THE EDITORS

SIR DONALD MACKENZIE WALLACE, K.C.I.E., K.C.V.O.

ARTHUR T. HADLEY, LL.D., President of Yale.

HUGH CHISHOLM, B.A. (Formerly Scholar of C.C.C. Oxford)

THE DEPARTMENTAL EDITORS

FOR LAW AND GOVERNMENT:
The Hon. Sir John Scott, K.C.M.G., Deputy Judge-Advocate-General.

FOR MILITARY AFFAIRS:
Sir George Sydenham Clarke, K.C.M.G., F.R.S.

FOR MEDICAL SCIENCE:
D. Noel Paton, M.D., B.SC., F.R.C.P.ED.

FOR THEOLOGY:
Rev. W. E. Collins, M.A., Prof. of Ecclesiastical Hist. at King's Coll., Lond.

FOR MINING:
Henry M. Howe, A.M., Prof. of Metallurgy at Columbia University.

FOR BOTANY:
D. H. Scott, M.A., PH.D., F.R.S., Hon. Keeper, Jodrell Laboratory, Kew.

FOR GEOGRAPHY AND STATISTICS:
J. Scott Keltie, F.S.S., F.S.A.SCOT., LL.D., Sec. Roy. Geog. Soc.

FOR ASTRONOMY:
Simon Newcomb, PH.D., LL.D.

FOR MATHEMATICS:
Joseph Larmor, M.A., D.SC., SEC.R.S., University Lecturer in Mathematics, Cambridge.

FOR ELECTRICITY:
J. A. Fleming, M.A., D.SC., F.R.S., Prof. of Electrical Engineering, Univ. Coll., London.

FOR ART:
M. H. Spielmann, Editor of the *Magazine of Art.*

FOR ZOOLOGY:
G. Herbert Fowler, PH.D.

FOR NAVAL AFFAIRS:
Jas. Richard Thursfield, M.A.

FOR BIOGRAPHY:
Richard Garnett, C.B., LL.D.

FOR LITERATURE:
Edmund Gosse, LL.D.

FOR ECONOMICS:
Wynnard Hooper, M.A.

FOR RAILWAYS:
Major Henry G. Prout, Editor of *Railroad Gazette*, N.Y.

FOR MUSIC:
J. A. Fuller Maitland, M.A., F.S.A.

FOR GAMES AND SPORTS:
Alfred Watson, Editor of the *Badminton Library.*

PREFATORY ESSAY: THE INFLUENCE OF COMMERCE ON INTERNATIONAL CONFLICT.
FREDERICK GREENWOOD.

PREFATORY ESSAY.

THE INFLUENCE OF COMMERCE ON INTERNATIONAL CONFLICT.

By Frederick Greenwood.

TRADE is almost as old as the beginnings of human speech, and may be counted among the first and best uses to which speech was turned. When we think of the conditions amid which it arose in the still most fascinating guise of barter, what a pity it seems that there was no mind wise enough to understand what had happened, no fancy bright enough to catch and reflect the beauty of its promise! The practice began, we may suppose, in the village communities of the time as a neighbourly convenience, since every exchange of what was needed less for what was wanted more struck out the spark of pleased surprise which to this day makes the happiest bargains. A far greater pleasure was missed by those first bargainers for want of wit to comprehend it. Men were already men and far advanced from all other creatures, but yet were incapable of knowing what an immensity of change began with acquisition by barter, and too insensitive to feel or to care for the distance at which it placed them from the brutes, though by one remove alone. Its infancy being so purely innocent, in a world all rapine for both man and beast, the goodness that came in the train of its material advantage must have seemed to any high human intelligence the promise of a heaven-for-earth transformation. But no such intelligence existed to mark the change, dwell upon its meanings, mark its potentialities, and blamelessly commit the mistake that was made hundreds of thousands of years afterwards with no excuse whatever.

The earliest conditions of trade.

For, take any great intellect that we know of, suppose it at work at the time when acquisition by barter crept in upon acquisition by capture and robbery, and we see that such a mind might be pardoned for prophesying complete regeneration for mankind. If he saw in this simple innovation something that we might compare with another Speaking of the Word as in the Book of Genesis, still he might be pardoned. For he himself would have known no other dispensation on earth than that which included man in one order of life with the beasts, if not in one law of being, and he can have seen no such means of departure from that state as he discovered when mine became thine and thine became mine to the profit and pleasure of both. This was indeed to go upon new paths altogether, and thence toward others yet more remote from the dread domain of tooth and claw. Following upon the invention of barter, many undreamt-of kinds of good, as great as or far greater than itself, would have been apparent at once to a divining intelligence; and as the moral good which accompanies material advantage may be counted upon more surely than any other, and since barter was all innocence at the beginning and seemingly incapable of vice, prediction that mankind would be led to its utmost perfection by trade might have been uttered by the wisest in those days.

The truth, then, seems to be that wisdom was saved from disappointment in this momentous particular by having no existence. Trade prospered and no doubt did great things in ages impenetrably dark; but we must believe that before there was brain enough in any head to breed reasoned dreams of the future of mankind, trade had revealed its demerits and insufficiency. That, however, is to speak in the ordinary loose way. Like many other things that we accuse of degrading or otherwise damaging the mind of man, trade is in no way harmful of itself, but only as offering employment and satisfaction for some of the worst as well as the most wholesome cravings of human nature. Morally, it was at its best at first, or so it is reasonable to think; for we have actual observation to go by besides well-grounded conjecture. The earliest or almost the earliest conditions of trade have lasted here and there to our own time. The trappers of the Hudson's Bay Company found them in North America; they were little changed in the South Sea Islands when our traffic began there; so they remain in Africa among peoples and tribes in various stages of advancement from the man-brute borderland. And when we mark what barter is among such peoples, we must conclude that it has least guile where intelligence is most rudimentary. There we see where the fault lies if barter has achieved no such mission as, at its beginning, might have seemed worthy of Providential design, and was even thought capable of after ages of failure from its high possibilities as a civilizing agency. Yet its achievements for good (the acknowledgment is unnecessary, and yet must not be withheld) have been immensely great in every kind. Much as they have been exalted, they might still be praised without stint or antiphone if we could be sure that the set-off which must be placed against them in the sharpening of unbeneficent faculties, the stimulation of the lower passions and ambitions, is a dwindling and not a rising quantity. That, however, is much in doubt at present; and since at the same time all the political and social forces of the world are moving in unexampled volume and rapidity, the difference involved in the doubt is of such importance that it can hardly be exceeded.

Whoso looks forward to the influence of trade, now that it has become the one grand object of contention with Governments and peoples, naturally looks back also for what light the past may afford. The whole history can never be known. It would be a comparatively easy study if it began with Greece and Rome, or perhaps beyond them with Egypt and the great Semitic empires whose history enlarges at such a rate under the discovery of to-day. But the same inquiry makes out that this which was "the ancient world" of our grandfathers had other ancient worlds—empires and civilizations not unworthy of those high-sounding names, though now without intelligible record. How they were established, or, what is more to our purpose, how they were maintained, is unlikely to be ever known in particulars; but though their successors flourished more by trade than was lately believed, we must suppose that tribute and not trade was the main support of them all. As it was with the later civilizations of old, so no doubt it was with the earlier. All were built up, under the simple dispensation of the prime, by conquest, plunder, subjugation, and attained to increasing degrees of magnificence by tribute; though not without help from trade, nor, of course, from the arts that were fed from both. In substance this is the history of the ancient empires that we know most about (its reversal, the story of their fall), and the unended tale may be read, with certain differences for the better and some disguises not so much so, in the chronicles of the kingdoms of the modern world. Spain, Portugal, Holland, England herself but a century or two ago, became rich by exploitation which might almost as well be called tribute as trade in some cases, more than as well in others; yet trade was the common name for it, as now it is for ruthless and unashamed extortions of conquest in West Africa.

Looking back, then, it seems that trade, to speak of it in the larger, newer meaning of the word, has never been dissociated from aggression, for we can scarcely except such periods in the history of nations when they rested from conquest in the enjoyment of its gains. The tradition is unbroken, though it starts from before the Flood. It goes on from utter barbarism through one civilization to another, and through the darkness of the intervals between one and another. With but little change of circumstance, small softening of conditions, what it was at the beginning may be seen to-day in the Congo country. That, however, may be regarded as a strange and unexpected "survival"—an illustrative particular. The general statement is broad enough that arms and adventure were at the making of all the trade of the modern world; but still with this advantage to the spirit of conquest, that it took to itself a benign and profitable purpose, and this advantage to commerce, that it shared in the romance of outland enterprise and the glory of war by sea and land.

No people should be more sensibly aware of this ancient association than the English, one of whose most cherished recollections is the adventure of their great sea captains in "the Spanish main"; adventure which, though understood to be piratical, is not remembered for that, but for its splendid belligerency combined with its high commercial character. After that time the association of war and trade became more familiar; and yet it was in England, in the latest and most enlightened century of the Christian era, that trade was discovered to be the natural foe and destined subverter of war. And so recently as the fifth month of the second year of the present century there arose (was it from the New World?) the phantom of a reason for thinking that this strange thing might be true. But at the time of which we speak—the thirty years from 1840, or thereabout—trade had not yet produced its brood of monster millionaires, nor was there a dream of such a progeny to be proved absurd by the economic science of the day. Even as a fancy of that commerce-worshipping time, there was no conception of Finance as an organism great enough to supersede war, or to do so inasmuch as the old barbaric methods of conquest applied to the subversion of rival States, the wounding of their prestige, the reduction of their security, the transfer of their honours and their means of prospering. We to whom the phantom made its entirely unexpected first appearance are at liberty to interpret by it, if we please, the prophecy that commerce would banish war; but we may not do so as if any such fulfilment had been looked for. All that the phantom portends (if it is to be considered a portent) is the supersession of the tiger by the stoat, which is far below the meaning of our prophets—far below it and very different. The commercial enthusiasm of fifty years since predicted an internationalism of the peoples, brought about by a great extension of trade, the consequent discovery in practice of its true principles as they apply between nation and nation—above all, discovery of the fatal hostility of militarism to industrial progress, the sole means of advancement for the masses of mankind. Militarism retains them under the old dispensation with its universal "law of the beasts," Industrialism opens the only broad path of emergence from it; and the road had never stood so clear as at the time we speak of. Till then commerce had moved in slow and narrow ways, often obstructed and not seldom destroyed. Now, equipped to a wonder by Science, Invention, Discovery, all working together as if from a reserve of forces held back for thousands of years for its timely use, commerce made such play to such beneficent effect that it might well be supposed capable of more than its own advancement. The abolition of war, the institution of a reign of peace throughout the civilized world, was very much more; but it was accepted as probable by most thoughtful minds—of course we mean in England. Moderately stated, the expectation was that commerce, spreading rapidly from this the grand centre of its enterprise over all the civilized nations, would draw their peoples into a common interest. Better acquaintance with each other, which trade intercourse would procure and its amenities improve, must break down the absurd old race hatreds; they would disappear. That accomplished, it would be no longer easy for monarchs and their ministers to attempt their gambling ambitions, or to indulge or avenge their mere personal pride, by plunging their people into war. It would be the less easy to do so because the spread of commerce was the diffusion of enlightenment as to the truest interests of the nations; and while no people would henceforth be willing to cut the throats of another merely because they were foreigners, neither would it permit interruption of its new-found blessings by quarrels that ought to be settled in the wise merchant way: by arbitration.

Dreams of the extinction of war.

This was the argument of sobriety and the philosophical. Enthusiasm, of course, was far more eloquently and confidently prophetic, yet not as departing from the approved common sense of the day, or from the postulate on which in one shape or another its social philosophy rested almost entirely: to wit, that the most constant factor in human and therefore in national affairs is an intelligent appreciation of private interests. Grounded upon a dogma so safe and respectable as this, enthusiasm could ply the lyre without ever seeming to be visionary or romantic; and how much there was of it, how much of this enthusiasm even in unemotional and uncommercial persons, would seem exaggerated if told to men who were born in a later day.

No romance, only rejoicing perception of a thing assured; and yet what did these anticipations amount to? In effect, they were the anticipations which, according to our supposition, a keenly imaginative intelligence would have drawn from the first use of barter in a world where appetite and force were all the law; yet they never found common acceptance till fifty years ago. All the promise that barter brought into the world was visible from before the time when there was mind enough to comprehend it; the saving practice continued and spread for thousands of generations; and not till these generations of thinking men had passed away did the belief arise that commerce, the born antagonist of war, would overcome it forthwith. It can hardly be that so much confidence against so much experience was ever shown before; and we may also say, considering what the abolition of war signifies, and how much else would go with it, that never was so tremendous a revolution of the moral order contemplated with such matter-of-fact composure. The abolition of war was of course understood by the enthusiasts of commerce as an immense achievement; but it evidently figured in their minds as a vaster abolition of the corn-laws might, rather than as the victory it would be over passions, instincts, impulses continued through ages of inheritance from primeval man. That it would mark a great moral departure in every way was of course recognized and joyfully proclaimed; but the reward of the great achievement reserved for trade which occupied the foremost place in expectation was the unchecked advance of trade itself.

The domestic history of that time is so poorly recorded that the new generation hardly knows how much of explanation there is for hopes and forecasts so absurdly optimistic. It has been said above that sixty years ago it seemed as if Science, Invention, Discovery, were all working for commerce as if from a reserve of equipment held back for thousands of years for its use when the right hour had come. To most readers of the new volumes of the *Encyclopædia Britannica* this will seem a more or less acceptable flower of speech, meant to adorn and with no other meaning. But in the known history of the world there have been strange concatenations of change from unknown causes, sudden rushes to development as if by the operation of prepared forces biding their time and strangely hiding in concealment: it is hard to understand how they should have been concealed. Such occurrences, when they happen, naturally take the imagination of men, to their exaltation if fortunate; and our little flower of speech describes one of them without much aid from fancy. The reality is that though the human mind, and the practice of inquiry, and the direction of it by the more importunate needs and aspirations of mankind, have been the same and ever active from time immemorial, there never was such a display of invention and discovery of a certain order as that which suddenly began in the earlier half of the 19th century. It does seem as if these intellectual agencies, theretofore quiescent though not for want of instigation, had found their appointed time and hastened to heap their hoarded services on industry and trade. The present generation is so familiar with the achievements of science in mastering the secrets and harnessing the forces of Nature as to be almost *blasé* with them. But in their first days these achievements were veritable wonders—wonders in themselves, their novelty, their voluminous advance; and since by some new mystery all seemed addressed to the aggrandisement of trade, it is not very surprising that there should be an enthusiasm of commerce in which it was regarded as an instrument of Destiny. The beneficence of its aggrandisement—that could be seen far better then than now. Not long before the rise of Modern Invention, England had laboured year after year in the worst impoverishment of a most glorious but most exhausting war. There is a sense in which working men were right when they used to say that "war makes good for trade." But the time in which it seems to do so is short, as the wars that England was engaged in at the beginning of the last and the close of the preceding century were not; they were followed by many years of industrial lassitude; and this the people had to endure under a weight and a variety of taxation which the financier of to-day stares at incredulously. Even when trade had begun to revive, the general distress was great enough to break out from time to time in violent disturbance, which even after 1840 was sufficiently serious to alarm the Government. Such were the conditions in which the country stood when the released spirits of Invention and Discovery supplied commerce with their magic, easing its processes, enlarging its forces, multiplying its chances, shortening and smoothing every path that it came and went upon. Nor was there any tarrying of results. To other wonders was added the rapidity with which (the enormous first-advantages of free trade assisting) the whole country was filled with material prosperity and the knowledge of the way to more. In twenty years the world was so transformed that no saying was so common as that if one came from the dead he would not know it for the world he had left. No one who is able to cast back his mind from these times to those will lack excuse for the prodigious pride in itself which commerce then displayed, or wonder much at the extravagant elation of its dreams.

Unless some individual participants in the United States must be taken into account, the extravagance was entirely English; but for that there is the further excuse that England was the birthplace of the New Day, the first recipient and distributor of its bounties. Nowhere else in the world (it has been said before) could the gifts of Science, of Invention, have been put to such use and increase. The boast holds no longer, but in that day England had a population of artificers that could be equalled nowhere. A very pretty breed has been produced in the United States since that time, but in the "'thirties" and "'forties" of the last century there was a larger and readier supply of mechanical aptitude in the British islands than any other nation could furnish. The indispensable material to begin upon, coal and iron, lay ready to hand in matchless abundance, and the advantage of its possession was greatly increased by the coal and iron being found close together. Beyond the seas which bounded all this good fortune were many growing colonies, and one vast dependency with a swarming population all ready for the new traffic. Elsewhere the enterprise of the country and the excellence of its goods had founded markets half over the world, and the road to those markets was familiar to the largest and best protected mercantile marine that the world had ever known. From its geographical position (which one great canal has strengthened and another may impair) London remained the most convenient port of distribution then open to trade; and, lastly, there was no lack of capital. Though a comparatively poor country as measured by the standard of riches in these days, there was money enough in England for all the needs of enterprise, with a stronger backing of credit than any other could command. The possession of so complete and unique a series of advantages was of course fortuitous, but (we know the universal superstition of mankind) in relation with the other wonders of the time it had a look of destiny. It is the foible of every great nation to conceive itself, at one period or another, chosen to work out some mighty change for good, and if the dream was that commerce was to bring about a saving order of things, and to do so in the end by banishing war, it was a dream that England had more excuse for giving way to than her commercial power, potentiality, opportunity, supplied. This is true because the ascendancy of the England of that day was not commercial only. When the moral influences which she was to enlist for the extinction of war had yet to operate, England could all but ordain peace as the most commanding belligerent power in Europe. That was her position at the time of which we speak; and it completes the explanation and excuse of illusions that were to be destroyed as completely as was the unhappy town of St Pierre, by similar forces though not of the physical world, and with the accompaniment of similar reflections.

British ascendancy in 1840.

There was also some egotism to pardon in this dream of the commercial redemption of man, for at every view of it Britain figured as prophet, priest, pioneer, and the greatest gainer of all whether in goods or glory. But it would be a far blacker fault to suppose the forecast a romance of selfishness, and thoughtless to deny it a superficial plausibility. As we have said, the expectation that science-taught commerce would work miracles was not formed till marvels had been wrought. To the eyes of the generation that saw its rise its bounties were prodigies; and though we should wonder now if it did not spread widely and rapidly through the land, it was a new thing then that it did. And we have always to remember the times which that generation looked back upon. Of wars there had been enough, whether for the good they secure or the ill they bequeath. Poverty was universal. Material prosperity, though not the noblest thing on earth, had become the first thing needful for all the populations of Europe, for the people of Great Britain almost as much as any. When in such conditions the means of material prosperity were suddenly enlarged, as if by a providential awakening of faculties half dormant in the human mind, and when the new dispensation had shown the substantiality of its benefactions and their fruitfulness, the thought that the people would never let those benefactions go was bred in the air. That commerce would banish war was only another expression of the same thought, or rather the expression of its specific meaning; and, in the mood then prevalent, we can feel how captivating was the persuasion that influences making strongly for peace and good-will would extend and still extend with the expansion of international traffic. Nor was there any mistake as to the reality or the character of those influences. The mistake was in assuming their future predominance, in discarding the consideration that trade has other incitements than those which bring individuals or nations under the rule of interdependence. To be sure, rivalry with England for commercial supremacy was only thought of then by Englishmen as a pleasing impossibility, unless, indeed, for the United States in a hundred years or so. But the calculation that commerce would abolish war, what ground did it stand upon? It was that, convinced of the more substantial glories of peace, freed by trade intercourse from the barbaric prejudice of race, the European peoples would no longer allow the old wars for the lust of conquest and the pride of aggrandisement by subjugation. But that should have suggested two questions at least: firstly, whether in so doing the European peoples would contentedly resign all ambition to excel, whether they would not begin to think of striving with England for equality in the larger fields of the greatest good; and, secondly, what the difference is, in practice, between the contention of individuals for trade and the strife of nations. The usual resort in the one case is to "cut rates," in the other—— ?

There were many men in England, of course, who doubted that the victories of trade could include extinction of the Old Adam in Governments and peoples in the summary way that was looked for, if ever at all; but a certain association of the new cult with religion strengthened the natural inclination to silence in face of a joyfully confident and very large majority. Many of the best minds in the country, too, indulged the hope or permitted the belief, which soon found a creeping admittance into the regulation of public affairs. Confidence in immunity from attack, acting congenially upon the official negligence which may hope to figure largely in England's epitaph, had impoverished the Services; the Manchester idea covered the impoverishment with a spurious but hard-wearing moral sanction. Mr Gladstone's first budget was a product of the time in its heyday. It was framed in 1853,—"a large plan which," said his colleague Lord John Russell, "it rejoices me to be a party to"; and a boldly meritorious budget it was, with this peculiarity: it included a scheme for the extinction of income tax,—a scheme, however, which was to be carried out by a comprehensive rearrangement of the national finances extending over seven years! Seven years of unbroken peace were needed for working out the scheme; continued peace thereafter was necessary for its enjoyment; and therefore, to the foreknowledge of its author, the success of his plan would have been but a *succès pour rire* if it ran but for a year or two after completion. Confidence in the remoteness of war could hardly be more clearly shown than by the proposal of such a scheme on such conditions; but the whole significance of this illustration of the persuasions of the time is not seen till we remember that Mr Gladstone's confidence in his plan included confidence that the House of Commons and the public would make no difficulty of its essential premisses—as in fact they did not. That was done by war itself (the war in 1854) which even while the seven-year scheme was yet untried, had stalked across the horizon.

Subsequent course of international relations.

From the fact that Mr Gladstone's prepossessions on this great matter remained unshaken, since, indeed, they seem to have been little changed from first to last by the changing portents of his many years of life, he might be put out of court reasonably enough as a too exceptional witness. His views of the subject would have to be regarded as a biographical detail (though far from unimportant in the case of so great a political personage), and not as a strangely common error of mind strongly exemplified.[1] That, however, is what it was. If Mr Gladstone's policy and the conduct of it were largely determined by a conception of war as fast dying out under the influences of Industrialism and the "enlightenment of the age," he was supported in that idea by a widely diffused body of feeling which could not be turned from the logic of the Manchester revelation. Experience had no effect,

[1] On this point Mr Sydney Buxton, his friendly historian as Finance Minister, says: "He was, perhaps, too much inclined to believe that, as he said in 1862, 'we have sown our wild oats long ago,' and that the national debt would be never again appreciably increased."

observation went for nothing. The wars that began in the middle of the last century, as if provoked by the prophecy that there would be no more of them, were not only numerous enough to be convincing on that score, but offered strong evidence of little-changed and undiminished impulses to war. In the Crimean war the old-world motives were at work on all sides, and, when needed, in the old disguises: the Russian motives, territorial aggrandisement and the half-mysterious, often invincible stimulus of race; in Turkey, forces once the same, but now called to the defence and not the seizure of spoil; the Principalities, revolt against subjugation; France, dynastic considerations, very personal; England, protection of threatened interests and a menaced "position in the world." Half the battles in the "frankly pagan" days of antiquity, we might say nearly all, would come into one or other of these descriptions. The Austro-German war, a large-scale repetition of tribal conflict for ascendancy. The Italian war of Liberation names its own character—again the rebellion of a conquered people, marked by all the good and the bad characteristics of its predecessors "in the dark backward and abysm of time." Or then the Franco-German war; which in all that relates to motive, intention, machination, assembled so many precedents from barbarism as to prove an unweakened heredity. Had these wars been arranged to teach the lesson it could hardly have been better done. Apart from the miscalculated influences of commercial intercourse, the wars of the latter half of the 19th century might well have revealed a growing unwillingness, a restraint, fathered by wisdom and mothered by kindness; but if any change to that effect had been going on, it was little more appreciable by the senses, when the hour came for discovering it, than the meantime weather-wearing of the hills. Yet, despite all this positive evidence, belief in the antiquation of war as a working fact of the day maintained its existence.

It would have done so less vigorously, no doubt, but for certain principles of political economy from which false pictures of the future were drawn. In making these pictures you took the world as it was, saw it imbibe from ever-multiplying sources of information the true principles of international trade, and enjoyed the pleasure of each in finding out that the broadest principle of all is the easiest to follow. It is, of course, that every people should devote itself to the supply of such commodities as the natural resources and aptitudes of the country enable it to produce most cheaply—the surplus of these being exchanged for other commodities produced elsewhere under similar conditions. You saw that obedience as by compulsion followed the understanding of this first principle; it fulfilled itself by becoming known. At once, therefore, the nations were brought into a combination in which each secured its utmost profit to the advantage of the rest. At the same time, the comfort of each being dependent on the harmony of a now organic whole, a universal interest in the maintenance of peace is established. Viewed, then, under these conditions, what a picture did the working world present to the fancy of our island philosophers fifty years ago! Here stood England, incomparably rich in the means and appliances of factory work, machine work, engineering, mining. Busy and apt in all industrial arts, especially in those which the newly-employed agency of steam quickened and cheapened, her cities were fast becoming factories, while fleets of carrier ships were at hand to convey their products wheresoever on earth they were a want. England's part in the universal harmony was plainly appointed therefore; she could but call her labourers in from the fields and become manufacturer-in-chief for the rest of the world. Looking abroad upon this unadvanced remainder, there was France, confectioner of many articles of taste and luxury—wine-grower, too, for those who did not drink beer; France had always understood her *rôle*, and would go on with the production of her incomparably elegant superfluities. Elsewhere were broad cornlands, abundant and cheap grazing lands; here the people would address themselves with contented assiduity to their old-world employments, raising a commercial surplus of wheat, hides, tallow, bristles, for distribution from British ports. And so with many another scene of tranquil industry. An uncommercial Russia, a peasant Germany, numbers of what may be called country States, would become emulous in the production of food-stuffs and raw material, their rural lowliness being enriched and adorned by good things in exchange.

It may be that this bright vision of promise has not the embodiment of print in any of the political economy books. But its warrant is there; and since it was not the work of imagination so far as any one knew at the time, but a forecast from the teaching of a science impregnably logical, we can see how it may have served to counter the lessons of those 19th-century wars. The truth is, however, that while the logic of the political economists remains all that it was, the forecasts drawn from it ever go wrong, and none so completely as the more important and impressive of them. We have hitherto spoken of those that related to commerce and war as failures, as unconfirmed; in truth, they have been destroyed by violent disproof. The co-ordination, the interdependence of commercial exchange (what you can best supply for what we can best supply) has an almost æsthetic beauty as a principle; it was thought so obviously sound, and its advantages so equitable as well as great, that it must prevail wherever it was known; and no doubt its adoption in the spirit and meaning of its propounders would have been a powerful means to the extinction of war. But it was adopted nowhere. The nations are many, and in different conditions of existence; but none of them would consent to a system of international trade the first recommendations of which were the utmost economy of advantage and the promise of abating the most dreaded cause of misery and waste. Why? The explanation is suggested (not, of course, for the first time) in the foregoing paragraph. An uncommercial Russia had no idea of remaining so. A peasant Germany could not definitely resign itself to that order of existence, however much it might be solaced and dignified by music and books. If Industrialism is the only real hope of human advancement, as Mr Spencer preaches and as many governing men have believed without reasoning about it much, it is a social duty to open and keep open the means of employing all the industrial gifts, inclinations, aptitudes that exist in the community. If a great commerce gives strength to a nation and substantiality to its enterprise, then it is a national duty to strive for the possession of a great trade. There are no circumstances in which either duty can be properly neglected; and since their performance comes under the wholesome ordinance of competition, since also they may be carried far without trespass and farther yet without unfair aggression, it would even be absurd to subdue such duties to the eternally limiting scheme of the professors. But there is more in the facts than this. Were there no more, if, that is to say, these national duties not only could be but habitually were carried out within the bounds of contention proper to trade, every nation might make its own fair growth, the professional ideal might be left to its unfructuous loveliness, and yet there would be a happier likelihood of the decline of war. But in all such matters we have to reckon with the inveterate fact that the relation of nations to each other is not the relation of individuals in the same community. Probably there ought not to be any difference, but there is, and it is immensely great. As a consequence "the bounds of contention proper to trade" in the citizen's case widen into license when the contention for trade is international. And thereupon comes the fact that a great commerce is envied not only for such uses as capital stands for within the community, but as a mark of ascendancy and a means of success in other fields of contention far older and more honoured than the struggle for new markets. The pride of command, the glory of conquest—the strongest *collective* passion of tribes and nations from their beginning, if not the only one—must be served. A great trade affords the most effective service in the unending conflict of national ambition, and trade itself is in our day as closely associated with international conquest as tribute was in times of old. Extension of trade and expansion of empire mean the same thing in most European tongues. They cannot be uttered without calling up visions of the fleets and armies necessary for acquirement or protection; fleets and armies which become more numerous and powerful as the rivalry increases which is little else than war in abeyance.

These conditions, which apply equally to the European States inasmuch as they aspire to greater domination or fear to be dispossessed, must change entirely before it can be said that commerce and war are at variance. Change there has been of late, increasing at an accelerated pace year by year; but not in the expected direction. The rivalry intensifies among the European States as they rise to a nearer equality in power; the number of aspirants for empire has increased, making their claims good in the old way by building fleets and adding army corps to army corps. Yet more unexpectedly, a vigorous Eastern State has come into the "world-conflict" for trade and territory, with a retinue of ships and soldiery magnificently armed. Now, this is a nation which did maintain within itself, for hundreds of years till the other day, all the functions of a full and busy social life, even to the finish of the arts.

Immediately upon that surprise another and far greater nation drew out from its own little universe of self-content, to enter the field of Imperialism. Very much because the Americans are not Orientals, but Europeans even as Britons are, this is the more instructive case of the two. For though the conscious motive of the United States in entering upon the Spanish-American war was to stop a useless waste of life under relentless misrule, one result of that war was increase and acknowledgment of the desire, irrepressible though long-pent, to give America a place among the conquering peoples. It is idle to talk of it, impossible for all but a very few minds to think of it, as a vain desire. But, however it may be considered from the moral, prudential, psychological points of view, that the desire exists and prevails is much to the purpose of this discussion. Acknowledged by the world as a great because vastly capable country, America possessed all that could be won by industry untaxed and unchecked by militarism (as Mr Spencer would have it), and by the undistracted use of the highest commercial faculty. It did not suffice. Long before the war, there were many signs in America of a coming change. The conditions which made obedience to the curbing of national ambition more inviting than obedience to that ambition had passed away; and, as was said at the time, it was not in the unregenerate nature of things that a strong, numerous, capable, proud, and stirring people should be content for ever to confine themselves and their influence within the bounds of home government. But it would be superfluous here to go into motive; enough to state it. The question being whether the tendencies of civilization run toward the extinction of militarism by industrialism, two powerful nations which have hitherto held aloof from the struggle for empire march into the arena with horse, foot, and artillery, and thus make contribution to the answer. One is of the outer East, and not unlikely to bring another Eastern people after it, or even the whole race to which it belongs. The other is of the West; a nation which, having come to full growth upon a religion proscriptive of "world-policies," and having prospered beyond all dreaming as a self-contained industrial republic, decides that as a career it does not satisfy. To be complete, it must be a career of conflict and dominion; with enlargement of trade for business justification, but more looked to for a becoming share of "the glory that was Greece and the grandeur that was Rome." And so, with a right-about face, the American people turn from their entirely successful experiment in industrial monasticism, hasten to build fleets of warships, and launch forth upon the ancient ways of national emulation.

It must be agreed that if more impressive evidence of the tendency of change than this can be found, it must be very convincing; and there is such evidence. We come back to the old countries of Europe, and looking to the agencies of civilization which were to have worked with the amenities of trade to abolish militarism (a disagreeable word, but inclusive of intended meanings which "war" does not express), we find these agencies employed in bringing about an entirely different result. Nor is their working partial, unless in one particular the most unexpected where every expectation has been falsified. The civilizing influences of the time force militarism upon people and princes alike, but most upon the peoples. The pressure is felt, though unequally as yet, where empire is a possession and where it is an aspiration; and commerce and labour call eagerly upon militarism in the one case for the protection of trade acquired, in the other for the acquisition of trade desired.

War as a trade weapon.

The effect of these crowding civilizing agencies as they tell upon the "dim populations" of Europe is readily traced out. One of them is the closer intercourse of men by the "abolition of distance" between village and town, but more especially by "the effacement of the physical barriers between nation and nation"—these beneficent changes being the work of our railways, steamships, telegraphs. Another is the diffusion of education, and a printing press that cheapens the means of enlightenment so bountifully that every man may partake. For the dim populations these are the most effective civilizing influences, though no doubt there are others. And now what are their main results for the masses personally, practically, as citizens and industrials? The answer is that the extension of civilization means extension of the demand for the appliances, comforts, and luxuries of civilized life. The effacement of the physical barriers between nation and nation is more famous for enlarging acquaintance with these things, at least by sight and hearing, than for softening the hostilities of race by personal converse. The abolition of distance between village and town has the same effect, besides affording to villagers a readier means of seeing what it is to be a town artisan and not a peasant. And so the first employment of the commonest and most powerful agencies of civilization is to bring close to the eyes of poor men what others enjoy, to give them a taste for it as well as a sight of it, and to inform them at large on the subject by every print that finds its way into the hands of poverty. But the higher living so naturally coveted, and that certainly represents civilization however much else that better state may mean, is not obtainable by the wages of rural labour; and it is not labour alone that seeks the higher living which civilization commends and demands. Hence proceeds the enormously increased and increasing eagerness for trade, for factory profits, which has seized upon the European nations; although, as we remember, they were to have played a more philosophic and harmonious part in the commercial economy of the world. Hence, but with added cause, the raging desire for colonies which broke out not long since, the competition for an exclusive hold upon distant fields of enterprise, which is business beyond all doubt, and necessary business, but not of the kind that turns spears to pruning-hooks. We have said "with added cause," for where the wants of the people move them to discontent (civilization being a prolific creator of needs and appetites) Governments are taken with anxiety. They become eager for commercial empire as a provision of wealth and comfort on the one hand, as the prevention of social disorder on the other. Seeing how rapidly and adventurously the still exploitable portions of the earth are staked out for occupation, Governments and people are agreed that their purpose cannot be achieved by waving palm-branches from the doors of empty warehouses. No, but (in short) by the waving of the sword; by the use of it on occasion; by the maintenance of large armies to have and to hold; but especially by adding ship to ship, rediscovery being made that sea-power is the secret of empire, very much by the control of trade.

So far we have viewed the matter from the side of the nations which strive to acquire; the difference when we look to them that possess is only that between the offensive and defensive in warfare. Be his condition what it may, every intelligent Briton knows whether the wider diffusion of commerce and the more general interest in it abroad do or do not reduce England's obligations to stand well armed. He may doubt whether the great "world-movement" continued from the 19th century into the 20th is for trade for the sake of empire, or empire for the sake of trade; but he sees that in either case the upshot is that British commerce needs the sword of defence more and more. No doubt it needs other defence, such as firmer energies and a keener outlook upon business would supply; but this also is understood, though by no means as a substitute for the protection which the greatest navy ever seen is not too great to secure. This is for defence against a sudden blow, and is so vast a navy because the captivation—no, the necessity of commerce for other nations brings a sudden blow within probability. Nevertheless, up to the time when these pages are written, this which is a clear is not an animated conviction in the public mind. And yet, when the consequences are considered, failure in defence of a great and long-established commerce is far more serious than defeated endeavour to set up an empire of trade, or militarism, or any other. The difference is provided by the law under which the luxuries of to-day are the wants of to-morrow. A solace for poor communities (as for all poor folk), this unfailing compensatory law imposes on the rulers of England a far sharper responsibility than they have ever yet revealed a consciousness of. There is poverty enough in the country, Heaven knows; but take the mass of the population, excluding those who would be called rich by working men, and we shall see that many things which were the luxuries of a well-remembered generation have now become absolute needs. The trade of the country has been good so long, that a share of its benefits not at all too large, but larger than is commonly reckoned, has spread down through the multitudes of a newly-created "lower middle class" to the working population. And there we find many who not only know by sight, and hearing, and sensibility the sweetnesses and decencies which civilization requires, but, thanks to the wages supplied by an abundant commerce on the one hand, thanks to the cheapening of all manner of civilizing refinements on the other, have made imperative wants of them by habituation. If this is to be regretted we must be sorry for the better good which a nation draws from the enrichment of industry; for that better good is a common people in which the lower refinements and the higher decencies of life become sheer necessities. That, however, is by the way. Now, even a gradual attainment to such advantages is preferable to rapid acquisition; but being acquired, and having become constituent in the life and character of the people, what would it be to be stripped of them suddenly? We should listen to the truth that speaks in us when questions so momentous arise, and not be afraid to do so. Were the blow to fall which is a reasonable contingency if great fleets are not a foolish waste, it would be virtually (war is quick work at sea) a matter of a few weeks; the trade that feeds numberless factories would in that brief time depart; ransom under the name of indemnity would impose its intentional burden; and then the law of which we have spoken would fulfil its round. The needs that once were luxuries, and then became both the signs and the substantialities of social advancement, would be so many privations bitterly felt but not of the rousing kind. In other and perhaps more obvious ways they would be demoralizing privations, and of course an added quantity to those which were the common lot of the common people in the bad times at the beginning of the last century.

Drawn from the most grateful benefactions of trade, these are reasons for a vigorous alliance of commerce with armed Force; and the fuller the benefit the better the argument. There have been times, as we have said, when this combination under the British flag was little else than piratical; it had been so under other ensigns a hundred times before, is so now, and will be found at the same game as long as this world is made up of various races and nations at different removes from barbarism or at different stages of decadence. So long, therefore, it must also be a defensive combination, in which state it may not only play a natural but a humane and a righteous part. We have given some reasons for thinking so in England's case. Were there a better case, an empire more amply endowed with wealth and power more nobly employed and widely shared, it would make a better argument. Such an empire would perish under readier attack unless more formidably armed.

The benefactions of commerce have never been more loudly celebrated than in these days: they are as the beauty of Helen, with (perhaps) a more interested call to strife. But commerce has its vices, and they should have a greater share of attention. Domestic vices, as seen in the crowding of cities, the massing of misery, the physical degradation of the people, and in some other things that make for meanness, we do not concern ourselves with. The relation of commerce and war is our theme, and there are ways in which commerce works in that relation to extremely bad effect. One of them is by keeping up an incessantly reckless cry for new markets. It is a cry that naturally commends itself as a proof of energy and a sign of ever-conquering advance; there is too much evidence, consular and other, of a different explanation. Are the old markets filled before the cry for new ones is raised? That they are is assumed from the repetition of the demand; that they are not is proved by the one fact that within the last thirty years a newly-risen nation of traders has grown rich by gleaning in fields of enterprise where, it appears, British merchants were disappointed with the main crop. England's markets? England's markets abroad have been so numerous, so various, and so firmly held by virtue of first occupation, that they should have sufficed to this day by close thought and assiduity. Most of them wanted and would have repaid, as they have repaid later incursionists, the cultivation that a town shopkeeper spends on his town customers. Our commerce could not descend from the dignity of wholesale export to the *petits soins* which its rivals have introduced into the trade; would rather sweep up the first gains of an "unspoilt" market and pass on to others entirely new. "By disdain of small business, by contempt for the little cares that win small business, by a preposterous philistine habit of treating foreign tastes and preferences as whims that ought not to be humoured, British commerce shortens the harvest of its opportunities while ever reaching forth for more." Now this was well enough, no doubt, when many populous lands had been little visited, and when England's competitors for trade to far-off places were few and of small consideration. But all that was changed years ago; we have just been recounting the portentous how and why. All the greater nations are fighting together for new markets, oftener than not by their Governments sword in hand; and nearly all are animated by a fiery opinion that England has more than her share, to their injury. Notwithstanding this opinion England must hold her own and keep her high place. But it cannot be done with ease; and the "commercial interests" of the

The cry for new markets.

country should know that when in such conditions they clamour for new markets, the old ones being lazily or ineptly used, they do a grievously unpatriotic thing. The armed forces of the country may of course be called upon most properly to protect the commerce of the country, and perhaps to extend it; but not to extend it on such terms as these.

More serious in itself, and yet more serious because quite unchecked, is another vice: the recklessness of commerce in educating barbarism in the methods of war, and supplying the weapons it is taught the use of. The teaching is not always systematic or direct, but yet it goes as far where the taught are not savages or just emerging from savagery, but advanced from that state by many steps, and therefore more adept, and again on that account more dangerous pupils. The Abyssinians may be mentioned as in this category; much pains have been taken to bring the Abyssinians within the European system as a properly-equipped military people. And direct teaching goes farther yet in the case of the Chinese, who are not at all barbaric in the sense of being unformed and unpolished, but in the first place eminently capable, and in the next fixed in a civilization which is antagonistic in the highest degree to that of their instructors in warfare. Most of the commercial nations of Europe have competed for the privilege of imparting this instruction, which if ever it becomes effectual (as there is increasing reason to believe it will under the stimulus of hatred for its original teachers), will probably add to the armies of the world one of the most disturbing ever known. Yet it was but for the sake of a little trade (supply of war-material chiefly we may suppose, or the opening of doors to "concessions") that English, Germans, and others beside Russians, have played the part of drill-masters and gunnery instructors in China. No doubt this was done in belief that the Chinese were too inept and spiritless to turn their instruction to account. Europe had that excuse, such as it was—the excuse of a hazardous, unnatural calculation. But the error of politics and trade—yet of politics far less than trade, with its compelling cry for new markets—remained unabated when there was plentiful reason for suspecting it. As the commercial eagerness of Europe increased, it was accompanied by yet more heedless provocation of the spirit that detested it, and by further lessons to the Chinese in the feasibility of expelling their invaders. However, this is not a chapter on the "awakening" of China. The intention is only to recall the reckless induction of war in that much misunderstood country, and the culmination of the error when the European Powers felt themselves driven to the necessity of settling government at home on commercial empire abroad. In truly barbaric countries, as in nearly all parts of Africa, trade carries on with a like carelessness of the fact that its most positive civilizing process is the one that a Zulu or a Basuto, for example, is by nature, education, situation, most ready to profit by. No doubt he also acquires some of the amenities of civilization—those that fall away with such astonishing readiness from its white pioneers when their business lies in an india-rubber country. Much more lightly, however, do such graces sit upon the tribes of fighting-men who are being taught the Chinaman's lesson in more indirect ways. No doubt this cannot be avoided, but it might be hindered or delayed, whereas trade (which must be considered as an entity without regard to its eccentric members) seems to be quite indifferent on that point. Anything which, by observation, or experience, or provocation, or all three, may train these half-savage millions the sooner into formidable fighting-men is tolerable to trade, if in the meantime business is well served by it. This is no mere peccadillo, but a vice which, considering how rapidly the world narrows, and how much more speedily consequence follows upon cause, becomes signally unpatriotic.

The business conscience.

To these unpleasant portents others have been added so lately that their scope can hardly be measured. Tariff-wars are new, as intended by the Government of one state to defend its trade from subversion by another, or to force from another trade advantages. Commerce having risen to such importance in international rivalry, at the same time standing for so much between Governments and peoples, it may be that tariff-wars have been invented to stave off more dread "complications," upon which, indeed, tariff-wars seem to merge sometimes. In any case they witness to the command of trade in the world's affairs, and to its fertility in matter of direct quarrel. A sudden development of the American system of "combines" offers an entirely new view of a possible future, in which the financial machinery which obtains command of the whole stock of some indispensable commodity may find employment more august. State employment is intended: state employment in a scheme of war without bloodshed. A Government about to declare war arranges with an expert syndicate to obtain control of the whole supply of certain food-stuffs for a certain time, and pays in millions—as a Government about to declare war against a strong Power could well afford to do for such a purpose—to keep this food from the lips of the people to be attacked. Anticipated result, famine from the earliest possible moment without the usual preliminaries of slaughter and blockade; or a demonstrable certainty of famine, which, presented at the right moment, would compel submission on the one side, and confer triumph by mere cash transaction on the other. The plan is simple, almost certainly workable, and sure of commendation on grounds of humanity. And it has a particular interest for England, because it would fail against any but an island state, as England is, and one that is open to starvation in a similar degree.

Such being its limitations, there is almost as little likelihood that Finance will abolish war as that Commerce should; unless we admit the conjecture that a time will come when the great twin brethren will build for themselves a throne of dominion so mighty that to command its own peace will be the banishment of war. Meantime all previous conjecture has perished in disappointment and worse. For the influence of commerce was not the only trust of those who looked for the decline of war. Their expectation was that the characteristic intellectual agencies of the last century, the invention, the discovery, the high mechanical science which equipped trade so magnificently, would abet the suppression of war by direct operation. But that they stood for enlightenment, demonstrated the superiority of the arts of peace, added to the number of good things which war should take shame in destroying—such vague considerations as these seem to have been the only foundation of what was hoped from them. Yet there was some specific argument, as we have seen; and this too has given way. Nothing was reckoned upon more confidently for a great mixed crop of moral and material good than the bringing of the world together by the shortening of distances and the multiplying of means of communication. One unexpected consequence of these real blessings—the driving of Governments yet farther into militarism for the sake of trade—has been already noted. But there have been other results which, instead of reducing the need for armies and diminishing their cost, increase both. The bringing together of the various families of mankind has been accomplished with great success as to the material part. But as to the moral effect, it must be reckoned as much worse than nothing, according to evidence brought down to the second year of the new century. There were occasional bursts of fury between nation and nation in the less neighbourly days of old. In these times there are occasional bursts of fury as before; but, more remarkably, the intervals are filled with incessant bickerings among the peoples. The relations of the Governments remain what they were, with only one substantial difference: they are sometimes gravely embarrassed by these bickerings, which do not make for peace.

The shrinkage of the world.

But as the world is brought into an ever-narrowing compass, other consequences ensue which bear more directly upon militarism. Frontiers close in; and as distances diminish, as time contracts and movement becomes more rapid, larger armies must be kept in readiness to meet or forestall a foe. The facilities and appliances of war being what they are—thanks to the abounding mercies of science and invention—sudden conquest must be provided against; and since fifty thousand men may be rendered useless within a fortnight of the proclamation of hostilities, large reserves must be kept on a footing of instant readiness. Armies thus attain to more importance than they ever had before, do in fact become a more immediate and more costly necessity; and this they would be, it seems, if only because of the contraction of time, the closing of distances, the acceleration of movement. But modern armies must be large for another reason: the tremendous forces of destruction to which they are exposed compel provision of a corresponding "margin" for repair. These immensely destructive forces are among the most prodigal gifts of invention and science. If armies are so costly a necessity nowadays, it is not only because they must be more numerous, but because science and invention are tireless in providing ever more terrible and still more expensive engines of war. Hence the need of additional taxation, and therefore of additional trade, and therefore of increased competition for trade. The good genii of the 19th century have done great things for the material welfare of mankind, but what have they done for peace?

Peace has been little favoured by their labours indirectly—their direct labours have been assiduously addressed (no doubt with the best intentions) to enhancing the devastation and the waste of war. And their works continue.

When this unexpected outcome forced itself on attention, second thoughts discovered in it the very thing that would extinguish war most certainly and speedily. War would become so costly, above all it would become so dreadful, that it would not be endured. This remained a hopeful belief for some years, and it was not without reason. It was not without reason then. Since then war has been provided with far greater terrors, and once or twice it has made such havoc, in a space of time terrible in its brevity, as was never seen before under the sun. Yet humanity does endure the excess. There is no sign of its being shocked in the least. Invention is still at work upon improved means of ravage, and the State spends more and more on its productions amidst little complaint. For commerce prospers in reliance on war; war is everywhere pledged to commerce; and the old order reigneth still.

There is no more demonstrable truth in mundane affairs than this, and none, of course, that compares with it for importance. Should we not acknowledge it, then? To deny would be as reasonable in these days as to doubt that the original forces of Nature still operate by contention; and therefore it is not denied. But it is a truth that we conspire to cloak from ourselves and each other, not only because there is so much in it that disappoints and even appals, but also because it awakes in us a feeling of shame. And these are not bad reasons for silence, which would be blameless enough were it never allowed to obscure the facts, and if it were not accompanied by certain hypocrisies of a distinct, demoralizing character. But then it has those disadvantages, and to get rid of them would be a great reform. Now that would be done with sufficient completeness by quiet recognition that the international relations of mankind are what they are: that is to say, barely redeemed from barbarism, however well-gloved they may be in our day. Sincere endeavour has been made to bring them under the rules that govern civic communities, and not quite without success. In peace time, indeed, the success appears considerable; nevertheless, it is but superficial. Those relations are still rooted in the primal order of things, and at every disturbance show that they are. Now this is a time of great disturbance, and likely to last. Why, then, should we not acknowledge to ourselves the unregenerate character of international relations, and act *not* as if it were a merit to misunderstand them? To do this would be to clear away the doubts that hang upon the obligations of defence; or in case the offensive-defensive should be forced on us, we might then undertake it without resort to false and unworthy affectations of sacrifice to moral compulsion.

An illusion to be shed.

ENCYCLOPÆDIA BRITANNICA

NEW VOLUMES.

MOSAIC.

Mosaic.—The art of mosaic has never been deeply implanted in the artistic sensibilities of the north of Europe, nor has it been employed much either in France, or Germany, or England. It ceased to be generally adopted in Italy when fresco, oil, and tempera painting came into vogue. Gothic architecture is ill suited to its robust claims as a decorative art; and the incoming of fashion for the latest and least interesting development of classical architecture, "Palladian," divorced not only it, but mural painting also, from all architectural schemes. To be properly consequent and effective, buildings, ecclesiastical or public, should be constructed with the intention of being covered almost entirely by mosaics, which demand rich environment, marble or other colour; mosaic is essentially a colour medium. It is therefore scarcely surprising that when mural decoration became pre-eminently pictorial, and gestures and expression grew complicated, elaborate, and naturalistic, an art limited in its powers of presenting such manifestation of realistic design was relegated into the limbo of obscurity.

There are no instances of the use of mosaic in England after the Roman occupation. The Normans, who derived it from the Greeks and Saracens, and adopted it in Sicily, did not import it either to France or England. Although English churches, and French also, were highly decorated with polychromy from early times up to the 16th century, there is no evidence of mosaic ever having been used. The revival of a school of mosaicists in Rome during the 17th century, employed in the decoration of St Peter's, and here and there sparsely engaged in other churches, led to the idea which Wren would have carried into effect, namely, making use of mosaic for the cathedral of St Paul's in London; but his scheme, if it was ever really entertained, was not carried out, as we all know; and the art, which might have become the fashion in England, remained an exotic. Even late into the years of the 19th century mosaic decoration was regarded by classical purists as a barbarous art, and the glorious decorations in that material to be seen in Sicily, Italy, Greece, Asia Minor, and Russia were disregarded as works of high art. They were in many cases cut out to provide room for extravagant and vulgar designs in fresco or tempera, unmeaning, undecorative, and wholly abominable as decoration. Those Roman mosaics over the altars in St Peter's, being copies of celebrated oil pictures, while they cannot be denied excellence as such and marvellous dexterity, reveal the worst possible taste, for they attempt to represent adequately, in cubes, touches of the brush which were spontaneous, fluid, thick and thin, and as sensitive and spontaneous as the finger pressure on the violin string, so accurate that the least deviation from absolute position produces discord. The only service which such a misplacement of labour and of material can be said to have rendered, is, that when the original oil pictures have been destroyed by time, these inadequate copies of them will remain. In St Mark's in Venice Titian, Tintoretto, Veronese, and other oil painters of renown failed when they put into mosaics designs fitted only for easel pictures. Deeply indeed is it to be regretted that the mosaics (of which there still remain a few unrestored in St Mark's and in various churches in Italy and Sicily), designed and executed by Greeks, were cut out in the 16th century and later, to be supplanted by designs which, however good in themselves, are entirely ill adapted to the restricted conditions which are the strength and not the weakness of mosaic treatment when used in perfect justification of its capabilities.

These restrictions are many, and some are obvious. In the first place, mosaic is not suited for a small scale of design. It is true that in the Opera del Duomo in Florence there is a miniature mosaic (executed in the 12th century) of extraordinary beauty, which must have taken a lifetime to execute; but still this remains a curiosity, a bit of craftsmanship, rather than a great work of art. There is also a copy of Mr Holman Hunt's "Finding the Saviour in the Temple," executed for Clifton College by assistants in Messrs Powell's establishment in Whitefriars, London; it is admirably done, no doubt, but it is a long way behind the original, which is a design wholly ill adapted to mosaic. There are several other instances, notably one by Mr H. Holiday of "The Last Supper," where mosaic has been employed to translate a beautiful design, which would have been more satisfactorily executed either in oil or water colours. There are also several isolated figures in mosaic in cathedrals and churches of England, small in scale, of good workmanship, but failing *quâ* mosaic, because had they been done in oil or tempera colour their design would have been better justified. The primal and most obvious limitation is in matters of detail —detail as regards a multiplicity of forms, many gradations either of colour or tone and naturalistic accidents. In this respect good mosaic is like good *basso relievo;* it is accomplished by firmly pronounced outlines, unconfused masses, large planes unbroken up by small adjuncts, and generalized and conventionalized forms and simple colour. So all small curves, as well as small tints, should be eliminated, because it is not in the nature of the material to do them justice. One can scarcely conceive a choice less happy for mosaic than the centre group taken out of the upper portion of the Disputa fresco in the Vatican by Raphael, yet this florid piece of work, so facile in creation, was chosen to be executed on the eastern wall of the morning chapel in St Paul's. It is admirably copied as far as it goes, or rather as far as the material permitted, but hopelessly wanting in the spontaneity and charm of Raphael's delicate and sketchy work.

It is useless to illustrate the many similar mistakes that have been made. They were made in some of the earlier work in the choir of St Paul's. The best example of mosaic on a small scale is in Ravenna, the tomb of Galla Placidia; the best upon a large scale is the great Christ at the east end of the cathedral at Monreale. These two works absolutely justify the means to the end. Interesting are the designs made by Sir Edward Burne-Jones for the mosaics for the American church in Rome, but the execution and colour are alike monotonous. The cathedral of Chester contains a series of mosaic pictures designed by Mr Clayton. The Guards' chapel in St James's is adorned likewise by the same artist, under the direction of the late Sir Arthur Blomfield. In the chapel for the school at Giggleswick are mosaics designed by Mr Jackson, R.A., admirably and broadly treated in true mosaic character; these were executed *in situ* and not, according to the modern habit, upon paper, away from their environment and by a foreign firm. Those mosaic *pictures* which are placed in niches in the great gallery of South Kensington Museum are failures *quâ* mosaic, though the designs in many instances are fine, notably those by Lord Leighton and Mr Val Prinsep; but their execution is uninteresting, because the cubes are laid so flatly and so evenly that they suggest an oil picture *appliqué* upon a flat ground.

Messrs Powell have been employed on several occasions to decorate churches with mosaic. This firm has adopted the old style, and rejected the new one initiated by Dr Salviati of Venice. If we observe the surface of a fine Greek mosaic, such as that of Andrea Tafi in the Baptistery of Florence, or the few remains of unrestored mosaic in St Mark's, Venice, or indeed other works scattered over Italy, we shall see that it is rough, not smooth; that the cubes are irregular in shape; that there is always a space of the ground colour left, red or white, and visible between each cube. In modern mosaic, with rare exceptions, restoration or other, the cubes have been jammed up closely together, and the surface is as smooth as a piece of paper; thereby is engendered a mechanical and uninteresting surface, over which light plays with monotony, and hence that brilliant and scintillating effect so essentially the character of true mosaic is absent. The tendency in modern times has been to rival the smoothness and general appearance of an oil picture, which is the very antipodes of the nature and demands belonging to a material eminently structural and therefore eminently in harmony with building construction. This defect, and it is a grave one, is evident in the works in mosaic more or less recently set up in Paris, notably in the apse of the Pantheon, the east end of the Madeleine, and the vaulting of the great staircase of the Louvre. Those in the apse are finely designed, but scarcely look like mosaic, those in the Madeleine still less so, and the last not at all. These several mosaics were executed by the École Mosaique, long established in Paris, but they are far from interesting or satisfactory.

The artist who designs for this material must set aside all the principles he has learned to estimate in paint, either of oil or tempera. As an instance of a painter, pre-eminently delicate in his colour and tone, failing as a mosaic designer, we may quote Cimabue, whose beautiful designs in the cathedral at Pisa would have been far more effective had the artist painted them upon the wall with the medium in the requirements of which he was so great a master. The same criticism may apply to the mosaics in recent years set up on the west front of Santa Maria del Fiore in Florence. These look like oil pictures. One would never imagine, looking at the cartoons for them in the Opera del Duomo, that the artist had intended his designs for any other material than that in which they are executed—oil colour; so, when translated into another material, they retain their special elements of character, and look to be what indeed they are—copies in glass cubes of pictures. The very first principles which go to make a fine picture are just those which should be avoided in mosaic—elaborate modelling, delicate transitions of light and shade and picturesque effects of dark and light, materialistic resemblance indeed. The designer for mosaic should ever bear in mind his material, and in his designs for it he should accentuate those characteristics which belong essentially and specifically to mosaic and to *no other technique.* If he is a painter, he must forget his lessons in that art and take up with new ones—those which teach broad masses of colour obtained in lines. He will find that effects gained by a technique employed in oil colour look bald and ridiculous when translated into mosaic. Water-colour and pastel are by far the best media for cartoons to be copied in mosaic. We do not know how these were executed in ancient days; probably the design was drawn on the wall, and there were no cartoons. The master not only invented, but he was the master-workman also, and that is how it should be. The probability is that the custom of drawing the design upon the wall practised by the early Frescanti was the survival of a method adopted by the mosaicists, just as their method repeated that of Roman and Greek wall painters. Of course this direct method leads to a large style, a style harmonizing with environment, scale, &c.; the tendency is to draw large in a large building, to draw small in a small one. Anyhow, this is quite certain, that all the fine Byzantine and 13th-century mosaics, as well as wall paintings, were executed *in situ* and not away, as was the usual custom in England and elsewhere until recently. What foolishness it seems, when looked at directly and from a common-sense point of view, to design a wall decoration away from the building it is to adorn, then to send it to a foreign country to be set up in another material, unseen during its progress by its creator, and then, still invisible to him, to be applied to a wall! Who can wonder that such piecemeal work must, ninety-nine times out of a hundred, issue in failure?

Mr Harry Powell has permitted the writer to make use of some of his reflections upon the mosaicist's art in the following notes. The mosaicist should not separate the artistic from the technical details of his craft. He must study not only the decorative effect, form, colour, and spacing of his design, but the surface to be covered as well as the materials with which he builds.

Surface.—Good brick-work, the mortar joints slightly cut back, affords the best foundation for mosaic. The hollow and sharp-edged joints provide a key for the cement into which the cubes will be set, and they diminish the risk of sagging, a not uncommon event if the cement is not welded to the wall by being well pressed into the joints. If the mosaic is to be applied on stone, the stone must be notched and well roughened to provide support. Whether the surface is brick or stone, it must be well saturated with boiled oil to prevent suction, because if too much suction takes place the powder only of the cement will remain and the cubes will drop out.

Cement.—A cement suitable for mosaic is one which retains its tenacity, which can be applied in layers, which sets slowly, and which is not liable to change colour after long exposure. These conditions are best met by an oil cement. One consisting of equal weights of white oxide of zinc and carbonate of zinc, mixed with double boiled oil and containing small proportions of wax, gold size, and slaked lime gives good results. This cement can either be white or red, white where greyness of tone is desirable, red where a richer effect is desirable. It is generally mixed with a small portion of oxide of iron or oxide of manganese, which prevents the whiteness of the joints from rendering adjacent tints grey from a distance.

Atmospheric Corrosion.—As the atmosphere of modern towns is more corrosive than that of mediæval Venice or mediæval Rome, it is important that, in choosing the cement and the materials to be embedded in it, the mosaicist should be certain that they are impervious to atmospheric impurities.

Glass.—Although marble, mother-of-pearl, and other substances have been, and are still occasionally used, the predominant material in ancient as well as modern mosaics is glass. When prepared with due regard to the continuing proportions of its ingredients, glass is impervious to the action of ordinary acids, and is practically indestructible. It can be made to assume almost every shade and tint of colour (see GLASS). There are many kinds of glass, but for mosaic work either a potash-lead or a soda-lime glass is usually employed. Both of these glasses can be rendered opaque by mixing with the ingredients either oxide of tin or a mixture of felspar and fluorspar. The texture of a glass which owes its opacity to oxide of tin is dull and granular, and when the colouring agents are added the resultant colours are subdued in tone. Glass rendered opaque by the admixture of felspar and fluorspar has a bright, vitreous. easily cleaned surface, and readily develops brilliant colours.

Production of Colours.—Colours are obtained by mixing and melting with the ingredients of the opaque glass small proportions of certain metallic oxides. Oxide of chalk gives a purple blue; oxide of copper gives a peacock blue; oxide of copper with oxide of iron gives a green; oxide of copper mixed with oxide of iron and a strong reducing agent gives a red; oxide of chromium a green; oxide of nickel a purple; oxide of uranium a yellow; and oxide of manganese a violet, or a black, if a larger quantity of oxide is used. By continuing the oxides a practically unlimited palette may be readily obtained.

Manufacture of Glass Slabs.—The mixtures, in a state of powder, are shovelled into crucibles standing round the grate of a furnace, and when fusion is complete the viscous glass can be coiled upon the heated end of an iron rod and removed for use, very much in the way that thick treacle may be coiled round the bowl of a spoon. A mass of molten glass, thus collected, is allowed to fall upon a flat iron table, and is pressed into a slab about six inches square and half an inch thick. The slabs are removed to an oven, where they are allowed to cool slowly, and when cool are removed and broken by a hammer or a miniature guillotine into tesseræ or cubes. The fractured edge of the tesseræ is used for the surface of the mosaic.

Gold and Silver Slabs.—The tesseræ containing gold or silver leaf are as impervious to surface corrosions from the effects of atmosphere as the solid colours. The process of manufacturing a gold or silver slab for mosaic work is to spread the metallic leaf on a very thin tray of transparent glass, about five inches in diameter, and after it has been heated to press upon the surface of the leaf a mass of molten glass, so as to create cohesion between the molten glass and the glass tray through the pores of the metallic leaf. The slabs thus formed contain gold, silver, or platinum leaf hermetically imprisoned between two layers of glass. The slabs are cut up into tesseræ or cubes by means of a diamond or glasscutter's wheel. Only one surface can be used for mosaic work.

Tinted Metals.—By using coloured glass for the thin glass trays which form the surface of the metallic slabs a variety of tinted metallic effects are obtained. Moreover, if the glass which is to form the background is coloured, and if the slab after it has been cooled is strongly reheated, the leaf becomes sufficiently disintegrated to allow the colour of the background to show through, with the result that the colour effect of the metallic leaf is modified.

Palette and Tools.—The palette of the mosaic worker is a shallow box with many partitions, each division containing different-coloured tesseræ. The only tools required are clippers, for shaping the tesseræ, and a pointed awl for pricking through the cartoon into the cement the outlines of the design. Although the process and tools are simple, it requires prolonged training of mind, hand, eye, and fingers to enable a workman to create in mosaic a living representation as distinguished from a lifeless copy of the master craftsman's design.

Drawing Directly on the Wall.

Curved Surfaces.—If the mosaicist desires to draw his cartoon directly upon the wall, a necessary procedure where curved surfaces are presented, he goes to work in the following manner. He causes a model to be made to scale, of a dome, semi-dome, or spandrel, and upon it he draws his design with a brush in strong red pigment, having previously squared up the whole surface to scale. This done, he causes the dome, semi-dome, or spandrel to be covered over with thick brown paper. This being attached to the wall with white lead sufficient only to give temporary adhesion, the brown paper is squared up to the scale of the small sketch; each square being relatively numbered. The master then sets his pupils to work to draw mechanically and copy accurately from the small design on to the full-sized dome, semi-dome, or spandrel. This done, the master follows on, correcting with charcoal or brush until the whole design is developed in strong outline. Having made a slightly-coloured sketch, the master with the aid of his pupils proceeds to mix all the tints in water colour, adding colla di pesce or fish glue and a little honey to prevent cracking. He then applies every tint separately, keeping each distinct, and above all minding that the local colours of all half tints are different from the colour of all shadows. This done, he dips his brush in black and draws all the outlines, the thickness of which depends upon the distance which will intervene between his work and the spectator; in order that the black may not appear cold from a distance, he will add to one side of the line a red line, thicker or thinner than the black according to the effect he wishes to produce. It is sometimes effective to add upon the other side of the black line a green line, so that the purple effect of the black and red shall be modified.

Colour.—We now come to the great question of colour and how to obtain it simply, and so that from a distance a blurred and woolly effect is not obtained. There should be a marked and sharp definition between all tints; they should not be *fused*; they should look sharply defined as the squares upon a chessboard, and appear crude and brutal. The work which looks least refined near at hand looks most finished at a distance. Red and blue lines alternately laid, either more red or more blue as the purple is intended to tend towards red or blue, make the best purple. Green is best made with yellow and blue lines, the masses being separated by red lines, and the shadows of green should be red or blue: if red, they should be outlined with blue; if blue, with red. Red should be treated flatly, shaded with a deeper red, which should be of a warmer tone than the lights. Blue should be shaded with blue or red; and it is well to mix green tesseræ with the blue in the lights, and again green tesseræ with the blue or red shades to modify crudity. Pure white should be very sparingly used: it expands greatly at a distance. The best white is that which is of the tone of Naples yellow. Pure white in an atmosphere such as that of England comes to look blue and cold at a distance. Whenever it is necessary, however, to use pure white, either a yellow or pink line should be set on one side of it.

It is impossible to keep the *flesh* too simple. The local colour, *i.e.*, a red orange, is the staple colour. Features should be drawn in strong red or burnt sienna, or a rich brown. The outlines of limbs or the contours of faces should be made first with a green line, a little darker than the local tints, then a red line darker still, then a black or brown line. *White draperies* are capable of being treated with endless variety. Their shadows may be green, red, blue, grey, or yellow. If the white drapery is to take a neutral tone when seen from a distance, all of these tints should be employed, because when mixed those positive colours appear neutral when seen from afar.

Gold drapery has a fine effect. Bright gold expands to four times the width of the line, so that the lines of gold should be thin. It may be that the gold drapery is to appear greenish; when that is desirable the folds should be drawn in green outlined with red. All deep shades should be treated with red and hot browns. As gold expands so considerably, a larger interval should be left between the tesseræ than between any other colour, even white. Each tessera should have a thin space of the ground colour round it. The tesseræ should never be jammed: it is that which causes so many modern mosaics to look like oil-cloth or chromo-lithographs.

The Finished Cartoon.

The finished cartoon, having been coloured in lines, should look exactly like the finished mosaic as regards effect; and the master, in making his cartoon, should always bear in mind that he is designing for mosaic, and not making a finished picture. The cartoon, when complete, is taken off the wall and cut up in pieces. Each piece is then carefully traced. The space upon the wall corresponding to each section is then covered with cement, but only upon that portion of the space which can be worked in mosaic in a day. The mosaic worker then applies the portion of the tracing upon the wet cement, and with a sharp point he pricks through the paper upon the lines thereon drawn; on removing the tracing he will find indents within the surface of the cement, which give him his cue to all the forms. Setting up the coloured design by his side, he takes the tesseræ, which exactly correspond in colour and tone with those on the drawing, and begins his work, commencing from the outline and working inwards towards the centre, the lightest portion being left to the last. Here comes in the real test whether the craftsman is capable or the reverse. This is soon judged by the master, who will put the work in and out until he is satisfied with the result. Unless the master has himself gone through the drudgery of laying the cubes, he can be no teacher. He must be a craftsman as well as a designer, and must know by experience and practice in a very difficult craft what the material can do with ease and what it is not called upon to do by reason of its inherent limitations. If he has not so trained himself he is certain to pictorialize what he should conventionalize, and moreover he will set technical difficulties in the way which are impossible to overcome. He must aim at the greatest simplicity without dulness, at producing the greatest effect by the simplest means, and to do that he must *know his material or fail.*

From what has been said it is evident that all mosaic work should be executed under the eye of the master, and therefore it is ridiculous to send cartoons to Italy to be executed there, transported to England, placed *in situ*, under different conditions of light, under different environment, and under conditions possibly reversed. Mosaic will never take its place as a master craft in England or elsewhere until the master designer is also a craftsman. All mosaics should be executed upon the wall, and not elsewhere; and to be successful the master must give up almost the whole of his time, when he is not designing, to overlooking the work of his pupils, however capable they may be.

These are the principles which the author followed in the work at St Paul's. It is not for him to say anything for or against his own work. But of this he is certain, it was conducted upon a right basis, and not on the wrong and futile method previously employed in England. England can produce as good craftsmen as any other country can do; and if those who have the power would be patient with them, instruct them, encourage them, and work with them, English artists would produce as good work and be as good craftsmen as ever were seen in the best periods of Byzantine or mediæval mosaic designers and craftsmen. (W. B. RI.)

Moscow, a government of central Russia, bounded by Tver on the N.W., Vladimir and Ryazañ on the E., Tula and Kaluga on the S., and Smolensk on the W. Area, 12,859 square miles.

Its geology has been carefully studied, and it appears that in the Tertiary period the surface of this province was already continental; but during the Cretaceous period it was covered to some extent with the sea, which has left its traces in sands, clays, and shales, the organic remains of which testify to the littoral character of these deposits. Jurassic deposits are represented by their upper divisions only; the lower ones, as well as Triassic and Permian deposits, are wanting. The Carboniferous deposits are of a deep-sea origin, and are only represented by the upper division which lies upon Devonian deposits, discovered in an artesian well at Moscow at a depth of 1508 feet. The pendulum anomaly, mentioned already by Schweitzer, has been investigated. It appears in a zone 10 miles wide and about 95 miles long from west to east, and is positive (+10″·6) to the north of Moscow and negative (−2″·7) to the south. The prehistoric archæology of Moscow has been carefully studied. The site of the district has been inhabited since the Stone Age. Bronze implements are rare, and there are places where instruments of stone, bone, and iron are found together. The inhabitants who left the burial mounds in the 10th to 12th centuries seem to have been of Finnish origin, and were poorer, as a rule, than their contemporaries on the Volga.

At the census of 1897 the population was 2,433,356, out of whom 1,208,783 were women, and 1,099,604 lived in towns. In 1899 there were 1,072,600 acres under crops, and the total average annual crop of the period 1895–99 was 5,813,000 cwts. of all grain (rye 3,433,000 cwts., oats 1,985,000 cwts.). The importance of the Moscow government as a manufacturing centre is steadily increasing, and it now stands first in Russia with its aggregate annual production valued at £40,300,000 (in 1896), the next three provinces being St Petersburg (£31,700,000), Piotrków in Poland (£21,600,000), and Vladimir (£17,800,000). The chief factories are for cottons (£13,075,300; 81,936 workers in 299 factories), woollens (£5,607,600), silks (£244,300), clothing (£659,800), sugar refineries (£1,050,400), distilleries (£1,700,000), iron works (£540,000). There is besides a very great variety of smaller industries, such as those concerned in gold thread and gold brocades, gold and silver jewellery, bronze, perfumery, sweets, tobacco, tanneries, gutta-percha, furniture, carriages, wall-paper, &c. In 1894 there were in the secondary schools (excluding Moscow) 61,300 pupils. For primary education there were 913 schools, out of which 13 were of the ministry of education, 591 of the *zemstvo*, 213 of the clergy, and 96 private. The government is divided into 13 districts, the chief towns of which are—Moscow (*q.v.*), Bogorodsk (11,210 inhabitants), Bronnitsy (3837), Dmitroff (4550), Klin (5057), Kolomna (20,970), Mozhaisk (4839), Podolsk (3808), Ruza (2505), Serpukhoff (24,456), Vereya (3704), Volokolamsk (2899), and Zvenigorod (2110). (P. A. K.)

Moscow, the second capital of the Russian Empire and chief town of the government of same name, situated in 55° 45′ N., 37° 37′ E., on both banks of the river Moskva. Its population has been growing since 1870 at the rate of about 2½ per cent. per annum, and was in 1872, 601,969; (1882), 753,469; (1897), 988,614 (1,035,664 with the suburbs). The housing problem is of great importance, as it appears that no less than 7258 lodgings, *i.e.*, over 10 per cent. of the total (occupied by 59,000 persons), are underground. Thus while the average for the city is two occupants to each room, there were more than 10,000 lodgings which had more than four occupants to each room, representing one-fourth of the population. The average mortality is consequently high, namely 28 per 1000 (33 per 1000 if the children inmates of the Foundling House be included). In 1890 there were 9818 industrial establishments giving occupation to 122,445 workers, of whom 14 per cent. were children, 11 per cent. girls above fifteen years of age and women, and 75 per cent. were men and boys above fifteen years. There were besides 15,481 trade establishments, with 10,893 employés.

Moscow still continues the chief industrial centre of Russia, and it is estimated that the yearly returns of the industries alone exceeded, in 1895, £20,000,000. Their character is best seen from the following figures:—

	Number of Establishments.	Number of Workers.
Textiles	753	35,692
Clothing, shodding, laundries	3815	22,391
Metals	1076	10,915
Building	814	10,760
Articles of food	654	9911
Wooden goods	881	8261
Machinery	577	7756
Paper and tanneries	609	7522
Polygraphic trades	181	2497

The importance of Moscow as a centre for trade is steadily growing, and it is estimated that the yearly returns of 15,500 trade establishments amount to £200,000,000; while as a centre for railways the city plays so predominant a part in the traffic, that from one-sixth to one-seventh of all the goods shipped by the railways of European Russia (about 322,000,000 tons) loaded or unloaded at Moscow. No less than 501,000 tons of grain and flour, 26,000 tons of meat, 27,000 tons of fish, 226,000 tons of naphtha and its products, 100,000 tons of coal, and 870,000 tons of fuel wood are imported every year. As to the passenger traffic, it attains every year 6,300,000 passengers entering or leaving. The foreign imports are about 230,000 cwts. of tea, 90,000 cwts. of iron and steel goods, about 200,000 bottles and 330,000 gallons of wine, 55,000 cwts. of drugs, as well as raw cotton, raw wool, and silk. The exports are chiefly manufactured goods, sugar, drugs, &c. Tramways are rapidly developing, the tendency being to municipalize them. There were in 1893, 58 miles of tramways (over 43,000,000 passengers), but there has been considerable development since. The banks, including the mortgage banks, are the most important in Russia. The water-supply has been largely increased, a new supply having been brought from Mytishchi, calculated to yield every day 4,200,000 gallons, but this can be extended so as to provide in the future 9,500,000 gallons. A number of excellent free libraries (Turguéneff's, Ostrovsky's, Tchertkoff's, Galitzyn's) have been opened, the two latter containing valuable collections of books and MSS. The remarkable Tretiakoff gallery of pictures, chiefly of the Russian school (1278), has been given by its owner to the city. A polytechnic containing a museum, a large school of technical drawing, and various museums—technical, decorative art, domestic trades, educational, zoological, antique art, hygienic, municipal economy, and so on—have been opened, and the number of societies for scientific and various other purposes has greatly increased. Of philanthropic institutions, free hospitals, cheap lodgings, and the like there is a great number; they own property valued at £3,000,000, possess an aggregate capital of £4,566,860, and in 1897 gave aid to 437,500 persons. Besides, the municipal relief of the poor was entirely reorganized in 1894, partly on the Elberfeld system and partly on quite new and original lines. The movement for the maintenance and scientific restoration of old church architecture has been of value to some of the antiquities as well as to the revival of the 16th-century Moscow style of building (partly Florentine, or Italian altogether). Several buildings, such as a very handsome new Gostinoi Dvor, in lieu of the old one, have been built in that style, which fully corresponds to the style of the best parts of the Kremlin. A gorgeous monument in memory of Alexander II. has been erected. Moscow has always been a centre for the publication of very cheap books for the peasant class, which are carried about the villages by pedlars. Owing to the efforts of Count Tolstoy and others, a great improvement has been introduced into these publications, books and pictures of a high standard being now circulated at a trifling cost. The importance of the book trade is evident from the fact that during a single year eleven firms issued 3,945,000 copies of 396 of such books, to which about 1,500,000 copies of the Posrednik firm must be added. As to the pictures, about 1,700,000 copies of the best kinds and 4,000,000 of the plainest ones (sold in the villages at half a farthing apiece) are printed at Moscow, and coloured by peasant children in the neighbouring villages. Owing to special conditions of censorship, the periodical press is not so much developed as it is in St Petersburg. There are only 6 daily and 2 illustrated papers, 3 reviews, and 16 periodicals of a general character, while the number of official publications is 9. There are, moreover, 72 scientific and technical periodicals weekly, making a total of 108 periodical publications, as against 304 published in St Petersburg and 1561 in the provinces. (P. A. K.)

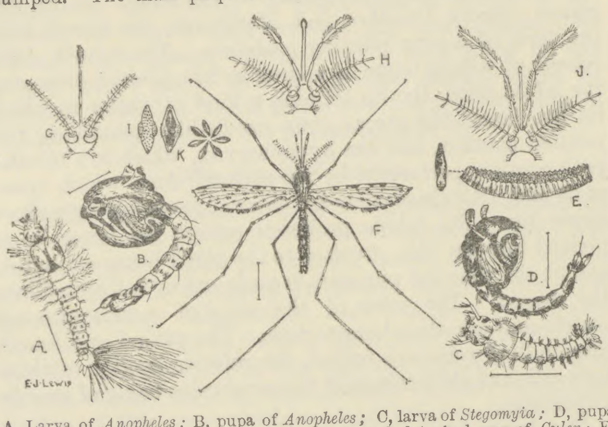
Mosquitoes.—The term "mosquito" is derived from the Spanish diminutive *mosca*—a little fly. A variety of insects comes under the name, the majority belonging to the dipterous family *Culicidæ*. Other insects called mosquitoes are the sand-flies (*Simulidæ*), certain midges belonging to the *Chironomidæ* of the genus *Ceratopogon*, and a few other blood-sucking diptera, such as *Phlebotomus*. True mosquitoes are *Culicidæ*. In that family the wing veins are covered with scales of varied form, and there are also scales on the head, body, and legs; another essential character is that the costal vein is carried right round the border of the wing. In all the genera, except *Corethra* and *Mochlonyx*, the mouth is in the form of a long piercing proboscis. The mouth parts consist of a long lower lip ending in two jointed processes, the labial palpi, the lip forming a kind of gutter in which lie five lancet-like pieces—two needle-like mandibles, two pointed maxillæ, and the hypopharynx, which is a tubular prolongation perforated by the salivary duct, which opens at its end. All these parts are covered above by the narrow upper lip. The whole proboscis except the lower lip is pierced into the skin previous to the blood being extracted, and at the time the puncture is made saliva is injected into the wound. The veins of the wing of a mosquito are scaled, and are also characteristic. The second and fourth longitudinal veins are forked, the relative lengths of these fork-cells and the position of the cross-veins being of specific importance.

The larvæ of mosquitoes are all aquatic, the majority living in still or slightly running fresh water, though some occur in brackish and a few in salt water. The pupæ are also aquatic, and are more or less active. In Europe and North America mosquitoes generally pass the winter as hibernating pregnant females; in tropical climates they go into a semi-hibernating condition during the dry season, when there is little water in which to deposit their eggs. There may be many broods in the year; Professor Howard has counted as many as twelve. Their reproductive powers are strongly developed; according to Ficalbi, one mother may be accountable for a progeny of 50 milliards in the fifth generation. Altitude has no effect upon the *Culicidæ;* some have been found in the Himalaya at 13,000 feet. Distribution takes place mainly by ships and trains, on which these pests are often abundant. The natural agencies of dispersal are very limited, as mosquitoes at once seek shelter from the wind, and the larvæ are seldom plentiful in running water.

In England mosquitoes are called gnats, and in parts of America gallinippers. Many species are undoubtedly normally phytophagous, but the majority of the females, and even a few of the males, are very sanguinary. These sanguinary *Culicidæ* form the true mosquitoes which cause such annoyance by their bites, as well as being carriers of disease. It has been said that blood is necessary for them to produce fertile eggs, but this is evidently erroneous. *Culicidæ* are found in all climates, and although in the tropics they are more troublesome than elsewhere, yet even within the Arctic circle they are often so abundant that they may completely cover the exposed parts of the body until, as described by Nansen whilst in Greenland, the hands look as if covered with rough woollen gloves. One genus at least, *Anopheles*, forms the intermediate host of the *Hæmamœbidæ*, the blood parasites that cause malaria, the gnats acting also as distributors of these germs from person to person. Another disease traced to them by Dr Patrick Manson, Dr Bancroft, and others is filariasis, in which *Culex panoplites* and *Anopheles* are employed (see NEMATODA). Other complaints, such as yellow fever and elephantiasis, are also connected with these insects.

The family *Culicidæ* embraces the following genera:—*Megarrhinus* (Desv), *Anopheles* (Meig), *Cycloleppteron* (Theo), *Psorophora* (Desv), *Mucidus* (Theo), *Stegomyia* (Theo), *Culex* (L.), *Eretmapodites*, *Panoplites*, and *Deinokerites* (Theo), *Tæniorhynchus* (Arri), *Ædes* (Meig), *Hæmagogus* (Will), *Ædeomyia* and *Wyeomyia* (Theo), *Uranotæmia* (Arri), *Trichoprosopon* (Theo), *Sabethes* (Desv), and the two non-piercing-mouthed genera, *Corethra* and *Mochlonyx*.

Those genera which cause most annoyance are *Anopheles*, *Stegomyia*, *Culex*, and *Panoplites* (see Fig.). *Anopheles* are nearly all blood-suckers in the female sex, both sexes having long palpi. Most of them have spotted wings, and when stationary remain with their proboscis and their body in a straight line; they can thus be distinguished from *Culex*, which, when settled, carry the proboscis bent at an angle to the rest of the body and the thorax humped. The male palpi are swollen at the ends, which is not



A, Larva of *Anopheles*; B, pupa of *Anopheles*; C, larva of *Stegomyia*; D, pupa of *Culex*; E, egg-float and further enlarged detached egg of *Culex*; F, female *Anopheles costalis*, Loew; G, head of ♀ *Culex*; H, head of ♂ *Anopheles*; J, head of ♂ *Culex*; K, eggs of *Anopheles*.

usually the case in *Culex* or *Stegomyia*. The larvæ live in all kinds of places, but show a decided preference for small surfaces of water, such as temporary roadside puddles; they cannot live in rapidly-running water, but a few exist in salt waters. They lie almost horizontally in the water, and are grey, green, or brown in colour; there is no respiratory siphon, and on the anal segment are four leaf-like plates. Head, thorax, and abdomen have tufts of many-branched hairs. Their food consists mainly of green algæ and other small water animals, including their own species, and plants. The pupæ have two truncated air-tubes on the thorax, and move about freely in the water. Fifty-five species of *Anopheles* are known, of which nine come from Africa, twenty-three from Asia, five from both North and South America, six from Europe, four from Australia, and four from the West Indies. They seem to be most abundant in India, the Malay Peninsula, West and Central Africa. It is in *Anopheles* alone that Patrick Manson, Ross, Grassi, and others have shown that the malarial parasite can develop. Only certain species (*A. funestus*, *costalis*, *maculipennis*, &c.) seem to act as intermediate hosts, and the probability is that all *Anopheles* do not do so. The malarial parasites are injected into the blood with the mosquito saliva.

Culex is the largest genus of the family, and contains probably more than 200 species; at present some 140 only are known in the restricted genus. The palpi are short in the female, long in the male; the head is covered with narrow-curved and forked-upright scales, the scutellum with narrow-curved scales only. The larvæ live in a variety of places, those of the household mosquitoes usually in water-butts and cisterns, and small receptacles of rain-water; some even in cesspools. A few live in the sea (*C. marinus*, Theo, &c.), others in salt marshes (*C. nemorosus*, variety *salinus*, Fic.). *Culex* larvæ differ from *Anopheles* in having a long respiratory siphon, and in the head being much broader than the rest of the body. When at the surface they hang head downwards, the siphon resting against the water-film; they are very active, and move by a series of jerks. The pupæ have two siphons on the thorax, but they are more cylindrical, and not truncated as in *Anopheles*. Some mosquitoes of this genus have a wide distribution; *Culex fatigans* (Wied) occurs all over tropical, sub-tropical, and warm temperate countries. Members of this genus act as the intermediate hosts of *Filaria Bancroftii*, and also of the *Proteosoma* or blood-parasites of birds (Ross), but so far all experiments with human malaria have failed with them. Some of the most vicious mosquitoes are contained in the genus *Stegomyia*, which is separated from *Culex* on account of the flat head, scales, and scutellar scales. The larvæ apparently have a much shorter and thicker siphon than in *Culex*. One species, *S. fasciata* (Fabr), is almost cosmopolitan, this little black-and-white mosquito being one of the commonest species of the family. Members of other genera also bite, and, as we have said, are connected with certain diseases in man. Those of the genus *Panoplites*, characterized by their broad wing-scales, cause severe irritation, the saliva being distinctly acid; most of these are riverside pests. In the genus *Ædes* both male and female have short palpi. The allied genera are *Ædeomyia*, with broad wing-scales; *Hæmagogus*, with five-jointed palpi; *Sabethes*, with the feet provided with paddle-like tufts in the male sex; and *Uranotænia*, small mosquitoes with very small fork-cells and usually some brilliant scales. The genera *Trichoprosopon* and *Limatus* (Theo) are distinguished by the presence of scales and chætæ on the metanotum, seen in no other Culicidæ. They thus differ from *Wysomyia*, which has only chætæ. (F. V. T.)

Moss, a seaport town of Norway, county of Smaalenene, on the east shore of Christiania Fjord, 37 miles by rail south of Christiania. Here was signed, on 14th August 1814, the convention which united Norway to Sweden. The town was almost destroyed by a fire in 1858, but was promptly rebuilt. The little river Mosse affords motive power for saw-mills, flour mills, iron works, and factories for wood-pulp, rice-busking, bottles and glass, preserves, a distillery, &c. The trade, of the annual value of £300,000 to £400,000, consists chiefly in the export of timber, ice, wood-pulp, grain and flour, and spirits, and in the import of grain and flour (mostly rye from the Black Sea ports), limestone and coal. The port, which affords 13 to 22 feet of water beside the quays, was cleared by 220 vessels of 77,200 tons burden in 1899. Population (1875), 5117; (1891), 8051; (1900), 8941.

Mossamedes, a town of Portuguese West Africa, capital of the district of Mossamedes, on the south side of Little Fish Bay (Bay of Mossamedes or Angra do Negro). It is regularly built, and defended by the fort of São Fernando. It serves as a sanatorium for the province of Angola. Population, 5000. The district of MOSSAMEDES is watered by the rivers Kubango, Kunene, and Kwando, and exports spirits, cotton, india-rubber, coffee, wax, hides, gums, ivory, fish, orchil, and cattle. In 1901 the district was divided—the coast district or Mossamedes, and the inland district or Huilla. The trade increased from £57,000 in 1886 to £146,667 in 1899. Fish is the principal export.

