average age of death is lower in Bermondsey than in Lambeth, as would be expected from the comparative sanitary condition of the population in their dwellings.

The statement shows that valuable as may be the works accomplished since the last visitation, they do not at all correspond to the need of them. In the metropolis even, much remains to be done in the way of sewerage. Everywhere,

ill-ventilated schools are a great source of disease amongst children. Ill-ventilated workshops are similarly operative as regards adults; and the fact of an effect from the bad condition of such places, was shown by the rise in health when cotton-factories were closed, and the workers had the benefit of the open air. If cholera should not come, remedial measures will not the less have been advantageously taken, in view of the demand for them which is constant.

At the meeting, Mr. Chadwick moved the first resolution, which was:—

"That the outbreak of cholera in Constantinople, in Egypt, in Malta, in Italy, in Spain, and Marseilles, and the occurrence of scattered cases of cholera in the metropolis, and also the outbreak in this country of an extraordinary epidemic in cattle, which has often been the precursor of extraordinary epidemic attacks on human beings, must be taken as portending an extraordinary epidemic visitation on the people of this country, which should be guarded against by all means available from voluntary exertion, as well as from the exercise of Governmental and local authority."

This was seconded by Dr. Aldis, and supported by Dr. Richardson, and Mr. Liddle. The last-named of these, medical officer of health for Whitechapel district, said:—

"There were now local boards and medical officers of health in each district—an advantage which the metropolis did not enjoy when it was last visited by the cholera. These boards and their medical officers would be most willing to lend every possible help in carrying out sanitary measures. The question might be asked, 'What can the local boards do?' They could order the daily cleansing of the streets. All the streets in the city of London were cleaned daily; and if the main thoroughfares required this, how much more the narrow and the streets containing the habitations of the poor? They might appoint additional inspectors. In some large districts there was only one inspector of nuisances. It was, however, desirable that there should be a second and even a third inspector to visit the dwellings of the poor, to discover nuisances, and to report daily to the medical officer of health. The local boards should order the daily emptying of the public dust-bins, and the daily removal of dung heaps and laystalls. They should enforce a better supply of water, and, if possible, always from the main. He had in several cases succeeded in obtaining the adoption of 'water-waste preventers,' whereby the poor were provided with a constant supply of water, cool and sparkling, from the main. It was desirable to know what provision the guardians had made for the reception of cholera cases. He feared it would be found that the accommodation in workhouses for cholera patients would be very deficient. The local boards ought rigidly to enforce the paring and draining of all the back yards and courtyards of the houses in the poorer districts. The Legislature ought also to be asked to pass a new Building Act, whereby houses unfit for human habitation might be removed, and also a more efficient Nuisances Removal Act. The medical officers of health should endeavour, as far as practicable, to prevent overcrowding in the poorer districts; but this was a most difficult thing to do."

The observations deserve attention. The allusion to the water-supply, the deficiency of which has been so often spoken of by us, met with the entire approval of the meeting; and the resolution was unanimously agreed to.

Dr. Stewart moved, and Mr. E. Webster seconded, the second resolution, which was:—

"That, having regard to the known character of the threatened epidemic visitation, and to the course of previous extraordinary epidemics, it is probable that the great severity of the visitation will be in the same places and upon the same classes that are now most severely scourged by typhus, dysentery, and the various species of foul air diseases, and that all well-directed exertions protective of those classes from the extraordinary epidemic, should the threatened attack be spared, will nevertheless be preventive of the so-called zymotic or fermenting diseases, which are never absent from the districts chiefly inhabited by the poor, to which nearly 20 per cent. of the ordinary death-rate is due, and an annual sacrifice approaching to 100,000 lives is occasioned."

Mr. W. Rendle, late medical officer of health, St. George's, Southwark, said he could corroborate the advantages of the house-to-house visitation. He should be sorry if the speech of Mr. Liddle led the public to suppose that, because we now had medical officers of health and vestries, the public might rely on their action, and need trouble itself very little about the cholera. That would be a great delusion. The medical officer of health might give his vestry good advice, but the majority would usually be found to be composed of interested persons. He had once been a medical officer of health, but was now a member of the vestry, and not its officer. The vestries, no doubt, might do a great deal of good, if the majority of those bodies were desirous that the law should be carried out. Too often, however, this was not the case. Typhus, for example, had been ravaging the metropolis for five years. It was understood by medical

men that typhus and cholera flourished in precisely the same district. Well, what had been done towards ronting typhus fever? So far from expelling typhus it had been allowed to increase. He had no confidence in the vestries carrying out measures of sanitary prevention until the disease was upon us, and people died by scores. Then they would be seized with alarm, and would make matters worse by stirring up and emptying cesspools, turning out people from crowded and unhealthy districts, and creating a panic among the poor. The local bodies should do their duty when there is yet time, and not postpone all action until the cholera was actually upon us. The persons elected into the vestry should be the best men in the respective parishes. Too often, however, the persons most qualified refused to act, and thought it a trouble and a disgrace to serve.

The resolution was carried.

Lord Ebury moved the third resolution:—

"That in order to disseminate instruction for the guidance of the voluntary exertions which may be needed or serviceable to aid or to supplement the action of the central or the local authorities, and to sustain the general public interests in the prevention of excessive disease and premature mortality, this conference recommends:—

"That the active co-operation of the parochial clergy—of the members of the Association—of medical officers of health of the metropolis—of the members of the Epidemiological Society—of the members of the Society of Arts, who have specially devoted themselves to the improvement of the dwellings of the labouring classes—of the council of the Working Men's Clubs, and of other voluntary associations of a kindred character, be invited to make united effort through a joint executive committee, and that the Health Department of the Association for the Promotion of Social Science be respectfully invited to carry this resolution into effect."

Mr. Burge, medical officer of health of the Fulham district, regretted that the local authorities had no power at present of dealing with original cases of disease for the purpose of isolating them. Provision ought also to be taken against the improper retention of dead bodies, in the case of death from contagious disease. He had known cases where the interment of such bodies had been delayed seven, fourteen, or even twenty-one days.

The resolution was carried unanimously.

The Right Rev. Chairman, in speaking after a vote of thanks, said he believed that the Conference would have practical result. Previous to the report of Dr. Greenhow he owned he was of opinion that the metropolis was well prepared against an outbreak of cholera. It was now conclusively shown, however, that a great deal still remained to be done; and all who were invested with authority should exert themselves.

The proceedings were brought to a close by the episcopal benediction.

It seems to be generally supposed that should the visitation reach us, benefit of the sanitary works that have been accomplished since 1848-49 will be felt. But we apprehend that the benefit will not be so great as is calculated upon. The Thames no doubt receives a smaller volume of sewage from the old sewers; but that it is not yet a pure stream, is obvious to any one who has occasion to go by steamboat. Our supply of water is not taken, as within recollection was great part of it, from the Thames at Chelsea and Lambeth; still, where it is drawn, it is polluted with the excrete which are most generally recognised as the predisposing cause of cholera, when impregnating water even slightly, and afterwards drunk with it, and with which the Thames water is all more or less impregnated. Overcrowding increases, and so does the dirt of the streets,—both, we believe, causes of disease and mortality. The smoke-nuisance is not appreciably lessened. Baths and wash-houses, and model-dwellings, can be scarcely said to have increased in proportion with the population. And now there is likely to be added, insufficient nourishment.

A letter from Ancona, referred to in the *Corriere Mercantile* of Genoa, gives us an idea of the causes which have there favoured the outbreak of cholera. Amongst them the writer places the filthy and close dwellings of a great part of the lower classes, the disgusting cesspools, the total want of cleanliness amongst persons of humble means, owing to the want of water. There is no water, except that supplied by the public wells, so scantily that it is necessary to *faire la queue*, as at the theatres, in order to draw it, and then to keep it as something precious,—so that the poor are often obliged to wash their clothes in sea-water. To this must be added the trade in rags and old clothes, carried on in the thickly-populated lanes. On the 7th instant, 207 new cases were

reported, of which 102 proved fatal. Numerous other Mediterranean seaports have been visited, besides Constantinople and Barcelona. Alexandria has severely suffered: Cairo in less than a month lost 5,249 of its inhabitants; and Damietta 1,485 out of a population of about 4,000; the deaths at Malta have been numerous,—albeit not wholly from cholera; and the disease has appeared in Marseilles.

It is mentioned in *Galvani*, on the authority of a correspondent, as a "curious fact," that on the 9th instant a short but violent storm broke over Ancona, and that immediately afterwards a great improvement in the public health became perceptible. Not only did the number of cases diminish considerably; but the state of languor and prostration in which the patients lay, ceased in most instances. Now this goes to prove the correctness of the view first put forth in the *Builder*, and substantiated by other observations, that the virulence of cholera is peculiarly owing to the absence of ozone in the atmosphere. Ozone being electrified oxygen, is amply supplied during storms; hence, we agree with the writer in *Galvani*, that the diminution of cholera at Ancona is probably owing to the sudden supply of that substance produced by the electric fluid evolved during the storm.

It is suggested that the correctness of this theory might be tested by artificially electrifying the atmosphere of sick wards during cholera. We suggested, a good many years since, the use of Sir William Armstrong's electric steam boiler for just such purposes.

Experiments were instituted in Russia, not long ago, on a whole regiment of soldiers, by Dr. Pozmanski; and they showed that a tendency to cholera is always preceded by a lowering of the pulse, even down to forty. "Hence," it is observed, "a careful observation of the state of the pulse during the epidemic may be useful in averting an attack by a judicious recourse to tonics and a nourishing diet." If these views be correct, the question of the supply of animal food has quite the importance that we suspected.

Accounts which we have received from many of our towns show that the country is by no means prepared for the arrival of the disorder. Water-supply of towns is both insufficient in quantity, and polluted in source, as our lately-published particulars have shown.

Indeed, in one of the recent reports of the Registrar-General, 23 deaths were registered as occurring from cholera. In the following week, this number was reduced to 19. There is no doubt that since 1851, not a summer has passed without the occurrence of cases of the disease. They are "sporadic" that is scattered; and it is only at certain times that the malady becomes epidemic. The seeds of cholera, which are also in great part those of typhus, are always present; but some atmospheric condition is necessary to develop the disorder.

Whether such condition be now confined almost to the basin of the Mediterranean, or extend to this country, may soon be a question settled. Will our towns escape the fall of the impending cloud; or will the sad state of many of them only supply anew the lesson which has been once and oftener forgotten, although it is a lesson for our constant taking to heart?

#### THE EVILS OF OVERCROWDING.

SANITARY pioneers have fully established a practical public opinion in favour of thorough drainage and pure water-supply; and now they are doing the like work as regards the ventilation and other improvements of dwellings, so as to obviate or remove the many evils of overcrowding. Were proper means of ventilation contrived even in overcrowded lodging-houses, where three, four, half-a-dozen, or even more persons sleep in one small bedroom, the evils of overcrowding would be mitigated to a very considerable degree; but, in enforcing such a measure, great discretion would be requisite, in order to avoid the evils of draughts; and the want of means of warmth amongst the poor in winter also requires consideration. Short supplies of blankets and of fires are but too often made up for by the stuffing up of chimneys, broken panes, chinks round windows and doors, and even key-holes, so as to prevent all possibility of ventilation,—by night especially; for, by day, doors will open, and ventilation will have its way to some extent, in spite of all endeavours to the contrary. Even in barracks, where

there is no great want of either blankets or fires, the common soldiers have an inveterate propensity to stuff up ventilators.

But it is not among the lower classes alone that a public opinion in favour of ventilation, and against overcrowding, requires to be established by sanitary pioneers. The national desire of the Englishman for snuggeries and comforts induces him but too often, as his sometimes really insane fear of draughts does, to stuff up his bedroom chimneys, list his bedroom doors and windows, and battle with fresh air as if he were taking precautions to keep out thieves or other enemies. In fact, the term overcrowding is merely relative; and the comfortable couple at the west-end, who sleep in a bedroom thus barricaded against the access of fresh air, are, to all intents and purposes, as pitiable instances of the evils of overcrowding as can be found in Houndsditch or in Bethnal Green.

Nevertheless, the sanitary pioneers are doing their duty; and a public opinion in favour of ventilation, and against overcrowding, is fast growing; and, on the folk-love principle, that a straw thrown up shows which way the wind blows, the Irish navy's opinion, as he smashed the stinking gasspines in the street, that they needed "vintilashtin," shows how sanitary ideas are spreading; and we are hopeful that ere long the public opinion in favour of ventilation will fairly equal that which has already been so long and too well established against draughts.

These few remarks we merely meant to be prelude to an extract or two from an able and useful pamphlet "On the Evils of Overcrowding," by Mr. William Hardwicke, M.D., Deputy Coroner for Central Middlesex, which the Social Science Association have issued.\* The paper had been read at a meeting of the Health Department of the Association in June last, and was then ordered to be printed and circulated. Our extracts may be a little disconnected, but we shall endeavour to give a brief abstract of the paper, so as to include its remedial suggestions as well.

While public attention has long been directed to the benefits of water supply, drainage, and the removal of dangerous noxious vapours, and to the causes, comparatively little has been done to remedy those dangerous but invisible poisons engendered by the confined exhalations from the lungs and skin; the result of which has been a recommendation for the poor in all parts of the country.

The supposed state of epidemic disease, which threatens us, renders the present moment peculiarly favourable for discussing this subject, and for suggesting remedies. "Overcrowding," says Mr. Godwin, "means want of pure air; want of pure air means health, fever, death, widowhood, orphanage, pauperism, high rates, and loss of industry to the living."

A better knowledge of the principles of ventilation, and the means and necessity of obtaining a free supply of the purest air in our houses, schools, factories, and public buildings, is one of the great necessities of our civilised life; for the most indispensable condition of healthy life is the proper aeration of the blood. It is a common error to suppose, from an observation, that bad ventilation, which is equivalent to deficient oxygenation of the blood, is more productive of disease than bad drainage; but where, as is generally the case, the two are combined, the effects are most deleterious.

Densely-populated places show a rate of mortality closely corresponding to the proportionate increase of their population. The cause of disease which causes death in an excess of the natural standard of other places, is that termed the zymotic, having an atmospheric origin, and generally known as contagious, epidemic, and endemic diseases. Not only are ill-ventilation and overcrowding, in contact with filth and polluted air, favourable to the propagation of these diseases, but *this cause alone may even generate them.* Typhus, typhoid, scarlet fever, measles, small-pox, diphtheria, and cholera, are the "filth diseases" of our climate and country.

Not only do we find a high mortality from these unsanitary conditions, but outrages to decency and morality from overcrowding in cottages and houses where a whole family have to herd together in one small sleeping-room.

In many parts of London I have counted thirty and upwards of persons living in a family of eight or ten persons. I frequently still see five or six families living in one of these houses, under most unfavourable conditions. All feelings of shame and decency are thereby annihilated; illegitimate offspring, with immorality of all kinds, are favoured in these wretched abodes. They are the foci of crime as well as of disease.

#### REMEDIAL MEASURES.

There are, of course, numerous remedies to be suggested, some of them depending upon the efforts of the public bodies; others, upon improvements in Acts of Parliament relating to sanitary legislation.

1. I would propose that boards of guardians, parishes, municipal corporations, railway and other companies, should be induced to exercise the powers which they possess of purchasing sites, and building houses or cottages suitable for the occupation of the working people. Many parishes are complicit to erect, and already have erected, baths and wash-houses; they can provide parks, recreation grounds, and libraries, and not others for the benefit of the labouring class in many directions; and for the extension of this power, I believe the Local

\* On the Evils of Overcrowding in the Dwellings of the Poor, and Means suggested for their Removal. By WILLIAM HARDWICKE, M.D., &c., Deputy Coroner for Central Middlesex. 1, Adam-street, Adelphi, 1862.

Government Act gives the necessary authority. Where funds would be insufficient, the Government Loan Commissioners might advantageously advance money at a cheap rate with security for sanitary and other regulations to be observed in the erection of such institutions.

2. In the last twenty years I have watched with considerable interest the progress of these societies for purchasing land and houses, known generally as building societies. There are at least 2,000 of them, with an invested capital of 8,000,000. These associations are greatly favoured by special Acts of Parliament; they are capable of effecting substantial benefit to the working class, who may purchase through their medium a house in about fifteen years for the same monthly or quarterly payment that they usually pay for rent in lodgings. These societies offer a good and safe investment, and a large extension of them would tend to counterbalance the cupidity of bad landlords, and lower the rents of inferior houses.

3. It is desirable that certain changes should be made in the present mode of appointment of officers of health. It would be a great protection to public health for an officer to inspect certain houses let out in lodgings (in accordance with an amendment that might be made in the Common Lodging-house Act), where the density of population reaches beyond a certain limit, or where fever and zymotic diseases are noticed in the registered returns of death. A great blow would be given to the pestiferous and worst houses, if their houses, in some localities, were condemned as unfit for human habitation, and they were made responsible for the mischief inflicted on those whose poverty compels them to dwell in the cheapest and worst houses, and whose ignorance of sanitary law betrays them into dangers from which they have no means of escape.

4. The progress of sanitary legislation would also be materially advanced, if the coroner, whose functions are now confined to inquiries into cases of sudden death, those resulting from accident, violence, or poison, should be empowered to extend so as to include inquiry into deaths from all well-known preventable causes. Death is now, to an alarming extent, the result of neglect—and often willful, and even criminal—of the laws of health. A man has no right to expose and propagate contagious disease, than he has to injure the hair of his neighbour.

5. With regard to other remedial measures for lessening the evils of overcrowding, I must not omit to mention the Sanitary Reform Act which will require amendment before it can be worked efficiently. Its administration must be made compulsory where it is now only discretionary. There are some evils it cannot grapple with; for instance, as arise from a want of systematic drainage.

6. I am inclined to think, too, that the powers of the Metropolitan Board of Works should be extended so as to enable that body to become the conservators of the open spaces, and to carry out a systematic cleaning of the streets.

7. In furtherance of sanitary reform, and in close connection with my subject, I may mention that much benefit might be derived from a change in the laws relating to the sale and purchase of land and houses. A more simple and satisfactory mode of such kind of property exists in some continental states than in the case of the middle and humble classes of this country many advantages which they do not now possess, of more safety and probably lessening their savings.

8. Attention has recently been drawn by Lord Shaftesbury to a very essential clause in the Bill passing through the standing orders of Parliament; namely, that Railways and Public Works and Improvement Bills which involve the demolition of houses, or where the working classes are displaced, shall secure proper accommodation for them elsewhere; also that notices shall be given to the lodgers, as well as to the owners and occupiers of such houses; and that, in suitable cases, a compensation shall be awarded to the more humble class for residential damage.

MR. C. T. NEWTON ON PHENICIAN ART IN BRITAIN.

At the annual meeting of the Archaeological Institute at Dorchester, Mr. C. T. Newton, keeper of Greek and Roman antiquities in the British Museum, delivered an address on Phœnician art in Britain. He commenced by observing that, at first sight, a lecture on Phœnician art would seem out of place at a meeting of the Institute, held at Dorchester, mainly for the purpose of discussing local antiquities. But, he said, the antiquities of the Phœnician race had a special interest, inasmuch as this people had been the first to navigate the Mediterranean through its whole length, had founded Gades outside the pillars of Hercules as early as 1100 B.C., and Carthage, about 800 B.C., and had, moreover, been the first to apply astronomy to navigation, and to simplify writing by perfecting the alphabetic method. They had, too, a special interest for British archaeologists, inasmuch as the tin which tempered the copper implements of the old world, and converted them into bronze, was certainly brought in great part from Britain. Now, formerly, antiquaries, like Stalioley, assumed that the Phœnicians came to the South of England, in ships, for the tin. No traces of the Phœnicians had, however, so far as the lecturer was aware, been found in Britain; and the late Sir Cornelius Lewis, in his "History of the Astronomy of the Ancients," had maintained that the Phœnicians never came to this country for tin, and that it was conveyed across the channel to Gaul, and thence by the overland route indicated by Diodorus to Marseilles.

Be this as it may, it is evidently a point of great interest to ascertain whether Phœnician remains exist anywhere, and what they are like.

The lecturer then proceeded to consider the remains of Phœnician art within the Mediterranean. Adverting to Professor Gerhard's Essay on this subject, published in 1846, he stated that the greater part of the objects published as Phœnician by that distinguished archaeologist consisted of remains probably of the Roman period, and belonging to semi-barbarous races, partially under Carthaginian influence: such were the curious temples in Malta and Gozo, which Dr. Barth thought Phœnician. The same observation applied to the alleged Phœnician remains from Sardinia and the Balearic Islands, and to the coins bearing Phœnician inscriptions of Gades, Ebusus, and other Carthaginian settlements in Spain or Africa.

But in the Eastern Mediterranean, between the island of Cerigo, at the southern point of the Moroa, and the coast of Phœnicia, were a series of islands, all known to have had Phœnician settlers in very early times. It is here that we get on the track of true Phœnician remains of a very early period. The proof of this is derived from several discoveries which have been recently made. These discoveries were those made at Nimrod by Mr. Layard, Mr. Loftus, and Sir H. Rawlinson; those at Camirus, in Rhodes, by Messrs. Biliotti and Salzmann; those in Cyprus by Dr. Ludwig Ross, Mr. Waddington, and the Comte Melchior de Voguë; and, lastly, the discoveries made in Phœnicia Proper, by M. Renan, whom the French Emperor, with an enlightened liberality worthy to be imitated by other Governments, had employed to excavate the sites of Tyre, Sidon, Byblos, and Aradus.

Commencing with the discoveries at Rhodes, the lecturer described how he had first accidentally discovered the Necropolis at Camirus in 1856, and how Messrs. Salzmann and Biliotti had continued their excavations there from 1859 to 1864. The antiquities which they discovered are a museum in themselves, ranging from the earliest to the latest date of Greek art, and comprising a number of objects which seem to be either Phœnician, or executed by early Greek artists under Phœnician influence.

The lecturer then exhibited drawings of the principal classes of objects presumed to be Phœnician, consisting of gold ornaments, chased and embossed, inlaid glass, Egyptian porcelain, alabaster vases, small bronze figures, painted fictile vases, and terra-cotta figures. He explained how most of these objects had an Asiatic character, suggesting a Phœnician origin. One of the gold ornaments, for instance, was the pendant of a necklace, representing a winged lion, below which was a row of pendant pomegranate fruits. This ornament at once reminds us of two things, the winged lions discovered at Nimrod, and the row of pendant pomegranates which ornamented the priest's robe in Solomon's temple, as described in the Book of Kings. The other gold ornament represents a winged female figure, holding up in either hand a lion standing on his hind legs, the Artemis Persike mentioned by Pausanias. Again, among the bronzes was a man riding on a camel. This animal could never have been used in the island of Rhodes. This bronze must, therefore, it would seem, have been imported from some Asiatic country. Glass, as is well known, was an invention of the people of Sidon, and variegated glass bottles, such as those found at Camirus, are of remote antiquity, having been found in tombs in Upper Egypt, of the date of Thothmes III. The quantity of these bottles found at Camirus is in itself an evidence of Phœnician trade. The objects in porcelain, again, are very like those found in Egypt, but have been thought by experienced archaeologists, like Mr. Birch, to be not Egyptian, but imitated from the Egyptian. The fictile vases belong to the class which has been called Phœnician by many archaeologists long before these discoveries. They are painted with friezes of animals and monstrous figures, on a field *semé* with flowers. These designs are probably borrowed from Assyrian friezes, embroidery, or Babylonian carpets. Lastly, among the terra-cotta figures was one probably representing the Phœnician Aphrodite, or Astarte, which is identical in type and scale, and almost in style, with one in the Louvre, found in a tomb at Sidon, by M. Renan. The lecturer then described the discoveries at Cyprus. In this island Dr. Ludwig Ross has explored the Phœnician sites of Dali, the ancient Idalim, Golgos, Paphos, and Amathus. At Dali have been found a quantity of small statues, cut in calcareous stone, of which the Louvre possesses a very fine collection, and the British Museum a

smaller collection, not yet exhibited for want of space. Here were also found, some years ago, twelve gold plates, embossed and chased with figures in relief, representing battle scenes. One of these plates is in the Louvre, another in the Bibliothèque Impériale at Paris.

At Amathus, Ross found an immense stone vase, like a laver, weighing about twenty tons, having under each handle a bull sculptured in relief. This vase has been taken possession of by the French Government, and is to be removed to Paris shortly. Since Dr. Ross's visit, Cyprus has been most carefully explored by Mr. Waddington and Comte Melchior de Voguë. The latter archaeologist has done much for Phœnician palæography, and we may hope, through his labours and those of the Duc de Luynes, to see the history of Phœnician writing much further developed, and criteria established by which the age of Phœnician inscriptions may be more accurately determined than at present.

Passing on to the discoveries of Mr. Layard and Mr. Loftus at Nimrod, the lecturer exhibited drawings of two bronze plates, embossed and chased with figures in relief, one of which bears the inscription "Arka" (country), in Phœnician characters. These, and a number of other similar plates, were found in a place at Nimrod by Mr. Layard, who in his works describes them as apparently not the work of Assyrian artists, and suggests that they may have been made by Phœnicians transported into Assyria as captives. Mr. Layard also found a number of ivory carvings, on one of which was a Phœnician inscription. These have apparently an Egyptian character, being ornamented with hieroglyphics; but Mr. Birch considers them to be pseudo-Egyptian, the work of a people with no true knowledge of hieroglyphics. They are, therefore, probably Phœnician. Now it is curious that, on turning to the antiquities from Camirus, we find the same phenomenon of blundered hieroglyphics on works of porcelain, on a silver plate, and on a gold ring.

Turning from the Eastern Mediterranean to Etruria, we find a most interesting illustration of these phenomena. In the grotto of Polledrara near Vulci, were found a number of antiquities, mostly of Asiatic character; but among them were several objects in porcelain with blundered hieroglyphics. At Cere (Cervetri), in the Regolini Galassi tomb, were found a number of chased and embossed silver cups, some of which were nearly identical with those found at Cyprus; and all through Etruria are found early vases, on which are figures in relief evidently taken from Asiatic designs. Lastly, a shell of a very rare kind, said only to be met with in the Indian sea, was found in a tomb in Etruria. This shell was covered with an Asiatic design of figures and lotus flowers. A fragment of a similar shell, similarly carved, was found in a tomb at Camirus, and another fragment by Mr. Layard at Nimrod. These shells were probably brought by the Phœnicians from the Red Sea, and sold with other trinkets to the Greeks and Etrurians.

In the time of Homer we find the Phœnician trader everywhere in the Greek ports, offering jewels and trinkets for sale, and now and then kidnapping the Greek women, who were attracted to look at their wares. With regard to the age of the specimens of Phœnician art which we possess, it is probable that those found in Rhodes belong to about the same period as the earliest specimens of Greek art. Mr. Newton then exhibited drawings of three very early specimens of Greek art: the Lion from the Sacred Way at Branchide, inscribed with a dedication to Apollo; one of the seated figures from the same site; and a bas-relief, found at Samothrace, with figures of Agamemnon, Epieus, and Talchylus. We get an approximate date for these sculptures by comparing the forms of the letters on the line with those in the inscription placed by the Ionian soldiers of Psammethicus I. or II., at Abou Simhal in Nubia, and the date of which must be between B.C. 664 to 583.

The earliest specimens of Greek art and the specimens of presumed Phœnician art have this in common,—that on both the ever-recurring ornament is the lotos and a fan-shaped flower, and that winged figures and monsters constantly occur, intermixed with friezes of animals. These characteristics seem borrowed from Assyria.

Another characteristic of Phœnician art is the obvious imitation of Egyptian symbols and ornaments, as shown in the examples cited from Rhodes and Etruria. Nothing can be more natural than that the Phœnicians, who were not only a race of mariners, but a manufacturing people, should have imitated such Egyptian

facts which are the rarest and most interesting, and presenting them to the general reader in a luminous and concise manner.

It is impossible for me to conceive a work which ought to be more interesting to the present age than that which exhibits before our eyes our "fathers as they lived," accompanied with such memorials of their lives and characters as enable us to compare their persons and countenances with their sentiments and actions.

I pretend to offer no opinion upon the value of the work in respect to art,—my opinion on that subject is literally worth nothing in addition to that of the numerous judges of paramount authority which have already admitted its high merits. But I may presume to say that this valuable and extended series of portraits of the illustrious dead affords to every private gentleman, at a moderate expense, the interest attached to a large gallery of British portraits, on a plan more extensive than any collection which exists, and at the same time the essence of a curious library of historical, bibliographical, and antiquarian works. It is a work which, in regard to England, might deserve the noble motto rendered with such dignity by Dryden:—

"From hence the race of Alban fathers come,  
And the long glories of majestic Rome."

I will enlarge no more upon the subject, because I am certain it requires not the voice of an obscure individual to point out to the British public the merits of a collection which at once sacrifices the imagination and the understanding, showing us by the pencil how the most distinguished of our ancestors looked, moved, and dressed; and informing us by the pen how they thought, acted, lived, and died. I should, in any other case, have declined

Lord Falkland and Fletcher the poet; Mr. Baker, of Bayfordbury, Kneller's Dryden, so finely engraved by Edelnick, and six of the Kit Kat Club portraits,—Lord Chancellor Somers, Addison, and Steele, Congreve and Vanbrugh, and old Jacob Tonson himself.

The "askings" of the Committee should not be confined to owners in England, Scotland, and Ireland; the Emperor of the French should be "moved" to lend Holbein's Archbishop Warham (Canterbury), and Vandeyck's noble full-length of Russia should be "asked," in the name of the Institute of British Architects, to lend Vandeyck's portrait of Inigo Jones, part of the Honghton Collection, and the only genuine likeness of the great architect of Whitehall. A loan might be sought from the King of Italy of Kneller's presentation portrait of himself in the Gallery of Painters' Heads in Florence. He wears his gold chain and his diamond ring. His house at Whitton is seen in the background.

PROPOSED PORTRAIT EXHIBITION AT THE SOUTH KENSINGTON MUSEUM.\*

As time is not subject to contingencies like human heings and Atlantic cables, and the year 1865 has little more than four almanac months to run through before the New year opens that is to give us, in the spring-time of its existence, a National British Portrait Exhibition, it behoves all who are employed in its formation to be about and active; nor should writers in public journals dedicated to Art cease from time to time to assist the staff of the Committee of Council in furthering the great educational scheme they have on hand. An exhibition like the one that is in course of formation will, in the well-known motto of the unhappy defunct Granger Society, "delight the eye, recreate the mind, impress the imagination, and thereby yield no small assistance to the judgment."

Nor is this feeling ill-expressed in the prospectus of the Granger Society: "Portraits of all celebrated persons are the most attractive of all ancient monuments. Their importance as works of art is unquestionable; equally undeniable is their value as historical evidences; in some instances they make their appeal by the magic of the names associated with them." Take, for example, Holbein's Sir Thomas More, surrounded by his family; Queen Mary and Philip II. of Spain, with their diminutive dogs, at Wolburn; witness the portrait of Lord Buryleigh upon a sedan, on men's shoulders, at Sherborne Castle; the family of Clifford, Earl of Cumberland, of the time of Elizabeth and James I. in the collection of the Earl of Thanet at Skipton Castle; Prince Rupert and Colonel Murray persuading Colonel John Russell to resume his Commission, in the collection of Earl Craven at Combe Abbey; Charles II. receiving the first Pine-apple grown in England from his gardener Rose. It would be easy to add to the catalogue. The destruction, at the great fire of the Houses of Parliament, of the historical Armada Tapestry, bearing portraits on its borders, was an irreparable loss.

The historical importance of portraits is admirably expressed in a letter by Sir Walter Scott, which we shall reproduce on this occasion, as it is not to be found in Sir Walter's works, or in his life by Lockhart, and is, above all, most appropriate to the subject of the proposed exhibition.

"To Mr. Harding, Bookseller, London.

"Abbotsford, 25th March, 1828.

Sir,—I am obliged by your letter, requesting that I would express to you my sentiments respecting Mr. Lodge's splendid work, consisting of the portraits of the most celebrated persons of English history, accompanied with memoirs of their lives. I was at first disposed to decline offering any opinion on the subject; not because I had the slightest doubt in my own mind concerning the high value of the work, but because in expressing sentiments I might be exposed to censure, as if attaching to Mr. Lodge's work is, however, one of such vast consequence, that a person attached as I have been for many years to the study of history and antiquities, may, I think, in a case of this rare and peculiar kind, be justly blamed for refusing his opinion, if required, concerning a publication of such value and importance.

Mr. Lodge's talents as an historian and antiquary are well known to the public by his admirable collection of ancient letters and documents entitled "Illustrations of British History," a book which I have very frequently consulted; and have almost always succeeded in finding not only the information required, but collected a great deal more as I went in search of it. The present work presents the same talents and industry; the same patient powers of collecting information from the most obscure and hidden sources, and the same talent for selecting the

expressing an opinion in this public and almost intrusive manner; but I feel that when called upon to bear evidence in such a cause, it would be unmanly to decline appearing in court, although expressing an opinion to which, however just, my name can add but little weight.

I am, sir, your obedient servant,

WALTER SCOTT.

Artist.	School.	Description of Subject or Object of Art.	Editor's Remarks.
Lely (49) .....	English.	Three-quarter portrait of Lord Chancellor Hyde, Seated.	The original.
Jansen (53) ...	Do. ....	Full length of Villiers, first Duke of Buckingham, in a dress of gold and silver braid.	The finest portrait of this illustrious personage.
Jansen? (53) Do. ....	Do. ....	Three-quarter portrait of Lord Keeper Coventry, in his robes.	—
Jansen? (43) Do. ....	Do. ....	Three-quarter portrait of Lucius Cary, Viscount Falkland, in a slashed doublet of black and white.	The original and unique.
Vandeyck (1)...	Flemish	Full length in white satin of Henrietta Maria, Queen of Charles I.	Very, very fine.
Do. (1) .....	Do. ....	Full lengths on one canvas of Earl and Countess of Derby and child.	Magnificently fine.
Unknown .....	English.	Full length of Thomas Howard, Earl of Arundel, in armour.	Very curious. He was the earliest collector of works of art in this country.
Do. ....	Do. ....	Full length of Charles II., when a boy. Red dress, stick in hand.	The original of many contemporary portraits.
Do. ....	Do. ....	Portrait of Fletcher, the poet (Beaumont and Fletcher).	Most curious.
Wissing (39) ...	Do. ....	Full length of Duke of Monmouth, in armour. By his side is Ferguson pointing to a globe, with his finger directed to England.	Fine, and curiously illustrative of Macaulay.

"Add but little weight," indeed! Let this letter have both Troy and Avordunoid weight with "The Right Honourable the Lords of Her Majesty's most Honourable Privy Council on Education," and with the "Science and Art Department" of the Committee of that Council that rules Lord Paramount over the South Kensington Museum.

Of the desirability of the "proposed Exhibition," of its educational importance, combining, as it cannot fail to combine, profit with pleasure, there cannot be a doubt; how, then, we will inquire, can it best be brought to the Kensington authorities is a formation of a catalogue of wants, of what is to be had and what can be had by official and private influences. This was done with success for the famous Manchester Art Treasures Exhibition of 1857. Possessors of portraits were taken by counties and collections. Hertfordshire, though a small county, is particularly rich in English portraits,—Hatfield House holding the Marquis of Salisbury's collection; Cassiobury that of the Earl of Essex; Panshanger, that of Earl Cowper; and Bayfordbury, the whole of the Kneller portraits of the Kit-Kat Club. A sample specimen of what was "wanted" and "written for" will prove of use at this time. The Earl of Clarendon, at the instigation of Mr. Peter Cunningham, was requested by the General Commissioner of the Manchester Committee of Management to lend for the purposes of the Exhibition the above-named portraits.

The owners of galleries and cabinets of art in Hertfordshire were not very liberal. The Marquis of Salisbury, after hesitating and half promising, lent nothing; Lord Verulam lent the original portrait of Lord Chancellor Bacon; Lord Clarendon lent the original portraits of Lord Chancellor Hyde and his friend Lord Falkland; the Earl of Essex lent the Hampton-Court Herefordshire portrait of Henry IV., the magnificent full-length by Vandeyck of Algron Percy, Earl of Northumberland, and Kitty Hyde, Duchess of Queensbury, celebrated in verse by Prior, Pope, Gay, and Horace Walpole. The Earl of Clarendon sent

widow of the poet of "Childe Harold." The portrait referred to that of this noble poet:—

"To Peter Cunningham, Esq.  
Ham Common, April 13th, 1857.

Sir,—Not having in my possession the portrait which I am requested to send to the Manchester Exhibition, I cannot have the pleasure of complying with your wishes. The present Lord Byron has the original picture by Phillips at his house in Eaton-place.—I am, your obedient servant,  
A. I. NOEL BYRON."

The fine portrait which Mr. Murray has of Lord Byron by Phillips, at No. 50, Aldemarle-street, is therefore, by this showing, a duplicate of "the original picture," at No. 48, Eaton-place.

STONEHENGE.

On the 26th ult. about fifty members of the South of England Literary and Philosophical Society made an excursion to Stonehenge. On their route they visited at Salisbury "the hall of John Hulle," the museum, which has lately received large accessions of much interest, the cathedral, and Old Sarum. At Stonehenge, after dinner, the party assembled within the circle of stones, and the Rev. E. Kell delivered an address on the structure and origin of Stonehenge, illustrating his subject by a variety of plans and drawings. He commenced with explaining the structure, which, he said, was erected on an extensive plain, surrounded by a vast number of barrows that contained the relics of the departed. He stated that the stones of the external circle and those of the five Trilithons were obtained from the neighbouring valleys, the minor stones from Devonshire and Cornwall. He then entered on the much-disputed question of the origin of Stonehenge, and enumerated the opinions of Inigo Jones, Bishop Gifford, Keyser, Stukeley, King, Davies, Sir Colt Hoare, the Rev. James Duke, Mr. H. Brown, and others. He gave his reasons for objecting to the theories of the pre-historic, Phœnician, Druidical, and Roman origin of Stonehenge, and following the opinion of Mr. Henry Wansley, who wrote in 1796, which has lately been so ably advocated by a writer in the *Quarterly Review* of June, 1860, argued that Stonehenge was erected by the British King Anolius Ambrosius, in memory of the 300 British nobles who were treacherously slain by Hengist near the spot, in 450, at a feast given by Vortigern. He showed that the neighbouring circle of Avebury

\* See p. 549, ante.

(allowed to be antecedent to Stonehenge) was built after the Roman occupation, from the circumstance that Silbury Hill (which is connected with it) is built on the Roman road that connected Bath with London. He maintained, consequently, that Stonehenge must also be subsequent to the Roman period. He then alluded to the important fact that no Roman writers ever adverted to Stonehenge, though they have so fully described the various Roman roads and stations in Great Britain, and the objects of interest connected with them. As four of these roads met in the vicinity of Old Sarum, only six miles apart, such a stupendous pile of building would have excited attention had it then existed. As a proof of previous Roman occupation, Mr. Kell drew attention to the Roman pottery described by Sir Colt Hoare to have been found by Mr. Cordington under the site of one of the fallen trilithons, and to coins and other Roman relics found in and about Stonehenge, which might be considered to put an end to all possibility of Phœnician or Druidical origin. The period for the probable erection of Stonehenge being brought down to the time of the departure of the Romans, the rev. gentleman showed the improbability of its being erected by the Saxons or the Danes, to whose style of buildings it was totally dissimilar, and that it was on this particular interval, between the departure of the Romans and the first subjugation of Britons by the Saxons, that all the ancient English historians, without any exception, aided our conclusions, drawn from the site and structure of Stonehenge; and asserted, without a single exception, that it was erected by King Ambrosius, who lies buried in the adjacent village of Amesbury, or Ambrosbury. He then cited passages from Geoffrey of Monmouth, Nennius, Giraldus Cambrensis, the Triads of the Welch Bards, and Camden, in proof of that position. Geoffrey states that "Aurelius Ambrosius, who reigned from 465 to 508, wishing to commemorate those who had fallen in battle, and who were buried in the convent at Ambresbury, thought fit to send for Merlin, the prophet, a man of the highest genius, either in predicting future events or in mechanical contrivances, to consult him on the proper monument to be erected to the memory of the slain." Nennius, who wrote as early as the seventh century, described the massacre, which was the exciting cause of the erection of Stonehenge, in the following terms:—"Hengist, under pretence of ratifying the treaty with Vortigern, prepared an entertainment, to which he invited the king, the nobles, and military officers, in number about 300. Speciously concealing his wicked intention, he ordered 300 Saxons to conceal each a knife under his feet, and to mix with the Britons. After they had eaten and drunk, and were much intoxicated, Hengist suddenly vociferated "Nimed ere Saxas," and instantly his adherents drew their knives, and rushing upon the Britons, each slew him that sat next him." This massacre took place in the year 461. As connecting Stonehenge with Hengist, it should be remarked that the ancient name of Stonehenge was Stonehengist. Giraldus Cambrensis, who writes in 1187, states: "These stones, according to British history, Aurelius Ambrosius, king of the Britons, procured Merlin to bring by supernatural means from Ireland into Britain. And in order that he might leave some famous monument of so great a treason to future ages, set them up in the same order in which they had formerly stood on that spot where the flower of the British nation fell by the cut-throat practice of the Saxons, and where, under the pretence of peace, the ill-scoured youth of the kingdom, by murderous design, were slain." It is true that some of these writers mix up with the account of the transactions a fabulous story of the stones being brought by Merlin at the command of Ambrosius from Kildare, in Ireland, by supernatural means; but this is not a subject for surprise in an unenlightened age, which found it difficult to suppose such extraordinary stones could have been erected without the aid of magic. The main points of the history are alike in all the historians, and have internal marks of credulity in the circumstances of the times in which they occurred. Mr. Kell considered the circular form of the temple to indicate Buddhist origin—this being the usual style of Buddhist architecture—agreeing with the writer in the *Quarterly Review*, that the doctrine and practices of Buddhism had made way in western Europe as early as the second century. It was well known that the Druids did not worship in stone

temples, but only in groves, which could not have existed on Salisbury plain. He concluded by citing a touching passage from Temyson's "Death of King Arthur," which referred to the manners of this period.

We find the following in *Notes and Queries*—

"Bishop Gibson contends that Stonehenge could not have been erected by the Danes, 'as for many other reasons so particularly, because it is mentioned in some manuscripts of Nennius; who, as everybody knows, wrote almost 200 years before the Danes were masters of any considerable part of this island.' Nennius, in the 'Historia Britonum,' mentions the treacherous massacre of the British chiefs; but I do not find any mention of Stonehenge. Can any one inform me where Stonehenge, by any of its names, is mentioned by Nennius?" J.

ROMAN VILLAS RECENTLY DISCOVERED IN CHEDWORTH WOOD, GLOUCESTER-SHIRE.

On the 18th of June, 1864, Mr. Farrer, of Ingleborough, uncle of Lord Eldon, was shown by one of the game-watchers, a rabbit-hole, from which in ferreting he had brought out tesserae and pieces of pavement. Mr. Farrer immediately perceived the probable value of the indications of Roman antiquity, and carefully excavated the place, between walls; but the pavement was as a whole quite destroyed. It had apparently been laid on stones, leaving small flues or passages, which had been covered with flags. Further examination led to the discovery of quantities of loose tesserae, bits of ornamental tiles, painted stucco, burnt stone, and brick; and, following with the utmost care all indications of the course of the walls, Mr. Farrer succeeding in clearing away, first the trees, and then the accumulated soil, from what seem to be two distinct sets of villa buildings. Excavation is still proceeding, and therefore an accurate account cannot be given of the whole plan; but at the recent meeting of the Archaeological Institute at Dorchester, a descriptive account of the discoveries was read by Mr. J. Farrer. The locality of the remains is a portion of Chedworth Wood, called Fawcombe, the property of Lord Eldon. It is near Witlington, where considerable remains have been already brought to light, and is between two and three miles up the Coln, west of the point where that stream (at a distance of seven miles from Cirencester, the ancient Corinium) crosses the well-known Foss-way at Foss Bridge.

The position of the villas shows great taste, the buildings being half-way up a steepish slope in a recess between hills, which have been covered from time immemorial with wood. The buildings face,—the one nearly east, the other nearly south, with a lovely view down the narrow well-timbered valley of the Coln; the view being bounded at the distance of some two miles by the line of beeches bordering the ancient Foss-way. The underwood has in regular course been felled about every twenty years, but no tradition seems to exist of there having been any such building as that lately brought to light.

Mr. Farrer said—So far as at present appears, No. 1 villa was built in the form of two sides of a square, looking east and north. Along the side looking east ran a corridor, about 9 ft. wide and 133 ft. in length. The rooms, evidently the best ones, were apparently all paved. The southern one, the largest, was 28 ft. 9 in. by 18 ft., and retains a good pavement. It is laid apparently on a floor generally solid, but with a large flue round part of the inside of the walls, and flues running also diagonally through the room. The pavement, ornamented with figures at the corners, was speedily covered up, in the hope of preserving it till such time as it should be decided what places should be protected by permanent building, so as to keep everything as much as possible in the existing state. Unfortunately the pavement has in some places given way; but we are very anxious, if possible, to preserve all without relying the floor; and also, if possible, to show by a section the way in which the warming by hypocaust or fires was arranged. The level of the rooms is about 3 ft. 6 in. above the corridor, and is reached by well-worn steps in two places. The northern room on the same side has been on a hypocaust, warmed from an external fireplace, discovered since the making of the plan. Its sides are of brick and tile. It was choked up with ashes, burnt rubbish, and soil. Adjoining it is a bath, 7 ft. 2 in. by 5 ft. 4 in., and 4 ft. 4 in. in depth. Near the bath was a circular place, supposed to have been a well or trough, 4 ft. wide by

2 ft. 10 in. The room or rooms also in this part retain a good pavement. The walls are of the stone of the country, unbewn. They are mortared; and the height left averages about 4 ft. No indication of them remained above ground. The side looking north has been about 95 ft. in length; and the rooms have been two deep, generally about 45 ft. in total width, but built irregularly; and, being on the slope of the hill, the eastern ones are on a lower level than those adjoining the better part of the building. The roof has been of stone slate, much of which is good, with, in many instances, the very nails left in them. It is intended to use them in such building as is advised for the preservation of the remains. The total number of rooms traced clearly at the time of making the plan was eighteen. Small fragments of pillars and worked stone are found, and numerous coins, all of bronze. The following ones have been named:—Tetricus, Carausius, Alectus, Constantius Chlorus, Theodora, Constantius Magnus, Constantinus II., Magnianus, Valentinianus, Victorinus. There are found also bone and bronze pins, fibulae, a stylus, rings, keys, a horse-shoe, numerous iron instruments, daggers, knives, small fragments of glass, of Samian ware and inferior pottery, and ornaments of Kimmeridge shale.

In a small recess, 4 ft. 4 in. by 2 ft. 5 in., at the back of the best room (No. 1), were found fragments of two stone statues. Only the sandaled feet were attached to the pedestal; pieces of the hands were near. On the under side of a step was a labrum very distinct (a rough cast of it is placed in the museum). Mr. Lysons discovered this and attached a great value to it. There was also another more rude, and the cast which has been made of it does not really show the effect. A remarkable very rude little stone was discovered, looking like a little altar for the penates. Mr. Franks, of the British Museum, considers it to be of the third or fourth century. There is one of terra-cotta in the British Museum somewhat resembling it; but what is its history I do not know. There is one cutting upon it of a grotesque figure and other marks. The most interesting relic is a silver spoon, 2½ in. long, 1½ in. wide, with a swan's head arched for handle. The handle is very short, 1½ in., and one may suppose that the spoon must have been for using with dry articles, such as salt or the like. Inside at the bottom of the spoon is the inscription "Censurine gaudas." This spoon, also, Mr. Franklin supposes to be of the third or fourth century; and I believe very few similar ones, if indeed more than one, have been seen at the British Museum. The spoon was found at the back of the building; now it is a bronze steelyard and a leaden weight. Animal bones—horse, ox, sheep, pig, and deer—are found all about, except in the superior rooms. In one room, No. 14, was a piece of a human skull. In No. 16 were with loose tesserae pieces of the material from which they had been formed. It is supposed from the melted lead and other traces of burning that the buildings were destroyed by fire. The second building all but, if not quite, adjoins and stands at right angles to the first. It consists, so far as at present can be seen from the excavation, of one corridor of about 300 ft. in length and 10 ft. 3 in. in depth, opening into rooms of various sizes. A hollowed stone drain runs at the back of all. Many of the rooms contain pavement, but it is of much inferior quality to that in the other building. Thirteen distinct rooms have been cleared, of which nine are of the uniform depth of 24 ft. 6 in., and vary in breadth from 8 ft. 9 in. to 24 ft. The tenth is of pentagonal form, 22 ft. in the deepest part. Large drains run under this room, of size sufficient to admit a boy. The height of the walls left after the clearing away of the rubbish is about 5 ft. at the back, where the hill rises. Remains of stone pilae and hypocausts are constant in this part. There have been fewer coins or other objects of interest found in this building than in the other. A mass of lead, 67 lb. in weight, was in No. 13, and also a piece of iron 3 ft. 7 in. long, and 7 in. square, much corroded. In No. 3 is a quern or millstone, 2 ft. 7 in. in diameter, and 3 in. thick. Part of a human jaw was found in a little chamber adjoining the pentagonal room. The section of the earth shows brick, tile, and burnt stone along the whole line. At right angles to the better building stand two pillars, broken at the height of 20 in. Mr. Farrer has, in the last few days, succeeded in finding the source of the water-supply from a higher level in the wood; in doing which more traces of building, with small baths or possibly ovens,

have been shown; also tesserae, with pieces of the material from which they were cut. There is thus every ground to hope that eventually a very tolerably perfect ground-plan of a Roman country-house may be disclosed, which cannot but be interesting, though the amount of actual objects of value does not appear at present to be very large. It is proposed to keep everything as much as possible *in situ*—placing a cottage with a little museum in the square formed by the buildings—and covering the two principal paved rooms with sheds of stone, wood, and glass. As it seems that Roman domestic architecture offered little more attractive to the eye than the exterior of dead wall, it is intended to build the cottage of the old stones in early style, with "post and pan" work of oak and plaster for the upper part, roofing it with the old stone slate. We are very anxious, if possible, to keep the pavements without relaying or otherwise disturbing them, and shall feel highly obliged by any advice which the experienced may kindly give upon the subject.

#### CONCRETE PIERS AND BREAKWATERS.

M. POIREL, who first made use of concrete blocks for hydraulic construction in 1833, in the port of Algiers, has just made a minute examination of the different works constructed on that system for the last thirty years. After the port of Algiers, the next application was in the construction of the port of Marseilles,\* afterwards at La Pointe de Grave (*embouchure* of the Gironde), then at Port-Vendres, Cette, Biarritz, Cherbourg, and other ports, the last being Leghorn, where the first curved breakwater was constructed on this principle.

These artificial blocks, dropped into the sea so as to form a heap, which ultimately takes a definite and permanent form, can be made of almost any size. The effort of the waves to displace a block is proportional to the surface impinged upon (this, in heavy weather, is estimated at 600 lb. to 700 lb. per square foot), and consequently to the square of the linear edge; whereas the power of the block to resist this force depends upon its weight, or the *cube* of its edge; therefore it is easy to give such dimensions to the block that the latter force may exceed the former, and that a complete stability may take place.

The first blocks constructed for the port of Algiers contained 353 cubic feet: taking the specific gravity at 2.3, we have the weight about 23 tons. Subsequently the size was increased to 530 cubic feet, giving a weight of about 34½ tons. At the port of Marseilles, they contained 353 cubic feet; and at the Leghorn breakwater, 706 cubic feet, or 46 tons weight. With natural blocks of stone, the greatest depths in which sea works had been attempted in France was 20 *mètres* (65.6 ft.), as at the Cherbourg dyke. At Algiers, however, the jetty in continuation of the ancient mole was formed with artificial blocks, laid at depths of 25, 30, and 35 *mètres* (82 ft., 98.4 ft., and 111.8 ft.). When the blocks are deposited in the sea loosely, so as to form a heap, they take a certain slope; but it must not be imagined that their stability is immediate. The bottom of the sea consisting in most cases of muddy sand, the reaction of the waves occasions a scour to take place at the base of the mass of blocks, which results in a settlement of the whole. After a lapse of time, however, the blocks arrange themselves into a form so as to cause the cessation of the scour, and a condition of permanent stability. This was found to take place when the mass had assumed a slope of 45°.

If, instead of descending the blocks loosely, they are laid regularly, as at Marseilles or Leghorn, it is easy to raise vertical quay walls of a height of from 20 ft. to 30 ft., so as to permit the largest vessels to be moored alongside. Construction of such walls, by the aid of natural blocks, is attended with extreme difficulty and expense in non-tidal waters such as the Mediterranean.

At the *deboûche* of the Suez Canal at Port-Saïd, in the Mediterranean, the construction of a double breakwater, inclosing a canal 1.6 miles long, is indispensable to the success of the undertaking. This may be impossible to be constructed, except by artificial blocks of concrete.

\* *Vide* paper read by Mr. T. Hawthorn at the Institution of Civil Engineers, given in the *Builder* of February 4th, 1865.

#### WINCHESTER CITY CROSS.

THE restoration of this cross under Mr. Scott's general direction, has just been celebrated at Winchester. It stands on the south side of the High-street. In the octagonal tier of niches at the base of the central finial forming the "tabernacle," there are statues, each being the ideal representation of the patron saint of one of the Winchester churches. They are the Virgin Mary, carrying lilies, St. Thomas, St. Maric, St. John, St. Peter, St. Lawrence, St. Bartholomew, and St. Swithin, each bearing insignia, and arrayed according to the traditions of the Church. The pillars from which the lower arches spring have their terminals ornamented with heads, four to each column representing kings, queens, bishops, priests, ladies, warriors, and burgesses of the Middle Ages. In the four-niche arches above are statues, one in each: St. Lawrence, mentioned by Milner as being removed to the west, is, as far as possible, restored and replaced in its original position, the south niche. Of the three new statues, Alfred the Great occupies the niche most prominent to view, the western: as king, he is represented crowned with a Saxon tiara, robed in an embroidered tunic, reaching to the knee, partly concealed by a mantle fastened on the right shoulder by a fibula or brooch. The legs are covered with upper and lower hose, the former decorated with strips of cloth as depicted in works on ancient clothing. He is armed with a short sword. In his right hand he bears a sceptre, and in his left a roll bearing the words, "Ye domes of England," in allusion to the "domboc," compiled when he divided his kingdom into counties, hundreds, and tithings. William of Wykeham occupies the northern niche. The great ecclesiastical architect is represented in full pontificals, bearing his crosier in his right hand, and in his left a book inscribed "Statuta Collegii Beate Marie de Winton," with the episcopal seal. Florence de Lunn, the first Mayor of Winchester, chosen to that dignity by Henry II., occupies the eastern niche. He wears a jewelled cap, or celf, and mantle, and bears in his left hand a long open scroll inscribed "Uberta Privilegiorum," in allusion to the charter granted to the city by his sovereign. The open arcade under has simply been restored. The steep steps which form the base of the whole structure have been mostly renewed. On the riser of the upper one towards the north there are cut the words "Restored Anno Domini MDCCLXV. William Badden, mayor." All the stone used for the carved portion is of fine Ketton oolite. The required work has been done under the special supervision of Mr. W. Coles, by Messrs. Poole & Son, of Westminster, for about 500*l.*

#### PRESERVATION OF TIMBER.

An orthopedic surgeon at Antwerp, named Hossard, has invented a new method of injecting into timber preservative solutions or dyes. It is based on the well-known principle that all porous bodies dilated by heat, have the property of absorbing—as plants do during the night—liquids, according as they are contracted by cold. The timber is heated to a high degree by means of steam or boiling water, which deprives it of its vegetable juices and resins, and is then immediately plunged into a cold solution or dye, which it absorbs so completely as very soon to sink to the bottom of the vessel. The process is very rapid, two hours sufficing for the largest railway-sleepers, and from five to fifteen minutes for palisades, planks, &c.

When it is considered that the present methods of timber-injecting, imperfect as they are, require a great amount of patience and loss of time, besides the expensive apparatus for exhausting and condensing, M. Hossard's method, indicated by a simple process in nature, seems worthy of being put in practice on a large scale.

FALL OF A BUILDING AT BRIGHTON.—On Monday night in last week, about nine o'clock, a weakly-built hayloft in Camelford-street suddenly bulged out and fell into the street, greatly alarming the inhabitants of the neighbourhood. Fortunately no one was passing at the moment, and no personal injuries were sustained. Subsequently, a stable immediately behind the loft being found to be sinking, the horses stalled there were removed to other quarters.

#### SCHOOLS OF ART.

*The Reading School.*—This school is said to be in a most satisfactory state, the pupils having made great progress in their studies under the tuition of Mr. Havell, the head master. A national medalion has been given to one pupil, and amongst the awards, which number altogether 230, are many given by lovers of the fine arts in this locality. The annual distribution of prizes to the students has just taken place, in the Town-hall, under the presidency of Mr. Hignford Burr. There was a very numerous attendance, and among those present were Mr. A. H. Layard, M.P., and Sir F. Goldsmid.

*The Cirencester School.*—Of the 18 works to which local medals were given this year 14 were selected for national competition, 3 of these obtaining first-class distinctions or medals, and 3 others second-class or honourable mention.

*The Newcastle-upon-Tyne School.*—This school continues to make steady progress. The pupils are not only numerous, but many of them are pretty far advanced, and have been successful in taking prizes. It appears, however, that no national medalion has been obtained this year. Nevertheless, the result of the examination is deemed highly satisfactory to the committee.

*The Cork School.*—Sixteen local medals and two national medalions have been taken by students of this school at the last examination held by the Department of Science and Art. Numerous pupils of the school and of the local national schools have also passed a successful examination by the Inspector, in free hand, geometry, perspective, model, and memory drawing.

#### METROPOLITAN COW-SHEDS AND THE CATTLE DISEASE.

##### DEMOLITIONS IN LONDON.

THE sanitary department of the police, in connexion with the Common Lodging-house Act, has worked with such excellent effect, and given so much satisfaction, that the staff has been recently increased; and it is very evident to those who have looked on, that the benefits dispensed by this well-selected body of men have been great, and that they have done most useful work. Those who have charge of the common lodging-houses, and are neglecting their duty and endangering the lives of persons from whom they receive large profits, are told what is needful to be done: they are reasoned with; the nature of the law is explained, and right sanitary measures are enforced: so that in nineteen cases out of twenty, it is not needful to bring the obstinate wrong-doer before the magistrate; and the people who live in those places, and would be otherwise left to the mercy of unscrupulous landlords, have reason to thank this department of the police.

A central police power connected with health, notwithstanding, is looked upon with suspicion; yet it is almost certain that such a power must be resorted to in connexion with the immense populations of our cities and towns,—where so many local interests are at work to stop the progress of improvement,—in order to prevent an immense sacrifice of human life.

At present attempts are made in all ways to defeat the object of the health-laws, which have been wisely but with difficulty made.

In great parishes there is an insignificant number of nuisance inspectors, some few of them men who are not at all fitted for such an important duty as the correction of errors and demerits which affect the lives of both human beings and animals. It is not our wish to class the bad with the good, nor to write what may be offensive to those who are earnestly endeavouring to do what is almost an impossibility. Sanitary inspectors of the right kind do not generally give satisfaction to their Boards; but we must positively assert that those health Acts which, if properly enforced, would, in each year, in Great Britain, save thousands of lives, and prevent a vast amount of misery and suffering, are in many places rather evaded than carried out. In the present state of the public health, with sickness threatening in various ways, with a human pestilence approaching (but which it is to be hoped Providence will keep from our shores), when an actual murrain is raging amongst the pent-up cows of the metropolis, and has within the last three weeks or a month destroyed milk-cows of the value of 30,000*l.*, the most effective attention is required. We may say, in passing,

that it may not, in the end, be cows alone that will be affected by this fatal disease.

It is hardly necessary to mention that a scarcity of butchers' meat will affect the price of all other kinds of food; and the history of the past, and the personal experience of many, show that lowness of diet in unsanitary situations leads to fevers and those other disorders which are classed with them, and various evils following in their wake. It is, unfortunately, not to be denied that the cattle-disease has been spreading amongst the cow-sheds of the metropolis to an alarming extent. And just on this point we will ask not only the City authorities, but also those of the metropolitan parishes, if they have in this department carried out rightly the health enactments which they have at their disposal, or properly done their duty?

How is it that, in the midst of thick populations, we have in the City so many cow-sheds? Years since, with both pen and pencil, we directed attention to the mischief of those places. We have shown that they are a fruitful source of disease and annoyance to those who live in the immediate neighbourhood; and that, through the artificial state in which the animals are kept and fed, the milk is rendered actually not fit for human food; and we repeat what we have often before said, that to keep cows in the pent-up and overcrowded situations in which they are still to be found, is as bad for the poor brutes as it is for the people who are lodged near.

The disorder which is at present raging amongst cattle is said, not only by competent physicians, but also by veterinary surgeons and others, to be a virulent kind of typhus fever, which is so deadly in its effect when once established, that it sets all medical aids at defiance, and spreads like wildfire amongst the herds. Those who were in affluence at the beginning of one week may be reduced to a state almost of beggary by the sudden destruction of the animals on which they depended for their livelihood.

We all know of the fevers and other disorders which are created by the want of ventilation, by dirt, and overcrowding. How, then, can any one who has looked into the London cowsheds, wonder at an outbreak of a pestilence amongst animals which are predisposed to it by the circumstances in which they are placed? We are not prepared, in connexion with this attack, either to admit or to deny that the epidemic which is producing so much anxiety, is of foreign importation. We, however, maintain that in the transport ships, in the confined holds of which the animals are brought from Holland and elsewhere, and in many of the metropolitan cow-sheds themselves, there are sufficient materials and proximate causes for the generation of typhus fever, virulent or mild, according to circumstances connected with seasons, food, &c., of more or less rare occurrence, so as to account for the present pestilence, without any importation of diseased animals whatever. The London cowkeepers were warned by us of the risk to which they were exposing themselves; and it was suggested that these would act wisely who would accommodate themselves to the altered conditions, and remove their stock in these railway days to country places, where the healths of the beasts would be far more certain; and the milk, when sent to the great capital, would have been far better if forwarded by the trains, and managed in a way which could be easily contrived. But many of the London cowkeepers are hard to convince,—even more so than were those persons who had interests in the metropolitan graveyards. In the course of investigations which have been carried on by us, our artist was forced out of one of the most abominable of those graveyards, where the dead were cropping up within a few inches of the surface, and practices were adopted which we trust will not again in the centuries that are to come disgrace the metropolis of this country. From ignorance, or in some instances considerations of profit by individuals, our course has been occasionally obstructed; but for the most part people understand our motives, or else do not care to be opposed to a power which even those who strive the hardest to preserve the old conditions of sanitary affairs know has never been ill-succ. It is, however, a fact, that we have had much more trouble and much less politeness from the cow-keeper than from several other classes.\* Although we have patiently borne with their foolishness in somewhat

the same way as it might be fancied John Bunyan put up with his persecution, or had those feelings of pity which might have inspired Daniel Defoe when he stood in the pillory, we have gone on in our course, knowing that our efforts would be backed by the intelligent part of the public press and by all right-minded persons.

As an instance of the state of some of the sheds in which the cows are kept, and of their unsuitable position, we will look at a place of this kind in Bartholomew Close. It is represented in one of a number of sketches that will be found on another page. The space in which, here in this ancient parlie, the animals are kept, presents all the appearance of a modern dwelling, excepting that there are paintings of cows upon the door, and an intimation that a dairy has been established on the spot since somewhere about 1776. In years gone by, we have sought through the neighbourhood for the coffins of the old monks of St. Bartholomew, and have found them, and fragments of the cloisters, the ancient hospitium, and other parts of this remarkable and still interesting part of old London. In our mind's eye we have many such curiosities before us, and the recollection of dear old friends now gathered with the dust who have been joined with us in these investigations; but we must cast aside for the present, favourite antiquarian pursuits, and call upon the female, of a Welsh-sounding name, who occupies the premises referred to. The doors being open, we venture to peep in; and in the place that was originally intended for the parlour, we see seven cows. Far more of them had been here formerly. A girl is washing the stairs; which lead to apartments above, occupied in other ways. Soon the proprietress appears; and, with due politeness, inquiry is made if we may look at the condition of the cows. "What are you?" says she. "Nobody shall see my cows except 'George Grey,' or some one from bin." Retiring from the defiant front surmounted by a shock of the red coloured hair which at the present time is so much desired, we proceed to make inquiries in the neighbourhood; but soon the fierce attendant upon the cows follows, and invites us, after all, in the most mild and considerate manner, to come and see the beasts. The very rough accompanying sketch will show what met the eye there; and, remarking that the place was totally unfit for the purpose, we parted in the most friendly way with our former antagonist.

For the present we pass on to another City cow-shed, close to Warwick-lane, not far from a very curious and ancient inn, illustrated some time since in the *Builder*. This is a curious relic of Old London, left, as several other parts about here seem to have been, by the Great Fire of 1666. It is not agreeable to any unpleasant things; but, for the sake of the great masses of the community, the truth must be spoken. Here the cows are lying side by side. So far as we may judge, it seems that three cows lie in the space of a one-horse stable. We leave the consideration of the ventilation, and some other circumstances of this place, to the City inspector. A woman here was nursing a child that was disfigured by festering sores. Can this be wondered at? The whole atmosphere was impregnated with impurity; and, no doubt, for many feet below the rotten pavement, the earth is impregnated with the most unwholesome matters.

In the hot summer day we saw multitudes of flies which were hovering about; and the fancy will see minute and, at present, invisible atoms being distributed abroad. We could easily smell these, and in the atmosphere in which they exist we find the especial cause of the disease which is at present raging amongst the overcrowded and filthily-kept cows.

We must presently say something more on this subject, and refer to clearances and changes that are being made in some parts of the metropolis. In illustration of the latter subject we give on the page on which our sketches of cow-sheds appear, some views explanatory of the demolitions lately made about Smithfield. The subject-matters of the cuts are as intimately connected as our page represents them; though the nature of the connexion may be understood only by those well acquainted with the metropolis.

Meantime we may here remark, that the cattle disease continues to absorb the attention of the agriculturists and breeders throughout the whole country; and meetings are every day held to concert measures of prevention. The appearance of the disease is reported from various places in Essex, Devonshire, Dorset, and Cumberland, as well as Scotland. In Edinburgh,

the cleansing of byres or cowsheds is proceeding by force of law, and cow-byshaws are being provided. New regulations for the cleansing and deodorising of cattle-trucks, setting apart of separate sets of trucks for home and foreign cattle respectively, are being carried out; and our energetic Privy Council are still issuing missives, in one of which the Secretary warns railway companies that the "knowingly bringing of cattle suffering under an infectious disease on a railway, so as to bring them in contact with other cattle, is an offence at common law," and shall be dealt with accordingly.

A veterinary surgeon at Stamford is said to have been killed by inoculation from the puncture of a fly which there was reason to believe had just been feeding on the diseased carcass of a cow. This is a serious matter, both as regards human life and the spread of the disease amongst cattle. Of late years we have occasionally been hearing of the virulence of fly-bites in France, where human beings are said to have been killed by such bites, but it is only now we hear of the like circumstance in England. A "carbuncular fly," as it has been called, is said to have lately killed a young lady at St. Maxima, in the Department of the Isere.

Before concluding, we may here give the recommendations of Professor Gamgee, of Birmingham, veterinary surgeon to the National Association for the Prevention of Cattle Disease, and principal of the Veterinary College:—

"The food on which the cows are fed should be carefully selected, properly stored, and given in sufficient but not immoderate quantity, and with great regularity. Sour grains, bad hay, &c., must be carefully avoided. Management of stock after the appearance of the disease—Whereas it is of great importance to attend to perfect cleanliness and proper ventilation under any circumstances, it is especially so if the plague or any such malady enters a stable. The sheds should be flushed with water, and disinfectants most freely used. Scrubbing all wood with hot water and soda, and applying disinfectants, such as Condy's fluid, &c. is to be especially recommended. Wherever diseased cattle have been hurged, all excrement should be removed, and the parts thoroughly purified."

The same fluid is recommended by one of the officers appointed by the Privy Council to be administered internally to the cows affected, an ounce in a quart of water as a draught, and repeated from three to six times a day.

A cattle plague has appeared, it is said, in America. We wonder if the Americans conceive it to have been imported from Russia, as we do. Why should it not be capable of originating in America as well as in Russia?—and if so, why should it not be capable of originating in England as well as in either America or Russia?

UNION BANK OF LONDON.

The directors of the Union Bank of London, for many years established in Prince's-street, opposite the Bank of England, finding their business steadily and rapidly increasing, lately purchased the premises in Mansion House-street, at the corner of St. Mildred's-court, formerly occupied by Messrs. Lubbock & Co., the bankers, and the houses between those premises and the Britannia Insurance Office, at the corner of Prince's-street. The old buildings on the site of their new acquisitions have recently been pulled down; and a new building is now being erected in their place. It will extend, when completed, from St. Mildred's-court to the Britannia Office, and thus have a frontage towards Mansion House-street of 120 ft.

This building will form a considerable addition to the bank, which will ultimately occupy a space of over 9,000 ft. on the ground-floor. The upper part of the bank, towards Prince's-street and towards St. Mildred's-court, is devoted to the board-room, secretary's office, &c.; but it is proposed to let the whole of the upper part of the building seen in our view, towards Mansion House-street. The access from Mansion House-street will be by a doorway which will be immediately opposite the new street now being made between Blackfriars and the Mansion House.

The cost of the new works will be about 30,000. The architect is Mr. P. C. Hardwick. The contractors are Messrs. Cubitt & Co.

\* The keepers of pigs, against the provisions of the law, might here be classed with the cowkeepers.

LONDON DEMOLITIONS; AND THE COW SHEDS.

THE UNION BANK OF LONDON.—MR. P. C. HARDWICK, ARCHITECT.

## THE ATLANTIC CABLE.

It is an ill wind which blows nobody good. The *Great Eastern* has thoroughly redeemed her lost prestige, and justified the never-failing confidence in the capabilities of her constructor, Mr. Scott Russell; although the constructors of the lost Atlantic cables have not redeemed theirs. The cables are both failures, notwithstanding the high encomiums passed upon the one just lost by those engaged in laying it. But if the cable were so perfect in its construction, how does it happen that in the certainly not very clearly written official account of the laying and the losing of it and the grappling for it, the reporter says, in his diary, of date 2nd August, and after the cable had broken in the attempt to lift it in search of the supposed fault,—“If the cable had been free from faults, the laying of it had been of the utmost certainty. All the scientific men began to find the form of the cable was defective. The ship and paying-out gear were perfect.”

Notwithstanding that everybody seems to take for granted that there was a fault to be found out in the last of the liftings, however, we must do the cable the justice, in our estimation, of repeating, that even still we do not see any reason, after a careful perusal of all that has been said of the occurrence, to blame the cable at all for the existence of any such fault. The occasion on which the “partial loss of insulation” occurred, which was,—hastily and in error, as we conceive,—attributed to a fault in the cable similar to the others which did previously exist in it, was precisely the occasion on which that “partial loss of insulation” was announced at Valentia, which there is high authority for believing was in all probability attributable to an extraordinary magnetic storm which precisely then took place, and which was held to be quite sufficient to account for the “partial loss of insulation” then discovered at both ends of the cable. Had any one with sufficient knowledge of that terrestrial magnetism which was liable temporarily to interfere with the working of telegraphic lines, been on board the *Great Eastern*, and had pointed out the probability that the magnetic storm was the real and only cause of the partial loss of insulation, no attempt would have been made to lift the cable until that storm had subsided; and, in all probability, the cable would thus not have been broken and lost, but laid, by this time, and at work, unless some new fault should have afterwards led to another lifting and a final breaking of the unfortunate cable.

And as to the actual breaking and the actual faults, is it not probable that the extreme twisting, or torsion, with which the cable must have been laid when payed out from fixed concentric coils, occasioned the fracture in the lifting, as well as the faults from penetration of the core by wrenched and fractured surface wires? The error of the coiling seems to be a very obvious one to any one who ever handled a rope or a gutta serena garden-tube. It was three times, at least, pointed out in the press at the time when the public attention became concentrated on the subject, just before the re-appearance of the *Great Eastern*,—namely, in a letter dated 14th August, in the *Liverpool Albion*; in one dated 15th August, in the *London Star*; and in another dated 16th August, in the *Swansea Cambrian*. The editor of the *Cambrian*, however, who, we understand, was himself the author of the letter in his own paper, had previously sent that letter to the *Times*, which did not insert it,—we should like to know why. Had turn-table coil-tanks, or revolving coils, as suggested, or even figure-of-eight coils, been used, the torsion, which has probably done all the mischief to both cables, would have certainly been avoided.

Various other suggestions for the better lifting of the cable have been made, such as the provision of occasional slack in its course, with buoys affixed. We see, by the way, from Dr. Russell's diary, that the cable was repeatedly cut and re-spliced. How would such splices affect the lifting of such ponderous cables? Had the weight been less, the lifting might have been readily effected with the apparatus provided for the purpose; but the weakness and utter insufficiency of that apparatus are very strange and unaccountable. Since there was a lifting apparatus, why was it not made sufficiently strong and powerful, if made at all?

It is most earnestly to be hoped that the successive misadventures with Atlantic cables will not prevent the renewal of the attempt to lay

one, whether that just broken or a new one, or both. In spite of all shortcomings, the result certainly cannot be said to be either hopeless or fatal as regards the possibility of laying an efficient cable: “experience teaches” quite the contrary; but the capitalist public may not see the matter exactly in this light. Why has not some commercial or stock-broking man or now quietly got a very light line, well made, on the most improved principle, and run it out across the Atlantic at a venture? He would have risked the outlay—not very great it might be—but he might have succeeded in placing himself in a position to command markets which would have enriched him ere the public line was laid. As it is, we had better take time by the forelock, for there are other two, if not more, schemes for telegraphic annexation of America to Europe in the field.

One of these is the French Transatlantic Cable Company's scheme for a line *vis à vis* Paris to Lisbon, and thence to Cape St. Vincent by land; from this last place to the Canary Islands, along the coast of Morocco; from the Canary Islands to Cape Verd, along the African coast, with stations at St. Lewis (Senegal), and at Gorée; from Cape Verde to Cape St. Roque, on the coast of Brazil,—a distance across the Atlantic of less than one-half that of the cable intended to be laid by the *Great Eastern*; from Cape St. Roque to Cayenne, along the American coast; and from Cayenne to New Orleans by the coast, or probably by cables connecting the principal West India Islands.

Another is the proposed Russian line. According to the terms of the contract between the Russian Government and the company (which is an American one), the line is to be completed within five years, passing through Behring's Straits, the Russian possessions in America, and English Columbia, to San Francisco, where it will join the American lines.

As for our own Atlantic cable, the directors of the various boards interested have come to the conclusion to take steps to proceed with the undertaking, by appealing to the public for capital to enable them to provide another cable, but not for laying it till May next, when the *Great Eastern* will, at the same time, attempt to recover and complete the cable which has just been lost. The machinery for raising the rope, and necessary repairs to the *Great Eastern*, could not, it seems, be completed before the end of October, by which time the season would be too far advanced to warrant a trial this year. We are glad to hear that the utmost harmony prevails among all concerned in the enterprise, and that no despondency exists as to the result; but we hope that renewed endeavours will be made to obtain a still better cable than the confessedly faulty one just broken and lost, and better arrangements in the coiling and uncoiling, laying and lifting of the cable so constructed.

## RAILWAY MATTERS.

The City extension of the Chatham and Dover line, leading from Earl-street, Blackfriars, to West-street (where the junction is to be ultimately formed with the Metropolitan line), has been inspected by Colonel Yolland, the government inspector, and declared to be satisfactory. Several times, an engine, heavily ballasted in its train, has passed easily from the Ludgate-hill station to West-street and back again along the line, notwithstanding the great apparent delicacy from Ludgate-street to Snow-hill. Colonel Yolland declared the line to be, in every respect, fit for traffic, but that its opening could not take place before its connexion with the Metropolitan, north of West-street, was completed, which we understand will not be the case until the beginning of November.

The North London Railway Company have declared a dividend at the rate of 6 per cent. per annum.

The London and South Western Railway have just adopted the system of electric communication between passengers and guards of trains, which was brought lately under the notice of the public by Mr. Peacock, the telegraphic superintendent of their line.

A new railway chair, having for its object the prevention of accidents such as have of late occurred in consequence of the permanent way being under repair, has been invented by Mr. Lees, of the engineer's office, London and North Western Railway. The system at present in operation on railways renders it necessary, for

the purpose of replacing a worn or damaged chair, that the rail should be removed; and for replacing a rail, that the chair should also be removed;—arrangements which are inconvenient and unsatisfactory where there is a large traffic on a line, and short intervals between the trains during which any repairs may be accomplished. These difficulties Mr. Lees proposes surmounting by such a construction of chair that the rail can be removed without disturbing the chair, and the chair removed without disturbing the rail; and it is said at the same time to possess other advantages over the chair at present in use. Mr. Woodhouse, the engineer of the southern division of the London and North Western Railway, has ordered a number to be made and laid down on trial.

A new apparatus to prevent harm from collisions, has been invented by a Mr. Matthew Fitzpatrick. It is said to consist of buffers or cushions, 5 ft. wide, 3 ft. high, and 2 ft. thick, composed of a peculiar arrangement of wool and compressed air. These cushions are adapted to a powerful self-acting leverage apparatus, which, in case of collision, suspends the whole weight of the springs by forcing downwards on the rails four powerful standards, having 12 in. surface, and capable of sustaining any necessary weight. “The wheels are just raised off the rails, and revolve in air, giving place to the standards. Progressive motion is thus destroyed, the force of the shock expended on the cushion, and the deadening power of the wool will prevent the travellers in the carriages from feeling any projectile force or disturbance. Each engine and each carriage is armed both before and behind with these cushions and leverage, so that whether the danger come from the front or the rear,—whether the guard or driver see the danger or not,—the moment a collision takes place, or an obstacle is struck, the self-acting leverage is put in motion, and travellers, engines, and carriages will be safe.”

Almost all the railways made in Wales of late years have been formed by contractors who have provided nearly all the capital, and have taken the shares of the different concerns at their own risk. The country, says a correspondent of the *Times*, has in this way had the benefit of something like 700 miles of railway which would not have been made for at least another century if we had waited for the localities to subscribe the necessary funds. If, therefore, Parliament had refused its sanction to these lines, the men who have made them would have taken their knowledge and capital to distant countries, and at least 8,000,000 of money would have been lost, as far as Wales is concerned. While, on a different system, the South Wales cost 28,000*l.* a mile, and the Carmarthen and Cardigan 50,000*l.* a mile, about 150 miles of railway in Wales were made by one contractor (the *Times*' correspondent), during the last seven years, at a cost (in shares and debentures) not exceeding 10,000*l.* a mile.

The traffic returns of railways in the United Kingdom, published for the week ending the 12th of August, amounted, on 12,154 miles, to 767,227*l.*; and for the corresponding week of 1864, on 11,801 miles, to 731,080*l.*, showing an increase of 353 miles and an increase of 36,147*l.*

In reference to the Mont Cenis railway and tunnelling by means of steam instruments armed with teeth, or punching apparatus, the following curious Scriptural passages are quoted by Mr. James Bruce:—“Behold, I will make thee a new sharp threshing instrument, having teeth: thou shalt thresh the mountains, and beat them small, and shalt make the hills as chaff.” (Isa. xli. 15). These engineering arts, he thinks, must be ascribed to man's inspiration by the Divine Spirit, who “doth instruct him to discretion, and doth teach him” for it is said, “This also cometh forth from the Lord of Hosts, which is wonderful in counsel, and excellent in working.” (Isa. xlviii. 20.)

New carriages of a luxurious kind are about to be placed on the Nicholas Railway, between St. Petersburg and Moscow. In addition to a handsomely furnished saloon and smoking-chamber, each carriage comprises a series of smaller apartments opening on both sides of a corridor. The sofas, ottomans, and cushions of the daytime are at night converted into beds, mattresses, pillows, &c., so that the passengers can sleep with all the comforts of home. There are, of course, separate divisions for ladies and gentlemen; and, when the travellers wake in the morning, they find their clothes brushed and folded by the attendants, and all the arrangements for washing and dressing ready for use.

Russia is supposed to be rather a backward country; but when will England reach this height of comfort and luxury in railway accommodation? Carriages of the description above-mentioned are to be provided on the Nicholas Railway for the second and third as well as for the first class, the only difference being in the elegance of the fittings. A slight additional charge above the ordinary fares will be made for these vehicles, and those who do not choose to pay it can travel in the old carriages.

MONUMENTAL.

**Albert Memorial at Fettercairn.**—Some years ago a subscription was set on foot to get up a memorial of a royal visit to Fettercairn, in Scotland, and it was more eagerly entered into owing to the death of the Prince Consort. Various plans were proposed and set aside, and ultimately the one fixed on was a triumphal arch in the Gothic style, from designs by Mr. John Milne, architect, St. Andrews, which has now been erected and inaugurated. The arch spans the road leading to Brechin. It is built of stone of a very durable quality from Aldhar quarry, near Brechin. It is something in the style of a triumphal arch, with Gothic treatment. It consists of two massive octagonal towers, each about 7 ft. in diameter, and supported by Gothic buttresses. The towers are about 60 ft. in height, and are surmounted with metallic gilt finials. The arch is semi-circular, 18 ft. 4 in. span, and the height to the keystone is 16 ft. 4 in. Surmounting the arch, including the keystone, or centre, is a scroll containing the words, "Visit of Victoria and Albert," in raised old English letters. In the angles formed by the arch, and under the cornice, are at one corner the word "Sept." and at the other "1861." Above the cornice on each side, and under the copo of the arch, is a crown in relief. The top of the arch is coped with embrasures, and in the centre is a semi-turret with gilt metallic finials.

**Sutherland Monument at Golspie.**—The site for the monument to be erected in memory of the late Duke of Sutherland, at Golspie, N.B., being now fixed upon, workmen are busy dressing stones for the base, &c. Some of the stones weigh upwards of 15 tons, and the smallest is about 6 tons weight. They are all of native granite, and have been brought a distance of upwards of twelve miles before reaching their destination.

**The Shakespears Monument in New York.**—On the 23rd of April, 1864, which was the tercentenary anniversary of Shakespeare's birth, the corner-stone of a monument to him was laid by a society of gentlemen in the Park. It appears that the sum of 19,803 dollars has been contributed. It was originally resolved by the committee that no design should be adopted until 20,000 dollars were collected; and, as that sum is now in hand, they are ready to receive designs for the monument, which is intended to be a full-length representation of Shakespeare. The sculptor must be an American.

THE BUILDING TRADES.

**Sudbury.**—A meeting of the carpenters and joiners of Sudbury has been held at the Four Swans Hotel, and resolutions have been passed for an advance of 2s. per week on the present wages, and a further advance of 1s. per week after the 31st of March, 1866. The present demand is equivalent to a rise from 18s. to 14. The reasons assigned are the very low rate of wages compared with other towns, and the increasing scarcity of provisions, clothing, tools, &c. Circulars to that effect have been sent to the masters.

**Saltair.**—The stonemasons who were employed in the erection of a new mill at Saltair, have now been for some time on strike. The men refused to work owing to the contractors behaving employed two non-union men. The masters are said to have found it difficult to obtain a fresh supply of men, the union men behaving employed two "crows" for the purpose of watching the premises, and of warning any workmen making an approach thereto.

**Ipswich.**—The operative bricklayers in Ipswich have presented a memorial to the masters, feeling that the time has now arrived when an advance of wages can be asked for and given, based on necessity, justice, and right." The workmen say "there are special and cogent reasons why an advance of wages should be given, taking into consideration that provisions,

clothing, house-rent, tools, &c., are much dearer, while the wages in the principal towns of England are much advanced, thus offering an inducement for us to leave Ipswich for those towns." This movement, the men say, spontaneously emanated from non-society men; and they respectfully request an advance of wages to 4s. a day. The ordinary wages are now 3s. 4d. a day, but some of the best hands are already paid 4s.

**Stourbridge.**—The strike of the glass-cutters still continues, and the prospect of any immediate settlement of the dispute is becoming more remote. More of the men have given notice, and are coming out. The men on strike receive 15s. a week from their trade society.

"THE CAUSE AND PREVENTION OF FIRES."

SIR,—My attention has been just called to a letter from Mr. Lewis M. Becker in your journal of the 29th ult., on the subject of the cause and prevention of fires.

After recommending public inquiries into the causes of extensive conflagrations, the writer proceeds to make the following remarks:—"Such fires as those of Gresham-street and New Southwark-street, in which goods were deposited in fancied 'fireproof' buildings, with solid masonry, lofty floors, iron girders, cast-iron party walls, fire-concreted (sic) arched ceilings, &c., do not seem to teach architects and builders any lesson, but experience has taught the fire companies that these 'fire-proof' (?) buildings burn more furiously, rapidly, and destroy every vestige of their contents (even that which is considered incombustible), than ordinary buildings that are not considered fireproof; and from the massive and weighty materials used in their construction, they have in every case caused the entire building (from cellar to roof) to be so destroyed as to necessitate rebuilding."

It is rather unfortunate for Mr. Becker that he has referred to the late fires in Southwark-street to support a theory which is entirely at variance with experience. Of the two large warehouses in Southwark-street destroyed by fire, the first (that of Mr. Barnett Meyers) was very substantially built, but was not pretended to be fireproof in any respect, all the floors having been timbered, and the several parts of the building connected. This warehouse was completely destroyed "from cellar to roof." The second warehouse (that of Messrs. H. E. & M. Moses), of which I was architect, was also not intended to be fireproof; but, having in view the purposes of the building, I advised my clients to cover two-thirds of the area of the structure, at the second-floor level, with a fireproof floor, constructed upon Fox & Barrett's principle. The object was not to build a fireproof building, but simply to construct a fireproof division. The result was precisely the reverse of that stated by Mr. Becker. The fire commenced in the upper part of the building, and the whole structure above the level of the fireproof floor was reduced to ashes. Below that level, the warehouse did not suffer the slightest damage, the fireproof floor having effectually arrested the flames. On the other hand, the one-third of the building which had no fireproof floor, was completely gutted "from cellar to roof."

I may add that the Fox & Barrett's floor, which showed itself capable of carrying many hundred tons of burning debris, and which proved itself to be a truly fireproof division, was of the lightest construction, the concrete being scarcely 5 in. thick. The division-wall which separated the one-third of the building destroyed from the two-thirds saved was not an "extra thick party-wall," but (though nearly 70 ft. long) was only 14 in. thick, with three small half-brick piers in its length.

I think, sir, you will admit that if such slight divisions of incombustible materials proved themselves really fireproof, the lesson to be learnt from the Southwark-street fire is precisely the reverse of that taught by Mr. Becker.

N. S. JOSEPH.

Nevertheless, the general assertion that "fire-proof" buildings as usually constructed, are not simply not fireproof, but comprise features that are favourable to the communication of fire from one part of a building to another, and favourable also to entire ruin of the fabric, is too well supported by the testimony of the surveyors of insurance companies, to be capable of being controverted.

GAS.

In Gravesend a meeting of the principal gas consumers of the town has been held, at which the price of gas was discussed. The directors had refused to reduce their price from 5s. to 4s., but had decided to reduce it to 4s. 6d. from the 24th June last. It was now for that meeting to say whether they would pay 4s. 6d. per 1,000, whilst so many other towns were supplied at a lower price, or whether they would proceed to form another company, to enable them to get gas at a cheaper rate. In reference to the dividend paid by the company, the chairman said Mr. Oakes had assured him that they had never paid more than 6 per cent.; but when he asked Mr. Oakes if that 6 per cent. was upon paid-up capital alone, or upon capital made by the creation of new shares which had been allotted without payment to shareholders, Mr. Oakes did not give a direct reply. He (the chairman) believed that not more than 15,000l. had been paid up in cash out of the capital of 30,000l. Mr. Crook said only 10,000l. had really been paid up. Why were they in Gravesend paying 4s. 6d. per 1,000, when others paid less? Just because the directors chose to enlarge their capital by making new shares to three times the original amount; and now they had got their Act they thought they could do as they pleased. Some further discussion took place, after which it was resolved unanimously that the reduction made by the gas directors from 5s. to 4s. 6d. is not fair to the consumers; and that counsel's opinion be sought,—first, as to whether anything in the Act of the present company threw difficulties in the way of the formation of a second; and also as to whether, if such was the case, it would be necessary to have an Act to constitute a new company. A sub-committee was appointed to obtain information and report to a future meeting.

The Bakewell Gas Company have declared a dividend at the rate of 8 per cent., free of income-tax. A reduction has also been made in the price of gas, which is now 5s. 6d. per 1,000.

FROM SCOTLAND.

**Musselburgh (near Edinburgh).**—The building committee of the Episcopal church, Musselburgh, have accepted the offer, by Sir Archibald Hope, of Pinkie, of a site for a new church. The site is at the end of the town, near the old stone pillars of the East Port, where the policy grounds of Pinkie project in front of the line of buildings on the south side of the High-street. Some months since the building committee invited a limited number of architects to furnish plans, in competition, for the new church, in answer to which eight sets of drawings were sent in. The committee having considered the designs, have given the preference to one submitted by Messrs. Paterson & Shicels, of Edinburgh. The contracts have been accepted, and building operations will shortly be commenced. The church will be seated for 200 persons; but there is provision for future extensions, which will increase the number of sittings to 320. The edifice will have an open timber roof, and attention will be paid to the arrangements for heating and ventilating. The chancel is treated as an apse, from which access to the vestry is obtained. The public entrance to the church is from the north elevation, through the tower. The architectural style of the building is Gothic of the thirteenth century, freely treated. The apse has an octagonal end, with buttresses at each point of the octagon. The windows are shafted, and have carved capitals and cusped arched heads. A moulded string course runs over the arches, and abuts on the buttresses, which have crocketed terminals and carved finials. The side elevation of the church is treated in a more subdued style. The west elevation faces the town, and is flanked on the north by a spire, which will be seen from a considerable distance. The base is square in plan, and is supported by double buttresses at the angles. On the east side there is a small staircase leading to the bell-ringers' gallery, which is treated so as to form a feature in the design. The central part of the spire assumes the octagonal form, the walls on each face being pierced with narrow windows. The whole height of the spire will be 100 ft. to the top of the vane. There are three windows in the west gable. The church will be enclosed from the street by a parapet wall and cast-iron railing. The church and outworks are estimated to cost 1,550l. The contractors are,—for the mason's

work, Mr. James Black; joiner's work, Mr. A. Forbes; plumber's work, Mr. James Dickson; plaster-work, Messrs. Millar & McNeny; and slater's work, Mr. Lamb.

**Kirkintilloch.**—The movement which was commenced a few years ago for the erection of a monument to the memory of David Gray, the Poet of Merikland, has been consummated in the "Auld Aisle" burying-ground, near Kirkintilloch, over the grave of the poet. The inscription was written by Lord Houghton. Owing to the elevated position of the burying-ground, which is about a mile south of Kirkintilloch, and overlooks the Luggie, Bothlin Burn, and the valley reaching to the foot of the Campsie range of hills, the monument forms a conspicuous feature in the landscape. The inauguration, by Mr. Sheriff Bell, has just taken place.

**Burntisland.**—The town council at a recent meeting had before them a communication from the North British Railway Company, proposing, on certain conditions, to form a deep-water harbour at Burntisland. The proposal, we understand, is made with the co-operation of the coal-masters of Fife, and the harbour would be for their accommodation. It is proposed to form it on the east side of their pier now in course of erection, the ground in connexion with it, lately purchased by them, giving them excellent facilities for the undertaking. The prosecution of the scheme would seem to bring on the amount of compensation which would be asked for shore-dues, and this was the chief inquiry put to the council. Power was given to Provost Stewarwright to open negotiations with the company on the subject. The new pier still makes steady progress, excellent stone for its formation having been found without trouble in the necessary excavations which the access to the pier required to be made.

#### PROVINCIAL NEWS.

**Westerham (Kent).**—At a public meeting held in the King's Arms Hotel here, the chairman, Mr. J. C. Colophon, explained the drawings and plans prepared by Mr. W. G. Habershon, the local public hall company's architect, and addressed the meeting upon the long existing necessity for such a building, and the accommodation that would be afforded by adopting the plans exhibited. The plans showed a building in the Tudor style of architecture, in stone, with brick dressings, containing a room for the use of the members of the Westerham Literary Institute, housekeeper's room, ladies' cloak-room, billiard-room, club and smoking room, lavatories and other necessary conveniences, with a hall to be used for lecturing or concerts, and capable of holding 250 persons, comfortably seated. The estimated cost of building, including furniture, cost of ground for site, &c., is 1,800l. The chairman announced that 1,500l. had already been subscribed. The meeting, after some discussion, adopted the plans, and resolved to call upon the committee to instruct Mr. Habershon to proceed in obtaining tenders for the erection of the building, which will be at once proceeded with.

**Manningtree (Essex).**—The new edifice erected by the Manningtree Corn Exchange and Cattle Market Company (Limited), in the centre of High-street, is fast approaching completion. The building is of white brick, with stone dressings, and is fronted by a portico with four Corinthian columns. A circular-headed window each side and above the portico gives to the building an ornamental appearance. The Exchange measures on the basement 48 ft. square, is 19 ft. high from the floor to the springing arch, and has a lantern roof, supported by cast-iron girders forming elliptical arches, and eight ventilators. Accommodation will be afforded for thirty merchants' stands similar to those in use in the Colchester Corn Exchange. Besides being used for a Corn Exchange, the building will be appropriated to the holding of public meetings, lectures, concerts, &c., and it will be lighted, when necessary, at night, with gas burners. The architect is Mr. Barnes, of Ipswich; and the builder, Mr. G. Hewitt, of the same place. The contract was taken at 900l. A piece of ground, situated in the Back-lane, has been formed into a cattle market, with sheds and pens, in convenient proximity to the Corn Exchange. The 31st of August has been fixed for the public opening of the markets.

**Birmingham.**—The improvement of New-street has been resolved upon by the Town Council. It is proposed to make a street fourteen yards wide between the bottom of Stephenson-

place and the intended junction of Post-office-place and Pinfold-street. The street will run at the back of the Theatre, removing nearly all the houses in Queen-street. This improvement is regarded as a means of disbanding and dispersing a vicious community inhabiting a locality in which the houses will have to be demolished to make way for the new thoroughfare. The corner where New-street and High-street join will be rounded off.

**Bolton.**—The Town Council of Bolton have instructed Mr. W. Hill, of Leeds, architect, to whom was some time ago awarded the first premium in the competition for town-hall designs for the borough, to prepare new plans for the building, the dimensions of the original design having been reduced. He is also to have Mr. George Woodhouse, of Bolton, associated with him in carrying out the erection. Mr. Woodhouse, it will be remembered, was fifth of the six competitors. "The usual commission of 5 per cent. payable for architect's services is to be shared between them, and their respective duties in the execution of the work to be such as they themselves may determine." The new plan is to retain all the architectural features of Mr. Hill's original design. It will occupy a total area of 2,700 square yards, and will have a frontage of 135 ft. The large hall will be 110 ft. by 55 ft., and is to accommodate 2,000 persons standing. It is estimated that the entire cost, including site, will be about 70,000l. Negotiations have already been completed for a considerable portion of the site, and all other requisite preliminaries will be got through speedily, so as not to occasion further delay.

#### WATER SUPPLY.

**Cones (Isle of Wight).**—According to the plans, &c., drawn up by Mr. Manwaring, of Southampton, for the second or storage reservoir, it is to be so situated that the houses at Mill Hill, the upper part of the Diggings, and other elevated spots may be supplied with water from it. It is to contain 4,000,000 gallons, and to cost not over 3,700l. The shape is a square, the distance from side to side 205 ft. at the bottom, 253 ft. at the top; depth, 16 ft. The bottom is proposed to be of concrete faced with cement; the sides of brick set in hydraulic mortar with a rubble backing.

**Cirencester.**—The *Agricultural Gazette* is furnished by a correspondent with the following particulars as to the dip of a well at Cirencester in 1863, 1864, and 1865. There is a bed of gravel about 10 ft. under the surface of the valley in which Cirencester stands, and water is constantly descending through it to the Thames, three miles south of the town. The gravel bed rests on the fuller's earth, a more or less water-bearing stratum, and underlies the river Churn, which, rising on the high ground of the Cotswold Hills, near Cheltenham, descends the Cotswold Hills, near Cirencester, to the vale of the Thames. In this gravel bed at Cirencester the Romans sunk many wells, and it is one of these, not in use, the depth of which is given. The average rainfall is 30 in., but that of 1863 was only 27.95, and of 1864, 24.6. The fuller's earth not being deep under the surface, is soon affected by great rains. As the average rainfall of summer is greater than that of winter, the writer attributes to evaporation the fall of water which always takes place from April to October; and asks whether this does not point to the use of checking evaporation in high dry soils by means of plantations, as much as encouraging it in low-lying clay districts by clearing away timber and by deep cultivation?

**Blyth.**—A company called the Croft Gas and Water Company (Limited) has been formed for supplying the inhabitants of Cowpen Quay, Waterloo, and the neighbourhood, with gas and water, particularly the latter. The capital is

10,000l., in 2,000 shares of 5l. each. The directors, in their prospectus, state that they have obtained from the proprietor of the Bedside estate sufficient ground, at a moderate price, whereon to erect works, adjoining the river Blyth, a little above Bedlington bridge, where an unlimited supply of good water can at all times be had. The estimated cost of putting up a pumping engine, making reservoirs, laying pipes, &c., is about 4,000l. Considering the almost total want of water in the place at present, a plentiful supply will be a great boon to the inhabitants generally, whose chief dependence is upon the primitive water-carts. It is not intended to proceed with the gas works at present.

#### CHURCH-BUILDING NEWS.

**Newington.**—The new church of All Saints', in Surrey-square, Old Kent-road, has been consecrated. A district with a population of 8,000, taken from that of St. Peter's, Walworth, has been assigned to it. The first stone was laid in December. The ground was given by the Rev. T. C. Clark, B.D., who also contributed 1,000l. towards the building fund. The church is of the Decorated style of Gothic architecture of the fourteenth century. It has been built from the design of Mr. Robert Parris and Mr. Samuel Field, architects. It consists of a nave, 82 ft. long by 30 ft. wide, with north and south aisles, 35 ft. wide, and small transepts; a chancel, 30 ft. long by 22 ft. wide; making the total length 112 ft. by 60 ft. in width; also a tower at the west end of the north aisle, the lower part of which forms the principal entrance. The exterior of the church is faced with Kentish rag and Bath stone. The number of sittings is 800, which are to be all free. There are no galleries. The cost, without the upper part of the tower and spire, not yet built, will be about 5,600l. The cost of the upper part of the tower and spire, including walls to ground, and other expenses, will be about 1,000l. The builder is Mr. William Higgin.

**Herne Bay.**—The enlargement of Christ Church, Herne Bay, has been found requisite. According to the plan at present proposed, a chancel and two transepts will be added to the east end, a suitable tower on the north side of the chancel (carried up over a new vestry), and an organ chamber on the south side, while two new public entrances will be opened at the east end of the aisles. It is estimated that this enlargement will cost about 2,100l., including 500l. for the tower, the completion of which may, however, be postponed, leaving the sum of 1,600l. as the amount immediately required. The plans recommended are supplied by Messrs. George & Vaughan, of London, but we believe this matter is not settled.

**Cowley (Oxfordshire).**—The parish church of St. James, Cowley, has been re-opened by the Bishop of Oxford after having undergone extensive restorations. The church has been virtually rebuilt, only the tower and south wall of the original structure remaining. An aisle has been added to the nave and chancel, effecting, with the substitution of benches for the old-fashioned pews, nearly double the accommodation. The arcade between the aisle and the nave gives a new character to the church. The whole of the roofs are new, and of course all the timbers are exposed. The floors throughout are laid with tiles from Mr. Godwin, of Hereford, the chancel floor being partly of encaustic tiles, and laid to an ornamental design. The chancel stalls are of oak, and the seats of the nave deal, varnished. The pulpit is of Caen stone, and the old font has been set upon a new pedestal. The reredos is of different kinds of marble, inlaid in small squares or panels, the centre panel forming a niche, in which is placed a golden cross. Some curious ornamentation which was found on the walls on the removal of the whitewash has been reproduced, and pains were taken to preserve the characteristic architectural features of the original edifice. The plans were furnished by Mr. Street, and the work was executed by Messrs. Joseph Castle & Co. The cost, it is understood, has been about 2,000l.

**Streatham (Berks).**—The church of this parish has been restored and re-opened. The old parish church having stood nearly seven centuries, required renovation, and it has, under the auspices of two lay friends of the church, been restored and enlarged. Mr. Sidney Pusey (the inappropriate rector), has rebuilt the chancel, on an enlarged site, and the nave, the aisles, and a new vestry have been built at the expense of

Mrs. Stone, of Streatley House. The size of the church has been increased by adding a fourth bay between the old site of the nave and the new chancel, and the roof has been raised bodily a height of 7 ft. or 8 ft., and a clerestory composed of four Early English quatrefoils on each side added. This addition gives a considerable increase of light, and improves the proportions of the building. A tower arch has also been added, together with a western window. All the interesting details of the ancient work have been preserved. The materials used are flint with stone dressings, internally and externally, Bath stone alternately with chalk. The eastern triplet and the western window have been filled with coloured glass which was purchased by subscriptions contributed by numerous parishioners, rich and poor, in memory of the late Mr. W. H. Stone, of Streatley House. The architect employed was Mr. C. Buckridge, of Oxford, and the contractors were Messrs. Wheeler, Brothers, of Reading; the woodwork being executed by Mr. James Mathews, of Reading.

**Aylesbury.**—A committee has now been appointed to obtain subscriptions for carrying out the restoration of the exterior of the parish church, and upwards of 1,000l. have already been promised.

**Great Holland (Essex).**—The old church of Great Holland, with the exception of the tower, has been taken down, and the chief stone of a new building has been laid by the rector. The new church, designed by Mr. Arthur W. Blomfield, architect, is Early English; the walls of rubble, faced with flint, and Bath stone dressings. It will consist of nave, chancel, north aisle, and vestry, the two latter being additions to the accommodation comprised in the old structure.

**Elperstone (Notts.).**—A new bell and clock have been put up in the tower of Elperstone church. The clock was made by Messrs. Cope, of Radford. It has two dials—ono to the east, the other to the west; and strikes Doncaster chimes on four out of a peal of six bells. The chimes are arranged by Mr. Leckett Denison, inventor of the great clock for the Houses of Parliament. The clock is fixed on a pair of cast-iron brackets, weighing 2 cwt. each, bolted, and built to the wall, to be free from vibration. It is supplied with a compensating pendulum, invented by Mr. Denison.

**Wilton.**—The church here, which has been undergoing a partial restoration of the nave, &c., has been re-opened. The nave has now a lofty and open roof: the seats are all new, open, and of oak, with a considerable increase of accommodation. The pillars and arches have been scraped, cleaned, and repaired; the aisles floored with encaustic tiling; and there is a new porch, also a new window. The south walls have been repaired, buttressed, and pointed with cement. There is a pulpit of carved oak and white stone about to be erected. The south door is of new oak, with iron ornaments, &c.

**Gloucester.**—The cathedral, says the local *Chronicle*, has just received an addition to its increasing embellishments in a form not hitherto attempted therein. We allude to a pavement of stone and encaustic tiles, designed by Mr. Luggall, the architect, which has been laid down in the cloister by the Rev. Sir Lionel Durrell, B. Bart., over the grave of his late uncle. The inscription is deeply incised in a fine red Forest of Dean stone, and filled in with red and green cements. A memorial stained glass window is also being prepared for the opening above the door from the north aisle into the cloister.

**Exeter.**—The chief stone of a new church has been laid on "Mount Dinham." It is to be dedicated to St. Michael and All Angels, and will be erected at the sole cost of Mr. William G. Gibbs, a Somerset gentleman. The church will be the largest in Exeter, save the cathedral. It will be 140 ft. in length, and the wall will be 40 ft. in height, and the ridge 60 ft. The breadth of the nave is 40 ft. The tower and spire will be 220 ft. high. The outside of the church will be built of Hamhill and Westleigh stone, and the inside of Bath stone, and the principal supports of the east window and the chancel pillars of polished Devonshire marble; the remainder of the pillars of Hamhill stone. The dressing of the east window will be of Box granite, and the other dressings of Corsham stone. The style is Early Decorated. There are no galleries. The seats are to be open, and made of oak. The choir will be in the chancel, where there will be choir and priests' vestries. The organ-loft will be in the chancel, raised above the choir. There is to be a marble reredos and

a pulpit of carved stone. The church is expected to be completed in about two years. The architect is Mr. Hawkins, and the builder Mr. White, both of London.

**Coddington (Herefordshire).**—The rector and churchwardens, assisted by a lady in the neighbourhood, have decided upon restoring the parish church, plans embracing the complete restoration of the fabric having been prepared by Mr. F. R. Kempton, of Hereford. The works, which are in a forward state, will consist of a new tower, 40 ft. high, and a spire of 48 ft. at the west end of the church, a new organ-chamber and vestry on the north side, and an entrance-porch on the south. The tower will contain six bells, at a cost of 350l. or 360l. The new work is of native stone (close at hand), with Bath stone dressings. The church has features of an early date, the north and south walls being probably of the thirteenth century. In the alterations, the object of the rector is to conserve the old character of the building. The interior will undergo the usual course of scraping and cleaning, and the roofs will be thoroughly repaired. The church will be re-seated with open oak benches, the floor laid with Godwin's encaustic tiles, a new reredos erected, and the pulpit removed from the south to the north side. The north door will be removed, as also the old gallery at the west end; and the gable end of the nave and chancel new coped. Messrs. Collins & Gullis, of Tewkesbury, are the contractors.

**Blanchorth (Corkshire).**—The new church just completed here on the site of an old and dilapidated one has been opened for divine service. The style is Geometrical, with nave, 47 ft. by 19 ft.; chancel, 22 ft. by 15 ft.; vestry, 12 ft. by 8 ft., and south porch. At the west end of the nave is an engaged spirelet, 50 ft. high to the weathercock. The walls are built of Puntan stone, dug in the parish. The accommodation is for 150 adults, at a cost of 700l. The east window is a memorial one, by Messrs. Lavers & Barrard, the gift of Mrs. Prichard. Mr. Withers was the architect, and the builders were Messrs. Thomas, Rees, & Jones.

**Blackburn.**—It has been resolved that an addition of 25 ft. shall be made to the length of St. John's Church, to accommodate 400 extra sitters. Mr. J. Brierley has been authorized to prepare the necessary plans.

**Weaste.**—The new church of St. Luke, Weaste, has been consecrated by the Bishop of Manchester. The site was obtained from Sir R. Gore Booth. The foundation-stone was laid on the 5th of August, 1864. The church is situated on a sloping hill; and in connexion with it is a recreation ground, covering three-quarters of an acre. The church grounds, and the parsonage, which is built on the opposite side of the road, occupy about two acres. The church consists of nave, north and south aisles, chancel, apse, vestry, porch, tower, and spire. The style is that of the thirteenth century. The edifice is of unpretending proportions, with simplicity of detail. The architect was Mr. Scott. The total cost of all the works is about 11,000l.

**Beverley (Yorkshire).**—Contracts have been accepted by the churchwardens of the parish of St. Mary for the erection of walls round the new cemetery for this parish on Molescroft-road, and the work is now being proceeded with. Mr. Howe, architect, has prepared plans for the laying out of the ground in an ornamental style. It is expected that the draining will be commenced at once, and that the whole will be ready for opening early next spring.

**Grantham.**—The general committee for the restoration of Grantham Church held two meetings last month. A report having been presented by the sub-committee, it was determined by the general committee to accept Mr. Hall's tender for the restoration of the roof, at a cost of 9,588l. The sub-committee in their report to the general committee state that the subscriptions promised to the restoration fund amount to 11,553l. 1s. 3d., of which 6,258l. have been realised. It is proposed, in compliance with the advice of Mr. Scott, in carrying on the work of restoration, to pay attention, firstly, to the roof; secondly, to the internal walls and stonework; thirdly, to the floor and seating. Mr. Scott has suggested that the roof of the chancel and its aisles should be panelled, and that those of the nave and its aisles should be constructed with open ribs; and he has furnished designs which the sub-committee have approved. It is believed that the existing flat roof at the east end of the south aisle is in sufficiently good condition to allow of its being

taken to pieces and re-framed; but that, with this exception, and that of the modern roof at the west end of the same aisle, which will be left untouched, the whole of the remaining portion must be renewed. The roofs are to be constructed of Dantzic oak, to be double-boarded, and to be covered with lead, the repairs of the parapets and gables being included in the tender. The sub-committee announce that they have accepted the following offers towards the great undertaking:—1. A new pulpit, by the Rev. Arthur P. Cust, and other members of his family; 2. A corona, by Colonel the Hon. F. Peregine Cust; 3. The restoration of one of the east windows of the chancel, and the filling it with stained glass, by the trustees of Charles Clarke's charity.

**Long Sutton.**—The work of re-pewing and restoring the parish church has commenced. The chancel end is partitioned from the body of the church, the organ is temporarily placed at the west end, the roof is off, and the old pews and seats have been removed. Messrs. Halliday & Cave, of Greetiam, are the contractors for the whole of the works.

DISSENTING CHURCH-BUILDING NEWS.

**Spilsby.**—The memorial-stone of the new chapel, for the use of the Congregational body of Nonconformists, has been laid at Spilsby. The building will, when completed, cost about 1,000l. Mr. G. P. Kennedy, of Glasgow, is the architect; Mr. Sivers, of Spilsby, the contractor; and Mr. G. Smith is clerk of the works.

**Crich (Derbyshire).**—The United Methodist Free Church, henceforth to be known as "Mount Tabor United Methodist Free Church Chapel," has been opened for divine service. It is described by the *Derbyshire Advertiser* as having some pretensions to the Gothic style of architecture, and pleasantly situated. The seats in the body of the chapel with the rising gallery, will accommodate about 300 persons. The platform, in the Grecian style, is 6 ft. square, with an elevation of 3 ft. The bannisters are in cast-iron, mounted with mahogany. The windows, the gift of Mr. J. Smedley, Lea Mills, are Gothic in style, and are ornamented with stained glass. School and class rooms are underneath. The cost of the building and site is upwards of 450l. The contractors were Messrs. D. Wilkinson, Crich, and S. Wbamby, Lea.

**Swindon.**—The new Independent chapel in course of erection at the corner of Victoria-street is progressing, the walls being now several feet above the ground. The contractor is Mr. John Phillips.

**Burslem.**—The Wesleyan new chapel at Milton (Leigh memorial), the foundation-stone of which was laid in June, 1864, has been opened for divine worship. The chapel has been named in honour of the late Rev. Samuel Leigh, a native of the village, and the first pioneer of missionary enterprise in New Zealand and Australia. The site was given by Mr. Anthony Shaw, of Newport House, Burslem. The chapel is in white brick and stone, in the Continental Gothic style, with a spire. It stands near the turnpike road leading from Stoke to Leek, a short distance from the old chapel, and has been built from the plans and designs of Messrs. Ward & Ford, architects, Hanley and Burslem. Mr. Thomas Cope, of Smallthoru, was the contractor for the works. The cost, it is said, will be about 1,000l., and the building is calculated to seat 300 persons.

STAINED GLASS.

**Boadicote Church, Oxfordshire.**—A painted window has just been fixed in the parish church at Boadicote, representing the "Good Shepherd." It is the work of Mr. T. Dury, of Warwick.

**St. Peter's Roman Catholic Church, Leamington.**—A stained glass altar-window has recently been placed in the Lady's chapel of this building. The subject chosen is the "Annunciation," and the top portion of the picture is ornamented by scrolls of lilies and roses. It was designed and painted by Mr. T. Dury, by whom the other stained glass windows were executed, and to whom the general decorations of the church were entrusted.

**Otterburn Church.**—A set of painted windows has been given to this church by a Miss Reed, in memory of her father and mother. One of the subjects is the "Presentation in the Temple of the Infant Saviour." The other window, in two

lights, represents "Doreas making Garments for the Poor, with St. Peter raising her from the Dead." The whole is the work of Mr. Wailes, of Newcastle.