Mossley, municipal borough (1885) and market town in the Prestwich parliamentary division of Lancashire, England, 10 miles east-north-east of Manchester, on the river Tame and the London and North-Western Railway. The new church of St George's has been completed. A mansion which cost £80,000 has been sold to the corporation for the nominal sum of £4000, and is used as the town hall. There are foundries, mill-works, woollen factories, and large cotton-spinning mills. Population (1881), 13,850; (1891), 14,162; (1901), 13,452.

Mostaganem, a town of Algeria, in the department of Oran, chief town of the arrondissement, 44 miles east-north-east of Oran, on a plateau 278 feet high, half a mile from the Mediterranean coast. It has been made the head of a railway line connecting the coast with Tiaret. The surrounding country, laid out in vineyards and orchards, is one of the healthiest and most fertile of the colony. There are seventeen European villages in the district, and in the town are tanneries and peltries. An active trade is carried on in wool, skins, figs, and raisins. Noted Mussulman schools attract numerous students. Wholly an artificial creation, begun in 1888 and not yet finished, the port, notwithstanding the heavy outlay it has cost, promises but mediocre results. The tonnage averages about 70,000 a year. Population (1881), 13,420; (1891), 14,975; (1900), 17,353.

Mostar, the chief town of Herzegovina, Austria-Hungary, and the seat of a Roman Catholic and a Greek bishopric, situated on the Narenta river, and on the railway from Sarajevo to Metkovic, 81 miles south-west of Sarajevo and 27 north of Metkovic. A Government tobacco factory has been established. The Narenta is crossed by an iron bridge, built in 1881, the remarkable old bridge (built by the Turks in 1566, probably on the site of an old Roman bridge) being now used only by foot-passengers. Population (including the garrison), about 14,500.

Mosul.—1. A viláyet of Asiatic Turkey, of which the greater part lies to the east of the Tigris. It is divided into three sanjaks, Mosul, Shehrizor, and Suleimanieh, and has an area of 29,000 square miles. Population, 295,000 (Moslems 245,000, Yezidis 15,000, Christians 30,000, and Jews 5000). The climate is very hot, but healthy. The soil, naturally fertile, is little cultivated. 2. The capital of a viláyet and sanjak of the same name, situated on the right bank of the Tigris. It is now of little industrial or commercial importance, but remains the collecting and distributing centre for the north Mesopotamian desert and Kúrdistán. The exports and most of the imports pass through Baghdad. Mosul is the meeting point of roads from Aleppo, Diarbekr, Bitlis, north and west Persia, and Baghdad, and it is on the projected line of railway from Constantinople to the Persian Gulf. The population amounts to 40,000 (Moslems 31,500, Christians 7000, Jews 1500). The town is the seat of British, French, and Russian consulates.

PARRY. *Six Months in a Syrian Monastery.* 1895.—SACHAU. *Am Euphrat und Tigris.* Berlin, 1899.—VON OPPENHEIM. *Vom Mittelmeer zum Persischen Golf.* Berlin, 1900. (C. W. W.)

Motala, a modern town of Sweden, county of Östergötland, on the east side of Lake Wetter, on the Göta canal and the river Motala, at its exit from the lake, 42 miles west from Norrköping. It was only founded in 1880. Two miles east of the town are the Motala ironworks (1822), the largest in Sweden, with branches in Norrköping, Gothenburg, and other towns, in which iron war-ships, railway locomotives, iron bridges, machinery, &c., are built. Population (1900), 3047.

Motherwell, a police burgh and important railway junction of Lanarkshire, Scotland, near the Clyde, $12\frac{1}{2}$ miles south-east by east of Glasgow by rail. A distinctive modern industry is bridge-building, which is carried on in three large establishments. Among modern erections are a town hall, a new post office, and a hospital. A theatre is about to be built. Electric lighting has been introduced, and it is proposed to spend £120,000 on an additional gravitation water scheme. A park was presented to the town in commemoration of Queen Victoria's jubilee. United Free, Baptist, and Episcopal churches have been erected, also a secondary and technical school. There is, too, a Roman Catholic secondary and technical school. Motherwell has been subject for many years to considerable damage to buildings from the working of the mineral field on which the town is built. Population (1881), 12,904; (1891), 18,736; (1901), 30,243.

Motion, Laws of.—Before the time of Galileo (1564–1642) hardly any attention had been paid to a scientific study of the motions of terrestrial bodies. With regard to celestial bodies, however, the case was different. The regularity of their diurnal revolutions could not escape notice, and a good deal was known more than 2000 years ago about the motions of the sun and moon and planets among the stars. For the statement of the motions of these bodies uniform motion in a circle was employed as a fundamental type, combinations of motions of this type being constructed to fit the observations. This procedure did not afford any law connecting the motions of different bodies. Copernicus (1473–1543) employed the same system, and greatly simplified the application of it, especially by regarding the earth as rotating and the sun as the centre of the solar system. Kepler (1571–1630) was led by his study of the planetary motions to reject this method of statement as inadequate, and it is in fact incapable of giving a complete representation of the motions in question. In 1609 and 1619 Kepler published his new laws of planetary motion, which were subsequently shown by Newton to agree with the results obtained by experiment for the motion of terrestrial bodies.

Acceleration of gravity.

The earliest recorded systematic experiments as to the motion of falling bodies were made by Galileo at Pisa in the latter years of the 16th century. Bodies of different substances were employed, and slight differences in their behaviour accounted for by the resistance of the air. The result obtained was that any body allowed to fall from rest would, in a vacuum, move relatively to the earth with constant acceleration; that is to say, would move in a straight line, in such a manner that its velocity would increase by equal amounts in any two equal times. This result is very nearly correct, the deviations being so small as to be almost beyond the reach of direct measurement. It has since been discovered, however, that the magnitude of the acceleration in question is not exactly the same at different places on the earth, the range of variation amounting to about $\frac{1}{2}$ per cent. Galileo proceeded to measure the motion of a body on a smooth, fixed, inclined plane, and found that the law of constant acceleration along the line of slope of the plane still held, the acceleration decreasing in magnitude as the angle of inclination was reduced; and he inferred that a body, moving on a smooth horizontal plane, would move with uniform velocity in a straight line if the resistance of the air, and friction due to contact with the plane, could be eliminated. He went on to deal with the case of projectiles, and was led to the conclusion that the motion in this case could be regarded as the result of superposing a horizontal motion with uniform velocity and a vertical motion with constant acceleration, identical with that of a merely falling body; the inference being that the path of a projectile would be a parabola except for deviations attributed to contact with the air, and that in a vacuum this path would be accurately followed. The method of superposition of two motions may be illustrated by such examples as that of a body dropped from the mast of a ship moving at uniform speed; and in this case it is found that the body falls relatively to the ship as if the latter were at rest, and alights at the foot of the mast, having consequently pursued a parabolic path relatively to the earth.

The importance of these results, limited though their scope was, can hardly be overrated. They had practically the effect of suggesting an entirely new view of the subject, namely, that a body uninfluenced by other matter might be expected to move, relatively to some base or other, with uniform velocity in a straight line; and that, when it does not move in this way, its acceleration is the feature of its motion which the surrounding conditions determine. The acceleration of a falling body is naturally attributed to the presence of the earth; and, though the body approaches the earth in the course of its fall, it is easily recognized that the conditions under which it moves are only very slightly affected by this approach. Moreover, Galileo recognized, to some extent at any rate, the principle of simple superposition of velocities and accelerations, due to different sets of circumstances, when these are superposed (see MECHANICS, *Ency. Brit.* vol. xv.). The results thus obtained apply to the motion of a small body, the rotation of which is disregarded; and, our first notions being derived from this case, the motion of any system is dealt with by regarding it as built up of small portions. Such portions, small enough for the position and motion of each to be sufficiently specified by those of a point, are called "particles." Other forms of experiment can readily be arranged to test, with regard to terrestrial motions, the correspondence of constant acceleration to constant conditions, and the principle of superposition.

The period immediately succeeding that of Galileo's work and teaching was not very fruitful in results. Descartes helped to generalize and establish the notion of the fundamental character of uniform motion in a straight line, but otherwise his speculations did not point in the direction of sound progress in dynamics; and the next substantial advance that was made in the principles of the subject was due to Huygens (1629–95). He attained correct views as to the character of centrifugal force in connexion with Galileo's theory; and, when the fact of the variation of gravity (Galileo's acceleration) in different latitudes first became known from the results of pendulum experiments, he at once perceived the possibility of connecting such a variation with the fact of the earth's diurnal rotation relatively to the stars. He made experiments, simultaneously with Wallis and Wren, on the collision of hard spherical bodies, and his statement of the results (1669) included a clear enunciation of the conservation of linear momentum, as demonstrated for these cases of collision, and apparently correct in certain other cases, mass being estimated by weight. But Huygens's most important contribution to the subject was his investigation, published in 1673, of the motion of a rigid pendulum of any form. This is the earliest example of a theoretical investigation of the rotation of rigid bodies. It involved the adoption of a point of view as to the relation between the motions of bodies of different forms, which practically amounted to a perception of the principle of energy as applied to the case in question.

Centrifugal force.

We owe to Newton (1642–1727) the consolidation of the views which were current in his time into one coherent and universal system, sometimes called the Galileo-Newton theory, but commonly known as the "laws of motion"; and the demonstration of the fact that the motions of the celestial bodies could be included in this theory by means of the law of universal gravitation. A full account of his results was first published in the *Principia* in 1687. (For Newton's formal statement of laws of motion see *Ency. Brit.* vol. xv. p. 676; this should be read in conjunction with the introduction and explanations given in the *Principia.*)

Galileo-Newton theory.

Such statements as that a body moves in a straight line, and that it has a certain velocity, have no meaning unless the base, relative to which the motion is to be reckoned, is defined. Accordingly, in the extension of Galileo's results for the purpose of a universal theory the establishment of a suitable base of reference is the first step to be taken. Newton assumed the possibility of choosing a base such that relatively to it the motion of any particle would have only such divergence from uniform velocity in a straight line as could be expressed by laws of acceleration dependent on its relation to other bodies. He used the term "absolute motion" for motion relative to such a base. Many writers on the subject distinguish such a base as "fixed." It is sometimes convenient to apply to the base in question a name of a more specific character. The name "Newtonian base" will serve this purpose. Assuming such a base to exist, Newton admitted at the outset the difficulty of identifying it, but pointed out that the key to the situation might be found in the identification of forces; that is to say, in the mutual character of laws of acceleration. In this connexion he took an important step by distinguishing clearly the character of "mass" as a universal property of bodies distinct from weight.

There can be no doubt that the development of correct views as to mass was closely connected with the results of experiments with regard to the collision of hard bodies. Suppose two small spherical bodies which can be regarded as particles to be brought into collision, so that the velocity of each, relative to any base which is unaffected by the collision, is suddenly changed. The additions of velocity which the two bodies receive respectively, relative to such a base, are in opposite directions, and if the bodies are alike their magnitudes are equal. If the bodies though of the same substance are of different sizes, the magnitudes of the additions of velocity are found to be inversely proportional to the volumes of the two bodies. But if the bodies are of different substances, say one of iron and the other of gold, the ratio of these magnitudes is found to depend upon something else besides bulk. A given volume of gold is found to count for this purpose for about two and a half times as much as the same volume of iron. This is expressed by saying that the density of gold is about two and a half times that of iron. In fact, experiments upon the changes of velocity of bodies, due to a mutual influence between them, bring to light a property of bodies which may be specified by a quantity proportional to their volumes in the case of bodies which are perceived by other tests to be of one homogeneous substance, but otherwise involving also another factor.

The product of the volume and density of a body measures what is called its "mass." The mass of a body is often loosely defined as the measure of the quantity of matter in it. This definition correctly indicates that the mass of any portion of matter is equal to the sum of the masses of its parts, and that the masses of bodies alike in other respects are equal, but gives no test for comparison of the masses of bodies of different substances; this test is supplied only by a comparison of motions. When, as in the case of contact, a mutual relation is perceived between the motions of two particles, the changes of velocity, or when gradual changes of velocity are in question, the accelerations, are in opposite directions, and the ratio of their magnitudes determines the ratio of the masses of the particles, the motion being reckoned relative to any base which is unaffected by the change. It is found that this gives a consistent result; that is to say, if by an experiment with two particles A and B we get the ratio of their masses, and by an experiment with B and a third particle C we get the ratio of the masses of B and C, and thus the ratio of the masses of A and C, we should get the same ratio by a direct experiment with A and C. For the numerical measure of mass that of some standard body is chosen as a unit, and the masses of other bodies are obtained by comparison with this. Masses of terrestrial bodies are generally compared by weighing; this is found by experiment to give a correct result, but it is applicable only in the neighbourhood of the earth. Familiar cases can readily be found of the perception of the mass of bodies, independently of their tendency to fall towards the earth. The mass of any portion of matter is found to be permanent under chemical and other changes, and this fact adds to its importance as a physical quantity. Minute variations may possibly occur, but none has been established.

The Galileo-Newton theory of motion is that, relative to a suitably chosen base, and with suitable assignments of mass, all accelerations of particles are made up of mutual, so called, actions between pairs of particles, whereby the two particles forming the pair have accelerations in opposite directions in the line joining them, of magnitudes inversely proportional to their masses. Thus the product of mass and magnitude of acceleration is the same for each. The mutual action between two particles is otherwise expressed by saying that a force acts upon each of them, in the line joining it to the other, each force being measured by the product of mass and acceleration; so that pairs of forces are equal and opposite. Thus the total acceleration of any particle is that given by the superposition of the accelerations due to the several forces which act upon it. An equivalent operation is to compound the several forces acting on a particle by the parallelogram law (see MECHANICS) into what may be called the resultant force, the total acceleration of the particle being the same as if this alone acted.

Application of the theory.

To apply and verify the theory, we depend on being able to identify and classify forces. They are recognized by their reciprocal character, and it is found possible to establish permanent laws connecting the forces in any system with its configuration and other recognizable characteristics. A generalization of Galileo's results takes the form that under constant conditions of this character force is constant, and that the superposition of two sets of conditions, if their independence can be secured, results in superposition of the forces associated with them separately. The association of forces with the conditions of their occurrence causes some confusion of nomenclature. It is possible to regard specified physical conditions or a certain configuration, such as strain in a case of contact, as providing a definition of force of a certain type; to deduce other types by reference to their neutralizing effect; and to regard the expression in terms of acceleration as an experimental result. Such a course is sometimes followed, and within a limited range of application to terrestrial mechanics it is a natural procedure; but for the purpose of a universal theory it is difficult to maintain this point of view consistently, and the definition of force in terms of motion is usually adopted by modern writers as being logically the more convenient. Particular laws of force may be suggested by a study of the simplest cases in which they are manifested, and from them results may be obtained by calculation as to the motions of systems of any given structure. Such results may be tested by direct observation. For the calculation of the motion of any body which is known to be perfectly rigid, no knowledge of the forces between particles composing the body is needed, beyond the fact that they neutralize any tendency to change of shape.

Gravitation.

Newton's law of gravitation affords the most notable example of the process of verification of a law of force, and incidentally of the Galileo-Newton theory. As a law of acceleration of the planets relatively to the sun, its approximate agreement with Kepler's third law of planetary motion follows readily from a consideration of the character of the acceleration of a point moving uniformly in a circle. Newton tells us that this agreement led him to adopt the law of the inverse square of the distance about 1665–66, before Huygens's results as to circular motion had been published. At the same time he thought of the possibility of terrestrial gravity extending to the moon, and made a calculation with regard to it. Some years later he succeeded in showing that Kepler's elliptic orbit for planetary motion agreed with the assumed law of attraction; he also completed the co-ordination with terrestrial gravity by his investigation of the attractions of homogeneous spherical bodies. Finally, he made substantial progress with more exact calculations of the motions of the solar system, especially for the case of the moon. The work of translating the law of gravitation into the form of astronomical tables, and the comparison of these with observations, has been in progress ever since. It has involved great labour and refinement of calculation, and is not yet completed. The verification is sufficiently exact to establish the law of gravitation, as providing a statement of the motions of the bodies in question which is correct to a high degree of accuracy. In the meantime some confirmation of the law has been obtained from terrestrial experiments, and observations of double stars tend to indicate for it a wider if not universal range. It should be noticed that the verification was begun without any data as to the masses of the celestial bodies, these being selected and adjusted to fit the observations. It may be mentioned that another factor has been introduced into the problem of the motions of these bodies by the recognition of the effects of their imperfect rigidity.

The case of electromagnetic forces between two conductors carrying electric currents affords an example of a statement of motion in terms of force of a highly artificial kind. It can only be contrived by means of complicated mathematical analysis, and the question of its correspondence with any actual division of the conductors into particles is a difficult one. In this connexion a statement in terms of force is apt to be displaced by more direct and more comprehensive methods, and the attention of physicists is chiefly directed to the intervention of the ether. In fact, the study of this part of the subject leads us to look upon the universal statement of motion in terms of force as really only a provisional one, to be employed in default of more intimate knowledge of the connexions between material systems. It is worth noting that there are indications of this having been Newton's own opinion.

Newtonian base.

The Newtonian base deserves some further consideration. It is defined by the property that relative to it all accelerations of particles correspond to forces. This test involves only changes of velocity, and so does not distinguish between two bases, each of which moves relatively to the other with uniform velocity without rotation. The establishment of a true Newtonian base presumes knowledge of the motions of all bodies. But practically we are always dealing with limited systems, so any actual determination must always be regarded as to some extent provisional. In the treatment of the relative motions of a limited system, we may use a confessedly provisional base, though it may be necessary to introduce corrections, either exact or approximate, to take account either of the existence of bodies outside the system, or of the rotation of the base employed relative to a more correct one. Such corrections may be made by the device of applying additional unpaired, or what we may call external, forces to particles of the system. These have only to take account of differences of accelerations of the several particles. The earth, which is commonly employed as a base for terrestrial motions, is not a very close approximation to being a Newtonian base. Differences of acceleration due to the sun and moon are not important for terrestrial systems on a small scale, and can usually be ignored, but their effect (in combination with the rotation of the earth) is very apparent in the case of the ocean tides. A much more sensible defect is due to the earth having a diurnal rotation relative to a Newtonian base, and this is never wholly ignored. Take a base attached to the centre of the earth, but without this diurnal rotation. A small body hanging by a string, at rest relatively to the earth, moves relatively to this base uniformly in a circle; that is to say, with constant acceleration directed towards the earth's axis. What is done is to divide gravitation into two components; one of these then corresponds to this acceleration, and the other one is what is called the "weight" of the body. Weight is in fact the force which corresponds to the Galileo acceleration with which the body would begin to move relatively to the earth if the string were cut. Another way of stating the same thing is to say that we introduce, as a correction for the earth's rotation, a force called "centrifugal force" which, combined with gravitation, gives the weight of the body. It is not, however, a true force in the sense of corresponding to any mutual relation between two portions of matter. The effect of centrifugal force is to make the weight of a body at the equator about ·35 per cent. less than the value it would have if due to gravitation alone. This represents about two-thirds of the total variation of Galileo's acceleration between the equator and the poles, the balance being due to the ellipticity of the figure of the earth. In the case of a body moving relatively to the earth, the introduction of centrifugal force only partially corrects the effect of the earth's rotation. Newton called attention to the fact that a falling body moves in a curve, diverging slightly from the plumb-line vertical. The divergence in a fall of 100 feet in the latitude of Greenwich is about one-eleventh of an inch. Foucault's pendulum is another example of motion relative to the earth which exhibits the fact that the earth is not a Newtonian base.

For the study of the relative motions of the solar system, a provisional base established for that system by itself, bodies outside it being disregarded, is a very good one. No correction for any defect in it has been found necessary; moreover, no rotation of the base relative to the directions of the stars without proper motion has been detected. This is not inconsistent with the law of gravitation, for such estimates as have been made of planetary perturbations due to stars give results which are insignificant in comparison with quantities at present measurable. Our knowledge of motions of the stars and of the solar system relative to them is rather scanty, but is not inconsistent with the view that the theory may be applicable throughout the whole extent of the known universe. It is natural to suppose that the Newtonian base has a relation to the ether, which is the vehicle of electrical and optical phenomena, but this is a question which has not yet emerged from the region of speculation.

Measurement of time.

For the measurement of motion it must be presumed that we have a method of measuring time. The question of the standard to be employed for the scientific measurement of time accordingly demands attention. Galileo measured time for the purpose of his experiments by the flow of water through a small hole under approximately constant conditions, which was of course a very old method. He had, however, some years before, when he was a medical student, noticed the apparent regularity of successive swings of a pendulum, and devised an instrument for measuring, by means of a pendulum, such short periods of time as sufficed for testing the pulse of a patient. The use of the pendulum clock in its present form appears to date from the construction of such a clock by Huygens in 1657. Newton dealt with the question at the beginning of the *Principia*, distinguishing what he called "absolute time" from such measures of time as would be afforded by any particular examples of motion; but he did not give any clear definition. The selection of a standard may be regarded as a matter of arbitrary choice; that is to say, it would be possible to use any continuous time-measurer, and to adapt all scientific results to it. It is of the utmost importance, however, to make, if possible, such a choice of a standard as shall render it unnecessary to date all results which have any relation to time. Such a choice is practically made. It can be put into the form of a definition by saying that two periods of time are equal in which two physical operations, of whatever character, take place, which are identical in all respects except as regards lapse of time. The validity of this definition depends on the assumption that operations of different kinds all agree in giving the same measure of time, such allowances as experience dictates being made for changing conditions. This assumption has successfully stood all tests to which it has been subjected. All clocks are constructed on the basis of this method of measurement; that is to say, on the plan of counting the repetitions of some operation, adopted solely on the ground of its being capable of continual repetition with a certain degree of accuracy, and possibly also of automatic compensation for changing conditions. Practically clocks are regulated by reference to the diurnal rotation of the earth relatively to the stars, which affords a measurement on the repetition principle, agreeing with other methods, but more accurate than that given by any existing clock. We have, however, good reasons for regarding it as not absolutely perfect, and there are some astronomical data the tendency of which is to confirm this view.

Theory of energy.

The most important extension of the principles of the subject since Newton's time is to be found in the development of the theory of energy, the chief value of which lies in the fact that it has supplied a measurable link connecting the motions of systems, the structure of which can be directly observed, with physical and chemical phenomena having to do with motions which cannot be traced in detail. The importance of a study of the changes of the *vis viva* depending on squares of velocities, or what is now called the "kinetic energy" of a system, was recognized in Newton's time, especially by Leibnitz; and it was perceived (at any rate for special cases) that an increase in this quantity in the course of any motion of the system was otherwise expressible by what we now call the "work" done by the forces. The mathematical treatment of the subject from this point of view by Lagrange (1736–1813) and others has afforded the most important statements of the theory of the motion of a system that are available for practical use. But it is to the physicists of the 19th century, and especially to Joule, whose experimental results were published in 1843–49, that we practically owe the most notable advance that has been made in the development of the subject, namely, the establishment of the principle of the conservation of energy (see ENERGETICS, *Ency. Brit.* vol. xxviii.; also ENERGY, vol. viii.). The energy of a system is the measure of its capacity for doing work, on the assumption of suitable connexions with other systems. When the motion of a body is checked by a spring, its kinetic energy being destroyed, the spring, if perfectly elastic, is capable of restoring the motion; but if it is checked by friction no such restoration can be immediately effected. It has, however, been shown that, just as the compressed spring has a capacity for doing work by virtue of its configuration, so in the case of the friction there is a physical effect produced, namely the raising of the temperature of the bodies in contact, which is the mark of a capacity (in the sense in which the word is used) for doing the same amount of work. Electrical and chemical effects afford similar examples. Here we get the link with physics and chemistry alluded to above, which is obtained by the recognition of new forms of energy, interchangeable with what may be called mechanical energy or that associated with sensible motions and changes of configuration.

Having identified forms of energy other than mechanical, we can attempt to apply to physics and chemistry, or, as we may say, to molecular systems and the ether, not only the principle of conservation of energy, but also other relations connecting changes of energy of various types with the characteristics of a system. In this way the 19th century saw the first steps taken towards the carrying out of work which Newton bequeathed to his successors in the concluding sentences of the *Principia*.

MOTOR VEHICLES.

I. LIGHT VEHICLES.

MOTOR-CAR is a term primarily employed in America to denote the car or carriage containing the electromotor used for propelling an electric tramcar or train of carriages on rails, but of late years more usually applied in Great Britain to light automobile or mechanically-propelled carriages running on common roads. On the Continent of Europe and in the United States the usual expression for these vehicles is "automobile"; the term "autocar" has also been employed.

The first practical steam carriage was made by Richard Trevethick in 1802 (Fig. 1), though Cugnot had produced a rudimentary

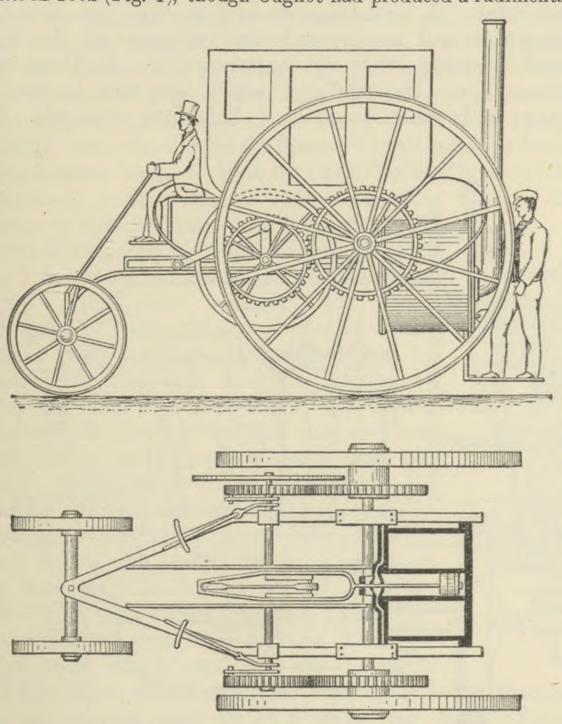

FIG. 1.—Trevethick's Steam Carriage: Side View and Plan.

one in France in 1769; but very little was done in this direction until 1824, from which date a number of these vehicles were constructed and used with considerable success, taking the form of stage coaches propelled by steam, and weighing some 3 or 4 tons unloaded. Among the most successful of steam-carriage designers at this time were James, Gurney, Dance, Hancock, Maceroni and Squire, Somers and Ogle, Church, Hill, and Scott-Russell, all of whose vehicles proved practicable to some extent. Some of these ran regular passenger services, notably between Cheltenham and Gloucester, attaining average speeds of 10 to 14 miles per hour; but great opposition was met with owing to the narrow prejudice of those whose interests related to horse-haulage, and every obstruction was offered in the shape of prohibitive tolls and legislative enactments. The result was that steam carriages were driven off the roads in favour of railways, although the select committee of the House of Commons appointed in 1831 to inquire into the subject reported completely in favour of their adoption (as did also that of 1873). In 1861 the first Locomotives on Highways Act was passed, but the crushing blow came in 1865, when the Legislature prescribed (1) that the number of persons required to drive the locomotive should be increased to three; (2) that a man should precede with a red flag; (3) that the maximum limit of speed should be reduced to 4 miles per hour; and (4) that they should be forbidden ever to blow off steam, &c. These restrictions were confirmed rather than relieved by the 1878 Act. Although these Acts were created to deal with heavy traction, the famous 1881 appeal in the Court of Queen's Bench placed every type of self-propelled vehicle, from a traction engine down to Bateman's steam tricycle, under their narrow limitations.

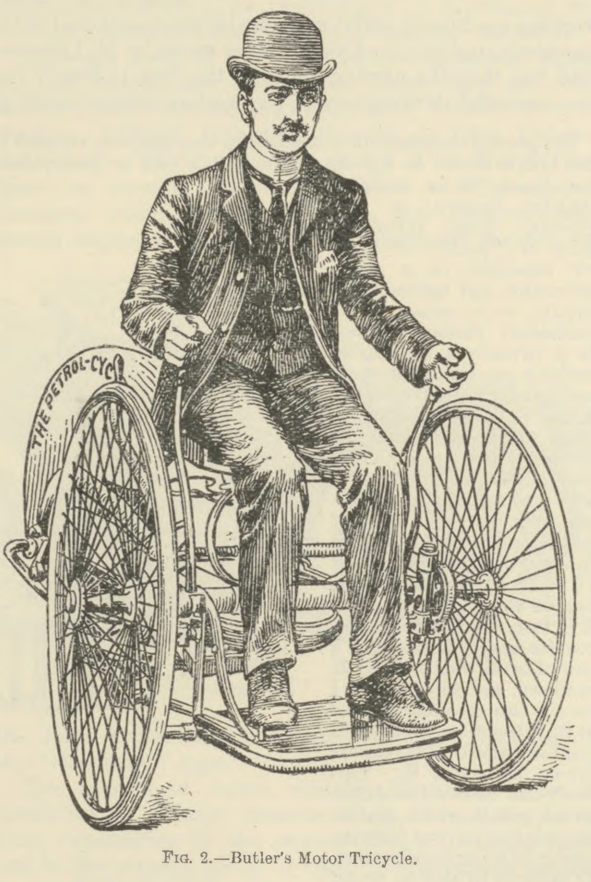

FIG. 2.—Butler's Motor Tricycle.

This resulted in the development of the heavy traction engine, and light motor vehicles were little more heard of in Great Britain. There were a few exceptions, however, notably the steam vehicles of Rickett (1860), Carrett (1861), Tangye (1862), Yarrow (1862), Holt (1866), Todd (1870), Perkins (1870), Mackenzie (1875), and Blackburn (1878), and some electrical carriages made by Elwell (1884), Ward (1886), and Volk (1888). An important departure was that of Butler, who constructed in 1885 what is believed to be the first vehicle (a tricycle) propelled by an internal combustion engine in England (Fig. 2); he used the vapour of benzoline exploded electrically. Later, Roots successfully employed heavy oil, as did Knight. The chief prohibitory clauses of the Acts were repealed in 1896, when public interest revived, and Great Britain, in spite of its early exploits in mechanical traction, found that it was completely left behind by other countries, such as France, Germany, and America, whose engineers had been handicapped by no such restrictions.

France has undoubtedly led in the development of the light automobile vehicle, though it is right to mention that the most successful vehicles used there derive their power from a petroleum spirit motor invented by a German, Herr Gottlieb Daimler, who made numerous vehicles, commencing with a bicycle fitted with this motor (Fig. 3) in 1885. He disposed of his French patents to the firm of MM. Panhard and Levassor, who were well-known makers of wood-working machinery, and it may here be mentioned that to the ingenious application of the Daimler motor by M. Levassor, who was then the moving spirit of the firm, is largely due the successful development of the modern motor industry.

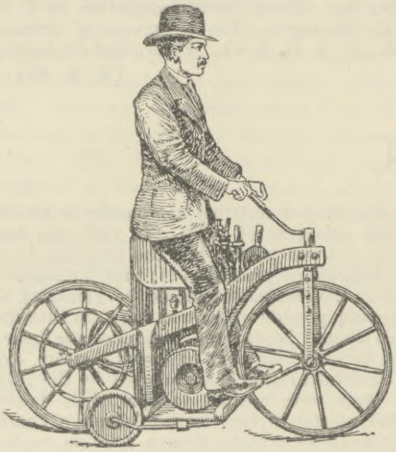

FIG. 3.—Early Daimler Motor Bicycle.

The general arrangement of mechanism that has been adopted by this firm is shown in Fig. 4. The motor, a two- or four-cylinder "equipoise," is a modified Daimler, known as the Phœnix, using petroleum spirit or "petrol" of sp.g 0·7 vaporized in a spray carburator and ignited electrically, or by means of incandescent platinum tubes It is virtually a gas engine working on the Otto cycle and making its own gas from petrol. It is situated in front, and transmits its power by means of a friction cone A, working into the fly-wheel, to one of the changeable spur wheels B^1 B^2 B^3 B^4 on the square shaft C, thence to one of the fixed spur wheels D^1 D^2 D^3 D^4 on the second-motion shaft E. This shaft E in turn drives a transverse counter-shaft I through a pair of bevel wheels F and H as shown, and counter-shaft I carries two sprocket pinions at its extremities, from which the back wheels of the car are driven by chains K. This shaft also carries the differential gear G, which enables its ends to revolve at different speeds for going round corners. In order to be able to propel the carriage backwards, a reversing motion is introduced consisting of two intermediate spur wheels RR^1 carried on a separate shaft L. When it is desired to go astern the sleeve carrying the spur wheels B^1 B^2 B^3 B^4 is moved along the shaft C into a position such that the wheel B^1 engages with R, and R^1 with the spur wheel D^1; this causes the shaft E—and consequently the back wheels of the car—to rotate in the opposite direction. The four pairs of spur wheels (which run in oil) allow of four ratios of gearing which are interchangeable whilst running, according to the power required, the friction clutch being relieved by the foot at each change of gear. There is also a pedal for regulating the speed of the motor, and a powerful foot-brake, acting on the counter-shaft, besides two band brakes on the back wheels actuated by a lever. The steering is effected by a wheel with worm gear, and the carriage can be steered at high speed with one hand. These vehicles are nearly always fitted with pneumatic tyres, and many have ball or roller bearings, and electrical as well as tube ignition.

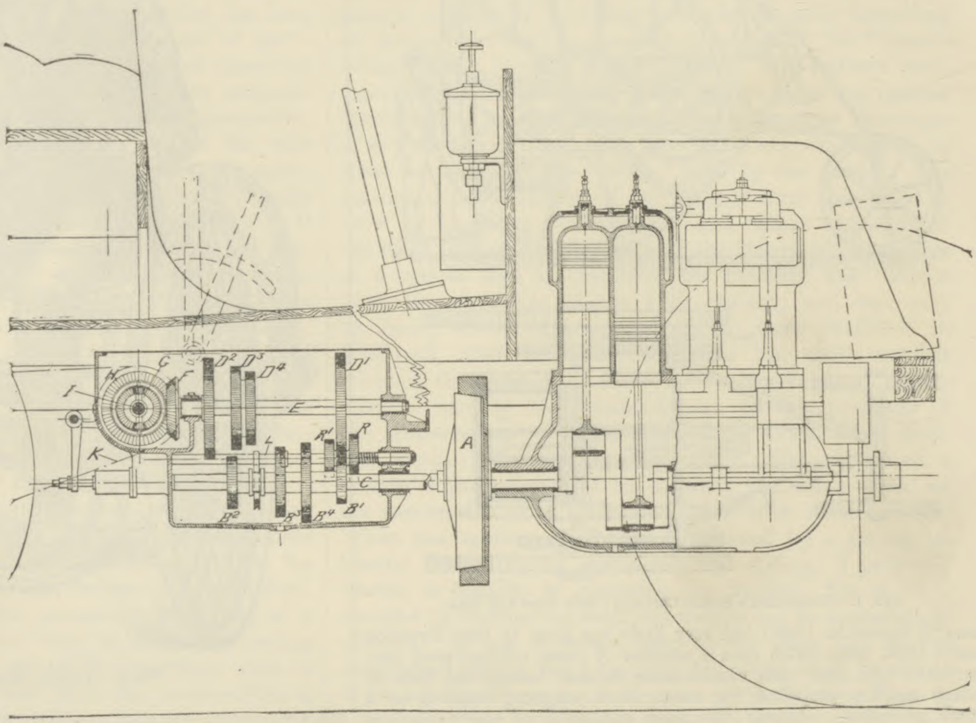

FIG. 4.—Mechanism of Panhard and Levassor Motor Cars.

A great impulse was given to the French industry by the organization by the *Petit Journal* of a trial run of automobile vehicles from Paris to Rouen in 1894. This was followed next year by a race from Paris to Bordeaux and back, in which £2500 in prizes was awarded, mostly to MM. Panhard and Levassor, and MM. Peugeot Frères. The first carriage was driven by M. Levassor, and performed the journey of 744 miles in one trip, without a break-down, and at a mean velocity of 15 miles per hour. A still more important race was held in 1896, the course being from Paris to Marseilles and back. It was organized by the Automobile Club of France, a society founded in that year upon the initiative of the count de Dion and baron de Zuylen, for the furtherance and encouragement of automobile locomotion: its membership grew in three and a half years to some 2000, and it is now one of the leading institutions in France. The race was 1060 miles in length, and was run under most adverse conditions of weather; the winning carriage by Panhard and Levassor nevertheless made an average speed of 15·85 miles per hour, and was followed by two others of the same house, while the Delahaye and Peugeot carriages did good work. A prominent feature of this race was the remarkable and unexpected performances of the new petrol tricycles (Fig. 5) constructed by de Dion and Bouton, some thousands of which are now in use in France and other countries. This firm were also the builders of three steam vehicles which attempted the race, but did not get through. This and the Paris–Bordeaux race in fact established the triumph of petrol (*i.e.*, petroleum spirit) for long distances over steam, which only seems to have gained first place on two occasions, viz., the Concours du *Petit Journal* in 1894, and the Marseilles–Nice–Turbie race in January 1897, when a de Dion brake covered the rough and hilly route of 145 miles in $7\frac{3}{4}$ hours. This vehicle, however, was very heavy, and no successful attempt seems to have been made in France to construct a light steam vehicle except

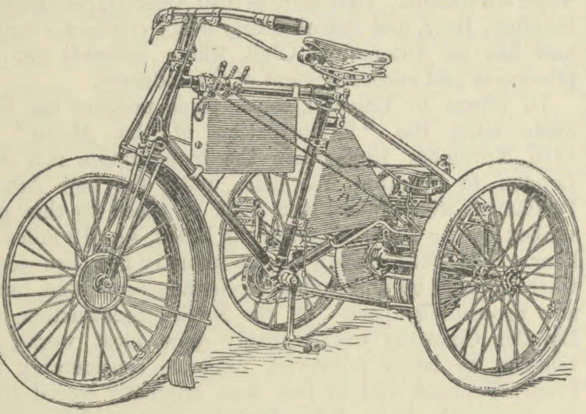

FIG. 5.—De Dion and Bouton Petrol Tricycle.

by M. Serpollet, whose "flash" generators are extensively used on tramways.

The speeds attained continued to increase. In 1897 the Paris–Dieppe and Paris–Trouville races showed an average of 26 miles per hour. In the Paris–Amsterdam race (1898), Charron, on an 8-h.p. Panhard carriage, kept up a mean speed of 28 miles an hour, and in 1899 he won the Paris to Bordeaux race on a 12-h.p. vehicle of the same make, covering the 350 miles in 11 hours 43 minutes without a stop. In the same year was held the longest motor race up to the present time (August 1902)—viz., the "Tour de France," 1440 miles in length, the distance being covered by Chevalier de Knyff (16-h.p. Panhard) in 42 hours 33 minutes running time. Other races of that year were the Paris–St Malo (200 miles), won by Antony's 16-h.p. Mors in 7 hours 32 minutes; the Paris–Ostend (204 miles), the winning cars being Girardot's Panhard and Levegh's Mors (tie); Paris–Boulogne (143 miles), won by Girardot's Panhard; and the Bordeaux–Biarritz, won by Levegh's 16-h.p. Mors. In 1900 de Knyff in the Pau–Bayonne race attained a mean speed of 43·4 miles per hour, the distance being 208 miles. He used a Panhard machine of 20 h.p. similar to Fig. 6, but fitted with a "racing" body; and during one part of the race he is said to have done $34\frac{1}{2}$ miles in $33\frac{1}{2}$ minutes. The most important race of this year, however, was that from Paris to Toulouse and back, which was won by Levegh's 24-h.p. Mors, the distance of 836 miles being traversed at an average rate of 42·7 miles per hour. Levegh in the same year was also credited with an average of 51 miles an hour from Bordeaux to Périgueux; the distance, however, was short, viz., 72 miles.

In 1901 the racing season in France was characterized by two important events, namely, the Paris–Bordeaux and the international race from Paris to Berlin, for which prizes were offered by the German emperor, President Loubet, and the king of the Belgians. The first of these races was won by Fournier on a Mors vehicle of about 60 horse-power. Fournier made an average speed of 53 miles an hour to Bordeaux—a distance (after deducting the neutralized sections) of 328 miles, his fastest-timed piece being $17\frac{1}{2}$ miles in 15 minutes; and from Paris to Berlin he covered a distance of 686 miles at a mean velocity of over 44 miles per hour, excluding 63 miles of "controls," or towns and villages through which each competitor has to follow a cyclist at 6 or 8 miles an hour in order to ensure the safety of the public and effectually prevent any attempt at racing through crowded places. The latter event was one which put the vehicles to an extremely severe test, owing to the roughness of the road throughout the greater portion of the journey. In 1902 the French Government commenced making strenuous efforts to encourage amongst agriculturists the manufacture of denaturalized alcohol as a substitute for petroleum spirit, and to this end a race—known as the "Circuit du Nord"—was organized by the Minister of Agriculture, in which the fuel used had to contain at least 50 per cent. of common vegetable alcohol. The course was $571\frac{1}{2}$ miles in length, and was covered by Farman, the winner, on a Panhard machine in about 12 hours. The big event of the year, however, was the race from Paris to Vienna, which was won by Renault's 16-h.p. "voiturette." Deducting the Swiss portion of the route (which was neutralized), the distance was 615 miles, which was accomplished in 15 hours 48 minutes—running time. Seventy-seven per cent. of the starters arrived at Vienna; and, considering the dangerous character of the route—its many steep and tortuous descents—this and the race from Paris to Berlin afford striking illustrations of the advance that has been made in the perfecting of the mechanical road carriage since the commencement of this new industry.

Although most of the big races have been won by the cars of Panhard and Levassor, or Mors, there are other makers whose vehicles are widely used, notably Peugeot, Dietrich, Richard, Delahaye, Renault, de Dion, Darracq, and others. The transmission system of the Peugeot and Mors is virtually the same as that of Panhard and Levassor, while Dietrich, Richard, and Delahaye have mostly employed belt-driving and horizontal engines, and

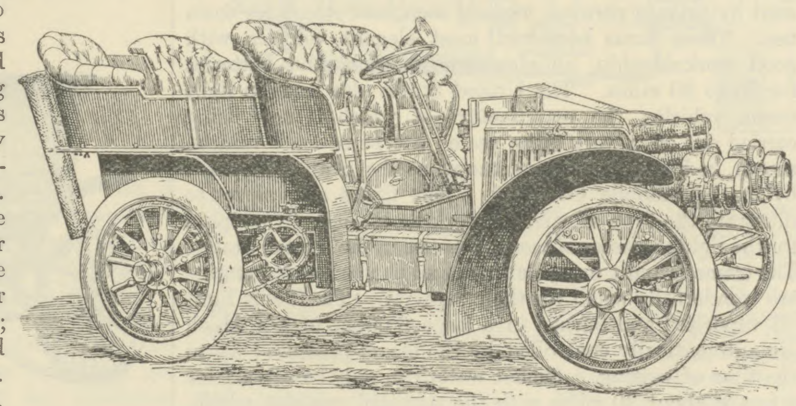

FIG. 6.—Panhard Car.

the three firms last named are makers of light cars of the "voiturette" type.

The success of motor vehicles in France may be attributed in a large measure to the demonstration of their capabilities by the organization of frequent races, and to the support given to these by the various authorities and the public, who at once saw the advantages of the new means of locomotion. Whatever may be said to the contrary, these races and the experience thereby gained have undoubtedly brought out the weak points, have induced makers to construct machines of the very best material and workmanship, and have enabled them to produce a wonderful combination of speed, durability, lightness, and strength—a state of perfection that would otherwise scarcely be existent. Hence the importance attached to these periodical contests in the preceding remarks.

In America the first important developments in automobiles were inaugurated by the *Times-Herald* contest in November 1895, in which the tractive power and consumption of fuel were considered. There was deep snow on the ground, and the results achieved were hardly successful, though the Mueller and Duryea cars figured prominently. The latter, together with the Winton (which represented America in the Gordon Bennett Cup race of 1900), are amongst the best-known vehicles propelled by gasolene in the United States. Duryea employs a well-balanced engine, and the speed changing is effected by clutches, the spur wheels remaining always engaged. To

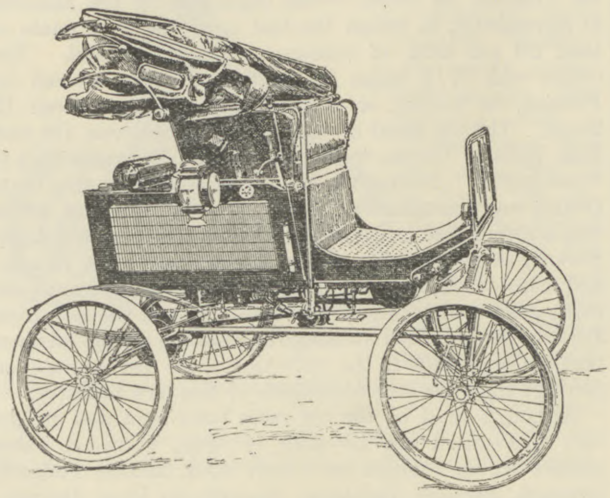

Fig. 7.—"Locomobile" Steam Carriage.

America is due the first place in regard to electrical carriages, the Columbia of the Pope Manufacturing Company, the Riker, the Woods, and similar vehicles being extensively used by private persons, medical men, and others for town use. These firms construct most elegant vehicles with good workmanship, noiseless transmission, and batteries for 30 to 60 miles. The United States also leads in light steam vehicles, the manufacture of which is now being carried out on a very large scale; a type of such vehicle, shown in Fig. 7, and once known as the Stanley, is built by the Locomobile Company. This figure also serves to illustrate the type of carriage work most generally adopted for the lighter classes of motor vehicles in the United States. The frame is built on cycle lines, and the boiler and engine are wonderfully small for their capacity. The fuel is light oil vaporized and burned in a large number of jets which are automatically controlled by the steam pressure; up to the time of writing, sufficient water can only be carried for a run of about 30 miles with the standard vehicles, which, however, have found much favour owing to their low price and quiet running.

As regards other countries, Germany holds an important position, having produced the two great exponents of petrol motors—Gottlieb Daimler and Carl Benz. It is believed that M. Lenoir, a Frenchman, constructed in 1862 the first vehicle propelled by an internal combustion engine, but he apparently did not follow up his invention as did Herr Benz, who constructed his first carriage in 1885, since when some 2500 of these cars—a type of which is shown in Fig. 8—have been turned out at the Rheinische Gasmotoren-Fabrik of Mannheim. This firm uses horizontal cylinders, electric ignition, and principally belt-driving. The late Herr Daimler, whose work has already been alluded to, was the founder of the Daimler Motoren Gesellschaft of Cannstadt, which constructed vehicles under his patents with the transmission formerly by belts, but now on the lines adopted by Panhard and Levassor. Their latest production is a racing machine of 35 h.p. known as the Mercedes, which won laurels at the Nice races of 1901 and 1902. It is fitted with magneto-electric ignition, and a 4-cylinder motor cooled by an air-fan in addition to the water circulation. Germany, as also America, Switzerland, Belgium, Italy, and indeed nearly every civilized country, now has its Automobile Club, whose interests are the protection and encouragement of the industry.

To return to England, considerable progress has been made since the "Emancipation of the Motor" on 14th November 1896, when the inauguration run from London to Brighton was held, under the new Act of Parliament which raised the limit of speed to that prescribed by the Local Government Board, *i.e.*, 12 miles an hour. The pure growth of the industry has been somewhat impeded by unscrupulous company promotion, but is now proceeding apace. Of the British constructors, the Daimler Company has probably done most work; its vehicles, as lately improved, resemble considerably the French Panhard, and in fact were originally copied from it. Sectional views of the Daimler motor (12 h.p. 1902 type) are shown in Figs. 9 and 10. The Motor Manufacturing Company builds similar vehicles, using the Daimler and Iden motors, whilst Napier was the first in England to construct powerful machines for the Continental races, and one of his vehicles won for Great Britain in 1902 the international automobile race held annually for the Gordon Bennett Cup. The Napier car is also of the Panhard type, but with a modified motor, heavier gear, and other improvements. The Wolseley Tool and Motor Car Company have a type of their own, and their carriages are of substantial design and workmanship and are low in price. In addition to the constructors named above, there are numerous smaller firms engaged on motor cycles of the de Dion system

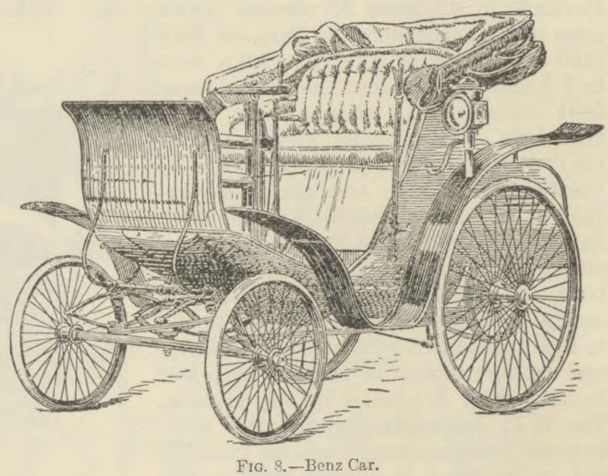

Fig. 8.—Benz Car.

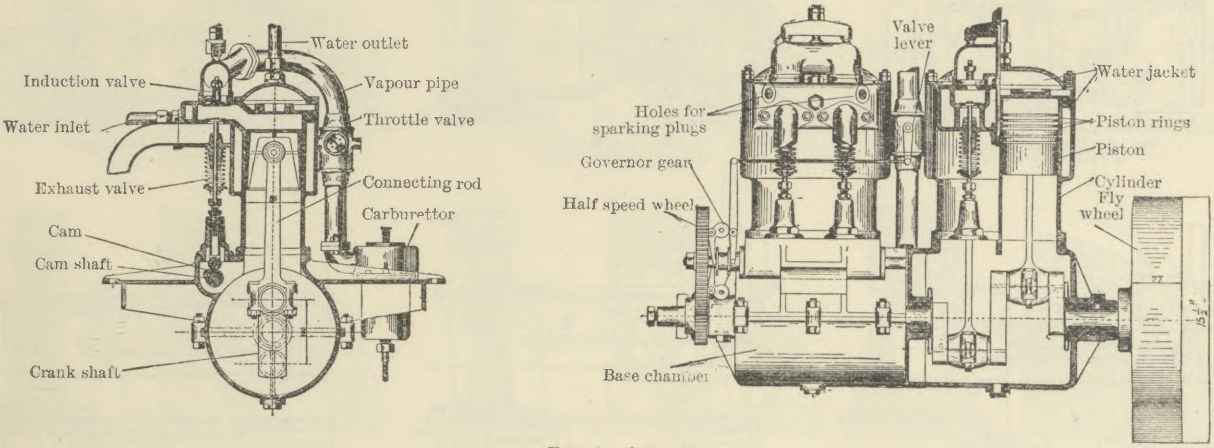
and on light cars of the "voiturette" class. The Automobile Club of Great Britain and Ireland, amongst whose members are many leading sportsmen and scientific men, has its headquarters in London, with numerous branches at other important centres. It has done much to protect the interests of automobilism in Great Britain; and its frequent tours and competitions have helped to popularize the motor vehicle and to educate the public as to its capabilities. The most important of these events was probably the thousand miles trial of 1900, which was the first serious test of motor cars in the United Kingdom; the gold medal for this event was awarded to a French car—that of the Hon. C. S. Rolls, built by Panhard and Levassor of Paris. Similar tests have been repeated annually. It is probable that the revived industry in Great Britain will assume before long as large proportions as it has taken in France, where it developed with an unprecedented rapidity, £2,400,000 worth of motor vehicles having, it is estimated, been turned out there during 1897, 1898, and 1899. The big makers are so full of work that some require a year for the execution of orders, and premiums of 50 to 100 per cent. have been paid for immediate delivery, whilst upwards of £2000 has several times been realized for high-powered vehicles that have won important races. The French nation, however, has taken the matter up purely from a sporting standpoint, and has rushed into it with an impetuosity hardly characteristic of the Briton, with whom the new means of locomotion is likely to come into favour slowly but steadily.

The three commonest methods of propulsion that have been employed up to the present are steam, oil, and electricity. Of these steam appears to be the most suitable for heavy loads, having a great range and elasticity of power; oil or spirit for light carriages, enabling long distances at high speed to be conveniently covered without stoppages; whilst electricity—the "ideal" motive power—is at present a luxury to be employed only for towns and short distances, until a light battery is discovered having a far greater capacity than is at present possible. The mechanical difficulties that have been encountered in the development of the light motor vehicle are very many, and the chief disadvantages hitherto prominent have been noise, vibration, and uncertainty of action, all of which, as one may notice in the modern vehicles, have now been greatly reduced, although it is still essential for an owner to have a mechanical instinct—or to employ a competent man—for the efficient working of his car. For their advantages, apart from heavy transport (dealt with below), much may be said. The capabilities of the modern automobile, the extraordinary control, freedom from vibration when in motion, and the exhilarating effect of gliding swiftly and smoothly through the air, are points of which the ordinary individual is totally ignorant; hence the reason why a first ride in a good vehicle usually converts the most prejudiced person. A good motor-car has a large field of use and enjoyment, though the public should be cautioned against the purchase of cheap and inferior productions, many of which are on the market and which cause much disappointment. A motor carriage has a scope of work far beyond the capabilities of a horsed vehicle. It can cover long distances, is under absolute control, and can therefore travel at very high speeds with perfect safety. It greatly



FIGS. 9 and 10.

economizes space when among street traffic, and would, if generally employed, render the streets far more sanitary, as well as reduce the wear on the roads; it costs nothing for fuel when not in use, and but a penny a mile on an average when running.

A word of warning to the novice may not be out of place. The possessor of an autocar should not let enthusiasm and the ever-increasing thirst for speed get the better of prudence, and should show due consideration for nervous horses, and users of the road generally, remembering that in England a pedestrian has as much legal right to the road as any vehicle. In this way each automobilist will do his part in the popularization of the mechanical road carriage, which has been brought to its present state of perfection by an amount of ingenuity and art realized by few, and which is destined in the near future to play an important part in the civilization of the world.

II. HEAVY VEHICLES.

Until the close of the 18th century, the common road constituted the only means by which goods could be transported upon land from one part of the country to another. The marvellous development in the carriage of goods by land since about 1830 is due to the introduction and gradual perfection of the railway system, the essential features of which are a hard steel wheel rolling upon a hard smooth track, and the substitution of mechanical for animal traction. Railways now constitute the great arterial systems of communication by land all over the world, and it is no wonder that their rapid development, which has absorbed in the United Kingdom alone a capital of over one thousand million pounds, has led to the comparative neglect of the application of mechanical power upon roads. It is true that traction engines have now been brought to a high state of efficiency, and are being increasingly employed both at home and abroad, but when it is remembered that the vast and ever-growing tonnage carried upon railways must fall very far short of that carried upon roads, it will be seen how limited is the field

TYPES OF HEAVY MOTOR VEHICLES.

A, Air-fan; B, boiler; C, condenser; D, differential gear; E, engine; G, gearing; H, hot-water tank; O, oil-tank; S, steering; W, water-tank; X, auxiliary engine.

which is covered by this type of engine. With the exception of the traction engine itself, it cannot be said that there has ever been the same serious attempt to introduce mechanical propulsion for the conveyance of goods that has been shown in the previous section of this article to have taken place since about 1840 in connexion with passenger and pleasure vehicles. But it was to be expected that sooner or later the natural course of events would lead to the introduction of improved and more speedy means of conveyance of goods upon roads, and there is every reason for thinking that during the present century there will be a development in this direction bearing at any rate some proportion to the development of railways during the century that is past.

In the first place, it may be remarked that railways themselves are dependent upon the use of roads for the distribution of goods, railway companies being, in many of the great cities, the largest owners of horses and waggons; all the railway system would, therefore, derive much benefit from improved means of road transit. But further, there is a vast field for development in the conveyance of goods which could not be dealt with at all by railways, and in the opinion of those best fitted to judge, country and agricultural districts might be largely opened up if a more rapid and efficient mode of conveyance upon roads became established, while it is almost certain that up to distances of 40 or 50 miles motor vehicles can even now compete successfully with the railways for the carriage of goods in the great industrial centres. The general feeling that the progress in mechanically propelled vehicles which might be so advantageous to the country at large was made absolutely impossible by legislative restrictions led to the passing of the Locomotives on Highways Act in 1896, which has doubtless been the direct cause of the production and successful introduction in Great Britain of a number of heavy motor vehicles, capable of carrying loads up to 6 and 8 tons.

Before proceeding to describe these vehicles, it may be noted that the regulations of the Local Government Board respecting motor vehicles issued in accordance with the foregoing Act, as far as heavy motor vehicles are concerned, deal chiefly with restrictions of weight and speed. If the weight of the vehicle is between $1\frac{1}{2}$ and 2 tons, the limit of speed is 8 miles an hour, whereas when the weight exceeds 2 tons, the limit of speed is placed at 5 miles an hour. It is in the direction of the tare limit, or weight when unladen, that the greatest difficulties have been found by manufacturers. The extreme tare limit is placed at 3 tons—with a trailer weighing 1 ton—and the construction of a vehicle for heavy traffic which will carry a paying load, and which when unladen shall, with its motive power and accessories, weigh only 3 tons, has not only involved the application of the greatest ingenuity and skill, but has necessitated the use in many cases of an expensive metal like aluminium for casings and other parts of the motor. Even with the greatest mechanical skill in construction and design, it is questionable if the full benefits of the self-propelled vehicle can be realized with the 3-ton tare limit in connexion with the hauling of goods to and from docks, and in the great manufacturing centres. Energetic steps are being taken to obtain a modification of this limit, which will probably be successful if the proper protection of the road surface can be secured with the heavy loads which could then be carried.

Concerning the actual results which have been obtained, a summary is given on p. 21 of the trials of heavy motor vehicles held in the years 1898, 1899, and 1901, under the auspices of the Liverpool Self-Propelled Traffic Association, although it must be remembered that their practical success must really depend upon a lengthened experience of working, so as to enable a comparison to be made with horse traction. Such facts as are already available from the experience of the engineers of the city of Liverpool, of the Mersey Docks and Harbour Board, of the Lancashire and Yorkshire Railway, and of private firms, were collected in a paper on "Road Locomotion," read before the Institution of Mechanical Engineers on 26th April 1900, which paper has been freely drawn upon in the preparation of this article.

Driving Wheels for Heavy Motor Vehicles.

In the United Kingdom it may be said that steam is the only power which has been introduced up to the present time for the mechanical propulsion of vehicles for heavy traffic. It does not by any means follow, however, that this will permanently be the case, and both oil engines and electricity have been used with a certain amount of success, while in America compressed air for such purposes is being given a trial. The following descriptive account is limited, however, to steam motor vehicles, which in the first place will be briefly dealt with from the point of view of their general arrangement and construction.

General construction.

Figs. 1 to 6 represent by skeleton diagrams the plan and elevation of these vehicles, a uniform system of lettering being adopted. A glance at these will show the very varied methods in which makers have distributed the essential features. All the boilers are placed in the front and above the car, except in the Musker system (Fig. 6), in which a horizontal boiler with a special fan or draught for the burner is employed, and is placed transversely under the middle of the car, no funnel being required (see also Fig. 26). The next important feature of difference between the systems is in the position of the engines. In the Thornycroft and Lifu systems (Fig. 4, see also Figs. 22 and 23) they are placed horizontally in the middle of the waggon, and the main driving wheel is driven by means of toothed gearing. This is also the case in the Musker system. The Coulthard-Leyland (Fig. 1; see also Figs. 24 and 25) and Clarkson-Capel systems (Fig. 3) all have vertical engines from which the motion is transmitted to the main driving wheel by means of chain gearing operating through a counter-shaft. In the Bayley system (Fig. 2) the engine is also vertical, but transmits the motion by means of a horizontal shaft placed longitudinally with the waggon; by bevelled gearing this drives a counter-shaft which in turn drives the main driving wheel by a pinion and spur wheel. In the Simpson-Bibby system (Fig. 5; also Fig. 27) the arrangement is neat and ingenious. A pair of small three-cylinder engines work separately and independently the two main driving wheels, the use of separate engines obviating the necessity for a jack-in-the-box or differential gearing. Another important feature of difference between the various systems is to be found in the fact that the Musker, Leyland, Coulthard and Clarkson-Capel all use condensers, the location of which can be seen by an inspection of the various diagrams, whereas in the others the effect of superheating the steam is relied on in order to avoid the emission of visible vapour. This latter device acts very well in hot dry weather, but when the atmosphere is cold and moist a cloud of steam is undoubtedly formed, the machine thus failing to comply with the provision of the Act which requires that no *visible* vapour be emitted by light locomotives except from temporary or accidental causes.

Wheels.

When it is remembered that the load has to be concentrated upon the point of contact of the periphery of four wheels, which have also to transmit tractive force from the motor, it is no wonder that they have hitherto been almost entirely made with iron tyres. At the first Liverpool trials of heavy motor vehicles great trouble was experienced with most of the wheels, which had been made in the best possible manner for ordinary vehicular traffic, and in almost all cases they showed signs of the severe stresses and shocks to which they had been subjected, so much so that some of them utterly broke down in consequence. Figs. 7 to 12 illustrate some of the wheels which have been specially designed by the makers of motor vehicles, and show in each case the arrangements for driving, which form a vital part of the design. Messrs Coulthard used a wheel entirely of iron (Fig. 9), which seemed to give very satisfactory results at the Liverpool trials, where it must be noted that part of the 40 miles run was over a road paved with cobbles of the sort well known in certain parts of Lancashire, affording a test scarcely to be surpassed in severity. Messrs Bayley's wheel (Fig. 11) differs from the others in the important detail of being coned or dished, and it has the further important peculiarity that the spur wheel attached to the driving wheel is annular, and is driven by an internal pinion. This affords considerable protection from dust and dirt, and enables the outside of the annular wheel to be used very effectively as a brake wheel encircled by a band brake. The spokes are of oak with ash felloes, the iron tyre being 5 inches wide. In consequence of the new design and special construction of the wheels adopted by most of the makers, they were enabled to stand much better at the second Liverpool trials, but even in the second report the judges wrote in their special conclusions as follows: "The wheels and tyres were generally efficient, but concentration of heavy loads upon the present small area of wheel-contact is a serious difficulty in the problem of goods transport by motor vehicles, and constitutes the chief mechanical cause of the slow progress made." Quite recently one or two makers have been appreciating the great difficulties of this question, and have tried to adopt solid rubber for tyres. Fig. 12 represents Messrs Simpson and Bibby's wheel, in which india-rubber is shown cross-hatched in section, and from which satisfactory results appear to have been obtained.

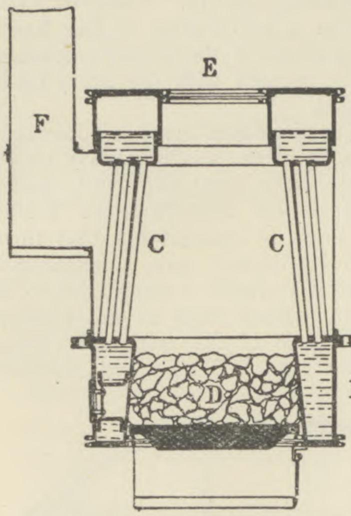

Fig. 13.—Thornycroft Water-tube Boiler.

It is important to notice that while high speeds up to 70 miles an hour and above have been obtained by means of pneumatic tyres with motor vehicles weighing in some cases more than a ton, the limit of speed at which a heavy motor vehicle on iron tyres can run with any great load without rapidly destroying the vehicle must apparently be placed at something like 5 miles an hour. The development of heavy motor traffic is greatly retarded by the difficulties which are encountered in the matter of speed upon bad roads, and even upon good roads during the winter time, while upon the best of roads in dry weather it is scarcely possible to carry more than a total possible load of 15 tons upon four wheels of a motor waggon. Inasmuch as a motor waggon carries its own power and is a very expensive machine, it is necessary for its commercial success that it should carry the greatest possible load at the highest possible speed consistent with the safety of the public and the efficiency of the motor; for these reasons attention has been turned to some contrivance or other that will replace the ordinary wheel. This is a time-honoured problem which all attempts have hitherto failed to solve, but the recent trials of the Diplock walking machine—called by the inventor the "Pedrail"—give promise of a successful result. In this invention supports carrying rollers are placed on the ground, and the motor or traction engine may be said to be rolled over them, so that a rail fixed to the waggon moves along while the wheels themselves are temporarily supported on the ground and picked up when the load has passed over them. The results seem to point to a great future development in this direction, especially where bad roads have to be negotiated, or heavy loads carried where no roads at all exist.

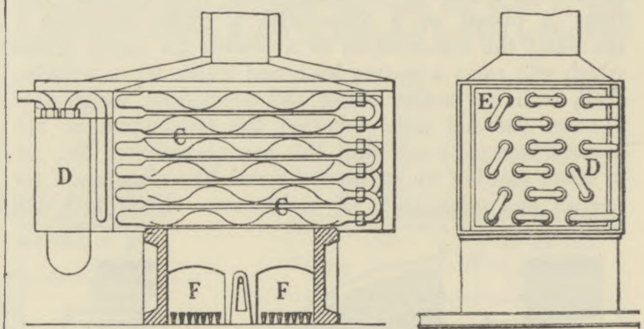

Fig. 15.—Simpson-Bibby Flash Boiler.

Boilers.

The two most important considerations in connexion with the design of a steam boiler for motor vehicles are, first, it must be as light as possible consistent with high pressure, and secondly, it must be capable of being forced so as to meet a sudden demand, such as is caused by climbing a hill, for an increased quantity of steam at a higher pressure. The latter point really constitutes one of the great advantages of steam for a motor vehicle, and in many designs has enabled change of speed-gearing to be dispensed with, since in engines working under the compound system arrangements are made to use high-pressure steam in both cylinders in order to surmount a hill or to transport a heavy load over a piece of bad road. One of the most successful boilers is that of the Thornycroft Steam Waggon Company, Chiswick, represented in section in Fig. 13. This consists of two separate annular portions, A and B, almost rectangular in section, connected by a number of cylindrical straight water tubes which form the walls of a slightly tapered hollow cone CC. The furnace D is contained in the hollow of the lower annulus B, being fed through the opening in the upper annulus A, through the cover E, which can be removed for the purpose. The flame has to find its way on all sides through the narrow spaces left between the water tubes, the products of combustion escaping by means of the funnel F. The de Dion boiler, shown in Fig. 14, is better known in France than in the United Kingdom, but at the Liverpool trials on the Bayley waggon it proved itself a very efficient steam generator. It consists, like the Thornycroft, of a double annulus of rectangular section, connected by water tubes, the essential difference between the two boilers being that one annulus M is much smaller than the other, and is partly contained in it; the water tubes connected with them, instead of being vertical as in the Thornycroft, are slightly inclined from the horizontal. The furnace N, as in the case of the Thornycroft, is fed through a

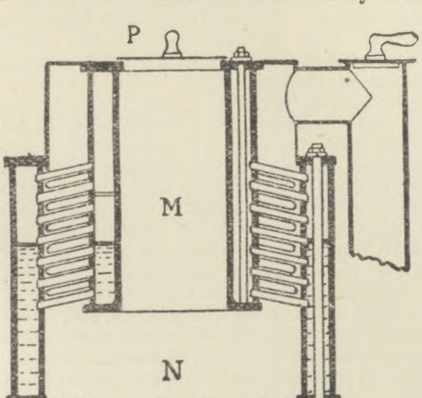

Fig. 14.—De Dion Water-tube Boiler.

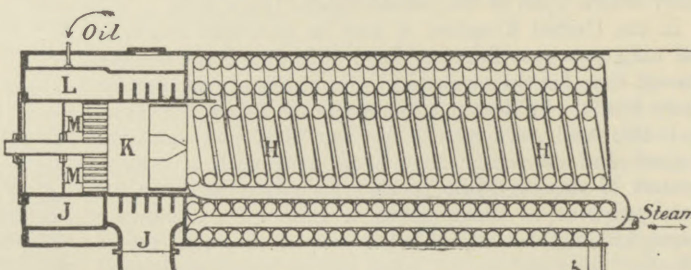

Fig. 16.—Musker Boiler and Burner.

cover P. It is obvious that the heating surface is disposed to the best advantage, as is shown by the results obtained.

The two foregoing boilers are of the water-tube type, but some motor waggons employ flash boilers. In this type of boiler a small quantity of water is injected at each stroke of the engine into a heated coil of metal, or series of tubes, to be flashed into steam and superheated. M. Serpollet has for some years been engaged in perfecting such a boiler, while in Great Britain Messrs Simpson

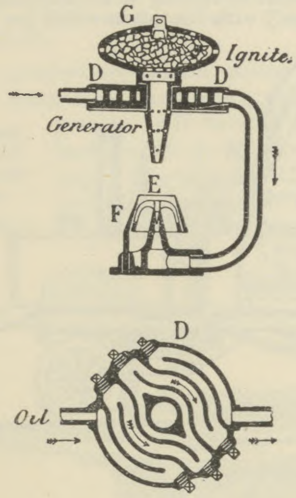

Fig. 17.—Lifu Burner.

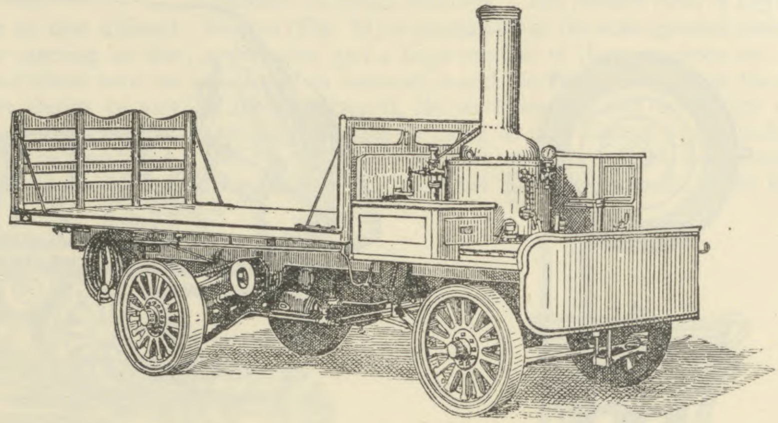

Fig. 25.—Coulthard 5-ton Lorry.

and Bibby have a very strong and effective flash boiler, shown in Fig. 15. This consists of a series of indented heavy steel tubes C, connected outside the furnace by a Haythorn joint. The

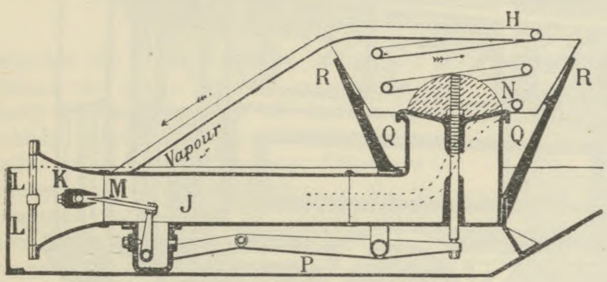

Fig. 18.—Clarkson-Capel Burner.

indentations alternate about 168 times in the generator, and any fluid passing round them must encounter an amount of baffling that exposes it in the most effective way to the action of the heating surface. The steam is made to pass through a drum D, which is found necessary to prevent the superheated steam having too high a temperature. The boiler is heated by a coal furnace FF, and in about 40 minutes from lighting the fire steam is generated.

One of the newest forms of combined boiler and burner is that of Messrs C. and A. Musker of Liverpool (Fig. 16). It consists of three cylindrical coils, HH, of strong steel tubes, and the flame is made to circulate in the annular space between them. The point at which the water enters is shown in the diagram, and likewise that at which the steam is supplied to the engine. The weight of this boiler and contents, independently of the burner, is only 4 cwts., and it is capable of developing 30 h.p., representing a weight of 15 lb per h.p. This indicates the great steaming capacity of this type of boiler, and its suitability for motor vehicles.

It will be noted that in some of the foregoing boilers solid fuel is used, while for the Musker boiler liquid fuel is employed, as it is also in the Lifu, Serpollet, and other steam systems. It cannot be said that at present it is more economical, but with an efficient burner it is certainly more convenient. Some at least of the difficulties in the way of the construction of a burner using heavy petroleum seem to have been successfully overcome in the systems above mentioned. The essential feature of all these burners is a heated surface over which the liquid fuel is allowed to pass, so as to become heated and vaporized; the vapour then issues from a suitable jet burning in air under the boiler. The number of burners for liquid fuel which have been invented in recent years is very great, and the figures given merely represent types of those in operation with motor vehicles. An important distinction must

Liquid fuel burners.

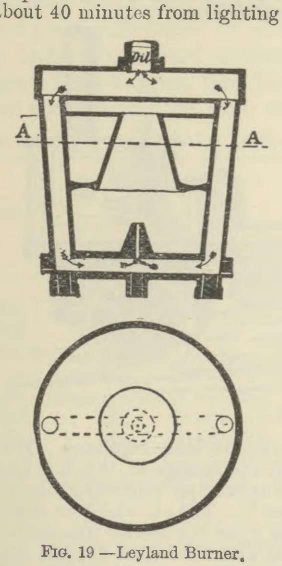

Fig. 19.—Leyland Burner.

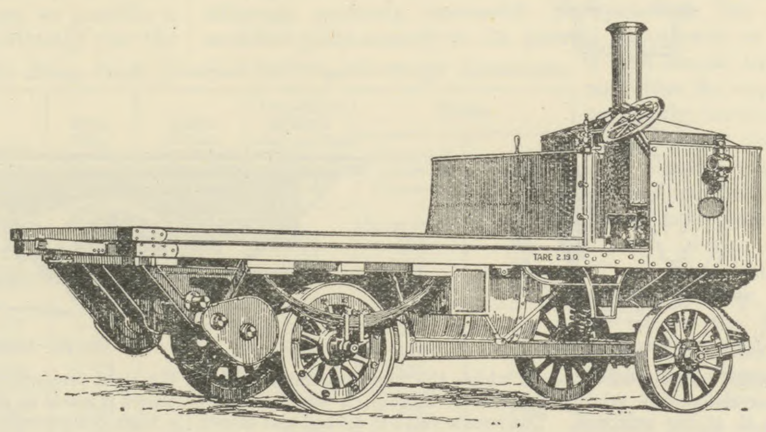

Fig. 27.—Simpson-Bibby 5-ton Lorry.

be made between burners for light and heavy oil, for with a light spirit vaporization, although necessarily effected on the same principle, is a far less difficult matter, and probably does not involve the same risk of carbonizing the petroleum.

The Lifu burner (Fig. 17) consists of a casting D, in the tortuous passages of which the petroleum is made to circulate; it thus becomes thoroughly vaporized, since the casting is placed in the body of the flame which issues at E. F is an air cone which allows the proper proportion of air to mix with the vapour issuing from the needle-valve, which is shown in section and is self-regulating. A peculiar feature of the contrivance is an igniter G, filled with fire-brick which is maintained in a red-hot condition by the flame, so that in the event of the flame being extinguished suddenly, it is immediately relighted from the hot fire-clay. In order to ensure perfect combustion, arrangements are made for regulating the supply of air in both the Clarkson-Capel and Musker burners. In the former, which is shown in Fig. 18, this is in a sense done automatically. The air can be regulated in quantity by altering the amount of opening of the diaphragm at LL. It mixes there thoroughly with the vapour which has been

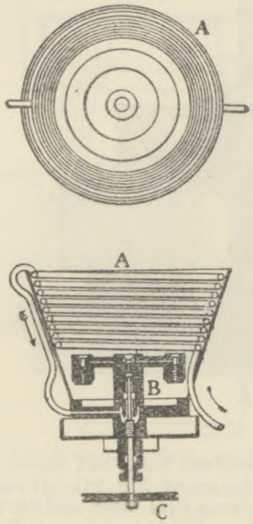

Fig. 20.—Longuemare Burner.

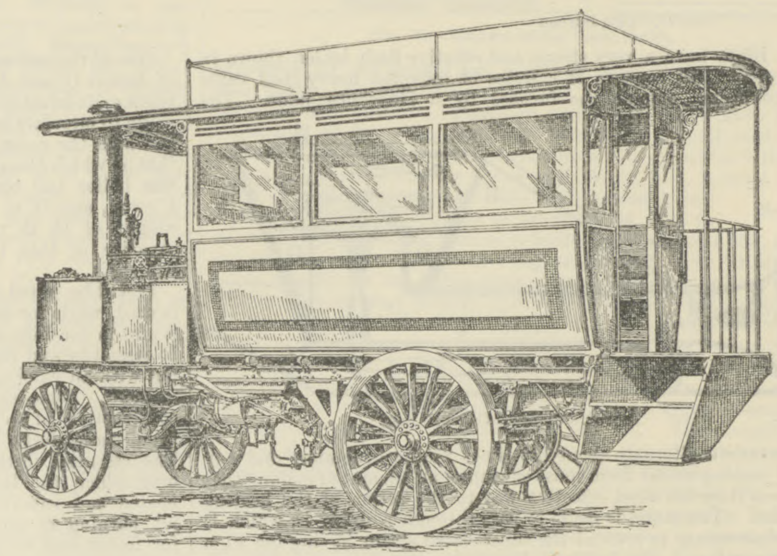

Fig. 23.—Thornycroft Steam Motor Omnibus.

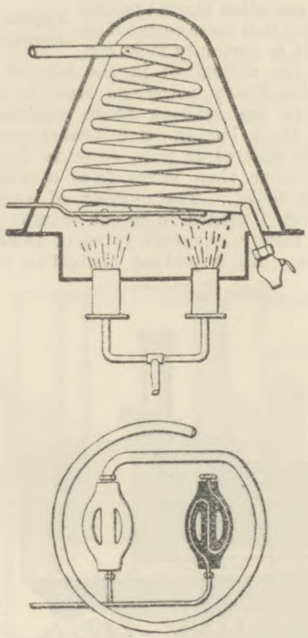

Fig. 21.—Tangye Burner.

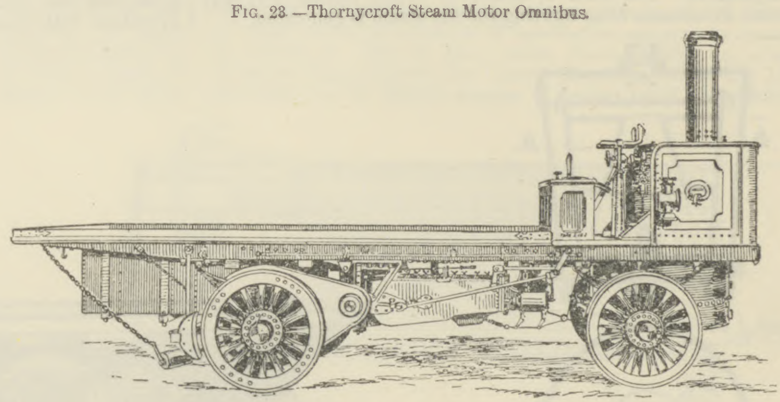

Fig. 24.—Leyland 5-ton Lorry.

generated in the coil H, round which the flame circulates. This vapour enters the mixing chamber J through a small needle-valve M, at the orifice K. The needle-valve is opened and closed by a lever P, which at the same time raises and lowers the larger valve N, so as to regulate the outflow of combined mixture of oil and air underneath at QQ, the flame being baffled on the inside of a hollow nickel cone. The whole arrangement worked very satisfactorily in the Liverpool heavy motor trials. For the burner of Messrs Musker, which is shown attached to the boiler in Fig. 16, the air is supplied by a fan driven by the same auxiliary engine which supplies both the water for the boiler and the oil for the burner, the right proportion being thus automatically regulated. The air passes inwards as shown, through the passage JJ, which is kept at a high temperature by means of cylindrical projecting ribs which form part of the ignition chamber K. The oil, which is admitted by drops at the point L, falling upon the heated iron surface, is vaporized and immediately mixed with the heated air, the mixing being further ensured by causing the vapour and the air to pass through a number of holes in a perforated block M. Ignition takes place in the ignition chamber K. The Leyland burner is shown in section in Fig. 19. The Longuemare burner, shown in plan and elevation, Fig. 20, is largely used in France; it consists of a row of coils through which the spirit is brought and afterwards passed down a pipe B, through a needle-valve regulated by a wheel C, which can be operated by the driver. The Tangye burner (Fig. 21) will be easily understood from a reference to the sectional plan, while the elevation shows the way in which the flame vaporizes the liquid fuel. The coil, boiler, and casing are also shown.

General view of different types.

In general appearance motor waggons at first differed very much from each other, each maker starting at the problem as it were *ab initio*, and there were no traditions to go upon or to fetter design in any way. Hence it was that the questions whether protection for the driver should be employed, whether an air-cooled condenser should be adopted, whether the boiler should be in front of or behind the driver, or even underneath the body of the car, were all matters upon which different makers held different opinions, and this led to great differences in the general external appearance of the first waggons designed by the various makers. But very quickly a remarkable tendency became visible to conform to one particular type, viz., that which was first adopted in the Lifu system, and which is illustrated by Figs. 22, 24, and 27. In these waggons there is a workmanlike funnel and casing for the boiler, behind which the driver sits without any attempt at weather protection, a precaution which may be said to have been found practically futile on a motor waggon; the engines and boiler are carried underneath the frame, as in the original Lifu waggon, thus leaving as large as possible a space for carrying the load, which comes directly over the driving wheels. These general features are well shown in the Thornycroft waggon (Fig. 22), and there is no waggon better known or which stands higher in the matter either of design or workmanship. Fig. 22 shows the Thornycroft 7-ton lorry, and Fig. 23 shows the Thornycroft system adapted to a steam omnibus. The present form of Leyland waggon (Fig. 24) is practically of the same general external appearance, and a large number of these waggons are now employed in Lancashire and elsewhere; and, as in the case of the Thornycroft, the workmanship and design are such as to enable them to carry at the highest legal limits of speed a full load without any very rapid deterioration, over some of the roughest Lancashire roads. The same may be said of the Coulthard, which is shown in Fig. 25, although in the illustration the waggon is shown which, although perfectly successful in operation, has been modified quite recently in its general appearance, so that it now almost exactly resembles the waggons previously mentioned. Fig. 26 shows the oil-fired Musker waggon, the general details of which have been previously given. Fig. 27 is the Simpson and Bibby lorry. Fig. 28 shows the Mann 5-ton lorry, which is interesting from the fact that, like the Foden motor waggon, it employs a horizontal type of boiler. Both the Foden and the Mann lorry have given excellent results in practice, the former

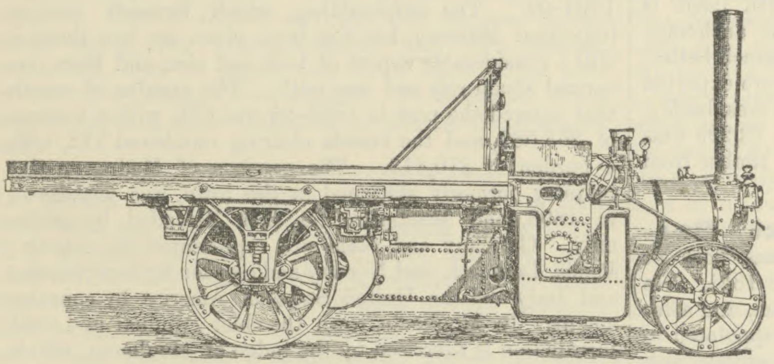

FIG. 28.—Mann 5-ton Lorry.

behaving remarkably well at the War Office trials in 1901, under the severe tests to which it was subjected by the military experts.

The table on the previous page gives the chief data of the heavy motors which competed in the various trials conducted by the Self-Propelled Traffic Association at Liverpool. Full information and details of the motors, also their respective consumption of fuel, water, &c., will be found in the three volumes of Reports.

(H. S. H.-S.)

Motril, a town of Spain, in the province of Granada, one mile from the coast. Its population was 17,108 in 1897. The sugar-cane and beetroot grown in the district both contribute to the increasing prosperity of the sugar factories. Alcohol, flour, soap, iron, and cotton stuffs are among the other industrial products. Motril itself is considered a port of the second class, but the anchorage at Calahonda, 4½ miles to the south-east, is much better. Grapes, esparto grass, dry figs, and almonds were exported to Great Britain in 1898; and to France zinc ores, barley, and fruit. The imports in that year included 12,299 tons of coal from Great Britain and 2518 tons of timber from Russia.

Mouchez, Amédée Ernest Barthélemy (1821–1892), French savant, was born at Madrid of French parents on 24th August 1821. He entered the Naval School at the age of sixteen, and after serving with distinction on various ships was appointed to the command of the *Bisson* in 1856. Being struck with the inaccuracy of the then existing charts of South America, he conceived the design of surveying the whole coast of Brazil. Some idea of the energy and activity he displayed in this task and the enthusiasm with which he inspired his officers may be gathered from the fact that the survey of these coasts, extending for a length of some 3000 miles, was finished in two years and a half. In recognition of this service he was appointed a member of the Bureau des Longitudes. He displayed the same qualities in organizing the French expedition to the island of St Paul to observe the transit of Venus in 1874, and the following year was appointed rear-admiral, and elected a member of the Academy of Sciences. In 1878 he accepted the post of director of the National Observatory at Paris, in succession to Le Verrier. He was perhaps not a great astronomer in the sense that the term is applied to his predecessor, but he found here ample scope for the exercise of his great administrative abilities. During the fourteen years of his directorship the usefulness of this famous institution was largely extended. The grounds of the Observatory were enlarged, and two powerful instruments of a novel kind were installed; a new spectroscopic department was established, and the gigantic task of re-observing all Lalande's stars was completed. Under his direction twenty-one volumes of the *Annales* were published, as well as the first two volumes of the great catalogue, in which he rendered accessible to astronomers the observations which had been accumulating at the Paris Observatory for more than half a century. He founded the *Bulletin Astronomique*, the School of Astronomy at the Paris Observatory, and the observatory of Montsouris, where naval and military officers, explorers, and others are instructed in such astronomical observations as are necessary in their various callings. It is, however, as author of the great scheme for an international photographic survey of the heavens that Mouchez will be chiefly remembered. The advances which had been made at the Paris Observatory and elsewhere in stellar photography suggested to him the magnificent idea of constructing, by the international co-operation of astronomers, a complete photographic chart of the celestial vault, which, containing more than fifty million stars, would hand down to future ages a faithful picture of the state of the heavens at the end of the 19th century. At three great congresses presided over by Mouchez, and attended by representative astronomers from all the leading observatories of the world, the initial difficulties inseparable from such a vast scheme were overcome; and although he did not live to see the completion of his splendid project, he had the satisfaction before his death of knowing that its ultimate success was assured. His death occurred very suddenly at his country seat at Wissous, near Antony, on 25th June 1892. (A. A. R*.)

Moulmein (or Maulme'n), the headquarters of the Amherst district and Tenasserim division of Lower Burma. The population—53,107 in 1881—was only 55,785 in 1898–99. The shipbuilding, which formerly was an important industry, has now been given up, but there is still a considerable export of teak and rice, and there are several steam rice and saw mills. The number of vessels that entered the port in 1898–99 was 674, with a tonnage of 263,089, and the vessels clearing numbered 712, with a burden of 270,413. The garrison of Madras native infantry, formerly stationed in the town, was withdrawn in 1898, and Moulmein was then defended by police only. Germany and Siam are represented by consuls; Persia, Denmark, and Norway and Sweden by vice-consuls; and Italy and the United States of America by consular agents. In Moulmein town the chief criminal and civil jurisdiction is exercised by the judge of Moulmein, who is sessions judge and district judge. There is an amalgamated high, normal, and practising school, as well as a high school.