#### SCHOOL-BUILDING NEWS.

**Birkenhead.**—The foundation-stone of a new building in Park-street, Birkenhead, to be devoted to educational purposes, and to be called St. Lawrence's Roman Catholic Schools, has been laid by the Earl of Denbigh. The ground upon which the foundation of the schools has been laid, is large in extent, and is situated at the corner of Park-street and Beckwith-street. It runs 236 ft. along Park-street and 177 ft. along Beckwith-street. It has been laid out for a large church house and schools, the schools being the first to be built, owing to want of funds to build any other portion. The style of architecture is Gothic, adapted to modern requirements. The schools will consist of two stories. The ground-floor will be divided into three schools, for boys, girls, and infants. The upper story will ultimately be divided similarly to the lower one. At present, and until the large church is built, this story will be left open and used as a temporary chapel. It will be about 100 ft. long and 40 ft. broad. The upper story will be reached by an exterior staircase in the manner of the ancient staircase at St. Augustine's, Canterbury. Everything like ornament has been rigidly excluded from the building, but attention has been given to strength of construction. The height of the building from street-curb to apex of gable of roof will be about 63 ft. The whole building will be under one open roof, about 44 ft. span. The walls are to be of brickwork: the sills of the windows will be the only portion of the walling in stone. The absence of stonework will generally be compensated for by the introduction of moulded brickwork for window-jambes, cornices, &c., after the manner of the brick buildings in Belgium, where churches, town-halls, &c., are constructed solely of this material. The schools are to supply accommodation for the children of about 5,000 parishioners. The cost of the building will be upwards of 3,000*l.*, without fittings. It has been designed by, and will be carried out under the superintendence of, Mr. Edmund Kirby, architect, Birkenhead and Liverpool.

**Higher Broughton (Manchester).**—The foundation-stone of the new Wesleyan Schools, Higher Broughton, has been laid. The site of the proposed building is behind the present Wesleyan Chapel, in Great Cheetham-street, Higher Broughton. The principal front will be in Peru-street. The building will consist of a mixed school 48 ft. by 30 ft., and three class-rooms adjoining 18 ft. by 11 ft. 6 in. each. Underneath one of these there will be a heating-chamber; but in addition to this, open fireplaces will be constructed in each class-room, for use when the heating-apparatus is not required. There will be a separate entrance for boys and girls to the school. It is intended to add an infant-school-room, 36 ft. by 18 ft., at some future time, and thus complete the design of the facade in Peru-street. The style of architecture is Early English. The building will be of seconds brick and very plain, the sum set apart for the object being too small to admit of the introduction of any ornamentation. The usual conveniences are placed at the rear of the schools. The principal front of the schools in Peru-street, when finished, will be enclosed by a low fence wall, surrounded by a light iron ornamental cresting. The designs have been prepared by Messrs. Haley & Son, architects, Manchester, under whose superintendence the works will be carried out. The contract has been undertaken for the whole scheme by Mr. Titchell, builder, Strangeways, for the sum of 1,200*l.*

#### METROPOLITAN BUILDING ACT.

##### CAUTION TO BUILDERS.

On the 27th of July last, Mr. Henry Lovett, builder, of Kentish Town, was summoned before Mr. Mansfield, at the Marylebone police-court, by the district surveyor of St. Pancras, for neglecting to give notice of the erection of a wooden building, used as a skittle-alley. The builder had refused to amend the irregularity, but the magistrate adjourned the case for fourteen days, to enable him to do so. On the 10th instant the adjourned summons was heard, and as it then appeared that no alteration had been made in the building, the defendant was fined 5*l.*, and 12*s.* 6*d.* costs.

#### ACCIDENTS.

PLANKS improperly placed at the Charing Cross Railway Terminus, during the execution of certain works at the departure gate in the West Strand, were the cause of an accident on the 21st ultimo, to Mr. William Reid, of Conduit-street, that has resulted in his death. On the day of the accident, the western gate for foot-passengers being closed for needful repairs to the pavement, planks were put from the edge of the pavement to the footway outside the carriage-entrance, as the road was wet and muddy, the carriage gate being shut on one side. The evidence on the inquest showed that, on the evening of the 21st, the deceased, accompanied by his grandsons, came up by the train to the Charing Cross station. Mr. Reid, who had a bag in one hand and an umbrella in the other, ran down to the gate to secure an omnibus, and tripping against the planks, fell against the gate and injured his head. He was taken to Charing Cross Hospital, where the wound, described then as being a slight scotch, was dressed, and he went home; but shortly after he became worse, and subsequently died. The jury found that "the deceased died from erysipelas and inflammation, the result of accident at the Charing Cross Railway Station, caused by the planks being improperly placed."

At Penzance, at the town-hall in process of erection, a fatal accident has occurred to a workman from a false step. A young man, William Rowe, fell 26 ft., and was so seriously injured that he died in two or three days. On the inquest, the foreman said—William Rowe has worked for us almost ever since we have been here, as a labourer; on Wednesday last, the 9th instant, he was engaged with Robert Robinson in carrying stone towards the top of the building, and had to traverse a wooden gangway, which was formed of two 10-inch planks; this kind of gangway had been used for the commencement, as the walls increased in height; and deceased had, therefore, been accustomed to its use for many months; between three and four o'clock on Wednesday I saw deceased working with Robinson, but did not witness the accident: there was not the least risk in using the gangway when I saw it. In answer to a jurymen, he said,—I have put an additional piece of railing now, near the gangway, and a platform under it to catch any one who falls; but no such fatal accident as this has happened for forty-six years, and we had no idea that any one would fall.—The jury, who had viewed the place where the accident occurred, said additional precautions had been taken, and the sudden corner the men had to turn was a dangerous one, but the danger was now diminished. Robinson said,—I am a mason's labourer at Penzance, and on Wednesday last was carrying up stone with the deceased to the builders of the new buildings. In the afternoon we carried up several stones over a gangway, which I consider to be sufficiently strong for a quarter to four, as we reached the scaffolding—Rowe being behind, as the tallest man generally is—he rested his end of the barrow, partly on the scaffold and partly on the gangway; the weight at my end was right in the angle, against William Phillips, who awaited the stone—a coin: Rowe then made a step from the gangway to the scaffold (at a time when he was quite clear of the barrow), but did not step far enough, and fell backwards down to the beams of the first-floor, 26 ft. below, not saying a word, but a slight exclamation. The accident arose entirely from deceased's own want of care. Deceased was twenty-eight. The surgical evidence showed that the deceased's right thigh bone was fractured, his ribs fractured the same side, his lungs lacerated, and that there were other injuries.—The jury returned a verdict of accidental death.

#### RECENT PATENTS CONNECTED WITH BUILDING.\*

**WARMING AND VENTILATING APPARATUS.**—*J. Kissack.* Dated November 24, 1864.—In brickwork or masonry, of any suitable external form, erected in any convenient place, such as a vault or cellar, at a lower level than the rooms or places to be warmed and ventilated, the patentee forms a furnace or fireplace with the bars inclined downwards from the front to the bridge, or horizontal, in the usual way. The mouth of this furnace or fireplace, and the front of the ash-pit, are fitted with doors which can be closed almost air-tight, but they are provided with slides or shutters to regulate the supply of air to maintain combustion, the object being the economisation of fuel. The arch is formed in any suitable way. The heated gases or products of combustion are led over and alongside, or either over or alongside, the arch into flues where a number of pipes are disposed horizontally, or nearly so. These pipes are open at the surface of the brickwork or masonry, or, if under cover, they are continued to the outside of the main building to receive fresh air. At the back end, somewhere about the bridge of the furnace, they, the said pipes, converge and join into one, two, or more main flues, fitted with controlling dampers, through which the air heated to any desired temperature by regulation of the air admitted to maintain combustion in the furnace or fireplace, is led to the place or apartment to be warmed and ventilated, the heat imparted to the air being sufficient to cause a continuous inward current through the pipes.

**APPARATUS FOR LIFTING OR ASSISTING TO LIFT WINDOW-SASHES AND OTHER LIKE FRAMES.**—Dated November 23, 1864.—At present balance-weights are employed to lift or assist in lifting window-sashes of the class known as "guilotine," and the object of this invention is to

substitute for the weights an apparatus which, while producing similar effects, avoids the inconveniences attendant upon the employment of weights. The apparatus consists of a spring barrel, to which one end of the ash-line, band, cord, or chain is attached, while the other end is attached to the sash-frame, and is carried over a pulley in the usual manner. To every sash-frame the patentee applies two such apparatuses, one for each sash-line. As soon as the sash-frame, supposing it to be the under one, is commenced to be raised, the springs come into play, lift or assist in lifting the sash, and wind the sash-lines upon the barrels. The apparatus is applicable to other frames as well as window-sashes, which have an up-and-down movement.

**PORTABLE WATER-CLOSETS.**—*J. H. Wilson.* Dated June 29, 1864.—The object of this invention is the construction of water-closets in such a manner that the pan, cistern, valves, and other parts thereof, connected together in such a way that they can be removed as a whole, and when placed in any convenient position, on board ship or other place, and connected to a soil-pipe, are at once ready for use. In some cases the patentee attaches the soil-pipe to the apparatus before leaving the manufactory. The invention consists simply in the use of a pan formed, by preference, of cast-iron, enamelled internally, and uncoated or otherwise ornamented externally, and supported on suitable feet or rests, which are cast with or attached thereto. The supply-cistern is placed so as to spring up from the upper edge of the back of the closet-pan, and may be of one piece therewith, or be permanently attached thereto. The supply-cistern, on the side immediately above the pan, is so shaped curved, or recessed, as to form an easy back to the closet-seat.

#### Miscellaneous.

**THE LATE MR. C. O. PARNELL.**—Professor Hayer Lewis writes,—As one of the intimate friends of the late Mr. C. O. Parnell, allow me to set right a statement in your pages, that "he had gone to Baden in hope of relief from painful illness." He left London in apparently the best of health and spirits, on the 17th July, for his annual vacation of a month. The intense heat of the weather brought on a low fever, from which he was not able to rally, and he expired on 27th July, from pure prostration.

**LEAD-POISONING.**—Since we first drew the public attention, many years ago, to poisoning by water in which lead was dissolved, as by the action of certain qualities of water on lead cisterns and pipes, various instances of lead-poisoning through the impregnation of water with lead have been discovered and remedied; and we now observe that a correspondent of the *Times* instances a case in which water boiled in tinned vessels has been found to have produced symptoms of poisoning by lead. The tin used in lining the domestic vessels is said to have been discovered to be adulterated with lead, or to have been an alloy of tin with lead. We should rather feel inclined, however, to regard the introduction of lead in this case as being accidental rather than intentional. The *Times* correspondent wishes to know "whether there be any coating for iron which would resist heat and the ordinary action of water, and which could be substituted for what is called tin." He does not seem to be aware that of late years enamelled pots and kettles have been very much used instead of tinned ones. They appear to be quite capable of resisting heat so long as they contain water or moisture. The same writer gives the following as an easily applied test for lead in water:—"Take two tumblers: fill one with water which is known not to have been in contact with lead: fill the other with the suspected water. Dissolve in each about as much bichromate of potash as will stand on a groat. By daylight the water in each tumbler will be of the colour of pale sherry and water. Cover the tumblers so as to keep out dust, and let them stand in a warm place in a room with a fire in it for twenty-four hours. If the suspected water be free from lead it will still have the same colour as the other; but if there be lead in the water it will have a more or less opalescent tint, as if a drop or more of milk had been put into it. If there be a great quantity of lead in the water, a very slight film of lead will be deposited on the glass. Bichromate of potash can be got of good druggists, and a few drachms will be enough to test many samples of water."

\* Selected from the *Engineer's Lists*.

AN INTERNATIONAL ARCHAEOLOGICAL CONGRESS is to be held at Antwerp next year. The Archaeological Academy of Belgium have appointed a commission to make the arrangements.

THE SEWERAGE OF WOOLWICH.—Operations have been commenced in Beresford-square, Woolwich, for the purpose of diverting part of the drainage of the town into the new southern metropolitan outfall-sewer. The contract has been taken by Messrs. Hill & Keddell, the well-known contractors, of London, at a cost of 8,910*l.*, and will be carried out under the experienced superintendence of Mr. J. Hoghton and Mr. John Barnett, engineers to the Metropolitan Board of Works.

PROPOSED MEMORIAL CROSS AT NEWLAND.—The warden of the Beauchamp almshouses has given the work of designing and erecting a cross on the site of the old parish church of Newland, to Mr. Forsyth, of Worcester, sculptor. The cross will stand on the ground covered by the sanctuary of the old church; and from the base of the steps surrounding the pedestal, to the summit, will be 23 ft. high. In character, the work will be similar to that of an Irish cross. The shaft and a portion of the base will be constructed out of a light grey-coloured Staffordshire stone. There will be trefoils in the arms of the cross, and on the west the centre will bear the sacred monogram in inlaid black marble. Beneath this, the western side, the shaft will contain an inscription denoting that the cross is intended to commemorate the spot whereon the old church stood. The east, north, and south faces will each have an inlaid black marble cross. Part of the base will be of red Mansfield stone, with a band of black marble running above. There will be a flight of three steps on which the base will stand, the dimensions of the outer steps being 14 ft. square.

THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.—The preparations at Birmingham are, in every department, in an advanced state, and there is every promise that the meeting will be one memorable in the history of the Association. The president of the Association is Mr. John Phillips, M.A., LL.D., F.R.S., F.G.S., &c., Professor of Geology in the University of Oxford. The manufacturing industries of Birmingham and the district, the striking geological feature of Dudley and the South Staffordshire coal field, and the beauty and interest of the neighbouring towns of Lichfield, Stratford, Worcester, and Malvern, to which pleasant excursions have been arranged; the central position of Birmingham, and the good accommodation available for the sections, will insure the scientific interest and general success of the meeting. The chief railway companies will convey members and associates at a single fare for the double journey, from Monday, September 4, to Saturday, September 16, inclusive, on the presentation of a pass-ticket, signed by the local secretaries. The following is the programme for the Evening Meetings: Wednesday, September 6, 8 p.m., Inaugural Address; Thursday, September 7, 8 p.m., Soirée and Conversazione; Friday, September 8, 8.20 p.m., Lecture by Mr. J. Beete Jukes, M.A., F.R.S., Local Director of the Geological Survey of Ireland, &c., "Probabilities as to the Position and Extent of the Coal Measures beneath the Red Rocks of the Midland Counties; Monday, September 11, 8.30 p.m., Private Dinner given by the mayor; Tuesday, September 12, 8 p.m., Soirée and Conversazione. Arrangements have been made for the following excursions, programmes of which will be issued:—Saturday, September 9: 1. Warwick and Stratford-on-Avon; 2. Coventry and Kenilworth; 3. Worcester and Malvern; 4. Wroxeter, Shrewsbury, Wenlock, The Wrekin, and Coalbrookdale. Thursday, September 14: 5. The Dudley Caverns, the South Staffordshire Coal Fields and Ironworks; 6. Lichfield, Walsall, Gannock Chase, and the Burton Breweries. The sections will be presided over by the following gentlemen:—Section A.—Mathematical and Physical Science: Mr. W. Spottiswoode, M.A., F.R.S. Section B.—Chemical Science: Professor W. A. Miller, M.D., F.R.S. Section C.—Geology: Sir R. I. Murchison, K.C.B. Section D.—Zoology and Botany: Professor Thompson. Sub-section D.—Physiology: Professor Acland, M.D., F.R.S. Section E.—Geography and Ethnology: Sir Henry Rawlinson, F.R.S. Section F.—Economic Science and Statistics: The Right Hon. Lord Stanley, F.R.S.,—and Section G.—Mechanical Science: Sir W. G. Armstrong, C.B., F.R.S.

THE BROUGHAM DINING HALLS, FLEET STREET. We direct attention to the opening of this establishment, which is set on foot by a company, under the auspices of Lord Brougham, Mr. Blanchard Jerrold, and others, to provide cheap and wholesome dinners to classes who have been hitherto in the habit of having only unwholesome whilst dear food.

THE NEW LAW COURTS.—On Monday, and for some days past, workmen were busily employed in converting the old Insolvent Debtors' Court, in Portugal-street, into a court for the commissioners appointed in connexion with the new law courts. Considerable alterations are being made for the accommodation of the public. The commissioners, it is expected, will commence business in about a month or six weeks, towards the end of the long vacation.

NEW AMERICAN FURNACE.—The *American Artisan* gives particulars of a patent just issued to Horace Boardman, for an improved iron-making furnace. A smelting or reducing fire in combination with a gas or combustion chamber, with tuyères for admitting atmospheric air, and provided with openings in the division-wall between the reducing fire and a gas or combustion chamber, is so arranged as to permit the ignited gases at a high temperature to act directly upon the ore while it is in contact with the carbonaceous fuel within the reducing fire; the gases being at the same time aided in their passage through the openings in the division-wall by a vacuum in the upper portion of the reducing fire by means of a steam-jet or any equivalent device. This smelting or reducing fire may also be combined with a reverberatory furnace and a balling-hearth, so that the converted ore, in a metallic state, can be separated from the cinder or slag, and be balled ready for the shingling-hammer, while the escaping gases from the grate of the reverberatory furnace, having been applied to heat the balling-hearth, are conveyed to the gas-chamber, and after receiving a second portion of oxygen are made to aid in smelting and deoxidising the ore; thus greatly reducing both the consumption of fuel and the labour in the process of making wrought-iron.

THE PARKS.—In the Green Park, a ride is being formed from the corner opposite Buckingham Palace, to the turnings into Pall-mall, at Stafford House. The railings have been taken down, and will be re-erected several yards back into the park. There is already a ride from Buckingham Palace to Storey's-gate, parallel with Birdcage-walk. It is said that there is to be another, from Notting-hill-gate to the Marble-arch,—and that Cumberland-gate and Hyde Park-corner may eventually be similarly connected. Equestrians could then go in comfort between Notting-hill and the Marble-arch, Hyde Park-corner, Albert-gate, Kensington, Constitution-hill—where a ride has not yet been made—Birdcage-walk to the Houses of Parliament, and along the Green Park now ride to Pall-mall and the clubs. In Regent's Park there is only a gravelled siding, and no regular ride. The arrangements for forming a park for the south-eastern portion of the metropolis are now completed, the Metropolitan Board having, after eight years' deliberation, fixed upon a site and concluded negotiations for its purchase. The site consists of 65 acres of land in the parish of Rotherhithe, bounded by Jamaica Level, Union-road, the Rotherhithe New-road, and the South-Eastern Railway. The board will be put in possession of the fee on the 29th of next month, when the purchase-money, 58,000*l.*, will be paid. A loan of 80,000*l.* will be negotiated by the Board, for the purchase of the land and for laying out the park. Of the 65 acres, only 45 acres will be devoted to the purposes of the park; the remainder will be appropriated to building plots, and a road to encircle the park; so that the Board will be re-couped a portion of its outlay. But it will be necessary to remove some of the nuisances in the locality, which the local authorities have not been successful in removing. Thus the Atlas Manure-works, close to the site of the park, still emit at times vapours not only detrimental to health, but also destructive to the vegetation in the surrounding fields, so that the park trees and shrubs would be destroyed in the same manner. Mr. Salmon's manure-works have been recently located in the same neighbourhood; and not far removed from the farther side of the park is a monstrous pigstye; whilst beyond this again there are railway arches in which chemical operations are carried on, giving rise to choking, burning, and oppressive vapours.

THE BRITISH ARCHAEOLOGICAL ASSOCIATION.—The meeting at Durham is satisfactorily progressing. On the 23rd, a description of the cathedral was given by Mr. Gordon Hills.

THE ANGLo-FRENCH EXHIBITION AT THE CRYSTAL PALACE.—Mr. Blanchard Jerrold has undertaken to look up the French exhibitors, and send over the articles which have not yet arrived for this exhibition. The committee purpose giving a dinner to the French exhibitors before long. Mr. Coningsby says that they will do this, even if unaided; but some assistance would enable them to provide an entertainment more worthy of themselves and of the acceptance of their guests; and they are quite willing to accept aid from those who may wish to render it. We hope they will have every success.

CHURCH OF ST. PUDENTIANA, ROME.—Mr. S. W. Tracy asks us to mention that he made surveys with measurements, which he believes are the only ones, of this church, and that he also made the drawings from which the illustrations in the *Illustrated London News* were engraved. He adds:—"In addition to the drawings above referred to, I have a ground-plan of the church, and a sketch of the well down which tradition says the mutilated remains of the Christian martyrs were thrown, by way of sepulture, by St. Pudenciana and her sister, the daughters of Pudens, in whose house the church was formed. I reserve for a future occasion any remarks on the evidences afforded by the existing remains and the opinions recently expressed by others on this subject. Some interesting paintings are still to be seen in a portion of the crypt under the modern church, now converted into a family vault."

THE IRON AND COPPER TRADES.—*Ryland's Circular* of 19th August gives the following quotations:—Manufactured Iron.—South Staffordshire: marked bars, 8*l.* 10*s.*; hoops, 9*l.* 10*s.*; sheets, singles, 10*l.*; doubles, 11*l.* 10*s.*; latens, 13*l.*; angles, 8*l.* 5*s.* to 9*l.*; gas strips, 8*l.* to 8*l.* 10*s.* The commoner makes of the district in bars are being quoted at 7*l.* 10*s.* to 8*l.* at works; puddled bars, 6*l.* 2*s.* 6*d.* to 6*l.* 7*s.* 6*d.*; scrap bars, 6*l.* 10*s.* to 7*l.*, according to quality.—North Staffordshire: bars, 7*l.* 10*s.* to 7*l.* 15*s.*; best, 8*l.*; best best, 8*l.* 10*s.*; best T iron, 9*l.*—Welsh bars, 6*l.* 15*s.* to 7*l.*; Welsh rails, 7*l.* 2*s.* 6*d.* to 7*l.* 5*s.* at works. These prices are quoted as "at works." The copper market remains quiet, but very firm, at the following rates: tough, 86*l.* per ton; best selected, 89*l.*; manufactured, 93*l.*

PANIC OF FIRE IN A CHAPEL.—Brickfields Congregational Chapel, Stratford, has been the scene of a great excitement in consequence of an alarm of fire in the midst of the service. The first lesson was being read, when many of the congregation exhibited great uneasiness at a smell of fire. As the smell became stronger, the chapel-keeper, fancying he saw smoke issuing from the vestry-door, walked down the aisle for the purpose of ascertaining the truth of the case. On opening the door a volume of smoke rushed into the chapel, and then indescribable fear and confusion ensued. The cry of "Fire" having now been openly raised, the fear of the congregation was increased by another cry, "Take care that the gas does not explode." It required all the coolness and courage of the most prudent to guard against a terrible catastrophe. There was a general rush to reach the doors, and it being between the lights, and the chapel fast filling with smoke, the excitement was rendered still worse by the darkness of the place. As the outlet at the doors was blockaded, and people could not get out quickly enough, many jumped over the pews, and endeavoured to reach the doors by scrambling over the heads and shoulders of others. Shrieks for help now came from the gallery, the staircase of which was literally crammed; and it was only by the greatest efforts that some in their uncontrollable fright were prevented from jumping into the body of the church. At length the chapel got cleared. Provisionally, though the excitement had been great, there was really little damage done. It appeared from the statement current, that the officiating minister had been out for the afternoon, and, having been smoking, had, on coming into the vestry, put the remaining part of his cigar into the pocket of his overcoat, which he hung up. In the pocket were some fuses, which appear to have ignited and set the coat smouldering, besides other woollen things in the vestry. There was nothing highly inflammable; or, added to the excitement, the consequences would have been disastrous.

**THE SUEZ CANAL.**—According to a telegram from Ismail, dated August 17th, the floodgates of the Suez Canal have been thrown open, and a vessel laden with coal passed direct from the Mediterranean to the Red Sea on the 15th inst. Intelligence of the event was at once despatched to the Emperor Napoleon at the Chions camp, and his Majesty returned a congratulatory reply. So many accounts previously have appeared of the actual termination of the undertaking, that it is necessary to remark that the size of the vessel is not stated, and that much must assuredly remain to be done before the waterway across the isthmus will be available for sea-going vessels of ordinary dimensions. That the work will ultimately be completed according to the design, may, however, be regarded as probable. Since these words were in type, a letter has appeared in the *Times*, asserting that what is open must be no more than a fresh water canal, of not more than 3 ft. to 5 ft. in depth.

**ANCIENT EGYPTIAN FASHIONS.**—The Egyptians shaved their heads and chins, and looked with abhorrence on the rough-haired and long-bearded Asiatic nations. They only allowed their hair and beard to grow when in mourning, and looked upon it in any other circumstances as a sign of low and slovenly habits. Most of them wore their shaven pills, wigs made of curled hair, with a series of plaits at the back. Poor people, who could not afford the expense of real hair, had their made of black sheep's wool. By a singular contradiction, the great people wore artificial beards, which they likewise affixed to the images of their gods. The beard of an individual of rank was short and square; that of a king equally square, but much longer; and that of a god was pointed and turned up at the end. Ladies wore their hair long, and worked into a multitude of small plaits, part of which hung down their back, and the remainder descended on each side of the face, covering the ears completely. They generally had an ornamental fillet round the head, with a lotus-bud in front by way of a *ferrière*. Some of the *crème de la crème* indulged in a head-dress representing a peacock, whose gorgeous plumage set off their dark tresses; and princesses were usually distinguished by a coiffure of extraordinary dimensions, combining all the riches of the animal, vegetable, and mineral kingdoms.—*Himmel's Book of Perfumes.*

**TENDERS**

For rebuilding 44, Chancery-lane, Mr. J. Blyth, architect:—  
 Piper & Wheeler ..... £2,614 0 0  
 Foxley ..... 2,573 0 0  
 Mansfield ..... 2,529 0 0  
 Patman ..... 2,498 0 0  
 Myers ..... 2,471 0 0

For building new warehouse, and alterations to old ditto, at Aldermanbury Postern. Mr. T. J. Hill, architect:—  
 Hardiman & Sanden ..... £1,530 0 0  
 Heaslow ..... 1,447 0 0  
 Lovett & Brown ..... 1,425 0 0  
 Turner & Sons ..... 1,345 0 0  
 Bishop ..... 1,321 0 0  
 Sahey ..... 1,284 0 0

For additions to Woodlands Parsonage, near Reading. Mr. J. H. Money, architect:—  
 Rabbits ..... £255 0 0  
 Salisbury ..... 224 10 0

For the erection of new buildings, with furnace-shaft and storeroom, in connection with the Albert Oil Mills, Hammersmith. Mr. G. H. Simmons, architect:—  
 Accepted ..... £4,815 0 0

For St. Stephen's Church, Dulwich. Messrs. Banks & Barry, architects. Quantities supplied by Messrs. Strudwick & Co.:—  

Church.	Honse.	Total.
Carruthers	£9,477	£2,087
Colls & Son	9,190	2,790
Brown & Robinson	9,384	2,055
Ennor	9,139	2,290
Ferry & Co.	9,324	1,514
Savay	8,879	2,233
Stimpson	8,535	1,950

For alterations and additions to Syston Lodge. Mr. R. W. Johnson, architect:—  
 Bland ..... £320 0 0  
 Neale ..... 514 15 0

For works to be done in restoration of All Saints' Church, Somerby, Leicestershire. Mr. R. W. Johnson, architect:—  

Church.	Chancel.	Total.
Holliday & Case	£ 8. 0.	£ 8. 0.
Barnes & Weaver	1,177 10 0	185 0 0
East	1,139 2 0	121 15 0
Morrison & Finkler	1,655 17 3	142 0 9
Rupell & Johnson	958 0 0	162 15 0
	844 10 0	139 10 0

For house and shop, at Britton, for Mr. J. W. Clarke. Mr. A. J. Hiscock, architect:—  
 Adamson & Sons ..... £2,375 0 0  
 Aris & Sons ..... 2,100 0 0  
 J. Taylor ..... 2,100 0 0  
 Rider & Son ..... 2,088 0 0  
 Melachlan ..... 1,993 0 0  
 Colls & Son ..... 1,994 0 0  
 Marsland & Sons ..... 1,976 0 0  
 Over ..... 1,951 0 0  
 R. Taylor ..... 1,539 0 0  
 West & Morse ..... 1,280 0 0  
 Neale ..... 1,885 0 0  
 Sharpe ..... 1,885 0 0  
 Pearce & Stone ..... 1,784 0 0

For three houses in Melton. Mr. R. W. Johnson, architect:—  
 Flude ..... £739 0 0  
 Porter ..... 737 0 0  
 Glover ..... 719 0 0  
 Barnes & Weaver ..... 671 0 0  
 East ..... 639 0 0

For alterations at Rotherby, Leicestershire. Mr. R. W. Johnson, architect:—  
 Neale ..... £390 0 0  
 Pearson & What ..... 335 0 0

For villa residence in Northamptonshire. Mr. R. W. Johnson, architect:—  
 Watkin (accepted) ..... £1,550 0 0

For alterations on the estate of Mr. W. A. Pochin. Mr. R. W. Johnson, architect:—  

At Barkby	Thorp.	Grange.	Total.
Neal	£315 0	£196 0	£511 0
Duxberry	308 19	199 5	498 15
Bland & Sons	305 15	183 17	489 12

For first portion of works in restoration of St. Michael's Church, Edmoutherpe, Leicestershire. Mr. R. W. Johnson, architect:—  
 Weaver ..... £555 17 0  
 Halliday & Case ..... 491 16 0  
 East ..... 475 10 0

For improved dwellings for the industrial class<sup>865</sup>. Southampton. Messrs. Guillaume, Parmenter, & Guillaume, architects:—  
 Day ..... £4,625 0 0  
 Adams ..... 2,280 0 0  
 Phillips ..... 2,216 0 0  
 Gambling ..... 3,159 0 0  
 Brown ..... 3,159 0 0  
 Hill & Sons ..... 3,155 0 0  
 Sanders ..... 3,100 0 0

For the new Borough Gaol, Hull. Mr. David Thorp, surveyor to the Corporation:—  
 Neal ..... £20,933 0 0  
 Hutchinson ..... 59,450 0 0  
 W. & J. Hall ..... 59,424 18 2  
 Musgrave ..... 59,238 0 0  
 Simpson & Malone ..... 59,216 16 1

For three houses at Croydon, for Mr. W. Chambers. Mr. J. Tolley, architect:—  
 Day ..... £2,550 0 0  
 Day ..... 2,400 0 0  
 Pollard ..... 2,243 0 0  
 Lose ..... 2,144 0 0  
 Richards (accepted) ..... 1,987 0 0

For residence at Croydon. Mr. R. C. Baxter, architect:—  
 Rawlings ..... £2,987 0 0  
 T. Mason ..... 2,280 0 0  
 Colls & Jay ..... 2,791 0 0  
 Hill & Keddell (accepted) ..... 2,647 0 0

For Presbyterian Church, Tottenham. Messrs. Haiberston & Pitt, architects:—  
 Wood ..... £1,969 0 0  
 Humphrey ..... 1,950 0 0  
 Simpson ..... 1,949 0 0  
 Sanders ..... 1,895 0 0  
 Clarke ..... 1,689 0 0  
 Cushion ..... 1,640 0 0  
 Rogers ..... 1,619 0 0  
 Hill & Keddell (accepted) ..... 1,596 0 0  
 Ramsay ..... 1,583 0 0

For schools and master's residence, Chicksand-street. Mr. T. Stately, architect:—  
 Maers ..... £1,800 0 0  
 Little ..... 1,884 0 0  
 Dudley ..... 1,880 0 0  
 Hill & Keddell (accepted) ..... 1,807 0 0

For bar fittings, &c., complete, for Mr. Harris, at Nos. 5 and 6, Richmond-place, Barnsbury. Mr. C. Foster, architect:—  
 Lawrence ..... £280 0 0  
 Starke ..... 224 0 0  
 Davey ..... 215 0 6  
 Sparrow ..... 210 0 0  
 Smith ..... 207 0 0  
 Davies ..... 169 0 0  
 Stone ..... 93 0 1

For alterations, &c., at 34, Charles-street, Middlesex Hospital, for Mr. Fortescue. Mr. C. Bradley, architect:—  
 Stableford ..... £468 10 0  
 Wicks ..... 453 0 0  
 Hailey ..... 432 0 0  
 White (accepted) ..... 406 15 0

For Church of St. John the Evangelist, Brentford. Mr. J. T. Jackman, architect:—  
 Osborne ..... £2,128 0 0  
 Cowland ..... 1,730 0 0  
 Gascyne ..... 1,810 0 0  
 Jackson ..... 1,890 0 0  
 Nye ..... 1,654 0 0  
 Adamson & Sons ..... 1,651 0 0

For rebuilding No. 177, Piccadilly, for Mr. James Toovey, bookseller. Mr. Josiah Houle, architect:—  
 J. & W. Bird ..... £3,735 0 0  
 J. & C. T. Anson ..... 3,639 0 0  
 Patman & Fotheringham ..... 3,610 0 0  
 Mansfield & Son ..... 3,580 0 0  
 J. & W. Sanders ..... 3,490 0 0  
 Keyes & Head ..... 3,469 0 0  
 Little ..... 3,462 0 0

For house at Teddington, for Mr. R. C. Carrington. Mr. J. T. Jackman, architect:—  
 Brunson ..... £375 0 0  
 Hiscock ..... 658 0 0

For St. Mary's National Schools, Wandsworth. Mr. J. W. Dennison, architect. Quantities by Mr. Staehau:—  
 Bowley, Brothers ..... £1,890 0 0  
 Avis & Sons ..... 1,728 0 0  
 Nicholson ..... 1,709 0 0  
 Adamson & Sons ..... 1,692 0 0  
 Galland & Thomson ..... 1,650 0 0  
 Taylor ..... 1,639 0 0  
 Scott ..... 1,595 0 0

For building two houses in Park-road, Battersea, for Mr. John Riches. Mr. C. Bowes, architect:—  
 Lathey, Brothers (accepted) ..... £590 0 0

For alterations at No. 10, Bush-lane, Cannon-street. Mr. F. H. Williams, architect:—  
 Gammon & Sons ..... £1,039 0 0  
 Ryder ..... 948 0 0  
 Ennor ..... 948 0 0  
 Wren ..... 724 0 0

For rebuilding No. 5, Carburton-street, Marylebone, for Mr. Taylor. Mr. Edwin Bull, architect. Quantities supplied:—  
 Mannoch & Co. ..... £900 0 0  
 Huggell & Hussey ..... 828 0 0  
 Grover ..... 685 0 0  
 Duncanson ..... 637 0 0

For first contract for St. Stephen's Church, Kensington. Mr. J. Peacock, architect:—  
 Manley & Rogers ..... £8,377 0 0  
 Jackson & Shaw ..... 8,343 0 0  
 Mansfield & Son ..... 8,291 0 0  
 Wells ..... 8,189 0 0  
 Myers & Sons ..... 8,159 0 0  
 Dove, Brothers ..... 8,085 0 0  
 Carter & Carter ..... 7,983 0 0  
 Simms & Martin ..... 7,777 0 0

For the erection of a villa, in the London-road, Devizes, for Mr. W. Brown. Mr. Weaver, architect:—  
 Long ..... £4,995 0 0  
 Plank & Ash ..... 1,680 14 0  
 Radell ..... 1,655 0 0  
 Mullings (accepted) ..... 1,609 0 0

For the erection of a pair of villas, in the London-road, Devizes, for Mr. J. Shilstone. Mr. Weaver, architect:—  
 Mullings (accepted) ..... £1,668 0 0

For taking down and rebuilding schools, at Potterne, Wilts. Mr. Weaver, architect:—  
 Watts (bricklayer, slater, and plasterer) ..... £233 10 0  
 Davis & Sprules (carpenters) ..... 135 10 0  
 Crudge (plumber, glazier, &c.) (accepted) ..... 15 10 0

For building an additional wing to the male side of the Wilts County Lunatic Asylum. Mr. Weaver, county surveyor, architect:—  
 Long ..... £1,842 10 0  
 Mullings (accepted) ..... 1,810 0 0

For alterations and additions to Nansuch House, near Chippenham, Wilts, for Rev. M. Brown. Mr. Weaver, architect:—  
 Piminger ..... £375 0 0  
 Plick & Ash ..... 310 0 0  
 Downing & Son (accepted) ..... 310 0 0

For the erection of a Viearage House at Laock, near Chippenham, for Rev. E. P. Nicholl. Mr. Weaver, architect:—  
 Mullings ..... £1,983 0 0  
 Long ..... 1,975 0 0  
 Downling & Son (accepted) ..... 1,650 0 0

For alterations and additions to warehouses, No. 39, Red-cross-street, for Mr. T. Loveridge. Mr. H. Ford, architect:—  
 Rawlins (accepted) ..... 616 15 0

For new warehouse front, &c., No. 15, Noble-street, for Messrs. Tubbs & Lewis. Mr. H. Ford, architect:—  
 Hardiman & Sanden ..... £247 0 0  
 Rawlins ..... 369 0 0  
 Hills & Sons ..... 362 0 0  
 Lark ..... 348 0 0  
 Prince ..... 268 0 0  
 Palmer & Son ..... 195 0 0

# The Builder.

VOL. XXIII.—No. 1178.

Out and About: in Derbyshire.

DERBYSHIRE presents remarkable variety, and offers something to interest most minds,—suit most tastes. The lover of nature, the lover of art; the inquirer as to progress, the student of Mediæval practices and powers; the invalid in search of health, and the eager spirit seeking excitement and pleasure, may each there find what he wants, and a great deal more. Starting from London, take a run, for example, to Derby, then to Dove Dale, to pleasant Rowsley, where the Wye is lost in the Derwent, and whence you attack Haddon Hall and Chatsworth, and make a trip to vulgarized Matlock; get

across the country to Chesterfield, for the purpose of viewing Hardwick Hall, Bolsover Castle, and Wingfield Manor House; and then rail away to Buxton, and the route will include several churches of interest, many remarkable sepulchral monuments, some historic houses of world-wide fame, rich with associations; a large number of fine pictures, several wonderful caverns, Nature's architecture, sparkling with gems; not to speak of man's work, that has opened them: and some of the loveliest views of moor, of mountain, and of plain, that ever gladdened eyes and filled the heart with delight and thankfulness. One is tempted to exclaim with an untaught poet of a more northern county,—

"Look round on this world,—it is sweet, it is fair;  
There is light in its sky, there is life in its air;  
Sublimity breathes from the forms of its hills,  
And beauty winds on with its rivers and rills;  
The dew, as with diamonds, its meads hath besprinkled;  
From its groves are a thousand wild melodies sent;  
While flowers of each tint are by morning impregnated:  
Oh! why is there woe in so lovely a world?"

But we will think not of the woe in the world just now; only of the pleasant, elevating, and instructive things that are to be found in it, and especially in this part of it; and will seek by a little gossip on the line we have indicated to interest in it such of our readers as do not happen to know the places included, and to awaken the recollection of those, doubtless the much larger proportion, who are already acquainted with them. The tourist student taking this road should not forget his sketch-book, and might return by way of Manchester, Chester, Shrewsbury, Hereford and Gloucester, or Worcester,—of this part of the business, however, some other time.

Derby, the *Derwent-ly*, or Derwent town, of the Saxons and Danes (first from the Celtic *Dar*, water), has little of its old architecture now to show. The ugly red bricks of the locality are at present used with little pretence to taste. Few modern red-brick towns in England, by-the-by, are pleasing to the sight. A new church of some size is growing up not far from the railway-station, the west front "inspired" by that of Tintern Abbey. The fine, well-known Perpendicular tower of All Saints' is hampered with a wretchedly ugly church tacked on to it, by Gibbs, in 1725. The Albert memorial win-

dow, by Clayton & Bell, which has been set up at the east end of the chancel, is richer in colour and more effective than the majority of modern works. We had not an opportunity, however, to examine it properly. Some modern monuments in the church deserve more than a look, including one to that Elizabeth Countess of Shrewsbury, the noted "Boss of Hardwick," who built so much in the county. This remarkable woman married four times, and raised herself to greater power each time. Her second son, William, was the first Duke of Devonshire. It is well known that a fortune-teller asserted her death should not happen while she continued building. Whether because of this or not need not be asked; certain it is she built the original Chatsworth, Hardwick, and Oldcotes, and ultimately died during a hard frost, when the men had left of work! Her character has been variously painted. Fuller speaks of her as a woman of undaunted spirit and wit, beautiful and discreet, living a creditable and happy life; while Lodge says she was proud, selfish, and unfeeling, kept her husband in terror, and died immensely rich without a friend. She is said to have set up her own monument in All Saints' Church. It is noticeable how many good things the world owes to people who have been called bad by their contemporaries.

Kedleston Hall, Lord Scarsdale's place, four miles from Derby town, built by the Adams, Brothers, exactly a hundred years ago, has an entrance-hall of striking character, given by a range on each side of noble Corinthian columns of Derbyshire alabaster, with white marble capitals. These columns are 25ft. high. Waagen, in his "Art Treasures," describes them as "of one piece," and they have that effect, but examination shows that this is not the case, each being in two or three pieces cleverly put together. The ceiling is poor, the ornaments of genuine "Adalphi" character, and the colour of the walls is not well calculated to give the best effect to the columns; nevertheless this hall, 67 ft. long between the walls and 42 ft. wide, is unquestionably a fine one, and leaves an impression on the mind. The doorways of the withdrawing-room are formed with handsome columns and pediment of alabaster; the floor of the curved corridor that connects on each side the central building and its six-columned portico, on high stylobate, reached by handsome external flights of steps, with the wings, is an excellent piece of work; still, as in most of the buildings and art of the time, no hit of sentiment or feeling is to be found. The inscription, to his friends and himself (*Amicus et Sibi*), is, nevertheless, a feature in that direction. There are several good pictures,—a head, ascribed to Rembrandt, in the music-room; a fine Giordano; a curious landscape, with Scripture composition in foreground, by Do Momper, Velvet Brengel, and old Franks, conjoined; a particularly fine Claude; a head by Salvator Rosa; and some others; but notably the picture of Daniel foretelling ruin to Nebuchadnezzar, ordinarily attributed to Rembrandt, but by some, and with more correctness, as we venture to think, to Solomon Koningk, his worthy scholar and follower. Rembrandt would scarcely have painted such a Daniel,—the blot in the picture. This remarkable work was in the Manchester Great Exhibition, and may be remembered by the deceptively-painted opal in the king's throne, even by those who have forgotten the composition. Tradition and the housekeeper point to a picture over one of the doors as "Shakspeare, by Vandyeck." Who would not rejoice if these two respectabilities could be believed? Six and thirty small works, in Limonsin enamel, after a series of wood engravings by Albert Dürer, are so hung as to do them great injustice. Coming out, the Circular Saloon, 42 ft. in diameter, and 20 ft. more than that in height to the eye of the dome, will

commend itself to the attention of all who are interested in planning. The park is charming, and the church, close to the house, shows some bits of Norman work and two monuments below the paving, where in each case a sculptured head, in full relief, is seen within a quatrefoil opening. Heads, in such a position, of smaller size and in lower relief, are less uncommon.

Alton Towers, with its exquisitely beautiful grounds, its hill and dale, art and nature, come hereinto the ronto, but we have recently alluded to its beauties that we run on to Ashbourne Church, noted as a dated example of thirteenth century work. A small brass plate (perhaps 7 in. by 3½ in.), of some age, now in the church, gives the inscription, showing that the building was dedicated in the year 1241,—"*In honore sc. Oswaldi, Regis, et Martyris*," &c. The original inscription is engraved in Pegge's Sylloge, and reproduced in the "Companion" to the Oxford "Glossary." The chancel, large, and the north transept, have lofty lancet windows. Some valuable monuments to the Cockayne family are being injured by damp. Amongst the Boothby monuments, one of a child in quiet sleep is a good work by Banks. It has a pedantic inscription in English, Latin, Italian, and French.

The town itself is quaint and interesting, with many schools, almshouses, and other parochial structures scattered about; and the views of the valley in which it stands, seen when approaching it, are fine. Canning made it talked about years ago by these two lines in one of his "skits,"—

"So, down thy dale, romantic Ashbourne glides  
The Derby Dilly, carrying six insides."

The drive from Derby to Dove Dale is charming, too, though it is hard now-a-days, when sitting behind a pair of horses after a railway journey, to avoid remembering the little girl, who having ridden fifty miles in a train, then took a coach to her uncle's house, some five miles further, and being asked on her arrival if she had come by the train, replied,—"*We travelled a little way in the train, and then all the rest of the journey in a carriage.*"

Approaching the dale we reach Ilam, with its pretty prim cottages, built for effect, and a memorial cross, by Derick, after the fashion of that at Waltham, but including a fountain, inscribed to Mrs. Mary Watts Russell, by her husband, the owner of the estate. The inscription says,—

"Free, as for all these crystal waters flow,  
Her gentle eyes would weep for others' woe;  
Dried is that font; but long may this endure,  
To be a Well of Comfort for the poor."

This font, however, would seem now to be dry too, or, at any rate, drying. The water in the basin round the cross, when we were in the neighbourhood, had evidently been there for some time, and was not attractive. The disinclination of even water to run away at Ilam is understandable: it is certainly a pretty spot. Ilam Hall comes well into the picture; and, as we approach the Isaack Walton Hotel, Thorpe Cloud on one side (a truncated one as seen here though a pointed mountain viewed from behind), and Bunster Hill on the other, mark the entrance to the picturesque Dale. The name of the hotel alluded to will remind readers of the connexion of this beautiful piece of Derbyshire and Staffordshire (here the counties touch) with the well-known host of Fleet-street, "Father of angling," and his son-in-law, Charles Cotton, who has sung the merits of the Dove with brave words. The Tibor, the Tagus, and the Po cannot show such streams,—

"The Maece, the Danube, and the Rhine,  
Are puddle-water all, compared to thine;"

and Tame and Isis, when conjoined, are made to lay their trophies at its feet. This is simply stuff, but Dove-dale is a lovely place notwithstanding. The stream here smoothly flows, with its often-painted "stepping-stones," and there rushes impetuously through a narrower

channel and dashes itself into foam against fallen stones that impede it; while on either side tree-covered hills alternate with craggy masses of rock; in one part grass-land smiles, in another precipices frown. The view from the Lover's Leap (of course there is a lover's leap) is truly grand; including an amphitheatre of Scotch firs, ash, and beech, mixed up with limestone rocks of quaint shape. The more prominent rocks have names of old standing, and "Dove-dale Church," "The Sugar Loaves," and other masses are pointed out to the tourist. The "photographing gentlemen," as our guide put it, are changing the names; why or wherefore does not seem clear. Thus on their views they call the group long known as "The Twelve Apostles" "Tissington Spires North;" surely a stupid alteration. Do pray, gentlemen of the camera, leave the old names alone.

The path here and there is rugged, and in ascending to Reynard's Cave, the highest aim of the enterprising examiner of Dove-dale, the difficulty almost amounts to danger: at any rate, care and a steady head are necessary.

Ilam Hall, though just out of Derbyshire, must not be passed by us without a few notes and praises. It is one of the best of the modern Gothic houses created at the commencement of the present century. The first stone was laid in 1821, and the late Mr. Shaw was, we believe, the architect. As the residence of a private gentleman, not pretending to be a palace or a castle, it is complete and homogeneous. Good taste appears to have had direction over every part of it: nothing incongruous or poor meets the eye. The grounds, too, are charming, and the ancient village church within them, and near the house, harked by Thorpe Cloud, comes into the view from the windows. Why called Thorpe Cloud, by the way,—this mountain? Thorpe is the hamlet whence it springs, and the Cloud will be seen most days hanging lovingly around its shoulders. The Hall contains some fine pictures: two good Van Dycks, Landseer's "Dogs of St. Bernard rescuing a Traveller," a landscape by Gainsborough, a portrait of Congreve, who wrote at Ilam his comedy, "The Old Bachelor," which was produced in 1693, and part of "The Mourning Bride," produced in 1697; a charming sea-piece by Calcott, full of movement; a good picture by Opie, "The Dame School" (the head of the old woman worthy of Rembrandt), and Howard's "Pleiades and the Morning Star," suffused with poetic feeling. There is, too, an admirable bust of the late Mr. Watts, by Chantrey, who also executed an elaborate and beautiful monument to his memory, erected in the chancel here by him. In this, Mr. Watts is represented as rising from his bed, by the side of which are his only daughter and her children, who, it is understood, wait to receive his dying words. An open book in his hands, to which he is directing their attention, prevents the immediate recognition of this idea by one viewing the monument for the first time. It is, nevertheless, a work of high merit, and can scarcely be contemplated without some emotion. The church, mostly of the Decorated period, was restored not long ago by Mr. Scott: the font is Norman, rude and coarse.

And now away to Rowsley, with its model inn "The Peacock," dear to anglers, and indeed to all who like a pretty place, quiet kindly attention, and a good cook. Autumn is upon us:—

"Now sheaves are slanted to the sun  
Amid the golden meadows;  
And little sun-tan'd gleaners run  
To cool them in their shadows."

But all is at present green and fresh; we do not yet see those varied tints that make,—

"The gorgeous autumn woods so beautiful  
That even old Winter means, as he sweeps through,  
To spoil such solemn beauty."

In the neighbourhood a good deal of the land belongs to Mr. Whitworth, the well-known great-quantity maker. This includes Darley Dale stone-quarry, from which the getting of stone has been stopped, in order that it may be rendered, by planting, an ornament to the estate. Darley Dale Church is distinguished by the possession of a number of early gravestones, besides some that were taken away, and are to be seen in the museum of the late Mr. Bateman, not far off. Several noticeable incised stones are set up in the church, especially two, in memory of members of the family of Rollisley, in the sixteenth century; one of which, dated 1513, we have no hesitation in placing amongst the finest examples now remaining. The inscription around this—partly in Latin, partly in English—is very

curious; it runs thus:—"Hic jacet corpus Johes Rollislei armigri Elesabeit uxoris ejus thesauri dei qui jain the yere of owro Lord a thousand V. C. and thritten."

A stained-glass window, in memory of Raphael Gillum, put up not long ago, over archaic as it may be, displays by some of the figures a very tender expression, and gives those who will look into it something to think about. The very ancient yew tree outside, the tree which seems to mourn over what it shadows, measures 32 ft. in circumference in the largest part. We do not remember one bigger.

In Rowsley Charell stands the monument to Lady John Manners, by Calder Marshall and Forsyth, of which we gave an engraving some time ago. The lower part (arches and small marble columns) is rather confused; and the angles being taken off below the slab makes the tomb look somewhat top-heavy. The figure, however, is devout and charming, and the whole effect very praiseworthy. The floor of the little chapel in which the monument stands has a pavement of marble mosaics, by Tomlinson, of Bakewell, rich and satisfactory. The church, Norman in manner, was designed by Mr. Salvin the younger.

Close by is Haddon Hall, whose general external appearance is best seen approaching it from Rowsley. The building stands beautifully: well elevated and embowered in trees, above which appear its towers and battlements,—a capital skyline. Coming nearer, the bridge over the Wye leading up to its gate-house gives another picture, and entering the outer court the nineteenth century is quite out, and the mind may revert without difficulty to the men who fought for the Roses and those who danced with Elizabeth: to say nothing of that earlier time when the manor belonged to the Conqueror's son, Peveril "of the Peak." This old Hall has many ghosts for those who can see them; much music for those who can hear. Such practical gossip as we can get out of it will serve to begin another paper of jottings Out and About.

#### THE DURHAM CONGRESS OF THE BRITISH ARCHEOLOGICAL ASSOCIATION.

On Monday, the 21st of August, at Durham, commenced the twenty-second annual congress of this Association. The business of the meeting occupied the entire ensuing week. It will be remembered that the Association was induced to direct its steps to this interesting northern city by the invitations received from the University of Durham, the mayor and corporation of the city, the clergy, and local antiquarians. The results of the week have justified the invitations as much as they must have gratified the members of the Association and other visitors.

At 3 o'clock on Monday, Bishop Cosin's Hall, on the Palace Green, was filled to overflowing by the members and their friends assembled to receive his Grace the Duke of Cleveland, the president of the Association for the year. Amongst those present, the venerable Bishop of Exeter was noticed by all with especial interest and regard. Upon his arrival the Duke of Cleveland was introduced by Lord Houghton, and then delivered his inaugural address.

His Grace recommended the study of archaeology, and represented it in the light of a complementary science to geology. He alluded to the marks of the most remote periods of history as being less abundant than in some other counties, and then noticed the considerable and interesting remains of the period of the Roman occupation which the county of Durham possesses. He pointed out undoubted memorials of the Saxons and the Danes, and then described the richness of the city and its neighbourhood in monuments of Mediaeval times, both churches and castles. The Duke concluded his address with a warm tribute to the memory of two able and sincere friends of the Association and of the science of antiquity, viz. His Grace the late Duke of Northumberland and the Rev. Mr. Hartshorn.

After the delivery of complimentary addresses by the Venerable Archdeacon Bland on behalf of the cathedral authorities, the Mayor of Durham, and the Rev. T. Chevallier on behalf of the University, the Association proceeded to examine the castle, under the guidance of the Rev. G. Ormsby.

The castle is a noble pile of building, magnificently placed on the lofty and precipitous rocks above the river Wear. A castle was erected

here in the time of William the Conqueror, but Mr. Ormsby showed that it was hardly probable that any part of that edifice could now be traced. The castle soon became the possession of the prince-bishops of Durham, and was altered and enlarged by them at various periods. Hugh Pudsey, bishop from 1154 to 1193, must have raised a large part of what yet remains. Mr. Ormsby conducted the party to the upper story of an immense structure forming the northern side of the castle, where the walls still exhibit Norman arches and windows elaborately enriched with chevron ornaments according with the era of Bishop Hugh. The lower parts of this building are cased and concealed by works of various subsequent ages, and by modern fittings. Bishop Hatfield's hall, a magnificent apartment of the Perpendicular era, was examined. The ancient keep on a lofty mound is so transformed to the purposes of the students' lodgings of the modern university as to possess but little mark of antiquity. The entrance gateway to the castle has considerable remains of Norman work. The last point to which Mr. Ormsby led the way was what he believed to be the ancient chapel of the castle, perhaps the most interesting feature within it. He was inclined to assign to it an age coeval with William the Conqueror. It is situated in the basement, under Bishop Ingh Pudsey's work, and consists of three aisles or avenues, so narrow that a man may stretch his arms across from pillar to pillar. It is three or four bays in length (under 30 ft. long altogether), and was lighted by an east window to each aisle, and by some windows on the north side; upon which side, however, it is well nigh buried to the top of its walls in the ground. It is vaulted throughout, and the ancient pavement remains. The altar-space is raised one step, and the brackets which were above the altar yet remain.

The Rev. T. Chevallier doubted the possibility of using such a place for a chapel, and mentioned a suggestion made to him by a learned authority, that it must have been a water-tank.

Mr. Gordon Hills thought the building as old as the chapel in the Tower of London, and considered the features to mark it as a chapel so distinctly as to preclude all doubt on the subject.

In the evening, a public dinner, at which upwards of 200 persons sat down, took place in Bishop Hatfield's Hall, at which the Duke of Cleveland presided. His Grace was supported by the Bishop of Durham, Lord Houghton, the dignitaries of the cathedral, and members of Parliament for the city. The vice-chair was taken by the Mayor of Durham, and there was a full gathering of the members of the Association, with as many friends as the great hall would hold. Not a few who would gladly have been present were unable to obtain tickets, merely from want of space to receive them.

On Tuesday morning a party of about 100 persons started at an early hour to visit Lumley Castle, Chester-le-Street, the Roman station at Lanchester, and Lanchester Church.

Lumley Castle, which overlooks the Wear, at a few miles distance from Durham, was built by an ancestor of the Lumley family in the reign of Edward I, but much of the present building dates from about 1700. In the great hall, with its minstrel gallery, are nearly twenty large portraits, representing the ancestors of the family, commencing with its founder, Lulph, the Saxon. If these were genuine portraits, they would, of course, possess extreme interest to the antiquary; but they have long been suspected to be "counterfeit presentments" in more than one sense; and Mr. J. R. Planché confirmed this suspicion, and suggested that they were copies of old engravings worked up into a fanciful series of family portraits. The Rev. John Dodd, who acted as *dicarone* here, pointed out the chief objects of interest. Viscount Lumley was created Earl of Scarborough in 1670.

From Lumley Castle the party drove to Chester-le-Street, which was of old a Roman station, and was called by the Saxons Concastre. In 883 a bishopric was founded here, under Eardulph, the last Bishop of Lindisfarne, who found refuge in this spot from the Danes, bringing with him the body of St. Cuthbert; but in 995 the Danes ravaged the Northumbrian coast, and the bishop and monks fled to Ripon, hearing with them the remains of the saint. When the invaders retired, he and his followers set out on their return towards their deserted cathedral. But at Wardlaw, a hill on the south bank of the Wear—so the legend runs—the carriage containing the body of the saint became fixed, and the united efforts of the whole party

could not move it. Fasting and prayer for three days followed this phenomenon, and then the saint made known his wish to rest in Durham. However that may be, St. Cuthbert's remains were taken to the city, and Chester-le-Street lost its bishopric. The old cathedral at Chester-le-Street was of wood, but it was removed by Eggleic, about 1045, and a stone church erected in its place.\* In one of the aisles of the present building is a stone effigy, supposed to represent St. Cuthbert, really a priest of the thirteenth century. In the north aisle, called the Aisle of Tombs, are fourteen monuments—recumbent figures, with descriptive tablets above them—supposed to represent various members of the Lumley family, from the time of the Conquest down to the sixteenth century. The Rev. H. Blane, in his paper descriptive of the church, expressed some surprise that there was no notice of these monuments in Cough; but the inexorable Mr. Planché declared that he was not at all surprised at the omission, since Cough no doubt thought them of no value as monumental remains. Mr. Planché regretted to say anything which might give pain to those who cherished a feeling of reverence for these tombs; but there could be little doubt that with the exception of two in marble and one in sandstone, they were merely bad imitations of other monuments, and were, in fact, spurious.

From this point the party made for Lanchester. Close by the village, in a very commanding position, are the remains of a Roman encampment—no mere earthwork, but a walled station, with what was once solid, well-finished masonry. Dr. Collingwood Bruce, who gave an interesting description of the fortifications, *ambulando*, surmised that the Picts and Scots may have broken down the wall at various points, but the ruin has been chiefly wrought by those who looked upon the stonework as a valuable quarry, and built from the materials which it supplied farm-houses, boundary-walls, and mansions, ruthlessly using even the sculptured stones. The remains of the aqueduct, along with the altars and coins which have been from time to time found among the ruins, show what importance was attached to the station.

A heavy thunder-storm broke out while the visitors were under Dr. Bruce's guidance. Fortunately the village church formed a convenient and not a distant meeting-place, and here Mr. Edward Roberts undertook at short notice to point out some of the leading archaeological features. A fine Norman chancel arch, with later work of about 1220, and some fragments of painted glass in the vestry, were noticed. Dr. Bruce and the Rev. Mr. Greenwell clearly pointed out that the church had been chiefly constructed with material taken from the neighbouring Roman camp.

The weather was still most gloomy when the party, of whom a considerable proportion were ladies, left the village for Ushaw College, about four miles from Durham. Here they were received by the rev. president, Dr. Tate, and the Roman Catholic clergy, with unbounded hospitality, and were waited on by servants who evidently looked upon their duties as a labour of love. Solid food was in abundance, and wine flowed without stint. Mr. Headlam, M.P., the Judge Advocate-General, expressed the universal feeling when, in the name both of Association and visitors, he thanked the ven. president for the good cheer and the most generous reception accorded to them. Ushaw College is hardly more than sixty years old, so that of archaeological study in the strict sense there was none. Upon the destruction of the seminary at Donay, during the French Revolution, some portion of the inmates settled near Lanchester, and for their accommodation a college was begun and dedicated to St. Cuthbert. There are in the college some 300 students. Dr. Lingard, Cardinal Wiseman, and Mr. Justice Shee have been among the students of whom Ushaw is justly proud. The completeness of the arrangements for the accommodation of students, and the lavish and tasteful ornamentation of the chapels, could not be overlooked. So much of interest was to be seen, and so much remained unseen, that it was difficult to take leave of Ushaw; but the visit, necessarily hurried as it was, left most agreeable impressions on all the party. With some small misadventures in the thick darkness that prevailed, the return to Durham was safely accomplished.

\* This was succeeded in the thirteenth century by the existing structure when the church became collegiate. Of the work of 1045 a few broken stones only remain.

Wednesday morning, after the cathedral service, was devoted to a description of Durham Cathedral and its monastic buildings, by Mr. Gordon Hills, the party being assembled in the new library, anciently the monks' dormitory, to hear a preparatory discourse, after which they were conducted first to the cathedral and then over the monastic buildings. The general plan of the cathedral is that of a cross, with remarkable appendages at the east and at the west ends; that at the east end being known as the Nine Altars, and that at the west end as the Galilee. The present church was begun nine years after the introduction of the Benedictine monks. They were introduced in 1083. Bishop Carlisle, who began the present building, died only two years afterwards. Although Carlisle did not live to see much of his work completed, it continued to progress rapidly at the eastern end. The nave was raised to the roof under Ralph Flambard, who succeeded Bishop Carlisle, and held the see from 1099 to 1128; and, although there was no record of the final completion of the church, it must have been completed shortly after that period. A very remarkable building, of which Mr. Hills said he was sorry to say they could see little now, was the chapter-house, which was erected before 1140. It was remarkable for its apsidal end, the whole of which was pulled down near a century ago, and converted into a square room. There were one or two interesting remains of it in the room in which they then were, and among these were three large corbels—figures sustaining a weight on their heads—or, according to the Greek, *caryatides*, from which the vaulting sprung. There had been a fourth, but what had become of it he did not know. Before leaving the library, Mr. Hills showed that parts of the substructure of the deanery and refectory were older than Carlisle's cathedral, and evidently intended for a set of buildings on a smaller scale than was eventually carried out. He also pointed out that the monks in this monastery had inhabited that part usually assigned to the lay brethren, with the reasons which led to this deviation. The attention of his auditory was also directed to a drawing of Carlisle's church, by Mr. Robson, late architect to the dean and chapter, from which they would see the changes that had been effected in later times in the upper parts of the building. The party then proceeded to the cathedral, and Mr. Hills having taken a position at one of the pillars in the nave, said they were now in that part of the church which was erected by Ralph Flambard, and which extended from the cross arch to the west, being the nave of the church. He needed not, he said, to call their attention to the extraordinarily massive construction of the piers and arches—the circular piers being no less than 25 ft. 6 inches in circumference—but what he wished to point out was, that in the eastern part of the nave the arches had no ornamentation whatever, having only plain moulding, while at the bay in which they then stood (opposite the main entrance) they had chevron moulding which was continued up to the end of the church. They found that the vaulting was constructed with the same ornament, but with this difference between the two, that while everything to the top of the walls had round, or what was called Norman arches, the vaulting itself was of the pointed form. This had led to some misapprehension as to the date of the vaulting. He could not trace the mistake further back than to the writings of Brown Willis in the last century, who told them that Prior Melsomy vaulted the nave of the church between 1233 and 1244, but when they came to examine it they would find it impossible to believe that this could have been the case; and he thought they must rather conclude, seeing the way in which the vaulting harmonised with the ornamentation in that part of the body of the church, that, having carried up the walls under Ralph Flambard, the workmen commenced the roof and carried it on in the same ornamental style as that in which they had completed the nave. The probability was, that the vaulting was put on in Bishop Pudsey's time, and one reason for that opinion was the circumstance that the ornamentation was similar to that found in the Galilee or Lady Chapel, which was well known to have been constructed by him. The nave now was very bare indeed of ornamentation from what it was from the time it was first devoted to worship down to the Reformation, because at the Reformation the magnificent roof-screen, which was considered the choicest in the country, and an altar named after the Saviour, were removed from

henceforth the western arch of the central tower. Having referred to the several altars which stood in that part of the church, and to the spot where the sanctuary was situated, he drew attention to the line of blue marble in the pavement extending between the northern and southern doors. That, he said, was a great peculiarity in the building, for to the east of that mark no woman was ever permitted to go, up to the time of the Reformation. Various reasons had been given for such exclusion, which it was hardly worth while to quote; but it might simply be stated that it seemed to have arisen from the misconduct of certain monks at one of St. Cuthbert's monasteries, to which a nunnery was attached, and he resolved never again to allow men and women to be associated at any of his monasteries. The mark, however, might have had another meaning originally, for he had a strong suspicion that, in early times, there was some intention of shutting off the choir at that point. The Galilee Chapel at the west of the building was next visited. This chapel, Mr. Hills said, was erected by Hugh Pudsey, possibly towards the conclusion of his episcopate, which began in 1153, and lasted nearly forty years. In placing the chapel there the bishop stopped up and enclosed the ancient west door of the church. They were told he was led to erect that building to the worship of the Virgin Mary, and for the use of females, for whom, being at the time excluded from the rest of the church, it became necessary to provide some other place. This was perhaps one of the earliest lady chapels erected. One object which Bishop Pudsey had in erecting that chapel was to give a becoming surmise to the remains of the Venerable Bede. Bishop Langley, before the Reformation, caused a considerable alteration to be made in front of the great altar, and his own tomb to be erected there, and it was to him they owed the construction of the new flat roof, the roof having previously been pointed, and he also put in windows of a pointed character all through the west front, and constructed the massive buttresses over the river banks. The latest work which had been carried on at that part of the building was the reconstruction of the north side. The work was now finished, and he thought they had every reason to be satisfied with the admirable style in which it had been executed. The Nine Altars Chapel was next visited, when Mr. Hills called attention to the magnificent screen dividing the choir from the chapel. Right in the middle of the quadrangular space to the east of the screen was originally placed the shrine of the saint himself, where Bishop Carlisle's church originally terminated with an apse. The question of the identity of the body of the saint was one, Mr. Hills said, which was raised in very early times; for there were some people who disbelieved that the body could be preserved uncorrupted for so many years. When Abbot Turgot, by whom the main part of the church was erected, under Bishop Carlisle, prepared the place for the reception of the body of the saint, he caused an examination of the remains to be made, and it was found that the body was eased in more than one coffin, and carefully protected on the external coffin with hides, the body itself being wrapped in coco clothes, which were pressed so firmly that it was recorded by Reginald the Monk that he could not in any place insert his finger betwixt the cloth and the body. It is an opinion now pretty well received amongst medical men that such a mode of preservation would effectually retain the form of the body in almost lifelike appearance for a great number of years. That it was the identical body of the saint which had so long been preserved was conclusively shown, because some hundred years before that time it was reported to be so lifelike that the hair and nails were said to have grown upon it; and a certain monk was alleged to have been deputed to trim the hair and nails, Reginald recording that in the coffin were the scissors and comb which the monk had used. On the suppression of the monasteries in the reign of Henry VIII., the body was again examined on breaking up the shrine. The commissioners were surprised to see the body so perfectly kept, and orders were afterwards given for its reinterment. It remained undisturbed from that period till 1827, when Dr. Raine and other gentlemen, anxious to find out if the body was still in preservation, caused the ground to be opened; and although the outer coffin and the series of inner coffins were much broken, they were sufficiently whole to show that they were those described by Reginald. They found that the form of the body had been lost

and reduced to a mere skeleton; but amongst a number of relics they came upon the very comb which had been spoken of so many hundred years before, and which was now preserved in the library of the old refectory. Richard Poor, who was Bishop of Salisbury, and founder of that cathedral, became Bishop of Durham. Under him the first measures to raise money for the erection of the nine altars were taken, but he died two years before the work was begun, in 1242. The architecture is much like that of the church which they studied at their congress at Salisbury; and it also agreed in a remarkable manner with the Nine Altars at Fountains. Mr. Hills then referred to the nine altars which gave the name to the chapel, and the saints to whom they were dedicated, stating that the altars were originally divided from each other by oak screens of elaborate tabernacle work, and were each fitted up with canopies, chaises, cups, &c., everything of the most costly description. When inspecting the choir, he said that it was the most ancient part of the whole building, being that which was begun and erected in Bishop Carleph's time; but the vaulting he attributed to Abbot Melsouby, who built the Nine Altars. The magnificent structure on the south side of the choir, in what was called the Decorated style, was the tomb of Bishop Hatfield, erected in his own lifetime, and upon which he had placed a throne, which was still used as the throne of the bishops of Durham. Preceding to the transepts, Mr. Hills said that that part of the cathedral, as they would understand from the sketch by Mr. Robson, was not originally finished with a lofty tower as it was now seen, but in fact with a low Norman tower. The tower had seen very many vicissitudes; for not only was the Norman tower displaced, but a tower built by Hugh Darlington, a near successor of Melsouby, had also entirely disappeared. It was struck by lightning in 1429, and in part destroyed, and shortly afterwards the rest of the tower was found to be going to ruin. Of the history of the tower, as it was now seen, nothing was known until it was brought to light by Dr. Raine, who proved it to have been erected about the middle of the fifteenth century. It would be seen that it had been begun at a time when what was called Perpendicular work prevailed, and was rebuilt from immediately above the great Norman arches. They would notice the extraordinary bulk of the columns upon which it was supported; and he must say that that bulk was no more than was required, as the weight upon them was nearly 11,000 tons. The chevron moulding of the vaulting was found existing in the south transept, while it was absent in the north, showing that the north transept was finished first.

The party then left the church, and visited the chapter-house, cloisters, kitchen, and other parts of the monastic buildings, bringing the inspection to a close by a visit to the residence of the dean, formerly the prior's hospice.

Next to St. Cuthbert, though at a great distance, St. Godric was held in reputation in this neighbourhood. His sanctity seems principally to have consisted in extreme bodily penances. His cell was about 4 miles from Durham, and there the "cold ground" was his only bed, a stone his pillow, and bread made from flour mingled with ashes he considered too good until it had been kept monthly for several months. But his crowning merit consisted in standing for whole winter nights up to his neck in water; which feat of holiness, it is related, "so angered the devil that he stole the saint's clothes." The miracles he wrought, added to these penances, gained for him admittance into the calendar of saints; and after his death a monastery was founded near his cell, called Finchale Priory, the ruins of which were visited in the afternoon. It is situated in a richly-wooded valley, or rather glen, through which the river Wear flows over a rocky bed, making a delightful sound of running waters. On one side the river there is a steep cliff studded with trees, and the priory is situated on sloping ground on the other side. Mr. E. Roberts, who undertook to explain and describe the priory, said that, notwithstanding the great sanctity of St. Godric, the monastery erected in honour of him, in the twelfth century, was always poorly endowed. The visitors to the shrine must, indeed, have been very parsimonious, for the monks were nearly always in debt; and it is recorded that, in one year, their expenditure was double the amount of their revenue. The church of the priory originally consisted of a nave, choir, two aisles, with a transept; but the arches of the aisles

were afterwards built up, leaving only the nave, transept, and choir, and the rough stones are now to be seen filling up the arches. The architecturo generally has a very naked and unornamental appearance. The cause of taking away the aisles has been much debated; but it was attributed by Mr. Roberts in his explanatory description to the poverty of the monastery, the monks not being able to effect the necessary repairs. About the year 1300, small sums were obtained and appropriated to the re-edification of the church and house. It seemed to him that the state of repair in which the aisles then were, induced them to fill in the arches, so as to save themselves the expense that would have been consequent upon the rebuilding of the same. One very great regret which he had to express with regard to those ruins was, that they had been converted into a fruitful quarry for the use of all persons in the neighbourhood. They had taken away the stones and used them in the construction of other places. For some time that practice was rigidly put a stop to, but he heard now that it was a recurring evil, and that the stones were being carried away in large quantities and used in the erection of farm-buildings in that locality. In this way the figures and sculptured stones had been removed, and he thought that it was desirable that the inhabitants of Durham should endeavour in some way to prevent such destruction of so fine a memorial of the past as that. The carrying away portions of the remains of the priory deprived them of a monument which could not be replaced, and of information which they could not otherwise gain. The conventual buildings were on the south side. The ground rose rapidly from the river, but the building, instead of rising in proportion, had its floors raised to the level of the upper land. That was a nice example of the manner in which the builders of that day accommodated their buildings to the land which they had to deal with, and suited their work to the place and materials. The date of the priory seemed to be about the time of Henry II., or from 1194 to 1200. He wished it to be understood that he gave that as his own opinion. There was a short tower in the centre. The windows were lancet and were rabbited. They had not been glazed with glass, but enclosed by lattices. In the transept there were places for altars, no one doubt having been the shrine of St. Godric, to whom, with St. John the Baptist, the church was dedicated. The nave was wider at the west end than at the east in a greater degree than is usual. When describing different portions of the conventual buildings, Mr. Roberts pointed out several errors into which he conceived Dr. Raine had fallen. He noticed also some popular errors, one of which is that an arch which led into the prior's apartments was the way into the kitchen of the monastery—such an opinion having no better foundation than the existence of a modern fireplace for the use of the picnic parties who frequently visit the beautiful spot.

At the evening meeting, in the castle, the first paper read was a very elaborate one by Mr. J. Hodgson Hinde, "On the progress of the Roman arms in Britain, with especial reference to the position of the northern frontiers at different periods."

Mr. T. Wright, in moving a vote of thanks to Mr. Hinde, drew attention to several points on which he thought Mr. Hinde was in error, and discussed briefly the object of the wall of Hadrian, which he said was intended as a protection against those extensive marauding expeditions of the Caledonians from the North, by rendering it impossible for them to carry away their plunder.

The Rev. Prebendary South then read a paper "On a Roman altar found on restoring Gainford church in 1864," with explanation of the inscription. The date he assigned to the altar was about 150 A.D. The altar had been converted into the capital of a pillar, and having been appropriated to assist in the building of a Christian church, the discovery of the original character of the stone had been made after it had been so appropriated for upwards of 600 years.

On Thursday morning, a special train carried the excursionists to Barnard Castle, where Captain Robinson acted as guide. The castle, now in ruins, was built by Bernard Balliol, in the beginning of the twelfth century, and the most interesting of the remains are a four-circular Norman tower, and a Norman gateway. The work was dismantled in 1630, and the internal

arrangements have become almost totally obliterated. The sunny brightness of the morning displayed to the visitors the charming scenery of the Tees, on the banks of which river the castle stands.

The next point in the progress of the party was Staindrop church, where they were received by the Rev. J. F. Hodgson, who drew attention to the architecture of the building, showing how from a humble Norman edifice it had increased to the size and dignity required for a collegiate church. Mr. Planché interested the visitors by his remarks on the sumptuous monuments of the Nevilles, which the church contains.

A short drive through Raby Park brought the Association to the princely seat of the president,—Raby Castle. Here they were received with the most thorough hospitality; and in the upper hall, where about 200 guests sat down, the Duke and Duchess, with the Marquis and Marchioness of Normandy, Lord Houghton, and other visitors, were unremitting in their attentions to the wants of the travellers. Mr. Planché, as a vice-president of the Association, in a few apt words, acknowledged the hearty kindness of the noble entertainers, and the Duke of Cleveland warmly expressed the gratification which the presence of the Association afforded him.

In the lower hall a history of Raby Castle was then read by the Rev. J. F. Hodgson, in which the industry, learning, and enthusiasm of that gentleman were conspicuous. Nothing could be more complete than his acquaintance with the subject which he undertook. The difficulty was to condense it into an illustration of the building suited to the time at disposal. The stately castle to which it refers, as it now stands, was erected soon after 1315, as proved by the licence to fortify it, extracted from the close rolls of Bishop Hatfield, of Durham, and by the general coincidence of the architecture with that period. Passing through a fine gate-tower, the bailey of the castle is entered. The castle itself consists of a quadrangular mass of great dignity and splendour, with an open court in the centre. One side of the court or quadrangle opposite its entrance is occupied by the two halls, one above the other, of such stupendous proportions that carriages are admitted to drive across the quadrangle and into the lower hall. The sides of the quadrangle have the kitchen and offices springing from one end of the hall, and the principal chambers of the castle from the other, according to the usual distribution of the age.

At the evening meeting in the Town-hall at Durham, an elaborate and excellent paper was read "On the Norman Ancestry of the Nevilles," by Mr. Planché. Mr. C. Carr furnished an interesting account of a supposed Anglo-Saxon inscription of considerable length found on an oak beam at Hexham Castle, but which, it was maintained by some present, was English of the fifteenth century. The evening was brought to a close by a short paper by Mr. T. W. King, of the *York Herald*, pointing out the MSS. relating to Durham in the Library of the College of Arms.

On Friday, the excursion was planned for Tynemouth Priory and Newcastle. At Tynemouth the Association was met by Mr. Sidney Gibson, the historian of the priory. The entire form of the church is traceable, and the mode of its division into two parts, for monastic and for parochial use, was pointed out. The most considerable remains are at the east end of the church, and present a specimen of almost unrivalled beauty of the purest Early English work. A miniature lady-chapel, of elaborate Perpendicular work, in perfect condition, is attached to this part. A few fragments of the conventual buildings remain.

At Newcastle the Association was greeted by the deputy-mayor and sheriff of the town, the presence of the mayor being prevented by illness.

Dr. Collingwood Bruce pointed out to the visitors, with great animation, the main features of archaeological interest in the castle, which, though not the largest, is reckoned the most complete specimen of a Norman stronghold now existing in this country. William the Conqueror ordered it to be built; but no remains of that structure now remain. The present castle was built by Henry II., between 1172 and 1177, and the cost of it appeared to be £921,11s. 9d. In 1312 the castle was besieged by King David of Scotland, and bravely defended by Sir John Neville; and in 1388, before the battle of Otterburn, Harry Hotspur defended it from Lord Douglas.

Having afterwards visited St. Nicholas Church,

they then inspected that portion of the town walls and of the tower still visible in Pink-lane; thence to Westgate-street, and to the old Dominican chapel in the Friars. Passing along the west walls, they visited St. Andrew's Church, and thence along Blackett-street, through the market and the news-room, they proceeded to All Saints' Church, where they inspected Roger Thornton's brass, one of the finest specimens of monumental brass to be found in the kingdom. After noticing some of the curious old houses which are to be found in the lower part of the town, the party directed their steps to the Assembly-rooms, where, by the hospitality of Mr. Hodgson Hyde, a sumptuous repast was awaiting them. In thanking the host for his hospitality, Mr. Nathaniel Gould, an octogenarian vice-president, excited the most interest and amusement by his vigorous delineations, from his own recollection, of Newcastle and its inhabitants, upwards of seventy years ago. He described himself as one of the few now living who had learned his alphabet from the almost forgotten horn-book.

The evening meeting, at the Town-hall, Durham, was almost engrossed by a description of the ancient Roman city of Eboracum (Wroxeter, Salop), by Mr. Thomas Wright. A large audience listened with unflagging attention to his account of the discoveries made in the excavations proceeding in late years, under his direction, and of his hopes and difficulties in the further progress of the work. Mr. J. B. Berge followed with a complete and concise account of the Durham Mint.

On Saturday morning an excursion was arranged to Brancepeth Castle and church, and to Bishop Auckland. Brancepeth Castle, about five miles from Durham, is the seat of Lord Boyle. It is most beautifully situated, and stands on a bold eminence overlooking a large expanse of landscape, with a most exquisite foreground of wooded dells, running streams, and undulating turf. The castle itself was originally built by the celebrated Geoffrey Neville, but very little of the original work remains, and though the castle presents the external form of a baronial residence of the thirteenth century, the walls have the freshness of yesterday. The company were admitted into all parts of the interior, which comprises a baron's hall, an armory, and all the mimic resemblance of an ancient castle. In one chamber there is a ladder which conceals a secret staircase that leads down one of the towers into the grounds.

The church is a fine old structure, which has been recently restored, and presents several features of interest to the antiquary. Mr. Hodgson Fowler explained with conciseness the chief points of interest at Brancepeth church. It contains some monuments of the Bulmers or Nevilles, and some remarkably interesting woodwork.

From Brancepeth the party went by railway to Bishop Auckland, where the palace of the Bishop of Durham is situated. The Bishop of Durham received the company on the lawn in front of the palace in a most genial manner, and himself pointed out the most ancient part of the residence, which is the lower window in the court facing the chapel. With that exception, the palace has undergone so much renovation and restoration that scarcely any of the old work remains.

The party then went into the chapel, and his lordship and Mr. Sidney Gibson pointed out some of the difficulties which the renovations of Bishop Cosin, since the Reformation, created in settling the original date of the work. Mr. Le Kenz made some observations, and Mr. Gordon Hills was called upon for his remarks. He commended the graceful beauty of the pillars and arcades, and noticed the singular varieties occurring in different parts of them. He, nevertheless, with confidence assigned the work to the period between the erection of the Galileo and the Nine Altars at Durham, which would make it an erection of about 1210.

The dining-hall of the palace was not sufficiently large to accommodate all the company at once, but after one-half had been amply provided for in a most hospitable style, the other portion of the party was admitted. The bishop presided at one end of the table and Mrs. Baring at the other. The present Bishop of Durham is renowned for his hospitality, and he seemed to have pleasure in entertaining his numerous visitors, who retired highly gratified with their reception.

At the Town-hall, in the evening, the Mayor of Durham, whose courteous attention to the Association throughout the week maintained the

ancient dignity of his office, gave a *conversazione*. Three papers remained on the roll of business to be disposed of: they were all of considerable value; on "Bishop Richard de Bury," by Mr. Sidney Gibson; on "Ancient Wills and Inventories relating to Durham," by the Rev. G. Ormsby; and one on "Durham and its Palatinate," by the Rev. J. H. Blunt. The two latter subjects were skillfully epitomised by their authors. The intervals of refreshment were enlivened by some admirable vocal music from members of the cathedral choir. "The cloud-capt towers," from its appropriateness and excellence, obtained rapturous applause. The proceedings terminated with the usual complimentary vote of thanks to all who had furthered the objects of the Association, and an acknowledgement to the mayor, moved by Mr. N. Gould, with a finale of "God save the Queen" from the choir.

Some members of the Association, under the guidance of Mr. E. Roberts, have organized a further excursion to Hexham and Lindisfarne.

#### CHESTER BLUNDERS.

CHESTER has a singular fascination for the world. It is known far and near as possessing a peculiar and unique style of street architecture, that is charmingly quaint and picturesque. No one is considered to have seen Old England who has not seen Chester. Its pleasant rows, with their sheltered walks; its half-timbered houses, with their cunning carvings, legends and gables, and latticed casements, and strange signs dangling here and there, are objects that stand apart in the recollection of travellers who have seen the hundreds of cities between Chester and China, or London and Lisbon, or Paris and Perr. What, then, should be the aim of the Chester people? Should they obliterate these distinctive features, or perpetuate them? We are induced to put this question in the hope that it may have the effect of awakening Chester to a sense of the error committed in adopting for the new buildings in the neighbourhood of the railway station, and in the length of road between it and the ancient city, the commonest type of the most commonplace and third-rate plain, brick, oblong-windowed houses. The handsome railway hotel is a mistake of a similar kind. The visitor arriving at Chester is disappointed to find an Italian palace provided for his accommodation. He would have preferred and enjoyed the appearance of a structure built in the style his associations of idea must have led him to expect. In this matter the originators of the Grosvenor Hotel, within the confines of the city, have acted most unwisely. This is as handsome an edifice as the eye could wish to see employed for such a purpose, and as capacities as a legion of travellers could require; and yet it fulfils the expectations raised by the reputation of the city, and the row-like arrangement of its basement story forms exactly the covered way all places intended for the alighting and departure of travellers require. But we see, and with great regret, that the land between the railway station and the city will perpetuate no such characteristic picturesqueness, unless the disposition of it is re-considered. Already tall, featureless, stiff brick houses are in course of construction, and adjacent plots of ground are marked out as to be let on building leases. It seems to us that, to reduce Chester to an imitation of some third-rate quarter of the metropolis is as great a piece of folly on the part of its magnates as the killing of the geese that laid the golden eggs. The importance of a place is regulated in great measure by its traffic. The thousands of visitors who are attracted to Chester by the beauty of its street architecture must surely be an item worthy of consideration. Diminish this attraction and one great source of traffic will disappear. Already too many commonplace houses have usurped the sites of ancient beauties for the Chester leaders of taste to permit any further losses. The north gate and the east gate are both structures that are out of place, and that would gladly see replaced by those that were taken down to make way for them. What has the north gate,—a handsome structure, of white stone, of the Doric order, forming a capacious elliptical arch, divided from two smaller ones at the sides by couples of pillars,—as erected by the late Mr. Thomas Harrison, at the expense of one of the Earls of Grosvenor,—to do with Chester,—pleasant, sunny, shady, gabled Chester? And Watergate and

Bridgegate are just as incongruous. Let Chester be Chester, not a pretentious mixture of Greeco, Italy, Harley-street, and Holborn.

The Rows should be kept up. If extensions be required they should be made in the same genial spirit. Every quaint structure now standing should be carefully preserved, and, if we may say so, affectionately handled, repairs should be attended to, and no alterations permitted. Cheshire is allowed to be "the mother and nurse of the gentility of England," as Smith, the antiquary and Rouge-dragon Pursuivant, asserted it to have been, and Chester to have been the headquarters of mystery plays and city shows; and it is most disappointing to find niches of them dwindling from this "high estate" for the want of the employment of brains as well as hands.

On the occasion of a recent visit to this queen-mother of cities, the extent of the traffic proclaimed itself in the fact that the spacious station was what is technically known on the line as *blocked*. It was so full of trains they could neither be got out nor in.

#### THE NEW BOULEVARD OF FLORENCE.

THE contract for carrying out the great work of constructing a grand boulevard or "stradone" around Florence has been at length decided in favour of an English company, represented by Messrs. Crosswell, Stephen Breda, & Co. Much discontent has been expressed by the other companies, candidates for the contract, that more time was not afforded them before they were entirely thrown over; but the Comune, in an answer to a letter of complaint from Mr. French, the banker—published in the "Nazione"—affirm that they delayed for twelve days the signing of the contract; that, finding that the money 50,000 francs, agreed upon to be deposited, as guarantee, was not forthcoming, they argued, naturally, that a company not in a condition to produce, at the given time, or even after some days of delay, a sum of 50,000 francs, was not in a position to have at command the 25 millions of francs, which will be the sum, at least, necessary for the completion of the work; and that consequently the finishing of the work might be retarded—an event which the municipality have striven hard to avoid.

The present works are to extend eastwards from the iron bridge beyond the Ponte alle Grazie, on the south-east of the city, to the iron bridge near to the entrance of the Cascine on the north-west, making a semicircle that will inclose three-fourths of the present city. The boulevard is to be divided into six sections, the first comprised between the iron bridge near San Nicolo and the Porta alle Croce; the second to extend from the Porta alle Croce to the Porta Pinti; the third from the Porta Pinti to the Porta San Gallo; the fourth, from the Porta San Gallo to the Fortezza; the fifth to the Canal, called Canale Macanino; the sixth from the Canal and the right shore of the Arno to the iron bridge near the Cascine. The whole project has been under the supervision of the engineer Poggi and his coadjutor Tito Gori. These have taken under their more especial consideration the position of the boulevard, the drainage, the laying down of the gas, the roads, the footpaths, the planting of trees, the sluice or great reservoir for the reception of the drainage, the means of the final disposal of the same, and also the devising of means for the protection of the city against the ravages caused by the annual inundations, especially from the Mugnone, a river at the north of the city outside the Porta San Gallo. For all these works, and the cost of indemnification, the engineers Poggi and Gori have estimated a sum of 1,845,890 francs. A deduction of 43,750 francs is made, arising from the demolitions.

The contract includes the demolition of the old walls round the city; the works to commence a month from the signing of the contract. One great object was the speedy erection of houses, of which there is great need. And as the month of August is that in which the notices for leaving are chiefly given by the tenants of houses in Florence, that also formed another stringent reason for expediting the signing of the contract, that the appropriations and subsequent indemnifications might be more advantageously arranged.

The assignment of the walls and adjacent edifices destined to be razed, will be made to the contractors one month before the day on

which the work will be put in hand. The area destined for the new buildings will be divided by the commune into lots, which may be of different configurations, length, and depth. The purchasers may unite two or more lots, or divide one into many, or diminish it in extent, on giving notice to the commune, who will have power to object to the plan when the superficies of any one lot shall remain less than 1,200 square metres, and the frontage facing the high road less than 30 metres in length. This is to prevent the erection of too insignificant buildings. The Government reserve to themselves the right of retaining for the public use those parts of the land already appropriated to public works, and the gardens Gherardesca and Lucca, on the north of the city.

On the lands consigned to the contractors and on those which may be sold by them by public auction, edifices especially destined for habitations are to be erected. The designs for these houses, and the disposal of the lands adjoining them, are to be laid before the municipality, to see that no manufactories are to be erected thereon, to which use they have the power of refusal. Where practicable, great care has been taken not to impede the progress of the new streets already commenced on the north side of the city, in which first-class houses are being erected; but where houses of third-rate class have been begun, and which might impair the grand outline of the boulevard, these will be stopped, and indemnification made. Also, wherever advantageous alterations are proposed by the owners of houses already existing on the line of the boulevard, these can be done on the plans being subjected to, and approved of by the municipality and contractors. Mr. Norton, we understand, is concerned as architect.

No building is to be less than 12 metres in height from the footpath to the eaves of the roof, or have less than 18 metres of frontage, nor have less than a ground floor and first floor. The enclosure facing the road, of building or land, is not to exceed, if by a wall, 1 metre 80 centimetres in height; any higher enclosure must be of gates of open ironwork. The commune is to have the right of surveillance of the works, of obliging the contractor to modify his designs, and, above all, to see that the solidity and salubrity of the buildings be secure.

The auctions for the sale of the houses to be taken down and for the sale of land, all must take place within six months from the signing of the contract. Within two months from the day on which the contractors become possessed of the lands, the designs for two-fourths of the frontage of the Boulevard are to be laid before the commune; for another fourth within six months of the appointed day; the remaining fourth within a year. The works are to be begun eight days after the time assigned by the commune, without any change of design or projection being made by the contractor. The buildings are to be raised to the first-floor within twelve months, covered within eighteen months, finished within thirty months, counting always from the day designated by the commune for their commencement.

For every week of delay, the contractor is to pay a fine of a thousand francs to the municipality. Four weeks after the delay incurred, the commune is to have the power of conducting the termination of the works in hand, or conceding them to others, or to the same contractor, under new terms of guarantee.

The commune will charge themselves with the appropriation of the lands necessary for the execution of the works, for which the contractor or grantees shall pay them at the rate of 61 fr. per square metre, with the exception of about 600,000 square metres situated in the third, fourth, and fifth sections, which land is to be given as a subsidy to the company. Each purchaser of land is to deposit 50,000 francs with the commune, to be returned at the completion of the works, or forfeited. There are details of workmen's wages employed in the making of roads, drains, defences against inundations, &c., all to be reimbursed by the commune. The agreement of the latter is to enlarge the Porta Rossa and other thoroughfares within the year.

The one great object to be brought about is the speedy conclusion of the boulevard. If fines and forfeitures can effect this, the boulevard will rise in an incredibly short space of time. It must be remembered that, independently of the construction of houses, the company undertake, for the government or commune, to have completed, from the day of signing the contract,—within eight months, the demolition of the walls;

ten months, the construction of the drainage; twelve months, the ground-plan; eighteen months, roads made and elevation of paths formed; twenty-two months, the trees planted; thirty months, the footpaths finished.

The company, or contractors or grantees, appear by all the rules and regulations laid down, the guarantee money deposited, &c., to be most stringently bound to complete their contract; for, according to the ultimate wording of the contract, "when the possessor of the land shall have forfeited 200,000 francs, the communal administration shall proceed to the completion of the works at all risks to the owner of the property. And for a still more secure guarantee for the execution of the compact, the commune take to themselves the right (by way of reimbursement) of appropriating the deposit made by the purchaser, and in case of that not being sufficient, to have recourse to the fund raised by the sale of the houses. Hence it is proposed that the sum placed as a guarantee shall be as a deposit made between agreeing to the stipulations of the contract and the commencement of the works; and that the guarantee money shall be gradually increased, in proportion to the real value of the constructions being raised, the original deposit never to be less than the first sum agreed on. The advantage seems to a looker on to be all on the side of the municipality. With an impoverished exchequer—an inactive population—they will have their city extended, beautified by foreign capital, mostly foreign labour. It is hoped that those who have courageously undertaken this great work may reap a plentiful pecuniary harvest.

#### ON RAINFALL AND GUTTERS.

The fall of rain and the best method to be employed for its removal from the roofs of buildings, is a subject which recommends itself to the serious attention of the architect. In temperate latitudes, where the rainfall is frequent and copious, the style of roof generally applied to buildings to cause the rain to shed freely is that of the pent-roof. This is formed by the meeting of two oblique sides, at an acute or other angle, and is a style of roof almost invariably seen to surmount dwelling-houses, and may be frequently met with in larger buildings. Where the uppermost surface of a building is extensive, it is usually divided, so that it may be covered by three or more pent-roofs, running along its entire length. These allow the rain to shed into gutters, or alleys, which in some cases decline slightly towards the extremities of the building, and so carry the water off through down pipes at the ends, until it approaches subterranean drains, and is finally conveyed to the river.

Where down pipes can be conveniently used the gutters are generally horizontal. As a rule, these roofs are hipped towards the ends of the building, so that the angle of which they may be formed seldom faces the observer. In many old buildings and dwelling-houses, mansard roofs were employed, which caused the rain to shed more freely at some portions than at others. Latterly this style of roof had fallen into desuetude.

In many of the dwelling-houses lately erected, flat or platform roofs have been constructed, while in buildings with any pretensions to magnitude, the curved or arched roof seems gradually to have superseded every other. In localities where snow falls abundantly, it is obvious that the employment of flat roofs would be very injudicious; but many large buildings in London have been covered, and moderately sized buildings still are covered, with flat roofs, over which a thick coating or layer of asphalt, or tar and lime is laid. In buildings where the pitch of the roof will not allow the rain to shed freely, metallic sheeting is preferred, either in the form of zinc, galvanized corrugated iron, or sheet lead. The largest roof of the pent or oblique style known, is that which was erected over the riding-house at Moscow. The span of this roof was 235 ft., and its slope about 19 degrees. The slope of the curved roofs attached to the more important and extensive modern buildings is segmental, and falls very often as a circumference from its tangent.

This circumferential or arched style of roof has come to possess a wonderful fascination for modern engineers. This kind of roof being invariably constructed of iron, the architect can

no longer work altogether alone. It may, therefore, be hoped that these giant undertakings may eventually bring about something more in the shape of harmony between art and science than can be now perceived. The hand that startled Belshazzar seems to have run along the walls of modern history, dooming the works of man to decay or extermination. Those which are fashioned more beautifully will fade from want of strength, and those which seem likely to last are excessively ugly.

The adoption of the huge circular style of iron roof seems like the beginning of an age in which men look forward to meeting in greater numbers one of the mighty wings of an ideal civilization beneath which its children seek a momentary protection.

There is the roof over the Birmingham station, the Charing-cross roof, the roofs at Blackfriars, and finally one upon this plan is projected which will exceed even the dimensions of the colossal roof of Moscow.

Now, it is an important point, where the roofing of any kind extends over a large area, to ascertain the facility with which it may be capable of shedding rain from its surface. The deflection of the roof of a gas-holder has been known to have been serious, simply owing to a quantity of snow falling and being retained on its surface, and in one or two cases this circumstance has been alleged as sufficient to have caused the falling in of the roof. The weight of water retained on a badly-constructed gasometer roof during a copious and heavy fall of rain frequently endangers its safety should the pitch of the roof not allow the rain to run off freely.

The phenomena associated with the final descent of water are complex and numerous; and no doubt if such immense arched roofs come into use as the one now contemplated, and in course of being constructed for the new terminal station of the Midland Railway in London, the subject will have to undergo a sound and proper investigation. At present it would seem that no absolute rule is used in the practice of architecture to determine the requisite size of gutters in proportion to the buildings to which they may be attached. One or two sizes of gutter are made in enormous quantities, and used mostly without any approximate calculation as to quantity of discharge and probable rainfall. A house of several stories in height will invariably have a larger gutter than a cottage, although the area upon which the rain descends may be uniform in each case. The fall of rain, moreover, decreases in quantity in proportion to the height of a building.

The annual depth of rain at the top of Westminster Abbey was found to be  $12\frac{1}{16}$  in.; on the top of a house 16 ft. lower down it was  $18\frac{1}{16}$  in.; and on the ground it was  $22\frac{1}{16}$  in. It is more often considered by builders that the top of a house is a reservoir which may be drained at leisure; and consequently it is no uncommon thing to see the down-pipes and gutters of buildings discharging large quantities of rain long after the fall of rain has ceased.

A strict adoption of the necessary rules of architecture should obviate any such occurrence, as it must tend to a deterioration of the structure which could be avoided. The new station roof which will shortly be erected in New-road, St. Pancras, will be 800 feet in length, and will possess a span of 240 ft. It will, therefore, be the largest structure of its kind in the world. The greatest radius of the curve of the arch of which it will be formed will measure 160 ft. in length; that is, from the centre of the top to the ground.

If the roof were flat, it would expose an area to rainfall of 192,000 square feet. Whatever weight of water, therefore, may come upon the roof in this shape will be by its real form distributed over an extended area, and the velocity of its descent will be increased, causing it to act with accumulated force on the off-sides of the gutters.

The mean annual fall of rain in England is estimated at 32 in. The absolute rate at which it falls probably cannot be fairly ascertained; but its maximum rate may be taken as at 1 in. in an hour. The fall which took place on the 6th of the present month gives the highest known record both as to time and quantity, it having fallen 2-682 inches in a little over three hours. It might be of advantage to give a proper consideration to this carefully-measured result, because, as it is acknowledged that the formulae for attaining to a knowledge of the phenomena which regulate fluids when in motion are too

complex to lead to a ready and practical result, it is possible that by some few simple experiments with the above data some more accurate opinion may be gained.

It was found by Mr. Watt that, in a canal 18 ft. wide at top, 7 ft. at bottom, and 4 ft. deep, having a fall of 4 in. in a mile, the velocity was 17 in. per second at top, 14 in. in the middle, and 10 in. at the bottom. When water is at rest, it will escape at the rate of 1½ cubic inches per second per inch of the width of the opening through which it flows; but this opening must be cut downwards from the level of the water. If this quantity of water should be arranged to flow into a cistern, and a cut showing one square inch of section were made in the material of the cistern, beginning from the line of atmosphere resting on the water, the mobility of the water and the now active pressure of the atmosphere, both acting in the direction of the escape, would just be equal to whatever other force was required to cause the 1½ cubic inches of water to enter the cistern, and the supply and loss would be in equilibrium.

The rate of discharge of a gutter could therefore be ascertained by filling it and letting its contents escape through a square inch of aperture, caused to descend as the gutter emptied, and a just proportion arrived at between it and the size of the roof. The effect of water on a foot square of surface, with a velocity of 1 ft. per second, was determined by Bouquier to be 1 lb. 7 oz. At a velocity of 6 in. per second, water will transport fine sand; at 8 in., sand as large as flint-sand; at 12 in., it will move fine gravel; and at 24 in. it will roll along pebbles of 1 in. in diameter.

#### SANITARY STATE OF THE ARMY IN INDIA.

SINCE attention was first drawn in the *Builder* to the great need of sanitary reform in India, much has been done towards making a commencement of such improvements as were most pressing required. The Royal Commission of Inquiry appointed in 1859 has not been idle, although its elaborate report, including a voluminous mass of evidence and reports on which its conclusions are based, has only now been issued in a printed form.\*

Suggestions for carrying out sanitary works in India, including water supply and drainage, &c., and improved plans for barracks and hospitals, have been prepared by the Commission, jointly with the War Office Commission, and sent to India; and several of the evils described in the report and evidence have been, or are being, removed by the zealous co-operation of the military and civil authorities in India; so that the abstract of evidence and the report itself would already require modification as regards the habits of the soldiers. They still, however, represent the condition of stations and towns. As to the station reports, it may be recollected, we have already given some account, gleaned from the graphic and valuable observations by Miss Nightingale, to whom they were submitted in manuscript by the Royal Commission.

The inquiry has shown—

1. That by far the larger proportion of the mortality and inefficiency in the Indian army has arisen from endemic diseases, and notably from fevers, diarrhoea, dysentery, cholera, and from diseases of the liver.

2. That the predisposition to these diseases is in part attributable to malaria, in conjunction with extremes of temperature, moisture, and variability.

3. But that there are other causes of a very active kind in India connected with stations, barracks, hospitals, and the habits of the men, of the same nature as those which are known in colder climates to occasion attacks of these very diseases, from which the Indian army suffers so severely.

In examining into these causes, the Commissioners find that the stations generally have been selected without reference to health. Many of them are situated in low, damp, unhealthy positions, deficient in means of natural drainage, or on river banks, close to unwholesome native villages or towns.

The towns and bazaars in the vicinity of military

\* Report of the Commissioners appointed to inquire into the sanitary state of the army in India; with abstract of evidence and of reports received from Indian military stations. London: H.M.'s Stationery Office.

lines are in the worst possible sanitary state, undrained, unpaved, badly cleansed, often teeming with offensive and dangerous nuisances; with tanks, pools, and badly-made surface gutters, containing filth and foul water; the area overcrowded with houses, put up without order or regularity; the external ventilation obstructed, and the houses overcrowded with people; no public latrines, and every spare plot of ground covered with filth in consequence; no water-supply, except what is obtained from bad shallow wells and unwholesome or doubtful tanks. These towns and bazaars are the earliest seats of epidemics, especially of cholera, before their ravages extend to the European troops in the vicinity.

None of the stations have any subsoil drainage; and there are no other means of removing the rainfall except surface gutters. The ground about the lines is often broken up into pits and hollows, filled with stagnant water, or it is traversed by unwholesome ravines or nullahs. In certain states of the weather and wind nuisance is experienced in the lines from these causes, and from the foul state of neighboring native dwellings. Many of the older stations are irregularly built; and the buildings are arranged so as to interfere with each other's ventilation.

Both barracks and hospitals are built at or close to the level of the ground, without any thorough draught between the floors and the ground. And the men, both in barrack-rooms and sick wards, are exposed to damp and malaria from this cause, as well as from want of drainage. The ventilation is generally imperfect; and from the arrangement of doors and windows, men are exposed to hurtful draughts. Many of the rooms are too high, and as a consequence there is much surface overcrowding, both in barracks and hospitals, although with large cubic space. In a number of instances hotb the space and area per bed are much too small.

Barracks and hospitals have frequently no glazed windows, and only wooden shutters. Both barrack-rooms and sick wards are, as a rule, dark.

There are often four, or even six, rows of beds between the opposite doors or windows, increasing greatly the already existing difficulty of ventilation and exposing the inmates to foul air.

The greater proportion of the force is lodged in barracks in such large numbers per room as to be very injurious to health; many of these rooms being several hundreds of feet in length, and some of them containing from a quarter to half of a regiment each!

Water sources have been, with one or two exceptions, selected without analysis, although it is always hazardous to omit this precaution. The supply is taken from shallow wells and tanks, both of which are very liable to pollution. In a few cases, the water is derived from rivers. It is drawn by dipping, and carried in skins, thereby increasing its impurity. No precautions are taken for purifying drinking water. This unsatisfactory condition of the water-supply is one of the cardinal defects at Indian stations.

Abution and bath accommodation is often very deficient, and sometimes there is none. Very often there are no baths, and where baths exist there are not enough.

Privies and urinals are generally of a bad or defective construction. The contents are removed by hand, often producing great nuisance. There is no drainage for either privies, abutions, or cook-houses: the foul water is received into cess-pits or carried away by hand.

Hospitals are constructed on the same general plan as barracks. They have no proper abution or bath accommodation; no water-closets, only open privies situated at a distance; no drainage, no water-supply, except what is drawn and carried by hand labour.

The arrangements for the prevention of disease are either non-existent or most deficient. There are no proper sanitary authorities in towns, and no trained officers of health in any town or cantonment.

Stations on the plains and slopes of India up to 1,500 ft., and on the raised coasts of the sea, are comparatively salubrious. They only require adequate sanitary arrangements.

Stations on low inundated lands are hot beds of malaria.

Native lines are laid out, and huts built, without sufficient reference to health.

There is no drainage, clearing, or levelling, and little attention to cleanliness or ventilation.

Native hospitals are almost altogether wanting in means of personal cleanliness or bathing, in drainage or water-supply, in everything, in short, except medicine.

The statistical evidence shows that the mortality in the Indian army varies from 11½ per cent. in the most unhealthy, to about 2 per cent. in the most healthy places, even in their present unimproved state. It has been estimated that the lowest of these rates, or 2 per cent. (double the rate at home stations since the introduction of sanitary improvements), may be taken as the possible mortality under improved sanitary conditions.

The annual death-rate for the whole of India has hitherto been about 69 per 1,000. The European establishment is 73,000 men, and will, at the present rate of mortality, require 5,037 recruits per annum to fill up the vacancies caused by death alone.

A death-rate of 20 per 1,000 would require only 1,460 recruits per annum, so that the excess of mortality is 3,570 lives per annum.

Estimating the cost of recruiting, training, and landing men in India at no more than 100l. per man, the excess of mortality will be equivalent in cost to a tax of nearly 1,000l. per diem, irrespective of the cost of the extra sickness indicated by a high death-rate.

If the time should ever arrive when, under the influence of improved culture, drainage, and sanitary works, India should be freed from the local malaria which exists everywhere there now, as it once did in some form or other over Europe, we may cherish the hope of realizing what statistical inquiries appear to point to, namely, that the natural death-rate in times of peace of men of the soldiers' ages in India, will be no more than 10 per 1,000 per annum. But a reduction of mortality also indicates increased physical strength and greater fitness for duty in the army generally, as well as a smaller proportion of "constantly sick" in hospital; and hence a greater effective numerical strength. Fewer recruits would be required to supply the losses from disease, a point of very great importance.

Amongst the recommendations of the Commissioners they urge—

That works of drainage and water-supply be carried out at all stations. That all existing water sources be subjected to analysis, and those rejected which contain matters injurious to health. That the present method of drawing and distributing water be discontinued wherever practicable. That all water used for drinking purposes be filtered, or otherwise purified.

That all future barracks and hospitals be erected on raised basements, with the air circulating under the floors, and that in all existing barracks and hospitals the floors be raised as much as possible, and a free current of air allowed to pass beneath them.

That all new barracks be constructed to hold no more than a quarter-company in each building, or, at most, half a company in one building, in two separate rooms, having no direct communication with each other. That hospitals be constructed in detached pavilions, containing no more than from twenty to twenty-four beds. That future barracks and hospitals be arranged *en échelon*, to receive the benefit of prevailing winds; and that detached cottages be erected for married soldiers.

That barracks and hospitals be in future constructed with single verandahs only; and for no more than two rows of beds between the opposite windows.

That the cubic space per man in future barracks be from 1,000 to 1,500 feet, and the superficial area from 80 to 100 square feet, varying according to the airiness of the position. The same space and area to be allotted in existing barracks.

That the beds be so arranged, with respect to windows, doors, and wall-spaces, as to ensure the benefit of free ventilation, without exposing the men to draughts. That in existing barracks, where the space between the doors is too small to admit of this, precautions be taken to shelter the beds from draughts. That in all future barracks the wall-space be made sufficient to keep the beds at the least 3 ft. apart, and, at the same time, out of the door draught.

That the ventilation of barracks and hospitals be sufficiently provided for independently of doors and windows.

That all barracks and hospitals be provided with sufficient glazed window-space to light them, and that they be better lighted at night. Gas to be introduced where practicable.

That all barracks be provided with sufficient abution and bath accommodation, with a constant water-supply. That drinking-fountains, supplied with filtered water, be provided.

That barrack cook-houses be improved and better ventilated.

That, wherever practicable, iron or earthenware water-latrines, supplied with water, and drained to an outlet, be introduced, instead of the present system; that, where this is impracticable, all cesspits be abolished, and metal or earthenware vessels, to be removed twice a day, substituted. That improved urinals, supplied with a jet for lavatory purposes, as well as with a free supply of water for the cleansing and drainage of the urinals, be provided.

That the cubic space in hospitals be fixed at 1,600 feet, and upwards, and the superficial area at from 100 to 120 and 130 square feet per bed, according to the healthiness of the position; and that the wall-space per bed be never less than 8 ft. In existing hospitals the same space and area to be allowed.

That every hospital be provided with a constant supply of pure filtered water, and with drainage.

That every hospital be provided with abution accommodation, with fixed basins, and with baths, having hot and cold water laid on, constantly accessible from the wards. That, wherever practicable, water-closets, with drainage and water-supply, be introduced for hospital wards, and privies converted into water-latrines.

That a sufficient number of bill stations, or of stations on elevated ground, be provided; and that a third part of the force be located on these stations in rotation.

That the sanitary duties of regimental, garrison, and inspecting medical officers, prescribed in the new medical regulations of October 7th, 1859, be applied or adapted to all stations in India; and that properly-trained army medical officers of health be appointed to this service at the larger stations.

Considering the constant reference to sanitary subjects necessary in carrying out public works in India, the Commissioners deem it requisite that every cadet of engineers should attend a course of sanitary instruction at Chatham.

In order to the gradual introduction of sanitary improvements for barracks, hospitals, and stations, as well as in the seats of Government and throughout towns in proximity to military stations, they recommend the appointment of commissions of public health, one for each presidency, so constituted as to represent the various elements, civil, military, engineering, sanitary, and medical.

That in order to render available for India the experience obtained in dealing with all classes of sanitary questions in England, two officers of the Indian Government be appointed in England to be associated with the War Office Commission for this special purpose, unless it should be thought preferable to appoint a similar commission specially for the Indian department.

From the evidence given by the Commissioners, it would appear that the three great towns, Calcutta, Madras, and Bombay, are still in a sad state, sanitariously speaking, although it is satisfactory to think that Bombay has recently been provided with an excellent water supply, and that extensive works of drainage and water supply have been undertaken at Calcutta. As to Madras, the sanitary condition of the town, as described by Sir Charles Trevelyan, is as bad as that of Calcutta. The soil upon which the city stands is white sand. The river Kooam, which passes through it, is a tidal estuary, receiving all the town drainage along its course; but as the mouth of the estuary is silted up for most of the year, it becomes a foul, stagnant, open cess-pool, which is washed out once a year by the floods. Sir C. Trevelyan describes the drainage as being "extremely defective." There are, he says, plenty of drains,—in one sense too many,—for they are offensive in the extreme, because there are no means of propelling the offensive matter and getting rid of it. The drainage is effected by open drains "of the most offensive and scandalous description." There are no means of flushing them, on account of deficiency of water; and such is the offensive state of the general atmosphere from these defects, that a high wall is maintained between the Government House grounds and the body of the town, in one of the most thickly populated portions of the town, expressly for the purpose of excluding the noxious smell that may issue from the drains, thereby excluding the sea breeze, and preventing the improvement of the adjoining part of the town, and thus greatly aggravating the evil.

The water supply for domestic use is likewise "extremely deficient," and it has become partially deteriorated by offensive matter from the drains. Sir C. Trevelyan states that the introduction of a pure water supply is an extremely popular subject, and anxiously desired by the people; and that it is a matter of urgent necessity, on the commonest principles of duty, to provide it.

The evidence as to prevalent diseases, and especially as to virulent or Asiatic cholera, is interesting at the present time.

Sir Ranald Martin states that out of every 100 deaths of Europeans serving in the presidency of Bombay, between 1830 and 1846, the proportions of deaths attributable to the four great endemic diseases were as under:—

Fevers	...	...	23054
Dysentery and Diarrhoea	...	...	82441
Diseases of the Liver	...	...	9637
Cholera	...	...	10320

Cholera has been known to prevail as an occasional epidemic at different years, seasons, and places throughout India from 1771 to 1817; and there are authentic records of its existence in Batavia so far back as 1629. But in India, since 1817, cholera has engrained itself on the epidemics of the soil, and has become a disease of annual recurrence at many of the large stations, commencing generally at the beginning of the hot season, but sometimes in the rainy and cold season. It has proved everywhere, all over the world, the same disease, with the same mortality whenever it has fastened on a congenial soil; and its great tendency in India as elsewhere is to attack populations living in low, damp, crowded, and ill-ventilated situations, especially if supplied with impure water. While the proportionate mortality of those attacked is everywhere the same, the proportionate number seized in high and low situations differ most widely. Cholera and epidemic diseases in general are of rare occurrence in the elevated ranges of India, where the water is comparatively pure.

Troops, both European and native, while on the march, have been observed to become more liable to seizure by this disease, and when the attacks have occurred in cantonments after the march, it has been found that the virulence of the epidemic has been proportionate to the length of the march.

Referring to dysentery and cholera, Surgeon-Major Grant says that, in his experience, the most influential cause of these diseases in our Indian army is overcrowding in barracks; and that in goals he has observed the most appalling mortality from bad air. Even at hill stations, far removed above the influence of malaria, he attributes the prevalence of diarrhoea to neglect of ordinary sanitary arrangements. He also says that bad water is a common exciting cause of cholera in India.

Dr. James Bird states that—

"Diarrhoea, dysentery, and fevers have prevailed, and have been attended with great mortality" at stations at which he has served, "from want of due precaution in the selection of sites. Cholera, as an epidemic, appears mainly to owe its development and origin to miasma, favoured by elevated temperature and peculiar atmospheric conditions of climate; this development being greatly aided by preceding established conditions of filthy endemic situations, badly-constructed and ill-ventilated habitations, unwholesome articles of food and drink, producing predisposition to disease, aided by unhealthy trades and depraved moral conditions of vice and poverty. The other diseases are mainly local, and miasmatic in their origin."