Moundsville, a city of West Virginia, U.S.A., capital of Marshall county, on the Ohio river, and on the Baltimore and Ohio and Ohio River railways, in the "Panhandle" of the state. It contains the state penitentiary, and has varied manufactures. It derives its name from an interesting Indian mound in the vicinity. Population (1890), 2688; (1900), 5362, of whom 130 were foreign-born and 468 were negroes.

Mounet-Sully, Jean (1841–——), French actor, was born at Bergerac, 27th February 1841. His name was Jean Sully Mounet, but he adopted the above form early in life and has been always known by it. After a struggle against the prejudices of his parents, he entered the Conservatoire at the age of twenty-one, and a few years later took the first prize for tragedy. In 1868 he made his *début* at the Odéon, without attracting much attention. His career was interrupted by the Franco-Prussian war, and the liking he developed for soldiering had almost decided him to give up the stage when he was offered the opportunity of playing the part of Oreste in *Andromaque* at the Comédie Française in July 1872. His striking presence and voice and the passionate vigour of his acting made an immediate impression, and the eventual result was his election as "sociétaire" in January 1874. He became one of the mainstays of the Comédie Française, and distinguished himself in a large variety of tragic and romantic parts. Perhaps his most famous impersonation was that of Œdipus in a version of Sophocles' drama. This was first performed in the ruined amphitheatre at Orange on the occasion of a fête in 1888. Other prominent parts in his repertory were those of Achille in *Iphigénie*, Hippolyte in *Phèdre*, Hernani, Ruy Blas, Hamlet, Francis I. in *Le Roi s'Amuse*, Didier in *Marion Delorme*, &c. He was created Chevalier of the Légion d'Honneur in 1889, and is the author of a play entitled *La Buveuse de Larmes*.

Mountaineering.—Mountaineering is the art of moving about safely in mountain regions, avoiding the dangers incidental to them, and attaining high points difficult of access. It consists of two main divisions, rock-craft and snow-craft. Rock-craft consists in the intelligent selection of a line of route and in gymnastic skill to follow the line chosen. In snow-craft the choice of route is the result of a full understanding of the behaviour of snow under a multitude of varying conditions; it depends largely upon experience, and much less upon gymnastic skill. The dangers which the craft of climbing has been developed to avoid are of two main kinds, the danger of things falling on the traveller and the danger of his falling himself. The things that may fall are rocks, ice, and snow; the traveller may fall from rocks, ice, or snow, or into crevasses in ice or snow. There are also dangers from weather. Thus in all there are eight chief dangers: falling rocks, falling ice, snow-avalanches, falls from difficult rocks, falls from ice slopes, falls down snow slopes, falls into crevasses, dangers from weather. To select and follow a route avoiding these dangers is to exercise the climber's craft.

Falling Rocks.—Every rock mountain is falling to pieces, the process being specially rapid above the snow-line. Rock-faces are constantly swept by falling stones, which it is generally possible to dodge. Few accidents have occurred in such places. Falling rocks tend to form furrows in a mountain face, and these furrows (*couloirs*) have to be ascended with caution, their sides being often safe when the middle is stone-swept. Stones fall more frequently on some days than on others, according to the recent weather. Local experience is a valuable help on such a question. The direction of the dip of rock strata often determines whether a particular face is safe or dangerous; the character of the rock must also be considered. Where stones fall frequently débris will be found below, whilst on snow slopes falling stones cut furrows visible from a great distance. In planning an ascent of a new peak such traces must be looked for. In some mountain ranges (Himalaya, Alps of New Zealand) falling stones are more frequent than in the Swiss Alps. When falling stones get mixed in considerable quantity with slushy snow or water a mud avalanche is formed (common in the Himalaya). Mud avalanches keep to recognized tracks and move slowly, but advance to great distances and overwhelm large areas of land. It is necessary to avoid camping in their possible line of fall.

Falling Ice.—The places where ice may fall can always be determined beforehand. It falls in the broken parts of glaciers (*seracs*) and from overhanging cornices formed on the crests of narrow ridges. Large icicles are often formed on steep rock-faces, and these fall frequently in fine weather following cold and stormy days. They have to be avoided like falling stones. Seracs are slow in formation, and slow in arriving (by glacier motion) at a condition of unstable equilibrium. They generally fall in or just after the hottest part of the day, and their débris seldom goes far. It is generally possible to estimate the stability of a serac within reasonable limits. A skilful and experienced ice-man will usually devise a safe route through a most intricate ice-fall, but such places should be avoided in the afternoon of a hot day. Hanging glaciers (*i.e.*, glaciers perched on steep slopes) often discharge themselves over steep rock-faces, the snout breaking off at intervals. They can always be detected by their débris below. Their track should be avoided. In the early summer falls of ice are less common than in the autumn, when the winter snow has melted away and deprived seracs of its support.

Snow Avalanches.—These mainly occur on steep slopes when the snow is in bad condition, early in the year, or after a recent fresh fall. Days when snow is in bad condition are easily recognized; on such days it may be inadvisable to traverse snow-slopes which at another time may be as safe as a high-road. Beds of snow collected on rock ledges in bad weather fall off when a thaw comes, and are dangerous to rock-climbers. Snow that has recently fallen upon ice slopes is always liable to slip off bodily. Such falling masses generally make the lower part of their descent by couloirs. Snow avalanches never fall in unexpected places, but have their easily recognizable routes, which can be avoided in times of danger by experienced mountaineers.

Falls from Rocks.—The skill of a rock-climber is shown by his choice of hand-hold and foot-hold, and his adhesion to those he has chosen. A man who knows the limit of his powers and selects his grip accordingly may be stopped by a difficulty, but will not fall. Much depends on a correct estimate of the firmness of the rock where weight is to be thrown upon it. Many loose rocks are quite firm enough to bear a man's weight, but experience is needed to know which can be trusted, and skill is required in transferring the weight to them without jerking. On all difficult rocks the rope is the greatest safeguard for all except the first man in the ascent, the last in the descent. In such places a party of three or four men roped together, with a distance of 15 to 20 feet between one and another, will be able to hold up one of their number (except the top man) if one only moves at a time and the others are firmly placed and keep the rope tight between them, so that a falling individual may be arrested before his velocity has been accelerated. In very difficult places help may be obtained by throwing a loose rope round a projection above, and pulling on it; this method is specially valuable in a difficult descent. The rope usually employed is a strong Manila cord called Alpine Club rope, but some prefer a thinner rope used double. On rotten rocks the rope must be handled with special care, lest it should start loose stones on to the heads of those below. Similar care must be given to hand-holds and foot-holds, for the same reason. When a horizontal traverse has to be made across very difficult rocks, a dangerous situation may arise unless at both ends of the traverse there be firm positions. Even then the end men gain little from the rope. Mutual assistance on hard rocks takes all manner of forms: two or even three men climbing on one another's shoulders, or using for foot-hold an ice-axe propped up by others. The great principle is that of co-operation, all the members of the party climbing with reference to the others, and not as independent units; each when moving must know what the man in front and the man behind are doing. Help may sometimes be obtained by fastening iron or wooden pegs into cracks, and hitching a rope over. The greatest danger on difficult rocks is to be roped to a careless companion. After bad weather steep rocks are often found covered with a veneer of ice (*verglas*), which may even render them inaccessible. Climbing-irons (crampons, *steigeisen*) are useful on such occasions.

Ice Slopes.—Climbing-irons are also most useful on ice or hard snow, as by them step-cutting can sometimes be avoided, and the footing at all times rendered more secure. True ice slopes are rare in Europe, though common in tropical mountains, where newly-fallen snow quickly thaws on the surface and becomes sodden below, so that the next night's frost turns the whole into a mass of solid ice. An ice slope can only be surmounted by step-cutting. For this an ice-axe is needed, the common form being a small pick-axe on the end of a pole as long as from the elbow of a man to the ground. This pole is used also as a walking-stick, and is furnished with a spike at the foot. A great deal has been written about how to cut steps, which need not be repeated here. There is much to be learned in practice, and a wide difference between a quick and a slow step-cutter. One of the chief uses of a guide is to save his employer this labour. Special care must be taken not to slip on an ice slope, and to use the rope carefully, as the best ice-step remains slippery.

Snow slopes are very common, and usually easy to ascend. At the foot of a snow or ice slope is generally a big crevasse, called a *bergschrund*, where the final slope of the mountain rises from a snow-field or glacier. Such *bergschrunds* are generally too wide to be strided, and must be crossed by a snow bridge, which needs careful testing and a painstaking use of the rope. A steep snow slope in bad condition may be dangerous, as the whole body of snow may start as an avalanche. Such slopes are less dangerous if ascended directly than obliquely, for an oblique or horizontal track cuts them across and facilitates movement of the mass. New snow lying on ice is specially dangerous. Experience is needful for deciding on the advisability of advancing over snow in doubtful condition. Snow on rocks is usually rotten unless it be thick; snow on snow is likely to be sound. A day or two of fine weather will usually bring new snow into sound condition. Snow cannot lie at a very steep angle, though it often deceives the eye as to its slope. Snow slopes seldom exceed 40°. Ice slopes may be much steeper. Snow slopes in early morning are usually hard and safe, but the same in the afternoon are quite soft and possibly dangerous; hence the advantage of an early start.

Crevasses.—These are the slits or deep chasms formed in the substance of a glacier as it passes over an uneven bed. They may be open or hidden. In the lower part of a glacier the crevasses are open. Above the snow-line they are frequently hidden by arched-over accumulations of winter snow. The detection of hidden crevasses requires care and experience. After a fresh fall of snow they can only be detected by sounding with the pole of the ice-axe, or by looking to right and left where the open extension of a partially hidden crevasse may be obvious. A master of snow-craft hardly ever falls into a crevasse, a novice is liable to frequent falls. The safeguard against accident is the rope, and no one should ever cross a snow-covered glacier unless roped to one, or better to two companions.

Weather.—Many of the dangers resulting from bad weather have been referred to above. Storms seldom destroy mountaineers by mere cold or exposure, unless they sit down and lose vitality by inaction, but there have been cases of men blown from exposed positions to destruction. Many climbers have been struck by lightning, but few, if any, killed at high elevations. The main group of dangers caused by bad weather centre round the change it effects in the condition of snow and rock, making ascents suddenly perilous which before were easy, and so altering the aspect of things as to make it hard to find the way or retrace a route. The two extremes to be avoided are sitting still and making frantic haste. The worst of all remedies is alcohol; the best, food, patience, and a dogged will. In storm the man who is wont to rely on a compass has great advantage over a merely empirical follower of his eyes. In large snow-fields it is, of course, easier to go wrong than on rocks, but a trained intelligence is the best companion and surest guide.

History.—The craft of climbing is essentially a modern invention. Devised for sport, it has become an important adjunct to geographical exploration, for it bears to mountain-travel the relation that navigation bears to sea-travel. Till relatively recent times a mysterious dread of mountains lingered in the minds even of educated people; horror was the impression derived from mountain scenery by 18th-century travellers. The substitution of admiration for horror was the work of the 19th century. The chief Alpine passes were crossed in Roman and even prehistoric times. The first recorded mountain ascent after Old Testament times is Trajan's ascent of Etna to see the sun rise. The Roche Melon (11,600 feet) was climbed in 1358. Peter III. of Aragon climbed Canigou in the Pyrenees in the last quarter of the 13th century. In 1339 Petrarch climbed Mount Ventoux near Vaucluse. In 1492 Charles VIII. of France reached the top of Mount Aiguille. The Humanists of the 16th century adopted a new attitude towards mountains, but the disturbed state of Europe nipped in the bud the nascent mountaineering of the Zürich school. Leonardo da Vinci climbed to a snow-field in the neighbourhood of the Val Sesia and made scientific observations. Conrad Gesner and Josias Simler of Zürich visited and described mountains, and made regular ascents. The use of axe and rope were locally invented at this time. No mountain expeditions of note are recorded in the 17th century. In 1739 the Titlis was climbed—the first true snow-mountain. Pococke and Windham's historic visit to Chamounix was made in 1741, and set the fashion of visiting the glaciers. The first attempt to ascend Mont Blanc was made in 1775 by a party of natives. In 1786 Dr Michel Paccard and Jacques Balmat gained the summit for the first time. De Saussure followed next year. The Jungfrau was climbed in 1811, the Finsteraarhorn in 1812, and the Zermatt Breithorn in 1813. Thenceforward tourists showed a tendency to climb, and the body of Alpine guides began to come into existence in consequence. Systematic mountaineering, as a sport, is usually dated from Mr Justice Wills's ascent of the Wetterhorn in 1854. The first ascent of Monte Rosa was made in 1855. The Alpine Club was founded in London in 1857, and soon imitated in most European countries. Mr Whymper's ascent of the Matterhorn in 1865 marks the close of the main period of Alpine conquest, during which the craft of climbing was invented and perfected, the body of professional guides formed, and their traditions fixed. Passing to other ranges, the exploration of the Pyrenees was concurrent with that of the Alps. The Caucasus followed, mainly owing to the initiative of Mr D. W. Freshfield; it was first visited by exploring climbers in 1868, and most of its great peaks were climbed by 1888. Trained climbers turned their attention to the mountains of North America in 1888, when the Rev. W. S. Green made an expedition to the Selkirks. From that time exploration has gone on apace, and many English and American climbing parties have surveyed most of the highest groups of snow-peaks. The exploration of the highest Andes was begun in 1879–80, when Mr Whymper climbed Chimborazo and explored the mountains of Ecuador. The Cordillera between Chile and Argentina was attacked by Dr Güssfeldt in 1883, who ascended Maipo (17,752 feet) and attempted Aconcagua (23,080). That peak was first climbed by the Fitzgerald expedition in 1897. The Andes of Bolivia were explored by Sir Martin Conway in 1898. Chilian and Argentine expeditions revealed the structure of the southern Cordillera in the years 1885–98. Sir Martin Conway visited the mountains of Tierra del Fuego in 1898. The Alps of New Zealand were first attacked in 1882 by the Rev. W. S. Green, and shortly afterwards a New Zealand Alpine Club was founded, and by their activities the exploration of the range was pushed forward. In 1895 Mr E. A. Fitzgerald made an important journey in this range. Of the high African peaks, Kilimanjaro was climbed in 1889 by Dr Meyer, Mount Kenia in 1899 by Mr Mackinder, and a peak of Ruwenzori by Mr Moore in 1900. The Asiatic mountains have as yet been little climbed, though those that lie within the British empire have been surveyed. In 1892 Sir Martin Conway explored the Karakoram Himalayas, and climbed a peak of 23,000 feet. In 1895 Mr A. F. Mummery made a fatal attempt to ascend Nanga Parbat, whilst in 1899 Mr D. W. Freshfield took an expedition to the snowy regions of Sikkim. A body of Gurkha sepoys has now been trained as expert mountaineers by Major the Hon. C. G. Bruce, and a good deal of exploration has been accomplished by them. The only mountains of the northern polar region that have been explored are those of Spitsbergen by Sir Martin Conway's expeditions in 1896 and 1897, and the peaks in the north of Norway and the Lofotens by various Alpine Club and Norwegian parties. The great mountains of the south polar region have not yet been attempted. (W. M. C.)

Mount Carmel, a borough of Northumberland county, Pennsylvania, U.S.A. It is at the head of Shamokin creek, in the anthracite coal region, in the eastern part of the state, at an altitude of 1054 feet. It is on the Lehigh Valley, the Northern Central, and the Philadelphia and Reading railways. Its chief business consists of mining, handling, and shipping anthracite coal. Population (1880), 2378; (1890), 8254; (1900), 13,179, of whom 3772 were foreign-born.

Mount Clemens, a city of Michigan, U.S.A., capital of Macomb county, on the Clinton river near its mouth, and on the Grand Trunk Railway, in the south-eastern part of the state, at an altitude of 603 feet. It is noted for its mineral springs, which are said to possess remarkable curative properties, and which draw to it a large transient population. Population (1880), 3057; (1900), 6576—1194 foreign-born and 18 negroes.

Mount Desert, an island off the coast of Maine, U.S.A., a part of Hancock county of that state. It has an area of about 100 square miles, and is mountainous, rising to an extreme altitude, in Green Mountain, of 1527 feet. It contains many lakes and ponds, and is deeply penetrated by arms of the sea, affording a great variety of picturesque scenery. It is a popular seaside resort in summer, being reached by a line of the Maine Central Railroad and ferry, or by steamers from Portland and Boston. The chief points on the island frequented by visitors are Bar Harbour (far the most important), Seal Harbour, North-East Harbour, South-West Harbour, and Somesville, at the head of Somes Sound. Population (1890), 5337; (1900), 7989, increased in the season by 10,000 to 20,000 visitors.

Mount Morgan, gold-mining town and municipality (1890), Queensland, Australia, in the county of Raglan, 28 miles south-south-west of Rockhampton, to which a railway was opened in 1898, and believed to be on the richest gold site in Australia. The output in 1900 amounted to nearly £790,000, and during that year about 2000 persons were employed. Machinery is replacing manual labour to a considerable extent. Population (1891), 3514; (1901), 9609.

Mount Vernon, a city of Illinois, U.S.A., capital of Jefferson county, towards the southern part of the state, at the intersection of four railways, and at an altitude of 472 feet. The surrounding country is a rich farming region, for which it acts as a collecting and distributing point. Population (1890), 3233; (1900), 5216, of whom 111 were foreign-born and 190 negroes.

Mount Vernon, a city of Indiana, U.S.A., capital of Posey county, on the Ohio river, at the intersection of the Louisville and Nashville and the Evansville and Terre Haute railways, in the south-western part of the state. Population (1890), 4705; (1900), 5132, of whom 262 were foreign-born and 892 negroes.

Mount Vernon, a city of Westchester county, New York, U.S.A., on the Bronx river, and the New York Central and Hudson River, and the New York, New Haven and Hartford railways, in the south-eastern part of the state. It is a suburb of New York City, being distant but 13 miles. It was incorporated as a village in 1853, and chartered as a city in 1892. Population (1890), 10,830; (1900), 20,346, of whom 5265 were foreign-born and 516 negroes. The death-rate in 1900 was 19·4.

Mount Vernon, a city of Ohio, U.S.A., capital of Knox county, on the Kokosing river, and the Baltimore and Ohio and the Cleveland, Akron and Columbus railways, north-east of the centre of the state, at an altitude of 991 feet. It has manufactures of furniture, carriages and waggons, and locomotives, besides flour-mills and machine-shops. Population (1890), 6027; (1900), 6633, of whom 359 were foreign-born and 239 negroes.

Mouscron, a town of Belgium, in the province of West Flanders, 35 miles south of Bruges, with a station at the junction of the lines from Courtrai and Tournai to Lille (France). Its numerous industries include cotton and wool weaving, dyeing, and oil-refining. Population (1890), 13,764; (1900), 18,909.

Mozambique. See East Africa, Portuguese.

Mozyr, a district town of Russia, government and 241 miles south-east of Minsk, on the railway from Brest to Bryansk, and on the Pripet river. Coal has been found near the town, which is an *entrepôt* for goods shipped on the Pripet. Population (1897), 12,251.

Much Wenlock. See Wenlock.

Mudania, the ancient *Myrlea*, a town of Asia Minor, on the south coast of the Sea of Marmora, and the port of Brúsa. It is connected with Brúsa by a railway and a carriage road, and with Constantinople by a line of steamers. Olive oil is produced in large quantities. The population numbers 4800, almost wholly Greek.

Muhamrah (Mohammerah), a town of Persia, in the province of Arabistan, 30° 26′ N., 48° 11′ E., on the Haffár canal, which joins the Karun with the Shatt el Arab, and flows into the latter 40 miles above its mouth at Fao and about 20 miles below Basrah. It has post and telegraph offices, and a population of about 5000. With the opening of the Karun river, as far as Ahvaz, to international navigation in 1889, Muhamrah acquired greater importance, and its customs, which until then were leased to the governor for £1500 per annum, rose considerably, and now pay £8000. A British vice-consul was appointed in 1890. The following table shows the value of the exports and imports and the amount of shipping at intervals since 1890:—

Year.	Exports.	Imports.	Shipping.			
			Total.		British.	
	£	£	Entered, tons.	Cleared, tons.	Entered, tons.	Cleared, tons.
1890	58,096	146,141	...	...	...	...
1895	98,193	138,006	111,623	89,432	103,805	...
1899	131,706	207,892	105,480	86,252	97,765	...
1900	164,078	281,854	121,427	91,909	112,946	86,202

Nearly one-half of the exports was specie.

Until 1847, when it definitely became Persian territory in accordance with Art. II. of the treaty of Erzerum, Muhamrah was alternately claimed and occupied by Persia and Turkey, its ruler, an Arab sheikh, helping either Power as he found it convenient. Since then the governor of the town and adjoining district has been a sheikh of the K'ab, or Chaab, Arabs of the powerful tribe of the Shi'ah branch of Islam. At the close of the Anglo-Persian campaign in 1857 Muhamrah was taken by a British force.

Muir, Sir William (1819-——), Arabic scholar, was born at Glasgow, and educated at Kilmarnock Academy and at Glasgow and Edinburgh Universities.

In 1837 he entered the Bengal Civil Service, and there held several important appointments. He served as secretary to the Governor of the North-West Provinces, and as a member of the Agra revenue board, and during the Mutiny he was in charge of the Intelligence Department there. In 1868 he became Lieutenant-Governor of the North-West Provinces. In 1874 he was appointed financial member of the Council of the Governor-General of India, and retired in 1876, when he became a member of the Council of India. In 1867 the Order of the Star of India had been conferred on him in recognition of his public services. He had always taken an interest in educational matters, and it was chiefly through his exertions that the large central college at Allahabad, known as Muir's College, was built and endowed. In 1885 he was elected Principal of Edinburgh University in succession to Sir Alexander Grant. Sir William Muir is a good Arabic scholar, and has made a careful study of the history of the time of Mahomet and the following period. His chief books are a *Life of Mahomet and History of Islam to the Era of the Hegira*, a work of great historic value; *Annals of the Early Caliphate*, an admirable account of the period of early Saracenic conquests; *The Caliphate*, an abridgment and continuation of the *Annals*, which brings the record down to the fall of the Caliphate on the onset of the Mongols; *The Coran: its Composition and Teaching*; and *The Mohammedan Controversy*, a reprint of five essays published at intervals between 1885 and 1887. In 1881 he delivered the Rede lecture at Cambridge on *The Early Caliphate and Rise of Islam*. His interests are chiefly with the Arabs, and he has less sympathy with the other developments of Islam.

Muirkirk, a mining and manufacturing town of Ayrshire, Scotland, near the river Ayr, 25¾ miles east by north of Ayr by rail. It is one of the chief seats of the iron industry, and there are coal-mines and lime-kilns. There are parish council chambers and an institute, with library and recreation rooms. In the neighbourhood are four monuments to Covenanting martyrs, including Cameron of Aird's Moss and Brown of Priesthill; also Druidical remains and a Roman camp. Population (1891), 3329; (1901), 5670.

Mukden (Chinese, *Shingking*), capital of Manchuria, on the Hun-ho, 110 miles north-east of Newchwang, with a population of 250,000. It is a centre for trade and also for missionary enterprise, and has become of greater importance in consequence of the Russian encroachments and of the projection of new railways. It was formerly the headquarters of the Manchu dynasty, and their tombs lie within its confines.

Mülhausen, a town of Germany, in Alsace-Lorraine, district of Upper Alsace, 21 miles by rail north-west of Basel. It is the centre of the cotton industries of Alsace, though it also has numerous other industries. The museum of the Industrial Society (1882) contains a collection of Romano-Celtic antiquities and a historical museum and picture gallery. Of recent years the operatives have gradually moved farther out into the suburbs, leaving the model houses of the "artisans' town" to be occupied by small tradesmen. In addition to a zoological garden, the town has a new chemical school. Population (1885), 69,759; (1900), 89,012.

Mülheim, two towns of Prussia, in the Rhine province. 1. On the Rhine, 3 miles north-north-east of Cologne, with numerous manufactures. Population (1885), 24,975; (1900), 45,085. 2. On the Ruhr, 5 miles east of Duisburg. It also is a place of industrial activity, and has a large trade in coal. On the opposite bank of the river is the old castle of Broich. The "small" Evangelical church dates from 1879–81. Population (1885), 24,465; (1900), 38,292.

Mull, an island of Argyllshire, Scotland, the third of the Hebrides in size, separated from the mainland on the south-east by the Firth of Lorn and on the north-east by the Sound of Mull. A large stretch of grazing ground about Ben More was converted by the late duke of Argyll into a deer forest. Tobermory, which is a police burgh (population, 1019 in 1901) and the only town, has regular steamer communication with Glasgow and Stornoway. Granite and freestone are quarried in the island. Population (1891), 4691; (1901), 4711.

Müller, Ferdinand von, Baron (1825–1896), botanist and explorer, was born at Rostock on the 30th of June 1825, and was educated, after the early death of his parents, in Schleswig. He studied the flora of Schleswig and Holstein from 1840 to 1847, when he emigrated to South Australia and travelled through the colony from 1848 to 1852, discovering and describing a large number of plants previously unknown. In 1852 he was appointed Government botanist for Victoria, and examined its flora, and especially the Alpine vegetation of Australia, which was previously unknown. Then, as phytographic naturalist, he joined the expedition sent out under Augustus Gregory by the duke of Newcastle, Secretary of State for the Colonies. He explored the river Victoria and other portions of North Australia, was one of the four who reached Termination Lake in 1856, and accompanied Gregory's expedition overland to Moreton Bay. From 1857 to 1873 he held the office of director of the Botanical Gardens, Melbourne, and not only introduced many plants into Victoria, but made the excellent qualities of the blue gum (*Eucalyptus globulus*) known all over the world, and succeeded in introducing it into the south of Europe, North and South Africa, California, and the extra-tropical portions of South America. For these services he was decorated by many foreign countries, including France, Spain, Denmark, and Portugal; was created K.C.M.G. in 1879, baron of the kingdom of Würtemberg in 1871, and F.R.S. in 1861. He published eleven volumes of his *Fragmenta Phytographica Australiæ*, two volumes of the *Plants of Victoria*, and other books on the Eucalyptus, Myoporaceæ, Acacias, and Salsolaceæ, all profusely illustrated. He also co-operated in the production of Bentham's *Flora Australiensis*. In 1880 he was the recipient of one of the medals of the Royal Society of London. Baron von Müller took a leading part in promoting Australian exploration, especially the Burke and Wills expedition, which was the first to cross the continent, and in the various attempts to unravel the mystery which attended the fate of his fellow-countryman Leichhardt. He was a commissioner for all the industrial exhibitions held in Melbourne, and a member of the organizations for the representation of Victoria at the international exhibitions of London, Paris, Vienna, and Philadelphia. Baron von Müller was one of the greatest descriptive botanists of the 19th century, but his greatest feat was in the dissemination of the *Eucalyptus globulus*, which has supplied many treeless districts with excellent and fast-growing timber, and has enabled the resources of many districts to be developed which were previously rendered uninhabitable by malaria. He died at Melbourne on the 9th of October 1896.

Müller, Friedrich Max. See Max Müller.

Mullingar, the county town of Westmeath, Ireland, on the Royal Canal, 44 miles north-west of Dublin, in direct communication by rail with every part of Ireland.

It is the centre of the trade of the district, with regular markets and fairs. A post office has been erected. Population (1881) 4787; (1901), 4504.

Multán, or MOOLTAN, a city and district of British India, in the Lahore division of the Punjab. The city is 4 miles from the left bank of the Chenab, near the ancient confluence of the Ravi with that river; it has a railway station. Population (1881), 68,674; (1891), 74,562; municipal income (1897–98), Rs.1,62,275; death-rate (1897), 30 per thousand. The cantonments can accommodate a battery of artillery and four regiments of infantry. It has manufactures of carpets, silk and cotton goods, shoes, glazed pottery and enamel work, and an annual horse fair. It is a station of the Church Mission. There are three high schools (municipal, mission, and Anglo-Sanskrit), a normal school, six printing-presses, and Hindu and Mahommedan associations.

The district of MOOLTAN occupies the lower angle of the Bari Doab, or tract between the Sutlej and the Chenab, with an extension across the Ravi. Area, 6079 square miles; population (1881), 551,964; (1891), 631,434; and (1901), 710,548, showing an increase of 14 per cent., due to the extension of irrigation, between 1881 and 1891, and of 12·5 per cent. between 1891 and 1901; average density, 117 persons per square mile. The land revenue and rates in 1897–98 were Rs.10,57,337, the incidence of assessment being Rs.0 : 4 : 5 per acre; cultivated area, 679,412 acres, of which 582,500 were irrigated, including 427,059 from Government canals; number of police, 762; number of schools (1896–97), 263, attended by 7338 boys, being 11·9 per cent. of the boys of school-going age; death-rate (1897), 33·5 per thousand. The principal crops are wheat, millet, pulse, oil-seeds, cotton, and indigo. There are twenty factories for ginning and pressing cotton. Indigo is made only by native processes. Irrigation is largely conducted by inundation channels from the boundary rivers, but the centre of the district is absolutely barren. The district is traversed by the main line of the North-Western Railway from Lahore, which crosses the Sutlej by the Empress bridge opposite Bahawalpur, 130 miles. It is also entered by the branch from Lyallpur to Khanewal junction, crossing the Ravi. The boundary rivers are navigable for a total length of 344 miles.

Mun, Adrien Albert Marie de, COUNT (1841–——), French politician, was born at Lumigny, in the department of Seine-et-Marne, on 28th February 1841. He entered the army as an officer in the Chasseurs, saw much service in Algeria, and took part in the fighting around Metz in 1870. On the surrender of Metz, he was sent as a prisoner of war to Aix-la-Chapelle, whence he returned in time to assist at the capture of Paris from the Commune. Deeply attached to the Roman Catholic Church, and moved with pity by the condition of the working classes, he resolved to devote his life to forwarding these two interests in common. His impassioned and stately eloquence made him the most prominent member of the Cercles Catholiques d'Ouvriers, and his attacks on the Republican social policy evoked a prohibition from the Minister of War. He thereupon resigned his commission (November 1875), and in the following February stood as Royalist and Catholic candidate for Pontivy. The whole influence of the Church was exerted to secure his election, and the Pope himself, during its progress, sent him the Order of St Gregory. He was returned, but the election was declared invalid. He was re-elected, however, in the following August, and continued to sit, with a short interval, for the same constituency till 1893. The system that he advocated in and out of Parliament was a reversion to the guilds of the Middle Ages. His Christian Socialism differed from the Socialism that relies mainly on State intervention in desiring the regulation of labour by a patriarchal organization, in which employer and employed should live and work "side by side, like the members of a single family." But, pending the realization of these principles, he urged on the State the adoption of remedial measures, such as the prohibition of female labour in factories, compulsory insurance against accidents, and the fixing of a minimum wage. The proposals of successive Republican governments on secondary education and on the increase of the army found in him a warm opponent. He was, indeed, for many years the most conspicuous leader of the anti-Republican party. As far back as 1878 he had declared himself opposed to universal suffrage, a declaration that lost him his seat from 1879 to 1881. He spoke strongly against the expulsion of the princes, and it was chiefly through his influence that the support of the Royalist party was given to General Boulanger. But as a faithful son of the Church, he obeyed the encyclical of 1892, and declared his readiness to support a Republican government, provided that it respected religion. In the following January he received from the Pope a letter commending his action, and encouraging him in his social reforms. He was defeated at the general election of that year, but in 1894 was returned for Morlaix, for which he has since continued to sit. In 1897 he succeeded Jules Simon as a member of the French Academy. This honour he owed to the purity of style and remarkable eloquence of his speeches, which, except a few pamphlets, form his only published work. He took a conspicuous part in the debates on the Dreyfus question, and fought with rare pertinacity and skill against the Associations Bill of 1901, in which, however, he failed to effect any considerable modification.

Muncie, a city of Indiana, U.S.A., capital of Delaware county, on the West Fork of White river, and the Lake Erie and Western, the Cleveland, Cincinnati, Chicago and St Louis, and the Fort Wayne, Cincinnati and Louisville railways, in the eastern part of the state, at an altitude of 950 feet. It is within the natural gas belt, and has extensive manufactures of iron and steel, glass and paper. In 1900 there were altogether 347 manufacturing establishments, with a total capital of $7,793,832, an average number of 6294 wage-earners, and products valued at $12,106,648. Population (1890), 11,345; (1900), 20,942, of whom 1235 were foreign-born and 739 negroes.

Mundella, Right Hon. Anthony John (1825–1897), educational and industrial reformer, was of Italian extraction, and was born at Leicester in 1825. After a few years spent at an elementary school, he was apprenticed to a hosier at the age of eleven. He afterwards became successful in business in Nottingham, filled several civic offices, and was known for his philanthropy. He was sheriff of Nottingham in 1853, and in 1859 organized the first courts of arbitration for the settlement of disputes between masters and men. In November 1868 he was returned to Parliament for Sheffield as an advanced Liberal. He represented that constituency until November 1885, when he was returned for the Brightside division of Sheffield, which he continued to represent until his death. In the Gladstone Ministry of 1880 Mundella was Vice-President of the Council, and shortly afterwards was nominated fourth Charity Commissioner for England and Wales. In February 1886 he was appointed President of the Board of Trade, with a seat in the Cabinet, and was sworn a member of the Privy Council. In August 1892, when the Liberals again came into power, Mundella was again appointed President of the Board of Trade, and he continued in this position until 1894, when he resigned office. His resignation was brought about by his connexion with a financial company which went into liquidation in circumstances calling for the official intervention of the Board of Trade. However innocent his own connexion with the company was, it involved him in a good deal of unpleasant public discussion, and his position became untenable. Having made a close study of the educational systems of Germany and Switzerland, Mundella was an early advocate of compulsory education in England. He rendered valuable service in connexion with the Elementary Education Act of 1870, and when he became head of the Education Department, he made compulsion universal by the passing of the Universal Bye-Laws Act. The Educational Code of 1882, which was specially distinguished in educational circles as the "Mundella Code," marked an entirely new departure in the regulation of public elementary schools and the conditions of the Government grants. It inaugurated a system by which greater recognition was given to intelligent teaching and good management, and, by encouraging the cleverest and most industrious teachers, tended to secure for the children and for the State the best possible results. The seventh standard was a creation of the Mundella Code, and increased help was given to evening schools. Mundella also took an active interest in higher and technical education, as well as in the multiplication of art schools. He was likewise a firm supporter of trade unions, and did much towards securing from Parliament the emancipation of these bodies. To his initiative was chiefly due the Factory Act of 1875, which established a ten-hours day for women and children in textile factories; and the Conspiracy Act, which removed certain restrictions on trade unions. It was he also who established the Labour Department of the Board of Trade, and founded the *Labour Gazette*. He introduced and passed Bills for the better protection of women and children in brick-yards, and for the limitation of their labours in factories; and he effected substantial improvements in the Mines Regulation Bill, and was the author of much other useful legislation. In recognition of his efforts, a marble bust of himself, by Boehm, subscribed for by 80,000 factory workers, chiefly women and children, was presented to Mrs Mundella. He died in London, 21st July 1897.

Münden, a town of Prussia, province of Hanover, picturesquely situated at the confluence of the Fulda and the Werra, 21 miles north-east of Cassel by rail. It is an ancient place, municipal rights having been granted in 1247. A few ruins of its former walls still survive. The large Lutheran church of St Blasius (14th–15th centuries) contains the sarcophagus of Duke Erik I. of Brunswick-Kalenberg (died 1540) and his wife. The 13th-century church of St Ægidius was injured in the siege (by Tilly) of 1625, but subsequently restored. There is a new Roman Catholic church (1895). The town hall (1619), and the ducal castle, built by Duke Erik II. in 1571, and rebuilt in 1898, are the principal secular buildings. In the latter are the municipal museum and the collection of the forestry academy (1869). There are various small industries, and a trade in timber. Population (1885), 7053; (1900), 10,546.

Muni River Settlement (Spanish). See Fernando Po.

Munich, the capital of Bavaria, and the third (1900) largest town in the German empire, near the middle of southern Bavaria, about half-way between Strasburg and Vienna, in 48° 8′ 45″ N. and 11° 36′ 24″ E. (observatory), on the river Isar, in the district of Upper Bavaria, and 25 miles north of the foot-hills of the Alps. The process of converting Munich from a provincial capital into a great continental capital, which was begun shortly before the middle of the 19th century, is still being pursued. As opportunity offers, the narrow streets of the older city are being converted into broad, straight boulevards, lined with palatial mansions and public buildings of architectural pretensions, whilst at the same time building is going on apace in the suburbs—*e.g.*, Giesing, Schwabing, Nymphenburg, and in the quarter south of the English Garden. The hygienic improvement effected by these changes is shown by the mortality averages—40·4 per thousand in 1871–75, 30·4 per thousand in 1881–85, and 24·1 per thousand in 1896–98. The architectural style which has been principally followed in the later public buildings (*e.g.*, the law courts, finished in 1897, the artists' club, the German Bank, St Martin's hospital), as well as in numerous private dwellings, is the Italian and French Rococo or Renaissance, adapted to the traditions of Munich architecture in the 17th and 18th centuries. The new Bavarian National Museum (1899), at the south-east corner of the English Garden, is, however, a free adaptation of the native Renaissance style of the end of the 15th century. Amongst half a dozen new churches, the most noteworthy are St Luke's (Evangelical), a Transitional building, with an imposing dome, finished in 1896; the church of the Giesing suburb, Gothic, with a tower 312 feet high and rich interior decorations (1866–84); and the synagogue (1884–87), in the Romanesque style. Amongst other structures and institutions are the new building of the art association, the museum of plaster casts, and the ethnographical museum, all three in the arcades of the royal garden behind the palace; the academy of the plastic arts (1874–85), in the Renaissance style, situated just outside the gate of victory; the antiquarium, a collection of Egyptian, Greek, and Roman antiquities, under the roof of the new Pinakothek; the Bavarian army museum, in the arsenal; the Schack gallery, bequeathed to the German emperor by Count Schack in 1894, and rich in works by modern German artists; the historical museum and the Maillinger collections of art and civilization, both belonging to the town; the Lotzbeck private collection of sculptures and paintings; and the Ludwig Bridge across the Isar (1890–1891). Further, handsome additions have been made to the public monuments which adorn the streets and squares, including the Wittelsbach Fountain (1895), the monument to the Bavarian army (1892), the monument commemorative of the peace of 1871 (1900), and the marble statue of Liebig (1805–73), the chemist, set up in 1883. Munich in recent years has become one of the principal, if not the principal, art centre of Germany; and in music it is supreme. Among the educational and charitable institutions may be mentioned the technical high school (1865–1868), which in 1899 acquired the privilege of conferring the degree of doctor of technical science; the new military school, military academy, and cadet corps' establishment; the university agricultural college, the Max Joseph educational institute, the Roman Catholic theological seminary, the new deaf and dumb asylum, the St Martin's hospital, the medical and other scientific institutes of the university, the school of the building arts, the hydrographic school, art school, music school, teachers' seminary, industrial and commercial schools, and technical schools. The royal library now contains some 1,300,000 volumes and about 30,000 MSS., several of the latter of unique value; and the university library contains about 300,000 volumes. In 1900 the university, which had 194 professors and teachers, was attended by 4391 students. On the east side of the Isar is the new Maximilian park. During the last six months of 1897 and the first six months of 1898, 71,095,400 gallons of beer were made, of which about 25 millions were exported to foreign countries and other parts of Germany, the rest being consumed in Munich. (See further under Bavaria.) The restaurants and gardens attached to the breweries play a most important part in the social life of the people, and some of the former, *e.g.*, the Hofbräuhaus, are edifices of truly palatial pretensions. Indeed, the remarkable

"THE LAST DAY OF A CONDEMNED PRISONER." BY MUNKACSY.

(By permission of C. Sedelmeyer, Paris.)

number of nearly 12,000 persons depend for a livelihood upon inn and restaurant keeping, and of this number no fewer than 8500 are women. The building and equipment of powerful electric supply works at Höllriegelsgereut on the Isar, a few miles above Munich, has led many industrial establishments to remove out of the city to Sendling and over a score of villages in the neighbourhood. At Planegg near by and at Harlaching, to the south of the city, sanatoria were opened in 1898 and 1900 respectively. Population (1885), 280,373; (1890), 349,024; (1900), 499,959. In 1890 the suburbs of Schwabing and Neuhausen were incorporated in the city.

See *Münchener bürgerliche Baukunst der Gegenwart*, a series of sixty plates, Munich, 1898–99.

Munkács, a corporate town of north-eastern Hungary, in the county of Bereg, with 11,142 inhabitants in 1891, and 14,416 in 1901, situated near the Latorcza, where the hills touch the plains. Its most noteworthy buildings are the upper gymnasium, barracks for "honvéds," the Greek Catholic cathedral, the theatre, and the beautiful castle of Count Schönborn. In the vicinity of the town stands, on a steep hill 580 feet high, the old fort of Munkács, which played an important part in Hungarian history, and was famous especially for its heroic defence by Helene Zrinyi, wife of Emeric Tököli and mother of Francis Rákóczy II., for three years against the Austrians. It was afterwards used as a prison. Ypsilanti, the hero of Greek liberty, and Kazinczy, the regenerator of Hungarian letters, were confined in it. According to tradition, it was near Munkács that the Hungarians, towards the end of the 9th century, entered the country. To commemorate this, it was proposed to erect a statue of Árpád; in 1896 in the fort was built one of the "millennial monuments" established at seven different points of the kingdom.

Munkacsy, Michael von (1844–1900), a painter, whose real name was MICHAEL [MISKA] LEO LIEB, was the third son of Michael Lieb, a collector of salt-tax in Munkács, Hungary, and of Cäcilia Röck. He was born in that town on the 20th of February 1844. In 1848 his father was arrested at Miskolcz for complicity in the Hungarian revolution, and died shortly after his release; a little earlier he had also lost his mother, and became dependent upon the charity of relations, of whom an uncle, Röck, became mainly responsible for his maintenance and education. He was apprenticed to a carpenter, Langi, in 1855, but shortly afterwards made the acquaintance of the painters Fischer and Szamossy, whom he accompanied to Arad in 1858. From them he received his first real instruction in art. He worked mainly at Budapest during 1863–65, and at this time first adopted, from patriotic motives, the name by which he is always known. In 1865 he visited Vienna, returning to Budapest in the following year, and went thence to Munich, where he contributed a few drawings to the *Fliegende Blätter*. About the end of 1867 he was working at Düsseldorf, where he was much influenced by Ludwig Knaus, and painted (1868–69) his first picture of importance, "The Last Day of a Condemned Prisoner," which was exhibited in the Paris Salon in 1870, and obtained for him a *médaille unique* and a very considerable reputation (see Plate). He had already paid a short visit to Paris in 1867, but on the 25th of January 1872 he took up his permanent abode in that city, and remained there during the rest of his working life. Munkacsy's other chief pictures are "Milton dictating *Paradise Lost* to his Daughters" (Paris Exhibition, 1878), "Christ before Pilate" (1881), "Golgotha" (1883), "The Death of Mozart" (1884), "Arpad, Chief of the Magyars, taking possession of Hungary," painted for the new House of Parliament in Budapest, and exhibited at the Salon in 1893, and "Ecce Homo." He had hardly completed the latter work when a malady of the brain overtook him, and ultimately proved fatal. He died on the 30th April 1900, at Endenich near Bonn. Just before his last illness he had been offered the directorship of the Hungarian State Gallery at Budapest. Munkacsy's masterly characterization, force, and power of dramatic composition secured a great vogue for his works, but it is very doubtful if his reputation will be maintained at the level it reached during his lifetime. "Christ before Pilate" and "Golgotha" are said to have been sold for £32,000 and £35,000 respectively to an American buyer. Munkacsy received the following awards for his work exhibited at Paris: Medal, 1870; Medal, 2nd class; Legion of Honour, 1877; Medal of Honour, 1878; Officer of the Legion, 1878; Grand Prix, Exhibition of 1889; Commander of the Legion, 1889.

Munro, Hugh Andrew Johnstone (1819–1885), British scholar, was born at Elgin on 19th October 1819. He was educated at Shrewsbury School, where he was one of Kennedy's first pupils, and proceeded to Trinity College, Cambridge, in 1838. He became scholar of his college in 1840, second classic and first chancellor's medallist in 1842, and fellow of his college in 1843. He became classical lecturer at Trinity College, and in 1869 was elected to the newly-founded chair of Latin at Cambridge, but resigned it in 1872. The great work on which his reputation is mainly based is his edition of Lucretius, the fruit of the labour of many years (1860, 1864). A scholar of wide sympathies, he had yet made Latin poetry his special subject. His extensive knowledge of and enthusiasm for modern poetry found scope in the interpretation of the magnificent outbursts that relieve the exposition of Lucretius's theories, and enabled him to correct the frigid pedantries of his predecessor, Lachmann. His travels in Italy often guided him to a correct interpretation of the landscapes of Lucretius. As a textual critic his knowledge was profound and his judgment unrivalled. But beyond the bounds of pure scholarship, the editing of Lucretius demands an intimate knowledge of ancient philosophy. Munro's commentary bears ample testimony to the extent of his philosophical reading. He had indeed, as early as 1855, marked an epoch in the study of Aristotle's Ethics by his theory that books v. to vii. are the work of Eudemus. In yet another branch of classical antiquity, the study of archæology, he had made himself a master by frequent travels in Italy and Greece. Unfortunately, he gave to the world but few specimens of his powers. In 1867 he published a greatly improved text of *Aetna* with commentary, and in the following year a text of Horace with critical introduction, illustrated by specimens of ancient gems selected by C. W. King. His ripe knowledge and fine taste are nowhere better shown than in his *Criticisms and Elucidations of Catullus* (1878). He was a master of the art of Greek and Latin verse composition. His contributions to the famous volume of Shrewsbury verse, *Sabrinæ Corolla*, are among the most remarkable of a remarkable collection. His *Translations into Latin and Greek Verse* were privately printed in 1884. Like his translations into English, they are characterized by minute fidelity to the original, but never cease to be idiomatic. The combination of all these gifts secured him, by general consent, the first place among the Latin scholars of his age. He died at Rome on 30th March 1885. (H. SY.)

Münster, a town and episcopal see of Prussia, capital of the province of Westphalia, on the Dortmund–Ems canal, and at the junction of several railways, 107 miles south-west of Bremen. The tower of the Lambert church was rebuilt, to the height of 312 feet, in 1887–98, and the three iron cages were restored to their original places. A new Evangelical church was built in 1898. In 1889 a new building was erected for the municipal archives. Other edifices of modern date are the Government offices (1886–89), the post office (1878–80), the academy building (1878–80), and a synagogue (1880). The castle (begun in 1767) is the headquarters of the 7th German Army Corps. Amongst the public institutions may be mentioned the provincial assembly house, a gaol, the museum of Christian art (1866), the provincial museum of natural science, a theological seminary, teachers' seminaries, and colleges for theological candidates. A bronze equestrian statue of the Emperor William I. (1897) by Reusch, a war monument (1872), and the bronze figure of a Westphalian peasant (the *Kiepenkärl*, 1896) lend embellishment to the town. The academy was attended by 691 students (Roman Catholic) in 1900, the number of professors being 48. In the Royal Pauline Library there are about 120,000 volumes. There is an agricultural experimental station. Population (1885), 44,060; (1900), 63,776.

Münster, a town of Germany, in Alsace-Lorraine, district of Upper Alsace, at the east foot of the Vosges Mountains, 16 miles west by south of Colmar by rail. It is a flourishing place, with good houses and a new Evangelical church, and considerable manufacture of calico, cotton, and cloth. Population (1900), 6083.

Münster am Stein, a watering-place of Prussia, in the Rhine province, on the Nahe, 2½ miles south of Kreuznach, with brine springs (87° Fahr.). Above the village are the ruins of the castle of Rheingrafenstein (12th century), the seat of the counts of the Rhine, destroyed by the French in 1689, and those of the castle of Ebernburg, the ancestral seat of the lords of Sickingen, and birthplace of Franz von Sickingen (1481–1523), the famous lansknecht captain and protector of Ulrich von Hutten, to whom a monument was erected on the slope leading up to the ruins in 1889. Population (1900), 826.

Münsterberg, a town of Prussia, province of Silesia, on the Ohlau, 36 miles by rail south of Breslau. It was the former capital of the principality of Münsterberg, which existed from the 14th century down to 1791, when it was purchased by the Prussian crown. It has manufactures of drain-pipes and fireproof bricks; there are also sulphur springs. Population (1900), 8159.

Mural Decoration.—Mural decoration, it might be said, is the first and the last word of art, at least with the races of mankind who have acquired the habit of living in erected dwellings, with the craft of building walls. Primitive and prehistoric drawings and scratched outlines have been found upon the walls of caves, but it has only been with those races and in those countries where the craft of building has been practised that mural decoration has developed. The tendency to scribble and draw rude designs upon any blank wall-surface is observable anywhere and everywhere in our towns and villages, and our children only repeat in so doing the efforts of our primitive ancestors. At first, no doubt, with them, as with our children, the desire is to represent, or to record, some observed fact, or to symbolize something which has impressed their imagination, and this with gradually acquired skill becomes picture-writing, and finally a conscious aim at decorative mural effect. The ancient Egyptians realized to the full the value as mural surfaces of the white plastered walls of their temples and tombs as fields for simple mural painting in tempera in bright primary colours, in which the figures, as in all ancient mural art, are represented as on one plane and in profile, outlined and filled in flat local colours without shadow. This system of treatment, unconsciously perhaps, illustrates, in their simplest form, what may be termed the chief decorative principles of mural decoration, which, however varied, added to, or enriched by succeeding ages and stages of more complex and more conscious art, continually reassert themselves to correct excesses and that tendency to escape from real limitations which so frequently characterizes the evolution of the arts. Upon the external walls of their stone temples, at a later date, to give greater emphasis, the outlines of the figures and shapes of the hieroglyphics were chiselled. This probably led in course of time to the complete bas-relief so largely used by the Assyrians and the Persians in the decoration of the large mural surfaces of their palaces. With the Persians, indeed, as we may see in the coloured and glazed brick frieze of archers from the palace of Darius, or fortress of Susa, construction and decoration are one, since the figures—a repetition of two patterns used alternately, with repeating borders—are built up of separate bricks. Presumably, however, the figures were first modelled upon a slab of clay and afterwards cut up into separate bricks

We see low-relief sculpture, as a mural decoration intended for colour, carried to its perfection in the panathenaic frieze of the Parthenon at Athens, where, however, the Asiatic tradition in the simplicity of the processional and profile arrangement survives, and the single figures are shown on the same plane, and though the horsemen are represented one behind the other, or overlapping, there is but slight acknowledgment of distance. All the subtlety and exquisite refinement of an accomplished sculpture of the Phidian period seem concentrated in the work, which even without colour, as we see the frieze now, is yet full of the decorative effect of rhythmic recurring line and carefully planned balance of masses. The frieze as a whole, although full of life, variety, and movement, illustrates at once the acme of slab-sculpture and the gravity and restraint of true mural decoration.

The principles of mural decoration which dominated Roman civilization may be learnt from the painted walls of the Palatine, and the plaster and stucco reliefs of the tombs of the Latin Way, and the paintings of Pompeii. In these a different feeling comes in. We seem to see some aim at the expression of space and distances, though the main fields of colour upon the wall are still flat. We have fanciful arcades and pilasters, and hanging wreaths and garlands, subjects in separate panels, both figures and landscapes as well as still life, and the use of shadow and modelling in the representation of form; red, black, yellow, and turquoise being the prevailing colours of the grounds and panelled spaces of the wall. On the whole it is a type of mural decoration which seems to have been influenced by the modeller and relief sculptor and architect, and though graceful and often fanciful and even grotesque, has not the dignity and gravity of the Greek or the Asiatic. Raphael and his pupils in his Loggia revived it, and it has survived, more or less, in the mural decoration of Renascence buildings from that time onwards.

A more solemn and splendid type of mural decoration comes to us from the Christianized Greeks in the mosaics of St Sophia, of the churches of Ravenna of the 5th and 6th centuries, and of St Mark's at Venice. Strictly mural alike in structure, method, and effect, no decoration, perhaps, at its best is so impressive or so magnificent, and none seems so perfectly united with the architectural style and construction with which it is associated as mosaic.

As a consequence, perhaps it is the most difficult method to use with success in a building not originally intended for such decoration, or where carved architectural ornament competes with it, especially where the difficulty exists (which is always present) when it is sought by moderns to decorate a building of another age.

Upon the Byzantine traditions brought by Greek artists to Italy were founded her great schools of mural painting. Giotto showed much of the simplicity, directness, and decorative quality of the Byzantine, united with a new infusion of life and nature in the greater ease and freedom natural to the fresco painter. Fresco painting became the mural decoration and the distinctive language of artistic expression in Italy from the 13th to the 16th century, and the Latin race has set the type for mural decoration by painting ever since. Between the Arena chapel at Padua and the Sistine chapel at Rome we may find the whole story of its development, and very splendid the record is.

Such is a very brief and rough sketch of the historic background of mural painting before, in changing conditions, oil-painting and the portable easel picture displaced it —not, however, until mural painting in fresco and tempera had itself declined. Modern efforts at revival of mural painting have looked back to Italy for instruction in method and use of material, but all countries sooner or later, despite the effect of the interchange of ideas and knowledge of other countries and their arts, must be driven to adopt or to invent their own proper forms of mural decoration. Many efforts have been made in England to revive fresco painting. The Houses of Parliament bear witness to this, the principal works there being those of William Dyce and Daniel Maclise. That of G. F. Watts, whose easel work also is generally distinguished by its mural feeling, is full of serious purpose and dignity of conception too rarely employed. "Buono fresco" (the painting in tempera upon a freshly laid ground of plaster while wet), "spirit fresco" or Gambier-Parry method (the painting with a spirit medium upon a specially prepared plaster or canvas ground [1]), and "water-glass" painting (wherein the method is similar to water-colour painting on a prepared plastered wall, the painting when finished being covered with a chemical solution which hardens and protects the surface), have all been tried. Other processes are also in the experimental stage, such as that known as Keim's, which has been successfully tried by Mrs Merritt in a series of mural paintings in a church at Chilworth. Unless, however, some means can be found of enabling the actual painted wall to resist the natural dampness of the English climate, it does not seem likely that true fresco painting can ever be really naturalized in Great Britain. Of two of the few modern artists entrusted with important mural work in England, Ford Madox Brown and Frederick J. Shields, the former, distinguished especially for his fine series of mural paintings in the Manchester Town Hall, in the later paintings there adopted the modern method of painting the design upon canvas in flat oil colour, using a wax medium, and afterwards affixing the canvas to the wall by means of white lead. This is a usual method with modern decorators. Mr Shields has painted the panels of his scheme of mural decoration in the chapel of the Ascension at Bayswater, London, also upon canvas in oils, and has adopted the method of fixing them to slabs of slate facing the wall so as to avoid the risk of damp from the wall itself. Friezes and frieze panels or ceilings in private houses are usually painted upon canvas in oil and affixed to the wall or inserted upon their strainers, like pictures in a frame. (The present writer has used fibrous plaster panels, painting in ordinary oil colours with turpentine as a medium, as in Redcross Hall.) Recently there has been a revival of tempera painting, and a group of painters are producing works on panel and canvas painted in tempera or fresco secco, with yolk of egg as a medium, according to the practice of the early Italian painters and the directions of Cennino Cennini. A remarkably pure and luminous quality of colour is produced by this method, very valuable in mural decoration and also very durable, especially under varnish. There seems no reason why tempera painting should not be used for mural work on fibrous plaster panels, which, being hollow at the back, preserve their dryness. Tempera work can be readily cleaned with bread.

For the decoration and covering of the lower walls of churches, public buildings, and private dwellings, wood-panelling, with or without intarsia, silk hangings, or arras tapestry, have been the principal means from the later Middle Ages to our times, and they still obtain, at least in the houses of the rich. For interior walls, churches, and also in exterior mural decoration on secular buildings, sgraffito might be named as another method recently revived. It consists in cutting or scratching a design through a thinnish surface coat of plaster on to black or various colours previously laid beneath upon the wall. A series of experiments in this method (by the late Mr Moody and his pupils) may be seen on the east wall of the Royal College of Science, Exhibition Road, London. Mr Heywood Sumner has also decorated churches in this method, which is very durable, and being composed of coats of plaster, becomes essentially a part of the wall.

Wall-papers.—For the mural decoration of the house of the ordinary citizen, however, the above-mentioned methods are usually out of reach. The kind of mural decoration in most general use is wall-paper. This was no doubt at first a substitute for textile hangings, and we may still notice how, in type of pattern, wall-paper design is largely influenced by textile hangings. The earliest known example of wall-paper probably dates from the 16th century, but it does not appear to have come into general use until the 18th century. In the 19th century, in design wall-paper closely reflects prevailing taste and modes in decoration and furniture, changing as these have changed. Many eminent designers have given their attention to this sort of design, which demands much ingenuity and taste; among these may be named B. J. Talbot, J. D. Sedding, Lewis F. Day, C. F. A. Voysey, Heywood Sumner, Henry Wilson, &c. William Morris was very successful in changing the public taste and lifting it to higher standards in this direction, causing a strong revulsion of feeling for patterns of much more strictly mural type and mediæval in treatment. He adopted patterns from Venetian, Indian, and old English sources, while his own designs were emphatically mediæval in inspiration. Consisting at first of the repetition of a few simple floral units (like "the Daisy"), they became in his later time very rich and complex; but all, whether gay or quiet in colour, possessed the distinctive mural quality, forming good backgrounds, never in any way imitative; and though showing, as might be expected, a certain textile influence in their forms and spacing, they were always essentially patterns entirely adapted to their method—block-printing. The best wall-papers are printed from wood blocks upon which the pattern is cut, requiring a different block for each colour used, the outlines being formed of brass or copper strips set edgeways in the wood block, forming a kind of cloisonné. The flat colours form the surfaces of the block left by the cutter of the pattern. The colours are printed in succession as each printing dries, and by hand. Thus the size of the block which governs the width and depth of the repeat is necessarily limited—a square of 21 inches being usual; though greater depth is sometimes allowed, the 21-inch width is never exceeded, except in the case of friezes, which have occasionally run to 42 or more inches wide, though they are never deeper than 21 inches. Wall-papers are also stamped with raised patterns, in emulation of stamped leather, and gilded and lacquered. The cheapest kind of wall-paper is that produced by machine, and is printed from rollers, the outlines of the design being formed of brass or copper wire let into the wood of the rollers, the repeat, of course, corresponding to the circumference of the roller, each colour being printed in succession from a corresponding roller. Papers printed by this method never attain the precision, quality of tint, or finish of the block-printed

[1] It was in this method that the lunettes by Lord Leighton at the Victoria and Albert Museum were painted on the plaster wall. The same painter produced a fresco at Lyndhurst Church, Hants.

papers. Another kind, by which a certain quality of surface and depth of colour are given, is called flock. This might have originated in the attempt to imitate or to vie with cut velvet hangings and brocade. The ground colours are printed as before from blocks, the parts of the pattern intended to be raised in flock are printed in size, and the paper is then passed through a kind of well or trough of dry finely-powdered fibre, like dust, stained to the desired tint. The bottom of this well or trough of coloured fibre is flexible and is beaten up with sticks to keep the powdered fibrous colour flying, and enable it to settle evenly to the thickly-sized parts of the pattern, which when finished stand up in relief like the pile of velvet or carpet, though closer and harder. Bold patterns suitable for stencils or for stamped or cut velvets are the most effective in this process, but it is questionable whether paper-staining is not attempting to pass beyond its natural limitations in thus emulating effects which can only be satisfactorily obtained in textiles.

Stencilling.—Another and, in its simpler forms, cheaper and readier method of decorating walls is stencilling. There has been a considerable revival of this method, and the designs shown by various schools of the United Kingdom in the national competition at South Kensington often display remarkable ability in design and dexterity in the cutting and use of stencils. In some cases, indeed, there has been a tendency to over-elaborate, and by the use of blended tints to obtain effects from the method which its mechanical conditions hardly justify. The pattern is cut out of Bristol board or thin sheets of zinc, and so contrived that its parts are held together by what are called ties. In a stencil pattern the forms are blocked out in masses isolated from each other by lines. In the stencil the parts to appear in colour on the wall are holes, the separating lines and ties are solid and stop out the colour, and so when the stencil plate is applied to the wall and the colour painted through, by dabbing a stiff brush on the open parts, the dividing lines and ties appear white, or in the ground tint of the wall or hanging upon which the plate is laid. It may be made a tasteful and effective method of covering large wall surfaces, and is sometimes applied to hangings of various kinds. House painters and decorators do not use stencils much except for small borderings and corners, where they usually have a mean and cheap effect; but used as a means of covering a wall with a bold field of floral repeating pattern of an abstract kind, they may be quite sufficient and agreeable.

As to mural painting and decoration generally, it is to be regretted that more opportunities are not afforded to artists to exercise themselves in this highest field of design. Indeed, it would appear that the real modern equivalent for mural decoration as a popular art is only to be found in the coloured poster which covers the dead walls and temporary hoardings of our towns and cities, among which many clever designs have appeared; but while this class of work certainly frequently demands figure design upon a large scale and bold and simple colouring, the commercial exigencies and necessities of its very existence have a hopelessly vulgarizing effect, so that a serious school of design cannot be expected to arise out of such conditions. (W. Cr.)

Muravieff, Michael Nikolaievitch, Count (1845–1900), Russian statesman, born 19th April 1845, was the son of General Count Nicholas Muravieff (governor of Grodno), and grandson of the Count Michael Muravieff who became notorious for the drastic measures he employed in stamping out the Polish insurrection of 1863 in the Lithuanian provinces. He was educated at a secondary school at Poltava, and was for a short time at Heidelberg University. In 1864 he entered the chancellery of the Minister for Foreign Affairs at St Petersburg, and was soon afterwards attached to the Russian legation at Stuttgart, where he attracted the notice of Queen Olga of Würtemberg. He was transferred to Berlin, then to Stockholm, and back again to Berlin. In 1877 he was second secretary at The Hague. During the Russo-Turkish war of 1878 he was a delegate of the Red Cross Society in charge of an ambulance train provided by Queen Olga of Würtemberg. After the war he was successively first secretary at Paris, chancellor of the embassy at Berlin, and then minister at Copenhagen. In Denmark he was brought much into contact with the Imperial family, and on the death of Prince Lobánof in 1897 he was appointed by the Tsar Nicholas II. to be his Minister of Foreign Affairs. The next three and a half years were a critical time for European diplomacy. The Chinese and Cretan questions were disturbing factors. As regards Crete, Count Muravieff's policy was vacillating; in China his hands were forced by Germany's action at Kiaochow. But he acted with singular *légèreté* with regard at all events to his assurances to Great Britain respecting the leases of Port Arthur and Talienwan from China; he told the British ambassador that these would be "open ports," and afterwards essentially modified this pledge. When the Tsar Nicholas inaugurated the Peace Conference at The Hague, Count Muravieff dexterously extricated his country from a situation of some embarrassment; but when, subsequently, Russian agents in Manchuria and at Peking connived at the agitation which culminated in the Boxer rising of 1900, the relations of the responsible Foreign Minister with the Tsar became strained. Muravieff died suddenly on 21st June 1900, of apoplexy, brought on, it was said, by a stormy interview with the Tsar. He was a man of imperturbable self-confidence, but a political opportunist.

Murcia, a maritime province in the south-east of Spain; area, 4478 square miles. It is divided into ten administrative districts and parishes. Population (1887), 491,436; (1897), 518,263. The birth-rate is 3·72 per cent., the death-rate 3·14 per cent., the illegitimate births 5·03 per cent. New railway lines have been established.

In 1898 wheat was grown on 367,742 acres; rye, oats, barley, and maize on 547,150 acres; pod fruit on 14,600 acres; vines on 58,309 acres; olives on 66,112 acres. The live stock in that year included 11,054 horses, 34,718 mules, 46,620 asses, 8828 cattle, 225,730 sheep, 89,757 goats, and 44,275 pigs. The mines are very important, and many beds remain unworked for lack of means of communication. The mines actually worked in 1898 were 3 sulphur, 1 zinc, 14 iron, and 295 argentiferous lead mines. They employed 2844 hands, and smelting works 960 more. The mineral output included 10,000 tons of sulphurous ore, 46,716 of zinc, 371,391 of iron ore, 149,652 of argentiferous lead ore, and 12,700 of common salt. The smelting gave 1500 tons of sulphur, 80,018 of argentiferous lead, 8431 of poor grade lead, and 500,000 grains troy of silver. These figures show a considerable increase as regards lead and zinc, but a considerable decrease as regards iron. Manufacturing industries, though of minor importance, are numerous, and commerce is active through the ports.

Murcia, the capital of the province, well served by railways, lies 280 miles south-east of Madrid. Population (1887), 98,538; (1897), 108,408. In outward aspect it has greatly improved: promenades have been extended and laid out anew, churches and monuments have been restored, and the schools for primary and higher education, the hospitals, the provincial museums, the theatres and bull-ring, and the various economic societies have all developed. In addition to the silk industry, manufactures of woollen, linen, and cotton goods, saltpetre, flour, leather, and hats are all deserving of notice.

Murfreesboro, a city of Tennessee, U.S.A., capital of Rutherford county, near Stone river, and on the Nashville, Chattanooga and St Louis Railway, near the centre of the state, at an altitude of 583 feet. It was founded about 1800, and from 1817 to 1827 was the capital of the state. It was the scene of one of the battles of the Civil War known as Stone river or Murfreesboro. This occurred on the 31st of December 1862 to the 2nd of January 1863, between the Union forces under General Rosecrans and the Confederate under General Bragg. Although the action was indecisive, it resulted in the retreat of the Confederates. The Union army lost, out of 43,400 men engaged, 1730 killed, 7802 wounded, and 3717 captured. The Confederates, out of 37,800 men engaged, lost 1294 killed, 7945 wounded, 1027 captured. Population (1890), 3739; (1900), 3999, of whom 31 were foreign-born and 2248 negroes.

Murphysboro, a city of Illinois, U.S.A., capital of Jackson county, on the Big Muddy river, on the Illinois Central and the Mobile and Ohio railways, in the southern part of the state. Population (1890), 3880; (1900), 6463, of whom 557 were foreign-born and 456 were negroes.

Murray, Alexander Stuart (1841——), British archæologist, the eldest son of George Murray of Arbroath, was born 8th January 1841, and educated at Arbroath and Edinburgh High Schools, and at Edinburgh and Berlin Universities. In 1867 he entered the British Museum as an assistant in the Department of Greek and Roman Antiquities under Sir Charles Newton, whom he succeeded in 1886. His younger brother, George Robert Milne Murray, F.R.S., was made keeper of the Botanical Department in 1895, the only instance of two brothers becoming heads of departments at the Museum. In 1873 Dr Murray published a *Manual of Mythology*, and in the following year contributed to the *Contemporary Review* two articles, one on the Homeric question, which led to a friendship with Mr Gladstone, the other on Greek painters. He has also written for the *Nineteenth Century*, the *Quarterly Review*, the *Hellenic Journal*, the *Mémoires et Monuments Piot*, the *Revue Archéologique*, and similar periodicals. In 1880–83 he brought out the *History of Greek Sculpture*, which at once became a standard authority, and a second edition was called for in 1890. As keeper of his department, Dr Murray is acknowledged to have shown remarkably good taste in the arrangement of the collection in the exhibition galleries. In the Mausoleum and Ephesus Rooms he took especial interest, and in the latter are to be seen drawings by him representing a restoration of the Temple of Artemis. In 1886 he was selected by the Society of Antiquaries of Scotland to deliver the Rhind Lectures on archæology, out of which grew his *Handbook of Greek Archæology*, published in 1892, which also has become a standard work. In 1894–96 Dr Murray directed some excavations in Cyprus undertaken by means of a bequest of £2000 from Miss Emma Tournour Turner. These were commenced in 1894 by Mr Arthur H. Smith, and continued in the following year by Mr H. B. Walters, assistants in Dr Murray's department, and in 1896 by Dr Murray in person on a new site near Salamis. The numerous objects obtained, which greatly enriched the national collection, are described and illustrated in a handsome folio volume, *Excavations in Cyprus*, published by the Trustees of the Museum in 1900. Among Dr Murray's other official publications are three folio volumes on *Terra-cotta Sarcophagi*, *White Athenian Vases*, and *Designs from Greek Vases*. In 1898 he wrote for the *Portfolio* a monograph on Greek bronzes, founded on lectures delivered at the Royal Academy in that year, and he has contributed many articles on archæology to the standard publications [illegible] day. In recognition of his services to archæology, [illegible] made LL.D. of Glasgow University in 1887, and elected a corresponding member of the Berlin Academy of Sciences in 1900.

Murray, James Augustus Henry (1837——), lexicographer, was born at Denholm, near Hawick, Roxburghshire, in 1837, and after a local elementary education proceeded to Edinburgh, and thence to the University of London, where he graduated B.A. in 1873. Dr Murray, who holds that honorary degree from several universities, British and foreign, was engaged in scholastic work for thirty years, from 1855 to 1885, chiefly at Hawick and Mill Hill. During this time his reputation as a philologist was steadily increasing, and he was assistant examiner in English at the University of London from 1875 to 1879 and president of the Philological Society of London from 1878 to 1880, and again from 1882 to 1884. It was in connexion with this society that Dr Murray undertook the chief work of his life, the editing of the *New English Dictionary* based on materials collected by the society. These materials, which had accumulated since 1857, when the society first projected the publication of a dictionary on philological principles, amounted to an enormous quantity, of which an idea may be formed from the fact that Dr Furnivall sent in "some ton and three-quarters of materials which had accumulated under his roof." After negotiations extending over a considerable period, the contracts between the society, the Delegates of the Clarendon Press, and the editor were signed on 1st March 1879, and Dr Murray commenced the examination and arrangement of the raw material, and the still more troublesome work of re-animating and maintaining the enthusiasm of "readers." In 1885 Dr Murray removed from Mill Hill to Oxford, where his *Scriptorium* has since ranked among the institutions of the University city. A full account of the commencement of the dictionary and the manner of working up the materials will be found in Dr Murray's presidential address to the Philological Society in 1879, while reports of its progress are given in the addresses by himself and other presidents in subsequent years. In addition to his work as a philologist, Dr Murray has been a frequent contributor to the transactions of the various antiquarian and archæological societies of which he is a member. In 1885 Dr Murray received the honorary degree of M.A. from Balliol College.

Murray, Sir John (1841——), British geographer and naturalist, was born at Coburg, Ontario, Canada, 3rd March 1841, and after some years' local schooling studied in Scotland and on the Continent of Europe. He was then engaged for some years in natural history work at Bridge of Allan. In 1868 he began his career as an explorer by a visit to Spitsbergen on a whaler, and in 1872, when the voyage of the *Challenger* was projected, he was appointed one of the naturalists to the expedition. At the conclusion of the voyage he was made principal assistant in drawing up the scientific results, and in 1882 he became editor of the *Reports*, which were completed in 1896. He himself compiled a summary of the results, and was part-author of the *Narrative of the Cruise* and of the *Report on Deep-sea Deposits*. He also published numerous important papers on oceanography and marine biology. In 1898 he was made K.C.B., and from time to time he was the recipient of many distinctions from the chief scientific societies of the world. Apart from his principal work in connexion with the *Challenger Reports*, he went in 1880 and 1882 on expeditions to explore the Faroe Channel, and between 1882 and 1894 was the prime mover in various biological investigations in Scottish waters. References to the important work done by Sir John Murray will be found under the articles treating of geography, oceanography, &c.

Murray, John, publisher. See PUBLISHING.

Murree, a town and sanatorium of British India, in the Rawalpindi district of the Punjab, 7453 feet above the sea, about five hours by cart-road from Rawalpindi town, and the starting-point for Kashmir. Population (1881), 2489; (1891), 1459; but these figures omit the summer visitors and also the British troops; municipal income (1897–98), Rs.44,620. During 1897 the maximum temperature was 89·7° F. in July, and the minimum was 30° F. in December; the total rainfall was 61 inches. Since 1877 the summer offices of the provincial government have been transferred to Simla. It has hotels, banks, and churches, and the largest brewery in India, established in 1880, with an annual out-turn of more than 1,000,000 gallons. The Lawrence Memorial Asylum for the children of European soldiers had 103 boys and 82 girls in 1896–97, and there are four other schools for Europeans. A water-supply has been provided by the municipality out of a loan of Rs.1,00,000; and a water-rate is charged, yielding Rs.9000.

Murshidabad, or MOORSHEEDABAD (formerly Muxadabad), a town and district of British India, in the Presidency division of Bengal, the administrative headquarters of which are at Berhampur. The town is on the left bank of the Bhagirathi or old sacred channel of the Ganges. Population (1872), 46,182; (1881), 39,231; (1891), 35,576, showing a continuous decrease. It is still the residence of the Nawab, who now ranks only as the first nobleman of the province, with the style of Nawab Bahadur of Murshidabad, instead of Nawab Nazim of Bengal. The city is crowded with palaces, mosques, tombs, and gardens, and retains some of the manufactures of luxury, such as carving in ivory, gold and silver embroidery, and silk-weaving. A college is maintained for the education of the Nawab's family, with 60 pupils in 1896–97, and there is a high school, with 347 pupils. There are eleven printing-presses, issuing three vernacular newspapers.

The district of MURSHIDABAD has an area of 2144 square miles. Population (1881), 1,226,790; (1891), 1,250,946; and (1901), 1,335,374, showing an increase of 2 per cent. between 1881 and 1891, and 6·7 per cent. between 1891 and 1901; average density, 623 persons per square mile. Classified according to religion, Hindus in 1891 numbered 620,163; Mahommedans, 618,653; Christians, 540, of whom 68 were Europeans; aborigines, 9333; Jains, 2257. The land revenue and rates in 1896–97 were Rs.11,51,179; number of police, 768; boys at school (1896–97), 25,631, being 28·2 per cent. of the male population of school-going age; registered death-rate (1897), 28·46 per thousand. The principal industries are silk and indigo, though neither is flourishing. There are nearly 50 silk filatures, employing 12,000 persons, with an out-turn of 538,000 ℔, valued at Rs.30,00,000; and 21 indigo factories, employing 4000 hands, with an out-turn of 2000 maunds, valued at Rs.3,35,000. A narrow-gauge railway crosses the district for 14 miles, from the East Indian line at Nalhati to Azimganj on the Bhagirathi, the home of many rich Jain merchants. The district suffered from drought in 1896–98.

Murtoza, a town of Portugal, district of Aveiro, 6 miles north of Aveiro and on the east side of the lagoon. It is an important fishing centre. In 1900 the population numbered 9881.

Murzuk. See TRIPOLI.

Muscat, MUSKAT, or MASKAT, a town on the south-east coast of Arabia, capital of the province of Oman. Its value as a naval base is derived solely from its position, which gives it the command of the entrance to the Persian Gulf and of the Arabian Sea coast. The little district of Gwadur, wherein lies the chief port of Makrán, belongs to Muscat, and it is by political arrangement with the sultan that the British occupy that port with a telegraph station of the Indo-Persian telegraph service. Muscat is under British political influence, and an Indian political residency is established there. The most remarkable feature in its geographical position is its isolation from the interior of the continent. The mountains rise behind it in a rugged wall, across which no road exists. It is only from Matrah, which may be regarded as a northern suburb shut off by an intervening spur which reaches outwards to the sea, that land communication with the rest of Arabia can be maintained. Both Muscat and Matrah are defended from incursions on the landward side by a wall with towers at intervals. Muscat rose to importance with the Portuguese occupation of the Persian Gulf, and it is still noted for the extent of Portuguese ruins about it. Two lofty forts, of which the most easterly is called Jaláli and the western Meráni, occupy the summits of hills on either side the cove overlooking the town; and beyond them on the seaward side are two smaller defensive works called Sirat. All these old Portuguese constructions are in a ruinous condition. A low sandy isthmus connects the rock and fortress of Jaláli with the mainland, and upon this isthmus stands the British residency. The sultan's palace is a large, three-storeyed building near the centre of the town, a relic of Portuguese occupation, called by the Arabs El Jereza, a corruption of Igrezia (church). This term is probably derived from the chapel which was once attached to the block of buildings which formed the Portuguese governor's residence and factory. The bazaar is insignificant, and its most considerable trade appears to be in a sweetmeat prepared from the gluten of maize. Large quantities of dates are also exported. The early history of Muscat is the history of Portuguese ascendancy in the Persian Gulf. When Albuquerque first burnt the place after destroying Karyát in 1508, Kalhat was the chief port of the coast and Muscat was comparatively unimportant. Kalhat was subsequently sacked and burnt, the great Arab mosque being absolutely destroyed, before Albuquerque returned to his ships, "giving many thanks to our Lord." From that date, through 114 years of Portuguese ascendancy, Muscat was held as a naval station and factory during a stormy period of local revolts, Arab incursions, and Turkish invasion by sea; but it was not till 1622, when the Portuguese lost Hormuz, that Muscat became the headquarters of their fleet and the most important place held by them on the Arabian coast. In 1650 the Portuguese were finally expelled from Oman. Muscat had been much reduced in strength previously by the humiliating terms imposed upon the garrison by the Imam of Oman after a successful siege in 1648. For the short period of five years the Persians occupied Oman, but they disappeared in 1741. Under the great ruler of Omán, Saiad Said din Sultan (1804–56), the fortunes of Muscat attained their zenith; but on his death, when his kingdom was divided and the African possessions were parted from western Arabia, Muscat declined to that second-rate position which it still retains. Its recent history is unimportant. In 1883–84, when Turki was sultan, the town was unsuccessfully besieged by the Indabayin and Rehbayin tribes, led by Abdul Aziz, the brother of Turki. In 1885 Colonel Miles, then resident at Muscat, made a tour through Oman, following the footsteps of Wellsted in 1835, and confirmed that previous traveller's report of the fertility and wealth of the province. In 1898 the French acquired the right to make use of Muscat as a coaling station.

STIFFE ("Trading Ports of Persian Gulf," vol. ix. *Geog. Journal*) gives the most comprehensive account of the port of Muscat which has been published during recent years, if we except the political reports of the Indian Government from the Persian Gulf. Colonel Miles's explorations in Oman will be found in vol. vii. *Journal R.G.S.* 1896. (T. H. H*.)

Muscatine, a city of Iowa, U.S.A., capital of Muscatine county, on the west bank of the Mississippi river, and on the Burlington, Cedar Rapids and Northern and the Chicago, Rock Island and Pacific railways, in the eastern part of the state, at an altitude of 554 feet. The city has extensive manufactures of lumber, iron, brick, tiles, and pottery. In 1900 there were altogether in the city 247 manufacturing establishments, with a total capital of $3,725,971 and products valued at $5,791,110. Population (1890), 11,454; (1900), 14 073, of whom 2352 were foreign-born and 125 negroes.

Muscogee, a town in the Creek Nation, Indian Territory, U.S.A., north of the centre of the territory, on a level plain near the Arkansas river, on the Missouri, Kansas, and Texas Railway, at an altitude of 600 feet. It is the United States headquarters of the territory, the official home of the agent for the Indians, and the headquarters of the United States courts. Its inhabitants consist almost entirely of whites and negroes, as the Indians remain away from the railways. Population (1890), 1200; (1900), 4254, of whom 100 were foreign-born and 1120 negroes.

Muscle. See PHYSIOLOGY.

Museums.—Not the least striking aspect of artistic and educational progress during the last quarter of the 19th century has been the growth and development of museums, both in Great Britain and abroad. This growth, as Prof. Stanley Jevons predicted would be the case, synchronizes with the advancement of education. Public museums are now universally required; old institutions have been greatly improved, and many new ones have been founded. The British Parliament has passed statutes conferring upon local authorities the power to levy rates for library and museum purposes, while on the Continent the collection and exhibition of objects of antiquity and art has become a recognized duty of the state and municipality alike. The modern museum differs essentially from the museum formed a century ago. The aimless collection of curiosities and bric-à-brac, brought together without method or system, was the feature of certain famous collections in bygone days, of which the Tradescant Museum, formed in the 17th century, was a good example. This museum was a miscellany, without didactic value; it contributed nothing to the advancement of art; its arrangement was unscientific, and the public gained little or no advantage from its existence. The modern museum, on the other hand, should be organized for the public good, and should be a fruitful source of amusement and instruction to the whole community—to whom most museums now belong. History records few museums as having belonged to the public, the famous museum of Ptolemy at Alexandria (300 B.C.) being for the learned rather than the community at large. In Athens also the collections of sculpture were doubtless accessible to the public, though not directly founded for their benefit. In mediæval times the Church and cloister afforded the only museum and picture gallery to which the public were invited. Great collections were formed by princes and nobles, collections which in many instances have now become public property. And even when Dr Waagen described the collections of England about 1840, private individuals figured chiefly among the owners of art treasures. Nowadays in making a record of this nature the collections belonging to the public would attract most attention. This fact is becoming more obvious every year. Not only are acquisitions of great value constantly made, but the principles of museum administration and development are being more closely defined. What Sir William Flower, an eminent authority, called the "new museum idea" (*Essays on Museums*, p. 37) is pervading the treatment of all the chief museums of the world. Briefly stated, the new principle of museum development, first enunciated in 1870, but now beginning to receive general support, is that the first aim of public collections shall be education, and their second recreation. To be of teaching value, museum arrangement and classification must be carefully studied. Acquisitions must be added to their proper sections; random purchase of "curios" must be avoided. Attention must be given to the proper display and cataloguing of the exhibits, to their housing and preservation, to the lighting, comfort, and ventilation of the galleries. Furthermore, facilities must be allowed to those who wish to make special study of the objects on view. "A museum is like a living organism; it requires continual and tender care; it must grow, or it will perish" (Flower, p. 13). Perhaps the best illustration of the new museum idea is a negative example—the Soane Museum in London, where the collection of Sir John Soane (d. 1837) is exhibited. Like the Tradescant Museum, it has all the faults condemned by the modern rules of organization, being without method or science either in the objects exhibited or in the manner of their display. At the same time it possesses objects of great merit, though their charm and value are minimized by their juxtaposition to other things; but the little museum, being a source of much enjoyment to the public, can at least claim to have attained one objective of the new idea.

Classification.

Great progress is being made in the classification of objects, a highly important branch of museum work. There are three possible systems, namely by date, by material, and by nationality. It has been found possible to combine the systems to some extent; for instance, in the ivory department of the Victoria and Albert Museum, South Kensington, London, where the broad classification is by material, the objects being further subdivided according to their age, and in a minor degree according to their nationality. But as yet there is no general preference of one system to another. Moreover, the principles of classification are not easily laid down; *e.g.*, musical instruments: should they be included in art exhibits, or in the ethnographical section to which they also pertain? Broadly speaking, objects must be classified according to the quality (apart from their nature) for which they are most remarkable. Thus a musket or bass viol of the 16th century, inlaid with ivory and highly decorated, would be properly included in the art section, whereas a common flute or weapon, noteworthy for nothing but its interest as an instrument of music or destruction, would be suitably classified as ethnographic. In England at any rate there is no uniformity of practice in this respect, and though it is to be hoped that the ruling desire to classify according to strict scientific rules may not become too prevalent, it would nevertheless be a distinct advantage if, in one or more of the British museums, some attempt were made to illustrate the growth of domestic arts and crafts according to classification by date. Examples of this classification in Munich, Amsterdam, Basel, Zürich, and elsewhere afford excellent lessons of history and art—a series of rooms being fitted up to show, in chronological order, the home life of our ancestors. In the National Museum of Bavaria (Munich) there is a superb suite of rooms illustrating the progress of art from Merovingian times down to the 19th century. Thus classification, though studied, must not check the elasticity of art museums; it should not be allowed to interfere with the mobility of the exhibits—that is to say, it should always be possible to withdraw specimens for the closer inspection of students, and also to send examples on loan to other museums and schools of art—an invaluable system long in vogue at the South Kensington Museum, and one which should be still more widely adopted. An axiom of museum law is that the exhibits shall be properly shown. "The value of a museum is to be tested by the treatment of its contents" (Flower, p. 24). But in many museums the chief hindrance to study and enjoyment is overcrowding of exhibits. Although a truism, it is necessary to state that each object should be properly seen, cleaned, and safeguarded; but all over the world this rule is forgotten. The rapid acquisition of objects is one cause of overcrowding, but a faulty appreciation of the didactic purpose of the collection is more frequently responsible.

Growth and progress.

In Great Britain, museum progress is satisfactory. Visitors are numbered by millions, access is now permitted on Sundays and week-days alike, and entrance fees are being consistently reduced; in this the contrast between Great Britain and some foreign countries is singular. A generation ago the national collections of Italy used to be always open to the public. Pay days, however, were gradually established, with the result that the chief collections are now only visible on Sundays without payment. In Dresden payment is obligatory five days a week. The British Museum never charges for admission. On the other hand, the increase in Continental collections is more rapid than in Great Britain, where acquisitions are only made by gift, purchase, or bequest. In other European countries enormous collections have been obtained by revolutions and conquest, by dynastic changes, and by secularizing religious foundations. Some of the chief treasures of provincial museums in France were spoils of the Napoleonic armies, though the great bulk of this loot was returned in 1815 to the original owners. In Italy the conversion of a monastery into a museum is a simple process, the Dominican house of San Marco in Florence offering a typical example. A further stimulus to the foundation of museums on the Continent is the comparative ease with which old buildings are obtained and adapted for the collections. Thus the Germanisches Museum of Nuremberg is a secularized church and convent; the enormous collections belonging to the town of Ravenna are housed in an old Camaldulensian monastery. At Louvain and Florence municipal palaces of great beauty are used; at Nîmes a famous Roman temple; at Urbino the grand ducal palace, and so on. There are, however, certain disadvantages in securing both building and collection ready-made, and the special care devoted to museums in Great Britain can be traced to the fact that their cost to the community is considerable. Immense sums have been spent on the buildings alone. The new buildings of the Victoria and Albert Museum are to cost £800,000. Had it been possible to secure them without such an outlay, the collections themselves would have been much increased, though in this increase itself there would have been a danger, prevalent but not yet fully realized in other countries, of crowding the vacant space with specimens of inferior quality. The result is that fine things are badly seen owing to the masses of second-rate examples; moreover, the ample space available induces the authorities to remove works of art from their original places, in order to add them to the museums. Thus the statue of St George by Donatello has been taken from the church of Or San Michele at Florence (on the plea of danger from exposure), and is now placed in a museum where, being dwarfed and under cover, its chief artistic value is lost. The desire to make financial profit from works of art is a direct cause of the modern museum movement in Italy. One result is to displace and thus depreciate many works of art, beautiful in their original places, but quite insignificant when put into a museum. Another result is that, owing to high entrance fees, the humbler class of Italians can rarely see the art treasures of their own country. There are other collections, akin to art museums, which would best be called biographical museums. They illustrate the life and work of great artists or authors. Of these the most notable are the museums commemorating Dürer at Nuremberg, Beethoven at Bonn, Thorwaldsen at Copenhagen, Shakespeare at Stratford, and Michael Angelo at Florence. The sacristies of cathedrals often contain ecclesiastical objects of great value, and are shown to the public as museums. Cologne, Aachen, Milan, Monza, and Reims have famous treasuries. Many Italian cathedrals have small museums attached to them, usually known as "Opera del Duomo."