The evidence shows that the local causes of epidemic disease in India are precisely the same as those which exist in this country, aggravated by a higher temperature and by the presence of malaria.

As to the comparative salubrity of high-lying localities in cholera seasons, it may be recollected that, on the last occasion when London suffered from cholera, Bermondsey and other low-lying localities on the south side of the river were first and most virulently attacked; and that comparatively few cases occurred in the higher-lying districts of the metropolis. Whether this difference was exclusively owing to difference of water supply, may be questioned; but certainly the supply to the low-lying districts from the Thames was at that time very bad, compared with what it now is; and, on the whole, we think it may be safely predicted that the improved water supply, much as it still requires to make it perfect, and the many sanitary improvements which have of late years been carried out in London, will greatly diminish the virulence and mortality of cholera, should it still reach us, although there are but too many localities ready, like fuel for fire, where it will break out as fiercely as ever, should the epidemic torch be only applied to the choleraic combustible.

The report under notice of course enters fully on other questions besides those in which we are more especially concerned; but of these we have not room to speak. The whole, however, forms a searching and thorough inquiry into the state of our Indian army, and cannot but lead to vast and speedy improvements in its condition, to the saving of much life and no less money.

#### THE CATTLE PLAGUE.

STILL the terrible pest amongst the cattle remains unabated.

When we see the present sad position of affairs, and fear for the future results, we cannot but regret that the notes which have been made, and the warnings which we have from time to time given, should have been attended with such small practical results. It is now, however, of no use indulging in idle regrets, for the murrain is a confirmed and serious fact. Not only is milk,—that important article of human food,—lessened in quantity, but the "Roast Beef of Old England" is also in danger. The destruction of beasts is also in danger. The destruction of beasts has been already enormous, and the typhus fever, or whatever the prevailing malady may in reality be, is spreading throughout the herds in all directions. Nevertheless, great part of those who are the most directly concerned at present, appear to be in quite as helpless a state as were the inhabitants of London at the time of the Great Fire of 1666, when the Lord Mayor, and other authorities of the city, seemed paralysed and apparently deprived of action, while, day after day, the fire roared and rolled on in its destructive course. Just so a disease, which, in money amount, will prove as disastrous as the Great

Fire, is destroying one of the main elements of that food which in an especial manner promotes the health and strength of the people of the British nation, while nearly all that the authorities can do is to look on in helpless despair.

The Privy Council, which has no small energy and great powers at its disposal, have as yet been of but little practical use. It is true that they have appointed a limited number of inspectors of cattle, and have issued certain instructions through their secretary, but who maintain that this high official body has not yet fully done its duty.

Meetings have been held at the Mansion House in some of the large metropolitan parishes, and provincial towns. Learned professors are making lengthy communications to the newspapers. The cow-keepers and the wholesale cattle salesmen are at variance. In fact, at the present time this most important question is in a hopeless state of perplexity and confusion.

As regards the Government interference in Great Britain, we fear that the manner of action used in foreign states would not do here. Respecting the manner of dealing with this kind of disease in Russia and some other parts, Professor Gamgee mentions that concealment of the existence of the plague in any herd is punished by the imprisonment of the owner of the animals, from one to six months, besides fines. On the declaration being made that the disease has appeared in any shed or on any farm, an official inspection is made to ascertain that it is the plague which has appeared. The infected district is then closed for the introduction or exit of stock, and the holding of markets, and a check is even placed on the movement of the people. Wherever the sick animals have been seen, both sick and healthy are killed. Butchers are engaged to dress the carcasses, and those that can be eaten are disposed of: the others are buried five or six feet below the ground and disinfected with chloride of lime. The cleansing of stables is also most carefully conducted under supervision. Charcoal and lime are used on the ground, and boards are placed over this, on which the animals lie. All freework is removed; and, in addition to the free use of disinfectants, the walls are frequently lime-washed. The transport of cattle occurs in vans or other conveyances under direct supervision of a competent inspector. The police are made to accompany suspected animals from sheds or farms to slaughter-houses; and, when beasts are killed on a farm, every precaution is taken that the meat is directly conveyed to a butcher's stall without danger of being distributed within reach of live stock liable to take disease. All food, litter, utensils, and other objects which have been placed in close proximity to diseased cattle, are burned or disinfected. Any fresh animal brought into an infected district or shed must be shown to the inspector, even if only introduced to be slaughtered. If, however, it is intended to be kept, it must be kept separate from other stock, on pain of a severe penalty. Cattle smuggled into an infected district are confiscated. When the disease appears a man is employed for the immediate supervision of the animals. He is to keep the sick under lock and key. No market can be kept within three miles distance of an infected farm. Diseased animals cannot be turned out into fields, commons, or other public places.

When suspected animals require to be removed to a distance, they are in those districts not allowed to travel on the road, but are removed in railway trucks under careful supervision. The purchase of dairy stock for the supply of large towns occurs under special inspection, and a ledger is kept showing the names and residences of buyer and seller; and all newly bought cows have to be kept for a period of not less than ten days.

It will be observed in connexion with the above treatment that no attempt is made to cure the disease. Indeed, Mr. Gamgee says,—“The treatment of diseased animals should be discontinued as much as possible; and this is found of great service in exterminating the disorder.”

Again, this gentleman says,—“I quite agree with the Austrian veterinarians, that to cure in this case is to kill; because so long as sick and convalescent animals are kept about, the danger of propagating the malady is enormous.”

To us this seems to be rough management, especially when we consider the great value of stock of this description, and that in connexion with diseases of this kind which affect the human body, a large percentage of cures are

sure to be effected by the removal of the sick to places which are well circumstanced as regards sanitary arrangements, aided by proper medical means. See, for instance, the large number of cures which are effected in the London fever and small-pox hospitals; and these might be increased to three times the present extent, if persons were taken to those institutions in the early stages of the disorder. In connexion with cholera, the removal of those stricken to the hospitals, and of their families, who still appeared to be in good health, to proper situations, has had an almost magical power in checking the pestilence; and in localities where this plan has been vigorously applied in extinguishing it altogether. With experience of this kind before us, it would appear to be the wisest and least expensive plan to provide sanitariums on a sufficiently large scale, in some of the open and solitary spaces which still remain in the neighbourhood of the metropolis, and to which faintly heated might be readily conveyed by special trains, where there would be facilities for hurrying, or in other ways disposing of the heasts which have died, or those which have been destroyed. In order to prevent the passage of sick animals through the streets, railway trucks might be drawn to the localities from which it is necessary to remove the cows, &c., and it might be well if operations of this kind were performed at night. We have good authority for stating, that if plans of this kind are rightly managed, two out of three of the infected animals might be saved.

The idea of attempting to stop the importation of foreign cattle is, in the present state of affairs, ridiculous. We have the pestilence in our midst, and here it must be battled with. We believe that no quarantine regulations, however strict, will prevent the introduction of cholera to our shores, if the peculiarities of the air and those other subtle agencies which spread malaria abroad point in our direction. With care we have examined the accounts of former plagues, but we can find no distinct proof that they have been imported by infection. If, however, it should be considered needful, quarantine ground for foreign cattle might be established on the coast, as in the neighbourhood of the Nile. The supply of foreign cattle has, in the present state of our population, become a necessity.

There is one part of the Privy Council order in connexion with the present cattle plague to which we decidedly object; and we wonder how such an order could have been allowed to be promulgated. The order runs as follows:—"That every animal within such district, being in such disorder, or slaughtered on account thereof, shall be hurried, if practicable, on the premises where it had died or been slaughtered; and if this be not practicable, as near thereto as may be convenient." We can fancy few worse arrangements than this. Ardenly did we strive to prevent the intramural interments of human bodies, and yet inducements are here held out for the burial of plague-stricken animals within the range not only of our cattle, but of our citizens.

As we have already said, this most important matter is ill managed. Within the Metropolitan district we should know the exact extent of the mischief which has been already done; accounts should be also kept in the various counties; and each week we should be enabled to trace the progress of the disease, and to note its increase and decline.

The arrangements for slaughtering and disposing of animals are abominable. Take, for instance, the account of Mr. Ebsworth, the medical officer of health for the parish of St. Mary's, Newington. While paying a visit to a patient who was seriously ill, his attention was directed to the condition of a slaughter-house on the other side of the street; and it was reported to him that fifteen cows had been ordered by the Government inspector to be destroyed at the Bricklayers' Arms station, and then to be buried. The animals were destroyed; but instead of the carcasses being buried, they were carried through the parish of St. George to Mitcham, where, says Mr. Ebsworth, they were boiled down, and carried back through the parish of St. Mary, Newington, in the shape of cat's-meat.

Very properly Mr. Ebsworth brought this matter before the notice of the District Magistrate, when Mr. Stanley, a veterinary surgeon, who has been appointed an inspector of animals by the Government, gave some explanation, and expressed an opinion that the disease could not be communicated through a dead animal. With

this opinion neither the medical official nor the magistrate agreed. Professor Simonds took part in the discussion, and mentioned that "there were the greatest difficulties, if not impossibilities, in finding places near London in which the dead carcasses of diseased animals can be buried." In the present case the animals were sent to the Bricklayers' Arms station, and were then taken to the slaughter-house in Kent-street, where there is a dense population. [Could anything be worse than this?] But it appears that there were no sufficient means at this spot for the purpose, and so they were taken to Mitcham. Mr. Simonds did not think that there was danger from hoiled animal matter, but that the conveyance of dead carcasses through the streets might spread disease. And here it is to be noted that the veterinary authorities differ. Mr. Stanley says: "*The disease could not be communicated from a dead animal.*" The famous Professor of veterinary science says it can; and so we go on groping in the dark and confounded by various counsels.

But in connexion with the disposal of the dead heasts, common-sense suggests the idea that in the pressing emergency of this sad visitation, which is in reality a national calamity, we must find new and sufficient means.

What is there to prevent the conveyance of the dead animals to the waste lands which spread for miles in the neighbourhood of Woking, or the parts beyond the Aldershot Camp? In such situations it might be found safe to utilize the carcasses. There are several other situations in which this work might be carried on. Some parts of the Thames shore might be appropriated to this purpose, to which the transit of dead animals might be cheaply made from particular points by means of lighters.

It is advised by some, that when the disease attacks a cow-shed, it should be closed in the same manner as the houses were formerly in the time of plague in old London. This will never do; for there can be little doubt that in the ancient times the mortality of the population was greatly increased by the shutting-up-system. We are still convinced, that by means of thorough attention to cleanliness and to ventilation, the removal of animals from the crowded cow-sheds and other unnatural conditions; using a wise means of separation, and resorting at the very earliest stages of the disease to medical treatment; if the means of comparison are afforded, we shall soon find a marked decline of this plague; but in its present stage, we want some competent authority which will actively and vigorously lead in the right direction.

The Russian Government, we observe, have determined that no single head of cattle shall leave a Russian port without examination and a certificate of health.

Consul-General Mansfield sends a despatch from St. Petersburg, in which he gives the important information that *water impregnated with iron is a remedy for the disease.* It was found, he says, that cattle on a farm where there was chalybeate water were not attacked, or recovered very rapidly after drinking plentifully of the water. The lint was not lost. Rusty iron was put into the cattle-troughs, and highly chalybeate water thus produced, and the cattle which drank of it speedily recovered. This fact cannot be too widely circulated at the present moment.

#### SANITARY MATTERS.

**Canterbury.**—The evidence adduced before the Government Inspector appointed to inquire into the sanitary condition of Canterbury has fully established the fact that the Local Government Act is needed to give Canterbury that reputation for cleanliness which its position as a cathedral city demands. The arguments set forth by the opponents of the scheme were completely nullified by the evidence of two out of the three witnesses called by the council in support of the action taken by that body. In the first place, there is the evidence of Mr. Saunders, the sanitary inspector of the city, whose testimony is unquestionably fair and impartial. He clearly stated at the investigation that numerous thickly-populated districts in Canterbury had no system of drainage whatever; that the Pavement Commissioners had no power to aid owners of property in making sewers in these places; that sewage matter from a number of cottages was conveyed through an open dyke into the river Stour; and that poor residents below were compelled to use for all domestic purposes the water

thus rendered putrid. Added to this is the strong testimony of Mr. Rigden, a surgeon of considerable eminence in the city, and whose practice peculiarly fits him to give reliable evidence. With these facts before them, the authorities at the Home Office can have little difficulty in deciding that the Local Government Act is required here.

**Chichester.**—Mr. Simon, medical officer of the Privy Council, has recently paid a visit to Chichester. The conclusions of his report are as follow:—1. "That the death-rate of Chichester is unnecessarily high, and that preventable disease often prevails. 2. That the causes of this are, absence of proper drainage; polluted water; a large cattle market held in the city streets; an inefficient administration of the Nuisances Removal Acts. 3. That the removal of these causes is of urgent necessity, and that steps ought not to be delayed to be taken.—For establishing a complete system of drainage, for removing the cattle market outside the city, for the more efficient administration of the Nuisances Removal Acts."

**Portsmouth.**—An extensive system of drainage, the cost of which will be 90,000*l.*, is about to be commenced at Portsmouth. The tender of Messrs. Furness, of London, for 47,000*l.* for the first portion of the works, has been accepted by the local Board.

**Sheffield.**—The highway committee of the town council have issued an elaborate report on the drainage of Sheffield, and they discuss the question of adopting a plan or plans for preventing the accumulation of sewage, and removing its offensiveness from the town. The committee remark that to talk about the abatement of the nuisance arising from the sewage is easy, but to devise a plan and carry it out is most difficult. After careful inquiry they find that "the nearest available ground for the application of the sewage of Sheffield as a manure in a liquid form, and following the natural inclination of the valley of the Don, is between Mexborough, Bolton-on-Deane, and Conisburgh; the next is below Doncaster; and when Thorne is reached, there are several hundred acres of barren land, called Thorne Waste. There also, for many miles around, exists a vast extent of level ground which would, no doubt, be much improved by the application of sewage manure." The natural drainage of Sheffield and the district is through the valley of the Don, and to that river the committee consider their attention must be directed. The report proceeds to say, "that one of the plans suggested is the removal of the sewage by railway to barren lands on the hills and mountains above Sheffield. This in other localities might be available, but the difficulties in the way of its adoption here are almost, if not altogether, insuperable. The weight of even the daily amount of solid matter will be too vast for removal, while the carriage of 30,000 or 40,000 tons of liquid sewage, day by day, appears impossible. If it could be accomplished, it would have the advantage of simplicity, and of certainty as to cost. Of the other plans the most important, and the one which calls for serious consideration, is that pertaining to the whole valley of the Don. The valley of the Don comprises within its water-shed the towns of Penistone, Sheffield, Chesterfield, Rotherham, Barnsley, Doncaster, and Thorne, and the extensive villages of Stockbridge, Driffield, Whittington, Swinton, Mexborough, Worsbrough, Wombwell, Wath, and Conisburgh. To carry out this system it will be necessary to construct an outfall sewer, extending, in the first instance, from Sheffield to Thorne, or further, with branches from Rotherham, Mexborough, Swinton, Barnsley, Worsbrough, Wombwell, Conisburgh, and Doncaster. Chesterfield and its vicinity might probably be drained into another water-shed. At Thorne there is a very large quantity of barren land, which would form an excellent receptacle for the sewage; and the application of the sewage for the improvement of the soil might probably be combined with the warping system, and aid further in bringing a vast extent of land into a state of comparative fertility, and improving the condition of the land in that part of the country." For accomplishing their purposes an Act of Parliament will be requisite, under the powers of which a commission of sewers might be instituted with authority to purchase land, construct works, borrow money, levy rates, &c. The committee is of opinion that it will be prudent on the part of the local Board, before entering on any costly experiments, to confer with the authorities of the chief towns and villages in the valley of the Don, and to discuss with them

the propriety of their joining in the scheme, and of appointing an eminent engineer to examine and report on its practicability.

**Sunderland.**—The returns of the registrars show that the deaths in the fortnight ending Wednesday week were 116, against 93 in the corresponding fortnight of last year. The increase has been occasioned entirely from diarrhoea, and chiefly among children under twelve months, there being 40 deaths under one year, and 22 above one year and under five. In the six weeks ending June 28 the total deaths from diarrhoea were 6; whilst in the same time, from that date to August 9, they had increased to 51. The number of deaths was highest in the North Bishopwearmouth district, and chiefly in what is called the New Town, Ayre's Quay, and Deptford portions of the district.

**Edinburgh.**—The medical officer of health for the city, Dr. Littlejohn, has issued a volume full of valuable statistics and suggestions regarding the sanitary condition of the city of Edinburgh. The following contains a summary of the suggestions with which his report concludes:—

It will be observed that the suggestions offered range themselves under two great divisions,—viz., those which it is the duty of the authorities to carry into execution; and, 2ndly, those which should be adopted by the inhabitants themselves. The measures proposed differ much as to their relative urgency; but I have no hesitation in stating that the sanitary condition of the Old Town, and particularly that portion of it comprising the districts covering the central ridge, with the Abbey and Grassmarket at either extremity, is a subject that can only be properly dealt with by the municipality, and should be taken up without delay. It includes the following points:—

1. The satisfactory paving and draining of the closes.
2. The improvement of the house accommodation of the poor, by insisting on the introduction of water and gas, the cleaning of common stairs, and the performance of necessary repairs.
3. The diminution of overcrowding of the population, by limiting the number of persons in each apartment, by lowering the houses in height, and by removing all tenements in a ruinous condition.
4. The opening up of the worst localities by means of new streets, which should pass at right angles to the long and unwholesome closes, and give increased facilities for their thorough cleansing. Such new communications would also afford sites for improved dwellings for the poor where they are most required, and would form an era in the sanitary history of Edinburgh.

In the modern part of the city there is less call for interference on the part of the authorities.

**Belfast.**—The local water commissioners, in committee, have been considering the question of procuring an immediate supply of water for this town. After some discussion, committees were appointed to negotiate with reference to certain springs contiguous to the town.

**Plan for Carrying off the Sewage of Towns.**—The town surveyor of Bolton, Mr. H. Baylis, has adopted a plan by which the nuisance occasioned in a small river, flowing through a manufacturing town, have been abated. The propriety of considering the plan with regard to the Liffey has been suggested at Dublin. The carrying out of the scheme is said to be not necessarily expensive. The bed of the river has been first cleaned, and then paved, at an inclination from the river wall on each side towards the centre. At the angle formed by these pavements, which is, of course, in the midst of the bed of the river, is formed a paved trench of semicircular form. The heavy saturated water and sewage matter run into this trench, and the water of the stream, be it large or small, enters into combination with it, and carries it continuously away with the current. When the weather is dry, and the stream small, the trench acts as a flowing drain, the paved bed of the river being dry and clean, there being no possibility of deposit resting thereon, because, as the river water or stream level is diminished, the surface is scored by the water in its descent.

#### CONTINENTAL NEWS.

**Berlin.**—Amongst the more important buildings now in progress in this city is the Bathhaus, or Hôtel de Ville, which is already more than half finished. Some idea of its size may be gathered from the fact that the costs are estimated at four millions of thalers (800,000). It is almost entirely of stone, and its three stories contain innumerable offices, committee-rooms, &c. Mr. Wisemann is the architect. A new and magnificent "gymnasium" is being erected here, chiefly at the private expense of the king, who was present at the laying of the foundation-stone, and who has been pleased to give his name to the institution. Gymnastic exercises on the bars, &c., take the place of our out-door amusements in Germany; and, as the members of the gymnasium are chiefly young men, these

institutions have ere now taken active part in revolutionary movements, and have been consequently regarded by the powers that be as hot-beds of the most dangerous kind. The king, therefore, not only countenancing, but encouraging these gymnasia, is looked upon as a healthy sign of the times. Banrath Lohse is the architect, and has introduced all modern appliances of ventilation, warming, &c.—The French Academy has elected Ober Banrath Prof. Strack as member of the Fine Arts Department, in the room of Dr. Stüler, deceased.

**Württemberg.**—At Stuttgart, there is a good deal of building going on. A new Protestant church is being erected, from plans of the architect Lein. Then a new English church is just roofed in. It is cruciform, and in Early English style, the material being a greyish sandstone. The local superintending architect is a Mr. Wagner, but we believe the plans came from England. A new building for public archives is also in progress, the estimated cost being about 25,000*l.* Then the erection of a new post-office has been determined upon: it will be erected on the site of the present one, and is to communicate with the chief railway station by means of a tunnel. The costs are expected to amount to 40,000*l.* Many of our readers have probably noticed, and still more will probably notice, the utter confusion now existing at the railway station. Though its size was by no means inconsiderable, the increased traffic rendered an enlargement at last positively necessary. The Chambers have voted 4,000,000 of florins (about 340,000*l.*) for extensions, which are now being carried out as rapidly as the traffic will admit. 12,500*l.* have also recently been voted for an extension of the telegraphic system throughout the kingdom. In curious juxtaposition to these sums, stands an appeal to the "German people," to aid in restoring the very interesting chapel attached to the Castle of Hohenstanfen, the cradle of Barbarossa and other emperors, under whom Germany reached the zenith of its greatness. An ancient doorway in this little church has the inscription, "Hic transit Cesar," and marks the way Barbarossa went to Mass. The committee now beg for 700*l.*—and cannot get it!

#### ST. PETER'S CHURCH, VAUXHALL.

The corner stone of this church was laid by his grace the Archbishop of Canterbury, on Thursday, the 16th of April, 1863. The architect, Mr. J. L. Pearson, had formed the conception of a still more perfect design, but the committee compelled him reluctantly to omit much that would have rendered the building more beautiful and effective. The contract was offered for competition to eight builders; the tender of Messrs. Longmire & Burge, for 6,387*l.*, being the lowest, was accepted. The specification was divided into three sections; a heavy fine to be paid if the works were stopped at the end of the first or second portion. The committee were, however, able to proceed with the whole, and the church was consecrated on the 28th of June, 1864, being the Vigil of St. Peter's day. It is calculated to hold nearly 900 persons, every place being free to the poor, who, to the number of 7,000, are crowded around. The parish of St. Peter's, Vauxhall, was cut off, in 1861, by the Rev. R. Gregory, from his own district of St. Mary's, Prince's-road, the Rev. G. W. Herbert being appointed first incumbent.

The church stands upon a portion of the old Vauxhall Gardens; the principal entrance being from Upper Kennington-lane, through the west porch or narthex; this porch is 23 ft. long by 7 ft. wide, and is groined internally. The nave is 78 ft. long, and 24 ft. wide, and has two aisles 10 ft. wide. It is entered from the west end, and is divided into five bays. The arches are of brick, and rest on circular stone columns with carved and sculptured capitals. Above the nave arcade, on each side, is a blank triforium, which it is proposed to enrich with painted subjects taken from the Old Testament for the north, and from the New Testament for the south side. Only one of these is at present executed; it was presented by Messrs. Clayton & Bell. The clerestory above this has four two-light windows on each side of the nave, with traceried heads. At the west end of the south aisle is the baptistery, about 16 ft. square: the font is plain and square, and rests on clustered columns. The south aisle is lighted by four wide lancets, and the north aisle by two, and by two windows at the west end. There is a large external

door in the north aisle opening into the space where it is proposed ultimately to erect the tower. The chancel has an apsidal east end, and is 42 ft. long and 23 ft. wide. The lower portion of the east end it is proposed to enrich by means of frescoes, the most prominent feature of which will be a band of seven subjects, representing the Passion of our Lord. Immediately above these is the chancel triforium, with seven two-light windows, and laucet arches and columns inside; and over this the clerestory, which has eleven lancet windows, four of which are already filled with painted glass, a memorial gift of Mr. B. Lancaster, one of the principal benefactors of the church. The sedilia and credence shelf are formed in the south wall of the sacrum, and consist of four recessed pointed arches, with columns, &c. The reredos is of alabaster, enriched with carving, executed by Messrs. Poole, of Westminster; the mosaics are the work of Dr. Salviati, of Venice. The stalls are of oak, and of solid character. Behind them, on the south side, is the organ-chamber; and on the north side a wide aisle, with an elegant vaulting shaft in the centre, about 28 ft. by 35 ft., for the accommodation of the school-children. East of this are the vestries. The whole of the church is groined in brick, with stone ribs springing from vaulting-shafts of red stone, with carved capitals. The chancel arch is carried up to the groining. On the north side of the nave, at the east end, is the pulpit. It is square, and of stone, with an incised picture towards the west, representing St. Peter preaching on the Day of Pentecost: it is also richly carved. Between the nave and the chancel is a low stone wall, with metal screens upon it. The floors are of red and black tiles. The seats are of deal. The church is lighted by circles of gas, hanging from the under side of the nave arches. It is warmed by hot water. The total cost, including all charges (but exclusive of all ornamentation), is 8,500*l.* About 1,200*l.* still remain as a debt upon the building, for the payment of which donations are earnestly requested from those who rejoice to see the Church at work among our London masses.

There are meetings held in the district, to which the poor can come in their working clothes; and when they are sufficiently instructed to value the privileges of worship, they attend the hearty congregational services in church, which are not such as to attract strangers from a distance, but suited to the needs of the parishioners. St. Peter's Church, with its surrounding schools, parsonage, orphanage, and other parochial buildings, forms a striking ecclesiastical group.

#### PRIZES AWARDED BY INSTITUTION OF CIVIL ENGINEERS.

The council have awarded the following premiums:—

1. A Telford Medal, and a Telford Premium, in books, to J. W. Bazalgette, for his Paper "On the Metropolitan System of Drainage."
2. A Telford Medal, and a Telford Premium, in books, to Calcott Reilly, for his Paper "On Uniform Stress in Girder Work."
3. A Telford Medal, and a Telford Premium, in books, to E. Hele Clark, for his "Description of the Great Grimsby (Royal) Docks."
4. A Telford Medal, and a Telford Premium, in books, to Captain Whitley Tyler, R.E., for his Paper "On the Festiniog Railway."
5. A Telford Premium, in books, to J. England, for his Paper "On Giffard's Injector."
6. A Telford Premium, in books, to T. Hawthorn, for his "Account of the Docks and Warehouses at Marseilles."
7. A Telford Premium, in books, to E. Fletcher, for his Paper "On the Maintenance of Railway Rolling Stock."
8. A Telford Premium, in books, to E. Johnston, for his Paper "On the Chey-Air Bridge, Madras Railway."
9. A Telford Premium, in books, to Godfrey Oates Mann, for his Paper "On the Decay of Materials in Tropical Climates."
10. A Telford Premium, in books, to W. J. Walker Heath, for his Paper "On the Decay of Materials in Tropical Climates."
11. A Telford Premium, in books, to Joseph Taylor, for his Paper "On the River Tees, and the Works upon it connected with the Navigation."
12. The Manby Premium, in books, to H. Burdett Hederstedt, for his "Account of the Drainage of Paris."

ST. PETER'S CHURCH, VAUXHALL. INTERIOR, LOOKING EAST.—MR. J. L. PEARSON, ARCHITECT.

## SCULPTURE, CANTERBURY CATHEDRAL.

The niches in the south porch of Canterbury Cathedral are being filled with statues by Mr. Pfyffers, in pursuance of a scheme which has been laid down by the Dean. The niches on the south face contain the founder and foundress, King Ethelbert and Queen Bertha; and four archbishops—Augustine, who planted Christianity in Kent, and founded the archiepiscopal see; Lanfranc, who built a large portion of the former church; Anselm, the greatest divine of the early days of the English Church; and Cranmer, the chief of the Reformation. On the eastern side of the porch, chronological order is observed. The eight historical personages here represented belong to the Saxon period. First in the upper row we have Gregory the Great, with whom originated the mission of Augustine to England. Mr. Pfyffers has adopted the conventional representation of his subject, and has placed the dove on his right shoulder, symbolizing the suggestion of his discourses by the Holy Spirit. On a scroll are inscribed his celebrated words "Non Angli sed Angli." The next is Archbishop Theodore of Tarsus, the first introducer of the study of Greek into England, and founder of the school attached to the monastery, the predecessor of the King's school. The next is Archbishop Dunstan, a portion of whose shrine yet remains in the cathedral. The next figure, and the last in the upper row, is that of St. Elphege, or Alphege, who was murdered by the Danes at Gravenstead, whither they had taken him after the sack of Canterbury in 1012.

In the lower row we have represented four kings of the Saxon period, beginning at the south-east corner:—Alfred the Great, holding a book inscribed "Leges Angliae;" Edmund, king of East Anglia, from whom Bury St. Edmunds is named; the Danish King Canute, who bequeathed his iron crown to the church at Canterbury; he is represented at the moment when he rebuked the flattery of his courtiers by letting the waves come up and wet his feet. On his shield is inscribed "Vox Domini super aquas." ("The voice of the Lord is over the waters.") Next, and last in this row, is the figure of King Edward the Confessor, taken from his Great Seal, yet extant.

Most of the statues, costing 24l. each, have been presented by individuals. They are executed with much ability, in Caen stone, and are to be treated with some hardening process. The scheme includes as many as sixty-seven statues, proceeding round the west end.

## CHICHESTER CATHEDRAL AND SIMILAR RESTORATIONS.

SIR,—In the *Builder* for the 19th of August appears a letter from "Civis Cicestrensis," in which he refers to the suggestion of your correspondent "P. S. A.," that it would be well, in restoring Chichester Cathedral, if the lantern were left open. The writer advocates this modification of the structure as it came down to us, which, in his opinion, would be an improvement, and endeavors to dispose of the very obvious objection to such a proposal that it is a modification, by advancing views of church restoration which I sincerely hope are not generally held, and with regard to which I trust you will permit me to offer one or two remarks.

"Restoration and re-construction I venture to look on as differing very wide from each other," says your correspondent, "and, while recognizing the good results of the conservative spirit in which Mr. Scott ordinarily works, he, in the same breath, calls the special instance which is under consideration "Chinese copyism." Now, while quite admitting that, where modern interpolations have substituted inappropriate features for original ones, the re-construction of those is not restoration, it appears to me, Sir, not to admit of a question that, in a case where a Medieval structure has perished, of which drawings so complete and fragments so numerous exist that it is possible to re-construct it as it stood, then at least, re-construction, and re-construction only, will fully "restore" that which is lost; and of this case the tower in question is, I apprehend, a signal instance.

I do not gather from any of the letters which have appeared on the subject, or from Willis's Essay on the architectural history of the fabric, that there exist grounds for believing that this lan-

tern was open at the time of its original construction. If this can be shown to have been the case, such a fact would be a strong and legitimate argument in favour of what it is proposed to do, which I contend the beauty of an arrangement not contemplated by the original architect is not; but the case is not put on the footing of restoring an ancient arrangement, but of effecting a desirable alteration. Still it is only proposed to "restore" the fabric; but the word is to be stretched to carry a meaning which neither itself nor the architectural process which it represents ought legitimately to convey.

In dealing with the buildings from which we have learned most of the little we as yet know of Medieval architecture, we cannot be too scrupulously careful to guard them from alterations, and to transmit them intact, as far as is in our power, to succeeding generations. This can never be done, unless we carefully confine our work to that which it is absolutely essential to do, and restrain our disposition to alter or, as we term it, improve, the grand old fabrics, when necessary repairs are in hand. For want of the proper appreciation of this duty, how many unnecessary, capricious, and destructive changes have been introduced, how many valuable features have been irremediably lost, how often has "restoration" been but an excuse for mutilation, alteration, modernization, and every sort of tampering!

Fortunately, many opportunities offer where we architects of the present day can have our own way, and show what skill and taste we may have, in entirely new buildings; and many occasions occur where, in necessary enlargements, we have opportunities of adapting new work to old; but I deprecate most earnestly the idea in treating any monument of the architecture of our country, be it a village church or be it a cathedral, we are to hold ourselves at liberty to make such alterations as our taste or caprice may dictate in the work of those who made the architecture which we can only learn and copy.

This is not a question so much of the Chichester lantern as of the general principle. Chichester is in too good hands for one to feel any doubt that what is done will be right; but Mr. Scott's views of restoration are not those which are universally held and acted upon; and my object in this letter is to oppose the view implied, and indeed expressed, in your correspondent's letter, that restoration includes the right to make modifications at will. Where such must necessarily be made, make them and call them by their right name; but wherever they can be avoided, let us be content, and even thankful, to discharge the pious task of repairing and re-establishing the works of our forefathers, without interfering to modify their designs, or to substitute our own conceptions for theirs.

walls which indicated the former extension of the building; and no doubt existed that the parish church originally stood on the north of the chapter-house.

A train took a considerable party from Pulborough to Amberley, where, by the permission of the railway authorities, it stopped close under the castle walls. Amberley Castle was thus reached by a short walk of two or three minutes. The objects of interest at Amberley are the castle, which was a very ancient residence of the Bishops of Chichester, and the church, recently restored by the Rev. G. A. Clarkson, the vicar.

Relative to the castle and church, Mr. Clarkson delivered a summary of a paper which is to appear in the forthcoming volume of the Society's transactions. Amberley lies about five miles north of Arundel, twelve north-east of Chichester, and 5½ miles from the Standard in Cornhill. In 1861, it was described as one of those picturesque old-world villages still to be found beyond the influence of the railway navy. In August, 1863, however, it was brought more into communication with the outer world by means of the railway which runs through it, connecting the Mid-Sussex and the South-Coast lines of the Brighton Company. The castle is built on the first portion of the South-Down chalk, after passing from the Wealden in a southerly direction. According to a distinguished archaeological writer, Mr. Matthew H. Bloxam, the castle is not a castle at all, though called so. It is one of those defended mansions, of which we have a list of nearly 400, crenellated, embattled, and, to a certain degree, fortified under the Crown. Many of these embattled mansions were, in after times, popularly denominated castles, but they want many of the characteristics of the old castles. The history of Amblecley dates from an early period, and is associated with the struggles and the fortunes of Cedwalla, the son of a sub-king of the West Saxons. It was subject to the decrees of the Council of Nice, described in Domesday-book, and, in the reign of Henry I., and subsequently, seems to have come gradually and entirely into the possession of the Bishops of Chichester, who built here an episcopal seat.

As to the size of the castle, if castle it be, the buildings include a farmhouse, another dwelling, and a plot of ground on which Edgington had pitched a tent for the rest of the business of the day; comprising a dinner, of which from 250 to 300 persons partook. Some business, however, was transacted in the interim, and another stroll was taken round the ruins and the church.

The company left the castle by trains which stopped for their special convenience at the different stations.

## KENT ARCHÆOLOGICAL SOCIETY.

The eighth annual congress of this Society took place at Hever Castle and Tonbridge, and notwithstanding the retired situation of Hever, the beauty of the weather and the rich scenery of the district induced a large party to assemble.

Hever Castle was built by Sir Geoffry Boleyn, in the time of Henry VI., and added to by his son, Sir Thomas Boleyn, father of Lady Ann Boleyn, the unhappy wife of Henry VIII., whose visits to this castle add much to its celebrity. Through her the property became vested in the Crown: thence it passed through the Waldegraves and Humphreys to the Waldos, in which family it still remains. The building is moated round by the River Eden, and is in good preservation. It is castellated, with two porticoes in perfect condition. The internal arrangements are of an inferior character, though in many instances rendered interesting by legends of the courtship and estate of its royal owner.

The Rev. William Wilberforce Batye, the rector of Hever, explained the principal points of interest.

The annual meeting was held in the hall of the castle, when the Marquis Camden presided.

The Society next proceeded to the church, where are some interesting brasses, as shown in the first volume of the "Archæologia," after which the company again crowded into the vehicles prepared to convey them to Tonbridge. They proceeded through a very enclosed and well-timbered part of the wood to Chiddingstone, the seat of Mr. H. D. Streatfeild, where the party alighted at this interesting village, examining the church and the old timbered houses. They also went into the park to see the chiding stone, as it is called, and which is said to have given name to the parish, as the

## SUSSEX ARCHÆOLOGICAL SOCIETY.

The annual general meeting of this Society was held this year at Amberley cum Pulborough. The meeting took place under the presidency of the bishop of the diocese, and on a site of which he is the especial owner.

Pulborough is a place full of archaeological interest, from the fact of its standing on the old Stone-street, running from Chichester through Halmaker to London, and passing Bignor. The neighbourhood abounds with Roman remains; and it is regarded as an undoubted fact that the existing Pulborough quarries were worked by the Romans nearly 2,000 years ago. There was no regular commencement of the meeting. The Rev. P. Royston guided the visitors to Pulborough church, with its lych gate and brasses, and to Old Place and New Place, the Park Mount, and Hardham Priory, accompanied by Mr. Gordon Hills, the architect.

Old Place, the residence of the Apsley family, stands above the church. It is an interesting fragment of a manor-house of the time of Henry VI. New Place contains portions of a manor-house built by the same family, probably in the time of Henry VIII., though containing traces of a still older building.

Next followed a ride to Hardham, a short two miles off. Here is a farmhouse, built over some famous old cellars, or rather the crypt of what is still called Hardham Priory, the chapter-house of which, with its arched windows, and other portions of its original structure, still remain. Mr. Hills pointed out various portions of the

soldiers of ancient times were taken there for punishment, but history has been silent on this point. It is a large sound stone work, about 13 ft. in height, resembling the Sphinx head, and probably a remnant of Druid worship. After traversing a delightful country, the members found themselves at Tonbridge Castle, an interesting remnant of olden times, but modernised and now the residence of the Rev. T. P. Fleming. Mr. Fleming here entertained the Society with some curious information as to the ancient customs of the place. He then proceeded to explain the old structure. In the new ball, arrangements were made to dine 250.

#### SURREY ARCHÆOLOGICAL SOCIETY.

The general meeting of the members of this Society was held at Titsey Park, the residence of Mr. Granville Leveson-Gower, M.P., one of the vice-presidents.

Those of the members and their friends who resided at a distance assembled at the Redhill Junction Railway in the morning. Here vehicles of all descriptions were in readiness to convey the party in the first instance to Godstone church, where, however, there were but few archaeological remains for examination.

Having seen and heard all that could be gleaned in connexion with Godstone church, the party proceeded onward to Barrow-green, the residence of the Right Hon. Edward Cardwell, who gave permission to inspect the curiosities of his mansion. Mr. Charles Percival, LL.D., gave an account of Oxted and the Burgh family. The mansion, he observed, took its name from a very large and remarkable barrow in the neighbourhood, which he hoped would soon be excavated. The pilgrims' road to Canterbury passed near to Barrow-green, the route of which could in several localities be clearly defined.

The church at Limsfield was next visited, Mr. Eales giving an account of it. The party then proceeded towards Titsey Park, the woods and gardens of which were open to visitors, by the special invitation of the owner. In front of the mansion there are the remains of a Roman villa, recently discovered, which were described by Mr. W. W. Pocock. The church, which is in close proximity to the mansion, was also visited, and a description of it given by Mr. Gower.

After luncheon, the party returned to Redhill Junction.

#### PENZANCE ARCHÆOLOGICAL SOCIETY.

The annual picnic of this Society has taken place. A large party was expected to join the mail train from Plymouth at the Truro station, and thus swell the Society's party at Penzance, so as to proceed across the hills to Gurnard's Head, a distance of about seven miles from Penzance. On arriving at Truro no party joined the train. The weather was bad, but at the hour of starting the sun shone out. The members of the Society and their friends then mustered at the end of the Marazion-road pretty strongly, there being about 150 to be conducted to the scene of the proposed archaeological exploration. After proceeding about five miles, the company left the conveyances and proceeded on foot to Mulfra Quoit, or Moel-vre (bare hill) Quoit, which was duly inspected. Mr. T. Cornish also led the way through the heath to Bosphrennis hut—Bos-porth-ennis (the house of the island port)—having reference, no doubt, to Porthmoro, on the sea-shore close by. After this the party were conducted by Mr. Cornish to a large mound of stones, which are supposed to be unopened remains of an ancient barrow or burial-place. A fallen cromlech was also exhibited in a field but a few yards off, of which the tenant of the land told of his having heard that many years ago a miller made the top stone of the cromlech round as it then was, in order to convert it into a millstone, but that he found it too hard. The story is not probable, because there is no brook adjacent at which the top of the cromlech could have been used as a millstone. There is no other top cromlech stone at present known to be of a circular form. The party having regained their vehicles, were conveyed to Gurnard's Head, where the picnic took place; after which the company were driven to two specimens of barrows pointed out by Mr. Millett. Having been opened, there was no doubt as to their ancient character. The whole of those present crept

into the subterranean barrows, which were lighted up by means of magnesium wire. The members of the party then returned to Penzance.

#### AN ILLUSTRATION OF DRY-ROT.

So great is the mischief caused by dry-rot, that good must be done by keeping attention directed to the causes of it. Several cases of this serious disorder in buildings have come under the observation of the writer, and in all those in which investigation was made, the cause evidently arose from damp, or want of ventilation. In some instances both these evils were combined. One of the cases referred to was observed in the old church of St. Pancras, during the time when extensive alterations were either just completed or in course of progress; but long before the works referred to were

long a time before; and in a short time beams, planks of flooring, railings, &c., were reduced to rotteness; the colour changed, and a heavy dark brown dust fell, and represented the once solid timber. On making an examination with a view towards discovering the cause of the attack, it was found that in the graveyard near the church, there were graves and several vaults: there were also vaults in the inside of the church. Most of them were filled, or nearly so, with water, which had run from the overcrowded graves. In the interior there were water-logged vaults, and the walls were saturated with damp. It was also seen that from the want of proper spouts and drains, near the outer walls, the drip from the large pent-roof had fallen into the foundations. In this situation, when the window-frames were properly arranged, a drain dug round and from parts of the church, and other alterations, which should long before have been made, were completed,

Dry Rot in a Church.

commenced, the church was in a most unwholesome condition; and some of our readers will remember the accounts which appeared in this paper at a time when there was much agitation respecting the closing of intramural places of interment, descriptive of the ill-ventilated state of the church. Both old and young complained of the bad air in the church, which caused persons to leave during the service, affected with headache, dizziness, and sickness; and several persons who with their families had been for long in the habit of attending the church were forced to discontinue doing so. On entering the church, even after the doors had been for some time open, the air was thick, heavy, and unpleasant to the smell, reminding one of those charnel-houses in which are dead men's bones. In many parts the graveyard, in consequence of the immense accumulation of bodies, had risen to a height of from 5 ft. to 6 ft. and 7 ft. above the original surface of the floor of the church and the burial-ground.

When the dry-rot made its appearance, it spread with amazing rapidity. Sometimes in the course of a night, a fungus of about the consistency of newly fallen snow, and of a yellowish white unwholesome colour, would be found to have spread over a considerable surface. The fungus was without shape, but in some cases it rose to a height of 2 in., 3 in., or 4 in. above the planks or other surfaces on which it grew. It could be cut with a knife, leaving a clear edge on each side, and there did not seem to be any covering or membrane over the outer or under surfaces. The smell of those matters was unpleasant, and seemed like the concentration of the smell which had pervaded the church for so

the dry-rot vanished, and we have heard no complaint of the foulness of the air.

Our engraving shows,—A. Grave-yard, raised above the surface of the ground by the deposit of the dead. B. Original surface of Church. C. Vault, partly filled with water, in which were coffins.

#### THE CASTLE HOWARD TUMULI.

LATELY we mentioned the renewed examination of the British barrows on the Earl of Carlisle's estate at Castle Howard. The operations have now been completed for the present year; and a particular account of them has appeared. They have revealed a distinct system of burial, generally of single bodies, placed in hollows dug in the apices of natural hillocks, which seem, so far as present researches have gone, to indicate the mode of burial of a distinct tribe or a particular social grade of the pre-historic Britons. Over the whole of these rude burials a slight mound has been raised, but this modern cultivation has nearly obliterated, rendering the places of burial very difficult of identity. The burials were all of the latest race of Britons who resorted to cremation. In no instance during these Castle Howard diggings has any trace of the long-skulled tribes, who buried the body entire, been found. In like manner, all trace of Christian burial has been wanting. The first opening of the low round barrows (the eighth of this year's explorations, and the eleventh of the Castle Howard series) was made on the summit of a natural hill north-west of the last great burial-mound described,

on Taylor's Moors. The small tumulus was formed of stone and sand, and had been much ploughed down, but was still 20 ft. in diameter, and (say) 1 ft. high. Just below the tilled surface a cap or dome of pure charcoal was found, beneath which was the deposit of burnt bones, placed in a central hollow formed in the natural ground, 1 ft. wide and 1 ft. deep. The appearance of the sides and immediate locality showed that the body had been consumed on the spot. The skull indicated youth. There was no flint implement, nor any guide to the sex of the interment. This burial was of the rudest and most primitive description.

The next opening made was on the apex of a hillock about 150 yards west of the large tumulus on Windmill-hill. Here, again, the plough had nearly eradicated all traces of the interment. The mound as measured was 120 ft. diameter and 1 ft. high. An opening was made in the centre, but little trace of burial was found. A few inches below the surface a deposit of burnt bones was met with, piled round with stones in the celt fashion. Below this burial a large stone slab was found, and below it a second (or rather the first) burial, in a deposit of charcoal. This body had been most imperfectly burnt, and was one of considerable stature. Some bones were yet quite recognizable, the pelvic bones in particular. The first burial had been placed in a hollow in the natural ground, and had been covered by the flag on which the upper burial was made. At the south side of the hollow with the first burial a perfectly plain incense-cup was found, with the mouth to the body. The cup was 3 in. in diameter, and had no marking beyond a groove on the bottom, and showed no wheel-marks. The best idea of the shape is obtained from the twopenny pork-pie of the present day. There was no flint nor any ornament. This barrow was peculiar for having two burials, one upon the other.

The next opening was in a tumulus in a meadow adjoining Windmill-hill, which, although 27 ft. across, yielded no trace of any burial. It was thought this mound had been dug over and over again for rabbits.

The next excavation was made in a small mound on a hill west of the large tumulus on Windmill-hill. 9 in. below the surface (again ploughed down), in a central hollow in the natural ground, 2 ft. diameter and 1 ft. deep, a deposit of burnt bones, with many signs of burning, and two incense-cups, were found, one cup broken, and above the interment, the other perfect, and among the bones of the skull. The broken cup was of a blueish tender ware, pierced near the bottom, and beautifully marked externally with triangles having reversed lines. The fragments were nearly all recovered. The perfect cup was 3 in. in diameter, and resembled the base of a truncated cone. It was cord-marked horizontally, and was pierced with nine perpendicular lines of three holes, the upper eighteen being pierced through on the square, the lowest row being oblique, as if to drain off moisture from the bottom of the vessel. This was the first instance where two incense-cups had been found with one burial, the two differing in type also.

The next opening was made in the centre of a mound 30 yards west of the last, on a rounded hill, slightly added to and much reduced in size. In a circular hollow, 2 ft. wide and 8 in. deep, and about 12 in. below the surface, enormous quantities of charcoal were met with, some lumps being as big as a man's hand, and quite as perfect as if burnt yesterday, instead of having been buried over 2,000 years. The deposit of calcined bones was made in the midst of the charcoal; and on the top of the burial, near the bones of the skull, on the south-west, a small globular incense-cup was found, grooved horizontally, and profusely marked with dots on the sides and on the bottom. There were cord-marks on the edge. Up to this point no trace of flint implements had been found with any of these peculiarly rude burials.

The next opening was made by Mr. Monkman, in the "Rye-hills"—a sandy tillage field. The tumulus had been a very large one, and was still 40 ft. in diameter, but reduced to about a foot of forced earth. The mound was all sand, and was full of rabbit-burrows. The labour of driving a 15 ft. trench through it was lost, for the interment had been long since destroyed by the plough. Fragments of a fine cinerary urn and traces of the cremated interment were found near the centre, and four pieces of wrought flint were also found.

The next opening was in an immense tumulus

in the Slingsby-avenue, of which an estimate of 70 ft. diameter would be moderate. This mound had been so completely and frequently upturned for rabbits that every trace of the original purpose for which it was reared was lost, as was also a whole day's labour.

The last opening for the present year was made by the Rev. Mr. Greenwell and Mr. Biggs in a small barrow left unexamined in Cook's Moor, to the extreme west. The "bone" was 24 ft. diameter and 1½ ft. high. In the central hollow, 2 ft. wide by 1½ ft. deep, the burnt body was found in quantities of charcoal. There was no urn nor pottery, but there was a very fine thumb-flint, thus in the last opening discovery of the theory that no flint implements accompanied the low barrow burials.

A volume of description of the barrows is, we believe, in preparation by Mr. Greenwell, at whose cost the researches have been made.

THE PYRAMIDS OF EGYPT.

MAHMUD BEY, Astronomer to the Viceroy of Egypt, has published an interesting treatise, with the view of proving their dates from their connection with Sirius, the "Dogstar." The late Viceroy Said Pasha ordered him to work out this problem. He found the exact measurement of the largest to be 231 metres at the base, and 146-10 from the ground to the apex. Hence follows that the sides are at an angle of 51° 45'. Mahmud Pasha found that the angles of the other three pyramids, near Memphis, were on an average inclination of 52°. The fact that the sides of these monuments are placed exactly true to the four quarters of the globe, seemed to point to some connexion with the stars, and Mahmud Bey found Sirius sends his rays nearly vertically upon the south side, when passing the meridian of Ghizeh. He then found, on calculating back the exact positions the star occupied in past centuries, that the rays of Sirius were exactly vertical to the south side of the Great Pyramid, 3300 B.C. Sirius was dedicated to the god Sotbis or Toth Anubis, and hence the astronomer deduces, that the Pyramids were built about 3300 B.C.—a date nearly coinciding with Bunsen's calculation, who fixes the reign of Cleopas at thirty-four centuries before Christ.

DIOPHANTINE ANALYSIS AT OXFORD, IN 1865.

A WORKMAN having propounded the error, current among carpenters, that a triangle whose sides are as 3, 4, and 5, is the only right-angled one whose sides are commensurable, I corrected him by showing several others. This led me to observe that all these appeared to belong to two series; one of which, beginning from 3, 4, and 5, continually shortens the triangle, or brings the two short sides nearer to equality; while the other series, starting from the same, continually lengthens it, or brings the two longest nearer to equality. For example:—

Shortening Series.			Lengthening Series.		
3	4	5	3	4	5
20	21	29	8	15	17
119	120	169	5	12	13
696	697	985	12	35	37
4163	4264	6149	7	24	25
	6c.			3c.	

In the shortening series the two short sides differ always by the greatest common measure of all three; and in the lengthening series the two longest always differ by either once or twice that measure. This led to a conjecture that it might be a property of all such triangles to have (when reduced to their lowest terms) two sides differing by either 1 or 2; and I wrote to an Oxford mathematician to ask if this could be proved to be the case. He replied that, as the question belonged to the "Diophantine Analysis," he had referred it to the man he considered best up in that subject. Accordingly, in about a week I received a supposed demonstration that the above is universally true of all prime right-angled triangles. The process was by ordinary algebra, but jumping over steps that I was unable to supply, and arriving at the result that  $(x, y, z)$ , being the three sides in their lowest terms, either  $x, y, z$ , must be 1 or 2. Meanwhile, however, I had found this was not the case, as one example will suffice to show. For  $x, y, z$ , may be 161, 210, and 289, in which the two nearest, instead of differing by one or twice their greatest common measure, differ by forty-nine times!

E. L. GABBETT.

CONDITION OF WATERING PLACES.

You have long directed attention to the deplorable condition of the dwellings of the "poorest poor;" but the condition of the dwellings for those several degrees above the poor seems to merit attention, especially at the present moment, when anticipation, just or unjust as the event may prove, exists of the possibility of this country being again visited by cholera.

I have recently visited a watering-place on the east coast, and found a block of buildings, chiefly designed for the reception of visitors, of rather recent erection, admirably planned to engender or propagate disease such as typhus or cholera. The houses are in pairs; the lower floor, level with the ground, being for sitting-rooms, the upper for bedrooms. The walls extend on each side backward, forming, as it were, the one-half of the letter H. Close to the kitchens, and only a couple of yards from the rooms for human habitation, is a cesspool, one for each house, and in the space between, one pump for the use of the inhabitants of the two houses. Now if builders, I will not say architects, plan and erect houses in this way, can we wonder at the extension of disease? Only think of all the water for drinking, cooking, and personal ablution being derived from such a source!

M. D.

\*\* The name of the place and the position of the houses have been communicated to us, but we forbear at present from publishing them.

ST. MICHAEL'S CHURCH, ST. ALBAN'S.

"A word on the spot [says the poet Gray] is worth a cartload of recollection." What I am about to write to you "touching" Lord Bacon's church is noted before the church itself, now a mere carcass or shell, but instructive in every way,—a fitting subject for a peripatetic lecturer from that M.A. in architectural characteristics, the Professor Willis; fit to fill a note-book for future publication of our modern "Oxford antiquary," Mr. J. H. Parker.

That Mr. G. G. Scott has undertaken his work of restoration or alteration with a knowledge of what he is about, and a resolute determination to carry out his own views in re-making the church as it was before the attempted revival of the Classic style under Holbein, John of Padua, and still later, Inigo Jones, there cannot be a doubt; but he has such a task before him that, I am afraid, he will only reproduce—

"Small thanks to France, and none to Rome or Greece, A patch'd, yamp'd, future, old, revived, new piece."

And yet I am assured "No." I assuredly hope so.

At every visit I make to the church,

"Brushing with hasty steps the dewy away,  
To meet the sun upon the upland lawn,"

I tremble for the fate of a Jacobean south chancel doorway, plain and unpretending, under which Francis Bacon, when alive, entered the church wherein his mother was buried, and with whom, in his Will, he desired to be buried. It is still happily standing, though in discordance, I admit, with the Gothic architecture of the well-proportioned chancel, but in full accordance with Bacon's statue and the architecture of all that remains of Gorhambury as it stood in the days of Queen Elizabeth and King James.

The chancel-yard, by sheer necessity, is made to shelter a pile of lofty pews; some green-painted, some red-painted, —skirted with brass coffin nails (may I so call them?)—and enough, if lighted, to set Barry's Houses of Parliament, the Penitentiary, and Father Thames on fire. Happily these are condemned to firewood, for household purposes; and open carved seats will replace them, much to the comfort and cleanliness of the congregation.

The artificial earth, some 3 ft. deep, the accumulation of centuries of burials and neglect, that surrounded the outer wall of the church, has been removed sufficiently deep to admit of a tiled gutter and tile-drain-pipes. The plumbers are on the roof of the nave.

The exterior of the chancel is strongly shored up, and properly so, for it was (is) more than nodding to its fall; but I hope every hewn stone will be preserved that can be made available. A new "London stone," in London, would not be the London stone of the Romans or Jack Cade. A new rough-hewn red sand-stone in the Coronation Chair in Westminster Abbey could not be the Coronation-stone of King Robert I. of Scot-

land, or King Edward I. of England. The cut and reset Koh-i-noor of England and Queen Victoria, is no longer the neat and inestimable diamond of the Sikhs and Runjeet Singh. A Preservation Society is as much needed as a Restoration Society. C.

#### THE ARCHITECTURAL MUSEUM.

PRIZES FOR ART-WORKMEN.

The following competitions are open to all *bonâ fide* art-workmen, whether members of the Architectural Museum or not. It will be seen that the complaint of a stone carver in our columns some little time ago is thus answered.

The Council offer a first prize of 20*l.*, a second prize of 5*l.*, and a third prize of 2*l.*, for the most successful carvings in stone of a subject from Flaxman's illustrations of Dante, entitled "The Triumph of Christ."

A first prize of 15*l.* for the best, and a second prize of 5*l.* for the next best rendering in wood of a poppyhead not less than 10 in. high and carved on both sides.

A first prize of 10*l.* for the best, and a second prize of 5*l.* for the next best reproduction of the head of the Statuo of Germanicus in *repoussé* or bossed up silver.

A prize of 10*l.*, given conjointly by the Ecclsiological Society of London and Mr. Berensford Hope, is offered for the reproduction in translucent enamels, on a flat "plaque" or plate of silver, of the figure of S. Barbara, ascribed to Nino Pisano, and marked 7,431 in the Statuo or Sculpture Collection at the South Kensington Museum.

A prize of 10*l.*, given by Mr. Ruskin, is offered for the reproduction of the same figure in opaque enamels on copper, similar to those of the classe No. 2,231, the altar cross No. 2,332, and the two plaques Nos. 2,191 and 2,192, at South Kensington.

The Council of the Architectural Museum offer a first prize of 10*l.* for the best, and a second prize of 5*l.* for the next best panel filled with marble mosaic work, without figures or animal life, suited to architectural decoration.

In addition to the above prizes, certificates of merit will be given in deserving cases, and the Council of the Architectural Museum may, at their discretion, award the sum of 1*l.* or upwards, or a book, for objects showing merit, although not sufficient to secure a prize.

The conditions will be obtainable at our office.

#### THE ATLANTIC AND OTHER CABLES.

It is suggested by a correspondent of a daily paper to start three ships instead of one, each ship having a wire rope of great strength attached to the stern, of at least three miles in length. At the end of this rope (he continues) I would attach a crotch ring weighing several hundred pounds, through which the end of the cable at Valentia should be passed; the ships would then be obliged to follow the cable, as the least deviation would be indicated by the angle described by the ropes. The ships should be from two to three miles apart, the *Great Eastern* in the middle; and when within ten or fifteen miles of the broken end of the cable they would, by a signal from the *Great Eastern*, stop, and begin the winding up. When the cable is raised a mile high, the first and third ships should stop, leaving the *Great Eastern* to finish the work. By this means the slack of at least six or seven miles of the cable would be available to raise it at the surface of the water even if the depth were two miles.

The underwriters interested in the lost cable, it is said, have settled with the insurers, as if the cable were indeed a total loss. A new cable has already been begun, so as to prevent all possibility of improvement in the "faulty cable." The whole affair seems to be in the hands of the unsuccessful cable constructors.

In Europe, Asia, Africa, and Australia there are fifty-two submarine cables, which are of the aggregate length of 5,625 miles, and the insulated wires of which measure 9,763 miles. The longest of these is 1,550 fathoms, and the shortest 1½ fathom. There are ninety-five submarine cables in the United States and British North America, which measure 68 miles, and their insulated wires 133 miles. The overland telegraph lines between New York and the west coast of Ireland, through British Columbia, Northern Asia, and Russia, will be 20,479 miles long, 12,740 miles of which are completed. It

has at length been resolved that this line shall cross from America to Asia at the southern point of Norton Sound, on the American side, to St. Lawrence Island, and from thence to Cape Thadeus, on the Asiatic continent. Two submarine cables will be required for this, one 135 miles long, and the other 250 miles long. Cape Thadeus is 1,700 miles from the mouth of the Amoor River.

#### THE PROPOSED NEW ROYAL EXCHANGE FOR MANCHESTER.

The Exchange Committee have exhibited at the old Exchange a drawing for a new Exchange, upon the basis of the enlarged scheme suggested by the corporation.

The style is Italian. The principal entrance is placed in the Cross-street front, and the drawing accordingly exhibits the Cross-street and Market-street frontages. The Cross-street front presents two projecting pavilions, with a receding centre, the angles surmounted by towers. The pavilions, or wings, are united on the lower story by a portico of Doric columns, from 25 ft. to 30 ft. in height. The Market-street outline is in keeping with that of Cross-street, having two wings, one at either end, the recessed centre not being so deep as that on the Cross-street side. This frontage is terminated at the junction of Market-street and Exchange-street by a tower, placed so as to front directly towards Victoria-street. Another entrance at the junction of Exchange-street and Bank-street will be so placed as to front into St. Ann's-square.

The ground-floor will be occupied principally by the large room, which will be lighted not only from the roof in the centre, but also by windows looking into the three principal streets.

The area of the site is about 250 ft. by 200 ft. The upper stories contain suites of offices for public companies and others.

#### THE BUILDING TRADES.

*Ipswich*.—The master builders resolved that no answer could be forwarded to the operative bricklayers, as to their desire to have an advance of wages to 4*s.* a day, until the names of the persons who issued the circular should be attached to it. The men, to the number of sixty-nine, thereupon signed a round-robin, and demanded an answer, which was sent, and to the effect that they could not agree to advance the rate of wages to 4*s.* a day; but in order to enable them to complete the contracts now on hand, they would agree, that after the first week in October the rate of wages should be in classes of 3*d.*, 4*d.*, and 4½*d.* an hour, the class of the men to be determined by the masters on arriving at their value. The men would not accept these terms, and turned out.

*Pershore*.—A meeting of journeymen bricklayers has been held in this town, to consider the low rate of wages, and adopt means for raising the same. All the speakers agreed as to the impossibility of maintaining themselves and families with the low rate of wages paid, while provisions of all kinds were so high. For years past the masters in Pershore, they said, had been paying only 3*s.* per day, which, taking into consideration the loss of time, &c., averaged, in the majority of cases, scarcely 10*s.* per week during the year. It was also stated that the bricklayers in Pershore were receiving from 3*s.* to 9*s.* per week less wages than the bricklayers in neighbouring towns,—the highest rate of wages paid in Pershore being 12*s.* per week, whilst in Evesham it was 21*s.*, and in Worcester 27*s.* It was unanimously agreed to inform the master builders in Pershore of the men's determination to cease working after the 26th ult., unless at an advance of 6*d.* per day.

*Jedburgh*.—At a meeting of the joiners of this town it has been resolved to ask the masters for an advance of 2*s.* per week of wages, as they were below the other towns in the district.

*Penrhyn*.—We have already mentioned that there has been a strike of the quarrymen at the extensive Penrhyn Quarries, North Wales. The quarrymen have since had several interviews with the proprietor, Col. Pennant, M.P., and an arrangement has been arrived at, and all the men have resumed work. The chief point complained of by the men was, that when the rock happened to turn out bad many of them did not earn more than 6*s.* to 7*s.* per week, and they

applied that they should be secured a minimum rate of wages irrespective of how the rock turned out. This has been conceded, at least in principle, by Col. Pennant, although no fixed minimum has yet been determined upon. An advance is also to be given to those who are engaged in making slabs.

#### JOINT COUNTIES LUNATIC ASYLUM FOR CARMARTHEN, CARDIGAN, AND PEMBROKE.

The building is nearly ready for occupation. The establishment was intended to contain 305 patients, but owing to the architect's plans being curtailed of two wings, it is only suited to accommodate 212 patients.

The architect employed by the committee of visitors is Mr. David Brandon, of London. The building was begun in March, 1863, by the contractor, Mr. George Pollard, Tannock, Somersetshire. Mr. George Pratt has superintended the erection since August, 1863, as clerk of the works. Mr. Chaplin and Mr. Beard were employed as foremen and managers to the contractor.

The walls are built of stone chiefly from Tygwyn quarry, with Bath-stone dressings. The whole of the exterior walls are cased with brick inside with a hollow space to prevent the damp coming to the interior. Flues and other means are adopted to carry off the foul air from the sleeping dormitories, corridors, &c.

The towers, east and west, which are 85 ft. high, contain large slate cisterns capable of holding 6,000 gallons each of water; this water is pumped up from "Job's Well" by means of a steam-engine, to the top of these towers, from whence it finds its way to other cisterns and taps throughout the whole of the building. Hot-water cisterns are fixed below those of cold water, and this is used for baths for lunatics and the washing up connected with the patients.

The whole of the stoves and ranges and fittings in kitchen, hot-water supply, &c., have been executed by Mr. Thos. Potter, of London.

The site has an elevation of 190 ft. above the level of the sea, and commands a view of the town and environs of Carmarthen, with an extensive and charming view of the Vale of Towy, and the hills near Brecon in the east, and on the west the high range in Pembrokeshire. It is situated about one mile from Gwilldall-square, Carmarthen.

#### RAILWAY MATTERS.

The report of the directors of the London, Chatham, and Dover Company shows in a tabular statement that the receipts of the general undertaking, 7½ miles open, amounted for the half-year ending the 30th June to 146,619*l.*, and for the same half of last year to 125,207*l.*, showing an increase of 17-10 per cent. The total receipts on the same mileage for the half-year ending the 30th June, 1863, amounted to 82,848*l.* The aggregate number of passengers conveyed on the company's lines and branches during the past three half-years was 11,383,157, of which 8,658,693 were third-class, 1,832,362 second-class, and 892,102 first-class passengers; and of the total number of passengers mentioned, 8,873,550 were conveyed over the Metropolitan Extensions, of which 6,706,962 were third-class, 1,428,586 second-class, and 737,002 first-class.

The invention of Mr. Preece, the superintendent of telegraphy on the South-Western Railway, for communication between passengers, guards, and drivers of trains, and which is now in use in certain of the express trains on the South-Western line, has been thus described:—In the middle of every carriage is a small circular wooden top, the form of which is covered with glass protecting an enamel face, on which is inscribed "To warn the guard, break the glass and turn the handle," which handle projects from the disc. The glass breaks at the slightest tap, and the handle on being turned sets ringing three electric bells, one in a van at the fore end of the train, another in a van at the aft end, and the third immediately in front of the driver on the engine. The men then act in accordance with the following instructions:—

"When the guards and engine-man hear the bell ring, they will at once look carefully along each side of the train, and in case any violent oscillation be seen, or a carriage be on fire, or other occurrence of a serious

elevation being 90 ft. The height of the central portion, from the ground to the apex, will be 40 ft., whilst that of the two wings up to the cornice will be 20 ft., and the depth to the extreme back about 100 ft. From the roof, in the centre of the building, a dome will rise, forming a prominent feature in the external appearance of the structure. The Board-room will be immediately under this dome, by which it will be lighted. The main entrance will be on the west side of the High Park-street frontage, leading to the several offices and the Board-room. The chief office for receiving the poor-rates will be 30 ft. by 27 ft., lighted from High Park-street, and in the wings on each side of this apartment, there will be two other offices respectively appropriated to the department of the superintendent registrar, and that of the Government tax collector. The Board-room will be in the centre of the interior, and will, of course, be the principal apartment in the building. Its dimensions will be 50 ft. by 30 ft., and its height from the floor to the dome, 45 ft. This apartment is intended to be devoted to the meetings of guardians, as well as to the annual general vestry meetings, and all other meetings connected with the business of the township. Corridors of ample dimensions will run entirely round the Board-room, giving access to the several offices and waiting-rooms within the building. At the rear of the building there will be a court-yard, with all sanitary conveniences, together with a dispensary. The architect is Mr. Layland, and the builder Mr. Samuel Campbell, whose contract amounts to 5,788*l.* The price paid for the land was 12*s.* per square yard.

### Books Received.

*Papers upon the Supply of Water to Towns.*  
By BALDWIN LATHAM, C.E. London: Spon. 1865.

THESE papers are of practical value. They treat of water supply from various sources, and are illustrated by diagrams of strata, water-bearing and otherwise, and of well-sinking, with designs of wells, &c. Rainfall is also treated of, and the circulation, evaporation, and absorption of rain-water, water supplies from collecting areas and their quantities, examples of water-works supplied from such areas, as well as from rivers and streams, and from springs and wells.

### VARIORUM.

A CHART of the Atlantic Telegraph has been published by Messrs. Bacon & Co., showing the Atlantic and other Submarine Telegraphs in Europe and America; a View of the *Great Eastern* Steamship; Diagrams of the Morse Telegraphic Machine and Alphabet; a View of the Atlantic Ocean from Valentia, Ireland, to Trinity Bay, Newfoundland; showing a Sectional View of the Soundings, drawn from Official Documents, with the number of Fathoms marked across the Ocean and other illustrations; of a subject now interesting many persons. It might have been done better.—"Vaugher's Parliamentary Companion," for the Session 1865 of the New Parliament. This is a small but useful publication, which appears monthly during the session, and contains lists of the Honours of Peers and Commons, with the town residences of members, and other information.—"Collingridge's Guide to Printing and Publishing." Collingridge, City Press, Aldersgate-street. This Guide has been issued from the City Press for many years, and it contains a great quantity of information concerning printing and publishing, useful not only to authors but to professional and mercantile men as well.

### Miscellanea.

THE HAYMARKET THEATRE.—Mr. Walter Montgomery's short management is proving, we are glad to hear, successful in a pecuniary point of view, while it has served to afford enjoyment to playgoers at a usually dull period of the year. He has placed before them several standard plays very well acted. The new tragedy, "Fra Angelo," produced on Wednesday evening, proved to be better adapted for the Surrey than the Haymarket, though manifesting ability on the part of a young author.

THE COBURG STATUE AND THE ANGLO-FRENCH EXHIBITION.—The cast of Mr. Theed's statue of the late Prince Consort, which stands in the Centre Transept of the Crystal Palace, has been lent by her Majesty to the committee of the Anglo-French Exhibition, as a mark of approval and sympathy with their object.

QUEEN'S COLLEGE, LIVERPOOL.—The Rev. Wm. Allen Whitworth, M.A., late scholar of St. John's College, Cambridge (sixteenth Wrangler in 1862), and joint editor of the *Oxford, Cambridge, and Dublin Messenger of Mathematics*, has been appointed Professor of Mathematics and Natural Philosophy in Queen's College, Liverpool.

COBDEN MEMORIAL SCHOOLS AT OPENSHAW.—The schools about to be built in Tipton-street, Openshaw, in connexion with the Methodist Free Church, will be designated the "Cobden Memorial Schools." The committee purpose building an unpretending and substantial structure, to contain two large school-rooms and four class-rooms; and, probably 700*l.* would be sufficient for the purpose. Several subscriptions have been sent, and others are promised.

COVENT-GARDEN THEATRE.—Mlle. Carlotta Patti made her first appearance this season at Mr. Mellon's concerts last Monday. Her reception showed how great a favourite she is, and her singing how well she deserves to be so. The same evening was also to be noted by the production of a new waltz, "The May Waltz," composed by Mr. Mellon himself expressly for these evenings. It was well received. When hundreds of listeners will stand for three hours closely packed, hours which cannot be the three coolest out of the twenty-four, there must be something good to keep them in a quiet and agreeable state of mind. Such is the case at Covent-garden Theatre every evening.

MEMORIAL OF SIR DUNCAN M'DOUGALL, IN ST. PAUL'S CATHEDRAL.—The formal ceremony of unveiling a bust and tablet memorial of the late Colonel Sir D. M'Dougall, has taken place in the crypt of St. Paul's. The sculptor was Mr. George G. Adams, of Sloane-street, and the cost 300 guineas. A white freestone slab supports a moulded marble base, on the plain portion of which, between the moulded bastions, the musket and sword are carved in relief, united in the centre by a wreath of bay. Above this moulded base is a square block of pure white marble, on which is the inscription. The monument is placed on the right side of the entrance to the Nelson and Wellington tombs. On the left side is a marble tablet, by the same artist, to the memory of Capt. L. Thompson, one of the defenders of Barr, to which the Emperor of the French contributed.

THE ALBERT HOLIDAY AT THE ROYAL HORTICULTURAL GARDENS, SOUTH KENSINGTON.—On Saturday, the 26th of August, being the forty-sixth anniversary of the Prince Consort's birthday, the gardens of the Horticultural Society were thrown open, by command of the Queen, to the public, free, in commemoration of the birthday of their founder. At eleven o'clock the military and volunteer bands commenced playing. There were numerous refreshment-stands, and the two annex gardens were set apart for those who desired to picnic on the grass with the provisions they had brought with them. In spite of the great crowd, not a single accident has to be reported, nor any willful damage done to the flowers, shrubs, or buildings. The visitors included a decidedly superior class to those of last year. The number of visitors was 130,000.

NEW LIGHTHOUSES AT BUDDOENESS.—The foundation stone of the new lighthouses at Buddoeness, the works in connexion with which have been in course of erection for some months, has been laid by the Master and other members of the Fraternity of Masters and Seamen of Dundee. The new lighthouses—the plans of which were prepared by Messrs. Stevenson, of Edinburgh, the engineers to the Northern Lights Commissioners, as well as to the Dundee Seamen Fraternity—are to be considerably higher than the present ones, by which the lights will be seen at a greater distance at sea. The height of the largest of the two is to be 101 ft. above high water, and it will be seen at a distance of fifteen miles; while the present is 71 ft. in height, and is seen at thirteen miles. The lower light will be 61 ft. above high water, and will be seen at twelve miles and a half; while the present is 48 ft., and is seen at eleven miles and a half.

THE RUINS OF BURY CASTLE DISCOVERED.—Workmen engaged in the construction of a main sewer along the line of an intended new street in Bury, leading from the old market-place to Castle-croft, came in contact with some heavy masonry which interfered with their progress, and on digging down from the surface it was discovered to be the foundation of the western side of the long-hurled ruins of Bury Castle. The rubble walls are much decayed, whilst the abutments, eight of which are at present exposed, are in a state of capital preservation, each stone plainly marked with an X, which is believed to be the delph or quarry mark.

ST. JAMES'S TOWER, TAUNTON.—At a vestry meeting held for the purpose of considering Mr. Ferrey's report, as to the state of the tower of St. James's parish church, it was resolved "that the churchwardens be requested to obtain from Mr. S. K. Pollard a specification for the complete repair of St. James's tower, and that persons he invited to tender for the execution of the work; and that an estimate be obtained for the rebuilding of a *fac-simile* of the present tower, and that both be presented to the meeting on an early day." Mr. Pollard's estimate for the repair of the tower was about 1,200*l.*, which Mr. Ferrey considers a fair one; and Mr. Pollard and his colleague obtained an estimate for rebuilding the tower, which was 2,600*l.*

PARTIAL DESTRUCTION OF AN IRON CHURCH BY A THUNDER WIND.—On Thursday evening in last week, a great wind from the south-east blew over Dalston, with thunder and lightning; and portions of roofs, bricks, boughs of trees, and blinds from the windows of tradesmen, were thrown in all directions, the lightning, to crown all, striking St. Mark's church, Ridley-road, on the south-east corner, and passing to the ventilator on the roof of the church, dashing it inside. The whirlwind next stripped above 50 ft. of the roof on the south-east end, and passing over to the north-west gable, there carried off about 40 ft. The structure was composed of iron, and fragments above 4 ft. in length, and 2 ft. in breadth, were hurled into the air above 80 ft. high, and carried to a distance of several hundred yards. Several walls were blown down in the neighbourhood: one, running 100 ft. long and 6 ft. high, was completely destroyed, in Philip-road, Dalston.

THE SOUTHAMPTON WORKHOUSE PLANS.—The poor-law guardians of Southampton must be an unusually wooden-headed Board. Having applied to all the local architects for plans, with secret mottoes, and got five plans, they submitted these to Mr. Hawley, the poor-law inspector for the General Board. Mr. Hawley selected one marked "Air" as the best, and "Si je puis" as the next best. To "Fortune cetera munda" he stated a number of objections. By this time the names of the architects had oozed out, and got into the wrong-heads of the Board, whose proclivities ran upon the author of "Fortune," whose design, therefore, has had the good fortune to be selected by the Board as the most suitable to their ideas of what a workhouse ought to be. The author of "Air" is Mr. T. A. Skelton, a young local architect; and Messrs. Guillaume, Parmenter, & Guillaume are the authors of "Si je puis." On the ground of *want of experience* in workhouse building, Mr. Skelton's plan was rejected; and, "Fortune" being notoriously blind, the second best plan, by *experienced architects*, was invisible, and the wilfully blind board could only see the plan whose architect they were bent on patronizing.

IRON PAVEMENT.—One noticeable feature of the extensive new goods sheds and sidings in course of construction by the railway company at Ipswich, says the *Suffolk Chronicle*, is the iron pavement manufactured by Messrs. Ransomes & Sims, and termed Knapp's patent, which has been used in three or four of the principal thoroughfares in London. It consists of a number of cast-iron cells some 3 in. square, on the upper edges of which are small knobs at short intervals, to enable the horses to get a secure foothold, the cells being filled up with earth. The pavement is manufactured in pieces 17 in. square, so made as to lock the one into the other so securely that it is next to impossible for the surface to become irregular. This pavement is placed upon a foundation of concrete. The cost slightly exceeds that of the very best granite, but it is calculated that its durability far exceeds that of any other pavement; and the foothold it gives the horses is considered to be much superior.

**THE LATE SIR JOSEPH PAXTON.**—It has been decided to erect a monument in Coventry to the memory of the late Sir Joseph Paxton, who for ten years represented that city in Parliament. The site chosen is in the Coventry Cemetery, which was designed by Sir Joseph, and laid out under his superintendence.

**THE PNEUMATIC DESPATCH.**—The tubular line and works of the Pneumatic Despatch Company from the Euston-square terminus of the London and North Western Railway to the central depot at the Bull and Gate, Holborn, are nearly completed. Under the direction of the company's engineer, Mr. Hammell, a carriage was passed backwards and forwards in the tube, in anticipation of the speedy opening of the line. The actual terminus of the trunk line, apart from that between Holborn and Euston-square, is to be constructed in St. Martin's-le-Grand, on a site near the corner of Newgate-street; and to this spot the tube will be eventually carried; it has already reached the brow of Holborn-hill. The present line may be regarded as the trunk of a future extensive pneumatic system, the branches of which will intersect the principal districts of the metropolis.

**A GAS ENGINE.**—The gas is introduced by an ordinary housepipe into a cylinder containing two chambers, each of which is filled with it. The gas being mixed with common air, which is sucked in by an appliance, at the rate of eleven parts of air to one of gas, is exploded by means of an electric spark in each chamber alternately, and the force of the explosion produces the motive power, corresponding to steam in an ordinary engine, which propels the machinery. The quantity of gas contained in the chambers is very small, and the contents of each chamber are exploded eighty times per minute, the exhausted air left by the explosions being carried off as soon as produced by a waste-pipe. The engine is employed in Mr. Middlemas's manufactory in driving machines used in the making of bread.

**ANGLICAN: FALL OF A NEW BUILDING.**—In its New Zealand summary, the *Daily Southern Cross* for May last gives an account of the fall of a new building in Queen-street, Auckland, intended for a theatre and auction-rooms. While eighteen workmen were engaged in and about the building, suddenly and from an unexplained cause the wall of the building fronting Queen-street cracked and fell, carrying away the entire scaffolding, and portion of the wall on the outside. The roof of the adjacent shop was crushed in, and the whole premises were completely destroyed. The woodwork of the roof of the theatre very fortunately remained intact, being supported by the side walls, and the workmen who were on it were thus enabled to effect their escape. It is stated that the front wall is to be rebuilt up again, and that the framework of the roof, which has slipped forward, will then be raised by screw-jacks. The side walls will remain to be partially rebuilt, but the back wall is apparently uninjured.

**WORKING CLASS DWELLINGS FOR LIVERPOOL.**—The sub-committee of the Health Committee appointed to report on this subject have issued a report of Messrs. J. B. Hughes and Newlands presented to them. The following are the conclusions of this report presented as *quasi* principles for discussion:—1st. That within reasonable limits from the seats of labour, it is possible to build workmen's dwellings merely such suited to the class contemplated, at rents which they can afford. 2nd. That, within the same limits, it is possible in good thoroughness to build workmen's dwellings, combined with shops; the shops paying the difference of rent, that is, the deficiency caused by the low rents of the houses. 3rd. That it is probable, if almost certain, that landowners outside the borough will set their faces against the railway scheme, on the ground of paperizing their estates. The workmen working in Liverpool, and living in parishes outside, would, with their families, in the case of poverty or distress, be chargeable on the parish where they are domiciled. 4th. If the railway scheme is not opposed on the grounds above noted, and the minimum charge for carriage be 6d. per week, cottages may be built without land for a garden, to be let at 3s. per week, which, with the railway charge, will make the rent 9s. 6d. per week, quite as much as a workman of the class intended to be benefited can pay; but if with land sufficient for a small garden, at 3s. 8d. per week, including carriage.

**UNHEALTHY STATE OF MIDDLESEX SESSIONS COURT.**—During the progress of business in the first court of the Middlesex Sessions, in Clerkenwell, on the 10th ult., Mr. Cooper rose and said, as senior counsel of these sessions, and seeing generally intelligent and active magistrates on the bench, he begged to call their attention to the wretched ventilation of the court,—a court never intended to hold the number of persons who usually crowded it. The consequence was, the foul air breathed over and over again hung over the floor of the court, there being no draughts from below to blow it up through the ventilator, which was very defective. The magistrates quite agreed with Mr. Cooper as to the state of the court, and were sure it would receive the attention of the proper authorities. Mr. Francis (the deputy clerk of the peace) said the matter should be duly brought before the magistrates on the next court day.

**ACCIDENT.**—Mr. Smith Flesher, of the firm of Messrs. Flesher, Brothers, of Burley, in Wharfedale, builders, who are the contractors for the erection of a new wing to a house, was standing upon a scaffold erected outside the building, and had just completed the laying of a large projecting stone forming part of the ornamental cornice, when the stone, along with two other courses already fixed, gave way, and he was precipitated to the ground from an altitude of about 20 ft.; the stone first mentioned, which weighed nearly half a ton, falling upon his head and killing him on the spot. A cousin of the unfortunate man, named Christopher Flesher, who was upon the scaffold at the time, seeing his danger, sprang forward, and caught one of the upright poles to which the scaffold was fixed, the falling fragments dreadfully crushing and lacerating his right leg. It is a sad coincidence that the eldest brother of Mr. Flesher, about twenty-two years ago, and also on a Saturday, lost his life by falling from the top of the tall engine chimney then just erected at the works of the late Mr. Peter Garnet, paper manufacturer, Otley.

**RAILWAY BRIDGE BETWEEN CANADA AND THE UNITED STATES.**—The International Bridge, which is to cross the head of the Niagara river from Fort Erie, in Western Canada, to Buffalo, in the state of New York, will obviate the use of the dangerous ferry which at present receives the traffic of the two Canadian lines of railway terminating at Fort Erie. When the bridge is finished, a perfect connexion will be established between the Buffalo and Lake Huron section of the Grand Trunk Railway and the Erie and Niagara Railway on the Canadian side, and the Atlantic and Great Western, the Erie, the New York Central, and the Lake Shore Railways, on the American side of the river. The International Bridge is to be a massive structure of stone and iron, and with two stories, to serve the purposes respectively of the railway and ordinary traffic. The contracts for its construction have lately been signed in England, and it is to be completed and ready for opening within the term of two years. There are also proposals to build international bridges connecting Sarnia with Port Huron, Morrisburg with Waddington, and Windsor with Detroit.

**ST. MICHAEL'S CHURCH, FINSBURY.**—This new church, which is situated in Mark-street, Paul-street, Finsbury, the centre of a thickly populated and poor district, has been consecrated by the Bishop of London. The right rev. prelate, before proceeding with the consecration, directed that several vases of flowers, with which the communion-table was decorated, should be removed; and obtained an undertaking from the incumbent, the architect, and churchwardens, that a charcoal cartoon of the Crucifixion, on the east wall of the chancel, should be effaced on the following day. The church, which contains 1,000 sittings, all of which are free, was erected at a cost of 7,500l. by Messrs. Sharpenden & Cole, of London, of which 3,500l. were paid for the site. The whole of this sum was raised by subscription, 6,000l. being given by one anonymous gentleman. The building, which was designed by Mr. James Brook, of London, is of the Early Pointed style of architecture, the tracery heads of the windows being geometrical. The plan consists of a nave, 97 ft. 6 in. long, 26 ft. 9 in. wide, with central aisles, 10 ft. 6 in. each; and the chancel, 28 ft. long by 24 ft. 3 in. wide, having an aisle and sacristy to the north, and on the south side a small transept containing the organ. The roofs, which are open to the rafters, are 70 ft. high to the bridge of the nave.

**CRYPTS.**—An "Amateur" writes,—I am about to build a house with a terrace walk before it, somewhat as represented in your paper of Aug. 12th, as the Bank of Scotland. I should esteem it a favour if your correspondents informing me whether it is practicable to make the crypts habitable in regard to damp, and how the roof could be carried out to prevent rain and snow percolating through the gravel walk above. I thought of laying a coat of asphaltum on the roof, then filling in with bricklayer's rubbish, and laying gravel thereon; but I have no doubt many of your correspondents can suggest a better plan. The ground naturally falls to the south, so that the ground line of the south wall of the crypt will be on a level with the garden.

**BATH ABBEY CHURCH.**—A tender has been accepted from Mr. Bladwell for carrying out, under the direction of Mr. G. G. Scott, the groining of the roof of the nave in the Abbey Church, at Bath, at a cost of 3,000l., and of the aisles of the church, at an outlay of 2,500l. The work will be taken in three compartments or bays, the first two being taken at a cost of 2,200l. Having made themselves responsible for this further instalment of the work of restoration, the committee look for increased help from the public. During the recent excavations, it was found that the cause of the sinking of the northern turret in the west front was that it had no sufficient foundation. It is now proposed to underpin the turret, so as to make it secure before the reparation of the west front is commenced.

**LOUTH TO GAINSBOROUGH.**—The question of providing additional railway accommodation between Louth and the neighbouring towns has been started and has died out, and been revived and failed again several times. Once more, however, the attempt is now under consideration, in the shape of a line from Louth to Market-Rasen, and thence to Gainsborough, thus placing these towns in direct communication with Manchester, Sheffield, and other large northern towns. Messrs. Rogers & Marsden, architects and surveyors, of Louth, have received instructions to prepare a preliminary survey and take the necessary levels, so as to ascertain the best route. Those of our readers who are acquainted with this district will be aware that this line would traverse some of the hilliest and most picturesque parts of the country; and the traveller from the south would receive a very different impression of Lincolnshire from that usually held, viz., that Lincolnshire people live in a swamp and are web-footed.

**FORMATION OF A PARK FOR SOUTHWALK.**—The arrangements for forming a park for the south-eastern portion of the metropolis are said to be completed; the Metropolitan Board having, after eight years' deliberation, fixed upon a site for it, and concluded their negotiations for its purchase. The site consists of sixty-five acres of land, situated in the parish of Rotherhithe, and is bounded by Jamaica Level, Union Road, the Rotherhithe New Road, and the South-Eastern Railway. The Board will be put in possession of the fee on the 29th of this month, when the purchase-money, 58,000l., will be paid. The Finance Committee of that body have received instructions for negotiating a loan of 80,000l. for the purchase of the land, and for laying out the park. Of the sixty-five acres, only forty-five will be devoted to the purposes of the park, as the remainder will be laid out in building plots and a road to encircle the park, so that the Board will be recouped a portion of its outlay by the sale of the plots in question.

**POOR RATES.**—The House of Lords has decided, in the case of *Jones v. the Mersey Docks and Harbour Board*, that the only occupier exempt from the operation of the 43rd Elizabeth, c. 2, is the Sovereign, as not being named in the statute; and that the direct and immediate servants of the Crown, whose occupation is, the occupation of the Crown itself, also come within the exemption. But this ground of exemption does not warrant many decisions which have held that property used for public purposes is not rateable. So also trustees, who are in law the tenants or occupiers of valuable property upon trust for charitable purposes, as hospitals or lunatic asylums, are, in principle, rateable, notwithstanding that the buildings are actually occupied by paupers who are sick or insane. It was consequently held (reversing the decisions of the courts below) that the Mersey Docks and Harbour Board were liable to be rated for the relief of the poor in respect of the docks in their occupation.

**FITZROY TEMPERANCE HALL.**—This hall, in Little Portland-street, Regent-street, having been partly rebuilt and greatly enlarged, is to be opened on the 5th. The present dimensions of the principal hall are,—40 ft. long, 28 ft. in width, and 30 ft. high. The roof is arched with five principal ribs, and lighted with a lantern light above of metal work. A gallery runs round the building on sides and front, having an open front of iron work. The platform is raised. Behind are the committee-room and library; and above are two ante-rooms; and a kitchen in the basement. The hall will accommodate 500 persons. The present works, including gas-fitting, decoration, seats, and furniture, amount to about 700*l.*; besides which, 150*l.* have been paid as a fine to the Duke of Portland on obtaining a new lease for forty years. Messrs. Bywaters were the builders, and Mr. Henry Draper was the decorator.

**TRADES FREE SUNDAY AT THE CRYSTAL PALACE.**—A "free Sunday" demonstration of the London trade societies took place last Sunday at the Crystal Palace, the directors of which had placed it at the disposal of the Trades' Delegates Committee for procuring the opening of the national and art museums on Sunday afternoons. There were about 8,000 free tickets, which were divided amongst the secretaries of the trades' societies and other working men's organisations for distribution among the members of these societies. The result was that nearly 10,000 of the skilled artisans of the metropolis, with their wives and families (children being admitted without tickets), visited the palace and grounds. At five o'clock Dr. Perfit delivered a lecture on "The Antiquities of Egypt" in the Egyptian Court.

**THE LAMBETH BRIDGE COMPANY.**—The following report of the directors will be submitted at the ordinary meeting of the shareholders on Monday, the 4th day of September:—"The directors are now enabled to report to the shareholders that the arbitrator has made his award in the action brought against the company by Messrs. Porter, the contractors for building the bridge. The sum claimed was 8,466*l.* 9s. 2d. The amount awarded as due is 3,913*l.* 19s. 3d., with 300*l.* for costs, and 219*l.* 9s. for half the expenses of the award; making in all 4,433*l.* 8s. 3d. The directors have required payment of an amount of unpaid calls on the shares on which it only has been received, sufficient to meet this sum. As Mr. Davis's lease is now drawing to a close, the directors recommend that the dividend for the last half-year be made at the rate of 5*l.* per cent. per annum, only, as they are at present not aware of the actual amount of traffic. This will leave 1,020*l.* in hand. The directors believe that 5*l.* per cent. will be the lowest dividend paid by the company in future."

**BRAMAH'S HOUSE: "JENNY'S WHIM."**—It is deserving of record, says *Notes and Queries*, that within the first fortnight of this August two interesting buildings in Fimbleco have been levelled with the ground to make way for modern "improvements." The first was the small house in Belgrave-street, South, in which Joseph Bramah, the engineer, lived and died, together with the factory behind it, occupied until a few years back by his firm; and the second, the remains of the once celebrated "Jenny's Whim" Tavern. The former has been removed for the purpose of projected alterations on the Marquis of Westminster's estate, and the latter for the enlargement of the railway leading from Victoria Station across the Thames.

TENDERS

For a pair of houses, Christchurch, Reading, for Mr. Richard Attenborough. Mr. Joseph Morris, architect:—  
Woodroffe ..... £2,450 0 0  
Dunn ..... 2,350 0 0  
Sheppard ..... 2,320 0 0  
Dodd ..... 2,300 0 0  
Kendall ..... 2,300 0 0  
Matthews ..... 2,297 0 0

For alterations to 5, Carleton-street, W., for Mr. Taylor. Mr. E. Bull, architect:—  
Mannock ..... £90 0 0  
Hagden ..... 748 0 0  
Greer ..... 688 0 0  
Duncannon ..... 657 0 0

For repairs to the church of St. Michael, Paternoster Royal. Mr. Richard Tress, architect:—  
Peake ..... £1,434 0 0  
Newman & Mann ..... 1,430 0 0  
Princes ..... 1,387 0 0  
Conder ..... 1,380 0 0  
Westcott ..... 1,379 0 0  
Browne & Robinson ..... 1,265 0 0

For finishing a pair of semi-detached villas, St. John's Park-road, Westwick-hill, for Messrs. Hindley, Messrs. Lander & Beddell, architect:—  
Childs & Son ..... £1,616 0 0  
Scrivener & White ..... 1,473 0 0  
Grover ..... 1,368 0 0  
Mann ..... 1,393 0 0  
Palmer ..... 1,290 0 0  
Manley & Rogers ..... 1,281 0 0

For rebuilding Primitive Methodist Chapel and Schools at Pocklington. Mr. Joseph Wright, architect. The following Tenders accepted, the old materials included:—  
For Bricklayer's, Plasterer's, Plumber's and Glazier's, and Painter's Work.  
Thomas Grant ..... £375 0 0  
For Carpenter's and Joiner's Work.  
George Grant ..... 430 0 0  
For Mason's Work.  
Richardson ..... 62 10 0

For Primitive Methodist Chapel, at Drax. Mr. Joseph Wright, architect:—  
Lester & Hinsley ..... £311 0 0  
Hudson & Spivey ..... 213 0 0  
Kellow & Huddell ..... 227 0 0  
Barley & Dyson (including two additional windows) (accepted) ..... 227 0 0

Tenders for rebuilding Primitive Methodist Chapel and Schools and Class-rooms at Scarborough, including old materials. Mr. Joseph Wright, architect:—  
Harrison ..... £3,199 0 0  
Wilson ..... 3,162 6 0  
Hall ..... 3,000 0 0

The following tenders accepted:—  
Bricklayer's and Plasterer's Work.  
Wilson ..... £1,450 0 0  
Joiner's Work.  
Rexton ..... 1,289 0 0  
Plumber's and Glazier's Work.  
Stephenson ..... 63 13 0  
Slater's Work.  
Hardgrave ..... 80 0 0  
Ironfounder's and Gasfitter's Work.  
Thompson ..... 131 0 0  
\* Boundary-walls and palisades not included.

For Portsmouth drainage: first contract:—  
Sims & Blaxten ..... £68,888 0 0  
Nowell & Duern ..... 62,000 0 0  
Threl ..... 59,221 0 0  
Coker ..... 57,000 0 0  
Bennett ..... 62,000 0 0  
Moxon ..... 51,500 0 0  
Ridley ..... 49,800 0 0  
Parsons ..... 47,000 0 0

For the erection of a pair of cottages at New Malden, Surrey. Mr. Geo. Welch, architect:—  
Jones ..... £395 0 0

For alterations to No. 25, Union-street, Spitalfields, for Mr. R. Brushfield. Mr. James Tolley, architect:—  
Fritchard (accepted) ..... £225 0 0

For five houses, shops, &c., St. Peter's, Derby, for Mr. Geo. Gascoyne. Messrs. Giles & Brookhouse, architects:—  
Bridgman ..... £3,888 0 0  
Gadby ..... 3,874 0 0  
W. H. & J. Slater ..... 3,850 0 0  
Thompson (accepted) ..... 3,832 15 0

For new chapel, Traffic-street, Derby. Messrs. Giles & Brookhouse, architects:—  
Gadby (accepted) ..... £1,500 0 0  
(Exclusive of gas-fittings, warming-apparatus, &c.)

For parsonage-house, St. James the Greater, Litchurch, Derby. Messrs. Giles & Brookhouse, architects:—  
Dunsatoy (accepted) ..... £1,900 0 0

For school-house and master's residence at Mickleover, near Derby. Messrs. Giles & Brookhouse, architects:—  
Storer (accepted) ..... £400 0 0

For addition to the residence of Mr. W. Richardson, at Quarndon, near Derby. Messrs. Giles & Brookhouse, architects:—  
W. H. & J. Slater (accepted) ..... £379 0 0

For additions to chapels at Paddington Cemetery, Mr. C. P. Hay ward, architect:—  
Ramsay (accepted) ..... £189 0 0

For additional buildings at the Brockham Limestone, near Reigate:—  
Ramsay (accepted) ..... £249 0 0

For a new brewery and maltings at Northampton, for Messrs. P. & R. Phillips, architects and engineers. Quantities supplied by Messrs. R. L. Curtis & Son:—  
Watkins ..... £14,600 0 0  
Cosford ..... 12,271 0 0  
Smith ..... 12,057 0 0  
Dunkley (accepted) ..... 10,909 0 0

For alterations and additions to 28, Lowndes-street, Chelsea, for the Right Hon. the Earl Colclough. Mr. G. C. Handford, architect:—  
Adams & Sons ..... £5,327 0 0  
Smith ..... 5,250 0 0  
Ridley ..... 5,150 0 0  
Edwards ..... 4,838 0 0  
Carter & Sons (accepted) ..... 4,820 0 0

For a new Infant School at Krayford, Kent:—  
Hart ..... £595 0 0  
J. & S. Nichol ..... 467 0 0  
Shurp & Son ..... 445 0 0

For building a villa residence at Mitcham, for Mr. A. Atwood. Messrs. Wimbly & Taylor, architects. Quantities supplied:—  
Myers & Son ..... £3,232 0 0  
Killy ..... 3,022 0 0  
Montfrie ..... 2,900 0 0  
Hart ..... 2,756 0 0  
Colls & Son ..... 2,744 0 0  
Scrivener & White ..... 2,695 0 0  
Wells ..... 2,585 0 0  
Marland & Sons ..... 2,630 0 0  
Adams & Sons ..... 2,630 0 0

For rebuilding workshop and two small houses at Greenwich. Mr. Gordon Stanham, architect:—  
Adams & Son ..... £895 0 0  
Williams ..... 777 16 2  
Williams ..... 759 0 0

For alterations at No. 8, Clarendon-road, Kensington. Mr. Stanham, architect:—  
Adams & Son ..... £1,075 0 0  
Williams ..... 1,049 0 0

In two vols. 8vo. price 4*l.* and 5*l.* respectively. By W. D. HASKELL. Price 3*l.* 3s. or with the former two vols. price 5*l.* 5s. Publisher, A. HAY & CO., 105, Great Russell-street, London, W.C.

# The Builder.

VOL. XXIII.—No. 1179.

Out and About.  
in  
Derbyshire.

ADDON HALL, wherein we stood at the close of our previous notes, although it has remnants of Norman work, and a great hall and a gatehouse of the fourteenth century, is mainly a Tudor building. When the general feeding of lord and retainers together in the dining-hall had ceased, and a private dining-room formed part of the necessary accommodation, the labourers were ceasing to be serfs (little hotter than chattels, indeed, they had been,—even saleable); and dined in their own cottages.

The dining-

room at Haddon was fitted up by that Sir George Vernon who, from his style of living, got to be called the King of the Peak, and shows in a panel near the fireplace the year in which this was done, namely, 1545. Sir George himself died in 1567. Besides the date the carving shows, with many coats of arms, his initials joined by a love-knot with those of his wife; the half-unwise exhortation,—

Drive God and honour the King;

and, in the oriel, portraits in low relief of Henry VII., his queen, and the jester Will Somers; in order, perhaps, to commemorate the circumstance that Prince Arthur, the first son of Henry VII., had often visited Haddon. The carving in this room is altogether interesting; notice especially three panels of interlaced or knot work very ingeniously designed and pleasing in result.

A buttery-hatch, with shelf to receive the dishes, will be seen, near the window, opening into a passage leading to the kitchen. The panelled ceiling—the room is low—was originally painted, and has been murderously chip-ped all over, with the intention that plaster might be applied. The carved shields under the ceiling show the bearings of the Avenells, Pipes, Pierrepoints, and Vernons, but not those of the Manners'. The latter, now its owners, were brought into the family by the daughter of this Sir George, the beautiful Dorothy Vernon, who, according to the story, ran away from the Hall, during high festival, with Sir John Manners, son of the then Earl of Rutland. In the hall-

room or gallery, a remarkable apartment, 169½ ft. long and 18 ft. wide, with three large bays in its length, and which was fitted up later, say 1589, we get the crest of Manners, a peacock, added. The panelled plaster ceiling and the carved panelling, Corinthian pilasters, and so on, which decorate it, are well known, through the pencil, to many more than those who have paced its floor and contrasted the now deserted aspect of the place with past scenes of antique pageantry and revelry. "Man plods his way through thorns to ashes," says Byron: some of the race, however, contrive to reach that goal by paths strewn with rose-leaves.

The floor of the Long Gallery shows some noble oak boards; tradition says, all out of one tree. The plank in the centre is the widest; those on each side get gradually narrower. Wonderfully flat and straight and sound that floor is. There are some pictures in this apartment and a few elsewhere, mostly of little value, but including amongst them two or three, at any rate, that deserve more care than they have lately received: they are fast going to ruin. The Duke should get some competent man to look to them at once. The State bedroom, with its coarse and ugly relief over the fireplace, representing Orpheus and the Beasts, has a very large oriel, in which, by the way, stands a handsome old looking-glass mounted in brass and tortoiseshell, and is hung with Gobelin's tapestry. A large quantity of tapestry of various sorts will be found in other of the apartments. When the custom of painting the walls of rooms declined in England, in the fourteenth century, tapestry got to be used; Arras became celebrated for its fabric, and large quantities of it were brought over. Much, too, was made in our own country; and everywhere,—

"Clothes of gold and arras were hang'd in the hall,  
Depayted with pictures and bystories many folde."

The amount of money spent on these hangings was enormous, and our merchants made large fortunes by dealing in them. Three entries alone, from the wardrobe accounts of Henry VII., quoted by Mr. Parker, show an expenditure on such stuffs of sums equivalent, in the aggregate, to about 12,000*l.* of our money. After the reign of that King the use of it declined, and we got sometimes stamped leather in its place, and oftener wainscoting. The latter, it may be remembered, when it shows an imitation of a piece of linen folded, the "linen panel," as it is called, may usually be taken as belonging to the succeeding reign, the time of Henry VIII.

The building, generally, at Haddon, barring an overdose of whitewash, is kept in a fair and not overdone state. The chapel, however, wants a little attention. This, which by the way, was a parish church, has on the south side of the nave some Norman work; and the east window contains some stained glass, in memory of Sir Richard Vernon, dated 1424. The walls of the chapel have been covered with painted groups, the arches with scrolls. Masons' marks are obvious here, and several points of interest present themselves to the investigator. The old altar slab, it will be noticed, has been put down for the present table to stand on.

Getting on to the upper terrace, the well-known flight of steps, loved of artists, leading to the balustraded enclosure known as Dorothy Vernon's Walk is seen. This flight of steps,—there are twenty-six of them,—is seldom painted to look so lofty as it is. The "Walk" to which it leads, shadowed as it is by ancient trees, and commanding a beautiful view of the house, and, in one part, of the adjacent country, is a charming one, full of poetic influence. A stroll here by moonlight would be a thing to remember. For a more extensive view, the Eagle Tower, one of the more ancient portions of the pile, must be ascended (in going up, notice some of the guard-rooms and the arrangement on the stair-

case used by the old archers to string their bows), and when on the top a lovely prospect is seen, including the Valley of the Wye, masses of trees, and here and there old houses,—

"Stone porch, with ancient east and west,  
And English gables English ivy-drest."

Chatsworth is close by. Let us go there next, prepared, let it be, for a different scene. Haddon preserves the past, Chatsworth speaks chiefly of the present. The estate was purchased in the sixteenth century by Sir William Cavendish, the then husband of the after Countess of Shrewsbury of whom we spoke at Derby. She completed a mansion here, which Sir William at her instigation had begun. This, however, wherein Mary Queen of Scots was detained, has disappeared, and the whole history of the present house and grounds is told by an inscription in the hall that says they were founded in the "year of liberty" 1688 (the year of the Revolution, in which the Earl of Devonshire, afterwards the first duke, had chief share), were entered upon by William, sixth duke, in 1811, and completed by him in the year of his sorrow (*anno maroris sui*: the year in which his niece, the wife of the present duke, died), 1840.

Chatsworth,—shades of Talman, Wyatville, and Paxton, forgive us!—is an overpraised place, and yet one of the finest residences in the kingdom. Approaching it through the Park from the Haddon end, the visitor *descends* upon the house, so that its chimney-pots come first, which is not advantageous, and the lines of the building show straight, square, and uninteresting. It is the result of an enormous expenditure, and includes an immense assemblage of costly works; nevertheless, we repeat the belief that it has been overpraised and so must now disappoint many. The way in which visitors are shuffled through it by a young woman or two who really know nothing about it, has something to do with this feeling, and might be remedied. This is not the case in the gardens, where the guides show all necessary intelligence; but there the artificiality apparent, the Crystal-Palace character, so to speak, is unsatisfactory, spite of many beauties. We do not use the term in any degree as depreciatory of the marvellous and beautiful creation at Sydenham, the growth of a dozen years; but at an hereditary seat, world famous, one does not look to find built-up rock-work and a manufactured rocking-stone. The waterfall is an ugly abomination; but the lofty Victoria Jet, throwing water 267 feet into the air, may be set against it and give a good balance on the right side.

There are some fine pictures scattered about, but in the badly lighted picture-gallery proper the majority are uninteresting. The names, by the way, of some of the artists, are written in an odd manner,—thus we get close together Holbten, Mabenge, and so on. One of the most noted works in the gallery is that representing the consecration of a bishop, believed to be Thomas à Becket, and attributed to John Van Eyck, the co-founder, with his brother Hubert, of the art of oil painting. This picture is a puzzle. It is signed thus, at the base of the stone archway represented as enclosing the group,—  
"Johes . de . Eyck . fecit + ano . MCCCC . ZI . 30 . Octobris," and is the earliest picture known bearing the painter's name. It is, however, so inferior in some respects to other works of his of the same period, that, but for this scarcely questionable signature, and the fact that many of the heads have evidently been repainted and repainted so as to account for some of the inferiority, we should hesitate to accept it as the work of John Van Eyck or of that date. Some of the robes are, for all that, wonderfully painted. There is a Wheel of Fortune picture marked with the double H of Holbein, and dated 1533, and, with this exception, we did not happen to find another picture in the gallery attributed to this painter which we are willing to accept as

his work. The Hall and chapel contain some of the best work by Verrio we have ever seen. The maidens who show visitors the house, or, rather assist in getting them out of it as quickly as possible, point to a painting (on the back of one of the doors) of a fiddle hanging on a hook as Verrio's *chef-d'œuvre*; but there is no occasion to believe them. In the chapel just now alluded to, and in many of the rooms, will be found some supremely good wood carvings of flowers and animals, generally attributed to Grinling Gibbons, but which are for the most part the work of Samuel Watson and his associates. Watson, a Derbyshire man, was buried at Heonor, and has a monument, according to Black's "Guide," thus inscribed—

"Watson has gone, whose skillful art display'd,  
To the very life whatever nature made;  
View but his wondrous works at Chatsworth Hall,  
Which are so gazed at, and admired by all,  
You'll say 'tis pity he should hidden lie,  
And nothing said to revive his memory."

The dining-room has some good family portraits by Vanduyck and Gerard Honthorst, and two chimney-pieces, with life-size figures of Bacchantes, higher than the shelf, by Professor Westmacott and Sievier. The south gallery has a grand collection of drawings by Raffaele, Rubens, Rembrandt, Leonardo da Vinci, Holbein, Albert Durer, Giulio Romano, and many other of the wonderful fellows of old time: these are now arranged in schools. In the shape of sculpture, too, there are some charming things, especially by Canova and Thorvaldsen, not grand but graceful. Canova's statue of Napoleon's mother, inscribed with what designates her "the unhappy mother of the greatest son," is one of the best of his works. Scattered amongst the sculpture, too, are exquisite specimens of Derbyshire and other marbles, and the largest vase of Blue John, the well-known fluor spar, that has ever been worked. This brilliant spar, only to be found in this county, and in one cavern, gets its title of fluor from its fusibility; but why it was christened Blue John, any more than why zinc ore is called Black Jack, deponent knoweth not. William Talman was the architect, if not the builder, of the earlier portion of Chatsworth, and in 1692 Sir Christopher Wren appears to have reported on the works. The west front was finished by Talman in 1706. The great northern wing, extending 385 ft., was built under the direction of Sir Jeffrey Wyatville. There is much to praise—much to admire—at Chatsworth, a princely house in a park eleven miles round. Nevertheless, and perhaps without due regard to the punning motto of the Cavendishes, to be found in more than one place in the building, "*Cavendo tutus*," safe by caution, we maintain the opinion that Chatsworth is overpraised. With which dash of heresy we stop short for the present.

#### THE DAILY-LIFE MUSEUM, TWICKENHAM.

The particular knowledge that is important to daily life has been unhappily that which there has been the chief neglect in acquiring and imparting. To know what food one should eat, what clothes one should wear following the seasons, and how one should proceed in order to secure the comforts of a home, have been recognised as conducive to some of the ends of existence, alike by political economists and divines. As said our greatest epic poet,—

"To know  
That which before us lies in daily life,  
Is the prime wisdom."

But, till lately there was neither effort on the part of the richer classes, for the acquisition of such knowledge, nor sufficient perception of the special importance of it to those who, being poor, are beset at once by the two misfortunes of having nothing wherewith to replace loss, and generally nothing saved wherewith to prevent the necessity that such condition entails, of living at the most uneconomical rate.

The lines we have quoted are appropriately given by Mr. T. Twining in the heading of a synopsis of the contents of "The Economic Museum, or Museum of Domestic and Sanitary Economy," which he has established, at Twickenham, as a repository of information for every-day life, or "with a view to impart in a manner at once scientific and entertaining, that knowledge of common things which is so necessary for securing health and comfort." To the formation and maintenance of this collection, with the

special library attached to it, and to the dissemination of information by lectures and publication, Mr. Twining has, with noble philanthropy, devoted the last fifteen years of a life that is attended with much bodily suffering, and has expended what must amount to a considerable sum from his private means. The museum should be known to all those who feel particular interest in what relates to the condition of the people—whether the dwellings alone, as of certain classes, he considered, or the entire range of life that passes in or is associated with homes; that is to say, it should be better known than it is. This is not the first time that we have endeavoured to bring the collection and library to the notice of our professional readers.

The classes or divisions of subjects illustrated in the museum, are numerous; and each class requires more space for the adequate illustration than it has been possible to afford in the building at Twickenham. The whole matter of domestic and sanitary economy deserves to have devoted to it, specially, a national museum, besides numerous local museums. Mr. Twining's own idea is given in the introduction to a first part, which he has printed, of a catalogue of the library. He says,—"Economic collections, varied in form and dimensions according to local requirements and resources, should be established throughout the length and breadth of the land. London should have its Economic Museum on the fullest scale; provincial towns should have affiliated collections; mechanics' institutes should have a room allotted to illustrations of the science of common life; lecturers should be supplied with portable Economic collections; and educational establishments, even down to the village school, should have their Economiums, or cabinets of useful objects."

For each sort of institution or collection, Mr. Twining's arrangement, whether as to classification, labelling, or economy of space, will be most suggestive. As the collection is the work of one individual, we may rightly ascribe to it as an educational agent, an importance not second to that of any collection in London for the illustration of a special subject. But the museum is intended chiefly as a place of reference to facilitate the formation of the other museums. The small building in which the collection is arranged, has been erected by Mr. Twining in the grounds of his residence, Perryn House, at a very short distance from the Twickenham railway station. The entrance is in Whitton Lane, and is easily found. The public days are Wednesdays and Saturdays; and the hours are from 2 to 5 p.m., when explanatory lectures are given by the curator. Admission, however, may be obtained on other days, by appointment. The railway company grant a reduction of fares to schools, and to large parties of the working-classes. We need scarcely say that admission is gratuitous.

Mr. Twining's object is, as stated by himself, "to initiate a general system for diffusing the knowledge of domestic and sanitary economy much more effectually than it can be done by books alone, and as a standard element of the education of youth, and of the instruction of adults;" and he will afford facilities and assistance to philanthropists in this country or abroad, desirous of forming economic collections on any scale for popular instruction. The collection, together with the library, is considered calculated to be appreciated by clergymen, teachers, district visitors, medical men, and "others engaged in the intellectual training of the people, or interested in promoting health and comfort among the poor;" and, we say, amongst the "others" the architect should be ready to find himself. "Here" in the museum, as are the words of the preface to the synopsis, "all classes of society, and especially those whose income is small, are shown how their dwellings should be constructed in accordance with sanitary principles, what household improvements they may derive from the discoveries of science, or borrow from the customs and appliances of other nations, what fabrics they should wear, what food they should eat, and how it ought to be cooked, how they may distinguish things which are genuine, wholesome, substantial, durable, and really cheap, from those which are cheap only in appearance, and in short how they may live with judgment, and get the best money's worth for their money." Special divisions of the collection are devoted to hygiene, education, emigration, and some other subjects.

The effort for the formation of the collection originated in 1850; it was sanctioned by the

Council of the Society of Arts in 1852; and an exhibition of Domestic Economy formed part of the Paris Exhibition of 1855, when the cross of the Legion of Honour was conferred on Mr. Twining. Temporary exhibitions have since been held in various parts of Europe, as Brussels, and Vienna, promoted by M. Dupleixanx, M. Helm, and others. The present collection was commenced at the House of the Society of Arts in 1856; the food department was exhibited, so far as it had taken form, in 1857 at South Kensington, and gave rise to the present food-museum at South Kensington. In 1858, the collection was transferred to the Polytechnic Institution, where several classes were added, and where it was particularly noticed by us. In 1860, it was placed where it now is.

The contents of the building at Twickenham are divided into nine classes, namely, Building Designs, Building Materials, Furniture (including "Ironmongery"), Clothing, Food, Fuel, and other Household Stores; Health; Home Education, Self-Instruction, and Recreation; Miscellaneous, and the Library. The first eight classes occupy the largest portion of the building, or a space of 80 ft. by 29 ft. This space is divided by four longitudinal passage-ways, which are each bordered on both sides by table-space, and screens or wall-space,—the screens not running up so high as to interfere with the light; which is partly through the roof, and partly from windows in the upper portion of the external walls. The collection is arranged to be viewed following the order of classes as we have given them. The narrowness of the passage-ways conduces to the intended examination; but in a more frequented museum, the principle of disposition would not be available to the like extent: it is well, however, to recollect the disadvantages for purposes of study, which the system of large halls and Crystal Palaces may have. The corridor-arrangement prevents the likelihood of any of the objects in a series, escaping attention. One end of the building, beyond the space mentioned, is devoted to lobbies, a workshop, and the curator's room; the other end includes the library, and a space for stores, and other heavy objects.