United Kingdom.—The influence and reputation of the British Museum are so great that its original purpose, as stated in the preamble of the Act by which it was founded (1753, c. 22), may be quoted: "Whereas all arts and sciences have a connexion with each other, and discoveries in natural philosophy and other branches of speculative knowledge, for the advancement and improvement whereof the said museum or collection was intended, do, or may in many instances give help and success to the most useful experiments and undertakings . . ." The "said museum" above mentioned referred to the collection of Sir Hans Sloane, to be purchased under the Act just quoted. Sir Hans Sloane is therein stated "through the course of many years, with great labour and expense, to have gathered together whatever could be procured, either in our own or foreign countries, that was rare and curious." In order to buy his collections and found the museum, a lottery of £300,000 was authorized, divided into 50,000 tickets, the prizes varying from £10 to £10,000. Provision was made for the adequate housing of Sir Robert Cotton's books, already bought in 1700 (12 and 13 Will. III. c. 7). This Act secured for the nation the famous Cottonian manuscripts, "of great use and service for the knowledge and preservation of our constitution, both in church and state." Sir Robert's grandson had preserved the collection with great care, and was willing that it should not be "disposed of or embeziled," and that it should be preserved for public use and advantage. This Act also sets forth the oath to be sworn by the keeper, and deals with the appointment of trustees. This is still the method of internal government at the British Museum, and additions to the Board of Trustees are made by statute, as in 1824, in acknowledgment of a bequest. The trustees are of three classes: (*a*) three principal trustees, namely the Primate, the Lord Chancellor, and the Speaker; (*b*) general trustees, entitled *ex officio* to the position in virtue of ministerial office; (*c*) family, bequest, and nominated trustees. A standing committee of the trustees meets regularly at the museum for the transaction of business. The great departments of the museum (apart from the scientific and zoological collections, now placed in the museum in Cromwell Road, South Kensington) are of printed books, MSS., Oriental books, prints and drawings, Egyptian and Assyrian antiquities, British and mediæval antiquities, coins and medals. Each of these eight departments is under a keeper, with an expert staff of subordinates, the head executive officer of the whole museum being styled director and chief librarian. Among the higher officials there are also assistant keepers of departments, and fifty-eight first and second class assistants. The annual expenditure on the British Museum (excluding science) amounts to £145,000, of which £60,000 is for salaries and wages, £10,000 for furniture and fittings, and £22,000 for purchases. During 1899 the number of visitors amounted to 663,000, the number of students being 237,000. A special feature of the museum work, namely the catalogues and reproductions of acquisitions, realizes an income of £1800 a year. The museum has been enriched by bequests of great importance, especially in the library. Recent legacies have included the porcelain bequeathed by Sir Wollaston Franks, and the valuable collection of works of art (chiefly enamels and goldsmithery) known as the Waddesdon bequest—a legacy of Baron F. de Rothschild. The most important group of acquisition by purchase in the history of the museum is the series of Greek sculptures known as the Elgin Marbles, bought by Act of Parliament (56 Geo. III. c. 99).

British Museum.

There are four national museums controlled by the Board of Education, until recently styled the Department of Science and Art. The chief of these is the Victoria and Albert Museum at South Kensington. This museum has a dependency at Bethnal Green, the Dublin and Edinburgh museums having been now removed from its direct charge. There is also a museum of practical geology in Jermyn Street, containing valuable specimens of pottery

Museums of the Board of Education.

and majolica. The Victoria and Albert Museum owed its inception to the Exhibition of 1851, from the surplus funds of which 12 acres of land were bought in South Kensington. First known as the Department of Practical Art, the museum rapidly established itself on a broad basis. Acquisitions of whole collections and unique specimens were accumulated. In 1857 the Sheepshanks gallery of pictures was presented; in 1879 the India Office transferred to the department the collection of Oriental art formerly belonging to the East India Company; in 1882 the Jones bequest of French furniture and decorative art (1740–1810) was received; in 1884 the Patent Museum was handed over to the department. Books, prints, MSS., and drawings were bequeathed by the Rev. A. Dyce and Mr John Forster. Meanwhile, gifts and purchases had combined to make the collection one of the most important in Europe. The museum is not yet regularly divided into departments under expert keepers, as at the British Museum, but the chief features may be summarized as consisting of pictures, including the Raphael cartoons lent by His Majesty; textiles, silks, and tapestry; ceramics and enamels; ivory and plastic art, metal, furniture, and Oriental collections. (There are also large scientific collections.) The guiding principle of the museum is the illustration of art applied to industry. Beauty and decorative attraction is perhaps the chief characteristic of the exhibits here, whereas the British Museum is largely archæological. With this object in view, the museum possesses numerous reproductions of famous art treasures: casts, facsimiles, and electrotypes, some of them so well contrived as to be almost indistinguishable from the originals. An art library with 75,000 volumes and 250,000 prints and photographs is at the disposal of students, and an art school is also attached to the museum. It is estimated that since its foundation nearly forty million people have visited the museum. As regards the cost, it is impossible to state the exact amount, since the annual estimate deals with the department in general as well as the museum proper. The museum has a staff of 57 members, whose salaries amount to £28,000 annually, apart from a large staff in the secretarial department. The purchase grant for 1900–01 amounted to £11,260. The museum does considerable work among provincial schools of art and museums, "circulation" being its function in this connexion. Works of art are sent on temporary loan to local museums, where they are exhibited for certain periods, and on being withdrawn are replaced by fresh examples. During recent years there has been a satisfactory progress in this branch of work, and in the future it will have to be still further developed, being the only means of repaying the provinces for their share in creating the central museum. The subordinate museum of the Board of Education at Bethnal Green and that at Edinburgh call for no comment, their contents being of slender value. The Dublin Museum, though now controlled by the Irish Department, may be mentioned here as having been founded and worked by the Board of Education. Apart from the fact that it is one of the most suitably housed and organized museums in the British Isles, it is remarkable for its priceless collection of Celtic antiquities, belonging to the Royal Irish Academy, and transferred to the Kildare Street Museum in 1890. Among its most famous specimens of early Irish art may be mentioned the shrine and bell of St Patrick, the Tara brooch, the cross of Cong, and the Ardagh chalice. The series of bronze and stone implements is most perfect, while the jewels, gold ornaments, torques, fibulæ, diadems, and so forth are such that, were it possible again to extend the galleries (thus allowing further classification and exhibition space), the collection would surpass the Danish National Museum at Copenhagen, its chief rival in Europe. The Dublin Museum is visited by 420,000 people yearly. The Edinburgh Museum (costing about £13,000 a year) has about 330,000 visitors yearly.

Other national and quasi-national museums.

The famous collections of Sir Richard Wallace (d. 1890) having been bequeathed to the British nation by his widow, the public has acquired a magnificent gallery of pictures, together with a quantity of works of art, so important as to make it necessary to include Hertford House among national museums. French art predominates, and the examples of bronze, furniture, and porcelain are as fine as those to be seen in the Louvre. Hertford House, however, also contains a most remarkable collection of armour, and the examples of Italian faience, enamels, bijouterie, &c., are of first-rate interest. The maintenance of this collection (which is governed by trustees), when initial outlay upon furnishing and structural work is completed, will cost about £5000 a year. The museum of Sir John Soane, preserved in his house in Lincoln's Inn Fields, to which reference has already been made, was acquired under statute (3 Will. IV. c. 4), and is governed by trustees. The universities of Cambridge and Oxford have museums, the latter including the Ashmolean collections, a valuable bequest of majolica from D. Fortnum, and some important classical statuary, now in the Taylorian Gallery. Christ Church has a small museum and picture gallery. Trinity College, Dublin, has a miniature archæological collection, containing some fine examples of early Irish art. The National Museum of Antiquities of Scotland, now controlled by the Board of Manufactures, was formed by the Scottish Society of Antiquaries, and has a comprehensive collection of Scottish objects, lay and religious. The Tower of London contains armour of historic and artistic interest, and the Royal College of Music has an invaluable collection of musical instruments, presented by Mr George Donaldson. Art museums are also to be found in several public schools in the United Kingdom.

Municipal museums.

The Museums Act of 1845 enabled town councils to found and maintain museums. This Act was superseded by another passed in 1850, by Mr William Ewart, which in its turn has been replaced by amending statutes passed in 1855, 1866, 1868, and 1885. The Museums and Gymnasiums Act of 1891 sanctioned the provision and maintenance of museums for the reception of local antiquities and other objects of interest, and allows a ½d. rate, irrespective of other Acts. Boroughs have also the right to levy special rates under private municipal Acts, Oldham affording a case in point. Civic museums must still be considered to be in their infancy. Although the movement is now firmly established in municipal enterprise, the collections, taken as a whole, are still somewhat nondescript. In many cases collections have been handed over by local societies, particularly in geology, zoology, and other scientific departments. There are now about 250 museums, and it was estimated in 1887, after a most diligent inquiry (*British Association Report*, 1887, p. 97), that of these there were about 16 in which fine art, and 23 in which archæology, predominated. At that time there were some 35,000 specimens of fine art and 350,000 of archæology. There are about 12 museums in which Roman antiquities are noticeable, among them being Leicester, and the Civic Museum of London, at the Guildhall. British and Anglo-Saxon relics are important features at Sheffield and Liverpool; in the former case owing to the Bateman collection acquired in 1876; while the Mayer collection presented to the latter city contains a highly important series of carved ivories. At Salford, Glasgow, and Manchester industrial art is the chief feature of the collections. Birmingham, with perhaps the finest provincial collection of industrial art, is supported by the rates to the extent of £4200 a year. Its collections (including here, as in the majority of great towns, an important gallery of paintings) are entirely derived from gifts and bequests. They are valued at £60,000, and have been visited by as many as 1,100,000 persons in a single year. Birmingham has made a reputation for special exhibitions of works of art lent for a time to the corporation. These loan exhibitions, about which occasional lectures are given, and of which cheap illustrated catalogues are issued, have largely contributed to the great popularity and efficiency of the museum. Liverpool, Preston, Derby, and Sheffield owe their fine museum buildings to private generosity. Other towns have museums which are chiefly supported by subscriptions, *e.g.*, Chester and Newcastle, where there is a fine collection of work by Bewick the engraver. At Exeter the library, museum, and art gallery, together with schools of science and art, are combined in one building. Other towns may be noted as having art museums: Stockport, Nottingham (Wedgwood collection), Leeds, Bootle, Swansea, Bradford, Northampton (British archæology), and Windsor. There are museums at Belfast, Larne, Kilkenny, and Armagh. The cost of the civic museum, being generally computed with the maintenance of the free library, is not easily obtained. In many cases the librarian is also curator of the museum; elsewhere no curator at all is appointed, his work being done by a caretaker. In some museums there is no classification or cataloguing, and the value of existing collections is impaired both by careless treatment and by the too ready acceptance of worthless gifts; often enough the museums are governed by committees of the corporation whose interest and experience are not great. However, municipal museums in the United Kingdom have a great future. With sympathetic encouragement from the public they will develop in a rapid and satisfactory manner. Where municipalities have been assured of public support in their efforts, they have invariably done their utmost to promote the interest of their civic collections.

Foreign Museums.—Art museums are far more numerous on the Continent than in England. In Germany progress has been very striking, their educational aspect being closely studied. In Italy public collections, which are ten times more numerous than in England, are chiefly regarded as financial assets. The best examples of classification are to be found abroad, at Vienna, Amsterdam, Zürich, Munich, and Gizeh in Egypt. The Musée Carnavalet, the historical collection of the city of Paris, is the most perfect civic museum in the world. The buildings in which the objects can be most easily studied are those of Naples, Berlin, and Vienna. The value of the aggregate collections in any single country of the Great Powers, Russia excepted, probably exceeds the value of British collections. At the same time, it must be remembered that masses of foreign collections represent expropriations by the city and the state, together with the inheritance of royal and semi-royal collectors. In Germany and Italy, for instance, there are at least a dozen towns which at one time were capitals of principalities. In some countries the public holds over works of art the pre-emptive right of purchase. In Italy, under the law known as the Editto Pacca, it is illegal to export the more famous works of art. Speaking generally, the cost of maintaining municipal museums abroad is very small, many being without expert or highly-paid officials, while admission fees are often considerable. Nowhere in the United Kingdom are the collections neglected in a manner through which certain towns in Italy and Spain have gained an unenviable name.

Germany and Austria.

Berlin and Vienna have collections of untold richness, and the public are freely admitted. Berlin, besides its picture gallery and architectural museum, has a collection of Christian antiquities in the university. The old museum, a royal foundation, is renowned for its classical sculpture and a remarkable collection of mediæval statuary, in which Italian art is well represented. The new museum is also noteworthy for Greek marbles, and contains bronzes and engravings, together with one of the most typical collections of Egyptian art. Schliemann's discoveries are housed in the Ethnographic Museum. The Museum of Art and Industry, closely similar in object and arrangement to the Victoria and Albert Museum in London, contains collections of the same character—enamels, furniture, ceramics, &c. Vienna also has one of these museums (Kunstgewerbe), in which the great value of the examples is enhanced by their judicious arrangement. The Historical Museum of this city is interesting, and the Imperial Museum (of which the structure corresponds almost exactly with a plan of an ideal museum designed by Sir William Flower) is one of the most comprehensive extant, containing armour of world-wide fame and the choicest specimens of industrial art. Prague, Innsbruck, and Budapest are respectively the homes of the national museums of Bohemia, Tirol, and Hungary. The National Museum of Bavaria (Munich) has been completed, and its exhibition rooms, 100 in number, show the most recent methods of classification, Nuremberg, with upwards of 80 rooms, being its only rival in southern Germany. Mainz and Trier have Roman antiquities. Hamburg, Leipzig, and Breslau have good "Kunstgewerbe" collections. In Dresden there are four great museums — the Johanneum, the Albertinum, the Zwinger, and the Grüne Gewölbe—in which opulent art can best be appreciated; the porcelain of the Dresden galleries is superb, and few branches of art are unrepresented. Gotha is remarkable for its ceramics, Brunswick for enamels (in the grand ducal cabinet). Museums of minor importance exist at Hanover, Ulm, Würzburg, Danzig, and Lübeck.

France.

The central museum of France, the Louvre, was founded as a public institution during the Revolutionary period. It contains the collections of François I., Louis XIV., and the Napoleons. Many works of art have been added to it from royal palaces, and collections formed by distinguished connoisseurs (Campana, Sauvageot, La Caze) have been incorporated in it. The Greek sculpture, including the Venus of Melos and the Niké of Samothrace, is of pre-eminent fame. Other departments are well furnished, and from a technical point of view the manner in which the officials have overcome structural difficulties in adapting the palace to the needs of an art museum is most instructive. The Cluny Museum, bought by the city in 1842, and subsequently transferred to the State, supplements the mediæval collections of the Louvre, being a storehouse of select works of art. It suffers, however, from being overcrowded, while for purposes of study it is badly lighted. At the same time the Maison Cluny is a well-furnished house, decorated with admirable things, and as such has a special didactic value of its own, corresponding in this respect with Hertford House and the Poldi-Pezzoli Gallery at Milan—collections which are more than museums, since they show in the best manner the adaptation of artistic taste to domestic life. The French provincial museums are numerous and important. Twenty-two were established early in the 19th century, and received 1000 pictures as gifts from the State, numbers of which were not returned in 1815 to the countries whence they were taken. The best of these museums are at Lyons; at Dijon, where the tombs of Jean sans Peur and Philip the Bold are preserved; at Amiens, where the capital Musée de Picardie was built in 1850; at Marseilles and at Bayeux, where the "Tapestry" is well exhibited. The collections of Lille, Bordeaux, Toulouse, and Avignon are also important. The objects shown in these museums are chiefly local gleanings, consisting largely of church plate, furniture, together with sculpture, carved wood, and pottery, nearly everything being French in origin. In many towns Roman antiquities and early Christian relics are preserved (*e.g.*, Autun, Nîmes, Arles, and Luxeuil). Other collections controlled by municipalities are kept at Rouen, Douai, Montpellier, Chartres (14th-century sculptures), Grenoble, Toulon, Ajaccio, Épinal (Carolingian objects), Besançon, Bourges, Le Mans (with the remarkable enamel of Geoffrey of Anjou), Nancy, Aix, and in many other towns. As a rule, the public is admitted free of charge, special courtesy being shown to foreigners. In many cases the collections are ill cared for and uncatalogued, and little money is provided for acquisitions in the civic museums; indeed, in this respect the great national institutions contrast unfavourably with British establishments, to which purchase grants are regularly made.

The national, civic, and papal museums of Italy are so numerous that a few only can be mentioned. The best arranged and best classified collection is the Museo Nazionale at Naples, containing many thousand examples of Roman art, chiefly obtained from the immediate neighbourhood. For historical importance it ranks as *primus inter pares* with the collections of Rome and the Vatican. It is, however, the only great Italian museum where scientific treatment is consistently adopted. Other museums of purely classical art are found at Syracuse, Cagliari, and Palermo. Etruscan art is best displayed at Arezzo, Perugia (in the university), Cortona, Florence (Museo Archeologico), Volterra, and the Vatican. The Florentine museums are of great importance, consisting of the archæological museum of antique bronzes, Egyptian art, and a great number of tapestries. The Museo Nazionale, housed in the Bargello (A.D. 1260), is the central depository of Tuscan art. Numerous examples of Della Robbia ware have been gathered together, and are fixed to the walls in a manner and position which reduce their value to a minimum. The plastic arts of Tuscany are represented by Donatello, Verrocchio, Ghiberti, and Cellini, while the Carrand collection of ivories, pictures, and varied mediæval specimens are of much interest. This museum, like so many others, is becoming seriously overcrowded, to the lasting detriment of churches, market-places, and streets, whence these works of art are being ruthlessly removed. The public is admitted free one day a week, and the receipts are devoted to art and antiquarian purposes ("tasse . . . destinate . . . alla conservazione dei monumenti, all' ampliamento degli scavi, ed' all' incremento dei instituti . . . nella città."—Law of 1875, § 5). The museums of Rome are numerous, the Vatican alone containing at least six—Museo Clementino, of classical art, with the Laocoon, the Apollo Belvedere, and other masterpieces; the Chiaramonti, also of classical sculpture; the Gallery of Inscriptions; the Egyptian, the Etruscan, and the Christian museums. The last is an extensive collection corresponding with another papal museum in the Lateran Palace, also known as the Christian Museum (founded 1843), and remarkable for its sarcophagi and relics from the catacombs. The Lateran has also a second museum known as the Museo Profano. Museums belonging to the State are equally remarkable. The Kircher Museum deals with prehistoric art, and contains the "Preneste Hoard." The Museo Nazionale (by the Baths of Diocletian), the Museo Capitolino, and the Palazzo dei Conservatori contain innumerable specimens of the finest classical art, vases, bronzes, mosaics, and statuary, Greek as well as Roman. Among provincial museums there are few which do not possess at least one or two objects of signal merit. Thus Brescia, besides a mediæval collection, has a famous bronze Victory. Pesaro, Urbino, and the Museo Correr at Venice have admirable examples of majolica; Milan, Pisa, and Genoa have general archæology combined with a good proportion of mediocrity. The civic museum of Bologna is comprehensive and well arranged, having Egyptian, classical, and Etruscan collections, besides many things dating from the "Bella Epoca" of Italian art. At Ravenna alone can the Byzantine art of Italy be properly understood, and it is most deplorable that the superb collections in its fine galleries should remain uncatalogued and neglected. Turin, Siena, Padua, and other towns have civic museums.

Italy.

Belgium and Holland.

The Ryks Museum at Amsterdam, containing the national collections of Holland, is a modern building in which a series of historical rooms are furnished to show at a glance the artistic progress of the Dutch at any given period. Nine rooms are also devoted to the chronological display of ecclesiastical art. Besides the famous paintings, this museum (the sole drawback of which is the number of rooms which have no top-light) contains a library, many engravings, a comprehensive exhibit of armour, costume, metal work, and a department of maritime craftsmanship. Arnhem and Haarlem have municipal collections. At Leyden the University maintains a scholarly collection of antiquities. The Hague and Rotterdam have also museums, but everything in Holland is subordinated to the development of the great central depository at Amsterdam, to which examples are sent from all parts of the country. In Belgium the chief museum, that of ancient industrial art, is at Brussels. It contains many pieces of mediæval church furniture and decoration, but in this respect differs only in size from the civic museums of Ghent and Luxemburg and the Archbishop's museum at Utrecht. In Brussels, however, there is a good show of Frankish and Carolingian objects. The city of Antwerp maintains the Musée Plantin, a printing establishment which has survived almost intact, and presents one of the most charming and most instructive museums in the world. As a whole, the museums of Belgium are disappointing, though, *per contra*, the churches are of enhanced interest, not having been pillaged for the benefit of museums.

Russia.

New museums are being founded in Russia every year. Kharkoff and Odessa (the university) have already large collections, and in the most remote parts of Siberia it is curious to find carefully chosen collections. Krasnoyarsk has 12,000 specimens, a storehouse of Buriat art. Irkutsk, the capital, Tobolsk, Tomsk (university), Khabarovsk, and Yakutsk have now museums. In these Russian art naturally predominates. It is only at Moscow and St Petersburg that Western art is found. The Hermitage Palace in the latter city contains a selection of mediæval objects of fabulous value, there being no less than 40 early ivories. But from a national point of view these collections are insignificant when compared with the gold and silver objects illustrating the primitive arts and ornament of Scythia, Crimea, and Caucasia, the high standard attained proving an advanced stage of manual skill. At Moscow (historical museum) the stone and metal relics are scarcely less interesting. There is also a museum of industrial art, the specimens of which are not of unusual value, but being analogous to the Kunstgewerbe movement in Germany, it exercises a wholesome influence upon the designers who study in its schools.

America. Much may be expected of American museums, which are not committed to traditional systems, and where scientific treatment is allowed its fullest scope. They exist in great numbers, and though in most cases their exhibits are chiefly ethnographic, a far wider range of art objects will undoubtedly be secured during the next generation. The National Museum at Washington is chiefly notable for its historical relics of America. The Smithsonian Institute in the same city has similar collections. On the other hand, the Metropolitan Museum of Art (held by trustees for the benefit of the city of New York) has in the Cesnola collection the most complete series of Cypriot art objects. It has also departments of coins, Greek sculpture, and general examples of European and American art. The Museum of Fine Arts at Boston is very comprehensive, and has a remarkable collection of ceramics, together with good reproductions of antique art. The public is admitted free on certain days of the week. There are other museums at St Louis, Chicago, and Washington, as well as Montreal in Canada; and the universities of Harvard, Chicago, and Yale have collections.

Various countries. The Swiss National Museum is situated at Zürich, and though of medium size (50 rooms), it is a model of arrangement and organization. Besides the special feature of rooms illustrating the historical progress of art, its collection of stained glass is important. Basel also (historical museum) is but little inferior in contents or system to the Zürich establishment. Geneva has three collections. Lausanne holds the museum of the canton, and Bern has a municipal collection. All these institutions are well supported financially, and are much appreciated by the Swiss public. The art museums of Stockholm, Christiania, and Copenhagen rank high for their intrinsic excellence, but still more for their scientific and didactic value. Stockholm has three museums: that of the Royal Palace, a collection of costume and armour; the Northern Museum, a large collection of domestic art; the National Museum, containing the prehistoric collections, gold ornaments, &c., classified in a brilliant manner. The National Museum of Denmark at Copenhagen is in this respect even more famous, being probably the second national collection in the world. The arrangement of this collection leaves little to be desired, and it is to be regretted that some British collections, in themselves of immense value, cannot be shown, as at Copenhagen, in a manner which would display their great merits to the fullest degree. There is also at Copenhagen a remarkable collection of antique busts (Gamle Glyptotek), and the Thorwaldsen Museum connected with the sculptor of that name. Norse antiquities are at Christiania (the university) and Bergen. Athens has three museums, all devoted to Greek art: that of the Acropolis, that of the Archæological Society (vases and terra-cotta), and the National Museum of Antiquities. The State owns all discoveries, and these are accumulated at the capital, so that local museums scarcely exist. The collections, which rapidly increase, are of great importance, though as yet they cannot vie with the aggregate in other European countries. The Gizeh Museum of Egyptian antiquities (Cairo), founded by Mariette Bey, and developed by Maspero, is the best national museum in the world, well housed in a large building erected in 1890, well classified, and liberally supported with money and fresh acquisitions. Minor museums exist at Carthage and Tunis. At Constantinople the Turkish Museum contains some good classical sculpture and a great deal of rubbish. The Museo del Prado and the Archæological Museum at Madrid are the chief Spanish collections, containing numerous classical objects and many specimens of Moorish and early Spanish art. In Spain museums are badly kept, and their contents are of indifferent value. The museums of the chief provinces are situated at Barcelona, Valencia, Granada, and Seville. Cadiz and Cordova have also sadly neglected civic collections. The National Museum of Portugal at Lisbon requires no special comment. The progress of Japan is noticeable in its museums as in its industrial enterprise. The National Museum (Weno Park, Tôkyô) is large and well arranged in a new building of Western architecture. Kiôtô and Nara have excellent museums, exclusively of Oriental art, and two or three other towns have smaller establishments, including commercial museums. There are several museums in India, the chief one being at Calcutta, devoted to Indian antiquities. In Australia the museum movement is just beginning to thrive, the desire for national collections having been hitherto limited to pictures.

The best history of museums can be found in the prefaces and introductions to their official catalogues, but the following works will be useful for reference:—Annual Reports presented to Parliament (official) of British Museum and Board of Education; Civil Service Estimates, Class IV., annually presented to Parliament; Second Report of Select Committee of House of Commons on Museums of Science and Art Department (official), 1 vol., 1898; Annual Reports of the Museum Association, London.—EDWARD EDWARDS. *The Fine Arts in England.* London, 1840.—Prof. STANLEY JEVONS. "Use and Abuse of Museums," printed in *Methods of Social Reform.* London, 1882.—Report of Committee on Provincial Museums. Report of British Association. London, 1887.—THOS. GREENWOOD. *Museums and Art Galleries,* London, 1888.—Prof. BROWN GOODE. *Museums of the Future.* Report on National Museums, Washington, 1888–89; *Principles of Museum Administration.* Report of Museum Association, London, 1895.—MARIOTTI. *La Legislazione delle Belle Arti.* Rome, 1892.—L. Paris, 1895.—Sir WILLIAM FLOWER. *Essays on Museums.* London, 1898.—*Le Gallerie Nazionali Italiane,* 3 vols. Rome, 1894. (B.)

Músh, the chief town of a sanjak of the same name in the Bitlis vilayet of Asiatic Turkey, altitude 4800 feet, situated on the south side of a fertile plain dotted with villages, through which the Kara Su runs. The climate is healthy, but very cold in winter. The population numbers 15,000, of whom one-half is Armenian. The massacre of Armenians at Sasún, in the mountains to the south, in 1894 aroused general indignation in Europe. (See ARMENIA.)

MUSIC.

SINCE the publication of the article on MUSIC in the earlier volumes (ninth edition) of the *Encyclopædia Britannica*, the conditions of the art have undergone so striking a change, alike in the United Kingdom and in other countries, that it is necessary to give an account, more or less summary, of modern tendencies, and to pass in rapid review the later state of music in the countries where it has been most generally encouraged.

Germany. To begin with the country which for over two centuries was universally recognized as the chief centre of the musical art. Ever since the time of Bach and Handel, Germany has been supreme in music, whether we regard the excellence and thoroughness of her institutions, the superlative eminence of her great masters, or the wide diffusion of a love of music throughout the nation at large. As the 19th century came near to its close, it became increasingly apparent that the legitimate successors to such men as Wagner and Brahms had not yet appeared; the death of the former in 1883 made it clear that there was no great or even very meritorious operatic composer ready to take his place, while on the death of Brahms in 1897 much the same discovery was made in the domain of what is known as "absolute" music. Such merely epigonal figures as Bungert (b. 1846) and Cyrill Kistler could not, even by the most eager set of admirers, be credited with powers in any way comparable to the genius whom they imitated; and Humperdinck's (b. 1854) striking success with *Hänsel und Gretel* (1893) is the result of his application of the Wagnerian principles of "music-drama" to a childish subject and to themes closely analogous to the folk-song, rather than of any great originality of his own. On the other hand, neither the eccentricities of Richard Strauss (*q.v.*), who has tried to out-Liszt Liszt himself, nor the academic productions of a host of younger men, showed anything that could be interpreted as giving promise of the advent of a successor to Brahms, in whom the long line of great German masters appears to have come to an end.

France.

From the earliest days of their music, the French have had the enviable power of assimilating the great innovations which were originated in other countries, without losing their habit of warmly appreciating that which their own countrymen produce. That which happened with the Netherlandish composers of the 16th century, and with Lully in the 17th, has been repeated, more or less exactly, with Rossini in the early part of the 19th century and with Wagner at its close. In one generation after another, the young French composers have succeeded in applying the principles of the great foreigners without forfeiting their own hold on the nation's respect. During the last quarter of the 19th century all that is represented by the once-adored name of Gounod has been discarded in favour of a style as different as possible from his. The change was mainly due to a Belgian musician of masterly cleverness, César Auguste Franck (1822–1890), who established a kind of informal school of symphonic and orchestral composition, as opposed to the conventional methods pursued at the Paris Conservatoire, where attention was chiefly given to the operatic and sentimental styles. Beyond the immediate circle of Franck's actual pupils, what may be called the revolt against sentimentality was widely supported, and its influence can hardly be exaggerated. Massenet was left as almost the only representative of the older school, and from Edouard Lalo (1823–1892) to Charpentier (b. 1860), all the younger composers of France adopted the newer style. With many of them their newly-found freedom in such matters as harmonic relations, modulations, &c., has been somewhat abused, and with Alfred Bruneau (b. 1857), in spite of the intense power of dramatic realization that is revealed in *Le Rêve* and *L'Attaque du Moulin*, there are many passages in his *Requiem* and in *Messidor* that are undeniably lacking in beauty; with him the dramatic propriety of the truth of his music excuses much that would otherwise be repellent, but in the case of Gabriel Fauré (b. 1845) his application of these strange methods to "absolute" music is seldom successful except with the few amateurs who profess to prefer ugly music to beautiful. Camille Saint-Saëns (b. 1835) is beyond question the soundest representative of modern French music, if only by reason of his greater command of resources of every kind and his success in all forms of music. A few other names must be mentioned as making up the modern French school, a body of undoubted distinction and influence: Ernest Reyer (b. 1823) is the author of some ambitious and sterling operas; F. L. V. de Joncières (b. 1839), an enthusiastic follower of Wagner, and a composer of merit; Emanuel Chabrier (1842–1894), a man of extraordinary gift, wrote one of the finest *opéras comiques* of modern times, *Le Roi malgré Lui* (1887), and a grand opera, *Gwendoline*, of no small value; Charles Marie Widor (b. 1845) is an earnest musician of great accomplishment; and Vincent d'Indy (b. 1851), a strongly original writer, alike in dramatic, orchestral, and chamber compositions. In the class of lighter music, which yet lies above the level of *opéra bouffe*, mention must be made of Léo Delibes (1836–1891) and André Messager (b. 1855). In describing the state of music in France, it would be wrong to pass over the work done by the great conductors of various popular orchestral concerts, such as Pasdeloup (b. 1819), Lamoureux (1834–1899), and Colonne (b. 1838).

Italy.

In Italy during the last quarter of the 19th century many important changes took place; three aspects of modern Italian music must claim our notice. First, the later development in the style of Verdi (1813–1901) was only completed in *Otello* (1887) and *Falstaff* (1893), while his last composition, the four beautiful sacred vocal works, show how very far he had advanced in reverence, solidity of style, and impressiveness, from the time when he wrote his earlier operas. By his side during the last years of his life stood Arrigo Boito (*q.v.*), the accomplished writer of his two last libretti, and the composer of *Mefistofele*, a work which had an immense influence on modern Italian music, and not impossibly on Verdi himself. Among the writers of "absolute" music the most illustrious are Sgambati (b. 1843) and Martucci (b. 1856); the latter's great symphony in D minor is a work the like of which has not been heard in Italy for many years, and the composer's high standard and splendid accomplishment can hardly fail to procure him lasting fame. The third and least estimable aspect of modern Italian music is that of the young operatic school, of which the first production was the *Flora Mirabilis* of Spiro Samara (b. 1861), given in 1886. There were a good many operas, many of them in one act, and most of them dealing by preference with tragedies of low life, but the most celebrated of all was *Cavalleria Rusticana* by Pietro Mascagni (b. 1863), upon which a prize was bestowed, and which was brought out in 1890. No work by the same composer has made a similar success, and among the many who have cast in their lot with this squalid school very few have attained more than an ephemeral reputation. The most familiar to English opera-goers is Leoncavallo (b. 1858), whose *Pagliacci* has kept the stage for some years since its production in 1892. In contrast to these composers is the work of Giacomo Puccini (b. 1858), who may be called the legitimate successor of Verdi. His operas are *Le Villi* (1884), *Manon Lescaut* (1893), *La Bohème* (1896), and *Tosca* (1900). So far as concerns the works themselves, the oratorios of Don Lorenzo Perosi (b. 1872) are not of much account, but as an influence on the church music of Italy they must be highly esteemed.

Russia.

The new Russian school of music has been so popular in England for the last few years that its rapid rise into recognition could not be ignored. As a definite school it had its origin with Balakirev (b. 1836), who was instrumental in founding the Free School of Music at Moscow, and who introduced the music of Berlioz and Liszt into Russia; he instilled the principles of "advanced" music into Borodin (1834–1887), Cui (b. 1835), Moussorgsky (b. 1839), and Rimsky-Korsakow

(b. 1844), all of whom, as usual with Russian composers, were, strictly speaking, amateurs in music, having some other profession in the absence of any possible opportunity for making money out of music in Russia. The most remarkable man among their contemporaries was undoubtedly Tschaikowsky (1840–1893), whose works, culminating in the "Pathetic Symphony," have enjoyed a wonderful vogue in Great Britain and elsewhere; Liadow (b. 1855) excels as a writer for the pianoforte, but Glazounow (b. 1865) has already accomplished so much, in so many forms and of such wonderfully high quality, that it seems almost safe to predict that he will be regarded as the chief product of the school.

Scandinavia. Of late years the music of Norway and Sweden has been so closely allied with the name of Grieg, and so very few other composers have made any mark, except sundry imitators of his style, that a reference to the article GRIEG is all that is necessary.

United States. A distinctively American school of composers can hardly be said to have come into existence as yet, but some of the musicians of the United States have reached so high a level of attainment that it would be impossible to ignore them in a general survey of music. It is the fault of European musicians, not their own, that their works have not become as widely recognized outside the United States as many of them deserve to be; and those compositions which have been heard in the United Kingdom have for the most part made a great impression. Of the older American composers, only John Knowles Paine and Dudley Buck, both born in 1839, need be mentioned. The former has written oratorios, choral, orchestral, and other music; is professor of music at Harvard University, and now ranks with the advanced school of romantic composers. The latter was one of the first American composers whose names were known in Europe; and if his numerous cantatas and church music do not reach a very high standard according to modern ideas, he did much to conquer the general apathy with regard to the existence of original music in the States. George Whitfield Chadwick has produced many orchestral and vocal works of original merit. Born in 1854, he may be taken as the typical musician of Boston. Though the works of Clayton Johns (b. 1857) are less ambitious, they have won more popularity in Europe, and his songs, like those of Arthur Foote (b. 1853) and Ethelbert Nevin (b. 1862) are widely known. Edward Alexander MacDowell (b. 1861) has written not only a very large number of artistic songs, piano pieces, and choruses, but symphonic poems, overtures, and suites for orchestra, many of which are better known to German than to English musical audiences. Walter Johannis Damrosch (b. 1862), the eminent conductor of the New York Symphony Orchestra, and of various operatic undertakings, has established his position as an original and poetic composer, not only by his opera, *The Scarlet Letter*, but by such songs as the intensely dramatic "Danny Deever." Within the last few years the name of Horatio William Parker has come into prominence in England, and his oratorio settings of the hymn "Hora novissima" and of "The Wanderer's Psalm" are deservedly popular. Their masterly workmanship and his power of expression in sacred music mark him as a distinct personality, and one from whom much may be expected. Numerous orchestral as well as vocal works have not been heard out of America, but a group of songs, newly set to the words of familiar old English ditties, have obtained great success. Finally, Mrs H. H. A. Beach, the youngest of the prominent composers of the United States, has attained a high reputation as a writer in all the more ambitious forms of music, in which her success is all the more remarkable since she is entirely self-taught in the more advanced kinds of composition as well as in orchestration. Numerous of her songs and anthems have obtained wide popularity in America, and she is a highly accomplished pianist. If the American composers' names are hardly known to the generality of amateurs in Great Britain, it is worthy of note that no country has produced a greater number of the most eminent singers in the present day. Mesdames Eames, Nordica, Susan Strong, Suzanne Adams, Sybil Sanderson, Esther Palliser, Evangeline Florence, and very many more among leading sopranos, with Messrs Oudin and Bispham, to name but two out of the host of excellent male artists, have proved the natural ability of the Americans in vocal music; and it might almost be said that the more notable pupils of the various excellent French schools of voice-production are American with hardly an exception.

United Kingdom. Before attempting to describe the great renaissance of English music which accomplished itself in the last quarter of the 19th century, it will be well to glance at the general conditions of music and the causes of the change. Only the most bigoted admirers of foreign music could deny that there has been a great change in the national feeling with regard to music. The nation had been accustomed for so long to consider music as an exotic, that, notwithstanding the glories of the older schools of English music, the amount of attention paid to everything that came from abroad, and the rich treasures of traditional and distinctively English music scattered through the country, the majority of educated people adhered to the common belief that England was not a musical country. The beauty and the enormous quantity of traditional Irish music, the enthusiasm created in Scotland by trumpery songs written in what was supposed to be an imitation of the Scottish style, the existence of the Welsh Eisteddfodau, were admitted facts, but England was supposed to have had no share in these gifts of nature or art, and the vogue of foreign music, from Italian opera to classical symphonies, was held as evidence of her poverty, instead of being partly the reason of the national sterility. In the successive periods during which the music of Handel and Mendelssohn respectively had been held as all-sufficient for right-thinking musicians, success could only be attained, if at all, by those English musicians who deliberately set themselves to copy the style of these great masters; the few men who had the determination to resist the popular movement were either confined, like the Wesleys, to one branch of music in which some originality of thought was still allowed, that of the Church, or, like Henry Hugo Pierson in the days of the Mendelssohn worship, were driven to seek abroad the recognition they could not obtain at home. For a time it seemed as if the great vogue of Gounod would exalt him into a third artistic despot; but his influence was at first only felt harmfully on the Church music of his time, the introduction of his masses into England being synchronous with the popularity of the Tractarian movement: English opera had fallen on such evil days that no native composer had even the energy to imitate his *Faust*, the only one of his operas that was then popular; and, by the date of the two sentimental oratorios that were written for Birmingham, *The Redemption* (1882) and *Mors et Vita* (1885), the renaissance of English music had already begun, and ultimately English composers had strength enough to resist the effects of their wide though somewhat transient popularity. It should be explained at this point that the phrase "harmful influence" is used quite without reference to the merits or demerits of the music in itself; it refers simply to the kind of influence exerted, which is only to be regretted when the composers are brought face to face with the necessity of consciously and deliberately imitating a popular model, because they know that there is no chance of success in any other way. All the great masters, from Bach, Mozart, and Beethoven, down to Brahms and Wagner, have had influence upon the musicians of their time and upon subsequent generations; but only a very few, and none of those just mentioned, have so dominated a whole nation's music that their influence could fitly be described as harmful. The Sacred Harmonic Society was the chief temple of the *culte* of Handel, as the Ancient Concerts had formerly been; and the Philharmonic Society was almost given over to the adoration of Mendelssohn and his servile imitators.

The opera. Until about the 'eighties, the affairs of foreign opera in England were most depressing; entirely without artistic influence of any kind, the rival houses presided over by the impresarios Frederick Gye (1810–1878) and Colonel J. H. Mapleson (1828–1901) had been going from bad to worse; the traditions of what were called "the palmy days" had been forgotten, and with the retirement of Christine Nilsson in 1881, and the death of Tietjens in 1877, the race of the great queens of song seemed to have come to an end. It is true that Mme. Patti was in the full plenitude of her fame and powers, but the number of her impersonations, perfect as they were, was so small that she alone could not support the weight of an opera season, and her terms made it impossible for any manager to make both ends meet unless the rest of the company were chosen on the principle enunciated by the husband of Mme. Catalani, "Ma femme et quatre ou cinq poupées." Mme. Albani (b. 1851) had made her name famous, but the most important part of her artistic career was yet to come. She had already brought *Tannhäuser* and *Lohengrin* into notice, but in Italian versions, as was then usual; and the great vogue of Wagner's operas did not begin until the series of Wagner concerts given at the Royal Albert Hall in 1877 with the object of collecting funds for the preservation of the Bayreuth scheme, which after the production of the Nibelungen trilogy in 1876 had become involved in serious financial difficulties. The two seasons of German opera at Drury Lane under Dr Hans Richter (b. 1843) in 1882 and 1884, and the production of the trilogy at Her Majesty's in 1882, under Angelo Neumann's managership, first taught stay-at-home Englishmen what Wagner really was, and Italian opera as such (*i.e.*, with Italian as the exclusive language employed and the old "star" system in full swing) ceased to exist as a regular institution a few years after that. The revival of public interest in the opera only took place after Mr (afterwards Sir Augustus) Harris (1852–1896) had started his series of operas at Drury Lane in 1887. In the following season Harris took Covent Garden, and since that time the opera has been restored to greater public favour than it ever enjoyed, at all events since the days of Jenny Lind. The clever manager saw that the public was tired of operas arranged to suit the views of the *prima donna* and no one else, and he cast the works he produced, among which were *Un Ballo in Maschera* and *Les Huguenots*, with due attention to every part. The brothers Jean and Edouard de Reszke, both of whom had appeared in London before, the former as a baritone, and the latter during the seasons 1880–84, were even stronger attractions to the musical public of the time than the various leading sopranos, among whom were Mme. Albani, Miss Macintyre, Mme. Melba, Frau Sucher, and Mme. Nordica, during the earlier seasons, and Mme. Eames, Mlle. Ravogli, MM. Lassalle and Plançon, and many other Parisian favourites later. As time went on, the excellent custom obtained of giving each work in the language in which it was written, and among the distinguished German artists who were added to the company were Frau Ternina, Frau Schumann-Heink, Frau Lilli Lehmann, and many more. Since Harris's death in 1896 the traditions started by him have been on the whole well maintained, and as a sign of the difference between the present and the former position of English composers, it may be mentioned that two operas by Cowen, *Signa* and *Harold*, and two by Stanford, *The Veiled Prophet* and *Much Ado about Nothing*, have been produced. To Signor Lago, a manager of more enterprise than good fortune, belongs the credit of reviving Gluck's *Orfeo* (with the masterly impersonation of the principal character by Mlle. Giulia Ravogli), and of bringing out *Cavalleria Rusticana*, Tschaikowsky's *Eugen Onegin*, and other works. The fortunes of English opera must be pursued in connexion with the renaissance of music.

The renaissance. Without a congenial atmosphere no germ can be developed, and if it be just to name one institution and one man as the creator of such an atmosphere as allowed the genius of English composers to flourish, then that honour must be paid to the Crystal Palace and Mr August Manns (b. 1825), the conductor of its Saturday Concerts. At first engaged as sub-conductor, under a certain Schallehn, at the building which was the lasting result of the great Exhibition of 1851, he became director of the music in 1855, so for the better part of half a century his influence was exerted on behalf of the best music of all schools, and especially in favour of anything of English growth. Through evil report and good report he supported his convictions, and for many years he introduced one English composer after another to a fame which they would have found it hard to gain without his help and that of Sir George Grove, his loyal supporter. In 1862, when Arthur Sullivan had just returned from his studies in Leipzig, his *Tempest* music was produced at the Crystal Palace, and, whatever views may be taken as to the composer's music as a whole, it is beyond question that it was this success and that of the succeeding works from the same hand which first showed Englishmen that music worth listening to might be produced by an English hand. The hold of Sullivan's music upon the English public was at its strongest in the series of "Savoy Operas," from *The Sorcerer* to *Utopia, Limited*; and though these works owe their success at least as much to Gilbert's admirable librettos as to Sullivan's music, they convinced the average English theatre-goer that English comic opera could be as bright as French. Sullivan reached the highest point of his achievement in *The Golden Legend* (1886), his most important contribution to the music of the renaissance. An important part of the Crystal Palace music was that the concerts did not follow, but led, popular taste; the works of Schubert, Schumann, and many other great masters were given constantly, and the whole repertory of classical music was gone through, so that a constant attendant at these concerts would have become acquainted with the whole range of the best class of music. From 1859 onwards the classical chamber-music could be heard at the Popular Concerts started by Mr Arthur Chappell, and for many years their repertory was not less catholic than that of the Crystal Palace undertaking; that in later times the habit increased to a lamentable extent of choosing only the "favourite" (*i.e.*, hackneyed) works of the great masters does not lessen the educational value of the older concerts. The lovers of the newer developments of music were always more fully satisfied at the concerts of the Musical Union, a body founded by Mr John Ella in 1844, which lasted until 1880. From 1879 onwards the visits of Hans Richter, the conductor, were a feature of the musical season, and the importance of his work, not only in spreading a love of Wagner's music, but in regard to every other branch of the best orchestral music, cannot be exaggerated. Like the Popular Concerts, the Richter Concerts somewhat fell away in later years from their original purpose, and their managers were led by the popularity of certain pieces to give too little variety. The importance of Richter's work was in bringing forward the finest English music in the years when the masters of the renaissance were young and untried. Here were to be heard the orchestral works of Parry, Stanford, Mackenzie, and Cowen; and the fact that the audience from the first contained a large proportion of the cultivated aristocracy of London brought the names of these composers into notice much more effectually than could have been the case in other surroundings. Meanwhile outside London the work of the renaissance was being carried on, notably at Cambridge, where by the amalgamation of various smaller societies with the University Musical Society, Stanford created in 1875 a splendid institution which did much to foster a love of the best music for many years; and at Oxford, where private meetings in the rooms of Hubert Parry brought about the institution of the Musical Club, which has borne fruit in many ways, though only in the direction of chamber-music. The Bach Choir, founded by Mr Arthur Duke Coleridge in 1875, and conducted for the first ten years of its existence by Mr Otto Goldschmidt and subsequently by Professor Stanford, worked on purely uncommercial lines ever since its foundation, and besides many important works of Bach, it brought forward most important compositions by Englishmen, and had a prominent share in the work of the renaissance. The careers of the five composers who must be called the masters of the renaissance — Parry, Stanford, Mackenzie, Goring Thomas, and Cowen—are dealt with separately under their own headings; but taking them as a group or school of composers, it will be realized by every thoughtful student of music that their works show a spontaneity, a warmth of imagination, a degree of power and technical skill, which are scarcely to be found in the perfunctory, conventional music of the older generation of English writers, the purveyors of what Wagner called "Kapellmeistermusik." Parry's earlier compositions had a certain austerity in them which, while it commanded the homage of the cultivated few, prevented their obtaining wide popularity; and it was not until the date of his choral setting of Milton's *Ode at a Solemn Musick* that he found his true vein. In this and its many successors, produced at the autumn festivals, though very rarely given in London, there are a nobility of utterance, a sublimity of conception, a mastery of resource, that far surpass anything accomplished in England since the days of Purcell; while his "Symphonic Variations" for orchestra, and at least two of his symphonies, exhibit his command of the modern modifications of classical forms in great perfection. Like Parry, Stanford first caught the ear of the public at large with a choral work, the stirring ballad-setting of Tennyson's *Revenge;* and in all his earlier and later works alike, which include compositions in every form, he shows himself a supreme master of effect; in dramatic or lyrical handling of voices, in orchestral and chamber-music, his sense of beauty is unfailing, and while his ideas have real distinction, his treatment of them is nearly always the chief interest of his works. The work of the musical renaissance has been more beneficially fostered by these two masters than by any other individuals, through the medium of the Royal College of Music. In 1876 the National Training School of Music was opened with Sullivan as principal; he was succeeded by Sir John Stainer in 1881, and the circumstance that such artists as Mr Eugen d'Albert and Mr Frederic Cliffe received there the foundation of their musical education is the only important fact connected with the institution, which in 1882 was succeeded by the Royal College of Music, under the directorship of Sir George Grove, and with Parry and Stanford as professors of composition. In 1894 Parry succeeded to the directorship, and before and after this date work of the best educational kind was done in all branches of the art, but most of all in the important branch of composition. Mackenzie's place among the masters of the renaissance is assured by his romantic compositions for orchestra, such as *La Belle Dame sans Merci* and the two "Scottish Rhapsodies"; some of his choral works, such as the oratorios, show some tendency to fall back into the conventionalities from which the renaissance movement was an effort to escape; but in *The Cottar's Saturday Night; The Story of Sayid; Veni, Creator Spiritus,* and many other things, not excepting the opera *Colomba*, or the witty "Britannia" overture, he shows no lack of spontaneity or power. As principal of the Royal Academy of Music (he succeeded Macfarren in 1888) he revived the former glories of the school, and the excellent plan by which it and the Royal College unite their forces in the examinations of the Associated Board is largely due to his initiative. The opera just mentioned was the first of the modern series of English operas brought out from 1883 onwards by the Carl Rosa company during its tenure of Drury Lane Theatre: at the time it seemed as though English opera had a chance of getting permanently established, but the enterprise, being a purely private and individual one, failed to have a lasting effect upon the art of the country, and after the production of two operas by Mackenzie, two by Arthur Goring Thomas, one by F. Corder, two by Cowen, and one by Stanford, the artistic work of the company grew gradually less and less important. In spite of the strong influence of French ideals and methods, the music of Arthur Goring Thomas was remarkable for individuality and charm; in any other country his beautiful opera *Esmeralda* would have formed part of the regular repertory, even if the same favour had not been accorded to its successor, *Nadeshda;* and his orchestral suites, cantatas, and a multitude of graceful and original songs remain as evidence that if his career had been prolonged, the art of England might have been enriched by some masterpiece it would not willingly have let die. After a youth of extraordinary precocity, and a number of variously successful attempts in the more ambitious and more serious branches of the art, Cowen found his chief success in the treatment of fanciful or fairy subjects, whether in cantatas or orchestral works; here he is without a rival, and his ideas are uniformly graceful, excellently treated, and wonderfully effective. His second tenure of the post of conductor of the Philharmonic Society showed him to be a highly accomplished conductor.

In regard to English opera two more undertakings deserve to be recorded, although the hope that London will be placed on an equality with the other European capitals in the possession of a permanent operatic institution seems as far off as ever. In 1891 the "Royal English Opera-House" was opened with Sullivan's *Ivanhoe*, a work written specially for the occasion: the absence of anything like a repertory, and the retention of this one work in the bills for a period far longer than its attractions could warrant, brought the inevitable result, and shortly after the production of a charming French comic opera the theatre was turned into the Palace music hall. The charming and thoroughly characteristic *Shamus O'Brien* of Stanford was produced in 1896 at the Opera Comique Theatre, and ran with great success. This work brought into public prominence the young conductor Mr

Henry J. Wood (b. 1870), who exercised a powerful influence on the art of the country by means of his orchestra, which was constantly to be heard at the Queen's Hall, and which attained, by continual performance together, a degree of perfection before unknown in England. If the organization did a good deal more for Russian than for English music, it at least achieved an important work in bringing music within the reach of all classes at the Promenade Concerts given through each summer, as well as by means of the Symphony Concerts at other seasons.

The new school of English writers contains many names of skilled composers whose attainment of a high place upon the roll of fame is only doubtful because the British public at large is still slow to realize that any good can come out of England in the way of musical creations. Some of these have already attained conspicuous success, and a few of them have been heard of in Continental centres of music. Dr Edward Elgar has made his reputation within the last few years by his vigorous *Caractacus* and the grandiose imaginings of his *Dream of Gerontius*, as well as by orchestral and chamber compositions of decided merit and individuality. Mr Edward German (b. 1862) has won great success as a writer of incidental music for plays, and in various lighter forms of music, for which his great skill in orchestration and his knowledge of effect stand him in good stead. Mr Frederic Cliffe's orchestral works are too few in number, but their quality is extremely high. Mr Arthur Somervell (b. 1863) has won the public ear by his charming songs, and notably by a fine song-cycle from Tennyson's *Maud*, though his *Mass* and various orchestral works and cantatas and pianoforte pieces show his conspicuous ability in other forms. Various compositions written by Mr Hamish MacCunn (b. 1868), while still a student at the Royal College of Music, were received with acclamation; but his later work up to 1902 was not of equal value, though his operas *Jeanie Deans* and *Diarmid* were successful. Mr Granville Bantock, an ardent supporter of the most advanced music, has written many fine things for orchestra, and Mr William Wallace, in various orchestral pieces played at the Crystal Palace and elsewhere, and in such things as his "Freebooter songs," has shown strong individuality and imagination; considerable power was exhibited by the late Erskine Allon, and Mr Arthur Hinton has produced things of fanciful beauty and quaint originality. Miss Ethel M. Smyth, whose *Mass* was given at the Royal Albert Hall some years ago in most favourable conditions, has had her opera *Fantasio* produced at Weimar and Carlsruhe and *Der Wald* at Covent Garden; her strength lies in orchestral writing, and her ideas are remarkable for power. Miss Maude Valerie White's graceful and expressive songs must not pass without a word of recognition, nor the cleverly devised cycles of songs or quartets by which Mme. Liza Lehmann made a new reputation after her retirement from the profession of a singer. The first part of Mr S. Coleridge Taylor's *Hiawatha* scenes was performed while he was still a student at the Royal College, and so great was its popularity that the third part of the trilogy was commissioned for performance by the Royal Choral Society: his name is known by this work throughout England, and musicians have long realized that he possesses a style quite his own, in which the subtle art of emphasis by reiteration is thoroughly understood. His feeling for orchestral colouring is very strong, and his permanent success a matter of certainty. Dr H. Walford Davies and Mr W. Y. Hurlstone excel in the serious kind of chamber-music, and use the classic forms with notable skill; and if Mr S. P. Waddington's *John Gilpin* and Mr R. H. Walthew's *Jackdaw of Rheims* seem to convey the idea that their leanings are towards what is trivial, the power and humour with which both composers have done their work and their other compositions show them to be worthy to be numbered among the best of the younger writers.

English executive musicians have never suffered from foreign competition in the same degree as English composers, and the success of such singers as Miss Anna Williams, Miss Macintyre, Miss Marie Brema, Miss Clara Butt, Messrs Ben Davies, Edward Lloyd, Santley, Ffrangcon Davies, Plunket Greene, Andrew Black, and Watkin Mills, or of such pianists as Miss Fanny Davies and Mr Borwick, is but a continuance of the tradition of British excellence. If no English violinists have been able to command the success of Sarasate, Ysaye, or Kubelik, Messrs Kreuz and Hobday as viola players and Messrs Squire and Ludwig as violoncellists established a firm hold upon the public; and the fame of the best English artists cannot be shaken by such phenomena as the extraordinary rage for M. Paderewski, or the fashion, commoner a few years ago than at the present day, of attaching great importance to the performances of infant prodigies.

The election of Sir Frederick Bridge (b. 1844) to the Gresham professorship on the death of Dr Wylde in 1890 put a new value on the lectures, for as organist of Westminster Abbey he had the faculty of attracting the attention of the public at large, and his lectures were not only instructive, but very amusing also. His appointment as conductor of the Royal Choral Society, in succession to Sir Joseph Barnby, was a popular success. Of the societies formed for the purpose of bringing the best music into the lives of the poor, the People's Concert Society, founded in 1878, is the oldest and the most widely useful; the musical organizations in connexion with such philanthropic undertakings as the Passmore Edwards settlement and the Oxford House at Bethnal Green are doing a valuable work in a thoroughly artistic if unobtrusive way.

The scientific study of the music of the past has more and more decidedly taken its place as a branch of musical education; the learned writings of W. S. Rockstro (1823–1895), many of them made public first in Grove's *Dictionary of Music*, made the subject clear to many who had been groping in the dark before; and the actual performance of old music has been undertaken not only by the Bach Choir, but by the Magpie Madrigal Society under Mr Lionel Benson's able direction. In vocal and instrumental music alike the musical side of the International Exhibition of 1885 did excellent work in its historical concerts; and in that branch of archæology which is concerned in the structure and restoration of old musical instruments important work has been done by Mr A. J. Hipkins, the Rev. F. W. Galpin, and others. The formation of the Folk-Song Society in 1899 drew attention to the importance and extent of English traditional music, and did much to popularize it with singers of the present day. (J. A. F. M.)

Music Halls.—If the Thespian cart or chariot, with all the dramatic sock and buskin actions represented on that movable platform, and the miracle plays performed by the monks in religious sanctuaries, in which the principal characters often represented the ruling powers of heaven, hell, and earth, were the origin of the theatre, the British theatre, protected by monopolist laws and patent rights, was undoubtedly the creator of that sturdy, comparatively modern, and very flourishing institution known generally as the music hall. The "saloon theatres" of the 'thirties were the music halls of to-day, and they owed their form and existence to the restrictive action of the patent theatres. These theatres had the exclusive right of representing what was broadly called the "legitimate drama," which ranged from Shakespeare to Monk Lewis, and from Sheridan and Goldsmith to Kotzebue and Alderman Birch of Cornhill, citizen and poet, and the founder of the turtle-soup trade. The patent houses defended their rights when they were attacked by the "minor" and "saloon" theatres, but they often acted in the spirit of the dog in the manger. While they pursued up to fine and even imprisonment the poachers on their dramatic preserves, they too often neglected the "legitimate drama" for the supposed meretricious attractions offered by their illegitimate competitors. The British theatre gravitated naturally to the inn or tavern. The tavern was the source of life and heat, and warmed all social gatherings. The inn galleries offered rather rough stages, before the Shakespeare and Alleyn playhouses were built. The inn yards were often made as comfortable as possible for the "groundlings" by layers of straw, but the tavern character of the auditorium was never concealed. Excisable liquor was always obtainable, and the superior members of the audience who chose to pay for seats at the side of the stage or platform (like the "avant-scène" boxes at a Parisian theatre), were allowed to smoke Raleigh's Virginian weed, then a novel luxury. This was, of course, the first germ of a "smoking theatre."

While the drama progressed as a recognized public entertainment in England, and was provided with its own buildings in the town, or certain booths at the fairs, the Crown exercised its patronage in favour of certain individuals, giving them power to set up playhouses at any time in any parts of London and Westminster. The first and most important grant was made by Charles II. to his "trusty and well-beloved" Thomas Killigrew "and Sir William Davenant." This was a personal grant, not connected with any particular sites or buildings, and is known in theatrical history as the "Killigrew and Davenant patent." Killigrew was the author of several unsuccessful plays, and Sir William Davenant, said to be an illegitimate child of William Shakespeare, was a stage manager of great daring and genius. Charles II. had strong theatrical leanings, and had helped to arrange the court ballets at Versailles for Louis XIV. The Killigrew and Davenant patent in course of time descended, after a fashion, to the Theatres Royal, Covent Garden and Drury Lane, and was and still is the chief legal authority governing these theatres. The "minor" and outlying playhouses were carried on under the Music and Dancing Act of George II., and the annual licences were granted by the local magistrates.

The theatre proper having emancipated itself from the inn or tavern, it was now the turn of the inn or tavern to develop into an independent place of amusement, and to lay the foundation of that enormous middle-class and lower middle-class institution or interest which we agree to term the music hall. It rose from the most modest, humble, and obscure beginning—from the public-house bar-parlour, and its weekly "sing-songs," chiefly supported by voluntary talent from the "harmonic meetings" of the "long-room" upstairs, generally used as a Foresters' or Masonic club-room, where one or two professional singers were engaged and a regular chairman was appointed, to the "assembly-room" entertainments at certain hotels, where private balls and school festivals formed part of an irregular series. The district "tea-garden," which was then an agreeable feature of suburban life—the suburbs being next door to the city and the country next door to the suburbs—was the first to show dramatic ambition, and to erect in some portion of its limited but leafy grounds a lath-and-plaster stage large enough for about eight people to move upon without incurring the danger of falling off into the adjoining fish-pond and fountain. A few classical statues in plaster, always slightly mutilated, gave an educational tone to the place, and with a few coloured oil-lamps hung amongst the bushes the proprietor felt he had gone as near the "Royal Vauxhall Gardens" as possible for the small charge of a sixpenny refreshment ticket. There were degrees of quality, of course, amongst these places, which answered to the German beer-gardens, though with inferior music. The Beulah Spa at Norwood, the White Conduit House at Pentonville, the Yorkshire Stingo in the Marylebone Road, the Monster at Pimlico, the St Helena at Rotherhithe, the Globe at Mile End, the Red Cow at Dalston, the Highbury Barn at Highbury, the Manor-House at Mare Street, Hackney, the Rosemary Branch at Hoxton, and other *rus-in-urbe* retreats, were up to the level of their time, if rarely beyond it.

The suspended animation of the law—the one Georgian Act, which was mainly passed to check the singing of Jacobite songs in the tap-rooms and tea-gardens of the little London of 1730, when the whole population of the United Kingdom was only about six millions—encouraged the growth eventually of a number of "saloon theatres" in various London districts, which were allowed under the head of "Music and Dancing" to go as far on the light dramatic road as the patent theatres thought proper to permit. The 25th of George II., cap. 36, which in 1902 was still the only Act under which the music halls of forty millions and more of people were licensed, was always liberally interpreted, as long as it kept clear of politics.

The "saloon theatres," always being taverns or attached to taverns, created a public who liked to mix its dramatic amusements with smoking and light refreshments. The principal "saloons" were the "Effingham" in the Whitechapel Road, the "Bower" in the Lower Marsh, Lambeth, the "Albert" at Islington, the "Britannia" at Hoxton, the "Grecian" in the City Road, the "Union" in Shoreditch, the "Stingo" at Paddington, and several others of less importance. All these places had good companies, especially in the winter, and many of them nourished leading actors of exceptional merit. The dramas were chiefly rough adaptations from the contemporary French stage, occasionally flying as high as Alexandre Dumas the elder and Victor Hugo. Actors of real tragic power lived, worked, and died in this confined area. Some went to America, and acquired fame and fortune; and among others, Frederick Robson, who was trained at the "Grecian," first when it was the leading saloon theatre and afterwards when it became the leading music hall (a distinction with little difference), fought his way to the front after the abolition of the "patent rights" and was accepted as the greatest tragi-comic actor of his time. The "Grecian" saloon theatre, better known perhaps, with its pleasure garden or yard, as the "Eagle Tavern," City Road, which formed the material of one of Charles Dickens's *Sketches by Boz*, was a place managed with much taste, enterprise, and discretion by its proprietor, Mr Rouse. It was the "saloon" where the one and only attempt, with limited means, was ever made to import almost all the original repertory of the Opéra Comique in Paris, with the result that many musical works were presented to a sixpenny audience that had never been heard before nor since in England. Auber, Hérold, Adolphe Adam, Boieldieu, Grétry, Donizetti, Bellini, Rossini, and a host of others gave some sort of advanced musical education, through the "Grecian," to a rather depressing part of London, long before board schools were established. The saloon theatres rarely offended the patent houses, and when they did the law was soon put in motion to show that Shakespeare could not be represented with impunity. The "Union Saloon" in Shoreditch, then under the direction of Mr Samuel Lane, who afterwards, with his wife, Mrs Sara Lane, at the "Britannia Saloon," became the leading local theatrical manager of his day, was tempted in 1834 to give a performance of *Othello*. It was "raided" by the then rather "new police," and all the actors, servants, audience, directors, and musicians were taken into custody and marched off to Worship Street police station, confined for the remainder of the night, and fined and warned in the morning. The same and only law still exists for those who are helping to keep a "disorderly house," but there are no holders of exclusive dramatic patent rights to set it in motion. The abolition of this privileged monopoly was effected about this time by a combination of distinguished literary men and dramatists, who were convinced, from observation and experience, that the patent theatres had failed to nurse the higher drama, while interfering with the beneficial freedom of public amusements.

The effect of Covent Garden and Drury Lane on the art of acting had resulted chiefly in limiting the market for theatrical employment, with a consequent all-round reduction of salaries. They kept the Lyceum Theatre (or "English Opera House") for years in the position of a music hall, giving sometimes two performances a night, like a "gaff" in the New Cut or Whitechapel. They had not destroyed the "star" system, and Edmund Kean and the boy Betty—the "Infant Roscius"—were able to command sensational rewards. In the end Charles Dickens, Sir Edward Bulwer-Lytton, Sir Thomas Noon Talfourd, and others got the patents abolished, and the first step towards free trade in the drama was secured.

The effect of this change was to draw attention to the "saloon theatres," where during the performances smoking, drinking, and even eating were allowed in the auditorium. An Act was soon passed, known as the Stage-Play Act—the 6 and 7 Vict. c. 68—appointing a censor of stage-plays, and placing the London theatres under the control of a Crown officer, changing with ministries. This was the Lord Chamberlain for the time being. The Lord Chamberlain of this period drew a hard-and-fast line between theatres under his control, where no smoking and drinking were allowed "in front," and theatres or halls where the old habits and customs of the audience were not to be interfered with. These latter were to go under the jurisdiction of the local magistrates, or other licensing authorities, under the 25 Geo. II. cap. 36—the Music and Dancing Act—and so far a divorce was decreed between the taverns and the playhouses. The Lord Chamberlain eventually made certain concessions. Refreshment bars were allowed at the Lord Chamberlain's theatres in unobtrusive positions, victualled under a special Act of William IV., and private smoking-rooms were allowed at most theatres on application. All this implied that stage plays were to be kept free from open smoking and drinking, and miscellaneous entertainments were to enjoy their old social freedom. The position was accepted by those "saloon theatres" which were not tempted to become Lord Chamberlain houses, and the others, with many additions, started the first music halls.

Amongst the first of these halls, and certainly the very first as far as intelligent management was concerned, was the "Canterbury" in the Lower Marsh, Lambeth, which was next door to the old Bower Saloon, then transformed into a "minor theatre." The "Canterbury" sprang from the usual tavern germ, its creator being Mr Charles Morton, who honourably earned the name of the "*doyen* of the music halls." It justified its title by cultivating the best class of music, and exposed the prejudice and unfairness of Planché's sarcasm in a Haymarket burlesque—"most music hall—most melancholy." Mr Charles Morton added pictorial art to his other attractions, and obtained the support of *Punch*, which stamped the "Canterbury" as the "Royal Academy over the water." At this time by a mere accident Gounod's great opera of *Faust*, through defective international registration, fell into the public domain in England and became common property. The "Canterbury," not daring to present it with scenery, costumes, and action, for fear of the Stage-Play Act, gave what was called "An Operatic Selection," the singers standing in plain dresses in a row, like pupils at a school examination or a chorus in an oratorio at Exeter Hall. The music was well rendered by a thoroughly competent company, night after night, for a long period, so that by the time the opera attracted the tardy attention of the two principal opera managers at Her Majesty's Theatre in the Haymarket and Covent Garden Theatre, the tunes most popular were being whistled by the "man in the street," the "boy in the gutter," and the tradesman waiting at the door for orders.

With the "Canterbury Hall," and its brother the "Oxford" in Oxford Street—a converted inn and coaching yard—built and managed on the same lines by Mr Charles Morton, the music halls were well started. They had imitators in every direction—some large, some small, and some with architectural pretensions, but all anxious to attract the public by cheap prices and physical comforts not attainable at any of the regular theatres.

With the growth and improvement of these "Halls," the few old cellar "singing-rooms" gradually disappeared. "Evans's" in Covent Garden was the last to go. "Rhodes's," or the "Cyder Cellars" in Maiden Lane, at the back of the Adelphi Theatre; the "Coal Hole," in the Strand, which now forms the site of Terry's Theatre; the "Doctor Johnson," in Fleet Street (oddly enough, within the precincts of the City of London), disappeared one by one, and with them the compound material for Thackeray's picture of "The Cave of Harmony." This "Cave," like Dickens's "Old Curiosity Shop," was drawn from the features of many places. To do the "cellars" a little justice, they represented the manners of a past time—heavy suppers and heavy drinks, and the freedom of their songs and recitations was partly due to the fact that the audience and the actors were always composed of men. Thackeray clung to "Evans's" to the last. It was his nightly "chapel of ease" to the adjoining Garrick Club. In its old age it became decent, and ladies were admitted to a private gallery, behind screens and a convent grille. Before its death, and its revival in another form as a sporting club, it admitted ladies both on and off the stage, and became an ordinary music hall.

In its most prosperous days (or nights) "Evans's" never applied for a music licence, and the other "cellars" followed its example. The music, as in circuses, was held to be ancillary, not what the public paid for. They were kept in countenance by places like "Willis's Rooms" in King Street, St James's, where the fashionable and exclusive assemblies known as "Almack's" were held without any formal legal sanction. The Georgian Act was probably considered too common and vulgar to touch; and until the licensing authority was taken from the local magistrates and handed over to the London County Council, the Act 25 Geo. II. c. 36 was often neglected on both sides. The L.C.C. examine and enforce their powers. They have been advised that they can separate a music from a dancing licence if they like, and that when they grant the united licence the dancing means the dancing of paid performers on a stage, and not the dancing of the audience on a platform or floor, as at the short-lived but elegant Cremorne Gardens, or an old-time "Casino." They are also advised that they can withhold licences, unless the applicants agree not to apply for a drink licence to the local magistrates sitting in brewster sessions, who still retain their control over the liquor trade. Theatre licences are often withheld unless a similar promise is made—the drink authority in this case being the Excise, empowered by the Act of William IV. (5 and 6 Will. IV. c. 39, s. 7).

The rise and progress of the London music halls naturally excited a good deal of attention and jealousy on the part of the regular theatres, and this was increased when the first "Great Variety Theatre" was opened in Leicester Square. The building was the finest example of Moorish architecture on a large scale ever erected in England. It was burnt down in the 'eighties, and the present theatre was built in its place. Originally it was "The Panopticon," a palace of "recreative science," started under the most distinguished direction on the old polytechnic institution lines, and with ample capital. It was a commercial failure, and after being tried as an "American Circus," it was turned into a great variety theatre, the greatest of its kind in Europe, under the name of the Alhambra Palace. Its founder was Mr E. T. Smith, the energetic theatrical manager, and its developer was Mr Frederick Strange, who came full of spirit and money from the Crystal Palace. He produced in 1865 an ambitious ballet—the Dagger Ballet from Auber's *Enfant Prodigue*, which had been seen at Drury Lane Theatre in 1851, translated as "Azaël."

The Alhambra was prosecuted in the superior courts for infringing the Stage-Play Act—the 6 and 7 Vict. c. 68. The case is in the law reports—*Wigan* v. *Strange*—the ostensible plaintiffs being Mr Horace Wigan, the actor and manager, and Mr Benjamin Webster, the celebrated actor and manager. They were supported by Mr J. B. Buckstone and many other managers. A long trial before eminent judges, with eminent counsel on both sides, produced a decision which was not very satisfactory, and far from final. It held that, as far as the entertainment went, according to the evidence tendered, it was not a ballet representing any distinct story or coherent action, but it might have been a "divertissement"—a term suggested in the course of the trial. A short time after this a pantomime scene was produced at the same theatre, called "Where's the Police?" which had a clown, a pantaloon, a columbine, and a harlequin, with other familiar characters, a mob, a street, and even the traditional red-hot poker. This inspired proceedings by the same plaintiffs before a police magistrate at Marlborough Street, who inflicted the full penalties—£20 a performance for 12 performances, and costs. An appeal was made to the Westminster quarter sessions, supported by Serjeant Ballantine and opposed by Mr Hardinge Giffard (afterwards Lord Chancellor Halsbury), and the conviction was confirmed. Being heard at quarter sessions, there is no record in the law reports.

About this time "Pepper's Ghost" was a great public attraction at the theatres and music halls in London and the country. The music halls were prosecuted for infringing stage law in this case, although the actors and actresses never appeared on the stage in a solid form, but were thrown up as reflections by an underground arrangement of mirrors. The chief offenders in the provinces were Messrs Day and Son, music hall proprictors, of Birmingham, and in London Mr Charles Morton at the "Canterbury." Convictions were obtained in all cases. There were other prosecutions for other offences under the Act, one being against the "Royal" Music Hall (formerly known as "Weston's) in Holborn. This performance openly broke two laws at the same time—the Copyright Act and the Stage-Play Act. It was a condensed version of Barnett's charming opera of *The Mountain Sylph*, originally produced at the "Grecian," and the chief magistrate at Bow Street had no option but to fine the defendants, Messrs Sweasey and Holland. The fines were light, the prosecution in this case acting on principle.

These prosecutions, and threats of more, suggested the institution of a parliamentary inquiry, and a House of Commons Select Committee was appointed in 1866, at the instigation of the music halls and variety theatres. The committee devoted much time to the inquiry, and examined many witnesses—amongst the rest Lord Sydney, the Lord Chamberlain, who had no personal objection to undertake the control of these comparatively young places of amusement and recreation. Much of the evidence was directed against the Stage-Play Act, as the difficulty appeared to be to define what was *not* a stage play. Lord Denman, Mr Justice Byles, and other eminent judges seemed to think that any song, action, or recitation that excited the emotions might be pinned as a stage play, and that the old definition—"the representation of any action by a person (or persons) acting, and not in the form of narration"—could be supported in the then state of the law in any of the higher courts. The variety theatres on this occasion were encouraged by what had just occurred at the time in France. Napoleon III., acting under the advice of M. Michel Chevalier, passed a decree known as "La Liberté des Théâtres," which fixed the status of the Parisian and other music halls. Operettas, ballets of action, ballets, vaudevilles, pantomimes, and all light pieces were allowed, and the managers were no longer legally confined to songs and acrobatic performances. The report of the Select Committee of 1866, signed by the chairman, Mr (afterwards Viscount) Goschen, was in favour of granting the variety theatres and music halls the privileges they asked for, which were those enjoyed in France and other countries.

Parliamentary interference and the introduction of several private Bills in the House of Commons, which came to nothing, checked, if they did not altogether stop, the prosecutions. The variety theatres advanced in every direction in number and importance. Ballets grew in splendour and coherency. The lighting and ventilation, the comfort and decoration of the various "palaces" (as many of them were now called) improved, and the public, as usual, were the gainers. Population increased, and the six millions of 1730 had become forty millions (and more) in 1902. The same and only Act (25 Geo. II. c. 36), adequate or inadequate, still remained. London is defined as the "administrative county of London," and its area—the 20-miles radius—is mapped out. The Metropolitan Board of Works retired or was discharged, and the London County Council was created and has taken its place. The London County Council, with extended power over structures and structural alterations, acquired the licensing of variety theatres and music halls from the local magistrates (the Middlesex, Surrey, Tower Hamlets, and other magistrates) within the administrative county of London. The spread of so-called "sketches"—a kind of condensed drama or farce—in the variety theatres, and the action of the London County Council in trying to check the extension of refreshment licences to these establishments, with other grounds of discontent on the part of managers (individuals or "limited companies"), led to the appointment of a second Select Committee of the House of Commons in 1892 and the production of another Bluebook. The same ground was gone over, and the same objections were raised against a licensing authority which is elected by public votes, only exists for three years before another election is due, and can give no guarantee for the continuity of its judgments. The consensus of opinion (as in 1866) was in favour of a State official, responsible to Parliament—like the Home Office or the Board of Trade—the preference being given to the Lord Chamberlain and his staff, who know much about theatres and theatrical business. The chairman of the committee was the Hon. David Plunkett (afterwards Lord Rathmore), and the report in spirit was the same as the one of 1866. Three forms of licence were suggested: one for theatres proper, one for music halls, and one for concert rooms.

Though the rise and progress of the music hall and variety theatre interest is one of the most extraordinary facts of the last half of the 19th century, the business has little or no corporate organization, and there is nothing like a complete registration of the various properties throughout the United Kingdom. In London the "London Entertainments Protection Association," which has the command of a weekly paper called the *Music Hall and Theatre Review*, looks after its interests. The general figures placed in the hands of the chairman at a late meeting were sufficiently startling, but they are more likely to be under- than over-stated. In London alone five millions sterling of capital is said to be invested in these enterprises, employing 80,000 persons of all grades, and entertaining during the year about twenty-five millions of people. The annual applications for music licences in London alone are over 300.

Besides the "Canterbury" and the "Alhambra," London in 1902 had the "Palace" in Charing Cross Road, the "Empire" in Leicester Square, the "Pavilion" in Piccadilly Circus (occupying the finest site in western London), the "Hippodrome" in Cranbourn Street, the "Oxford" in Oxford Street, the "Royal" in Holborn, the "South London" in London Road, the "Paragon" at Mile End, the "Cambridge" at Shoreditch, the "Empire" at Bow, the "Bedford" at Camden Town, the "Metropolitan" in the Edgware Road, the "Granville" at Walham Green, the "London" at Shoreditch, the "Foresters'" at Bethnal Green, the "Tivoli" in the Strand, and other theatres of variety in every quarter, including the suburbs. The "provinces," as they are called, are not inclined to lag behind the metropolis, and in the North of England, at Blackpool, a coast town much frequented by "trippers," there are five amusement enterprises outside the regular theatres, concert halls, and gardens, that represent one million sterling. Some of these places may be over-capitalized, but after every allowance is made, enough remains to show that there the theatres proper have now to face a formidable and growing competition. Professional variety "artistes," with their own companies, go "on tour" from one place to another throughout the year. These "tours" are not always confined to the United Kingdom. They often extend to America and Australia, and to various parts of South Africa. Some few get to India and Ceylon, and many go to France, Hungary, Russia, Sweden, and Norway, and particularly to Germany and Holland. (J. HD.)

Muskegon, a city of Michigan, U.S.A., capital of Muskegon county, on the southern shore of Muskegon Lake, 5 miles from Lake Michigan, in the western part of the state, at an altitude of 589 feet. Muskegon Lake forms an excellent harbour, one of the best on the Great Lakes, with a depth at the entrance of 14 feet. The city has regular steamboat communication with Chicago, Milwaukee, and other lake ports, and a large commerce by water. Three railways enter the city, the Pere Marquette, the Grand Rapids and Indiana, and the Grand Trunk. It derives its water supply by pumping from Lake Michigan. Muskegon is a manufacturing city of much importance. In 1900 its manufacturing establishments numbered 200, with a total capital of $4,602,390, and 3235 hands. The products were valued at $5,097,059; of this sum $1,223,918 represented the value of the lumber and timber products. Population (1890), 22,702; (1900), 20,818, of whom 6236 were foreign-born and 23 negroes. The death-rate in 1900 was 12·2.

Musselburgh, a municipal and parliamentary burgh, at the eastern extremity of the coast-line of Midlothian, 5½ miles from Edinburgh, bisected by the river Esk, which divides Musselburgh proper from the more populous district of Fisherrow. While still retaining most of the venerable features of its High Street, the town has tended more and more to become a seaside suburb of Edinburgh, and has thus lost something of its old individuality. New streets and buildings are springing up, and water, drainage, and other improvements have been carried out. The golf-links, though injured by over-playing, are still a great attraction. Musselburgh joins with Leith in sending a member to Parliament. Population (1891), 8888; (1901), 11,704.

Mussoorie, or MASURI, a town and sanatorium of British India, in the Dehra Dun district of the North-West Provinces, 6600 feet above the sea. Population (1891), 10,086; municipal income (1897–98), Rs.70,890, the incidence of taxation being Rs.5:8 per head. It stands on a peak of one of the lower Himalayan ranges, amidst beautiful mountain scenery. It practically forms one station with Landaur, the convalescent depot for European troops, 7362 feet above the sea. Some distance off, on the road to Simla, is the cantonment of Chakrata, 7300 feet. Hitherto it has been approached by road from Saharanpur in the plains, but in 1900 the railway was opened to Dehra. There are numerous schools for Europeans, including St George's College, the Philander-Smith Institute, the Oak Grove School of the East Indian Railway, and several Church of England and Roman Catholic institutions. It has two English newspapers. The first brewery in India was established here in 1850. There are now two breweries, with an annual out-turn of 400,000 gallons; and a third, at Chakrata, with an out-turn of 73,000 gallons. It has botanical gardens, and is the summer headquarters of the Trigonometrical Survey.

Muthuswamy Aiyar, Sir T. (1832–1895), native Indian judge of the High Court of Madras, was born of poor parents in the village of Vuchuwadi, near Tanjore, on the 28th of January 1832. His widowed mother was forced by poverty to remove with Muthuswamy and his brother to Tiruvarar, where the former learnt Tamil, and soon set to work under the village accountant at a monthly salary of one rupee. About this time he lost his mother, whose memory he cherished with reverence and affection to the last. His duty took him to the court-house of the Tahasildar, Mr Naiken, who soon remarked his extraordinary intelligence and industry. There was an English school at Tiruvarar, where Muthuswamy managed to pick up an elementary knowledge of the English language. Mr Naiken then sent him to Sir Henry Montgomery's school at Madras, as a companion to his nephew, and there he won prizes and scholarships year after year. In 1854 he won a prize of 500 rupees offered to the students of the Madras Presidency by the Council of Education for the best English essay. This success brought him to the notice of Sir Alexander Arbuthnot and Mr Justice Holloway. He was offered help to proceed to England and compete for the civil service, but being a Brahmin and married, he declined to cross the ocean. Instead he entered the subordinate

Government service, and was employed in such various posts as school teacher, record keeper in Tanjore, and in 1856 deputy inspector of schools. At this time the Madras authorities instituted the examination for the office of pleaders, and Muthuswamy came out first in the first examination, even beating Sir T. Madhowrao, his senior by many years. Muthuswamy was then appointed in succession district munsiff at Tranquebar, deputy collector in Tanjore in 1859, sub-judge of south Canara in 1865, and a magistrate of police at Madras in 1868. While serving in the last post he passed the examination for the degree of bachelor of laws of the local university. He was next employed as a judge of the Madras Small Causes Court, until in 1878 he was raised to the bench of the High Court, which office he occupied with ability and distinction for over fifteen years, sometimes acting as the Chief Justice. He attended by invitation of the Viceroy the Imperial Assemblage at Delhi in 1877. In 1878 he received the honour of C.I.E. and in 1893 the K.C.I.E. was conferred on him. But he did not live long to enjoy this dignity, dying suddenly in 1895. Muthuswamy was too devoted to his official work to give much time to other pursuits. Still he took his full share in the affairs of the Madras University, of which he was nominated a fellow in 1872 and a syndic in 1877, and was well acquainted with English law, literature, and philosophy. He was through life a staunch Brahmin, devout and amiable in character, with a taste for the ancient music of India and the study of the Vedas and other departments of Sanskrit literature.

Mutsu Hito, MIKADO OR EMPEROR OF JAPAN (1852——), succeeded his father, Osahito, the former emperor, in 1867, and was crowned at Osaka in 1868. The country was then in a ferment owing to the concessions which had been granted to foreigners by the preceding shogun, Iemochi, who in 1854 concluded a treaty with Commodore Perry by which it was agreed that certain ports should be open to foreign trade. This convention gave great offence to the more conservative daimios, and on their initiative the mikado suddenly decided to abolish the shogunate. This resolution was not carried out without strong opposition. The reigning shogun, Hitotsubashi, yielded to the decree, but many of his followers were not so complaisant, and it was only by force of arms that the new order of things was imposed on the country. The main object of those who had advocated the change was to lead to a reversion to the primitive condition of affairs, when the will of the mikado was absolute and when the presence in Japan of the hated foreigner was unknown. But the reactionary party was not to be allowed to monopolize revolutions. To their surprise and discomfiture, the powerful daimios of Satsuma and Chōshū suddenly declared themselves to be in favour of opening the country to foreign intercourse, and of adopting many far-reaching reforms. With this movement Mutsu Hito was cordially in agreement, and of his own motion he invited the foreign representatives to an audience on 23rd March 1868. As Sir Harry Parkes, the British minister, was on his way to this assembly, he was attacked by a number of two-sworded *samurai*, who, but for his guard, would doubtless have succeeded in assassinating him. The outrage was regarded by the emperor and his ministers as a reflection on their honour, and they readily made all reparation within their power. While these agitations were afoot, the emperor, with his advisers, was maturing a political constitution which was to pave the way to the assumption by the emperor of direct personal rule. As a step in this direction, Mutsu Hito transferred his capital from Kyôtô to Yedo, the former seat of the shoguns' government, and marked the event by renaming the city Tôkyô, or Eastern Capital. In 1869 the emperor paid a visit to his old capital, and there took as his imperial consort a princess of the house of Ichijo. In the same year Mutsu Hito bound himself by oath to institute certain reforms, the first of which was the establishment of a deliberative assembly. In this onward movement he was supported by the majority of the daimios, who in a supreme moment of patriotism surrendered their estates and privileges to their sovereign. This was the death-knell of the feudalism which had existed for so many centuries in Japan, and gave Mutsu Hito the free hand which he desired. A centralized bureaucracy took the place of the old system, and the nation moved rapidly along the road of progress. Everything European was eagerly adopted, even down to frock-coats and patent-leather boots for the officials. Torture was abolished (1873), and a judicial code, adapted from the Code Napoléon, was authorized. The first railway—that from Yokohama to Tôkyô—was opened in 1872; the European calendar was adopted, and English was introduced into the curriculum of the common schools. In all these reforms Mutsu Hito took a leading part. But it was not to be expected that such sweeping changes could be effected without opposition, and thrice during the period between 1876 and 1884 the emperor had to face serious rebellious movements in the provinces. These he succeeded in suppressing; and even amid these preoccupations he managed to inflict a check on his huge neighbour the empire of China. As the Government of this state declared that it was incapable of punishing certain Formosan pirates for outrages committed on Japanese ships (1874), Mutsu Hito landed a force on the island, and, having inflicted chastisement on the bandits, remained in possession of certain districts until the compensation demanded from Peking was paid. The unparalleled advances which had been made by the Government were now held by the emperor and his advisers to justify a demand for the revision of the foreign treaties, and negotiations were opened with this object. They failed, however, and the consequent disappointment gave rise to a strong reaction against everything foreign throughout the country. Foreigners were assaulted on the roads, and even the Russian Cesarevitch, afterwards the Tsar Nicholas II., was attacked by would-be assassins in the streets of Tôkyô. A renewed attempt to revise the treaties in 1894 was more successful, and in that year Great Britain led the way by concluding a revised treaty with Japan. Other nations followed, and by 1901 all those obnoxious clauses suggestive of political inferiority had finally disappeared from the treaties. In the same year (1894) war broke out with China, and Mutsu Hito, in common with his subjects, showed the greatest zeal for the campaign. He reviewed the troops as they left the shores of Japan for Korea and Manchuria, and personally distributed rewards to those who had won distinction. In this, as in all matters, Mutsu Hito always placed himself in the van of his countrymen. He led them out of the trammels of feudalism; by his wise and progressive rule he lived to see his country advanced to the first rank of nations; and he was the first Oriental sovereign to form a defensive alliance with a first-rate European Power. He had several sons and daughters, his heir-apparent being Yoshi Hito (b. 31st August 1879), and he adopted the epithet of *Meiji*, or "Enlightened Peace," as the *Nengo* or title of his reign. The year 1902, according to the Japanese calendar, was the 35th year of Meiji.

Muttra, or MATHURA, a city and district of British India, in the Agra division of the North-West Provinces.

The city is on the right bank of the Jumna, 30 miles above Agra; it has a railway station. Population (1881), 57,724; (1891), 61,195; (1901), 59,574; municipal income (1897–98), Rs.61,225, mostly from octroi; incidence of taxation, 14 annas per head; registered death-rate (1897), 53 per thousand. The special cult of Krishna with which the neighbourhood is associated seems to be of comparatively late date. Much of its prosperity is due to the residence of a great family of Seths or native bankers, who were conspicuously loyal during the Mutiny. Temples and bathing stairs line the river bank. Most of the public buildings are of white stone, handsomely carved. There are an American mission, a Roman Catholic church, a museum of antiquities, a high school, thirteen printing-presses, and it is a cantonment for a native infantry regiment.

The district of MUTTRA has an area of 1441 square miles; population (1881), 671,690; (1891), 713,421; (1901), 763,221, showing an increase of 6 per cent. between 1881 and 1891, and of 7 per cent. between 1891 and 1901; average density, 529 persons per square mile. The land revenue and rates are Rs.17,38,808, the incidence of assessment being R.1 : 8 : 6 per acre; cultivated area (1896–97), 677,224 acres, of which 283,606 were irrigated from wells, &c., including 100,640 from Government canals; number of police, 2465; vernacular schools, 96, with 4880 pupils; registered death-rate (1897), 38·6 per thousand. The principal crops are millet, pulse, cotton, wheat, and indigo. There are 41 indigo factories, with an out-turn valued at Rs.2,52,000. The famine of 1878 was severely felt. The eastern half of the district is watered by the Agra canal, which is navigable, and the western half by branches of the Ganges canal. A branch of the Rajputana Railway, from Achnera to Hathras, crosses the district, and the proposed chord line of the East India, from Agra to Delhi, will traverse it from north to south. Besides Muttra city, the district also contains the holy places of Brindaban, Gobardhan, Gokul, and Mahaban, all associated with the cult of Krishna as a herdsman.

Muzaffar-ed-Dîn, SHAH OF PERSIA (1853–——), the second son of Shah Nasr-ed-Dîn, was born 25th March 1853. He was in due course declared *valî ahd*, or heir-apparent, and invested with the governorship of Azarbaijan, but on the assassination of his father in 1896 it was feared that his elder brother, the governor of Ispahan, might prove a dangerous rival, especially when it was remembered that Muzaffar-ed-Dîn had been recalled to Tehran by his father upon his failure to suppress a Kurd rising in his province. In fact, in early youth he had been a fanatical supporter of orthodox Islam, but his views had undergone a complete change under French influence at Tehran. All opposition, however, was satisfactorily obviated, and Muzaffar-ed-Dîn was duly enthroned 8th June 1896. On this occasion he announced the suppression of all purchase of civil and military posts, and then proceeded to remit in perpetuity all taxes on bread and meat, thus lightening the taxation on food, which had caused the only disturbances in the last reign. That his character had become stronger with maturity was shown by his firmness in repressing the fanatical outbreak against Christian Armenians at Kazoni in September 1899. In accordance with his long-expressed intention of visiting the Paris Exhibition of 1900, the Shah arrived 23rd July, and was conducted by President Loubet to the Palais des Souverains in the Bois de Boulogne. While residing there a dastardly attempt was made to assassinate him by an anarchist named François Salson, but he escaped without injury. (See also PERSIA.)

Muzaffargarh, a town and district of British India, in the Derajat division of the Punjab. The town is near the right bank of the river Chenab, and has a railway station. Population (1881), 2720; (1891), 3058; municipal income (1897–98), Rs.11,728.

The district of MUZAFFARGARH occupies the lower end of the Sind-Sagar Doab. Area, 3422 square miles; population (1881), 338,605; (1891), 381,095; (1901), 405,743, showing an increase of 12 per cent., due to the extension of irrigation, between 1881 and 1891, and of 6·5 per cent. between 1891 and 1901; average density, 119 persons per square mile. The land revenue and rates in 1897–98 were Rs.7,07,892, the incidence of assessment being Rs.0 : 6 : 8 per head; cultivated area, 472,358 acres, of which 359,025 were irrigated, including 294,194 from Government canals; number of police, 389; number of schools (1896–97), 174, attended by 3721 boys, being 9 per cent. of the boys of school-going age; death-rate (1897), 44 per thousand. The principal crops are wheat, pulse, rice, and indigo. The most important domestic animal is the camel. The district is crossed for 64 miles by the North-Western Railway, and the boundary rivers are navigable for 277 miles. These rivers also furnish numerous irrigation channels, originally constructed under native rule.

Muzaffarnagar, a town and district of British India, in the Meerut division of the North-West Provinces. The town is 790 feet above the sea, and has a station on the North-Western Railway. Population (1881), 15,080; (1891), 18,166; municipal income (1896–97), Rs.19,488, mostly derived from octroi; incidence of taxation, nearly 14 annas per head; registered death-rate (1897), 46·95 per thousand. There are a high school and one printing-press.

The district of MUZAFFARNAGAR has an area of 1658 square miles; population (1881), 758,444; (1891), 772,874; (1901), 877,984, showing an increase of only 2 per cent. between 1881 and 1891, and of 13·6 per cent. between 1891 and 1901; average density, 529 persons per square mile. The land revenue and rates are Rs.18,41,322, the incidence of assessment being R.1 : 8 : 7 per acre; cultivated area (1896–97), 627,348 acres, of which 310,522 were irrigated, including 202,026 from Government canals; number of police, 1860; vernacular schools, 133, with 4577 pupils; registered death-rate (1897), 31·8 per thousand. The principal crops are wheat, pulse, cotton, and sugar-cane. The district is watered by the Ganges and Eastern Jumna canals, and crossed by the North-Western Railway for 26 miles.

Muzaffarpur, a town and district of British India, in the Patna division of Bengal. The town is on the right bank of the Little Gandak river, and has a railway station. Population (1881), 42,460; (1891), 49,192; (1901), 45,499. It is a well-laid-out town, and is an important centre of trade, being on the direct route from Patna to Nepal. The high school had 448 pupils in 1896–97. It has a German mission, six printing-presses, and a club for Indians.

The district of MUZAFFARPUR has an area of 3003 square miles; population (1881), 2,582,060; (1891), 2,711,445; (1901), 2,746,009, showing an increase of 5 per cent. between 1881 and 1891, and of 1·2 per cent. between 1891 and 1901; average density, 914 per square mile, being exceeded in all India only by the neighbouring district of Saran. Classified according to religion, Hindus in 1891 numbered 2,378,168; Mahommedans, 332,906; Christians, 371, of whom 123 were Europeans. The land revenue and rates in 1897–98 were Rs.14,99,312; number of police, 509; number of boys at school (1896–97), 30,058, being 15·3 per cent. of the male population of school-going age, compared with 28 per cent. for the province generally; registered death-rate (1897), 32 per thousand. Indigo and opium are largely grown. There are 30 indigo factories, employing 40,000 persons, with an out-turn of 9000 maunds, valued at Rs.14,68,000. The district is traversed in several directions by the Tirhut system of the Bengal and North-Western Railway. It suffered from drought in 1873–74, and again in 1897–98.

Muztagh. See PAMIRS.

Mweru, a large lake of Eastern Central Africa, traversed by the Luapula or Upper Congo. It measures about 76 miles in length by some 25 in breadth, and is roughly rectangular, the axis running from south-south-west to north-north-east. At the south end a shallow bay extends to 9° 31′ S. East of this, and some miles farther north, the Luapula enters from a vast marsh inundated at high water. The southern portion of the lake is bordered by flat country, that to the east being forest-clad and abounding in rubber trees. In the northern half both shores form low cliffs, 100 to 200 feet high, while farther from the lake the country rises on the west to an extensive plateau, and on the east to a range of broken hills some

800 feet above the water-level. The Luapula leaves the lake at its north-west corner, making a sharp bend to the west before assuming a northerly direction. The northern shore was found by Mr Weatherley, by careful rope measurement, to be almost 19 miles in length. Besides the Luapula, the principal influent is the Kalungwizi, from the east. North-west of the Luapula mouth lies the island of Kilwa, about 8 miles in length, rising into plateaux 600 feet above the lake. Here the air is cool and balmy, the soil dry, with short turf and clumps of shady trees, affording every requirement for a sanatorium. The lake was reported by the Belgian Lieutenant Brasseur, in 1897, to be diminishing in size, but this probably referred to periodic fluctuations. Mweru was reached by Livingstone in 1867, but its western shore was first explored in 1890 by Mr Alfred Sharpe, who two years later effected its circumnavigation. The whole eastern shores from the Luapula entrance to its exit, together with Kilwa island, belong to British Central Africa; the western to the Congo Free State.

See Sharpe in *Proc. R.G.S.*, 1892, and *Geographical Journal*, vol. i., 1893. (E. He.)

Myaungmya, a district in the Irrawaddy division of Lower Burma, formed in 1896 out of a portion of the Bassein district. It has an area of 3005 square miles, and a population (1891) of 217,878, and (1901), 303,308, showing an increase of 39·2 per cent. and a density of 101 inhabitants to the square mile. In 1898–99 there were 844 villages, paying Rs.15,41,719 revenue. Of the population, 203,319 were Buddhists and Jains, 1787 Mahommedans, 569 Hindus, and 12,203 Christians, of whom 12,111 were natives, mostly Karens. There were also 271 non-Christian Karens. Of the total area of 1,923,200 acres, 432,682 were cultivated in 1898–99, 472,494 acres were not available for cultivation, and the cultivable area available, apart from fallow, was 898,968 acres. The total rainfall in 1898–99 was 118·82 inches. The chief town is Pantanaw, which had in 1891 a population of 6030. Myaungmya, which is a municipal town, had 2162 inhabitants in 1891.

Mycenaean Civilization.—"Mycenaean" is a convenient epithet for a certain phase of a prehistoric civilization, which as a whole is often called "Aegean." It owes its vogue to the fame of Henry Schliemann's discovery at Mycenae in 1876, but is not intended to beg the open question as to the origin or principal seat of the Bronze Age culture of the Greek lands.

The site of Mycenae itself was notorious for the singular and massive character of its ruins, long before Schliemann's time. The great curtain wall and towers of the citadel, of mixed Cyclopean, polygonal, and ashlar construction, and unbroken except on the south cliff, and the main gate, crowned with a heraldic relief of lionesses, have never been hidden; and though much blocked with their own ruin, the larger dome-tombs outside the citadel have always been visible, and remarked by travellers. But since these remains were always referred vaguely to a "Heroic" or "proto-Hellenic" period, even Schliemann's preliminary clearing of the gateway and two dome-tombs in 1876, which exposed the engaged columns of the façades, and suggested certain inferences as to external revetment and internal decoration, would not by itself have led any one to associate Mycenae with an individual civilization. It was his simultaneous attack on the unsearched area which was enclosed by the citadel walls, and in 1876 showed no remains above ground, that led to the recognition of a "Mycenaean civilization." Schliemann had published in 1868 his belief that the Heroic graves mentioned by Pausanias (ii. 16) lay within the citadel of Mycenae, and now he chose the deeply-silted space just within the gate for his first sounding. About 10 feet below the surface his diggers exposed a double ring of upright slabs, once capped with cross slabs, and nearly 90 feet in diameter. Continuing downwards through earth full of sherds and other débris, whose singularity was not then recognized, the men found several sculptured limestone slabs, showing subjects of war or the chase, and scroll and spiral ornament rudely treated in relief. When, after some delay, the work was resumed, some skeletons were uncovered lying loose, and at last, 30 feet from the original surface, an oblong pit-grave was found, paved with pebbles, and once roofed, which contained three female skeletons, according to Schliemann, "smothered in jewels." A few feet to the west were presently revealed a circular altar, and beneath it another grave with five corpses, two probably female, and an even richer treasure of gold. Three more pits came to light to the northward, each adding its quota to the hoard; and then Schliemann, proclaiming that he had found Atreus and all his house, departed for Athens. But his Greek ephor, clearing out the rest of the precinct, came on yet another grave and some gold objects lying loose. Altogether there were nineteen corpses in six pits, buried, as the grave furniture showed, at different times, but all eventually included in a holy ring.

These sepulchres were richer in gold than any found elsewhere in the world, a fact which led to an absurd attempt to establish their kinship with the later and only less golden burials of Scyths or Kelts. The metal was worked up into heavy death-masks and lighter breastplates, diadems, baldrics, pendants, and armlets, often made of mere foil, and also into goblets, hair-pins, rings engraved with combats of men and beasts, miniature balances, and an immense number of thin circular plaques and buttons with bone, clay, or wooden cores. Special mention is due to the inlays of gold and niello on bronze dagger-blades, showing spiral ornament or scenes of the chase, Egyptian in motive, but non-Egyptian in style; and to little flat models of shrine-façades analogous to those devoted to Semitic pillar-worship. The ornament on these objects displayed a highly developed spiraliform system, and advanced adaptation of organic forms, especially octopods and butterflies, to decorative uses. The shrines, certain silhouette figurines, and one cup bear moulded doves, and plant forms appear inlaid in a silver vessel. The last-named metal was much rarer than gold, and used only in a few conspicuous objects, notably a great hollow ox-head with gilded horns and frontal rosette, a roughly modelled stag, and a cup, of which only small part remains, chased with a scene of nude warriors attacking a fort. Bronze swords and daggers and many great caldrons were found, with arrow-heads of obsidian, and also a few stone vases, beads of amber, intaglio gems, sceptre heads of crystal, certain fittings and other fragments made of porcelain and paste, and remains of carved wood. Along with this went much pottery, mostly broken by the collapse of the roofs. It begins in grave 4 (Fig. 1), with a dull painted ware, which we now know as late "proto-Mycenaean," and it develops into a highly-glazed fabric, decorated with spiraliform and marine schemes in lustrous paint, and showing the typical forms, false-mouthed amphorae and long-footed vases, now known as distinctively Mycenaean. The loose objects found outside the circle include the best intaglio ring from this site, admirably engraved with a cult scene, in which women clad in flounced skirts are chiefly concerned, and the worship seems to be of a sacred tree. In houses south of the circle occurred some goldsmiths' moulds, which supply indubitable evidence of native productivity, many rude painted idols in terra-cotta, and (it is said) the fragments of a most notable vase, decorated with armed warriors in a debased style approaching the later "Dipylon" manner.

This treasure as a whole was admitted at once to be far too highly developed in technique and ornament, and too individual in character, to belong, as the lionesses over the gate used to be said to belong, merely to a first stage in Hellenic art. It preceded in time the classical culture of the same area; but, whether foreign or native, it was allowed to represent a civilization that was at its acme and practically incapable of further development. So the bare fact of a great prehistoric art-production, not strictly Greek, in Greece came to be accepted without much difficulty. But before describing how its true relations were unfolded thereafter, it may be mentioned that the site of Mycenae had yet much to reveal after Schliemann left it. Ten years later the Greek Archæological Society resumed exploration there, and M. Tsountas, probing the summit of the citadel, hit upon and opened out a fragment of a palace with hearth of stucco, painted with geometric design, and walls adorned with frescoes of figure subjects, armed men and horses. An early Doric temple was found to have been built over this palace, a circumstance which disposed for ever of the later dates proposed for Mycenaean objects. Subsequently many lesser structures were cleared in the east and south-west of the citadel area, which yielded commoner vessels of domestic use, in pottery, stone, and bronze, and some more painted objects, including a remarkable fragment of stucco, which shows human ass-headed figures in procession, a tattooed head, and a plaque apparently showing the worship of an aniconic deity.

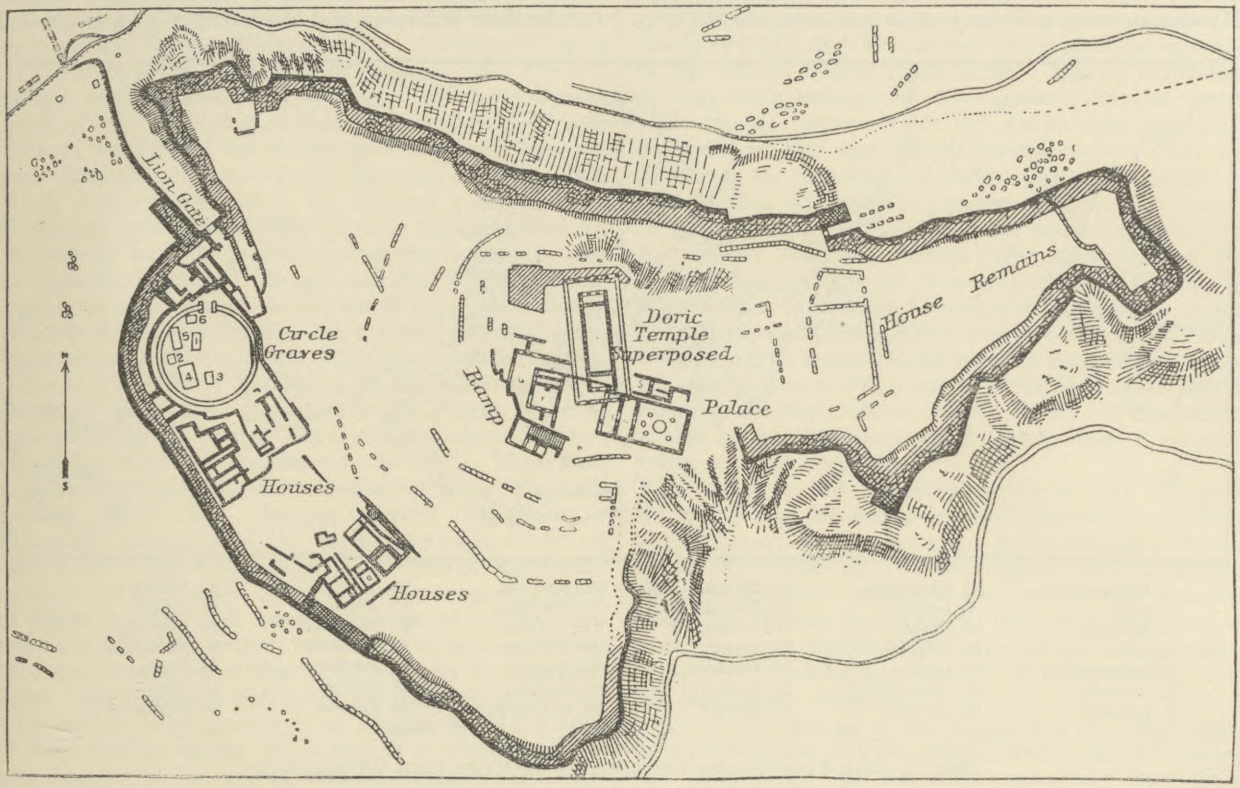

FIG. 1.—PLAN OF THE CITADEL OF MYCENAE.

(Based on a plan in Schuckhardt's "Schliemann's Excavations.")

From the immense variety of these domestic objects more perhaps has been learned as to the affinities of Mycenaean civilization than from the citadel graves. Lastly, a most important discovery was made of a cemetery west of the citadel. Its tombs are mostly rock-cut chambers, approached by sloping *dromoi;* but there are also pits, from one of which came a remarkable ivory mirror handle of Oriental design. The chamber graves were found to be rich in trinkets of gold, engraved stones, usually opaque, vases in pottery and stone, bronze mirrors and weapons, terra-cottas and carved ivory; but neither they nor the houses have yielded iron except in very small quantity, and that not fashioned into articles of utility. The presence of fibulae and razors supplied fresh evidence as to Mycenaean fashions of dress and wearing of the hair, and a silver bowl, with male profiles inlaid in gold, proved that the upper lip was sometimes shaved. All the great dome-tombs known have been cleared, but the process has added only to our architectural knowledge. The tomb furniture had been rifled long ago. Part of the circuit of a lower town has been traced, and narrow embanked roadways conducted over streams on Cyclopean bridges lead to it from various quarters.

The abundance and magnificence of the circle treasure had been needed to rivet the attention and convince the judgment of scholars, slow to reconstruct *ex pede Herculem.* But there had been a good deal of evidence available previous to 1876, which, had it been collated and seriously studied, might have greatly discounted the sensation that the citadel graves eventually made. Although it was recognized that certain tributaries, represented, *e.g.*, in the 18th Dynasty tomb of Rekhmara at Egyptian Thebes, as bearing vases of peculiar form, were of Mediterranean race, neither their precise habitat nor the degree of their civilization could be determined while so few actual prehistoric remains were known in the Mediterranean lands (Fig. 2). Nor did the Mycenaean objects which were lying obscurely in museums in 1870 or thereabouts provide a sufficient test of the real basis underlying the Hellenic myths of the Argolid, the Troad, and Crete, to cause these to be taken seriously. Both at Sèvres and at Neuchâtel Aegean vases have been exhibited since the 'thirties, the provenience in the one case being Phylakopi in Melos, in the other case Cephalonia. Ross, by his explorations in the Greek islands from 1835 onwards, called attention to the early intaglios, now known as *inselsteine;* but it was not till 1878 that Newton demonstrated these to be no strayed Phoenician products. In 1866 primitive structures were discovered in the island of Therasia by quarrymen extracting pozzolana for the Suez Canal breakwaters; and when this discovery was followed up in 1870 on the neighbouring Santorin by representatives of the French School at Athens, much pottery of a class now known immediately to precede the typical Mycenaean ware, and many stone and metal objects, were found and dated by the geologist Fouqué, somewhat arbitrarily, to 2000 B.C., by consideration of the superincumbent eruptive stratum. Meanwhile, in 1868, tombs at Ialysos in Rhodes had yielded to M. Biliotti many fine painted vases of styles which came later to be called the third and fourth Mycenaean; but these, bought by Mr Ruskin, and presented to the British Museum, excited less attention than they deserved, being supposed to be of some local Asiatic fabric of uncertain date. Nor was a connexion immediately detected between them and the objects found four years later in a dome-tomb at Menidi in Attica and a rock-cut "bee-hive" grave near the Argive Heraeum.

Even Schliemann's first excavations at Hissarlik in the Troad did not surprise those familiar equally with Neolithic settlements and Hellenistic remains. But the "Burnt City" of the second stratum, revealed in 1873, with its fortifications and vases, and the hoard of gold, silver, and

bronze objects, which the discoverer connected with it (though its relation to the stratification is doubtful still), made a stir, which was destined to spread far outside the narrow circle of scholars when in 1876 Schliemann lighted on the Mycenae graves. Like the "letting in of water," light at once poured in from all sides on the prehistoric period of Greece. It was established that the character of both the fabric and the decoration of the Mycenaean objects was not that of any well known art. A wide range in space was proved by the identification of the *inselsteine* and the Ialysos vases with the new style, and a wide range in time by collation of the earlier Theraean and Hissarlik discoveries. A relation between objects of art described by Homer and the Mycenaean treasure was generally recognized, and a correct opinion prevailed that, while certainly posterior, the civilization of the *Iliad* was reminiscent of the great Mycenaean period. Schliemann got to work again at Hissarlik in 1878, and greatly increased knowledge of the lower strata, but did not recognize the Mycenaean remains in his "Lydian" city of the sixth stratum; but by laying bare in 1884 the upper remains on the rock of Tiryns, he made a contribution to the science of domestic life in the Mycenaean period, which was amplified two years later by Tsountas's discovery of the Mycenae palace. From 1886 dates the finding of Mycenaean sepulchres outside the Argolid, from which, and from the continuation of Tsountas's exploration of the buildings and lesser graves at Mycenae, a large treasure, independent of Schliemann's princely gift, has been gathered into the National Museum at Athens. In that year were excavated dome-tombs, most already rifled, at Arkina and Eleusis in Attica, at Dimini near Volo in Thessaly, at Kampos on the west of Mount Taygetus, and at Maskarata in Cephalonia. The richest grave of all was explored at Vaphio in Laconia in 1889, and yielded, besides many gems and miscellaneous goldsmiths' work, two golden goblets chased with scenes of bull-hunting. In 1890 and 1893 Stacs cleared out more homely dome-tombs at Thoricus in Attica; and other graves, either rock-cut "bee-hives" or chambers, were found at Spata and Aphidna in Attica, in Aegina and Salamis, at the Heraeum and Nauplia in the Argolid, near Thebes and Delphi, and lastly not far from the Thessalian Larissa.

But discovery was far from being confined to the Greek mainland and its immediate dependencies. The limits of the prehistoric area were pushed out to the central Aegean islands, to Antiparos, to Ios, to Amorgos, to Syros and Siphnos, all of which are singularly rich in evidence of the pre-Mycenaean period. The series of Syran built graves, containing crouching corpses, is the best and most representative that is known in the Aegean. Melos, long marked as containing early objects, but not systematically excavated until taken in hand by the British School at Athens in 1896, shows at Phylakopi remains of all the Aegean periods. Crete has been proved by the tombs of Anoja and Erganos, by the excavations on the site of Knossos begun in 1878 by M. Minos Kalokairinos and resumed with startling success in 1900 by Messrs Evans and Hogarth, and by those in the Dictaean Cave and at Phaestos, Gournia, Zakro, and Palaeokastro, to be prolific in remains of the prehistoric periods out of all proportion to remains of classical Hellenic culture. A map of Cyprus in the later Bronze Age now shows more than five-and-twenty settlements in and about the Mesaoréa district alone, of which one, that at Enkomi, near the site of later Salamis, has yielded the richest gold treasure found outside Mycenae. Half round the outermost circle to which Greek influence attained in the classical period remains of the same prehistoric civilization have been happened on. M. Chantre in 1894 picked up lustreless ware, like that of Hissarlik, in central Phrygia, and the English archæological expeditions sent subsequently into north-western Anatolia have never failed to bring back "Aegean" specimens from the valleys of the Rhyndacus and Sangarius, and even of the Halys. In Egypt Mr Petrie found painted sherds of Cretan style at Kahun in the Fayum in 1887, and farther up the Nile, at Tell el-Amarna, chanced on bits of not less than 800 Aegean vases in 1889. There have now been recognized in the collections at Gizeh, Florence, London, Paris, and Bologna several Egyptian or Phoenician imitations of the Mycenaean style to set off against the many debts which the centres of Mycenaean culture owed to Egypt. Two Mycenaean vases were found at Sidon in 1885, and many fragments of Aegean, and especially Cypriote, pottery have been turned up during the recent excavation of sites in Philistia by the Palestine Fund. South-eastern Sicily has proved, ever since Orsi excavated the Sikel cemetery near Lentini in 1877, a mine of early remains, among which appear in regular succession Aegean fabrics and motives of decoration from the period of the second stratum at Hissarlik down to the latest Mycenaean. Sardinia has Mycenaean sites, *e.g.*, at Abini near Teti; and Spain has yielded objects recognized as Mycenaean from tombs near Cadiz, and from Saragossa.

The results of three excavations will especially serve as rallying points and supply a standard of comparison. After Schliemann's death, Dörpfeld returned to Hissarlik, and recognized in the huge remains of the sixth stratum, on the southern skirts of the citadel mound, a city of the same period as Mycenae at its acme. Thus we can study there remains of a later stage in one process of development superposed on earlier remains, after an intervening period. The links there missing are, however, apparent at Phylakopi in Melos, excavated systematically from 1896 to 1899. Here buildings of three main periods appear one on another. The earliest overlie in one spot a deposit of sherds of the most primitive type known in the Aegean and found in the earliest cist-graves. The second and third cities rise one out of the other without evidence of long interval. A third and more important site than either, Knossos in Crete, awaits fuller publication. Here are ruins of a great palace, mainly of two periods. Originally constructed about 2000 B.C., it was almost entirely rebuilt at the acme of the Mycenaean Age, but substructures and other remains of the earlier palace underlie the later. The latter was built round a great central court, and was more than one storey high. Stairways and galleries and fragments of the upper storeys remain, chiefly on the east side. The palace was not fortified. Numerous store galleries, sunken baths, and a room with stone throne and seats are the main architectural features. Much has been recovered of internal decoration in fresco, painted plaster relief-work, and carved stone; and great variety of furniture in all materials, including objects which supply links with Egypt.

Since recent researches, some of whose results are not yet published, have demonstrated that in certain localities, for instance, Cyprus, Crete, and most of the Aegean islands, where Mycenaean remains were not long ago supposed to be merely sporadic, they form in fact a stratum to be expected on the site of almost every ancient Aegean settlement, we may safely assume that Mycenaean civilization was a phase in the history of all the insular and peninsular territories of the east Mediterranean basin. Into the continents on the east and south we have no reason to suppose that its influence penetrated either very widely or very strongly. There has been much excavation in Egypt, but not half-a-dozen sites have yielded the characteristic pottery, not even sites near the Levant sea as thoroughly explored as Naucratis and Daphnae. About Syria and inland Asia Minor we must speak with more reserve; but all research made hitherto suggests that there, as in Sicily, the peculiar products of the Mycenaean culture were sporadic importations. As to Thrace and Macedonia, as well as the Cyrenaic coast of Africa, there is no good evidence as yet available.

The remains that especially concern us here belong to the later period illustrated by these discoveries, and have everywhere a certain uniformity. Some common influence spread at a certain era over the Aegean area and reduced almost to identity a number of local civilizations of similar origin but diverse development. Surviving influences of these, however, combined with the constant geographical conditions to reintroduce some local differentiation into the Mycenaean products.

The Neolithic Age in the Aegean has now been abundantly illustrated from the yellow bottom clay at Knossos, and its products do not differ materially from those implements and vessels with which man has everywhere sought to satisfy his first needs. The mass of the stone tools and weapons, and the coarse hand-made and burnished pottery, might well proceed from the spontaneous invention of each locality that possessed suitable stone and clay; but the common presence of flaked blades, arrowheads, and blunt choppers of an obsidian native, so far as is known, to Melos only, speaks of inter-communication even at this early period between many distant localities and the city whose remains have been unearthed at Phylakopi. The wide range of the peculiar cist-grave strengthens the belief that late Stone Age culture in the Aegean was not of sporadic development, and prepares us for a striking similarity in the succeeding ware with incised non-spiraliform geometric ornament which prevails over an area extending from Hissarlik to Sicily, and for the universality of a certain fiddle-shaped type of stone idol. Local divergence is, however, already apparent in the relative prevalence of certain forms; for example, a shallow bowl is common in Crete, but not in the Cyclades, while the *pyxis*, so common in the graves of Amorgos and Melos, has left little sign of itself in Crete; and from this point the further development of civilization in the Aegean area results in increasing differentiation. The Greek mainland has produced as yet very little of the earlier periods (the excavators of the Heraeum promise additions), but the primitive remains in the rest of the area may be divided into four classes of strong family likeness but distinct development.

The pottery supplies the best criterion, and will suffice for our end. We have no such comprehensive and certain evidence from other classes of remains. Except for the Great Treasure of Hissarlik, and the weapons in Cycladic graves, there have been found as yet hardly any metal products of the period. Of the few stone products, one class, the "island idols" already referred to, was obviously exported widely, and supplies an ill test either of place or date. There have not been discovered sufficiently numerous structures or graves to afford a basis of classification. Fortified towns have been explored in Melos, Siphnos, and the Troad, and a few houses in Aegina and Thera; but neither unaltered houses nor tombs of undoubted primitive character have appeared in Crete as yet, nor elsewhere than in the Cyclad isles.

(1) Crete follows up the geometric incised ware with a painted geometric fabric developed out of it. This is made on the wheel, and covered with dull glaze, mostly fired black to dull red, on which colour is applied. In fabric, form, and decoration it quickly develops so marked an individuality that, but for the predominance of certain peculiar vase-shapes found also in the Cyclades, it would not readily be known for an Aegean product at all. The walls of the vessels are often reduced to a metallic egg-shell consistency, and both the forms and the treatment of the clay surface are imitated with extraordinary fidelity from metallic, probably gold, fabrics, and the decoration, whether in sharply-moulded rings and protuberances, incrustation, white spotting, or hard geometric painted lines and conventional plant forms, owes its origin to the metallurgist. This ware, known as "Kamáres," from a cave near a village on the south-east of Mount Ida, where it was first observed, but apparently to be found always between the primitive and the Mycenaean strata in Crete, is singular in the field of ceramics, and must owe its fully developed character to some peculiar influence, perhaps to the impression made on a people which did not possess the precious metals by some imported gold or silver fabrics.

(2) If the ware of Crete shows the paramount influence of metal, that of the central Cyclades shows the influence of hard stone. There the geometric incised linear ornament is developed into incised curvilinear of an elaborate kind—an advance which potters elsewhere, not accustomed to an intractable material, could achieve only by paint. At present Syra has yielded the best examples, but early sites exist in the marble islands, Naxos and Paros, and also in Siphnos, and the origin of the Syran forms and decoration will probably be found elsewhere.

(3) The volcanic isles of the south-west, Thera and Melos, display the most orderly development of the art of working clay, unaffected by other materials, probably because good clay was readily procurable. Paint appears on the grey body clay of vessels found at very low levels, and curvilinear colour schemes slowly replace rectilinear. Not hampered by the traditions of workers in stone or metal, the Melian and Theraean potters are those that evolve the most suitable fabrics and shapes in earthenware, and earliest begin to adopt natural forms as motives of decoration. All kinds of vegetable schemes, most naturalistically treated, become characteristic of their school, and from those they pass to marine motives, fish, seaweeds, and the like, and finally to birds and even the human form.

(4) There remains the eastern Aegean, where vessels found in the Burnt City at Hissarlik, at one end, show strong affinity to those from early graves in Cyprus at the other. Here is a certain unmistakable Asiatic element. The use of the wheel and of slip and colour come in early, but the shapes develop towards the fantastic and grotesque, and the decoration makes no approach to nature. One would say that a race whose natural artistic capacity was free to develop in the western isles was either not itself present in the easternmost part of the area, or was quickly contaminated there by some strong alien influence. But such conjectures as to history are very hazardous, while not only has very little of the Anatolian coast been explored, but the earlier sites in the great Sporades islands are unknown.

Here are indubitably distinct lines of local development, but there persists, nevertheless, an equally indubitable common character, which both binds all together into one family of civilization and distinguishes all from other contemporary civilizations, for example, from those of the Nile or Mesopotamian valleys. To take one piece of evidence only. A certain form of beaked jug, called by German archæologists *schnabelkanne* (Fig. 3), is characteristic of the whole area from before the first introduction of the potter's wheel to the end of the period. The shape is so peculiar that reason revolts against the suggestion of spontaneous invention in divers places. It is found with the same inevitable certainty on Cretan sites as at Hissarlik.

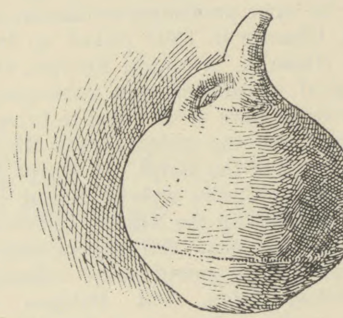

Fig. 3.—Schnabelkanne.

Above the strata, however, which contain these remains of local divergent development, there lies in all districts of the Aegean area a rich layer of deposit, whose contents show a rapid and marked advance in civilization, are essentially uniform, and have only subsidiary characteristics due to local influence or tradition. The civilization there represented is not of an origin foreign to the area. The germs of all its characteristic fabrics, forms, and motives of decoration exist in the underlying strata, though not equally in all districts, and the change which Mycenaean art occasions is not always equally abrupt. It is most reasonable to see in these remains the result of the action of some accidental influence which greatly increased the wealth and capacity of one locality in the area, and caused it to impose its rapidly developing culture on all the rest. The measure of the reaction that took place in divers localities thereafter depended naturally on the point to which local civilizations had respectively advanced in the pre-Mycenaean period.

The pottery, which supplies a voluminous commentary on the new period, is distinguished not only by the regularity of its forms, the purity of its clay, the smoothness of its slip, and the quality of its glaze, but especially by the general use of a peculiar paint, lustrous on properly prepared surfaces. Traces, however, of an earlier knowledge of that pigment have been found in Melos. Along with this ware, however, continued to exist ruder fabrics in common use. In the ware, found up to 1885 mainly at Mycenae, Furtwängler and Löschke distinguished four stages of development. At first greyish ware with dull white and red decoration in a paint only slightly lustrous, because applied on the body clay. To this early class belong, for example, the vases found by Schliemann in the fourth and fifth graves of the Mycenae circle. Next a class with black-brown decoration on a white slip, found in Thera and the Heraeum and Spata graves. Thirdly, the acme of the style, a thin yellow ware of very pure clay with hard slip and decorated with paint highly lustrous. This predominates at Mycenae, and prevails all over the area from Sicily to Cyprus. The decoration varies from brown through yellow to red, detail being often applied in white on a surface polished by hand; and it differs from the fourth and last class only in that its paint is more lustrous, its ground deeper in tint, and its glaze more brilliant. Of this fourth class Ialysos in Rhodes has supplied good examples.

As to the decorative motives in vogue there is less uniformity. The earlier Mycenaean vessels have curvilinear and generally spiraliform geometric schemes. These pass into naturalistic vegetable forms, and finally become in the finest typical vases almost exclusively marine—algae, octopods, molluscs, shells, in many combinations. Of the last kind is the most of the Rhodian ware, and

Fig. 4.—Bugelkanne.

that which lay thickly just below the surface at Phylakopi, and is not of Melian manufacture. On the native Cretan products with Mycenaean paint and slip vegetable schemes of strongly naturalistic character predominate, but marine motives are not absent. Everywhere animal, bird, and human forms are but seldom found. Man certainly appears very late, and in company with the Oriental motives which characterize the Spata objects. Insects, especially butterflies, become common, and when their antennae terminate in exquisite spirals decorative art is at the end of its progress.

The vase-forms become so numerous and various that only a reference to Furtwängler and Löschke's *Formentafel* will give any idea of them. All the later Greek shapes find their prototypes. One type alone must have special mention, since it is as characteristic of this period as the *schnabelkanne* of the earlier. This is the pseudamphora or *bugelkanne* (Fig. 4), with false neck and a small spout projecting from the body of the vase. Originally the neck was open, and the subsidiary spout was introduced for convenience of drinking; and the later evolution is so singular that it amounts to proof, if not of the common origin, at least of the common character of Mycenaean civilization. It is found everywhere in the area, made of various local clays, and it long survived into the "Geometric" or sub-Mycenaean period.

Not only in the continuous and universal commentary of painted earthenware, but in many other media, we have evidence of "Mycenaean" art, but varying in character according to the local abundance or variety of particular materials. We have reached an age when the artist had at his disposal not only terra-cotta, hard and soft stone, and wood, but much metal—gold, silver, lead, copper, bronze containing about 12 per cent. of tin alloy—as well as bone and ivory, and various compositions from soft lime plaster up to opaque glass. If it were not for the magnificent stone utensils, in the guise of lioness heads, triton shells, palm and lotus capitals, with spirals in relief and miniature shields for handles, which have come to light at Knossos, we should have supposed stone to have been a material used (except architecturally) only for such rude metallic-seeming reliefs as stood over the Mycenae gate and circle graves, or for heavy commonplace vases and lamps. We have discovered no large free statuary in the round in any material as yet, though part of a hand at Knossos speaks to its existence; but figurines in metal, painted terra-cotta, and ivory, replacing the earlier stone idols, are fairly abundant. For these bronze is by far the commonest medium, and two types prevail; a female with bell-like or flounced divided skirt, and hair coiled or hanging in tails, and a male, nude but for a loincloth. The position of the hands and legs varies with the skill of the artist, as in all archaic statuary. Knossos has revealed for the first time the Mycenaean artist's skill in painted plaster-relief (*gesso duro*). The life-size bull's head from the northern entrance of the palace and fragments of human busts challenge comparison triumphantly with the finest Egyptian work. And from the same site comes the fullest assurance of a high development of fresco-painting. Tiryns had already shown us a galloping bull on its palace wall, Mycenae smaller figures and patterns, and Phylakopi its panel of flying-fish; but Knossos is in advance of all with its processions of richly-dressed vase-carriers, stiff in general pose and incorrect in outline, but admirably painted in detail and noble in type; and its yet more novel scenes of small figures, in animated act of dance or ritual or war, irresistibly suggestive of early Attic vase-painting. Precious fragments of painted transparencies in rock-crystal have also survived, and both Mycenae and Knossos have yielded stone with traces of painted design. Moulded glass of a cloudy blue-green texture seems to belong to the later period, at which carved ivory, previously rare, though found even in pre-Mycenaean strata, becomes common. The Spata tomb in Attica alone yielded 730 pieces of the latter material, helmeted heads in profile, mirror-handles and sides of coffers of Orientalizing design, plaques with outlines of heraldic animals, and so forth. Articles in paste and porcelain of native manufacture, though often of exotic design, have been found most commonly where Eastern influence is to be expected; for instance, at Enkomi in Cyprus. But the glassy blue composition, known to Homer as κύανος, an imitation of lapis-lazuli, was used in architectural ornament at Tiryns.

But it is in precious metals, and in the kindred technique of gem-cutting, that Mycenaean art effects its most distinctive achievements. This is, as we have said, an age of metal. That stone implements had not entirely passed out of use is attested by the obsidian arrow-heads found in the circle graves, and the flint knives and basalt axes which lay beside vases of the full "Mycenaean" style at Cozzo del Pantano in Sicily. But they are survivals, unimportant beside the objects in copper, bronze, and precious metals. Iron has been found with remains of the period only as a great rarity. Some five rings, a shield boss, and formless lumps alone represent it at Mycenae. In the fourth circle grave occurred thirty-four vessels of nearly pure copper. Silver makes its appearance before gold, and is found moulded into bracelets and bowls, and very rarely into figurines. Gold is more plentiful. Beaten, it makes face-masks, armlets, pendants, diadems, and all kinds of small votive objects; drawn, it makes rings whose bezels are engraved with the burin; riveted, it makes cups; and overlaid as leaf on bone, clay, wood, or bronze cores, it adorns hundreds of discs, buttons, and blades. Next to Mycenae in wealth of this metal ranks Enkomi in Cyprus, and pretty nearly all the tombs of the later period have yielded gold, conspicuously that of Vaphio. From the town sites, *e.g.*, Phylakopi in Melos, and Knossos, it has disappeared almost entirely. Detached from the mass of golden objects which show primitive or tentative technique are a few of such elaborate finish and fineness of handiwork that it is hard to credit them to the same period and the same craftsmen. The Mycenae inlaid dagger-blades are famous examples, and the technical skill which beat out each of the Vaphio goblets in a single unriveted plate has never been excelled. The goldsmiths seem not to have used acids. They imitate the *cloisonnée* work of Egypt in pastes only, but reproduce very beautifully the soldered bead patterns of the same land. In general schemes of decoration metal follows pottery. Linear ornament passes through vegetable to organic forms, mainly marine, which are finally stylized into heraldic conventions.

The intaglios in stone, work of the same class of artist as the ring bezels, are fashioned oftenest out of agates, among semi-transparent materials, and jaspers, among opaque. But finer stones, such as amethyst, are not infrequent, and soft stones, like hæmatite and steatite, are also used. Rock-crystal seems to have been the most esteemed material. In shape the intaglios are lentoid, oval, or round. The subjects engraved are animals in various attitudes, single, combative, heraldically opposed, or held in human hands by the leg or neck. The lion, the bull, and various kinds of goat appear most often. Less commonly are seen human figures, men semi-nude, women in flounced skirts, sometimes seemingly in act of adoration before altars or aniconic divinities, sometimes engaged in combat. Rarer still are birds and fish and fantastic combinations like the griffon. On the commoner sort of stones we see geometric schemes, but very rarely vegetable. Impressions of gems bearing human portrait heads were found at Knossos, and the vast number of other clay impressions unearthed there and at Zakro confirms the theory that the use of these intaglios was primarily for sealing. They appear, from a Knossian fresco, to have been worn, among other places, on the wrist.

We are fortunate in possessing very considerable remains of all kinds of construction and structural ornament of the Mycenaean period. The great walls of Mycenae, of Tiryns (though perhaps due to an earlier epoch), and of the sixth layer at Hissarlik, show us the simple scheme of fortification—massive walls with short returns and corner towers, but no flank defences, approached by ramps or stairs from within and furnished with one great gate and a few small sally-ports. Chambers in the thickness of the wall seem to have served for the protection of stores rather than of men. The style of building is faced Cyclopean, tending towards polygonal, with ashlar coigns. The great central residences on the citadels are usually of what is known as the Megaron type; that is to say, they consist of an outer court, from which a vestibule is entered across a massive threshold placed between *antae*, and a second and smaller threshold admits to a paved and columned hall with central hearth. Besides this, both at Tiryns and Phylakopi, is found a second block of chambers enclosed by a distinct wall and entered from a common passage, which is conjectured to have been the residence of the harem. The Cretan palaces at Knossos and Phaestos, however, are of much more complicated plan. Remains of much architectural decoration have been found in these palaces—at Mycenae, frescoes of men and animals; at Knossos, frescoes of men, fish, and sphinxes, vegetable designs, painted reliefs, and rich conventional ornament, such as an admirably carved frieze in hard limestone; at Tiryns, traces of a frieze inlaid with lapis-lazuli glass, and also frescoes. The rough inner walls that appear now on these sites must once have looked very different. The smaller houses at Mycenae and Phylakopi consist of two or three rooms opening off a common passage, but at Zakro and Knossos more elaborate structures have been found containing ten or more rooms opening one from the other and from a central hall. Certain chambers at Knossos, paved and lined with gypsum, and two in Melos, have square central piers. These seem to have had a religious significance, and are possibly shrines devoted to pillar-worship. The houses of the great dead were hardly less elaborate. The "Treasury of Atreus" had a moulded façade with engaged columns in a sort of proto-Doric order and marble facing; and there is good reason to suppose that its magnificent vault was lined within with metal ornament or hanging draperies. The construction itself of this and the other masonry domes bespeaks skill of a high order. For lesser folk bee-hive excavations were made in the rock, and at the latest period a return was made apparently to the tetragonal chamber; but now it has a pitched or vaulted roof, and generally a short passage of approach whose walls converge overhead towards a pointed arch but do not actually meet. The corpses are laid on the floor, neither mummified nor cremated; but in certain cases they were possibly mutilated and "scarified," and the limbs were then enclosed in chest urns. There is evidence for this both in Crete and Sicily. But the order of burial which first made Mycenaean civilization known to the modern world continues singular. Similar shaft graves, whether contained within a circle of slabs or not, have never been found again.

The latest excavation has at last established beyond all cavil that the civilization which was capable of such splendid artistic achievement was not without a system of written communication. Thousands of clay tablets (many being evidently labels) and a few inscriptions on pottery from the palace at Knossos have confirmed Mr A. J. Evans's previous deduction, based on gems, masons' and potters' marks, and one short inscription on stone found in the Dictaean Cave, that more than one script was in use in the period. Most of the Knossos tablets are written in an upright linear alphabetic or syllabic character, often with the addition of ideographs, and showing an intelligible system of decimal numeration. Since many of the same characters have been found in use as potters' marks on sherds in Melos, which are of earlier date than the Mycenaean period, the later civilization cannot be credited with their invention. Other clay objects found at Knossos, as well as gems from the east of Crete, show a different system more strictly pictographic. This seems native to the island, and to have survived almost to historic times; but the origin of the linear system is more doubtful. No such tablets or sealings have yet been found outside Crete, and their writing remains undeciphered. The affinities of the linear script seem to be with the Asianic systems, Cypriote and Hittite, and perhaps with later Greek. The characters are obviously not derived from the Phoenician.

This Mycenaean civilization, as we know it from its remains, belongs to the Aegean area (*i.e.*, roughly the Greek), and to no other area with which we are at present acquainted. It is apparently not the product of any of the elder races which developed culture in the civilized areas to the east or south-east, much as it owed to those races. It would be easy to add to the singular vase-forms, script, lustrous paint, idols, gems, types of house and tomb, and so forth, already mentioned, a long list of Mycenaean decorative schemes which, even if their remote source lies in Egypt, Babylonia, or inner Anatolia, are absolutely peculiar in their treatment. But style is conclusive. From first to last the persistent influence of a true artistic ideal differentiates Mycenaean objects from the hieratic or stylized products of Egypt or Phoenicia. A constant effort to attain symmetry and decorative effect for its own sake inspires the geometric designs. Those taken from organic life show continual reference to the model and a "naturalistic grasp of the whole situation," which resists convention and often ignores decorative propriety. The human form is fearlessly subjected to experiment, the better to attain lightness, life, and movement in its portrayal. A foreign motive is handled with a breadth and vitality which renders its new expression practically independent. The conventional bull of an Assyrian relief was referred to the image of a living bull by the Knossian artist, and made to express his emotions of fear or wrath by the Vaphio goldsmith, the Cypriote worker in ivory mirror handles, or the "island-gem" cutter.

Since we have a continuous series of links by which the development of the characteristic Mycenaean products can be traced within the area back to very primitive forms, we can fearlessly assert that not only did the full flower of the Mycenaean civilization proper belong to the Aegean area, but also its essential origin. That it came to have intimate relations with other contemporary civilizations, Egyptian, Mesopotamian, perhaps "Hittite," and early began to contract a huge debt, especially to Egypt, is equally certain. Not to mention the certainly imported Nilotic objects found on Mycenaean sites, vases in grey granite and diorite, statuettes and fragments of porcelain and paste bearing hieroglyphic inscriptions and cartouches of Pharaonic personages, the later Aegean culture is deeply indebted to the Nile for forms and decorative motives. For example, the Cretan funerary urns are as Egyptian in shape as in their ornamental schemes of ducks chasing insects among the lotus plants. The same must be said of the Knossian frescoes of scenery. Only the treatment of the subjects on the Mycenaean dagger-blades is native; technique and subject are alike borrowed. The beautiful spiral and lotus pattern, of which the Orchomenos ceiling gives the finest presentation, finds its prototype in Egyptian, not Boeotian Thebes. And so forth, through a long list of Mycenaean products, none the less of home manufacture and, in virtue of treatment, distinct in their kind.

At what epoch did Aegean civilization reach its full development? It is little use to ask when it arose. A *terminus a quo* in the Neolithic Age can be dated only less vaguely than a geological stratum. But it is known within fairly definite limits when it ceased to be a dominant civilization. Nothing but derived products of sub-Mycenaean style falls within the full Iron Age in the Aegean. Bronze, among useful metals, accompanies almost alone the genuine Mycenaean objects, at Enkomi in Cyprus, as at Mycenae. This fact supplies a *terminus ad quem*, to which a date may be assigned at least as precise as scholars assign to the Homeric lays. For these represent a civilization spread over the same area and in process of transition from bronze to iron, and if they fall in the 9th century B.C., then the Mycenaean period proper ends a little earlier, at any rate in the west. It is possible, indeed probable, that in Asia Minor and Cyprus, where the descent of northern tribes about 1000 B.C., remembered by the Greeks as the "Dorian invasion," did not have any direct effect, the Mycenaean culture survived longer in something like purity, and passed by an uninterrupted process of development into the Hellenic; and even in Crete, where there was certainly a cataclysm, and in the Argolid, where art was temporarily eclipsed about the 10th century, earlier influence survived and came once more to the surface when peace was restored. Persistence of artistic influence under a new order, and differences in the artistic history of different districts widely sundered, have to be taken into account. The appearance, *e.g.*, of late Mycenaean objects in Cyprus, does not necessarily falsify the received Mycenaean dates in mainland Greece. For the main fact however, viz., the age of greatest florescence all over the area, a singular coincidence of testimony points to the period of the 18th Pharaonic Dynasty in Egypt, usually dated from the middle of the 18th to the end of the 16th century B.C. To this dynasty refer all the scarabs or other objects inscribed with royal cartouches (except an alabaster lid from Knossos, bearing the name of the earlier "Shepherd King," Khyan), as yet actually found with true Mycenaean objects, even in Cyprus. In a tomb of this period at Thebes was found a bronze patera of fine Mycenaean style. At Tell el-Amarna, the site of a capital city which existed only in the reign of Amenhotep IV., have been unearthed by far the most numerous fragments of true "Aegean" pottery found in Egypt; and of that singular style, which characterizes Tell el-Amarna art, the art of the Knossian frescoes is irresistibly suggestive. To the 18th and two succeeding dynasties belong the tomb-paintings which represent vases of Aegean form; and to these same dynasties Mr Petrie's latest comparisons between the fabrics, forms, and decorative motives of Egypt and Mycenae have led him. The lapse of time between the 18th and the 10th centuries is by no means too long, in the opinion of most competent authorities, to account for the changes which take place in Mycenaean art.

The question of race, which derives a special interest from the possibility of a family relation between the Mycenaean and the subsequent Hellenic stocks, is a controversial matter as yet. The light recently thrown on Mycenaean cult does not go far to settle the racial problem. The aniconic ritual, involving tree and pillar symbols of divinity, which prevailed at one period, also prevailed widely elsewhere than in the Aegean, and we are not sure of the divinity symbolized. Even if sure that it was the Father God, whose symbol alike in Crete and Caria is the *labrys* or double axe, we could not say if Caria or Crete were prior, and whether the Father be Aryan or Semitic or neither. When it is remembered that, firstly, knowing not a word of the Mycenaean language, we are quite ignorant of its affinities; secondly, not enough Mycenaean skulls have yet been recovered to establish more than the bare fact that the race was mixed and not wholly Asiatic; and thirdly, since identity of civilization in no sense necessarily entails identity of race, we may have to do not with one or two, but with many races—it will be conceded that it is more useful at present to attempt to narrow the issue by excluding certain claimants than to pronounce in favour of any one. The facial types represented not only on the Knossian frescoes, but by statuettes and gems, are distinctly non-Asiatic, and recall strongly the high-crowned brachycephalic type of the modern northern Albanians and Cretan hillmen. Of the elder civilized races about the Levantine area, the Egyptians, Assyrians, and Babylonians may be dismissed at once. We know their art from beginning to end, and its character is not at any period the same as that of Aegean art. As for the Phoenicians, for whom on the strength of Homeric tradition a strong claim has been put forward, it cannot be said to be impossible that some objects thought to be Mycenaean are of Sidonian origin, since we know little or nothing of Sidonian art. But the presumption against this Semitic people having had any serious share in Mycenaean development is strong, since, facial types apart, the only scripts known to have been used in the Mycenaean area and period are in no way affiliated to the Phoenician alphabet, and neither the characteristic forms nor the characteristic style of Phoenician art, as we know it, appear in Mycenaean products. The one thing of which recent research has assured us in this matter is this, that the *Keftiu*, represented in 18th Dynasty tombs at Thebes, were a "Mycenaean" folk, an island people of the northern sea. They came into intimate contact, both peaceful and warlike, with Egypt, and to them no doubt are owed the Aegean styles and products found on Nile sites. Exact parallels to their dress and products, as represented by Egyptian artists, appear in the work of Cretan artists; and it is now generally accepted that the *Keftiu* were "Mycenaeans" of Crete at any rate, whatever other habitat they may have possessed.

As to place of origin, central Europe or any western or northern part of the continent is out of the question. Mycenaean art is shown by various remains to have moved westwards and northwards, not *vice versâ*. It arose within the Aegean area, in the Argolid as some, *e.g.*, the Heraeum excavators, propose, or Crete, the Cyclades, or Rhodes; or, if outside, then the issue is narrowed for practical purposes to a region about which we know next to nothing as yet, northern Libya, and to Asia Minor. So far as the Mycenaean objects themselves testify, they point to a progress not from south or west, but from east. In the western localities, notably Crete and Mycenae, we have more remains of highly developed Mycenaean civilization, but less of its early stages than elsewhere. Nothing in the Argolid, but much in the Troad, prepares us for the Mycenaean metallurgy. The appearance of Mycenaean forms and patterns is abrupt in Crete, but graduated in other islands, especially Thera and Melos. The Cretan linear script seems to be of "Asianic" family, and to be inscribed in Melos on sherds of earlier date than its appearance at Knossos. Following Mycenaean development backwards in this manner, we seem to tend towards the Anatolian coasts of the Aegean, and especially the rich and little-known areas of Rhodes and Caria.

It does not advance seriously the solution of the racial problem to turn to Greek literary tradition. Now that we are assured of the wide range and the long continuance of the influence of Mycenaean civilization, overlapping the rise of Hellenic art, we can hardly question that the early peoples whom the Greeks knew as Pelasgi, Minyae, Leleges, Danai, Carians, and so forth, shared in it. But were they its authors? and who, after all, were they themselves? The Greeks believed them their own kin, but what value are we to attach to the belief of an age to which scientific ethnology and archæology were unknown? Nor is it useful to select traditions, *e.g.*, to accept those about the Pelasgi, and to override those which connect the Achaeans equally closely with Mycenaean centres. We are gradually learning that the classical Hellene was of no pure race, but the result of a blend of several racial stocks, into which those pre-existing in his land can hardly fail to have entered; and if we have been able to determine that Mycenaean art was distinguished by just that singular quality of idealism which is of the essence of the art which succeeded it in the same area (whatever be the racial connexion), it can scarcely be doubted in reason that Mycenaean civilization was in some sense the parent of the later civilization of Hellas. In fact, now that the Mycenaean remains are no longer to be regarded as isolated phenomena on Greek soil, but are seen to be intimately connected on the one hand with a large class of objects which carry the evolution of civilization in the Aegean area itself back to the Stone Age, and on the other with the earlier products of Hellenic development, the problem is no longer purely one of antiquarian ethnology. We ask less what race was so greatly gifted, than what geographical or other circumstances will account for the persistence of a certain peculiar quality of civilization in the Aegean area.

Myelat, a division of the southern Shan States of Burma, including sixteen states, none of any great size, with a total area of 3723 square miles. The name properly means "the unoccupied country," but it has been occupied for many centuries. All central Myelat and great parts of the northern and southern portions consist of rolling grassy downs quite denuded of jungle. It has a great variety of different races, Taungthus and Danus being perhaps the most numerous. They are all more or less hybrid races. The chiefs of the Myelat are known by the Burmese title of *Ngwekunhmu*, *i.e.*, chiefs paying their revenue in silver. The amount paid by the chiefs to the British Government is Rs.99,567. The largest state, Loi Lông, has an area of 1600 square miles, a great part of which is barren hills. The smallest, Nam Hkon, has no more than 4 square miles. The majority of the states have less than 100 square miles. Under British administration the chiefs have powers of a magistrate of the second class. The chief cultivation besides rice is sugar-cane, and considerable quantities of crude sugar are made and exported.

Myers, Frederic William Henry (1843–1901), English poet and essayist, son of Frederic Myers of Keswick—author of *Lectures on Great Men* (1856) and *Catholic Thoughts* (first collected 1873), a book marked by a most admirable prose style—was born at Keswick, Cumberland, on the 6th of February 1843, and educated at Cheltenham and Trinity College, Cambridge, where he won numerous honours, and in 1865 was appointed classical lecturer. He had no love for teaching, which he soon discontinued, but he took up his permanent abode at Cambridge in 1872, when he became a school inspector under the Education Department. Meanwhile he published, in 1867, an unsuccessful essay for the Seatonian prize, a poem entitled *St Paul*, which met at the hands of the general public with a success that would be difficult to explain, for it lacks sincerity, and represents views which the writer rapidly outgrew. It was followed by small volumes of collected verses in 1870 and 1882: both are marked by a flow of rhetorical ardour which culminates in a poem of real beauty, "The Renewal of Youth," in the 1882 collection. His best verse is in heroic couplets. Myers is more likely to be remembered by his two volumes of *Essays, Classical and Modern* (1883). The essay on *Virgil*, by far the best thing he ever wrote, represents the matured enthusiasm of a student and a disciple to whom the exquisite artificiality and refined culture of Virgil's method were profoundly congenial. Next to this in value is the carefully wrought essay on *Ancient Greek Oracles* (this had first appeared in *Hellenica*). Scarcely less delicate in phrasing and perception, if less penetrating in insight, is the monograph on *Wordsworth* (1881) for Mr John Morley's "English Men of Letters." In 1882, after several years of inquiry and discussion, Myers took the lead among a small band of explorers (including the Sidgwicks and Mr Hodgson, Mr Gurney, and Mr F. Podmore), who founded the society for Psychical Research. He continued for many years to be the mouthpiece of the society, a position for which his *perfervidum ingenium*, still more his abnormal fluency and alertness, admirably fitted him. His proficiency in the neo-hermeneutic jargon evolved by the society excited the admiration of all who frequented the psychical meetings in Westminster town hall. He contributed greatly to the coherence of the society by steering a mid-course between extremes (the extreme sceptics on the one hand, and the enthusiastic spiritualists on the other), and by sifting and revising the cumbrous mass of *Proceedings*, the chief concrete results being the two volumes of *Phantasms of the Living* (1886). Like many theorists, he had a faculty for ignoring hard facts, and in his anxiety to generalize plausibly upon the alleged data, and to hammer out striking formulæ, his insight into the real character of the evidence may have left something to be desired. His long series of papers on *Subliminal Consciousness*, the results of which were embodied in a posthumous work called *Human Personality and its Survival of Bodily Death*, constitute his own chief contribution to psychical theory, and this, as he himself would have been the first to admit, was little more than provisional. The last work published in his lifetime was a small collection of essays, *Science and a Future Life* (1893). He died at Rome on 17th January 1901, but was buried in his native soil, at Keswick. (T. SE.)

Myingyan, a district in the Meiktila division of Upper Burma. It lies in the valley of the Irrawaddy, to the south of Mandalay, on the east bank of the river. Area, 3139 square miles. Population (1891), 351,861; (1901), 357,117, showing an increase of 1·49 per cent. and a density of 113 inhabitants to the square mile. There were 868 villages in 1898–99, paying Rs.6,52,057 revenue. The greater part of the district is flat, especially to the north and along the banks of the Irrawaddy. Inland the country rises in gently undulating slopes. The most noticeable feature is Popa hill, an extinct volcano, in the south-eastern corner of the district. The highest peak is 4962 feet above sea-level. The climate is dry and healthy, with high south winds from March till September. The total rainfall in 1898–99 was 35·28 inches, which was slightly above the average. The highest shade reading was 106° F. in May, and the lowest reading in the cold weather a little over 70°. The ordinary crops are millet, sesamum, cotton, maize, paddy, gram, and a great variety of peas and beans. The district as a whole is not well watered, and most of the old irrigation tanks had fallen into disrepair before the annexation. There are no forests, but a great deal of low scrub in the district. The lacquer ware of Nyaung-u and other villages near Pagan is noted throughout Burma.

The population was classified as follows in 1891:—Buddhists and Jains, 348,667; Hindus, 1386; Mahommedans, 1213; Christians, 595. A considerable number of Chinese inhabit Myingyan and others of the larger villages. The net area cropped during 1898–99 was 251,190 acres, and 831,134 acres remained available for cultivation, while there were 276,473 acres of fallow. 650,000 acres are uncultivable out of the total acreage of 2,008,797. The headquarters town, MYINGYAN, stands on the Irrawaddy, and had a population in 1891 of 19,790. It is the terminus of the branch railway through Meiktila to the main line from Mandalay to Rangoon. The steamers of the Irrawaddy Flotilla Company also call here.

Myitkyina, the most northerly of the districts of Upper Burma in the Mandalay division. It was separated from the Bhamo district in 1895. The district is cut up into strips by comparatively low parallel ranges of hills running in a general way north and south. The chief plain is that of Myitkyina, covering some 600 square miles. To the east of the Irrawaddy, which bisects the district, it is low-lying and marshy. To the west it rises to a higher level, and is mostly dry. Except in the hills inhabited by the Kachin tribes, there are practically no villages off the line of the Irrawaddy. The Indawgyi lake, a fine stretch of water measuring 16 miles by 6, lies in the south-west of the district. A very small amount of cultivation is carried on, mostly dry cultivation. The area under forest during 1898–99 was 82,560 acres. Area, 10,640 square miles. Population (1891), 51,021; (1901), 67,149, showing an increase of 31·6 per cent. and a density of 6 inhabitants to the square mile. The people live in 139 villages, and pay Rs.67,767. The numbers of the Kachins in the hills were, however, very imperfectly known. The rainfall in 1898–99 was 74·07 inches. The headquarters town, MYITKYINA, had in 1898 a population of 1623, including the garrison of 400 military police. It is the limit of navigation on the Irrawaddy, and is also the terminus of the railway from Rangoon and Sagaing.

Mymensingh, or MAIMANSINGH, a district of British India, in the Dacca division of Bengal. It occupies a portion of the alluvial valley of the Brahmaputra, east of the main channel (called the Jamuna) and north of Dacca. The administrative headquarters are at Nasirabad, sometimes called Mymensingh town. Area, 6332 square miles. Population (1881), 3,055,237; (1891), 3,472,186; (1901), 3,917,460, showing an increase of 14 per cent. between 1881 and 1891, and of 12·8 per cent. between 1891 and 1901; average density, 619 persons per square mile. Classified according to religion, Mahommedans in 1891 numbered 2,396,800; Hindus, 1,045,566; Christians, 211, of whom 18 were Europeans; aborigines, 29,609. The land revenue and rates in 1897–98 were Rs.10,69,960; number of police, 695; number of boys at school (1896–1897), 62,534, being 22·4 per cent. of the male population of school-going age; registered death-rate (1897), 27·8 per thousand. The two staple crops are rice and jute. There are 20 jute presses, employing 1000 persons, with an outturn of 680,000 bales, valued at Rs.25,00,000. A branch line of the Eastern Bengal Railway, running north from Dacca to Nasirabad, will ultimately connect, through Jamalpur, with Jagannathganj on the main stream of the Brahmaputra. The district was severely affected by the earthquake of 12th June 1897, which destroyed the church and high school at Nasirabad, and damaged even the solid buildings.

Myriapoda.—In Professor Moseley's article on the Myriapoda, in vol. xvii. of this work, the relationship was mentioned which the class bears to the Insecta. Much work has since been done, especially in the department of embryology, and several eminent naturalists have expressed the opinion that the class Myriapoda, which has hitherto been considered a homogeneous group, should be broken up; and that of its two larger sub-classes, the Chilopoda should be joined with the Hexapoda, the Diplopoda being left by themselves under the original class-name. Mr Pocock proposes to give to the Diplopoda, Scolopendrellidæ, and Pauropoda the name of Progoneata, and to the Chilopoda and Hexapoda the name of Opisthogoneata. A few of the principal differences between Chilopoda and Diplopoda which have led to this view may be mentioned:—

(1) The mouth parts cannot satisfactorily be homologized in these two sub-classes; (2) the form of the somites is different, the sternum in Chilopods being wide and in Diplopods compressed, while the sectional form of Diplopoda is cylindrical and that of Chilopoda flattened dorsoventrally; (3) the stigmata and tracheæ are simpler in Diplopods than in Chilopods; (4) there are no foramina repugnatoria in Chilopods (except in very rare cases); (5) the reproductive organs open in Chilopoda in the posterior region of the body, and in Diplopoda in the anterior. In Chilopods the generative organs are dorsal, in Diplopods ventral. In Diplopods the gonad is unpaired and opens by two ducts, in Chilopods it is paired and opens by a single duct; (6) the nerve-cord in Chilopoda is double (Fig. 2), and is only united at the ganglia, and in Diplopoda the two cords are fused together.

Of these differences some tend to show a closer relationship to the Hexapoda;—(1) the mouth parts of the Chilopods can be homologized with those of Hexapods; (2) the stigmata and the tracheæ in their complexity show a likeness to those of Hexapods; (3) the terminal opening of the generative tube and the junction of two ducts to form a single tube furnish a resemblance to Hexapods. On the other hand, it may be urged that the different number of legs to each segment cannot be reckoned as a real difference, as both embryology and palæontology show that the so-called double segments of Diplopoda are not double in reality, but are double segments imperfectly fused. Further, the differences in the width of the sternal region, and in the separation of the nerve cords, are bridged over by the embryonic form of the Diplopoda and by the adult Polyxenus. The form of the young Chilopod is cylindrical in section. The junction of the two generative ducts to form a single tube is not without exception in Hexapoda.

Thus the position of the generative tube and its opening is left as the chief character on which to found the new arrangement, and more evidence appears to be required before the groups should be described as proposed. As regards the claims of Scolopendrella to form a link between the Chilopoda and Insecta, the opinions as to its position are very conflicting. A Chilopod has been described by Pocock, the structural peculiarities of which link together the Scolopendroid and Lithobioid forms. He has named it Craterostigmus. It resembles the Lithobiomorpha and differs from the Scolopendromorpha in the form of the poison claws, in the coxa of the 15th pair, in the presence of 6 pairs of stigmata on the 3rd, 5th, 8th, 12th, and 14th segments, and in the possession of a single eye. *Cermatobius*, another Chilopod discovered since Professor Moseley wrote, has its stigmata in a more dorsal position than Lithobius, and forms a link between Lithobius and Scutigeridæ.

We will now consider the chief points which have been worked out by later investigators in the embryology of the class.

In the Diplopoda the *segmentation of the ovum* is partial. In *Julus moreletti* the surface is marked by furrows corresponding with the segments, but in *Julus terrestris* this is not the case. The mesoblast is formed from a keel-like thickening of the ventral surface of the blastoderm, the epiblast by the layer of cells surrounding the exterior of the yolk; while the hypoblast is represented by the cells still remaining in the yolk at the close of segmentation. In the *first formation of the embryo*, the

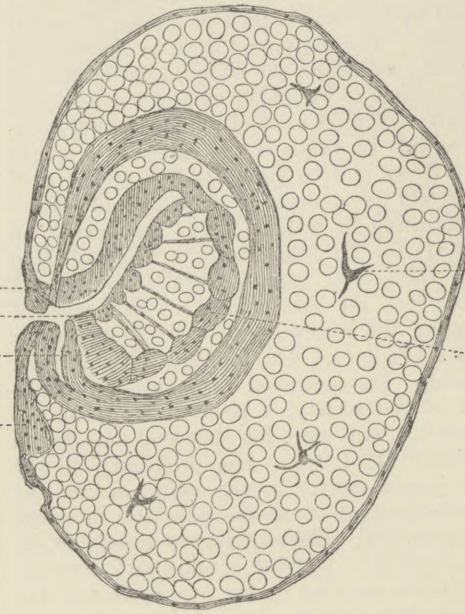

Fig. 1.—Section through twelfth-day Julus.

somites are formed in order from before backwards. The ventral flexure takes place in *Julus* when the antennæ, the mouth parts, and three pairs of legs are formed. In Strongylosoma the ventral flexure is formed much earlier, before the appearance of the antennæ, and the furrow is not so deep as in *Julus*. In Polyxenus it is somewhat deeper. In the *nervous system* (Fig. 1) the cerebral ganglion arises as a thickening of the cephalic lobes, and is split off from the epiblast. In *Julus* two pits are formed in the cephalic lobes, a process which is probably connected with the formation of the optic ganglion. The ventral chain arises as two thickenings in the middle ventral line of the epiblast, partially divided by a furrow. The ganglia are formed as thickenings on the cord. The ganglia in the young Diplopoda are more widely separated than in the adult. The *generative organs* are formed from the somatic part of the primitive segments. The coelom-sacs fuse in the middle line, and each coelom-sac fuses with the one behind, so as to form the long generative tube. In the *digestive system* (Fig. 2) the formation of the proctodæum and stomodæum takes place much earlier than that of the mid-gut. The former structures are epiblastic and are formed by invagination, while the latter arises as an accumulation of the cells remaining in the yolk. The Malpighian tubes are formed as evaginations of the proctodæum. The *heart* is formed by the cells remaining in the yolk. These arrange themselves in the pseudocoele so as to form a tube, which is at first imperfectly closed, but gradually becomes firmer and more perfect, leaving, however, unclosed spaces which afterwards become the ostia. A pericardial sinus beneath the heart is formed by the same cells. The *tracheæ* appear late in the development. In *Julus* they begin as pit-like invaginations of the epidermis as soon as the animal is hatched. The *eye* in *Julus* begins as a thickening of the epidermis in which pigment is deposited. Then a cavity is formed in the thickened part, so that the whole appears as an optic vesicle. As the cavity increases the internal wall becomes thin and the external thick. The internal represents the retina and the external the lens. A further discovery in the development of the Diplopoda, made by Verhoeff, is of the greatest interest. Professor Moseley drew attention to the peculiar shape of the first pair of legs in the male *Julus.* Dr C. Verhoeff discovered

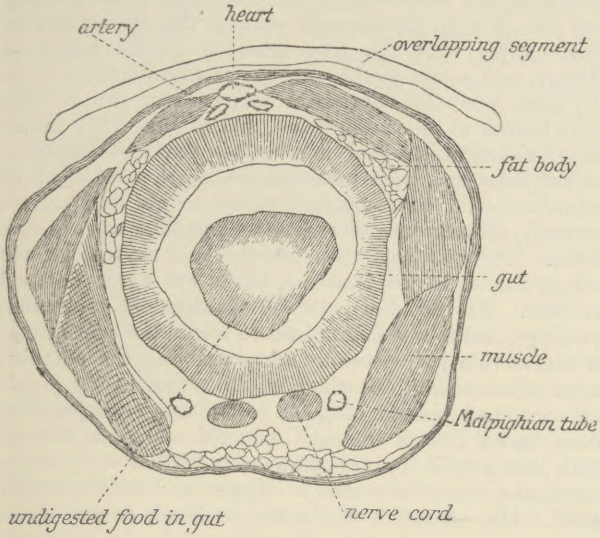

Fig. 2.—Section through just-hatched Lithobius.

that there is a stage of development in which the immature animal has a complete pair of legs in place of the hook-like legs of the mature animal. This immature or larval stage differs from the mature stage in three points: in the shape of the cheeks, in the form of the first pair of legs, and in the shape of the copulatory organ. He calls the immature or larval stage the "status medius," and the animal the larva (*schalt-männchen*). He compares this stage in Myriapoda to the subimaginal stage in Insecta.

In the Chilopoda the structure of the ovum and the segmentation have been worked out in *Geophilus ferrugineus,* and resemble those in the Diplopoda except that the process of segmentation is extended in a greater degree to the yolk, the latter as well as the surface being divided into yolk-pyramids, which, however, are connected at the centre. A ventral keel is formed as in the Diplopoda. The smaller cells of the ventral surface mark out the germinal streak at the end of which the cephalic lobes are formed. The somites are marked off by constrictions from before backwards. The anus is formed very early in the development of Geophilus, the mouth much later. The ventral flexure is formed when a considerable number of somites are present. The development of *Scolopendra cingulata* and *Sc. Dalmatica* has been worked out very carefully by Heymons. The segmentation is a modified form of epibole, the yolk-free micromeres surrounding the yolk-laden macromeres. The coelom arises by splitting of the mesoderm, and the coelom sacs are not enterocoelic. The brain consists of a præ-oral syncerebrum and three pairs of post-oral ganglia. The head in Diplopoda, Chilopoda, and Insecta consists of the acron united to six posterior metameres. The lymphatic bands of the adult are the representatives of the nephridia of Annelids, and the cephalic lymph bodies are equivalent to the green glands of Crustacea. The coelom extends into the dorso-lateral regions, and sends a diverticulum to the upper part of the legs. The generative organs are formed from the upper part of the dorso-lateral coelom on either side, which unite in the middle line. The heart and vascular system are derived from the schizocoele. For a long time there is a zone of undifferentiated tissue between the 30th metamere and the telson, which zone is homologous with the zone of budding in other forms. There are a series of invaginations connected with the formation of the nervous system which resemble the ventral organs of *Peripatus.*

Fossil Myriapods have been divided into four orders: (1) Protosyngnatha, (2) Archipolypoda, (3) Chilopoda, (4) Diplopoda. The first two of these orders differ considerably from those of the present day. The Protosyngnatha have ten somites; the body is cylindrical in section; the head, bearing antennæ and mouth parts, shows no signs of segmentation; bundles of bristles are arranged in longitudinal rows along the back. There is a single dorsal and a single ventral plate to each segment, the dorsal and ventral plates being of equal breadth. There is a wide space between the base of the leg on one side and the base of the leg on the opposite side. The Archipolypoda have legs on every somite, no somite being apodous. The dorsal

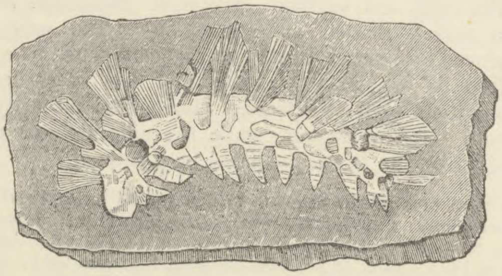

Fig. 3.—*Palæocampa anthrax.* (From the *Cambridge Natural History*, by permission of Messrs Macmillan.)

plates are more or less perfectly divided, the divisions corresponding with the pairs of legs. The Chilopoda and

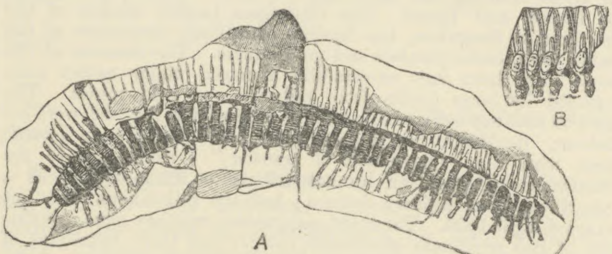

Fig. 4.—*Acantherpestes major.* A, Whole animal; B, Branchiæ on ventral surface. (From the *Cambridge Natural History*, by permission of Messrs Macmillan.)

Diplopoda bear a great resemblance to those of the present day.

1. Protosyngnatha. *Palæocampa anthrax* (Coal) (Fig. 3).
2. Archipolypoda. Fams.:—(1) Archidesmidæ (Old Red Sandstone); (2) Euphoberidæ (Coal), *Acantherpestes major* (Fig. 4), and *A. inæqualis, Euphoberia* (with nine species); (3) Archijulidæ (Coal), *Archijulus, Xylobius, Mazonus.*
3. Chilopoda. Fams.:—(1) Geraseutigeridæ (Coal), resembling Scutigeridæ; (2) Eoscolopendridæ (Coal), *Eileticus, Anthracinus, Aequalis, Ilyodes, Palanarthrus;* (3) Lithobiidæ; (4) Scolopendridæ; (5) Schizotarsia; (6) Geophilidæ. The last four are mostly from amber.
4. Diplopoda. Fams.:—(1) Glomeridæ (Amylispes may belong here); (2) Polydesmidæ; (3) Lysiopetalidæ; (4) Craspedosomidæ; (5) Julidæ; (6) Polyxenidæ. These are mostly from amber; *Julopsis cretacea,* from the chalk of Greenland.

The Carboniferous fossils discovered by Scudder have completely altered our ideas as to the age of the Chilopoda. Before his discovery the earliest Chilopods had been found in amber; now we know that they extended back into the Carboniferous times. The fossil forms show a certain approximation between the Chilopodous and Diplopodous forms of the present day in the following particulars: (1) the number of legs to each somite, the Archipolypoda having the dorsal segment more or less perfectly divided, thus agreeing with the facts of embryology; (2) the cylindrical shape of the body, a feature that is also paralleled in the embryological history of the two stocks; (3) the wide sternal region which, as has been said before, is reproduced in the embryology of *Julus.*

Good bibliographies of the subject may be found in LATZEL. *Die Myriapoden der Oesterreich-Ungarischen Monarchie*, 1884. —ZITTEL. *Handbuch der Palæontologie.* Munich, 1885.—KORSCHELT and HEIDER. *Lehrbuch der Vergleichenden Entwicklungsgeschichte.* Jena, 1890. (F. G. S*.)

Mysore, a native state of Southern India, in political relations with the Governor-General. Owing to the mis-government of the chief, the British assumed the administration in 1831. On his death in 1868, his adopted heir was recognized; and in 1881, when he had reached the age of eighteen, full powers of government were granted to him, subject to conditions specified in the "instrument of transfer." One of these conditions was that the civil and military station of Bangalore should remain under British administration. The new raja, who proved altogether worthy of the confidence placed in him (see below), died in 1894, and was succeeded by his son, then aged ten years. During his minority the maharani acted as regent, while the administration was conducted by the Diwan, assisted by a council.

The total area of the state is 27,936 square miles, subdivided into 9 districts. Population (1881), 4,186,188; (1891), 4,943,604; (1901), 5,538,482, showing an increase of 18 per cent. between 1881 and 1891, and of 12 per cent. between 1891 and 1901; average density, 198 persons per square mile, ranging from 343 in Bangalore district to 124 in Chitaldrug. Classified according to religion, Hindus in 1891 numbered 4,639,127; Mahommedans, 252,973; Christians, 38,135; Jains, 13,278; "others," 91. The proportion of Hindus (93·8 per cent.) is larger than in any province of India, showing how ineffectual was the compulsory persecution of Haidar and Tippu. The Christians largely consist of the garrison at Bangalore, the families of military pensioners at the same town, coffee-planters and gold-miners. The finances of the state have been very successfully managed under native rule, assisted by large profits from railways and gold-mines. The income and expenditure (in tens of rupees) for 1897–98 were:—income, Rx.1,915,972; expenditure, Rx.1,855,090. In accordance with the "instrument of transfer," Mysore pays to the British Government an annual tribute of Rs.35,00,000, as a contribution to military defence; but the full amount was not exacted until 1896. The state maintains a military force, consisting of two regiments of *silladar* cavalry and three battalions of infantry; total, about 4000 men; and also an imperial service transport corps. An interesting political experiment has been made, in the constitution of a representative assembly, which meets annually for the purposes of discussion, without any legislative power. Since 1891 this representative assembly has been elected by local boards and other public bodies. In 1897 the session lasted for five days. The number of members present was 275, of whom 252 were Hindus. The Diwan, as usual, presented a formal report on the administration of the year; and no less than 500 subjects are said to have been discussed. The industry of coffee-planting is not in a flourishing condition, the area under coffee showing no increase during the last ten years of the 19th century. In 1897 the total number of acres was 125,876, compared with 141,528 in the preceding year. Of this total, about one-third belongs to European planters. The annual out-turn of gold from the Kolar mines is about 500,000 oz. (J. S. Co.)

CHAMARAJENDRA WADIAR BAHADUR, Maharaja of Mysore (1862–1894), was the adopted son and successor of Maharaja Krishnaraj, into whose hands as a child the British Company had, after the final defeat of Tipu Sultan, restored the greater part of the territories of Mysore. When Krishnaraj eventually took over the management of his state from his minister Purnaiya in 1812, he received an orderly and contented principality with a surplus of two crores of rupees. Within twenty years he had driven his subjects into rebellion and involved himself and his state in heavy debt. The British Government therefore assumed the government in 1831, and placed it in the hands of commissioners. The revenues in 1832–33 amounted to 55 lakhs; in 1862 they had reached 100 lakhs, in 1881 they grew to 107 lakhs, and in 1894 to 179 lakhs. In 1862 no less than 88 lakhs of state debts and of the Maharaja's own liabilities had been liquidated. The entire administration had been reformed, a revised system of land revenue introduced, and many public works executed. The maharaja therefore pressed his claims to a restoration of his powers, but Lord Canning and the British Government refused the application as incompatible with the true interests of the people of Mysore, and as not justified by any treaty obligation. In the same year Chamarajendra was born of the Bettada Kote branch of the ruling house, and in June 1865 Maharaja Krishnaraj adopted him as his son and successor, although he had been informed, in March 1864, that no adoption could be recognized except to his own private property, already once more heavily weighted with private debts. The maharaja then renewed his request for the recognition of his adopted son, but it was again declined in 1865. In 1867 the policy of Government underwent a change, and it was determined to secure the continuance of native rule in Mysore by acknowledging the adoption upon certain conditions which would secure to the people the continued benefits of good administration enjoyed by them under British control. The old maharaja died on 27th March 1868, and Chamarajendra Wadiar was publicly installed as the future ruler of Mysore on 23rd September 1868. His education was taken in hand, abuses which had grown up in the palace establishment were reformed, the late maharaja's debts were again paid off, and the whole internal administration perfected in every branch during the minority. On the 25th March 1881 Maharaja Chamarajendra, having attained the age of 18 years, was publicly entrusted with the administration of the state. He made over to the British Government, with full jurisdiction, a small tract of land at Bangalore, forming the "civil and military station," and received in return the island of Seringapatam. But the most important incident of the change was the signing of the "instrument of transfer," by which the young maharaja, for himself and his successors, undertook to perform the conditions imposed upon him. To that agreement the maharaja steadfastly adhered during his reign, and the instrument is a landmark in the history of British relations with the protected states of India. The maharaja's first minister was Ranga Charlu, who had been trained in the British administration of Mysore. He signalized the restoration of native rule by creating a "Representative Assembly," composed of 350 representatives of all classes of the community, who, in the absence of special cause, such as plague, meet annually to hear an account of the state administration for the previous year. The assembly has no power to enact laws, to vote supplies, or to pass any resolution binding upon the executive. But it gives to the leading men of the districts a pleasant opportunity of visiting the capital, and to a limited extent brings the force of public opinion to bear upon the minister. In 1883 Sheshadri Aiyar succeeded Ranga Charlu, and to him Mysore is indebted for the extension of railways and schemes of irrigation, the development of the Kolar goldfields, and the maintenance of the high standard of its administration. The maharaja showed his loyalty by placing two regiments of cavalry at the disposal of the Government of India for imperial service. He died at Calcutta, 28th December 1894, universally regretted and beloved by his subjects. His eldest son, Krishnaraj Wadiar, born in 1884, succeeded him, and his widow, Maharani Vanivilas, was appointed regent. Chamarajendra set the first example to India of a constitutional ruler. He was faithful to the terms of the instrument of transfer, contributing a subsidy in lieu of military service, granting facilities for British railways and cantonments, accepting the British coinage and postal system, readily conceding to the paramount Power extradition and foreign jurisdiction, maintaining the laws, regulations, and settlements introduced by the British administration, and leaving his foreign relations and any serious internal difficulties to the arbitrament of the British Government. The restoration of native rule to him marked the final abandonment of the annexation policy, and the instrument of transfer summarizes the obligations of a protected state to the British protecting power. (W. L.-W.)