The building itself is not presented entirely as an example of the sort of construction that might be economically adopted for buildings of the same dimensions; although such may have been the idea when the structure was designed. The "fibrous slab" was used for external walling, and for flooring; and the results have been very unsatisfactory.

A special programme or catalogue of each of the classes into which the museum is divided, has been for some time in preparation; but, as yet, a portion of the library catalogue, to which we have alluded, has alone appeared.

The library consists of British and foreign publications and documents on domestic, sanitary, educational, social, and charitable economy, selected and arranged in the affording an example for the formation of similar libraries; the presenting to persons desirous of forming economic and educational museums, or of compiling lectures, the facilities for reference; and the supplementing information given on the labels in the Museum, by books to which the labels would be made to refer. "Books and Documents of Reference," in a "Preliminary Department," are classed under the heads "The Economic Movement," "Benevolent Congresses," "Exhibitions of Inventions, &c.," "Museum Catalogues," "Publishers' Catalogues," "Tradesmen's Lists," "General Information," and "Special Scientific Knowledge (including Domestic and Sanitary Science, Medicine, Chemistry, Natural History, Agriculture, Arts and Manufactures)." Then follows Section I., "Domestic and Sanitary Economy," with the heads, "Knowledge of Common Things," "Arts and Manufactures," "Trades and Occupations," "Servants and Housework," "Household Economy and Miscellaneous Receipts," "Cottage Gardening and Farming," "Dwellings," "Food and Household Stores," "Cookery," "Adulteration," "Physiology and Hygiene," "Domestic Medicine," "Mothers, Infants, and the Sick Room," "Special Branches of Hygiene" (including "Climate and Locality," "Warming and Ventilating," "Clothing," "The Skin and Cleanliness," "The

\* "Handbook of Economic Literature, being a Descriptive Catalogue of the Library of the Twickenham Economic Museum, or Repository of Useful Knowledge for Every-day Life," Part I.; "Domestic and Sanitary Economy." Printed for T. Twining, esq., by C. Whiting, Beaufort House, Strand, 1862. 8vo., pp. 52.

Head," "The Eye," "The Ear," "The Teeth," "The Stomach"); "Accidents and Sudden Illness," "Industrial Pathology," "Public Health and Safety," "Temperance," "Gymnastics," and "Travelling, Emigration, &c." Appended to the title of a book, or document, in the body of the catalogue, is in nearly every case a short statement of the nature of the contents; so that the catalogue becomes of considerable value for reference. Its second part is intended to comprise sections of the library which are devoted to "Educational Economy," "Social Economy," "Charitable Economy" (or matter relating to British and Foreign Provident and Benevolent Institutions); and "Periodicals." Under Educational Economy, will be lists of publications adopted in schools, and specimens of lesson-books on common objects, and of pictorial illustrations,—this section being in connexion with Class VII. (Education) of the Museum. Mr. Twining is of opinion that the educational system promoted by societies, in the schools for the working classes, has, in regard to training the intellect, teaching to make intelligent use of knowledge acquired, and coupling physical with mental hygiene, so as to realise the "*mens sana in corpore sano*," advantages which are not found in those who are rich and able to pay for education of their children. The section headed "Social Economy" represents those branches of social science which deal especially with the condition of the working-classes, relations of employer and employed, and schemes for benefiting and laws relating to the poor; and contains with other material, some compendiums of law, and books required by magistrates and parochial authorities.

In the Museum, Class I., "Building Designs," comprises numerous drawings and models of different dwellings that have been erected in town and country, for the working-classes. The models, on a uniform scale, help to explain arrangements to those who are not accustomed to architectural drawings. In the same class are illustrations of "*Cités Ouvrières*," and villages of an improved character. Endeavour is made to show how existing dwellings might be altered. Homes of the people in former times are represented; and illustrations are given of the best construction for the several parts of buildings.

The next class comprises specimens of "Materials for Building and for Furniture," such as different kinds of stone, artificial stone, bricks and tiles, paving materials, mortars and cements, roofing materials; wood of various kinds, with botanical illustrations, and exemplification of processes for preserving and rendering fireproof; varieties of window-glass, and processes of the manufacture; and materials and appliances for house-painting, whitewashing, and staining, besides paperhangings. It would be easy to add greatly to the specimens in this division of the museum; but the illustration, by consecutive series, in the case of some of the materials and processes, is useful whilst exceedingly suggestive. Thus the visitor to the museum is shown by specimens of bricks, what are "burs," "shuffs," "place bricks," and "grizzles," and what is a "good stock-brick," and what a "malm" brick. He sees a specimen of bricks defective through bad quality of the clay, and another of bricks defective from improper burning. Then he finds a series of specimens of painter's work, had work as well as good, including "knotting with red lead and glaze," "common priming and stopping," and "ground colour for green," each marked as *inferior* work, "patent knotting, best," "common priming, inferior," "finished with two coats to look like three, and he charged as such, inferior," and specimens of the best priming, and of two coats, three coats, four coats, and five coats work. To some of the materials, as the bricks, prices are attached,—those which are considered as average,—those which are representations of work of each class, are generally found representations of the tools that are used in the trades or handicrafts.

Class III., "Fixtures, Furniture, and Household Utensils," affords information of the way in which the most useful metals are extracted from the earth, and are converted into some of the fittings of houses. Similarly the manufacture of earthenware is illustrated. Specimens of different kinds of "ironmongery," fittings, apparatus for cooking, cutlery, lighting apparatus, brushes, and foreign and British manufactured articles contrasted, are in this class. Different estimates, referring to the specimens, show the amounts for which working men may furnish

themselves with assortments of articles in hardware, earthenware, and glass, according to their weekly wages, taken as beginning from 15s. a week, and ranging to 3l. per week.

Class IV. is devoted to textile materials, fabrics, costume, and clothing. The materials are shown as produced, and in various stages of preparation for the loom, and as dyed; they include matting, druggets, and carpeting, and fabrics for apparel, including trimmings, hosiery, shoes, waterproofed articles, and head-coverings. Clothing for infants, as used in several countries of Europe, is shown; and there are also specimens, models, and prints, of costumes of various parts of the world. In the same class, are priced lists of outfits suited to the various requirements of the working classes.

Class V., "Food, Fuel, and other Household Stores," starts with illustrations of the philosophy of nutrition, including a statement of the proximate constituents of food; or we should rather say, so far as the subject may be considered understood; for, at present, as we apprehend, very little compared with requirements for the preservation of health, is known of the action of food upon particular constitutions and bodily conditions. Tables of the dietaries in different public institutions are given; and these seem to prove that the condition of those who are confined in prisons is as well cared for, in one respect, as has been so often reported. Specimens of food of various kinds are shown, divided into what is derived from the animal and vegetable kingdoms. One division of the latter kingdom is devoted to leguminous seeds or pulse, and to roots and bulbs; another to vegetables of which the stalk, leaves, or tops are eaten; also there are secreted or extracted products, condiments, narcotics, and various kinds of drinks. There are also specimens of adulterated articles. Thus there are samples of flour as adulterated by sago, potato-flour, bean-meal, chalk, carbonate of magnesia, gypsum, pipeclay, and alum. Sweetmeats are shown as adulterated by gypsum, white clay, Dutch pink, chromate of lead, rose-pink, red lead, Venetian red, red ochre, burnt amber, Prussian blue, ultramarine, Brunswick green, and arsenite of copper. There are, moreover, substances used for adulterating tea, coffee, and hops, or as substitutes for them. Culinary science, and the preservation of food are illustrated in the same class; which, further, includes specimens of fuel, and materials for ignition, and of materials for washing and cleaning.

In Class VI., "Sanitary Department," endeavour is made to grasp a wide range of subjects. Public works for water-supply, sewerage, and protection from inundations; appliances for ventilation of dwellings; for prevention of inconvenience from damp, smoky chimneys, and noxious effluvia,—the latter including disinfectants; appliances for hygiene, as baths; "the hygiene of dress," nursery appliances; orthopedic apparatus; and artificial limbs; means of relief from different defects of the teeth, the hearing, and the vision; appliances for the sick-chamber, household remedies, antidotes to poisons, drugs and their adulterations, and treatment of accidents; articles of which the manufacture is injurious; and the prevention of injuries and diseases which attach themselves to certain occupations, are all in some measure illustrated. The subject of industrial pathology, a most important one, was brought under the notice of the Society of Arts, by Mr. Twining, in 1854.

Class VII., already adverted to ("Homo Education; Self-Instruction; Recreation") has rather an indication of its importance in the subject of domestic economy, than the illustration to be desired, which requires space similar to that afforded at South Kensington. Instructive toys, illustrations of the various sciences, the formation of herbaria, processes used in the arts of design; the principles of taste in outline, colour, and subject; prints and figures suitable for cottage-decoration, music, and gymnastic exercises, all come within Mr. Twining's scheme. A diagram on the wall shows at one view, the different sizes of drawing-paper.

In Class VIII., "Miscellaneous Articles not referable to the foregoing Classes," are such matters as scientific appliances for household use, including clocks, barometers, thermometers, scales and weights, and measures; stationery, miscellaneous household-requisites, toilet-articles, "The Housewife's Work-box," the "Cot-tager's and Emigrant's assortment of Tools for carpentering, shoemaking and farriery," garden and field implements, seeds, and appliances

for locomotion and the conveyance of burdens, and contrivances for lightening labour, useful to travellers and emigrants, and for self-help in emergencies. Samples of museum-fittings and appliances, with estimates for the use of persons desiring to form economic collections on any scale of development, belong to the same class.

As we have sufficiently explained, scarcely one of the divisions of the wide subject, domestic and sanitary economy, can be considered as illustrated, in the museum at Twickenham, more than suggestively for the formation of other museums. Mr. Twining, in addition to his remarks already quoted, observes that economic collections might be varied in scale and character, and "blended with almost every rational device for popular recreation," that they might be made "a place of resort for the sight-loving as well as for the studious portion of the public," and "established on purely philanthropic or on partly commercial principles," as well as that they might "respond to the special pursuits of any class of men, agricultural, mining, manufacturing, commercial, seafaring, military, &c., and be made to represent the requirements and resources of any race, climate, or locality." In certain seaports, emigration would claim a distinct collection. Insitutes and associations for self-improvement, and schools, (as before said, even down to that of the village,) should have their collections or cabinets, for which local tradesmen could supply examples, and others could contribute the manual or intellectual labour. Mr. Twining calls particular attention to the importance of clearly written and sufficiently explanatory labels, and offers to forward specimens of these, as well as drawings and estimates of fittings, such as he has adopted (and many of which are of peculiar contrivance), and to render other assistance. In every respect, he has initiated a good and great work, one which deserves the notice and co-operation of our professional, no less than our general readers; and we trust that he may have the reward which alone he seeks, namely the satisfaction of having shown the way to the production of a great amount of social improvement. As to the division of his museum and library which may be of the chief professional interest to architects, he has not collected all that has been published, but he has got together so much, and so much more than we believe there is at any other single place, that no architect having to plan dwellings for the *industrious classes*, (as they are called, as if exceptionally,) should feel himself in a position to commence work, until after having visited the Twickenham Museum, and well studied the drawings, hooks, and other material there waiting his attention.

#### THE EARLY LIFE OF SIR THOMAS LAWRENCE, P.R.A.\*

I HAVE been requested to prepare for publication the following particulars of the early life of the late Sir Thomas Lawrence. The circumstances under which they were originally collected are these. About a month after Lawrence's death, I was asked by Mr. Thomas Campbell, then poet laureate, whether I could help him in a life of Sir Thomas Lawrence, which he intended to publish, by supplying him with any particulars as to the painter's boyhood. I replied that I thought I could, and shortly afterwards obtained the following reminiscences from my wife's aunt, who was then living, at a very advanced age, at Melksham. Campbell's design was subsequently abandoned, and these reminiscences are now given for the first time to the public, as nearly as possible in the words of the narrator, Mrs. Nalder.

"The late Sir Thomas Lawrence was the youngest of five children, there being besides him Andrew, a clergyman; William, a major in the army, who died a few years ago; and Lucy and Ann, who are, I believe, still living. Their father, Thomas Lawrence, was originally an exciseman, and eloped with his wife, who was the daughter of a clergyman of the name of Read, at Tenbury.

I think it must have been about the year 1765 that I went to reside with Mr. and Mrs. Lawrence: at that time they kept the White Lion Inn, and American Coffee House, at Bristol. I remained with them about two years. Some

\* This account, drawn up by Mr. T. B. Smith for the Wiltshire Archaeological Society, will interest a larger circle of readers than that of the Magazine of this very excellent society.

time after this, Mr. Lawrence wrote to me that he had taken the Black Bear Inn, at Devizes, and that he should be very glad if I would come to them there at once, to superintend the bar, and to assist his wife in the domestic arrangements of the establishment. I accepted the proposal, and on my arrival saw for the first time the late president of the Royal Academy, then a very beautiful and engaging child, between two and three years of age. He was a boy of remarkably fascinating manner, and frequently amused himself by endeavouring to draw little pictures on paper with a blacklead pencil.

I perfectly recollect, as I was one afternoon sitting alone in the bar, watching him whip his top in the entrance-hall, his running up to me, and saying, 'Miss Lea' (that was my maiden name), 'sit as you are, and I will draw your picture.' I did as he desired, and in a few minutes he produced what was always considered an excellent likeness of me. He was at that time in petticoats, and, I think, not more than four years of age. I shall never forget the pleasure with which his father caressed him when shown this his first attempt to portray the 'human face divine.' He snatched it from the table, and ran out of the house to purchase a frame for it. It hung for some time in the bar, and was much admired by persons frequenting the inn. I subsequently gave it to one of my brothers, on his going abroad, and it was lost, with all the rest of his property, in the French Revolution of 1790.

The next likeness which young Lawrence executed, was that of your mother's first husband, Mr. Benett Swayne. These portraits, I think I may venture to affirm, were the foundation on which the painter's future fame was raised, as from this time numbers of persons became anxious to have their likenesses taken by a child in petticoats, and the reputation which he thereby acquired was the cause of his talents being at length directed solely to that occupation which nature had so distinctly pointed out for him.

The crayon picture which I now present to you, was done by young Lawrence when about fourteen years of age. It is one of the first which he executed in this style, for which he used to charge three guineas, frame included. It is a portrait of Miss White, who afterwards married the Rev. W. Jacobs, rector of Shillingstone, Dorsetshire. Her father at that time kept the Castle Inn, at Marlborough, and between him and Mr. Lawrence there existed a degree of intimacy which induced the young artist to bestow especial pains upon the picture. It was given me by Mrs. Jacobs herself. Many years afterwards, at an interview which had become of it, and expressed a hope, when he came into Wiltshire, of being able to call upon me, and look again at one of his earliest productions.

And here I cannot help remarking on the great kindness with which I have always been received by the late president whenever I called upon him, which was as often as I visited London, and the pleasure which he took in describing to me the portraits on which I found him engaged.

[To this testimony of the kindness of Sir Thomas Lawrence I must be permitted to add my own. On Mrs. Nalder's last visit to him in town, she was speaking of my fondness for paintings, when he very kindly gave her a note for me, as an introduction to his studio in case I should call when he was from home. This introduction, however, I never had an opportunity of presenting, but gave it to the Queen, when I sold her the picture of Miss White, as I shall presently relate.]

"To return to the artist's boyish days. I often remember his father saying, with tears in his eyes, when looking at his early productions, that he had no doubt but that I should live to see him a great man, though he himself might not. And years afterwards, when Sir Thomas was lodging in Piccadilly, and his portraits were beginning to engage the attention of the fashionable world, I called upon his father, in Gerard-street, Soho, and was reminded by him of the predictions which he had so often uttered, in the Bear Inn, at Devizes, of the future greatness of his son.

With regard to the elder Lawrence himself, I may add, that he was a man of somewhat eccentric habits. Although remarkably neat in his dress and general appearance, yet he had so great an aversion to new clothes, that whenever his wife noticed that any portion of his attire

was getting worn or shabby, she used to send to the tailor to replace it, effecting the exchange while he was asleep. He was remarkably fond of politics, theatricals, and recitations, and prided himself on his readings of Milton and Shakspeare. He was also a great favourite of Garrick's, who frequently visited the house, staying sometimes a week or a fortnight at a time, during one of which visits he presented his host with a folio copy of the *Spectator*, to which the latter, as may be imagined, attached ever afterwards great value.

So fond was Mr. Lawrence of books, that in almost every room in the house there was a bookcase, containing a choicest selection of volumes for the use both of his guests and of his personal friends."

Such are the particulars which I obtained from my dear and respected friend, who died a few weeks after she had related them to me. I have often since regretted that I had not drawn her attention to the subject before her faculties were dimmed by age, as she could then doubtless have given me much information which had, in 1830, entirely escaped her memory.

Sir Thomas Lawrence was born at Bristol in the year 1769. Of the gentility of his father's character, I heard much from the late Sir Robert Blagrove, with whom I spent an evening at the Bear Hotel, Devizes, some twenty-two years ago. Sir Robert told me that when a subaltern, he had been recruiting at Devizes, and was quartered at the Bear for nearly three months. Though upwards of eighty years of age at the time that I met him, he proved to be a most lively and entertaining companion, and, amongst other things, entertained me by singing with great heartiness the chorus of a song, with which, he said, "the jolly old landlord used to amuse him in his younger days."

Some references having been made in "Waylen's History of Devizes,"\* to the sale of the portrait of Miss White, of which mention has been made above, the following additional particulars of the sale may perhaps not be considered out of place.

It having become generally known that this picture had been sent to the Duchess of Kent, and the Princess Victoria, for their inspection during their visit to Earlstoke Park, in 1830, it became an object of considerable interest, and on the sale of the Earlstoke collection two years later, Mr. George Robins, the auctioneer, wished me to allow it to be included in the catalogue. This I declined to do. It is somewhat remarkable that among so valuable a collection of paintings as that possessed by the late Mr. Watson Taylor, there should have been only one by Sir Thomas Lawrence (a portrait of Earl Camden, whose private secretary Mr. Watson Taylor had been during the Earl's lord-lieutenancy of Ireland in 1798). While this sale was going on, a picture dealer called upon me, and, after a minute examination of the portrait of Miss White, offered me 150 guineas for it. I however declined the offer, as I had made up my mind, whenever I sold it, to give the refusal to the Queen. In 1839 I addressed a letter to Lord Melbourne, then First Lord of the Treasury, on the subject. The matter was by him referred to Sir Henry Wheatley, the keeper of Her Majesty's Privy Purse, and in a few days the bargain was brought to a close, and the portrait placed in the picture gallery at Buckingham Palace. Sir Henry informed me next day that Her Majesty was very well pleased with the purchase, and had been comparing it with a sketch which she had herself made of the picture when lent to her at Earlstoke Park.

On the hack of the canvass is the following autograph:—

"Be pleased to keep this picture from the damp and from the sun.  
T. Lawrence, 15th Sept., 1784."

Sir Henry Wheatley showed me on this occasion, a most excellent likeness of himself, in full regimentals, by Lawrence, for which 1,000 guineas had been paid. This was one of the painter's last productions.

I may here, perhaps, be allowed to insert some letters referring to that period in Lawrence's career, when he had first begun to attract attention in London. They were addressed by his father to the Rev. Dr. Kent, a worthy clergyman of rather eccentric habits, who then lived at Whistley House, in the parish of Potterne, near Devizes. Amongst other eccentricities he always rode on a white horse. The doctor and his horse appear to have attracted the young artist's notice;

as one day Dr. Kent rode up to the Bear Inn, Devizes, which was at that time kept by Mr. Lawrence, sen., and demanded in an authoritative manner to be shown a caricature of himself and horse, which he heard was in Mr. Lawrence's possession. Mr. Lawrence, suspecting his son Tom had been exercising his pencil at the doctor's expense, called him from his play, and asked him if he had ever drawn the likeness of that gentleman and his horse? Tom said he believed he had, and, taking the inquirers into his bedroom, they there found, sketched on one of the walls thereof, a very excellent picture of the doctor and his favourite white charger.

Dr. Kent was so pleased with this performance, that he immediately took young Lawrence to the shop of a bookseller, Mr. Burrough, Mr. Smith's grandfather, and there made him a present of the first box of colours he ever possessed, and also a choice selection of books. The Rev. Doctor's friendship was from this time of the most substantial and useful kind to the young artist and his family, and terminated only at the doctor's death. Shortly after this first introduction Mr. Kent received from his protégé a very spirited head of our Saviour sketched in chalk. It is in an oval frame 9 in. by 7 in., and it has written on the back of it by Lawrence, "Dr. Kent is requested to accept this trifle from his grateful friend and servant,

T. LAWRENCE, JUN."

This picture, which is one of the earliest of his productions extant, is now in the possession of Henry Kent Norris, esq., of Devizes, a relative of the doctor's, and would prove a very valuable addition to any collection of the works of the late Sir Thomas.

With this introduction I proceed to give the letters, the originals of which are at present in Mr. Norris's possession:—

Rev. Dear Sir,—Although I begin with hoping most sincerely that you are well and happy, I wish to inform you that next Wednesday will be a very flattering day to my youngest son, from the opening of the Royal Exhibition in Grosvenor-street, and have let a small part of it to a single gentleman at 60 guineas, and mean to furnish the remainder, neat and plain, as we conveniently can, and have always every convenience for your reception, when you shall be pleased to honour with your company (and for as long a time as you please) which I hope will take place in three weeks at farthest.

I have your friend's directions to you, viz., for the 26th, the 30th, and May 6th, and will therefore close my present account with assuring you how very much

I am, ever your's,  
With the most perfect respect and gratitude,  
T. LAWRENCE.  
\* Wife and children always join their best wishes and readiest services.

Rev. Dear Sir,—I received the favour of your's, and am truly and very much concerned for your being so much troubled and distressed, and most sincerely wish a speedy end to all of them, and a succession of blessed peace and perfect happiness.

I wished for your company yesterday at the Chapel of the Foundling Hospital, where the devotion, preaching, and singing, work altogether for the benefit of the hearer, and leave the mind in a state of tranquillity and humble resignation to the divine will. Wednesday will most assuredly become a day of triumph to our youngest son: for then the exhibition opens; but to-morrow is the public dinner, which will be held in the grand room, where Sir Joshua will sit at the head of the table, at his right hand the Prince of Wales, and on his left the Primate and Metropolitan of all England, and to which treat a much greater number are invited than was before ever known with only three excuses returned.

Their Majesties and the Princesses were there on Friday, and expressed the highest degree of satisfaction: in short it is spoke of as the best.

All my son's pictures were received, being twelve in number; while many others were rejected for want of room.

I am informed that Sir Joshua dwelt in contemplation on the merits of one of his pieces for upwards of twenty minutes; and when it was told him that another artist had ventured to copy after him in his manner, his reply was, "They may study after him, but in his opinion they would never overtake him."

It is the united wish of this family to be favoured with your company; and in very deed I most sincerely hope it would prove a pleasing relaxation to all your care, which we, in our little way, but accompanied with our very best endeavours, would alleviate if we could not remove. Pray write more fully, for we are all now promising.

I told you what we wore the Haunted Tower was like to enact: it is advertised for the four and fiftieth time.

The nation is like to continue at peace, and the stocks continue to rise.

No payment for the Queen or Princess yet, but his

\* "History of Devizes," 1859, p. 453.

business increases most rapidly at 20 guineas a head, which is a greater price than was ever charged by Sir Godfrey Kneller—surprising at his age; but, as Hamlet says, "Time will have the upper hand."

Lady Lincoln, for chance of air, is coming to Sunning Hill, near Windsor, and Lucy with her, who we expect soon to town for a short time; and Tom has given Nanny a box at his expense to give her the meeting, who pleads attention to duty an excuse. My son will incline agreeably to yours, with the most grateful acknowledgments, on the 6th of May; and I am,

Ever so, Rev. Dear Sir,  
Yours, LAWRENCE.

20th April, 1700.  
Rev. Dear Sir,—Words are wanting to express my sense of gratitude to Heaven and to the world, for the great name my son has so wonderfully acquired from the opening of the exhibition. That you may form a judgment of my reason for being thus thankful, I herewith present you with extracts from different papers of yesterday that I have seen. —N.B. It opened on Wednesday.

The *Diary* says:—"Mr. Lawrence, young as he is, trends close already on the kibe of the most eminent of the profession. Such a head as that of Mr. Locke, painted as we understand at a single sitting, and such a portrait as Miss Farren's, might create envy in the mind of the first artist that ever existed."

We have seen a great variety of pictures of Miss Farren; but we never saw before one so beautiful and character upon canvas. It is completely Elizabeth Farren, arch, careless, sprited, elegant, and engaging."

"If any picture from another pencil can do thus, it is the claim,—we say this with astonishment!—of young P. Lawrence. For the whole length of Miss Farren, which for winning ease, for expressive attitude, for the mind's eye, and that peculiar style of feature so difficult to catch, of sweetness without insanity and spirit without distortion, can never be exceeded."

The *Morning Herald* says:—"The portrait of Miss Farren, by Mr. Lawrence, possesses great merit, and is extremely characteristic. The back ground is very fine."  
The *Morning Chronicle*, after speaking of Sir Joshua, says of Lawrence:—

"The picture of Her Majesty, No. 109, is admirable in point of likeness. The drapery is well disposed, but the landscape will admit of improvement. The fill of Miss Farren is an excellent production; he hath given all the richness and fascination of the original with exquisite effect."

Of the other portraits, that of his brother, the clergyman, is by far the best. This picture, with respect to likeness and coloring, we had almost said, unrivalled."

The *Gazetteer* says:—"Mr. Lawrence hath this year fulfilled all the promises which he gave a year ago. We cannot speak with sufficient commendations of the beauties he hath exhibited. Miss Farren is one of the most delightful portraits we ever saw. The Queen is a most perfect likeness, and the small angel is a cabinet jewel."  
The best portraits in oils are Mr. Cholmondeley, Lord Malmesbury's daughter, Mr. Tomkins, and Lord Randon, by Sir Joshua; and Mr. Locke, Miss Farren, the Queen, little Lord Paisley, the Angel, and his Sister's heads, the Princess Amelia, and No. 208, by Sir Lawrence."

And again, in the same paper,—"Lawrence deserves the greatest encomiums for his portraits. That of the Queen by this artist, is certainly a performance of which Vandike himself would have been proud."

The *London Evening* says:—"Lawrence hath improved since last year, astonishingly! His portrait of Miss Farren yields to none in the room; that of the Queen has already been mentioned by the public; and these, with the other portraits, speak him one of the most promising geniuses of the age; that Lawrence bids fair to be the first portrait painter in the kingdom, is not saying too much."

The *Times* today (with which I will conclude) says of the portraits,—"Those of the Queen, by Lawrence and Russell, and that of Miss Farren likewise, by Lawrence, appear to be the best."

You will perceive by the catalogue the great number of artists, and then judge of the grateful surprise of

Rev. Dear Sir, your most devoted servant,  
30th April, 1700. Yours, LAWRENCE.

Rev. Dear Sir,—This morning met B. D. Esq.\* He has not been wanting in his polite attention towards us, consequently commencing your good wishes.

We went together to the Royal Exhibition, where I communicated to him a little of my intelligence extraordinary, and he in return uttered his thoughts respecting what the town would have occasion to mourn his absence, which would not be these four or five days, and that he would call at 57, Greek-street, in the intermediate space. He was going to visit at the habitation of the Prime Minister, where I having no pretensions, we on that account agreed to bid farewell.

I cannot sufficiently express my satisfaction, and you believe me, at the great name my son has so deservedly acquired; he is, in a manner, become the theme of every applauding tongue. But more of this when I shall have the grateful pleasure of waiting upon you where your last favour was addressed, and where I hope you will sleep with the most pleasing assurance, and attended with the most grateful welcome by all.

I am, Rev. Dear Sir, ever yours,  
4th June, 1700. P. LAWRENCE.

P.S.—We have no encouragement to return for any impertinent inquiries that may be made. I will (may I not?) hope for the favour of seeing you very suddenly.

Tom is going this day, to die at the head of his Majesty, where Sir Joshua will be the toast maker.

The Rev. Dr. Kent; Whitley, Devises, Wilts.

As a long life passed in literary pursuits, his end was accompanied by acts of benevolence, of which his relations and friends were partakers.

Nor were the poor omitted in his bequests, as the diocesan by his last will to the hospitals of St. Saram and Bath; to the Society for the benefit of Clergy, and the Widows and Orphans in this diocese, the needy in this and the neighbouring parishes, besides other charitable donations, bear testimony.

\* B. D. Esq., I suspect, is meant for Bernard Dickens, son of Bowden Park, near Devises, who was intimately acquainted with both Dr. Kent and Mr. Lawrence.  
It appears that Dr. Kent died in 1704, and was buried at Potterne. In the elegant parish church of that place we find a marble monument erected to his memory, from which we have extracted the following:  
Henry Kent, D.D., died 27th Decr, 1709, aged 61 years.

He left, also, to Merton College, Oxford, of which he was formerly fellow, all his valuable and extensive library, together with a handsome sum for its augmentation.

To return to the subject of this paper. Lawrence was elected a Royal Academician in 1790. It appears, however, to have been the wish of George III. that this honour should have been conferred upon him some two or three years earlier; a fact which gave rise to the publication of some "Loyal Odes to Desloyal Academicians," from the caustic pen of Peter Pindar. They are eighteen in number. The following is an extract from the introduction:—

"The foundation of the following odes is simply this. The president of the Royal Academy reported lately to the Academicians his Majesty's desire that a Mr. Lawrence might be added to the list of the R.A., his Majesty being perfectly convinced of the young artist's uncommon abilities, and consequent fair pretensions to the honour. Notwithstanding the royal wish, and the wish of the president, and the wish of Mr. Benjamin West, the R.A. received the announcement of his Majesty's wish, Sir Joshua's wish, and Mr. West's wish, with the most ineffable sangfroid, not to call it by the harder name, *disputat*. The announcement happening on the night of an election of associates, at which Mr. Lawrence ought to have been elected an associate (a step necessary to the more exalted one of R.A.), the number of votes for Mr. Lawrence amounted to three, and that of his opponent, Mr. Whentley, to sixteen."

In these odes I find Lawrence's name mentioned only twice.

"Refuse a monarch's mighty orders!  
It smells of treason!—on rebellion borders!  
'S death, Sir! it was the Queen's fond wish as well  
That Master Lawrence's should come in!  
Against a Queen so gentle to rebel,  
This is another crying sin!  
What! not oblige in such a trifling thing  
So sweet a Queen, and such a goodly King!"

Ode i.  
Go, Sirs, with halters round your wretched necks,  
Which some contrition for your crime bespeaks,  
And much offended Majesty inspire.  
Say, piteous, kneeling in the Royal view,  
'Have pity on a bad and abandoned crew,  
And we, great King, will sin no more.  
Forgive, dread Sir, the crying sin,  
And Mister Lawrence shall come in!"

Ode xvii.  
The reputation which Lawrence had acquired subsequently induced the Prince Regent to commission him to paint the portraits of the sovereigns, statesmen, and generals who had been actively engaged in the last great contests with Napoleon. He commenced his labours in 1814, with the portraits of the King of Prussia, of Platoff, and of Blucher, who were then in England. In 1818 he proceeded to the congress at Aix la Chapelle, thence to Vienna, and in 1819 to Rome, where he completed the series with the portraits of Pope Pius VII. and of Cardinal Consalvo. All these pictures are now, I believe, in the Waterloo Hall, at Windsor Castle. Mr. Lockhart gives the following account of this commission in his life of Sir Walter Scott. "On Scott's arrival in London, in 1820, one of his first visitors was Sir Thomas Lawrence, who informed him that the King (George IV.) had resolved to adorn the great gallery then in progress at Windsor Castle, with portraits, by his hand, of his Majesty's most distinguished contemporaries. All the reigning monarchs in Europe, and their chief ministers and generals, had already sat for this purpose. On the same walls the King desired to see exhibited those of his own subjects who had attained the highest honours of literature and science, and it was his pleasure that the series should commence with Walter Scott."

Lawrence received the honour of knighthood from the Prince Regent in 1815; was elected president of the Royal Academy in 1820; and died in London, after a very short illness, on the 7th of January, 1830.

It remains only that I should add a few words as to the personal appearance of the late president, though as I never myself saw him, I am only able to repeat what I have heard from others. I have already said that, as a child, he was remarkable for his beauty and his engaging manners; as a man he was a general favourite with ladies, and was always pleased to be in their society, though he never married. When in the prime of life, he was an exceedingly handsome and well-built man. His features were open, with a commanding expression, yet kind, conciliatory, and captivating. Of his conversation, Sir Walter Scott once said, "He is, from the habit of coaxing his sitters, I suppose, a

little too fair spoken, otherwise very pleasant." His manners were most courteous. And I cannot better bring this brief sketch to an end than by repeating the eulogium once passed upon him by King George IV.—"Lawrence is the most perfect gentleman in my dominions."

WOOD-WORKING MACHINERY FOR NEW ZEALAND.

MESSRS. THOMAS ROBINSON & SON, Rochdale, Lancashire, have just executed a large order for an enterprising English company who propose to establish large timber works at Wairoa-kaipoore, some sixty or seventy miles from Auckland, the capital of the colony. The order embraces machines of a gigantic size; one or two of them, indeed, being larger than any hitherto manufactured for the purpose of entering timber, either in this country or any other.

Three timber frames for sawing logs into boards, capable of receiving logs of 8 ft. square, 5 ft. square, and 4 ft. square; two rack or saw benches, with a travelling top, 50 ft. long, and working with a saw cutting 26 in. deep; one planing and squaring machine, capable of planing timber 15 in. wide and 20 ft. long; one self-acting saw bench, 6 ft. long and 3 ft. wide, carrying a saw 36 in. in diameter, and cutting 15 in. deep; one moulding and planing machine, to work timber 3 in. thick and 9 in. wide; two mortising machines of large size; one tenoning machine for joiner's and carpenter's work, by which the tenon is cut at one operation. The order further comprised two travelling cranes capable of lifting fifteen tons each, and two powerful cranes for taking the logs of timber from the river; as also grinding machines, &c.

The total weight of metal used in the construction of the machines we have thus catalogued exceeds 300 tons; and the value of the machinery, when completed, will exceed 7,000. Bearing in mind that it was only, so to speak, yesterday, that steam power was successfully applied to wood-cutting machinery, one is in doubt which to admire most, the mechanical skill and ingenuity of Messrs. Robinson & Son, or the pluck and enterprise of the company, who are prepared to expend so much capital in establishing this gigantic joiners' shop at the Antipodes.

From what we can learn of the natural history of the district of Auckland, however, there is evidently scope for the operations of such an establishment there. The Kanri pine, the timber from which we are assured equals in durability the Baltic pine-wood, attains there an enormous size. They are often found growing to a height of 90 ft. without a branch, and they are frequently a girth of 40 ft. Some are met with, indeed, with branches 3 ft. in diameter.

The largest timber-frame included in their order is as wonderful a piece of mechanism as the timber which it is made to cut is wonderful as a product of nature. The height of the frame is 30 ft.; it weighs altogether about 50 tons; and, armed as it will be with ten saws, each of 14 ft. in length and 12 in. in breadth, it will cut a log of Kanri timber 50 ft. long into beams in less than fifteen minutes. This powerful sawing-machine will be driven direct by a horizontal high-pressure engine fixed on the same level as the foundation-plate of the frame. The two smaller timber-frames enumerated in the list we have given are very similar in principle and structure. The one intended for logs 5 ft. square will carry forty saws, while that for logs 4 ft. square will carry forty-eight saws. At Messrs. Robinson's works at Rochdale, logs of timber may be seen being rolled into timber-frames, to be cut up into boards, and afterwards transferred to one or more of a row of wood-cutting machines to be by them squared, planed, tongued, and grooved, tenoned, mortised, or moulded, as might be desired. The rapidity with which some of these machines perform their work is wonderful. Rough boards from the saw-frames fed into one end of the machine appear at the other squared, planed, and shaped ready for immediate use. One planing-machine is capable of planing and tonguing and grooving 1,200 deal boards, such as are used for flooring purposes, in a day.

LANSING BUILDING LAND COMPETITION.—The successful competitor is Mr. Webb, Dulwich.

\* \* \* A young portrait painter of some merit. P.P.\*

### ST. JAMES'S PARK: THE NEW RIDES. PROJECTION FOR A NEW WALK.

HAVING reason to know that the *Builder* regularly finds its way to Her Majesty's Office of Woods and Works, I thought it a convenient medium,—Mr. Editor being agreeable to spare the space,—to present a few observations to command the notice of the Chief Commissioner, which the works now going on at the line of separation of the St. James's Park and the Green Park have suggested.

Those of the public desirous of seeing metropolitan improvements progress, and who know how greatly the power of the honourable Commissioner to aid in the furtherance of public works is dependent on his personal influence with the House of Commons, would rejoice at the accession of political capital for use to that end he would acquire by the construction of the new road—a *la Rotten-row*—side by side with the Birdcage-walk; and, as it will do, the numerous horsemen members of St. Stephen's to have an easy and safe center in their daily approach to the House.

The honourable Commissioner, seemingly encouraged by the appreciation of that work, is now making a further hit in the same direction, by the formation of a similar line of ride on the opposite side of the park, designed also for the enjoyment of the same class in the approach to the public offices and the clubs of St. James's. At the same time, it must be admitted that these concessions to the high class few are made, at least, at some sacrifice—a sacrifice of beautiful green sward area of the Royal Parks in a part where there is the least of it to spare. It is virtually a circumscribing of the recreation ground of the masses, the space diverted becoming wholly unseizable for any purpose other than that particular one to which it is given over.

The administrative policy, however, in respect to the royal parks pursued by the present Chief Commissioner, shows him by no means unmindful of the claims of the other classes, and indeed in these quarters the honourable Commissioner is always favourably regarded for the liberal concessions he sanctions; and if he could be induced to embrace in the work now going on a little matter of improvement hereafter to be pointed out—accommodative to those classes—it would perhaps tend to silence many who will incline to question the fairness of the spoliation of the parks intended for the recreation of the many, to the promotion of equestrianism partaken of only by the very few.

Of the vast community engaged in the various different departments of facture and trade of that emporium of the world's fashion, the West End (by which term is here meant the district traditionally known by the name, and which may be distinguished as being comprised within the circle scribbled with a half-mile radius round Burlington Gardens), no few have their homes in Westminster or Pimlico and other further off neighbourhoods in that direction, inclusive of districts which the rail from Victoria has opened out. Mostly these persons make the passage of St. James's Park on foot, *via* Buckingham Gate, one way in the morning in proceeding to their occupations, and again in the evening in the return therefrom.

Those who would like ocular demonstration of this should some day take up a position opposite the great bronze gates, the central entrance to the palace, through the hours which it is usual for the different grades above adverted to proceeding to, and returning from, their occupations. The hurried manner these crowds of pedestrians will be observed all to pursue their way sufficiently indicates the boon that the opening out of any new cut having the effect of shortening the journey would confer. As one of this crowd of daily to-and-fro-passers this way, I have, during the short time the iron railings have been down for the formation of the new ride, been in the habit of crossing the works and passing the Green Park obliquely, over the grass to the entrance to the Park from Piccadilly, opposite Devonshire House, and the striking convenience of the line has reminded me of the desirability of a permanent communication being formed in that direction. To effect this it only requires the removal of the existing gate of entrance to the Green Park which stands at the bottom of Constitution-hill from its present position, and setting it at the first angle at the western end of the Mall, in a line with the north wing of the palace (it would there still serve all the purposes of its present intent), and the

laying down from thence to the Piccadilly gate, at the corner opposite Devonshire House, of a 15 ft. wide gravel path. By this it will be seen that between the last-named point and Buckingham Gate the walk would become a continuous straight line.

The introduction and use of such additional footpath as is here projected could surely be prejudicial to nothing nor inconvenient to any one, whilst it would afford to a vast mass of the public the choice of a pleasurable walk in their daily "up" and "down" journey, over one of the most agreeable and health-invigorating spots of all London's open spaces, and a save in distance (measuring the projected line as against the present tortuous route by the stableyard, from a point at the top of St. James's-street), of some 300 paces, avoiding, too, at the same time a couple of crossings, both of them now, at times, very dangerous ones, by the rapid nature of that particular carriage traffic to which the road here has of late become subject. F. C.

### A WORD OF ADVICE TO MARGATE.

How much Margate depends upon its visitors and upon the reports of medical men possibly townspeople themselves have never cared to calculate; but can the stream of visitors be depended upon, and the influence of the medical profession be favourable, if things are allowed to go on longer as they have done this summer? What are the facts? The largest and most costly houses in the town—those in the Royal Crescent—have to complain, through the medium of the public press, that for weeks the kitchen refuse has been entirely unremoved! In addition, numberless visitors to the Marine-terrace address letters of complaint, again and again, to the local authorities, of the intolerable stench coming into the hack windows of all the houses. Others complain of nuisances from pigsties, &c., in crowded localities. The very fort, though upon high ground, does not escape. At times its approach has been almost impossible, from the horrible effluvia arising from the vast natural cesspool dirty people have turned to account in "No Man's Land." Those who have sought another route to the same place, have had to encounter nuisances even worse, in the shape of stagnant pools of high-water at the top of Love-lane and King-street! Many more cases occur to mind. Now all these nuisances are so palpable, it scarcely seems credible that the authorities could have allowed them to remain a single day. Yet the season is nearly over; and, so far as visitors can see, nothing has been done. Who must be to blame? There is certainly a sanitary inspector in the town (although no office bears any such outward sign), because a hand-bill may now be seen in shop-windows requiring an "assistant sanitary inspector." Sadly he must be needed! Although we can hardly believe it, we are informed that the houses in Love-lane, affording examples of so terrible a nuisance, and the marsh, from which rises the horrible stench at the back of Marine-terrace, are actually the property of the sanitary inspector himself.

By saving a small rate, the town may be ruined. Movement is much needed at Margate, if it is to keep its place; but before all, and above all, there must be cleanliness and the means of cleanliness.

### RESTORATION OF THE CITY CROSS, WINCHESTER.

MR. BUCKLER writes to us thus, touching the pastoral staff of William of Wykeham:—"It would have been well if the sculptor had placed the pastoral staff in the left hand of the statue of William of Wykeham, as it is wrong in the right hand, as described at p. 606. Reference to the effigy in the cathedral would have averted the mistake; for although not grasped, it does not rest on the left side by accident, in the monuments of Wykeham and Waynflete.

At the consecration to the episcopate, before the newly-consecrated bishop blesses the people, the consecrator places the pastoral staff in his left hand ("*consecrator tradit ei baculum pastoralem in sinistra*"), and it is thus held by the bishop on subsequent occasions, with very few exceptions, which I need not particularize, when it is held in both hands; and it is always satisfactory to be correct.

### CLOSED BURIAL-GROUND OF ST. GEORGE'S, HANOVER-SQUARE.

LARGE shut-up areas within a great metropolis are a waste, loss, and obstruction; just in the proportion as the opening out of such inclosures would be an enlargement of liberty, an embellishment, and promotive of public health.

Fronting Hyde Park, and within 250 yards of the Marble Arch, an open space of ground, concealed from view, slopes in wilderness, unknown save to the four ranges of houses which circumscribe the ghastly quadrilateral, and afford a view from their back windows of trees and shrubs fitfully planted, which seem to flourish upon the hungry gravel superstratum. This plot had a central opening reserved on the south towards Hyde Park of 80 ft., within which was erected a one-story building, 80 ft. by 18 ft., very much like a stable with a belfry, completed in the year 1764, when the whole was dedicated to the objects of a cemetery—at that period suburban—for the parish of St. George. Since then several hundreds of tombstones have been stood on end, together with a few more pretensions monuments; but in the year 1854 burials were discontinued, when the mortuary chapel was finally closed, and the leaden coffins which filled the vaulted catacombs in a double range of 80 feet in length, were removed and deposited together in a pit, packed in superincumbent gravel.

The small funeral chapel still remains, with about a score of votive tablets, both within and without. The reading-desk, the benches, even the trestles stand as in the days of mourning, in one half of the building; the other half serving as a residence for the family in charge of the desolation, who have also a fair and not neglected portion of the burying-ground to form a pleasure-garden, besides a plot at the north end for leguminous productions.

The trees periodically planted by monks have grown with exceeding luxuriance, and seem to profit by the mortal tribute deposited in the naturally sterile soil; so that the whole extent wears a not unpleasing sylvan appearance; and, were it not for the bustling tombstones, the aspect of this expanse of over four acres would not only be most pleasing to the eye, but would readily double the value of the numerous houses that command a view over it.

The whole Park frontage belongs to the parish of St. George, Hanover-square, seventeen houses being at the disposal of the vestry, besides the frontage court to the mortuary chapel, measuring 60 ft. by a depth of 40 ft., with clear open to the Park.

This most invaluable scope of land has already been set apart and consecrated, therefore no expropriation ought to be made of the sacred soil; but there is a use to which it might be justly dedicated; and even a parish vestry need not be offended if that mode of appropriation should turn out more profitable than letting out grounds to building speculators.

What is suggested to the vestry has, however, no affinity to the appropriation of any portion of the dormant burying-ground by lease or transfer of any kind, but only to its application for the legitimate purpose of founding a church in aid for this most important populous and wealthy district, which actually stands in need of another parochial temple for devotional worship more than any other quarter of the metropolis.

There could be no desecration of the hallowed site in its dedication to religious worship—that of the Established Church: the mortal remains, now resting within the verge of the central plot, might be carefully deposited in catacombs, vaulted under a suitable edifice; and here is an opportunity for the foundation of a noble temple upon the finest site to be found anywhere. There is already an opening to the park, available without loss; and, save the structure itself, the only outlay needed would be for the purchase of one house in Seymour-street, to make a carriage and foot thoroughfare, so as to give access from the north side, and to confer upon the church a free circulation and ingress for all comers.

With respect to this now unused cemetery, as well as all others shut up within the metropolis, an immense improvement might be made by laying the tombstones in a horizontal position: it has been done in many old churchyards, with great benefit to the living: where so treated, the grass, shrubs, trees, and flowers, grow luxuriantly in the intervals; and when walks are cut and access given, the monumental records, hitherto concealed and unthought, may be read by loiterers and wanderers, awaking,

perchance, at times a happy reflection and rescuing may a legend from obscurity and darkness. Why should the resting-place of the dead be revolting or disagreeable to the living? The old churchyards, heaped up many feet by the mortality of centuries, were barred out by countless obstructing stones, and shapeless mounds. There is no longer a necessity for this—indeed, every perch of open turf is imperatively needed for a civic population swollen beyond example or precedent. The health of every crowded locality is improved by opening out and planting all such sealed inclosures. The object of sculptured epitaphs is to commemorate the dead; whereas the effect of locked cemeteries is to consign them to oblivion. It is not thus in Italy, where the Campo Sauto is a favourite resort. The Romans placed their tombs on the roadside. Our Cathedrals of the Middle Ages consigned them to cloisters; but the Parisians first introduced the amenities of trees and flowers at Père la Chaise.

QUONDAM.

## INDUSTRIAL EXHIBITIONS.

**Wakefield.**—The Industrial and Fine Arts Exhibition here has been opened. In every department embraced in the exhibition the collection is large and interesting; and, indeed, the result achieved is such as could scarcely have been expected when the subject was first mooted. A suitable building for this enlarged exhibition had to be provided; and the Tammy Hall having been just vacated, the committee entered into an agreement for that building for six months; and the mayor and corporation having granted an open space of ground between the Court-house and the Mechanics' Institution for the same length of time, advertisements were inserted in the papers for plans for a building either of wood or brick. Several designs were forwarded, but the plan which seemed to meet with universal approval, and from which this building is erected, was by Mr. William Watson, and the contractors were Messrs. Latham & Son, both of Wakefield. The building consists of a large vestibule, with a picture-gallery on either side, that on the north for oil-paintings, and on the south for water-colours, &c. These galleries will contain about 500 paintings, commencing with Hogarth down to the present time, contributed by a large number of artists and owners of art-works. Also, a good collection of photographs, chromolithographs, pencil drawings, pen-and-ink sketches, and a few choice examples of sculpture, bronzes, &c. Besides these galleries, the temporary building contains a large central hall, 100 ft. by 60 ft., and a refreshment-room, &c. The Tammy Hall is entered by steps from the central hall, and contains besides offices a lower room with shafting, which, in consequence, has been assigned to machinery in motion. Above this is an upper room 223 ft. long by 30 ft. wide, the walls of which are coloured with a neutral tint. Thus the exhibition is held in six rooms, which contain about 17,500 square feet of floor and table space, and 17,000 square feet of wall space. The number of exhibitors, including the fine-arts department and children, amounts to nearly 2,000. Regarding the classification and arrangement of articles, which in all exhibitions of a similar character has been found the most difficult part of the undertaking to perform satisfactorily, the articles have been arranged partly in sections, and always so as to produce a pleasing appearance. In arranging the catalogue, the committee determined to throw all the goods exhibited into sections, rather than adopt the more ordinary plan of classes. This has enabled them, by placing together all things that had any relationship, or naturally succeeded each other, to make each group larger, and at the same time get rid of that awkward class, the miscellaneous.

**Birmingham.**—The Industrial Exhibition for the working men of Birmingham and the Midland Counties, has been opened in Bingley Hall. The inaugural ceremony was preceded by a procession through the principal thoroughfares of the town. Among those seated in front of the orchestra were Lord Lyttelton, Lord Leigh, Mr. Newdegate, M.P.; Mr. Bromley, M.P.; the Mayor; Mr. Elin Burritt, United States consul; and others. Lord Lyttelton delivered the inaugural address. Much, he remarked, had been said about the obligation resting on the upper classes to mingle more with the lower, or hard-working classes; but he thought the middle classes were perhaps more in need of being reminded of their duty in this respect towards

those both above and below them. Having pointed out the mutual dependence of classes, and the desirableness of intercourse for the purpose of making society more compact, he insisted that it was the duty of all to work, whatever might be their position; and he characterised such exhibitions of industry as that in Bingley Hall, as a mutual encouragement to all classes to do their share of this general duty. It was difficult to say what the staple trade of Birmingham was. He had heard it said that there were as many as 300 distinct handicrafts in Birmingham, from which it followed that its industry was like some great machine fixed to its place by many springs. It did not matter much if one or two broke; the general fabric remained sound and undisturbed, unlike those places where the staple trade formed a main spring, without the action of which all the rest stopped.

**Liverpool.**—A movement is on foot for holding, in Liverpool, in January next, an industrial exhibition, the contributors to and exhibitors in which will be working people. The objects of the promoters (some of whom are amongst the most prominent men of the town) are the promotion of mechanical and artistic tastes, industry, ingenuity, and economy of time amongst the working classes, and the establishment of a means of disposing of the articles privately constructed or invented by the exhibitors. Between twenty and thirty intending exhibitors have already applied for space for mechanical inventions, engines, manufacturing and nautical machinery. In the latter class is an ingenious hydraulic propeller for ships, &c. **Greenwich.**—An exhibition of the industrial manufactures of Kent will shortly be held at Greenwich. The primary object of the promoters is to afford an opportunity to the working classes of Maidstone and the other portions of the South-Eastern district to exhibit specimens of skilled workmanship produced by themselves. A separate class, comprising a selection of prize-holders from previous exhibitions, will be arranged in a separate portion of the building, and will be eligible for prizes to be competed for among themselves. The prizes offered for competition will consist of four classes: 1st, and special, a gold medal; 2nd, silver; 3rd, bronze; and 4th, honorary certificates of merit. A memo of the exhibition will be provided for each exhibitor. The committee reserve to themselves the liberty of admitting works of art of superior merit or special interest, not the production of the working-classes, as a loan, such works, however, not to enter into the competition for prizes.

## OPENING OLDHAM PARK.

This park has been formally opened by the Mayor. The formation of the park was suggested by a special committee appointed by the town council for considering the steps necessary to be taken for the purpose of employing the distressed operatives of the borough, thrown out of employment by the recent cotton famine. The Swine Clough Estate, valued at 10,750*l.*, was purchased, and, to render the park and approaches complete, the council purchased about 20 acres of adjoining land, making altogether about 72 acres, which have been obtained at a cost of 18,100*l.* Of this land, nearly 60 acres have been laid out as a park. The aggregate cost of the site, the buildings, roads, the laying out and making the main roads bounding the easterly side of the park, leading to Glodwick, and culverting over 200 yards of Sheepwashes Brook to receive a large embankment in forming the roads, is about 31,000*l.*, of which sum 30,900*l.* have been lent by the Public Works Loan Commissioners, under the Public Works (Manufacturing Districts) Act, 1863, repayable, with interest at three per cent. per annum, by annual instalments extending over a period of thirty years. On the acquisition of this land, the committee offered premiums for the two best designs for laying out the park; and of those submitted, the designs and plans of Mr. Henderson, of Birkenhead, and Messrs. Woodhouse & Potts, of Oldham, were adopted. There are two principal entrances to the park, one situated on the westerly or Sheepwashes side, and the other on the easterly or Glodwick side. At the entrance there are two gates, one leading to land intended to be appropriated for building purposes, and the other leading to the park. The entrance-building is of Yorkshire stone, in the Italian style, with small tower. The gates are of ornamental cast-iron, hung to stone piers. The terrace walk commences about 70 yards from

the entrance-gates, and is approached by a flight of steps. The terrace is 18 yards wide, and about 400 yards long. In the centre is erected a hand pavilion, having an ornamental cast-iron front, commanding a view of the opposite walk, which connects the terrace with the roads on the lower side of the park. In the centre of this walk a fountain has been erected, built of stone, having two basins, and supported by five granite columns, with carved stone capitals. The jet issues from the mouth of a dolphin held in the arms of a boy carved in stone. This fountain is the gift of Mr. Josiah Ratcliffe, the mayor. The terrace terminates with a stone balustrade, and a flight of steps leading to the higher ground, whereon is erected a building intended for a refreshment-room and place of shelter, with one upper story for a museum. The windows of this room are of stained glass, representing "Peace and Plenty" and "Industry and Commerce." The building and gates at the Glodwick entrance are similar in design to those of the Sheepwashes. The park includes other buildings, such as a propagating-house, gardener's cottage, &c.; and affords ample space for the recreation and enjoyment of the people.

## HOSPITAL VENTILATION.

We class among fever hospitals all those constructed for the reception of patients afflicted with contagious disorders; and any proposition tending to diminish or prevent altogether the spread of infection, should be listened to with the greatest attention. Nearly every hospital in Europe is at present overcrowded; consequently there are congregated often in one ward persons affected with maladies of such a different nature that it is indispensable for their recovery to have not only a good supply of pure air, but to be protected from contamination with other patients. This is proposed to be effected by the plan suggested by Dr. Bachrich, of Paris, which consists in having separate air-shoots or chimneys of canvas, or other inexpensive material, for each bed. The ward is divided into three parallel divisions, the central one being a depressed passage with raised platforms on each side running the whole length of the apartment (like guard-heads), on which the headsteads are placed. Inclosed by the uprights of the platforms, and on each side of the central division, are two continuous air-tubes, 1 ft. by 6 in. in section, communicating with the external air. This conduit is pierced with small holes about 8 in. apart, so that the air enters slowly into the ward, without direct draught, and is carried off from each bed by a separate pipe into a general flue. As the committees of two of the most important hospitals in this country and in France now on the eve of construction, viz., St. Thomas's in London, and the Hôtel Dieu in Paris, have signified their intention of adopting every improvement that modern science can suggest, the plan of Dr. Bachrich should be inquired into.

## THE LOGGETTA DEL BIGALLO.

At the corner of the Piazza del Duomo, and the street called Via Calzavola, leading from the Piazza del Duomo to the Piazza Vecchia, must have been remarked by all visitors to Florence, what at first sight appeared a ruin of an old building enclosed in old patched scaffolding, worn black with age; but on closer inspection could be seen, wicore glimpses of it could be caught at a short distance from the scaffolding, or by peeping through the cracks of the old hoarding, remains of a building of great architectural beauty.

There seems a peculiar fondness in Florence,—hard to be accounted for,—for leaving buildings unfinished; see the façades of the churches, the grand Duomo itself not excepted. The modern art-exhibitions contribute numerous plans from year to year, many of great merit, for façades for the Duomo, S. Lorenzo, &c.; but the marble exterior of the Duomo has been worn and patched up again with bright new marbles, shining out in strong contrast with the old black worn marble of the fourteenth century, and still the hideous brick front remains uncovered, though, as it is stated, the princely Demidoff has offered to complete it at his own expense. But to return to the subject of our engraving. This beautiful little loggia has remained bricked and boarded up since 1836 until the 14th of May of this year, chosen to inaugu-

THE LOGGETTA DEL BIGALLO, FLORENCE.

rate so much that was pleasing to the eye and taste as well as to social feeling.

During the last two years there have been workmen employed on the work of nubricating the arches, mending the marble ornaments of the pillars, &c.; and now, except a few low palings around, the loggia is left open to view. It formed in the thirteenth century the entrance to the hospital of the Misericordia. In 1240, the Dominican monk, Pietro da Verona, afterwards Pietro Martirio, whose martyrdom Titian has immortalised on his canvas, came to preach against the heresies then being promulgated in Florence by Paternon, and excited many of the citizens to a crusade against them, instituting a military sacred order of twelve bands, headed by twelve of the chief of the citizens, called "Capitani della Fede." These, after a victory gained over the heretics in the Piazza of Santa Felicità, in Florence, took the title of Capitani del Bigallo. The order devoted themselves to the care of pilgrims; and, after joining with the order of the Misericordia, on the latter removing to their present hospital on the south of the Duomo, in 1525, took exclusively the care of the abandoned orphans, and established themselves

in the building of which this loggia forms a part. The Loggetta is said to have been built from the designs of Niccola di Pisano. It consisted of four arches, two of which are still closed. The two now open lead to a chapel enclosed by gates of Gothic wrought-iron work; inside are marble life-size figures of the Virgin and two saints by Alberto Arnoldi. On each side of the altar were formerly frescoes, by the son of Ghirlandajo. The statues over the north arch facing the baptistery were either by Niccola or Andrea Pisano. The arches are ornamented with medallions, enclosing half-figures of saints, exquisitely carved. By the side of the statues are two frescoes, by Roselli and Ventura; the subjects, Pietro Martirio preaching to the people against heresy, and Pietro giving the white standard, embroidered with a red cross, to the twelve nobles heading the Crusade. The frescoes are well executed, and almost preserved entire.

The restorations of the Loggia have been carefully done, but show a falling off from the work of the thirteenth century. It is to be hoped many more equally interesting restorations may be effected to add to this interesting specimen of Italian Gothic.

#### NORFOLK HOTEL, BRIGHTON.

THIS well-known old family hotel, situated in the best part of the King's-road, has passed into the hands of a company, and has been rebuilt from designs, and under the superintendence, of Mr. Horatio Nelson Gouley, architect, Brighton. The new hotel contains fifteen sitting and sixty-four bed rooms, with bath-rooms, lavatories, and waterclosets on each floor, and every modern convenience. There are two coffee-rooms, a smoking-room, and a handsome well-lighted billiard-room. The kitchen is commodious and well ventilated, and is fitted up by Messrs. Jeakes & Co., of Great Russell-street, London, in good style. The hotel is replete with every convenience for carrying on the business. Attached to the hotel are coach-houses and stabling for the visitors.

The bells throughout the hotel are on the electric system, and have been fixed by Mr. Preece, of Southampton. The building has been erected in two parts; the northern portion by Mr. Reynolds, and the southern portion by Mr. Bland. It is expected to be opened by the middle of October.

THE NORFOLK HOTEL, BRIGHTON, SUSSEX.—MR. HORATIO N. GOULY, ARCHITECT.

WORCESTER DIOCESAN ARCHITECTURAL SOCIETY.

The members of this Society, with their friends, have paid a visit to Hereford, for the purpose of examining the architectural and other antiquities of that ancient city, and also for visiting—on the following day—several of the churches and other objects of interest in the neighbourhood. The party from Worcester, on arriving at Hereford, was augmented by several ladies and gentlemen residing in the city and county.

With the Rev. F. T. Havergal as *cicerone*, the party first visited All Saints' Church, which, it was explained, was the largest parish church in the city. Couplings' Hospital, or the "Red Hospital," as it is more commonly called, from the colour of the cloaks worn by the inmates, was the next building visited. The party next adjourned to St. Peter's Church, taking a brief view of the old place in the market square on the way. After discussing the separation of the chancel and other details, in St. Peter's, luncheon was taken at the Green Dragon Hotel; and afterwards, a paper on the monuments in the cathedral, by Mr. M. H. Bloxham, of Rugby, was read by Mr. Walker, the author not being able to be present. The company then resumed their peregrinations, proceeding first to the cathedral, where, after viewing the Bishop's Palace, and some of the principal features of the building, old and new, which were described by Mr. Havergal, they attended divine service. The Castle-green, the Museum, Eibelbert's Hospital, and the site of Ethelbert's Well, were afterwards visited.

The Rev. F. T. Havergal invited the ladies and gentlemen remaining in Hereford, to take tea and coffee at his residence in the college, where they had an opportunity of inspecting a choice collection of ancient MSS., and other objects of antiquity.

The programme of the second day included a trip from Hereford to Weobley, calling at the White Cross, Stretton Sugwas, Credenhill, Brinsop, Mansel Lacey, and Yazor, on the way; but the experience of the morning showed that the journey must be curtailed a little, and this was done by omitting the proposed visit to Mansel Lacey and Yazor.

THE FRENCH EXHIBITION BUILDING.

In reply to the statement made by Mr. Maw and Mr. Payne that the French Commissioners have appropriated the design and system of classification published by them in our pages in 1861, and to the evidence they furnished of that fact, the Commissioners say, through Lord Cowley, first, that the document Mr. Maw mentions was never communicated to the Imperial Commission, and that it was therefore quite impossible for it to have derived from it any hint for the plans it has had drawn up; and secondly, that the difficulty solved by the Imperial Commissioners' plan was not the general problem of the form, whether rectangular or elliptic, which alone was sufficient to comply with the conditions laid down by his Imperial Highness the Prince Napoleon in the report at the close of the Universal Exhibition of 1855, namely, the arrangement of the products at the same time by specialties and by nationalities; but it was principally in the details of execution which, to respond to the necessities, so multifarious, of this grand assembly, required numerous practical observations, the fruit of experiments collected in the preceding Exhibitions.

For the rest, the Commissioners continue, Mr. Maw may, by giving his labours to the public, make public opinion the judge of his demand.

Mr. Maw writes in reply,—The proposal for a double system of classification made by Prince Napoleon at the close of the Exhibition of 1855, referred to in the Vice-president's letter, will be found at page 140 of the report of the French Commissioners. It is simply the revival of an idea broached, I believe, by M. Potomier in 1850 for taking a longitudinal system for geographical classification. This mode of arrangement was freely discussed for the Exhibition of 1851, but given up as impracticable on account of not providing for the irregularities of relative geographical and specific areas.

A double system of classification was not even attempted for the French Exhibition of 1855, or

put into any practicable form till 1861, when the scheme we submitted to M. Mocquard of intersecting concentric and radial lines based upon an ellipse solved the difficulty, by providing an endless interchange of adjacent geographical and specific areas of various sizes.

The French design doubtless complies with the conditions of a combined specific and geographical classification; but the real question at issue is, whether it does not bear unmistakable evidence of having been taken from ours published four years previously?

A careful comparison seems to us to show that it is so. Mr. Maw repeats, "that not only has the general plan of our design, as well as the peculiar system of classification been adopted by the French commissioners, but also many of the subordinate features; as, for instance, the central garden, the elliptic form, and even the proportions of the ellipse on which the building is based—the widening of four of the radial avenues into transepts; the placing of an external arcade around the elliptical building, and the relative position of the annexed buildings, outside the ellipse, which collectively put the theory of an accidental coincidence entirely out of the question."

THE, SO-CALLED, DISCOVERIES IN ROME.

SIR,—Herewith I inclose a copy of an autograph note with which I was favoured, in 1859, by the late most eminent cardinal priest of the title of St. Pudenciana, in acknowledgment of a ground plan of his church, laid down to scale from a sketch made by myself, and the measurements taken with the assistance of my brother, the Rev. W. A. Buckler, on the 29th April in the preceding year, 1858. Allow me to add, that I am delighted at the increased attention devoted to ecclesiastical history and architecture, and hope that Mr. S. W. Tracy\* will not be offended with me if, in pursuing similar studies, I have unconsciously taken precedence of him in visiting the said church, including the Martyr's Well, Chapel of St. Peter, and the Baths of Novatus.

The urbane editor of the *Gentleman's Magazine*, having taken the liberty to tamper with a former letter on this subject,† seems reluctant to realize the fact that I have more than a superficial interest in, and limited perception of, the visible features of an ancient structure in which I felt special concern.

During my comparatively brief visit to Rome, it happened that my habits were to a considerable extent subterranean. Before starting, I had carefully read "Fabiola" and Dr. Northcote's useful volume on the Roman Catacombs.

I heard mass in the venerable crypt of the old Vatican, and visited the substructures of the churches of Sta. Pudenciana, San Martino in Monte, S. Lorenzo, S. Alessio, the newly-discovered church and catacomb of S. Alexander, the "Clementine cellars," &c.; and am amazed to find that such quiet and inoffensive proceedings should prove displeasing to any.

C. A. BUCKLER.

(COPY.)

"8, York-place, Portman-square, London, W.,

March 8, 1859.

MY DEAR SIR,—I am much obliged to you for your kindness in sending me a plan of the Church of S. Pudenciana, and I am glad to find that you derived so much pleasure from your visit to Rome.

I am, my dear Sir,

Yours very sincerely in XL,

C. A. Buckler, esq. N. CARD. WISEMAN.

UNDERGROUND ROOMS: CRYPTS.

Your correspondent, "Amateur," should in all fairness receive as reply to his important question, the same that Abernethy gave,—"Take advice." Surely if his child were ill, he would not write to the *Lancet*, and ask a professional opinion upon his case, free; and yet his application through the *Builder* is parallel. If no architect has been employed, he should employ one; but setting that question aside, the subject of the ventilation and consequent dryness of crypts and other underground portions of buildings, has not been well thought upon. The only way to ensure success is, by a system that will allow pure, dry air from above, to be poured in nearly upon the level of the floor, and the damp air to be freely drawn off: without this all asphalt roofing and other appliances to keep out upper damp will be useless. G. W.

\* *Builder*, August 26, 1865, p. 615.

† *Gentleman's Magazine*, 1854, vol. II., p. 212.

WATER CISTERNS.

At this warm season, and while the apprehension of epidemics excites so much alarm, some little attention to the storage of pipe-water for household supply is of as much importance as the sewage question or other sanitary considerations. While the water is drawn clear and sparkling from the tap, it is taken for granted that it is pure and wholesome, although perhaps the cistern may not have been inspected or cleaned out for years.

A case in point will prove the necessity not only of looking after the pipes and conduits, but also of clearing out the repositories of the water.

Having taken a new house, the writer found all the appliances in fair seeming order, and that the test-tumbler looked bright and sparkled. Not being a lover of the pure element unmixed, the semblance sufficed; but some weeks after, on perceiving a heavy stercor from the sink, and on smashing the still clear glass, it was palpably fetid! Immediately the cistern was opened, and he discovered at the bottom of a large crystal supply, over an inch of black slime; and at the top, the carcass of a rat, swollen, blanched, and depleted. Of course it needed only to let off the water, to scrub and clean out the cistern. This was done, and the supply has been ever since as faultless as Dr. Lethely estimates the tribute from the various London companies. In truth, the house cistern ought to be inspected from month to month during summer, and at least quarterly at other seasons; for there will always be some organic matter in the purest water, as well as other ingredients produced in its passage through pipes, whether of lead or of iron, and when, by only letting off the supply and sluicing out the cistern, all deposits may be cleared off, no housekeeper or paterfamilias should neglect the duty. There may be death in the pot where least suspected, and after the element of air, water is the most vital. T. H. H.

WANTS AT ALDERSHOTT.

SIR,—One of the greatest wonders of the age is the growth of the little village of Aldershot: its progress is second to not even a colonial town. From a mere than obscure village it has become a populous and important market town in less than twelve years, and an erection of twelve years' standing is a curiosity. The value of building land has increased so much that it now commands as much rent in a week as it did, up to 1853, in a year; and there is a continual demand for habitations of every description. What are termed cottages in other places have few representatives in Aldershot, and the working classes are driven from the town to the suburbs, of which there are not a few, in every direction. Farnham, as well as Farnborough, are, so to speak, suburbs of Aldershot, for numbers employed in the latter reside in the former; and Farnham professional men get considerable patronage at Aldershot, especially architects, as they style themselves, for there is but one in Aldershot with conceit enough to place his profession under that head. The ugly massive structures that are springing up with mushroom rapidity, at an enormous expense, display as much thought and inventive talent in their designers as existed in the Georgian days. Plate-glass and stucco reign supreme in Aldershot, and so great a favourite is the latter with the Aldershotites or Aldershoters, that they have suffered their market-house to be smudged with it to such a thickness that its features are threatening to fall off, and they now see the wisdom of not making the furniture of the same material.

Rents are enormously high in Aldershot, and both villas and cottages are in constant demand. There are numbers of pleasant sites to build them upon, but the local builders and architects are constantly employed increasing the number of shops. The streets are regularly planned, paved well, and kept clean. There are two gas companies' works, and water-works in course of construction, but there is neither public hall nor theatre, though there are several hotels with music-halls attached; and in the camp, which lies to the north of the town, there is a theatre for the use of the army, where civilians are sometimes invited. That a good theatre, a good public hall, and pleasure-grounds are called for, not a shadow of a doubt can exist, and in these undertakings a field is open for those capitalists

who pine for shares in joint-stock concerns. But above all, a railway is in most urgent demand, as the town proper, which consists of some dozen streets of shops, and which for plate glass would bear comparison with London itself, is three miles from five or six railway stations, each one having a share of its traffic. The number of mechanics continually pouring into the place and neighbourhood make a club or reading-room and library imperatively necessary. There are no places of resort for the soldier, but none for these; nor are there houses for them to live in. Certainly there is a "Cottage Improvement Society" at Farnborough, but why should workmen be compelled to go three miles when there is abundance of land within a twelfth of that distance to build improved cottages upon?

Again, few places stand so much in need of another church as the colonial-like town of Aldershot. I.

WANT OF TASTE IN HOMES.

Sir,—I am here (Harwich) waiting for the train, and have just been priming myself for a visit to a friend in a neighbouring town by looking at the guide-book; and lo! 'tis said, amongst other things both good and qualified, that long rows of brick cottages extend and intersect each other to the confusion of casual gazers. Now this just reminds me of a defect which our local, if not our London architects need rectify for their reputations' sake; and no traveller with eyes can help noticing how brick upon brick crowds the outskirts of numerous towns in our good old country. Recently, I saw quite a colony of houses, all in line and all of brick, in Ireland, but a sad sameness marked them, though scores of rows ran hither and thither enough to puzzle the kindest "district visitor" going on good errands.

It seems to me that variety, though quaint, in the matter of bricks, on the Continent, need not be claimed as their exclusive forte; and it would certainly add but little to the expense, and much to the ornament and taste, of our streets if at least the corner houses had some distinctive mark and character, without unduly trenching on the pockets of those shrewd capitalists who nally "run up bricks for stone, and — for mortar" in a wholesale way, and could therefore afford a little to please many eyes as well as those of A. Tyro.

EARLY ADVISERS OF CO-OPERATION.

I CANNOT help remarking that, in reading your various and interesting articles on the co-operative movement and the bearing it is likely to have on the subject of strikes, the name of Mr. Babbage should never be mentioned, or the chapter on "A New System of Manufacturing," in his valuable treatise on "The Economy of Machinery and Manufactures," ever alluded to. This was first published in 1828, and the following is the sixth paragraph in that interesting chapter:—

"Another advantage would be the total removal of all real or imaginary causes for combinations, the workman and the capitalist would so shade into each other—would so evidently have a common interest, and their difficulties and distresses would be mutually so well understood, that instead of combining to oppress one another, the only combination which could exist would be a most powerful union between both parties to overcome their common difficulties."

I need scarcely add that the above has reference to a co-operative system of manufacturing by the author, with a view to preventing strikes, and which, in common fairness, should not be ignored. FAIR PLAY.

THE "DIOPHANTINE" ANALYST.

IN the note on p. 631, headed "Diophantine Analysis," are two typographical errors I wish to correct. I. The heading should not say "at Oxford in 1865," as the fact occurred in 1863, and may have led to some polishing up of the subject by this time. II. In the last sentence but one, for "either  $x, y, z$ , must be 1 or 2," read, "either  $x = y$  or  $y = z$  must be 1 or 2,"—as the earlier part will make it clear that I meant. The result at which the learned analyst arrived was a supposed confirmation of my guess, that whenever  $x, y, z$ , are numbers prime to each other, and  $x^2 = y^2 + z^2$ , then either  $x = y$  or  $y = z$  is 1 or 2.

The example I had meanwhile found to the contrary, that  $161^2 + 240^2 = 289^2$ , was derived,

like all the other triads I gave, geometrically from the triangle of 3, 4, and 5, by some simple bisections. I may now add these simpler cases:—  
 $48^2 + 55^2 = 73^2$   
 $65^2 + 72^2 = 97^2$

The fact is, that we may derive from any triad of this kind, any number of others, in which the two perpendiculars (or legs) shall differ constantly by the same number. Write the sides of the original triangle under each other, with the hypothenuse second. Then make a second column thus:—Take the sum of the two upper figures for a new top figure, the sum of the two lower for a new bottom figure, and the sum of all three for a new middle figure. Repeat the operation on this second column so as to get a third, and this will represent the sides of a new triangle. Continuing the process to any number of columns, the alternate ones, namely each that contains two odd numbers, will give a prime right-angled triangle with the same difference of legs as the first. (It is easily seen that no such triad can consist of two even numbers and one odd, nor of three odd, nor three even). Thus we get from 5, 12, 13, the following series with legs always differing by 7.

	I.	II.	III.	IV.
Short leg .....	5	18	49	121
Hypothenuse ..	13	30	73	176
Long leg .....	12	25	65	169

And from 8, 15, 17, the following (omitting the merely computative columns), with the same difference of legs—

	I.	II.	III.	IV.
Short leg .....	8	65	396	2225
Hypothenuse ..	17	97	565	3283
Long leg .....	15	72	403	2332

The series whose legs differ by 1, is as follows (I having given the fifth of them incorrectly):—

	I.	II.	III.	IV.	V.	VI.	VII.
Short leg .....	3	20	119	606	4650	23600	127003
Hypothenuse ..	5	29	169	935	5731	33481	195025
Long leg .....	4	21	120	697	4650	23601	127004

I do not see my way to a triad with legs differing by any number between 1 and 7, nor between 7 and 17. The difference may be any member of these two series:—

$1, 7, 17, 31, 49, 71, 97, \&c.$  (that is  $2n^2 - 1$ ),  
 $7, 23, 47, 79, 119, 167, \&c.$  (that is  $(2n-1)^2 - 2$ ).

These methods, however, do not elicit all the triads existing in a given range, for they would have passed over 161, 240, 289.

The curious property of these numbers formerly gave, and may give again, to the simpler ones, a practical value in building, on which I may address you some remarks.

P.S. Since writing this, I am persuaded I can, by a simple method, find all the right-angled triangles possible in a given range of numbers. The following twenty-two are, if I am not mistaken, all that can exist with neither leg exceeding 120. Nine of them contradict the mathematician's deduction, and seven were not discoverable by either of the above methods.

Long leg .....	4	12	15	21	24	35
Short leg .....	3	5	8	9	12	12
Hypothenuse ..	5	13	17	25	25	37
Long leg .....	40	45	55	60	63	72
Short leg .....	9	28	48	33	11	16
Hypothenuse ..	41	53	73	65	61	65
Long leg .....	80	84	91	99	105	112
Short leg .....	39	13	69	20	88	15
Hypothenuse ..	89	85	109	101	137	113

E. L. GARDETT.

PROVINCIAL NEWS.

Devizes.—The contract for the new bank which is about to be erected by the Wilts and Dorset Banking Company in Devizes Market-place, on the site of the old "White Swan" premises, has, we understand, been taken by Mr. Phillips, of Swindon.

Derby.—Mr. Humphreys's tender has been accepted for the stone, wood, and brickwork of the side shops and galleries of the new Market-hall, and Mr. Swinger's tender for the ironwork. The plans and specifications have been prepared by the borough surveyor, under whose superintendence the works will be carried out. Messrs. Haywood have finished their contract for the iron roof, and the roof is being rapidly covered in.

Birmingham.—Although the actual issue of books, and the throwing open of the news-room of the Central Free Library, cannot take place until after the visit of the British Association, inasmuch as the rooms have been placed at their disposal by the Council, the formal ceremony of opening has been made a fitting prelude to the proceedings of the Association.

LEEDS.

Proposed New Corporate Buildings.—The question as to the desirableness of erecting a building on the vacant land at the east side of the town-hall has been lately discussed by the Repairs Committee of the Town Council. The building would be used for the accommodation of the barristers attending the assizes, as a banqueting-room for the mayor, and for other corporate purposes. The town clerk having, says the *Intelligencer*, expressed an opinion that the council had not the requisite powers, the carrying out of the project has been adjoined. 40,000*l.* is the sum mentioned as the probable cost of the building.

New Mechanics' Institution.—On Thursday in last week the foundation-stone of the new Mechanics' Institution for Leeds was laid by the mayor, who is also the president. For some years the necessity of a new building has been recognised; but various causes have contributed to defer its erection until the present time. Mr. Brodric, the architect of the town-hall, is the architect for the new institution, which is to be erected on the east side of Cookridge-street, opposite the new baths. Its cost is estimated at 20,000*l.*; and to meet the expenditure, the committee have 14,000*l.* in subscriptions promised and in the value of the present building. In addition to a large lecture theatre, library, &c., provision is to be made for the School of Art, for the schools connected with the institution, and for a fine-art gallery.

THE BUILDING TRADES.

The labourers employed in the metropolitan saw-mills, whose wages are 1*l.* 1*s.* per day, have made a request to the proprietors of the mills for an advance of 6*d.* per day, grounded on the high price of provisions and house-rents. The advance asked for not having been conceded, the men employed at Messrs. Robinson & Bartram's mills, Belvedere-road, Lambeth; the York-road mills, the Bermundsey mills, and one or two smaller establishments, to the number of nearly 300, struck work, and subscriptions were organised for their support by the workmen in the other mills. The men also have a trade society from which to receive support. A general meeting of the men in all the mills has been held, and they have pledged themselves to support the movement, and insist upon the advance asked for.

Sudbury.—A meeting of the master builders of this town has been held, at which, after some little discussion, it was agreed to accede to the wishes of the men, who have accordingly resumed their work, having received the advance.

Norwich.—The carpenters and joiners of this city are seeking an increase in their wages of a half-penny per hour. At a meeting, largely attended, it was stated that delegates previously appointed had waited upon the carpenters and joiners of the city, who reported that most of the principal employers were willing to concede the advance if others would do so, and the difficulty under which the men seemed to labour was that of getting a start. Comparisons were made of the rates of wages paid the different trades, from which the men argued that they were justified in seeking the advance. As no definite answer had been received from any of the masters, it was resolved,—"That in the opinion of this meeting before any further steps are taken, the men shall memorialise their several masters for a definite answer either *pro* or *con*." Other resolutions were passed by the meeting respecting the form of the memorial, the protection of any man who might be "marked," &c. There are about 300 carpenters and joiners in the city, and two-thirds of this number were represented at the meeting. The men have since had another meeting, which was also largely attended, and, as no satisfactory result was come to by the masters, two propositions were submitted,—one, to the effect that employers should be acquainted by circular that if their request was not acceded to, there would be a "turn out" on the 1st of March next; the other that the men should now "turn out." The latter was carried by a slight majority.

Hartlepool.—A general strike has taken place amongst the navvies employed by Mr. Adamson, the contractor for the new reservoirs at Hart, near Hartlepool, which are being constructed by the Hartlepool Gas and Water Company. The cause of the difference is that a new foreman has

been pleaded over them; and it is said that he is more severe and strict than his predecessor, so the men were determined not to work until he was dismissed. Mr. Adamson did not feel inclined to accede to the arbitrary proceedings of the men, and refused to discharge him, and the consequence was that they all left work, and demanded their money that was due. Mr. Adamson was driving to the works when several of the men surrounded his conveyance, stopped the horse, and threatened violence unless he paid them at once. He was obliged to pull out his purse to convince them that he had nothing wherewith to pay them upon him, but seeing the excited state some of them were in he promised to return to Hartlepool to obtain the money and satisfy their demands. This he did; and now the whole works are lying idle, and 140 men thrown out of employment.

**Stockport.**—For some time, Messrs. Hawleyworth & Co., contractors for the Heaton-lane sewerage, under the public works, have been using bricks supplied by Messrs. Simpson & Co., of Hempslaw-lane; but the brickmakers' union having taken exception to them, the brickmakers have succeeded in inducing the bricksetters to strike against their use! Fresh bricklayers were advertised for at 7s. per day, in opposition to the union.

**Congleton.**—During the last fortnight, the work at the tower of the new town-hall, Congleton, has been at a stand-still, in consequence of the masons refusing to work. This arose from the contractor, Mr. Burkitt, having given a portion of the tower-work to Mr. Burslem, to be executed at his stoneyard. This, the men contend, is contrary to the rules of the trade. The other trades are all busily at work.

**Runcorn.**—A number of quarrymen employed by Messrs. J. D. Wright & Son, Runcorn, have struck work. It appears that a great portion of the stone-getters have lately joined the union, and have demanded to be paid daily wages, and not as formerly by the piece. The union does not allow working by the piece: hence this demand. The pieces of the turn-outs have, to a certain extent, been supplied.

**Cirencester.**—The carpenters and joiners employed by Mr. Bridges at the restoration of the parish church have struck for an advance of 4s. per week, on the ground that the high price of meat, house-rent, &c., necessitate a rise in wages. The present rate of wages is 1l. per week of 59 hours. There are several large jobs going on in the neighbourhood which are said to be paying 35s. per day. The carpenters and joiners are working on hard English oak, which they regard as an additional reason for being granted an advance, which it is said some of the principal masters in the town are inclined to give.

#### SANITARY STATE OF ST. JAMES'S, WESTMINSTER.

The ninth annual report of the medical officer of health (Dr. Lankester), for 1864-5, has been printed. It shows that the mortality in this, like other parishes, has been in excess this last year. The annual death-rate in 1856 was 682, and the highest death-rate to 1863 inclusive was 664, in 1859, while the death-rate of 1864 was 632. "From this," says the reporter, "it would appear that all your sanitary arrangements have been in vain; and that, in spite of our sanitary activity, mortality is on the increase. It will be observed, however, that this is not really the case; and that there has not been a regular increase of deaths for the last nine years. The year 1862 was not above the average, whilst the years 1863 and 1864 have undoubtedly been years of exceptional mortality." The report then proceeds to show that the increase has not depended on those diseases of the zymotic class generally allowed to be most under the control of sanitary activity, such as typhus and typhoid fever, diarrhoea, &c. There has been a great decrease of death in the Berwick-street division of the parish; less in the St. James's-square district; and least of all in the Golden-square district. Acute diseases of the chest were the chief causes of the high mortality of 1864. On the other hand, the evils attendant on the use of gas, with reference to deaths from colds, the reporter says,—"Overcrowding may explain the death in the Berwick-street division; but we found an excess of death in the St. James's-square division, where overcrowding can hardly be said to exist. It is in this division of the parish that the attentiveness of man has succeeded in producing

results precisely similar from quite a different cause. The use of gas without sufficient ventilation renders the air as impure as if overcrowding were present. One gaslight consumes as much oxygen and gives out as much carbonic acid as five human beings. The burning of gas gives rise to precisely the same consequences on the system; and I am convinced that a large amount of the mortality of persons above thirty, in London and our large manufacturing towns, is due to the utterly reckless way in which gas is burned in shops, workshops, factories, sitting and bed rooms. Gas may be burned in rooms with impunity, and even made to assist in ventilating rooms, by arrangements being made for securing the exit of impure air and the entrance of fresh air. Such arrangements are not only not common, but they are the exception of the houses in our parish; and such is the ignorance of the danger incurred by this process of slow poisoning, that it is with the greatest difficulty that even the most intelligent and wealthy of the inhabitants of the parish can be persuaded to adopt plans for preventing this poisoning of themselves and their families. One result of this poisoning of the blood by the impurity of the air is the extreme susceptibility of the system to cold. Hence persons have recourse to shutting up windows and doors, and enclosing rooms, and thus increasing tenfold their susceptibility to cold."

#### RAILWAY MATTERS.

The traffic receipts of railways in the United Kingdom amounted for the week ending the 26th of August, on 12,241 miles, to 749,042l., and for the corresponding week of last year, on 11,889 miles, to 712,036l., showing an increase of 352 miles and of 37,006l.

It is now definitely settled that the Great Western carriage works will come to Oxford. The Crisley meadow, which underwent an examination as to its subsoil, &c., having been reported by the Company's engineers as an eligible site, they have instructed their solicitors at Oxford to get the necessary conveyance from the town-ward, and everything is progressing satisfactorily. The company, it is said, have taken every opportunity of satisfying themselves as to the eligibility and healthiness of the site, and the capabilities of Oxford to supply the wants and requirements of a large addition to the present population.

Extensive alterations and additions to the works and stations of the Great Northern Railway in Doncaster, involving an aggregate outlay of 50,000l., are now being made, or have been completed. New hammer-shops have been added to the already extensive plant; and a large and commodious goods station, with the requisite sidings, is in course of construction. St. James's Bridge is lengthened by two arches, to afford siding facilities for the goods traffic; and two gasometers, each 60 ft. by 20 ft., are being erected on the edge of Crispall by Mr. Knappton, of York, it being the company's intention to manufacture the gas required in the various departments. The necessary brickwork, excavations, &c., are entrusted to Messrs. Anelay, builders, Doncaster. The improvement of the booking-offices, the lengthening of the station-platforms northwards, and other works will shortly be proceeded with. When the whole of the contemplated improvements are carried out, both the passenger and goods stations will be complete. The Great Northern are preparing to accommodate their premises to the new traffic that will necessarily shortly come from the direction of Hull and other places, and to give further stimulus to the local traffic between the metropolis and South Yorkshire, by selecting a new and more commodious site where the mineral traffic may be adequately worked both for their own and the Great Eastern Railway.

#### FROM IRELAND.

**Belfast.**—The foundation stone of a new Methodist College, Belfast, has been laid here. For the principal building the whole sum has been subscribed,—upwards of 12,000l.—and the only subscriptions now required from the public, and which it is confidently expected will soon be given, is an extra sum of 6,000l. or 7,000l., for the construction of extra and required buildings in the rear, to render the fabric complete. The building will be situated on a hill, almost oppo-

sito the Botanic Gardens,—the ground having been granted free by Mr. James Carlisle. The design, which was selected in a limited competition, comprises a longitudinal range of building, with two transverse wings, projecting both to front and rear; also a central rear building. The total number of students to be accommodated is 20; of boarders, 80; and of day pupils, 100.

**Duncrana (Derry).**—The foundation stone of a new hotel has been laid at Duncrana. The building will cost about 3,000l.

**Crossgar (Ulster).**—The foundation stone of a church for the Presbyterians of Lisara has been laid. The church will stand on a rising ground in the best part of the town, adjacent to the market-house, and will be a conspicuous object from the railway station, as well as from other points of view. The style adopted is Transitional. The plan is arranged in the form of a nave without aisles; with vestibule and turret-forming entrance-porch in front, and sessions-room, with hypocaust underneath, in rear. The nave, which is 54 ft. 4 in. by 35 ft. in clear, is lighted on each side by a row of double lancet-windows, and in end gable over pulpit, by a traceried window of five lights. The roof is to be open timbered, carried on four trusses, framed with wrought curved ribs, hammer-beams, &c. The principal elevation of the church is composed of a gable, with a turret and slated spire, rising from it at the side. The gable has a double-arched entrance doorway, the jambs and pier of which have angle shafts with moulded and carved capitals. Over the doorway is a large traceried rose window, 13 ft. in diameter, with moulded reveal, hood moulding, &c. The turret, which, with its slated spire, rises to a height of 75 ft., will have a belfry in its upper stage. The flank elevations of the church are divided into five bays each, by buttresses, with double lancet lights in each bay. The pews are to be open, with ornamental cut bench ends. The aisle passages will be laid with coloured tiles. The entire woodwork of the church is to be exposed, stained, and varnished. The building is so planned as to admit of a gallery being introduced. Four hundred persons, it is calculated, will find sitting-room on the floor; and the space available for a gallery would afford room for one hundred additional. The architect is Mr. W. J. Barre, of Belfast.

#### ACCIDENTS.

An inquest has been held at Westminster Hospital touching the death of an engine-driver, who was killed at the Thames Embankment, near Westminster Bridge. Witnesses stated that the deceased was employed under Mr. Furness, the contractor, to work a donkey-engine on the tramway, and that one of the managers of the works had remonstrated with the deceased some hundreds of times about his neglecting to lash his engine as directed. It was necessary, however, to leave him some discretionary power in the management of the portable engine. A stone, when in mid air, spun round rapidly and struck a beam under the tramway. The shock brought the unsecured engine on to its side, and it fell bodily to the ground beneath. The deceased jumped from the engine and fell under the stone, which crushed him in a dreadful manner. He was killed on the spot. The jury returned a verdict of accidental death, and recommended that the lash of the engines should be made imperative for the future.

In the section of the Great Low Level Sewer, now being formed in the Old Ford-road, near the River Lea, men had been engaged in clearing the waterway, and had commenced pile-driving, when a large part of the soil fell in upon the labourers. All succeeded in getting away but two: one of these was afterwards rescued, but the other poor fellow was buried in the earth to such an extent that it was some time before his body could be recovered. Life was found to be extinct. The contractor, Mr. Webster, at once directed the necessary measures to be taken to prevent a further fall.

A fatal scaffold accident has occurred at the London and Westminster Branch Bank, in High-street, Whitechapel. The premises are now nearly finished. One of the carpenters was at work in the interior of the building with some others on a scaffold about 7 ft. from the ground, engaged in putting up the fittings of the fascia near the ceiling, when, in endeavouring to force the joists home, the planking slipped from under his feet and he fell through the opening thus

made. Immediately below the place where the unfortunate man was at work, was an opening through the floor from the basement, where it is intended to place a lift when the premises are completed. The hole was boarded over, but the sudden weight of the man falling upon the boards snapped them in two, and the man fell through to the floor of the basement, a distance of about 20 ft., and was killed on the spot.

An inquest has been held by Dr. Lankester in Marylebone Workhouse, relative to the death of a man who was strangled by a coal-lift at the Langham Hotel. The evidence set forth that the lift was used for kitchen purposes. The lifts were under the supervision of one of the men of Messrs. Easton & Amos, the engineers, and he instructed two other men as to their use. On the basement the lift was guarded by gates, and no other persons than those referred to had anything to do with it. It was shown that it was the duty of the deceased to go to the basement to have the lift raised. Instead of that, however, he mounted the railings and pulled the rope, which caused the lift to ascend, and on its reaching the floor upon which deceased was standing, the upper framework struck his chin, and before he could withdraw himself he became suffocated by his neck being jammed between the lift and the sill of the door. Some suggestions having been thrown out by the jury as to additional precautions being taken, and to which the proprietor of the hotel satisfactorily responded, a verdict of "Accidental death" was recorded.

In Chatham Dockyard one of the workmen was screwing a nut on a temporary bolt of one of the armour plates of the *Bellerophon*, iron ram, by means of a large screw wrench, when the wrench suddenly slipped from the nut and precipitated the man to the bottom of the dock, a distance of nearly 30 ft. Life was found to be extinct.

An accident, which immediately proved to be fatal, has occurred at Messrs. Aldbert & Co.'s premises, Bow-street, Long-acre. A bricklayer was, with other men, engaged in putting another story to the premises, when the deceased, in stepping from the top of a high ladder on to the scaffold, missed his footing and fell from a height of 35 ft. on a stage 8 ft. from the ground. On the lower stage were pieces of brick, one of which fractured his skull and penetrated the brain, in which it remained firmly wedged.

At the Town's Yard, Gaythorn, township of Chorton-upon-Medlock, stones used for paving purposes are kept. The stones were piled against a wall, and almost reached the coping, so that the pressure must have been immense. The wall fell, and crushed a man to death, inflicting also rather severe injuries on another man. A third had a narrow escape. The length of the wall that fell was about 30 ft.

The whole of one side of a new building at Rochdale fell with a tremendous crash the other day, doing damage to the extent of 1,000l. Fortunately no one was injured, the shop people being away holidaying.

An inquest has been held at the Infirmary, Newcastle, on the body of an engine-fitter. Deceased was employed at Messrs. Stephenson's works, South-street, Newcastle. He was coming down stairs with an axe-hox upon his shoulder. The steps are of wood, and laid at the edges with iron; and, having steel hobs in his boots, deceased slipped his foot, and fell upon the iron which he was carrying. His wound did not heal, and was eventually the cause of his death from pyæmia. Verdict, "Accidental death."

#### CHURCH-BUILDING NEWS.

**Symondsbery.**—A small church, built in memory of the late rector of Symondsbery, has been opened in the parish of Eype, a place so closely connected with Symondsbery that it may almost be said to be of the same parish. Mr. Talbot Bury, of London, was the architect; and the contractors were Mr. George Swaffield, of Shipton, who took in hand the masonry; Mr. Geo. Hayward, of Burton, who has done the carpentering; and Mr. Wm. K. Brown, painter, &c., Bridport, to whom has been given the plumbing, painting, glazing, and decorative portion. The style of architecture is Decorated. The building consists of a nave, 65 ft. long by 22 ft. broad; a chancel, 26 ft. long by 20 ft. wide; and an aisle on the north side, with a lean-to roof, which, from the interior, gives the north

side of the nave the appearance of having a clerestory. There are small transepts, projecting 7 ft. on the north and south sides, which cause the design to partake of the cruciform character. To the east, and adjoining the north transept, is the vestry, which, inside is entered through a screen. The walls are built of local stones, but the facings of the windows, doors, and arches, and internal work, are of Bath stone. The bell-turret rises to a considerable altitude, 35 ft., near to the west end of the roof. This is made of wood. The lower part is covered with slates, and the spire with lead, near the top of which has been introduced a corona of the same metal. A lightning-conductor has been added. The roof, 44 ft. high, is slated with brown and grey-coloured slates, disposed in rows, and at the summit are some ornamental ridge tiles, the east and west ends of the roof having ornamented stone crosses. There are three entrances,—one for the vestry, a second at the north-west side, and the third at the south.

**Bowes (Yorkshire).**—The parish church has been restored and re-opened. Whilst the restorations were in progress, fragments of Roman pottery were discovered in the foundations, which in all probability had been dug from the remains of the old Roman camp closely adjacent. The church having fallen into a dilapidated state, and become totally unfitted for the assemblage of the congregation, it was resolved, about two years ago, that it should be restored, and ultimately the work was entrusted to the Messrs. Hay, architects, Liverpool. Messrs. Borrowdale, of Barnard Castle, obtained the contract for the masonry; and Mr. Hutchinson, of Barnard Castle, executed the woodwork. A new porch, with cross and gables, has been built on the north side, and a traceried window placed at the west end. All the windows, indeed, have been replaced, with the exception of one in the east gable. There are sittings for 100 persons, with open benches, stained and varnished. The nave and transepts are floored with wood, ventilated, and drained underneath. The church is heated by two stoves, the flues being in the walls. Drains and channels are placed round the exterior of the building, and a high-pitched roof has been substituted for the former flat one. The roof is covered with Westmoreland slates, and the timbers inside are stained, varnished, and polished. Crosses of suitable design have been placed on the gables; and iron-moulded gutters carried round the roof. On the west gable is a turret containing two bells. Polished York stone has been used in the approaches to the chancel and altar; and the north transept has a traceried screen of oak. In the interior of the church are two piscines, one in the south wall of the chancel, and the other in the north transept. In the floor of the church are many early English grave-stones, some of which have once held brasses, but the whole of which are now worn and defaced, and the inscriptions utterly gone. These grave-stones are now concealed by the wood flooring. In the churchyard is the grave of two lovers, whose fate suggested Mallet's ballad of "Edwin and Emma."

#### INTIMIDATION CASE AT LATCHFORD.

**RICHARD MULLEN**, a joiner in the employment of Mr. Mottram, was charged on warrant with having, on the 2nd of August, at Latchford, unlawfully by violence to the person of one Samuel Lomax, endeavoured to force him to depart from his hiring.

Mr. Moore, on behalf of the defendant, pleaded not guilty. Mr. Marsh said he appeared to prosecute, on behalf of Messrs. Gibson, the employers of Lomax. When the case was last before the magistrates, he stated his intention of asking them to commit the defendant; but on referring to the last Criminal Consolidation Act he found a material variation from the words in the previous Act, and was of opinion that he was not in a position to substantiate any charge under that Act. The Act was for an assault "under any conspiracy to raise the rate of wages." In the present case, although there was a strike, in consequence of the men demanding a higher rate of wages than the masters were inclined to give, it was not pretended that there had been any unlawful conspiracy.

After evidence *pro* and *con* was given, the magistrates retired; and, on their return into court, Alderman T. G. Rylands, addressing the defendant, said: "The Bench are quite prepared to admit that up to this time you have borne a respectable character, and they might have hoped that that character would have saved you from committing yourself in the way you clearly have done in connection with the strike which is now taking place in the town. It is not the part of the Bench to express any opinion on the subject of strikes; they have only to deal with such cases as yours, if they arise. No doubt whatever rests on our minds that you have been guilty of the assault which is charged against you. They regret exceedingly that they have to deal with the case in the particular form which the law lays down. You are committed to Knutsford House of Correction for one month, with hard labour."

#### Miscellaneous.

**DESTRUCTION OF THE CATHEDRAL AT SYDNEY.**—A telegram has been received from Sydney, via Point de Galle, stating that "it is reported that St. Mary's Cathedral has been totally destroyed by fire."

**BATTERSEA PARK.**—Messrs. Hill & Keddel have been entrusted with the drainage of Battersea Park, for Her Majesty's Woods, &c., under the direction of Mr. Pennefather, architect. It will be commenced on Monday next.

**THE PAXTON MEMORIAL.**—Several correspondents express their regret that it is proposed to erect the Paxton statue within the grounds of the Crystal Palace, where it will merely rank as one of many works of art, and not be open freely to the public view. We think they are right, and that the question of site ought to be reconsidered.

**CURZON EXHIBITION HALL, SUFFOLK-STREET, BIRMINGHAM.**—Fourteen tenders, varying in amounts from 9,900l. to 9,276l. were received for the above building. One only being in accordance with the form supplied by the architect, the whole were rejected. The revised tender of Messrs. Horsley, Brothers, 7,076l., has since been accepted. Mr. E. Holmes is the architect.

**COMPETITION IN BRISTOL.**—The Liverpool and London Globe Insurance Company are about to erect offices for the use of the company, with suites of chambers over. The directors recently invited certain local architects to furnish designs for the intended building, and the following became competitors, viz., Mr. Gingell, Mr. Hirst, Mr. Frigg, Mr. Ponton, Messrs. Pope & Bindon, and Messrs. E. Godwin & Crisp. Seven sets of drawings were sent in, and the directors have resolved to adopt the design submitted by Mr. Gingell. Although no money prize was offered to the competing architects, the Board granted a special premium of fifty guineas to the design furnished by Mr. Hirst, which they deemed second in merit. The new building will have a frontage of about 55 ft.

**THE LATE MR. AFFOLD, F.R.S.**—The death of this gentleman, well known as an amateur engineer, has been announced. His centrifugal pumps formed striking features of our Great Exhibitions, both in 1853 and 1862. The paying-out apparatus used in laying sub-marine telegraphs was mainly his contrivance. His own house displayed some curious mechanical arrangements. We remember the extent to which they started his guests at a dinner there some years ago, at which we happened to be present. Doors opened when they were approached; water came into the basins when needed, without visible interference; the temperature of the rooms was regulated involuntarily; and the window-slitters closed in a quiet, dignified way, of themselves, when the gas was lighted. It was a curious dinner. Alack! How many of those who were present have departed from amongst us!

**NEW OFFICES AT LIVERPOOL FOR THE LIVER FRIENDLY SOCIETY.**—These new offices, in Prescott-street, between the London-road and the Old Swan and Kensington villages, are nearly completed. The frontage in Prescott-street presents an elevation in Gainsborough, Shropshire, stone. The height is nearly 60 ft., and the width 127 ft. There are four stories, three of which, exclusive of the basement story, are lighted from the front. The entrance is through a portico, on either side of which are Aberdeen granite pillars. The general style is Italian Gothic; ornamented caps decorate various lines of projection, and the carving and disposition of the stone impart to the whole an attractive appearance. The general office intended for the transaction of business with the public, is 33 ft. in length, and 22 ft. in breadth. Mr. Culsbaw is the architect of the building. The contractor's estimate amounted to 6,000l. The land originally cost about 1,200l. Mr. John Westmoreland is the builder; Mr. Hugh Yates, of Everton, the mason; Mr. Thomas Hughes, the bricklayer; Messrs. Taylor & Tothill, the plumbers, painters, and glaziers; Mr. W. Callaghan, the slater and plasterer; Messrs. Thomas Harrison & Co., the ironfounders; Mr. Samuel Abbot, the cabinetmaker. Mr. J. R. Cooper, ironmonger, supplied the ranges; and Mr. James Clerk fitted up the engine. The building is ventilated with the patent ventilators of Mr. William Watson, of Halifax. Mr. William Taylor was clerk of the works.

**STATUE OF THE LATE EARL OF CARLISLE.**—A movement has been commenced under encouraging circumstances to erect a statue of the late Earl of Carlisle, in Dublin. The list of subscribers is headed by Lord Wodehouse, the present Lord Lieutenant of Ireland.

**PROPOSED CHURCH FOR THE DEAF AND DUMB.**—It is proposed to build a church in London for the use of the deaf and dumb, of whom it is thought there are no less than 1,800 in the metropolis alone without a suitable place of worship. The Queen has given 50*l.*, and a gentleman offers 25*l.*, if forty others will give the same amount within three months. It is to be hoped the project will be carried out.

**GAS.**—The Folkestone Gas Company has just declared a dividend of 20 per cent., leaving a balance of 268*l.* odd to dispose of. New works will shortly be commenced.—The Eastbourne Gas Company have declared a dividend of 10 per cent. and a reduction in the price of their gas from 5*s.* 10*d.* to 5*s.* A rather formidable opposition to this company is springing up, on the ground of the high price still charged by the company.—The Stafford Gas Company are largely extending their works, in order to supply the greatly increased demand for gas in this town and neighbourhood. A new tank and gasholder are in course of erection, at an outlay of about 3,000*l.* The new works, it is said, will enable the manager to make gas at a cheaper rate.

**COMBUSTIBLE MUD.**—At the proceedings of the Asiatic Society of Bengal lately, Major Risley described a combustible mud, which exists in large tracts, notably in the Pertabgar district in Oudh, where there is a heel or swamp of it, which looks like ashes and smoulders like wood. The mud, when dried, hazes quite freely. It has been tried by a locomotive foreman, and found to give very nearly as much steam as wood. The Calcutta analyzers call it an impure peat, resulting from the continued deposition of vegetable matter at the bottom of a marsh. It is curious that the natives, though well aware of its properties, make no use of it; their reason being that it owes its origin to "enormous sacrifices of rice and grain burnt *in situ* by firelike people in old time."

**FIRE IN THE CATACOMBS, KENSAL GREEN CEMETERY.**—A curious fire occurred some time since in the Cemetery, Kensal Green; concerning which a few words even now may not be amiss. Smoke was discovered issuing from the catacombs in the Dissenters' portion of the ground; and for some time it was impossible to tell exactly where the fire was, as a last resource, a brigademans was fitted on with the fire-dress invented by M. Galibert, similar to the one now being exhibited at the Polytechnic Institution. The necessary air was supplied by the steam-engine. The man descended, and found that the vault No. 13 was in flames. The fire was then soon extinguished. When the steam and smoke had in a great measure passed away, a party of men descended by No. 16 vault, which had contained ten coffins, none of which were leaden ones. Five of the coffins were almost totally consumed; and the others, with one exception, were more or less injured. The stench and the sight were horrible. Numerous conjectures got afloat as to the origin of the fire. Amongst them was one that the fire was the act of a Hindoo, who wished to dispose, in the Hindoo manner, of the body, supposed to be there, of one of the suite of the Queen of India. Other conjectures were based on an alleged discovery of coal and rags in one corner of the vault, though unguited. It seems, however, that the fire may have arisen from one of the persons employed on the occasion of the interment of the late Mr. Parkes, having thrown a piece of lighted paper on one of the coffins. The vault was exceedingly dry; coffins which had been there many years were falling in shreds like tinder. At the upper part of the vault there is a place for a candle, and it is believed that in lighting this a candle when Mr. Parkes's coffin was being put on to the bars which it rested, a spark must have been dropped, and that it smouldered away unobserved until gas emitted through some aperture in the lead of the enclosed coffin ignited, and at the same time communicated a flame to the wood of the inner coffin, and so on to the others on the same tier. Although molten lead dropped all around the coffin of Mr. Parkes, it was but slightly injured.

**BURSTING OF A CANAL.**—The Grand Junction Canal lately burst one of its banks near Sison, in Leicestershire, and very seriously flooded the surrounding district. The canal was emptied for a distance of ten miles, and when this vast body of water was set at liberty it swept across the country towards the river Welland, doing immense damage to the harvest fields.

**WELDING IRON.**—An invention has been provisionally specified by Messrs. Standly & Prosser, of Cockspur-street, which consists in the employment of hydrogen or its compounds, alone or mixed with oxygen or atmospheric air projected from blow-pipes, for the purpose of welding plates or masses of iron, or other metals. They prefer to mix the gases in a reservoir at the base of the blow-pipe.

**BLACKBURN SEWERAGE, &c.**—The report of the borough surveyor, Mr. F. Smith, on the sewerage, paving, and other works executed during the twelve months ending June 30th, 1865, under the provisions of the "Public Works (Manufacturing Districts) Act, 1863," has been printed. It contains the following summary:—

	£	s.	d.	£	s.	d.
Sewerage and Private Drainage Works	17,155	5	11			
Forming, Paving, and Flagging of Streets	16,839	10	4			
Improvements in the Corporation Park	323	11	3			
Total amount of work executed under the Public Works Act to June 30th, 1865	34,322	10	6

**AN EXPENSIVE DISPUTE ABOUT WATER SUPPLY.**—In November last the representatives of the townships of Dewsbury, Batley, and Heckmondwike, who, along with the Sheffield mill-owners, own the Dunford reservoir, went to Parliament to obtain borrowing powers, in order to raise money to repair it and construct additional reservoirs. The result of disputes between the townships resulted in the loss of the Bill; and now the ratepayers have been mulcted in the costs, which amount to 4,687*l.*, made up of the following items:—Mr. Bateman, engineer, 95*l.* 18*s.*; Messrs. Younge & Co., solicitors, Sheffield, 422*l.* 12*s.* 6*d.*; Messrs. Pritt & Co., London agents, 605*l.* 14*s.* 10*d.*; Messrs. Walker & Dean, solicitors, Dewsbury, 1,461*l.* 5*s.* 6*d.* It is now, however, within the power of the Sheffield millowners to repair the Dunford Bridge reservoir, and charge the cost on the three disputing townships.

**SANITARY INSPECTION OF CARLISLE.**—Some gentlemen interested in this subject have appointed district committees, including the mayor, town clerk, inspector of nuisances, and city surveyor. In the course of discussion as to nuisances, Mr. Nelson called attention to the disadvantages of back-to-back houses, and the present asphalt arrangements. Mr. Kirkup brought under notice nuisances at the Citadel Station. The Caldwellgate committee, says the local *Journal*, "has already commenced operations by cursorily examining that mother of rookeries, or fever nests, the Willow Holme, with her offspring, viz.,—Armstrong-lane, Jane-street, and Chapel-lane. In sporting phrase, game was plentiful, and the scent strong. The owners of these preserves well deserve publicity at the hands of the committee. Incredible as it may appear, horses and donkeys, fastened up to their respective carts, stand out all night in these heightened and 'unknown' places; the ground in a filthy state, and in close wet weather emitting a fearful stench; vile heaps piled up in places. A poor woman, speaking from an upper window, hailed the committee's presence as that of guardian angels, and with corroborative names and dates she told of the ravages by disease and death in the several houses around. Opposition to such inquiries may be offered, but must be met and set aside. Indifference may be shown by some, and for a time, but this must not and shall not discourage us. The possibility or the prospect of an epidemic will readily turn the scale in our favour, and convert this indifference, it may be, into nervous anxiety amongst our inert opponents."

**THE TOWER OF BABEL.**—"A Carmelite monk," says the *France*, "writes from Bagdad that he has planted in the Tower of Babel, the ruins of which still exist, a statue of Notre Dame des Victoires, blessed by Pius IX. There was on the occasion a grand ceremony, attended by many Mussulmans."

**PREHISTORIC MAN.**—Mr. Milne Edwards communicated to the last meeting of the French Academy of Sciences a letter from M. Lartet, on the discovery of a curiously-engraved fragment of ivory found in one of the caverns of Périgord. The piece of ivory, says the *Reader*, in reporting the circumstance, was discovered in several fragments, which, when put together, showed a roughly-engraved figure of a mammoth, its most remarkable characteristic being a long mane, which feature at once recalled the celebrated Siberian elephant, so entirely preserved by ice. Although this rude drawing may or may not have been made by some one contemporary with the mammoth (most probably it was), yet it can hardly deepen the conviction of those who believe in the co-existence of man with the elephant *primigenius*.

**MR. LAYARD ON SCHOOLS OF ART.**—At the fifth annual distribution of prizes in the Reading school, Mr. Layard, M.P., who presided, said: In 1851, that in which the English artisan failed was in matters of taste: where form and colour were principally concerned, France and some other countries were far in advance of us. Yet it was a most remarkable thing that in 1862 we had so far gained on France and upon other European countries, that the struggle was no longer to keep up with France, but it became a struggle on the part of the French to keep pace with us. He had seen the French trade reports which had been sent in, and in many instances he found that the French representative workmen stated that we were distancing them, and that it would require all their skill to keep pace with us. In particular they alleged that they were in danger of losing ground in consequence of the increased skill and the increased appreciation of beauty in form and colour, which were manifesting themselves in this country. He held that to be a most interesting and important fact, and he would pause to ask how to a great extent this result had been gained? In consequence of the Exhibition of 1851, was founded in London an institution which he ventured to say was an honour to the country. Although, as a member of the House of Commons, it was often his fate to hear what were called the "Brumpton boilers" ridiculed, he ventured to say that the institution established at Kensington was an institution which reflected the highest honour upon the country. He had seen nearly all the public museums in Europe of the same category; and, considering that the Kensington Museum had only been established for eight or nine years, he believed there was no institution in Europe which in so short a time could show such results. Whatever might have been the object of the original founders of Kensington Museum, the value of the institution was shown in the assistance and encouragement it gave to schools of art such as that which had been established in Reading. These schools of art had already exercised great influence throughout the country.

**TENDERS**

For a parsonage-house to the church of St. Mary, at Tolmers, Newgate-street, Hertfordshire, about to be erected at the cost of Miss Mills. Messrs. Lander & Bedells, architects:—

Miskin	£3,642	0	0
Sharrington & Coles	2,730	0	0
Mare	2,729	0	0
Scrymgeour & White	2,660	0	0
Hill & Son	2,555	0	0
Norris	2,550	0	0
Sanders	2,444	0	0
Manley & Rogers	2,377	0	0
Partinson	2,350	0	0
Osborn	2,180	0	0
Britt	2,027	0	0

For Camberwell local sewers, blocks 3 to 5. Mr. J. C. Reynolds, surveyor:—

Bridley	£19,000	0	0
Wainwright	47,000	0	0
Hill & Kedell	38,578	0	0
Niblett	35,500	0	0
Detlich	37,000	0	0
Munday	32,150	0	0
Blackmore	31,534	0	0
Robinson	29,395	0	0
Pearson (accepted)	27,900	0	0

For five houses at Holloway, for Mr. W. Reynolds, Mr. T. J. Hill, architect:—

Palmer	£2,025	0	0
Reid	1,990	0	0
Dabbs	1,970	0	0

For the erection of new gasworks for the Sevenoaks Gas Company—

Table with columns for contractor names and amounts. Includes Osborn, Nowell & DeCwra, Lambell, Grover & Son, Rose, Honaday, Munday, Deewra & Son.

For joiners' and plasterers' work to a house, St. Alban's, Herts., Mr. Thomas Hill, architect. Quantities furnished by Mr. R. H. Burden—

Table with columns for contractor names and amounts. Includes Biggs, Burton & Poff, Young, Miskin, Smith (accepted).