Mytilene, or MITILINI (classical LESBOS), an island of the Aegean, forming the main part of a sanjak in the Archipelago vilayet of European Turkey. It is divided into the three districts of Mytilene or Kastro, Molyvo, and Kalloni; and the chief towns are Mytilene (15,000) in the east, Molyvo (3000) in the north, Sigri in the west, and Kalloni on the Gulf of Kalloni. The ports are Sigri, Longone in the south, and Olivier near Mytilene. Vessels of large draught cannot enter any of the ports, but there is good anchorage outside. The valleys are fertile, and on the higher grounds there is pasturage for numerous sheep. Oxen are kept mainly for draught, and about 7000 cattle are annually imported from the Anatolian coast for food supply. The native horses are small, and transport is effected mainly by mules, of which large numbers are bred for sale. The fisheries are of considerable importance, especially sardines. The main industry, however, is the pressing of olives in the production of olive oil, there being 45 steam-pressing establishments, and about 100 oil mills worked by hand. The annual value varies greatly according to the season, sometimes amounting to nearly £200,000, and sometimes falling below £100,000; in 1900 it was £400,000. The industry of next importance is the manufacture of soap. Valonea is obtained in the northern part of the island, but only of second-rate quality. Figs and grapes are grown, but hardly in greater quantities than suffice for home consumption. The roads throughout the island were re-made in 1889. There is telegraphic communication on the island, and communication with the mainland by cable to Aivati on the Anatolian coast. In 1900 the number of steamships that entered and cleared was 1182 of 536,326 tons, as compared with 1324 of 596,106 tons in 1898; the number of sailing vessels in 1900 was 3299 of 30,345 tons, as compared with 3042 of 38,148 tons in 1898. The chief exports are olive oil (£119,000 in 1900), soap, valonea, skins, dried figs, and fish (principally sardines). Average rainfall for ten years ending 1899, 24·57 inches. The town of Mytilene is built in amphitheatre shape round a small hill crowned by remains of an ancient fortress, and contains 14 mosques and 7 Christian churches, one of which is the cathedral. It possesses flour-mills, oil-works, soap-works, potteries, tanneries, and cement works, and has a large shipping trade. Population of the sanjak (1890), 107,283, of whom 92,700 were Greek Orthodox, 13,712 Mussulmans, and the remainder Catholics, Jews, and Armenians; (1901), 130,000.

Myxœdema. See PATHOLOGY (*Metabolic Diseases*).

Nabha, a native state of India, within the Punjab. Area, 936 square miles. Population (1881), 261,824; (1891), 282,756; (1901), 297,949, showing an increase of 8 per cent. between 1881 and 1891, and of 5·4 per cent. between 1891 and 1901; average density, 318 persons per square mile. Estimated gross revenue, Rs.7,00,000; military force (including police), 1818 men; no tribute. The raja's imperial service troops did good service during the Tirah campaign of 1897–98. The territory is crossed by the Rajpura–Bhatinda Railway, and irrigated by the Sirhind canal; and the state revenues contributed to the construction of both these works. In 1896–97 the number of schools was 24, with 958 pupils; the proportion of boys at school was 1 out of 162 of the male population.

The town of NABHA has a station on the Rajpura–Bhatinda Railway. Population (1881), 17,116.

Nabua, a town in the extreme southern portion of the province of Ambos Camarines, Luzon, Philippine Islands. It is situated in the district known as La Rinconada, on account of its inaccessibility, and is the centre of a large, level, and fertile agricultural region, which produces rice, Indian corn, sugar, and pepper in abundance. The marketing of agricultural products is, however, interfered with by the difficulties of communication. The language is Bicol. Population, 17,000.

Nachod, a town in Bohemia, Austria, on the Mettau river, at the entrance of the Lewin–Nachod pass, about three miles from the Prussian frontier. The old castle contains a collection of historical paintings and archives, and in the town hall there is a small museum. The castle, which has been the property of the Prince of Schaumburg-Lippe since 1864, was presented to Ostavian Piccolomini in 1634. The important engagements fought near the town on the 27th and 28th of June 1866 opened Bohemia to the victorious Prussians. There are coal-mines in the neighbourhood; and the industry comprises cotton-spinning, dyeing, and bleaching. Population (1890), 6364; (1900), 9899, chiefly Czech and Catholic.

Nachtigal, Gustav (1834–1885), German explorer, son of a Lutheran pastor, was born at Eichstedt in the Mark of Brandenburg, on 23rd February 1834. After a course of medical study at the universities of Halle, Würzburg, and Greifswald, he practised for a few years as a military surgeon. Being of a weakly constitution, and finding the climate of his native country injurious to health, he repaired to Algiers and Tunis, and took part, in the capacity of surgeon, in several expeditions into the interior of Africa. Commissioned by the king of Prussia to carry conciliatory gifts to the sultan of Bornu, he set out in 1869 from Tripoli, and succeeded after two years' journeyings in accomplishing his mission. From Bornu he extended his travels to Baghermi, and proceeding by way of Wadai and Kordofan, emerged from darkest Africa, after having been given up for lost, at Khartum in the winter of 1874. His journey, graphically described in his *Sahara and Sudan* (1879–89), was eminently valuable in its fruits, and placed the intrepid explorer in the front rank of discoverers. On the annexation of Tunis by France, Nachtigal was sent there as consul-general for the German empire, and remained there until 1884, when he was despatched by Prince Bismarck to West Africa as special commissioner, ostensibly to inquire into the condition of German commerce, but really to annex territories to the German flag. On his return voyage he died at sea off Cape Palmas on 20th April 1885, and was buried at Grand Bassa. His remains were later exhumed and conveyed for interment to German Cameroon. In spite of his weak physique, Nachtigal was a daring, resourceful, and strong-willed man, while his amiability, straightforwardness, and modesty made him universally beloved and respected.

Naden, Constance Caroline Woodhill (1858–1889), English author, was born at Edgbaston, 28th

January 1858, her father being an architect. Her mother died just after the child's birth, and Constance was brought up in the home of her grandfather, Mr Woodhill, a retired jeweller. She was a clever girl and quick at learning, and was interested in modern culture in all its forms, artistic, scientific, and philosophical. In 1881 she published *Songs and Sonnets of Spingtime;* in 1887, *A Modern Apostle, and other Poems*. Her poems made such an impression on Mr Gladstone that he included her, in an article in the *Speaker*, as one of the foremost English poetesses of the day. After her grandfather's death Miss Naden found herself a rich woman, and she travelled in the East and then (1888) settled in London. But on 23rd December 1889 she died, as the result of an operation. Since 1876 she had paid increasing attention to the study of philosophy, with her friend Dr Lewins, and the two had formulated a system of their own, which they called "Hylo-Idealism," and which after Miss Naden's death aroused some little discussion. Her main ideas on the subject are contained in a posthumous volume of her essays (*Induction and Deduction*, 1890), edited by Dr Lewins.

Nadia, or Nuddea, a district of British India, in the Presidency division of Bengal. The administrative headquarters are at Krishnagar. Area, 2982 square miles. Population (1881), 1,662,795; (1891), 1,644,108; (1901), 1,667,990; average density, 559 persons per square mile. Classified according to religion, Hindus in 1891 numbered 689,224; Mahommedans, 947,390; Christians, 7297, of whom 106 were Europeans; "others," 197. The land revenue and rates in 1897–98 were Rs.9,62,339; number of police, 721; number of boys at school (1897), 30,708, being 25·5 per cent. of the male population of school-going age; registered death-rate (1897), 26 per thousand. The chief industry is indigo. There are 47 factories, employing 7000 persons, with an out-turn of 2400 maunds, valued at Rs.4,30,000. The district is traversed for about 100 miles by the main line of the Eastern Bengal Railway, leading to the river port of Kushtia, and onward to Darjeeling; and a branch to Krishnagar has been opened. The three so-called "Nadia rivers"—the Bhagirathi, the Jalangi, and the Matabhanga—carried in 1897–98 a total traffic in country boats valued at Rs.1,50,78,428.

Naegeli, Karl Wilhelm von, Swiss botanist (1817–1891), was born on 27th March 1817, near Zürich. He early devoted himself to the study of botany, which he pursued for a time under A. P. de Candolle at Geneva, and graduated with a botanical thesis at Zürich in 1840. His attention having been directed by Schleiden, then professor of botany at Jena, to the microscopical study of plants, he engaged more particularly in that branch of research. Soon after graduation he became *privat-docent*, and subsequently *professor extraordinarius*, in the University of Zürich: in 1852 he was called to fill the chair of botany in the University of Freiburg-in-Breisgau; and in 1857 he was promoted to Munich, where he remained as professor until his death on 11th May 1891. Among his more important contributions to science were a series of papers in the *Zeitschrift für wissenschaftliche Botanik* (1844–46); *Die neuern Algensysteme* (1847); and his *Gattungen einzelliger Algen* (1849); his *Pflanzenphysiologische Untersuchungen* (1855–58), with Cramer; his *Beiträge zur wissenschaftlichen Botanik* (1858–68); a number of papers contributed to the Royal Bavarian Academy of Sciences, forming three volumes of *Botanische Mitteilungen* (1861–81); and, finally, his volume, *Mechanisch-physiologische Theorie der Abstammungslehre*, published in 1884.

The more striking of his many and varied discoveries are embodied in the *Zeitsch. für wiss. Bot.* In this we begin with Naegeli's extension of Robert Brown's discovery of the nucleus to the principal families of Cryptogams, and the assertion of its universal occurrence in plants, together with the recognition of its vesicular structure. There is further his investigation of the "mucous layer" (*Schleimschicht*) lining the wall of all normal cells, where he shows that it consists of granular "mucus," which, at an earlier stage, filled the cell-cavity, and which differs chemically from the cell-wall in that it is nitrogenous. This layer he proved to be never absent from living cells—to be, in fact, itself the living part of the cell, a discovery which was simultaneously made by von Mohl (1846), who gave to the living matter of the plant-body the name "protoplasm." In connexion with these discoveries, Naegeli controverted Schleiden's view of the universality of free-cell-formation as the mode of cell-multiplication, and showed that in the vegetative organs, at least, new cells are formed by division. In the *Zeitschrift*, too, is Naegeli's most important algological work; such as the paper on *Caulerpa*, which brought to light the remarkable unseptate structure of the Siphoneæ, and his research on *Delesseria*, which resulted in the discovery of growth by a single apical cell. This discovery led Naegeli on to the study of the growing-point in other plants. He consequently gave the first accurate account of the apical cell, and of the mode of growth of the stem in various Mosses and Liverworts. Subsequently he observed that in *Lycopodium* and in Angiosperms the growing-point has no apical cell, but consists of a small-celled meristem, in which the first differentiation of the permanent tissues can be traced. One of the most remarkable discoveries recorded in the *Zeitschrift* is that of the antheridia and spermatozoids of Ferns and of *Pilularia*. The *Beiträge zur wiss. Botanik* consists almost entirely of researches into the anatomy of vascular plants, while the main feature of the *Pflanzenphysiologische Untersuchungen* is the exhaustive work on the structure, development, and various forms of starch-grains. The *Botanische Mitteilungen* include a number of papers in all departments of botany, many of them being continuations and extensions of his earlier work. In his *Theorie der Abstammungslehre* Naegeli introduced the idea of a definite material basis for heredity; the substance he termed "idioplasm." His theory of evolution is that the idioplasm of any one generation is not identical with that of either its progenitors or its progeny: it is always increasing in complexity, with the result that each successive generation marks an advance upon its predecessor. Hence variation takes place determinately, and in the higher direction only; while variability is the result of internal causes, and natural selection plays but a small part in evolution. Whereas, on the Darwinian theory, all organization is adaptive, according to Naegeli the development of higher organization is the outcome of the spontaneous evolution of the idioplasm.

More detailed accounts of Naegeli's life and work are to be found in *Nature*, 16th October 1891, and in *Proc. Royal Soc.* vol. li. (S. H. V*.)

Næstved, a market town of Denmark, county Præstö, on the east coast of Sealand, 58 miles by rail south-west of Copenhagen. From 1140 to the Reformation it was one of the most important towns of the kingdom, though dependent upon the monastery of St Peter's (founded here in 1135); its church was restored in 1883–85. The mediæval town hall was restored in 1894. North of the town ($1\frac{1}{4}$ miles) lies Herlufsholm, where Admiral Herluf Trolle founded a Latin school in 1567, which still survives. Population (1880), 4792; (1890), 5502; (1901), 7162.

Naga Hills, The, a district of British India, in the hills division of Assam. Its inner boundaries were laid down in 1882; but some measure of political control is exercised by the deputy commissioner in charge over a tract of country, also occupied by Naga tribes, extending north-eastwards to the frontier of Burma. The administrative headquarters are at Kohima—population (1891), 1781—which is garrisoned by a Gurkha regiment and also by a strong force of military police. Area, 5710 square miles. Population (1891), 122,867; (1901), 102,409; average density, 18 persons per square mile. Land revenue, Rs.51,660, the incidence of assessment being 10 annas per acre; number of police, 741; number of boys at school (1896–97), 275, being 2·94 per cent. of the male population of school-going age. A cart-road is maintained from Nichuguard to Manipur, and a bridle-road from Wokha to Golaghat, in the Brahmaputra valley. The main line of the Assam–Bengal Railway is being extended through the district along the Dhansiri river to Golaghat; and a branch to the Gauhati section will turn off at Lumding. Deep cuttings and tunnels, together with the sparse population and unhealthiness of the country, combine to make this a work of great difficulty. Only slight damage was done by the earthquake of 12th June 1897.

Nagasaki, a town on the south-west of the island of Kiushiu, Japan, situated in 32° 44′ N. and 129° 52′ E., with 107,433 inhabitants, and a foreign settlement containing a population of 1000. This place owed its earliest importance to foreign intercourse. Originally called Fukae-no-ura (Fukae Bay), it was included in the fief of Nagasaki Kotaro in the 12th century, and from him it took its name. But it remained an insignificant village until the 16th century, when, becoming the headquarters of Japanese Christianity, and subsequently the sole emporium of foreign trade in the hands of the Dutch and the Chinese, it developed considerable prosperity. The first port of entry for ships coming from the south or the west to Japan, it lies at the head of an inlet some three miles long, with shores indented by bays and sloping up to thickly-wooded hills. This fjord forms a splendid anchorage, and is largely used by ships coming to coal and by men-of-war of various nationalities. But the opening of Moji for export purposes has deprived Nagasaki of its monopoly as a coaling station, and the visits of war vessels have been reduced owing to the acquisition of Port Arthur by Russia, of Wei-hai-wei by Great Britain, and of Kiao-chow by Germany. It seems probable, indeed, that unless advantage be ultimately taken of its manufacturing facilities, Nagasaki will lose much of its former importance. Up to the present, however, its population and its commerce have shown a substantial growth, especially its population, which was only 55,063 in 1889, and had increased to 107,433 in 1899. The following table exhibits the condition of its foreign commerce during the years specified :—

	Exports.	Imports.	Total.
	£	£	£
1884 . . .	718,310	197,438	915,748
1889 . . .	1,005,367	472,839	1,478,206
1894 . . .	444,839	676,718	1,121,557
1899 . . .	620,777	1,114,751	1,735,528

Marine products, coal, and cotton goods are the chief exports, and raw cotton, iron, as well as other metals and materials used for shipbuilding, constitute the principal imports. There is nothing in the present condition of Nagasaki's foreign commerce to suggest appreciable expansion. Its most important enterprises are represented by the engine works of Aka-no-ura, two large docks and a patent slip, the property of the Mitsu Bishi Company. Steamers of over 6000 tons have been constructed at these docks, which, as well as the engine works, are situated on the western shore of the fjord. The brisk atmosphere of business that pervades them does not reach the town on the eastern side, where, under the shadow of forests of tombstones that cover the overlooking hills, the citizens seem to live in the company of their dead and in the memory of their past. Nagasaki is celebrated for two very incongruous things: the tranquil loveliness of its scenery and the coaling operations that take place in the harbour, where thousands of men, women, and children, trained to mechanical regularity of action, transfer the fuel from lighters to the ship's bunkers with such rapidity that they have been known to put 1360 tons of coal on board a steamer in four hours, being at the rate of 5·7 tons per minute. The coal is obtained chiefly from Takashima, an islet eight miles south-east of the entrance to the harbour, and in lesser quantities from two other islets, Naka-no-shima and Ha-shima, which lie about a mile farther out. These sources of supply do not appear likely to last many years longer. On the north side of the channel, by which the harbour is entered, there stands a cliff called Takaboko, which, under the name of Pappenberg, has long been rendered notorious by a tradition that thousands of Christians were precipitated from it in the 17th century because they refused to trample on the Cross. It has been conclusively proved that the legend is untrue. (F. BY.)

Nagina, a town of British India, in the Bijnor district of the North-Western Provinces; station on the Oudh and Rohilkhand Railway, 48 miles north-west of Moradabad. Population (1891), 22,150; municipal income (1897–98), Rs.10,609. There is considerable trade in sugar, besides manufactures of guns, glass-ware, ebony, carving, hemp-sacking, and cotton cloth. It was formerly the headquarters of the district.

Nagode, a native state of Central India, in the Baghelkhand agency. Area, 450 square miles. Population (1881), 79,629; (1891), 84,097, showing an increase of 6 per cent.; average density, 187 persons per square mile. The revenue in 1897–98 was Rs.1,50,526, of which Rs.99,198 was derived from land. The number of schools is 5, attended by 171 pupils. The chief, whose title is raja, is a Rajput of the Purihar clan. The present raja resides at Benares, while the minister has conducted the administration under British supervision. The state suffered severely from the famine of 1896–97.

The town of NAGODE is 17 miles west of the British station of Sutna. Population (1881), 4828. It was formerly a military cantonment, and has an Anglo-vernacular school and dispensary. The present capital is Unchehra; population (1891), 5442.

Nagoya, capital town of the province of Owari, Japan, on the great trunk railway of Japan, 235 miles from Tôkyô and 94 miles from Kyôtô. Population (1889), 162,767; (1899), 244,145. It is the fourth of the chief cities of Japan. In its vicinity (13½ miles distant) are the celebrated potteries of Seto, where the first glazed pottery made in Japan was produced by Kato Shirozaemon, after a visit to China in 1229. From Kato's time Seto continued, during several centuries, to be the chief centre of keramic production in Japan, the manufacture of porcelain being added to that of pottery in the 19th century. All the products of the flourishing industry now carried on there and at other places in the province are transported to Nagoya, either for sale there or for export to other centres of consumption. Cotton mills have been established, and an extensive business is carried on in the embroidery of handkerchiefs. Another of its celebrated manufactures is *arimatsu-shibori*, or textile fabrics (silk or cotton), dyed so as to show spots in relief from which the colour radiates. It is further distinguished as the birthplace of *cloisonné* enamelling in Japan, all work of that nature prior to 1838—when a new departure was made by Kaji Tsunekichi—having been for purposes of subordinate decoration. Quantities of *cloisonné* enamels are now produced in the town.

Nagpur, a city, district, and division of British India, Central Provinces. The city is 1125 feet above the sea; railway station, 520 miles east of Bombay. Population (1881), 98,299; (1891), 117,014; (1901), 124,599, showing an increase of 6·5 per cent. since 1891. The town is well laid out, with several parks and artificial lakes, and has numerous temples, with fine carving. The suburb of Sitabaldi contains the chief Government buildings, the houses of Europeans, the railway station, and the cantonments, with fort and arsenal. The garrison consists of detachments of European and native infantry from Kamptee. It is the headquarters of two corps of rifle volunteers. Nagpur is the junction of two important railway systems—the Great Indian Peninsula to Bombay, and the Bengal–Nagpur, now opened throughout to Calcutta. The large weaving population still maintain their reputation for producing fine fabrics. Two steam cotton mills, with 1398 looms and 60,000 spindles, employ 4000 hands, and work up 125,000 cwts. of raw cotton in the year; there is also machinery for ginning and pressing cotton. Education is provided by two aided colleges—the Hislop and the Morris, called after a missionary and a former chief commissioner—with 198 students in 1896–97; four high schools, with 1705 pupils; a law school; an agricultural school, with a class for the scientific training of teachers; a normal school; a zenana mission for the management of girls' schools; an Anglican and two Catholic schools for Europeans, with 336 boys and 171 girls. Good boarding-houses and common playgrounds have been established, and inter-school tournaments are encouraged by a field-games association. There are several libraries and reading rooms, and an active Anjuman or Mahommedan society, besides eight printing-presses, issuing one English newspaper and three in Marathi and Hindi.

The district of NAGPUR has an area of 3843 square miles; population (1881), 697,356; (1891), 757,862; (1901), 751,584, showing an increase of 9 per cent. between 1881 and 1891, but a decrease of nearly 1 per cent. between 1891 and 1901; average density, 195 persons per square mile, being the highest rate in the province. The land revenue and rates in 1897–98 were Rs.11,20,876, the incidence of assessment being just over 8 annas per acre; cultivated area (1897–98), 1,247,042 acres, of which 24,388 acres were irrigated from tanks and wells; number of police, 1008; boys at school (1896–97), 15,405, being 31·8 per cent. of the male population of school-going age, the highest proportion in the province; girls at school, 1139, being 2 per cent.; registered death-rate (1897), 50 per thousand. The principal crops are millet, wheat, oil-seeds, and cotton. There are two steam factories for ginning and pressing cotton at Kamptee, which is the chief centre of trade. The district is traversed by the two lines of railway which meet at Nagpur city; total length, 50 miles. It is also well provided with roads.

The division of NAGPUR comprises the five following districts: Nagpur, Bhandara, Chanda, Wardha, and Balaghat. Area, 24,127 square miles; population (1881), 2,758,056; (1891), 2,982,507; (1901), 2,716,748, showing an increase of 8 per cent. between 1881 and 1891, but a decrease of 9 per cent. between 1891 and 1901; average density, 112 persons per square mile, ranging from 197 in Nagpur district to 65 in Chanda.

Nagybánya, a corporate mining town, picturesquely situated in north-eastern Hungary, in the county of Szatmár, with 9842 inhabitants in 1891 and 11,183 in 1901. There are a gymnasium, a Minorite convent, a directory of mines, hospitals, and several other offices and public institutions. Its mines—gold, silver, lead—are useful, and managed by the state. In the beautiful park are many ateliers, frequented in summer by pupils of the painting academy of Munich.

Nagybecskerek, a corporate town of Hungary, capital of the county of Torontál, with 22,370 inhabitants in 1891 and 26,407 in 1901. It has an asylum, supported by the Piarists, an upper gymnasium, a school for apprentices, a theatre, a carpet factory, and several financial institutions. Besides the administrative offices, there are a royal tribunal, a royal district court of justice, and a public prosecutor's office.

Nagyenyed, a corporate town of Hungary, capital of the county of Alsó-Fehér, with 6048 inhabitants in 1891 and 7494 in 1901. Its famous educational institution, the Bethlen College, founded in 1622 at Gyulafehérvár by Gabriel Bethlen, prince of Transylvania, but transferred in 1662 to Nagyenyed, contains a theological academy, an upper gymnasium, a normal school, and an elementary school, with a rich library and interesting collections. There are manufactures of carved-wood furniture and textiles. The town has played an important part in Hungarian history. In the Middle Ages it carried on a flourishing trade, and its celebrated wine cellars still exist.

Nagykároly, a corporate town in the north-eastern part of Hungary, capital of the county of Szatmár, with 13,593 inhabitants in 1891 and 15,382 in 1901. Besides the Government departments and a few educational institutions of higher rank, there is the beautiful castle of the Counts Károlyi, with a large park, and the statue of the celebrated Hungarian poet Francis Kölcsey.

Nagykikinda, a corporate town of Hungary, in the county of Torontál, with 22,923 inhabitants in 1891 and 24,843 in 1901. Being one of the centres of the produce of the famous wheat of the Banat, its traffic is brisk and flour industry important. Besides wheat, it produces also many kinds of fine fruit. It was once the seat of a privileged Servian district of south Hungary, and the moiety of its population is Servian.

Nagyszeben (German, *Hermannstadt*), a corporate town of Hungary, capital of the county of Szeben, with 24,766 inhabitants in 1891 and 29,577 in 1901. Besides several public institutions, there are interesting museums of the Lutheran Church and of the Carpathian Association of Transylvania. It is the seat of an army corps.

Nagyszombat (German, *Tyrnau*), a corporate town of Hungary, in the county of Pozsony, with 12,342 inhabitants in 1891 and 13,181 in 1901. Among its institutions are a Roman Catholic seminary for priests, a gymnasium, an orphanage, and many convents and churches; hence the town is sometimes called Little Rome. It was in this town that the famous archbishop and cardinal Peter Pázmány founded in 1635 the university, which at the end of the 18th century was transferred to Budapest. Among its industrial establishments the most important are a sugar refinery and manufactories of matches and malt.

Nagyvárad (German, *Grosswardein*), chief town of the county of Bihar, Hungary. It is a centre of commerce, industry, and traffic. In its ancient fort several Hungarian kings are entombed. Population (1891), 38,557; (1900), 50,177.

Naini Tal, a town and district of British India, in the Kumaon division of the North-Western Provinces. The town is situated in 29° 22′ N. and 79° 29′ E., 6400 feet above sea-level. Population (1881), 6576; (1891), 12,408; municipal income (1897–98), Rs.2,21,670; incidence of taxation, Rs.5.11.9 per head. Naini Tai is a popular sanitarium, and the summer headquarters of the government of the province. It is situated on a lake, surrounded by high mountains. In 1897 the municipality raised a loan of Rs.1,35,000 for an improved water-supply. The approach from the plains is by the Rohilkhand and Kumaon Railway from Bareilly, which has its terminus at Kathgodam, 22 miles by cart road. There are several European schools, three printing-presses (each issuing an English newspaper), besides barracks and convalescent depot for European soldiers, and a brewery.

The district of NAINI TAL comprises the lower hills of Kumaon and the adjoining Tarai, or submontane strip. Area, 2658 square miles; population (1891), 356,881; (1901), 306,362, showing a decrease of 15·4 per cent.; average density, 115 persons per square mile. Land revenue and rates, Rs.2,59,807, the incidence of assessment being Rs.0.6.9 per acre; cultivated area (1896–97), 262,484 acres, of which 355 were under tea; number of police, 641; vernacular schools, 40, with 1054 pupils; registered death-rate (1897), 37 per thousand.

Nairn, a royal and parliamentary burgh (Inverness group) and the county town of Nairnshire, on the Moray Firth, 15½ miles east-north-east of Inverness by rail. Its dry climate, good beach, and golf-course draw increasing numbers of visitors yearly. New hotels and a large number of new houses have been built, and the burgh boundary has been enlarged; the water-supply is about to be increased, the drainage system extended, and the harbour improved. The public hall contains a museum, reading-room, and library in connexion with an endowed literary institute; there is also a seamen's hall and library, and a convalescent home. New United Free and Established churches have been built. There is a secondary school. Population (1881), 4645; (1891), 4640; (1901), 5105.

Nairnshire, a small maritime county in the north-east of Scotland, bounded on the W. and S. by Inverness-shire, on the E. by Elgin, and on the N. by the Moray Firth.

Area and Population.—In 1891 the barony of Ferintosh, forming part of the parish of Urquhart and Logie-Wester, was transferred to Ross-shire from Nairnshire; of parishes partly in Elgin and partly in Nairn, the parish of Dyke and Moy and part of the parish of Ardclach were given to Elgin; while of parishes divided between Nairn and Inverness, Cawdor was placed wholly in Nairn, Daviot and Dunlichity wholly in Inverness, part of Moy and Dalarossie was added to the parish of Cawdor, and Croy and Dalcross was re-divided. The area of the county (foreshore excluded) is 104,245 acres, or about 163 square miles. The population was, in 1881, 10,455; in 1891, 10,019; in 1901, 9291. On the old area, taking land only (124,968 acres, or 195·3 square miles), the number of persons to the square mile in 1891 was 51, and the number of acres to the person 12·5. In the registration county the population decreased between 1881 and 1891 by 3·4 per cent. Between 1881 and 1891 the excess of births over deaths was 881, and the decrease of the resident population 308. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Per cent. of Illegitimate.
1880	130	37	262	10·6
1890	142	42	205	10·24
1899	149	57	235	8·9

The birth-rate, marriage-rate, and death-rate are all below those for Scotland. The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881–90.	1890.	1891–98.	1899.
Birth-rate . .	27·26	25·66	23·90	23·48	28·51
Death-rate . .	13·53	16·32	16·56	17·89	18·07
Marriage-rate .	3·85	4·83	4·89	4·70	6·91

In 1891 there were 1894 Gaelic-speaking persons in the county, and one foreigner. Valuation in 1899–90, £36,192; 1899–1900, £37,865.

Administration.—The county unites with Elgin to return a member to Parliament, and Nairn (5105), the county town and only royal burgh in the county, is one of the Inverness group of parliamentary burghs. There are four civil parishes and part of a fifth (Croy and Dalcross), all forming the Nairn combination. The number of paupers and dependents in September 1899 was 304. Nairn forms a sheriffdom with Inverness and Elgin, and a sheriff-substitute sits alternately at Nairn and Elgin.

Education.—Five school boards manage 13 schools, which had an average attendance of 1236 in 1898–99, and two voluntary schools (one Roman Catholic) had 52. There is one secondary school in the burgh of Nairn, and the whole of the county and burgh "residue" grant is spent in subsidizing science and art classes in that school, and cookery classes in the county schools.

Agriculture.—In 1898 the percentage of cultivated area was 24·6. Barley and oats are the principal corn crops, covering about equal areas. A great improvement has been notable in the breed of horses. The following table gives the principal acreages at intervals of five years from 1880:—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	26,359	9183	4900	10,010	2188	78
1885	26,152	9338	4695	9,914	2191	14
1890	25,283	9052	4648	9,487	2054	38
1895	25,709	9054	4630	8,626	3337	59
1899	25,748	9022	4601	10,014	2087	22

The following table shows the live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1880	1328	5955	1794	20,108	720
1885	1188	5837	1891	16,438	753
1890	1179	5926	1842	18,441	788
1895	1433	6199	1773	18,335	681
1899	1529	6246	1991	19,360	690

Of the 352 holdings in the county in 1895, the average size was 73 acres; 10·23 per cent. were under 5 acres, 44·32 between 5 and 50 acres, and 45·45 over 50 acres. The number between 50 and 100 acres was 78; between 100 and 300, 75; between 300 and 500, 5; one between 500 and 1000, and one over 1000. There were 12,767 acres under wood in 1895. At the census of 1891, 1130 men and 159 women were engaged in agriculture.

Industries and Trade.—Apart from three distilleries and some sandstone and granite quarries, there is no industry except fishing. In the district of the river Nairn 4600 salmon were caught by fixed nets in 1898.

Najibabad, a town of British India, in the Bijnor district of the North-Western Provinces, 31 miles south-east of Hardwar. Population (1891), 19,410; municipal income (1897–98), Rs.13,161. It was founded in the middle of the 18th century by a Rohilla chief, and still contains several architectural monuments of Rohilla magnificence. It has a station on the Oudh and Rohilkhand Railway, with a junction for the branch to Kotdwara. There is considerable trade in timber, sugar, and grain, and it possesses manufactures of metal-ware, shoes, blankets, and cotton cloth. The nawab of Najibabad was a ringleader during the Mutiny.

Nakskov, a seaport town of Denmark, county Maribo, at the head of a wide bay at the west end of the island of Laaland, 31 miles by rail west of Nykjöbing, with a large sugar factory. The church dates from the beginning of the 15th century; restored in 1859 and 1897. The port was entered by 1016 vessels of 58,385 tons, and cleared by 948 of 57,398 tons in 1899. Population (1880), 5278; (1890), 6722; (1901), 8310.

Namur, a province of Belgium, bordering on the Belgian provinces of Hainaut, Brabant, Liége, and Luxemburg, and on France. It possesses coal mines, employing 2600 workers; iron mines (550 workers); marble, building-stone, and paving-stone quarries, and limestone pits, employing 3400 workers; plastic clays and slates. In general of little fertility, except to the north of the Meuse, the soil produces especially oats, potatoes, rye, beetroot, and fruits (apples and plums). Woods, occupying 27 per cent. of the surface, give cover to the fox, the deer, and the boar. The most noticeable industries are glass, cutlery, and the manufacture of chemical products and of beetroot sugar. The province is divided into three administrative arrondissements, the capitals of which are Namur (32,223 inhabitants in 1900), Dinant (7512), notable for its picturesque situation on the Meuse, and Philippeville (1217). Namur, with an area of 1414 square miles, is one of the least populous of the provinces of Belgium, having (1900) only 346,512 inhabitants, or 245 per square mile. The population, 315,796 in 1876, has thus undergone an increase of 12 per cent., against 27·7 per cent. in the same period for the whole of the kingdom.

Namur, a town of Belgium, capital of the province of the same name, 37 miles south-east of Brussels by rail. Railways connect it with the chief Belgian towns and with France, the duchy of Luxemburg, and Prussia. Population (1880), 25,354; (1900), 32,223.

Nanaimo, a town on Vancouver Island, British Columbia, with valuable coal mines in the immediate vicinity. It is connected with Victoria by the Esquimalt and Nanaimo Railway, and has a daily steamer service to Vancouver. Population about 5000.

Nancy, the old capital of Lorraine and chief town of the French department of Meurthe-et-Moselle, 218 miles from Paris by rail. The population in 1886 was 69,463; in 1896, 83,668 (96,306 in the commune); 102,463 in 1901. It has doubled since 1870 by reason of the large number of Alsatians and of people from Metz (and its district) who transported their families and industries here in order to preserve their French nationality. The town has been made the headquarters of the general command of the 20th *corps d'armée*, owing to the subdivision of the old 6th *corps d'armée* of Châlons-sur-Marne. To facilitate the traffic of the Eastern Railway (the line from Paris to Avricourt and Strasbourg), a circular railway has been constructed skirting the town on the north-east. At the port on the Marne–Rhine canal the shipping totals a tonnage of about 237,400 each year, the goods carried consisting of building materials, iron ore, coal, wood, &c. In 1892 a statue of Claude Gelée, called Lorrain, the celebrated French artist of the 17th century, was erected; in 1896 a monumental obelisk to commemorate the interview between President Carnot and the Grand Duke Constantine of Russia in 1893; in 1885 a pyramid in honour of Dr Crevaux, the explorer of the Amazon; and a statue of Jeanne d'Arc, a reproduction of that erected in Paris, with busts of the caricaturist Grandville and of the satirical poet Gringoire. Nancy has been associated in recent years with the new school of hypnotism, for a discussion of which see HYPNOTISM.

Nandgaon, a feudatory state of India, in the Chhattisgarh division of the Central Provinces. Area, 905 square miles. Population (1881), 164,339; (1891), 183,866; (1901), 126,444; average density, 139 persons per square mile; estimated revenue, Rs.2,61,000; tribute, Rs.70,000. The state owes its origin to a grant from a raja of Nagpur to his family priest in the 18th century. The present chief is a minor, and the administration is under British control. The state has long been well governed, and has derived additional prosperity from the construction of the Bengal–Nagpur Railway, which has a station at Raj-nandgaon, the capital. Here there is a steam cotton mill, with 156 looms and 14,868 spindles, employing 800 hands, and using up 15,528 cwts. of cotton annually.

Nanking, the capital of the provinces of Kiangsu and Anhwei, China. Since 1880 Nanking has been slowly recovering from the state of ruin caused by the Taiping rebellion. Barely one-fourth of the area within the walls has been reoccupied, and though its ancient industries—chief of which was silk-weaving—are reviving, no great progress has so far been made. As the seat of the provincial government, however, which embraces the three provinces of Kiangsu, Kiangsi, and Anhwei, Nanking is a city of first-class importance. The viceroy is the most powerful of all the provincial satraps, inasmuch as he controls a larger revenue than any other, and has the command of larger forces both naval and military. His importance is further enhanced by the fact that, in addition to his other functions, he is superintendent of foreign trade for the southern ports, including Shanghai, a position which gives him great weight in all political questions. Nanking was made a treaty port by the French treaty of 1858, but it was never formally opened. Its proximity to Chinkiang, where trade had established itself while Nanking was still in the hands of the rebels, made its opening of little advantage, and the point was not pressed. It was made a place of call for the landing of passengers by steamer in 1878, and in 1899 it was voluntarily thrown open to foreign trade by the Chinese Government. It contains an arsenal for the manufacture of munitions of war, as also powder mills. A naval college was opened in 1890, and an imperial military college a few years later under foreign instructors. Want of system and of continuity in the method of instruction appears to be nullifying these projects. The population is estimated at 140,000. The only foreign residents are missionaries (mostly American) and employés of the Chinese Government. The only public feature of interest in Nanking is the so-called Ming Tombs, being the mausoleum of Hung Wu, the founder of the Ming dynasty, and one or two of his successors. They lie outside the eastern wall of the city, but they are ill cared for and rapidly going to decay.

Nanning, a treaty port in the province of Kwangsi, China, situated on the West river, 250 miles above Wuchow and 470 miles from Canton. It is the highest point on the West river which is accessible for steam traffic. From Canton, as far as Wuchow, the river has a minimum depth of 8 feet, but on the section from Wuchow to Nanning not more than 3 or 4 feet are found during winter. The town is of considerable size, with a population of 40,000, and constitutes the chief market on the southern frontier. Its opening was long opposed by the French Government, who had acquired the right to build a railway to it from Tongking, by which they hoped to divert the trade through their own possessions. The port has only been lately declared open, but trade is expected to be considerable. Navigation by small native boats is open westwards into Yunnan as far as Posê.

Nansen, Fridtjof (1861——), Norwegian explorer. See POLAR REGIONS and GEOGRAPHY.

Nanterre, town and port on the Seine, arrondissement of St Denis, department of Seine, France, 6 miles west-north-west of the Invalides, Paris, on the railway to St Germain and at the foot of Mount Valérien. The principal manufacture is that of aluminium; it is also noted for cakes, and stone is quarried in the vicinity. Port traffic, 1900, 153,850 tons. The crowning of the Rose Queen, a custom handed down from mediæval times, is annually observed with considerable ceremony. Nanterre (the ancient *Nemptodurum* or *Nemetodurum*) owes its origin to the shrine of Ste Geneviève (420–512), whose name is still associated with various places in the town and district. The combined prison and mendicity depôt for the department is a very large institution, about two miles from the town. The prison is capable of containing 1500 persons, and the mendicity institution 2900. About

7000 men and 2000 women pass annually through the latter establishment. Population (1891), 5056; (1901), 14,140.

Nantes, capital of the department of Loire-Inférieure and the most populous town of Brittany, situated, 247 miles from Paris by rail, on the right bank of the Loire, which here divides into several branches. The maritime port of Nantes, reached by the ship canal from the roadstead of St Nazaire, has been much improved. Booms have been built, and a slipway facilitates the repairing of ships. The port extends over a length of about a mile and a half. The outer port as far as Chantenay has a length of over half a mile. The principal quays extend along the right bank of the branch which flows past the town, and on the western shore of the island of Gloriette. The depth of water alongside these quays varies from 10 to 20 feet; their total length used for trading purposes is 5 miles, and warehouses cover an area of 17 acres. The river port occupies the St Félix and Madeleine branches, and has quays extending 2625 feet, with an average breadth of 130 feet. Finally, on the Erdre is a third port for inland navigation, with a length of 4100 feet and an average breadth of 80 feet. All these quays are bounded by railway lines along the right bank of the river, which the railway to St Nazaire follows. On 31st December 1899 there were 240 ships of 77,474 tons attached to the port, all but 64 being coasting vessels. In 1899, 2814 vessels of 551,701 tons entered and 3029 of 667,355 tons cleared; the foreign trade was represented by 482 entrances of 278,042 tons and by 560 clearances of 309,208 tons, the number of French vessels engaged therein being 188 of 84,058 tons. The value of exports reached £794,796, and that of imports £2,546,000. The chief imports are fine sugar (raw)—Nantes imports more of this commodity than any other port in France—cereals, cocoa, wood for building purposes, coffee, hemp, olive-oil, cellulose pulp, wine, copper, and manure. The exports are grain, flour, and refined sugar. The French colonies, England, Sweden, and Norway furnish the imports—the exports being despatched to England, the French colonies, and Belgium. The chief industries are sugar-refining (30,000 to 35,000 tons are imported, mainly from French colonies), the manufacture of soap (producing 15,000 tons), the husking of rice (9000 tons), and the manufacture of woollen and cotton fabrics, 1507 tons of which are exported. Thirty-three firms manufacture alimentary preserves of fish, especially sardines (4000 to 5000 tons are exported), and of vegetables in tins. The firms engaged in salting lard, beef, and fish export 1000 tons. In 1899, 4,236,000 cubic feet of pine wood imported from Norway and Finland were used in the manufacture of wood pulp, which produced 8800 tons of paper. Several firms manufacture blocks of compressed coal dust, and it is a curious fact that 12,000 tons of coal thus prepared are exported to England. The manufacture of biscuits is important—one firm making 80 tons daily. The millers' trade is of modern establishment. One mill alone treats 400 to 500 tons of wheat daily. One factory sends out annually, amongst other chemical productions, 7000 tons of an acid extracted from the chestnut. Nantes has workshops turning out machinery, boilers, and iron frame-work, and has also shipbuilding yards, foundries, forges, bell-foundries, and tanneries. There are 50 nursery gardens and manufacturers of bottles, stained glass, and tobacco (1800 workmen). Population (1886), 110,638; (1901), 128,349.

Nanticoke, a borough of Luzerne county, Pennsylvania, U.S.A., on the North Branch of Susquehanna river, and on the Central of New Jersey, the Pennsylvania, and the Delaware, Lackawanna, and Western railways, in the eastern part of the state, at an altitude of 540 feet. Its site is level, and its plan fairly regular. It is in the anthracite coal region, is surrounded by mines, and its industries consist chiefly in mining and shipping coal. Population (1880), 3884; (1890), 10,044; (1900), 12,116, of whom 5055 were foreign-born.

Nantwich, a market-town in the Crewe parliamentary division of Cheshire, England, on the river Weaver and the North-Western and Great Western railways. Shrewbridge Hall, formerly a private mansion, was converted into the brine baths hotel for cases of rheumatism, gout, and general debility. Besides its manufactories, the town possesses tanneries and an iron foundry. It is one of the finest fox-hunting centres in the country, being within easy distance of several meets. Population (1881), 7495; (1901), 7722.

Napier, town in Hawkes Bay county, New Zealand, 155 miles east by south of New Plymouth. It has railway communication with Wellington, New Plymouth, and the Wairarapa, Wanganui, and Manawatu districts. Tree-planting, the sinking of artesian wells, and a fine esplanade by the bay have much improved its appearance and comfort. The large breakwater, which will supersede the imperfectly-sheltered Port Ahuriri, is nearly completed. The imports in 1898 were only £181,486, while the exports reached £1,113,242. In 1900 the imports were £219,000, but exports had fallen to £770,000. Population, 9015.

Napier and Ettrick, Francis Napier, Baron [9th Baron Napier of Merchistoun, and 1st Baron Ettrick of Ettrick] (1819–1898), British diplomatist, was born in 1819, and succeeded his father in the peerage in 1834. He entered the diplomatic service in 1840, and was employed in successive posts at Vienna, Constantinople, Naples, Washington, and The Hague. During this time he earned the highest opinions both at home and abroad. In 1860 he became ambassador at St Petersburg, and in 1864 at Berlin. In 1866 he was appointed governor of Madras, and was at once confronted with a serious famine in the northern districts. In dealing with this and other problems he showed great activity and practical sense, and he encouraged public works, particularly irrigation. In 1872 he acted for a few months as Viceroy, after Lord Mayo's assassination; and on Lord Northbrook's appointment to the office he returned to England, being created a baron of the United Kingdom (Baron Ettrick of Ettrick) for his services. He continued, both in England and in Scotland, to take great interest in social questions. He was for a time a member of the London School Board, and he was chairman of the Crofters' Commission in 1883, the result of which was the appointment of a permanent body to deal with questions affecting the Scottish crofters and cottars. He died at Florence, 19th December 1898, leaving a widow and three sons.

Napier of Magdala, Robert Cornelis Napier, 1st Baron (1810–1890), British field-marshal, son of Major Charles Frederick Napier, Royal Artillery, was born at Colombo, Ceylon, on 6th December 1810. He entered the Bengal Engineers from Addiscombe College on the 15th December 1826, and after the usual course of instruction at Chatham, arrived in India in November 1828. For some years he was employed in the irrigation branch of the Public Works Department, and in 1838 he laid out the new hill station at Darjeeling. Promoted captain in January 1841, he was appointed to Sirhind, where he laid out cantonments on a new principle—known as the Napier system—for the troops returning from

Afghanistan. In December 1845 he joined the army of the Sutlej, and commanded the Engineers at the battle of Mudki, where he had a horse shot under him. At the battle of Firozshah on the 31st December he again had his horse shot under him, and, joining the 31st Regiment on foot, was severely wounded in storming the entrenched Sikh camp. He was present at the battle of Sobraon on 10th February 1846, and in the advance to Lahore; was mentioned in despatches for his services in the campaign, and received the medal with two clasps and a brevet majority. He was chief engineer at the reduction of Kote-Kangra by Brigadier-General Wheeler in May 1846, and received the thanks of Government. He was then appointed consulting engineer to the Punjab Resident and Council of Regency, but was again called to the field to direct the siege of Multan. He was wounded in the attack on the entrenched position in September 1848, but was present at the action of Surjkhand, the capture of the suburbs, the successful storm of Multan on 23rd January 1849, and the surrender of the fort of Cheniote. He then joined Lord Gough, took part, as commanding engineer of the right wing, in the battle of Gujrat in February 1849, accompanied Sir W. R. Gilbert in his pursuit of the Sikhs and Afghans, and was present at the passage of the Jhelum, the surrender of the Sikh army, and the surprise of Attock. For his services he was mentioned in despatches and received the medal with two clasps and a brevet lieutenant-coloneley. At the close of the war Napier was appointed civil engineer to the board of administration of the annexed Punjab province, and carried out many important public works during his tenure of office. In December 1852 he commanded a column in the first Hazara expedition, and in the following year against the Boris; and for his services in these campaigns was mentioned in despatches, received the special thanks of Government, the medal and clasp, and a brevet coloneley. He was appointed military secretary and adjutant-general to Sir James Outram's force for the relief of Lucknow in the Indian Mutiny in 1857, was engaged in the actions of Mangalwar, Alambagh, and Charbagh, and the first relief of Lucknow. He directed the defence of Lucknow until the second relief, when he was severely wounded in crossing a very exposed space with Outram and Havelock to meet Sir Colin Campbell. He was chief of the staff to Outram in the defence of the Alambagh position, and drew up the plan of operations for the attack of Lucknow, which was approved by Sir Colin Campbell and carried out by Napier as brigadier-general commanding the Engineers, in March 1858. On the fall of Lucknow Napier was most favourably mentioned in despatches, and made C.B. He joined Sir Hugh Rose as second-in-command in his march on Gwalior, and commanded the 2nd brigade at the action of Morar on the 16th June. On the fall of Gwalior he was entrusted with the task of pursuing the enemy. With only 700 men he came up with Tantia Topi and 12,000 men on the plains of Jaora Alipur, and completely defeated him, capturing all his guns (25), ammunition, and baggage. On Sir Hugh Rose's departure he took command of the Gwalior division, captured Paori in August, routed Firozshah, a prince of the house of Delhi, at Ranode in December, and, in January 1859, succeeded in securing the surrender of Man Singh and Tantia Topi, which ended the war. For his services Napier received the medal with three clasps, the thanks of Parliament and of the Indian Government, and was made K.C.B.

In January 1860 Napier was appointed to the command of the 2nd division of the expedition to China under Sir Hope Grant, and took part in the action of Sinho, the storm of the Peiho forts, and the entry to Peking. For his services he received the thanks of Parliament, the medal with two clasps, and was promoted major-general for distinguished service in the field. For the next four years Napier was military member of the Council of the Governor-General of India and, on the sudden death of Lord Elgin, for a short time acted as Governor-General, until the arrival of Sir W. T. Denison from Madras. In January 1865 he was given the command of the Bombay army, in March 1867 he was promoted lieutenant-general, and, later in that year, appointed to command the expedition to Abyssinia, selecting his own troops and making all the preparations for the campaign. He arrived at Annesley Bay in the Red Sea early in January 1868, reached Magdala, 420 miles from the coast, in April; stormed the stronghold, freed the captives, razed the place to the ground, returned to the coast, and on the 18th June the last man of the expedition had left Africa. He received for his services the thanks of Parliament, the war medal, and a pension. He was raised to the peerage, and made G.C.B. and G.C.S.I. The freedom of the cities of London and Edinburgh was conferred upon him, with presentation swords, and the universities bestowed upon him honorary degrees. In 1869 he was elected a fellow of the Royal Society. He held the command-in-chief in India for six years from 1870, during which he did much to benefit the army and to encourage good shooting. He was promoted general in 1874, and appointed a colonel-commandant of the Royal Engineers. In 1876 he was the guest of the German Crown Prince at the military manœuvres, and from that year until 1883 held the government and command of Gibraltar. In the critical state of affairs in 1877 he was nominated commander-in-chief of the force which it was proposed to send to Constantinople. In 1879 he was a member of the Royal Commission on Army Organization, and in November of that year he represented Queen Victoria at Madrid as ambassador extraordinary on the occasion of the second marriage of the king of Spain. On the 1st January 1883 he was promoted to be field-marshal, and in December 1886 appointed Constable of the Tower of London. He died in London on the 14th January 1890. His remains received a state funeral, and were buried in St Paul's Cathedral on the 21st January. He was twice married, and left a large family by each wife. A statue of him on horseback by Boehm was erected at Calcutta when he left India, and a replica of it was afterwards set up to his memory in Waterloo Place, London. (R. H. V.)

Naples, a city and the chief town of a province, Italy, situated on the north shore of the Bay of Naples, 161 miles by rail east-south-east of Rome. It is the seat of a prefecture comprising the sub-prefectures of Casoria, Pozzuoli, Castellammare, and sixty-eight communes. According to the census of 1881, the population of the province was 1,001,245, and the city 493,115; and in 1901, 1,135,906 and 563,731 respectively. In the later years of this period there was a constant increase of births and a low death-rate (see below). The city proper is about 12 miles in circumference. On the north-east shore of the bay, opposite the ancient site of Pompeii, stands Nuova Pompeii, where is situated the famous sanctuary of the Madonna di Pompeii. On the north-west shore the grotto of Pozzuoli (or Posilippo) has been strengthened by supporting arches, without which it threatened to collapse. Another example of Roman tunnelling is the neighbouring gallery, now dry, bored to convey water to Cumæ from the Lake of Avernus. A tunnel for the railway and steam tramway also runs through the promontory of Posilippo. It is 826 yards long, 13 yards high, 11 yards broad, with pavements for foot passengers 8 feet broad, and with a lift in the centre giving access to the new Parco Savoja. A penal settlement is situated on the island of Nisida, and the Royal Park of Astroni should be mentioned. The Lake of Agnano, as it formerly existed, was also an extinct crater more than two miles in circumference. In 1870, however, it was drained and cultivated, to the great improvement of the air. In 1883 the island of Ischia (famous for its thermal waters) was visited by an earthquake, during which some 4000 inhabitants and visitors were killed. The Via Caracciolo was finally completed in 1891.

The Risanamento.—The curve of the bay is continually being modified by the filling up of the gulf, but indeed, since the cholera epidemic of 1884 the whole city has been rapidly modified by the *Risanamento*, an undertaking designed to purify the city by destroying old houses and *fondaci*, and by constructing large new thoroughfares flanked by hygienic dwellings. Some two-thirds of the work originally planned has been executed, and the remaining third is to be completed at an approximate cost of £1,600,000. The funds for the undertaking were furnished partly by the state, which provided 75,000,000 lire (£3,000,000), and partly by the Risanamento Company, which has a capital of £1,200,000. The work of Risanamento provides labour for a large number of men, but otherwise it confers little benefit upon this class of the population, to whose means the new houses are not adapted. Working-class houses, properly so called, have not been constructed. The old area of 1950 acres has been increased by the districts of Vomero Nuovo, near San Martino. *New Quarters.*—Santa Lucia, near the Castel dell' Ovo; the Sant' Efremo quarter, behind the Albergo dei Poveri; and the districts of Vasto alla Ferrovia; Sirignano alla Riviera; Margherita; the Amedeo Extension; the Avenue Principessa Elena at Mergellina, and the Parco Savoja upon the Posilippo Hill. By degrees the narrow streets and alleys of Porto Mercato, Pendino, and San Lorenzo disappear and are replaced by large thoroughfares, and the famous lanes (Vicoli) of Santa Lucia, with their horrible filth, have also followed suit.

Communications and Lighting.—A more rapid system of city communication corresponds to the growth of the network of streets. The tramway service is exceedingly complete, and on some lines electric traction is employed. Within a short time electricity will be employed throughout the city. The use of electric light is also rapidly extending, and it is already used for the illumination of the theatres, the railway, the hotels, factories, arcades, and the principal streets.

Water-supply.—The cholera epidemic of 1884 led also to the reorganization of the water-supply. Previous to that date concessions had been granted for this purpose. First under the management of an English, and then of a French company, the works which bring the water from the sources of the Serino, on the Avellino Hills, have been completed. The exact spot is the lower source at Urciuoli, 1050 feet above sea-level, which gives a minimum supply of 30,800,000 gallons daily. The higher source at Acquaro has not yet been tapped. The aqueduct, which measures from 5 to 6 feet in diameter, runs for a distance of about 40 miles to Cancello, passing through 49 tunnels of an aggregate length of 10 miles. Thence the water is forced through metal syphons for another 15 miles to the reservoirs of Capodimonte and Scudillo. The gradient is one-half per thousand. Some thirty communes near the line of the aqueduct draw from it their water-supply. The work cost £1,400,000, and the water, which is of excellent quality, is supplied at about 1s. 2d. per 1000 gallons. As a result of the improved water-supply, Naples has been exempt from epidemics, and the average mortality from infectious diseases has fallen to 7·25 per cent., a figure lower than that of any European capital except Brussels, where the average is 6·49 per cent. The reformed sewer system has also contributed to this result. The outfall of sewage is beyond Cape Misenum in the Licola marshes, whither the sewage is carried by two large urban collectors through Cuma and Coroglio.

Castles, Churches, &c.—Castel Capuano, formerly residence of the princes of Anjou, but chosen in 1540 as the Law Courts, is being restored on account of its insecure condition. The Law Courts have therefore been transferred to the Institute of Fine Arts. Castel Nuovo will become the municipal palace as soon as it is freed from the old buildings which surround it. Within niches in the front of the royal palace have been placed, by commission from King Humbert, the statues of Roger the Norman, Frederic II., Charles of Anjou, Alphonso of Aragon, Charles V., Charles III., Joachim Murat, and Victor Emmanuel. The royal palace of Capodimonte was, until the summer of 1900, chiefly used as a modern picture gallery and armoury, but was rarely used as a royal residence, except by Queen Margherita, who retained a small suite of four rooms. Victor Emmanuel III. has, however, made Capodimonte his principal summer palace. He has enlarged the grounds, removed the picture gallery to Caserta, and refurnished the royal apartments. The archbishop of Naples need not necessarily be a cardinal, but is usually of noble birth. The religious houses suppressed in 1868 have been in great part reconstituted, but they no longer figure as recognized corporations. Among the more noteworthy Neapolitan churches should now be mentioned Sant Anna dei Lombardi, with the picture of Christ by Modanino (Guido Paganini); the sacristy of San Domenico Maggiore, with the remains of ten princes of Aragon; and San Severo, containing valuable sculptures by Sammartino Queiroli, Corradini, and Celebrano. There are six non-Catholic churches: English, Scottish, Gallican, German, Greek, and a Jewish synagogue. One of the most noteworthy constructions of modern Naples is the Galleria Umberto I., an extensive arcade inaugurated in 1890 on the site of the squalid Vicolo Campane. The arcade is slightly larger than that of Milan. It has four entrances, a central cupola, and is richly ornamented with gilding and bas-reliefs. Eighty-six shops are in the interior, and ninety on the exterior. A theatre called the Salone Margherita is situated underground.

Libraries and Education.—The libraries number eight. Of these the Nazionale has 600,000 volumes, and that of the Society of Italian History more than 70,000 volumes, dealing with the history, geography, and administration of the Two Sicilies. The foundation-stone of a new university was laid in 1898, but the work of building has not yet begun, as the site is now considered too small for the needs of the city. In 1899–1900, 6000 students were registered, and a similar number were on the books for 1900–1901. Education in general may be said to be steadily progressing, and the number of persons unable to read and write is gradually diminishing. The municipality spends £50,000 for the education of some 25,000 children. The commune of Naples supports 43 day schools and 4 evening schools for boys, 11 evening schools of design, and 40 day schools for girls. Important educational institutions are—(1) The Industrial Museum, supported by the state, the province, and the commune—an institution which comprises several technical schools and schools of art applied to industry; (2) The Vittorio Emanuele Reformatory, founded by the provincial administration; and (3) The Opera Ravaschieri, supported by public subscription, for the education of abandoned children. The Marine Station, of which an account is given under AQUARIA, should also be mentioned.

Charitable Institutions.—The charitable institutions (*opere pie*) have been partially reorganized by grouping together cognate institutions, decreasing the number of employés, and increasing the benefits to the indigent. To the number of those previously existing must be added the new asylum, and the sanatorium for consumptive patients, at San Gennaro di Pozzuoli, generously given to the city by the Duchess Ravaschieri.

New Theatres.—Few changes have taken place in Neapolitan theatres. The *Mercadante* has been renovated and an amphitheatre added; a variety theatre opened at Chiatamone, while the popular *San Carlino* has been demolished in the course of the Risanamento. The *Pulcinella*, also, has disappeared, and has been replaced by small and sparsely-attended music halls.

Shipping.—The improvements in the port and the warehouses have brought Naples up to the level of the principal maritime cities. The minimum depth of water in the harbour is now 19 feet, the average 26 to over 50 feet, though in the small commercial port the depth is only 10 to 13 feet. The old landing-stage of the Immacolatella, near the Custom House, now serves only for small boats, while the new landing-stage, opposite Via Duomo, meets all the requirements of large sea-going steamers. The imports are valued at from 3½ to nearly 5 millions sterling annually, the principal items being cereals, metals, animals and animal foods, stoneware and glass, cottons, and leather wares; and the exports at approximately 2½ millions sterling, live animals and animal produce, cereals, manufactured hemp and flax being the principal. The traffic of the port was in 1900 6,657,185 tons. Italy holds the first place with 2,807,490 tons; Germany comes second with 1,468,290 tons; Great Britain third with 1,298,708; and France fourth with 497,650 tons. Naples is one of the principal Italian ports for the embarkation of emigrants.

Finance.—The financial condition of the municipality of Naples scarcely appears satisfactory. Income amounts to about £950,000 per annum, drawn chiefly from the octrois and from taxes upon comestibles. The octroi is collected by the state, which pays £460,000 per annum to the commune, in addition to which the commune is authorized to collect further indirect taxes to the amount of some £70,000 per annum. The other sources of income, principally direct taxes, yield rather more than £400,000. The total municipal debt, which bears interest at rates varying from 5 to 2 per cent., amounts to £5,500,000, for the service of which £347,612, or rather more than a third of the total municipal revenue, is required. The other items of expenditure are for police, street cleaning, lighting, schools, and the sanitary service.

Industries.—The trade of Naples has undergone some modifications. There are large foundries, iron-works, iron shipbuilding yards at Torre dell' Annunziata, Pozzuoli, and other towns along the shores of the bay. In Naples itself the glove and coral industries have fallen off, but the production of carved wood, bronze and iron bedsteads, goldsmiths' work, lithography, and artificial flowers has, under the influence of the above-mentioned Industrial Museum, considerably increased. This institution, by stimulating work, helps to educate the lower classes by raising their moral and economical condition, and frequently changes the so-called *camorrista* into an honest artisan.

The Camorra.—At the time when the *camorra* existed as an organization young members were known as *garzoni di malavita*, and became later *picciotti di sgarroe*, rising finally to the dignity of *camorrista*. Every quarter of the city had its own special *camorra* jurisdiction, called a *paranza*, with its purser or treasurer, known as the *contatore*. The *camorra* never assumed the form of brigandage, like the Sicilian *maffia*, and very rarely assassinated by order. If weapons were used, they were used in duelling, or *dichiaramenti*, one of the last of which took place in 1892. The *camorra*, indeed, no longer exists in the form of an organized association, but is rather a manifestation of individual bullying, a kind of tax collected by the strong drone from the weak producer. Sometimes, however, it takes the form of obtaining by private initiative redress for injury in cases where official justice is impotent. The word *camorra* is now replaced by the expression *malavita*, the members of which, always armed, or "clothed," according to their slang term, constantly use the revolver and the razor. The revolver is employed between men in a duel; the razor is used to disfigure women in cases of jealousy, or *vendetta*. The authorities have made some efforts to crush out the evil, especially by exiling the worst characters to places of compulsory residence, but they are weak in dealing with the abuse. Of course, as in every large city, thieves and swindlers are plentiful; but they are not necessarily members of the *camorra*, or *malavita*, which is now little more than a legend. It may be said in another sense, however, that the *camorra* has grown upwards, and that highly-placed and well-known *camorristi* infest municipal administration and political life. During elections, both local and general, violence and corruption openly find free play. In the autumn of 1900 revelations made with regard to the power of the *camorra*, in the course of a libel suit, led to the dissolution of the Naples municipality and to the appointment of a royal commissioner. A Government commission of inquiry into the municipal corruption exercised by the *camorra* was also appointed.

The Police Service.—The police service is carried out by 830 policemen (*agenti questurini*), 547 municipal guards, 567 carabineers, and 1195 customs officials. It may be said that the policemen and carabineers alone perform useful service. The absence of respect for authority is noteworthy, and the crowd often takes the part of a criminal in opposition to the police. Criminality, however, shows considerable diminution. In 1899, 4420 thefts (or 1247 less than in 1898), 717 murders (or 53 less than in 1898), and 16,448 cases of wounding (or 2938 less than in 1898) were reported, an improvement which, in the opinion of magistrates, is not to be attributed only to the severity of penalties, but also to a real improvement in the habits of the population. One of the greatest scourges of Neapolitan life is the apparently ineradicable mendicancy of a whole class of paupers, who expose to the public their real or simulated physical woes. The authorities appear impotent to deal effectively with this plague, and the charitable institutions are powerless, because they cannot harbour fictitious paupers who, for their part, have no desire to become inmates of institutions which would prevent them from plying a lucrative and unworthy trade.

The union of Naples with the rest of Italy, while commercially and industrially disadvantageous, has helped to improve the habits, the civilization, and the activity of the Neapolitans. In Naples the upper and middle classes are partisans of unity. The common people are indifferent. The frequency of contact with other provinces is gradually modifying customs and creating a beneficent rivalry. The consciousness of the Neapolitan that he is regarded as an inferior by his countrymen of the North and Centre, while not creating a regionalism proper, doubtless retards the moral and truly national unification of the country.

Napoléon, Victor Jérôme Frédéric (1862– ——), eldest son of Prince Napoleon (see BONAPARTE) and of Princess Clotilde, was born at the Palais Royal, Paris, on 18th July 1862. Upon the overthrow of the Imperial Government he went into exile with his parents, but was brought back by his father as soon as circumstances permitted, and, notwithstanding his princely quality, received the ordinary public school education of a young Frenchman. By the death of his cousin the Prince Imperial (see BONAPARTE) in 1879 his father became head of the Bonaparte family and the Imperialist party, a considerable section of which, notwithstanding, alarmed at Prince Napoleon's democratic and anti-clerical opinions, wished to depose him in favour of Prince Victor. The latter resisted all attempts to estrange him from his father until 1884, when he consented to place himself at the head of the more conservative, who were probably the more numerous, section of the Bonapartists. Both princes were expelled from France in 1886; the son withdrew to Brussels, the father to Switzerland, and no reconciliation ever took place. By the death of his father in 1891 Prince Victor Napoleon became undisputed head of the Imperialists, though there were some who looked hopefully towards his younger brother Louis, a military officer in the Russian service.

Nara, the first permanent capital of Japan, situated in the province of Yamato, 25½ miles from Osaka (by rail), with a population of 30,539. Up to the beginning of the 8th century the Imperial Court changed its location at the accession of each sovereign, and the court's place of residence naturally became the official metropolis. But Nara remained the metropolis during seven consecutive reigns (709 to 784), and its seventy-five years of favoured existence sufficed for the building and furnishing of several imposing shrines and temples, for the laying out of a noble park, for the casting of a colossal image of Buddha, and for the execution of many other beautiful specimens of applied art. Not much is known of the Nara palace in its original form, but many of the articles and ornaments used by its inmates survive in a celebrated collection which, during nearly twelve hundred years, had been preserved in a store-house connected with the Shôsô-in. This collection cannot be visited by strangers more than once a year, and even then only by special permission. But some of the massive and beautiful temples erected in the days of the city's greatness stand still intact, and their graceful proportions, together with the sculptures and paintings they contain, speak eloquently of a refined and even luxurious civilization.

Not less remarkable was the vigorous growth of the Buddhist creed throughout the Nara epoch. This faith in the 8th century assumed the dimensions almost of a mania, and found outward expression in many striking architectural and artistic works. The best of these, namely, those dating from the first half of the century, show Indo-Grecian affinities, which gradually grow fainter as the end of the epoch approaches. The huge bronze image of Lochâna Buddha in the temple called Todai-ji is often spoken of as the most remarkable of the Nara relics; but however beautifully proportioned the great idol may have been originally, clumsy restorations in consequence of fires and other accidents have so marred it that it can no longer be compared with many smaller examples of contemporaneous and subsequent sculpture. More worthy of close attention are two effigies of Brahma and Indra preserved among the relics of Kobuku-ji, which, with Kasuga-no-Miya, Ni-gwatsu-dô, and Tôdai-ji, constitute the chief religious edifices. These figures, sculptured in wood, have suffered much from the ravages of time, but nothing could destroy the grandeur of their proportions or the majesty and dignity of their pose. Several other works of scarcely inferior excellence may be seen among the relics, and at the shrine of Kasuga is performed a religious dance called Kagura, in which the costumes and gestures of the dancers are doubtless the same as those of twelve centuries back. Although a railway now gives access to the town, Nara has not suffered at the hands of the iconoclast. Every effort is made to preserve all the ancient features in their entirety. A museum has been formed, where many antique objects of great interest are displayed, as well as works from the hands of comparatively modern artists. Nara in the days of its prosperity is said to have had a population of a quarter of a million. (F. BY.)

Narbonne, chief town of arrondissement, department of Aude, France, 37 miles east of Carcassonne by rail. The remains of the ancient fortifications in the vicinity of the railway station have been removed and the site occupied by a new and well-built quarter. An œnological station was formed in 1894. Population (1881), 25,076; (1891), 24,640; (1901), 28,892.

Nares, Sir George Strong (1831-——), British vice-admiral and Arctic explorer, son of Captain W. H. Nares, R.N., of Aberdeen, was born in 1831, and after passing through the Royal Naval College at New Cross, entered the navy in 1846. His first experience of the Arctic regions was in the *Resolute* (1852–54), with Mecham; and he subsequently served in the Crimea, and was employed in surveying work in different parts of the world. Between 1872 and 1874 he commanded the *Challenger* in the famous voyage of deep-sea exploration. In 1875 Captain Nares was appointed to command the *Alert* in the Arctic expedition of that year, in company with the *Discovery* (Captain Stephenson). In the face of unparalleled difficulties he took the ships farther north than had been reached before (82° 27′ N.), and after encountering the greatest difficulties and hardships, he brought the ships both safely home in October 1876. It was on this expedition that Lieutenant (afterwards Admiral) A. H. Markham, with sledges, reached 83° 10′ 26″ N. On their return Nares was made K.C.B.; and in 1878 he was sent in command of the *Alert* to survey Magellan Strait, South America. From 1879 to 1896 he was attached to the Harbour Department of the Board of Trade. He became a vice-admiral in 1892. Sir George Nares published various accounts of his explorations, and a *Naval Cadets' Guide*, which went through several editions. (See also POLAR REGIONS, GEOGRAPHY.)

Narni, a town and bishop's see in the province of Perugia, Umbria, Italy, on a height (1191 feet) above the Nera, 8 miles by rail south-west of Terni. The cathedral dates from the 13th century. There are remains of the bridge of Augustus, and of an ancient aqueduct. The town has mineral springs. Narni was the birthplace of the Emperor Nerva, of Pope John XIII. (965–972), and of the 15th-century condottiere, Erasmus of Narni, known as Gattamelata. There have been bishops since the year 369. Population about 3000.

Narsinghgarh, a native state of Central India, in the Bhopal agency. Area, 623 square miles. Population (1881), 112,427; (1891), 116,280; average density, 186 persons per square mile. Estimated revenue, Rs.5,00,000; tribute to Holkar, Rs.85,000. The chief, whose title is raja, is a Rajput of the Omat clan. The state was founded about 1681 by a minister of Rajgarh, who compelled the ruler of that state to transfer to him half his territory. The present raja is a minor, and is being educated at the Daly College at Indore, while the administration is being conducted under British supervision. The town of Narsinghgarh is situated in 23° 42′ N. and 77° 5′ E. Population (1881), 11,400; (1891), 8561.

Narsinghpur, a town and district of British India, in the Nerbudda division of the Central Provinces. The town is on the river Singri, a railway station 52 miles east of Jubbulpore. Population (1881), 10,222; (1891), 10,220.

The district of NARSINGHPUR has an area of 1916 square miles; population (1881), 365,173; (1891), 367,026; (1901), 313,829; showing a decrease of 14·5 per cent. between 1891 and 1901; average density, 164 persons per square mile, being the highest for any rural district in the province. The land revenue in 1897–98 was Rs.6,28,325, the incidence of assessment being R.0.9.5, the highest rate in the province; cultivated area (1897–98), 545,278 acres, of which 3141 were irrigated; number of police, 355; boys at school (1896–97), 6307, being 22·8 per cent. of the male population of school-going age; registered death-rate (1897), 73·65 per thousand. The principal crops are wheat, rice, millet, pulse, oilseeds, and cotton. There are manufactures of cotton, silk, brass, and iron-ware. At Mohpani is a coal-mine, which employs about 276 persons and has an output of 22,472 tons. The Great Indian Peninsula Railway runs through the district for 70 miles, with seven stations, besides a branch to Mohpani.

Narva (*Rugodiv* of Russian annals, also *Ivan-Gorod*), a seaport and fortress of Russia, government and 100 miles west of St Petersburg, on Narova river, which flows from Lake Peipus or Chudskoye, and enters the Gulf of Finland in Narva Bay (100 miles long and 55 miles wide), 8 miles below this town. Only ships of 7 feet draught can enter the river. The town was founded in 1223 by Danes, and changed hands between Teutonic knights, Danes, Swedes, and Russians until it was taken by Peter I. in 1704, after the Russians had suffered a terrible defeat four years before. Its fortress, built on the right bank of the river, and known as Ivan-Gorod, has lost its importance, and is abandoned. The cathedral and the town hall (1683) contain many interesting antiquities. The population in 1897 was 16,577. There are two gymnasia for boys and for girls, a navigation school, and an Esthonian school. It has several important manufactories on the waterfalls of the Narova—cotton-mills (388,812 spindles, £971,500 yearly returns), woollen cloth mills (12,300 pieces of cloth), flax and jute mills, saw mills, and steam flour mills. The port is visited every year by about a hundred vessels. A wealthy watering-place has grown up at Ust-Narova, or Hungezburg, at the mouth of the Narova.

Narvacan, a town near the centre of the province of South Ilocos, Luzon, Philippine Islands, and a mile from its Pacific coast. It lies in a level valley surrounded by mountains, and has a cool and healthful climate. The soil, not only in the valley, but also on the neighbouring mountain-sides, is very fertile, and produces rice, Indian corn, cotton, tobacco, and sugar-cane. Many of the inhabitants manufacture salt from sea-water, and others cut and market the hard-wood trees of the adjoining forests Cotton fabrics are woven by the women and sold to the pagan mountain tribes. The language is Ilocano. Population, 16,000.

Nashua, a city of New Hampshire, U.S.A., capital of Hillsboro county, on the Nashua river, at its junction with the Merrimac, and on the Boston and Maine Railroad, in the southern part of the state, at an altitude of 120 feet. The city has an irregular plan, is divided into nine wards, and derives its water supply from Pennichuck creek by pumping. Its prominence as a manufacturing city is due to the fine water-power derived from the rivers. Its manufactures are varied, consisting largely of cotton, iron and steel goods, and paper. Population (1890), 19,311; (1900), 23,898, of whom 8093 were foreign-born and 62 negroes.

Nashville, the second largest city of Tennessee, U.S.A., capital of Davidson county and of the state, on both banks of the Cumberland river, which is here navigable, near the centre of the state, and at an altitude, at the Union depôt, of 435 feet. The city is irregularly laid out, on a hilly picturesque site, is divided into 20 wards, has an excellent water supply, owned by the city, and is paved in the business parts with brick and granite blocks, while the residential streets are macadamized. Several lines of the Louisville and Nashville, and the Nashville, Chattanooga, and St Louis railways furnish communication in all directions. Besides the state buildings and institutions, Nashville contains several institutions for higher education. Among them are Vanderbilt University, with, in 1899, 93 instructors and 766 students; the University of Nashville, with 70 instructors and 1306 students; Roger Williams University, with 9 instructors and 130 students; Fisk University (for coloured), with 31 instructors and 249 students; and Central Tennessee College (also for coloured), with 36 instructors and 327 students. All these institutions are co-educational. There are also two colleges for women. In 1890 the manufacturing establishments numbered 420, with a capital of $9,904,295. They employed 8122 hands, and the products had a value of $14,590,823. These products were varied, the only item of importance being lumber. Near Nashville are the Hermitage, the home of General Andrew Jackson; Belle Mead, a famous stock-farm; and a national cemetery. The assessed valuation of property, real and personal, was in 1899, $36,429,396, the net debt of the city was $3,413,500, and the rate of taxation $24.50 per $1000. Population (1890), 76,168, of which only 3794 were of foreign birth and 29,395 were coloured; in 1900, 80,865, of whom 3037 were foreign-born and 30,044 negroes.

Nasik, a town and district of British India, in the Deccan division of Bombay. The town is on the Godaveri river, 4 miles from a railway station, 117 miles north-east of Bombay. Population (1881), 21,660; (1891), 24,429. Nasik is a very holy place of Hindu pilgrimage, being 30 miles from the source of the Godaveri. It has manufactures of cotton goods, brass-ware, and mineral waters, besides a high school, with 375 pupils in 1896–97, and four printing-presses, each issuing a vernacular newspaper.

The district of NASIK has an area of 5940 square miles; population (1881), 781,206; (1891), 843,582; (1901), 819,575, showing an increase of 8 per cent. between 1881 and 1891, but a decrease of 2·8 per cent. between 1891 and 1901; average density, 138 persons per square mile. The land revenue and rates in 1897–98 were Rs.19,80,547, the incidence of assessment being R.0.11.2 per acre; cultivated area (1897–98), 1,830,000 acres, of which 92,309 were irrigated from wells, &c., including 23,312 acres from Government canals; number of police, 947; children at school (1897–98), 16,479, being 1·9 per cent. of the total population; registered death-rate (1897), 54·77 per thousand, being the highest in the province. The principal crops are millet, pulse, wheat, and oil-seeds. Yeola is an important centre for weaving silk and cotton goods; there are flour-mills at Malegaon, and the railway workshops at Igatpuri employ 400 hands. There are cantonments at Deolali and Malegaon. The district is crossed by the main line and also by the chord line of the Great Indian Peninsula Railway.

Nasirabad, or MYMENSINGH, a town of British India, headquarters of Mymensingh district in Bengal, situated on the left bank of the old channel of the Brahmaputra, which is only navigable during the rainy season. It is the terminus of a branch of the Eastern Bengal Railway from Dacca (76 miles), which has been extended to Jagannathganj, on the Jamuna or main stream of the Brahmaputra (56 miles). Population (1881), 10,561; (1891), 11,555. The high school had 290 pupils in 1896–97. The earthquake of 12th June 1897 destroyed the church and the high school, and seriously damaged other public buildings.

Nasmyth, James (1808–1890), Scottish engineer, was born in Edinburgh on 19th August 1808, and was the youngest son of Alexander Nasmyth, the "father of Scottish landscape art." He was sent to school in his native city, and then attended classes in chemistry, mathematics, and natural philosophy at the University. From an early age he showed great fondness for mechanical pursuits, and the skill he attained in the practical use of tools enabled him to make models of engines, &c., which found a ready sale. In 1829 he obtained a position in Maudslay's works, where he stayed two years, and then, in 1834, started business on his own account in Manchester. The beginnings were small, but they quickly developed, and in a few years he was at the head of the prosperous Bridgewater foundry at Patricroft, from which he was able to retire in 1856 with a fortune. The invention of the steam-hammer, with which his name is associated, was actually made in 1839, a drawing of the device appearing in his note-book, or "scheme-book," as he called it, with the date 24th November of that year. It was designed to meet the difficulty experienced by the builders of the *Great Britain* steamship in finding a firm that would undertake to forge the large paddle-wheel shaft required for that vessel, but no machine of the kind was constructed till 1842. In that year Nasmyth discovered one in Schneiders' Creuzot works, and he found that the design was his own and had been copied from his "scheme-book." His title, therefore, to be called the inventor of the steam-hammer holds good against the claims sometimes advanced in favour of the Schneiders, though apparently he was anticipated in the idea by Watt. Nasmyth did much for the improvement of machine-tools, and his inventive genius devised many new appliances—a planing-machine ("Nasmyth steam-arm"), a nut-shaping machine, steam pile-driver, hydraulic machinery for various purposes, &c. In his retirement he lived at Penshurst in Kent, and amused himself with the study of astronomy, even publishing a book on the moon in conjunction with Carpenter. He died in London on 7th May 1890. His *Autobiography*, edited by Dr Samuel Smiles, was published in 1883.

Nasr-ed-Din (1829–1896), Shah of Persia, was born 4th April 1829. His mother, a capable princess of the Kajar family, persuaded Shah Mohammed, his father, to appoint him heir apparent, in preference to his elder brothers; and he was accordingly made governor of Azerbaijan. His succession to the throne, 13th October 1848, was vigorously disputed, especially by the followers of the reformer El Bab, upon whom he wreaked terrible vengeance. In 1855 he re-established friendly relations with France, and coming under the influence of Russia, signed a treaty of amity, 17th December 1855, with that Power, but remained neutral during the Crimean war. In 1856 he seized Herat, but a British army under Outram landed in the Persian Gulf, defeated his forces, and compelled him to evacuate the territory. The treaty of peace was signed at Paris, 4th March 1857, and to the end of his reign he treated Great Britain and Russia with equal friendship. In 1866 the Shah authorized the passage of the telegraph to India through his dominions and reminted his currency in the European fashion. In 1873, and again in 1889, he visited England in the course of his three sumptuous journeys to Europe, 1873, 1878, 1889. The only results of his contact with Western civilization appear to have been the proclamation of religious toleration, the institution of a postal service, accession to the postal union, and the establishment of a bank. He gave the monopoly of tobacco to a private company, but was soon compelled to withdraw it in deference to the resistance of his subjects. Abstemious in habits, and devoted to music and poetry, he was a cultured, able, and well-meaning ruler, and his reign, already unusually long for an Eastern potentate, might have lasted still longer had it not been for the unpopular sale of the tobacco monopoly, which was probably a factor in his assassination at Tehran on 1st May 1896, by a member of the Babi faction. He was succeeded by his son Muzaffer-ed-din.

NATAL.

I. Geography and Statistics.

THE area of Natal was increased at the latter end of 1897 by the annexation of Zululand, including the British Amatongaland Protectorate. The colony comprised in 1901 an area of 31,307 square miles, with a seaboard of 376 miles. Lying between the 26th and 32nd parallels of S. latitude, it was bounded on the N. and N.W. by the Portuguese possessions and the Transvaal Colony (late South African Republic), on the W. by the Orange River Colony (late Free State) and Basutoland, and on the S. by the Cape Colony and Umtamvuna river. The area of the province of Zululand is estimated at 10,456 square miles, including the lake of St Lucia, which is about 680 square miles in extent. Nearly one-third of the province is comprised of a low-lying belt along the sea coast, from 20 to 30 miles in width, extending from the Umhlatuze river to the Portuguese possessions, which form its northernmost boundary. This belt is, for the most part, marshy, sparsely populated, and unhealthy for Europeans, especially during the midsummer months. The remainder of the country consists chiefly of an elevated plateau varying from 1000 to 5000 feet in height, and the climate here is healthy for Europeans. These uplands are abundantly watered, and to a considerable extent are suitable for both pastoral and agricultural purposes, particularly towards the west, south of the Umhlatuze river. Maize and other cereals form the principal articles of cultivation. All the magistracies are connected by waggon road, and regular postal communication is maintained between them by means of native runners.

As the result of the Boer war, a further addition was made in 1902 to the territory comprised in Natal, consisting of a portion of what had previously been included in the Transvaal Republic. The addition resulted from communications which passed between the Natal Government and Lord Milner at the end of 1901, and was sanctioned by the Imperial Government in March 1902. The Natal Government originally made two proposals for annexing new territory :—

1. It was proposed that the following districts should be transferred to Natal, viz., the district of Vryheid, the district of Utrecht, and such portion of the district of Wakkerstroom as was comprised by a line drawn from the north-eastern corner of Natal, east by Volksrust in a northerly direction to the summit of the Drakensberg Range, along that range, passing just north of the town of Wakkerstroom, to the head waters of the Pongola river, and thence following the Pongola river to the border of the Utrecht district. In consideration of the advantage to Natal from this addition of territory, Natal should take over £700,000 of the Transvaal debt.

2. It was proposed to include in Natal such portions of the Harrismith and Vrede districts as were comprised by a line following the Elands river north from its source on the Basutoland border to its junction with the Wilge river, and thence drawn straight to the point where the boundaries of Natal, the Transvaal, and the Orange River Colony meet on the Drakensberg. In consideration of this addition to her territory, Natal should take over a portion of the Orange River Colony debt, to be raised at the end of the war to the amount of £200,000.

The Imperial Government decided to sanction only the first of these two proposals, the reasons for this decision, with the result to Natal, being indicated in the following passage from Mr Chamberlain's despatch in March 1902 on the subject :—"The (1902) existing boundary between Natal and the Transvaal is not marked by strong natural

Sketch Map of Natal.

divisions, and is undoubtedly inconvenient—large wedges of Transvaal territory being interposed between the northern part of Natal and Zululand, while the natives of the districts to be transferred are closely allied to those of the adjoining portions of Natal. With regard to Vryheid this is pre-eminently so. The natives of Vryheid are Zulus, and still, as I understand, consider themselves as part of the nation; and it therefore will be a natural and convenient arrangement that they should be placed under the Zululand administration. The district was only separated from the rest of Zululand in 1883 by a raid of armed Boers, who established a republic, which was incorporated in the late South African Republic in 1888. In handing over this district to the administration which controls the rest of Zululand, His Majesty's Government feel that they are reuniting what ought never to have been separated. With regard, however, to the proposed transfer of territory from the Orange River Colony, the circumstances are different. There is no such historical reason as exists in the case of Vryheid for making the transfer. On the contrary, the districts in question have invariably formed part of the state from which it is now proposed to sever them, and they are separated from Natal by mountains which form a well-defined natural boundary. In these circumstances, His Majesty's Government have decided to confine the territory to be transferred to the districts in the Transvaal. These districts, according to such statistics as are available, appear to contain not less than 8000 white inhabitants and some 50,000 natives, and have an area of upwards of 7000 square miles, which will mean an addition to the white population of Natal of about one-seventh, to her native population of about one-sixteenth, and to her territory of about one-fourth."

Geology.—The geology of Natal and Zululand resembles to a great extent that of Cape Colony. The physical features are also very similar. In both cases the upland plateaux consist of the more or less horizontally bedded rocks of the Karroo formation, with its included coal and iron deposits; and here and there local outcrops of older sedimentary and metamorphic rocks have been exposed by denudation. This formation has produced interesting collections of fossil Reptilian and Batrachian remains, while in its coal-bearing series several genera of plants occur, together with the remains of Palæoniscid fish. Reptilian remains have been found in the neighbourhood of Weston, on the Mooi river and other localities in the Drakensberg, while fossil fish have been reported from the Biggarsberg. The coastal area of Natal and the southern portion of the littoral of Zululand are formed chiefly of Dwyka Conglomerate with the overlying Ecca shales, while the northern littoral of Zululand consists of Recent and Pleistocene sands overlying Mesozoic beds of Upper Cretaceous age. The Dwyka Conglomerate is extensively quarried near the mouth of the Umgeni river near Durban. In places distinct and undoubted evidence exists of the glacial conditions which obtained during its deposition. On the western side of the Inchanga granite this formation forms an extensive outcrop which extends through the colony. To the west of this outcrop the Dwyka and Ecca beds pass under the Karroo formation, and practically exist underlying that formation across the whole South African continent until they again crop out in the district of Kimberley, Griqualand West, and Bushmansland. The country intervening between the upland plateaux and the coastal area consists of granite, metamorphic, and sedimentary rocks which are older than the Dwyka Conglomerate, but which have not yet been satisfactorily correlated with the pre-Mesozoic rocks in other parts of South Africa. Of sedimentary rocks we have the horizontally and false-bedded sandstone series, which form the flat-topped mountains so characteristic of this region, and are classed by Dr Sutherland and Mr Griesbach as Table Mountain sandstones, and by Mr E. J. Dunn as belonging to the Witteberg and Zuurberg series of Cape Colony. Exposures of the fundamental rocks of the colony, granites, gneisses, and schists, occupy a considerable belt of country, passing from the coast near Port Shepstone in a north-easterly direction through Natal by Inchanga and the Noodsberg Mountain, and extending into Zululand, where they are exposed in the valleys, in the western portion of the province as far north as Melmoth, by the denudation of the overlying coal-bearing formation. To the east of Eshowe the Ungoye Mountains are formed of these rocks, and in the neighbourhood of the Hlabisa magistracy a small area of granite occurs. The minerals that are known to occur in the colony have chiefly been discovered in these granitic and metamorphic areas. Representatives of the formations younger than the Karroo are of rare occurrence, and are only present as outliers on the coast. These consist of rocks of Upper Cretaceous age. Wherever they are exposed these rocks contain large quantities of marine organisms. From a comparison of these fossils with those from the Cretaceous rocks of Southern India it has been deduced that they are of the same age as the Trichinopoly series of India. In the case of one form, *Ammonites Gardeni*, its occurrence is common to the Upper Cretaceous of Southern India, Australia, and Vancouver Island, Canada. In the neighbourhood of Lake Sibayi, towards the borders of Amatongaland, beds of Chalk occur, associated with the fossiliferous rocks. From the highest beds of the Karroo formation down to the lowest portion of the Ecca, the whole series is seamed with intrusive dykes and sills of volcanic rock, chiefly of a basaltic type, and rarely showing olivine as a constituent. In the coal-producing areas the intrusion of these basaltic rocks in close proximity to the seams of coal has frequently rendered them of little value by converting them into anthracitic coals of inferior quality or altogether burning them up. There are few, if any, coal-seams which have not locally undergone alteration or destruction from this cause. Natal possesses a valuable coalfield in Klip River county. In 1881 Mr F. W. North, who was engaged by the Government to report on the coalfields of the colony, estimated for the coalfield referred to "a total area of 1350 square miles that may be depended upon for supply." The number of producing collieries in 1898 was seventeen, situated between Elandslaagte and Newcastle.

The comparative outputs in the years specified were:—

1889.	1894.	1898.	1901.
25,609 tons.	141,010 tons.	387,811 tons.	567,460 tons.