For 137 cottages and 9 shops, for the Burton-on-Trent Building Company, Limited, Mr. Henry Worth, Sheffield, architect. Quantities supplied—

Table with columns for contractor names and amounts. Includes Marriott, Bidal, Lowe & Sons (accepted).

For alterations and additions to Tollesbury Lodge, for Captain Sherwood. Mr. Horace Darken, architect—

Table with columns for contractor names and amounts. Includes Holland, Eade, Lee & Baker, Snabury & Son (accepted).

For new drapery premises, Headgate, Colchester, for Messrs. Mayer & Co. Mr. Darken, architect—

Carpenter, Joiner, Bricklayer, Slater, and Plasterer's Work

Table with columns for contractor names and amounts. Includes Shepherd & Son, Naylor, Eade, Lee & Baker, Robson (accepted).

Plumber, Glazier, and Painter's Work

Table with columns for contractor names and amounts. Includes Rogers, Rix (accepted).

Joiner's Work

Table with columns for contractor names and amounts. Includes Pitt, Smith & Co. Work, Evans.

For new railway inn at Brightingsea, for Messrs. Nicholl & Co. Mr. H. Darken, architect—

Table with columns for contractor names and amounts. Includes Page, Harmer, Eade, Lee & Baker, Padney, Lake & Gull (accepted).

Accepted for the erection of five dwelling-houses at the park entrance, Kingston-upon-Hull, for Mr. John Bryson. Mr. William Kirby, architect—

Excavator, Bricklayer, and Plasterer.

Table with columns for contractor names and amounts. Includes Sergeant, Shaw, Dawber, Smith and Hell-hanger (exclusive of stores), King & Peach.

Carpenter and Joiner.

Table with columns for contractor names and amounts. Includes Jackson, Plumber and Glazier, Gouldsbrough, Wright & Dreyer.

For cleansing and deepening the river, fish-ponds, and ornamental water, and formation of islands, at Knuston Park, Northamptonshire. Mr. Jno. Usher, architect, Bedford—

Table with columns for contractor names and amounts. Includes Whiteman, Winn & Foster, Oliver, Strickson, Freeman, Coker, Harding, Weaver & Mills.

For alterations and additions to house and premises, and building warehouse, for Mr. H. D. Fisher, St. Neots, Huntingdonshire. Mr. J. Usher, architect—

Table with columns for contractor names and amounts. Includes Todd & Handley (accepted).

For alterations to houses, Malden-road, Kentish-town, for Mr. A. Richards. Messrs. Pain & Clark, architects—

Table with columns for contractor names and amounts. Includes Manley & Rogers, Rowe, Gamble, Ebbs & Sons.

For alterations to house, new lodge, and stable buildings, at Willenden-lane, for Mr. John Marrian. Messrs. Pain & Clark, architects—

Table with columns for contractor names and amounts. Includes House, Stable buildings, &c., Rowe, Manley & Rogers, Ebbs & Sons.

For alterations and additions to St. Paul's Church, Balsall Heath, Birmingham. Mr. Edward Holmes, architect. Quantities supplied by Mr. Mansell—

Table with columns for contractor names and amounts. Includes Hardwick & Son, J. & W. Webb, Haden & Son, Matthews, Jeffrey & Frichard, Wilson & Son, Briggs & Son, Wilkes (accepted).

For alterations and additions to St. Mary's Church, Mosley. Mr. Edward Holmes, architect. Quantities supplied by Mr. Mansell—

Table with columns for contractor names and amounts. Includes Briggs & Son, Pratt, Hardwick & Son, Partridge, Child, Wilson & Son, Naden & Son, Horsley, Brothers, Futcher, Janson, Macey, Downs, Myers.

For new mansion, Sunningdale. Mr. Henry Clutton, architect—

Table with columns for contractor names and amounts. Includes Futcher, Janson, Macey, Downs, Myers.

For Congregational Church, Liskeard, Cornwall. Mr. John Tarring, architect—

Table with columns for contractor names and amounts. Includes Call & Pethick, Firks, Clarke, Sargeant (accepted).

General Estimate

Table with columns for contractor names and amounts. Includes Call & Pethick, Clarke, Firks, Sargeant (accepted).

Separate Estimate—Galleries

Table with columns for contractor names and amounts. Includes Call & Pethick, Clarke, Firks, Sargeant (accepted).

For new Baptist Chapel, Luton, Beds. Mr. F. Warburton Stent, architect. Quantities supplied—

Table with columns for contractor names and amounts. Includes Sawyer, Williams, Staines & Son, Brown, Smart (accepted).

For the restoration of premises recently destroyed by fire in New Southwark-street, for Mr. Barnett Meyers. Messrs. Tiltot & Chamberlain, architects—

Table with columns for contractor names and amounts. Includes Myers & Son, Henshaw, Lawrence & Son, Holland & Co., Brass, Wells & Sons, Piper & Wheeler, Hill & Keddell (accepted).

For the erection of a villa at Lower Clapton. Mr. T. K. Green, architect—

Table with columns for contractor names and amounts. Includes Carter & Sons, Newman & Mann, Henshaw, Mansbridge, Culow, Tully (accepted).

For the erection of farm-buildings and foreman's cottage, at Needingworth, Hunts. Mr. Robert Hutchinson, architect—

Table with columns for contractor names and amounts. Includes King, Mitham, Saint, Henshaw, Allpress, Smith.

For the first portion of new schools, St. Ann's, Walworth. Mr. W. Wigginton, architect—

Table with columns for contractor names and amounts. Includes Ennor, Kirby, Oxford & Co., Marsland & Son.

Alterations to Albion House, Commercial-road East. Mr. W. Wigginton, architect—

Table with columns for contractor names and amounts. Includes Shop, Front, Shutter, Johnson, Dudley, Ennor, Warshitt, Hearle (accepted), Bunnett (accepted).

Alterations to chancel, St. James's Church, Paddington. Mr. W. Wigginton, architect—

Table with columns for contractor names and amounts. Includes Evtit (accepted).

For alterations and new bar-fittings at the Queen's Head, Piccadilly, for Mr. H. Bradshaw. Mr. Isaac Bird, architect—

Table with columns for contractor names and amounts. Includes Brown, Ebbs & Sons.

For taking down and rebuilding shop and premises, No. 337, Strand. Mr. Charles R. Teague, architect. Quantities supplied by Mr. T. J. Hill—

Table with columns for contractor names and amounts. Includes Brass, Hardman & Hanson (accepted), Henshaw, Turner & Son.

For rebuilding No. 70, St. Paul's Church-yard. Mr. Richard Tress, architect—

Table with columns for contractor names and amounts. Includes Couder, Sewell & Sons, Macey, Henshaw, King, Colman.

For new premises at Aldershot, for Messrs. Copeman & Lacy. Mr. Henry Peck, architect. Quantities supplied—

Table with columns for contractor names and amounts. Includes Perry, Martin, Duke, Lee, Mason & Son.

For building villa residence, at Lamphun, Exmoore, for Mr. J. Benson. Mr. T. W. James, architect—

Table with columns for contractor names and amounts. Includes Moore, Manley, Williams, Stickland (accepted).

For house and shop for Mr. Skerrett, Hanley, Messrs. R. Scrivenor & Son, architects—

Table with columns for contractor names and amounts. Includes Travars, Hanselley.

For the erection of school and lecture-rooms, Cannon-street, Birmingham, for Cannon-street Chapel trustees. Mr. Edward Holmes, architect. Quantities supplied by Mr. Mansell—

Table with columns for contractor names and amounts. Includes Jones, B. N. & W., Partridge, Hardwick, Matthews, Jeffrey & Frichard (accepted).

For building chapel at Manor-road, Barmendsey. Mr. George Leng, architect. Quantities supplied—

Table with columns for contractor names and amounts. Includes Ogburn, Kent, Thompson, Price & Co., Stone & Pritchard, Kelly, Garland & Soper.

For workshops, show-room, and mill, for the Royal Porcelain Company, Worcester. Messrs. R. Scrivenor & Son, architects. Quantities supplied—

Table with columns for contractor names and amounts. Includes Hughes, Branson & Murray, Naden & Son, Webb & Son, Hilton, Barlow, Warburton, Brothers, Wood & Son, Mackenzie.

For dwelling-house, George-street, Hanley. For Mr. J. Warner. Messrs. R. Scrivenor & Son, architects. Quantities supplied—

Table with columns for contractor names and amounts. Includes Woodridge, Barlow, Steele.

For finishing and decorating eight villas, Lancaster-road, West Dulwich, for Mr. John Davy. Gardens, fences, roads, &c. not included. Mr. Randall Stap, architect—

Table with columns for contractor names and amounts. Includes Green (accepted).

For building two detached villas, in Chatsworth-road, Mr. Randall Stap, architect—

Table with columns for contractor names and amounts. Includes Sheldon, Scott, Green (accepted).

CHURCH, TURRET, and STABLE CLOCKS.

J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 33 & 34, Ludgate-hill, E.C. Established 1749.

TO ARCHAEOLOGISTS, ARCHITECTS, AND ANTIQUARIES.—Messrs. COX & WYMAN, having had great experience in the production of every class of Work, viz. to topography, Architecture, and the Fine Arts, their Establishment affords special facilities for the execution of this class of PAINTING, whether illustrated or otherwise, in the best possible manner, with promptitude, and at moderate prices.—COX & WYMAN, Fine Art and Classical Painters, 7, 7 1/2, Great Queen-street, London, W.C.

NEW WORK BY MR. W. FAIRBAIRN, G.E. In September, in 8vo, with Plates and Woodcuts.

IRON SHIP BUILDING, its History and Progress, as contained in a Series of Experimental Researches on the Laws of Strain; the Strength, Form, and other conditions of the Material; and a History into the Present and Prospective State of the Navy, including the Experimental Results on the Resisting Powers of Armour Plates and Shot at High Velocities. By W. FAIRBAIRN, G.E. L.L.D., F.R.S. &c. \* A New and Revised Edition of Mr. FAIRBAIRN'S TREATISE on MILLS and MILLWORK, Vol. II, in 8vo, 1st issue. London: LONGMANS, GREEN, & Co. Paternoster-row.

NEW AND ENLARGED EDITION, 1865. BIDDER'S BATHWORK TABLES, showing the Contents of Excavations, Area of Slips, &c.

By G. P. HIGGINS, Esq., G.E. In Sheets, 24. Mounted to Case, to fold, 3s. 6d. 'The Retreat, Abbott's Leigh,' 1844, February, 1853. I have this day disposed of the Copies of the above-mentioned 'Bidder's Tables for calculating Earthwork,' to Messrs. Vacher & Sons, 22, Pall-mall-east, London, Vol. II, in 8vo, 1st issue, at this date. For Bathwork, &c. see separate sheet, headed 'SAMUEL MAYNARD, Esq., of Bathwork, &c.' London: VACHER & SONS, 22, Pall-mall-east, S.W.

# The Builder.

VOL. XXIII.—No. 1180.

*Why we have Typhus.*

NOTHER Blow for Life?" Yes. And a hundred other, if need be. We have nailed our colours to the mast, and will die fighting. It is dreary, disheartening work to speak without being listened to; to implore without success. But now that some of our more powerful contemporaries are again entering the same cries, and making the same prayer; now that the punishment for disregard is beginning to be appreciated, and the possibility of a consequent evil even more serious than usual looms in the distance, it may be hoped that earnest efforts will be made throughout the metropolis and other large towns to wipe away some of the known causes of disease, and to lessen the typhus crop. The resident physician of the London Fever Hospital, Mr. Jeaffreson, has recently pointed to a number of places continually producing typhus patients, and the *Times* has powerfully commented on the infamous fact that this state of things being known, the remedy being obvious, and the power of applying it being possessed, nothing is done to obviate the evil. To some of the very places named we drew attention eleven years ago, and showed indisputably, not merely that they were producing disease and death, but *why* they did so, and why they would inevitably continue to do so so long as their condition remained unchanged.\*

Let us again do this,—again show why it is that the inhabitants of certain houses are continuously stricken with fever and other diseases, taking one of the parishes mentioned in Mr. Jeaffreson's statement, that of St. George, Southwark.—St. George the Martyr!

We will first show what has been going on in the parish in the production of fever, as set forth in a recently published document by Mr. W. Rendle, lately the medical officer of health of this parish, and now a vice-president of the Association of Medical Officers of Health, and which calls for the attention not merely of his fellow-parishioners, but of the inhabitants of other metropolitan parishes also.† The parish contains large numbers of the poor, and there is continued presence amongst them of fever and those other disorders that are preventible. In five years there have been 400 deaths from fever, representing no fewer than 3,400 cases. With reference to an inquiry as to this prevalence here of fever, specially made to Mr. Jeaffreson in April last, that gentleman replied,—“The number of fever cases sent from your parish to this hospital from July 29th to December 31st, 1864, was 183, a considerably larger number than that sent in the same period from any other London parish or union. The fact most prominent in relation to these cases was that they came continuously month by month from the same buildings, or building even. On in-

quiry this fact was sufficiently explained on my learning that houses from which five, six, seven, and even eight typhus cases had been sent here, still remained utterly unregarded by the sanitary authorities, and allowed to remain overcrowded and filthy in the extreme. I also found that families who had been frightened from homes from having lost relatives from fever in them, had had their places quickly supplied by fresh candidates for typhus, who entered infected rooms without even the forms of cleansing having been gone through.” He pointed out that if infected houses were scrubbed and lime-washed from top to bottom, and kept empty afterwards for ten days only, there was no doubt that they would become safe habitations, provided decent sanitary regulations were subsequently enforced. Sanitary inspectors should keep a close watch over the hooks which show the localities whence fever cases are removed, and on the occurrence of even one case have the spot thoroughly investigated, and, if necessary, emptied, repaired, and cleansed. By such means, he said, he had not a doubt that at least fifty per cent. of the typhus cases and typhus mortality might be prevented.

The writer thus confirms the opinion we have so often expressed as to the small value of the present sanitary inspection as carried out in some metropolitan districts. In Mr. Rendle's hook several striking instances are mentioned of the slow way in which parish authorities move when health is threatened and death actually at work; but we must be content with mentioning a case in Webber-row, where two dissipated old people, who were not in want, occupied an upper room, containing about 600 cubic feet of air. During ten days six people lived and slept there, with rather less than 100 cubic feet of space for each. The room was filthy, and the smell most offensive. In a few days the woman took, or, as may be supposed, produced fever; for it was not traced from anybody to this house. She laid so for three weeks: the old man took it soon after. The daughter, also, who waited on them, a week after that. A month from the first outbreak the man below took it, and this unfortunately destroyed the provider for a wife and six children. Then two of the man's children took it; then his wife's mother, who is also dead; then two more of the children. On the 20th and 26th the man and woman were removed; and on the 20th the woman below stairs applied to the vestry to have “the stench removed.” The neighbours began to cry out about it. The doctor said that it was worse than tongue could name. The relieving officer said that it was enough to infect a neighbourhood. The parish doctor had been asked if it would not be better for the people to go to the Infirmary or Fever Hospital, than to be there. He had recommended it, but the people would not consent, and until the woman stirred in the matter nothing was done. Then, on her request, and on Dr. Bateson's recommendation, they were removed, but “the removal, when effected, was too late—the mischief was done. No means could have been adopted better calculated for producing and spreading a bad fever.” In a room next to the sick, there was a large closet on the stairs, in which were stowed cabbage and other refuse; and once also for about three days all the chamber discharges,—and this in hot weather! After the daughter had been taken away ill of fever, there was no one to wait on the sick but the woman downstairs, who did it with fear, which was too well grounded. Her husband was attacked, and he was allowed to remain in the house until within a few hours of his death. Then two of the woman's children were attacked; then the mother, who was a healthy, active woman, was seized by the fever and died; and, says Mr. Rendle,—“If, within one week or ten days of the outbreak of this fever, the house had

been emptied and cleaned, there is not the shadow of a doubt but that much of this misery and death might have been prevented, and the people might, after a short interval, have again, and with safety, inhabited the cleansed and disinfected house; and the same truth is applicable to multitudes of cases here and elsewhere.”

Who can wonder at the spread of fever or any other pestilence under such circumstances, or in the alley to which we will now bend our steps, for the purpose of endeavouring to describe a place in which fever is at the present time rife?

Maypole-alley is the name of the object of our investigation. It is on the west side of High-street, Southwark, not far from the well-known “Tabard.” To this, which contains a large population, a narrow entrance leads, having on one side of it the shop of a “provision merchant,” on the other the shop of a baker. We have sketched its aspect. It is festooned with hams and flitches of bacon. Who of the thousands that pass it daily are aware of the crowd of half-poisoned men, women, and children who dwell beyond this opening? We descend and pitch upon one house. Long as our experience has been, we do not remember any home which for evil sanitary state was worse than this, of which we give illustrations. On opening the street door, close to the threshold we find an untrapped and broken sink (a reference to the rough ground-plan will help to afford an idea of the spot). A little further on is a closet: no water is laid on; and from the closet oozes forth the actual soil and refuse of the people. The drain is useless for its purpose; and at the inside of the door of this house is collected putrid water more than ankle-deep. In this dwelling we find the population of the rooms to be:—Seven, three, seven, four,—twenty-one people. The pavement inside the passage is composed of bricks ill set, pieces of stone, and boards rotten with the damp. Standing on one of these boards, and pressing with the feet, there comes a thick greenish-black substance with a poisonous smell,—in fact, the essence of cesspool refuse. The same dangerous semi-liquid flows beneath the beds and the rooms in which the people stay. Through the broken floors the fever-breeding air passes to the lungs of the people who are here lodged!

The closet, in its present position, without any trap, without any means of proper drainage, without any ventilation either at the back or at the roof, is of itself a cause of sickness and death, and as surely as darkness follows the setting of the sun, so certainly is human life sacrificed when men and women herd in such situations. Turning to the room on the right hand, on the ground-floor, three children are being removed to the fever hospital. Constantly there is fever raging in those rooms. Why should we wonder at it? For the room marked II in the ground plan has not cubic space of more than 250 ft. or 260 ft.—not sufficient for one person's health, even if ventilation were attended to; and yet, here, before the fever-stricken children were taken away, seven people dwelt. Lying on the floor were the dirty grey mouldy-coloured blankets and other bed-things; dark and dismal was the appearance of the corner in which the beds lay, and which were placed in a position where the very foulest of gases would collect and remain until they assumed an almost solid shape. Strangely contrasting with these conditions, over the mantelpiece were looking-glasses, crosses, and figures of our Saviour, prints, photographs of relatives, fancy vases, and other articles, serving to show how great is the love of art, such as it is, amongst the poorest classes of the community. The majority of the tenants here are Irish; but the same desire for decoration will be found in connexion with the English population in the dark rooms of the metropolis and in the cottages of the peasantry

\* See, too, “London Shadows,” by Geo. Godwin, 1854. “Town Sweeps and Social Bridges,” by the same, 1859. † London Vestries and their Sanitary Work: are they willing and able to do it? And may they be trusted in the face of a severe epidemic? London: John Churchill & Sons, 1865.

throughout the rural districts. The houses are all close together in a very narrow court, clustered, as it were, so that the fever is truly "nested." Within twenty yards is a Roman Catholic School for children, in which sometimes twenty, sometimes even fifty and more children are being "educated."

We believe that to this moment, no *cleansing, whitewashing, or emptying* has been done by the Local Board of Health, the vestry, or his officers, notwithstanding the warning in the Poor-law officer's book seven weeks ago, fever cases in succession during sixteen weeks, and one death recorded!

Happily the court is not at present crowded, as the people are mostly "hopping." The twenty-four houses usually hold more than two hundred persons. If these people had been all at home during this hot weather, the fever would probably have spread like wildfire.

The danger of inspecting such spots as this is not small, and often leads us, when occasionally risking it, to admire the cool, calm bravery of the medical men who constantly attend the sick in these fever-dens. There are other dangers besides those of the battle-field. Some of these our physicians brave daily in their missions of mercy. Honour be to them. And we would here take the opportunity of mentioning one who has long assisted ourselves in such inquiries as this, with a total disregard of personal consequences, Mr. John Brown. Fortune has not been kind to him, troubles have kept him down, but he deserves well of the public he has long aided us in humbly trying to serve.

To return, however, to Maypole-alley. From the women we hear the usual account of the loss of infant life. One woman, who, before coming here, had resided in Kent-street—a spot not far off—had lost seven children; and so goes the tale of death. But those who visit such localities should not depend upon the first accounts which are given. Ask, for instance, if there is plenty of water, and the answer will be generally, "Yes." "But on the Sundays have you any water?" and then the reply is, "No, sir, not a drop on Sundays, and not a drain on Monday morning." Costume is not especially attended to in Maypole-alley. Here in the open space, are some children playing and fighting in a state of perfect nakedness! as completely so as are those of the heathen savage in Africa, on whose behalf such extensive missionary operations are organized. Let us send preachers to the heathen; but, at the same time, it should be remembered that missionary labours are needed in such courts and alleys as that which is now brought into notice. Thoughtful people would not fail to observe the thinness of the arms and legs, the enlarged stomach, the general pallor of the complexion, which cannot be disguised even by the thick coating (the only covering) of dirt and filth which is left upon the skin. On a second visit, an elderly woman was engaged in washing a chair with no clothing but one thin coloured garment, reaching scarcely to the knees. It stirs the temper to see such things; and it would be well if there were missionaries who, entering these places, would preach decency and cleanliness to the people living there. We must first, however, enable them to be decent and clean.

In this place poison lurks in all directions. In the house just now referred to, the water is brought from a tank far too small for the purpose, and the state of which there were not the means of investigation; but near to it is a sample of the water-casks which are supplied for the use of houses. The water supply has just come in. Look shading your eyes and peering into the barrel, which will not hold sixty gallons of water. There is to be seen a thick coating of a coral-like formation. It is not, however, of such a hard nature. On passing a walking-stick into the water, the fungus, which has grown from neglect, falls away, and up to the surface rise large globules of gas; in fact, there is poison in those reservoirs. "God help us," said one woman, "if the cholera should come!" The casks for water are placed, for the most part, close to the closets and to had and untrapped drains. In the back yards, which, in connexion with some of the houses, exist, the pavement is broken, and in this far more mischief lurks than is generally supposed. Removing some of the stones and bricks, there is to be seen below terribly black wet soil, intensely putrid, and which extends far below the surface. From this cause alone arise, especially in hot weather, the germs of disease.

In one house the emanations from the closet

and the drain connected with it, were, without any overcrowding, sufficient to account for an outbreak of zymotic disease. Some of the doors which lead to the back part of the premises are curious; here is one but a little over 4 ft. in height. Bending the back, we enter the yard, where there is the usual had condition of pavement. In a corner of one of these yards there is a low dilapidated wooden shed, which has the appearance of a pigsty; indeed, it may formerly have been used for this purpose; but on opening the door, to our astonishment we find that the place was arranged for sleeping in, and were told that a woman had lodged here for some time past; "and faith," said an Irish woman, "she is there rid of the fleas, and the cracks let in the nice fresh air." This, however, was a fallacy, a deadly fallacy, for the closet and untrapped sink were close by, and near to these stood the water-harrel, as is the case in other instances.

At the bottom of Red Cross-court, close by, there are other houses in a fever-producing condition; and we could go to many other places in the parish, and show the same evils existing. Surely, however, we have done what we undertook to do. We have shown sufficient reason for the prevalence of fever in May Pole-court and other parts of St. George's, Southwark. The parish authorities have grievously neglected their duty. We call upon them earnestly, as we do upon other authorities in a similar position, to change this dreadful state of things.

#### AN ARCHITECT'S NOTES IN AMERICA.

HEATING AND VENTILATING SCHOOLS AND PUBLIC BUILDINGS: INTERNAL ARRANGEMENTS AND FITTINGS OF PRIVATE HOUSES.

The public buildings of America, more particularly of the Northern States, are all warmed by various heating apparatus, of which the hot-air furnace previously spoken of is the one most commonly in use. The evils that have been pointed out as apt to attend employment of this mode of warming in private houses, have less force when the distributing pipes have not to be of unequal heights. This latter difficulty is a serious one, and unless due judgment has been exercised in planning the laying, and determining the proper sizes of the tin pipes, the heat will be given off very capriciously, and much annoyance will be caused. But in large buildings, all of one floor more especially, the hot-air pipes may be of large diameter, and when their provision has been thought of in the original plan, there is much to be learned from American examples. With us our own expensive failures have made persons timid of heating or ventilating on a large scale, so that a few facts, with brief descriptions of some particular cases, will be valuable.

The public schools of New York and Boston are in their way as nearly models as well may be. The school furniture, the contrivances for the comfort of the scholars, and the clever planning of the buildings, have often received notice and commendation here.

The system of education employed, or the admirable opportunities afforded *gratuitously* to all, to give their children an education, under the direction of the best teachers and professors that high salaries can procure (it may not be out of place to state, by way of parenthesis in elucidation of this, that during his successful tour in America, some six or seven years ago, Thalherg was engaged in more than one public school, to give a short course of musical instruction and illustration), might well deserve fuller description, but of the modes adopted for warming and ventilating it is more to the present purpose to speak.

The principle upon which the system in all cases is made to act, depends upon two very simple desiderata: easy introduction of warmed pure air, and equally easy unobstructed mode of exit for the foul.

The former is obtained by the large supply of air artificially warmed (by furnace, hot-water, or occasionally steam) passing through apertures in the floor or skirting of the rooms, through tin pipes of large diameter. The latter is secured generally by gathering very large flues (made of boards smoothly planed and fitted) from the upper portions of the rooms into a spacious air box in the roof, from whence the foul air is passed out into the external air by a simple ventiduct, that, although so well known in

America, does not seem to have been employed with us. The apparatus is called "Emerson's Ventilator," and consists of two sorts, the injector and the ejector. Both of these have been used to good service on board ship, the Collins steamers, the *Niagara*, and many others having been supplied therewith. The two are generally used together, though sometimes the one only is sufficient. The ejector consists, first, of a large box above the roof serving as a base, and communicating with the foul-air chamber immediately below. Above this base rises a cylinder of three or four diameters in height, at top of which is a truncated cone, widely extending at the base, and cut off at the top so as to be of the same diameter as the cylinder. Above this is supported a thin disc of metal, sufficiently large to keep out the rain, and this completes the contrivance. There are some miles insisted upon, as to the exact size and proportion of the several parts, the simple deduction however being, the larger the better. The whole is made of galvanized iron, and is afforded at cheap rate. Its action is certain, and although some scientific controversy has been excited as to its precise principle, the result is, in general, most satisfactory. The theory seems to be, that with the smallest breeze flowing over the surface of the roof, a vacuum is created upon the reverse side of the cone, and consequently a portion of the column of air within the cylinder is continually displaced. The form of the ventiduct and the provision of the protecting disc prevent downward draught. To correspond with this, only at a much lower elevation, is an *injector*, consisting of the same mechanism reversed, being, in fact, a series of truncated cones, or funnels, one within the other, and from these a shaft conducts into apertures near the floors of the school-rooms; thus continually a stream of cold external air from above is sent to mingle with the warm air from the registers communicating with the furnace below; and as fast as this fresh supply is given off, it is passed through the building, and, having done its duty, escapes out at the exhaling apertures leading to the ventilators on the roofs.

Literally, hundreds of examples of buildings successfully warmed and ventilated on this principle may be cited; and although sometimes the air is allowed to stagnate and become over-heated, these are faults rather of management than of the system employed. The cost, in all the cases where the outlay could be ascertained, was surprisingly small for the benefit obtained.

A large church fell under the writer's observation, in which the mode of warming, &c., was so simple and inexpensive, and the result so satisfactory, that a few words may well be bestowed.

The building was of brick, well and substantially built, seating between 700 and 800 persons, without galleries. The style was Romanesque, the dressings of stone, and the interior in American oak and pine.

Across the entire front was a spacious vestibule, with a large tower flanking one end, and a smaller turret the other. At the other end of the building was a deep aise, forming what might be termed the chancel; although, as the building was for Presbyterian use, that term would scarcely express the meaning. Underneath the vestibule was the heating apparatus, having its smoke-pipe carried in iron up the centre of the tower, and opening into a chamber especially contrived just above the roof. Round this iron was built a wide shaft of half-brick thickness, also opening into the same receptacle. The warm air from the air-chamber attached to the furnace was admitted into the building in the floor of the central and side passages, through large apertures near the entrance; and at the other end, the floor of the aise being considerably elevated, the risers of the steps were perforated, and back of these was an inclosed box from which, under the floors, spacious air-drains were made leading into an exhaust-chamber below the tower floor. This opened into the shaft surrounding the smoke-flue, and thence the supply and exhaust were at the same end of the building. The action of the apparatus, when in full operation, was most simple and satisfactory. The warm air circulated across the building, its natural tendency being towards the opposite end (as all external doors opened only from the entrance end), and thence, passing through the openings under the aise, was drawn by the rapid upward draught of the column of air within the shaft surrounding the smoke-flue through the air-drains, and allowed to escape

into the ventilator at the top of the tower. This ventilator was an Emerson's ejector of large size, its somewhat matter-of-fact appearance being partially concealed by a light canopy with trellised sides, forming a finish to the roof of the tower.

The situation of the building was exposed, and the winter extremely cold, the town in which the church in question had been erected being in the western part of the state of New York; and the cost of the whole building, including heating apparatus, was stated at something under 2,000.

It should be stated, that in summer time the same apparatus is usually made effective for ventilation (as was the case in the church just mentioned), only in lieu of warm air from the furnace-chamber, cold air from without is admitted through the same apertures, whilst the upward current of air is set in motion by a ring of gas-pipe perforated with small jets, circling the inner surface of the exhaust shaft, a few feet above the floor, which, when ignited, suffices to effect the purpose. In nearly all cases, both public and private buildings possessed contrivances for rendering the warming apparatus of winter available for cooling currents of air during hot weather.

There is yet another mode of heating in frequent use in America, which, in large buildings, factories, hotels, &c., has been employed with advantage. Steam from a boiler placed where most conveniently accessible, is admitted into thin cases of corrugated metal—copper they should be, but cheapness generally causes iron to be substituted. These cases are put together upright in metal stands of open work, more or less ornamental, each case a few inches from the other, and in size and number, according to the amount of heating surface required. Underneath these (or when placed in a recess, at the side) cold air is brought in copiously from without, and passing over the corrugations of the cases, becomes sufficiently heated to circulate warmth through the apartment. It will be seen, however, that unless the ventilation is thorough the heat would be dry and easily overcome from these steam-supplied cases, but the system has its advocates, and may frequently be seen in New York and elsewhere. Dr. Reid, of ventilating celebrity, made a professional visit to America, but left no recognized proofs of his proficiency other than in availing himself of this appliance to warm a banking-house in New York, by placing the steam cases against window openings, so that the ash being opened at pleasure, the cold air would be warmed in its passage through the cases into the room. The result, however, was nothing deserving much notice, and some significant hints were made of the costly experiments indulged in, before the matter was arranged to the late doctor's satisfaction.

Gas is used occasionally for heating purposes. The ordinary gas stove, and the ornamental grate for the inflammation of Asbestos, are the same as in no here. For cooking purposes a simple contrivance is in common use, which is admirably adapted to a nursery. A cylinder is fitted over the ordinary gas-burner, supported by some simple metal bracket, having the upper end covered with wire gauze, and the lower perforated. A tripod is placed above this to receive the vessel to be heated, and the gas lighted above the gauze. The effect is, that atmospheric air, mixing in the cylinder with the gas, the flame is soft and broken, like that from ignited spirit, and the bottom of the saucepan or kettle is unblackened. The same apparatus is used in hotel bars to heat the water, and is much better than the dirty process that may be seen in the office-rooms of our railroad stations and other places.

One more item connected with heating should be noticed. The Americans are well-known lovers of hot cakes for breakfast, tea, and supper, different preparations of flour, buckwheat, and Indian corn, forming dishes of great delicacy and variety. In a celebrated lunatic asylum, near Boston (and very probably in many hotels and other establishments), there is a huge griddle of soap stone, heated underneath, and upon this the batter is poured, and the cakes are cooked to perfection, without butter or grease of any description. The nature of the stone prevents articles from sticking, and makes a more wholesome dish of these celebrated Yankee delicacies. Fish is also cooked in the same way. The whole building in question (the Somerville Asylum), deserves more extended notice, for its heating and ventilating arrange-

ments were, when visited six or seven years ago, the best to be seen in the United States. They were, however, similar in principle to the methods before detailed, excepting that the fresh warm air was admitted from apertures in the upper part of the rooms and passages, and drawn off from the floors. The habits of the unfortunate patients were stated to render this necessary, as any one acquainted with their management can readily understand.

Note should be made of a weather-strip, in almost universal use, which excludes cold air from the bottom of outside doors. This is simply a strip of hard wood, the width of the door, hinged on the outside a little above the bottom, and provided on the underside with spiral springs, fitting into recesses cut on the face of the door. When opened, the springs force the strip outwards, and thus lift it over the threshold; but, when the door is closed, the ends of the strip catch against stops fitted to the jambs, and press it tightly down below the bottom of the door. This very simple and efficacious article is in such common demand that many shrewd Yankees go about from house to house fitting the strips to the doors, and charging so many cents per foot for the contrivance, which is patented, and forms, doubtless, a source of considerable profit to all parties concerned. As far as memory serves, it was called "Wotherspoon's patent weather-strip, for making doors and windows tight," and might be introduced here with advantage.

The uniform size of the building lots in New York, and all other American towns, has given rise to many peculiarities of plan, some of which are well worth noting. A "street lot" means 25 ft. front, by 100 ft. in depth; an "avenue lot" the same frontage, by about 125 ft. In New York, all the streets in the upper or new part of the city run east and west, all the avenues north and south. The avenues are of great width, the streets less, but are amply wide; and every tenth street is of the same width, or nearly so, as the avenues.

Land being so valuable, every man tries to make as much as he can out of his lot; and hence it is no uncommon thing to find two houses of costly magnificence of outside appearance and inside decoration upon one lot; being, in fact, but 12½ ft. each in width. Many others are placed three upon two lots, or four upon three, and so on; but the New York house proper is 25 ft. front upon a lot 100 ft. in depth. Grand houses are, of course, built upon several lots, and frontages of great size may be seen; but when this is the case, the mansions differ in no essential particulars from houses of similar dimensions in London or Paris. The genuine 25 ft. front house is, however, almost *sui generis*.

In the first place it is of enormous depth, 60 ft., 70 ft., even 90 ft. of the lot being given up to the house; for the Americans love grand parlours; and, as the rooms are seen in their best magnificence by gas-light, the small court-yard thus left is of no great consequence.

It is in admitting daylight into these disproportionately long rooms that Yankee contrivance is well displayed. Of course, windows, though of great size back and front, would barely suffice, and therefore various modes of "inter-lighting" have been introduced. It should first be remarked that these houses are of two kinds, "English basement," as they are called, and "high stoop." In the former (which is more modern than the other) the house is entered upon nearly a level, the dining-room being in front, and the kitchens and offices behind, with the cellars underneath. From the hall-door the principal staircase leads to the parlours on the story above, the bedrooms being on upper floors in the usual manner. The hall-door usually opens into a vestibule, from which the staircase opens direct; the passage to the dining or living room and domestic offices being shut off by a door. The other house resembles this, excepting that a high flight of broad stone steps leads up to the hall-door, and the reception-rooms are upon the entrance-floor. The outer landing on top of these steps is called a stoop.

In the narrow houses the hall is dispensed with, a vestibule opening directly into the front room, and the staircase is usually midway in the hall, to allow rooms the full width of the building in the rear.

The arrangement of the parlours almost always consists of two rooms of equal size, divided only by columns (generally of scagliola)—the tin pipes conveying hot air to the upper rooms often occupying the hollow of the pillar, with a third room at back (called in New York parlance a

"tea-room") the entire width of the house, and opening from the middle room by wide and lofty sliding double doors filled with ornamental glass. Above these rooms the great depth of the house gives a large space between the bedrooms for closets, dressing-rooms, &c., which are lighted by a well opening from the roof, and several which windows are inserted in the several closets, &c., requiring light. The top of this shaft or well projects considerably above the roof, with glass sides, and with the top opening into a ventilator; so that when properly constructed, the same arrangement serves for ventilation as well as light. The bottom is frequently made to assist in giving light to the central parlour by having a panel in the ceiling, of ground and tinted glass, immediately below the opening, the height of the rooms allowing many ornamental features to carry out this effect, such as false ceilings with recessed panels, flat domes, &c. But this shaft would be insufficient to convey much direct light, on account of the great height of the building, unless assisted by some mechanical contrivance. In most houses this is secured by having reflecting surfaces set at angles on the unbroken side of the shaft, which serve to increase the amount of light to a remarkable extent. They are made of tinned corrugated metal, highly polished, and covered with plate glass, set in metal frames, and made so as to occupy the whole width of the shaft, and extending a third to a half of the depth. When set at a proper angle, the light from above is refracted in such a direction as is required, and in great heights they are made to refract one to the other, and so transmit the rays to any particular spot. Similar reflectors are extensively used to increase the amount of light in back rooms, counting-houses, &c., and in the clear, cloudless atmosphere of America, where no floating smuts dim the surface of such appliances, they are of great utility; how far the smoke of our large towns would militate against their general introduction here, is a question experiment only can satisfy.

This great depth of houses in American towns affords an opportunity for exceedingly comfortable arrangements of the chamber-floors. The bedrooms are always large and lofty, and in a very large house each bedroom is of still more ample size and proportion, the number being but little increased by the enlarged area of the building. American houses are so replete with conveniences in this respect, that householders find the furnishing of all their rooms but their parlours a comparatively inexpensive affair. The principal bedrooms always have large closets, with hanging wardrobes, drawers, &c., between the front and back, with also a vestibule opening between each, and greatly assisting to air the apartments. Each room also always has a large dressing-closet, with marble slab, washing-basin, hot and cold water, and if not a full-sized bath, almost always a foot or sponge bath. The bedroom itself needs only the bed and a few chairs, and a couch, by way of furniture, for all toilet requisites are in the dressing-closets attached.

In summer time the floors are covered with Indian matting; and as there are no obstructive pieces of large furniture to remove, this can be taken up, and the floors washed and swept, as often as is wished.

In all these houses the grates and fenders are fixtures, as well as the gas and heating arrangements, so that a tenant has only actual furniture to bring in. As the Americans are great lovers of change, and usually move at least every two or three years, this is a desideratum. All leases date from the 1st of May, and it is amusing to see nearly the whole population migrating from one house to another, to the great profit of the carmen who remove the goods, and of furniture dealers, whose ware, it may be imagined, does not last any longer for such frequent changing about.

The great depth of such houses gives not only ample space upon the bed-room floors, but allows also the domestic offices to be roomy and convenient. Back of the kitchen is always a large wash-room, usually an extension of the kitchen itself, without any division between. This is furnished with a wooden trough, wide and deep, and 12 ft. or 14 ft. in length, divided into three or four divisions, with hot and cold water laid on to each, and a plug to let the contents run off. Nearly all families do their laundry work at home; hence every convenience that ingenuity can contrive may be found in this department of the domestic offices. The spacious cellar below, in some houses, or more frequently

the upper floor in others, afford a large drying-room in wet weather; and when this is at the top of the house, a lift is always contrived to carry up the things. The American washing-machines are well known here; but ladies say it is just as well that the American wash-board in universal use has not been introduced, for though it saves the time and the hands of the wash-women, it quickly wears out the clothes.

Most of the best houses in New York have a billiard-room. This is often on the upper story, and is always large, lofty, and well lighted. One indispensable feature is a "lift" leading from the butler's pantry, so that "sherry coolers," ice-water, cigars, and other luxuries usually appreciated by gentlemen may be quickly sent up without requiring a servant to run up and down stairs. A room of this character in a private house well known to the writer was replete with

such conveniences. Speaking-tubes led to the rooms below, and a little box of blank cards and a pencil were handy to the door of the lift, so that, the signal being given to the servant below, the card with the want written thereon dropped into its receptacle, and down went the tray, presently to re-ascend freighted as per order.

All hotels, and many large private houses, are fitted with the "Annunciator" in lieu of bells. This differs from the machinery employed in our large new-erected hotels, and consists of a frame situated in the office, on the face of which small half-circular discs are suspended, each one covering the number of the room painted on the surface of the dial behind. When a bell-pull is drawn down in any apartment, a bell is struck by the machine, and the half-circular disc turns over, revealing the number of the room, and this

remains exposed until a handle is turned by the attendant in the office, which is not done until the bell has been answered and the order attended to. Jackson's annunciator used to be considered the best, and the charge for the machine was at the rate of about 1l. for each room with which connexion was made.

The universal use of sliding, instead of folding doors, should be remarked. Their advantages are numerous over our manner of closing large internal openings. The doors run into double partitions on either side upon metal ways at bottom, usually handsomely plated, the weight of the doors being carried by suspension overhead by means of large flanged wheels traversing upon a metal bar, and extending the whole width of opening and door. The lock fittings are of course adapted to this mode of closing, the lock-bolt consisting of a hook which drops

into a socket within the plate upon the other side. Americans go to great expense with their locks, knobs, and other fittings for doors and windows; the night latch entrusted to discreet young men is not there a formidable weapon of defence, but a neat little instrument of steel not much larger than a watch-key, and usually worn as such.

Staircases are uniformly handsome, with heavily moulded polished rails, newel posts, and balusters. Black walnut is rather the favourite material. An effective arrangement may often be seen, by which the great length of side wall in the large, long sitting-rooms, is made less bare and tame. Recesses between the fireplace and end walls are left, corresponding in width with the windows, and are filled with plate-glass mirrors, and hung with npholstery to match the window curtains. A sitting-room of a well-known American author is recalled to memory as possessing this feature, and very pleasant and liveable the apartment looked.

Instead of Venetian shades, nearly all the windows are fitted with folding blinds, light, and of French polished hard wood, shutting into boxes in the reveals of the windows, like our ordinary shutters.

It will be admitted that in all these addenda to a house, American landlords leave much less than ours do for a tenant to introduce; and although the rents are exorbitantly high, there are (or were, alas!) no taxes for an occupant not being an owner to pay, and therefore upon the whole you get the worth for your money.

In New York, before the present unsettled times, a good house in the upper part of the city, 25 ft. frontage, and four stories high, could readily command two hundred to two hundred and fifty guineas a year, and in some favoured localities even as high as three hundred. The larger houses were seldom to be had excepting by purchase, and the prices would vary from four thousand guineas upwards.

#### THE FRENCH ENGRAVINGS IN THE FREE LIBRARY, LIVERPOOL.

THAT good deeds are like good seeds, and bear abundant fruit, we have new proof in the number of presentations and loans made to the public by means of the Free Library, Liverpool. Several fine paintings by modern artists are of especial interest. These have been presented by various individuals. But it is the loan of French engravings, by Mr. Percy M. Dove, that we are about to describe particularly. A selection from the school of the Low Countries preceded the present exhibition; and the German and Italian schools will be doubtless illustrated after the present collection is removed. By these means, students and other inquirers will be instructed not only in the various mannerisms of the different masters, but in the more considerable points of departure of the schools. The managers of the present loan have compiled a sufficiently satisfactory catalogue, and prefixed it with an explanatory description of the different modes of engraving,—etching, line engraving, etching and line engraving combined, mezzotint, and aqua-tinta. And seeing that the examples of each manner are representations of celebrated pictures, and portraits of the most eminent men and women in French history, they are justified in the belief that the collection will afford rational pleasure to the public.

As the room in which the selection was exhibited is only capable of holding about 180 frames, it was necessary to confine the examples to those of the best artists. In Huber's "Ecole de France," there are 375 engravers mentioned; and there have been besides these about sixty painters who engraved. It being, therefore, impossible to represent the entire school, it was resolved to illustrate the greatest period of French engraving, that of the brilliant reign of Louis XIV., and to add a few specimens of the condition of the art before and after that period, to indicate its progression.

Looking at the exhibition collectively, it is apparent that there have been successive fashions in the mode of finishing off engravings by borders. We see at one period they were finished with a little border of oval beading, having a square tablet for an inscription attached to it. At another, the border still represented beading, but was octagonal in form. Again, we see circular borders and square ones inclosing smaller squares. Another kind consists of parallel-gramical borders of little roses, and of orna-

ment and flowers mixed; and a further variety consists of three sides of a square with a semi-circular head. Many of the ovals are finished with the coats of arms of the persons represented, the name and title of the individuals being given in Latin below. Altogether, the variety of modes of bordering engravings is not the least interesting part of the instruction conveyed. The back-grounds, too, are a study in themselves. We may see that the now inevitable curtain and the column crept in two hundred years ago. A rich heavy curtain, fastened in festoons, with tassels tossed high in air by the action of a very high wind, which appears to have curiously prevailed in the chambers of most princes, is another favourite back-ground. Many, however, are quite plain.

The earliest engraver represented is Philip Thomassin, born 1536, of whom Evelyn wrote,— "His labours are worthy of eternity, so excellent was his choice, so accurate his graver." But one example is given of this artist, "The Discussion on the Holy Sacrament," after Raffaello. There are, however, ten specimens of the power of his pupil, the next master, James Callot (1593).

This artist executed 1,480 etchings, notwithstanding that his death took place when he was only forty-three years old, from which we may learn how much industry bears upon success. No engraver has reached a greater popularity than this artist, and many collectors reject all works previous to his. The specimens chosen comprise his celebrated set of four pieces representing the gipsy life with which he made himself acquainted by joining a company of Bohemians when he left his father's house at twelve years of age to study in Italy. "The Parterre of the Carden of Nancy," "The Great Miseries of War," in a set of eighteen pieces; "The Martyrdom of St. Sebastian," "View of the Louvre," "The Hunt," "The Massacre of the Innocents," and "The Miracle of St. Mansuy." They, perhaps, show as well as any other selection could have done his great versatility and facility of expression of feeling. The last-mentioned example has given rise to much discussion and criticism, and the compilers of the catalogue point out that Meaume, in his "*Recherches sur la Vie et les Ouvrages de Jacques Callot*," describes it in six pages of closely printed matter.

A couple of illustrations of Karl Andran, and one of Michael Lasse, bring us to the works of another luminary in art, Claude Lorraine. One of the examples exhibited, "L'Enlèvement d'Europe," was formerly in the possession of Queen Charlotte,—a circumstance we record to mark the esteem in which the etchings of this artist are held, every plate being eagerly sought up and held as the choicest ornament of the best collections. An impression of "The Cowherd" is given, that was made before a small bird seated on a branch of a tree was covered by a light cloud in subsequent copies, this distinction marking the extra rarity of the plate. In the same way "The Setting Sun" has additional interest because it is "an impression before the corners were rounded." Claude Mellan, of whom it was said that "his men have character and his women grace," is the next master whose life-work is indicated. His style differs from that of his predecessors and contemporaries, from his adoption of a new mode of working, using no cross-strokes, and relying only on a single line for all his effects. His celebrated "Face of Christ," called the "Sadarium," is among the selected examples. The curiosity of this work consists in the fact that it is executed by a single spiral line, begun at the extremity of the nose and continued until the whole face was finished. Cried Evelyn, in his rapturous way, "Who has not hevel with admiration the incomparable hurn of Claudius Mellan? The "Sadarium" is a prodigy of his rare art and invention, because it is wholly new and performed with admirable dexterity." With a single example from Pierre Daret (1610) we are introduced to the works of John Morin. This master used dots and strokes in his plates, and finished his subjects off in a heading-like outline of an octagonal form. The portraits exhibited do not give the hands of his sitters. There are seven specimens, six of which are portraits, of which that of John Peter Canus, "*Episcopus de Balley*," is particularly vigorous. The works of the next master on the walls, Pierre Lombart, are quite different in their treatment. In his portraits, he shows much more of his subject, following the examples of Vandyck, but, many of whose paintings were engraved, and finishes them off with oblong borders of flowers and ornament

in different designs. Seven examples are given of his manner, all being portraits of English celebrities, after Vandyck. It is in some of these that the column and curtain first find footing.

Giles Ronselet, in due chronological order, is next represented by three engravings, the "Dead Christ in the Lap of the Virgin," after Annibal Caracci, "Sibille Hellespontique," and "Sibille Cymariene;" and is followed by the "Works of Mercy," of the friend and pupil of Claude, Sebastien Bourdon. Francis Poilly, whom Strutt pronounced one of the most skilful artists in the management of the graver that France ever produced, is laid under contribution for three subjects,— "The Flight into Egypt," with an angel strewing flowers, after Guido Reni, a feathery, flowery work, we should pronounce more thoroughly French than any yet mentioned; a "Holy Family," after Sebastian Bourdon; and the "Marriage of St. Catherine." Twelve specimens mark the popular appreciation of the next master, Gerard Edelinck (1627). He is believed never to have used the point, the graver being his only implement of manipulation. We must point out two of his portraits. First, that of "Jules Harlouin Mansart," after Rigaud, the superintendent of the king's edifices, and architect of Versailles, who is seated before a background composed of rich drapery, tied up with enormous tasselled cords, and a large column. His flowing wig and velvet clothing, his point lace cravat, and riband and star dangling from his neck, are an expression of sumptuousness that it must be mortification for modern architects to inspect. The second example is that of the wife of M. Claude Heloyt, *décédée à Paris, 1662*. She is looking up to heaven, and holding a crucifix close below her chin, as though she had but just removed it from her lips. The expression of this face will haunt any one who looks upon it: such intensity of loving worship must move the coldest soul.

We pass over the next engraver, John Edelinck, whose one work exhibited has been deemed worthy of the supposition of material assistance from his brother, and come to the twenty-four examples selected from the hurn of Robert Nantein (1630). This artist was patronised by Louis XIV., whose portrait he had painted and engraved, and it was through his influence that the monarch issued the decree that gave engraving the same rank as other fine arts. Like Callot, he died early; but he has left proof of his industry in eighteen historical subjects and 216 portraits. Louis created him keeper of the engravings of the royal cabinet, to which newly-made office he added a pension of 1,000 livres. Most of his portraits are finished as ovals, to which is attached a tablet for inscriptions. Stephen Picart (1631), Claudine Bonsemet Stella (1634), William Valet (1636), are represented by one work each. It might have been some encouragement to female artists to have seen a greater appreciation of Mlle. Stella manifested in a larger selection from her works, especially as M. Watelet places her at the head of female engravers. A "Holy Family," after N. Ponsin, many of whose works she engraved, is the subject exhibited. A much larger value is placed upon the work of Anthony Masson, who is represented by fourteen plates. There is one of the portraits by this artist that will return again and again to the mind's eye, like that of Madame Heloyt. It is that of William de Brisacier, known by the name of the Crey-headed Man. The armour, the point-lace, the hair, and indeed every detail by this artist are marvellous; but in this instance the beautiful scanty luminous white hair is nothing less than a miracle of art. Dumesnil, the French art-critic, writing of this print, says, "One can tell the complexion of this man; we feel, as it were, the lightness of his beautiful grey hair, while his collar appears to be indubitably real lace." And Strutt, dwelling upon its beauties, says, "No one who has not seen and examined it can form an idea adequate to its singular merit." Those unable to realize the preciousness of this work will best rise to an appreciation of it by trying to do likewise. Those better skilled will best esteem it. Masson is believed to have worked in a manner the reverse of that commonly practised. Instead of moving his graver, he held it fast and still, and moved, instead, the plate with his left hand. His portraits are principally large ovals, with branches and laurels proceeding from the base in both directions. But a more prolific artist than any yet mentioned was ushered on to the

stage, 1637. Sebastian Le Clerc is said to have executed 3,000 plates. He was, besides, an architect and mathematician, and professor of perspective in the Academy Royal de Paris. Of this large amount of industry and learning, one example only is given by Mr. Dove, or those whom he entrusted with the selection, "The Apotheosis of Isis." But one example, too, is given of Charles Simonneau the Elder (1639), notwithstanding he has the reputation, like the Admirable Crichton, of having excelled in everything he did. Gerard Andran (1640) is more popular. It was of this artist that Le Brin said, in his case engraving embellished painting. Watelet also observed that he seemed to have painted with the point and the graver, so much did his works present the ease and facility of the brush, and strut places him, without any reservation, at the head of historical engravers. Two martyrdoms, those of St. Agnes and St. Lawrence, "The Death of St. Francis," "The Judgment of Solomon," and "The Preservation of the Young Pyrrhus," are the *chefs-d'œuvre* selected as specimens of the powers of one whom Basan calls, to give one further enigma, the Raffaele and Rubens of engraving in France.

"The Three Maries at the Tomb," after Carracci, place Jean Louis Ronlet before the bar of posterity. Sir Nicholas Dorigny (1657), who came to England in 1771, to engrave the cartoons of Raffaele, at Hampton Court, and whose prints are considered the best copies we have of some of them, is represented by a "Cupola in Rome," after Domenichino. The catalogue states that he studied the great masters of Italy for twenty-eight years. Such a length of probationary study should have insured him more distinctive recognition, if time be a good teacher. However, there are other artists who have been obliged to be dismissed in the same summary fashion, for want of space. Gaspar Duchange, Pierre Drevet, Antoine Trouvain, John Andran, Nicolas Henri Tardieu, Nicolas Edelneck, are but recognised with a similar short measure, notwithstanding that the latter engraved Philip, Duke of Orleans, on horseback, with considerable spirit. A portrait of Margaret Beccalle, widow of Maximilian Titon (foundress, with her husband of the Convent des Dames Hospitalières de l'Ordre de St. Augustin à St. Mandé), is the more noticeable of two examples of Louis Desplaces (1682). Michael Dossier (1684), Charles Dupuis (1685), and Louis Strugue (1695), are cited just to make one bow and depart, to make the links in the chain perfect; and then Pierre Drevet, jun. (1697), is cordially recognised. Ten specimens of his portraits are given. They are especially admired for the fidelity with which hair, point-face, and ermine are rendered. Huber says it is impossible to examine his portrait of Bossuet, Bishop of Meaux, without astonishment. That of Cardinal Dubois, in a sitting posture, with an envelope in his hand addressed "Au Roy," before a background of drapery drawn up like velvet sails, with cordage of gold, is truly a superb performance; and those of Samuel Bernard, counsellor of state; Robert de Cotte, architect to the king; Antonius Portal, Nicholas Boileau, Ludovicus Augustus Dombaram Princeps, Charles Gaspard, Louis Henri de Bourbon and Louis Alexandre de Bourbon, Comte de Toulouse, can scarcely be considered less so. Louis Gerard Scotin (1690), who worked for a long time in this country, is represented by his "Birth of Adonis." Bernard Lepicie (1699), who was likewise employed for years here; John Haussart (1700), and Laurent Cars (1702) usier in a new century. A portrait of the celebrated Madame de Clisson, in the character of "Medea," represents the last-named artist.

Five examples are given of John Danlé (1708), portraits of Catharino Mignard, Mlle. Pelissier; D. Monette, painter, with a towel cap on his head and his hand up and finger pointed, as though listening to something he can hear through his open chamber-window; M. de Nesuer; and a "Bacchanalian Fête." After Rembrandt, Jacques Philippe le Bas (1708) was the first artist who made copious use of the dry point: a proof, after Teniers, of "Flemish Rejoicings," and "Le Chasseur Fortuné," have been selected from his numerous works as examples of his striking touch, and life and grace. One piece only of the work of J. Moyrean (1712) is shown; and only two specimens are given of the very astonishing powers of J. J. Ballechon (1715). His portrait of Charles Rollin, the eminent historian, seated in a black silk habit, with pen in one hand, and the other extended towards some books on a writing-table before him, over

which and the arm of his chair the rich folds of some heavy drapery have fallen is especially noticeable for freedom and vigour. The eminence attained by a contemporary, John George Wille (1717) is exhibited, in thirteen selections. His satins are considered matchless in their execution; and his "Death of Cleopatra," exemplifies his facility in this respect very admirably. Some of this artist's pieces are in the form of three sides of a square, with a semi-circular head. His "School-mistress," and other small portraits, are in square, broad beading-like borders. Three single pieces, "Maria, Princess of Poland," "Diana and Acteon," and "La Foueni au Village," represent as many artists.—J. M. Tardieu, D. Sornique, and P. F. Basan; the latter is known to have executed 450 prints. Six fine examples are given of the etchings of Antoine Marenay de Ghny (1725), one of the most successful of the imitators of Rembrandt, and three of J. J. Boisseau, another follower of the same great painter. The "Coopers in a Wine Cellar," by the last engraver, is an admirable specimen of an artist whose prints are allowed to form an epoch in the history of engraving with the dry point.

The mannerism of P. F. Charpentier (1730), the originator of a new method of aqua-tinto, is shown in his "Industrious Fishers." The remaining selections are single and dual examples of the workmanship of Halbout, Cathelin, Pelletier, Tellard, Denon, the *manière grignolée* of Viehl, Bervic, Desnoyers, and Dupont. The fine engraving of the full-length portrait of the first Napoleon, in his imperial robes and crown of laurel-leaves, after Gerard, has made the name of Augustin Louis Boucher Desnoyers familiar to many besides collectors.

We have thus faintly indicated the nature of the feast to which Mr. Dove has liberally invited the public. The workmanship and industry of fifty-nine artists in one particular branch, extending over a period of two centuries of time, is laid out in one view. We may mark the gradual phases through which the art of engraving has passed from the days of Thomassin to those of Dupont, the mannerisms and fashions that came in and went out again, and the main distinctions that separate this French school from others, with an ease which is seldom within reach. The hanging deserves a word of acknowledgment, none of the prints being out of sight, over head, or on the ground. We cordially echo the sentiment of the committee, "These works are lent for public enjoyment. It is hoped they will meet with public protection," as well as that of the Abbé Marolles, quoted nearly two centuries ago by Evelyn, and now prefixed to the catalogue, which we have before mentioned.—"This curiosity [collecting of prints] I affected from my youth, preferring it even before paintings, for which yet I have infinite esteem; not only for that they are more proportionate to my purse, but because they better become our libraries."

#### RAILWAYS AND IMPROVEMENTS IN LONDON.

THE frequent publication of maps of London and the suburbs, showing the railways, is now a necessity to those who have to move much about the metropolis. The lines of railway are becoming so numerous, and their arrangement presents itself with so much intricacy, that it is impossible, without a map, to disentangle the lines, and arrive at the position of judging what are the advantages that they offer. Mr. Stanford's periodic issue, after each session of Parliament, of his map showing lines in operation, lines sanctioned previous to the last session, and those sanctioned in that session, therefore constitutes an essential service rendered.\* The map is given to a scale of one inch to a mile; and a portion of the metropolis extending from the River Lea and Greenwich, eastward, to King's Cross and the Palace of Westminster westward, is shown on the scale of two inches; so that such a knot as is planned to occupy the ground between Deptford, New Cross, and Rotherhithe, may be, by possibility, unravelled, and the threads there connected with their continuations.

\* "A New Map of Railways and Miscellaneous Improvements sanctioned in 1865, also the Railways in Operation, and those sanctioned before 1865; London and Ten Miles Around; accompanied by a List of the Plans numbered to correspond with this Map, and with the Private Bill Office List." London: E. Stanford; Vacher & Sons; Letts & Co. August 10th, 1865.

Amongst the lines recently opened, may be mentioned the two branches from Twickenham on the Windsor line of the South-Western Railway,—the one, the Thames Valley Railway, serving Hampton, Sunbury, and Halford,—and the other the Twickenham and Kingston line, serving Teddington, Hampton Wick and Norbiton near Kingston; the Mid-Kent line to Croydon; the Crystal Palace High-level line; and the line from Sutton to Epsom Downs. Amongst the more important lines in progress, of those sanctioned before 1865, is the more direct route to Sutton and Epsom Downs, from London Bridge. This line, for which, together with that for South London, a large extension of the London Bridge Station is being made, runs parallel with the Greenwich line for some distance, and then passes by Peckham, Denmark-hill, Dulwich, Streatham, Mitcham, and Carshalton, to Sutton. It has junctions with the lines that it intersects; which, as existing, are the London, Chatham, and Dover main line, the Crystal Palace line, the Barking and Croydon, the Wimbledon and Croydon, and the Croydon and Epsom. From Peckham, or Denmark-hill, the South London branch extends past Brixton to the London, Chatham, and Dover line, which starts from the Victoria Station; and between the Battersea Park and Wandsworth-road stations, and westward to Clapham Junction, sundry lengths of viaduct are in progress, having some relation with the widening of the railway bridge, and with the buildings that have just risen up on the Bliddelex side; but which lines cannot here be allotted, unless guessingly, to either company. The traffic of the Crystal Palace High-level line at present converges from the Ludgate-hill and Victoria Stations to Brixton; but the Ludgate-hill traffic will shortly branch off from a point south of Walworth, and join the other traffic at Peckham Rye. From Peckham Rye there will be a direct route to Greenwich; and this last will have a junction with the North Kent line, which is intersected. From the Tunbridge line there will be a branch to Dartford,—a great loop, in fact, to the North Kent. From Streatham, in the direction of the Merton and Wimbledon Station on the South-Western line, there will be a line which after a short distance will be divided into two branches, one taking a northward and the other a southward route to the same station.

North of the Thames, the chief lines in hand are the Midland Railway, which starts from King's Cross, near the Great Northern, and has a junction, *via* Wilton, with the Great Western and the North and South Western Junction, at East Acton; the Edgware, Highgate, and London line; the Watford Junction, and the short branch to Muswell Hill and Alexandra Park; the Tottenham and Hampstead Junction; and the Great Eastern line from the main line at Bethnal-green to Edmonton, and a line from Stratford to High Beech, the two latter lines joined by one from Dalston passing by Walthamstow. Besides these there are, better known, the extension of the Metropolitan Railway, the line connecting the Charing Cross with the London and North-Western Railway, and the City Branch of the North London. We have omitted to mention a line from Hammersmith to Turnham-green; and one, joined by the other, from Acton-green on the North and South-Western Junction Railway, to Richmond.

The lines sanctioned last session, if we except the Hornsey and Hertford branch of the Great Northern, and the Surrey and Sussex Junction, which last starts from a little beyond Croydon, are to be regarded chiefly as filling up short breaks in the system. The lines include the Acton and Brentford, the East London (Thames Tunnel line); the Edgware, Highgate, and London Junction with Tottenham and Hampstead Junction; the Hammersmith and Fulham; the Tottenham to Winchmore-hill, and the Edmonton to Enfield Armony, branches of the Great Eastern; the Millwall Dogs; a line from North to Malden on the South-Western; various short connexions of the London, Chatham, and Dover, and of the London and Brighton lines; the Metropolitan and St. John's Wood Extension to Hampstead; the North London, Highgate, and Alexandra Park; and the Waterloo and Whitehall line.

Miscellaneous Improvements sanctioned by Parliament in 1865, have their localities marked on the map. They include works in connexion with the Courts of Justice Concentration, the General Post Office, Hyde Park Gate Estate, India Office Site and Approaches, and Public Offices Site and Approaches; the Metropolis

Sowago and Essex Reclamation, Regent's Canal (Limehouse Basin), Saint Clement Danes Improvement, West London Wharves and Warehouses, Westminster Improvements, and White-chapel and Holborn Improvements.

If Mr. Stanford should be able to keep his large Map of London posted up from year to year, both as to buildings and routes, on the same principle as he adopts in the publication that we have noticed, he will be a public benefactor,—albeit the duty would be inappropriately be undertaken by the Metropolitan Board of Works. A perfect map of London, added to and corrected each year, and stamped with the highest authority, should be generally procurable. Mr. Stanford certainly has done much to supply the want.

#### THE SCOTISH NATIONAL MEMORIAL OF THE PRINCE CONSORT.

The memorial committee have appointed an executive committee with authority to have the memorial erected according to the design approved of by her Majesty, and under the arrangements made by the acting committee. A design for an equestrian statue of the Prince, surrounded by groups of figures, by Mr. John Steell, R.S.A., her Majesty's sculptor for Scotland, has met with the royal approval, and is now being carried out. In making his design, Mr. Steell had in view several sites, but he gave preference to one in the park, immediately adjoining Holyrood; and this site was approved of by her Majesty. It is situated on the slightly rising ground to the east of Holyrood Palace, and is about 100 ft. north from the roadway. The monument, which will be 95 ft. in height, will be a conspicuous object in the view of Holyrood Palace from several points. On the north and north-west, it will be visible from the Calton Hill, Regent-road, and from the railroad at Arthur's Hill; on the west from Dumbiedykes; and on the south from the slopes of Arthur's Seat and adjacent eminences.

The memorial will consist of several stages rising from an oblong square platform measuring 24 ft. to 20 ft., and surrounded by an ornamental railing. On the substructure thus formed the equestrian statue will be placed. Mr. David Bryce, R.S.A., has been commissioned to carry out the architectural portion of the work. The Prince will be represented in the uniform of a field-marshal. All the sculpture will be in bronze, and the pedestal and platform in Binny stone. The panels of the upper stage of the pedestal are to be filled with illustrations in alto-relief of incidents in the life of the Prince. On the centre of each side of the stage below that just described rests a group of Classic emblems, indicative of the tastes and pursuits of the Prince. Two of these groups will be executed by Mr. W. Brodie, and two by Mr. Handyside Ritchie. The groups on the angles of the base have been assigned respectively to Mr. Steell, Mr. Brodie, Mr. Clark Stanton, and Mr. George Maccallum. It is intended to submit these groups for her Majesty's approval.

#### CONDITION OF GALASHIELS.

A MEETING of the commissioners of police for the burgh has been held, to receive reports regarding the sanitary condition of the town from a committee appointed by the Board to make inquiry. The town having been divided into four districts, a report from each was read. The reports from the whole four divisions were very similar in character,—pig-styes abounding to a great extent, many of them in close proximity to dwelling-houses in crowded localities; while dung-heaps and accumulations of all sorts of filth, bad and broken drains, were more or less prevalent in all the districts. After a long discussion, in which it was regretted the Police Act was so vague and loose on what constituted a nuisance, and the powers to remove the same, it was ultimately resolved to issue a proclamation ordering the removal of all pig-styes when situated within 20 yards of any dwelling-house or street, and that within six days after the issuing of such proclamation; and in the event of any owner of such pig-stye neglecting or refusing to remove the same, that steps at once be taken to prosecute the offenders.

#### OUT AND ABOUT: IN DERBYSHIRE.

An enthusiastic reader says, why do you not show us the little panels you mentioned as in the dining-room at Haddon; you had a graver in your hand as well as a pen and a press, and can surely do so if you like? Well, good reader, as you manifest so much interest in our ramblings and jottings, here they are, as well as we can draw them from two slight and hasty rubbings made with a little scraped lead from a pencil, for want of better materials. And this may lead to the remark, that it is desirable when rambling about the country that the visitor should always have with him a piece of heel-ball and some sheets of soft paper. To the student, one careful sketch is more beneficial than a dozen rubbings; but time will not always permit this, and, moreover, the object may be collection rather than study or practice with the pencil. The size of the Haddon knots is about 7 inches over: their ingenuity and elegance are obvious. But we must get on. To pleasant Rowsley and its quiet ancient inn, whence Haddon and Chatsworth have been visited, we must bid adieu, first mentioning, as a thing to be seen before taking to the rail (to go a little backwards), to Matlock, the Druidical circle, about seven miles off. This is on a bill known as Arher Low, whence a good view may be obtained, unless it should happen to rain, as it did when we were there. Ye powers! how it did rain, and how it did blow! To stand on the edge of the vallum was scarcely possible,—to examine the ancient monument, quite so. The vallum and ditch are tolerably perfect; the stones, about thirty in number originally, are all flat, and much worn, some of them almost to a point. Two that we measured in the storm were about 11 ft. long. The diameter of the circle is perhaps 150 ft. Who shall rightly tell its antiquity? At any rate, here Jupiter and Apollo, under other names, were worshipped long and long before the Romans came to help to make Britain what it now is. A harrow may be noticed hard by; and in the neighbourhood are various mines. The richness of Derbyshire in coals, lead, harytes, iron, limestone, marbles, china stone, potter's clay, slate, spar, zinc, and so on, is very great; about 7,000 hands are employed in getting them. The stone walls loosely put together without mortar, used to divide the fields: the stones often gathered from the face of the land, form a striking feature of part of the county, and at times give a dry and uninteresting aspect. For protection's sake and warmth in respect of the cattle, these division-walls occur very closely together, in the oldest lines, and following the dip and rise of the land in parts so acutely as to take the shape of inverted arches.

Of Matlock and Matlock Bath we shall stop to say little beyond advising the landowners and those concerned to exercise some control over the houses that are being built there. The river should also have attention. Its condition at certain states of the weather is very unsatisfactory. The place, beautiful exceedingly as it is by nature, is vulgarised by its common, tasteless structures and the constant inpouring of excursionists. As to the latter, however, the desire all must feel that our mill-bands and others should have opportunities put within their reach of healthful, invigorating, intelligence-giving recreation, will prevent complaint or regret. A large building with four towers is being erected on the summit of one of the hills here, for an additional hydropathic establishment. Seen from all sides, its purpose is asked by every one approaching the place, and it thus serves as an immense advertisement. This would be equally the case if its outline were less abominably vulgar. The natural scenery of Matlock is charming,—hills, trees, and rocks, with a river at the foot,—High Tor, Masson Low, and the Black Rocks. But of this and of the remarkable caverns these bills contain, and of the bubbling streams and tufa-bearing waters that have their origin in them, every one has heard:—

"Where, as proud Masson rises rude and bleak,  
And with misshapen torrets crests the Peak,  
Old Matlock gazes, with marble jaws beneath,  
And o'er scard' Drwmet bends his flinty teeth;  
Deep in wide caves below the dangerous soil,  
Blue sulphurs flame, imprison'd waters boil."

The rail, with a loop, carries us to Chesterfield, to serve as a point of departure for Hardwick Hall and Bolsover Castle, which may be visited in one excursion, the distances being less than Black's very poor "Guide to Derbyshire" states them to be. From Chesterfield to Hard-

wick is eight miles, from Hardwick to Bolsover three or four miles, and thence back to Chesterfield may be called six miles. The church at Chesterfield is known by a great distortion. It used to be said of a somewhat celebrated Sussex town,—

"Proud Petworth; poor people;  
High church; crooked steeple."

But the crookedness there, now removed, was nothing to the crookedness of Chesterfield spire, which is an ugly abomination, and ought to be set right: the contemplation of it must have an effect on the taste and moral character of the town, giving, as it must do, a twist to the mind, and blunting the perception for the true. Some have been found to maintain that the spire was purposely thus formed (it is of timber covered with lead); but we may be sure this idea is erroneous: the old builders were much too wise to construct such an ugly and damaging object. The sun and the wind are doubtless the culprits. We shall hope to bear before long that the defect, long-standing as it may be, has been remedied. The interior of the church is very handsome; the tower-arches and the lofty arcade on each side of the chancel giving a fine effect to that end of the building; saying nothing of the carved wood screen canopied on both sides, and some sixteenth century monuments interesting in respect of costume.

The appearance of Hardwick on approaching it is very singular, and shows the literal truth of an old local saying: "Hardwick Hall, more window than wall." The front, in fact, is little more than mullions filled in with glass: the windows on the first floor lighting the picture-gallery, for example, are 20 feet high. We are speaking now of the "new" house, if the term may be used, the house built by our Countess of Shrewsbury before named, the noted Bess. The estate was part of her dower when she married Sir William Cavendish. The existing house was not handed-on enough for her, so a new one was built close by, and there they both stand pretty nearly as she left them; the new one an Elizabethan residence unmeddled with. The open work of the parapets of the towers takes the form in all parts of her initials, E. S. (Elizabeth, Countess of Shrewsbury), under a coronet. The great entrance-hall is lofty and light, but shows little architectural taste. The various rooms contain the furniture of their time, large quantities of tapestry, some of it particularly good, and many interesting portraits. The dining-room has on the mantelpiece the date 1597, with the initials E. S.

There are reminiscences in the house of Mary Queen of Scots, of whom the Earl of Shrewsbury, between 1568 and 1584, had charge, though it seems doubtful if Mary ever occupied rooms in the present building. The furniture that belonged to her, now there, may have been brought either from the old house or from Chatsworth. In what is called the State Room, a noble apartment with a fine bay, the upper part of the walls all round is adorned with groups in relief, including Diana and a Stag-hunt, some of them being painted. The great feature, however, of this baronial residence internally is the picture gallery before alluded to, about 170 ft. in length, 22 ft. wide, and 26 ft. in height, and containing some 170 portraits of men and women, mostly of the Elizabethan period or connected with the house of Cavendish. On the portrait of one of the latter appears the touching exclamation, "*Hou prisca fides!*" Walking through this remarkable apartment, Queen Elizabeth in her power, Mary Stuart in her captivity, Lady Jane Grey in her simplicity, the first Duke of Devonshire in his elevation, the clever and Jesuitical Hobbes, fit past the mental vision in their habits as they lived. The world seems but a meeting-place for shadows that come and go.

At Hardwick, as at Chatsworth, the young person who showed us through the rooms knew nothing whatever as to the subjects of the pictures or the painters of them. There was a private catalogue, it was said, but that was locked up. We fully appreciate the public service rendered by the Duke of Devonshire, in allowing this and his other noble houses and collections to be seen at all; but we would put it to his Grace, with the greatest respect and consideration, whether it would not be wise to enable visitors to see them effectively, and so to a better end. A few printed lists in the rooms, or, better still, a small tablet under each picture, stating the subject and the painter's name, would make want of intelligence on the part of the guides of less consequence. Again,

PANELS IN THE PRIVATE DINING ROOM, HADDON HALL. A.D. 1545.

why should these guides be instructed to say to any visitor who may take out a pencil, "No sketching is allowed?" Surely the Duke can scarcely be aware that this is the case?

And now, driver, on to Bolsover Castle. As part of this pile has become the residence of a private individual, the Rev. John Hamilton Gray, admittance to the whole is not usually obtainable without introduction, a regrettable circumstance, the place being very curious. Its history, to be didactic for a few minutes, is this. Soon after the Conquest, a castle was built here, where it seems just possible that an earlier stronghold had previously stood. The manor had been granted by the king to the William Peveril of whom we have already heard, and by him or his successor the castle was erected. In the reign of Henry II., one of the Peverils committed a crime, and the castle came into the hands of the Crown, and so remained for a long time. It underwent sieges, and had troubles. In the reign of King John the castle was fortified against the Barons. Many vicissitudes followed; the castle was granted to various persons, and, reverting to the Crown, was made over by King Edward VI. to that Lord Talbot who was afterwards sixth Earl of Shrewsbury. And now comes in our Boss of Hardwick again; for, marrying the earl, she set to work to rebuild Bolsover, and it was during the suspension of the works here, in 1607, through frost, that she died. Her second son, Sir Charles Cavendish, finished in 1616 what she had begun, and this is the now inhabited building, a curious Elizabethan and Jacobean restoration of a Norman castle. It is a square castellated structure, four stories in height, with a turret at each corner, and a high tower. In addition Sir Charles commenced, and his son William, who became Marquis of Newcastle, finished, some magnificent apartments adjoining and a remarkable riding-school, and in 1633 and 1634 entertained King Charles I. at enormous cost. Ben Jonson's masque, "Love's Welcome," was written for the occasion. Then came civil war and neglect; and about the year 1740, the second range of buildings of which we have spoken, was unroofed, and has so remained ever since,—a picturesque ruin, maintained by the Duke of Portland, who represents, in the female line, the Dukes of Newcastle, of the race of Cavendish. The picture-gallery or banquetting-hall, in the unroofed part, is 222 feet long and about 21 feet wide, a remarkable apartment; the character or style of design, too, is very curious, and worth studying. Externally, a debased

kind of Tudor column projects at intervals from the wall, and is carried on a corbel!

The castellated building, now a dwelling, as we have said, has a "star chamber," with hilt roof sprinkled with gold stars in imitation of the well-known Star Chamber of Westminster. One of the apartments is called "Heaven," from the paintings that decorate it; and another, "Hell." The former, like some other rooms in the building, has a hooded chimney-piece, carved in plan, inlaid, and very handsome. Drawings of these would be useful. The building is fitted up by its present occupants in a fitting and appropriate manner. Mrs. Gray is known as the authoress of "A Tour to the Sepulchres of Etruria," and several other works; and one of the rooms contains a fine collection of antique vases referred to in her books.

The view from the rampart which surrounds the old garden, whence are seen the ancient fortifications of the town, and that from the top of the tower, are remarkably fine. The latter includes the tower of Lincoln Cathedral, one of those elevated spots used, even as late as the seventeenth century, to rouse the surrounding country by means of beacons. Some of the hills and towers so employed in connexion one with another have been bound together in rhyme:—

"So on and on, without a pause, untired they bounded still,  
All night from tower to tower they sprang; they sprang from hill to hill;  
Till the proud peak unfur'd the flag o'er Darwin's rocky dale,  
Till like volcanoes flared to Heaven the stormy hills of Wales,  
Till twelve fair counties saw the blaze on Malvern's lonely height,  
Till stream'd in crimson on the wind the Wrekin's crest of light,  
Till broad and fierce the star came forth on Ely's stately fane,  
And tower and hamlet rose in arms o'er all the boundless plain;  
Till Belvoir's lordly terraces the sign to Lincoln sent,  
And Lincoln sped the message on o'er the wide vale of Trent;  
Till Skiddaw saw the fire that burn'd on Gaunt's embattled pile,  
And the red glare on Skiddaw roused the burghers of Carlisle."

In Bolsover Church, part of which is Norman, there is a costly monument to Sir Charles Cavendish and his family; and one larger and more elaborate, including columns, pediment, and figures, to Henry Cavendish, Duke of Newcastle. If the inscription is to be believed, Charles Cavendish (he was the son of our "Boss") had all the virtues known or gessed at. On the

north side of the chancel there is an interesting piece of sculpture, about 5 feet long and 3 feet in height, representing the Nativity. It includes Mary with the Infant Christ, Elizabeth and Joseph. The heads of two bulls are seen over the manger. This is pointed to on the spot as early Norman work, and is so described in the most recent Guide. In truth, however, it is a work of the early part of the fourteenth century. Those who require proof of this beyond the general character of the sculpture, may look to the tracery on the censor the boy is swinging. A small carving of the Crucifixion, outside, over the priest's door in the chancel, is probably Norman. The stone of Bolsover Moor, it will be remembered, was that which the commissioners who went out to find the best stone for the new Houses of Parliament recommended for that purpose; though, after all, it was not used. We will now cross the country to the neighbourhood of the Peak proper.

#### HIGH ALTAR, ST. ALPHONSUS' (R.C.) CHURCH, LIMERICK.

This sumptuous piece of ecclesiastical work is now in course of erection in the abovenamed church. The materials are Caen stone and Irish marbles, with a new feature, in the shape of panels of gilt and enamelled copper and brass work, and bosses of crystal in metal settings. The six angels are fine works from the workshop of Mr. Bonilton, the well-known sculptor, of Worcester: they bear the emblematical types of the Passion of our Lord, and are life-size. The general execution of the work has been entrusted to Mr. Earp, who is fully sustaining his reputation. The central canopy rises to a height of 37 ft., which will give some idea of the scale of the whole design. Messrs. Peard & Jackson have skillfully realised the architect's designs, as regards the metallic enrichments just now mentioned. Mr. Scannell, of Cork, supplied the marble shafts. The cost of the work fixed is \$500. This is the gift of one generous individual, who, not content with such a work of personal devotion and liberality, has also presented a communion-rail of marble, metal, and carved stone work, also in course of execution, and we believe, proposes to carry out other works. The whole undertaking is in the hands of Mr. Goldie, as the architect.

HIGH ALTAR, ST. ALPHONSUS' (R.C.) CHURCH, LIMERICK, IRELAND.—MR. G. GOLDIE, ARCHITECT.

## MANUFACTURE OF CAST STEEL.

In the Mechanical Section of the British Association meeting at Birmingham, Mr. H. Bessemer read a paper "On the Manufacture of Cast Steel: its Progress and Employment as a substitute for Wrought Iron."

The paper opened with a review of the inventions which had finally resulted in the establishment of "Bessemer" ironworks throughout the country. It pointed out at some length how the disadvantage of the old fixed converting vessel was remedied, and other improvements introduced. Up to this period the manufacture of cast steel by the old as well as the new process was still so far imperfect that steel of the highest quality could not be made from inferior iron. In 1839, the trade of Sheffield received an enormous impulse from the invention of Josiah Heath, who patented in this country the employment of metallic manganese, or, as he called it, "carburet of manganese." The addition of a small quantity of this metal, say from  $\frac{1}{4}$  to 1 per cent., rendered the inferior coke-made iron of this country available for making cast steel. It removed from these inferior qualities of iron their red shortness, and conferred on the cast steel so made the property of welding and working soundly under the hammer. The reading of Mr. Bessemer's paper on the subject, at Cheltenham, in 1856, led to great expectations as to the value of his process, and licenses to manufacture malleable iron, under the patent, were purchased by ironmasters, to the extent of 25,000*l.*, in less than twenty-five days from the reading of the Cheltenham paper. Great excitement existed at the moment in the iron trade, and many persons seemed to covet a share in an invention that promised so much. There was consequently a general rush to the Patent Office. Some of the gentlemen who applied even repented some of the author's own patents, while others patented things in daily use, in order that they might be considered new, when added to the products of the new process. The paper described the features of the numerous patents applied for within six weeks of the reading of the paper at Cheltenham, and remarked that if that long series of patents could have been sustained in law, it would have been utterly impossible for the author to have employed manganese with steel made by his process, although it was considered by the trade to be impossible to make steel from coke-made iron without it.

Soon after the reading of the Cheltenham paper, several rough trials of the Bessemer process were made privately, by persons in the iron trade, and defects discovered which were supposed by practical men to be perfectly fatal to the invention. The press then spoke of the utter impracticability of the process, and of regret that the high expectations originally formed were so fallacious. [Speaking for ourselves, the *Builder* must here be excepted, since we never for a moment lost confidence in the final success of the Bessemer process; but the storm gradually subsided, and the process and its author were soon nearly forgotten. Imperfections in the process there certainly were, but the author had had the most irrefragable proof of the correctness of the theory on which his invention was based, and also that the reasoning on which it was so utterly condemned by the trade was in itself wholly fallacious. He therefore decided not to argue the question against a hundred pens, but to energetically prosecute his experiments, and to remain silent until he could bring the process to a commercial success. When, at the expiration of three years of incessant labour on the part of himself and his partner, Mr. Longson, and an expenditure of more than 10,000*l.*, the process was again brought before the public, not the slightest interest was manifested by the trade. This was discouraging, and one of two things became imperative; either the invention must be abandoned, or the writer must become a steel manufacturer. The latter alternative was unhesitatingly accepted, and Messrs. Henry Bessemer & Co. determined to erect steel works at Sheffield, in the very heart of the stronghold of steel-making. At these works the process had ever since been successfully carried on: it had become a school where dozens of practical steel-makers received their first lessons in the new art, and was the germ from which the process has spread into every state in Europe, as well as to India and America.

By the time the new works at Sheffield had got into practical operation the invention had sunk so low in the public estimation, that it was not thought worth paying the 50*l.* due at the

expiration of three years on Mr. Mushet's large hatch of manganese patents. They were consequently allowed to lapse, and become public property. The author had therefore used without scruple any of the numerous patents for manganese without feeling an overwhelming sense of obligation to the patentee.

At the suggestion of the author, works for the production of manganese and alloys were erected by Mr. Henderson, at Glasgow, who now made a very pure alloy of iron and manganese, containing from 25 to 30 per cent. of the latter metal, and possessing many advantages over Spiegel Eisen, which it would doubtless replace.

Specimens of iron manufactured by this process and afterwards bent and tested in every way, were exhibited on a table in the room.

The paper proceeded to notice some of the more important applications of steel as a substitute for wrought-iron. In no case, it was pointed out, was this change of material more important than in the construction of ships, for in no instance were strength and lightness more essential. Bessemer cast-steel ship plates were then described, and their advantages illustrated by facts and statistics. The application of steel to projectiles was next considered. Next its uses for railway purposes, such as the manufacture of engine-cranks, axles, tires of wheels, and even rails. The paper described successful experiments which had been made in the use of cast-steel for these purposes. It concluded by stating that cast-steel was now being used as a substitute for iron to a great and rapidly-increasing extent.

There were now seventeen extensive Bessemer steel works in Great Britain. There were at present erected, and in course of erection, in England, no less than sixty converting vessels, each capable of producing from three to ten tons at a single charge. When in regular operation, these vessels were capable of producing fully 6,000 tons of steel weekly, or equal to fifteen times the entire production of cast-steel in Great Britain before the introduction of the Bessemer process.

The average selling price of this steel is at least 20*l.* per ton below the average price at which cast-steel was sold at the period mentioned. With the present means of production, therefore, a saving of no less than 6,240,000*l.* per annum might be effected in Great Britain alone, even in the present infant state of the steel manufacture.

At the conclusion of the paper a discussion took place, in which Mr. Wm. Fairhair, Sir Wm. Armstrong, Mr. Bramwell, and other gentlemen took part; and it was resolved that Mr. Bessemer's paper should be printed.

Although there have been much more brilliant meetings of the British Association, the Birmingham meeting has been an interesting and successful one.

## COALBROOKDALE.

DURING the recent meeting of the British Association for Science, a party of excursionists proceeded to Coalbrookdale, and were received at the station by Mr. G. Maw. Here, by the aid of diagrams, he briefly explained the geology of the district, and then conducted the party to Buildwas Abbey, which was described by the Rev. Mr. Wain, rector of Wenlock. After viewing the abbey, the geologists next inspected the drift beds adjacent. The old monks of Wenlock had here made their burial-ground, and recently vast numbers of skeletons had been exhumed from the drift; and Mr. Maw observed that, if the local geologists had not been extremely conscientious, they might have attempted to impose upon the scientific world, and have produced a large collection of Abbeville jaws. The party then divided into two sections, one of which, under the direction of Mr. Randle, went to inspect the fossiliferous beds at the base of the Wenlock shale, and the other went direct to Benthall Hall, where they were afterwards joined by the other section. Mr. Maw hospitably provided luncheon, to which ample justice was speedily done. The encaustic tile works of Messrs. Maw & Co. were next visited, and the various processes shown and explained. A piece of tessellated mosaic work, designed for the frieze of the India Offices in London, was in course of formation. Mr. Maw explained that such work in ancient examples, as in Granada, was never used except for walls; yet at the Crystal Palace it was to be seen laid as flooring. This mosaic work for the India Offices is the first piece of that kind of decoration which has

been used in this country. 50,000 pieces are contained in a single square yard, and in some parts there are four or five times that number. The works of the Coalbrookdale Iron Company, at a short distance, were then inspected; and, under the guidance of Mr. Crook, the visitors were made to comprehend the various processes of moulding, pouring the iron, and fitting up the various kinds of castings. A table-top was cast in their presence.

By invitation of the Severn Valley Field Club, not only the visitors to Coalbrookdale, but also those who, in the early part of the day, had been to Wroxeter to visit the remains of the ancient Roman city of Uriconium, assembled at dinner in the Literary and Scientific Institute. The dinner was presided over by Mr. Dickenson, of the Coalbrookdale Company. Professor Phillips, Lord Stanley, Mr. G. More, M.P.; Dr. Kirk, the coadjutor of Livingstone; Mr. Frank Buckland, Mr. Hepworth Dixon, and others, were present, and spoke in an appropriate manner to the several toasts to which they responded.

## THE ACTION OF SULPHIDE OF LEAD, WITH REFERENCE TO PICTURES.

IN the chemical section of the British Association for Science, Dr. D. S. Price read a paper "On the Action of Sulphide of Lead, and its bearing upon the Preservation of Paintings in Picture Galleries." The author had been led to an investigation of this subject by observing that in the glass cases at the Crystal Palace, which are painted with white lead, substances which emitted sulphurous vapours did not cause a darkening of the surface of the case, excepting where it was protected from the direct influence of the light. A number of experiments were subsequently tried on the action of light on sulphide of lead produced by the action of sulphuretted hydrogen on lead paint. A board painted with white lead was exposed for several hours to the action of sulphuretted hydrogen gas, until the surface had acquired a deep brown or chocolate colour. Glasses of different colours were then placed upon it. It was then exposed—one portion being at the same time covered with an opaque medium, and another left wholly exposed. The board which had been thus painted was exposed to the action of the light, and several impressions were photographed by the light acting through the glass. The glasses employed were red, blue, yellow (silver), smoke, and violet. The results were that the portions, as before observed, exposed to the light were bleached, those protected remaining unaltered, while intermediate effects were produced with glasses of different colours; drying oils, when exposed to the action of light, rapidly bleached; and when hauled oil was used, still further action was produced.

Professor Hofmann, confirmatory of the lecturer's remarks, also observed that blue, which had become faded, when exposed to light assumed its almost original brightness. This accorded with the evidence of Mr. Farren, who had exposed a picture to the light, when the blue portion which had greatly faded became restored.

Mr. George Wallis, of the South Kensington Museum, also made several observations, and instance the fact that some old picture dealers, not very careful of truth, were accustomed to make new pictures look like old ones by the method described. He did not know whether he ought to say so, as it would probably go forth to the public; but it was a fact that the air of South Kensington was purer and better for the preservation of pictures than that of the National Gallery. A landscape exhibited by the lecturer had a very amusing appearance—the parts covered by an opaque medium retaining their original colours; those portions exposed to the light looking as if melted down by age, or rather as if it had undergone an extraordinary whitening process.

## LONDON COW-SHEDS AND THE CATTLE PLAGUE.

WE are told that the observations we have made respecting the metropolitan cow-sheds and the corporate and parish management, have caused anger on the part of those who have an interest in keeping up abuses, and continuing in an old-fashioned course. Some City functionaries connected with Newgate market have spoken of

the *Builder* as having written "sensational articles." In reality, however, we have simply, but earnestly, told the truth. Years since, and from time to time, we have given notes of warning on this special point. It would have been better for all if they had been listened to. We hear that the paper referred to has been the means of causing damage to the cow-keeper of St. Bartholomew's-close. We are sorry for the woman, if it be true that her means of living have for the present been taken away; but if, as we are informed, the cows have been in this instance removed, while in a state of good health, so that, if needful, they might be disposed of at their true value, the owner may regard the circumstance as fortunate. In all directions the murrain is doing its deadly work. In a cow-shed, one of the best construction, near King's-cross, which we have had an opportunity of inspecting, when we saw the place there were 201 cows lying in long perspectives, and great care seemed to be taken respecting the beasts, which but a short time ago were in good condition. Nevertheless, Dr. Hillier, the medical officer of health of St. Pancras, reports that within the last fortnight eighty of these cows have been taken away seized by the disease, and who can say what a few more days may effect? If we consider the 210 cows at 20l. each, a low valuation, there is here a loss of 4,200l. We maintain now, as we always have done, that the keeping of cows in unnatural conditions is a sure cause of disease. Here the state may be better than in other places, but still it is not right; and in more than one article which has appeared in the *Builder*, there has been mention made of the offensive smells which have been passed from here over the neighbourhood. Much has been done; for instance, the London graveyards have been closed; no longer are the burial-places of large cities filled, month after month, with the bodies of the dead. A main system of drainage has been enforced in the capital; the common lodging-houses, both in town and country, have been placed under surveillance, and rendered wholesome; in several ways measures have been regulated for the improvement of health, and other good measures have been carried; the outbreaks have thus been stemmed, but strongholds against sanitary improvements still require to be won.

Look at the sketches and notes in another part of our present issue, respecting Maypole-alley. Here the houses belong to a wealthy man, who owns much property of the same description. This is a matter which shows the need of police inspection of houses largely sublet, for the parish authorities do not and will not do their duty. For the assault of even this one of the walls of the stronghold of insanitary defence, we are gaining strength every day; why should large house proprietors in towns be permitted to neglect their duty?

#### VOLUNTARY EFFORTS NEEDED TO OBTAIN SANITARY IMPROVEMENTS.

ELEVEN years have elapsed since I addressed you upon the subject of the preventive measures required to be recognised and adopted against the spread of cholera and kindred diseases.

I then submitted a report of the labours of the Local Board of Health for the parochial district of Regent-square Church, St. Pancras, during the year 1854.

Whether or not the suggestions contained in that report, and noticed several times in your Journal, have been acted upon elsewhere, I cannot say, but my experience has since confirmed me in the opinion I then held previous to the passing of the bills presented to Parliament by Sir Benjamin Hall, viz.—that no Acts of Parliament are ever likely to render individual exertion unnecessary.

Local self-government has many advantages; but it has also its disadvantages, and one of the chief is the difficulty of finding a vestry willing to augment the taxes of its own parish by adopting active sanitary measures of a preventive character.

The most that is commonly done, is the reception of the complaints of the ratepayers, and requiring the abatement of the nuisance complained of; though sometimes, unless the matter is followed up by the complainant, the Sanitary Committee ceases to interest itself in the matter, and the guilty parties effect a compromise,—at least as much consideration being shown for the pocket of the owner as the health of the occupier and the public generally.

Fevers still exist, generating and fostering disease; sometimes through the ignorance of the people themselves, and sometimes from the apathy of the authorities and the indisposition of intelligent individuals to act as informers.

Consequently, notwithstanding successive sanitary Acts of Parliament, there seems to be still the same want which was felt by the Incumbent and Committee of Regent-square Church during the cholera of 1854, viz., a want of some well-informed person or persons, backed by an independent and public-spirited committee, whose business it should be to discover and report the nuisances existing in the district, that they may be referred to the action of the constituted local authorities in the event of their continuance after a proper notice to remove them.

In the experience of the Regent-square Board it was found to be unnecessary to do more than to serve a notice upon offending parties, pointing out the nuisance, and requiring its removal in accordance with the provisions of the sanitary Acts of Parliament; while many were glad to engage the services of the inspector to superintend the works required to be done, and thanked the Board for its valuable suggestions.

Just as there are district visitors among the poor, attached to every church; so there might be a sanitary committee, and a paid inspector, who should be under the direction of an honorary consulting architect or surveyor, upon the plan adopted at Regent-square Church.

EDWARD C. ROBINS.

#### CHURCH OF ST. HELEN, BISHOPSGATE.

It may perhaps be interesting to some of your readers to learn, that in the repairs and restorations now being carried out under our superintendence by Mr. Westacott, we have, after removing sundry coats of whitewash, discovered at the east end of the church, over the altar, some very spiritedly executed cherubs' heads, with effulgent rays, and Jehovah's name in Hebrew: they were (at some time very long distant, and still in the recollection of some of the older parishioners) covered over to save expense of restoration; and having passed out of sight were virtually forgotten.

It appears by the parish books that Sir Christopher Wren was consulted as to the repairs of the church in 1696, and a rate of 6d. in the pound was afterwards made. It is probable, judging both from the character of the work and the fact of Sir James Thornhill having been employed by Sir Christopher on several of his other works, that the painting is Sir James Thornhill's; whether it be so or not, it is certainly of masterly execution.

An extra parochial committee has been formed to aid and assist the parish and churchwardens, including Alderman Copeland, Mr. William Tite, M.P., Mr. Foster White, Mr. William Williams, and Deputy Jones, treasurer. And it is proposed to restore the roof, over the nuns' choir, replace that over the chantry, and restore such other portions as the funds contributed will enable them to do. The work now in progress is at the expense of the parish, who have passed a rate for this purpose.

No alteration is proposed to be made in the seating of the church, but the accumulated whitewash of centuries will be removed; and, as far as the funds in the hands of the churchwardens will permit and the assistance of friends will allow, the various objects of historical interest, such as the monumental and archaeological antiquities, will be restored and preserved.

WADMORE & BAKER.

P.S. We may mention that some further portions of the bagioscope have been found, together with one of the original triplet windows of the chantry. The other two have been destroyed by the introduction of one of later date.

#### THE THREATENED EPIDEMIC.

The special committee appointed at the conference called by the Association for the Promotion of Social Science, held a meeting on the 12th inst., when a number of important resolutions for a course of action, in compliance with the resolutions of the conference, were discussed and partly settled. Mr. Edwin Chadwick, C.B., was in the chair, and Dr. Aldis, Dr. Lankester, Dr. Hardwicke, Mr. C. Hawkins, Mr. Rendle, Mr. Godwin, Dr. Dobell, Mr. Beggs, Mr. J. N. Radcliffe, Dr. Milroy, and others, took part in the discussion.

#### UNDERGROUND ROOMS: CRYPTS.

SIR.—Permit me, in common fairness, to state my defence to "G. W."

I have built much, and invariably employed an architect; and in this special case have employed one of no mean abilities; at least, your paper has illustrated his designs. Ahermichy's wise saw of "Take advice," I have followed, but find the modern instance of "doctors differ" illustrated. I pay all deference to architects' elevations and plans, but I must question their talents in details. They may succeed with churches or chapels, but with houses they are far behind the march of intellect. I have seen errors in many mansions that would shame a common bricklayer or a country joiner. Did not one of their own profession, Professor Kerr, see fit to give to any one with "siller" in his pocket the means of overcoming at least some of the difficulties that beset the builders of houses? How necessary such a work was a reference to the publishers will quickly tell by its sale. I remember a Yorkshire squire once naïvely saying to a horse-dealer, "My good fellow, you buy your horses to sell; — [naughty word] nice horse; but I buy to ride, and his forelegs would tumble me down in twenty yards." So with houses: architects build for taste, but clients have to live therein.

To my original inquiry, my architect tells me you will see alcoves similar to those in the Sydneyham and Kensington Gardens. Now, these crypts are really dungeons, or soldiers' rooms or dormitories of one of the oldest castles in the North of England. I am anxious to engraft this old bit into the new hall, most especially by making them habitable. My architect has suggested almost what "G. W." did, a thorough current of fresh air below. But where he demurs, and I receive so many conflicting opinions, is in regard to a perfectly dry covering, which is a gravelled terrace walk. I am anxious it should be habitable, and at the same time perfectly healthy. So far, I have been unsuccessful. I have great objections that this part of the castle (and almost the only part), of one of the oldest castles, inhabited once by a French ambassador mentioned by Shakespeare, and a younger branch of the extinct premier earl of England, should degenerate into a garden summer-house. Such, and such only, are my reasons for appealing to your columns; not, assuredly, to save myself an architect's fees of 5 per cent., which, pure and simple, would on such a matter be trifling indeed.

AN AMATEUR.

#### DRY-ROT IN DWELLINGS.

SEEING in the *Builder*, p. 630, some observations relative to dry-rot and its effects, it brought to my recollection cases in action not dissimilar and equally destructive. At different times while engaged in the superintendence and execution of work in this and the sister kingdom, I was astonished at the wholesale havoc made by dry-rot beneath floors, under roofs, wainscoting, staircases, window trimmings, &c. In one stone-built bonse on the seaside particularly, where the joists were raised on dwarf walls, and where ventilation, it was to be supposed, had full play, the fungus generated, and revelled in the havoc that it made. The joists in most places had lost their hearings, and the flooring when I had it lifted was eaten almost through. In the under side of the boards you might pick a hole in any part with your nail, and displace any quantity with the least effort. Those parts of the window trimmings technically called in carpentry, backs, chows, and boxings, on their inner side were coated over with a complete sheet of fungi, and when disturbed by their removal gave forth a heavy, sickening, and charnel smell. The wall immediately behind the window shutters and box lining was also coated over with the woolly spawn, and here and there between the joints of stone, where no necessity existed for a coat of plastering, on account of those portions being hid by the woodwork, I could observe the matter oozing forth in its incipient state. The timber used appeared to be the best red deal originally, but it was so completely eaten through that nothing kept it from open embrasure to the room but the several coats of paint which it had from time to time received. Several of the most expensive and richest description of paper-hangings, which were put up, from time to time, were in a short time as often completely de-

stroyed from the emanations through the plastering.

The walls had at last, in the principal rooms, to be studded from ceiling to floor, and sheeted with thin boards, over which a covering of oil-cloth was put before receiving the paper.

The owner was anxious to know from me the occasion of the rot. I soon informed him, in this instance, of the cause.

The particular house in question was one of a series designed of a unique and elaborate Gothic character, of which three were finished, which were similarly affected by the "rot." An unprincipled contractor, to whom they were entrusted, and who had got his price, not wishing to act honestly, and being determined to leave the country indebted before they were finished, used the worst material of stone and mortar in their erection.

Being in close proximity to the sea-side, he indiscriminately used the sea-sand for outside and inside purposes. The saline property of the sea-sand, when used for inside building purposes, told its own tale, and exhibited its effect as I have stated.

I may remark, I have also, from time to time, come in contact with cases of dry rot showing no appearance of *fungi*; quite dry and crisp, and giving but little of the characteristic smell.

Two of the best precautions I wot of to provide against the occurrence of this timber plague, is the adoption of thorough ventilation underneath floors and other places similarly circumstanced, and complete avoidance of sea-sand for inside purposes, and in all other places where the preservation of timber in house-building is indispensable.

C. H. C.

SOCIAL SCIENCE ASSOCIATION.

The ninth annual meeting of this Association will be held in Sheffield, from Wednesday, the 11th, to Wednesday, the 11th of October, under the presidency of Lord Brougham.

The following are the special questions for discussion in the Health Department:—

1. In what way can the unnecessary Exposure of Workmen to Dangers of Life or Health be best avoided, especially in Collieries, Mines, and Manufactories?

2. What are the best means of preventing the Spread of Contagious Diseases?

3. To what extent can the Contamination of Air in Towns be diminished? And by what means?

4. In that of Economy and Trade the following questions will be discussed:—

1. What are the best means of establishing a system of Authoritative Arbitration between Employers and Employed in cases of Strikes and Lock-outs?

2. Can the Principles of Co-operation be Profitably applied to Production? And, if so, under what conditions?

3. Is it desirable to Consolidate the existing Railways of the United Kingdom into one System under Government control?

4. In the department of Education, a section of art has been added for the consideration of the following and other questions:—

1. What Improvements can be made in the Schools, Museums, and Exhibitions of Art, with a view to the Development of the Public Taste, and the Prosperity of our Manufactures?"

WORKS IN LOUTH, LINCOLNSHIRE.

The corporation of Louth met on Tuesday last to receive tenders for the erection of a Market-house in the Market-place. For many years the accommodation for the country people has been such only as the open streets afforded; and in this respect Louth presents a marked contrast to the surrounding country towns, which are for the most part provided with comfortable market-houses, well frequented, and particularly on a market-day. The corporation, however, having at last taken the matter in hand, the whole of the provision-market is to be transferred to the new Market-house. The proposed building is about 100 feet long by 60 feet wide, and is roofed with a single span semicircular iron trussed roof, supported partly on brick piers and partly on foliated stone corbels. On one side of the hall are three butchers' shops, and an office for the market-keeper. At the south end, and facing the Market-place, is a

handsome and lofty clock-tower of ornamental brick-work, with dials on each side; above which, and resting on a moulded brick cornice, is a square hipped roof, with dormers on each side; the whole being surmounted by an octagonal spire, with gables crocketed and finialled.

The scheme also includes the rebuilding of four new shops, with dwelling-houses attached, in front of the Market-house, replacing a number of buildings exceedingly dilapidated and disreputable in appearance, and extending from the Market-place to the Town-hall in Eastgate.

The architects, Messrs. Rogers & Marsden, of Louth, have in their design adopted a purely constructional character, the ornamentation being in brick-work, stone, and terra-cotta. In treatment and detail generally, the design is Italian Gothic. Four builders resident at Louth were invited to tender for the works; of these, Mr. William H. Coulam's offer, being the lowest (£5,967l.), was accepted by the council, and the work will be commenced immediately.

CERAMIC ART.

In the park of St. Cloud, the new (Sèvres) porcelain factory in progress of erection is expected to be finished next year, and is so far advanced that one can form an idea of the general arrangement of the buildings. The principal one consists in an underground story lighted by loopholes, a ground-floor, a first-floor, and an upper story with a mansard roof. Three pavilions, united together by galleries, compose the frontage. The underground story is to contain the immense and valuable collection of moulds of important artistic interest. On the ground-floor are the sale-rooms; and on the first-floor the library and ceramic museum, terra-cotta works of art, glass and crystal articles, paintings and enamels on glass. The workshops, drying-galleries, and ovens, are in the rear of the buildings.

Every diligent art-student who has travelled on the Continent has visited the magnificent Ceramic Museum at Ronen, belonging to the municipality, and collected by M. Pottier, conservator of the departmental library and antiquarian collection. This *salon* has just added to the *salon* a glass case containing a collection of all the original tools and instruments which have been employed in the manufacture of Ronen pottery. They are the gift of an ancient manufacturer of porcelain, who has now retired into private life.

COLOUR FOR CEMENT.

Sir,—I should feel much obliged by being informed what kind of colouring to use for my house, which is situated on an elevation, and much exposed to the action of the south-west wind and rain. The colouring I have hitherto used is constantly blistering off, and consequently puts me to considerable expense, as the house is large, and requires a folding in proportion. The walls are faced with Portland cement.

SOUTH WALES.

\* \* We have asked a similar question before without effect. Makers profess that good Portland cement needs no colouring at all; or, at any rate, only a wash made with the same material. It may be that the cement of our correspondent's house is itself bad, and thence the blistering. Much of what is called Portland cement is merely rubbish.—Ed.

CUSTOMS OF THE BUILDING TRADE.

At the Sheriff's Court on Tuesday, before Mr. H. F. Gibbons, deputy Judge, points were decided in reference to the rules governing masters and workmen in the building trade. In the first case, Potts v. Westcott, the plaintiff, a labourer, sought to recover arrears of wages, and alleged that he had been employed by the defendant upon some scaffolding work, for which he was entitled to claim 4s. per hour. He was only paid 4s. per hour, and hence the present proceedings. Defendant stated that plaintiff had been employed upon scaffolding work for five weeks, during which time he had been regularly paid 4s. per hour; but the work giving rise to the present proceedings was ordinary masonry work, and according to the rules of the trade, plaintiff was only entitled to 4s. which was duly paid to him. Plaintiff replied that the great question was whether he was to be paid 4s. or 4s. per hour; and he might inform the court that, in some places, the men were agitating for 5s. per hour. It was for this sum that Messrs. Cabitt's workmen had struck, and no doubt the matter was not yet settled. The Judge said he had nothing to do with any strike; the only question before the Court was, whether the plaintiff had really been employed upon scaffolding work during the time for which he claimed the extra farthing. Plaintiff could swear that he had been engaged by the defendant to do some scaffolding work, and he was regularly timed at 4s. per hour for five weeks, at the expiration of which time he was put on the short money. The alteration took place just about the time of the strike by Messrs. Cabitt's workmen. Defendant was prepared to prove that he had adhered to a rule well known in the trade. This, of course, was

quite a matter of principle with him, and he wished to point out to the Court that he did not rest his defence upon any question of strike or agitation, but upon a fact that plaintiff had been actually paid in accordance with a scale of which he himself was well aware. The Judge was of opinion that plaintiff had not made out his case, and was inclined to believe that defendant had paid him the fair and proper amount of wages. It was quite true that the plaintiff had been in the employment of the defendant at higher wages than those paid him for the job giving rise to this action; but it was not denied that when plaintiff was paid under the higher scale, he was employed upon scaffolding work, which was sworn by defendant to have been finished at the time the reduction of the wages was made. Plaintiff would be nonsuited.

The second case was James v. Wagstaff, and the plaintiff, a journeyman builder, sought to recover a sum of 7s. which had been stopped as his share of some damage done to a sheet of plate-glass. Plaintiff stated that he was at work for defendant, and an accident occurred to a sheet of plate-glass. Defendant assessed the damage at 21s., and as there were three men on the job, stopped 7s. each. The other men submitted, but plaintiff refused. Defendant stated that he employed over one hundred men, and the rule of the shop was that when any gang of men did any damage, it was paid for amongst them. Now, on the day of the accident plaintiff, with two other men, was very busy with some sashes, one of which they allowed to drop upon the glass. The damage was 21s., and it was stopped in the usual manner.—Plaintiff denied that he was engaged with the other men. He was passing along, and one of the men, finding a sash too heavy for him, called plaintiff to assist him. This plaintiff did, and the sash-line slipped, letting the sash fall upon a sheet of glass. As to the rule plaintiff knew nothing, nor had he been told anything about it.

Defendant called his foreman, who said that the rule was well known in the shop; and when the accident occurred he was called in and the matter settled. Each man laid it on the other. Plaintiff had always denied that he caused the accident, and thought he could not be bound by the rule. The Judge considered that the rule was a very reasonable one. Plaintiff did not, and left the shop rather than submit. The Judge said there was a very reasonable rule to which the other workmen had been parties, and to which they had submitted. If plaintiff worked at a shop, it was his duty to make himself acquainted with its rules. Plaintiff thought they should be stuck up in the shop. The Judge did not agree with this, and considered that plaintiff had been very ill-advised in bringing this action. He would now be nonsuited.

STRIKES AND OTHER TRADES QUESTIONS.

The saw-mill labourers lately in the employ of Messrs. Bartram & Co., Belvidere road, Lambeth, but on strike for the advance of 4d. per hour, were recently joined by those of Mr. Alcock. The labourers employed at the building-yards and saw-mills in Lambeth have nearly all received an advance, in some cases of 4d. and in others of 1d. per hour. They have all been contributing to the men on strike.

Louth.—Most of the operative joiners in the town have struck for an advance of wages.

Yarmouth.—The carpenters and joiners of this town are seeking an increase of wages, from 3s. 6d. to 4s. per day.

Huddersfield.—At the Huddersfield Police-court lately, a Mr. A. Graham, stonemason, was summoned by an operative for 3½ days' wages, at 27s. a week. Defendant pleaded that the man was only worth 24s. a week; but the master masons of Huddersfield have recently issued placards offering 27s. a week wages, and the complainant had been induced to come to Huddersfield in consequence of the representations made in the placard, and had made no agreement whatever as to wages. The defendant contended that no agreement having been made, he was at liberty to pay the complainant what he thought he was worth; but the bench considered he ought to pay 27s. a week, as stated in the placard, and they made an order for the amount claimed.

Low Moor.—The Low Moor Company, says the Bradford Observer, employ an omnibus to go round the out district every morning for the purpose of collecting their workmen and bringing them direct to their work. By this means the men are prevented dropping into public-houses on the way, and so losing much time. The plan has succeeded so well that it is intended to carry it out on a wider scale by employing more buses.

Suicidal Results of Strikes and Outlooks.—The London agents (Messrs. W. Bird & Co.) for a foreign house (Messrs. Schneider & Co., Le Creusot, France), in a business circular, offering foreign manufactured iron and machinery to English firms at less than English prices, say:—“The employment of foreign manufactured iron in English engineering establishments is no longer unusual. We have delivered special descriptions even into the very centre of our iron districts, and have also profitably supplied from foreign sources many castings that would otherwise have been made here only at greatly increased prices.....Without under-

rating the great capacity and power of the various branches of the English iron trade, with whom we continue, as heretofore (unfettered), our long-existing relations, it is obvious to every one that, by the operation of 'strikes' and 'lock-outs' alone, the great natural advantages of the English ironmasters have been considerably curtailed, and the carrying out of important undertakings sometimes jeopardised, and even altogether prevented. Other sources of supply, even though foreign, have therefore become a necessity of the times."

#### CHURCH-BUILDING NEWS.

**Heytesbury (Wilts).**—The ancient collegiate church of this parish is about to be restored, under the direction of Mr. Butterfield, and the cost will be principally borne by Lord Heytesbury, aided by the ratepayers and the public.

**Stoke Courcy (Somerset).**—The old Norman church of St. Andrew has been re-opened after closure for two years, during which it has been restored, at a cost of about 6,000. At the east end of the church is a triplet window, with zigzag mouldings. The window represents the birth, crucifixion, and resurrection of our Saviour, and was given by Sir Peregrine Acland and Lady Hood, as a memorial window, in remembrance of the late Lady Acland. The superaltar is composed of a massive slab of black marble, the diaper on which is illuminated and gilt. The platform upon which the altar is raised is ornamented with encaustic tiles, which bear upon their front the following text,—"Do this in remembrance of me." On the south side of the chancel is a Norman window, of stained glass, representing St. Andrew, the patron saint of the church; and near it are three sedilia, the canopies of which are supported on marble columns. On the north side is a Norman credence-table, and a doorway of the same period leading to the vestry. The roof of the chancel is also of Norman design. In the north aisle is the organ, with illuminated pipes. The seats are open, with carved oak ends, and are chiefly the old ones restored. The stalls in the chancel are also of oak, facing north and south. The tower contains six bells, the last of which, by Mr. Warner, of London, was presented by Sir Peregrine Acland, who also gave a clock, by Mr. Dent, to the church. All the bell-cages and timber connected with the various stages of the tower have been replaced, by Sir P. Acland, with oak beams. The parapet was removed and restored, and the spire was almost entirely reconstructed at the same time. The west gable of the church is adorned with a St. Andrew's cross. The whole exterior of the church has undergone a restoration; and whilst examining some perpendicular windows in the tower, the old rude Norman windows were discovered, which were afterwards restored, and inserted in the place of those of the later period. The church is paved with encaustic tiles, and during the time the work of restoration was being carried on, it was discovered that the level of the church had been raised nearly 2 ft. The old level was then restored, and in doing this some of the ancient encaustic tiles were found, which have now been inserted in the pavement near John de Vernal's tomb, in the south aisle. Near the entrance of the church there is an ancient Norman font, which had long been thrown aside, and was actually being used for the purpose of making mortar. Its value becoming known, it was restored, and replaced in the church. The tower is far wider from north to south than from east to west, and thus allows the arches spanning the nave considerable width. The restorations were executed under the direction of Mr. J. Norton, of London, architect. Mr. Brock, of Bristol, was the builder. The illuminations in the church were executed by Mr. Stansell, of Taunton; and the organ was reconstructed by Mr. Ling, of Taunton. The brook which flows before the church has been arched over, and a public road carried round the church. The cost of the whole was defrayed conjointly by the Society of Merchant Venturers of Bristol, Sir P. Acland, and the parish.

**West Monkton (Somerset).**—St. Edmund's District Church, parish of Dunmanway, has been consecrated. The edifice has been erected in the midst of the romantic scenery lying a few miles north of the town of Dunmanway, in the centre of the property of Captain Shildham, through whose means and exertions it has been completed. The church is a Gothic building,

with a spire. The eastern window (erected by Messrs. Forrest & Bromley) is a memorial. The western window is the gift of the bishop; and the font was presented by the rector.

**Sealand.**—The foundation-stone of a new church, in course of erection at Sealand, has been laid. The want of such an edifice a little beyond midway from Chester to Queen's Ferry has long been felt, and the River Dee Company have not only given the ground, but reared the structure at their own expense. Mr. Douglas, of Chester, is the architect, and Mr. Bellis, also of Chester, is the builder. The church will be in the parish of Hawarden, and will take the name of St. Bartholomew. The edifice is designed in the Early Gothic style, and in plan consists of a chancel with stalls and sedilia; nave seated with open benches to accommodate 200 adults and 100 children; font under the west window; small transept on the north side of the nave to receive the organ; and vestry on the south side of the chancel, under the tower, which will be 60 ft. high. The church will be entered through a porch on the south side. A small doorway in the west side of the tower leads to the vestry and chancel. The building will be constructed of stone from the Heelsy quarries, the interior being entirely finished in chiselled masonry. The timbers of the roof will be visible from the church.

#### DISSENTING CHURCH-BUILDING NEWS.

**Halsted.**—The memorial stone of a new Congregational chapel has been laid here. The new building is intended to take the place of the old barn-like structure, known as the "old Independent meeting-house," Parsonage-street, on the site of which it is now being rapidly reared. The exterior of the new building is faced with Kentish rag-stone, and Caen-stone dressings, in the decorated style of English Gothic. The north front consists of a centre gable, surmounted with a five-light crocketed finial, 60 ft. high, and filled with a five-light tracery window. Below this are two two-light windows under the end gallery, separated by a canted buttress. On the east and west sides are two two-light windows, divided by transoms into two heights, and having buttresses between them, the buildings containing the front staircases forming one wing and the other wing being the transept gables, filled with three-light tracery windows, 20 ft. high. Attached to the transept on the west side is a tower, containing one of the staircases, surmounted by a stone spire 110 ft. high. The plan is a parallelogram with an apsidal end, the extreme length from north to south being 70 ft. and 42 ft. wide from east to west, with transepts 60 ft. wide. Accommodation is provided for 800 persons. Internally the main roof is divided transversely into three spans with arched principals in the centre 45 ft. high; and trussed hammer-beams on each side, supported on cast-iron columns with ornamental capitals. The timbers will be wrought and stained, and the ceilings formed of varnished hoarding. Galleries will extend round the four sides of the chapel, approached by two staircases in the front, and two others attached to the transepts, which will have direct communication with the schools below, with the ground floor, and the galleries. The schoolroom below is capable of accommodating 300 children; there are also four classrooms. Messrs. Sudbury & Son, builders, Halsted, have taken the contract for 3,000, from designs by Mr. Frederick Barnes, of Ipswich, architect. About 600l. or 700l. additional will be necessary for other expenses, making the total cost about 3,700l.

**Brighton.**—The members of the Wesleyan body in this town have, for some time past, been engaged in raising funds for the erection of a new chapel at the west end. A site has been purchased in Norfolk-road. The design for the building, we understand, is by Mr. Ellison, of Liverpool, architect, and the edifice is intended to seat 1,000 persons. The entire cost, including ground, &c., is estimated at about 5,500l. About 2,000l. are still required.

**Church Stretton.**—The foundation-stone of a new Congregational chapel has been laid here. The site is nearly in the centre of the town. The chapel will be 50 ft. by 24 ft., and will afford sitting-room for 800 people. The front will be of freestone. Mr. Bratton, of Birkenhead, is the architect, and Mr. Richards, of Pulley, the contractor. The estimated cost is about 700l., and nearly 400l. have been already subscribed.

#### STAINED GLASS.

**Boyn-hill Church, Maidenhead.**—Two stained windows, by Messrs. O'Connor, have lately been placed in this church at the expense of the Misses La Motte. They are placed at the west end of the church, one on either side of the large west end window. The subject on the one on the north side is "The Ascension." The subject of that on the south side is "The Nativity." The whole of the windows in this church are now filled with stained glass, numbering twenty-seven, including the two large east and west windows. A tower to this church is now just completed. Mr. Street is the architect, and Messrs. Silver & Son are the contractors, who are completing the spire.

**Talberton Church, Sussex.**—The chancel of this church has been adorned by the addition of three stained-glass memorial windows, designed and executed by Mr. Clutterbuck. The subjects, nine in number, embrace some of the principal events in the life, death, and resurrection of the Saviour.

**Basford Church, near Nottingham.**—The subject illustrated in the memorial of the late Duke of Newcastle, is the Worship of the Magi, as emblematic of the duke's attachment to the church. There are two upright lights, in the one of which Mary is seated, with the infant Saviour on her knee, while Joseph holds up a lily, the emblem of the Virgin. The three eastern monarchs are seen in the other compartment worshipping, and presenting their offerings; while their Asiatic attendant, with a camel, appears behind. Underneath are the emblems of our Lord, the Lamb and Banner, and the Pelican feeding her Young. Messrs. Ballantine & Son, Edinburgh, are the artists. The east triplet window has also been filled with memorial glass of a similar character, executed by the same artists. The subjects are,—"Christ blessing Little Children," "The Lord's Supper," and "The Crucifixion." These lights are erected in memory of Adolphus Marx, of Nottingham; John Rogers Pitman, incumbent of St. Barnabas, Kensington; and Ichabod Wright, of Mappuly Hall.

**Melbourne Church.**—This church has lately had placed in it a stained glass window, to the memory of the late Judge Cantrell, who aided in the restoration of the edifice. The window, which is by Mr. Harding, of London, is placed in the north transept, near the family vault of the deceased judge. The design represents Moses, as the lawgiver, with the commandments written on two tables of stone.

**All Saints Church, Ennscoote.**—A new subject has been introduced into the chancel window of this church. It is a figure of St. Alban, proto-martyr of England, as a Roman soldier, bearing a sword; and in another compartment underneath, the saint is represented about to suffer martyrdom. A soldier by his side stands prepared to behead him; and another, who refused, is being led away to undergo a like punishment. It is the work of Mr. T. Dury, of Warwick.

**Chaddesley Corbett Church, Worcestershire.**—Mr. Perrins (father of the Mayor of Worcester) has presented to the church of his native parish, Chaddesley Corbett, a stained-glass window, which is now in hand in the atelier of Mr. George Rogers, of Worcester. The design presents the leading events in the life of our Lord, and includes a multitude of figures.

**Presbyterian Church, Swansea.**—The large window of this church has been filled with stained glass, executed by Messrs. Ballantine & Son, Edinburgh. In the centre light the Burning Bush, and the motto, "Nec Tamen Consumebatur," are introduced, and the other pictures of the window are filled with foliated and geometric glass of the Decorated period, in accordance with the style of the church.

**Clanabogan Church, Omagh (Ireland).**—A memorial window having three upright lancet lights, with three large circular shapes in the top tracery, has been erected in this church. The groundwork and bordering consist of early foliated mosaic glass, deep in colour. The Galbraith shield, crest, and motto, are introduced into the dexter and sinister compartments, and an escutcheon in the centre light. The window was executed by Messrs. Ballantine & Son, Edinburgh.

**Presbyterian Church, Leghorn.**—Two memorial windows have recently been sent to the church, executed by Messrs. Ballantine & Son. They are large lancets, and are filled with foliated grounds, borderings, and geometric figures. One window contains the Henderson arms.

**Books Received.**

"PENNY READINGS, in Prose and Verse: selected and edited by J. E. Carpenter. F. Warne & Co., Bedford-street, Covent Garden."—  
 "The Government of the Country: How we are Governed; or the Crown, the Senate, and the Bench. By Albany Fouhlanque, Jnn. Revised and present Date, by W. A. Holdsworth. F. Warne & Co., London."—  
 Mr. Warne, lato of the Routledge firm, opens the publishing business of a new company with these two popular works, each of them very useful in its way. Of the origin of the penny-reading movement Mr. Carpenter says: "We learn from an admirably written pamphlet by Mr. Charles Scully, editor of the Ipswich Express, that the 'penny readings' now adopted at so many literary, scientific, and other kindred institutions, were established by himself, associated with Mr. Gowing, in the same town, as far back as 1859. In some sense, however, the idea was but the revival of an old one, doubtless quite unknown to these gentlemen; for, as many as five-and-thirty years ago, a series of 'readings blended with music' was given, at the Crown and Anchor Tavern, in the Strand, London (now the 'Whittington Club') for which the veteran author, Mr. J. R. Planche, wrote and spoke an address, which we have great pleasure in presenting to our readers, and which may be very appropriately read on the 'opening nights' of the ensuing season. Since their establishment in Ipswich the idea has spread far and wide."—  
 "Engineering Facts and Figures for 1864." Edited by A. Betts Brown, Mechanical Engineer. London and Edinburgh: A. Fullerton & Co. 1865. This "annual" register of progress in mechanical engineering and construction is not only a compilation from current sources, but contains a varied and useful collection of facts and figures in mechanical engineering, in a handy form.

**Miscellaneous.**

THE PENRITH SURVEYORSHIP.—A notice of resignation has been sent in to the local Board of Health, by Mr. John Ross, their surveyor, who has been appointed engineer and surveyor to the St. Helen's Board of Commissioners.  
 THE BACUP SURVEYORSHIP.—At a recent meeting of the local Board the appointment of a surveyor was considered. There were four candidates selected from thirty-nine applicants, and the appointment fell upon Mr. Thomas Leeburne, of Leek.  
 GIBDEN MEMORIAL.—At a meeting of the Ghibden Memorial Committee, held at Manchester, it was resolved to entrust the commission for the statue to Mr. Marshall Wood. The total subscription was announced at 4,377l., of which more than 3,000l. have been paid into the bank.  
 NEW GASWORKS FOR SEVENOAKS.—Owing to the rapid increase of building in the Sevenoaks neighbourhood, and the certainty of a new town springing up in the immediate vicinity of the new South-Eastern Railway Station, the present gasworks have been found inadequate to the supply, and the directors determined upon erecting new works; and a piece of ground near London, Chatham, and Dover station has been secured.  
 THE CHINESE COLLECTION.—Passing by the costly jewels, jewel-stands, enamels, and other pieces of splendour, what may be called the curiosities of Captain Negrone's collection, now Piccadilly, have more attraction for us. Here, one case, is a mantle made of the skins of unhorned antelope, and near it a carved cameo with a very suggestive intimation on the back of it that the person in whose hands it is found will forthwith be decapitated. One of the vases at which you may look seems to be of plain white porcelain; but, pour some coloured water into it, and the dragons with which it is adorned become visible. There is a bottle containing the essence of crocodile "hard by; but, should you be faint, do not attempt to sniff it, for it is said to be so strong a stimulant that, instead of bringing you to life, it will take you to death. It is a very remarkable collection, and is said to be worth half a million sterling. We wonder what it cost the gallant captain of the 2nd regiment of the French line?

THE NEWARK PLASTER WORKS.—A joint-stock company has been formed, to carry on and extend the plaster works of Mr. W. Jacobs, of Newark, who supplied the plaster of Paris used for the Great Exhibition building of 1852, from his large manufactory at the Trent works, Newark. When the business is fully developed, it is said, it will be the largest plaster of Paris works in Europe. Mr. Jacobs is the manager.

COMPENSATION: IN LONDON.—The Weigh House Chapel, says the City Press, being required by the Metropolitan District Railway Company, it was agreed to submit the case for arbitration to Mr. J. R. Clutton, who has just made the following award:—For the chapel, schools, &c., 10,000l.; for the freehold site, 25,000l.; besides a life annuity of 500l. as compensation to the Rev. Thomas Binney.

MEMORIAL STREET TABLET.—The Birmingham Shakespeare Club, by the permission of Mr. Scholefield, M.P., who owns the residence, have placed a memorial tablet on the house in the old square formerly occupied by Dr. Hector, and visited by Dr. Johnson. The inscription states:—"Here in this house Samuel Johnson was the Guest, Edmund Hector was the Host. Of this Host this Guest has written, 'Hector was likewise an old friend, and the only companion of my childhood who passed through the school with me. We have always loved one another.'"

INDUSTRIAL EXHIBITION IN SALFORD.—An Industrial Exhibition has been opened at St. Matthias's Working Men's Club, Silk-street, Salford. The mayor of Salford presided, and was supported by the Bishop of Manchester, the clergymen of the parish, and a number of ladies and gentlemen. The exhibition is a small one of its kind, but contains many objects of interest, contributed principally by working men of the parish in which it is held, many of whom are members of the club. The proceedings having been opened by singing and prayer, the Rev. E. B. Chalmer gave a history of the Salford Working Men's Club, which he said was the first established in this country, and had been the means of effecting a mighty change in the behaviour of the people at the Adelphi.

SANITARY CONDITION OF CROFTON.—A report from the temporary relieving officer, as to the sanitary condition of No. 2 district, states that the block of buildings bounded by Wilmott-street, George-street, Medlock-street, and River-street, best known by the name of "Pop Gardens," are in an extremely bad condition, chiefly arising from the bad sewerage and neglected state of the ashpits and water-closets, several of the latter being without doors, and so filled with night soil as to render them quite useless, and a great nuisance to the neighbourhood. In Irving-street and Agnes-street are a number of other closets and ashpits in a similar condition, whilst the sewerage in George-street is sadly defective. There are many cellar dwellings in the neighbourhood, the interiors of which are very dirty, owing chiefly to the slothful habits of the occupants. There are at present twenty-one cases of fever in the workhouse, chiefly from the district reported on.

BOLTON TOWN-HALL.—The Bolton Chronicle says,—The town-hall project has at length assumed practical form. The general plan of the building was already determined in the selection of Mr. Hill's design: we have now settled upon the size, and are enabled to arrive at an approximate estimate of the cost. Instead of covering 4,800 square yards, as originally planned, it is proposed to cover about 2,700 square yards only. The large hall, though we have always looked upon it as an essential feature, has been very properly reduced. As first proposed, it would have been 145 ft. by 75 ft.; and in Mr. Hill's plan, 130 ft. by 65 ft.; it is now proposed to be 110 ft. by 55 ft. One session court is to be excluded. Nor is the Free Library and Museum to find a home within the precincts of the town-hall. The result of their various modifications is, that instead of embarking on a scheme which would probably have ended in an outlay of 130,000l. or 140,000l., we have now the prospect of realising a handsome and commodious town-hall at a cost of about half that sum, Mr. Ald. Wolfenden estimating it at not more than from 70,000l. to 75,000l., and inclining rather to the lesser amount. Recognising the advantages of having a local architect along with Mr. Hill in carrying out an erection of this magnitude, the council have associated Mr. G. Woodhouse, of Bolton, with him.

LINCOLN CATHEDRAL.—Workmen have been engaged in placing lightning conductors on each corner of the three towers of the cathedral and along the body of the nave. The man who fixes the wire is fastened to a seat, which, by means of a pulley, is drawn up and down at pleasure. New rancs are also to be placed at the top of the rood tower. The cost of the work will be about 300l.

THE HUDDERSFIELD WATER SUPPLY.—At the last monthly meeting of the Huddersfield Improvement Commissioners, it was stated by Mr. Hobson that the Waterworks Commissioners were going to apply to Parliament for power to increase the present water supply. They had to furnish 500,000 gallons daily, to supply the town adequately; but, for the last five months, the gauges showed that all their sources of supply furnished less than 250,000 gallons; and the result was great inconvenience to the inhabitants.

DERBY.—The Lords of the Treasury have given the corporation power to sell to Mr. Bass, for 3,000l., about six acres of Holmes pastures, to be used as a public recreation ground. The widening of a portion of Balington-lane and St. Peter's-street is on the eve of commencement, as is also the erection of a pile of buildings by Mr. Gascoyne, from designs furnished by Messrs. Giles & Brookhouse. Derby, with its narrow and circuitous thoroughfares, built as they were in early times, has yet need of many such improvements to render it equal to the requirements of the present day. The alteration referred to includes the widening of Balington-lane up to Gower-street to a width of 36 ft. Some years ago, the same proprietor, in conjunction with the late Mr. Forman, not only formed Gower-street, at a great personal cost, but also widened Balington-lane from that point to the top. The design also includes the setting back and straightening of a considerable portion of St. Peter-street, in order to coincide with the line of frontage in the lower part of that thoroughfare.

HEALTH OF NATIONS.—On the 30th ult. a lecture was delivered in the large hall of the Mechanics' Institution, Longsight, Manchester, by Mr. Bradley, surgeon, on the subject of "The Health of Nations." The lecture lasted an hour and a half in delivery, and was illustrated by many charts, diagrams, skulls, and other specimens. The lecturer, having travelled considerably in the East (Turkey, Egypt, &c.), and in the United States and Canada, was enabled to speak from his own experience of the sanitary state of foreign countries, as well as of home affairs. In addition to general sanitary matters, the subject of hospitals, infirmaries, and other kindred institutions was treated, especially as respects arrangements connected with ventilation and sanitary state. Allusions and comparisons were made to the customs and plans in foreign countries and in Great Britain. Dr. Roberts, physician to the Manchester Infirmary, was president on the occasion, and at the termination of the lecture a vote of thanks to the lecturer was carried by acclamation. The proceeds were devoted to the increase of the library of the Mechanics' Institution.

DISCHARGING MUD INTO THE THAMES.—At the police-court, Wandsworth, recently, the West Middlesex Water Works Company were summoned by the Thames Board of Conservancy for discharging a large quantity of mud from a reservoir at Barnes into the river. It appeared from the evidence of George Rough, the river keeper, that on Sunday night, the 13th ult., he heard a gang of men working in the reservoir drawing the mud down to the pipe leading to the river, and that shortly after three o'clock on the following morning, when the tide was low, the sluice-flap was raised, and he then saw large quantities of mud rushing out into the Thames. He added that the shore was covered with mud for a distance of forty yards. The Board's superintendent of works said that he spoke to the foreman, and cautioned him not to allow the mud to be discharged into the river. The river keeper also proved that he served a notice a month before the occurrence. The company's engineer said the works were let to a contractor, who received orders not to discharge the mud into the river. The magistrate went into figures, and said that 3,000 loads or tons of mud had not been accounted for, and that he had no doubt they had been put into the Thames. As it occurred after notice, the penalty would be 20l.

**DRAINAGE OF CHATHAM.**—The movement for carrying out an extensive drainage of Chatham, although supported by many of the largest ratepayers in the town, has met with considerable opposition, and already steps have been taken to induce the Board of Health to reconsider the matter before that body decides on adopting a general system of drainage. Some of the ratepayers have appointed a committee to draw up a counter memorial to the Board of Health against the carrying out of the proposed system, which is said to involve an outlay of 120,000.

**LIABILITY TO REPAIR FENCES.**—In the case of Barber v. Whiteley, the Court of Queen's Bench decided that, as between the owner of an ancient inclosure, and the commoners of the adjoining waste, or persons to whom the waste is subsequently allotted on a general inclosure, there is a presumption in favour of an obligation on the former to repair the dividing fences; and where, in addition to this, there was, as in this case, evidence of the fences having been in fact immemorably repaired by such inclosing owner, the court (drawing inferences of fact) held that he was bound so to repair.

**BRISTOL SCHOOL OF ART.**—Last week the annual meeting and distribution of prizes in connexion with the Bristol School of Art took place at the Academy, Clifton. The chair was taken by the president of the society, Mr. P. W. S. Miles. Mr. Atkinson, one of the hon. secs., read the report. It stated that Mr. J. N. Smith, a master formerly in the Dundee School of Art, had been appointed head master. The results of the examination in May last were on the whole encouraging. It referred to the new "Art Minutes," which the committee feared would press heavily upon the future of the school—by reducing the income of the masters and the stipend to pupil-teachers, and by rendering the instruction of public and private schools unremunerative. From the treasurer's accounts, it appeared the receipts for the year were 302l. 12s. 11d., and the expenditure left a balance in hand of 7l. 3s. 2d.

**IMPROVED DWELLING-HOUSES.**—A public meeting was held last week, at 198, Pentonville-road, for promoting the formation of a company to carry out improved dwellings, when the following resolutions were unanimously carried:—"That the great destruction of houses inhabited by the working classes for railway and other improvements, and the consequent overcrowding and increase of rent for apartments and small houses, render it exceedingly desirable that effectual measures should be at once taken to supply the great want of properly-constructed tenemented houses;" and "That, in the opinion of this meeting, the most effectual measure would be the formation of a limited company, constituted in such manner that all classes should be enabled to contribute to its shares, while the occupiers of tenements in the company's houses might diminish their rent by becoming shareholders in the company." A provisional committee was elected.

**THE GREAT FIRE AT CONSTANTINOPLE.**—No fewer than 2,800 houses, public buildings, and places dedicated to divine service, have been for the most part levelled with the ground, and the principal mosques are now nowhere to be seen. Over 22,500 persons had to rush out of their habitations, almost naked, to escape from the ravages of the fire. The conflagration commenced in a building two stories high. From that part the flames spread with rapidity, igniting in succession whole rows of houses and stores on the north-west side. The scene amongst the poor people was pitiable in the extreme. There is strong ground for supposing that a great loss of life has taken place. The burnt-out people and their children had to sleep in fields and gardens near. The principal portions of the houses were composed in a great measure of timber. No conflagration of such magnitude has taken place since the burning of the city of Hamburg. The fire is now considered to have been fairly stopped at each point. Whole streets, squares, mosques, and government buildings were blazing away at the same time. Measures have at once been taken to get up a subscription for the housing of the poor burnt-out creatures, which, it is to be hoped, will be liberally responded to. The idea of a connexion between pestilence and fire is strengthened by this occurrence. The ulterior result, however, may be a great good to Constantinople.

**FALL OF A RAILWAY BRIDGE IN BIRMINGHAM.** The Great Western Company have sustained a loss by the partial destruction of one of their bridges, in Birmingham, the accident, however, being attended with serious injuries to one man only. The occurrence took place at Livery-street Bridge, the line of the Great Western Railway passing on a diagonal line beneath Livery-street at this point. The roof of the bridge is formed of large iron girders, supported on strong brick arches, and between it and the street pavement are courses of brick and a mass of soil. At present there seems nothing to account for the accident, a great portion of one end of the bridge having given way with no warning whatever.

**TENDERS**

For corn warehouse, Dover, for Messrs. Bradley, Brothers, Mr. Rowland Keer, jun., architect. Quantities supplied:—  
 Still & Co. £3,139 2 0

For the erection of public-house, Edgware-road, for Mr. F. Squire. Mr. D. Gylby, architect:—  
 Williams £1,975 0 0  
 Rogers 1,735 0 0  
 Gillett & Wisby 1,735 0 0  
 Selleck 1,693 0 0  
 Palmer 1,689 0 0  
 Gales 1,688 0 0  
 Stevenson 1,686 0 0

For sandy alterations to premises 79, Gracechurch-street, for Messrs. Innes, Brothers, & Co.:—  
 Cander £3,440 0 0  
 Hack & Sons 3,381 0 0  
 Ashby & Horner 3,353 0 0  
 King & Sons 3,680 0 0  
 Coleman 2,899 0 0  
 Lawrence 2,979 0 0  
 Jackson & Shaw 2,850 0 0

For the erection of premises St. Paul's Churchyard, for Messrs. Alex. Allan & Co. Mr. T. Archibald, architect:—  
 Cander £6,979 0 0  
 Sewell & Son 6,887 0 0  
 Macey 6,849 0 0  
 Henshaw 6,640 0 0  
 King & Sons (accepted) 6,390 0 0  
 Coleman 5,997 0 0

For the erection of a public-house situated in Paulton-street and Church-street, Chelsea, for Mr. W. H. Johnson. Mr. Thomas Muncey, architect. Quantities supplied:—  
 Chamberlain £2,019 0 0  
 Moultrie 1,888 0 0  
 Stimpson 1,860 0 0  
 Adamson & Sons 1,843 0 0  
 Cowland 1,787 0 0  
 Eborall 1,760 0 0

For rebuilding stabling, &c., at rear of 28, Lowndes-street, for the Right Hon. the Earl Cadogan. Mr. George C. Handford, architect:—  
 Smith £2,240 0 0  
 Brass 2,109 0 0  
 Eborall 2,046 0 0  
 Adamson & Sons 2,043 0 0  
 Carter & Sons (accepted) 1,945 0 0

For alterations and additions to north-east wing of Chelsea Workhouse. Mr. George C. Handford, architect:—  
 Gales £650 0 0  
 Sims & Marten 845 0 0  
 Humphries, Brothers 731 0 0  
 George 730 0 0  
 Eborall (accepted) 720 0 0

For house, lodge, stable, and coach-house, at Gloucesters, for Mr. D. Walker. Mr. J. Giles, architect. Quantities supplied by Mr. D. W. Young:—  
 Sharpington & Cole £11,187 0 0  
 Clutterbuck 11,032 0 0  
 Wingate & Sons 10,932 0 0  
 Avis & Son 10,590 0 0

For erecting a Free Methodist Chapel at Walhamgrove. Mr. F. Borcham, architect. The quantities supplied by Messrs. Parker & Elger:—  
 Marland & Sons £2,560 0 0  
 Richards 2,270 0 0  
 Parsons 2,269 0 0  
 Stimpson 2,196 0 0  
 Scrivener & White 2,062 0 0  
 Adamson & Sons 2,035 0 0  
 Alfred & Doneton 1,889 0 0  
 Pitts 1,795 0 0

For new Baptist chapel, at Red-hill, Regiate. Mr. J. F. Matthews, architect. Quantities supplied:—  
 Wells £1,595 0 0  
 Wesley 1,490 0 0  
 Room 1,267 0 0  
 Sheppard (accepted) 1,230 0 0

For the erection of malthouse, &c., Hook Norton, Oxon, for Mr. John Harris. Mr. Edward Holmes, architect. Quantities supplied by Mr. Mansell:—  
 Jones & Son £1,836 15 0  
 Matthews 1,582 0 0  
 Hardwick 1,578 0 0  
 Barratt (accepted) 1,370 0 0

For Barking-road Schools. Mr. H. Hansom, architect:—  
 Clark £1,650 0 0  
 Fox & Reepened 855 0 0  
 Nagle 846 0 0  
 Fisher 794 0 0  
 Watson 700 0 0  
 Nutt & Co. 633 0 0  
 Colsons 594 0 0  
 Tairce & Co. 659 0 0

For new shop front, New-street, Birmingham, for Messrs. Lilley & Addinell. Mr. Edward Hollins, architect. Quantities supplied by Mr. Mansell:—  
 Brasswork  
 Branson & Murray £353 0 0  
 Partridge 520 0 0  
 Briggs & Son (accepted) 768 0 0  
 75 10 0

For additions to farm-house, Goldhanger, for the Rev. C. B. Leigh. Mr. Horace Darken, architect:—  
 Eade (accepted) £450 0 0

For three houses in Colchester, for Mr. J. H. Jardine. Mr. Horace Darken, architect:—  
 Eady £355 0 0  
 Eade 674 0 0  
 Dobson 575 0 0  
 Lee & Baker (accepted) 468 10 0

For the Fountain Liquor Shop, St. Botolph's, Colchester. Mr. Horace Darken, architect:—  
 Dobson £345 0 0  
 Everitt (accepted) 337 0 0

For Parochial Schools, Wesley, Essex. Mr. Horace Darken, architect:—  
 Canham £350 0 0

For first section of main drainage and iron outfall works for the Borough of Portsmouth. Mr. Lewis Angell, engineer:—  
 Simms & Marten £68,888 0 0  
 Novell & Doevra 62,000 0 0  
 Thirst 59,221 0 0  
 Coker 57,047 0 0  
 Bennett 51,977 0 0  
 Moxon 51,500 0 0  
 Ridley 49,900 0 0  
 Farness (accepted) 46,800 0 0

For resident engineer's house at Thornsett, for the Sheffield Water Company. Messrs. Flockton & Abbott, architects:—  
 Craven, Brothers £1,300 0 0  
 Robertson 1,008 0 0  
 Longden (accepted) 1,016 10 0

For residence at Ranby, for Mr. F. Otter. Messrs. Flockton & Abbott, architects:—  
 Neill £4,573 0 0  
 Bellamy 4,164 16 0  
 Huddleston (accepted) 3,834 0 0

For addition to corn store on the Canal-road, Strood, for Mr. W. Hammins. Mr. J. H. Andrews, architect:—  
 Couchman £389 0 0  
 Sollett 388 0 0  
 Gates (accepted) 375 10 0

For the erection of conservatory, &c., for Mr. Walter Williams, West Bromwich. Mr. Edward Holmes, architect. Quantities supplied by Mr. Mansell:—  
 Matthews (accepted) £255 0 0

For erecting new offices, &c., at Old Jewry, City, for Mr. J. K. Farlow. Mr. John Whitehead, architect:—  
 Lawrence & Son £23,373 0 0  
 Myers & Son 23,353 0 0  
 Holland & Hauner 23,330 0 0  
 Ashby & Horner 23,210 0 0  
 Brass 23,087 0 0  
 Hill & Sons 23,000 0 0  
 Hart 22,400 0 0  
 Bland 22,382 0 0  
 Piper & Wheeler 22,152 0 0  
 Macey 21,845 0 0  
 Browne & Robinson 21,790 0 0

# The Builder.

VOL. XXIII.—No. 1181.

*Out and About: in Derbyshire.*

BUXTON has not an ancient sound: no associates it rather with modern watering-place times: with well-dressed loungers seeing and being seen: and yet certain it is that the Romans knew and used the place; left a bath there, "beautified" out of creation in the last century; made roads in the neighbourhood, and set up milestones, of which we can still see the shape and appearance. It is not at all unlikely, indeed, that even the old Druids knew the value of

the waters when worshipping in a damp grove brought rheumatism, for their circles and barrows were numerous in the neighbourhood. John Jones, "Phisition," wrote "The Benefit of the Ancient Baths of Buckstones" in 1572, and four years afterwards Mary Queen of Scots, whom we have seen a prisoner in this county in charge of the Earl of Shrewsbury, went to Buxton in his custody for the benefit of the waters, and returned again and again during the following half-dozen years. We will not think so meanly of that dangerously charming lady's abilities as to believe, as asserted, that she wrote on the glass window of her room in the Old Hall, where now stands the hotel of that name,—

"Buxton, whose fame thy milk-warm waters tell,  
Whom I, perhaps, no more shall see,—farewell!"

The waters still have fame, though how they effect good is not very clear. The supposition is but a month old, and it comes from France, that their electric state has more to do with it than their chemical composition. We are ready for our own part to believe anything of electricity; so we listen and wait with no desire to contradict.

At Buxton, as elsewhere in Derbyshire, the Duke of Devonshire is the man of power,—the owner of the soil. Houses pass away, and people pass away; but the land remains; and, what is more, it does not increase in quantity. A new California may treble the amount of gold in use, and so lessen its value; but any material addition to the number of square miles of land forming this little island of ours, is not within the limits of human expectation. The wise men of the earth, therefore, get hold of the ground. The Duke is a wise owner; he helps materially to keep up the very charming Park and Serpentine Walks provided for the visitors; subscribes for the band that will play agreeably under our hotel window at six o'clock this afternoon; and, in fact, he will do anything in reason likely to increase the attractions of the place and benefit his tenants. A company are building a large hotel near the railway station. This will have the advantage of not being in a hole, as the present mostly-frequented hotels, with all their attractions and advantages, are. The continual presence of a lofty green bank, that shuts out all things beyond, however it may be diversified with paths, arranged now by Wyatville and then by Paxton, and at certain hours spotted with people, is not conducive to expansion of thought or a feeling of freedom.

Still fine views are close at hand; no occasion to go far for them: and the beauty of the place is, that you have within reach two entirely different sorts of country: on one side hill and dale, trees and water, in marvellous combination of form and smiling colour, forcing the exclamation,—

"How much of ornament, of varied tint,  
Is brought together by God's lavish hand  
In one rich landscape;"—

and on the other, extensive moorlands, rough and wild; peat-heds, thick black streams, and lofty mountains, with nothing to disturb the silence but the occasional heavy whirr of the grouse the tread has startled. On this side is Axe-edge, the loftiest mountain in the neighbourhood, topped by an ordnance cairn; a little nearer to Buxton a lime company is desolating the cliffs. Axe-edge, we may further note, is the nursing mother of four rivers,—the Dane, the Dove, the Goyte, and the Wye; not the better known Wye that runs from Pimlinton to Chepstow, but the Wye that is swallowed by the Derwent at Rowsley, before talked about. So—

"The many mountain streamlets  
Glide on in harmless play,  
Still following, as God guides them,  
In an appointed way,  
And ever singing pleasant songs  
In darkness as in day."

Some swell into mighty rivers, connecting cities and hearing the fleets of nations; others but take fertility and beauty to a circumscribed spot, refresh but a solitary traveller here and there, and then are lost in a "swallow;" but all have their work to do; all contribute to the wonderful goodness of the wonderful whole.

The scenes of another kind, to which we have referred, lie along the line of the railway to Rowsley. Their praises have been sung far and wide, and yet with scant justice. Words cannot paint such a view, for example, as that seen from the head of Monsal Dale. To mention as prominent features hills clothed with verdure and pierced by rocks, the steep carriage-road running along the side of them, the lofty viaduct for the railway, and the Wye running at the foot,—even if we add, with Isa Craig,—

"It glimmers  
Through the stems of the beeches;  
Through the screen of the willows it shimmers  
In long winding reaches;"—

will give no notion whatever of the view unless the imagination add the wonderful play of light and shade deep down in the valley and amongst the trees at the side, the variety of tints displayed, and a hundred other indescribable charms.

Miller's Dale is even further beyond words. The enormous extent of the view, the mighty cliffs and craggy precipices, add sublimity to beauty, awe to delight. But for a little movement that is going on far down in the vale, we should have a too limited notion of the height at which we stand above the river. Are they rabbits that stir there; and is the hole, just beyond, their burrow? I' faith, no! they are positively men at work on the new railway,—live men with souls in them,—and yon's the tunnel. With such little taps and little spadefuls have our many lines been made. How small must most of the works on this earth appear when looked at from a higher sphere!

Chee Tor, a rock of limestone, is one of the wonders of the neighbourhood; to be ascended by those who can walk well. If we were going into points of detail, we should find one subject for comment in the dead trees observable in the plantations here as in various other parts of the county,—not single examples, but scores, but hundreds. They seemed to be chiefly larch. The only person from whom we could hear anything of the disaster, ascribed it to a bad winter two years ago.

Tideswell, not far from Miller's Dale, was once thought the mining capital of the Peak. It is now of little note, but has a fine church, mostly of the Decorated period. The tower,

Perpendicular, has a lofty turret at each angle, with between the turrets a pinnacle in the centre of each side, producing a curious effect at a distance. The chancel, with fine square-headed windows, is particularly remarkable. A vestry was formed late in the Perpendicular period, by the erection of a wall across the chancel at the east end, in front of which the communion-table stands. A monument here to Sampson Moverill, 1462, is known as an instance of two classes of monuments in one. Below, a sculptured recumbent emaciated figure is throwing off a shroud; and above, on a handsome slab of Parbeck marble, are brasses, including the emblems of the Trinity and the Evangelists, with an inscription. Another monument there includes a fine Parbeck slab; and the inquiry arises, how these came to be transported so long a distance. One brass, dated 1458, is in memory of Robert Lytton, of Lytton, said to be an ancestor of our great novelist. There are scullia, handsome, with straight heads like the chancel windows. The gallery in the nave should be removed, and the tower arch opened. When it is found that there is an intermittent well in the town, the origin of the name it bears is evident.

A more important well of that kind, however, will be found at a short distance from Tideswell, on the road to Castleton. It takes the shape of a pool for cattle. The side next the hill has a stone wall, forming the segment of a circle, at the foot of which is a stone trough, so to speak, a little higher than the level of the pool, with divisions in it; and into this trough, and over the front of it, the water flows for about five minutes in wet weather, and then ceases for a time, when the flow occurs again; and so on. A receptacle in the hill wherein the water collects, and a syphon-shaped channel leading from the lower part of the receptacle to the well, would sufficiently explain the action. It is of no use waiting at the well to-day,—the weather is against us: it is all ebb and no flow. We get on a little further, and reach the mine where our friend Blue John is specially worked,—the Blue John mine *par excellence*, whence the finest piece ever worked was obtained. Derbyshire is full of holes, wonderful holes; some bottomless, some topless, or apparently so. After visiting two or three, further work into "the bowels of the earth" is unnecessary. The Blue John mine, however, is special, and down we go. A little damp here and there, and a little ragged, but, on the whole, quite as easy as it should be to keep up the right idea. We go forward to an extent of 1,500 ft., and by that time are 500 ft. down, a good deal more than the ball of St. Paul's is up: and then we reach what is called the Variegated Cavern and, a blue light being fired, we see at our feet a black and yawning chasm, and we do not see the roof above our head. Here and there, in other parts of the mine, are stalactites and stalagmites, and though the visitor cannot sing with literal truth,—

"And o'er his head the dazzling spars  
Gleam like a firmament of stars;"—

there is enough of the spar visible to swear by, and the whole effect is interesting and striking. The spar is hard to work: a very small tazza occupies a man a week,—the man says.

Getting on towards Castleton, there are several fine pieces of nature that may be viewed; such, for example, as the remarkable ravine called Winnats, in which name some may not at first see the fact that the opening was earlier called the Wind-gates, though a visit to the place in a gusty winter's day would sufficiently explain why it was so named. And then comes Mam Tor, or as it is locally termed the Shivering Mountain, which, easy of ascent on one side, grassy, smiling, and tempting, ends on the other as a steep brown precipice, frowning over the adjoining country at its foot. It suggests the path some men take in life: all smooth, easy,

and pleasant up to a certain point, and then, caution being asleep,—a tumble over, and so an end. It is called the "shivering" mountain, not because it quakes or shudders, but apparently because it falls to pieces. Bacon speaks of "the breaking and shivering of a great state;" here we see the breaking and shivering of a great hill. It consists of friable shale, which, by the way, amongst miners is called "shiver," separated by coarser layers. These disintegrating, the face is constantly falling away.

Approaching the village the origin of its name is at once seen; for there stands, prominently crowning it, the ancient castle of which every one has heard, because every one, it may be supposed, has read "Peveril of the Peak." It is named in Domesday Book as belonging to that Peveril of whom we heard at Bolsover, and who, when his descendant behaved badly, went, like Bolsover, to the king; got into the hands of the harons in John's reign; and then was again taken for the king. We should tell no stories of the building if we exclaimed,—

"Behold you towers,—mark well those crumbling walls,  
The silent chroniclers of bygone years;  
Think what dark tales lurk in those gloomy halls,  
Of war and terror, tyranny and tears."

However, these we still have. While men remain what they are, and women too, there will still be "tyranny and tears" quite independently of castle walls. If the Castleton folk were wise they would make the way to their castle walls a little less difficult and tiresome than it is. The domain now forms part of the Duchy of Lancaster, descending from John of Gaunt.

Close by is the Peak Cavern, in the limestone, and very interesting. It is such a marvellous formation, indeed, that it has come to be called the Devil's Cavern. The approach to it is particularly fine. The neighbourhood, in truth, is full of wonders of this kind. Ovin's Mine, worked by the Saxons, the fearful gulf called Eldon Hole, and so forth; but it has nothing more beautiful than the dale in which Castleton lies. The foliage is rich, the fields are divided by hedges instead of the more usual grim stone walls; a noble amphitheatre of hills surrounds one side of it, and on the other we have the town, its quaint little church, the castle on the hill above, and the entrance to the Devil's Mine. We could scarcely find a more charming and appropriate spot in which to take leave for the present of delightful Derbyshire and its three over-riding names, Peveril of the Peak, Bess of Hardwick, and the Duke of Devonshire.

#### THE LONDON (CITY) BATHS, LAUNDRIES, AND DWELLINGS.

THERE have been recently erected in Golden-lane, Barbican, in one of the districts in London the most over-populated and abounding in poverty and wretchedness of the inhabitants, certain buildings appropriated to dwellings, and to public baths and laundries; and a company is in course of formation for purchasing and maintaining them. The buildings consist of a front and a rear block,—a narrow street separating, to get light and ventilation,—the two buildings together occupying an area of about 11,000 ft. and having five principal stories, and a basement, the whole running to a height of about 70 ft. to 80 ft. In the front building, a large dining-hall, or common room, and about ninety private baths occupy the principal floor; and below these are two swimming-baths. In the rear-building the lower floor is appropriated to a wash-house with eighty-four compartments, and a laundry; and above, there is a galleried room serving as a school-room and chapel. The upper floors in each of the buildings are given to the residences, of which there are 80: or there are 171 rooms. The buildings, which have cost upwards of 37,000*l.*, were erected at the expense of one individual, Mr. A. J. Vieweg, a Wood-street warehouseman, and native of Switzerland; who has achieved, out of his own resources, other good works in the same locality. One of the latter is the "City Gospel Hall," in Brackley-street, where there are religious services, and Sunday, day, and evening schools; and where the poor women of the neighbourhood are invited to come "for change of air and scene," to do their needle-work. Another is the "Albert Protestant Sunday Rest Temperance Home," containing residences and a day-school. A building devoted

to similar objects, which was commenced in 1862, is in Bell-alley, Goswell-street, and bears the inscription,—"This house is built as a pattern to other landlords who have the industrious working classes as their tenants." In Whitecross-street there is another establishment of a like character. In all, we believe, there are five schools, to which six teachers and a missionary are attached.

It would be difficult to express in efficient terms our admiration of the large-hearted philanthropy of the gentleman who thus, and without thought of pecuniary return, has devoted out of his gains,—understood to have been not of extraordinary amount, (although obviously they would have procured him many luxuries,)—sums of money such as, on the most moderate estimate, have been required for these several undertakings. We need not say how much we approve of the selection of such objects as the establishment of baths and wash-houses, and the construction of improved dwellings, as channels for benevolence. A better locality, moreover, could not have been selected, than that which Mr. Vieweg has chosen for his labours. Dilapidation, dirt, and discomfort are the striking features in Golden-lane; and a resident in any of the better quarters of London, visiting the district for the first time, might well wonder if there were any locality stamped with a greater amount and variety of the phases of misery, than this one in the heart of the metropolis.

Expressing our approval of the objects to which the exertions referred to have been directed, we are, however, under some responsibility in directing attention to details of the building. In short, our observation of the manner in which, in certain details, the objects have been sought to be attained, has led us to hesitate about the notices that we should take of the work; one that has been spoken of by our contemporaries in laudatory terms,—indeed in words which, as will be seen, we are by no means inclined to think undeserved in the main. The deductions from the measure of approval, however, that we have to make, relate to points so much associated with principles of the design and provision of buildings of the class of that just erected, that we feel called upon to say what they are, to prevent errors that repeated would go to reduce in an important degree good effects, and indeed to perpetuate evils that are sought to be corrected by the erection of such buildings.

In order that both sides of the question may be fairly weighed, we shall do right to state, what may seem to be against our views, that as many as 27,565 persons used the private baths in two months of the present year. Indeed at the beginning of August, when portions of the buildings were not quite finished, more than 70,000 persons had used the swimming-baths and private baths since the commencement, and chiefly since April. The washhouse is much appreciated; the school is well attended; and the residences let readily. Lastly, a valuation of the buildings by Mr. Whitecord, makes them worth 38,000*l.*, finished, fitted, and in working order.

The defects of the building are structural. Throughout, portions of the work, and of the fittings, that would be subject to extra-wear,—as from the purpose of the building, and from habits of the class occupying the tenements or frequenting the baths,—are, instead of being provided of extra-strength, quite of an opposite kind, is used where a different description of work should have been preferred. Thus, the divisions of the private bath-rooms are not of slate, as in the model-establishment in Goulston-square, followed in the other places in the metropolis, and as originally decided upon after much consideration; but they are of thin square-framed partitioning, of wood, only stained in some cases. Some of the baths are formed with glazed brick. The jambs of internal doors which are the entrances to the tenements, and lead out of very narrow passages, are finished defectively in joiner's work from which the wall-plastering is already breaking away. The roof, which is flat, and seems designed to be a place of resort for the inmates, (since there is a fine view from it,) is covered with zinc, insufficiently protected by hoarding to walk upon; and the iron railing is too slight to be safe after some years have passed by. On looking down the principal smoke-flue, we found that it was pargetted only for a few feet down. The brickwork generally is not well executed; and the wide joints in the work at the top of the building will soon need pointing. One of the worst defects, however, is

manifested in the tenements themselves. The rooms, at least in the upper stories, are two together, forming one tenement; and the fireplace is in the division between the two. The arrangement requires a flue to be arched over to the external wall. In each tenement that we entered, there had been so much settlement that the arch and flue had become cracked sufficiently to let smoke escape into the room. One of the occupants said that the cracks had been stopped up once, but had opened again.

The sort of design and construction that admits of such defects, is quite at variance with the conclusions of those who have paid much attention to the subject of buildings appropriated to the wants of the humbler classes. In connexion with places of residence, Mr. Henry Roberts, on more than one occasion, has dwelt upon the necessity for the extra-strength to which we have adverted, in fittings. It may be admitted that large returns, such as have accrued sometimes, as in the case of the Lambeth baths,—which have paid for three or four years 8 per cent., and are expected this year to pay 10 per cent.,—are not to be realised without economy; but it is not economy to have fittings such as will require to be reinstated before the returns, large though they may be, have provided means for the renewal. But, further, there is a distinct evil, besides had economy in finance, connected with inferior construction in buildings of the class we are referring to. The residences which are presented as improved,—as models, indeed,—becoming dilapidated, are in one important respect defective no less than the acknowledged badly planned dwellings. The crumbling of plaster, and decay and splitting of woodwork, the opening of joints by shrinkage and settlement, and the breakage of "ironmongery," help to cause dirt or that discomfort which reacts in a home, and which it is the object to remove from the humbler classes. We should add, that whilst ventilation has received attention in the Golden-lane buildings, what has been provided in the chapel is not adequate, and that the gallery-stairs are not sufficiently safe for young children.

On the occasion of an inspection when these notes were made, the drawings of the building were not procurable; therefore description of plan and general construction is made under disadvantages.

There are two entrances in Golden-lane to the front building. The main entrance leads, by steps, to the chief pay-office; and doors right and left, from the landing, give access to the end of the common room. The office is inclosed with glass, so that the clerk or manager can command a view both of the entrance and of the room. This room measures 70 ft. by 30 ft. Near to it are the kitchens. Doors from the further end of the room lead to the stairs to the first-class swimming-bath, and the private baths. The arrangement has advantages as regards control, but must interfere with the comfort of persons using the common room. Trussed girders carrying the floors above, and necessarily required to be of considerable strength, are prominent in the effect of this room. The height of the room is less than might have been desired. Busts of the Queen, the late Prince Consort, the Prince of Wales, Shakspeare, Milton, Mozart, Sir Walter Scott, Sir Robert Peel, Lord Palmerston, Garibaldi, and others, are placed on brackets on the walls. On the casing of the girders are painted, in large letters, Scripture texts. In every part of the building, unless some of the residences be excepted, similar texts abound, only in the greater number of cases painted in smaller letters than the texts on the girders. No Mahometan even, could display texts from the Koran more profusely in his building, than Mr. Vieweg displays texts from the Bible. In Golden-lane, however, no attempt is made to combine decorative effect with the texts; unless we except the rooms of some of the residences, which have been papered, and where the paper is diapered with the texts. Attention has often been called to the value of a similar method of decoration, so to speak of it, as for the walls of nurseries; but we are not aware that much attention is yet given to the matter, by the manufacturers of paperhangings. The patterns used by Mr. Vieweg were made to his order, such texts as he required being chosen. The patterns might have been varied, as well as improved; but these specimens help to suggest that addition could have been made to parts of the building at present needing decorative effect; and that the commendable object

with which the texts were placed, could have been advanced, even by making them somewhat less prominent. Actually, they meet the eye in every direction,—in the common-room, in the swimming-baths, in the private baths, in the wash-house, and, as we have said, in some of the residences. Each person using a private bath sees at least two of them; and in each compartment of the wash-house there is at least one of these texts.

The first-class swimming-bath measures 59 ft. by 33 ft.; and the charge for its use is 4d.; the second-class bath is 75 ft. by 32 ft.; and the charge is 2d. The private baths are divided into first and second class, the charge being 6d. and 3d.; but seven tickets taken at one time are charged as six. There are private baths for women. In connexion with the wash-house is a centrifugal wringing-machine; and there are fifty-seven drying-closets. There are also two patent washing-machines. An engine works the machines and the mangles; and it is proposed to turn any spare power to account for lathes in workshops at the top of the building. Ironing stoves and tables are also to be found.

The water has been supplied by the New River Company; but an artesian well is being sunk. A considerable depth has already been reached, the chalk being penetrated. The diameter of the well for the first 100 ft. down, is 6 ft.; the depth of boring below this 100 ft. is at least equal; and the water, which rises perhaps not more than 50 ft., is raised by pumping.

The residences let for 5s. 6d. and 6s. 6d. a week. The smaller tenements are simply two rooms, each about 15 ft. or 16 ft. square, with a door of communication. The principal room has small cupboards, and a good grate. Closets and sinks are common to several rooms, and are placed on the staircases. These last are of stone. The chapel is said to be capable of containing 400 people; but this must be under disadvantages, some of which we have referred to. Looking up from below to the gallery, the latter appears like a floor with a mere well-hole opening, so much are usual proportions reversed.

One of the points in which most judgment has been shown, has been in the leaving around the buildings, a certain portion of ground unbuild on. The building was designed by Mr. Charles Martin, C.E.

When the building was commenced, Mr. Vieweg contemplated laying out about 20,000l. The actual cost having been at least 17,000l. More than the estimate, it is desired that a portion of the 37,000l., or larger amount, should be returned to Mr. Vieweg. The company to which we have referred has been projected with this aim. The capital is set down at 50,000l.; the shares being 5,000 in number, of 10l. each; and it is proposed to raise (in accordance with the articles of association) 10,000l. in debentures, payable in five years, at 5 per cent. per annum interest. Amongst the inducements offered are the necessities of the labouring classes in London, and the wants of the locality; and the probability that the dwellings, baths, and laundries will be extensively used, through their short distance from the large City warehouses, and the Post-office, in which many persons are employed, and through their position in one of the main routes between the City and the northern part of London. The actual returns from the baths alone, nearly 1,000l. in four months, may be accepted as evidence that these views have some foundation. It must be mentioned that there is a mortgage debt of 13,000l., bearing interest at 5 per cent., and having of course a first claim. Mr. Vieweg is to take 10,000l. of the purchase-money, in shares, or will take more if needed; and his dividend is to be deferred "for three years, every other shareholder receiving 5l. per cent. before he receives any." Deducting the 13,000l. standing on mortgage, and the 10,000l. taken up in shares by the vendor, an amount of 14,000l. only is required to be raised in shares and debentures to complete the purchase; and there seems little reason to doubt that this sum will be got.

As the buildings are, they are calculated to effect, for some time, so much good, that we cannot resist expressing the hope that the company will be formed; and that the gentleman who projected them, and provided the money, will be reimbursed to the limited extent that he desires. But, even should experience show a sufficiency of returns to provide for frequent renewal of the fittings, and should it favour the ordinary economic view of large comparative returns from that small outlay per head of accommodation which permits numbers to be

provided for and to tell in the account, we apprehend that what are some of the main objects of philanthropic promoters of works of the character of this one in Golden-lane, may not be attained. We have hope that there will arise one day, a greater demand than now exists for better and more comfortable dwellings, amongst the class of people that Mr. Vieweg had in view. Now, it is impossible not to see, and not to deplore, the paucity of means, and even as it would seem in many cases the entire want of power, in the humbler classes to help themselves; and equally it is impossible not to recognize that, in the same class, there is even a preference for existing discomfort, that has become a habit, and that affects chiefly those who are left at home, to the sacrifice of indulgences, costly in their nature, and injurious. But whenever the comparison between requisites and luxuries shall be more correctly drawn, there will be the demand, which will not be exactly satisfied by the sort of accommodation and building-construction that Mr. Vieweg has been led to provide; and, then, a company owning a building of the character referred to, would be called upon to make at least improvements in it, at heavy cost.

#### ARCHÆOLOGIC ITEMS FROM ROME.

The summer sultriness gives the signal of suspense to labours of excavation, and almost all lanch are carried on underground in or near Rome. We may, therefore, in the present interval, find space for some general observations as to what has been accomplished during the past season by activities in this sphere. On the Palatine Hill, where works ordered by the Papal Government and by the Emperor of France have been progressing simultaneously, there is little to notice in addition to particulars now well known, save that the area of substructions and foundation-walls is gradually extending, more and more serving to throw light on the general plan, though not yet presenting to view any imposing elevation of the imperial buildings. The most important result of the works ordered by the Emperor since the beginning of the last winter has been the discovery of the very vaguely-marked but massive ruins of the Temple of Jupiter Victor, nearly central to the theatre over which these labours extend; but no art-remains of much value have been brought to light since the torso of a Faun (distinguished by characteristics of the highest order) was exhumed in the winter. The most interesting range of the Palatine antiquities, those ruins beneath the Church of St. Anastasia at the hill's north-western angle, consists of numerous vaulted chambers and corridors, besides stupendous fortification-walls of considerable extent, that may class with the most ancient of Rome's monuments, and be referred to the earlier king period. These discoveries, we are sorry to report, have been for almost a year left in statu quo, without the prospect of any labours on the site partially worked by Government order; great, indeed, being the contrast between the energy manifest in the now metamorphosed Farnese Gardens, where French enterprise is concerned, and the languid efforts of the Roman authorities on the western and northern slopes of the same hill. The Signor Righetti, who has purchased the Palazzo Pio, below which his discovery of the bronze Hercules proved such a treasure-trove, has undertaken the complete re-building of that residence; and other remains of Pompey's theatre and temple to Venus, over a portion of which it stands, are being gradually uncovered in those works. We have just visited the spot, and been obligingly conducted by a gentleman of that family over the subterranean long indeed known and accessible beneath this mansion, though now opened to a somewhat greater extent. It is not what recent research has yet obtained, but rather what the hitherto-discovered conveys promise of, that in fact renders a visit to the dark recesses under the Pio palace more interesting now than in years past; and in the massive style, as well as compact condition of the great structures, arcades of the theatre partly in square-lewn peperino, partly in reticulated masonry and rubble-work, we may see the earnest of the existence of much more, long buried in darkness and oblivion, which probably escaped the despoilers of the Middle Ages, owing to the accumulating of soil and alteration of the city-level around, though we may infer that

much of the antique was remorselessly swept away to give place to the Pio palace itself. In a magazine on these premises we saw the various and rich fragments, architectonic ornaments, Corinthian capitals and cornices in white marble, pavement in *porta santa*, besides one very valuable piece of sculpture, a finely-draped female statue wanting the head and arms, and measuring two metres in this mutilated state—all objects found in or near the same compartment with that magnificent bronze of Hercules, and supposed to pertain to the decorations of the Venus Temple.

The Palazzo Pio on one side joins on to a crescent of paltry houses, in whose general plan is recognizable the form of the ancient theatre. And here we may enter three large smoke-begrimed stables, formed out of the arched recesses of the arcades, with their massive vaults and walls, partly of *opus reticulatum*, now in many places hocked off or altered to suit modern purposes; the appearance of these interiors reminding one of caverns scooped out of living rocks,—a strange scene to come upon in the midst of crowded streets. At a short distance hence, on the southern side of the Pompeiana theatre, was lately found, under a shop, in the Via Giubbouari, an enormous shaft (diameter 4½ metres) of red Egyptian granite, laid prostrate; and near this, an immense fragment of white marble cornice with fine mouldings; these relics lying in a dark subterranean, at a depth, we might conjecture, of about 13 ft. below the modern level—brought to light nearly by accident in laying the foundations of a house;—it seems that no effort is to be made either for rescuing them or continuing to explore on a site so promising. The bronze Hercules remains still in an out-house of the Vatican, to receive the few restorations requisite from the hand of Tenerani; and with permission from that gentleman this wonderful statue may at times be seen. We leave to learned judges the anatomic power it displays; but what struck us most at a first view was the high conception of heroic beauty, the finely-marked characteristics of intellect that distinguish this above all other antiques of the same subject.

More important than all other recent undertakings on the part of this Government, are the excavations at Ostia, suspended till November next. At the last session (5th of July) of the Roman Archaeologic Academy, we heard a long and learned report from Signor Visconti, jun., on the general results of these works, a single drawing (why not more, we might ask?) being shown to illustrate this lecture, from an indeed admirably designed fresco in a tomb (now at the Vatican Library) of Orpheus's descent to the shades, and his meeting with Eurydice. It was by Pius VI. that systematic labours were first ordered at Ostia; recommenced, after long interruption, caused by political tempests, under Pius VII., they were again resumed in 1859, with direction of Signor Visconti, whose intelligent method has aimed at the disencumbering of the city's entire area, instead of excavation limited to certain sites. At that session of the Academy it was announced, amidst much applause, that the Pope had ordered the creation of a museum of Ostian antiquities *in situ*; the edifice chosen being a large one hitherto used as a depot for the produce of the saltworks in this seacoast, where in future the valuable art-objects hitherto, in every instance, transferred from Ostia to Rome, will be exhibited; but, it may be asked, to what superior advantage for the student or tourist, seeing that the unwholesome and desolate situation, sixteen miles distant from Rome, and the poverty of accommodation at the modern village, must continue to render Ostia one of the least frequented (though now, indeed, highly attractive) among historic spots near this city.

The preparations for erecting Tenerani's nobly-conceived monument to Pius VIII., at St. Peter's, are now nearly complete; and the colossal group,—the Saviour, the two chief Apostles, with the Pope kneeling in front,—will soon appear above the door leading from an aisle to the sacristy, where that egress will enter into the design of the architectonic basement. Another sculpture lately erected at St. Peter's is the colossal statue of St. Angela Merice, foundress of the Ursuline nuns, by Galli,—not, indeed, favourably seen in the high-placed niche assigned to it,—but a pleasing and dignified matron-figure, the monastic costume ably treated, and the venerable character of the nun contrasted with the youthful naïveté of a girl standing at her knee, introduced in

allusion to the special vocation of the Urulines, the worthy females enrolled in which order dedicate their existence to the instruction of their own sex. The project for the restoration of the Marcian Aqueduct, to discharge its waters first on the Quirinal, is not to be carried out by means, in any part, of the antique construction (now extant only in a few scattered ruins), but entirely by underground channels laid through the embankment of the railway, to be at the same time commenced between Rome and Tirol. Our consul, Mr. Severn, has energetically promoted this project, now sanctioned by authorities. At present, the most conspicuous public works here are those in churches; and in the re-opening of catacombs has of late been displayed great activity. On the other hand, many things, most obviously desirable and of most general interest, are neglected; classic sites left untouched; illustrious monuments abandoned to disgraceful uncleanness and profanation. Such inconsistencies form, indeed, one of the manifest peculiarities of Rome. We are often astonished to see how much is done by a Government whose revenues have been reduced, through late political shocks, by more than two-thirds; whilst our surprise at what is left undone may well be modified by the consideration that this Government absolutely and on system prevents all utterances of opinion, reducing the Press to an echo of its own wishes, or *usque ad nauseam* praises—under which state of things, can one wonder at any imaginable amount of abuses or short-comings?

#### WELSH WALES.

MANY tourists are under the impression they have seen North Wales when they have journeyed from Chester to Carnarvon, or penetrated from Shrewsbury to Machynlleth and Aberystwyth; but, in reality, real Welsh Wales is bounded by those districts. It is only where the railway ceases its generalizing effects, that national characteristics are found to linger in their original intensity. For any peculiarities we may see in the buildings along the line of railways, Wales, as seen from the line between Chester and Carnarvon, might be some picturesque district in England, especially if we except a tendency, here and there, somewhat pretentiously expressed, as in the rambling edifice at Abergelle, to maintain the traditional associations of the district with castellated architecture. The greater number of new buildings skirting the various stations are but repetitions of the new villas and terraces to be seen in every district in similar situations. They are, however, at some places so numerous as to warrant the common assertion that new towns are springing up. At Rhyl, Llanfairfechan, Abergelle, Griffith-crossing, and Port Dinorwig, there is much evident vitality in building matters; indeed, scores of smart villas are to be counted in the neighbourhood of most of the stations. The old grey nucleus of each place is lost in the overpowering number of new houses, and with it all distinctions of mannerisms in building. Arrived, however, at the length of the iron tether, Carnarvon, marked differences between England and Wales are perceptible; and an additional day's drive into Merionethshire brings the traveller into an "old, old, very old" country, full of ineffaced foot-marks of the ancient Cambrians. As we write, however, men are laying the magic sleepers and rails along the coast and through the hills, that will change all this. The shrill scream of the engine-whistle will break the charm that now appears to be thrown over the people and mountains, enchainning them both in a calm, grand serenity, and rendering haste and bustle as impossible to the one as to the other. The retentive descendants of the ancient Celts will be brought into constant and chafing communication with new customs; and Welsh Wales will gradually fade from the chart.

Carnarvon is retentive, too, to a certain extent, for there are Medieval streets in it with which time has dealt tenderly. Their overhanging gables nestle, in Vandycked lines, under the protection of the kingly castle to-day, as they must have done, with but little change of shadows, for these three hundred years and more. Much of it, however, is semi-modern—a synonym for the absence of all but the most miserable taste. The square immediately surrounding the castle outer works, for instance, has not a fine old house in it, nor a fine new one either, but is enclosed by shops and houses,

and hotels, built before the revival of artistic considerations. But it is easy to turn out of this into the most picturesque byways, or into the right regal castle, when there is no room left in the mind's eye for any feeling but that of entire satisfaction. The decorated traceried windows, the square-headed windows, the square-headed doorways, the staircases and corridors in the thickness of the tower walls, the views from the topmost turrets, the eagle tower in which the first Prince of Wales, Edward II., is believed to have been born, are all architectural facts that must delight every one. We are glad to note here that several judicious repairs have been made to keep the edifice from further decay. To defray the cost of such necessary repairs, an entrance-fee of 1d. is demanded, which arrangement has the further happy result of causing the constant presence of an attendant with a consequent refrain from destruction on the part of idlers. The basement of the proud eagle tower is suitably utilized as a volunteer drill-room.

A further proof of the presence of presiding intelligence in Carnarvon met our eye, in the ample distribution of handbills relating to the prevention of cholera. Notice is impressively given that all persons keeping pigs or other animals in confined places, or having upon their premises accumulations of offensive animal or vegetable matter, filthy privies, drains, or middens, are required to abate such nuisances under pain of punishment according to the statute. And, perhaps, nothing can give a better realization of the mixture of English and Welsh in Carnarvon than a statement that all such public announcements are printed twice over, first in English and then in Welsh. This particular bill goes on to say that a number of brushes will be kept at the police-offices, in High-street and Castle-ditch, and at the office of the relieving-officer, for the use of persons willing to lime-wash their premises, but too poor to purchase the necessary articles. We give this passage in Welsh, to show how many English words are gradually getting incorporated into that language:—"Rhoddir rhybudd hefyd yn miellach y bydd i nifer o frwshes gael eu cadw yn swyddfeidd y police, yn High-street a Castle-ditch, ac yn swyddia Mr. Thomas, y relieving officer, Rhif 10, Heuwallia, at wasaneth personan ag sydd yn rhy clawd a'w prynn, a rhoddir orders gan y police a'r relieving officer am y chydig o galch i'r cyfryw personan. Pola person ag sydd yn gwybod am unrhyw gas-lyethan, a dymunvi i hysghysn yr unrhyw i'r inspector of nuisances, yn ei swyddia, Local Board, Guild-hall.—LLEWELYN TURNER, MAER."

It is when the traveller attempts to leave Carnarvon for Merionethshire that he first realises his position. Two conveyances per diem,—the one a coach, the other an omnibus,—are the only public vehicles at his disposal. Should he arrive too late for the first, he must await the latter. Being now in a region where time is not reckoned as money, punctuality is not counted among the social virtues; and a delay of an hour and a half's duration is of the commonest occurrence. Packed at last with a great many more passengers than it can comfortably hold, the vehicle commences its twenty miles' drive to Portmadoc, with three horses. A man who has the charge of these horses accompanies them on the road till a change takes place, when he drops off the step, and a new officer accompanies the fresh ones. But the journey is not disposed of in this rapid manner. At every little village a stoppage is made, and the inside passengers, too tightly packed to get out, call for refreshments, which are demurely handed in at the windows. The outside passengers can alight more conveniently, and frequently avail themselves of the facility. Small parcels, too, have to be delivered at some places on the route, and as the roads are very hilly, compelling the most tardy pace in numerous places and as frequent stoppages for the conductor to put the brake upon a hindmost wheel at all steep declivities, the delays are vexatious. Admiring friends seem to accompany the conductor for some little distance out of each village, harking on behind till, their desultory conversation being concluded, they drop off and go their ways. The passengers talk Welsh among themselves till they wish to remonstrate or bargain, when they express themselves in bad English and Welsh, one after the other. We dwell on these details with the more minuteness, because they are things of to-day that will not be things of to-morrow.

There are few new houses, after leaving Carnarvon, on the line of coach road, till you come

through Penmorfa and Tremadoc, to Portmadoc; and then you step into a little newly-made marine place such as Herne Bay or Gravesend was thirty years ago, with the addition of the scenery of the Welsh mountains for immediate background and distant foreground. We mention those places advisedly, because we see in Portmadoc the same signs of rapid extension, the same germs of commercial prosperity as they presented at that period. Slates are the staple produce and principal export; and it would almost appear, the principal article of consumption, for wherever it is possible to use a slate instead of anything else, it is used most unreservedly. First, the pavements are of slate, the canthi-heads on the gutters are incised into slates and the names of the streets are incised into slates affixed upon the houses at the corners. Then slates are used for the basement floors of houses, for the roofs and ridges, for enclosures round gardens, and for many technical purposes which we will describe at greater length elsewhere. And behind Portmadoc towers one of a range of huge slate-coloured crags of great altitude. The little port at the water's edge, with its quiet craft filling with slates, is clearly the small beginning of a great, almost inexhaustible, mart. It has a small market-house, to which resort some few of the old ladies in the tall black hats we conventionally suppose to be the only Welsh costume, but far more customers in ordinary garb. Between Portmadoc and Merionethshire there is an arm of the sea that, at low tide, is left dry, with the exception of a wide stream in the centre of it; which is, however, fordable by horses and navigable by boat. A similar stretch of bare sea sands once lay twice a day before Portmadoc; but an embankment now confines the sea within bounds, thanks to the enterprise of Mr. Madoc. All traffic between Portmadoc and the opposite country is thus confined to the periods of low tide, or carried on by means of the coach road, by a circuitous route through the interior of the country. Once across into Merionethshire, and we seem to be picking our way, veritably, into ancient Britain. Nearly every house dotting the distant landscape on the Carnarvonshire side of the water is either whitewashed or coloured cream-colour, looking from afar off as so many sheets and blankets laid out to dry upon the hills; but in Merionethshire the grey stone of the district is left untouched, with the happiest result. The sky seems entranced with the rich greens and deep grey of the mountains and valleys, and the clouds to linger idly on the hill-tops, as though loth to leave so much loveliness and peace. Drovers of small black cattle appear to be almost the only things upon the move, except in the archaic villages, where a few of the inhabitants are leisurely going hither and thither. If the cottages were only circular, instead of parallelogramical, we might deem them the original celtic huts, reared by the tribes who first penetrated to those recesses. They are built of the stone of the district, in huge blocks, six or eight times larger than any stone used by modern masons. As the district is so highly mountainous, many of these primitive houses are built upon such steep slopes, that the eaves of the backs of them are touched by the soil. The fronts face the road or a tiny foregarden, and the swiftly-rising ground behind them slopes up the walls, touches the eaves of the back, and rises sometimes to the clouds behind, with the damp result that may be anticipated. The large blocks of stone not being very manageable for dainty features, everything presents a massive character, like the mountains around. The chimneys especially are stalwart and substantial, not to be blown over by Boreas in his most wilful mood. The lintels, too, the sills, and the corbels, mark the same phase in the character of the people as plainly as though they said, "Once done and done well." The farmhouses are exceedingly interesting; the most considerable of them in this district were built much in the same manner. The entrance seems to have given admittance into a large hall extending along the whole front of the house. The size of these halls may be realised when we add that modern necessities have agreed to divide them into three apartments, an entrance-hall, with a drawing-room on one side and a dining-room on the other. Iuigo Jones is accredited with one of the designs of the most considerable of these manor-house residences, Glyn, and its sunny fascinating façade of millioned lattices and dormers, certainly do him no discredit. Talbrenydd, a neighbouring house, is quite as picturesque, though not quite so considerable, its grey front being likewise

pierced with mullioned window-openings and dormers. Both of these houses once possessed the large hall, stretching from gable to gable, just described; and both have modernized that arrangement by the division mentioned. Taltreddyn has that special mellowness in its amber-grey masonry that only three centuries can give. We must not, however, convey an impression that everything is stationary in this charming part of the world.

At Penral, a mansion is in course of erection composed of a centre with two tiers of mullioned windows, with dormers above, and two advancing wings containing similar features. This, like its ancient neighbours, is to be of the important hard grey stone of the district, of which, indeed, the huge crags around are composed,—a material, in skillful hands, that should endure for all time, and which every vent will beautify with new tints. This, however, is not available for millions or ornamented work, which have to be wrought of less everlasting stone brought from a distance. And, by the road-side between this and Harlech Castle, within sight of a ruined chapel on the sea-shore, and of Llanfair-isaf, a more modern farm-house, a little village church has been tastefully restored, its belfry for one bell rebuilt, stained glass put into some of its window-openings, and an oak rood-screen repaired. Where much is so neat, we were disappointed to find the space below the communion-table used as a lumber-deposit, although probably this was but a temporary arrangement. A chapel, though of no architectural appearance, is in course of erection on the same line of road; and, returning towards Portmadoc on the Carnarvonshire side of the estuary, a very creditable church, newly finished, stands near a group of small new houses.

Harlech Castle is the architectural gem of Merionethshire. To many minds, especially to those taking pride in Welsh antiquities, Harlech would have more interest than Carnarvon. For, unlike that structure, it incorporates a real Welsh castle once inhabited and defended by a race of Welsh princes. As it stands, it consists of a barbacan and a parallelogramical keep just within it, with a strongly-fortified wall starting from either side of the barbacan and inclosing a large space of ground before the keep. This wall is strengthened by corner towers, and, to add to the inaccessibility of its commanding site, by a broad and well-defined moat. This is not, however, all the work of one period. Besides workmanship of the Decorated period and much Edwardian masonry, there are portions of the work of the blessed Bran, a Welsh prince of pious memory.

This patriarch among castles is too near the sea, though in a grand grey and green amphitheatre of mountains, to have acquired the rich warm tints of the manorhouse masonry suggesting its long neighbourhood to sunny flower-gardens and orchards. It presents that bleached grey tone that is the inscrutable gift of the sea-winds. Scanning the wind-whitened masonry of the outer walls minutely, you will see amongst its interstices arrowslits that are unmistakably earlier than the Conquest. There are plenty of Edwardian loopholes, too; but these cannot be confused with them. One, we perceived, is nearly the same length as ordinary Edwardian arrow-slits, but not more than an inch wide; and some three or four others are not more than 9 in. or 10 in. in length, and perhaps three-quarters of an inch in width. They are formed of the same stone as the rest of the masonry, by the simple expedient of leaving each interstice as the walls were built up. They, with the stonework in which they occur, are excessively interesting as affording the only known link between early Celtic works, such as huts, camps, and cromlechs, and our rare Saxon remains. Much of this ancient Welsh work has been encrusted by Edward with more masonry, to make it thicker and higher. His additions are easily distinguishable. This superb relic is little visited, owing to its thirty or forty miles' distance from railway communication; but it is of surpassing interest. There are some very peculiar features in it, worthy of the consideration of the archaeologist; one of these being an Edwardian chapel, in the upper story of the barbacan, and another a larger chapel in the enclosed space in front of the keep, which, at first sight, appears to have had two floors.

One of the rarest of the curiosities of antiquity is to be seen near this place. About eight years ago the attention of Dr. Griffith, of Taltreddyn, a resident antiquary, was called to a stone that had just been brought down from the

mountains, close to the primitive—we had almost said the pre-Adamite village of Llanbedr, on which was an incised sculpturo of the kind now recognised as Celtic. Being then unacquainted with the Northumbrian markings of the same period, no particular value was assigned to it, but the proprietor of the building, for which it had been carried down, ordered it to be preserved and placed at the foot of a Maen-hir, or stone pillar, of which there are also two fine examples close by. Here it still reposes, and in its new grouping will, doubtless, give rise to startling theories in the minds of those antiquaries who are unaware of its removal from its original site. Curiously, as in the case of many of the Northumbrian stones, it was found in the neighbourhood of the remains of numerous hut-circles, in a most picturesque region—a very paradise for antiquaries. Dr. Griffith purposes to explore the original site, carefully, in the course of the present month, in the hope of finding further of these mysterious writings. The present inscription is of especial interest, because it is not so much like those found in Northumberland as those observed in Malta and Ireland. The stone is about 3 ft. long by 2 ft. broad and 1 ft. thick, tapering towards the end on which the sculpture occurs. This is a spiral set of curves, fanfold.

All the boundaries in this part of the world are made of low loose stone walls, of which the top rows are placed with their jagged edges upwards to form a coping. The Welsh sheep being remarkably agile, extra precautions against stray fleecy visitors are taken in the shape of extra height and jaggedness of these primitive finishes, giving a still greater distinctiveness to the landscape. The fact of the stones being laid without mortar results in frequent gaps along the highways, whilst the facility of replacing them does not ensure that desirable end. The flocks of goats for which Wales was once famous are scarcer than formerly; but, perhaps, to make amends for this, their owners are cultivating their capacities. Near Tremadoc we saw an ingenious machine, perhaps not less humane than similar contrivances for horses in farmyards, by which a goat, with the assistance of a dog, churned all the butter.

Of Beddgelert,—in whose memory the Welsh still have a proverb, "as sorry as the man who killed his dog,"—of Tan-y-Bwlch, Dolwyddelan, Bettis-y-Coed, — beloved of artists, — Bala, with its beautiful lake that would bring so much healing could its waters be distributed in Bethnal-green and other parched places, Festiniog, Snowdon, and of other parts and things in Welsh Wales, we may tell hereafter if the opportunity occur.

#### HINTS ON THE EXHIBITIONS OF PORTRAITS.

"Scepitis irritant animos demissa per aurem,  
Quam que suat oculis subjecta fidelibus; et que  
Ipse sibi tradit spectator."

MORAT, de Arte Poetica, 180.

The design to call up the memory of our famous people by bringing them visibly home to us in their portraits, in storied urn and animated bust, preserved for many an age throughout the land, gives universal satisfaction.

It is a design full of promise, historical and social,—difficult, indeed, in respect of its execution on some points, which its promoters will find ways to settle with discretion. It is homage due to the mighty dead; and so vast an array of the worthies of past ages cannot fail to stimulate us and our children to rival the best of our fathers. The display itself will administer to a taste grown into a popular passion through the invention of photography; but this same taste for portraiture has prevailed in England time out of mind, as shown in many forms,—by good paintings of all materials, and by engravings; by wood-cuts, and stone images and statues; by curious illuminated manuscripts of ancient date, brasses, and bronzes; by enamels, porcelain, pottery, and mosaic; by pen-drawings, medals, and tapestry, real and gravely allegorical; and even by grotesque masks and caricatures. Public and private stores of such various works are carefully preserved among us in unrivalled abundance; and when a few of these stores happen to be dispersed, they are eagerly bought up. We prize highly faithful portraits of our men and women worthily distinguished in all ranks, from the humblest to the proudest,—from Shakspeare's "mean-born gentleman" to her that wears the crown,—as representatives

of the better genius of our people. We are even disposed, perhaps, too readily to yield in this way to the mischievous vanity of great criminals by holding up their likenesses to a morbid curiosity in glittering Tussaud galleries.

A high authority claims for us English a superiority in good portraiture, tracing it to some marvellous superiority in our national features. The curious passage alluded to is in No. 555 of the *Spectator*, to be cited in no absurd spirit of national vanity, seeing that the writer, when making this particular pretension, gives to our neighbours—Italians, French, Dutch, and others—their greater merits in the historical and imaginative departments of art. It is, moreover, agreed that the "true-born Briton" of Daniel De Foe is properly made up of many elements. We are, as he says, "Brito-Romo-Saxo-Dano-Norman-English!" The superiority, if we have any, must be traced to our love of liberty, and to our letter culture; but the *Spectator* starts a theory calling for much more elaborate research than there is here space for.

How old the love for good portraits is among us is a point set in a strong, original light by Queen Elizabeth's proclamation in her youth, strictly prohibiting the drawing of indifferent likenesses of herself!

What may be termed the origin of the present pictorial movement has a special interest, positive and comparative. The great schools of modern art—in Italy, in Germany, in Holland, and among the Flemings—were largely creations of the wealth and fine taste of their merchant-princes—heads of popular states; and among the stores of art in these popular states characteristic portraits were numerous. So here in England, manufacturing Manchester early founded its "Institution of Art, Science, and Literature;" whilst the same Manchester lately took the lead—and a distinguished lead—in portrait exhibition. Some forty years ago also liberal encouragement was afforded there to the publication of a valuable record of artistic intelligence, especially in portraiture; so that the work was properly dedicated to the author's patrons, "the Governors of that Manchester Institution." This was Thomas Dodd's "Repertorium of Painters, &c., from the Twelfth Century." Six volumes of it were printed; and the two first in Manchester in 1824.

Earl Stanhope's "National Portrait Gallery," and the collection of miniatures at Kensington, have done much in the same way; but what is preparing may be traced to a wider influence. Lately we have been roused from a deep sleep in regard to historical studies; and we begin to feel that portraiture and sculpture have powerful bearings on these studies. A result of success in the contemplated crowded exhibition will assuredly tend to make historians more and more teachers of true greatness, by associating it more and more with goodness.

When the Earl of Chatham rebuked Lord Suffolk's rash defence of savage warfare by appealing to the frowning tapestry of the defeated Armada, below which our peers so long sat, the venerable statesman gave an excellent example of the use of portraiture, which has been perhaps carried into many other scenes of social and political life. Indeed, the task now undertaken to collect the portraits of our people from all times, is a weighty one; and a few hints upon some of its branches, will not, it is thought, be unwelcome.

Our forefathers took an earnest part in what was held to be the revival of letters and art in Europe, after their decline upon the fall of the Roman empire; but the utter extinction of both has certainly been assumed incorrectly. The very ruins of the ancient civilized world offered many a model to the wondering eyes of the victorious barbarians, who were not long in profiting by what they could not but admire.

The story of Anglo-Saxon art has still to be told, whether in its relation to those ruins, or as it was influenced by Oriental relations. But passing on from the genuine Norman tapestry at Bayeux, to numerous paintings at home and abroad of the assassination of St. Thomas à Becket at the altar, long a popular subject of church art, we find multitudinous illuminated miniatures to the fifteenth century, certainly the portraits of known individuals, kings and subjects. A Biblical specimen of that lore, of which one folio volume is preserved in the Bodleian, and the other volume in the Public Library at Avras, has not fewer than 1,500 miniatures distinctly various, and their personality is shown by the fact of the work having been produced by a long succession of monks,—the writers in the Scriptorium, whose

names are duly set at the beginning of their respective parts with their differing likenesses.

Illuminated MS., and monumental brasses, have not yet been enough searched for individual portraits. They are rich in those aids to heroic biography and to family study. Chaucer is well known to us from his grave features, preserved in the contemporary MS. poem by Occleve in the British Museum. The verses thus illustrated are not more striking as an eulogy of the time of the great poet, than the likeness so carefully presented to the reader, from the enologist's affection for the deceased man, whom, when living, he certainly knew in his own early youth. An equally famous group in a MS. in the library of the Lambeth Palace, deserves to be more skilfully reproduced by modern art than was done by Mr. Strutt's pencil of the last century for Lord Orford's "Royal and Noble Authors." The original must have a conspicuous place along with the Chaucer and some others of that class, in the coming exhibition, and so invite profound criticism. It is interesting in the highest degree, if at present correctly interpreted, to the history of our earliest printing; but it is beyond price as a domestic display of the court in the reign of Edward IV., not often thought to have been intellectually occupied. It is Caxton's zealous patron, Earl Rivers, the queen's brother, himself a diligent writer and a poet, as well as a pre-eminently brave knight and ambitious statesman, presenting a bound volume to the king in person; and introducing also a shaven monk to Edward, but it is said to be doubtful if the printer is there. The queen and her eldest son, afterwards the hapless victim of that troubled time, Edward V., are standing by, with the Duke of Clarence, himself the chief actor in a former sad tragedy at Tewkesbury, and soon to be sacrificed in the Tower to the ambition of Richard III. This pretty picture is a gleam of sunshine in a dark day of political crime. It is the frontispiece to a *manuscript* of a valuable work, "The Sayings of Antient Philosophers" stated in the text, by Caxton himself to have been translated from a French original by Earl Rivers, who read it on pilgrimage by sea to a shrine in Spain. Caxton makes a very curious addition to his patron's work; and this volume seems to have been written from a printed copy, the new art not having yet superseded the old practice. Book-making was at this time, 1477, in laborious transition to its actual comparative perfection.

The scene is the more pleasing to look upon in reference to its collateral circumstances than even in regard to typographical interest. The learned earl was governor to the young prince, his nephew. King Edward's articles upon the training of his son are extant, doing his majesty great honour for their wise and feeling character. But if the common notion be correct, that this picture tells a real event, testifying the importance attached by the court to the production of Caxton's early printed volume, it much raises our opinion of the royal intelligence, and deepens our grief at the wreck so soon to come. This portrait of young Edward is the original of all the engravings of him in our histories.

In the fifteenth century, a fine recumbent figure in bronze is a fair remembrance of king-making Warwick, with family portraits about his tomb in the chapel of his castle, a memorial of Medieval art as well as of baronial greatness.

In the next century (the sixteenth), in the reign of the Tudors, our native artists began to be surpassed by the Holbeins and Antonio Moros of Holland. Our own skilful illuminators were gone, and not yet replaced from our own stock. An ill-founded prejudice against the "vanities" of art, — pictorial and architectural — prevailed in the minds of our good Reformers, who held it to be a duty to become wild iconoclasts. John Knox's maxim, that to get rid of the rocks their nests must be destroyed, had a practical sense in it, — but it led to sacrilegious abuse another way.

The age of Shakespeare and Spenser could not, however, refuse absolutely to be influenced by the divine inspirations of their art, or reject all the genuine works of genius. Our glorious cathedrals were spared; and that golden age of the past is redeemed to our credit in art by one man of a great lineage, — Sir Nathaniel Bacon, — whose fair fame as a painter is only thrown into the shade by the brighter greatness of his relatives, of whom his half-brother, Lord Bacon, is the chief.

Sir Nathaniel Bacon's eminence is attested

by Camden; and the best evidence of his powers is still to be seen at Calford, where he lived; at Goshambury, the family seat; and elsewhere. The most attractive specimens of his works are two portraits, that of his mother and his own. Perhaps he produced the marble monument of his sister, the Lady Periam, now in the church of Henley-on-Thames.

In the first few years of the next century, there fell out an event in the premature death of Prince Henry Stuart, elder brother of Charles I., that was no less fatal to our progress in the fine arts and in all the humanities, than to the spread of civil and religious liberty abroad as well as at home. The evil influence of this event has never been duly weighed by historians. The capital parts, indeed, of the case have been, and are to this day misrepresented with extraordinary perversity of judgment and failure in research.

In regard to the fine arts, painting, sculpture, and architecture, it is enough here to state that the royal collection usually attributed to King Charles, the younger brother, was founded and richly endowed by the incomparable Prince Henry. Young as he was, at his decease, not nineteen, his household at St. James's had in it already eminent artists. Inigo Jones was a member of that household, architect to the Prince of Wales, whose wise economy even surpassed his great liberality and his good taste. He himself corresponded with agents employed to buy pictures for him, and to engage painters to come from Holland into his service. His admiring friends were the accomplished patrons of art, Thomas Earl of Arundel and the Earl of Pembroke. His portraits are many and characteristic, and they associate him with every branch of art, of literature, and of science. The exhibition offers a fit occasion for setting this glorious young Prince of Wales in the light that belongs to his genius and character.

With the exception of the Scottish Vandycck, Jameson, and his descendants, the Alexanders, foreigners, in the persons of Lely and Kneller, kept the lead in portrait painting among us, until Hogarth and Sir Joshua Reynolds broke the spell. The recent collection of miniatures has indeed given good proof of the ability of our own artists in this field; and our fathers' judicious liberality to the Holbeins, Vandyccks, and Knellers, sufficiently testified our good national taste in portraiture. But for the last hundred years, our Reynoldses and our Lawrencees have set us in the place which the *Spectator* of Queen Anne's reign claims for us at the head of portrait painting.

#### RATZEBURG, AND HOW PRUSSIA TOOK POSSESSION.

STRANGE circumstances, according to the proverb, make us acquainted with strange bed-fellows; and a Londoner, out for his autumn holiday, often manages to get into queer out-of-the-way places. Two hours by rail brought us from Hainburg to Lubeck, an interesting old place, with curious churches and wonderful spires, none of which are upright, and funny gabled houses, with quaint woodwork and glazed tiles. Thence to Ratzeburg, the capital of the aforementioned duchy of Lauenburg, a part of that golden pipkin for which the three beauties, Austria, Prussia, and Mecklenburg have lately put in their respective claims. Prussia, thanks to the charms of her Bismarck policy, ultimately received the prize, and by accident we arrived here on the eve of the 15th of September, the day from which will date the formal possession (or seizure) of the duchy by his Majesty of Prussia. A pretty little town is Ratzeburg, lying on an island in the middle of a lake, some 5 miles long by 1 mile broad, and connected with the main land by two long dykes. Seen from neighbouring heights, the place, with its red-tiled roofs, looks for all the world like a dish of lobsters, on a blue plate, garnished with green-stuff. The town-hall and guard-houses occupy one side of the square; opposite are the two principal hotels, one of which has a Prussian sentry pacing up and down, for the house is full of officers, with their coats covered with all manner of crosses and stars; and the poor little fellow with the big musket has no easy time of it, for his superiors are swarming in and out, and each time he has to present arms. The eve of this day was celebrated by a serenade to the minister, Count Arnim Boitzenburg, staying at the house of Count Kielmannsgerge, and come from Berlin in order to take possession of

the Duchy in the King's name. This morning was ushered in by three individuals in plain clothes, but armed with drums, drumming all over the place, and calling out the various guilds. Then, at eleven, some 400 men of the 43rd regiment came on to the square, and drew up on one side; after which the guilds marched up, some 150 strong, and took up the opposite side.

Count Arnim then appeared on the steps of the town-hall, and, in a short speech, informed the world generally, and the Ratzeburgers in particular, that his Majesty had been pleased, by patent of the 13th instant, to convert the Lauenburgers into Prussians. He finished by calling for three cheers for the King, which was responded to by the soldiers at a given signal; but the guilds and the handful of lookers-on remained perfectly passive. A ladder was now set up against the building, and the royal escutcheon fixed over the door, at the which another cheer from the soldiers, and all was over. Thus Lauenburg became Prussian.

#### THE SCOTTISH ASTRONOMER ROYAL IN THE GREAT PYRAMID.

PROFESSOR C. PIAZZI SMITH has reported to the British Association on the results of his exploration of the Royal Observatory, or Central Chamber, and its mysterious chest, sarcophagus, or coffer, in the Great Pyramid. The paper was read by Mr. White, who exhibited the photographs which Professor Smyth has taken by help of the magnesium light; which light, however, has been to some extent a failure, in consequence, mainly, of the ventilators of the chamber having been choked up with stones and sand, thus greatly limiting the access of oxygen and the removal of foul air. The clearing of the ventilators, if that be practicable, at available cost, should have been first effected, and would still be desirable, even were well-borers required. As it was, the chamber rapidly got filled with the oxide of magnesia, which required twenty-four hours to settle down; so that but one photograph could be obtained in the course of a whole day. And, besides, carbonic acid gas so abounds in the chamber, that the only wonder is magnesium burnt at all; and its light must have been very deficient compared to what it would be were the ventilators cleared.

On a previous occasion it was said that measuring-rods in the interior of the chamber had been photographed; and, had these measuring-rods been sculptured on the walls, a very startling corroboration of Professor Smyth's idea of the Great Pyramid having been a standard measure office would have thus been obtained. It now turns out, however, that the measuring-rods which were photographed were the Professor's own rods, which he applied to the sarcophagus, stone coffin, or coffer, which he believes to be an aboriginal childron measure; and these rods were photographed, while so applied, in order to show the actual dimensions of the kist or coffer. This was a very odd way of demonstrating the exact size of the kist. If the Professor's own measurements are to be at all doubted, why are his measuring-rods to be implicitly credited? The one may be wrong as well as the other. A committee of three competent persons, or more, including the Professor, would have been a much more satisfactory mode of settling this singularly doubtful question.

On the subject of the kist, or coffer, and its dimensions, the author of the paper said, —

"According to the theory of the late Mr. Taylor, that coffer was a primal measure of capacity, from whence is derived the hereditary Anglo-Saxon wheat-measure called the quarter, of which coffer it is the fourth part. Whilst, however, we know by Act of Parliament how many cubic inches are contained in four quarters English, there has been much doubt as to the cubical contents of the granite chest of the pyramid. The measure of the French Academy in 1791 made it nearly 4,300 cubic inches greater than several English travellers have declared it to be, though they again by no means agreed with each other in subsidiary details. Now, however, by means of the apparatus which we have a series of photographs of this coffer, with a system of measuring-rods fastened about it, showing the rods inside and the size outside and, finally, the cubical contents being summed up, prove, that the remarkable granite vessel is a measure of capacity equal, with almost mathematical accuracy, to four quarters English."

Now, considering that this supposed standard measure was never open to reference by any nation of antiquity, — not even by the Egyptians themselves, who knew nothing of its existence, nor even of the existence of the chamber which contained it, nor of the passage leading to that chamber, — this extreme mathematical accuracy, so far from confirming the idea of the kist

having been "a primeval measure of capacity," only sheds an additional suspicion of its own upon such an idea. We know that without access to, and corrections by means of, standard measures, extreme mathematical accuracy in measures is impracticable for any prolonged series of years, far less for thousands of years without any such access or correction. If the pyramid kist be so nearly equal to four quarter measures, therefore, the coincidence is probably accidental, or to some extent dependent on other circumstances, like those relating to the common use of measuring-rods themselves, such as the curl or the measure of a man's forearm, and their derivation from nation to nation; as well as those relating to the average length and breadth of the human body itself, or "the measure of a man," with reference to kists or coffins capable of containing it, whether dead or alive. As regards the kist of the Great Pyramid, the impenetrable mystery in which for ages it was purposely hidden, corroborates our idea that it was used in the mysteries of initiation, as so many kists to be found in all ages been,—Druidical and Freemasonic inclusive; and the same mystery ever contradicts the idea that it was ever intended for a primeval standard or reference measure of capacity at all.

## TELEGRAPHIC.

THE provisional prospectus of another new Atlantic Telegraph Company has been issued. The company is to be known as Allan's Ocean Telegraph Company (Limited), from the circumstance that the cable which it is proposed to lay is to be constructed on the principle advocated by Mr. Allan, the well-known electrician and engineer. The capital to be raised is stated at 150,000*l.*; and it is proposed, in order practically to test the superiority of Allan's cable, to lay it in the first instance from Falmouth to Oporto; and should this section work satisfactorily, to carry it across the Atlantic to Halifax. One of the advantages of Allan's cable is said to be that it can be laid without much expense; and it is calculated that, not being saddled with any loss through previous failures, the undertaking should pay as well as 4*l.* a message of twenty words as its rival at 2*l.* As soon as the business increases, it is intended to lay another cable between Falmouth and Halifax direct.

The Atlantic Telegraph Company have had an extraordinary meeting, at which a proposal was sanctioned for raising between a quarter and a half a million of additional capital to sustain the company and its operations. The high terms of 12 per cent. and a share of profits, after the existing share capital gets 8 and the original capital 4 per cent., are to be offered to induce subscribers to come forward.

Mr. N. J. Holmes read a paper on "District Private Telegraphs," at the Birmingham meeting of the British Association. He pointed out that the popular use of the telegraph depended upon the adoption of a more easy system of signs than was used by the ordinary telegraph companies. This desideratum was secured by Professor Wheatstone's invention of the alphabetical telegraph in 1855. Upwards of 2,000 miles of private wires had been erected by the district company, employing upwards of 863 sets of instruments. The principle upon which the wires and instruments are supplied is that of rental. Comparatively few lines supplied were purchased by the parties using them, and those were chiefly over private properties.

## PROPOSED FRENCH TELEGRAPH TO AMERICA.

An arrangement has been entered into between the French Government and the proposers of a Franco-American telegraphic line as regards the terms of the concession, and the subject is to be brought before the Legislative Assembly in the next session. The route proposed is as follows:—Paris to Lisbon and Cape St. Vincent by land; thence by Hibernian submerged cable, through the Canary Islands, with stations along the Morocco shore, with stations at Fort St. Louis and Cape Goree. Here the cable will be immersed across the Atlantic Ocean to Cape St. Roque in the Brazils, and thence to Cayenne and New Orleans either by a shore-line or by only uniting the prin-

cipal islands of the Antilles. The length of immersed cable between Cape Verde and Cape St. Roque will be less than half that lately undertaken to be laid by the *Great Eastern*; and, as it passes between 15° north and 5° south latitude, it may justly be termed the "tropical cable." It will cross the equator somewhere about 25° west longitude.

## THE REPORTS OF THE MEDICAL OFFICERS OF HEALTH.

THE reports of the medical officers of health of the metropolitan parishes have a far greater value than is generally supposed. They are written by gentlemen who take great interest in their important work, and are fitted, both by their education and their rank in life, to take an independent position, and hold their own against the obstructive prejudices of boards of guardians. Their testimony is held in respect in the police and other courts, when matters of health are taken into consideration; but, as we have said, there is a want of management in the publication of their reports, and there are no means of getting a complete set of these reports, which, in a collected form, would give an immense amount of useful knowledge in connexion with the health of the metropolis. To remedy this, only needs a little arrangement. May we venture to recommend this to the consideration of the united body of medical officers of health. What would chiefly be required would be the adoption of a uniform size, and the co-operation of a publisher who, feeling an interest in the subject, would be likely to take a little trouble, at perhaps a small amount of profit.

In the hope that the views we have suggested may not be without good results, we will now glance at a few of the later reports.

*St. Pancras*.—Dr. Hillier, the medical officer of health for St. Pancras, directs the attention of the vestry to the prevalence of typhus fever, which he says is much aggravated by overcrowding, and he is of opinion that it is impossible to prevent this evil, and that the law relating to the matter cannot be enforced without encumbering the workhouses to a great extent, for house-rent is higher than ever in London; and the dwellings of the poor are constantly being removed by railway extension and in other ways. In St. Pancras, a great part of Agar Town has been pulled down, and much of Somers Town is condemned to the same fate. Rooms to accommodate a family with six or eight children, so adapted as to afford a fair amount of ventilation, cannot be obtained for less than 5*s.* to 8*s.* a week.\* It is only a few of the working men, who have families to support, that can manage to pay so much. The consequence, Dr. Hillier remarks, is that men having large families and earning less than 1*l.* a week, must live in rooms too small for them; and, as a consequence, disease is generated, and infectious disorders are propagated to a lamentable extent. Consumption, and the so-called tubercular diseases, are developed by want of air more than by any other cause. These diseases accounted for 865 deaths last year. About one-sixth of the whole deaths arise from preventible causes.

*St. Giles*.—Dr. Buchanan, in his report for 1864, says:—

"The registered deaths amount to 2974 per thousand of our population, and if the deaths of our parishioners in hospitals be included, the corrected death-rate is 3110 per thousand. There has been no such mortality as this since the health of the district has been made matter of study in these reports. It exceeds by two per thousand the death-rate of 1862, the year of highest previous mortality. It appears, therefore, that our district has to lament, equally with the rest of London, the remarkable fatality of the past year; and we cannot fail to be struck by the circumstance that in front of an advance in other parts of the town, St. Giles's keeps still advancing in its mortality. But it is right to point out that our own rise in mortality, great as it is, is this year scarcely beyond what has occurred in London as a whole, and that it is a satisfactory exception to former experience that the rise should not be particularly great in St. Giles's. Further, that of the districts among which St. Giles's is situated, St. Pancras, Holborn, and the Strand, but especially the Strand, have all exhibited a more serious rise (though not reaching the same actual amount of mortality) in their death-rate than St. Giles's, when the rate of 1864 is compared with the mean of 1862 and 1863. And, as has already been mentioned, some other districts have had a more formidable increase even than these now mentioned."

A valuable improvement has been made in 1864 in the method of procedure with owners of

\* In the model lodging-house for families, near old St. Pancras Church, three rooms which, at the time of the opening of the building were let for 4*s.* 6*d.* a week, now bring 7*s.*

houses that are habitually kept dirty. Much of the poor house property in the district is owned by some few landlords who wanted incessant looking after, and had come to regard the lenient measures or warning adopted by the Board as a cheap way of keeping them informed about the state of their premises. The Board has now resolved that in the case of persons habitually offending against the sanitary laws, proceedings before a magistrate shall be taken immediately if a simple notice be neglected.

The reporter states that—

"In the presence of the epidemic of typhus that has continued through 1864, continued attention has been given to the ventilation of houses and to preventing overcrowding of rooms. Handbills (in the form now long adopted by the Board) have been circulated with every notice that has been issued, warning landlords against permitting the practice of overcrowding. The decision of the magistrates that was obtained by the Board has been taken as a precedent when proceedings for overcrowding have been taken in other parts of England.

It is much to be desired that Local Boards should have power of dealing effectually with many sorts of sanitary defect against which the law does not at present properly provide. Collectively the medical officers of health have experience of many such shortcomings in the law, and they have recently drawn up a memorandum on the subject for the use of Government in framing future legislation."

*Whitechapel*.—Dr. Liddle, in his report for the quarter ending 1st July, 1865, says, as to overcrowding,—

"Such is the demand for houses among the working classes that rents are rapidly rising, and as it is almost impossible for the labouring poor to pay a higher rent than they paid for their rooms that they formerly occupied, each house soon becomes overcrowded. This overcrowding, for the sake of the public health, must be prevented. It is very probable that the districts adjoining the city of London suffer more from overcrowding than remote districts, in consequence of the local authorities there being empowered to institute a regular and systematic inspection. I am informed that the Sewers Act for the city of London (14th & 15th Vict. c. 91) is of immense service in that district in preventing overcrowding; but what must be the effects of such a systematic visitation upon the neighbouring districts, where the authorities have not the same powers to prevent overcrowding?

In self-defence, therefore, similar powers to regulate the number of persons who should be allowed to occupy a single room should be granted to all vestries and district boards, so that the same kind of inspection of the rooms in all such houses (as defined by the Sewers Act) might be adopted in all the metropolitan districts. Unless effectual means be taken to prevent overcrowding, disease will extend, and the rate of mortality increase, and consequently the burdens of the ratepayers will become augmented.

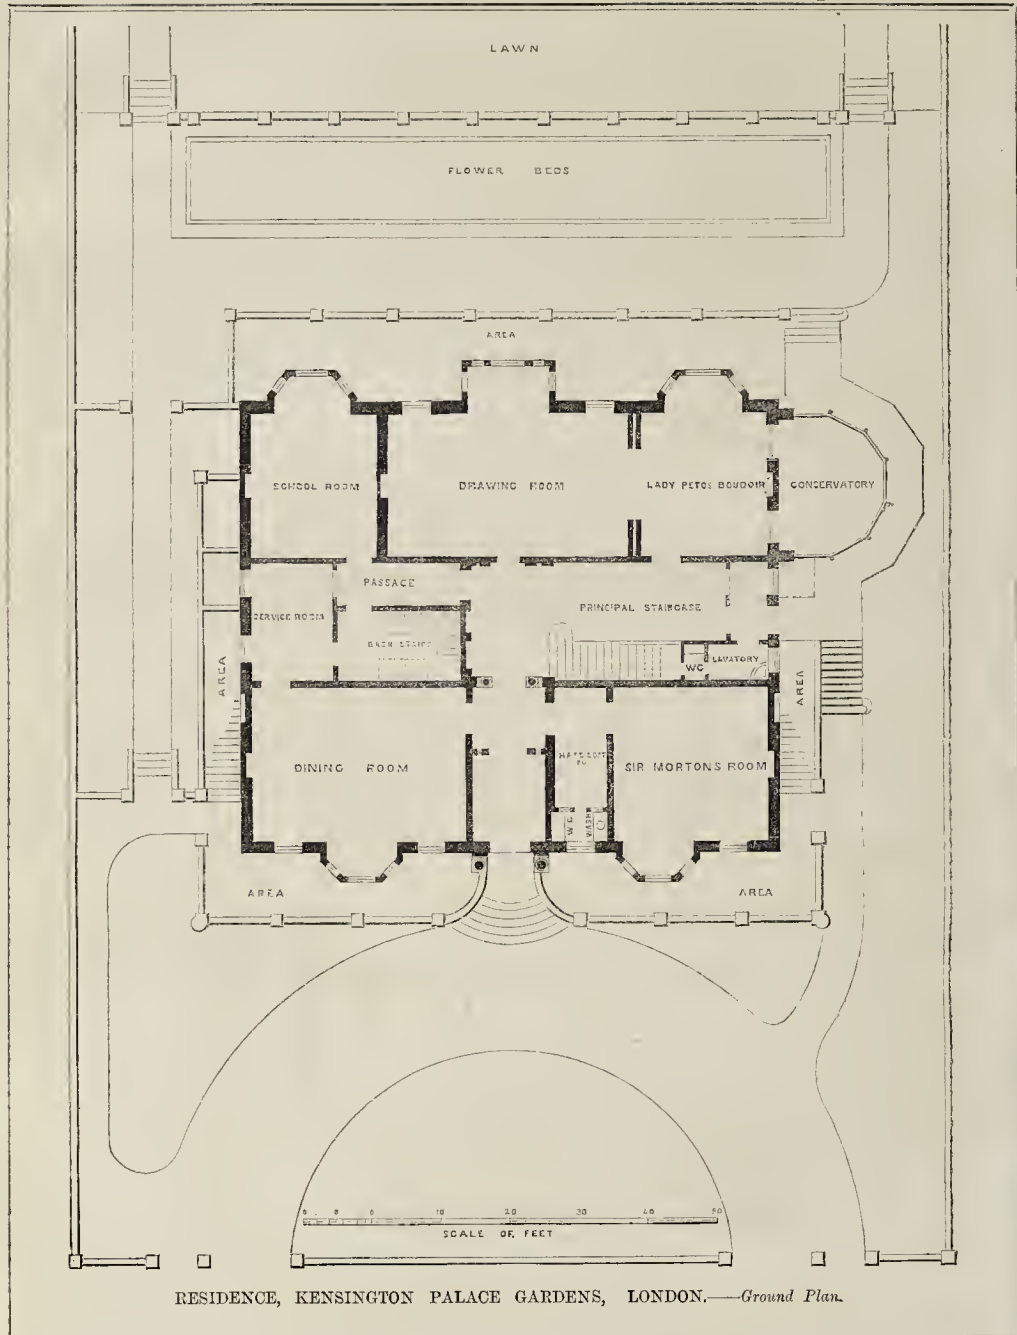

If such a system of supervision were to be carried out as in my opinion would be desirable, about 17,500 rooms would require a periodical inspection; for, unless a regular inspection at very short intervals be adopted, overcrowding will exist, and whenever overcrowding is found, nuisances will be of continual recurrence.

The overcrowding in this district is of two kinds, viz., that of the houses, and of the people occupying the houses. Many of the houses are built back to back, and, consequently, cannot have a current of air through them; and the spaces at the rear of others are so small that they are inadequately ventilated. The former evil may be prevented by proper provisions being introduced into a new Building Act; and the latter by the frequent inspection and putting rigidly in force the powers entrusted to local boards. There can be but little doubt that density of population exercises a powerful influence in increasing the rate of mortality. Cases of fever have been caused by overcrowding, and by the emanations from cesspools; but it cannot be said that overcrowding is either the cause of an increased rate of mortality or of fever. The poverty of the people, their occupations, their ages, the want of cleanliness at their command, the state of the drainage, the ventilation, and the existence or otherwise of efficient sanitary conditions, will produce a difference in the rate of mortality in any district."

## A MARKET FOR NANTWICH.

A COVERED market is about to be erected in Nantwich, from the designs of Mr. Thomas Bower, junr., architect, of that town. The site is given by Mr. Tollemaque, M.P., and the architect of Cholmondeley has given up the tolls to the town. The building is in the Elizabethan style of architecture. The hall will be covered with a light iron roof in three spans, carried on cast-iron columns, of an ornamental character; the centre roof will have a continuous lantern running the whole length of the building, fitted with glass louvres. Ventilation will also be obtained from the windows on each side of the hall, the upper half of which will also be fitted with glass louvres. The principal front will face the church, and will have two gables and a central block tower. The gables will contain the arms of the donors of the site and the market tolls, and the tympanum of the principal doorway the town arms. The building is 165 ft. long by 65 ft. wide, and will contain shambles, fish, poultry, butter, vegetables, fruit, and also a potato market. The building will cost between 3,000*l.* and 4,000*l.*, and will be carried out under the direction of the architect.

RESIDENCE, KENSINGTON PALACE GARDENS, LONDON.—Ground Plan.

TOWN RESIDENCE, KENSINGTON  
PALACE GARDENS.

A NEW town mansion, in Kensington Palace Gardens, for Sir S. Morton Peto, bart., M.P., which has been for some time in course of erection, is now rapidly approaching completion, and will shortly be ready for occupation. We give a view of the garden front and the ground-plan.

The building is of Portland stone, in the Italian style, with carved enrichments to the window-dressings and cornices, and alto-relievo panels with emblematical subjects above the

ground-floor windows. An enriched porch of slight projection gives access to a vestibule and then to a central hall with a wide easy staircase. On the right-hand side of the vestibule is Sir Morton Peto's business-room, 22 ft. by 22 ft. with hat and cloak-room, gentlemen's lavatory, &c., attached, and on the other side a dining-room, 31 ft. by 22 ft., with a large serving-room, fitted with hot-plates, &c., and communicating with the kitchen by means of a dinner-lift. Adjoining, is the servants' staircase, with a coal-lift running from the bottom to the top of the house, and communicating with every floor. The garden front is occupied by three rooms:

on one side a morning-room, 23 ft. by 18 ft.; in the centre the drawing-room, 35 ft. by 23 ft.; and opening from that, by means of large sliding doors, Lady Peto's boudoir, 23 ft. by 18 ft. This latter room leads on to the conservatory, which communicates by a broad flight of steps with the garden terrace. The conservatory is paved with encaustic tiles, and surrounded with flower-boxes of majolica tiles set in Sicilian marble. The tiles are by Messrs. Minton, who have also laid down in the vestibules and central hall an elaborate pavement of Roman mosaic. In the entrance-hall are large columns of Griotte marble, each in one piece, finished with enriched

RESIDENCE FOR SIR S. MORTON PELO, BART., M.P., KENSINGTON PALACE GARDENS.—MR. JAS. MURRAY ARCHTET.

Ionic caps and bases in bronze, by Messrs. Elkington. The decorations of the rooms are from the designs of Mr. Owen Jones. Messrs. Jackson & Graham are the decorators, to which firm has also been entrusted the furnishing. The woodwork of the rooms throughout is of wainscot.

On the basement, the servants' arrangements are elaborate; all the kitchen arrangements and the hot-water fittings generally throughout the house have been executed by Messrs. Feetham, of Clifford-street. The staircases and corridors on every floor are warmed by means of hot-water, which is laid on to every one of the principal bed-rooms and dressing-rooms, and also warms the conservatory.

The principal bed-room floor consists of Lady Peto's bed-room, 24 ft. by 21 ft., with Sir Morton Peto's dressing-room, 19 ft. by 25 ft., opening from it, and fitted up with bath, &c. Adjoining these rooms are a spare bed-room, 25 ft. by 19 ft., with a dressing-room opening from it, 20 ft. by 12 ft. On the other side of the principal staircase are a spare bed-room, 23 ft. by 22 ft., with a dressing-room, 17 ft. by 9 ft.; a night nursery, 20 ft. by 16 ft.; a day nursery, 23 ft. by 22 ft.; and two bath-rooms, fitted up with every requirement.

On the second-floor are two ranges of bed-rooms, consisting of ten spacious rooms, with bath-room and water-closets; and on the floor over this are six servants' large bed-rooms; a linen-room, lined with cedar, and heated with hot water; and housemaid's bath-room, closet, with W.C. &c. On this floor is situated the billiard-room, 23 ft. by 18 ft., having a curved ceiling worked into the Mansard roof, and entirely lined with polished wainscot relieved with a little ornamental bronze work. A jib door from this room opens into a lavatory and W.C. for gentlemen, lined with camphire wood, as are all the water-closets throughout the house, the peculiar and lasting fragrance of this wood having led to the choice of it for this purpose. The structure of the house is fireproof throughout; the floors being constructed of tile arches, carried by wrought-iron girders.

The stables, which are extensive and somewhat novel, are not adjoining the house, but are situated at some little distance, in the Mall, Kensington. They consist of a central alley or nave, two stories high, with an arched ceiling, and iron columns down each side, between which are arranged a row of twelve stalls and two loose boxes. There is a large coach-house (nine carriages) and several harness-rooms, &c., with residences for the coachmen and grooms. The fittings and arrangements have received studied care, the ventilation and supervision having been carefully attended to, and the appointments of the stalls, which are lined with Sicilian marble, being very perfect. Hot and cold water is laid on throughout, and the temperature of the harness-rooms can by these means be regulated to a nicety. The stable-fittings are by Mr. Burton, of Oxford-street. The mansion and stables have been erected at a cost of from 45,000l. to 50,000l., by Messrs. Lucas, Brothers, the contractors. Mr. Turpin is clerk of the works.

Mr. James Murray, of Portman-street, is the architect.

#### THE AUSTRO-ITALIAN RAILWAYS.

THE group of Austro-Italian railways is as follows:—

1. The great Vienna and Trieste line, in length 360 miles, uniting the Adriatic and consequently the Mediterranean ports with the east of Germany, giving receipts of 60,000 francs per kilometre, or 1,370l. per mile.
2. The line from Trieste to Vienna, by Venice, Verona, and Milan,—388 miles.
3. The Verona and Knifstein Railway, putting Italy and the Mediterranean in communication with Central Germany,—214 miles.
4. Florence into Franco, by Bologna, Modena, Parma, Alexandria, Turin, and the Mont Cenis,—314 miles.
5. Florence to Venice, embracing upon No. 4, at Bologna, and upon No. 2, at Venice,—68 miles.
6. Pesh to Trieste, embracing upon line No. 1, at Pragerhof,—224 miles.
7. Milan to Turin, completing the great line from Trieste into France,—87 miles.

Total, 1,645 miles of lines of the first order, out of a total length of 2,310 miles.

#### THE LATEST PHASE OF THE CATTLE PLAGUE.

For a considerable time the Privy Council fulminated orders which were of no use, and, as we have said before, the cattle were dying, and no practical means were used for their preservation (see *Builder*, August 26th and September 2nd). Since then the authorities have proceeded in a more intelligible manner; and as each day passes on we find that the remarks made in our pages at the beginning of this trouble are gaining ground in the public opinion, and that the suggestions made by us as means of cure are actually in a way of being carried out. Sanitariums are to be formed; we regret, however, that those places are not appointed at some more distant locality. Who would think of planting an institution of this kind at Stoke Newington and some of the other situations which are mentioned? What a pity it is that in all these matters of trouble men will not take a broad view of affairs, and seizing the bull by the horns, muzzle and prevent mischief. If new evils come upon us, let us endeavour to provide efficient means to prevent them. We recommended that sanitariums should be placed at a distance, where there might be means of cure available, and also opportunities of either utilizing or burying the dead heasts safely and with advantage; but even as it is, if the sanitariums be rightly managed, if they be not overcrowded, if ventilation and food be properly attended to, and cleanliness, together with early medical treatment, and other things which are needful, be strictly enforced, there can be no doubt that these will be amongst the chief means of checking the disease.