A coalfield which will probably be of equal value exists in the coast and northern districts of Zululand, but in the absence of means of transport it is unworked. The area is at present very imperfectly known, but may be about 800 square miles. When opened the coal appears, as a rule, to be harder than in the Klip river coalfields, the general difference in the nature of the coals being somewhat similar to that between the Welsh and North of England coals. Near the Umlalazi river, on the Zululand coast, however, bituminous coals are found. The thickest seam worked on the Klip River coalfields gives 5 feet 3 inches of coal. One seam opened in a shaft near the Ingalazi river in Zululand gives over 40 feet of coal when cut, but diminishes in thickness away from the shaft. Iron ore and limestone are found on both the coalfields mentioned, but no iron-smelting is at present carried on.

Climate.—The following is the mean for the twelve years 1885–96:—

Mean of Temperature.	Degrees.
Maximum	80·42
Mean	71·82
Minimum	61·50
Rainfall in inches	40·19

Population.—The following return shows the increase of population at intervals of five years:—

Year.	Europeans.	Indians.	Natives.	Total.
1874	18,646	6,787	281,797	307,230
1879	24,654	16,999	319,934	361,587
1884	35,453	27,276	361,766	424,495
1889	37,390	33,480	459,288	530,158
1894	45,707	35,411	503,208	584,326
1898	53,688	61,103	787,574	902,365

The returns for 1898 include the population returns for the province of Zululand, viz., Europeans, 1305; Indians, *nil;* natives, 200,330. Of the Indian population, a large number are under indenture of service in the colony. Of the European population, one-fifth approximately is of Boer extraction. The two principal towns of the colony are Durban (*q.v.*) and Pietermaritzburg (*q.v.*). The third in importance is Ladysmith, situate 119¼ miles from Durban on the main line to Johannesburg. It is a military station, and has a population, exclusive of troops, of 1800 Europeans, 1200 Indians, and about 1000 natives. Newcastle, 268 miles by rail from Durban, has a population of about 1200 Europeans and about 1100 coloured people. The four above-mentioned towns have municipal corporations. Other towns are: Dundee, the centre of the coal-mining industry, with a population of about 2000; Verulam, the principal town of Victoria county, distant 20 miles north of Durban, with total population of about 1000; Greytown, Estcourt, Harding, Richmond, Stanger, Howick, Pinetown, Umzinto, Weenen, Port Shepstone, Eshowe (Zululand).

The Registrar-General gave the following returns for 1898:—

Total marriages (by Christian rites)	1211
Total births	2713
Total deaths	1075
Increase of population by births over deaths	1638

The above returns do not include natives or Indians, there being no complete system of registration as far as they are concerned.

The following is an abstract of the religious returns:—

Denomination.	Places of Worship.	Average Attendance.
Church of England	120	10,070
Church of Rome	23	7,040
Wesleyan Methodist	405	26,655
Other	226	18,984

A comparatively small number of the South African natives have embraced Christianity.

Constitution.—The affairs of the colony were administered, under the Royal Charter of 1856, by a Governor assisted by an Executive and a Legislative Council up to 1893, in which year responsible government was established. The Legislative Council, consisting of twelve members, is summoned by the governor in council. The Legislative Assembly is an elective body, and consists of thirty-nine members. There are fifteen electoral districts, including two for the province of Zululand. The ministers, six in number, must hold seats either in the Legislative Council or Legislative Assembly.

Instruction.—Education is not compulsory, nor is it free, except where it is certified that the parents or guardians are unable to pay the school fees. Of the European children, but a very small proportion do not receive education at one or other of the schools. The number of schools under Government inspection is as follows:—

		Attendance.
European	303	8,674
Native	184	10,243
Indian	32	3,214
	519	22,131

Included in the above are the following Government schools:—

		Attendance.
High schools	2	264
Primary schools	18	4834
Model ,,	5	
	25	5098

The number of free pupils attending Government schools during the year 1899 was 470. The school fees paid into the treasury for the year ending 30th June 1899 amounted to £7904. The expenditure by Government on education for year ending 30th June 1899 was £56,048. Although education in Natal is for the most part controlled by Government, there are a good many schools, both primary and secondary, which are not under inspection. These private and denominational schools are mostly doing excellent work. To encourage the instruction of the children of farmers and others who reside so far from a Government or Government-aided school that they cannot avail themselves of the education therein provided, the Government pays grants-in-aid at the rate of £3 for each pupil under Standard VI., and £4 for each pupil in Standards VI. and VII., attending farm schools. An excellent cadet system is in force at all the Government boys' schools, and is very popular. Under this system the boys receive a military training, are taught the use of firearms, and attend an annual encampment.

Finance.—The following are the figures for revenue and expenditure:—

	Revenue.	Expenditure.
1874	£249,249	£254,402
1879	473,478	490,826
1884	610,937	707,529
1889	1,327,105	1,146,080
1895–96	1,169,781	1,148,094
1898–99	2,019,361	1,951,835

The largest items of revenue are derived from the railway, customs, and native hut tax. The public debt, which in 1874 was £331,600, amounted in 1898–99 to £9,019,143.

Defence.—Before the Boer war (1899) a large force of Imperial troops was stationed in the colony, the principal garrison towns being Pietermaritzburg and Ladysmith. The local forces consisted of the Natal Police (650 mounted Europeans, 45 Indian constables, and 900 natives) and volunteers numbering nearly 2000, chiefly mounted. Rifle associations also existed all over the colony. Two batteries, of two 6-inch B.L. guns each, commanded the approach to Durban harbour, the guns being manned by the Natal Naval Volunteers.

Stock.—Generally speaking, it may be said that the country over a belt of fifteen miles along the coast is unsuited for stock-farming. Horse-breeding is successfully carried on in the upper districts. The higher the altitude the healthier the animals and the greater their immunity from disease. Horse-sickness, a kind of malarial fever, which takes an epidemic form in very wet seasons, causes considerable loss. Cattle-breeding is probably the most lucrative branch of stock-farming, the country being pre-eminently adapted for horned cattle. Rinderpest recently swept through South Africa, and probably carried off in Natal from 30 to 40 per cent. of the stock of Europeans, while the natives' losses were even heavier. Serum and bile inoculation were undoubtedly the means of saving a very large percentage of the herds. The farmers soon began to recover from their losses. Attention has been given to improving the breed of cattle by the introduction of Shorthorn, Devon, and Holstein (or Friesland) stock. The principal breed of sheep is the merino, which does well in the higher altitudes. A Scab Act is in force, and is stringently carried out by Government inspectors, with most satisfactory results. The Angora goat thrives well in certain districts. Ostriches do well in the dry, arid valleys of the Tugela and Mooi rivers. Summary of stock on 31st December 1898:—

Description.	European.	Indian.	Native.	Total.
Horses	32,771	593	24,611	57,975
Cattle	155,456	1025	122,077	278,558
Sheep	543,619	7	56,403	600,029
Goats	98,510	2352	351,528	452,390
Pigs	15,081	1124	20,499	36,704
Mules	2,300	...	...	2,300
Donkeys	1,360	...	...	1,360
Ostriches	720	...	...	720
	849,817	5101	575,118	1,430,036

These figures are inclusive of the province of Zululand.

Agriculture.—Mealies (or maize) continue to be the chief crop, forming the staple food of the natives. Tea is now being largely grown in the coast districts, and the industry is likely to increase in importance. Already the annual yield exceeds a million pounds, and it is believed that other districts will be found suitable for the growth of the plant. Sugar continues to be an important coast product; the output of 1898 was 30,000 tons. Large quantities of the black wattle tree (*Acacia mollissima*) are now being grown, the bark forming an important article of export. The value of the bark shipped in 1898 was £57,888; the wood of the tree also commands a ready sale. The cultivation on the coast of tropical fruits, such as pineapples, bananas, mangoes, citrus fruits, &c., is being annually extended. Other fruits—apples, peaches, plums, pears, &c.—do well in some of the midland and upper districts.

Commerce.—In 1898 a Customs Union Convention was concluded between the Governments of the Cape Colony, Orange Free State, and Natal "on the basis, firstly, of a uniform tariff on all imported goods consumed within the union; and secondly, of free trade between the colonies and states in respect of all South African products." The union tariff imposes taxes on imported foods and other goods the like of which is produced within the union, and allows the free importation of articles used in such production. The Transvaal did not join the union, but the Convention made provision for a rebate of the whole or any part of the customs duty on imported goods removed to a country outside the union. Of the total imports of merchandise into the colony, about one-third are entered in transit for the Transvaal. The following are the trade and shipping returns for the years specified:—

Year.	Imports.	Exports.	Customs Revenue.	Shipping.	
				Entered.	Cleared.
	£	£	£	tons.	tons.
1874	1,121,948	770,034	109,725	64,156	62,128
1879	2,176,356	583,711	228,558	207,029	205,054
1884	1,675,850	957,918	179,908	210,181	212,604
1889	4,527,015	1,656,318	369,461	513,360	499,748
1894	2,316,596	1,197,611	193,199	732,997	730,925
1899	5,359,259	3,097,184	430,699	1,367,306	1,381,346
1900	5,912,000	1,135,320	655,040	1,417,539	1,405,180
1901	9,416,000	4,268,820	812,375	1,826,526	1,767,900

In addition there were imported goods overland to the value of £161,000 in 1900 and of £233,000 in 1901. The analysis, as far as can be stated, of the imports for 1901 was as follows:—British manufacture, £6,523,000; colonial and Indian, £1,416,000; United States, £719,000; foreign, £898,000. The exports include goods sent in transit to the Transvaal.

Railways.—There are open for public traffic in Natal 545 miles of rails of single line and of the standard gauge for South Africa, viz., 3 ft. 6 in., the whole being worked by the colonial Government. The main lines extend from the port of Durban to Pietermaritzburg, the capital, 70 miles inland, and from thence to Charlestown, on the border of the Transvaal (309 miles distant from the port), where it connects with the line to Johannesburg and Pretoria. Near Ladysmith (190¼ miles from the port) there is a line of 59½ miles to Harrismith, Orange River Colony, the property of, and worked by, the Natal Government. Among the extensions is one from Pietermaritzburg to Greytown (64½ miles), of which 40 miles have been opened to Dalton. Another extension from Coal Fields, the terminus of the Dundee branch line to the Buffalo river (13 miles), is in hand, and will form the Natal section of the line between Vryheid, in the Transvaal, and Natal. A branch line extends northwards from Durban to the Tugela (70 miles), the terminus of the North Coast extension, at the border of the province of Zululand. Another branch runs from South Coast Junction (5 miles from Durban) to Park Rynie (36 miles), and an extension of that branch to Port Shepstone (about 36 miles) is in course of construction, as well as a branch of 7 miles to Umzinto. The work of railway construction was begun in January 1876, and the sections then authorized were completed in November 1880. Two subsequent sections of 119 and 114 miles respectively were sanctioned, and the last, which completes the main line to Charlestown on the border of the Transvaal, was opened for passenger traffic on 7th April 1891, and for goods traffic on 1st August 1891. The line to Harrismith was opened for traffic on 14th July 1892, with a mileage of 59½ miles, 23½ of which runs through Orange River Colony. Connexion with Johannesburg and Pretoria was opened at the close of 1895. As might be expected in a country possessing the physical features of Natal, the gradients and curves are exceptionally severe. Out of the present mileage not less than 43 miles are upon grades of 1 in 30 and 1 in 35, and curves of 300 to 350 feet radius, while on over 100 miles more there are grades under 1 in 60 and curves of less than 450 feet radius. The main trunk line reaches an altitude of 3054 feet above the level of the sea at a point 58 miles distant from Durban; after falling 1000 feet in its further progress to Pietermaritzburg, it again rises, 12 miles after leaving that city, to a height of 3700 feet above the sea; at a point 134 miles from Durban it has reached an altitude of 5152 feet, but on reaching Ladysmith, 191 miles from Port Natal, the altitude has decreased to 3284 feet. The summit of the Biggarsberg chain is crossed at a point 233 miles from the port, at a height of 4800 feet, and when the border is reached, after crossing the western slope of the Drakensberg mountains, the train will have again gained a higher eminence than ever, the altitude being about 5400 feet. The Orange River Colony line, after leaving Ladysmith, ascends by steep gradients the whole of its own course in Natal territory, and when it gains the border on the summit of the more easterly point of the Drakensberg range, it is 5500 feet above the sea. In view of the great development of South Africa, every possible means is being taken in surveys to get lines with easier grades than the earlier lines, even at an enhanced first cost, it being found that the difficulties and expenses connected with working over steep gradients far outweigh the interest on the additional capital expenditure involved in obtaining better lines.

The following is a summary of railway statistics covering a period of 19 years:—

Year.	Miles of Line open. Average.	No. of Passengers conveyed.	Tonnage of Goods.	Capital invested on Open Lines.	Net Receipts per cent. of Capital.	Revenue.	Expenditure.
1881	98½	427,969	171,081	£1,204,416	£4 18 10	£173,109	£113,587
1885	116	424,367	192,457	£2,594,414	0 5 5	£135,548	£142,592
1890	285	641,648	301,753	£3,650,591	5 4 3	£606,713	£416,396
1895	401	422,002	393,379	£6,117,211	4 1 0	£526,494	£278,756
1899	518	1,428,317	976,987	£7,267,588	4 5 7¾	£940,100	£628,942

Harbour Works.—A very important feature in the progress of the colony is the success of the works undertaken to reduce the difficulties presented by the sandbar at the entrance to Durban harbour. These works comprise chiefly a south breakwater and north pier, narrowing the entrance to 600 feet. Powerful dredgers are also constantly at work on the bar. The effect of these operations has been to treble the depth of water, as will be seen from the following return of average depths on the bar at low water, o.s.t.:—

1874.	1879.	1884.	1889.	1894.	1899.
6′ 5½″	6′ 6¾″	7′ 1¾″	11′ 4½″	11′ 11″	19′ 7½″

The rise of tide is 6 feet at springs, and 4 feet 1 inch at neaps. The tonnage of ships entering the harbour has increased from 59,532 in 1884 (no previous returns) to 1,147,636 in 1899. The length of wharfage has increased from 266 feet in 1874 to 4900 in 1899, and the area covered by wharf sheds is 26½ times greater than it was in 1884, while the port revenue has more than doubled in that time. The annual expenditure on the work required to effect these changes has of course been considerable, and amounted during 1899 to £136,900. No further extension of the outer works is at present contemplated, but the superstructure of the north pier has yet to be finished. The construction of a quay wall with sheds, hydraulic cranes, lines of way, &c., is being rapidly pushed forward. The depth along the quay wall is 23 feet below low water, and it is proposed later to provide a depth of 27 feet alongside at low water. The site of the quay wall and part of the timber wharfage was a few years ago banks dry at half tide: a vessel of 10,200 tons can now be moored at one of the berths of this part of the wharf. There are seven dredgers and two steam hopper barges constantly employed, and the annual output from them is about 3,000,000 tons.

II. RECENT HISTORY.

At the conclusion of the first Boer war in 1881, the chief engagements of which were fought in the northern extremity of Natal, Sir Evelyn Wood was commander-in-chief of her Majesty's forces. He was also appointed for a short time administrator of Natal, and on his departure for England, after a final arrangement for the cession of the Transvaal, he was succeeded by Colonel (afterwards Sir Charles) Mitchell as administrator. In 1882 Sir Henry Bulwer was sent to Natal with the full title of governor, and in 1886 was succeeded by Sir Arthur Havelock. The feeling of the colonists after the retrocession of the Transvaal was extremely bitter. At Ingogo, Majuba, and Laing's Nek, all of them situated within the colony, British forces had been defeated by the Boers. And the treaty of retrocession was never regarded in Natal as anything but a surrender. Public meetings were held at various towns, and the resolutions passed at them, in the light of subsequent events, are of significance and interest. Thus at Newcastle, on 30th March 1881, a public meeting of loyal refugees and colonists resolved "That the Dutch communities of South Africa, having coalesced, and solicited the assistance of Dutch military officers to help them to establish a Boer Republican Government over the whole of South Africa, it becomes necessary for British-born colonists to organize in self-defence." On 6th April 1881 a resolution was passed at a public meeting in Durban, presided over by the mayor, and cabled to members of Parliament in London. "Durban public opinion: Utter disgust with settlement, British prestige with our natives entirely forfeited. No consideration for loyal Boers nor British residents. Terms of peace simply mean greater bloodshed at no distant date." The protest was vain. The treaty was finally concluded. The Transvaal Republic was established, and the prediction of the practical colonists of Durban, ignored at the time, was afterwards fulfilled to the letter. In justice, however, to the colonists of Natal, it must be recorded that, finding their protest with regard to the Transvaal settlement useless, they made up their minds to shape their policy in conformity with that settlement. But it was not long before their worst fears with regard to the Boers began to be realized, and their patience was once more severely taxed. The Zulu power (see ZULULAND), which had always been a menace to Natal as well as the Transvaal, was broken in 1879 by British forces. After the settlement intestine quarrels arose among the petty chiefs, and in 1883 some Transvaal Boers intervened, and subsequently, as a reward for the assistance they had rendered to one of the combatants, demanded and annexed 8000 square miles of country, which they styled the "New Republic." As the London Convention had stipulated that there should be no trespassing on the part of the Boers over their specified boundaries, and as Natal had been the basis for those operations against the Zulus on the part of the British in 1879, which alone made such an annexation of territory possible, a strong feeling was once more aroused in Natal. The "New Republic" was nevertheless allowed to remain, and in 1887 the British consented to the territory being incorporated with the Transvaal.

In 1884 the discovery of gold in De Kaap Valley, and on Mr Moodie's farms in the Transvaal, caused a considerable rush of colonists from Natal to that country. Railways were still far from the Transvaal border, and Natal not only sent her own colonists to the new fields, but also offered the nearest route for prospectors from Cape Colony or from Europe. Durban was soon thronged; and Pietermaritzburg, which was then practically the terminus of the Natal railway, was the base from which nearly all the expeditions to the gold-fields were fitted out. Waggons and oxen were in great demand, and convoys laden with stores and material for the camps at Moodie's and the new township of Barberton were daily despatched from both Durban and Pietermaritzburg. The journey to De Kaap by bullock-waggon occupied about six weeks. "Kurveying" (the conducting of transport by bullock-waggon) in itself constituted a great industry. Two years later, in 1885, gold was also discovered at the Witwatersrand, and the tide of trade which had already set in with the Transvaal steadily increased. Natal colonists were not merely the first in the field with the transport traffic to the new gold-fields; they became some of the earliest proprietors of mines, and for several years many of the largest mining companies had their chief offices at Pietermaritzburg or Durban.

The demand which the new industry made upon the one port of Natal, Durban, encouraged the colonists to redouble their efforts to improve their harbour. The question of a fairway from ocean to harbour has been a difficult one at nearly every port on the African coast. A heavy sea from the Indian Ocean is always breaking on the shore, even in the finest weather, and at the mouth of every natural harbour a bar occurs. The bar in its natural state is a shallow, shifting, submarine mass of sand, on which fresh sand is continually being deposited, and over which the water is frequently not more than a few feet deep. Over the "bar" the waves break, and often the surf is so high that only surf-boats—that is, barges battened down—in tow of specially-built steam tugs, can attempt to cross it. To deepen the channel over the bar at Durban so that steamers might enter the harbour was the cause of labour and expenditure for many years. Piers and jetties were constructed, dredgers imported, and controversy raged over the various schemes for harbour improvement. In 1881 a harbour board was formed, under the chairmanship of Mr (afterwards Sir Harry) Escombe. It controlled the operations for improving the sea entrance until 1893, when on the establishment of responsible government it was abolished. Success so far crowned their efforts that in 1899 the bar channel was reported to have, even at low water, a depth of about 19 feet. In order to cope with the growing trade, however, the railway system has been continually developing.

For many years Sir John Robinson led a party in Natal which agitated for a responsible form of government. In 1893 a Bill in favour of this change was introduced into the Legislative Council, and passed. The British Government gave their consent to the Bill, and the Constitution Act of 1893 became law. Sir John Robinson, K.C.M.G., was the first colonial secretary and premier under the new constitution, and Mr Harry Escombe, Q.C., the first attorney-general. In the same year the Hon. Sir Walter Hely-Hutchinson was appointed Governor of the colony. In 1898 Natal entered the Customs Union already existing between Cape Colony and Orange Free State.

In May 1899 the Natal Government began to suspect the nature of the military preparations that were being made by the Boers, and their apprehensions were communicated to the High Commissioner, Sir Alfred Milner, who telegraphed on 25th May to Mr Chamberlain, informing him that Natal was uneasy. When war became probable the Governor expressed his views to the Prime Minister that the Natal Government ought to give the British Government every support, and Sir John Robinson replied that their support would of course be given, but at the same time he feared the consequences to Natal if after all the British Government should draw back. Some further correspondence took place, in the course of which the Natal ministers pointed out that as in the event of war Natal would probably become the seat of operations, and would support the British Government, they would incur the "suspicion and unfriendly feelings" of the Free State and Transvaal. The Natal ministers therefore considered that in the circumstances they should not be exposed to attack by the action of the Imperial Government without first having an opportunity of expressing their opinions. In July the Natal ministry learnt that it was not the intention of the Imperial Government to endeavour to hold the frontier in case hostilities arose, but that a line of defence considerably south of the frontier would be taken up. This led to a request on their part that if the Imperial Government had any reason to anticipate the breakdown of negotiations, "such steps may be at once taken as may be necessary for the effectual defence of the whole colony." Sir W. P. Symons, the general commanding the British forces in Natal in September, decided to hold Glencoe. On the arrival of Sir George White from India, he informed the Governor that he considered it dangerous to attempt to hold Glencoe, and urged the advisability of withdrawing the troops to Ladysmith. The Governor was strongly opposed to this step, as he was anxious to protect the coal supply, and also feared the moral effect of a withdrawal. Eventually Sir A. Hunter was consulted, and stated that in his opinion, Glencoe being already occupied, "it was a case of balancing drawbacks, and advised that, under the circumstances, the troops be retained at Glencoe." This course was then adopted.

On 11th October 1899 war broke out. The first act was the seizure by the Boers of a Natal train on the Free State border. On the 12th Laing's Nek was occupied by the Boer forces, who were moved in considerable force over the Natal border. Newcastle was next occupied by the Boers unopposed, and on 20th October occurred the battle of Talana Hill outside Dundee. In this engagement the advanced body of British troops, 3000 strong, under Sir W. Penn Symons, held a camp called Craigside which lay between Glencoe and Dundee, and from this position General Symons hoped to be able to hold the northern portion of Natal. There is no doubt that this policy strongly commended itself to the Governor and ministers of Natal, and that they exercised considerable pressure to have it adopted. But from a military point of view it was not at all cordially approved of by Sir George White, and it was afterwards condemned by Lord Roberts. Fortunately only one Boer division out of three was actually present at the moment of attack, and General Symons was able to inflict a severe defeat upon them at Talana Hill. His bravery cost him his life. General Yule then took command, and an overwhelming force of Boers rendering the further occupation of Dundee dangerous, he decided to retire his force to Ladysmith. On 21st October General Sir George White defeated at Elandslaagte a strong party of Boers, who threatened to cut off General Yule's retreat. He again attacked the Boer forces at Rietfontein on 24th October, and on the 26th General Yule reached Ladysmith with his force in safety. Ladysmith now became for a time the centre of further operations. The Boers gradually surrounded the town and cut off the communication from the south. Various engagements were fought in an attempt to prevent this movement, including the disastrous mishap at Nicholson's Nek, when on 29th October a large British force was cut off and was compelled to surrender, and the battle of Farquhar's Farm on the 30th, during the course of which Captain Hedworth Lambton arrived from Durban with some naval guns and a party of bluejackets. The siege of Ladysmith continued till 28th February 1900, when, after various attempts to relieve the beleaguered garrison, Sir Redvers Buller's forces at last entered the town. During the six weeks previous to the relief, 200 deaths had occurred from disease alone, and altogether as many as 8424 were reported to have passed through the hospitals. The relief of Ladysmith soon led to the evacuation of Natal by the Boer forces, who trekked northwards.

During the Boer invasion the Government and the loyal colonists, constituting the great majority of the inhabitants of the colony, rendered the Imperial forces every assistance. One distinguished colonist, Sir Harry Escombe, widely respected and beloved, died before he could see his country once more freed of the enemy. He had gone at the outbreak of hostilities to Newcastle, where he hoped to be able to make some show of defence, but he was compelled to leave with the rest of the loyal inhabitants, and took part in the retreat from Dundee. The strain was too much for him, and being in delicate health at the time, he died shortly afterwards. In the actual hostilities the Natal Volunteers and other Natal forces took a prominent part. The Imperial Light Horse and other irregular corps were recruited in Natal, although the bulk of the men in the forces were Uitlanders from Johannesburg. As the nearest colony to the Transvaal, Natal was resorted to by a large number of men, women, and children who were compelled to leave the Transvaal on the outbreak of the war. Refugee and Uitlander committees were formed both at Durban and Maritzburg, and, in conjunction with the colonists, they did all in their power to assist in recruiting irregular corps, and also in furnishing relief to the sick and needy. Natal was the theatre of some of the most arduous fighting during the whole course of the war (see TRANSVAAL), and the brunt of it was shared by her colonists with the Imperial forces.

(A. P. H.)

Natal, a town and port of Brazil, situated in an estuary of the Rio Grande, and capital of the state of Rio Grande do Norte. It has a naval training school, an agricultural society, four churches, a cotton mill, &c. It is the principal port of the state. The chief exports are cotton, leather, rubber, butter, woods, and sugar. A railway runs from Natal to the frontier of Parahyba, through the most productive part of the state. Population about 60,000.

Natalie, QUEEN OF SERVIA. See MILAN, KING.

Natanz, a minor province of Persia, situated in the hilly district between Isfahán and Kashan, and held in fief by the family of the late Hissám es Saltaneh (Sultan Murad Mirza, died 1882), grand-uncle of the shah. It contains eighty-two villages and hamlets, has a yearly revenue of about £4000, and a total population of about 23,000. It is divided into four districts: Barzrúd, Natanzrúd, Tarkrúd, and Bádrúd. Natanz pears are famous throughout the country. The western part of the province is traversed from north to south by the high-road between Kashan and Isfahán, and has the well-known stations of Kuhrúd (7140 feet) and Só (7560 feet). The capital of the little province is NATANZ, a large village with a population of about 3000, situated 69 miles north of Isfahán, at an elevation of 5670 feet. It has an old mosque, with a minaret 123 feet in height, built in 1315.

Natchez, a city of Mississippi, U.S.A., capital of Adams county, on the east bank of the Mississippi river, and on the New Orleans and North-Western and the Yazoo and Mississippi Valley railways, in the south-western part of the state, at an altitude of 202 feet. Situated in the midst of a rich cotton-producing region, its industries are mainly connected with that staple. It has cotton mills, cotton-seed oil mills, gins, &c., and has a large cotton trade by rail and river. Population (1890), 10,101; (1900), 12,210, of whom 382 were foreign-born and 7090 negroes.

Natick, a town of Middlesex county, Massachusetts, U.S.A., on the Charles river, a few miles west of Boston, in the eastern part of the state, on the Boston and Albany Railroad. It contains a village, of irregular plan, which bears the same name. It has manufactures of varied character, among them boots and shoes and rubber goods. Population (1890), 9118; (1900), 9488, of whom 1778 were foreign-born.

National Debt.—Under the headings for the different countries of the world will be found details concerning the recent history and statistics of their respective public debts. The general subject of National Debts has been treated fully in the earlier volumes of this Encyclopædia (ninth edition, vol. xvii.), and in this supplementary article it will only be necessary to summarize the leading facts concerning the principal nations, and to deal with some of the newer problems which have arisen concerning the National Debt of the United Kingdom.

Debts of the world.

The following table shows the general state of the world's public indebtedness in 1900, divided according to the more important countries, the bracketed figures in black type indicating the position of the country referred to under each heading in the list. The figures in every case are not to be supposed to be absolutely accurate; statistics of national debts differ, often remarkably, and it is practically impossible to give a perfectly satisfactory comparison, owing partly to difficulties of computing the exchange, partly to inaccurate accounts, and partly to the varieties of debt (reproductive or non-reproductive, &c.); but, broadly speaking, the table shows the state of affairs, and may be compared with that given in vol. xvii.

The Principal Public Debts of the World, 1900.

Country.	Population.	Total Debt.		Per Head.		Annual Charge.		Per Head.

The total indebtedness of the countries named in the table amounts to £6,311,017,478, and the total indebtedness of the world (*i.e.*, including countries not here mentioned) for the year 1898 was computed by Lord Avebury (*Journ. Roy. Stat. Soc.* vol. lxiv. Part I.) as £6,432,757,000, as against £5,097,910,000 in 1888. This compares (taking figures compiled by Mr Dudley Baxter in *Journ. Roy. Stat. Soc.* March 1874) with a total indebtedness of 4680 millions sterling in 1874 and 1700 millions sterling in 1848. The United Kingdom had diminished its total debt since 1883 by 127 millions, the amount per head by £6, the annual charge by 6 millions, and the charge per head by 5s. 8d. The United States debt was lower by nearly a hundred millions. Japan, Egypt, and Brazil had sensibly improved their positions. But the following countries had increased their debts:—France (by 86 millions), Russia (by some 240 millions[1]), Italy (by 140 millions), Austria-Hungary (by 70 millions), Spain (by 190 millions), Prussia (by 227 millions), Portugal (by 80 millions), Holland (by 18 millions), Belgium (by 32 millions), and Argentina (by 73 millions).

The result is that, whereas in 1883 the total debt of the United Kingdom (756 millions) stood second to that of France (1000 millions), in 1900 it stood third to France and Russia; whereas in 1883 its weight per head of population was third, in 1900 it was eleventh; whereas in 1883 its annual charge stood second, in 1900 it stood fourth; and whereas the weight of the charge per head of population in 1883 was fifth, in 1900 it was eleventh. The indebtedness of the great British dependencies, on the other hand, had increased from 302 millions to 544 millions sterling, or by 242 millions; and the local (municipal) debt of Great Britain had risen from about 100 millions to upwards of 300 millions.

History of British debt.

It is interesting to recall the history of the British National Debt during the 19th century. The debt at the close of the Napoleonic war (1816) was nearly 887 millions sterling, and at the beginning of 1900 this debt had been reduced to 621 millions,[2] or a decrease of 266 millions—notwithstanding interim additions of about 367 millions, which made the gross reduction during that period 633 millions sterling, an amount actually larger than the whole (dead-weight[3]) debt at the end of the century. No country (except the United States, to a smaller amount) has ever redeemed its obligations on such a scale, and this was done while all other European countries of similar standing were piling up debt.

This enormous reduction was effected at different rates of speed. Between 1817 and 1830, when what was known as Pitt's Sinking Fund was in operation (depending upon the devotion of surplus income to the repayment of debt, but much complicated by the raising of fresh loans), a net reduction was made of £29,488,072—an *annual average* of £2,268,313. From 1830 to 1876 the system of using surplus revenue—the so-called Old Sinking Fund—for redeeming debt, was steadily applied, together with the creation of Terminable Annuities (see ANNUITIES, vol. xxv. p. 452), by which definite blocks of debt were cancelled and the whole amount paid off in a term of years. During this period the debt was reduced by £85,175,782, an *annual average* of £1,851,647. In 1876 Sir Stafford Northcote's (Lord Iddesleigh's) New Sinking Fund came into operation, in addition to previous methods of redeeming debt. By this system a definite annual sum was set aside for the service of the debt, the difference between it and the amount required for payment of interest forming a (new) Sinking Fund devoted to repayment of capital. This Fixed Charge was gradually reduced from about 29 millions to 26 millions in 1888, to 25 millions in 1890, and to 23 millions in 1899. The amount paid off during this period by means of Old Sinking Fund, Terminable Annuities, and New Sinking Fund, down to March 1900, was £155,238,639, or an *annual average* of £6,468,276.

It will be observed that the burden of the debt incurred previously to 1817 has thus been borne very unequally by different ages of "posterity." While the generations immediately succeeding the Napoleonic war paid off about £2,000,000 a year, the taxpayers between 1876 and 1900 paid at three times that rate. They did so largely without knowing it, since a large part of the amount was wrapped up in the Terminable Annuities; but it is very questionable justice that so large a proportion of the burden should have been imposed upon them. At any rate, there is clearly a good deal to say on the other side, should present-day financiers argue that posterity (a later posterity still) must not be asked to take its share of the burden of new debt raised to relieve the taxpayers who have been paying so large a proportion of the old one.

Consols.

The great bulk of the funded National Debt consists of what are known as "Consols." This name dates from 1751, when nine different Government annuities at 3 per cent. were consolidated into one, amounting to £9,137,821. These "consolidated annuities" formed the germ of what has since become the type of British Government stock. At the same time some of the annuities at a higher rate of interest were combined and the interest reduced to 3 per cent., and this stock was known as "Reduced," the two 3 per cent. stocks remaining side by side, until in 1854 the $3\frac{1}{4}$ per cent. Government stock was also converted into 3 per cents., under the style of "New Threes." "Consols," "Reduced," and "New Threes" formed thenceforth a solid body of British Three per Cent. stock, until in 1888 the whole amount was converted by Mr (afterwards Lord) Goschen into $2\frac{3}{4}$ per cents. (see NATIONAL DEBT CONVERSIONS). "Consols" were added to from time to time when fresh loans were needed: from 39 millions in 1771 they rose to 71 millions in 1781, to 101 millions in 1783, 278 millions in 1801, 334 millions in 1811, and 400 millions in 1858; but in 1888 they had decreased, by redemptions, to £322,681,035. "Reduced" were also added to: from 17 millions in 1751 they rose to 164 millions in 1815, and then gradually diminished to 102 millions in 1869, and to £68,912,433 in 1887, when they were converted with "Consols" into the New Consols (or "Goschens") at $2\frac{3}{4}$ per cent., to be reduced to $2\frac{1}{2}$ per cent. in 1903.

The lowest price ever quoted for "Consols" was $47\frac{3}{8}$ on 20th September 1797, owing to the mutiny at the Nore; the highest was 114 in 1896, owing to scarcity of stock, the operation of the sinking funds, and the demand for investment of savings bank moneys.

The high premium to which Consols rose towards the end of the century may be briefly explained. *Pari passu* with the reduction of the debt went a dwindling of the amount of Consols open to investors, and hence occurred a continued normal appreciation of the stock. In 1817 the amount of British Government stock per head of the population was £40 10s.; in 1896 this figure had decreased to £14 12s. The ordinary law of supply and demand would therefore in any case tend to increase the price of Government stock. This has always happened. The amount of Three per Cents. diminished from 528 millions in 1817 to 498 in 1827, and to 497 in 1837, and the average prices in these years were 73, 83, and 90; additions were made to the stock, and in 1847 (the amount being 510 millions) the price was $86\frac{3}{8}$; again the amount decreased, and in 1852 (500 millions) the price was 98; then a great conversion raised the amount to 734 millions in 1854, and the price went down to $90\frac{1}{2}$; but by 1887 the amount decreased by about 200 millions, and the price rose well above par; and though the reduction in interest in 1888 set back the price, it rose again as the amount of available stock diminished. Many causes, into which it is not necessary to enter, operated no doubt in keeping up the demand for British Government credit. Moreover, apart from the fact that in 1882 there were 689 millions of Three per Cents., and in 1900 only 501 millions of $2\frac{3}{4}$ per cents. in existence, the amount held by Government departments, and therefore practically locked up from the market, gradually

[1] It is difficult to compute the Russian debt properly, but the figure for 1883 given in vol. xvii. (640 millions) is clearly wrong. It should have been £416,000,000 for interest-bearing debt.

[2] Leaving out of account 8 millions of unfunded debt raised for the Boer war.

[3] The "dead-weight" debt, or national debt proper, excludes what are treated in the public accounts as "other capital liabilities," the interest on which is not included in the fixed charge; but it is taken to include the new debt of all sorts raised in 1900, 1901, and 1902 for the Boer war.

increased, until from this cause alone the amount of available stock was diminished by upwards of 200 millions; and a large amount more was practically locked up by being held by trustees, or by banks, insurance societies, &c. The savings banks deposits, increasing as they did by about £1,000,000 per month (owing partly to the raising in 1894 of the maximum limit), had to be invested in Government securities; and the compulsory activity of the Government as a buyer of Consols, both on this account and also for Sinking Fund purposes (in order to obtain stock to redeem debt on the increased scale already indicated) operated as an abnormal cause for sending the price of Consols high above par. Even at that figure (the average prices for Consols being $101\frac{1}{16}$ in 1894, $106\frac{1}{8}$ in 1895, $110\frac{3}{4}$ in 1896, $112\frac{15}{32}$ in 1897, $110\frac{15}{16}$ in 1898, and $106\frac{7}{8}$—having fallen owing to war prospects—in 1899) it was difficult for the Government brokers to obtain Consols, and it was principally owing to this state of things that in 1899 Sir Michael Hicks-Beach reduced the fixed annual charge for the debt (and *pro tanto* the New Sinking Fund) from £25,000,000 to £23,000,000.

It remains to give the figures for the British National Debt in 1902, after the disturbance due to the South African war. During the years 1900 and 1901 the new sinking fund was suspended, as well as the payments on the Terminable Annuity debt applicable to repayment of capital (except in so far as annuities to individuals were concerned); so that the debt was not reduced, as it would otherwise have been, by £4,547,000 in 1900 and by £4,681,000 in 1901. On the contrary, it was increased by fresh borrowings. Consols were raised (in 1901 and 1902) to the extent of £92,000,000; a "War Loan" of $2\frac{3}{4}$ per cent. stock and bonds, redeemable in 1910, was raised (1900) to the amount of £30,000,000; $2\frac{3}{4}$ per cent. exchequer bonds were raised (in 1900) to the amount of £24,000,000, and Treasury bills (in 1899 and 1900), £13,000,000. The total war borrowing amounted accordingly to £159,000,000, raised at a discount of (£6,585,000) 4·14 per cent. This includes the whole new borrowing in 1902, a portion of which was intended after the peace to be paid back in the current year; but for this no allowance can here be made. The accompanying table shows the totals for the "dead-weight debt" in 1900, 1901, and 1902, and, for convenience, also the "other capital liabilities."

	"Dead-weight Debt."	Chief Cause of Difference.[1]	"Other Liabilities."
31st March 1900	£628,978,782	+"War Loan," £30,000,000	£10,186,482
" 1901	690,992,621	+Exch. Bonds, 24,000,000	
		+Treas. Bills, 5,000,000	14,731,256
" 1902	747,876,000	+Consols, 60,000,000	20,532,000
July 1902	779,876,000	+Consols, 32,000,000	

"Other liabilities" it must be remembered, represent money advanced (generally by Terminable Annuity) on reproductive objects—telegraphs, barracks, public works, Uganda railway, &c.—and they could not, obviously, be properly included in the National Debt unless at the same time a set-off were made for the valuable assets held by the British Government, such as the Suez Canal shares, which in 1902 were alone worth upwards of £26,000,000. (H. CH.)

National Debt Conversions.—The great bulk of the funded debt of the United Kingdom consists of annuities, which are described as perpetual, because the state is under no obligation to pay off at any time the capital debt which they represent. All that the public creditor can claim is to receive payment of the instalments of annuity as they fall due. On the other hand, the Government has the right to redeem the annuities ultimately by payment of the capital debt; though it may, and frequently does, bind itself not to exercise that right as regards a particular stock of annuities until after a definite period. So long as a stock is thus guaranteed against redemption, the only way in which the annual charge for that portion of the debt can be reduced is by the Government buying back the annuities in the open market at their current price, which may be more or may be less than the nominal debt, according to general financial conditions and to the state of the national credit. The liability of the stock to redemption at par, when the period of guarantee has expired, prevents its market price from rising materially above that level. To enable the right of compulsory redemption to be enforced, it is only necessary that the Government should have command of sufficient funds for the purpose of paying off the stockholders, or should be able to raise those funds by borrowing at a rate of interest lower than that borne by the stock. Any circumstances which might tend to raise the price of the stock above par would also assist the Government in raising its redemption money on more favourable terms. When the amount of stock to be dealt with is large, the raising by a fresh loan of the amount required for redemption would occasion great disturbance. A more convenient method is the conversion of the existing stock to a lower rate of interest by agreement with the stockholders, whose reluctance to accept a reduction of income is overborne by their knowledge that the power of redemption exists and will be put in force if necessary. The opportunity for conversion may be looked for when the price of a redeemable stock stands steadily at or barely above par. Observation of the movements in the price of other securities will serve to show whether this stationary price represents the real market value of the stock, or whether that value is subject to depression owing to an expectation of the stock being converted or redeemed. Accordingly, the course of prices of other Government stocks which are free from the liability to redemption, of the stocks of foreign countries and the colonies, and of the large municipalities, must be watched by Government in order to determine, first, whether the conversion of a redeemable stock is feasible, and, secondly, to what extent the reduction of the interest in the stock may be carried.

The credit for the first measure of conversion belongs to Walpole, though it was carried through by Stanhope, his successor as Chancellor of the Exchequer. In
1717.
1714 the legal rate of interest for private transactions, which had been fixed at 6 per cent. in the year of the Restoration, was reduced to 5 per cent. by the Act 12 Anne, stat. 2, c. 16. But the bulk of the national debt still bore interest at 6 per cent., the doubtful security of the throne and the too frequent irregularities in public payment having hitherto precluded any considerable borrowing at lower rates. Walpole saw that the first requirement was to give increased confidence to the public creditors. Three Acts were passed dealing respectively with debts due to the general public, to the Bank of England, and to the South Sea Company. Three separate funds—the General Fund, the Aggregate Fund, and the South Sea Fund—were assigned to the service of the several classes of debt, each of these funds being credited with the produce of specified taxes, which were made permanent for the purpose; and it was further provided that any surplus of the funds, after payment of the interest of the debts, should be applied in reduction of the principal Such was the success of this measure that, in spite of the reduction of interest from 6 to 5 per cent. which was also enacted, the passing of the Acts was followed by a rise in the price of stocks. A curious preliminary to the introduction of these measures was the passing of a resolution by the House of Commons, which invited advances not exceeding £600,000, to be repaid with interest at 4 per cent. out of the first supplies of the year. The result showed that the time was not ripe for such a reduction of interest, as only a sum of £45,000 was offered on those terms. A further resolution was then passed, substituting 5 per cent.

[1] Other causes are redemption of land tax, variation in capital value of Terminable Annuities, and minor Treasury operations.

as the rate of interest, and the whole sum was at once subscribed. Besides accepting the reduction of interest on their own debts, the Bank of England and the South Sea Company agreed to assist the Government by advancing $4\frac{1}{2}$ millions at the reduced rate, to be employed in paying off any of the general creditors who might refuse assent to the conversion. The assistance was not required, as all the creditors signified assent. The debts thus dealt with amounted altogether to about $25\frac{3}{4}$ millions, and the annual saving of interest effected (including that upon a large quantity of Exchequer bills for which the Bank had been receiving over 7 per cent.) was £329,000.

Walpole had a further opportunity of effecting a conversion in 1737. In the meantime much of the 5 per cent. *1749.* debt had been reduced to 4 per cent. by arrangements with the Bank of England and the South Sea Company, and further borrowings had taken place at that rate, and even at 3 per cent. In 1737 the 3 per cents stood above par, and Sir John Barnard proposed to the House of Commons a scheme for the gradual reduction of the 4 per cents. As a financial measure the scheme would doubtless have succeeded; but Walpole, moved apparently by consideration for his capitalist supporters, opposed and for the time defeated it. A scheme on similar lines was carried through by Pelham as Chancellor of the Exchequer in 1749, and embodied in the Act 23 Geo. II. c. 1. By that Act holders of the 4 per cent. securities, amounting to nearly £58,000,000, were offered a continuance of interest at 4 per cent. for one year, followed by $3\frac{1}{2}$ per cent. for seven years, during which they were guaranteed against redemption, with a final reduction to 3 per cent. thereafter. It was necessary to continue the rate of 4 per cent. for the first year, as any objecting stockholders could not be paid off without a year's notice. Three months were allowed for signifying assent to the proposal. At first it was viewed with disfavour, and both the Bank and the East India Company opposed it. But the pens of the Government pamphleteers were busily occupied in showing the advantages of the offer, and at the close of the three months acceptances had been received from the holders of nearly £39,000,000 of the stocks, or more than two-thirds of the whole. A further opportunity was afforded to waverers by a second Act (23 Geo. II. c. 22), which allowed three months more for consideration; but for holders accepting under this Act the intermediate period of $3\frac{1}{2}$ per cent. interest was reduced from seven years to five. These terms brought in an additional £15,600,000 of stock; and the balance left outstanding, amounting to less than $3\frac{1}{2}$ millions, was paid off at par by means of a new loan. The annual saving of interest on the stock converted was at first £272,000, increasing to £544,000 after seven years.

For nearly three-quarters of a century no further conversion was attempted. In that period the total debt had *1822.* been increased tenfold, and the practice of borrowing in times of war by the issue of an inflated capital, bearing nominally a low rate of interest, prevented recourse to conversion as a means of reducing the burden after peace was restored. But in 1822 Mr Vansittart—who four years earlier had effected a conversion in the opposite direction, turning £27,000,000 of stock from 3 into $3\frac{1}{2}$ per cent., in order to obtain from the holders an advance of £3,000,000 without adding to the capital of the debt—was able to deal with the 5 per cents. These stocks amounted to £152,000,000 out of a total funded debt of £795,000,000. The prices at which the chief denominations of Government stocks stood in the market in the early part of 1822 indicated a normal rate of interest of more than 4 but considerably less than $4\frac{1}{2}$ per cent. In these circumstances, to propose the conversion of the 5 per cent. stocks to $4\frac{1}{2}$ per cent. would probably have been futile, unless the new stock were guaranteed for a long period, as holders would have stood in fear of a speedy further reduction. Nor could the Government hope to succeed in a reduction to 4 per cent. Mr Vansittart's plan was to offer £105 of stock bearing 4 per cent. in exchange for £100 of 5 per cent. stock, thus adding slightly to the capital of the debt, but effecting a large annual saving in interest. These terms were highly successful. Holders of nearly £150,000,000 accepted, leaving less than £3,000,000 of the stock to be paid off, and the annual saving obtained was £1,197,000. The new 4 per cent. stock was made irredeemable for seven years (Act 3 Geo. IV. c. 9).

There were, however, other 4 per cent. stocks, amounting to £76,000,000, which were not secured against redemption. Two years later, the conditions being favourable for their conversion, the Act 5 Geo. IV. c. 24 *1824.* was passed, offering holders in exchange a $3\frac{1}{2}$ per cent. stock, irredeemable for five years. The offer was accepted as regards £70,000,000, and the remaining £6,000,000 paid off, the annual saving on interest being £381,000.

In 1830 the guarantee given to the 4 per cent. stock of 1822 had expired, and the stock stood at a price of $102\frac{1}{2}$. Mr Goulburn decided to attempt its conversion without delay, and accordingly by the Act 11 Geo. *1830.* IV. c. 13 holders were offered in exchange for each £100 of the stock, either £100 of a $3\frac{1}{2}$ per cent. stock, irredeemable for ten years, or £70 of a 5 per cent. stock, irredeemable for forty-two years, these two options being considered of approximately equal value. No difficulty was found in securing assent. Over £150,000,000 of the stock was converted, almost wholly into the $3\frac{1}{2}$ per cent. stock; the balance of less than £3,000,000 was paid off, and an annual saving of £754,000 in interest was the result.

It was again Mr Goulburn's fortune to carry out a large and successful conversion in 1844. At that date the Funded Debt was made up of 3 per cent. and *1844.* $3\frac{1}{2}$ per cent. stocks in the proportions of about two to one, the only other denomination being the trifling amount of 5 per cent. stock created in connexion with the conversion of 1830. The price of 3 per cent. Consols ranged about 98, and that of the new $3\frac{1}{2}$ per cents, created in 1830, about 102. A reduction straightway from $3\frac{1}{2}$ to 3 per cent. was not to be looked for, but it was hoped to ensure that reduction ultimately by offering $3\frac{1}{4}$ per cent. for the first few years and a guarantee against redemption for a long term. Accordingly the holders of the several $3\frac{1}{2}$ per cent. stocks were offered an exchange to a new stock bearing interest at $3\frac{1}{4}$ per cent. for ten years and at 3 per cent. for the following twenty years. Practically the whole of the stock, amounting to £249,000,000, was converted on these terms, only £103,000 being left to be paid off at par. The immediate saving of interest was £622,000 a year for ten years, and twice that rate in subsequent years (Acts 7 and 8 Vict. cc. 4 and 5).

Mr Gladstone's only attempt at the conversion of the debt was made in his first year as Chancellor of the Exchequer. His primary purpose was to extinguish *1853.* some small remnants of 3 per cent. stocks which stood outside the main stocks of that denomination. The Act 16 Vict. c. 23 offered to holders of these minor stocks, amounting altogether to about $9\frac{1}{2}$ millions, the option of exchanging every £100 for either £82, 10s. of a $3\frac{1}{2}$ per cent. stock guaranteed for 40 years, or £110 of a $2\frac{1}{2}$ per cent. stock guaranteed for the same period, or else for Exchequer bonds at par. In the result stock to the amount of only about £1,500,000 was converted, and the remaining £8,000,000 had to be paid off at par, with some apparent loss of capital, as the current market price of the 3 per cents was less than par. The failure was largely owing to the fact that, between the initiation and the execution of the scheme, the train of events leading up to the Crimean war had become manifest, with unfavourable results to the public credit. Mr Gladstone had also included, as an optional portion of his plan, liberty to holders of the larger 3 per cent. stocks to exchange into the new 3½ and 2½ per cents. Very little advantage was taken of this permission, but the small amount of 2½ per cent. stock then created has been largely added to in later years by the conversion of stocks of higher denominations held by the National Debt Commissioners for the savings banks and other Government funds.

1884. Little better was the result of a more ambitious attempt made by Mr Childers in 1884. His offer (Act 47 and 48 Vict. c. 23) extended to the holders of all the 3 per cent. stocks, amounting to more than 600 millions, but no attempt was made to compel acceptance. There was offered in exchange for each £100 of 3 per cent. stock either £102 of a stock at 2¾ per cent., or £108 of a stock at 2½ per cent., both irredeemable for twenty-one years. But the amount exchanged into the new stocks was only 22 millions, of which more than one-half was stock held by Government departments.

1888. The most important of all the conversions of the British debt was effected by Mr Goschen in 1888. It applied to the whole of the 3 per cent. stocks, amounting to a total of £558,000,000, made up as follows:—£323,000,000 of Consols, a stock which dated from 1752, when it was formed by the consolidation of a number of minor stocks; £69,000,000 of Reduced 3 per cents, of which the nucleus was the stock reduced from 4 to 3 per cent. by Pelham's conversion in 1749; £166,000,000 of New 3 per cents resulting from the conversion of 1844. All the three stocks were, and had been for a considerable time, well over par. But for the past few years they had remained in almost a stationary position, relatively to the upward movement shown in the prices of the Government 2½ per cent. stock, and of the stocks of foreign governments, of British colonies, and of the leading municipalities. It was clear that the anticipation of a conversion or redemption scheme was weighing down Consols. Direct evidence of this fact was afforded by the course of a new 3 per cent. stock, the Local Loans stock, which Mr Goschen had created in 1887. Though bearing the same interest and resting upon the same ultimate security as Consols, this stock, which had been made irredeemable for twenty-five years, rose at once to a higher level of price. The opportunity for a great scheme of conversion had evidently come. The risk to be incurred by Government in undertaking the liability to pay off such an enormous body of stock, though less in comparison with the resources of the nation than that which Mr Goulburn had faced in 1844, was still very great, and it was rendered more formidable by the fact that holders of Consols and of Reduced 3 per cents were entitled at law to a year's notice before their stocks could be redeemed. If that right of notice were to be enforced as regards any large proportion of the stocks, no precaution could adequately guard against the risk of untoward circumstances arising to affect the operation before the year expired. Mr Goschen proposed to offer to the holders of each of the three stocks an exchange at par into a new stock bearing interest at 3 per cent. for the first year, at 2¾ per cent. for the next fourteen years, and at 2½ per cent. for twenty years thereafter, the stock to be irredeemable for the whole of that period, namely till 1923. Acceptance was made compulsory for holders of the New 3 per cents, with the alternative of being paid off at par, as they had no claim to receive notice; but it was made optional for the holders of the other two stocks, and a bonus of 5s. per cent. was offered to them as an inducement to forgo their right of notice. These provisions were duly embodied in the Act 51 Vict. c. 2. The terms were accepted by practically all the holders of the New 3 per cents and by the great majority of the holders in Consols and Reduced 3's, the amount left outstanding being only £42,000,000. To enable that balance to be dealt with, an Act was passed providing for the compulsory redemption or conversion of the outstanding stock at the expiry of the statutory notice. The funds required for this further operation were raised by the issue of Treasury bills and Exchequer bonds, by temporary advances from the Bank and from the National Debt Commissioners, and by the creation of an additional half-million of the new stock. In the result it was only necessary to find cash for paying off dissentients to the amount of £19,000,000. The final outcome of the whole operation was a saving in the annual charge of interest of £1,412,000, increasing to twice that amount after fourteen years.

The conversion of the Consols and Reduced 3 per cents was greatly facilitated by the exercise of a power, which the Act conferred, to pay to recognized agents, such as stockbrokers, bankers, and solicitors, a commission of 1s. 6d. per cent. on stocks in respect of which they lodged their clients' assents. These agents were thus afforded an inducement to give their clients explanation and advice, without which many of the fundholders would probably not have moved in the matter. The commissions paid amounted to more than £234,000, representing stocks to the amount of over £312,000,000. The Government will not again be confronted with this difficulty of having to give long preliminary notice of the intention to convert or redeem a large portion of the debt, as it is provided by the Conversion Act, 1888, that the present Consols shall be redeemable after 1923 on such notice and in such manner as Parliament may direct.

Naturalism.—"Nature" is a term of very uncertain extent, and the "natural" has accordingly several antitheses, often more or less conflicting, and only to be learnt from the context in which they occur. Thus, though Man and the World are often opposed as respectively subject and object, yet the word nature is applied to both: hence Naturalism is used in both a subjective and an objective sense. In the subjective sense the natural, as the original or essential, is opposed to what is acquired, artificial, conventional, or accidental. On this opposition the casuistry and paradoxes of the Sophists largely turned; it determined also, at least negatively, the conduct of the Cynics in their contempt for the customary duties and decencies; and it led the Stoics to seek positive rules of life in "conformity to nature." This deference for the "natural" generally, and distrust of traditional systems of thought and even of traditional institutions, has played a large part in modern philosophy, especially British philosophy. It was perhaps the inevitable outcome of the reaction, which began with the Renaissance, against the mediæval domination of mere authority. "L'homme qui médite est un animal dépravé," said Rousseau; and again, "Tout est bien sortant des mains de l'auteur des choses, tout dégénère entre les mains de l'homme."[1]

In psychology and epistemology, "no one," as Green has said, "is more emphatic than Locke in opposing what

[1] Quoted by Eisler, *Wörterbuch der philosophischen Begriffe*, 1899, s.v. Naturalismus.

is real to what we 'make for ourselves'—the work of nature to the work of the mind. Simple ideas or sensations we certainly do not 'make for ourselves.' They therefore, and matter supposed to cause them, are, according to Locke, real. But relations are neither simple ideas nor their material archetypes. They therefore, as Locke explicitly holds, fall under the head of the work of the mind, which is opposed to the real."[1] This opposition again led Hume, in the first place, to distinguish between natural and philosophical relations—the former determined simply by association, the latter by an arbitrary union of two ideas, which we may think proper to compare—and then, in the next, to reduce identity and causality, the two chief "philosophical relations," to fictions resulting from "natural relations," that is to say, from associations of similarity and contiguity. Subjective naturalism thus tended to become, and in the end became, what is more commonly called *Sensationalism* or *Associationism*, thereby approximating towards that objective naturalism which reduces the external world to a mechanism describable in terms of matter and motion—a result already foreshadowed when Hartley connected ideas and their association with brain vibrations and vibratiuncles. In ethics, also, the striving to get back to the natural entailed a similar downward trend. From the Cambridge Platonists, from Locke and Clarke, we hear much of rational principles of conduct, comparable in respect of intelligibility with the truths of mathematics; but already we find that in Shaftesbury the centre of ethical interest is tranferred from the Reason, conceived as apprehending either abstract moral distinctions or laws of divine legislation, to the "natural affections" that prompt to social duty;[2] and when we reach Bentham, with pleasure and pain as "sovereign masters," and the Mills, with love of virtue explained by the laws of association, all seems to be non-rational.[3] There is much resemblance, as well as some historical connexion, between the naturalism of moralists such as Shaftesbury and Hutcheson and the Common-Sense metaphysics of Reid and his school.[4] Hence Kant, distinguishing between a "naturalistic" and "scientific" or critical method in metaphysics, styles Reid and his followers "naturalists of pure reason," satirically comparing them to people who think they can settle the size and distance of the moon by direct eyesight better than by the roundabout calculations of mathematics.

So far we have seen the natural approximating to the non-rational. But when used in a subjective sense in opposition to the supernatural, it means the rational as opposed to what is above reason, or even contrary to reason. It is in this sense that the term Naturalism most frequently occurs; and it was so applied specially to the doctrines of the English Deists and the German Illuminati of the 17th and 18th centuries: those of them who held that human reason alone was capable of attaining to the knowledge of God were called theological naturalists or rationalists, while those who denied the possibility of revelation altogether were called philosophical naturalists or naturalists simply.[5] In these controversies the term Naturalist was also sometimes used in an objective sense for those who identified God and Nature, but they were more frequently styled Spinozists, Pantheists, or even Atheists. But it is at once obvious that dispute as to what is natural and what supernatural is vain and hopeless till the meanings of reason and nature are clearly defined. "The only distinct meaning of the word" [natural], said Butler, "is *stated*, *fixed*, or *settled*; since what is natural as much requires and presupposes an intelligent agent to render it so, *i.e.*, to effect it continually, or at stated times, as what is supernatural or miraculous does to effect it for once. And from hence it must follow that persons' notion of what is natural will be enlarged in proportion to their greater knowledge. . . . Nor is there any absurdity in supposing that there may be beings in the universe, whose capacities . . . may be so extensive, as that the whole Christian dispensation may to them appear natural, *i.e.*, analogous or conformable to God's dealings with other parts of His creation; as natural as the visible known course of things appears to us."[6]

The antithesis of natural to spiritual (or ideal) has mainly determined the use of the term Naturalism in the present day.[7] But current naturalism is not to be called materialism, though these terms are often used synonymously, as by Hegel, Ueberweg, and other historians of philosophy; nor yet pantheism, if by that is meant the immanence of all things in one God. We know only material phenomena, it is said; matter is an abstract conception simply, not a substantial reality. It is therefore meaningless to describe mind as its effect. Moreover, mind also is but an abstract conception; and here again all our knowledge is confined to the phenomenal. To identify the two classes of phenomena is, however, impossible, and indeed absurd; nevertheless we find a constant concomitance of *psychosis* and *neurosis*; and the more sensationalist and associationist our psychology, the easier it becomes to correlate the psychical and the physical as but "two aspects" of one and the same fact. It is therefore simplest and sufficient to assume an underlying, albeit unknown, unity connecting the two. A monism—so far neutral, neither materialistic nor spiritualistic—is thus a characteristic of the prevailing naturalism. But when the question arises, how best to systematize experience as a whole, it is contended that we must begin from the physical side. Here we have precise conceptions, quantitative exactness, and thoroughgoing continuity; every thought that has ever stirred the hearts of men, not less than every breeze that has ever rippled the face of the deep, has meant a perfectly definite redistribution of matter and motion. To the mechanical principles of this redistribution an ultimate analysis brings us down; and—beginning from these—the nebular hypothesis and the theory of natural selection will enable us to explain all subsequent synthesis.[8] Life and mind now clearly take a secondary place; the cosmical mechanism determines *them*, while they are powerless to modify it. The spiritual becomes the "epiphenomenal," a merely incidental phosphorescence, so to say, that regularly accompanies physical processes of a certain type and complexity. (See also PSYCHOLOGY.)

This absolute naturalism, as we may call it, the union, that is, of psychological and cosmological naturalism, is in fact a species of Fatalism, as Kant indeed entitled it.[9] It is the logical outcome of a sensationalist psychology, and of the epistemology which this entails. As long as association of ideas (or sensory residua) is held to explain judgment and conscience, so long may naturalism stand.

The naturalistic work of chief account at the present day is E. HAECKEL's *Die Welträtsel, Gemeinverständliche Studien über*

Naturalization.—Prior to the Naturalization Act of 1870, 33 and 34 Vict. c. 14 (see ALIEN and ALLEGIANCE in *Ency. Brit.* vol. i. 9th ed.), the allégiance owed to the British Crown was regarded as indissoluble, and down to 1868 the same doctrine was held in the United States. Almost at the same time both countries, through conventions with each other, treaties with other foreign Powers and by Acts of the legislature within, abandoned this position and opened a free exchange of nationality with foreign states. Naturalization, being a sovereign act, is not governed by the rules of international law, but by those of the public law of each individual state concerned. The Naturalization Act of 1870, sec. 7, subsec. 3, defines and regulates the position of naturalized British subjects, and provides that an alien to whom a certificate of naturalization has been granted shall enjoy all political and other rights, powers, and privileges, and be subject to all obligations to which a natural-born British subject is entitled or subject in the United Kingdom, *provided that he shall not, when within the limits of the foreign state of which he was a subject previously to obtaining his certificate of naturalization, be deemed to be a British subject unless he has ceased to be a subject of that state in pursuance of the laws thereof, or in pursuance of a treaty to that effect* (and the same rule obtains also in the case of statutory aliens, *i.e.*, natural-born British subjects, to whom certificates of readmission to British nationality have been granted). The italicized clause here referred to is applicable to the very numerous cases where naturalization has been effected in fraud of military service in countries where this is compulsory. Thus naturalization, whilst investing the new citizen with equal rights with one naturally born, does not extinguish the claims which are still in force in the state to which he has hitherto owed allegiance. In such cases the flag of the country of adoption will not protect the naturalized subject, on returning to the country of his birth, from the pains, penalties, and forfeitures visited for such default. (Calvo, *Dictionnaire de Droit International, s.v.* Naturalisation: "La naturalisation n'altère en rien les droits acquis avant son accomplissement, ni même les conséquences légales qui découlent de ces droits antérieurs.") In Germany no permission is given to persons between the ages of seventeen and twenty-five, and liable to conscription, to change their nationality, unless they satisfy the military authorities that they do not seek to divest themselves of German citizenship in order to escape from military duty; and such permission is likewise refused to officers in active service or reservists called upon to rejoin the colours.

The position of infant children of naturalized British subjects is still obscure. The Naturalization Act referred to provides that where the father, or the mother (being a widow), has obtained a certificate of naturalization in the United Kingdom, every child of such father or mother who during infancy has become resident with such father or mother in any part of the United Kingdom, or *with such father while in the service of the Crown out of the United Kingdom* (58 and 59 Vict. c. 43), shall be deemed to be a naturalized British subject. Mr W. E. Hall (*Foreign Jurisdiction*, p. 27) says: "The Act is silent as to children, whether born before or after naturalization, who are not, or at least have not been, resident with the father or mother in the United Kingdom. It is to be presumed that they remain aliens."

In most countries a lengthened sojourn is a condition precedent to naturalization. In Belgium, the United Kingdom, North America, and Russia the period of such sojourn is fixed at five years, in France, Greece, and Sweden at three, in the Argentine Republic two, whilst in Portugal a residence of one year is sufficient. In Germany, Austria, and Italy no period of residence is prescribed. In France a residence for ten years qualifies for naturalization without further ceremony; whilst in Austria a ten years' residence confers *per se* the rights of citizenship.

As regards naturalization in British colonies, the Naturalization Act provides that all regulations duly made by the legislature of any British possession for conferring the rights of naturalization shall, *within such limits*, have the authority of law. It seems well established that such a Colonial Act has only the force of law within the particular colony, and cannot invest a naturalized person with the character of British subject in foreign states; but says Hall: "The Naturalization Act does not seem to have been read quite in this sense, and it has been the practice to issue passports to the owners of colonial certificates of naturalization and to protect them in all foreign countries, other than their country of origin." Naturalization in India, which is not mentioned in the Act, is provided for by local statute, and the position of a person naturalized under such local ordinance is the same as that of a person naturalized in the colonies. In order to avoid the appearance of wishing to protect the naturalized subject who has become a British citizen *in fraudem legis*, all naturalized British subjects are described as such in the passports issued to them, and all applications for passports must be accompanied by the certificate of naturalization, in addition to those of identity and recommendation, and passports cannot be issued abroad to a colonial naturalized British subject except for a direct journey to the United Kingdom or to the colony in which he has become naturalized.

It is still a vexed question whether British subjects can divest themselves of their nationality in non-civilized countries, but the better opinion seems to be that the permission given to British subjects by the Naturalization Act to assume the nationality of a foreign state has regard only to such states as have a definite political organization. In all others British subjects remain amenable to British laws.

Naucratis.—The site of Naucratis was discovered by Professor Flinders Petrie in 1884; it is situated on the eastern bank of a canal, about 10 miles to the west of the present Rosetta branch of the Nile. In ancient times it was approached by the Canobic mouth, which was farther to the west. The identification of the site is placed beyond doubt by the discovery of inscriptions, with the name of the town, and of great masses of early Greek pottery, such as could not have existed anywhere else. The site was excavated in 1884–86 by the Egypt Exploration Fund, and a supplementary excavation was made by the British School at Athens in 1899. A list of the temples of Naucratis is given by Herodotus (ii. 178); they were the Hellenion, common to all the colonizing cities, and those dedicated by the Æginetans to Zeus, by the Samians to Hera, and by the Milesians to Apollo. A temple of Aphrodite is also mentioned by Athenæus. Traces of all these temples, except that of Zeus, or at least dedications coming from them, have been found in the excavations, and another has been added to them, the temple of the Dioscuri. The two chief sites to be cleared were the temples of Apollo and of Aphrodite, in both of which successive buildings of various date were found. Both were remarkable for the great mass of early painted pottery that was found; in the temple of Apollo this had been buried in a trench; in that of Aphrodite it was scattered over the whole surface in two distinct strata. A great deal of it was local ware, but there were also imported vases from various Greek sites. In addition to these temples, there was also found a great fortified enclosure, about 860 feet by 750, in the south-eastern part of the town; within it was a square tower or fort; a portico of entrance and an avenue of rows of sphinxes was added in Ptolemaic times, as is shown by the foundation deposits found at the corners of the portico; these consisted of models of the tools and materials used in the buildings, models of instruments for sacrifice or ceremonies, and cartouches of King Ptolemy Philadelphus. Professor Petrie naturally supposed this great enclosure to be the Hellenion or common sanctuary of the Greeks, but in the most recent excavations Mr Hogarth found traces of another great walled enclosure to the north-east of the town, together with pottery dedicated τοῖς τῶν Ἑλλήνων θεοῖς, and he claims with reason that this enclosure is more likely than the other to be the Hellenion, since no early Greek antiquities have been found in the southern part of the town, which seems rather to have been a native settlement. The cemetery of the ancient town was found on two low mounds to the north, but was mostly of Ptolemaic date.

Apart from the historic interest of the site, as the only Greek colony in Egypt in early times, the chief importance of the excavations lies in the rich finds of early pottery and in the inscriptions upon them, which throw light on the early history of the alphabet. The most flourishing period of the town was from the accession of Amasis in 570 B.C. to the Persian invasion of 520 B.C., when the contents of the temples must have been destroyed. The earlier chronology has been much disputed. There are clear traces of a settlement going back to the 7th century, including a scarab factory, which yielded numerous scarabs, not of native Egyptian manufacture, bearing the names of the kings that preceded Amasis. Among these were fragments of early Greek pottery. It seems a fair inference that the makers of these were Greeks, and that they probably represent the early Milesian colony, settled here in the time of Psammetichus I., before the official assignment of the site by Amasis to the Greek colonists of various cities. The most important of the antiquities found are now in the British Museum.

See W. M. F. PETRIE, &c. *Naukratis I.* Third Memoir of the Egypt Exploration Fund, 1886.—E. A. GARDNER, &c. *Naukratis II.* Sixth Memoir of same, 1889.—D. G. HOGARTH, &c. *Annual of the British School at Athens*, 1898–99. (E. GR.)

Naugatuck, a borough of New Haven county, Connecticut, U.S.A., on the Naugatuck river, and on the New York, New Haven, and Hartford Railroad, south-west of the centre of the state. It obtains water-power from the river for its manufactures, which comprise boots and shoes, woollen and rubber goods, cutlery and agricultural implements. Population (1880), 4274; (1890), 6218; (1900), 10,541, of whom 3432 were foreign-born.

Nauheim, or BAD-NAUHEIM, a watering-place of Germany, in the grand-duchy of Hesse-Darmstadt, situated on the north-east slope of the Taunus Mountains, 24 miles by rail north of Frankfort-on-Main. Its warm waters (84° to 95° F.) attract nearly 20,000 visitors annually; but, although known for centuries, they were prior to 1835 only employed for the extraction of salt (now about 2000 tons annually). The town has several parks, the largest being the Kurpark (125 acres), in which are the elegant Kurhaus and the two chief springs. The waters, which are saline, strongly impregnated with carbonic acid, and to a less extent with iron, are principally used for bathing. Three smaller springs, situated outside the Kurpark, supply water for drinking. In 1899–1900 a new spring (saline) was tapped at a depth of 682 feet. Another attraction of the place is the wooded surroundings, including the Johannesberg (773 feet), immediately overlooking the town. Population (1900), 4505.

Naumburg, a town of Prussia, province of Saxony, 29 miles south by west of Halle by the railway to Weimar, on the river Saale, near the confluence of the Unstrut. The cathedral (restored in 1883) was provided with a fourth tower in 1894, the gift of the Emperor William II. The town church possesses two pictures by Lucas Cranach the elder. The annual "Hussites feast" is still held here, but its supposed origin in a joyous festival held after deliverance of the town from the Hussites is fabulous, it having been proved that the Hussites never came to the walls of Naumburg. Close by is the pretty little watering-place of Kosen, famed also as the annual meeting-place of the representatives of the German students' corps. Population (1885), 19,107; (1900), 23,187.

Nautilus. See CUTTLEFISH and MOLLUSCA.

Navarra, or NAVARRE, a province of northern Spain, area 4046 square miles. It is divided into 15 administrative districts and 269 parishes. Its population was 304,184 in 1877, 304,051 in 1887, and 302,978 in 1897. The birth-rate is 3·47 per cent., the death-rate 2·79 per cent., and the proportion of illegitimate births 3·05 per cent. of the total births. Many of the inhabitants emigrate to South America and to France, where thousands of able-bodied lads from 19 to 22 years took refuge during the colonial and American wars of 1895–98, to avoid the conscription. A railway runs through the province to join the main line from Madrid to France at Alsasua junction. All the roads, like those of the three Basque provinces, are kept in excellent repair by the provincial council, assisted by the municipalities. Both bodies attend with some zeal to the primary schools, institutes, and normal schools. The province is agricultural rather than industrial. The wine trade is active, and the products of the vineyards are in great demand in south-west France and at Passages in Guipuzcoa for mixing with the French wines—the famous *coupages* that Spain now aims at carrying on in many of her ports. The industries include manufactures of arms, paper, chocolate, candles, alcohol, leather, coarse linens and cloths. The exports both by rail and by the passes in the Pyrenees consist of live stock, oil, wine, wool, leather, and paper. The forests have attracted the attention of foreign and native enterprise. Narrow-gauge railways convey the timber to the main lines. In 1897, 144,867 acres were devoted to wheat crops; 71,417 acres to rye, barley, oats, maize; 38,565 acres to pod-fruit, 134,382 acres to vines, and 22,875 acres to olive groves. The live stock included 16,320 horses, 17,447 mules, 14,617 asses, 40,568 cattle, 521,858 sheep, 50,476 goats, and 26,949 pigs. For its area, Navarre is one of the richest provinces of Spain in live stock. There are zinc, copper, iron, and lead mines giving employment to 352 hands. The works employ a few hundred hands, and turn out about 4000 tons of iron and steel, and 5272 tons of pig-iron.

NAVIES

I. Political and Economical Changes 1870–1900.

With the exception of the Russo-Turkish war of 1878, the year 1870 marks the last of the great European struggles, and is therefore a convenient starting-point to consider the subsequent growth of naval armaments. The period witnessed the advent of a new maritime, commercial, and colonial power in the federation of the kingdoms and states known as Germany. The final unification of Italy, with Rome as the capital, was also accomplished; and in the same year there began in Japan the rapid assimilation of an Eastern race to Western civilization. The opportunity of the Franco-German war enabled Russia to abrogate the treaty clauses providing for the neutrality of the Black Sea. It is not without significance that the denunciation of these clauses should have taken place in the year following the opening of the Suez Canal. Seven years later the Russo-Turkish war forced the conviction on Russia that a strong navy was necessary to the expansion of her empire. There thus resulted one of the most interesting events in history, where a strong navy was built up by a military power which possessed but an insignificant sea-borne trade and commercial marine, and suffered under the most striking disabilities, owing to its fleets in the Baltic, Black Sea, and Far East being widely separated. Not only could fleets thus situated seldom afford each other efficient co-operation, but many of the ships were of small dimensions, so as to operate on the shallow coasts, and sacrificed the coal supply which might otherwise have enabled them to effect a junction. The Black Sea fleet was further hampered by restrictions intended to prevent warships from passing through the Dardanelles. A temporary difficulty lay in the experience of corruption which nearly all navies have undergone, since they deal so largely in consumable and perishable goods. The numerous Black Sea courts-martial in 1900 gave indications of methods which vitally affect the preparedness of a navy. In Russia, owing to the same class controlling the Government, the navy, and dockyards, and pursuing its way without the safeguard of public criticism, the danger resulting from corruption is not one to be lightly estimated. These, however, are factors for which men have to form their opinions independently. While we cannot ignore them in comparing the strength of navies, they can only reveal their full effects under the supreme test of war. In other directions, however, we can measure Russian maritime interests very completely. It is significant that, in spite of the most determined efforts to support the mercantile marine by navigation laws and a monopoly of the coastal trade, it increased but slightly. There are no statistics available prior to 1895, but in that year Russia (exclusive of Finland) possessed 323,000 tons of sailing vessels and 206,000 tons of steamers; and in 1899, 268,000 tons of sailing vessels and 334,000 tons of steamers. This small increase is not a matter for surprise, for, if we except the island of Saghalien, Russia could communicate by land with the whole of her extensive empire.

In another continent, the United States of America was rapidly recovering its financial stability after the disastrous Civil War. It was building up industries and commerce destined to excite the apprehension of Europe by the end of the 19th century; an apprehension founded not alone on the effects of industrial rivalry, but also on the expansion of America into the chief markets of the world. This expansion was necessarily though tardily followed by the growth of the United States navy, and by the acquisition of transmarine territories in the West Indies, Philippines, Hawaii, and Samoa. The naval organization of 1898 was strained to such an extent, by the war with the third-rate naval Power of Spain, that the Navy Department refused to allow the battleships to be risked in an attack on the Spanish cruisers inside the fortified harbour of Santiago, and the United States was generally believed to have been saved from European naval intervention by the action of the British Cabinet. A determined effort was then made to bring the United States into the front rank of naval Powers. At the same time, it was recognized that naval operations were conducted under great difficulties, owing to the vast distances separating the squadrons on the Pacific and Atlantic coasts. Inquiries and negotiations were opened with the view of cutting a canal either by the Panama or Nicaraguan routes, and an arrangement was made with Great Britain by which the expense, maintenance, and defence of the canal should be in the hands of the United States.

II. The Growth of New Maritime Powers.

These, then, were some of the underlying factors which influenced the maritime rivalry characterizing the closing years of the 19th century. Whereas it might almost be said in 1870 that France and the United Kingdom possessed the only two great fleets of ironclads, the British First Lord of the Admiralty declared that the estimates for 1900–1901 were framed after a careful consideration of the navies of six great maritime Powers—viz., France, Russia, Germany, Italy, Japan, and the United States. Beyond the navies of the seven Powers, it cannot be said that there existed any vessels fit to lie in the line of battle. This in itself marks a profound change from the period of the Napoleonic war, when battleships cost one-thirtieth of what they did in 1902. When small Powers, like Denmark and Portugal, were able to afford the outlay on battleships, the action of their fleets was always a source of anxiety to the British Government. The rapidity with which sailing vessels could be built, and the facility with which small craft could be turned into privateers, had to be taken into consideration. At the end of the 19th century, though considerable progress had been made in the rapidity with which steel ships were built, the rate was not one which would enable the great maritime nations to fight for at least a year after the outbreak of war with any but the ships which were then completed or nearly so. In fact, the most rapid achievements, in favourable circumstances, in the building of battleships, were the *Majestic* and *Magnificent*, which were built and commissioned (1895) in twenty-two and twenty-four months after they had been laid down.[1] At the same time the special requirements of warships, and the tendency to give armour to even moderate-sized cruisers, had very considerably differentiated them from merchant vessels. While all the naval Powers provided for using some of the latter as auxiliaries, it was never contemplated that they should be required to fight vessels specially built for war purposes.

The net result of these changes was to enhance the predominance of the great maritime Powers, and while there had been a period when the national navy saved Denmark from Germany, and Turkey from Russia, that state of affairs was no longer possible at the end of the 19th

[1] Exceptional efforts were made in the case of these vessels, in order that early experience might be gained from their trials.

century. The great maritime Powers acting in concert, or remaining neutral whilst one of their number was engaged in a demonstration against Turkey, Greece, or China, or any other nation, could always enforce decisions with their ships, or were free to send troops over a sea on which their transports could move unmolested. So far as maritime strength was concerned, there could only exist groups of the seven naval Powers. Fighting amongst each other the smaller nations could engage in naval operations, as, for instance, when Japan fought China in 1895. It was inevitable that Japan should yield the chief fruits of her victory when Russia, Germany, and France interfered, while Great Britain and the United States lent her no active support. From that moment it became the settled ambition of the Japanese to become a great naval Power, and six first-class battleships were built in England between 1895 and 1902. In the latter year an alliance was concluded with Great Britain. The Japanese navy at the commencement of the war with China had consisted of only 30,000 tons of warships, while at the beginning of 1901 the aggregate amount was 260,000 tons. In bringing about this increase of the Japanese navy, it is probable that the necessity of gaining colonies for the surplus population of the islands and the expansion of Russia to the sea-coast opposite Japan were leading causes. The increase was in some respects as remarkable as the growth of the German navy, for the first ironclad Japan had possessed was a small one, the *Stonewall Jackson*, purchased from the United States Government in 1866.

The growth of naval armaments in the opening years of the 20th century became almost feverish, though Italy, crippled financially, tended to drop out and leave the field to the remaining six Powers. With the exception of Italy, we find the vote for new construction for each of the great naval Powers rising to the highest on record; and while Great Britain resorted to the policy of yearly programmes, Germany brought forward an ambitious scheme in 1900 which extended to the year 1916, though subsequent events pointed to the desire to complete it by a much earlier date. France and Russia also framed their programmes for a number of years ahead. Only one attempt had been made to check the rising tide of naval armaments, and that was the Tsar's Peace Conference at The Hague in 1899. Prior to the assembly of the Conference the First Lord of the Admiralty, from his place in the House of Commons on 9th March 1899, said:—

> We have been compelled to increase our expenditure as other nations have increased theirs, not taking the lead, not pressing on more than they. As they have increased, so we have increased. I have now to state on behalf of Her Majesty's Government that similarly, if the other great naval Powers should be prepared to diminish their programme of shipbuilding, we should be prepared on our side to meet such a procedure by modifying ours. The difficulties of adjustment are no doubt immense, but our desire that the Conference should succeed in lightening the tremendous burdens which now weigh down all European nations is sincere. But if Europe comes to no agreement, and if the hopes entertained by the Tsar should not be realized, the programme which I have submitted to the House must stand. It is constructed on the basis on which the House itself has always expected us to rest it. It is the lowest which can be justified by the existing expenditure on shipbuilding of other countries; it is the lowest by which we can secure the object which the people expect of the navy.

The Conference was fruitless so far as any reduction of naval armaments was concerned, the years 1900 and 1901 having each marked a fresh advance—in some cases considerable—in the naval budgets of the Powers.

III. The Evolution of Warships.

In 1870 Great Britain and France each had thirty-six ironclads built or building. Ship for ship, the advantage with the former Power was by no means great, and in the number of heavy guns she was inferior. By the end of the 19th century all the ships of 1870 had vanished from the sea-going squadrons. The British Admiralty at that time reckoned 4 per cent. per annum as the depreciation of a battleship, so that her life was estimated at twenty-five years. This obsolescence of ships is caused by the progress of marine engineering and the rivalry between gun and armour (*q.v.*). Until 1885, when chrome steel shot were invented, the advantage had been with the compound armour. Then came the face-hardening process, and the *Majestic* was the first ship in the world actually completed with Harveyed armour (1892). In 1901 the U.S. Naval Intelligence Department were able to report in their *Notes on Naval Progress* that the armour-plate once more held the advantage. At that time British naval practice, as in the battleship *Queen* and the cruisers of the *Kent* class, was to put 9-inch armour on to the sides of the battleships and 4-inch on to the sides of the cruisers. In 1901 a British Committee on Explosives recommended the adoption of a powder enabling higher velocities to be obtained, and consequently greater penetration (see Gunnery), thus foreshadowing the probability of the advantage resting with the existing thickness of armour for only a few years longer. The following year the old *Belleisle* of the British navy was fitted up with the armour then used, in order to be actually fired at by modern guns.

Few tasks are more difficult or more empirical than comparisons of naval strength. The most modern type of 12-inch gun at the end of the 19th century fired twice as fast as and was superior in all respects, including accuracy of shooting, to the $13\frac{1}{2}$-inch gun mounted in other battleships; while the latest type of 6-inch gun could perforate twice as much armour as an earlier type of 6-inch gun in another ship; and, again, there was much greater rapidity of fire. When we come to the armour question our difficulties are increased. At the end of the 19th century there were several varieties of armour in the first-class battleships. The usual formula was to assume that Krupp cemented armour was equal to 2·4 times its thickness in wrought iron, Harveyed or Krupp non-cemented to twice, and compound or steel armour to 1·7 times the thickness in wrought iron. The evolution of the armour is well and concisely illustrated by the following table, which is taken from the American *Notes on Naval Progress*:—

Armour Protection of British Battleships.

Date.	Ship	Thickness of Armour, in inches.	Weight of Armour, in tons.	Displacement of Vessel, in tons.	Percentage of Armour to Displacement.	Length of Vessel, in feet.	Length of Belt, in feet.	Percentage of Length of Belt to Length of Vessel.	Depth of Main Armour.
									Ft. in.
1881	Inflexible . .	16-24, iron	2450	11,880	20·8	320	110	34·3	15 8
1886	Collingwood . .	8-18, compound	1780	9,500	18·7	325	140	43	15 8
1892	Royal Sovereign .	Do.	2900	14,150	20·5	380	248	65·2	15 1
1895	Majestic . . .	9, Harvey	2790	14,900	18·9	390	217	55·6	15 0
1899	Canopus . . .	6, Harvey	1740	13,090	13·3	390	198	50·7	14 0
1900	Duncan . . .	7, Krupp	2000	14,000	14·3	405	285	70·3	14 0

The importance of these details in comparisons of naval strength may be illustrated by comparing some of the British Mediterranean battleships in 1902 with the French Mediterranean battleships of the *St Louis* class built at the same time. In the British ships the 6-inch guns of the secondary batteries were protected by 6-inch face-hardened armour, whereas the *St Louis* class had only 3-inch ordinary steel armour to protect their 5·5-inch guns. All the 6-inch guns in the British battleships could have perforated the French armour at 3000 yards not only with a direct hit but with a shot striking at an angle of 30° to the normal. On the other hand, even at the torpedo range of 2000 yards, a better gun than the French ships possessed could not have perforated the 6-inch face-hardened armour of the British ships. In October 1901 the French Minister of Marine was reported in *The Times* as saying at the launch of the *Léon Gambetta:* "The duty of the French navy is above all to secure superiority of fighting type for French units. Regard should be had to the fighting value of ships rather than to their numbers." So, in 1901, the French Government followed the British policy of large dimensions for battleships, it being recognized that the requirements of a ship fit to lie in the line of battle as then constituted and to have the coal endurance in order to be able to join the line of battle at a distance from a coaling base, could not be satisfactorily met on a dimension of less than 13,000 tons. On the other hand, it was always hoped that the necessity for relying on coaling bases might be obviated by some system of coaling whilst under way, and in 1902 experiments were satisfactorily carried out by the battleship *Trafalgar* which tended to show that a vessel could be coaled at a fair rate from a collier in tow. The need for large dimensions in battleships would still, however, exist in the necessary provision of armour and armament. Thus the 9·2-inch gun was introduced into the secondary armament in 1902 on board battleships in addition to the 6-inch gun, since it might be expected to perforate 6-inch face-hardened plates at 3000 yards and over at nearly all angles of impact. This of course meant increased weight. We find provision was made for battleships in Great Britain in 1902 of 16,500 tons, for Japan 15,200 tons (built in England), France 14,865 tons, Italy 13,500 tons, Russia 13,600 tons, and the United States 17,581 tons. The dimensions of battleships laid down by Germany continued to be 11,800 tons until, in 1901, vessels of 13,000 tons were laid down. The chief departures from the British type of battleships were some built in the United States with what were known as superposed turrets. The British system of placing the secondary armament in casemates (abandoned in 1902) was not so largely adopted by other countries. In addition some countries used triple screws and burned liquid fuel.

IV. Reconstruction of Ships.

We have a further source of complication in comparing the relative strength of navies. All nations in varying degrees have reconstructed vessels to bring them up to modern ideas. In such cases the life would probably be prolonged beyond the twenty-five years which we stated to be the British Admiralty's estimate in 1900 for a battleship. While at a later date the expenditure may be regretted, the system frequently offers a quicker accession of naval strength than is to be obtained by devoting the money to new construction. Both in France and Germany extensive reconstructions were at different times carried out, particularly about 1900–1902, and it appears to have been recognized that the most valuable are those undertaken sufficiently early in the vessel's career. Some of the most remarkable alterations were those of the *Hagen* class in Germany. These coast-defence ironclads were cut in two and lengthened by 27 feet. The increase of tonnage from 3500 to 4114 tons enabled the vessels to be generally improved, especially with reference to coal endurance. The experiment was regarded as successful. It was a characteristic of all German reconstructions that woodwork was, as far as possible, removed and steel substituted. The British trials of the *Majestic* firing at the *Belleisle* in 1900 were considered in Great Britain to have proved that there is no danger from fire where wood decks are bolted over steel. As showing the expenditure sometimes involved by reconstruction, it may be stated that the mere alterations from above-water torpedo tubes to submerged tubes in the *Brandenburg* were estimated to cost £46,000. Though Great Britain lagged behind France and Germany in the attention devoted to reconstruction, it should be remembered that all her recent battleships had certain advantages in the earlier adoption of submerged tubes and face-hardened armour. Thus we have seen that the *Majestic*, completed in 1895, was the first ship with face-hardened armour, and the enormous gain over the *Royal Sovereign* is illustrated by the remark that it was possible to increase the area protected by 50 per cent. for the same weight. In Germany, the *Aegir*, completed in 1897, or two years after the *Majestic*, and in France, the *Bouvet*, completed in the summer of 1898, were the first ships of the respective nations to have face-hardened armour, and this only on the thickly plated barbettes and belt. It thus results that the *Carnot*, *Jauréguiberry*, *Charles Martel*, and *Masséna*, all completed in 1897 and 1898, had nickel-steel armour, which was not nearly so efficient as face-hardened armour. While on the subject of reconstructions, it may be mentioned that in 1902 the policy was inaugurated in Great Britain of strengthening the armament and protection of ten battleships and fifteen protected cruisers. At the same time, owing to the congestion of work in the royal dockyards, the First Lord of the Admiralty intimated the intention of carrying out a great deal of the repair work of the navy in the private yards.