We have also suggested the absolute necessity which there is for statistics in connexion with this disease. This also is now to be attended to; and we look anxiously to gain knowledge of the present state of this complaint; the number of cattle within the metropolitan district; the number in perfect health; the number diseased; and each week a correct statement should be given of the progress or decline of the disorder.

There is also need of better provision for the slaughtering of diseased animals. A few days since we made careful examination of several cow-sheds in the North London district, and also looked in at one of the slaughter-houses at the New Cattle Market. At the time of our visit there were either five or six carcasses of beasts there. These were all dressed in the usual way, and hung up to the beam by pulleys; but the appearance of them was most forbidding. The general colour of the flesh was of a dark red, something between brickdust and mahogany; the fat looked yellow, and mixed with coloured fibres. The whole seemed to be tainted by inflammation. It appears that these unsightly matters were kept here waiting for the examination of the inspectors. Certainly we should think that it did not require any great exertion of skill to show that these were unfit for human food: why, then, take the trouble to dress these bodies? The smell which pervaded the place was most abominable. Oppressed with this, and the effect of some other bad atmospheres, we sat down to rest on a seat while we asked two men who were in attendance some questions. The scent here was worse than in other parts; and, on looking under the seat, we saw there stowed away a hideous collection of the offal of the slaughtered heasts. At once, with speed, we made a retreat. It was sickening in the extreme. There can be no doubt that, if moved by the wind, the gases from this place will be carried to a considerable distance; and close by are long ranges of sheds and layers for the reception of cattle, and the market is not many yards off. Therefore, if the complaint be so infectious as it is reported, there must be some danger from slaughtering diseased animals in such a situation as this; but, if the practice be continued, the health officers should see that the most powerful means of disinfection are used.

It is also of very great importance that we should sift the evidence which there is of the importation of this disease into the metropolis. Up to the present time there is no sufficient evidence to show that it has been brought from abroad; and during the weeks the pestilence has been raging, after inquiring with great care and reading all that has been written on the subject, we see nothing to alter the opinion which we expressed at the time of the outbreak, that it is far more likely peculiar conditions of the

atmosphere and the state of the cowsheds have been the joint means of generating this disorder; but this could be easily settled by inquiry managed rightly; especially we should note the passage of the disease from place to place: many of the London cowsheds are at a considerable distance from others; nevertheless the heasts die: can it be shown that in these instances there have been no diseased cows introduced?

In a report made, about a fortnight since, by Dr. Hillier, the medical officer of health for St. Pancras, it is stated that some of the places attacked were Argyle-street North, Crescent-mews, William-mews, William-street, Drummond-street, Guildford-street, Rochester-mews, College-street, Kentish Town, Highgate-road, &c. A reference to a map will show that there is so much space between most of these places, that unless it can be shown that the disease has been in some way communicated, this is strong evidence that the derangement and contagious are in the air.

At present the Home Office—chiefly advised by Professor Symonds—are opposed to the establishment of sanitariums; but other high medical and veterinarian authorities are of an entirely different opinion. Besides, common sense says, that, as it is acknowledged that the present disorder is exceedingly infectious, it would be well to remove the heasts from the cowsheds the very moment there are indications of disease. The sanitariums are not intended for healthy cattle: how, then, can there be any risk thus of spreading the infection? The removal of sick animals from the sheds would be a means of diminishing the overcrowding; for surely no one in his senses would think of bringing in fresh cows after the plague had shown itself until a sufficient time had been allowed to show that the animals left were safe.

Professor Dick, of the Edinburgh Veterinary College, reports that the sanitarium established there has not, so far, been attended with success; but he allows that in a great measure this has been owing to the delay and loss of time in getting the animals to the sanitarium; but that in the byres cures have been effected by administering at the first appearance of the disease a quart hottle of linseed-oil with half a bottle of whiskey, or from a half to a pound of salts, repeating this dose the next day if it has not operated rightly, and afterwards giving half an ounce of sulphate of iron night and morning; but, so far, all the medical treatment appears to be a matter of uncertainty.

Some of the cowsheds which we had but little more than a week before visited and found overcrowded, but where all was reported to be well, are now empty; and the people who had been so confident, and who had thrown doubts on the need of sanitary precautions, pointed to the places with dismay. At Mr. Camp's, at King's Cross, where we had seen 210 cows, there were only a few, which presented a miserable appearance in one corner.

As regards the sanitariums, it would be well not to let their construction and arrangements for ventilation depend altogether on the superintendence of either the medical or veterinary authorities: practical men, like Mr. Mechi, and some one of experience in drainage and ventilation, should also be consulted.

#### THE UTILISATION OF SEWAGE.

A PAPER was contributed at the British Association meeting, by Mr. H. Bird, entitled "Observations on the Utilization of Sewage as conducted at the Sewage Works in Stroud; and the Growth of the Sewage Plant." The population of Stroud using the newly-constructed sewers amounts to about 4,000; and the sewage is conveyed into the tanks with about 600,000 gallons of water a day, and during rainy weather the washing of the streets. The sewage, although so greatly diluted with water, does not lose its property as manure. For the collected matters, after being prepared for manure, and applied to grass land, greatly increased the crop, afterwards making it a deep green colour, and increasing the quantity of clover. Animals showed a preference for feeding upon such spots. The quantity experimented with has been from five cwt. to half a ton per acre. The quantity of water of course diminishes the value of the manurial property of the tail water of the tanks, which is now allowed to flow into the river Frome, after passing through a long culvert,

filled with mud, without affording the slightest nuisance or injury. But it ought in all cases to be used for irrigating land upon the plan of open carriers where the system can be adopted. Sandy and loamy lands resting upon gravel well drained, or even donk-drained lands, are best adapted for such irrigation. The floating substances are daily removed from the surface of the tanks, and the subsided sewage or sludge is removed often, at least once a week. It is injured by remaining in the tanks; and these should be constructed so as to favour the removal of the sludge by dredging or otherwise. The sludge is placed in heaps to dry. These heaps, when sprinkled with prepared clay, give off no stench, and this is prevented in dredging by the same means.

In experimenting with deodorants upon sewage and putrid matter in the year 1859, the author's attention was called to the appearance of flocculent and globular forms of fungi appearing in water containing sulphuric acid, or alum, or sulphate of iron and alum. The size of the fungus varies considerably in length and circumference, from that of a small seed to several inches, and its colour passes from a light drab to a complete black. It disappears in the summer months, when water contains its minimum quantity of sulphuretted hydrogen and other offensive gases, but it increases and flourishes most during the cold months, when the sewage is most loaded with putrid gas, and does not smell offensively. This is the plant that fills up filters and sewers, and creates the chief difficulty in filtering sewage. It seems to have the property of purifying sewage-waters, by absorbing the offensive gases. It is only present in water containing animal organic matter, but it is absent from pure spring and distilled water.

SANITARY MATTERS.

THE occurrence of epidemic cholera abroad, and the fear of its reaching England, have led to some little stir in various towns; and although it is to be hoped the *Times* was right in its suggestion that the Mediterranean might be the sole centre round which the present epidemic would circulate, still any sanitary movement which it may have excited in this country cannot but do good, unless it amount to a literal panic, which would be much to be regretted.

*Swansea*.—Considerable alarm and anxiety have been felt by the arrival of the ship *Hecla*, from Cuba, having one of its crew afflicted with yellow fever. The ship was placed in charge of the police, disinfectants were freely used, and other precautionary measures adopted.

*Wolverhampton*.—The chairman of the Sanitary and Streets Committee announced, at a recent meeting of the town council, that the committee had made an inspection of the town, and had found the courts and alleys on the north side to be in a very fair condition. Pountney's Fold, in the centre of the town, was defective most of all, in the absence of sufficient ventilation in the houses,—a subject over which the committee had, unhappily, no control; for the buildings were put up before the existence of the local board. The town clerk read a letter which he had written to the Home Secretary, reviewing the defective state of the law upon sanitary matters. The communication showed that local boards had no power over buildings erected before "the date of the constitution of the district," which were usually those that most required supervision; and next, that no system of sewerage, however excellent, could be carried out, if the owners of land through which it might pass put forth the obstacles that they were in a position to offer. Because of this difficulty the system of sewerage, which had obtained the sanction of the Home Secretary himself, for Wolverhampton, could not be commenced, notwithstanding the great urgency of improved sewerage in the town. It was resolved that the letter be forwarded to the Home Secretary, and to all the local boards of the kingdom.

*Lincoln*.—At a late meeting of the local Lighting and Paving Commissioners, attention was directed to the fact that diseases of a contagious nature were very prevalent in Lincoln. The mortality had increased 50 per cent. during the last year, and for three years past fevers, small-pox, and other contagious diseases, had occasioned off many victims in Lincoln. A great deal of the sickness was believed to be owing to the imperfect drainage from single houses. One

cause of the fever, however, was considered to have been the late oppressive heat. It was resolved to call the attention of the corporation to the subject.

*Leeds*.—The reports concerning the sanitary condition of the town which have been laid before the Leeds Board of Guardians by their medical officers, says the local *Intelligencer*, though containing matter enough for serious consideration, do not constitute a ground for anything like panic. Mr. Beardshaw, indeed, speaks of one locality in which typhus, diarrhoea, and dysentery prevail to an alarming extent; but, from the description which he gives of the locality, the prevalence of disease within it can hardly create surprise. The council are taking measures for promoting whitewashing and cleansing, scavenging, &c.

*Carlisle*.—The sanitary inspection committee for Rickergate Ward have presented their report. The document describes the state of the ward in minute detail. Many of the nuisances were such as might easily and readily be removed, whilst there are others of older standing which will require more time to effect their removal. The report has been referred to the surveyor and inspector to carry out its recommendations.

*Wick*.—The *John O'Grady's Journal* has a leading article on the sanitary state of this town, which is considered to be about as bad as can well be imagined. Remedial measures are suggested.

SANITARY WANTS IN MARGATE.

WE are glad to find that the few words of advice we thought it necessary to offer to the authorities have caused considerable stir, and may, it is hoped, lead to some endeavours to remedy the crying evils complained of. Several persons of position there offer to forward to us evidence of the existence of a much worse state of things than we have indicated; but we have no wish to raise a feeling abroad against the town if the much-needed improvements can be obtained by quiet representation.

SANITARY PROGRESS AT MARKET LAVINGTON.

PROGRESS, in a sanitary sense, seems to be rather slow at Market Lavington. The law countenances the fine theory that the public have only to apply to the properly constituted authorities to have all sanitary grievances at once redressed; but theory and practice are scarcely in accordance. A correspondent, Mr. W. H. Espeuett, who writes us from Market Lavington, near Devizes, appears to have been lately enlightened on this subject by attempts repeatedly made, during the last four months, to induce the local surveyor of highways and board of guardians to put the Market Lavington street drain-traps in good working order, and insert traps where (as in most cases) there are none; and also to get them to put down a proper covered drain where an open stagnant parish ditch now exists, causing illness in our correspondent's family, and in those of others also located near to the obnoxious ditch. The surveyor did not like to put the parish authorities to expense in the matter. The guardians consulted about it. A magistrate advised with our correspondent as to it. The result was this:—

"On Tuesday, 15th August, the Devizes Board of Guardians decided that the expenses should be shared one-third by the parish, one-third by the owner of my garden ground, and one-third by the owner of the field below; and that the management of this business and of the street-traps and drains should be placed in the hands of one who is not noted for any remarkable energy in the execution of sanitary matters,—so that it is supposed that, 'placing the business in his hands' is the same as saying, 'the bill may be read again this day six months.'

9th September, 1865. Four of the hottest months of the year have now passed away since the date on which I first made application for the removal of these nuisances, and nothing is yet done.

I think, Mr. Editor, it is time I called your attention to this state of things, which shows how easily country boards of guardians can evade and trifle with the law when it does not happen to suit their views to carry it out as intended: in fact, the laws are only waste paper in their hands."

THE CONDITION OF TOWNS.

SIR,—I have been reading the remarks in the *Builder* on Southwark. I tender you my sincere thanks, as a member of the human family, and say, "persevere," even to the hundredth thing.

How many times have you and I heard things stated, or read of them, without any effect; when at some moment we are startled with the truthfulness and importance of the same subject. We must sow the seed, and give it time to grow, and, depend upon it, sooner or later, it will produce fruit.

May you be induced to proceed, and protected and strengthened in your labour, is my earnest prayer. BRISTOL.

PROPOSED IMPROVEMENT OF BRISTOL.

At a meeting of the town council on Monday last, the committee reported,—

"That having carefully and minutely considered the several plans which have been from time to time proposed for street improvements within your jurisdiction, your committee have selected the following schemes, which they now submit for the determination of the town council, acting as the local Board of Health. 1st.—For the improvement of Park-street, as set forth and described in the report of Mr. R. S. Pope, herewith appended (31,000*l.*). 2nd.—For the improvement of Temple-street, and the formation of a new street leading from Bristol Bridge to the Great Western Railway Platform, as set forth and described in the report of Mr. S. C. Frupp, which is appended to this report (about 53,000*l.*). 3rd.—For improving the roadways leading from Redcross-street and Old Market-street. 4th.—For providing a carriage communication between Old Market-street and Stoke-croft, through St. Paul's parish, which has two plans set forth and described in the report of Mr. Josiah Thomas, herewith also appended (8,700*l.*). And 5th.—For a new street from Park-row to Maadlin-lane, set forth in the report of Mr. R. S. Pope, herewith appended (8,250*l.*).

Mr. J. Poole moved that the reports read he received, printed, and circulated among the members of the town council; that the plans be lodged in a public place for the inspection of the citizens; and that the house reconsider them both at an adjourned meeting which should be named.

Mr. Alderman Proctor urged with much force the objection there was to adopting the plan of one person and giving it to another to carry out, who would, therefore, have no responsibility; further, that the three recommendations had no reference one to another, and that in his opinion one competent architect ought to be employed to consider the whole question, and on him the responsibility should rest. He was, therefore, in favour of a little delay.

Some other speakers took the same view, but ultimately the motion was carried without a division.

Although delay is not to be advised in Bristol, where improvements long needed have been already too long postponed, it is impossible to deny the wisdom of Alderman Proctor's advice. The council should lay down a complete and well-considered plan, and carry it out, even if bit by bit.

SELF-ACTING APPARATUS FOR LIGHTING BUOYS.

MR. ALFRED VERLAQUES has proposed a self-acting apparatus for lighting htoys, by gas, in maritime and river channels. In both applications a successful contrivance would render great service to navigation by diminishing the enormous loss of life and property annually occurring. This plan consists in adapting to the buoy a contrivance exactly similar to that of the philosophical lamps so well known to every student. A vessel containing diluted sulphuric acid is enclosed in the buoy; in this is suspended, from a bell receiver, a mass of zinc placed at such a level that when the water in the bell has been driven out by the hydrogen produced by the decomposition of the water, the zinc shall be dry. At this stage a cock is opened at the summit, and a jet of gas is projected upon spongy platinum, ignition being the immediate result. The receptacle for the platinum can be made to revolve by the impact of the gas so as to present different coloured lights. As fast as the gas escapes, the acid-water rises in the bell until it is full and the light is extinguished. Meanwhile, the zinc has become again immersed, and more hydrogen is being produced, so that after a certain time the gas will escape again and be ignited. Thus a self-acting intermittent light will be established. There is much to be done

before this idea, however ingenious, can, if at all, become of practical use.

The originator says himself, that the chief problem lies in the opening and shutting of the exit of the gas, as regulator of the whole system. As to the feeble quantity of light developed by pure hydrogen gas, it can be rendered more intense by hydrocarbon essences; also, the saturated solution of sulphate of zinc can be emptied by a very simple contrivance into the sea, and fresh solution forced in. A little study will serve to perfect all these details of working.

#### INDUSTRIAL EXHIBITIONS.

**Nottingham.**—The Nottingham and Midland Counties' Working Classes' Art and Industrial Exhibition has been opened. This may well be called a first-class exhibition of its kind. The day of inauguration was held by almost general consent of the townspeople as a public holiday. A procession took place, starting from the Exchange. Lord Belper, the Lord Lieutenant of the county, inaugurated the exhibition, and at the close of his speech had occasion to remark that he regretted that "there were not some working men present,"—certainly a curious state of affairs in the opening of a "working classes' art and industrial exhibition." The building is Gothic in style, and in form an elongated octagon: it is 200 ft. long, 57 ft. wide, in outside dimensions, and 42 ft. high in the centre within the nave. It has a continuous gallery 12 ft. wide, supported at intervals of 12 ft. by wooden columns, continuing from the ground-floor to the roof of the nave—which is constructed of open diagonal timbering, the points describing a semicircle. The nave and also the gallery portion are lighted from the lower slope of the roof, which, without, is of the Mansard character. The roof over the gallery is separate—forming a lean-to; and its principals are continuous with those of the nave, each forming a sort of flying buttress. The galleries have four octagonal staircases concentrating upon the inner angles of the octagon ends, and forming bastion flag towers without, with steep roofs and cresting. The space underneath the gallery all round the building is apportioned principally to machinery, and is lighted by thirty double-pointed windows between the several buttresses. The galleries have a barrier of trelliswork 2½ ft. high. The building runs parallel with Shakespeare-street, and occupies nearly the top of the field. It is entered at the end facing Sherwood-street by a recessed arch, forming an open porch 19 ft. high and 11 ft. wide, having in its inner rim the inscription, "Industrial Exhibition." At the end of the building next Bilbie-street, the gallery contains an elevated orchestra, which affords space for 150 performers, exclusive of the space required for the large organ, erected by Messrs. Lloyd & Dudgeon. The roof is covered with felt painted with tar oil. The building, though erected in a temporary manner, has all the appearance of a permanent edifice. The walls are of brick, and this material is introduced to a great extent in the buttresses and other portions of the building, as well for ornamentation as for purposes of strength.

**Reading.**—The Exhibition here was opened in the Town-hall by the Bishop of Oxford. The industrial department includes many creditable productions, but they are considerably eclipsed by the loan collection, which includes some of the choicest objects of interest from Windsor Castle, and from the seats of the Earl of Abingdon, Lord Overstone, Mr. Benyon, M.P., and others of the nobility and gentry of Berkshire and the neighbouring counties. There are 1,700 articles exhibited.

**Hastings and St. Leonard's.**—This Exhibition has been opened in the Music Hall. The mayor was the inaugurator.

**Whitby.**—The third annual jet exhibition has been opened in St. Hilda's Hall, Whitby, by the Marchioness of Normandy. These exhibitions, it may be remembered, were commenced with the view of improving the artistic skill of the workmen, and at the suggestion of Mr. H. S. Thompson, the late member for the borough. At these displays prizes are awarded for the most skillful designs and best execution of brooches, bracelets, necklets, &c., and the idea has been so successful that the number of competitors increases year by year, and there is a striking improvement in the articles exhibited.

**Gateshead.**—It is proposed to hold an industrial

exhibition in Gateshead. According to the prospectus, the exhibition will be held in the Mechanics' Institute, in March, next year. It will consist of amateur works of art, such as mechanical appliances, scientific instruments and preparations, models, designs, drawings, paintings, photographs, electro-metallurgy, engravings, sculpture, ladies' work, including ornamental needle-work, wax flowers, &c. It is not intended to limit the district from which articles will be received.

#### ANNIVERSARY SONG FOR THE SOUTH KENSINGTON SCHOOL OF ART.

Thus day, old school-fellows, unite in joyful gratulation,  
For four-and-twenty years, to-night, have passed since  
our foundation;  
And oft returns our Festival day, to after-comers glorious,  
When, 'neath our Queen Victoria's sway, we also were  
victorious.

Then welcome, students, old and young! a happy life  
attend you;  
Fame blow her trump with sounding tongue, and fortune  
still befriend you.

We, classmates once, are classmates yet, right cordial be  
our greeting;  
Nor let us e'en through life forget, our school-days and  
this meeting.

Hurrah for all the schools of art! with all their genial  
teachers,  
Where all the learned their lore impart, the practised are  
the preachers:

Our pioneers the men of old, our prototype Creation,  
And ever by our art be told the progress of our nation.  
Perennial be the reign of art; long live our institution,  
A brilliant glory to impart to England's constitution!  
Be every master's name revered: may all, as we do, love  
them;  
Be emulation never fear'd, and time but still improve  
them.

"Health to the schools!" perpetual health, old school-  
fellows attending;

Be Talent lord of power and wealth, be Genius self-  
depending.

"Health to the schools!" increasing health, to all who  
since have left us;  
Success be theirs devoid of stealth, long have they not  
hereft us.

"Health to all schools!" wherever they be, a hindred  
ardour fire them;  
May every State their progress see, no adverse trial tire  
them.

"Health to the schools!" may every year bring still more  
friends surrounding!  
"Health to the schools!" in one long cheer, "with every  
good shounding."

Working Men's College.

W. R. COOPER.

#### COLOUR FOR CEMENT.

In reply to your correspondent, "South Wales," and also to your own remarks, permit me to say that I think the following mixture will produce a paint that will neither blister nor peel off, and will stand exposure to wind and rain:—

Take a spadeful of lime and slack it with one quart of warm blood, fresh from the slaughter-house. Add to this a sufficient quantity of beer grounds, or stale beer and skim milk, in equal parts, boiled together, to fill with the lime and blood an ordinary pail. Use no water, but add colouring at discretion. I used this extensively some years ago in exposed situations, in North America, as also the following, but prefer the above, as I find it has also been successfully tried here. The other plan is,—lime, one gallon, slacked with one gallon of skim milk. Add ¼ lb. of powdered alum and one gallon of wood ashes, mixing all to the consistency of thick cream, with soft-water, and adding colouring matter as required. On some occasions borax was substituted for the alum. I can favourably recommend this for new work, and have found the tint that results from the mixture very pearl-like and pleasant. G. W.

#### UNDERGROUND ROOMS: CRYPTS.

Your correspondent "Amateur" has taken so very good-naturedly my not unnatural supposition, that professional advice had not been consulted in his case, that I shall be glad to endeavour to briefly point out how I think his end may be attained. It is difficult, however, to make general remarks apply to special instances, particularly in the absence of plans and other details, with which, in default of a personal inspection, an architect usually has to assist him.

In my former reply, I said that a free supply of fresh air from below was needed; but I added

also that the damp air must as freely be drawn off from above: and it is upon the perfect working of a system that shall do this, that the habitability of underground rooms depends. An adaptation of the American system of injecting and ejecting, alluded to in "An Architect's Notes in America," in the *Builder* of 16th inst., would probably be found thoroughly effectual. As a preventive to damp from above, a gravel terrace-walk upon the arched roof of the crypts, with a well-made drain on either side, properly curved and freely working, would suffice; and instead of caring for an asphaltic covering, I would certainly prefer a false ceiling, with an air space of, say 1½ in. between it and the underside of the roof. I have used cork slabs as an interlining for underground rooms with excellent effect.

I must leave to some one else to defend the profession from attack upon the question of knowledge of such details, for I am afraid I must agree with him in the main.

I should add that I presuppose that the drainage is effectual; and I would like to ask whether in this case there is any flue that could be made to connect with these crypts by which ventilation could be aided? G. W.

#### BELLS.

At Hereford cathedral, Messrs. White & Son, with a staff of labourers, have been engaged in the arduous task of taking down the bells, a work rendered more difficult from the height of the lantern, which is 80 ft. The arrangements were under the personal supervision of Mr. G. Barter and Mr. Chick, the surveyor of the fabric.—Wolsey's great bell, at Sherborne, which has been cracked for some years, has been taken down to be re-cast. The removal was quite ceremonial. In the balance it was found wanting. The weighbridge returned the weight at 2 tons 8½ cwt., instead of 3 tons. The bell was, according to the local *Journal*, taken to the foundry of Messrs. Warner, in Cripplegate, by whom it was munged.—A great curiosity has lately been added to Berkeley Castle, namely, a "monster" Chinese bell. It has been raised upon a very ornamental iron frame in the outer court. It was brought from the ruins of a Buddhist temple at Tse-ke, in China, which had been burnt by the Taepings in December, 1864. The bell bears the following inscription, which has been translated by Dr. Lockhart, medical missionary, from Peking:—"Date, third year of the Emperor Kien-lung (A.D. 1725). Put up in the autumn month on a lucky day. The following faithful officers, gentry, and helowing literati subscribed for the casting of the bell." The names are all given in the large lower compartments. Names of men, 250; of women, 80 in all. The latter are distinguished by a peculiar letter or character. The large upper compartments contain Buddhist hymns and prayers.

#### FROM IRELAND.

**Deljast.**—The foundation-stone of a Wesleyan college has been laid in this town, by Mr. Wm. M'Arthur, of London. The institution is intended to comprise a first-class boarding and day school, and also a collegiate department, to give accommodation to a considerable number of resident students, who will be able to avail themselves of the advantages of the Queen's College. The design comprises a longitudinal range of buildings, with two transverse wings projecting both to front and rear; also a central rear building. The left side of the building is devoted to the collegiate department, the right to the school, the departments common to both occupying the centre. The principal entrance and president's house occupy the centre of the front, with the theological tutor's and head master's house at either side. The school-room and lecture-hall occupy the front, projecting wings, and are each 55 ft. by 27 ft. in the clear. The roof of the lecture-room is partially open, with semicircular ribs under the principals. The school-room, over which there is a large dormitory, is 22 ft. in height. The rear projecting wings at each side contain the classrooms and the library of each department, with the sleeping-rooms above. The students' bedrooms also occupy a portion of the second floor of the front, a separate room being given to each. Large dormitories are provided for the boys, in some of which the system of division into cubicles is adopted. Stone stair-

aces in the side towers give access to the upper  
coors of each side. The rear central building  
contains, nearest the front hall, a central stair-  
case, with two side passages to the dining-hall,  
which is 50 ft. by 23 ft. in the clear, with an  
open roof. The building is intended to be of red  
brick, with dressings of freestone. The total  
number of students to be accommodated is 30.  
Boarders 80, and of day pupils, 100. Mr.  
William Fogarty, of Dublin, is the architect, and  
Mr. James Henry, of Belfast, is the builder.  
The contract has been entered into for 12,688*l.*

—The *Dublin Builder*, in a review of the  
sanitary state of Belfast and its water-supply,  
which is anything but encouraging, says—  
While Belfast has been widening its chief  
thoroughfares and laying out spacious markets,  
has been systematically neglecting some of its  
most disgraceful and gigantic nuisances; neg-  
lecting, also, its water-supply; and failing, in a  
great measure, to keep pace in the matters of  
driving and sewerage with the rapid strides of  
London. To begin with, it enjoys the privilege  
of a winding stream, known as the Blackstaff  
river, which threads some of the most populous  
and poorest districts, and finally casts its  
filthy, lumpy stream upon the muddy bosom of  
the river Lagan. The outpouring of half a  
hundred factories, and the sewage of a vast  
quarter of the town, have made it a filthy,  
stinking, open sewer, offensive both to sight  
and smell, spreading its noxious vapours over the  
thoroughfares of the town, and dealing out  
pestilence and death among the unhappy factory  
workers who have the misfortune to live in its  
neighbourhood. In this discreditableness it  
has existed—year by year growing worse—for  
many years and more; and still the corporation  
has taken no steps to have it covered in, nor  
to do as we can learn from inquiry, are they  
about to do so. So sure as cholera visits the  
town, will this pestiferous sewer be one of the  
causes of an excessive mortality.

—The *Blackrock surveyor*, in reply  
to a commissioner, states that the original  
plan for the Town-hall and premises was  
made in 1861, and he expected to complete the building  
about 200*l.* less than that amount, and that it  
could be finished by New Year's Day.  
—The *local Chronicle*, in a leader on  
the health of the town, says—"Though we  
are happy free from disease in an epidemic  
form, it is too true that fever is somewhat rife,  
and the extraordinary heat of the weather tend-  
ing to develop that malady in badly-drained and  
unventilated houses." The *Chronicle* urges  
whitewashing, and the free use of  
lime.

#### PROVINCIAL NEWS.

—The foundation-stone  
of the town-hall and corn-exchange has been laid  
at Worcester, by Earl Pomfret. The new build-  
ing is situated in the High-street, and is being  
erected from the designs and under the superin-  
tendance of Mr. T. H. Vernon, architect, London;  
builders being Messrs. Wheeler & Son, of  
Worcester.

—A contemporary states, that  
at this in the High-street, houses in the once  
high park springing up like mushrooms, new  
buildings on the Elmstead-road, three lines of  
streets intersecting the town, nine licensed  
public-houses, and a tenth, magnificent and capacious,  
intended for the reception of families and  
making provision for their creature comforts,  
and some of the improvements of this old

—The only drawback hitherto  
mentioned by visitors to the enjoyment of this  
resort-place (which lies between the Great  
Oxmeads Head) has been the want of a  
steamer pier for landing and embarking passen-  
gers for promenade. This want is now  
about to be supplied. A public meeting has been  
held at Liandudno, at which, after the particu-  
lar plans of a proposed scheme had been  
read, resolutions of approval and intended  
to be unanimously passed.

—The directors of the Cumber-  
land Banking Company are about to erect a  
banking-house at Workington. The designs  
were prepared some time ago for Mr. Head, by  
Messrs. Birckett, architect, of Carlisle. The pro-  
posed building, which is to be located in Pow-  
er-street, will have some architectural features.  
The style may be described as Italian freely  
used. The frontage is 48 ft., and the building

will extend backwards about 66 ft., the Presby-  
terian church being opposite to one of its  
corners. The building will be of the white  
stone of the district, the flanks being of rusti-  
cated masonry. There is a projecting doorway  
of coupled columns, and the windows on the  
upper story are similarly supported by coupled  
columns and arched, the whole terminating with  
a cornice and balustrade. Besides affording  
extensive accommodation for banking purposes,  
apartments are shown for the residence of the  
manager. The estimated cost is about 3,000*l.*

—The *Blackburn Town Council* have  
decided on the erection of public baths, and a  
plot of land near St. Peter's Church has been  
purchased for the purpose, from Mr. Joseph  
Feilden, M.P. It has also been decided to erect  
a new fire-engine depot, on a piece of land in  
Clayton-street, and a new fish-market adjoining  
the Clarence Hotel, Lord-street.

#### CHURCH-BUILDING NEWS.

—A movement is on foot  
for the restoration of the parish church of Alford.  
It is a specimen of the architecture of the time  
of Edward III., and has been for a long time in  
a very dilapidated state. It is proposed to  
thoroughly restore the existing edifice, and also  
to erect an additional north aisle, to accommo-  
date the great increase in the population. In  
the re-arrangement of the sittings, a very con-  
siderable portion of them will be left unappro-  
priated. The cost of the proposed works is  
estimated at about 4,000*l.* The works will be  
carried out under the professional guidance of  
Mr. Scott, and under the direction of a com-  
mittee. The subscriptions promised amount to  
3,300*l.*

—The corner stone of the new  
church at Hopton, by Lowestoft, has been laid.  
The old church, in January last, was totally  
destroyed by fire, and it was determined to  
erect the new edifice in a more central position.  
With this object, a site given by Mr. Gurney for  
the purpose was fixed upon, contiguous to the  
turnpike-gate at Hopton, and in close proximity  
to the schools erected in 1861. Mr. S. S. Teulon,  
architect, of London, supplied plans for the new  
church, which will be Early English in style.  
It will consist of nave, chancel, and central  
tower. The last will be somewhat dwarfed,—  
60 ft. in height, to the battlements. The nave  
will be 45 ft. in length; chancel, 21 ft.; between  
the tower arch, 17 ft.; transepts, 9 ft. 7 in. The  
church is to accommodate 250 persons. It will  
be built of flint, with Bath stone dressings. The  
tender of Messrs. Browns & Bailey, builders,  
Norwich, for the erection of the church, has been  
accepted, the total cost of which, with various  
additions, will be 2,850*l.*, thus leaving about  
700*l.* more to be raised.

—The parish church, after  
being closed for a few weeks for the restoration  
of the windows and other necessary repairs, has  
been re-opened. The restoration of the windows  
has been executed by Messrs. Ward & Hughes,  
of London, and under the supervision of the  
Ven. Archdeacon Moore. The three chancel  
windows are the gifts of the Marquis of Angle-  
sey, Mr. Henry Allsopp, and Mr. M. T. Bass.  
In addition to the above, a fabric of interest to  
the parishioners has been placed in the church  
at a cost of about 200*l.*: it is a mural tablet to  
the memory of Mr. Thomas Fosbrooke Salt, of  
Stapenhill. The tablet has been erected by Mr.  
Ross, of London, sculptor, from the designs of  
Mr. G. Coldic, of London.

—An improvement has been effected  
in the parish church by decorating the interior  
in gold and colours, at the sole expense of a lady  
well known in the town for her liberality in  
church matters. The work has been executed  
under the direction of Mr. Blomfield, by Messrs.  
Heaton, Butler, & Bayne. The complete plan  
proposed by Mr. Blomfield comprises, besides  
the work lately done, further decorations on the  
east wall and in the chancel, including several  
figure subjects, a remodelling of the choir stalls  
and chancel, with a tessellated pavement, and a  
better arrangement of the organ. The decora-  
tions which have now been carried out include  
the whole of the ceiling of the nave and aisles,  
the columns and gallery fronts, and all the walls  
except the east wall, which cannot well be  
touched until the organ is moved. The ceilings  
and columns, and the walls to the height of 4 ft.  
6 in. from the floor, are painted in oil and flat-  
tened, the rest of the walls being coloured in

gister. Symbols are introduced in various  
places, and the different colours and bands of  
stencilled ornaments are intended to bring out  
the architectural features and mouldings of the  
building. In the hollow of the great cornice of  
the dome is inscribed, in black Roman letters, on  
a gold ground, "The Lord is in his Holy Temple  
let all the earth keep silence before Him." A  
good deal of gilding has been used in the capitals  
of the columns and other important places. As  
part of the plan of decoration, a scheme has  
also been prepared for filling the windows with  
stained glass, each window forming one of a  
series representing scenes in the life of our  
Saviour, and the parables. Of these, seven have  
already been presented and fixed. The glass is  
also by Messrs. Heaton, Butler, & Bayne. Be-  
sides these works, most of the old pews, which  
were originally 4 ft. high, have been cut down.  
The lighting has also been re-arranged, with  
new brackets by Messrs. Peard & Jackson.

—Holy Trinity Church has been re-  
opened for divine service, after a renovation of  
the interior. The church had been closed for  
about three months. The principal improve-  
ment is the decoration of the reredos; this has  
been done by the firm of Crace, Wignmore, & Co.,  
London. Many years having elapsed since any-  
thing was done to make good the ravages of  
time, it was necessary to colour the whole of  
the interior walls, to restore the mullions, &c.  
This has been done, together with other work,  
which has put the church in thorough repair.  
Other improvements have been effected, in-  
cluding the insertion of an instalment of a new  
stained window, by Messrs. Heaton, Butler, &  
Bayne, given by the Misses Paine, as a mem-  
orial of their late father; alterations to the pulpit  
and reading-desk, and the removal of the organ  
from the gallery to the chancel.

—The Marquis of West-  
minster has subscribed 2,600*l.* towards the  
building of a new church for the parish of St.  
James, Shaftesbury.

—The parish church  
has been re-opened for Divine worship, after  
undergoing extensive and much-needed restora-  
tions and additions. In the course of the work  
the fabric of the chancel has been for the most  
part rebuilt, the ancient vestry, however, and  
portions of the south wall and windows, being  
preserved. The roofs throughout are new; so  
also are the arcades of the nave, the south porch,  
and all the windows of the south aisle and the  
east and west windows of the north aisle. The  
architect's original plan contemplated a north  
aisle to the chancel, which would have provided  
increased accommodation, as well as room for  
the organ, so that the present gallery might have  
been removed. Unfortunately this is retained,  
and the aisle omitted, by which the church is  
very much injured in architectural effect. Funds  
being needed to complete the reseating of the  
church, the old pews have been adapted and re-  
fitted. The east window and reredos, the pulpit  
font, and stained glass, are special gifts. The  
chancel is paved with Codrington's encaustic tiles.  
The architect employed was Mr. Woodyer, of  
Grafham, Guildford. The entire cost of the  
restoration was about 3,000*l.* Messrs. Smith, of  
Tenbury, were the contractors.

—The chief stone of  
an aisle about to be added on the north side of  
the church here, has been laid. The edifice is  
being enlarged and restored under the superin-  
tendence of Mr. J. E. Gill, of Bath, architect.  
The plans comprise the rebuilding of the eastern  
part of the chancel as well as the erection of an  
aisle.

—Preparations are being made for  
the erection of a new church in the London-road.  
The site has been given by Mr. C. C. Higgs, of  
Charlton Kings, who contributes also a large  
sum of money towards the cost of the building.  
The architect is Mr. J. Middleton. The church  
will be in the Early Decorated style. It will  
stand about 200 ft. from the junction of two  
roads, in order to obtain sufficient width for its  
erection. The west end will face Cheltenham,  
and the east point towards Dowdeswell-hill. The  
church will consist of two parts—the body and  
the tower, the latter of which will abut from the  
building on the south-western corner; and, being  
only connected with the body by a short corri-  
dor, will allow of the completion and use of the  
main portion of the edifice while the tower is  
still in progress. The body of the church will  
comprise a nave, north and south aisles, chancel  
and chancel aisles. The chancel will be apsidal,  
and will be lighted by five two-light windows.  
It will be divided into two parts by a sanctuary

arch over the altar-rails, and the chancel arches will be enriched with coloured stones. To the east of the sanctuary arch the ceiling will be groined in wood, and to the west, over the remaining portion of the building; the roof will also be of wood, the ceilings being divided into panels between the different principals. A feature of the interior will be a total absence of plaster, as the inner walls will be faced throughout with stone. The church is intended to accommodate 650 persons. The whole of the floor will not be paved, a considerable space being left at the eastern end, as at Malvern Abbey and other churches, for moveable seats. The extreme height of the body of the building will be 60 ft. The nave will be 82 ft. long by 24 ft. 6 in. wide, and the aisles each 11 ft. 9 in. in width. The chancel will be about 40 ft. by 21 ft. The tower and spire will be 176 ft. in height, the tower itself being 76 ft. The total will be as nearly as possible that of St. Mary's. The spire will be broached, rising from the full width of the tower, without pinnacles. Through the tower will be the southern entrance to the church; and on the northern side, facing Battle-down, a porch will be erected corresponding with the abutment of the tower. The contract for the erection of the body of the church has been taken by Messrs. Jones, of Gloucester, at about 4,900l. The estimate for the tower and spire will be about 1,700l. more.

#### STAINED GLASS.

*St. Mary's Roman Catholic Church, Warwick.*—A memorial window, representing the repose in Egypt, has been placed in the west end of this building. It is the work of Mr. Dury, of Warwick.

*Gloucester Cathedral.*—Five stained windows have been placed in this cathedral. Three of them, says our authority, the local *Chronicle*, are entirely new, and are placed in the cathedral as memorials to relatives of the Rev. Sir W. Lionel Darell, and the late Mr. John Elliott and Mrs. Price, of this city. The window to Mrs. Price is the westernmost in the north aisle. The artists were Messrs. Ward & Hughes, and the subjects are Faith, Hope, and Charity, in the figure symbolical of Charity being placed in the centre light to preserve unity in the design. The memorial to the relatives of the Rev. Sir L. Darell is placed over the door to the east walk of the cloisters, or abbot's entrance. The window consists of three lights. In the centre is represented the risen Saviour, with the Virgin on one hand and St. John on the other. The borders and canopies are composed of foliage and fruit of the vine. In the tracery lights are the figures of two angels bearing scrolls. The artist is Mr. Preedy, and this is the first of his works which has been placed in this cathedral. The memorial to Mr. Elliott is placed in the westernmost window of the south aisle, next to the memorial to Dr. Jenner, to which it is a companion and rival work. It is by Mr. Hardman, while the artists of the Jenner memorial are Messrs. Clayton & Bell. The windows have each five lights. Six subjects in two tiers are pictured in the memorial to Mr. Elliott. In the upper part of the central light is a representation of the delivering of the two tables with the ten commandments to Moses. On the right is a representation of Paul before Agrippa, and on the left Solomon's Judgment. The other additional windows have been placed in the north aisle. Prior to the restoration a quantity of ancient glass was scattered in fragments about the windows. These were collected, and by the aid of inscriptions found on the glass, Mr. Hardman restored the windows. In one of these are figures of St. Patrick, St. Oswald, and St. James the Great, in the chief lights, and with St. John and a representation of another saint in the tracery; in the other are the figures of St. Dorothy, St. George, and St. Thomas, with St. Catherine and the figure of a bishop in the tracery. In each case all the figures in the tracery and the canopies over the chief figures are ancient glass; the remainder has been principally supplied by Mr. Hardman. With the exception of one window in the north aisle, stained glass for which is now being prepared by Messrs. Clayton & Bell, by direction of Mr. T. Marling, and the easternmost window of the south aisle, which will probably be taken in a day or two, all the windows in the nave have been filled. The memorial to Bishop Monk was completed just before the Festival of 1859. This

was followed by the window, illustrative of the martyrdom and funeral of Edward II.; and in six years, not only the windows in the nave, but also several of those in the cloisters, have been published; the following brief enumeration of them is given by the *Chronicle*:—

*West End.*—Great west window, memorial to Bishop Monk; artist, Wailes, Newcastle; subject, types of the ordinance of Baptism. South-west window, memorial to Dr. Jenner; artists, Clayton & Bell; subject, miracles of resurrection and healing performed by our Lord. North-west window, artist, Hardman; subject, coronation, arrival in Gloucester, baptism, and funeral of the British King Lucius, who, according to tradition, died and was buried at Gloucester.

*South Aisle* (commencing at the transept).—Memorial to Mr. J. N. Balme; the Crucifixion; by Warrington. Memorial to Mrs. Ellis; the death and funeral of Edward II.; Clayton & Bell. Memorial to Mrs. Evans; subject, the True Vine; Bell, Bristol. Memorial to Sir Berkeley Guise; coronation of Henry III. in Gloucester Cathedral; artists, Clayton & Bell. Memorial to Sir Henry Davey; events in the life of the Saviour; by Warrington. Memorial to Miss Evans; subjects, incidents in Christian life; Bell, Bristol. Memorial to Mr. Elliott; Hardman.

*North Aisle* (commencing at the transept).—The Darell memorial; artist, Preedy. Turner memorial; subject, miracles of raising the dead performed by our Lord; Clayton & Bell. Hooper memorial, the gift of Mrs. Claxson; Clayton & Bell. The two next are the restorations by Hardman. Mrs. Price's memorial; artists, Ward & Hughes.

#### Books Received.

*Photographs from Sketches by A. Welby Pugin.* Photographed and published by Mr. STEPHEN AYLING, Oxford-street, London.

Our readers have been informed that it was proposed to publish photographs of 600 of the sketches left by the late A. W. Pugin, in ten parts. The first of these parts is before us (the whole work, we believe, is ready for publication), and consists of twenty-nine sketches from Nuremberg, and twenty-one from Flanders.

The other parts will include sketches of objects of interest and beauty in the chief cities of France, Belgium, Italy, and Southern Germany. In these he has regarded not only the picturesque effect of churches, sepulchral monuments, castles, buildings, towers, bridges, and ruins, but, in many instances, has added plans, sections, and details of their several parts; and as many of the photographs contain several of these, the total number of illustrations will consequently be found to exceed 1,700. The costliness of the complete work (ten guineas) will be the chief bar to its circulation.

The publisher meets an objection that may be raised as to the faintness or indistinctness of some of the pictures, by statement of the fact that one of the most difficult operations the photographer has to contend with is in copying faint pencil outlines on a white ground; and, as many of the originals reproduced in this book are very slightly sketched on yellowish toned paper, the difficulty was increased. The majority, however, being drawn with pen and ink, the reproduction is nearly equal to the original. They serve to show Pugin's wonderful skill as a sketcher, and his command over perspective delineation.

*The Iron Shipbuilders', Engineers', and Iron Merchants' Guide and Assistant.* By HARRISON BURLINSON & WM. HENRY SIMPSON. McCordnald & Co., Euston-square, London.

This is a laborious series, of 219 large tables, containing the calculated weight of upwards of 150,000 different sizes of iron plates. The first table is for plates 1 ft. in length, and the last for plates 10 ft. in length, and from these the authors remark the weight of a plate of any size whatever, provided the sides be without curve, may be ascertained. Of course everything depends upon the strict accuracy of all these tables, and the authors state that they have all been carefully compiled and thoroughly revised.

#### Miscellaneous.

*THE EXTENSION OF YARMOUTH HARBOUR.*—Mr. Cullit, C.E., is of opinion that the present state of the harbour and near the entrance indicates that the north-pier requires to be extended; also that the deposit at the Knuckle ought to be removed and the Knuckle itself taken away. The pier should be extended 150 ft. further to seaward. The total expense would be about 14,000l.

*SOCIAL SCIENCE ASSOCIATION.*—The corporation of Bristol have resolved on inviting the Social Science Association to hold its 1866 meeting in their ancient and interesting city.

*THE SHEFFIELD BOROUGH SURVEYORSHIP.*—It has been resolved by the town council to raise the salary of Mr. S. F. Holmes from 300l. to 400l. a year, and appoint two assistant-surveyors, with salaries of 160l. and 110l. a year.

*THE LATE MR. WINKWORTH.*—We record with sincere regret the death, on the 15th inst., at Canonbury-place, Islington, of Mr. Thomas Winkworth, aged 75 years. Mr. Winkworth's benevolent contenance will be missed at the meetings of the Society of Arts and other places connected with the progress of science and literature. He took an early part in the movement that led to International Exhibitions, and contributed in other ways to the advantage of the public.

*ACCIDENT AT THE RIVER DOCK, SHADWELL.*—The tide has broken in through the temporary dam at the works in progress for increasing the extent and capacity of the dock between Shadwell and Limehouse, carrying away hundreds of tons of earth, and undermining houses and roadway. The dam was not materially injured, and active measures were at once taken to prevent further mischief. In place of the loose earth, a breastwork of timber of great strength has been formed, and filled in with clay.

*THE SOUTHERN EMBANKMENT OF THE THAMES.* The plan for the use of the southern embankment of the Thames is being landed at the wharf adjoining Westminster Bridge, from the Crossness Works, which are now completed. Extensive premises are also being erected on the ground, for the convenience of the works, which will be commenced forthwith. It is intended to widen the narrow parts of the Thames near Vauxhall, which is known as the Gorge, by the removal of the whole of Upper Fore-street, to which it runs parallel.

*SOUTH CROYDON.*—The new station at Croydon has been opened. It is distinguished as "South Croydon," and is a station with all the most modern improvements. South Croydon is not a main line station, but affords communication with London by a junction with the line from Leatherhead and Epsom to London Bridge and Victoria. The spire of the church which fell down here some little time ago is now restored. It stands close to the station, amidst groups of fine trees.

*LONDON ASSOCIATION OF FOREMEN ENGINEERS.* At the ordinary monthly meeting, on September 2nd (Mr. Joseph Newton, of the Royal Mint, in the chair), Mr. William Dalziel read a paper on "Gas-lighting in Railway and other Carriages, the object being to describe his invention, which is at present being tested on the South-Eastern Railway. Each carriage would have its own independent reservoir of compressed gas, sufficient, if needed, to supply two burners for six hours, and the whole occupying comparatively little space. The apparatus would be invisible to the passengers, and so simple that it could scarcely be deranged, unless by some severe accident.

*THE HERBERT MEMORIAL HOME FOR CONVALESCENTS.*—The laying of the first stone of the Herbert Convalescent Hospital has just taken place at Bournemouth, Hants. Immediately after the decease of the late Lord Herbert his friends and neighbors in his native county Wilts met to decide on the most appropriate mode of commemorating his good services in ameliorating the condition of the British soldier when it was decided that a statue of himself should be erected at Salisbury, and that a home for convalescents should be founded. On the 29th of June, 1863, the statue, executed by Baron Marchetti, was uncovered at Salisbury by Earl de Grey and Ripon, in the unavoidable absence of Lord Palmerston. Since that time several circumstances have intervened which have delayed the establishment of the convalescent home. A few months ago, however, was decided that the home should be built on the West Cliff, at Bournemouth. According to the anniversary of the birth of Lord Herbert the first stone of the building was laid by his son, the youthful Earl of Pembroke, in the presence of Lady Herbert and many hundreds of the *élite* of the counties of Wilts, Hants, and Dorset. The exact details of the building to be constructed there are not yet decided upon.

# The Builder.

VOL. XXIII.—No. 1182.

From Jaffa to Jerusalem.

HE port of Jaffa is, without doubt, the worst in the Mediterranean, and one of the worst in the world. It consists of a natural break-water of jagged rocks forming a semicircle of about three-quarters of a mile in

diameter, with two narrow openings for the entrance and exit of

small vessels—the water here being so shallow that vessels of the tonnage of passenger steamers are obliged to anchor at the distance of a mile or more from shore. As the whole coast of Syria is exposed to western gales, which pass over the full length of the Mediterranean, the anchorage is very insecure; and, when there is anything like a breeze, passengers are exposed to great perils in landing and embarking, as we ourselves can testify. Stout boats, each manned by at least six Arabs, convey travellers and merchandise to and from the shore, and their unearthly yells, as they rise to the stroke of the oar, are anything but reassuring to the timid and inexperienced. We fortunately landed in calm weather, and, with the exception of having to be hauled on to a landing-stage some 5 ft. above the water, suffered no very great inconvenience; but our embarkation was a very different affair. The wind was blowing great guns from the west, and the huge waves coming direct from the Pillars of Hercules, spent their fury upon the rocky barrier, sending up vast clouds of spray as they dashed against it. The steamer that was to receive us lay pitching and tossing, a mile at least from shore, and was invisible to us when we glided into the trough of the sea. However, we reached her in safety, not, however, without a strong impression upon our mind that the projected railway from Jaffa to Jerusalem had better be deferred until some mode of landing the live cargo which is to make it pay can be devised. As thousands of pilgrims disembark here annually, there must be many lives lost; but in this land of no newspapers it is impossible to arrive at the percentage of accidents. We were not on this occasion solitary in our fears: another boatload of travellers,—two Americans and an Irishman,—was seen toiling towards the steamer. As it neared us, we heard one of the former, a stout doctor, attempting to excite our captain's interest in getting him safely on board, by shouting at the top of his voice, "M. le capitain, je suis first-class passenger!" his fear getting the better of his French; the second, in great terror, shut his eyes and sang psalms, all the way from shore, as the doctor informed us. The Irishman, however, had fortified himself against the strong waters by a dose in no sense homeopathic, and, insensible to danger, employed the time of his transit in speculating upon the situation of the exact spot where the whale swallowed Jonah, and was dragged on board exultating and expostulating. When a substantial pier has been erected upon the rocky foundation, and steam-tugs are employed in the place of Arab boats, a trip to Jerusalem will lose half its danger and discomfort.

The town of Jaffa is built upon a conical hill rising out of a level shore; behind it is a wide plain, beyond which are seen the mountains of Judæa. The white flat-topped houses rise one above another to the summit of the hill, and look picturesque from the sea; but the interior of the town is disenchanted, as its steep streets abound with filth, which remains there until the rains wash it away. No wonder that the cholera has visited the place, and is now killing its sixty or seventy a day out of a population of 7,000. Great are the inconsistencies observable in the East, but one of the most glaring is that this dirty town is noted for its manufacture of that article which is most necessary to cleanliness—soap. Beyond the walls encircling the town, which were built by the Crusaders, there is no trace of antiquity within the town: even the so-called house of Simon the Tanner may be of almost any age, so far as appearances go, and is probably of the Mahometan period.

There was nothing to induce us to remain in this uninviting town, so we started for Jerusalem at three o'clock in the afternoon of the day after that of our arrival, intending to sleep in the Convent of Ramleh, according to the custom of most travellers on this road.

For two hours our road lay through one of the most thoroughly-cultivated districts in Palestine. On each side of the way there were gardens filled with luscious grapes, purple figs, and stately date-palms, whose clusters of ripe fruit and graceful branches were seen here and there above the fence of prickly-pear, which grows to the height of some 10 ft. or 12 ft., forming an impenetrable barrier to every animal whose hide is not like vulcanized india-rubber. Now the verdant scene is turned into one of utter desolation. Swarms of locusts have devoured every green thing: notwithstanding the utmost efforts of the inhabitants of Jaffa to check it by means of lines of fire or deep trenches, this vast army marched on devastating all before it, till it reached the sea-shore and perished there. Well may the poor Jews of Jerusalem, afflicted first by drought, then by a plague of locusts and consequent famine, and lastly by cholera, appealing to their European brethren, lift up their voices, and exclaim, "Then there came locusts which laid waste the land, so that the harvest of the field perished. And the famine was sore in the land; and we said, 'How shall we have strength to bear this grievous scourge? And now, woe unto us, there is death. The corpses of the dead lie in the street unburied, and the living die on every side.'"

At the end of the garden district we halted at a well adjoining a small but picturesque mosque, for a grateful draught of water offered to us by an Arab woman, for the consideration of a baksheesh. All the principal roads in Eastern countries are dotted with wells or tombs erected by pious Mussulmans. The parching rays of the sun make water here the chief necessary of life, and therefore the prime object of desire. Hence Mohammed, knowing the force of association, not only enjoined the use of it in every act of religious worship, but represented it as one of the principal sources of delight in his sensual paradise. The righteous were to be refreshed before entering by drinking at the Prophet's pond, which was "an exact square of a month's journey in compass," and the Jannat Aiden, or Garden of Eden, was to abound with rivers and fountains whose pebbles were rubies and emeralds. So we owed our refreshing draught, and probably many others, to some "hadji's" recollection of the well Zem-Zem at Mecca, or to his aspiration after the waters of Paradise.

Our road for the next two hours lay through a cultivated plain, bordered on the right by rising ground, upon which stood at intervals guard-houses for the protection of travellers. The sun set before we reached that much-

frequented abode of hospitality, the Latin Convent at Ramleh.

After a hearty supper, we were shown into the room, or rather cell, where we were to take up our quarters for the night. It was a square chamber, arched, and lighted by a single window, and into it were crammed four antediluvian four-posters, so close to one another as almost to touch. As the serving brother who accompanied us shut us in, our thoughts, excited no doubt by the antiquity of the beds, reverted to the thousands upon thousands of pilgrims, clean and unclean, who had fed in the refectory and had been fed upon here. The contemporaries of our great grandfathers certainly had occupied these beds. Had the learned Dr. Clarke? Had the observant Le Brun? Had the venerable Pococke? Had the enterprising Maundrell? Had the Lion-hearted Richard himself sought repose in this very cell, beneath these venerable hangings? Any sort of bed offers an attraction to a weary traveller, and a four-poster is especially inviting to him. But when there are four such in a small room, one is apt, before closing one's eyes in slumber, to wish for a larger room, more air, and fewer companions. We should not wish to be thought ungrateful to our entertainers if we suggest that, in these days of the hotel building mania, the erection here at Jaffa and at Jerusalem of very plain hotels, with about twenty bedrooms, with arched ceilings and cement floors, entered from an open corridor, would prove a profitable investment. The furniture should be of the simplest kind,—an iron bedstead, deal table and chairs, a good English wash-stand, and one or two strips of carpet would be all that the passing traveller would require. The expenditure of 1,000l. or 2,000l. would be sufficient to build, furnish, and start each of these establishments in a country where labour is cheap; and at certain seasons of the year the houses would be full every night. Nor would the worthy monks be injured, for a little opposition in this country, where things have been *in statu quo* for centuries, is a wholesome thing, and it would tend to make them furnish more comfortable quarters for those travellers who would still visit them.

We saw Ramleh only by the light of the waning moon, a little before dawn, while our baggage was being packed on mule-back. We saw a straggling village, built on sandy soil, amongst patches of foliage, with sundry remains of its former greatness in its towers and mosques. One of these was a church built by the Crusaders. In the dim morning light it appeared to be good twelfth-century work; but the early Arab style has so many features resembling First Pointed, that sometimes it is difficult to distinguish the difference between them from a distance. In proof of this we may mention that a large tower here, built by the Mahometans in A.D. 1310, until lately was supposed by many to be a structure of Christian times, and went by the name of the Tower of the Forty Martyrs. One of the minarets of the Mosque of Damascus, parts of the mosque El Aksa, the pulpit of the Haram, and many parts, especially the windows, of some of the mosques of Cairo, bear this resemblance to good thirteenth-century work, or more frequently to the bastard Gothic so fashionable in the present day, which is supposed by most people to be a revival of thirteenth-century architecture. On the other hand, many Christian edifices have been attributed to Mahomedan builders; as, for instance, the octagonal Mosque of the Ascension, on the summit of the Mount of Olives.

From Ramleh the country is flat for two hours' journey. The road then enters a ravine, and passes up the bed of a winter torrent, full of boulders, which it is no one's business to remove. It then ascends the first range of the hill country, and, after sundry steep ascents and descents, brings

us in sight of the village of Abon Gosh, an Arab sheikh who until lately levied black mail on all pilgrims not strong enough to resist him. We look upon the Bedaween as robbers, and consider their tax upon travellers a theft. But they are not much worse than those knights of Medieval times who extorted a toll from all who passed through their territory. Like them the Arahs consider themselves aggrieved by those who travel through their district without first paying for the privilege. Abon Gosh's people are now peaceable enough; and seeing that we were desirous of inspecting a building which bore marks of Christian origin, hut was used as a stable, invited us to enter. We found it to be a perfect twelfth-century church, divided into nave and aisles by four pointed arches on each side, springing from plain square piers, with mouldings in the place of capitals; both nave and aisles were groined without ribs. There was a plain lancet window in each bay and in the clerestory, and at the east end the nave and aisles terminated in shallow apses, which were not visible on the exterior, the wall being flush. The door was in the second bay on the north side. The walls of the aisles and the apses had many traces of frescoes. Should the projected railway to Jerusalem ever be accomplished, and should there be a station at Abon Gosh, it is to be hoped that some liberally-disposed Christian will restore this church. There will not be much work for an architect, as all necessary to make the building fit for worship is to glaze the windows, repair the roof, and restore the doorway. The shallow apse here seen is peculiar to the churches of Palestine; it is found in the neighbouring church of Lydda, at Djebail, and in other places. It might be well used in town churches where there is little available space, though it would probably shock those Mediaevalists who think there should be no church built without a deep chancel.

From the village, which lies in a hollow, we passed through many vineyards, and ascended a second mountain, from which we gained a momentary but glorious view of the plain through which we had lately passed, of Joppa, white and glistening in the distance, with a background of deep-blue sea. Then another valley full of foliage, showing what can be done when there is water and earth enough; then another range of stony mountains, more barren than those which we had previously traversed; hut as yet no view of Jerusalem. At last, upon gaining the highest point, we have before us the sight which gladdened the eyes of the Crusaders of old. We are puzzled and perplexed: there are, apparently, two cities; the one represented by a line of grey walls and nothing more, no towers, no minarets visible, nor showing any signs of being inhabited,—not below us, but almost on our level; and in front of it the other, also enclosed by a wall, containing a church and numerous smaller buildings swarming with carpenters, masons, and other workmen. We turn to our guide, the son of an hotel-keeper who had joined us on the way, and ask the meaning of it. "This is the new Jerusalem," he replies, "building by the Emperor of Russia, a fifth the size of the old city; it has a large church, an immense convent, and houses for the reception of the thousands of Greek pilgrims who resort here every Easter." So our first view of the Holy City was disquieting, and on the whole disappointing, for the view from the Jaffa road is perhaps the least interesting of any that can be obtained of Jerusalem. We see nothing but the outer wall and a few poor cafés that stand outside the gate.

Passing through the arched gateway, we emerge upon an open space, and the first thing that attracts us is a clean-looking Perpendicular church and bishop's house adjoining, which remind us of England as it was twenty years ago; the style being that of that period: we should do better now. Next we notice the citadel and Tower of David on our right; and on our left some ironmongers' and stationers' shops, which might belong to a provincial town in Germany as far as the character of the architecture goes. Slipping at every step over the uneven pavement, our horses carry us down a street leading to the bazaars; then, turning to the right, deposit their loads at the foot of the steps leading to an hotel in the street of the Holy Sepulchre. This hotel, which is kept by a converted Jew, is perhaps the best in the city. One side of it looks upon the pool of Hezekiah, an oblong reservoir, surrounded by houses, the inhabitants of which obtain their supply of water from it by means of buckets let

down by a rope. At the time of our visit the water was low, dark green in colour, and altogether very uninviting. Jerusalem might be kept well supplied by water if common care were used in its preservation, for under most of the larger houses there is a cistern. And, again, there are the immense reservoirs of former times, which might be restored to their former purposes. The Pool of Bethesda might be cleared out and rebuilt; and the walls of the conduit of the upper and lower pools just outside the walls, in the valley near the Jaffa Gate, might be repaired and lined with cement. Indeed, the whole city might be made to overflow with water. When we were there, there had been no rain for months: the supply of water had been neglected; it became low and impure, consequently fever, which commonly rises from the use of bad water, was rife, and there were complaints in every month. The Pool of Siloam alone continued to afford the inhabitants a good supply from its gushing source, the fountain of the Virgin; and in its neighbourhood (the King's Garden) alone was visible that verdant freshness which is a sign of the proximity of water. In a future number we hope to describe our walks about the Holy City.

#### ON ARCHITECTURAL PAINTING.\*

Art owes a greater debt to whitewash than it might like at first to avow. Whitewash preserved the portrait of Dante to Italy, and the records of much ancient art to England. The Puritan's whitewash was as good as a museum for the works it protected. But those works are now rapidly disappearing under the improving influences of restoration committees. It is difficult to detect the actual culprit of this ruthless destruction, because the builder employed in repairs shields himself behind the stupid ignorance of his men; the architect shelters himself behind the stupidity of the builder; and the ladies and gentlemen of the subscription list smile safely under the *Aegis* of limited liability. There has been a variation of public taste. It has now gone from one had thing to another, and from whitewash to hare walls. Public taste began to wake to a sense of its own impurity, and then rushed into immoderate use of soap and water. The indiscriminate destruction of early works of English art has been grievous. Much was had, no doubt; hut the good has gone with it, and, what is worse, the record of their composition, the incidents of their history, and the expression of their poetry are gone also. There are, however, scraps enough left to form for us the alphabet of restoration. No geological catastrophe denuded a continent more completely than the flood of modern Purism, under the lying name of Restoration, has laid bare the architecture of our ancestors. They have hurried its very bones. No martyr was ever more effectually flayed. The finer taste of other days had covered the hideous mortar joints and rough masonry of the interior of buildings, with a film of fine cement or gesso. But this has all been scraped away under the ignorant supposition that that too was merely whitewash. The exteriors had been left rough by the builders, all fit and right enough, to meet the action of rough times and rough climate; but the interiors were to meet only the gentle action of men's thoughts and men's prayers. Roughness and refinement are both elements of sublimity in art, but they can never change places. What would give masculine grandeur to an exterior would mar all good effect within: the last touch given to the interior was to soften down the asperities of the rough materials. Coarse lines and broken joints of mortar confounded the finer forms of architecture. A thin film of fine cement resolved those discords and prepared the way for the colourist. But now-a-days, colour, whitewash, gesso, and all are gone. Architecture, first washed of its dirt, then deprived of its complexion, and last of all denuded of its very skin, is presented to us in a state of nudity, which we are then called on to admire! This ruthless process, besides its effect on countless minor buildings, has reduced the interior of Lichfield and a great part of Worcester cathedrals, to a condition of bare masonry, and vaulting like that of a common beer-cellar; and has given the two magnificent columns which rise from the floor to the roof of the choir of Ely, the appear-

ance of two huge piles of double Gloucester cheese. These are but illustrations. This ruinous process has been the rule of modern restoration.

The employment of colour in architecture, in the times of its greatest perfection, is now too generally admitted to need proof or argument. The beauty of a nude colourless architecture may be, and often is, very great; hut it needs to be of the highest art to bear the trial of such nude exposure. Such beauty, the nude beauty of uncoloured architecture, is of the most abstract kind. The forms of architecture, and consequently the beauty of their composition, have nothing in common with nature. Of course its structural has; but I am now speaking of the higher ideal of its art, not the lower one of its mechanism. That higher ideal is a most abstract one. There is an element of beauty in architecture which surpasses the original conception of the architect. A painter preconceives his work; a sculptor does so, and works it gradually into shape in plastic clay; hut an architect does not and cannot pre-conceive all the varying effects of perspective and of light. They affect him as though he were a stranger to it.

Architecture is an intellectual creation. It may delight, attract, and awe the multitude, and no doubt it does; hut I doubt the power of the multitude to penetrate the depth of its poetry. It is too exclusively artificial, too abstract, too exclusive of all that is common to external nature to command all hearts. There is a note wanting in its scale. One touch might bring all the refinement of its calculated symmetry into harmony with nature. One touch might bring the abstractions of human mind into harmony with the feelings of human nature—one touch alone; and that is the touch of colour.

A cold white, snow-white rose, flushed with the glow of an autumn sun,—a glacier iridescent in the level rays of evening, as though it were changed into one great opal—how such beauty charms, and draws out an affection warmer than that of mere intellectual admiration!

A thing of colour is a thing of life. A colourless thing in nature, if there be one, savours more of death than life. In art, a colourless thing is hut a passionless abstraction. It may be, in both, pure and lovely, even though the idea of life have no part with it. But as life is better than death, so are things which suggest it, and so it results that as nature without colour is inconceivable, so art without colour is incomplete.

How then shall we apply this deduction to architecture? If its forms have no precedent in nature, whence are the principles of its colour to be drawn? I grant the difficulty, particularly at this time when people's eyes are so habituated to the poetry of Puritan whitewash or to Purist nudity, that colour comes upon them as a separate idea, clashing with that of architecture. I am not surprised at it. It is often less their fault than the artists'. Incompetent persons are intrusted with an art, of the delicacy and difficulty of which they have no more idea than their employers. There are few more difficult problems in art than the combination of painting with sculpture and architecture. The result is often most unsatisfactory, and neither artist nor employer knows why. And until the province, not merely of each art, hut of each branch of it be clearly recognised both by artists and their patrons, there can be no hope of rescue from that confusion of ideas which now make any harmonious combination of those arts impossible.

In so short a paper as this I can only offer you a few notes on two branches of this large subject:—

1. The methods of art employed in former times.

2. The principles which, in the most perfect styles of art, have guided, and ever must guide, the combination of painting and architecture.

There were three methods of painting,—fresco, mosaic, and tempera; and there were many modifications of each. Fresco, or the painting on fresh plaster, does not appear to have been in use with the ancients for purposes of fine art. The proof of this is that the plaster, preparing for the painter in fresco, only covers so much of the wall as the artist can finish in a day, or before the plaster sets. So a real fresco painting is at once recognised by the multitude of small patches of plaster joined together. The remains of classical art are on large surfaces. The mere colouring of walls, like a house-painter, was done in real fresco on fresh plaster; but, when the Greek or Roman works of fine art were done on walls, the plaster was kept artificially wet from day to day, and

\* Read by Mr. Gambier Parry at the recent meeting of the Wilt's Archaeological Society.

painted with colours mixed with lime and water. Pliny describes painting on wet plaster, and gives a list of colours which will not bear the burning effect of lime. But the effect of this method (which is now called *fresco secco*) was dull and heavy. Their other methods were the *encaustic*, i. e., by colours mixed with wax, and secured to the surface by heat; and the *tempera*, i. e., by colours mixed up or tempered with any flowing vehicles: hence our word *distemper* painting. The Greek and Roman artists used oil; but there is no evidence of their actually mixing colours with it. It was certainly used with wax as a protective varnish, and polished by rubbing it to a hard surface. The Egyptians and Greeks certainly used wax with their colours. There is a picture at Pompeii of a painter mixing his colours in a vehicle of this kind by heat, upon a stone with a fire under it.

Oil appears to have been of very ancient use. A Greek writer of the age of the Emperor Augustus describes the making and using of drying oils as a matter of no novelty. *Ælian*, a medical writer of the fifth century, also says that walnut oil is much used by painters, because it dries and preserves paintings for a long time. Oil is also mentioned as an ingredient of *tempera* by *Cinnius*, a painter and author in the fourteenth century; and, what more interests ourselves, there are numerous rolls and records of English works in which both oil and wax are mentioned as supplied to the painters in the thirteenth and fourteenth centuries.

The methods commonly used in England in those times were of various kinds of *tempera*. Real *fresco* was not practised in England. Indeed, there is no evidence of its use anywhere before the time of *Cinnius*. It appears first to have been used at Pisa at the end of the fourteenth century. But for architectural painting in particular it is remarkable that a German writer, *Eraclius*, of the twelfth century, and a Frenchman, *S. Audemar*, of the same date, both describe the colours used for walls as mixed with wax and oil. What was used by the German and the Frenchman, was used by the Englishman also. *Eraclius* writes about architectural painting thus—"If you wish to paint a column or a stone, take white lead and grind it very fine with oil." Here is actual oil-painting in the twelfth century. With this he describes their firm of white cement, which I have before referred to as coating all finished architecture. He then goes on to say, "You may then paint upon it in colours mixed in oil." The Frenchman, *S. Audemar*, is also very explicit to the same effect; and, as he was so near a neighbour, we may suppose him to describe what was done at that time in England, viz. in the twelfth and thirteenth centuries. He describes the great precaution taken at that time to secure permanence, such as that blue should be used on walls with water and egg, on wood with oil; that red lead should be mixed with gum for walls; and white and other colours, some with oil, some with egg and wine. Wax, also mixed with white lead, was prescribed as a ground for painting on wood; and a varnish of wax was given to vermilion to preserve it from the damp and air, which blacken it. The green used for wall-painting was *verdigris*, and he directs that it should be tempered with wine, or, if you prefer it, with oil.

It is to the excessive care and discrimination used in their methods of architectural painting in the Middle Ages that we must attribute their admirable durability. Particular seasons of the year were assigned to the preparation of particular materials, and their distempers were chosen with the utmost care, according to the material and colour used, varying between gum, egg, wax, fig juice, oil, size, and wine.

At Ely and Westminster, numerous records to this effect have been preserved.

Painting with lime and lime-water was in common use, as being the least costly for ordinary decorative work. On stone work common ornament was usually done in England by coating the masonry with a smooth wash of size and gypsum, and painting on that, with colours mixed in glue. Cautions against damp were reiterated by writers of those times, and artists often took the precaution of using trefoil, and linen saturated with wax or parchment size at the back of their paintings. If, in addition to these various methods, we recall the use of stencilling and of embossing the surface of walls for golden diapers, and for the imitation of jewelry, we have a tolerably broad sketch of all the processes employed by the English wall painters of the Middle Ages.

But enough of technicality: let us come at once to the second part of the subject, more generally interesting—the principles and practice of this art.

That colour had its place in architectural effect, and that it was necessary to its perfection, has been a principle recognised in all times and countries. I by no means insist that this should bind us to its adoption. The intelligence of one generation need never be in bondage to that of another; but the fact of art having been unanimous in its greatest and purest age, whether of Pagan or of Christian times, on this subject, is a sufficient reason for our inquiry whether our preference for uncoloured objects is a prurient taste, as some people are apt to arrogate to themselves, or whether it be not, as I believe it to be, a simple deficiency of perceptive powers, and the evidence of an elementary, incohærent, and limited taste.

In the palmiest days of Classic art, sculpture as well as architecture was coloured. Statues were treated in various ways. The best appears to have been by reducing the harsh whiteness of the marble in the nude parts, by a wash of softly-tinted wax. The effect was to mellow the tone without impairing the texture of the marble. The draperies were often coloured very powerfully, and gold and even jewelry were used.

The art of the statue painter was recognised as one of the greatest difficulty. It was an art as distinct as that of the landscape painter, or miniature, or figure painter is now. Unpainted statues are mentioned by classical authors as exceptions. The greatest sculptors preferred their own works when they had passed through the hands of the colourist.

As the buildings were universally coloured, the fine and cultivated taste of the Greek could not bear the bald blots of dead white, with which uncoloured statues would have marred the unity of his architectural effects. The buildings also were coloured without regard to the materials. Every moulding of the Parthenon, of the purest marble, was covered with colour or with gold; there was no cowardice, no quakerism of quiet colouring in those grand days. The interior walls of the Parthenon were painted with many patterns, and both within and without, the carved enrichments of capital and cornice were made richer still with paint. The sculpture was relieved by coloured backgrounds, and the statues were richly painted. The film of fine cement with which the marble was coated to receive the colours still remains in the hollows of foliage and draperies. That upon the statues of *Phidias* and his scholars can be seen in the British Museum, with the remnants of colour still upon them. It was the same everywhere. The Doric temples of Corinth and *Ægina* were coated all over and coloured in their way. The unpainted temple was as exceptional as the unpainted statue. Herodotus mentions the unfinished state of certain buildings, with a kind of apology for their want of colour. Their Parian marble still glared with whiteness, because, as he says, there had not yet been time to paint them. The primary colours were generally used on the architecture of the Greeks, and often in great intensity. Vermilion, ultramarine, and yellow earth were common; and a bright green—probably the same as that of which our Medieval painters were fond, the *Vert de Grèce*, whence our word *verdigris*—the French name *Vert de Grèce* originating in its importation to England from Montpellier, the greatest emporium for colours in Europe of the Middle Age. Works of Classic art, at the greatest distance apart, witness to the same principle in colouring, that what the carver had brought out in strongest relief should be still more strongly relieved by bold use of the primary colours and of gold; and that what the architect had left broad and flat should be maintained so by the painter, by diaper, flat, and conventional patterns, and bold simple bands of colour. This only applies to decorative art. Of higher art, figure and subject painting, we have only the direct evidence of hooks.

The paintings on ancient vases and the remains at Pompeii, are valuable indirect evidences of what the course of Classic art had been. Those vases represent to us the perfect ideal of Greek wall painting. The composition of the subjects on those vases is commonly much too fine to have originated with artists employed in a business comparatively low. The inference is a fair one that those compositions are repeated from the works of the greatest artists on the temple walls.

The system of flat composition in wall painting

was then universal. There is a description by *Pausanias*, of a work painted about 450 B.C., in which the figures of a great subject were in distinct groups one over the other. On the Greek and Etruscan vases this system of wall-painting is perfectly illustrated. The most beautiful and expressive groups are there made subservient to the architectural purpose. If those inferior works on more pottery were so fine, the great originals must have been admirable. The system of painting was one of sufficient relief to satisfy the eye, but not enough to disturb the dignity of the architecture. And let it be remembered that this date was the date also of *Phidias* and of *Ictinus*, the age of the zenith of Greek art.

An artist is not to be measured by the high finish of his works. The age of high finish and high relief in painting (just 100 years after this) was the turning-point of classic art to its decline. Painting then asserted its individuality. It was still admirable, but only for itself and by itself. Its reign was then in pictures—hangable, moveable pictures, with which the lesche and porticos of public buildings were covered as the walls of a modern exhibition. But by that very assertion of individuality it discovered itself from architecture. True architectural ornamentation, whether by decorative design or by high art figure-painting, was at an end; and, like a wounded bird which towers higher and higher before it falls dead, the abuse of art culminated in a certain Roman *Ludius*, who painted market-places, stalls, cobblers' stalls, and vulgar groups on walls, ignoring all principle and defying all taste. With him that chapter of the arts was closed.

I trust that you will have seen my purpose in this brief sketch of classic art. I can suppose that the story of Christian art might have been more interesting to you, but that classic art was a perfect prototype of what followed in Christian times. They both illustrate the triumphs of art gained by the principle of mutual subordination. Subordination, I mean, not reducing one art to the slave of another, but a mutual act, rather of espousal than of vassalage. When painting asserted its own individual powers, all combination with its great sister was at an end. In Christian art the case has been the same, and now-a-days all true principle of wall-painting seems to be ignored. The modern artist will not succumb to the requirements of his new position. He has been a picture-painter; he is now a wall-painter; but he continues a picture-painter still. All art is subject to conditions. Its excellence depends on their fulfilment. It is this fact of subjection to conditions which makes all art necessarily conventional. Painting is an art of exceedingly wide range—wide in respect to itself, from the bold symbolic outlines of an Egyptian hieroglyph to the giggling mimicry of a Dutch picture, and wide in respect to the purposes it can fulfil, such as for pottery, for walls, for moveable pictures, enamels, sculpture, architecture, glass, tapestry, &c.

This versatility of powers must be thoroughly realised before any just judgment can be formed. People err in taste because they ignore the proper base of criticism. They are confounded by the flood of heterogeneous forms which disgrace the character of modern art—and no wonder; but once seize the guiding star of all judgment,—once realise the conditions in which a work is placed—conditions as to itself, conditions as to its place, purpose, and materials—and then all is clear. No matter how much consecrated by long use or common associations, it must be at once condemned if its conditions be unfulfilled. Apply this to the subject before us.

Monumental art is of all others the highest in its aim. It must compel the resources which all arts can afford into union. The success of former ages is attributable to that union in which the whole chorus of the arts joined.

It is the modern self-assertion of each individual art that renders success in monumental art well nigh impossible.

By monumental art I mean the combination of the whole sisterhood of arts clustering round and working under the master spirit of architecture. Let each art be free as air, and rovel in its own powers alone and uncontrolled. But here it is not alone. I can conceive no taste more repugnant than that of vain self-assertion, where self-restraint would be the most graceful virtue.

Take, for instance, such a case as this—An artist paints a scene for a theatre. It would be

impossible for him to imitate too closely the natural effects of both linear and atmospheric perspective. But apply this scene so painted, with its sunny foreground in strong relief, its receding forms of wood or mountains, or of distant water mingling its horizon with the sky—apply this elsewhere. It was a triumph of art in its own sphere—it had fulfilled all its conditions. But now how ridiculous would all these be associated with the condition of architectural design. The artist has made all light and flimsy which the architect had left purposely and necessarily massive, hold and broad. Both mind and eye are offended at the result. He has placed the two arts in direct antagonism. He has stultified the architecture, and reversed every condition of equilibrium—opening that which should be closed, lightening that which should be heavy, leaving weighty masses of masonry without apparent support. He has turned heavy walls into thin air, and has left massive arches to carry the clouds.

But the great works of other times have given us the precedents and principles to attain the same success.

Surely it will not be denied that if ever taste culminated to its highest act, it was in the creation of beautiful works. If ever there was authority in taste—which we are bound to reverence—it was when art had attained its greatest triumphs.

Individual taste may now-a-days rebel, in vanity and self-assertion, but the greatest artists of the greatest days did otherwise.

I am confident that in conjunction with architecture all arts are raised at once to their highest sphere.

Architecture is the most conventional of all arts, the creature of thought, most abstract and refined, and with it the others can find companionship complete and sympathetic only in their purest and noblest forms, where all power is concentrated to symbolise and suggest rather than to realise, to address imagination rather than to satisfy curiosity. Naturalism and imitation are another, a distinct and most inferior phase both of sculpture and painting,—a phase, indeed, to which a good pupil must attain—to which the master must have himself attained to reach his higher standing ground. They are steps, mere steps, which all must mount who care to feel the pure air above, and to see the broad horizon of Arts' poetry in all its beauty.

I conclude, then, with this, that if those various arts of which my subject has treated could be attained, and their spirit guided by the genius of one master-mind,—if their full powers could be compelled and their resources welded together with unity of purpose and unity of result,—such a conclave of the arts could only meet for one great triumph—in our architecture completely beautiful—the mother and the mistress of them all.

#### ARCHITECTURE MADE EASY.\*

THERE is a growing and spreading branch of architectural literature, presumably meant for informing chiefly the general public as to modes of proceeding in building, which we are under difficulties in reviewing. This literature scarcely receives any attention from the practising architect: but it comes under the notice of students, in the form of gift-books. The profession should regard, however, what is their interest in the progress towards a general public appreciation of good building, and in the better estimation that would be consequent thereon, of the architect's part or mission in the production of the thing wanted. The work of educating for the calling of an architect has now been accepted as a duty by the profession; but the duty will not be well performed unless attention be given to the character of the books which may now, or should, according to the case, be in the hands of the student. Office-practice, oral teaching, and observation of buildings, will do very much; but reading and the examination of drawings and prints are too important in the short time that there is for an architect's education, to be left out of consideration. That there is a demand for illustrated books of a class wherein

the intimate union between the art decorative and the art structural and practical, is recognised as fact, is evident. It is a new demand: at least it was not much catered for during the period commencing with the appearance of "Stuart's Athens," ending in our own day with the multitudinous illustration of Medieval buildings, and including in its course the publication of many volumes of designs; although it had been recognised in Palladio's books, and in many folios of his successors. And such a demand is precisely one that every individual interested in the regeneration of true architecture, should be glad to find existing.

These observations are suggested by the first glance at a work before us, of which we have given the full title in a note; and which bears a certain likeness to less ponderous volumes that have come to us from one or two publishers. In its pages, excepting the ugly bill-poster that stands for title, there is something attractive to one anxious for information; and there really is a large amount of information given, and certainly much of it what might be very useful to architects in practice. The volume, however, is a specimen of "book-making;" the greater portion of it is previously published matter, re-cooked, or so extracted as to leave the particular branch of the subject insufficiently expounded; there are many errors of the press; some of the cuts are so far inaccurate in details that they might mislead a student; and the defects for purposes of reference, of the paging, which does not run consecutively throughout the volume, are not remedied by the Index. Some use has been made of matter that has appeared in our volumes. Generally the sources are acknowledged. But the compilation has been so performed, that what is given sometimes tends to bewilder the reader,—as for instance where structural design and decoration are treated: of opinions of others are there "pitchforked" together. In Mr. Ruskin's celebrated passage about architects living in cities, and the bricking "up to death men's imaginations," the words "forsworn nun" get changed to "forsworn men." Quantity of matter rather than quality is characteristic of the book. The defects of the volume would prevent our recommending it to the general public, or indeed to any one not possessing already much information, and who might not be trusted to supply the omissions, making use of what he found only as suggestion. A reader possessing information, however, might help himself, with the book, to the getting much more.

The text of the volume is comprised of thirteen essays and a supplement. The essays treat of "The Planning and Construction of Working Men's Cottages, and Dwelling-houses;" "Structural Design and Decoration;" "The Principles Involved in the Arrangement and Construction of Timber and Iron Framing;" "Building Materials: Stone, Artificial Stones, Cements, Bricks, Timber; Strength, Decay, and Preservation of;" "Warming, Ventilation, and Artificial Lighting;" "The Drainage of Town and Rural Districts and Building Sites: Street, Road, and House Sewers and Drains;" "Garden Structures: Greenhouses, Conservatories, Vines, Pines, and Peach-houses;" "The Arrangement and Construction of Schools;" "Breweries, Gasworks, Mills, &c.;" "Agricultural Architecture;" "Architectural and Building Contrivances in the International Exhibition of 1862;" "The Application of Isometrical Projection to the Delineation of Architectural Subjects;" and "Specifications and Estimates;" whilst the supplement gives an "Explanation of the Principal Terms used in Architectural Design and Building Construction," and practical notes and memoranda collected from different sources. The manner in which details are brought together in one sheet, in the case of some of the plates, makes these latter of a certain value. Original sources of some of the figures will be easily recognised. Illustration of subjects related to building, however, has not advanced since the publication of "Rees's Cyclopaedia," for which Farey drew and Lowry engraved. Publishers who aim at being really explanatory, as by the woodcuts they give, should compare the index-illustration of this time, with the precision and truth of that. Of the decorative character of some of the designs that are shown in the plates before us, the less said the better.

The first essay starts with an inculcation of principle that we must consider aptly chosen as the point of departure in a popular work on practical architecture. The writer says,—“As

our houses are made to live in, not to look at merely, it is essential that this their primary purpose should have the fullest consideration, while laying down the plans of their arrangement.” At the close of the essay, he refers to "The Grammar of House-Planning" (a work which we have reviewed) as intended, at the time of his writing, to comprise the treatment of points not fully gone into in the Essay. He makes a distinction, however, that we are not prepared to adopt, between *design* and *planning*, looking upon the former only as being connected with beauty of form and ornamentation; which last, both, he seems disposed to treat as things to be added,—forgetting that architectural or decorative effect in a building flows as much from good planning, as from anything superficial. To arrive at knowledge of what is really wanted in a house to be designed, and to succeed in planning the house, it is advised that female counsel be taken. We do not object to the recommendation.

In the first division of the general subject of the essay, cottages for working men are considered. Much of the information has appeared in Mr. Strickland's work reviewed by us along with the other of which the title has been given, and in the reports of various societies. Both divisions of the essay are illustrated with a considerable number of plans. The plans of the larger dwelling-houses and villas are, however, chiefly in outline, or without sufficient indication of details. The "flat" system is advocated for town-residences, but with the addition of the porter's *loge* as in Paris. The gain of space by this system, which in effect saves ground that in the English arrangement would be occupied by one or more staircases additional, is referred to, but not the despotism of the porters, in Paris. The liability to the sort of tyranny really comes into the question, although we believe not so much as to outweigh arguments in favour of a "Scoto-Parisian system of Town Architecture." In the principal plan given in the work before us, the porter's quarters are placed so that they would not sufficiently command the entrance. Whereas in the plan of a Parisian "Maison à loyer," which follows the other, every person going to the general staircase would have to pass the door, which would be glazed, of the porter's room. The latter part of the essay is devoted to the subjects of fire-proof construction; prevention of damp in walls, and use of hollow brick; and supply of water; and to some points connected with conveniences and fittings. One of the plates shows different systems of flooring, including some of those in use on the Continent.

In the essay that treats of Timber and Iron Framing, we find it stated that if from a rectangular form of section of cast-iron beam, parts at the sides were cut away so as to substitute Treigold's I section, (or leaving depth the same as that of the rectangular form, and breadth of top and bottom flanges the same as the breadth of the rectangle,) the withdrawal of material would not weaken the beam, and that similarly there would not be any weakening from a like operation to get Fairbairn's or Hodgkinson's form of section. This is an error, manifest to the practical architect, but dangerous as here promulgated to the student. Neither form obtained after the simple cutting away, would bear the same weight as the original beam with the perfect rectangle of section. The writer ought to have stated, in effect, that the metal cut out, or obtained, and the metal left,—the two added and re-joined together,—might be disposed in a form of section that would bear a greater weight than the beam of rectangular section would bear; or, conversely, that by adopting a form of section different from the rectangle, and dimensions of depth and breadth of the beam, and of thickness of metal, also different, the given weight might be supported, whilst some of the metal that went to form the rectangle could be saved. Of course there is a certain element of gain by reduction of weight of the girder itself; but there must be a loss of strength in the case referred to, unless some of the metal be used to add to depth of the girder. Generally, however, in the volume, the deficiency of which we have evidence, is not want of information with the writers on the subjects treated of.

Illustrative of the essay on schools, are drawings of school-houses in America, and Belgium. In parts of the volume, much information is given which many persons not within reach of London libraries will be glad to have at hand; we may instance what can be found on beating, drainage, and breweries and

\* "Working Drawings and Designs in Architecture and Building; with Essays on various Subjects, richly illustrated with Woodcuts. By Edward S. Eycland, Esq., Architect; Francis Lightbody, Esq., Civil Engineer and Architect; and Robert Scott Burn, Agricultural Architect (General Editor). A. Fullerton & Co., Edinburgh and London." Folio, pp. viii., & 31, 8, 20, 7, 25, 12, 17, 14, 8, 23, 8, 7, 14, & 24. Plates 48 & 7; and cuts.

factories. The notice of contrivances in the Exhibition of 1862 is utterly inadequate.

The model specification in the 13th Essay requires revision, to be of the intended use to the student. Thus where Buxton lime is mentioned in the bricklayer's work, there should have been a blank, since the sort of lime will depend somewhat on the locality of building. The direction that flashings are to be of "14 lb. lead," is of course one of the printer's blunders; but is one of the kind which, left standing, make part of the difference between a book of no value, and one put forward as works are in general advertised. Under "Plastering and Painting," the marginal heading which should be "Painting" is printed "Pointing;" and immediately opposite it, and following, having read "To bed and point all the doors and windows with strong hair-mortar," we find "To point the whole of the interior and exterior wood and iron work, usually painted four good coats," &c.; which is simple nonsense. We pity the student who falls foul of such defective parts of this book. The general editor was competent to correct blunders of this and every kind we have referred to. Do publishers under-estimate the item of outlay to be allowed for such revision? One specification given is for farm-buildings in Scotland. Some of the terms will not be intelligible to architects south of the Twee.

In the Supplement giving explanation of technical terms, there are several defects. Thus a general assertion is made as to the base of the Corinthian order in Choric monuments, although the monument of Lycorisates is the only one of the Choric monuments that can be in point; and the statements about the lightness there, of "the

mischievous done by a book meant for students and the general public, which mixes up with its information blunders such as we have given an idea of is not slight. Let a student take a wrong notion from a sentence or diagram, and he may not have corrected it ere he is called to practice. The *Dictionary of the "Architectural Publication Society,"* to which we perceive that one of the writers in the work before us, is a contributor, is generally remarkable for the excellence of its articles and illustrations, and the clearness of its definitions. There must have been some extraordinary reason for the diminished value here. We will not follow a common course of reviewers, namely advise correction in a second edition,—though much might this way be done for the production of a work that would become one of value: first editions should be, what often they are not, something more than proofs for correction. Some publishers act in a manner not only to spoil their own market, but to make publication the medium of disseminating not merely the knowledge that is power, but the half-knowledge that decidedly is not, and the positive error that is actively mischievous.

AN ODD NOOK OF LONDON.  
RED LION-YARD, GREAT WARNER-STREET, CLERKENWELL.

HERE and there in various parts of the metropolis, the wanderer comes upon odd nooks which are not only remarkable for their peculiarities, but also for the opportunity which has

other side the projection of the roof is not so great. An open gallery passes along the second story; and here let us remark that the plan of galleried houses is but a return to the system of the old London inns, with their tiers of rooms reached by galleries. The building here is a late example of the adoption of this principle, which, after long disuse, has been revived in our days on a more extended plan;—another instance of the truth of the proverb that "there is nothing new under the sun." It is pleasant to remark that the flower movement has extended boldly this way; in front of some of the rooms along the gallery there are healthy-looking plants, which form little gardens, and several of the pillars are completely festooned with creeping plants.

A little apart from the wooden structure, in order that no ground may be lost, shunted into a corner, there is a little two-roomed cottage, one of those unwholesome dens in which families are forced to seek shelter. The room on the ground is not more than 5 ft. by 8 ft. and 6 ft. high. The rent for this 240 ft. of cubic space is 4s. a week, and it is expected that an increase will be made.

Some years since we excited the indignation of the public, by showing that the Coldstream Guards, in the Portman-street barracks, had no more than an allowance of from 250 to 280 cubic feet of air each; but here a family of six people are driven to live in a room which only contains 240 ft. of cubic space, and without any ventilation, for there is no opening at the back. Here the allowance of space is 40 ft. for each person. A dust-heap, filled with rubbish, is close to the door; and

An Odd Nook in Clerkenwell.

structure supported," and about the base rising from "a circular platform," might be made in ignorance that the superstructure was solid and filled in between the columns, and that the substructure was square on plan. What is the "scape" of a column? If a north-country term for *apophysis*, it should have been explained. The word *αποφυγή* signifies escape or retreat. In many parts of the "Explanation" of Terms, we have certainly evidence of that lamentable want of precision which prevails with writers on architecture; which it is not easy to correct, but which every new glossary should do something to correct. Thus we read that *arris* is "the angle edge" "formed by the meeting of two posts placed at an angle to each other," &c. Now there may be an *arris* without the presence of two posts, or even one, in the construction. Surely, also "beam" and "bressummer" do not so commonly mean the same thing, as to be rightly explained by a single diagram of the former. The defects in the cuts, to which we have been obliged to refer, are particularly remarkable in this Supplement. For instance, in the "section of the lower part of a sash-frame," were the bottom rail of the sash made as shown, the sash could not be raised. It is no use expecting a reader to supply the omissions of explanation: the reader, or a glossary at least, is presumed to be ignorant; or explanation would not have been to be given.

It is unpleasant thus to have to point out defects in a work which contains so much valuable matter, that we do not hesitate to say good use might be made of it by an architect; but the

been taken of them for the accommodation of large numbers of people. Often, these slums are almost unknown regions to those who dwell in the surrounding parts: besides the dwellers, too, there are frequently extensive and varied operations carried on in them. One of the most remarkable of these spots that has recently fallen under our notice is the locality above mentioned, which is inclosed by other buildings. We annex a sketch of it.

On two sides of a very large area there are ranges of wooden shed-like structures two stories high. The ground-floor was originally intended for stables and coach-houses; and above these are apartments which were formerly occupied by those who had charge of the animals. At present a considerable number of horses and carriages are kept here; but the stables, as are most of the apartments above, are in an unhealthy and ill-ventilated condition; and the inspectors should see that scavengers do their duty better here, for at the time of our visit there were dangerous accumulations; especially as now many of the upper rooms have been taken possession of by families, and others are used as workshops of different kinds. Scattered here and there were heaps of litter, the wheels, bodies, and other parts of cabs, omnibuses, and carts. In some parts there seemed to be hospitals for carriages which have fallen into decay and trouble.

On one side the pent roof projects to a great extent (throwing broad shadows), and in the summer heat and stormy weather serves to protect the grooms and carriage-washers. On the

we suspect that the water-closet is without a drain.

The wooden buildings here present a very picturesque appearance, but, as we have already said, they require strict sanitary attention.

THE FAMILISTÈRE OF GUISE, FOUNDED BY M. GODIN-LEMAIRE.

WHILE the papers are teeming with descriptions of streets whose bad drainage, want of light and ventilation, and the dirty habits of the people who live in them, make permanent fever-nests, it is refreshing to the heart to know that in one spot in Europe a practical and thoroughly successful plan has been carried out to remedy this evil, and has been in active operation for more than four years.

M. Godin-Lemaire, a large manufacturer at Guise, near St. Quentin, France, having realised a considerable fortune by his kitchen-ranges, enamelled drawing-room stoves, &c., determined to employ his wealth in ameliorating the condition of his 700 or 800 workmen and their families.

It being out of the question to enrich them by increasing their wages, he sought how he could give them, in the necessities and comforts of life, the real equivalents of riches, viz., a healthy and cheerful home, every facility for domestic and personal cleanliness, and the education of their children from their cradle till the

age when it would be necessary for them to gain their livelihood.

To effect this, he began by erecting near his foundry, on the opposite bank of the river Oise, two handsome and spacious buildings, which are to be at a future period completed by a third. These edifices, each of which forms a parallelogram enclosing a vast court, are connected at their angles by annexes, and form the three sides of a square. Along the fourth side runs a wide road, on the opposite side of which the square will be regularised by other buildings already in course of construction, and necessary to complete the organisation of the *Familistère* (or dwelling for families), as M. Godin very aptly terms his new edifice. The whole of the buildings, together with lawns, woods, and gardens, cover six hectares (the hectare = 2 acres 2,260-3326 square yards). Nothing has been neglected to render the outward aspect of the buildings noble and attractive. All the decorations that taste can obtain from bricks have been lavished on the façade, such as frontals in the centre and at the angles, pilasters rising to the roof, panels in relief half-way up the building, a cornice with dentils under the roof, horizontal lines running along the façade under the first and third stories, dressings to all the doors and windows, the whole edged with violet bricks on a red ground, nothings is overloaded; all is graceful and harmonious.

M. Godin's intention in thus decorating the workman's house externally was to rehabilitate labour. The workman's dignity must be raised, even in outward forms. He must feel no humiliation on approaching his house. It must be neither a den, nor a prison, nor an almshouse. But the internal combinations have been no less carefully attended to than the external decorations.

We will give a short sketch of the principal building, which lies at the back of the square, the other two being constructed nearly on the same plan.

A court of 45 metres\* by 20 metres, offering, therefore, a surface of 900 square metres, is inclosed by a building four stories high, where 380 openings give access to air, light, and circulation. The fronts are 65 metres by 40 metres. The buildings are, therefore, 10 metres deep. At the distance of every 10 metres a thick partition-wall runs from the basement to the roof,—a necessary precaution against fire. Each division thus forms 100 square metres. These 100 metres are generally divided into two apartments, similarly distributed, which can be separated or taken together, according to the requirements of the family.

In the ten metres of the inside façade are three openings,—a door between two windows. This door opens into a small hall, formed by two partitions extending to half the depth of the building. These partitions would form a corridor, were the spaces between them not divided into three compartments. The first constitutes the hall; the other two form good-sized store-closets, the one opening into the apartment on the right hand, the other into that on the left hand of the hall. These closets are well furnished with shelves and drawers for crockery, glass, stores, &c. Underneath are places for brooms, brushes, dusters, and all that would otherwise lumber the room.

Two side doors opposite each other, lead from the hall into the separate apartments, each of which consists of two rooms and the above-named closet. The first room into which this closet opens, is lighted by the window looking into the court: it may be used as a sitting-room, a bedroom, or a workshop. This leads into the front room which looks into the square. This second room is of course larger than the first, as in a London house, because the landing and closets do not extend so far. In each room there is a fireplace, the good ventilation of which is secured by vent-holes from without, and a cupboard opens on each side of the fireplace: the whole is neatly floored, coated, and whitewashed. The mere partitions are 11 centimetres thick (the width of a brick), while the division walls are 22 centimetres (the width of two bricks). No one is therefore either overheard or disturbed by his neighbour.

Here, then, are two lodgings, each consisting of two good-sized rooms and a closet, well lighted, well ventilated, cheerful and healthy. They can easily, as the family increases, be thrown into one.

These lodgings, which are in point of fact,

\* The metre is by the Act of 1864 declared to be equivalent to 3 ft. 3.708 in.

distinct small houses, without their inconveniences, are reached by a wide balcony, running on each story along the inside façade of the edifice, and round the court. These balconies are constructed by the simplest of all means. The joists which support the flooring of each story are made to extend about 5 ft. beyond the walls. These beams, neatly hoarded, and protected by a light but strong iron railing, constitute the street which passes before every man's door. The balconies are reached by spacious staircases, placed at the angles of the edifice. The staircases and court are lighted, all night, by gas. On each landing is a fountain, the excellent water of which is raised by a steam-engine. The daily consumption per head is 20 litres (about 18 quarts). This shows how great a share cleanliness has in the use of this essential element.

On the same landing, but perfectly closed and concealed by double doors, are, first, the W.C., on the best English plan, and thoroughly ventilated; secondly, the dust-hole, which is connected by a shaft with a room in the basement, where all the dust and refuse, such as vegetable peelings, bones, &c., are collected, and regularly removed in carts once a day, before they have had time to ferment.

To preserve these balcony-streets, and allow the children to enjoy air and exercise in all weathers, the court is covered in by a vast skylight, rising above the roofs. It would require several pages to describe the ingenious means by which the thorough ventilation of this court, though so well protected against rain and snow, is maintained; suffice it to say, that under the buildings, which, together with the court, cover 2,600 square metres, are placed the arches which contain the cellars; for every workman has his cellar and his loft. Under the court is a vault, supported by long rows of square pillars, which give it somewhat the appearance of a crypt. Two large bays, or openings, in the basement walls give free access to light and air. It is here that all the ventilation-tubes of the chimneys have their lower orifice. The vault is pierced at regular distances along the building with air-boles, which open into the court, where they are closed by iron gratings, well levelled with the polished cement which forms the pavement. These, together with the openings under the skylight, and the wide gates, keep up a constant circulation of fresh air. In summer there is every facility for watering the court; and though the weather was particularly sultry when we visited it a few days ago, we found this court and the balconies, at all hours of the day, comparatively cool and pleasant.

This court is the favourite resort of the children, when out at school. There they can sport and give vent to their youthful spirits, under the very eyes of their mothers at work at their windows. Here they run no danger; for no carriage, no laden carts, no cattle, no drunken men pass this way. Protected from the mud and dirt and corruptible influences inseparable from the street, here children of all ages enjoy exercise and pure air to their hearts' content; but air, light, and freedom from damp and noxious emanations, necessary as they are to health, would yet be of little avail without cleanliness.

Accordingly cleanliness seems to be a ruling passion in the *familistère*. It is divided into general cleanliness and private cleanliness. The former is intrusted to the charge of a certain number of women. It is their business to sweep and wash the court, staircases, balconies, water-closets (which are cleaned three times a day); it is they who daily make the beds, and sweep and put in order the rooms of the single men who inhabit furnished lodgings on the third floor, and wash their house-linen; in short, all the general work is done by them, and paid for by the management. The mothers, wives, daughters, and sisters of the workmen find in these duties a remunerative employment for a portion of their spare time.

The care of the private dwellings is, of course, left to the inhabitants; but it is rendered so easy, and the example of external cleanliness exercises such a wholesome influence, that all the lodgers seem to take a pride in keeping their own private home to the general mark.

Bodily cleanliness is promoted by all the facilities which abundance of water within every one's reach,—hot and cold baths at 2½d. for adults, and free for children and invalids; wash-houses and drying-rooms at the disposal of all the inhabitants, &c.—can afford.

The washing for those families who prefer

giving it out also affords a source of profit to any of the female inhabitants who like to undertake it. The business requires no outlay but that of soap.

On the ground-floor are established retail-shops at wholesale prices, plus a small percentage to pay the expense of management. One for butcher's meat; another for pork, rabbits, &c.; another for fruit and vegetables; a grocery; a dairy; a wine, beer, and cider shop; a linen-dropper's, and a ready-made clothes shop; all, in short, that can be required for the use and comfort of a respectable workman's family. Add to this a cook-shop, where, at the hours allowed to workmen for their meals, simple, wholesome, and well-prepared food can be procured, and carried home for the family, or eaten in the public dining-room; and it will be seen that M. Godin has amply provided for all the legitimate wants of those who become tenants of this workman's mansion. The unmarried workmen generally take their meals at the restaurant, the average cost of which is between 8d. and 1s. a day.

The sales and cooking department being entrusted to women, afford other lucrative occupations to the workmen's wives and daughters. Not only are their first wants provided for, but even their honest enjoyments are not forgotten. A reading-room, well lighted and warmed, furnished with books and newspapers; a billiard-room, with chess, draughts, and dominoes, and a refreshment-room, complete the domestic arrangement of the *Familistère*.

But while their material comforts are attended to, and so managed as to insure both physical and moral health, M. Godin has established one single but inflexible rule, which he hopes will help to moralize still further that class whose interest he has so much at heart: NO CREDIT IS GIVEN. None are asked to purchase at the stores, or provide their meals at the restaurants: all are free to come or leave as caprice dictates, and to provide for their daily wants wherever they please; but if they seek the stores of the establishment or the dining-rooms, they must pay in ready money. Experience has shown that few new-comers avail themselves of these latter advantages: the force of habit, or the heavy chains of a debt incurred, very frequently force the housekeeper to return to her old haunts; but as the debts are cleared off, or the greater benefits to be derived, in price and quality, from the home-stores, strike her mind, she gradually acquires the habit of laying out her money at these stores. By this rule, M. Godin hopes to free his workmen from the slavery and demoralizing influence of indebtedness.

The rent for unfurnished apartments of from one to five rooms, with closets, &c., is at the rate of 3s. 9d. a room per calendar month. A furnished room for a single workman, containing an iron bedstead, two mattresses, two or four chairs, one or two tables, a wash-hand-stand complete, a slop-pail, a looking-glass, two clean towels a week, and the bed-linen changed twice a month, the bed made, and room properly done every day, costs 5s. 6d., or 6s. 8d. a month. On a separate bed in a dormitory placed in the annexes can be obtained at 1d. a day.

A medical man calls every morning at the office to inquire after the general health, and is bound to visit any who may require him at their own home. The medical service is paid by a mutual-aid society established among and managed by the workmen. This society allows 2 francs a day to any member whom illness keeps from work. But in so careful and healthy a residence, we need scarcely add that epidemics are as yet unknown, and that ordinary ailments are neither severe nor of long duration.

A musical society, composed of eighty workmen, exists; and, under the direction of a professional leader, paid by the establishment, adds very much to the enjoyment of the inhabitants. M. Godin's son is himself a member of the society; and we were very much pleased with a rehearsal we heard.

We will close this inadequate sketch by adding, that a nursery, well provided with neat cradles and with every contrivance for the maintenance of cleanliness, is at the disposal of all mothers. Here they can deposit their infants while at work; here they can come and snuggle them; or can, if convenient, leave them all night. They bring them, take them away, dress and undress them, feed them, or leave them to the care of the nurses (generally mothers of one or two of the infants), who watch day and night,—just as their occupations or caprice may suggest. They are sure that they will be well cared for.

In one of the annexes forming the fourth side of the square are the school-rooms. In one a sort of *Kindergarten* is established, where children of both sexes, between the ages of two and five or six, by means of games, rounds, choruses, and pictures, are gradually prepared for the good sound elementary and industrial education they receive in the other, or upper school, which they attend between the ages of five or six and twelve.

The educational portion of M. Godin's system is under the general supervision of a highly educated young lady of great intellectual powers, known in the establishment as "Mademoiselle Marie," and of a professor of great merit.

Healthier, neater, and happier children than those we saw in the *Pouponnat* (nursery), the *Bambinat* (infant school), and upper school, are nowhere to be found. As to the acquirements of both boys and girls in the upper school, they were perfectly surprising. Though none were yet twelve years old, they could all read and write perfectly. The beauty of their handwriting and perfect neatness of their ordinary exercise books was such as is never met with in boys' schools, and not often in girls' schools.

Being accustomed to school examinations, we looked at all things with a hypercritical eye, and found boys and girls well acquainted with the elementary rules of arithmetic, the rule-of-three, interest, alligation, and book-keeping. Their spelling was unexceptionable, and their knowledge of grammar excellent. The boys, moreover, had learned the extraction of the square and cube roots, mensuration, &c.; while the girls had been practised in the use of the needle, the art of cooking, and other domestic arts, which will make them good and useful daughters, and, later in life, desirable wives.

The *pouponnat*, *bambinat*, and school are gratuitous. We mistake—the attendance of the children is gratuitous. Their absence, except through illness, subjects the parent to a fine of 1d. a day. We have said perfect freedom, unshackled by any single regulation, except that of getting no credit at the stores, reigns in the Familistère. We omitted this one single exception. The parent is, by the terms of his lease, deprived of the liberty of allowing his children to vegetate in idleness and ignorance.

The Familistère is no charitable institution, and M. Godin has impressed this deeply upon his workmen. The schools, care of the court, hallooies, &c., and many other advantages, are directly gratuitous; but they are paid out of the rents received from the workmen, and yet leave a profit of about 6 per cent. on the capital expended. Hence, every inhabitant feels that, indirectly, he has paid for all the comforts he enjoys; he is quits with the management; he is indebted to no one; he can walk with his head erect; he is a free man.

Such is the very rapid sketch of an establishment worthy of all praise, and which ought to be visited and studied by all who take an interest in sanitary questions and social progress. The erection of numerous Familistères in town and country, on the plan of the enlightened and benevolent founder, M. Godin-Lemaire, would soon lessen those moral and physical plague-spots which cast devastation abroad far beyond their own precincts.

TITO PAGLIARDINI.

PURE WATER FOR ROME.

We mentioned some short time since the probability of the Aqua Marcia, celebrated in ancient times, being brought to Rome. We can now state that the concession was granted by the Roman Government on the 30th of August last, to Mr. Shepherd, the *gerant* of the Roman Gas Company, in conjunction with Mr. Henry Fawcett, of the Temple, London. We understand that the enthusiasm in Rome on the subject will leave little to be done in London in establishing a company. Rome will be highly benefited by the introduction of a large supply of water purer than any now obtainable there.

HULL AND EAST RIDING COLLEGE COMPETITION.

The first premium was awarded to Mr. R. G. Smith, of Hull, and the second to Mr. John M. Hooker, of Arundel-street, Strand (late of Messrs. Hooker & Wheeler, of Brunchley). There were fifteen competitors.

THE SAXON ARCHWAY IN ST. BENEDICT'S CHURCH, CAMBRIDGE.

The tower-archway, or belfry archway, of this church has long been known to antiquaries as one of the most perfect of the few remaining specimens of Saxon work. Till recently, however, it was so far concealed by a modern gallery, that neither its fine proportions nor its curious details could be sufficiently seen or appreciated.

It has now been thrown entirely open; the whitewash and plaster have been removed, the masonry cleaned down and pointed, and such portions of stonework as had evidently been chiselled away (fortunately only to a very small extent), have been carefully restored.

Immediately above the belfry-arch is a Saxon window, which has also been opened and restored. It is about large enough to admit of a man passing through, and is very rudely constructed of long-and-short work in the jambs, and clumsily arranged arch-stones; the latter, indeed are so put together on the lower side, as to suggest the idea that it was a mason's first attempt, and that he never could have seen, and had no notion of, the true principles of an arch.

But the belfry arch is a superior work, though very singular in its design. It is semi-circular, and contains thirty vousoirs or arch stones, of different thickness, all cut with tolerable regularity into a wedge-shape, but so arranged that they radiate from two centres. The material is Barnack stone. Round the arch, and continued below the impost to the ground, is a double moulding, consisting of a semi-circular fillet and a square-edged member, separated from it by a square channel of about equal width. The measurement across both these members is 13½ in. The arch and jambs are square-edged, and of one plain order. The arch-label, as well as the jambs, is constructed on the long-and-short principle; that is to say, the label is of six or seven segmental pieces, with intervening wedge-like pieces measuring 2 in. or 3 in. across; while the jambs are very neatly made of six larger slabs on each side, of different sizes, running through the entire thickness of the wall, which is 3 ft. These slabs are set up, as it were, on end, and separated by courses of stone about 4 in. thick, on the principle of long-and-short work. The impost is very bold, and has considerable projection. It seems a rude imitation of Roman architecture, something like a capital being worked to the shafts, or rather the moulded members that run down on each side. Towards the east, the label is terminated by an extremely quaint and rude figure of an animal, apparently a lion rampant, one on each side. Both these remain quite perfect, and measure rather over 2 ft. from head to tail.

The width of the archway is 8 ft. 4 in., and the total height, from the upper part of the label to the floor, is 20 ft. 6 in. Both sides, viz., the east and the west, are as nearly as possible the same, except that the figures of animals exist only on the nave side. The side-mouldings terminate both on the east and the west sides, a few inches above the floor, on a square stone projecting some 3 in.; these had been mostly chiselled away flush with the wall, but are now replaced.

The masonry on each side and above the arch was laid bare during the repairs, and found to be of the roughest rubble-work, composed of rag-collie, but mixed with pieces of clunch and flints. A piece of Roman brick was found in removing a broken stone at the base. The impost on each side is continued to the wall of the present nave, which is Early Decorated. This impost is rather more rudely cut on the north than on the south side. Its depth is 18 in.

From the jambs of the archway to the outer moulding on each side is a space of about 3 ft. A blocked arched recess had been cut in the inner face of the northern jamb, possibly for a holy-water stoup, though it is larger than those generally used. It appears to have been of the fifteenth century; but it has not been thought advisable to retain it, as it seriously marred the symmetry and really fine masonry of the original work, and it was so much mutilated as to render its restoration difficult.

It is not safe to venture any opinion on the date of this archway. One thing is certain; it has not a single feature in common with Norman design. It may probably be referred to the age of King Alfred.\*

Some other features of interest were discovered in carrying out the repairs. Remains of an en-

caustic pavement, in alternate tiles of highly-glazed green and yellow, but without patterns, were found under the present floor of the tower. This pavement, probably of the sixteenth or late in the fifteenth century, will be faithfully restored. A small doorway with good Perpendicular mouldings, and an aperture (hagioscope) opening obliquely into a chapel on the south side of the tower, had been completely blocked up, but are now opened and will be restored. Within the chapel, the marks of the original altar may be seen against the eastern wall. The altar-slab itself, though sawn in two, is laid down in the chancel pavement.

A Perpendicular window in the west wall of the tower will be replaced, and is to be filled with stained glass, the gift of a parishioner. This complete and ornamental restoration of the interior of the tower will, it is hoped, be followed by the rebuilding of the south aisle and the chancel, and the reseating the whole available area of the church.

NEW THEATRE ROYAL, NOTTINGHAM.

The new theatre in Nottingham, built from the designs of Mr. C. J. Phipps, was opened on Monday evening last, having occupied exactly six months in erection. The theatre itself, including auditorium and stage, occupies a space 112 ft. long by 67 ft. wide, and, taking in the box-rooms, saloons, dressing-rooms, &c., the whole forms a block 132 ft. long by 90 ft. wide.

The theatre is approached by six distinct entrances. The levels are so arranged, that in both Parliament-street and Sherwood-street the entrances to the pit are on a line with the street, there being no descending staircases. A staircase, 6 ft. 6 in. wide, leads to a circular saloon, on a level with the dress-box corridor. Communicating with this saloon are retiring and cloak rooms for both ladies and gentlemen. The gallery staircase is of stone, without winders, and both this staircase and all others have a solid wall in the centre, dividing the flights.

The plan of the auditorium, taking it on the dress-circle level, may be described as a semi-circle of 36 ft. diameter, opening, before reaching its diameter, by curves of a contrary flexure, to a width of 48 ft. at the first column of the proscenium, and at the same point uniting with the circular wall at the back of the boxes. There are two private boxes on each tier, between this and the opening of the proscenium, flanked on either side by a double range of columns. The curtain-line is 42 ft. from the front of the dress circle, and 48 ft. from that of the upper box and gallery front, the stage projecting from the curtain about 6 ft. into the auditorium; so from the stage-front the circumference of two circles, drawn from different centres, will touch, and the opposite circumferences describe the line of the dress-circle front, and the back wall of ditto, the former being 36 ft. diameter, and the latter 54 ft. 8 in. The ceiling is an exact circle, and takes the same line as the box-fronts, having an outer diameter of 12 ft. and 36 ft. to the edge of the cove. The centre of the ceiling is 44 ft. above the pit. In the centre, the dress-circle is 18 ft. 8 in. deep, giving seven rows of seats on platforms 2 ft. 8 in. wide, and, by the nature of the plan as mentioned, every seat faces the stage, and there is not one which does not have an equal and front view of the stage. The pit extends under the dress-circle to the back wall, having its separate outside corridor under that of the box-corridor. All corridors are 7 ft. wide, arched over an every tier in Dennett's patent fireproof material. The upper-circle does not take the same line as the dress-circle, but recedes in the centre nearly 6 ft., thereby diminishing the depth of the dress-circle, and admitting of two rows of balcony-stalls, something in the manner of the New Adelphi. The gallery extends over the box-corridors, and has eleven rows of seats. The respective accommodation in each part is:—Dress-circle, 250; upper-boxes, 250; pit, 850; gallery, 800; private boxes, 50; total, 2,200.

The dress-circle is fitted up with arm-chairs, so arranged as to admit of six wide gangways from the corridor, each seat being 21 in. wide, by a depth of 18 in., the back sloping 4 in. The seats, backs, and arms are stuffed and covered in rich Turkey cloth, the seats turning up to allow greater facility in passing. The upper boxes and pit have wide seats with sloping backs, both covered with American leather. On either

\* We will engrave a view of it for an ensuing number.

side of the proscenium, by the private boxes, are circular stone staircases, specially designed for the entrance to the private boxes on each tier, but giving access to every part of the house for the manager in a few seconds.

The lighting is effected by a powerful sun-burner, manufactured by Messrs. Strode & Co., of London, placed in the centre of the ceiling, but not depending more than 18 in. below it, around which are a series of ornamental glass drops. There is a large ventilating-shaft of iron, 6 ft. diameter, immediately above the sun-burner, carried through the roof, in the centre of which is another iron flue, specially to take off the products of combustion from the gas.

The stage measures in width from wall to wall 64 ft., by a depth from the foot-lights of 50 ft. to the back wall, a large recess being formed in part of this space at the back for a scene dock, over which is the scene-painting gallery, on a level with the flies, in the same position as at Covent Garden. There are three frames for painting, all properly counterweighted, and capable of being used for ascensions of scenery, &c. The width between the fly rails is 44 ft., height from stage floor to the lowest cellar, 20 ft.; so that large pieces of scenery can be raised or lowered completely out of sight. The fly floors are about 22 ft. from the floor of the stage, and the grooves are blocked down to 18 ft., being the height of the flats and wings. The whole of the stage is composed of sliders, and the joists are so arranged, that at any time the whole of the centre, floor, joists, &c., could be taken away, forming one large open space for mechanical effects. The stage has been laid down and the traps constructed under the immediate superintendence of Mr. Tasker, the clerk of the works, while the whole of the machinery has been constructed by Mr. W. Jones, from Her Majesty's Theatre. The foot-lights (by Strode & Co.) are of novel construction, and this is the first instance of their use in England. They consist of Argand burners, with the light reversed, and burning downwards; all the combustion is thus drawn away through an iron flue under the stage; perfect safety is also obtained, as not a particle of heat or vapour rises upwards, as can be tested by placing even a piece of gauze on them. The stage is divided from the auditory by a solid wall of brick, 18 in. thick, which is carried on an arch over the proscenium, directly up to meet the roof. The theatre contains ten good-sized dressing-rooms, all having separate water-closets, lavatories, &c., with water laid in.

The principal front consists of a portico, supported by six Corinthian columns. The bases and sur-bases are of Mansfield stone, and measure 6 ft. in height. The shafts from base to cap are 18 ft. in height, of Ancaster stone, and gradually taper from a diameter of 2 ft. 3½ in. to 1 ft. 11½ in. They are surmounted by carved Corinthian capitals, 3 ft. 2 in. in height, and support an imposing entablature (with plain frieze and bracket cornice), making a total height from base to cornice of 33 ft. 7 in. Over all will be an attic story (panelled with a view to sculpture), about 11 ft. in height, finishing with ornamental vases. The portico projects from the main frontage about 12 ft., and is 47 ft. long. Under it are five entrance doorways to the boxes. The main frontage is 76 ft. long, of two stories, the windows and doorways being circular-headed.

The decorations were executed by Messrs. Green & King, of Baker-street, London. The starting-point for the decorators has been the acoustical objects of the mode of construction, in which all ornament in relief has been avoided, and plain surfaces left for flat coloured decorations.

The proscenium is supported on either side by two pairs of fine Corinthian columns, enriched with gilding and other decorations. Between these are the private boxes, which are lined with a paper of the same design as the other boxes, but the prevailing hue of which is a delicate sage-green, which materially enlivens this portion of the house.

The chief feature of the decorations is a large painting, which occupies a rectangular panel, 26 ft. long and 5 ft. high, immediately above the proscenium. The subject represents the poet Shakespeare, crowned with a wreath, and sitting upon a throne, around on either side are a series of his principal characters, considered as his creations. A background of mountains, blue in the glimmering twilight, with a still, luminous sky, and a few broadly-indicated trees in the middle

distance, serve to throw the various figures into prominence; while the massive throne of masonry, assisted by the composition, gives due prominence to the central group. Mr. Holiday, of London, was the artist employed by Messrs. Green & King to execute this painting.

It only remains to mention that the general contractor was Mr. Arthur Haw, of Nottingham, with the following sub-contractors:—Mr. Rest, carpenter and joiner; Mr. Shipstone, mason; Mr. Weldon, plumber, glazier, and gas-fitter; Mr. Brown, painter; Mr. Caldwell, smith and iron-founder; Messrs. Dennett, of Nottingham, excelling the corridors and other parts in their patent fireproof arching. The sun-burner and float-lights have been made by Messrs. Strode & Co., of London. The iron gas border-lights and gas regulating apparatus were by Messrs. Jones & Co., Covent-garden. The stage gaswork was by Mr. J. White, of Bath. The seats for the dress-boxes have been manufactured at the steam works of Messrs. Wadman, Bath, from the registered design of the architect; and the private box chairs by Mr. Church, of the same city. The cost, with the purchase of the ground, has been little short of 15,000l.

#### SPIRES OF GERMANY.

In the Middle Ages, no people seem to have so far mastered the art of construction as the Germans: although their French neighbours far excelled them in artistic design and graceful detail, yet to the Germans must certainly be allowed the palm for engineering skill. The bridge over the Moldau at Prague is perhaps one of the greatest engineering undertakings of the Middle Ages. It is 1,500 ft. long, and has resisted the shocks of icebergs, with which the old river is often clogged, for 500 winters. The old bridges of Würzburg and Frankfurt are scarcely less remarkable. The principal objects, however, on which the Germans seem to have devoted to bestow their constructive skill, are the towers and spires of churches and town-halls. Vienna, Strasburg, Ulm, Landsbut, Freiburg, and Tain, are perhaps the most important. There are, however, many less-known spires that are quite as beautiful, and exhibit quite as great constructive knowledge.

The towns of Prague and Würzburg, viewed from a distance, give one the idea of a forest of spires; and at Würzburg, in particular, they are grouped together in such a remarkably picturesque manner, that one can scarcely believe that the whole town was not originally planned and built only to be painted. Lubeck, Nuremberg, Augsburg, Landsbut, and Erfurt, abound in spires; and as some of these towns are situated in very hilly country, they quite destroy the old theory that spires were only built in flat places.

I will attempt to give a slight chronological sketch of the gradual development of the spire in Germany. In very early Romanesque churches the towers are generally two in number, and are low and square, crowned with pyramidal roofs. Good examples are to be found at Treves, the "Ober-" and "Nieder-Münster," and "St. Jacob's Kirche" at Ratisbon.

Sometimes the churches of this date have one immensely heavy tower at the west end, as at Paderborn and Soest cathedrals. In the latter example the tower is gabled on each side, and on the apex of the gables rest the angles of a dwarf square spire. This form of spire is very common in late Romanesque work, but is not to be often met with in very early buildings.

Late Romanesque churches have often a number of towers. The abbey church at Laach has as many as six; the cathedral at Spyer, five; Worms, five; Mayence, six; Gelnhausen, five; Bamberg and Würzburg, four each. None of these towers are of great height, generally not more than about 150 ft. The two eastern spires of the cathedral at Würzburg (fig. 1), are an exception to this rule; they are about 300 ft. high. They possess also two other peculiarities. In the first place, they consist of an elongated lantern, of several stories, "broached" on to a square tower, the angles being filled up for several stories, with pierced buttresses. This is common enough in late work, but very singular in such an early example. Their other peculiarity is their being built of alternate courses of red and white stone. First Pointed spires are not common in Germany. Churches of this date, if of large size, generally possessed two spires at the west end, and sometimes, though rarely

two, also at the east; the spires are generally covered with slate. The western spires of Bamberg cathedral are good examples.

In "Second Pointed" spires, Germany is very rich. Churches of this date have generally only one spire, and that at or near the west end. Large churches often have two, usually flanking the west front. At St. Stephen's, Vienna, they are at the ends of the transepts. Spires of this date, if early, are generally covered with lead or slate. Fine examples occur at Lubeck and Nuremberg, and a very pretty one at Gemünden, near Würzburg (fig. 2). Later in the style stone spires are to be met with. Good examples are to be found at Freiburg Cathedral and Maria Zell, in Austria. Late Decorated spires generally consist of an elongated octagon lantern on a square tower. The spire proper forms only a very small part of the composition. St. Stephen's, Vienna; Steyer, in Austria; Botzen and St. Mary's, Würzburg, are good examples. A curious pair of slate spires of this date are to be found at the "Thin Church, Prague" (fig. 3). Third Pointed churches have generally only one spire, and early in the style they are similar to "Second Pointed" ones in general arrangement. St. Martin's, Landsbut, is a very fine example (fig. 4). It is entirely of brick, 420 ft. high. St. Jodoc, at Landsbut, has also a fine spire of this date, and similar in arrangement to St. Martin's. It is about 250 ft. high. Late "Third Pointed" spires of the same description are to be found at Nördlingen, Augsburg, and Munich. At Mayence and Frankfurt the towers are finished with small domes, instead of pyramidal spires. Examples of slate spires of this date are to be found at Prague (fig. 5), Erfurt, Nuremberg, Würzburg, Augsburg, and many other places. In very late examples the sides are hollow, and the spire itself painfully attenuated; and these continued to be used until the introduction of the bulb-shaped spire, which, in the earlier part of the seventeenth century, overran Holland, Belgium, France, Germany, and even found its way into England.

Figs. 6 and 7 are curious specimens of late German towers. The first is from a church at Landsbut, the second at Augsburg.

#### MONUMENTAL.

*The Albert Memorial, Mold.*—The inauguration of a drinking-fountain and clock, which were subscribed for by the inhabitants of Mold and vicinity, as a tribute to the memory of the late Prince Consort, has taken place. The site is at the Cross. The memorial is made of bronze, and was cast by the Coalbrookdale Company. Just below the clock are two gaslights. On the sides opposite New-street and Chester-street are portraits of the late Prince Consort, with inscription underneath.

*The Hatherton Memorial, Stafford.*—At a recent meeting of the subscribers to the fund for a memorial of Lord Hatherton, it was stated that the amount contributed was 2,000l., and that a statue would cost from 1,400l. to 1,600l., so that the balance would not fund a scholarship. An attempt was, therefore, made to limit the memorial to the foundation of scholarships; but an amendment by Major Chetwynd was carried, that a statue be erected in the marketplace of Stafford, as originally proposed; and any surplus be disposed of as might be directed by the subscribers. An attempt is to be made to procure additional subscriptions to fund scholarships.

*The Combermere Statue, Chester.*—This statue, the execution of which was entrusted to Baron Marocchetti, is now complete, and has been placed in the position it is destined to occupy, opposite the principal entrance to Chester Castle. The pedestal on which the statue rests is composed of blocks of granite from quarries near Falmouth, the height of the column being 12 ft., that of the statue about the same, making the total height from the ground to the top 24 ft. The statue is equestrian. The ceremony of unveiling is expected to take place in about a month's time.

SPIRES OF GERMANY.

"A WORD OF ADVICE TO MARGATE."

An inhabitant of Margate writes thus:—
To prove how entirely justified your remarks have been, I enclose you copy of a correspondence thereon between the mayor and the sanitary inspector. If you think it worth while to publish the letters, would you mind kindly adding a line to the effect that as the people of the town seem so properly sensitive to any adverse remarks in the press, they should remember that the same channel is equally open to words of praise; and that if any important improvements are seen to have been set on foot, no advertisement could do them so much good as the encouraging notice such enterprises would be sure to call forth.

It is curious that the Builder should have stirred the folks up after they have been thundered at again and again to no purpose by other London weekly papers and the local organs."

"To the Worshipful the Mayor.
My attention has been directed to an article in the Builder of the 12th inst. (which I send herewith), 'A Word of Advice to Margate.' May I ask if you intend to notice it in the same manner in which you lately treated an article in the London Observer, by directing the attention of the editor to the incorrectness of the statement. My object in asking this question is, that I am officially alluded to, and do not intend it to be passed over as a mere name.

An answer per bearer will oblige,
Yours obediently,
THOMAS D. REEVE,
Sanitary Inspector,
Margate, 12th Sept., 1865."

"Margate, 14th Sept., 1865.
Dear Sir,—In answer to your note of the 12th inst., I can hardly think the two cases to which you allude are at all similar. On the occasion referred to in your letter, I replied on an unjust attack of the London Observer, because I am personally acquainted that the principal statement therein contained was untrue, and that every precaution had been taken by the council to remedy, in the jurisdiction of the borough, the hitherto existing evil of indecent sea bathing.

You have officially called my attention to the article in the Builder, reflecting upon the sanitary condition of Margate. I am indeed thus reminded you that, you and many others are not strangers to my opinion of the unsatisfactory sanitary condition of the town; and to add that, being now placed in a position of responsibility, the existence of any possible nuisance is, I must confess, one of considerable anxiety to me.

You hold the office, of all others, the most important: upon its efficient discharge the prosperity of the town mainly depends, for all arrangements affecting health, and all improvements are to a large extent under its control. To my mind (and this you are aware is no new opinion) your own numerous occupations, however otherwise competent you may be, preclude the possibility of your giving that amount of attention to the duties of your office which it imperatively demands. Much as I regret that the department to which you refer is open to the attack in the Builder, it could be impossible for me, for reasons well known to yourself, to take the course suggested in your letter. The theory, however (quite new to me), advanced by the editor of the Builder, as to the cause of the stench at the back of Marine-terrace, appears to me to be an engineering one: its fallacy or otherwise I will not presume to question; but surely the cause, let it be what it may, ought to be within the comprehension of a sanitary officer, and its remedy immediate.

As the sanitary question, affecting so materially the prosperity of Margate, is one of much public interest (and more particularly that no mistake may be made of my views upon the subject), I intend to publish in the local press the remarks in the Builder, your letter to me, and mine in reply.

I remain, dear Sir, yours truly,
THOMAS H. KELLE, Mayor.
Mr. T. D. Reeve, Surveyor and Sanitary Inspector."

We may hope that, with a mayor entertaining, as Mr. Kelle evidently does, right views as to the importance of remedying sanitary defects and placing the town in a proper condition, Margate will not long remain open to such observations as we have felt it our duty to make. Every inhabitant of Margate is personally interested in obtaining improvement in this direction.

Since the above was set up, we have received the following epistle from the surveyor. We print it without any further comment, at any rate at present, than that afforded by the mayor's letter above:—

"Sir,—An article, headed 'A Word of Advice to Margate' having appeared in your journal of the 9th inst., reflecting upon me in my capacity of sanitary inspector of Margate, and which is also damaging to my property, I hereby give my contradiction and explanation of the alleged 'facts.' No person residing in Royal Crescent has ever complained 'through the medium of the press' of the non-removal of their kitchen refuse, as is alleged. A letter, however, was sent to the council applying for the cart to call; and proper directions were immediately given. No letters have ever been addressed (as is asserted) to the local authorities by persons to the effect that they were annoyed by other persons that I am aware of, complaining of a 'stench' coming into the back windows of 'all the houses'; but on the 10th of August last, a visitor residing in that terrace wrote, as follows: 'I am complaining of a smell at the back of the house; that letter was handed to me, and I found that the cause of complaint arose from defective drainage upon those premises. All nuisances arising from cesspits, whether complained against or not, I abolish immediately I discover them. 'No Man's Land' is not a 'vast natural cesspool,' as is represented; it is high ground, occasionally, in some places, having clandestinely there deposited oyster-shells, but the police have been

requested by me to prevent any rubbish whatever being thrown there. The water, alluded to, at the top of Love-lane, was not water from the 'bidge of any ship, commonly called 'bilge-water,' but was fresh rain-water occasioned by an extraordinarily heavy storm, which happened at the time of a high spring-tide: that local being below the level of such tides, the surface water from the hills could not then escape through the drain, but it subsided on the turn of the tide, and the cisterns that were overflowing were pumped out. The writer inquires, 'who is to blame?' insinuating that the sanitary inspector is blameable,—as though the sanitary inspector could and should make all 'dirty people' pure and cleanly; and as if he had constructed the drains in Marine-terrace and the houses in Love-lane; and as if he could command the elements! Above and beyond the hypocrisy and wickedness of the writer (who, while pretending to give good 'advice to Margate' and to save it from 'ruin,' slanders its visitors by exaggeration of falsehoods), is his gross calumniation of myself, and his insidious damaging of my property, in the following sentence:—'Although we can hardly believe it, we are informed that the houses in Love-lane, affording examples of so terrible a nuisance, and the marsh, from which rises the horrible stench at the back of Marine-terrace, are actually the property of the sanitary inspector himself.' The fact and truth is, I have not, nor ever have had, any house in Love-lane. No stench arises from my land in the marsh, immediately facing which I now erect a large number of my residences. The ditches on the part of the marsh belonging to me were under-drained and filled in during last winter, as soon as possible after I obtained possession of the property. At my own cost, I have also filled in the ditch at the adjoining marsh; and I am now under-draining and filling in the broad water-course in the marsh, belonging to Mr. Hatfield. So that the above-quoted slander is manifestly unjustifiable and malicious.

I cannot sufficiently condemn the anonymous calumniator, who, under pretence of benefiting the public, as it were stabs me in the back. I have, for upwards of fourteen years past, faithfully, zealously, and with credit to myself, performed the duties of my several offices under the local Board of Health, and the Council of the borough; and I hold faith in the moral utterance of Job:—

'Good name, in man, and woman, dear my lord,
Is the immediate jewel of their souls;
Who steals my purse, steals trash; 'tis something, nothing;
'Twas mine, 'tis his, and has been slave to thousands;
But he that filches from me my good name,
Robs me of that which neither heaven, nor hell,
Can make me poor in.'
THOMAS D. REEVE,
Surveyor and Sanitary Inspector, Margate."

TELEGRAPHIC.

In course of a discussion on india-rubber as an insulator, at the Birmingham meeting of the British Association, Mr. Gassiot said he questioned if the time had arrived for a final experiment in the laying down and working of an Atlantic cable. He thought the hearing of india-rubber in its various qualities as an insulator ought to be satisfactorily and conclusively determined before the laying of another cable in the Atlantic was attempted. If they went on from year to year with unsuccessful experiments, they would absorb all the capital; whereas, if they only waited the result of the experiments being diligently prosecuted by electricians in all parts of the kingdom, they would be able to come forward with a scheme which would be a success. There would be no difficulty in raising capital, and there was no doubt that the Atlantic telegraph would be laid; but before again embarking on the enterprise every experiment should be made. Captain Selwyn, as representing the naval profession, recommended what he called the seaman's way of laying the cable; viz., laying it from floating reels, to be dragged behind the vessel commissioned to carry out the work. It was entirely in the laying of the cable, he contended, that the whole damage had arisen; because cables that had once been laid worked well. He objected to the spiral form of the cable, on the ground that the upper part was sure to untwist by the strain, and the lower part twisted up as it lay on the bottom. He expressed doubt as to the suitability of the Great Eastern for the purpose, on the ground that she rocked more violently than other vessels when a real storm arose. He recommended the employment of two vessels in the attempt to raise the cable, and concluded by declaring his conviction that the expense and difficulty connected with the enterprise might be greatly reduced.

The buoys left by the Great Eastern at the broken end of the cable are said to have disappeared.

The only alteration that will be made in the new cable, according to the Mechanics Magazine, will be the substitution of strands in the place of solid iron wires for the external covering. These strands will each consist of three wires, and each strand will be covered with manila. It is thought that, by this means, all chance of the gutta-percha being pierced by the external wire will be prevented, as each wire singly would be too weak to be thrust into the interior of the cable.

SANITARY MATTERS.

Cirencester.—The local sanitary committee lately appointed a sub-committee to make a house-to-house visitation, and their report has just been made to the committee. Great improvement in the state of courts and passages has been made since before inspected, and more attention is paid to cleanliness and pure air on the part of the poorer classes. The drains, as a rule, are trapped and improved; but there are seventy pig-styes much requiring abatement, and cesspools and open privies still abound. Notices were ordered to be sent to the keepers of pigs and the owners and occupiers of premises having defective drains, as to these nuisances.

Leeds.—Various ward and other meetings have been held here for the promotion of sanitary improvement and the abatement of nuisances. A committee has been appointed to make district visitations, and report to the proper authorities all nuisances of a dangerous character. Fever is prevalent in the borough. The death-rate of Leeds for the last few weeks has been about double the average rate of the healthiest portions of England. The average death-rate of the Isle of Wight, for instance, is 16.5 per 1,000 inhabitants per annum, while the mortality of Leeds is at present at the rate of 31.8 per 1,000 per annum.

Havick.—This town has been visited by a very virulent type of typhoid fever. There have been thirteen cases and four deaths from one house, three being inmates, and the others having caught the contagion by visiting the house. Several patients of the poorer classes have been removed from their houses to the hospital of the combination poor-house, and there one death has occurred. The number of cases is on the increase. British cholera of a severe kind also prevails in the town. Great rejoicings, however, have taken place on the occasion of the introduction of an increased supply of water to the town, and also of laying the foundation-stone of a new corn exchange. The Duke of Buccleuch opened the sluices which admitted the water to the pipes from the river Allan; and Mr. Whyte Melville, Grand Master Mason for Scotland, presided at the ceremony of laying the foundation-stone. A grand banquet was held, which was attended by between 300 and 400 persons.

CHOLERA THREATENINGS.

In connexion with the cholera, we would still sound the note of preparation against it, in the same way as we would against a mortal enemy. Many months since we gave warning of the approach of this dread pestilence: then some thought we were unnecessarily alarming the public. Every week's experience, however, shows that we have been most unfortunately in the right, and that week after week the cholera is more closely nearing our shore. It has, as in its former approaches, come in direct courses. As we have before said, it passed along one side of the Red Sea, causing destruction of life and great terror. Then it passed to towns and provinces of Turkey, where thousands of deaths have taken place, and much misery has been created. Step by step, as this disease has progressed, we have most anxiously inspected maps, and ask our readers to do so likewise. It has touched points of Spain; we have ill reports from parts of Portugal; and, by the French seaboard of the Mediterranean, there is no doubt that the cholera has established itself, and that it is approaching towards the city of Paris. It has affected Toulon; and, if we trust the experience of former attacks of this description, there is actual fear that the cholera will soon be opposite to us in the Channel. But, as we have already said, this plague is marching on way from other directions. It has branched off into Austria; and thence, if we consider the former working of this disease, it is likely to pass over Prussia; and then again it may be brought by this road into close proximity with the coast, and from Russia and Asia across the Baltic Sea, by Denmark, we may have, as we once before had, the cholera attacking the Tyne; so that in three especial ways we are threatened with this scourge. And it must never be forgotten, in connexion with this question, that in England we have no reliance that the cholera will depend upon the heat of the weather, as regards its reaching this country;

for, as we too well know, when the cholera first reached England, it was at Tyneside, at about Christmas or New Year. Let us, therefore, not depend upon the winter or the approaching autumn for safety. The enemy, God willing, may not come, after all; but there is no doubt that we are threatened, and the chances are now very small that this country will escape a visitation. It therefore becomes an especial duty that those places which have been attacked before should be carefully attended to; and the Privy Council authorities should also look to all spots where the death-rate is high. And, might we hint, at this especial time it would be well for the Registrar General to tell us something of the death-rate of Newcastle-on-Tyne, Hull, and some other places along the coast which are most likely to be first brought into contact with the disorder, and that those figures should be kept before the public week after week. Attention to this will have more effect on the opinion of certain towns than might be thought, and perhaps lead to the saving of hundreds of lives. Dr. Hunter has been sent to Hull and elsewhere by the Government, for the purpose of inquiring into the state of health of towns, and we look with anxiety for some similar inquiry to be made in Manchester and Liverpool, where the death-rate is so very high—32 in the 1,000 in the former, and 27 in the 1,000, instead of a far larger usual amount in the latter. The death-rate of both these large towns is less than usual; but we want to know exactly to what the decline of the death-rate of Liverpool at the present time is especially to be attributed. Is it that a large part of the Irish population have gone to harvest-work, to hop-picking, and other pursuits which in the autumn season afford matters of profit to the Irish, as well as an advantage by removing this class of the people from the cellars of Liverpool to the fresh country air, and also affording them the means of getting better food? The London death-rate has risen from about 20 to 21 per 1,000, and it may be that the removal of the class to whom we have referred may have had some effect in connexion with this mortality; for during the harvest-time thousands of strangers pass through the metropolis, and crowd the casual wards of the workhouses, the lodging-houses, and so on. It is true that against this there must be set the large number of those who leave various parts of the metropolis. We refer to this in the hope that these peculiarities of the death-rate may meet with the needful amount of inquiry.

The accounts of the progress of cholera, as they come to us day after day, show how much the same is the effect now as it was formerly; the cloud of pestilence passes along, hovers over particular places, and does its deadly work; then, like a fire which has exhausted all the inflammable materials, the disease suddenly ceases.

During the present visitation, the ravages by this plague have been enormous; but in the East, and it may be some other countries, the number of the deaths will never be exactly known; for, as long as it was possible, the authorities did their utmost to deny the presence of cholera; and even now—for no useful purpose, so far as we can judge—the figures are disguised. At Constantinople the pestilence seems to have exhausted itself; but at Aleppo—that place so notorious in connexion with plagues at Damascus and Alexandria—the deaths are numerous.

At Constantinople the semi-official return now put forward is 34,000 deaths; but there is good authority for stating that the number may be put down at double this amount. The Levant newspaper reports that when the plague was raging in the Turkish capital, there were no birds to be seen flying in the air; and it is worthy of remark, that when the Government set earnestly to work the disease declined,—as it has done in every other instance where proper sanitary measures and medical means have been resorted to.

The great fire at Constantinople is another remarkable instance of a conflagration following closely upon pestilence. We could give many instances of the same result, but it may suffice to mention the Fire of London of 1666, which followed the Plague of 1665, and the fire and explosion at Newcastle-on-Tyne, which happened soon after the cholera attack there.

Since the above was written, a deputation from the council of the Epidemiological Society has had an interview with the Lord President of the Council. This Society was founded, on the cessation of the epidemic of cholera, in 1849.

This body has had extensive means of obtaining information, and seems to have done valuable work. In a document addressed to the Government, this Society refers to the experience of the visitations of 1832, 1848, and 1855, "as a proof that no reliance whatever can safely be placed upon quarantine to keep off or avert the pestilence. Sanitary precautions within a place are far more important than sanitary cordons without." Nevertheless, the council of the Society strongly urge that the interests of the public health require that a sufficient supervision should be exercised in all the chief sea and river port towns. In the successive visitations of cholera to this country it has always manifested itself, first on or near the sea coast, and in some large busy port. Thus it has attacked Newcastle, Sunderland, Hull, Edinburgh, and London. The report mentions, that besides the marked tendency in epidemic cholera, to commence on or near the coast, the seaport towns suffer with exceptional severity: the damp, low sites of the worst part of those towns, always in the vicinity of their harbours and docks, together with the filthy and crowded dwellings to which seamen generally resort, and their recklessly intemperate habits, cannot fail to aggravate other sanitary evils, and greatly to increase the predisposition of a maritime population to epidemic influences. The unfavourable state of health among the crews of merchant ships upon their arrival, renders them peculiarly susceptible of a poisonous atmosphere in the port. In the case of river ports becoming infected, the disease from its tendency to follow the line of the water communication, has often been observed to make its way thence upward into the interior of the country. In view of such considerations the council submit that it is desirable a sanitary inspection should be made of the principal seaport towns to ascertain their actual conditions, more especially their harbours, docks, shippers' dwellings for seamen, &c., and with a view of discovering what provisions or arrangements exist for the reception and treatment of cases of sickness in ships upon their arrival from abroad, in the event of the cholera making its appearance in the port.

This prayer we earnestly reiterate.

#### METROPOLITAN BOARD OF WORKS.

At the first ordinary weekly meeting of this Board after the recess, the chairman opened the tenders for the reconstruction of the Earl, Duffield, and Battle-bridge main sewers, and they were as follows:—Mr. W. Dethic, 88,500*l.*; Messrs. Hill & Kedwell, 94,400*l.*; Mr. Webster, 102,000*l.*; Mr. T. Pearson, 90,000*l.*; and Mr. E. Thirk, 99,959*l.* Mr. Dethic's tender was accepted, subject to the usual conditions.

Mr. Bazalgette, the engineer to the Board, brought up his monthly report on the Thames Embankment. It stated that during the seven weeks ending the 20th instant, 19,711 cubic yards of filling-in material had been supplied to No. 1 contract from the land, and 23,778 from the river. None had been supplied to No. 2 contract. The quantity supplied from the first weekly return was—to No. 1 contract, 86,207 cubic yards from the land, and 152,844 from the river; to No. 2 the quantities supplied were 6,864 cubic yards from the land, and 10,176 from the river.

The Chairman said he regretted to have to inform the Board that a water company was making an attempt to break up the new street that the Board had made in Southwark, for the purpose of laying down pipes. They had constructed a subway at vast expense, and it was greatly to be regretted that the street should be broken up, instead of the company carrying their pipes through the subway. The street, if once broken up, would never be so sound and level again. He was very sorry the Board had not the power of compelling them to make use of the subway. Mr. Bidgood asked whether they could not get an injunction against the company. The Chairman said they could not. The company had statutory powers, and the Court of Chancery could not interfere with them.

Other business was disposed of at the same meeting.

JARROW.—The new graving dock at Jarrow,—the largest dock of the kind on the east coast,—has been opened. The dock will accommodate vessels of the largest tonnage.

#### FROM LIVERPOOL.

The foundation stone of St. Cleopas's Church, Toxteth Park, has been laid. It is being built solely at the expense of Mr. William Pask, and is intended chiefly for the accommodation of the poorer classes. It will be dedicated to St. Cleopas, and will be in connexion with the Church of England. The site is a very suitable one, adjoining Beresford-road. The church is to be built of Yorkshire stone, with Stourton stone dressings, and is designed in the Decorated period of Gothic architecture. It will have a nave, north and south aisles, chancel, &c.; side chapel, tower, and spire at the north-east end, about 100 ft. high. The vestry will be under the tower, and the organ-chamber above, with an archway into the chancel. It is intended to erect a small gallery at the west end. The building will accommodate about 750 persons. Messrs. Nicholson & Eyre are the contractors for the whole work; Mr. James Williamson, clerk of the works; and Mr. John Denison Jee, the architect.

The Richmond Chapel, Breck-road, built for the use of the Baptist congregation hitherto worshipping at the Everton Athenaeum, has been opened for Divine service. An eligible site was secured in Breck-road, upon which the foundation stone of the new chapel was laid on the 4th of July, 1864, that day being the 150th anniversary of the formation of the first Baptist church in Liverpool. The cost of the land, chapel, and schools will somewhat exceed 6,000*l.*, towards which more than 4,000*l.* have been promised. The chapel and schools have been erected from the designs of Messrs. J. A. Pictou & Son. The former measures 66 ft. by 50 ft., and in front is a vestibule extending the full width of the building, from which staircases give access at each end of the gallery. At the opposite end of the chapel is a semicircular apse, or recess, containing the baptistery, with doors at each side leading to the vestries. On the left of the baptistery is the organ, built by Messrs. Gray & Davidson, with pews for the choir immediately in front. The pulpit is octagonal, of polished oak, with inlaid panels of ebony, supported by carved scrolls, and flanked by a flight of steps on each side. The whole interior of the chapel is fitted up with open benches, having an aisle 4 ft. in width down each side. The building will be warmed by means of hot-water pipes. The school-room is behind the chapel. It has an open roof, and is lighted at each end with large windows, rising in height with the rake of the roof.

A new Roman Catholic Church, situated in West Derby-road, the foundation stone of which was laid on the 1st of May, 1864, has been opened for Divine service. The church is built in a severe style of Gothic architecture, from designs by Mr. E. Welby Pugin, and it will accommodate from 700 to 800 persons. It is well lighted, and the approaches are good.

The increase of cattle and sheep weekly sent to the Liverpool Cattle Market has induced the directors of the Cattle Market Company to make a very considerable addition to the present market space, and the enlargement is now in progress. The space hitherto absorbed occupies an area of about 25,000 square yards, or upwards of five acres in extent; but, large as the area is, it has been found altogether inadequate. The committee have, therefore, obtained possession of an additional quantity of land at the northern extremity of their present property. This extension will increase the size of the existing market upwards of one-third, the space thus added being about 12,000 square yards, or between two and three acres; thus giving to the market, when the extension is completed, an entire area of nearly eight acres. A branch line from the new railway just constructed by the London and North-Western Company, between Edgehill and Bootle, skirts along the market at its northern boundary, on the margin of which a considerable number of large cattle-pens have been erected, extending upwards of 200 yards in length. The existing space in the market affords accommodation for about 8,000 head of cattle, and upwards of 15,000 sheep; but when the extension is completed, it is calculated that by the improved system on which the enlargement is being carried out, this accommodation will be nearly doubled, and that space will be afforded for as many as 6,000 cattle, and something like 30,000 sheep. The cattle-pens are formed of cast-iron columns, sunk a considerable depth into the ground, and passing through a massive block of stone, the frame-work of the pens being of oak. The sheep-pens are constructed of wrought-iron columns and frame-work. There

are two main avenues, 15 ft. wide, extending from the southern frontage in Prescott-road, and passing along the entire depth of the market to the northern extremity, where it is bounded by the railway; these avenues being 693 ft. in length, from south to north. The whole of the extension, which is being carried out under the superintendence of Mr. Thomas Wylie, of this town, surveyor, is expected to be completed in the course of a few months, when, it is said, the Liverpool cattle market, with the exception of London, will be the finest of its kind in the kingdom. The extensions which the Cattle Market Company are making will cost upwards of 8,000*l.*, being altogether independent of the outlay by the railway company.

RAILWAY MATTERS.

The Metropolitan "inner circle" system, suggested by the late City solicitor, Mr. Charles Pearson, will be a very important one. The Metropolitan railway belongs to this system. Already, in its unfinished form, it stands at the top of the list for its mileage traffic receipts, while its shares are at 40 per cent. premium. While the long lines of railway coming into London yield traffic receipts ranging only from 60*l.* to 160*l.* per mile per week, this undertaking brings in 703*l.* per mile per week, as the result of carrying the 7,162,823 persons who were conveyed during the last half-year. These numbers represent the result that would happen if every inhabitant of London travelled five times on the Metropolitan railway in the course of the year. When its extensions and connexions are completed, the trains will have to start every two minutes. The Metropolitan Extension will proceed by Smithfield, along the line of Long-lane, Barbican, and Chiswell-street, to Finsbury-circus, thence to Aldgate and the Tower, where it turns to the westward again by Thames-street and the Thames Embankment. At present the section from Farringdon-road to Finsbury only is being proceeded with. The contractor, Mr. Kolk, is behind time, and has had to pay a large sum in the shape of penalty. Everywhere, however, along the line, workmen are employed in great numbers. The greater part of the line between Farringdon-road and Moorfields is completed. The stations, too, are in a very forward state, and as many workmen are employed on them as can find room to work. The present station in Farringdon-road is merely temporary in its character. The permanent station, on a still more extensive scale, is now being erected in Charles-street, a thoroughfare running from Turremill-street across to the Farringdon-road. The entrance will be under a verandah extending the whole length of the street. There will be three platforms, to serve two distinct lines of railway which converge to run into the station. On one side of the central platform there will be two lines of mixed broad and narrow gauge, to serve the Great Western, the Great Northern, and the London, Chatham, and Dover companies, and on the other side two lines exclusively for the Metropolitan company's traffic. The station will be 300 ft. in length, with a mean width of 110 ft. From Farringdon-road to Aldersgate-street the line runs half the distance through open cuttings, and half in double tunnels. The roof of the Aldersgate station is elliptical, with a span of 80 ft. between the sustaining walls. The platforms will be fully 500 ft. in length. The Moorfields station is to be temporary, until the completion of the line eastward determines the ultimate form and dimensions it will have to assume. The rails on the line are steel, 6 in. wide at the base by 5 in. high, and are carried on sleepers, 10½ in. by 5 in., laid so close together as to average only 2 ft. 7 in. between centres. The already enormous traffic on the Metropolitan will receive a considerable addition shortly by the opening of the communication now nearly completed between their railway and the important line of the London, Chatham, and Dover company.

A calculation, made upon a paragraph which was lately entered the Registrar-General's weekly report of the health of the metropolis, gives the somewhat remarkable result that we are safer on the rail than in the streets of London. Some very dreadful railway accidents have occurred within the past twelve months, in two of which alone 38 persons were killed and 498 injured; but, accepting the past year as an average return, nearly five times as many people are annually killed and wounded in the metropolis

by carts, cabs, and omnibuses, as are killed or injured on all the railways of England, Scotland, and Ireland, taken together.

The traffic receipts of railways in the United Kingdom amounted, for the week ending the 9th of September, on 12,211 miles, to 752,537*l.*, and for the corresponding week of last year, on 11,905 miles, to 705,336*l.*, showing an increase of 336 miles, and of 47,301*l.*

COMMUNICATION BETWEEN PASSENGERS AND RAILWAY GUARDS.

Our attention has been called to a very ingenious invention for securing the much-to-be-desired communication between the passengers and the guards and drivers on railways, which has been patented by Messrs. Picken & Bailey, of Congleton. The specialty of these gentlemen's plan is, that it includes a contrivance by which the carriage from which the signal is issued is bolted by the action of ringing the bell, while an indicator is thrown out pointing at once to that carriage. Thus the guard can of course communicate with the seat of real danger, while the mischievous or foolish alarmist is subjected to instant detection. We need hardly observe that this would serve as a check on the abuse of the power of stopping a train, which is the greatest practical objection to the introduction of any system of signalling the guards.

SIR WILLIAM HOOKER AND KEW GARDENS.

A FEW days since, when driving homo from Richmond, I indulged myself in what is always to me a great delight, a walk through Kew Gardens.

It was tender, calm evening, and the grounds never looked more charming. "Clover and earnest Sir William Hooker," mused I, "your work is done—and well done; and you have gone home to rest! Now that you have laid aside your peaceful arms—the spade and pruning-hook—in the grave, here, on this spot you have so beautified, shonk't a modest yet noble statue be erected to your memory."

If the *Builder* should approve of the idea, and would with its trumpet-voice spread abroad the suggestion, the thing could easily be done; for surely it would be no difficult matter in trees and flower-loving England, to raise sufficient funds for a statue in honour of the cultivator to whom all England is so largely indebted. Of course, we must have a first-rate statue, by one of our best portraitists, Theed or Durham, or some equally clever sculptor; else it would be of no value, and would give no gratification to the beholder; and I would suggest as the site the flower-terrace, or Italian Garden, in front of the large glass-house, and facing the so very ornamental lake: all of which heaties have been added to the gardens during the judicious directorate of Sir William Hooker. Here, at present, stand three vases—or large tazze—each one almost, if not exactly, like the other two. The centre one of these I would remove, and let the statue occupy its place; for two of such things are quite sufficient, and the third could well be spared. Just now, also, the centre vase is by no means ornamental; for, with a wise endeavour to produce variety of design, it has been left bare of plants at its base, while the other two vases are banked up to their pedestals with flowers and variegated foliage, amongst which the fine red-brown velvety leaves of the *Colletia verschafttati* assert themselves grandly.

I do hope something may be done, and speedily, in honour of the late Director. Months are already accumulating over the quiet resting-place on Kew-green, where Sir William Hooker lies beside his father and his first little grandchild. JUSTINA.

JOHN BRIEN, HOUSE PAINTER.

SIR.—Mr. John Brien, house painter, has lost his reason, and now is an inmate of a lunatic asylum. Mr. Brien having taken a prominent, and not unworthy part, in various movements to improve the condition of the working classes, he, in his earnestness to promote the wellbeing of his class, to a large extent forgot his own. At the time this sad calamity befel him, his wife was an invalid and his family in difficulties. Under the above circumstances, a number of working men, in the painting and other trades, have desired to make an acknowledgment to Mr. Brien for his services, and help his family, who are deprived of their only support. A committee to carry out the above object sits nightly, at Mr. Stevens's Coffee-rooms, 148, Pentonville-road, to receive contributions and furnish subscription sheets. H. RANDALL.

INDUSTRIAL EXHIBITIONS.

Bristol.—The Working Men's Industrial Exhibition, which has been arranged in the great drill-hall of the 1st Gloucestershire (Bristol) Volunteer Corps, in connexion with Bristol, Bath, the West of England counties and South Wales, has been opened with much ceremony by the civic authorities, the bishop, deacons, and clergy, and numbers of the resident and neighbouring gentry. The exhibition is both a large and excellent one, and does honour to the ability, industry, and inventive and productive skill of the working classes connected with the district embraced by the operations of the committee. It had been intended by Lord Palmerston to open it; but his lordship's indisposition prevented his doing so, and Mr. Gladstone and Lord Stanley, who were invited at a late hour to accept the vacant honour, being both pre-engaged, the distinction was proffered to and accepted by the Mayor of Bristol (Mr. Naish). Prior to the ceremony there was a procession of the different trades and benefit societies, and the city was profusely decorated with flags; all the shops and places of business were closed; and there was bell-ringing, cannon-firing, a gala, and other tokens of rejoicing.

Preston.—The municipal authorities and inhabitants of Preston have reason to congratulate themselves upon the success of the art and industrial exhibition which has been inaugurated there. Lord Derby had promised to be present at the opening ceremony, and also to deliver the inaugural address, but was prevented by gout from being present. The exhibition, which was in aid of the funds of the Preston Institution for the Diffusion of Knowledge and the Central Working Men's Club, was held in the Corn Exchange, Lune-street. The Corn Exchange was set apart for the exhibition, and it was fitted up by Mr. Tyrer, of Manchester. The large room was the centre of attraction. In this were gathered many specimens of industrial and ornamental work. A procession of great length took place, and it included representatives from various industrial bodies with volunteer and other amateur bands. The streets were thronged with spectators, who lined the thoroughfares in dense masses, and every window was occupied. The proceedings were commenced by the choir singing the National Anthem, accompanied by the artillery band. The mayor opened the exhibition.

SCHOOLS OF ART.

The York School.—Mr. Tom Taylor presided at the annual meeting of this school, and in the course of his speech remarked that no young men or women could be said to have completed their education until they had availed themselves of the teaching of a school of art. Perhaps we should never make an artistic nation, but we should certainly never have a chance of becoming one until the work of schools like that had been going on for more than one generation. To some, the hope that England was ever to be an artistic nation might seem to be utopian. He could not himself think so. The powers that made the England of Alfred and Edward, of Henry and Elizabeth, of Cromwell and William, what it was, were still living in us. Some of them might be latent, some were in full swing. Some of our national faculties and tendencies might be adverse to art; our political and business faculties, perhaps, were not favourable to it; our Puritanical tendencies were directly opposed to it; but among our national powers most certainly lay the artistic.

The Manchester School.—The annual meeting and distribution of medals, books, and other prizes, awarded by the Department of Science and Art to students in this school, has been held in the lecture theatre of the Royal Institution. Mr. Thos. Bazley, M.P., president, occupied the chair. Mr. Muckley, the head master, read his report as to the progress of the school. Its success, with reference to the national competition just ended, was, said the report, almost as marked as before, eight awards having been made to the students of this school (but not yet received), that being the highest number this institution had hitherto obtained, and with one exception, more than any other school had gained this year. The numbers attending the artisan classes were much on the increase, and the amount derived from the fees of the past year was very satisfactory. The number of prizes taken in the second grade examination

was much larger than that obtained on previous occasions. Although their standard this year was very high when compared with former years, they were as yet on the threshold of that great art era which was so rapidly developing itself, and on which it was their duty to leave their footprints, as a vantage-ground for the benefit of future generations.

*The Yarmouth School.*—The new master of this school is Mr. Dornay, who has had experience as an art teacher in the metropolis. The prizes awarded to the pupils belonging to the school, at the two previous examinations, were presented by the mayor, at the town-hall. The hall was crowded to inconvenience with the parents and friends of the successful competitors, and the utmost interest appeared to be excited in the proceedings. The prizes were apportioned as follows:—First grade prizes: British School, 86; Hospital School, 45; Priory, 18; Charity, 33; St. Peter's, 5; total, 187. First grade certificate prizes: British, 50; Hospital, 49; Priory, 20; St. Peter's, 16; Charity, 9; total, 144. There were also 22 second grade prizes and 14 cards; 8 bronze medals, and one national medalion (not presented).

#### CHURCH-BUILDING NEWS.

*Gloucester.*—The restoration of St. Nicholas's Church is progressing. The organ gallery, which was erected across the western end of the nave, has been removed, and the whole length of the building from east to west is now thrown open. Two or three of the pillars on the north side are of an older period than the other parts of the building, and appear to confirm a tradition that originally a small chantry stood on part of the site of the church, and that the nave and aisles, &c., were subsequently added. The outlay on the restoration first contemplated was about 600*l.*, a large portion of which has already been raised by subscription. But when the work was once well entered upon, the incumbent, the Rev. W. Balfour, found that to restrict himself to the original designs would leave the restoration only half done. Additional contracts were therefore entered into, and the entire expenditure will amount to at least 1,200*l.* When the old flooring was removed the ground was found to be honeycombed, or encrusted, with vaults. The ground has now been levelled and covered with concrete, and plain open seats will take the place of the former high-backed pews. One of the old pews was said to be held by faculty, and as the alleged owner objected to its removal, it was feared that it would present an insurmountable obstacle to the restoration. The seat has, however, been pulled down. The buttresses and a considerable portion of the exterior of the tower were greatly dilapidated. A large outlay was thus rendered necessary. A warming apparatus will be fixed in the church; the walls and columns are being scraped and renewed; the ceiling of the nave and aisles is to be renewed; additional buttresses will be erected to strengthen the external wall of the north aisle; and the present unsightly dormer windows on the north side of the roof will be removed, and more suitable windows be substituted. The carved wood-work with which the chancel had been disfigured has been removed, and the ancient piscina, and the squint in the north wall, are thus uncovered. The chancel roof will be divided by stained ribs, and the panels receded. The old "three-decker" has been carted away, and the new pulpit will be placed on the north side of the nave, at the entrance to the chancel. Some of the ancient monuments in the chancel will be cleaned and retained; and new mullions will be placed in the chancel window (which has now been opened to its full height), and in the east window of the south aisle; and the windows will be filled with tinted glass. The organ has been re-erected at the east end of the north aisle. A portion of the old flooring consisted of grave-stones, several of which had been laid down between two and three centuries. The inscriptions on some of these are curious. In the churchyard, on the stone at the family grave of a former printer of this city who was famed for his accuracy, is the inscription—"Here lie the remains of," &c., "who died," &c., "and was interred at the cemetery!"

*Norton Fitzwarren (Somerset).*—The chancel and new chapel of the church have been re-opened for divine service, after having undergone a restoration under the management of Mr. C. E. Giles, of London, architect. In the east of the chancel is a memorial window, repre-

sented the Crucifixion, by Messrs. Clayton & Bell. The reredos is carved in Bath stone. The floor is laid with encaustic tiles, and the roof, of oak is decorated, by Mr. Stansell, of Taunton. The stalls for the choir are carved in oak. The whole church is now restored, except the rood screen, the nave and north aisle having been rebuilt about twelve years ago. In the new chapel is an organ, built by Mr. Vowles, of Bristol, at a cost of about 170*l.*

*Neath (South Wales).*—The Abbey Church, which has been closed for some time, whilst undergoing alterations, has been re-opened for divine service. Through the assistance of Lord Dynevor, Mr. Howel Gwynn, and other landed proprietors, a new aisle has been added to the church, which now consists of a centre aisle, with one on either side, and a chancel. The chancel has been laid with encaustic tiles, the gift of Mr. E. A. Moore, of Conlas. The glass in the window is "lined" in imitation of the old lozenge pane, and ground or deadened to render the light in the church diffusive. In the south aisle is a memorial window, which has recently been erected, representing the Angels at the Sepulchre announcing the Resurrection of our Lord. The church wants a stained-glass window in the chancel.

*Penrhyn (North Wales).*—A new church, built by Colonel Pennant in the slate quarry district at Llandegai under somewhat remarkable circumstances, has been consecrated. In the midst of the Penrhyn quarries, and almost surrounded by heaps of debris, a commodious little church was erected many years ago by the late Lord and Lady Penrhyn, for the benefit of the workmen and their families. Year by year the heaps of rubbish thrown from the quarries increased in size and encroached upon this edifice, so that it became necessary to discontinue the holding of service within it. Colonel Pennant then undertook to build, at his own expense, a new church on a site not far from the old one. It is placed on a mound facing the slate quarries, about half a mile distant from them in a straight line. In the valley below reposes the village of Bethesda, through which the river Ogwen foams to the sea, while, in the background rise Garnedd Llwlwyn and Dalrydd, the two highest mountains in Wales, after Snowdon. To the left flows Penmaenmawr, with Puffin Island and the Irish Sea nearer to the left. A deep valley lies between the church and the quarries, so that many generations must pass away before another church will have to be built from the same cause which necessitated the erection of the present one. In addition to this there is a dense population in the immediate vicinity of the church, composed principally of quarrymen and their families. The church holds 400 persons, and is in the Geometrical style, the material being local stone, with Anglesea limestone dressings. A tower and spire, 110 ft. high, stand at the east end of the north aisle. The chancel windows are filled with stained glass, by Messrs. Lavers & Barrand.

*Cramlington (Shields).*—The foundation-stone of a new church has been laid at Cramlington, by Sir M. W. Ridley, bart., M.P. The new building will be a feature in the village, where the want of proper church accommodation has long been felt. It will consist of a chancel, nave, aisles, vestry, and organ-chamber, with a tower at the west end, and will accommodate about 415 persons. The style is Pointed. The tower will be about 75 ft. high, and will form a conspicuous object from the surrounding country and a landmark from the sea.

#### Books Received.

*The New Testament.* Illustrated. Edited by EDWARD CHURTON, M.A., and W. BASIL JONES, M.A. 2 vols. London: John Murray. 1865.

BESIDES supplying a plain explanatory comment for private or family reading, parallel passages and short inferences, with which we need not meddle, this edition is distinguished by presenting accurate views from sketches on the spot, and from photographs, of the places in which the events of the history occurred, and which tend powerfully to illustrate those events, and make them clear to all comprehensions. As the editors say truly in the preface,—"It surely lends vividness to the impression with which we read the New Testament, to find the fisherman still casting his net into the Sea of Galilee, the women of Palestine grinding at the mill, or lighting the

oven with the grass from the field; to see the lilies, outvying the glorious array of Solomon, as they may yet be gathered in the plain of Magdala, or the olive-trees of unknown age, still flourishing on the mountain eastward of Jerusalem. The road from Jerusalem to Jericho still remains as a witness to the truth of the picture in our Lord's Parable; and the figs, peaches, and pomegranates are growing, as of old, about the slopes and ruined walls of Bethany." The journeys of our Lord around the shores of the Sea of Thiberias,—from Galilee and Nazareth to Jerusalem, and from Bethany to Jerusalem,—and the voyages of St. Paul may, partly at least, be traced on the panoramic views. It should be added that the illustrations, which include some historical subjects from Overbeck, are drawn on the wood by Mr. Percival Skelton, Mr. Hnard, and Mr. Scott. We can cordially recommend this very excellent edition of the New Testament, as well for its beauty as its usefulness.

#### VARIORUM.

"The Elements of Mechanism. Designed for Students of Applied Mechanics." By T. M. Goodeve, M.A. London: Longman & Co. 1865. This is a second edition, enlarged and improved, of a very good work of its kind, by the professor of mechanics at the Royal Military Academy, Woolwich, and late professor of natural philosophy in King's College, London. The author's intention is to simplify the subject as much as possible, and to convey a certain amount of practical information.—"Road Locomotives: an Epitome of the New Road Locomotive Acts." By Thomas Aveling. The owners and drivers of the new road locomotives are indebted to Mr. Aveling for this little handy book of road locomotive law.

#### Miscellaneous.

*THE CHINESE.*—The Chinese now exhibiting in the Egyptian Hall, Piccadilly, form a remarkable group. The giant has a singularly handsome head, and mildest manners. The London Stereoscopic Company, by the way, have sent us cartes de visite of the party, which are admirable and striking portraits.

*ANTS.*—So frequent are the inquiries how to get rid of this pest that we would almost require to give a permanent note in reply. We have not time to refer to what has been frequently said on the subject in our columns; but so far as our recollection serves us, chloride of lime was one of the most recent recommendations made by correspondents. The pyrethral powders, puff-balls, Keating's insect powder, &c., have also been advised, and boiling water where it can be conveniently or effectively used.

*THE BUILDING TRADES.*—A FURTHER ADVANCE OF WAGES CLAIMED.—A meeting of delegates from the carpenters' and joiners' societies' shops and jobs was held on Wednesday night, when the following resolution was carried:—"That on Monday next notices should be sent in to the master builders that the carpenters and joiners would require an advance of one halfpenny per hour on the present rate of wages on and after the first Saturday in May next." A committee was appointed to carry out the movement. The masters met and passed a similar resolution, also appointing a committee.

*SOUTHWARK IMPROVEMENTS.*—The District Board of Works of St. Olave, Southwark, have before them a project for improvements, and the creation of valuable property, of great magnitude. The London-Bridge Land Company, the present owners of the site formerly occupied by St. Thomas's Hospital, propose to cover a portion of Joiner-street beneath the Brighton Railway terminus, to make a street level of the level of the terminus, and to construct another street from Wellington-street, rising gradually to the level of the first. By these plans two new frontages would be created, and the value of the company's property greatly enhanced. The adhesion to the scheme of the directors of the railway company, and that of the local Board, is sought. The company are willing to convey to the Board, on the project being carried to completion, land to enable St. Thomas's-street to be widened at its junction with Joiner-street, and thus to effect an improvement which is much needed.—*South London Chronicle.*

**EXHIBITION IN MANCHESTER.**—A prospectus has been issued by the committee of the Manchester District Art Workmen's Association, announcing that it is their intention to hold an exhibition of arts and manufactures early next year.

**THE MAGNESIUM LIGHT.**—Experiments have been made at Birmingham to try the effect of the magnesium light when attached to a balloon in the air. The experiments were striking in effect, the light thrown forth being very brilliant, and illuminating the streets, houses, and crowds of people with a distinctness resembling day.

**OPENING OF THE PORTUGUESE EXHIBITION.**—The Portuguese International Exhibition has been opened at Oporto with great rejoicings, by the King and Queen, Dom Ferdinand, and Dom Augusto, who entered the crystal palace, with a brilliant suite, and were conducted through the central nave to the throne prepared for their majesties. Here an address was delivered by the president of the company by whom the palace has been constructed. England is best represented for manufactures among foreign nations in the Exhibition.

**DISCOVERY OF AN ANCIENT CITY IN MEXICO.** About 50 miles from Tuxan, in the province of Tlaxcala, in Jicorumbo, a dense forest of gigantic cedars, situated on a healthy table-land, the ruins of an extensive Mexican aboriginal city have just been discovered. The temples, says the *leader*, are of immense size, some with vaulted roofs, and so well preserved that ancient paintings appear fresh, and the courts are filled with figures of idols, and pyramids surmounted by the same.

**HARTLEPOOL HIGHWAY SURVEYORSHIP.**—At a special meeting of the Stockton and Hartlepool District Highway Board, for the purpose of selecting a surveyor for the district, out of a list of seventy candidates five of the number were selected; and, on a second vote being taken, the result was the election of Mr. Scott by a majority of twenty-two to seventeen votes. The salary is 180*l.* per annum.

**MIDLAND MASTER BUILDERS' ASSOCIATION.**—The master builders of the North Staffordshire branch of the General Builders' Association have celebrated the first anniversary of the formation of their society at the Saracen's Head Hotel, Hanley. A first-class dinner was provided. Mr. Inley presided, and the vice-chair was filled by Mr. John Steele, the secretary. The company included the principal builders of North Staffordshire.

**CRUMLIN VIADUCT.**—We are asked to give publicity to the result of an examination of this ingenious structure with a view to allay anxiety, and willingly do so. It appears considerable alarm has been manifested for some weeks past in consequence of rumours that the viaduct was not in a secure state. The authorities very properly, and without delay, deputed Captain Tyler, one of their inspectors, to make the necessary examination, and to apply the requisite tests, with a view of ascertaining the stability of the bridge. This examination took place last week. The first test applied was that of running a train of seven engines and their tenders (weighing together 240 tons), from one end of the viaduct to the other at different rates of speed. This train exactly covered two spans of the viaduct, and the appearance of so many engines linked together, with their polished work reflecting the rays of a bright sun, was a spectacle remarkable even to men experienced in the railway world. The moment, as might be supposed, was one of no ordinary excitement, and the results, as will be seen, were as gratifying as the most sanguine could desire. After six seven engines, with their tenders, were placed on one line, and one powerful engine and tender attached to fifteen large trucks heavily loaded with coal and iron (each truck and its tenders weighing 15 tons), were placed on the other line. These enormous masses, the greatest that could be put on, were simultaneously moved backwards and forwards at various rates of speed, the deflection and lateral oscillation being carefully noted. It is understood the report will show that there was not a shadow of foundation for the reports, and that the scientific tests now applied are well calculated to inspire increased confidence in the safety of this structure. The *chef d'œuvre* of the Messrs. Kennard, Lubbers.

**SANITARY INSPECTION OF OVERCROWDED LOCALITIES.**—By order of the Government Dr. Hunter is at present engaged in prosecuting a sanitary investigation in Bradford, having been charged with the duty of making a similar investigation in Leeds and Sheffield.

**ST. PETER'S VAUXHALL.**—Sir: I perceive in your number of the 2nd inst. a very clear and interesting account of the Church of St. Peter, Vauxhall; and although I have had the privilege of assisting in this good work, it was without my wish that my name appeared. I regret, however, that the names of the gentlemen (Messrs. Lavers & Barrand) who executed the memorial windows, and who also very liberally presented one of the triforium windows, are not mentioned. No doubt you were not aware of these facts, or the omission would not have occurred; and perhaps you will in justice to those gentlemen remedy the defect in your next number.—BENJAMIN LANCASTER.

**SANITARY REFORM.**—Under this title has been circulated a printed letter, addressed to Sir George Grey, as Home Secretary, by the town clerk of Wolverhampton, pointing out some defects in the law as regards the powers of local boards of health, and urging their amendment. The letter is an able one, in which difficulties in enforcing by-laws, and the want of comprehensive and compulsory powers for main drainage and sewerage of towns are more especially referred to; and the letter thus concludes:—"I trust that the interest you have hitherto evinced in sanitary reform will induce you, at the earliest possible period, to introduce and lend your powerful aid to the passing of a law which shall give to local boards of health ample powers to execute sewerage works, and provide for the comfort and welfare of her Majesty's subjects in populous places, particularly one's poorer brethren, whose lot it is to dwell in the crowded streets and pestiferous courts and alleys of large towns."

**LIGHTING RAILWAY CARRIAGES WITH GAS.**—The directors of the South-Eastern Railway Company have been making experiments with respect to gas-lights in carriages. A simple method introduced by Mr. Dalziel is on trial, and, should it answer, every carriage will carry its own supply of gas for a reasonably long journey. Experiments have also recently been in progress on the Great Northern, with the view of consuming the smoke from the engines, and of making gas for lighting carriages as the trains travel. Meantime, the Great Northern locomotives, of late, look much more like smoke-producers than smoke-consumers, so much so as to have attracted very general attention and some alarm about Holloway, and induced the belief that the smoke-consuming "experiments" are a mere blind. Why should locomotives be allowed to vomit forth enormous volumes of black smoke while other steam-engines are compelled to really consume their own smoke? We trust the proper authorities will look to this.

**IRON COW-STALLS.**—Musgrave's patent iron cow-house fittings appear to be an improvement in several respects on previous fittings. The patent has been obtained not only for improvements in the plan of cow-house fittings, but for the application of iron in their manufacture, and for the method of constructing them. The stalls are formed of strong division-plates of cast iron, the front having a round dwarf column, which offers a smooth surface to the cattle when turning in or out; and each cow is fastened by the ordinary chain passing round the neck, the end of which slides up and down a vertical iron rod, attached to the stall division. The troughs or mangers are of cast iron, the whole length of the stall, raised a few inches above the level of the pavement, and are combined with the stall division in such a manner that water emptied into any one trough will flow along the entire range. The fodder is contained in a wrought-iron rack, raised about a foot above the trough, and has open rails at back as well as in front, to expose the fodder to the action of the air. The advantages claimed for these improvements are—"the stalls are more durable than can be attained by any other means, very compact, easily cleaned, and will not harbour contagion. The arrangement is convenient, and facilitates dispatch in feeding. The cattle have a greater relish for their food, and the fodder never gets damp or heated." Fresh air inlets are placed in front of each cow, and a feeding-passage for trucks runs along the heads of the stalls. The floors are of flagging and asphalt or brick.

**CONTRACTS FOR IRON AND COPPER.**—The Mersey Dock Board, at their last meeting, agreed to accept tenders of the Mersey Steel and Iron Works Company for the supply of 400 tons of flat and round iron at the price of 17*l.* 17*s.* 6*d.* per ton for ordinary sizes of the best iron. They also accepted a tender of Messrs. J. Walker, Parkier, & Co., for the supply of five tons of pure dry lead, at 19*l.* 10*s.*; of Messrs. Goodlass, Wall, & Co., for Brnmswick green, at 18*l.* per ton; Messrs. Hallows, Roach, & Co., for a large quantity of sheet copper, at 81*l.* 10*s.* per ton; and the Bagillt Smelting Company for bagillt spelter, at 22*l.* per ton.

**NEW PATENT IRON DOORS.**—Among the patents just sealed is one for iron doors, invented by Mr. Joseph T. Harris. These doors are intended as a substitute for wood, and can be produced at almost the same cost. When fixed and painted it will be difficult to distinguish them from any kind of wooden doors, as they will be precisely the same in appearance, and will open and shut with equal facility. They are especially adapted for dwelling-houses, offices, and public buildings, and, indeed, for every purpose for which wooden doors are now used, their great merit being their extra security, lightness, and durability, in addition to which they can be made perfectly fireproof, and are not liable to shrink, as is the case with wood.—*Western Daily Press.*

**THE CAVES OF ELEPHANTA.**—A correspondent of the *Times* draws the public attention to the Caves of Elephanta, and the present condition and future prospects of these wonders of ancient art. On the three faces of the great statue which fronts the visitor on entering the temple (he says), will be now found, written in pencil, impressed with ink, or rudely carved with soldier's or sailor's knife, the names of the visitors. To chip off a nose—soon there will no noses left to chip—is considered a feat almost worthy of national gratitude. But this is not all, a large reclamation land company, employing several thousand coolies, is already on the island in active operation; and another to connect the islands of Elephanta and Bombay by means of bridges and a railway has been spoken of, and may, when the panic is over, be carried out; and then, to move the sculptures of the temples to the Victoria Museum in Bombay or to the South Kensington Museum may be the next proposal.

**BUILDERS' CONTRACTS: JARRETT v. BATEMAN.** This was an action brought to recover 18*l.*, which, according to the plaintiff's statement, he had paid to the defendant in excess of a contract. The plaintiff is a publican, residing in Alderley Park-road, Birmingham, and the defendant is a builder, at Sparkbrook. Mr. Parry appeared for the plaintiff, and Mr. Cutler for the defendant. On the 4th of April, 1864, the plaintiff gave the defendant an order to build a house at Salford, for 470*l.* During the completion of the contract the plaintiff applied money to the defendant from time to time; and it was not until after the last payment that he considered it necessary to reckon how much he had paid. It then transpired that the defendant had received 488*l.* Upon application for the 18*l.*, the defendant urged that he had done extra work for the amount. The extra work, which was the enlargement of a brewhouse, was not denied. His Honour, however, gave a verdict for the plaintiff for the full amount claimed, and pointed out to the defendant that the proper course to take with reference to the subject, would be to sue the plaintiff for the extra work done, if he considered he was entitled to it.

**AUCTIONEERS SUING AS PRINCIPALS.**—An action for use and occupation may be maintained by an auctioneer letting land without naming his principal as the contracting party, against a person who has received possession from him, and has occupied under the contract constituted by his being the highest bidder at the auction. The Court of Queen's Bench thus decided, in the case of *Fisher v. Marsh*, where it appeared that races were held at Port Meadow, a common over which the freemen of Oxford have common rights. The plaintiff, an auctioneer, by the usual posting-bills, advertised that he would let by public auction standings for hoots, &c., on the race-course, to the highest bidders. He was acting on behalf of the race committee, and the names of the committee were given. The court held that the defendant, to whom a standing for a booth was knocked down at the sale, could not dispute the plaintiff's title to let the ground, he having bought of and been let into possession by the plaintiff.

**OPENING OF A DRINKING FOUNTAIN AT EAST-BOURNE.**—On the 18th inst, the opening of the drinking-fountain, which has been erected at the sole cost of Mrs. Curling, of Kent Lodge, was inaugurated. The spot chosen is a suitable one, nearly opposite the Workmen's Hall, at the entrance of Pevensey-road. The fountain is composed of iron, bronzed, surmounted by two dolphins, above which is placed a public lamp. The stonework leading to the fountain itself was executed by Mr. Francis, of this town, and the iron work by Mr. Hood, of London, who supplies similar castings.

**CONCRETE ARCHING.**—In the extensive underground floors of a new harrack now erecting in Paris, the vaultings are being formed with the *Bétons agglomérés* of M. Coignet. The *Society of Arts Journal* says,—"The walls are full 13 ft. apart, and the concrete is laid on timber centerings, and trodden and beaten down with great care. The vault and flooring thus formed is about 2 ft. thick at the spring of the vaulting, but only about 10 in. on the crown, and it is found sufficiently strong for all practical purposes." It has also this great advantage, that the ceiling can at once be whitened and the floor laid with tiles of cement without further preparation. The process is said to be successful and economical.

**ENLARGEMENT OF COVENT GARDEN MARKET.**—The Duke of Bedford has determined to remove the block of buildings on the south side of Great Russell-street, from Wellington-street to the market, the extensive hotels the New and Old Hummums, in Tavistock-row, Covent Garden, and the houses on the west side of Wellington-street from Great Russell-street to the back entrance of the root and flower market, on the site of which a new market, with offices and standings, will be erected in a similar style of architecture to that of the present structure. The duke has refused to renew the leases of the New and Old Hummums Hotels, which are now closed preparatory to the materials being sold and the premises pulled down. The remaining houses required for the improvement will be removed as the leases expire.

**SOLID BRICK MACHINES.**—That brick machinery has not yet been brought to perfection seems evident from the great variety of inventions, each intended to supersede all others. First we had the moist-clay machines, requiring softening before manufacture and drying after it. Then we have had the dry-clay machines, requiring previous drying of the clay, but obviating the subsequent drying. The solid brick machinery appears to be an improvement on both of these. In this machine (Oates's patent) the clay is used of such a degree of dryness as to allow of its being mixed up and macerated and compressed into bricks by a single continuous action; the clay being formed into a continuous column and compressed into the moulds by the action of a revolving vertical screw. The clay requires generally no previous preparation beyond that given by the ordinary crushing-rollers, and is sometimes ready for putting into the machine direct from the pit; in other cases, where containing a mixture of stones, it is first passed through a pair of crushing-rollers.

**AN ANCIENT SCULPTURED STONE IN JEDBURGH ABBEY.**—For some years past it has been known to a few persons that a curiously-sculptured stone was built into Jedburgh Abbey, serving as a lintel in one of the passages immediately above what is known as St. Mary's aisle. This stone has been regarded by some as a fragment of a Runic memorial, while others believe it to be Anglo-Saxon. It has been taken out of its place and put in the northern transept. The stone is broken, but evidently the principal portion is entire. It measures 2 ft. 9 in. in length, and 2 ft. in breadth. The chief object on it is a tree, bearing clusters of fruit somewhat resembling grapes. The branches of the tree are turned so as to form perfect circles of about 8 in. diameter each. In the two undermost circles there are two animals, that on the right side of a wolf-like character, and that on the left like a ram. In the circles immediately above are two birds like vultures; and these, along with the wolf-like animal below, are shown in the act of eating the fruit of the tree, while the ram has hold of one of the branches in its mouth. In the circles above these are two peculiarly-formed animals. The heads are broken off, but the two legs, part of the body, and a wing are seen, and the under-part seems to have been intended to represent a serpent coiled round one of the branches.

**PANIC IN ST. ANDREW'S CHURCH, HOLBORN.**—Just as the clergyman was closing the service, last week, the congregation was thrown into a painful state of excitement, owing to some man in one of the aisles falling on the floor, and then screaming out "Fire!" as loud as he was able. In the confusion that prevailed many persons were thrown down, some were injured, and others fainted. The Royal Society's escape was sent for from the Hatton-garden station, when it was clearly ascertained that there was not the least ground for the alarm. During the confusion which prevailed the fellow who raised the cry got off.

**FATAL ACCIDENT AT BATTERSEA.**—A man has been killed, and several others injured, by a fall of timber, at the new railway works in progress at Battersea. At the inquest, the foreman gauger of carpenters was examined. He said he was in the employ of Messrs. Pickering, the contractors, and was superintending the erection of the rims which received the brickwork. The railway was built on arches, and was to be a junction for the London and Brighton line. The men had just completed the centres, and whilst the deceased was getting down from the one last completed, it fell, bringing down the other two, and one of the centres fell upon his head and killed him. The jury returned a verdict of accidental death, but strongly recommended that for the future stronger plates should be used for the centre joints, and that they be made of the very best iron.

**ONE RESULT OF A STRIKE.**—As was predicted at the time the North Staffordshire puddlers and shinglers were on strike, the extraordinary wages they were proved to earn when at work, frequently amounting in the case of men of the latter class to 20s. a day, have brought upon them the unwelcome attentions of the Board of Inland Revenue. A large number of men have this year been assessed to the income-tax, and the majority have paid it with a pretty good grace; but two of the shinglers in the employ of Earl Granville, at Hanley, persistently refused to pay, and they were accordingly apprehended. This bold step on the part of the district commissioners caused considerable excitement at the works; and the defaulters, rather than undergo a sojourn in Stafford goal, paid the tax at the last moment, and heavy expenses besides.

**CURIOUS DISCOVERY OF SEPIULCRAL SLABS.**—Helpston churchyard, near Stamford, is, at the present time strewn with sepulchral slabs, or stone coffin-lids, and the Rev. J. A. L. Campbell, the vicar, is inviting students in ecclesiology and archaeology to examine them. An architect had been instructed to examine the tower of the church, and as he had pronounced it to be unsafe, it was resolved to take it down, and rebuild it with the same materials, according to the original plan. On taking down the tower, it was found that a very considerable portion of the stone used consisted of monumental slabs of the Early English (thirteenth century) period. More than 100 of these interesting memorials must have been removed from the church floors and cemetery to build the Decorated tower. Some of them are still perfect: their length ranges from 1 ft. 8 in. to 5 ft. 11 in. All have the cross, and many also emblematical foliage. Mr. Tinkler, of Stamford, is the contractor for the work.

## TENDERS

For new sewers, Clapham, Contract No. 3. Mr. C. W. Johnson, surveyor:—

Blackmore	£31,000 0 0
Walker	30,800 0 0
Leitch	30,500 0 0
Hill & Keddell	29,700 0 0
Parson	26,997 0 0
Beaton & Routledge	23,000 0 0
Niblett (accepted)	22,500 0 0

For the erection of two houses, at Walnut-tree Bridge, near the works of Messrs. Wood, Brothers, for Mr. E. Mountjoy, Mr. J. Williams, architect:—

Stride	£765 0 0
Price	730 0 0
Cooper	725 0 0
Jarvis	695 0 0
Evans	649 0 0
Thomas (accepted)	645 0 0

For a public-house, at Walnut-tree Bridge, for Mr. D. James, Mr. John Williams, architect:—

Cooper	£530 0 0
Thomas	550 0 0
Price	515 0 0
Davies	511 0 0
Jenkins	510 0 0
R. Davies	735 0 0
T. J. Jenkins	775 0 0
Evans (accepted)	730 0 0

For erecting six houses, at Strood, Kent, for Mr. Carel, Mr. C. C. Corfield, architect:—

Gates	£1,477 10 0
Ball	1,471 0 0
Spicer	1,465 0 0
West & Sollett (accepted)	1,462 0 0

For parish schools and master's residence, including fence, walls, and playground, at Ringstead, Northamptonshire, Messrs. Wadmore & Baker, architects. Quantities supplied:—

Streather	£878 0 0
Ball	867 0 0
Allen	739 0 0

For sandy alterations and additions, for Mr. H. Collier, Walthamstow, Essex, Messrs. Wadmore & Baker, architects. Quantities furnished:—

Ashby & Sons	£984 0 0
Patman & Fotheringham	970 0 0
Browne & Robinson	968 0 0
Perry	854 0 0
Rivet (accepted)	843 0 0

For a pair of semi-detached villas, in Essex-road, Enfield, for Mr. Bevan, Mr. T. J. Hill, architect:—

Webb & Sons	£1,400 0 0
Patman	1,398 0 0
Cushing	1,396 0 0
Ashton	1,387 0 0

For building a new branch store for the Brixton Co-operative Industrial Provident Society, at Well-hans, Streatham:—

Harrington	£575 0 0
Candler	469 0 0
Mason	415 14 0
Clarke	413 14 0
Glover & Thompson (accepted)	385 0 0

For public-house, Maple-road, Penge, for Messrs. Day, Noakes, & Sons, Mr. G. Elkington, architect:—

Keat	£1,450 0 0
Wood & Mason	1,410 0 0
Hollidge	1,390 0 0
Bugher & Wheeler	1,197 0 0
Thompson	1,185 0 0
Eustace (accepted)	1,060 0 0

For restoring rooms, after fire, and erecting stabling, &c., at the White Hart, Tongham, for Messrs. Crooke, Mr. Henry Peak, architect:—

Loe	£295 0 0
Hughes	245 3 0
Duke	243 19 9
Mason	229 5 0

For new warehouses, and alterations and additions, for Messrs. Burgoyne & Burbidge, Coleman-street, City, Mr. C. E. Barlow, architect:—

Colls & Sons	£3,686 0 0
Piper & Wheeler	3,459 0 0
Newman & Mann (accepted)	3,396 0 0

For taking down and rebuilding the house, No. 19, Upper-street, Islington, for Messrs. Potter, Brothers, Mr. I. Bird, architect:—

Lawrence & Son	£1,944 0 0
Brown	1,820 0 0
Gannon & Son	1,673 0 0
Newman & Mann	1,622 0 0
Henshaw	1,517 0 0
Williams	1,483 0 0

For rebuilding Premises, No. 35, Throgmorton-street, for Mr. Stephens, Messrs. H. & J. D. Mathews, architects:—

Webb & Sons	£2,589 0 0
Conder	2,317 0 0
Hardiman & Sandon	2,227 0 0
Sevill & Son	2,147 0 0
Newman & Mann	2,026 0 0
Canon	1,965 0 0
Axford & Wheeler	1,865 0 0
Rensay	1,783 0 0

For the erection of a pair of semi-detached residences, in Southey-road, New Wimbledon, for Mr. A. O. Martin, Mr. E. Lawrence, architect. Drawings and specifications prepared by Messrs. Lansdown:—

Colls & Son	£1,673 0 0
Neale	1,438 0 0
Bowman	1,430 0 0
Dover	1,390 0 0
Nutt & Co.	1,368 0 0
Smith	1,159 0 0
Keys (accepted)	1,053 0 0

For recasting the parish church, Richmond, Surrey, and other alterations, Mr. A. W. Blomfield, architect:—

Long (accepted)	£3,389 0 0
-----------------	------------

For rebuilding the City Arms public-house, and two tenements, with shops adjoining thereto, in the City-road, also a stable and two shops in City-garden-row, for Mr. E. Lawrence, Mr. James Harrison, architect. Quantities not supplied:—

Green	£3,877 0 0
Sellock	3,720 0 0
Langrell (accepted)	3,650 0 0

## [ADVERTISEMENT.]

### CHURCH, TURRET, and STABLE CLOCKS.

J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1852. 53 & 54, Ludgate-hill, E.C. Established 1749.

# The Builder.

VOL. XXIII.—No. 1183.

Out and About: Shrewsbury, Wroxeter, and Haughmond Abbey.

SHREWSBURY is an old town and a very interesting town. "Every one knows that," may be replied; nevertheless, a great many people pass it unseen, and so it may not be useless either to Shrewsbury or to travellers to re-assert the fact. There are, perhaps, more wooden houses and half-wooden houses left here than any where else; and they serve to give the town a distinctive aspect. Remnants of Elizabethan and older buildings will be found scattered about in all directions. These, however, are gradually disappearing; thus at Rowley's Mansion, in Hill's Lane, put up in 1618, and the first brick building, as some people say, erected in Shrewsbury, there was a picturesque porch of the period,

but it has been removed within the last four or five months. The building itself is now used for housing bark and wool. The Monastic Remains, including the Abbey Church and the old pulpit, want proper care. Considering that in the (now destroyed) chapter-house of this establishment England's first authorised Parliament was held, it ought to be kept in general memory and respect; though it is not so often heard of as "Shrewsbury Clock," through the lie of our poet's fat creation. At St. Mary's Church, considerable works have been going on for some time past, and deserve attention. The examples it affords of all the Medieval styles, from late Norman to Perpendicular; its lofty spire, running up to the height of 220 ft., and the admirable stained glass to be found in some of the windows, make it one of the most interesting buildings in the county. Mr. S. P. Smith, who acts as both builder and architect, has had it in his hands for some years, and appears to be doing the work with considerable thoroughness. The nave, with its very handsome roof, is finished; and the plaster has been taken off the walls, and the face of the stonework made perfect. The chancel, divided off at the *crux*, is still in progress. The opening to tower from nave has Norman columns and a Pointed arch above. The nave, on the contrary, is separated from its aisles by an arcade on each side, consisting of semicircular arches on clustered columns with foliage capitals. Mr. Henry Pidgeon, in his careful little "Handbook for the Town of Shrewsbury," says, "although the mouldings on the shafts are peculiar to the

earliest Pointed style, they happily harmonize with the semicircular arches, and were probably additions cut in the thick heavy columns of the original Norman building," to assimilate them with other portions of the structure altered in the thirteenth century. It is quite clear, however, now, whatever may have been the case when Mr. Pidgeon wrote, that the columns and arches are the work of one time,—that time of transition when what we call the Early English style was superseding the Norman. In the course of the recent works the foundation, of concrete, for the original arcade was found, with that of a semicircular abais at the east end of the existing nave. The present nave, by the way, is slightly wider at the west end than it is at the east, and so, too, is the chancel. A grave-stone taken out of the foundation of the nave is sculptured with a serpent and interlacing ornament.

Amongst the glass windows there is one, on the north side of the chancel, particularly interesting. It sets forth, by small groups, incidents in the life of St. Bernard, and has been ascribed to the school of Albert Durer. It shows much fertility in design and power in drawing.

Shrewsbury greatly wants attention. Not long ago some observations in the *Builder* concerning "A Neglected Town on the Severn," were applied to it, and moved the indignation of some who ought rather to have aided any movement there which had improvement in view. Parts of the town are in a most deplorable, degraded, and discreditable state. We fell upon the back slums of Castle-street, a place called Roushill, and should need nothing worse to convict the authorities of scandalous neglect of duty. The present death-rate is a disgrace: but no wonder, with such want of drainage as exists, and when litigation and discussion take the place of wise deeds. The pavement "fanged with murderous stones," is villainous. Opposition on party grounds is manifested to every desired improvement. If one or two members of the Improvement Committee were hanged it would really be no more than they deserve, and it would save hundreds of lives. Indeed, if the act, striking a wholesome terror, served as a warning in other towns, it might save thousands. Pray, gentlemen, sink party differences, and try what can be done by a strong pull altogether to improve the health of your town. While councilmen squabble, men and women die. You would find even a money-profit from such deeds in the long run, and might perhaps lengthen your own lives, and save your children.

Amongst the few new undertakings in Shrewsbury, the Working Men's Hall must be mentioned with commendation, both in respect of purpose and of the building. Mr. Randall, who was the architect, has given them a capital meeting-room for lectures and other similar occasions, brick lined, with tile inscriptions. The refreshment department pays, and those who frequent it seem well satisfied with what is provided for them. Externally they have a sound brick and stone building, with tower, little columns, carved capitals, and other elements of the architecture of to-day. A neat little church and schools have been built just beyond the English Bridge; with red stone bands in the white stone walls. It must be observed by all, by the way, that everywhere throughout the country new buildings are showing thought and taste: the carving is good, and little points of interest, apt inscriptions and so on, are not uncommon.

The collections of the Shropshire Antiquarian Society and the School of Art occupy one building. The former include all that has been found at Wroxeter, once Uriconium,—and this is not a little. Painted stucco from the Roman walls, window glass, the eye-doctor's medicine stamp often mentioned, excellent red pottery, and important pieces of pavements are amongst the relics. It is to be regretted that these are not properly housed on the spot itself,—in the city where they

were found, and which they serve to illustrate. Wroxeter is little more than five miles from Shrewsbury by a charming road, especially at Ateham, where the Severn, the bridge over it, and the church, of red sandstone, ivy-covered, form a beautiful view. The church has one or two points of interest within, and should be looked at. And then comes Lord Berwick's place, Attiegham Hall, with its somewhat stately lodge and handsome grounds.

We are not about to describe Uriconium: that has been done already more than once pretty fully in our pages, and unhappily no fresh investigations have been made for the last three years. A sad pity surely! There lie preserved for us in amber the remains of one of the largest cities built and occupied by the Romans in our land, capable doubtless of throwing great light upon the condition of the country at that time,—upon the life of Roman Britain,—containing evidence, perhaps, of the exact time at which Christianity was adopted in this country; and yet a few thousands of pounds are not forthcoming,—nay, a few hundreds would do a great deal,—to lift the veil that shrouds so much of interest, to open a casket that holds the memories of at least 2,000 years! His Grace the Duke of Cleveland, to whom the land belongs, has shown interest in the study of antiquities, and would, no doubt, co-operate efficiently and liberally with an earnest effort on the part of the public. If the Society of Antiquaries, the British Archaeological Association, and the Archaeological Institute could be prevailed on to take up the matter in earnest, we should soon have the Shropshire Pompeii unveiled. Ascending the mound at the eastern end of the excavations, and remembering that the walls of the city were three miles round, the large area open for investigation is evident. The apartments, baths hypocausts, and areas opened, occupy but a very small space, and so disappoint many visitors who go there. The massive piece of Roman masonry, known as the Old Wall, which has always been above ground, and served to point out to generation after generation where the vestiges of the city were to be found, still remains the most striking feature on the spot. The long narrow building, in three divisions, found on the north side of this, and first identified by the writer of these notes, now some years ago, as the Basilica, has been long covered over again. Let us hope that we may soon see a different spirit prevailing, and a good hand of men at work upon the ground.

The visitor, still standing on the mound, has a glorious prospect. Behind him is the lofty Wrekin covered with wood,—at the time we saw it, a lovely mixture of purple and green. Before him is a noble panorama of hills, including those of Wenlock and Stretton; the Caradoc and the Breidden; while nearer is seen Wroxeter Church and a well-wooded country. Throwing back the mind's eye, we see here one of the largest towns of a British tribe, the Cornavii: not the merely painted savages of popular belief, but men capable of noble actions, and able at any rate to transport and set up, with marvellous regularity, immense stones. Then come in the Romans as masters; and a fine city is built, with columns, scientifically heated and well-drained habitations, public buildings, baths, mosaic pavements, window glass, roofing tiles, and painted decorations. On the hills we now see the Romans grazed. Look to some of the tiles that the civil and careful fellow who has charge of the place will show you, and you will see the shape of the foot of the dog that watched for them, and of the sheep and pigs they owned, left in the soft clay of the tile, walked over before it was burned. Some centuries pass, and then down come a horde of Picts and Scots, if not of Saxons, yet, from over the sea, and the town is sacked and burnt: the inhabitants who do not escape, being murdered.

One old man, who died crouching in a yard, had secured for our information the box of money he had saved, and this serves to tell us that the ruin of the city to which we are referring, took place probably about the middle of the fifth century. The dispossessed inhabitants then build Scrobbes-burg, now Shrewsbury (we know what sort of land we call "scrubs" to this day), and Uriconium remains, heaps of blackened ruins, for centuries untouched for reasons easily understandable. Then comes a time, the Normans dominant, when the ruins serve as quarries for the country round; and then the earth accumulates, and vegetation rots and flourishes and rots again, until a grassy waste covers up from sight the remaining foundations. We may not, however, dwell longer on the story, and must now quit the grounds; first suggesting to Mr. Thomas Wright and other members of the committee, to whom much is owing, that a little roof should be formed over the small portion of tessellated work, a guilloche pattern, remaining on the wall of one of the apartments south of the Old Wall, or it will certainly fall off; and that attention should be given to the masonry over the opening through the Old Wall, at present held up solely by the strength of the mortar used.

Wroxeter church has parts of late Norman date; and there was a building here in Saxon times; the priest's door, in chancel, now blocked up, shows a good zigzag outside, while inside we get a dog-tooth moulding round it. A handsome trefoil-headed opening, with ball-flower round it, and the back painted with representations of the Saviour and angels, was discovered in the north wall of the chancel about two years ago, and has been opened up. In the same part of the church there are some noticeable altar-tombs of late date, with recumbent figures; one in memory of Sir Thomas Bromley, 1555, and his wife; another, painted, dated 1570, for Sir Richard Newport, who married Bromley's daughter; and notably a third, with recumbent figures and this touching legend:—"Here lye the bodies of John Berker of Hauglmond, esq., and Margaret his wife, second daughter of Sir Francis Newport, knight, which Margaret deceased the 12th day of March, anno 1616, she being then of the age of 35 years; and the said John Berker, being in good and perfect health at the decease of the said Margaret, fell ill the day following, and deceased, leaving no issue behind." Ho was himself but forty.

The font, at the western entrance, is made out of what is described in the guide-books as the capital of a Roman column, but it would seem rather to be the base of a column of that period, with a portion of the shaft, which is hollowed out to form the basin. The tower, rebuilt, is mainly of the Perpendicular time, and has some earlier sculptured groups in panels inserted here and there.

At the entrance to the churchyard stand as gateposts two Roman column shafts, each surmounted with a Roman capital that did not originally belong to it. These were brought together, with praiseworthy motive, by Mr. Oadley, who lives close by, and has in his garden ingeniously combined many relics of Uriconium, which were gathered together before the more recent excavations were commenced. The capitals at the gate are both delicately sculptured with two rows of leaves, and should be removed from their present position and placed under cover.

In 1155, as we should have mentioned before, William Fitzalan gave this church of Wroxeter to the Abbey of Hauglmond. Should the visitor wish to know what remains of this abbey, he will go and see; the distance is not great—it is a little nearer to Shrewsbury than Wroxeter, but in another direction,—and he will be well rewarded for his pains. A very curious pile of ruins, indeed, is that of Hauglmond, or, as it is often spelt, Haglmond, Abbey, extensive and varied,—in some parts beautiful. The Abbey was founded by the Fitzalan we have named, and some of the remains,—the south doorway of the church into the cloisters, and the front of the chapter-house,—are of his time, say the middle of the twelfth century, and not earlier. The other remains are of the fourteenth and fifteenth centuries, grievously mauled in modern times by repairers, and include a noble refectory of good Decorated work, at the end of which,—

"A lofty window, hollow in the centre,  
Shorn of its glass of thousand colourings,  
Through which the deeper'd glories once could enter,  
Streaming from off the sun like seraph's wings,  
Now yawns all desolate."

Externally there is a stair turret on each side

of this window, with pyramidal top. A peculiarity is seen in the Norman remains, both in the church door and the doors of the chapter-house, which surprises at first sight; for between the columns of the semicircular-headed doorways,—the view we give of the church-door shows what we mean,\*—stand sculptured statues under crocketed ogee canopies. It is of course obvious, however, that these are the work of later hands, though time has now given one colour to the whole. The courses of the masonry, it will be noticed, run through the figures; the old shaft seen in the view is in several pieces, but the more modern shafts are of one stone each.

Not far from these interesting but vexatious ruins is Battlefield, where we might gossip of Henry IV. and Hotspur, and of the church built, or enlarged, to commemorate the great battle they fought there in the month of July, of the year 1403: but time and space fail. One sentence of friendly advice; one expression of earnest hope, and we finish. There has been a deal of hard fighting done by the brave people of Shrewsbury in old time, the time of bows and hills; and they should now do a little more with weapons of another sort. The enemies they have to cope with at this time are Apathy, Ignorance, and Self-interest; tough ones they are; and by a bloodless battle with these, winning, as they are sure to do if they try, they may give health, save life, and advance the prosperity of their ancient and picturesque town.

#### PUBLIC BUILDINGS IN AMERICA.

STORES: SEWERAGE: CEMETERIES.

The public buildings of America show in an interesting manner the history of the country. At first all those originally erected were copies, more or less correct, of existing models in the old country, carried out as well as the material (frequently wood) would permit, whilst the architectural ideas, and often the plans to carry them out, were brought from this side of the Atlantic. So little were the resources of the country developed, that materials also to a very large extent were imported.

In some of the earlier settled parts of the Union, buildings may yet be found constructed of English materials; and in Massachusetts an Episcopal Church may be seen in a remote rural district sent out bodily complete in every material in the reign of Queen Anne, and exactly representing all the uninteresting architecture of that time.

After a while, as architects began to be employed, and the profession found national representatives, very creditable reproductions of well-known European buildings were erected, being in most cases almost *in fac simile* of the copied type. Girard College, a costly erection of white marble, in Philadelphia, is a reproduction of the Madeleine; and many of the churches of New York, particularly Saint Paul, show how closely the designs of the Wren era have been studied. There is, however, perhaps, less of the English than of the Italian school discernible; and some of the really best buildings in New York, public and private, and especially the earliest large stores, are due to the pencil of an Italian.

Meanwhile in country towns native architects were increasing in numbers. It is amusing to trace how very soon these got tired of copying the lessons in architectural hooks, and began to develop "patterns"—for so only can they be called—of their own. One of the prettiest towns in New England—called lovingly the "City of Elms," on account of the profusion and beauty of its trees, but properly Newhaven—has its streets and suburbs filled with buildings in every outrageous form of the Brighton Pavilion. The leading architect there, having become enamoured by means of a large book of coloured plates and details of that piece of artistic folly, multiplied ludicrous Yankee copies of the style, abounding with notions incongruous and whimsical.

In such days, Gothic was, of course, treated as one may expect, but not worse than may be seen in examples here before the progress of the past twenty-five years had taught architects and the public better.

It is perhaps difficult to say what cognate style now prevails, or at any time prevailed, in America. In Church Pointed architecture, the Perpendicular seems the most favourite expression, and the specimens are no worse than had

specimens of the style are here. The grand church of New York is Trinity,—the first really substantially-built edifice designed by an architect,—but to Englishmen it possesses no features of interest, as its companions may be seen at Knightsbridge and so many other places elsewhere. New Yorkers speak of it as the Cathedral, but of course only in the sense of the mother church, as it does not possess any one of the architectural features of a cathedral. The style is Late Perpendicular, with a lofty nave and clerestory, side aisles, chancel, and tower and crocketed spire in the centre of the western front. Externally, it has flying buttresses, parapets, and all the usual details that might be looked for. The interior is effective, although too dark; and the general fault is a heaviness and clumsiness of ornamentation suggestive rather of the designs of the plasterer than the architect. The carving is due to Thom, the Scottish sculptor. The material is a warmly-coloured free-stone, brought from a neighbouring state, but hardly proving in appearance as yet its claim to satisfactory durability. The congregation have built, in more correct style, a large church "up town," which they somewhat over- modestly call Trinity Chapel. This is gorgeously illuminated and decorated, but lacks effect from the timid hand which dared only experimentize with half-tints and French-looking washes instead of positive colours.

Gracechurch was executed in rivalry with Trinity, and is as bright and gay and glittering as white marble and dazzling stained glass can make it. Its plan is cruciform, and it looks so very white externally, as always to suggest the idea of an enlarged ornament for a christening cake. The very spire is white, which as it is wood in semblance of stone, is in needless rigidity of purity. On the whole, "Old Trinity," as it is called, although erected not more than about thirty years ago, may be allowed its name as the New York Cathedral.

After naming these, it may justly be said that the vast number of New York churches have no especially distinguishing features. It may be mentioned, however, that St. George's, a very large building, is somewhat noticeable, from the fact that its galleries are supported upon brackets built into the walls, and the roof, a very wide span, is carried from wall to wall, thus requiring no columns or other obstructions to sight and sound. A new church in New York, somewhat after the style of Mr. Street, finds many admirers. From the stripy nature of its external finish—intensely red brick and cream-coloured stone,—the people, who are very quick at nicknames, call it the "Church of the Holy Zebra." In Philadelphia the architectural taste is certainly purer than in New York; and some of the public buildings, especially the banks and several insurance offices, are deserving of much praise. All buildings there are under the control of a regular Board; all prices are fixed, and the works measured on completion, and the value determined by its officers. The erections are all of a substantial honest character, and the designs are less adulterated. The markets of this town are admirable in their arrangements, and the appearance of the streets and finish of the houses neatness itself. The "Quaker city," as it is called, well deserves its name—plain, somewhat over formal, but admirably neat and clean, and with a demure, subdued richness, very suggestive of the followers of Penn.

Wonderful as has been the increase of all American towns in the north, and notable the advance in improved conveniences, comforts, and adaptation of buildings to national tastes and wants, there is not yet to be seen any indication of the marked character that American architecture might have been expected by this time to have assumed.

The cause probably is, that the ideas and habits of the people have hardly yet settled into a definite shape, and that accepting the styles of the old world to a sufficient extent to mould them to their own uses, they have not had skill or perhaps their own to develop an expression peculiarly their own. It is rather the fault of architects than of the people. The Yankees, shrewd as they are, are generously credulous in art matters, and yield only too ready a compliance to their professing guides. At present the German element, and that not of a good school, is much in fashion, and many costly and cumbersome erections have been permitted which a coming taste will condemn as unsuited to the material, climate, and habits of the country. The impression left after a pretty long acquaintance with the United States is this, that the intel-

\* See p. 170.

ingenuity and ingenuity of the people have done far more to produce the many excellences of American buildings than the designs of architects. The merchant who requires a town or country house, the directors who erect a bank or an insurance office, and the vestry who desire a church, give much thought and attention to their requirements, and eliminate a plan that might be made much more of had they been better seconded by the architect's aid.

The native members of the profession are too impatient to devote at all the requisite time to study. It is generally taken up as a business "to pay," and any such superfluity as an articulated apprenticeship in an office would be scouted as ridiculous in the extreme. How a man does pick up his qualifications it would be difficult to enquire; however, there are swarms of young men,—English, Irish, and German,—who go out to the country and are glad to accept situations as draughtsmen. These of course may be hired; and the contracts, specifications, and suchlike safeguards to the employer, are got up in so slipshod a way that a very brief experience enables a young man, previously a clerk in a store, or what not, to write "architect" on his sign, and sell plans by the sheet as many as he can have manufactured. Literally manufactured, for an office there abounds in all sorts of contrivances for reproducing drawings with accuracy and despatch; and it is well known that a certain New York architect, who perhaps has had more dwellings and stores to furnish his brethren combined, has recourse to most ingenious amusing contrivances to vary the details of designs, so as to meet the requirement of a hundred elevations, similar in all respects but in some points of embellishment or finish. Stencil plates, figured ruling-wheels to run in an ornamented carved moulding, and other manufacturing appliances were freely used, so that a set of drawings could, in advertising parlance, be undertaken with promptness and despatch at the shortest possible notice.

All this may be looked for in a country where the want of buildings is immediate, and where there is no responsible recognised organ of criticism. Art notices of the press there are, too often, either unmeaning panegyrics or personal abuse; rarely are they written by men educated specially to treat the matters they review.

The large buildings devoted to trade and commerce are more worthy of attention than the public edifices. The stores, as shops are called, are always spacious, lofty, well lighted, and fitted with every convenience for business. Of these, the buildings devoted to purposes of refreshment are very numerous, and deserve special attention. Nothing in London will compare with, and nothing in Paris surpasses, the best restaurants of New York. A celebrated one, the well-known Delmonico's, is a perfect model for a building of its kind. There have been other editions of this popular establishment, each one in its time the wonder of the city and eclipsed by its successor. The last new structure is on so vast and comprehensive a scale of convenience and elegance, as to leave nothing more to be desired; it is the only building of the kind where a man may find enormous space not incompatible with perfect quiet and comfort.

American towns abound with underground establishments of the same kind. The Germans much affect these; and there arc vast cellars, like long streets, in which hundreds of barrels of *lager-bier* are emptied; but, as may well be imagined, they are warm and badly ventilated, although frequently fitted up with much magnificence.

Confectionery, too, has its palaces. The American lasses, like their Spanish sisters, are very fond of "dulces," and splendid establishments are devoted to ices, chocolate, and suchlike trifles. One of these has so enormous a supply to provide, that the ice creams are manufactured by steam. It will not, it is hoped, be thought too trivial to state that American ice-creams are exceedingly cheap and good, and may have an enormous consumption.

The bars and drinking establishments have been too often described to need remark: the most noted are attached to the hotels, of which they in fact constitute the chief support.

Builders would, however, do well to note the universal use of marble for flooring, and the utter absence of all woolen stuffs or upholstery. The rooms are always free from dead air and stuffy reminiscences of departed dinners, and are kept as cool as the great heats of summer

will allow. A very brilliant white paint is much used in such buildings, composed of zinc and colourless varnish, taking a very high marble-like polish and retaining no stain. Well washed, and the paint constantly renewed, the walls have a pure coolness of effect. The window and door openings are enormously large, and are filled with blinds, made as before described. Most of them are fitted with pukkas, or movable flapping fans, of light material, suspended from the ceiling, and kept in motion by machinery.

Anything like our tap-rooms or gin-palaces is utterly unknown in American towns,—at least, in the North. There are abominations in the shape of "corner groceries," as they are called, where grocers, principally Germans, vend liquors even more poisonous than our own, and are frequented by the lowest class; but there is nothing in the appearance of a first-class American bar other than one of tasteful magnificence, cleanliness, and order. This can only be said of the large cities. The watering-places have in their huge barrack-like buildings,—gaunt, glaring affairs, most unattractive and mean,—the very strangest effect upon a European. The Americans certainly have no aptitude for life in the country, and all their favourite places of leisure resort only reproduce in their hotels city life and habits. Much as has been said in praise of the arrangements of many American hotels, not one hand can be raised in approbation of the accommodations, and the life at any of the fashionable watering-places.

Club-houses are beginning to be in great request in all the large cities, and are rapidly increasing in number and splendour. As a consequence, it is also a fact that the exclusive system of our own hotel life is making way in America; private rooms and private tables are in many houses rather the rule than the exception, and it is pretty well understood that the once time-honoured use of the hotel bar is not considered quite the thing now amongst the "upper ten."

In the American streets the first thing that strikes the eye is the height and regularity of the awnings protecting the shop-windows. These always extend the full width of the pavement, or sidewalk, as it is there called, and are carried upon iron pillars of uniform height. The covering is usually canvas or india-rubber cloth, which rolls up by machinery, as with us. Opposite each shop-door is an opening in the overhanging drop-piece, so that crossing from one side of the street to the other is not impeded. The shop is internally of uniform width from front to rear, the staircase being in common to all the floors above, which generally are tenanted by different occupants. The staircase being wide and open to view, forms a peculiar feature in the appearance of a block of American stores. The shops are lofty and the windows large,—usually a wide sheet of glass on each side, with the doorway in the centre. The great depth of these stores renders some mode of interlighting necessary. The usual plan is to have glass flooring, or illuminators overhead, although many buildings are arranged with an air and light shaft from the roof to the lowest floor.

The most unfavourable appearance of American street fronts is from the utter absence of all congruity of design in regard to height. The finish of the cornice, projection, and style of roof, are as varied as possible to imagine; and, as it is very rarely, indeed, that owners combine in the attempt to produce a uniform facade, even for a single block, the really handsome elevations, and the beauty and reality of the material, are not duly appreciated. "Each one for himself" is plainly the motto; so that when a hotel intervenes, and fills up with its large front a great length of block, its appearance is hailed as a positive relief. Most of the large hotels in New York are thus placed, and as they do not recede from the line of continuous building, they greatly help to give something like effect to the street architecture of Broadway.

The sanitary arrangements of most of the large American cities deserve attention. New York and Philadelphia are so admirably placed, each between two mighty rivers, that a very little has been required, and nothing especially noteworthy recurs to memory in regard to the latter town. In New York, however, there have been some admirable arrangements carried out for many years that have greatly relieved the city of its sewage. In the first place, all the ashes and house refuse are required to be put out in proper receptacles early in the morning, and are collected each day by daybreak. There are no dust bins or pits; but the inhabitants gene-

rally use iron boxes or barrels, and these are emptied, cleaned, and returned to each house early every day. All the sweepings of the streets, markets, &c., are collected every night, and are conveyed in properly-constructed carts to certain places by the water side, where their contents are received in iron flat boats expressly contrived for the purpose. These when filled are towed out before daylight, by a steamer employed by the city, and discharge their contents upon an island some miles distant, called Barren Island. All bone-boiling establishments and other recognised sources of nuisances, are by law compelled to be carried to this island, where there is an immense factory of artificial manure from the refuse brought to its shores. The natural situation of this large and densely populated city is so favourable for sanitary purposes, that it is not surprising that the system of general drainage has hardly been fully developed. There is, however, one custom that in the present lively sensitiveness to all things appertaining to sanitary measures, is worth investigating. A machine is used for the purpose of emptying cesspools and other receptacles, which is perhaps unknown here. It consists of a large air-tight metal cylinder, in shape and size somewhat like a locomotive boiler, mounted upon wheels, and drawn by one or a pair of horses. This cylinder has its air exhausted by an air-pump, and attached to it is a leather hose of large size, which is dropped down into the receptacle to be cleaned. Upon opening a valve, the contents, solid matter and all, are quickly drawn by atmospheric pressure into the cylinder, and when all is done the hose is drawn up, coiled into its barrel (filled with disinfecting fluid), and the machine rolls off to the boats before mentioned by the waterside. Many large blocks of houses, in the best part of the city, prefer this mode of drainage, all the houses emptying into one large well-made air-tight receptacle, well ventilated at top by connecting with an air shaft, and having a cover tightly keyed down, which is removed at night when the machine comes upon its regularly-timed errand. Very probably this system of sewage, the details of which are fully known to the writer, might be found exceedingly valuable in many inland towns, and such localities where the question of outfall presented unusual difficulty. Its cheapness, and the ready mode it presents of increase and enlargement, give it advantages; and as the proper working of the system depends upon the perfect tightness and the ventilation of the several receptacles, all the well-known and serious objections to ordinary cesspools are removed. The street sewers carry off the rain-fall.

The Croton Aqueduct, which supplies to New York water of excellent quality, brought from about forty miles from the city, is a well-known work, and is an admirable specimen of engineering skill. It conveys the water from such an elevation as to give it a natural flow to the highest required levels, and is provided in almost lavish profusion to every house.

Philadelphia is supplied from the Schuylkill River, the force of the current working enormous pumps which lift the water into a receiving reservoir, with sufficient head to convey it all over the city. The pumping-engines that do this work are considered admirable specimens of hydraulic machinery.

The cemeteries of America have often been admirably described. We might well take lessons from Greenwood, near New York; from Mount Auburn, and Laurel Hill. The beauty, extent, and cheerfulness of the grounds, and the exquisite neatness and order with which everything is kept are alike admirable and praiseworthy. Of course many peculiarities of individual taste may be seen; but, on the whole, the sentiment of the designs is touchingly appropriate, and the decorum and yet freedom from gloom of the places at large is very pleasant to contemplate. The small cost of interment in Greenwood is remarkable, when the certainty with which the memorials entrusted to the charge of the officials will be sedulously cared for, is considered. Nearly eight years ago a dear little child was consigned to the earth, in an inexpensive manner, in Greenwood; and yet, without hope of fee, and without any special care of friends near the spot, recent reports declare the little memorial left there to have been kept clean and perfect, and as much cared for as if it had been in one's own garden-ground, and close at hand.

No materials of a perishable nature are permitted to be used, and so far the climate seems

to promise a satisfactory durability to the monuments that have been erected. White marble, polished granite, and the brown and free stones of Connecticut, New Jersey, and Nova Scotia compose them; and as the size of each lot is liberal, and the rules compel considerable space between each grave or vault, there is not in any American cemetery the appearance of a stationary yard, so usual in our own places set apart for consignment of the dead.

#### BOOKS OF REFERENCE FOR ARCHITECTS AND ENGINEERS.

It has become a practice with publishers to issue books of a certain class without dates. This is better than misleading; but either system causes trouble to that useful class of men, the bibliographers, and to reviewers; and if it were the practice, as often suggested, to give the date of publication exact to the month, or even day, the advantages to many readers and inquirers would be great. Publications of second editions are much too often produced without the sanction of the original author; or they are made the vehicle for correction of defects that might, with proper care, have been prevented in the first edition,—that which the public were induced to take as correct, and so provide means for outlay on the edition following. There will be exceptions: in the case of some works, publication may be required in order to get sufficient revision,—which no single author would accomplish without assistance from his readers; but, generally, a second edition of a work should not appear without contemporaneous separate publication of the corrections and additions, in the form of pages purchasable by the possessors of the first edition. There would be greater readiness to purchase books, if the buyer had reason to believe that his property would not be deteriorated otherwise than necessarily by the progress of time, and the addition of new matter. And if one of the accompaniments of a change in the system were the publication of a smaller number of manuals, remembrancers, and rudimentary and educational works,—those published being as they would be likely to be, better,—knowledge would gain. Let literature be cheapened; let libraries be multiplied; let reference to books become within the reach of every student, and of every one engaged in a profession or trade: but it is possible to have too many publications. Where variation is made that is no improvement, there is no gain, but rather obstruction to progress; better than the publication of the new work, would have been the enlargement originally of the edition of the old.

These remarks do not mean to preclude future publications such as that of a class of books which are of great importance, giving tables and data for the reference of architects. There is nothing existent that exactly accords with our ideas of the requisites in pocket-remembrancers and office-books: though, as usual when a like observation has to be made, there are many works that have considerable merit in them, and from which useful hints could be taken.

Mr. Campin's "Engineer's Pocket Remembrancer," is not by any means the least useful book of its class. A copy of the second edition of the work is now before us, and has suggested some of these remarks.\* Judging from the preface, this publication, excepting the short appendix, is a simple reprint of a volume issued in 1853; but as there is no date on the title-page, and no mention of revision by the original author, we are left in doubt on two points, the real date of the matter in the "second edition," and whether Mr. Campin gives his imprimatur to it.

But we may say that an attempt to supply a book adapted for the pocket and the office in the same volume, is a mistake: in the one case, what is produced is too bulky,—that is, if the volume contain what will be wanted; in the other case, the work does not contain a great number of tables that will be required. The idea seems not to have occurred to any one to issue two companion volumes, of opposite

dimensions, the pocket-volume referring to the other, and being printed in very small but very good type. Where tables are already published, sufficient to render unnecessary and undesirable the publication of fresh ones, as in the case of tables of simple and compound interest, chemical tables, and others, it might be sufficient to refer in the pocket-book and the office-book, to those tables, where to be found; but, generally, the data, rules, and formulae, for architects' use, require both addition to their number in published volumes, and better and more easily to be comprehended tabulation and optimization. The builder's price-books in particular require better and more logical arrangement of columns, headings, and items. This we have often said.

The object of Mr. Campin's volume, in 1853, as stated by him, was "to supply the practical engineer with a pocket or office book in a concise form, containing all that is commonly required in the shape of tables and rules, to facilitate the various calculations which furnish the means by which the dimensions and proportions of works are determined." The rules and formulae are from a collection made by the author for his own use, some of them being original, and others simplified or corrected. Verbal rules and formulae, with examples, both, are given. The reasoning upon which the rules and formulae are based, is omitted, in order not to render the work bulky; and, at the date mentioned, the author claimed to have taken great care in the preparation of the tables, and in checking the printing of the formulae. But we should have preferred different methods of notation to those which we find in the present edition, as where a point that will be mistaken by many students for the sign of a decimal is used, and which indeed may interfere with ready reference generally. For illustration of what we allude to, we may adduce the first page of the rules and formulae relating to roofs. Here, figures, in place of letters, of reference, have been used for the diagrams, and are given in the text as though not an indication of a point or member of the truss, but as a dimension including a decimal. To show that no amount of care can be considered excessive in works of this class, we may mention that, on the page that we have spoken of, a mere printer's blunder, by raising one line of type too high, has made the figures  $10 \times 20 \times 10 \times 21$  equal to 15. If the number of handbooks were less, and more attention were given to the production and subsequent perfection of one work, or of the companion-volumes that we have suggested, such defects as we have instanced would be eliminated. It must not be supposed that the like shortcomings do not occasion trouble to those who are thoroughly qualified to use rules and formulae.

One addition there is, that we are decidedly of opinion, should be made to an office-book. We mean the names of the authorities. The insertion would not absorb much space. Mr. Campin states only generally in his preface, names of those whose works he has consulted. When we have given us weights of different kinds of timber and metals, and strength of such materials, it is often desirable to know upon whose experiments the figures rest; for, records of experiments do not always agree; besides, as no one knows better than Mr. Campin, to state that cast iron has a tensile strength of 17,628 lb., or 7·87 tons per square inch, and a compressive resistance of 120,000 lb., or 53·57 tons per square inch, is really, without the authority, insufficient information, since the strength may differ widely of these figures, or according to the make of iron, which is a point that in calculations has to be taken into account.

These observations refer to what are rather *lacuna* than defects in the present work; which is one that good use may be made of. Its tables of data include squares, cubes, and roots of numbers; areas and circumferences of circles; logarithms; natural sines and cosines, and tangents and cotangents; logarithmic sines, &c., decimals of feet, curvature and refraction, pressure of wind, Birmingham wire-gauge, coefficients of friction, strength of materials, and properties of steam, besides some "useful notes" to which we have alluded. In these last, many things, such as the weight of brickwork, are wanting. The first three parts of the Rules and Formulae comprise the calculations relating to mechanics generally of solids, liquids, and gases; and these are followed by rules for estimating weights of materials, and areas and contents, as in earthwork, and by rules for determining proportions of thermo-dynamic en-

gines, boilers, bridges and girders, arches and chains, roadway-plates, roofs, retaining-walls, and various matters in connexion with railways, and with gas, marine and hydraulic, lighthouse and electric engineering, respectively, and for surveying. The body of the work concludes with rules for the use of logarithms. The Appendix, of half a dozen pages, treats of "Calculations as applied practically to Engineering Purposes." It is given "in order to enable the student—or such as are unused to calculation—the more readily to modify or extend formulae, or find new ones if necessary;" but parts of it are not sufficiently elementary to attain the object.