The fact that Great Britain was in advance of the nations in adopting essential improvements formed a significant change from the period of the 'seventies, when all the European navies adopted breech-loading ordnance, whereas in Great Britain the *Ajax*, launched in 1880, was armed with muzzle-loading guns. This vessel was removed from the effective list in 1902, at which period the Admiralty appear to have finally determined on removing the reproach from the British navy that could have been levelled at the beginning of 1901, to the effect that, except for four muzzle-loading guns in the Italian navy, the British navy was the only one possessing the obsolete armament to the extent of over 300 guns. These were confined to some sixteen third-class battleships, a few coast-defence vessels, and obsolete cruisers which were not in commission in 1900, and they did not affect the superiority in the total number of breech-loading guns which Great Britain possessed over the second and third navies combined, as can be seen from Table F. These vessels, including the *Agamemnon* and *Ajax*, built in 1879 and 1880 respectively, were gradually eliminated in 1901 and 1902.

V. The Naval Policy of the Powers.

The British Empire.—To the student of naval history it is difficult to understand how the predominant naval power, with traditions from the Armada and Trafalgar periods, should have included coast-defence vessels in the British shipbuilding programmes in 1870 and subsequently. When, however, we consider the history of the controversies raging round imperial defence, we perceive that the coast-defence vessels were but a symptom of false ideals which had swept over Great Britain under the influence of the doctrine that "steam had bridged the Channel." It was one Sir Robert Peel had coined and Palmerston passed into circulation. "Our great reliance," St Vincent had said, "is on the vigilance and activity of our cruisers at sea, any reduction in the numbers of which, by applying them to guard our ports, inlets, and beaches, would, in my judgment, tend to our destruction." "The opinion of Sir Francis Drake," wrote Howard to Walsingham in 1558, "Mr Hawkyns, Mr Frobisher, and others that be men of greatest judgment (and) experience is that (the) surest way to meet with the Spanish fleet is upon their own (coast) or in any harbours of their own and there defeat them." No wisdom of the past could stand against a plausible formula that "steam had bridged the Channel." The state of affairs in Great Britain throughout this period 1870–85 was summarized by Sir George Clarke and Mr J. R. Thursfield in the preface to their work on *The Navy and the Nation*:—

The strength of the navy was allowed to decline till the annual vote for shipbuilding was equalled or exceeded by that of France, who within a few years of the disasters of 1870–71 began steadily to increase her fleet. It is indisputable that the vast expenditure upon measures of passive defence which was inaugurated in 1859 checked and stunted the growth of the navy. Too much, however, may be made of this point, and the actual expenditure is of small account in comparison with the warping of the national policy and the establishment of false standards, which only a great war can efface. After many millions had been uselessly squandered, the scares of 1878 and of 1885 were widely felt. It was realized that the nation was quite unprepared, and that measures of passive defence, however academically successful, were quite unsuited to the needs of war.

On the 21st November 1888 a committee consisting of Admirals Sir W. Dowell, Sir Vesey Hamilton, and Vice-Admiral Sir F. Richards, reported to the Admiralty on the naval manœuvres of that year. It is a report marked by unusual directness of language, in which the issues are very plainly stated, while it exercised a great influence on British naval policy. We quote some paragraphs:—

The main lesson which these manœuvres emphasize is that Great Britain, whose maritime supremacy is her life, is very far from being as strong as she should be on the seas, either in *personnel* or *matériel*. . . . We are decidedly of opinion that no time should be lost in placing her navy beyond comparison with that of any two Powers.

England ranks among the great Powers of the world by virtue of the naval position she has acquired in the past, which has never been seriously challenged since the close of the last great war.

The defeat of her navy means to her the loss of India and her colonies, and of her place among the nations.

Without any desire to question the sums annually granted by Parliament for the maintenance of the services, we cannot but note the disproportion in the appropriation when the magnitude of the issues involved is taken into consideration.

It would, in our opinion, be far more in consonance with the requirements of the nation by the provision of an adequate fleet to render invasion an impossibility than to enter into costly arrangements to meet an enemy on our shores (instead of destroying his "Armada" off our shores), for under the condition in which it would be possible for a great Power successfully to invade England, nothing could avail her, as, the command of the sea once being lost, it would not require the landing of a single man upon her shores to bring her to an ignominious capitulation, for by her navy she must stand or fall.

While due allowance is made for the influence of experts and writers, it cannot be doubted that the extraordinary growth of British maritime interests led to anxiety on the part of the commercial community which had a great deal to do with the determination to maintain the two-Power standard, or equality in battleships with the two next maritime Powers. This standard came into vogue in England in 1889. Thus the foreign trade of the United Kingdom had increased from 547 million sterling in 1870 to 870 million in 1901, exclusive of the enormous trade in bullion, specie, diamonds, and stock exchange securities. The earnings of British shipping alone in a single year were over 60 million sterling. The imports of corn, sugar, wool, and timber had each more than doubled in the three decades; and as these articles are so bulky, and the return cargoes of coal had increased fourfold from 11½ million tons in 1870 to 44 million tons in 1900, there was naturally an immense development in the mercantile shipping which is so absolutely dependent on naval protection in war time. Thus in the year 1870, 73,198,600 tons of shipping employed in the foreign and coastal trades had entered and cleared in the ports of the United Kingdom, whereas in 1900, 208,777,000 tons had entered and cleared. This last was exclusive of 1,572,000 tons employed in the transport of troops and stores for the South African war, which it was seen could never have been carried out had not the Royal Navy safeguarded Great Britain from any likelihood of hostile intervention. These figures and statements give, however, but an inadequate measure of the wealth and growth of those maritime interests which the British navy had to protect. Even when we have added the coastal trades and the growing foreign trades of the great dependencies and colonies of the British empire, there still remains the British shipping employed by other nations. As stated by the Shipping Federation in their petition to Parliament in May 1899, only one-third of British shipping was employed for the requirements of the United Kingdom. Then again, some 70 per cent. of the submarine cables of the world were owned by Great Britain, and she had become dependent not only for cotton (as in the Lancashire cotton famine of 1861–64) and for timber, but also for food, iron ores, and all raw materials of manufacture, on countries separated from her by the sea, which in war can tolerate only one master, and becomes a multiplying power to the strong and an enslaving tyranny to the weak. These necessaries for existence were brought to Great Britain, or were being paid for by return cargoes, in about 6500 British vessels in winter and 7500 in summer, which would be actually ploughing their way through the ocean on any one day of the year, exclusive of all in port loading with cargoes, and exclusive also of foreign vessels.

With such stupendous maritime interests to protect, it almost defies investigation as to why there should ever have been a cause for naval scares, and as to how it came about that a country with a past steeped in successful naval tradition should, in the plenitude of her strength, have had ministers who attempted to provide localized substitutes for the mobile naval defence. The British empire had a coast-line of 43,000 miles, or 10 times that of Germany or Italy, 5 times that of France, and 2½ times the coast-line of Russia or the United States. From such facts it may be inferred that, when once the essential basis of their faith in the sea had been sapped, the argument that fortifications and garrisons could be substituted for naval defence applied all along the coast-line. As might have been anticipated, with a limited sum of money available for the purposes of defence, when expenditure was unduly diverted to localized defences, the main issues on the sea, on which everything depended, were lost sight of. It was this false doctrine of localized defence which largely militated against the mother country obtaining any substantial aid towards the navy from the outlying empire, as under its spell the idea of Australia and Canada being defended in the Mediterranean appeared inconceivable.

The position was so bad at one time that even the actual ships provided were starved for want of ordnance. Up to 1888 the Ordnance Department was under the War Office, and for years the Admiralty demands had been systematically reduced. The following table, extracted from Sir Vesey Hamilton's *Naval Administration*, speaks for itself :—

	Asked for.	Granted.
1881–82	£647,759	£360,000
1882–83	877,001	616,033
1883–84	707,002	500,491
1884–85	899,602	500,000
1885–86	1,145,000	850,000
1886–87	1,516,887	1,000,000

In 1889 the sum of £1,717,561 was transferred from the army to the navy estimates for the ordnance vote, and with the augmentation of the navy this vote has considerably increased since that date.

The navy estimates of foreign countries embraced details of coast defence, and, as in the French estimates, subsidies for fishing-vessels, &c. With the transfer of the Artillerie et Infanterie de la Marine to the War Department as the colonial army, the French navy estimates were considerably reduced, and it is necessary to bear in mind this fact when comparing the growth of expenditure. The British navy estimates were net expenditure after deducting the appropriations in aid and any special provision for permanent works like docks. Thus, owing to the great increase in the navy of vessels of a larger type, it was found desirable to add docks at the following places, provision being made by special Naval Works Acts :—

	Docks.
Chatham	1
Malta	2
Gibraltar	2
Bermuda	Floating dock.
Cape of Good Hope	1
Hong Kong	1

In the ten previous years (1889–99) Great Britain had only added two docks at Portsmouth and one at Malta. During this period the longest cruisers had increased from the 400 feet of the *Northumberland* to the 500 feet of the *Terrible* class, and the battleships from 345 feet for the *Trafalgar* to 400 feet for the *Formidable*. Even with this development the largest battleships were from 200 to 300 feet and the largest cruisers 100 to 200 feet shorter than the largest passenger steamers, such as those employed in the Atlantic trade. In the same period the Mediterranean squadron had been doubled from 96,000 tons in 1889 to 205,000 tons in 1899, the Channel fleet increased fourfold from 37,000 tons to 155,000 tons; the China squadron was nearly trebled, and the remaining squadrons doubled. Hence the urgent necessity for special expenditure granted apart from the normal navy estimates.

From 1870 to 1885 the British navy estimates were maintained at from £10,000,000 to £12,000,000 sterling, and the *personnel* dwindled from 61,000 to 57,000 officers and men. The subsequent course of events is shown in Table C. It is characteristic of the haphazard methods pursued, that with the increase of ships provided for in 1885 no provision was made for increasing the *personnel*, and the then Board of Admiralty were accused by the succeeding First Lord of having neglected to provide even the money for the ammunition and torpedoes for the ships built. Again, with the Naval Defence Act of 1889, when provision was made for doubling the navy and everything pointed to a scarcity of officers in the future, the number of entries into the *Britannia* was actually reduced by one-fifth. Where foresight, organization, and business-like methods were vital, the administration of the British navy during those periods of its expansion does not show to advantage beside the carefully thought-out plan by which the German Admiralty proposed to carry out the vast increase of the Imperial Navy. In the latter case we find the expansion of the dockyards, *matériel*, and *personnel* of the navy going on hand in hand. The faults of the British system were obvious, and had been condemned by the highest authorities in the Government. "The exercise of the Treasury's powers," said the Prime Minister in 1900, "in governing other departments of the Government is not for the public benefit." On 24th November 1901 the First Lord of the Admiralty declared that if business men were appointed to the Admiralty, they would find "that under an infinite variety of sub-heads they had, fifteen months beforehand, to state what they were going to spend fifteen months hence, and that they could not, in the course of business, transfer sixpence from one sub-head to the other without the consent of a totally different firm." Nothing could more conclusively prove that the fault lay in the system than the fact that we should so often find First Lords of the Admiralty committing mistakes that they themselves had condemned. It would be difficult to believe that the author of the following words, extracted from "the statement of the First Lord explanatory of the navy estimates 1887–88," was the same First Lord who reduced the navy estimates in 1887 and 1888, and was forced by "popular pressure" to bring in the Naval Defence Act of 1889. Yet so it was, and we quote his words in full, since they afford a statesmanlike review of a lesson from which Great Britain appeared to have profited but little :—

A careful review of the expenditure of the past six years is necessary, in order that the significance of our present position, and the causes at work in establishing it, may be understood by Parliament and the country. In the period between 1881 and 1885 every naval Power in Europe, save England, largely increased its naval expenditure. The introduction of slow-burning powder, and the alterations in the design of heavy ordnance which it entailed, while giving increased velocity and accuracy to guns of all calibres, produced a corresponding development in the defensive power of armour-clads and protected vessels. Speed in the performance of naval tactics became an even more essential factor than before, and was so recognized abroad; and on vessels of comparatively small displacement successful efforts were made to realize, by engineering ingenuity, a speed wholly unknown to the smaller craft of a few years back. These developments of speed and power necessitated increased expense. England was the last naval Power to recognize these new conditions. In 1885, under popular pressure, the Government of that day admitted the insufficiency of its previous arrangements, and, with the assent of all parties in the State, Lord Northbrook, the then First Lord of the Admiralty, proposed to expend, in addition to the ordinary shipbuilding programme, a sum of £3,100,000 in the building of ships by contract in private yards. An additional sum of £1,600,000 for guns was also proposed to be added to the ordnance votes of the navy, which are included in the annual estimates of expenditure of the War Office [since transferred].

If this great sum had been spread over this period of six years more evenly, and if consideration and a continuous policy had attended its disbursement, the navy at this moment would be far stronger than it is. On the other hand, the increase of strength which this sum will ultimately give would have been more economically attained if hurry and scare had not attended its outlay. The conclusion to be drawn will, I trust, not be lost sight of by subsequent Administrations and by Parliament.

It may be said that from 1885 the British navy, supported by the public, was fighting against the inertia of previous years, and even the necessary Naval Intelligence Department which was formed in 1887 had a struggle for existence. In 1901 it consisted of 14 officers, as against 17 for the German Naval Intelligence Department.

By 1901 the evolution of naval opinion had reached as enlarged a conception of the functions of the British navy as Moltke possessed concerning the functions of the German army. Moltke's method was, on a careful estimate of the situation, to organize the army to suit what would be the probable situation in war, without reference to the possibilities which alarmists are prone to place in the foreground of their pictures. In 1901 the First Lord of the Admiralty laid down the true standard on which naval strength should be based, viz., "The navy ought to be so strong that it can have a reasonable certainty of success in the performance of any duty which it is reasonably probable that it will be called on to perform." This was emphasized in the House of Commons on 22nd February 1902, by the Financial Secretary of the Admiralty, who said, "Their duty was to have a naval force which should certainly not be less than the standard of two other Powers, and should be equal to any reasonable emergency with which we might expect to be confronted. This of course involved a power not only equal to, but in excess of, the standard of two Powers."

The tables accompanying this article show the progress achieved. From these it will be seen that in the 10 years ending 31st December 1900, or the closing decade of the 19th century, Great Britain had built or commenced 38 battleships, France 17, Russia 18, Germany 19, Italy 6, the United States 16, and Japan 6, making a total of 120 battleships built or commenced since 1890. If we exclude Japan, and so confine our attention to those nations likely to wage war on the Atlantic, we find that in 1902 one in three of the modern completed battleships was British. When we reflect that the average tonnage of these vessels was higher than that of any of the other Powers by nearly 1000 tons, the position of Great Britain appears to have been a fairly satisfactory one. The same apparently favourable position existed as regards the armoured and protected cruiser classes and the mercantile auxiliaries. Since 1890 Great Britain had built or laid down 96 armoured or protected cruisers, as compared with 41 for France, 19 for the United States, 18 for Japan, 16 for Italy, 15 for Germany, and 13 for Russia. The requirements of the British empire, with its 43,000 miles of coast-line, connected by shipping routes which have to be protected, and the necessity this protection imposes of persistently watching the enemy's ports, pointed to the need for larger supplies of cruisers than mere comparisons with other nations might suggest. Considering the matter as one of insurance, although there is very little strategic relation between the defence provided and the extent of interests which have to be defended, it is interesting to note that a Parliamentary Paper in 1899 gave the naval expenditure per ton of mercantile shipping as in Great Britain £2, 11s. 3d., France £14, 8s. 1d., and Russia £14, 18s.

It was a subject of controversy at the beginning of the 20th century whether the strain maintained on the British navy during peace was not an unnecessarily severe one, owing to the policy carried out by Great Britain alone of maintaining large squadrons in every part of the world. The opinion was held by many that the British navy would gain both in organization and training if these ships were more concentrated during peace. The growth of Italy, the important colonies which France had acquired in North Africa, and finally the opening of the Suez Canal, had brought about a concentration of French naval force in the Mediterranean. The Franco-Russian alliance induced the British Government to place their Mediterranean fleet on what was practically a war footing, and a great deal of expenditure was incurred at Gibraltar in the attempt to make it an efficient dockyard. In view of the proximity of the Spanish shore, and the fact that the home dockyards were distant only five days' steaming at moderate speed, this expenditure was very seriously called in question, on the ground that it could have been more usefully applied in other directions. The same law holds good as regards navies as in commerce, that large concentrated resources, such as great naval yards like Plymouth and Malta, work far more efficiently and rapidly than the necessarily small resources of an intermediate and expensively created dockyard such as Gibraltar promised to be. Therefore it is only a superficial view which would develop Gibraltar merely because naval actions might be fought in its vicinity. There is nothing to show in St Vincent's expressed opinions that even in his day, when England was so distant in time, he attached any value to Gibraltar beyond the opportunity of anchorage and ordinary supplies which it gave. There is the very good reason that he abandoned the Mediterranean when the over-anxious Admiral Mann carried his squadron to England, to show the real and concrete value which he attached to actual fighting ships. Millions had been diverted from direct naval expenditure on ships and men in the British empire to what was merely superficial, of local utility, or only supported by the plausible argument that resources and defences were being provided which enabled the fleets to operate more freely.

It appears to be difficult for men to understand that warships are built to fight ships of their class, and are quite unsuited for the direct attack of fortifications. The threat of interruption when attacking land defences—as occurred at Lissa, in the war between Italy and Austria—deters them from using their ammunition supply, which is even more limited in quantity than was the case in the past. The ammunition supply and the life of the gun have to be husbanded for the purpose of fighting the enemy's ships. It follows, therefore, that the sedentary defence need only be of moderate dimensions, except where it is contemplated, as was done by Lord Palmerston when he initiated the Portsmouth fortifications, that the sedentary defence *should defend the fleet itself*. This position was no longer contemplated in British naval policy at the beginning of the 20th century. It should also be remembered that no amount of defence on shore can safeguard the communications of bases like Malta unbacked by continental territory. Large supplies of coal could not be accumulated because of deterioration, so that the communications of the base in war might easily be of equal importance with the base itself. British naval operations must therefore, apart from the fortifications, provide for the defence of the base and its communications. In this connexion the answer of Moltke, when urged to build fortifications on a certain line of march, may be cited. He replied that if the enemy were to go that way the forts might doubtless be useful, but they would be unnecessary, as he should meet the enemy with the field army; but, he added, if the enemy takes another route, the men in the fortifications and the money which had been spent on them would be lost to the field army. Applying this lesson to the British navy, it was contended by some authorities on imperial defence that the scale on which shore defences were necessary to the British Empire was dictated solely by the probable raids of a few fast vessels and torpedo craft. In the absence of any fortifications, these vessels might otherwise be willing to incur the risk of capture for the sake of the damage which they might hope to inflict before they could be interfered with.

It was also contended that the sedentary garrison should be organized in such a way as not to interfere with the free movement to other parts of a large proportion of the troops. Both in South Africa and in China, in 1899 and 1900, naval forces had to be landed, and the ships denuded of their fighting complements, because the troops could not be sent without grave delays. The Benin expedition of 1897 was another case in point, where ships were denuded of their crews to undertake an inland expedition. When all the facts came out concerning the bombardment of Alexandria in 1882, they did not add to the prestige of the navy, but the final comment must be that the navy was called upon to perform work which was essentially military in its nature, and in which the fleet ought only to have played an indirect part. If in circumstances of peace Great Britain had so often to employ the navy on military work, the question was suggested by Sir John Colomb as to where the naval commander-in-chief would find the military forces to co-operate with the navy in capturing vessels in a harbour which is secured against attack by sea, but not against a landing-party. And yet it is the case that in offensive operations a military force, capable of being rapidly transferred by sea, is of the greatest assistance to the work of a predominant navy. Hence there arose a demand at the beginning of the 20th century for arranging that the coaling stations should be under naval control, so that the admiral should have at his disposal the military units which might be quartered on shore, as also the use of the shore guns on board the ships if he should require them.[1]

In respect of the sense of proportion which enables a statesman to consider the whole of a question before the parts are dealt with, it is doubtful whether imperial defence had made much progress in England or her colonies at the end of the 19th century. The whole system of Parliamentary procedure blocked the way to progress, for no member of Parliament would be in order who attempted to refer to the navy in a debate on the army estimates, or *vice versâ*. No discussion could take place as to the Cabinet Committee of Defence, which was supposed to deal with the whole question of imperial defence, for no salary attached to the secretary or the members of the Committee.

If British naval policy betrayed want of clear thinking, it must be confessed that France was even worse served. The Ministry of Marine changed its chief more than thirty times in thirty years, and was subjected to repeated commissions of inquiry, which only tended to create confusion. Numerous changes took place in the system of the administration, preparation for war, and policy. As regards shipbuilding, the navy estimates for 1900–1901 made provision for expenditure on six battleships. In the previous year (1899) the reporter of the French Budget Committee said that he approved, "without reserve, the decision of the Minister of Marine to suspend for 1899 the ordering of a new battleship, so as to concentrate all available resources on cruisers, torpedo-boats, and submarine vessels." It has been the prevailing characteristic of French naval policy in the past, that it seldom exhibited any stability of purpose, such as is stamped on the carefully thought-out German programme. In introducing the estimates for 1900, the French Minister of Marine pointed out that the programme of 1871 had been repeatedly modified, and yet was not completed. "The Government considers that it is indispensable to do away with such errors, and to lay down in definite form what should be the organization of the navy, adapting it, like that of the army, to the needs of defence on the one hand, and to the resources in men and money on the other." The failure of many ships he attributed to repeated modifications, and hence the origin of a fixed programme to be completed in 1906 or 1907. The Minister of Marine might have added that the programmes of 1891 and 1896 were arrested within three years of their being first sanctioned.

In the above remarks the French Minister of Marine laid down the limiting conditions of national and imperial defence. No resources can provide for safety at all points. To find out the vital needs of the probable theatre of war, and to take care that in a limited expenditure of men and money the whole is not sacrificed to the part,—these are the conditions on which the maritime supremacy of Great Britain can be maintained. To attempt to provide for all the possibilities of war is to disperse resources and to court defeat. The British empire would start a maritime war with immense advantages in her favour through the geographical position of Great Britain, the chains of coaling stations supplied from South Wales with the best smokeless steaming coal, and the possession of the greatest mercantile marine and shipbuilding yards in the world. France must ever labour under the disadvantage of her coast-lines being separated by the Iberian peninsula, while Russian fleets in the Baltic and Black Sea are separated by thousands of miles of foreign coast-line, and can only obtain access to the sea through narrow channels. The Sound, the Belts, and the Dardanelles are easily blockaded by a Power which holds the supremacy of the seas. The Baltic and Vladivostok are impeded by ice during the winter months. Port Arthur, closed to the sea by a superior fleet, is isolated except for a long and uncertain line of railway traversing 4500 miles to St Petersburg. On the other hand, the necessity imposed on the British navy of keeping the sea involved greater risks of navigation. This fact is one which can be deduced from history. In the French revolutionary war of 1793–1802 the British losses from causes other than fighting amounted to 18 sail of the line, 3 fifty-gun ships, and 43 frigates; the allied nations of France, Spain, and Holland only lost from these causes 10 sail of the line and 9 frigates. This is a somewhat remarkable fact, when we consider the inexperience and disorganization of the French and Spanish navies. As with those navies at the end of the 18th century, so at the end of the 19th, France and Russia combined lacked the advantages which belong to a homogeneous force. No naval alliance in history has ever been successful against an efficient navy except when the allies were numerically far stronger than the homogeneous force, or originated from a common stock speaking the same language. New inventions, such as liquid fuel, aërial navigation, and submarine vessels, may exercise a modifying influence, but a nation which is so conditioned by surroundings as to ensure unity of purpose in her policy must have an immense advantage in all circumstances.

Germany.—The German Navy Bill of 1900 for doubling the navy in sixteen years, while allowing for the obsolescence of vessels, was heralded by the following New Year's speech of the German emperor to his generals:—"As my grandfather did for the army, so will I for the navy, carry out the work of reorganization. The navy must be equal to the army. Then I shall be enabled to procure for Germany the place among foreign nations which she has not yet obtained." At the same time, possibly fanned to a certain extent by the growth of anti-English feeling, an extraordinary outburst of enthusiasm for the navy swept across the Fatherland. The German Navy League (founded on 30th April 1898, in imitation of the British Navy League, started on 1st January 1895), with H.R.H. Prince Henry of Prussia as patron, soon had 600,000 members and an income of £25,000 a year. A few days after the emperor's New Year speech some German vessels were seized by British cruisers off Delagoa Bay on suspicion of carrying arms and ammunition to the

[1] In connexion with the above remarks the speech of the First Lord of the Admiralty in the debate on Wei-Hai-Wai in the House of Lords may be quoted from *The Times*, 19th March 1902. After stating that he had the concurrence of his Board in his remarks, Lord Selborne said: "Bricks and mortar as applied to naval expenditure are an evil, very often a necessary evil, but they are an evil. What we want are more ships, and every penny that is spent in bricks and mortar and land fortification which could be spent on more ships is money unnecessarily and badly spent. Every garrison that we have to lock up hundreds and thousands of miles away from this country is an evil, very often a necessary evil, but an evil to be reduced to the smallest dimensions possible. . . . The number of these bases and the money spent on them should be limited in the strictest manner to the absolute necessities of the navy."

Boer forces. A wave of angry feeling swept throughout Germany, and the emperor telegraphed to the king of Würtemberg his hopes that "the events of the last few days have convinced wider and wider circles that Germany's honour, as well as her interests, must be protected on distant seas, and that for this purpose Germany must be strong and mighty at sea as well as on land." When the Navy Bill was passed the emperor telegraphed to the directors of the North German Lloyd, which owned the greatest mercantile fleet of any country in the world, that when the work of building up the imperial navy was complete "we shall be able to impose [*gebieten*] peace on sea as well as on land." When the Navy Bill was being discussed in the Reichstag, a secret session of the Budget Committee was held, respecting which *The Times*' correspondent pointed out that the subsequent public debate revealed that British maritime and imperial power had been the chief subject of discussion *in camera*. On 19th June 1901 the emperor made a speech in which he said that "our future is on the sea." This sentiment, "Unsere Lukunft liegt auf dem Wasser," had been used as a motto for the German nautical display at the Paris Exhibition of 1900.

In February 1902 a German socialistic paper, which had on more than one occasion published secret papers, came out with the announcement of an increase in the navy estimates which the German Government contemplated presenting in the following year to the Reichstag in extension of the huge programme of 1900. Only the Bill of 1900 is included in the details given below. They are alone sufficient to mark the sacrifices which were being demanded of the German people and the development of national aims since the Navy Bill of 1897, when the Chancellor declared that the proposals he then brought were directed only to "the speedy completion of an unfinished institution. . . . *We do not dream of rivalling the great naval Powers.*" The Bill would "form the basis of our fleet for many years to come." No one can complain of this development of national aims. It is, on the contrary, a subject for admiration that a nation in half a century should have reached such high aspirations, for in 1848 Moltke was despairing of his country, and the Prussian navy had consisted of but one corvette and two gunboats. The quotations are simply made with the view of showing the trend of German policy, apart from the more practical outlays involved in the £93,000,000 sterling voted for the navy and the expansion of the dockyards, and apart from the expenditure on the Kaiser Wilhelm Canal, which enabled ships to pass from the North Sea into the Baltic in ten hours. The proceedings as a whole form a record of triumph for the emperor over what had been once the hostile opinion of the public. This feeling he himself virtually expressed on 18th October 1899, when he launched the battleship *Kaiser Karl der Grosse*: "If the increase in the navy which I demanded with urgent prayers and warnings had not been stubbornly refused me during the first eight years of my reign—I did not even escape derision and mocking at the time—in how different a manner should we now be able to promote our prosperous commerce and our interests oversea! But my hopes that the German will brace himself to the task have not yet disappeared, for great and mighty is his love of his country."

By 1901 the *personnel* consisted of 31,038 officers and men, as against 28,204 officers and men in 1900. It should be remembered that the fixed defences of two of the naval ports were in the hands of the navy, and a certain number of soldiers were occasionally given sea experience by embarkation in the manœuvres. An increase of 33,000 officers and men was intended to take place during the next nineteen years to 1920.

In 1901 the *matériel*, including ships under construction, was made up as follows:—

Battleships, 21—
  Of which 8 first-class completed,
    8 building,
    5 third-class completed.
Coast-defence ships, 8.
Armoured cruisers, 6—
  Of which 3 completed (2 were obsolete battleships),
    3 building.
Protected cruisers, 6.
Small cruisers, 32—
  Of which 28 completed,
    4 building.

The following programme was proposed in 1900:—

	Cost of Unit.	
28 battleships	£1,225,000	
18 large cruisers	882,000	
45 small ,, ...	269,500	
16 torpedo-boat divisions . . .	294,000	
Total cost of programme		£67,007,500
To complete vessels previously voted . .		6,630,000
Total cost of new construction . . .		£73,637,500

Allowing for certain reductions, the annual cost, spread over the sixteen years to 1916, works out at £4,900,000. To the £74,000,000 for the active navy, a sum of about £20,000,000 has to be added for the increase of the dockyards.

The following was the official scheme for building new vessels to replace old tonnage. The names of the vessels becoming obsolete for each year are given below, and, disregarding these vessels, the German navy by 1916 was intended to consist of 38 battleships, 20 large cruisers, 45 small cruisers, and 16 torpedo-boat divisions. As passed, this was reduced by 6 large and 7 small cruisers. It does not follow that because vessels are labelled obsolete in this look ahead, and left out of the above list, they are not still serviceable, and there was nothing in the scheme to prevent the official programme from being completed long before 1916. As far as could be ascertained in 1902, the last but one of the new battleships would be laid down in 1905.

Become Obsolete.

Year.	Battleships and Armoured Coast-Defence Vessels.	Large Cruisers.	Large ships required to replace yearly.
1901	Bayern, Sachsen, Würtemberg, Baden	König Wilhelm, Kaiser, and Deutschland	7
1906	Oldenburg . . .	...	1
1908	...	Kaiserin Augusta .	1
1912	Siegfried . . .	...	1
1914	Kurfürst Friedrich Wilhelm, Brandenburg, Weissenburg, Worth, Beowulf, Frithjof	...	6
1915	Hildebrand . . .	Freya, Victoria Louise, Hertha, Fürst Bismarck	5
1916	Heimdall, Hagen .	Vinetta, Hansa .	4
1917	Ægir, Odin . . .	...	2
		Total . .	27

Apart from the obsolete ships, the German navy was intended to consist of 29 battleships by 1908, in addition to 20 large cruisers, 51 small cruisers, and 16 torpedo divisions, which should make it stronger than France expects to be in 1907. The shipbuilding resources of France had fallen so far behind those of Germany in 1902, that there did not appear to be a likelihood of any other nation, excepting the United States, entering into active rivalry with Germany in the race for the position of second maritime Power in point of strength. Unquestionably Germany was possessed of great resources, using the imperial dockyards at Danzig, Kiel, and Wilhelmshaven, in addition to a number of private yards. Five of the dockyards in 1900 ranged from Danzig, employing 4900 men, to Kiel employing 11,700. In all there were 42 dockyards of various dimensions, the 39 private yards employing nearly 25,000 men. The great Krupp iron-works, which controlled dockyards, iron-works, and coal-mines, employed nearly 47,000 men. Whilst these resources gave Germany a great advantage over France, Russia, and Italy, resort had still to be made very largely by German shipowners to Great Britain, there being building in Great Britain for Germany some 200,000 tons of shipping in 1901. When, however, we consider the insignificance of German shipbuilding until 1884, when Bismarck subsidized the great lines on condition that certain ships were built in Germany, the progress made in the later period is seen to be very great.

It is necessary to recall facts like these, for it must be remembered that the burden of naval armaments is not one that is lightly borne by the great maritime islands, which depend wholly on their navy to keep open their sea communications; and Germany, vitally dependent as she is for the defence of long land frontiers on her army, may find it difficult to face the joint burden in time of great trade depression. This, however, appears to be fully realized by the Government. For the two years 1899 and 1900 the Government spent beyond the estimates £800,000. In presenting the estimates for 1901, Baron von Thielmann said in the Reichstag that the estimates in future years would be much harder to balance, owing to "the daily augmenting sums due for pensions, and the yearly increasing demands for the expansion of the navy." On 8th January 1902 Baron von Thielmann said: "The Imperial finances have turned out to be even more unfavourable than could be foreseen a year ago. The advance which characterized the last years of the past century has not only become slower, but a depression has taken its place which has been accompanied by a great collapse of important banking institutions and other undertakings. This could not fail to have an unfavourable effect on the financial situation." The strength and consistency of German policy are a product of the passion of the nation for history. A noted French deputy, M. Jules Roche, in 1895, when comparing the French and German armies and the tradition in Germany in favour of taking the offensive in war, said: "Our neighbours breathe the air of history. They never break the chain of the past. In their conversation and their literature, events of the last century are to them as if they happened only a few years ago. What concerns Barbarossa interests them as much as contemporary events, and they make a scientific and political theory out of the consequences they deduce from historic events which for us would seem to have utterly faded away." In the German navy British naval history was closely studied, and the naval programme was framed with the view of taking the offensive, as had always been advocated by the great British sailors.

The principle which animated the German Government in its policy was that naval strength is part and parcel of maritime expansion. For this reason, no detail connected with the opening up of harbours or waterways was too insignificant for the Government. Both the *personnel* of the mercantile marine and the imperial navy are the recipients of the royal favour, and the highest honours have been paid alike to the founder of the North German Lloyd and to the mercantile captain who brought the *Bulgaria* home after great privations. While liberty was conceded in peace to the shipping, in war the Government had the power compulsorily to charter for their own purposes any vessel they might require.

The old law derived from history, that the sea will have only one master, indicates that there can be no finality to naval expenditure. When the Navy Bill of 1900 was being considered, the Secretary of State for the Imperial Marine, Vice-Admiral von Tirpitz, thus defined German policy:—"The geographical position of Germany, the absence of coaling bases, and the consequent necessity for replenishing at sea, make a large battle-fleet necessary. The North Sea and Baltic coasts are so much enclosed that a war against commerce only, advantageous as it may be to other nations, is not possible for us, even if our cruisers succeeded in making the open ocean; they would be unable to return with their prizes; and where could they obtain coal? The fleet of a Power like Germany can never be the same as that of France, for instance, whose coast-line forms a projecting angle into the ocean."

The preamble of the Navy Bill expressed the opinion that "the enemy's cruisers on the chief trade routes in the Skager Rak, in the English Channel, on the northern coasts of Scotland, at the entrance to the Suez Canal, and at the Cape of Good Hope could make German navigation almost impossible." Great Britain, alone among the Powers, could operate against commerce over this wide sphere, so that we may assume as correctly expressing German views the statement of Vice-Admiral Valois in a pamphlet published in Germany in 1899, that the naval preparations were directed against Great Britain. In these circumstances it is difficult to imagine the German Navy Bill of 1900 as likely to be the last word in the regrettable rivalry of naval armaments.

The coast-line of Germany is about one-tenth that of the British empire, but the coast-line is a factor which bears very slight relation to naval operations until a nation is in a position to establish blockades. The smallness of the German coast-line, and the concentration of over 50 per cent. of the commerce by sea in the single port of Hamburg, would have made it a simple operation for a Power in command of the sea to arrest the whole of the direct sea commerce of Germany. This commerce at the time amounted to about 40 per cent. of Germany's total commerce, but a higher figure was often given through the inclusion of trade by Holland and Belgium. It was evident, therefore, that if Germany contemplated a struggle on the sea and the maintenance of her shipping, there could be no alternative but, either by her own unaided efforts or in conjunction with allies, to continue at an increasing pace the sacrifices which she was making in 1902. We may add that for years past Germany had been making these sacrifices, for in the period 1869–97, prior to the Navy Bills, the annual naval and military expenditure of Germany increased by $21\frac{1}{2}$ millions sterling, as compared with Great Britain $17\frac{1}{2}$, France $13\frac{1}{2}$, and Russia 20 millions sterling. Only an increasing population and a thriving trade would enable fresh burdens to be easily borne, and this the German Government assumed (whether erroneously or not time must show) would be the case.

France.—In the section dealing with British naval policy reference has been made to the vacillation of the French administration as compared with that of Germany. This vacillation, reflected as it was by the political changes involving a new Minister of Marine on an average of once a year, affected shipbuilding, coast defence, war training, the direction of maritime affairs, and the future conduct of campaigns. It is related of Moltke that he expressed the opinion that though a general might choose a plan of campaign which was inferior to several others, concentration of purpose in carrying it through would be more likely to bring success than to attempt first one and then another of the wiser courses. It is because the most consistent idea held in common by the majority of French naval officers at the beginning of the 20th century was the old one of the *guerre de course*, which failed in the French Revolutionary and Napoleonic wars, that a brief mention of it must be made. At the same time it should be stated that attacks on commerce (when not brought about by the regular process of attaining command of the sea) require the dispersal of warships so as to attack at many points. The fact that in 1902 a concentration of French men-of-war was effected, so that the whole of the Pacific and Indian Oceans was confided to one squadron, might be taken as a virtual abandonment of the policy of the *guerre de course.*

In discussing the British navy estimates on 9th March 1899, the First Lord of the Admiralty said:—

> I want to call the attention of the House very briefly to the fact that some of our rivals are practically giving up the idea that they would be able to meet us in the open sea, or, if they were able to meet us in the open sea, that at all events the better policy would be to endeavour to wear out the patience of this country by prolonged attacks upon our commerce, our food supply, and our sources of production. They think that while our battleships would be lying opposite their ports they would be able to sweep down upon our commerce, until this country tired of the uncertainty and the injury inflicted upon us, and of the flag being transferred to other nations. It has been avowed in the most distinct terms. Scientific and professional writers and politicians and statesmen have all commended this plan, and, what is more, they have acted upon it. The plan now is to build very fast cruisers which shall prey upon our commerce, and which shall inflict that damage upon us which I have attempted to describe. We cannot sit still in the face of the construction of cruisers intended for that purpose. We know that purpose, and it is our bounden duty to defeat it.

There can be no doubt that this summary of French naval policy was in agreement not only with the expressed opinions of French naval officers, but also of responsible statesmen. M. Delcassé, when out of office, said, on 12th December 1896: "We [the French] must avoid general actions with the same perseverance that England will try to bring them about, and direct our efforts to where she is most vulnerable. For that purpose the first quality we require is a high rate of speed, and the power of steaming a long way without having to take in a fresh supply of coal." M. Lockroy, who had been Minister of Marine, said that "by launching some fast cruisers or torpedo boats on the great trade highways it would be possible for us to starve Great Britain, to suppress her commerce, and to ruin her industries."

This policy can, of course, only be judged on historical evidence. During the last French wars, when the same policy was tried, the British mercantile marine, during the twenty years of active war, lost to the French on an average 543 vessels yearly. The British mercantile marine varied during this period from 21,000 to about 25,000 vessels. Taking the average as 23,000 vessels, the loss was 2·36 per cent. As Great Britain added to the register 925 vessels per annum during that period, and in 1810 there were no less than 4023 prize ships which had been admitted to the British Registry, there was ample tonnage to replace the waste of war, time, and navigation. There were errors of detail in the Registry in those days, and there were undoubtedly nominal captures of British ships for the purpose of smuggling goods into French territory duty free, but these limiting considerations do not alter the main conclusion to be drawn from history that the *guerre de course* as an operation of war leads to the dispersal of resources, and cannot hope to assist the main end in view, which is to bring a war to a successful conclusion. To those who examined the list of French vessels at the end of the 19th century, it was familiar knowledge that there were none available for the attack of commerce if the requirements of the battleships in scouts and look-out vessels were to be met.

The budget of 1901 provided for 20 additional submarine boats of a speed of 8 knots. When all the submarines provided for in the budget of 1902 were laid down it was calculated that France would have, built or building, no less than 44 of these vessels, or more than the programme of 1897 contemplated. A great deal of the enthusiasm for submarine boats was undoubtedly caused by their apparent cheapness, varying from £14,000 for the defence class to about £40,000 for the offensive class. It had long been realized in France that if Great Britain's sea power was to be overthrown, then, to adopt a military expression, some "turning" movement in naval armaments must be executed which would circumvent the strength of the battleships. In Great Britain, in 1900, the First Lord of the Admiralty had quoted the reporter of the French Budget Committee, who stated that in building battleships materials in France cost 40 per cent. more than in England, and labour 10 per cent. more. It was evident that a competition in battleships would be ruinous to France, although the estimate above quoted appears to have been an exaggerated one. Much of the enthusiasm for torpedo-boats at one time, and submarine boats for defence purposes at a later date, may be attributed to this cause. It was thought that these would prevent hostile ships from operating on the coast, and so the seas would be open for the commerce destroyers. Vice-Admiral Fournier (an officer of distinction on the active list of the French navy) had advocated in *Le Flotte Necessaire* a navy of 117 armoured cruisers of 8300 tons, which, associated with 300 torpedo-boats, he thought could destroy British commerce and maritime power. The Budget Committee of 1894 considered that battleships, cruisers, and torpedo craft were all necessary, a due proportion consisting of three battleships, two cruisers, a torpedo vessel, and a number of torpedo-boats. The reporter of the French Budget Committee (1899) stated that he approved "without reserve the decision of the Minister of Marine to suspend for 1899 the ordering of a new battleship, so as to concentrate all available resources on cruisers, torpedo-boats, and submarine boats." M. de la Porte, in his report on the budget for 1900, declared that French naval policy would involve an offensive defence by small craft on the coast of France, and commercial war carried on by numerous fast cruisers possessing great coal endurance. By 1901 the policy of building all types was again predominant, possibly owing to the growing naval armaments of Germany, which nation had steadfastly refused to order submarine boats, while exhibiting considerable interest in the problem of aërial navigation.

The French programme of 1900, which superseded the one of 1896, was designed so that by 1907, subsequently altered by the Chamber to 1906, the French fleet would consist of—

	Total.
4 squadrons of 6 battleships, with a reserve of 1 battleship for each squadron	28
Armoured cruisers, 8 divisions of 3 cruisers each	24
Commerce destroyers (consisting of second and third-class cruisers) about	36
Torpedo gunboats	21
Destroyers	52
Torpedo boats	263
Submarine boats	38

(The programme of 1900 authorized only 26 submarine boats, but 44 were built or begun by 1902.)

In all the new battleships it was proposed to follow the British plan of large dimensions.

The United States of America.—While it is difficult to trace any clearly thought-out policy in the appropriations made by Congress for the United States navy at the end of the 19th century, the increase in the expenditure serves to indicate a determination to play a great part among the nations. Having regard to the enormous surplus of revenue, amounting in the fiscal year ending 30th June 1902 to over $90,000,000, it would be difficult to place a limit to the ambitions of the United States. The result of the successful war with Spain had made the United States a colonizing power. The report of the Secretary of the Navy, 4th November 1901, dealing with the further increase of the navy proposed for 1902, involving an additional expenditure of over £4,000,000, had referred to the responsibilities incurred in connexion with the transmarine territories of Porto Rico, Hawaii, the Philippines, and Cuba. "If we are to have a navy at all," the report stated, "it must be commensurate with these great extensions—greater in international even than in territorial importance. This necessarily involves the construction of more naval vessels, their manning, exercise, and maintenance." About the same time President Roosevelt emphasized certain doctrines absolutely dependent on armed force for their ultimate sanction. "The United States must not shrink from playing its part among the great nations. We cannot avoid hereafter having duties to do in the face of other nations. We do not intend to sanction any policy of aggression by one American commonwealth at the expense of any other, nor any policy of commercial discrimination against any foreign Power whatsoever. Commercially, all we wish is a fair field and no favour, but if we are wise we shall strenuously insist that under no pretext whatsoever shall there be any territorial aggrandizement on American soil by a European Power, and this no matter what form such territorial aggrandizement may take."

In order to be able to trace clearly the leading idea behind this outline of policy, we may quote from the subsequent speech of President Roosevelt at the Naval Academy, 2nd May 1902: "We all of us hope that the occasion for war may never come; but if it has to come, then this nation must win, and the prime factor in securing victory over any foreign foe must of necessity be the navy. If the navy fails us, then we are doomed to defeat, no matter what may be our material wealth or the high average of our citizenship. It should therefore be an object of prime importance for every patriotic American to see that the navy is constantly built up and, above all, is kept at the highest point of efficiency both in *matériel* and *personnel*."

In the days of wooden ships the American timber supply had given to the United States a great position in the shipping trade, and there appeared to be no reason why a similar position should not be won in the opening years of the 20th century. Stress was laid on this point by President Roosevelt in his message to Congress in 1901. The production of coal and iron, which had been the source of Great Britain's power, had reached a point in the United States at which the coal was cheaper (after due allowance had been made for its lower calorific power), and the production exceeded that of Great Britain by many millions of tons. The annual output of pig-iron was twice as large, and an even greater superiority had been won in steel production. At the end of the 19th century the United States paid to foreign and American shipowners £346,000 for the carriage of the mails. The coasting trade, as formerly, remained an exclusive monopoly for American vessels. Proposals from time to time came before Congress for encouraging American shipping by the payment of bounties, and the fact that 322 steamers were utilized in the Civil War, and over a hundred in the war with Spain in 1898, was not lost sight of as an argument in favour of encouraging the ownership of vessels under the Stars and Stripes. Mercantile auxiliaries were the outcome of the high organization of modern naval war requiring colliers, distilling ships, cold storage and provision ships, hospital ships, ammunition ships, telegraph ships, and parent ships for torpedo craft. It was recognized that most of these could be improvised from the mercantile marine if the details were settled beforehand. Such arrangements should prevent the transfer of desirable vessels to other flags at the moment they are likely to be required. This actually occurred in the case of the American cable-ship *Grappler* just prior to the American-Spanish war. An instance of the resort which might be made to auxiliary vessels was afforded in the American-Spanish war by the voyage of the U.S. battleships *Oregon* and *Iowa* from the West Indies to the Pacific. They took with them five colliers, one distilling ship, and one cold storage ship, so as to be self-supporting. Apart from auxiliary ships of this nature, the U.S. Government armed 11 fast steamers, 28 yachts, and 28 tugs. The United States has never been a party to the Declaration of Paris concerning privateering, though the Naval War Code (issued in 1900 to the U.S. navy under the approval of the President) lays down very clearly the rules which are to be acted upon as regards belligerent and neutral property. Apart from this, however, the policy of arming auxiliary merchant vessels has been acted on by all nations since the Prussian Government created a volunteer fleet in the war of 1870–71. These ships, it will be remembered, were officered and manned from the mercantile marine under naval discipline, and flew the national flag. While, however, it was recognized in the United States that fast auxiliaries could relieve cruisers of much of the work of scouting, communications, and could fight vessels of their own class, it was never contemplated that they could form efficient substitutes for armoured ships on other occasions. The real object aimed at, after the provision of a mercantile marine as a factor of commercial prosperity and an adjunct of the navy, was the development of the shipbuilding resources of the country. The importance of this consideration may be illustrated by the statement that it was possible in 1902 confidently to predict that the shipbuilding resources of the United States and Germany would enable those nations to take the second and third places in the navies of the world within the decade, in spite of any efforts of France and Russia based on the national shipbuilding resources. The development of resources is of great importance to a country circumstanced as is the United States. The geographical position and the absence of any vital point of attack conferred a power of prolonging a conflict which a country like Great Britain could not obtain except by successful action on the part of the organized fleets. In Great Britain there existed perfect free trade, and in Germany an approximation to free trade for anything to do with the materials of shipbuilding. Whether as a result of Protection, or of other causes, the fact remained that the cost of construction was in 1902 considerably higher in the United States than in Great Britain and Germany.

It had for a long time been a blot on the United States navy that so large a proportion of the *personnel* consisted of aliens, or naturalized aliens, instead of native-born Americans. While all the officers of commissioned rank were native-born Americans, 35 per cent. of the whole enlisted force in 1899 was of foreign extraction. In the annual report of the Chief of the Bureau of Navigation, we are told on 30th June 1899 there were 14,500 men in the United States navy, classified as follows :—

7380	native-born.
2441	naturalized.
1290	"alien, but declared."
622	alien residents of the United States.
544	alien non-residents.
2002	native-born apprentices.
187	foreign-born apprentices.

Fifty-six per cent. of the petty officers were native-born. To increase the proportion of native-born men, efforts were made to train landsmen for the purpose, and in 1901 the Bureau of Navigation was enabled to report that "the training system for landsmen has greatly added to the facility and economy with which the complements of the vessels of the Asiatic station have been kept as nearly full as practicable." One of the chief lessons derived from the war with Spain was the necessity of a large reserve to provide for expansion in war. This necessity was rendered greater owing to the excessive cost of the *personnel*, amounting to nearly six times as much per head as that of the German navy, and nearly twice as much per head as that of the British navy. It was felt that by devoting special attention to the training of a proportion of men, these could be used to stiffen the vast increase of *personnel* which experience had shown would take place on the outbreak of war. The utility of devoting special attention to the training of the select few was negatively shown by the results of the battle of Santiago, where out of 9474 rounds fired from the American ships only 124 rounds, or 1·3 per cent., hit the fleeing Spanish vessels. The tendency, however, is one which could be carried too far, and that this had been done was strenuously pointed out by the chief of the Bureau of Navigation in his report issued in 1901. The report said: "It has always been the policy of the Government to regard its regular establishment of the navy and army as a nucleus about which a larger establishment would be formed in case of war. The present establishment, however, can no longer be considered as an effective nucleus for such a purpose. It barely sufficed for the Spanish war; and were the fleet to be manned with full complements, as it would necessarily be if called upon to fight a first-class European Power, the present *personnel* would form barely one-fourth of the total establishment." Outspoken criticisms of this nature by the heads of the different naval departments were a characteristic of the American naval administration, and afford some indication of what might have been the case in the British navy had the recommendation of the Hartington Commission been carried out, that annual reports from the different Sea Lords of the Admiralty should be issued.

The position of that vast territory of 3½ million square miles, with a population double that of the United Kingdom, bordering on two oceans which were destined to be brought into closer union by an Isthmian canal, was a source of anxious thought in every quarter of Europe at the beginning of the 20th century. It was difficult to avoid the conclusion that when such a nation exhausted the tempting investments afforded by its own internal expansion, capital must overflow the borders in an era of maritime expansion and in the development of transmarine territory involving an increasing reliance on its fleet. To the British empire American capital might mean much, just as British capital in the past had been the prime factor in the development of the United States. In that case American capital might go far to enable the vast colonies and dependencies of Great Britain to come to the support of the maritime power of the mother country, over and beyond the insignificant contribution of £317,600 which they made in 1902. A cause for fear, however, remained to Great Britain in the probability of the American system of registry being made free enough to enable American combinations to buy up the principal British shipping lines and sail them under the United States flag. It had once been the case, about the middle of the 19th century, that President Pierce was able to report to Congress that "the United States foreign commerce has reached a magnitude and extent nearly equal to that of the first maritime Power of the earth, and exceeding that of any other" (1854). At this time American shipping was supreme in the Atlantic, though its doom was already sealed for a period by the advent of iron shipbuilding. The subject of its decay was the cause of repeated messages to Congress. On 4th December 1882 President Arthur wrote: "The Secretary forcibly depicts the intimate connexion and interdependence of the navy and the commercial marine, and invites attention to the continual decadence of the latter and the corresponding transfer of our growing commerce to foreign bottoms. This subject is one of the utmost importance to national welfare." The remedy which is indicated by the lessons of history appeared in President Cleveland's annual message in 1894: "The ancient provision of our law denying American registry to ships built abroad and owned by Americans appears in the light of present conditions not only to be a failure for good at every point, but to be nearer a relic of barbarism than anything that exists under a permission of a statute of the United States. I earnestly recommend its prompt repeal."

Personnel.

The following statistics for the great maritime Powers show their strength so far as the *personnel* of their navies is concerned :—

France (1901).

Officers	3,032	*Authority*—Estimates 1901
Men	111,961	
Dockyard riggers	2,000	Estimates
	116,993[1]	
Numbers for coast defence	14,181	
Remainder	102,812	

The navy had the following *personnel* available for coast defence :—

	Officers and Men.	Inscrits Maritimes.[2]
For manning batteries and providing signal-men for the same	...	7,000
For manning the torpedo boats of the "défense mobile"	5169	
For manning submarine boats	333	
For manning the "défenses sous-marines" and "défenses fixes"[3]	903	
Customs guards	493	
Semaphore service	283	

The French naval system of manning divides itself into three categories. (1) The Inscription Maritime nominally brought in 139,310 men in 1850 and 114,000 in 1894. It was becoming increasingly evident towards the end of the 19th century that a compulsory system could not adequately provide for the skilled mechanical work of the ships. (2) Volunteers. These chiefly supply the mechanic ratings, and a system of state schools was adopted to obtain them in 1901. (3) Army recruits, drawn by

[1] 51,243 in permanent force of the navy voted.

[2] These were formed into companies at the naval arsenals, and are supplied by the "inscrits" enrolled under category F (volunteers), men aged between thirty and thirty-three years. In 1900 there were 120,000 men of from 18 to 50 years of age on the rolls of the Inscription Maritime.

[3] These services included mine-fields, booms, searchlights, and a number of steam launches fitted with torpedo tubes or spar torpedoes. These latter were manned by "marine veterans," who in peace time manned the dockyard launches and performed other duties in connexion with the naval yards. They numbered about 2000, and only a small proportion would have been available in war time.

lots at an age of entry from eighteen to twenty years. For the purpose of the Inscription Maritime the Newfoundland fisheries were kept up at considerable expense to the nations in subsidies, although the number of fishermen was less than one-half the number of British fishermen in Newfoundland who were left untouched by the British navy, until in 1900 fifty were embarked for training. The French navy could only rely on obtaining the services of these men in the latter half of the year, the boats beginning to arrive in June and continuing to come in until Christmas time. On the other hand, the British consul at Bordeaux estimated that not less than 1300 men annually retired from the fisheries and were available for service in the navy. The actual number of French fishermen employed in the Newfoundland cod fisheries in 1898 was 5105.

Russia.

	Officers.	Warrant Officers and Men.
Total *personnel*, 1901	2131	57,957
Personnel employed in coast defence	*nil.*	

Italy.

	Officers.	Men.
Total *personnel* proposed in estimates for 1901–1902	1780	25,000
Of these there were to be employed in coast defences	...	3,489

Germany.

	Officers and Men.
Voted, 1901	31,157
Naval forces available for coast defence—	
4 divisions of seamen artillery (men only)	2,295
2 battalions marine infantry (all ranks)	1,273
2 depot companies and 1 field depot company for Kiaochow (strength variable)	...

This force was distributed among naval garrisons. These units have very large reserves, numbers not available.

The following rate of increase is fixed by law :—

Year.	Executive Officers.	Other *Personnel.*	Total.
1900	876	22,476	23,352
1905	1,179	31,187	32,366
1910	1,482	39,898	41,380
1915	1,785	48,609	50,394
1920	2,088	57,320	50,408
Total increase 1900 to 1920	1,212	34,844	36,056

It is evident that the increase fixed by law was considerably accelerated.

United States.

	Officers and Men.	Marines.	Total.
Actually serving, 30th June 1901	22,432	5845	28,277

	Men.
Garrison at Dry Tortugas, Florida	42
Guam (includes forty seamen)	145

In his annual report (1901) the Secretary of the Navy said :—"The results of the Spanish-American war were such as to assure every one having knowledge of naval matters that steps should at once be taken to meet the one certain and positive requirement which will face the nation upon an outbreak of war—the immediate necessity of that exigent time, if it comes, of a large increase in the men of the navy from an existing reserve—an increase which must, in the main, be made from the seafaring class, who, having acquired the habit of the sea, are at home on the water. There is no better way of insuring such a reserve than by the measure now urged. Our pressing need is for such a reserve—a body to go to the front on board ship at once upon the outbreak of war, or when it is imminent. Next to this will come the defence of the coast, and for such purpose the Naval Militia will be essential. I see reasons for both organizations, and have heretofore done all possible to aid the one now existing, the Naval Militia, and to convince Congress of the necessity for the authorization of the other, the National Naval Reserve."

Japan.

	Officers.	Men.
Total *personnel*, 1900	2027	21,815
Numbers employed in coast defence	Not known.	

Length of Service.

France.—(*a*) The length of service afloat in 1902 was forty-seven months, with a further thirteen months on "unlimited leave," during which men were liable to recall at any moment.

(*b*) In addition to (*a*) men were bound to serve in the first reserve for two years, and the second reserve for twenty-five years.

The conditions under (*a*) were regulated by the minister, according to the requirements and state of foreign affairs.

Russia (1902).—Five to seven years in active fleet, and then complete fifteen years' total service in the reserves.

Italy (1902).—Four years in active fleet and then complete twelve years' total service in the naval reserve, followed by seven years in the militia, but on unlimited leave during both the latter periods.

Germany (1902).—(*a*) Active service, three years; (*b*) reserve, four years. The men then join the "Seewehr" until completing their thirty-ninth year.

United States (1902).—(*a*) Active service four years; (*b*) there is not any naval reserve at present.

Japan.—Two methods, volunteers and conscripts. Volunteers—eight years in active fleet, four years in second reserve. Conscripts—four years in active fleet, three years in first reserve, five years in second reserve.

It is stated that half the seamen and two-thirds of the stokers are volunteers.

Great Britain (1902).—Voluntary service for twelve years. Voluntary re-engagement for ten years to qualify for pension. All pensioners are liable to be called upon to serve in times of emergency. There were two schemes for forming reserves. The Royal Naval Reserve scheme drew men from the mercantile marine and fishing population of the United Kingdom. The Royal Fleet Reserve scheme, introduced in 1901, while it gave a better system of training to the pensioners, was mainly designed to obtain the services in war of the men who had quitted the navy after the expiration of their twelve years' service. In 1902, 122,500 officers and men were voted for the permanent force, which means that by 1st April 1903, or the end of the financial year, it was hoped to attain that figure. In the Reserves, Class B of the Royal Fleet Reserve (which embraces the men who quitted the navy after twelve years' service) had reached a total of 1768 men on 1st March 1902, consisting of 861 seamen, 262 stokers, and 516 marines. These men were given a week's training in their former duties every year. On 31st December 1901 there were in the Royal Naval Reserve 1500 officers for combatant duties, 400 engineers, 20,627 seamen, and 3714 firemen.

The grand total of the whole force voted in 1902–03, including reserves and pensioners available for service, was 166,249, as compared with 161,640 in 1901–02.

In consequence of a series of articles in *The Times* in 1901–02, assailing the war training of the navy, in which an important count was the number of executive officers serving on shore or engaged in service other than sea service in modern fighting-ships, the First Lord of the Admiralty in 1902 issued the following interesting table of the distribution of officers :—

On 31st December 1901.	Captains.	Commanders.	Lieutenants.	Supplementary Lieutenants.	Sub-Lieutenants.	Midshipmen.	Total.
Serving in sea-going ships	101	145	718	112	154	679	1909
Employed on shore	54	116	192	18	...	...	380
On passage	3	2	26	2	...	...	33
At college, *Excellent*, *Vernon*, &c.	12	10	73	...	190	...	285
Other Government service	...	2	4	...	...	...	6
Full pay leave, or waiting employment	29	29	23	1	7	15	104
Not wishing employment for private reasons, sick, &c.	5	5	35	1	3	11	60
Total	204	309	1071	134	354	705	2777

The Extent to which Navies take Part in Coast Defences.

It is necessary to a clear idea of the *personnel* of the different navies to understand to what extent coast defence entered into their duties.

France.—Under the arrangements of 1902 the organization of coast defence placed the five naval arsenals of Cherbourg, Brest, Lorient, Rochefort, and Toulon under the command of vice-admirals, styled "Préfets Maritimes." The general defence of the littoral was, however, under the Minister for War. The "Préfet Maritime," as governor of the "place," had command of all the batteries and troops (army) quartered within his district, which extended 6¼ miles (10 kilometres) outside the line of land forts which form the defence of the "place." He also commanded all the floating defences and the semaphore system of the whole of his "arrondissement." French naval officers strongly advocated the defence of the coasts being entirely in the hands of the navy. The War Office were, however, opposed to this step, and the question was still under

Note.—The numbers given as projected do not include vessels intended to be laid down after the financial year 1902-3.

discussion. When the "Artillerie et Infanterie de la Marine" were transferred to the War Department, under the title of the Colonial Army, by the law of the 7th July 1900, the navy was deprived to a very large extent of the necessary *personnel* for manning coast defences, and this transfer caused a considerable diminution in the cost of the French naval *personnel*, which has to be taken into account in comparing the navy estimates for different years. The transfer necessitated a great change in the responsibility for coast defence from the Ministry of Marine to the War Department. The practice resulting was for the navy to provide the *personnel* for manning only those batteries which had guns trained on the channels and approaches to the harbours or roadsteads of the naval bases.

Russia.—The whole of the coast defence was in the hands of the army in 1902. The navy took no part, except in so far as ships and torpedo-boats may be employed in combination with the military forces.

Italy (1902).—The supreme authority in all matters relating to local sea-coast defences was vested in the respective naval commanders-in-chief of the maritime departments. With the exception of part of the defence of the naval ports, the *personnel* and *matériel* for coast defence were provided by the army.

In the naval ports the navy provided the *personnel* for the submarine defences, and the shore batteries commanding and protecting the mine field, and, in addition, worked all the torpedoes, torpedo batteries, and the electric lights. These absorbed 4527 officers and men. The navy also maintained a small force to work the semaphore stations. The necessary war *matériel* for the above items in the naval ports was provided by the naval estimates.

Germany.—Coast defences were being gradually transferred from the army to the navy at the end of the 19th century. In 1902 the navy garrisoned all land and sea-defence works at Wilhelmshaven, Bremerhaven, Cuxhaven, Heligoland, and Kiel, which were under the command of naval officers.

The submarine defences were entirely in the hands of the navy.

United States.—The navy took no part in the coast-defence system, except that in 1902 Dry Tortugas and Guam were temporarily garrisoned by the navy.

Japan.—The permanent coast fortresses were in the hands of the army in 1902, in so far as that the forts were manned by a military force of fortress artillerymen, and the command of all forts outside the limit of the several naval ports was in the hands of military officers. Where, however, the coast fortresses were situated within the confines of a naval station, the naval commander-in-chief was in supreme command.

All floating and submarine defences were in the hands of the navy. The coast-line of the whole country was divided into five naval divisions, each division having its headquarters at one of the five existing naval ports. The commander-in-chief of a naval station is directly responsible to the emperor in matters of strategy and warfare, but in administrative affairs he is required to abide by the instructions of the Minister of Marine.

When combined naval and military operations were carried out, the duties undertaken by the navy were as follows:—

1. Coast watch-towers and look-out service afloat.
2. Construction and maintenance of booms and other obstructions.
3. Submarine mine defences.
4. Communications and other services afloat.

Great Britain (1902).—The navy had nothing to do with coast defence, but maintained a coastguard of about 4200 men, which assisted the customs against smuggling, and kept up signal stations. Towards the end of the 19th century the practice arose of the War Office referring questions of coast or port defence to the Admiralty for opinion, and a joint committee of defence investigated these questions. A Cabinet Committee of Defence was supposed to harmonize the actions of the War Office and Admiralty, but the correspondents in naval manœuvres called attention to repeated cases of the forts firing on their own side and hampering the navigation of the ships with their searchlights. The naval authorities at the ports took cognizance of the plans of the Royal Engineers for defending the harbours with mines, and approved of these plans. They also possessed the power to veto the laying down of mines if they thought fit. The so-called coast guard ships were really inferior battleships intended to operate as a fleet in home waters. The Secretary of State for War in 1901 stated that he was willing and anxious to hand over the defence of the ports to the navy, while the Admiralty and former First Lords of the Admiralty strenuously opposed the step. This afforded a curious contrast to the reverse state of feeling in France. No clue could be obtained to the opinion of the Cabinet Committee of Defence, which could not be attacked in Parliament, as none of its members drew any salary in respect of work done on the committee. The procedure of the House of Commons at this date enabled a discussion to be raised only by a member moving the reduction of the responsible minister's salary, and in this case none was drawn, so that no estimates for discussion were provided.

TABLE C.

Table showing Increase of the British Navy between 1886 and 1903.

Year.	Total actually expended. (Figures in million £ Sterling).	Voted for New Construction.	Personnel. Numbers voted for the Navy.	Strength of Reserves. Officers.	Firemen.	Firemen and Seamen.
1886–87 [1]	13·27	3·50	61,400	256	256	18,007
1887–88 [1]	12·33	2·82	62,500	287	327	18,672
1888–89	13·00	2·59	62,400	321	439	19,155
1889–90	13·84	3·44	65,400	467	537	19,176
1890–91	14·13	5·43	68,800	673	569	19,207
1891–92	14·15	5·51	71,000	878	572	20,590
1892–93	14·30	4·05	74,100	1101	700	21,700
1893–94	14·05	2·98	76,700	1054	698	21,228
1894–95	17·64	4·78	83,400	1117	1382	22,914
1895–96	19·64	5·88	88,850	1400	2000	21,700
1896–97	22·27	7·33	93,750	1600	2500	24,200
1897–98	22·17	5·05	100,050	1651	2665	24,614
1898–99	24·07	6·73	106,390	1700	3306	26,141
1899–1900	26·00	7·33	110,640	1863	3494	25,456
1900–01	29·52	8·46	114,880	1896	3530	24,659
1901–02	30·88 [2]	9·00	118,625	1890	3714	24,341
1902–03	31·25 [2]	9·06	122,500	1900	3800	26,800

[1] In 1888 the cost of the transport service (at that time about £200,000) was transferred to the army estimates. The vote for naval ordnance, which then amounted to over a million, was transferred from army estimates to navy estimates, so that this has to be allowed for in 1886 and 1887.

[2] Net estimates.

In the case of the reserves, for the years 1892–93, 1895–96, 1896–97, and 1902–1903, we give the numbers voted. For the other years "the Statement of the First Lord of the Admiralty," "the Report of the Committee on the Royal Naval Reserve (1892)," and records at the Admiralty are used.

TABLE D.

The following table of the numbers actually borne on 1st April of the years named in the active service ratings of the British navy, shows the development of the different branches in the period reviewed. The chief feature is the growth of the engine-room branch.

Year.	Executive Branch.	Engine-Room Branch.	Marines.	Other Branches.
1868	31,981	5,391	15,970	11,052

NUMBER OF WARSHIPS.

Table F shows the number of the warships of the great maritime Powers in 1901.

It should be noted, however, that this table, compiled from the Admiralty return, includes many doubtful vessels. Ten British battleships of a total of 93,655 tons, armed with M.-L. guns, ought undoubtedly to have been struck out. Five of these ships (the *Ajax*, *Agamemnon*, *Téméraire*, *Superb*, and *Alexandra*) were withdrawn from the list in 1901–02, reducing the tonnage of battleships by 46,910. Some British cruisers and coast defence vessels armed with M.-L. guns were also withdrawn during 1901–02.

Note.—In compiling these tables English tons have been used throughout. The tonnage of warships is always given in displacement tons or the actual weight of the ship, but owing to the fact that France, Germany, and Italy used metric tons in their Navy Lists in 1902, while other nations used the English ton, and that reference books repeat the figures simply as tons, there was considerable confusion in comparing the tonnage of warships. Thus while the *Patrie* was given in the French Navy List as 14,865 tons, her tonnage in British measurement would appear as 14,630 tons. The course has therefore been adopted of bringing all to a common measure, this being the only way in which a proper comparison can be obtained.

TABLE F.—*Warships of the World on 15th January 1901.*

The previous year's British Admiralty return for 15th January 1900 as regards armaments was summarized by Mr Schooling :—

Class of Guns.	Number of Guns.		Percentage of France plus Russia's Guns to Great Britain's Guns.	
	Great Britain.	France plus Russia.	Great Britain.	France plus Russia.
Breech-loading guns—				
10 in. to 16·5 in. . .	205	276	100	135
4 in. to 9·5 in. . .	707	588	100	83
Total breech-loading guns	912	864	100	95
Quick-firing guns—				
4 in. to 6·5 in. . . .	1,630	1,215	100	75
12 pounders . . .	1,018	57	100	6
Smaller quick-firing and machine guns . . .	4,806	4,970	100	103
Total quick-firing guns .	7,454	6,242	100	84
Muzzle-loading guns—				
7 in. to 16 in. . . .	340	nil	100	nil
Torpedo tubes . . .	1,534	1,553	100	101
All classes of guns . .	10,240	8,659	100	85

Example.—France plus Russia had 84 quick-firing guns to every 100 quick-firing guns possessed by Great Britain.

AUTHORITIES.—The Navy Estimates; *The Naval Annual;* the *Journals* of the Royal United Service Institution; the *Proceedings* of the Institution of Naval Architects; *Notes on Naval Intelligence,* issued by the United States Naval Intelligence Department, and other works. (BR.; C. W. BE.)

Navigation.—The great development in both size and speed of ships during the last quarter of the 19th century enormously increased the responsibilities of those who command and navigate them, and has led to a careful examination of the existing modes of determining a ship's position at all times by day or night, both when in sight of land and on the open ocean. A comparison between the present text-books on the subject of navigation and those in use in 1875 shows how problems and methods which then were considered chiefly as theoretical exercises have now, from the altered conditions of the navigation of very fast ships, become methods of frequent practice, while corresponding improvements have been made in the instruments, such as compasses, charts, and chronometers, by the aid of which more satisfactory results are now attained. Much has also been done to advance the study of navigation and its numerous allied subjects by the development of the Royal Naval College at Greenwich and the United Service Institution; also by the establishment of shipmasters' societies (of which the well-known society in London is typical), where during the year valuable papers are read and useful discussions take place among those actually carrying out the practice of navigation. It does not appear to be generally known that the advantage of attending courses of study, both practical and theoretical, at the Royal Naval College, is offered to officers of the mercantile marine as well as to those of the royal navy. Arrangements exist by which ten such officers can be received every year and obtain free instruction on almost every subject connected with the nautical profession.

As the reader already has access to the article on this subject which appeared in the earlier volumes of this Encyclopædia (ninth edition), it will be convenient to trace the principal changes which have occurred since then in the chief subjects relating to the art of navigation.

Compass.—The general introduction of compasses with short needles and slow periods of vibration has done very much towards improving the accuracy with which a ship's "dead reckoning" is kept. The original model of these was that patented by Lord Kelvin in 1876, and since adopted in the royal navy as the standard. In this instrument we have a compass specially designed to enable the principles of compensation or correction proposed by Airy in 1837 to be accurately carried out, while its slow period of swing renders it in all circumstances extremely steady. Another conspicuous advantage arising from the use of compasses of this pattern is the readiness with which they admit of correction by the use of the "deflector," a simple instrument devised by Lord Kelvin for the measurement of directive force, the successful application of which to compass correction depends on the fact that, when the directive force is equalized on all points, the error of the compass is neutralized. Accompanying the great improvements in the construction of compasses, there have been great advances in the art of compass adjustment or correction by mechanical means of the errors due to the various kinds of iron or steel in the ship. Some of those errors (such as that caused by horizontal soft iron), which a few years ago were almost insignificant in amount, have, especially in men-of-war, become very large quantities, while the formidable source of error known as "heeling error" has increased, until in some vessels before correction a heel of 5° alters the direction by 20°. It is gratifying to find that the practical application of the principles laid down in the Admiralty *Manual* enables errors of 70° or 80° to be dealt with as readily as those of small amount, while the difficulties attending the heeling error—which, however accurately corrected originally, must be frequently recorrected on any great change of position—have been surmounted by the use of a simple instrument, which in favourable circumstances can be used even at sea. As the whole art of compass adjustment is carried out on the supposition that the compass needle is infinitesimal in length, it is obvious how much more nearly this fundamental condition is satisfied with the modern compass than with those having long needles which were formerly used. Recognizing the great value of a sound knowledge of compass adjustment, the Board of Trade have included this among the compulsory subjects of examination for the rank of master, thus following the example of the royal navy, where all navigating officers have to attend a practical course of study on the subject. While there is no reason to think that the magnetic character of land *above* the water has any disturbing effect on compasses on board ship, modern investigations have shown that in comparatively shallow water (7 to 8 fathoms) there are several parts of the world where land *under* water affects them. The most notable case is Cossack, in North Australia, where the disturbance varied from 56° E. to 26° W. at two positions 180 yards apart, and the area of disturbance extended over nearly three miles of navigable waters. The possibility of this insidious danger adds to the anxiety of the navigator when entering or leaving harbour, especially in circumstances such as occur at night, when he is probably depending entirely on compass bearings.

Log.—While improved and steadier compasses enable modern ships to shape more accurate courses, there is still great room for improvement in the instruments by which speed is measured. The common or hand log has ceased to be regarded as anything but the very roughest of guides, and the patent log in its original form of the record of the revolutions of a small screw towed by the ship does not give satisfactory results at great speeds, nor can anything more favourable be said of those forms where pressure on known areas are employed. The revolutions of the engines, with due allowance made for the condition of the ship's bottom, afford now perhaps the best means of estimating speed. (See Log.)

Charts.—The admirable low-priced charts and sailing directions issued by the Admiralty have now largely superseded those supplied by private publishers (familiarly known as "Blue Backs"), and the issue of the *Nautical Almanac* in its abbreviated and cheaper form has also done much to take the place of those numerous private almanacs and calendars which were necessarily much more liable to error than the original and official sources from which they were derived.

In 1899 the number of charts printed for the Hydrographic Office was 428,890, of which 278,701 were sold to the public for £16,915; and in the same year 15,050 *Nautical Almanacs* were sold. Among the many excellent modern publications of the Hydrographic Office, perhaps the *Ocean Passage Book* is one of the most generally useful, since, when used in combination with the admirable charts of full-powered and auxiliary tracks, it very greatly assists all navigators in planning out a successful voyage. We must here refer to the valuable results arising from the publication of the *Monthly Pilot Charts of the North Atlantic* by the American Government, and more recently by our own Meteorological Department, where observed meteorological results are skilfully combined with forecasts for the ensuing period, suggested tracks for ships are shown, and an epitome of recent navigational and meteorological experiences is given. (See Charts.)

Chronometer.—The marvellous accuracy with which the modern chronometer is constructed is doubtless greatly stimulated by the annual competition at Greenwich, from which the Admiralty purchase for the royal navy. These chronometers are all fitted with secondary compensation balances, and it is therefore unusual in the royal navy to apply any temperature correction to the rate. The perfection obtainable in compensation may be illustrated by the performance of a chronometer at the Royal Observatory in 1886, which at a mean temperature of 50° F. had a *weekly* rate of 1·6 seconds losing; and on being further tested at a mean temperature of 92° F., it only changed its *weekly* rate to 2·9 seconds losing. In the mercantile marine cheaper chronometers without secondary compensation are more commonly used, and temperature corrections applied, calculated from a formula originally proposed by Mr Hartnup, formerly of the Liverpool Observatory. Great success attends this mode of procedure, as illustrated by the following facts. From the discussion of the records of performance of the chronometers of the Pacific Steam Navigation Company during twenty-six voyages from London to Valparaiso and back, by giving equal weight to each of the three chronometers carried by each ship, the mean error of longitude for an average voyage of 101 days was less than three minutes of arc. As a single instance, in the s.s. *Orellana*, on applying temperature rates during a voyage of 63 days, the mean accumulated error of the three chronometers was only 2·3 seconds of time.

Fixing Position.—When a ship is steaming at the rate of 20 knots an hour the navigator remembers that a mile is passed over in three minutes, and that if in sight of land and fixing positions by objects on shore, it is essential to adopt some rapid method; otherwise when laid down on the chart the position shows where the ship *was*, and not where she *is*. This difficulty has led to the more general use of methods of obtaining positions by angles instead of bearings, and laying them down on the chart by the aid of the station pointer. Many advantages accrue from this, as the observer is not restricted in position on board, as is the case when using the compass, and especially if a double sextant (having two index glasses and one horizon glass) is employed two angles can be measured simultaneously, the result on the chart being very rapidly arrived at. An ingenious combination of sextant and station pointer in one has been proposed, and most simply carried out by attaching vertical sights to the legs of a station pointer, which is put on a suitable horizontal stand, and the legs moved until the sights are in line with the objects observed. To assist the navigator in the choice of suitable objects between which to measure the angles, a very useful pamphlet is issued by the Admiralty, from the diagrams in which it can be seen at a glance which combination of objects in sight gives the most favourable result, always remembering as a broad principle that nearer objects are more suitable than distant ones, and that the accuracy of position determined depends on the relative *distances* of the objects as well as on the magnitude of the *angles* between them. The rougher but at certain times very important method of fixing a ship's position when only *one* object can be seen, such as a light at night, is often of great value in modern coast navigation. It is well, however, to remember that in all cases where only *one* object can be seen, the estimate of position is liable to error, owing to any unknown or unallowed-for tide or current during the interval elapsing between the times of the two observations on which, whether using the "four-point" problem or that of "doubling the angle on the bow," the result depends. A simple and useful method, when only one point is in sight, of ascertaining whether with the course maintained a ship will pass at a prudent distance from the point, is to note the reading of the patent log when the object is 26° on the bow, and again when it is 45°; the difference between these readings will be the distance the ship will be from the point at time of nearest approach.

Danger Angles.—To avoid an unnecessarily wide *détour* in rounding points and shoals, extensive use is now made of both horizontal and vertical danger angles; the former is the angle on the arc of a horizontal circle passing through a point at the required distance from the danger, and through two previously selected, easily recognized fixed objects. Should circumstances enable the selection to be made of an angle of about 90°, the ship by continually measuring the angle may be steered on the arc of such a circle with great precision, and may even be safely taken through a channel *between* two dangers. The vertical danger angle enables similar results to be attained by measuring the vertical angle subtended by a known height; but except where the selected object is one whose height is *well* determined, such as a lighthouse, this method is not so trustworthy as the former.

Sounding Machines.—The chronicle of progress in the art of navigation would be very incomplete without reference to the extended use of Lord Kelvin's sounding machines, either in the original form, where the increased pressure at different depths is recorded by discoloration of chemical tubes, or in the later form known as the "depth recorder," where similar results are obtained by the automatic record of the position of a piston forced upwards in a tube by this increased pressure. Very satisfactory results can be obtained at speeds of 15 or 16 knots, enabling that great safeguard of navigation in many places, viz., a *continuous* line of soundings, to be accurately and rapidly obtained. In connexion with this should be mentioned a most ingenious invention known as the "submarine sentry," which on being set for any desired depth and towed overboard remains at that depth whatever the speed of the ship may be. On striking bottom it at once floats to the surface and rings a warning bell. Such an instrument is of obvious value in ships where, owing to the small number of available men, it is difficult to maintain a continuous line of soundings.

Great Circle Sailing.—The practice of great circle sailing has in modern navigation become far more general than formerly; not merely has economy of time and fuel to be considered, but on examining tracks laid down on the excellent pilot charts issued by the Admiralty and Meteorological Office, distinct advantages of winds and currents are often found to attend the pursuit of the great circle track. It is indeed advantageous for the skilful navigator, in planning out a long voyage, always to lay down on a wind and current chart the three possible tracks, viz., the rhumb track, the great circle, and the polar track, and then realize that a course shaped anywhere between the extreme tracks must be attended with some advantage in economy of distance. Great circles are seldom *calculated*, and are most simply originally laid down upon gnomonic charts, where they are represented by straight lines, and then transferred to Mercator charts, or they may very approximately be drawn upon the latter *directly* by the use of Airy's simple method. Azimuth tables or diagrams are sometimes useful in determining great circle courses, since the true bearing of a heavenly body is the great circle course to a position where that body is in the zenith. The latitude of such a position being equal to the declination of the body, and its longitude equal to the hour angle of the body ± the longitude of the observer, the hour angle with which the azimuth is looked out corresponding to the difference of longitude between the observer and that of the position referred to. What is known as the polar track is more difficult to draw accurately. It follows that if on a globe we see that the rhumb track always lying on the *equatorial* side of the great circle is necessarily longer than it, there must be on the *polar* side of that circle another track equal in length to the rhumb track, and equally distant from the great circle at the point of greatest separation. This curve is difficult to draw accurately, but in practice it will be sufficiently correct to mark on the Mercator chart this point of greatest separation on the polar side of the great circle, and draw the curve by hand through it and the extreme points. Cases may arise in practice where, owing to the terminal points of the voyage lying somewhat on the same meridian, the advantage of the great circle may not be very obvious, but the polar track may lead through more favourable winds and currents than the rhumb line, and only traverse the same distance. The excellent idea originally suggested by Maury of establishing steam "lanes" in localities where there is much ocean traffic, so as to minimize the risks of collision between outward- and homeward-bound ships, has been successfully carried out in the North Atlantic. The leading transatlantic steamship companies now agree to follow great circle routes from the Irish coast to points on the Banks of Newfoundland, which vary somewhat in position with the season of the year, but are published in advance. These "lanes" being avoided by sailing vessels, risks of collision are materially lessened.

Sextant.—The establishment of an observatory at Kew, part of whose work is the examination and testing of sextants, has led to great improvement in the construction of these instruments. The determination of "centering" error in a sextant with the means available to an ordinary observer is a long and troublesome operation, and although in an instrument made by a maker of repute such error may be usually neglected in observations at sea, yet for the more accurate work involved in finding errors and rates of chronometers it must be considered and allowed for. By a specially devised instrument this error (including error of graduation) is accurately determined, and for those sextants obtaining A certificates must at no part of the arc exceed 1′, and for those granted B certificates the maximum error must not be greater than 3′. During the five years ending 1899 no fewer than 3443 sextants were tested at this observatory (now incorporated in the National Physical Laboratory). With a view of measuring angles up to 180° sextants have been constructed in which the internal reflection of light from glass prisms has been employed instead of the reflection from mirrors, but great practical difficulties arise in accurately cutting prisms of the desired angle.

Refraction.—The effect of refraction in displacing the apparent sea horizon was partially investigated by the French about a century ago, and the conclusion arrived at was that it mainly depended upon the difference of the surface temperature of the sea and that of the stratum of air resting on it: when the sea surface was the warmer the horizon was apparently *depressed*, and observed altitudes were too great, and *vice versâ*, differences of 3′ to 4′ being found when these temperatures differed 9° F. The subject has now been thoroughly reinvestigated, and the original conclusions confirmed. The errors involved from this uncertainty with regard to the place of the horizon affect the ordinary observations for determinations of latitude (such as meridian and ex-meridian observations) by their full amount; in the determination of hour angles the error introduced will be equal to the error of position of horizon multiplied by the secant of latitude and by the cosecant of azimuth of the body observed. In "lines of position" the error considered will move such lines from or towards the place where the body observed is in the zenith, and will generally cause a position to err mostly in longitude if found by the intersection of two such lines on the *same* side of the meridian, and mostly in *latitude* if the intersecting lines are on *opposite* sides of the meridian. The interesting experiments referred to were carried out in 1899 by the Austrian navy in the Red Sea and at Pola, the requisite observations being made throughout the day with an alt-azimuth instrument from shore stations at elevations of 21, 33, 52, and 138 feet respectively, the sea surface and air temperatures being simultaneously recorded from a steamboat standing off shore. From the experience of over a thousand observations it was found that at an elevation of 33 feet, with a difference of 6°F. in sea and air temperatures, a displacement of $1\frac{1}{2}'$ was observed, which increased to $2\frac{3}{4}'$ when the difference of 12° F. occurred in the temperatures. Such results were only found to be true when a wind of force at least 2 or 3 was blowing; with winds of less force the warm air can apparently remain at a higher level without mixing with the lower cooler air, and abnormal results follow, amounting in one case to a displacement of $9\frac{1}{3}'$. When navigating the Red Sea or localities such as near the edge of the Gulf Stream, where very great differences of sea and air temperatures prevail, due consideration must be made for this source of error, and the practical navigator can also see how greatly this may affect his estimation with regard to currents.

Meridian Altitudes.—In ships of great speed, when steering on courses near north or south the *maximum* altitude of a heavenly body cannot be considered as identical with the *meridian* altitude, for the speed of the ship in these circumstances affects the altitude in the same way as if the ship were stationary, and the declination of the body changed at the same rate as the ship was moving and in the opposite direction. If the declination of the body observed is also rapidly changing, a still greater difference may occur. In the case of the moon, in a ship steaming 20 knots an hour south (true) and in the latitude of the English Channel, the maximum altitude at a certain period of the lunation may exceed the meridian altitude by nearly 4′, and occur eleven minutes after the time of meridian passage. In the case of the sun the corresponding figures would be in similar circumstances $1\frac{1}{4}'$ and six minutes. Meridian altitudes in such circumstances are usually observed when the ship time indicates the instant of meridian passage. The error considered only affects an observation of altitude when it is required at the instant of a heavenly body being on some particular azimuth, as the sun at noon, and has therefore *only* to be considered when observing a *meridian* altitude for latitude.

Star Navigation.—A notable feature of the progress of the art of modern navigation is the greatly increased practice of star navigation, and many of the supposed difficulties of night observations are found to be removed by experience. Determinations of positions at sea by twilight observations, when the brighter stars become visible while the horizon is still well defined, are probably the most accurate means we possess; and the careful navigator, by combining for latitude stars passing north and south of the zenith, and for longitude those near the prime vertical both east and west, can generally depend upon a good result, especially if suitable stars can be found for each pair at about the same altitudes. For these purposes the armillary sphere is extremely useful: this is a small celestial globe on which are depicted the principal stars visible to the naked eye. On elevating the pole to the approximate latitude of the observer, and turning the sphere until the sidereal time is under the fixed meridian, a correct representation of the heavens at the time of observation is obtained; the stars are then easily identified by their bearings and altitudes. This valuable instrument is not merely useful when at twilight, only a few of the brighter stars being visible, the constellations to which they belong are difficult of recognition, but it enables arrangement to be made in advance for such observations as are desired to be taken during the night. By marking in pencil on the globe the positions of the planets in right ascension and declination, the same sphere is also available for their identification. For star observations not made at twilight the invention of some simple and practical form of artificial horizon for use at sea is much to be desired. With the ordinary sea horizon it is well, however, to remember that although indistinct under the star, it may be favourable in the opposite direction, and when the altitude admits of the sextant measuring its *supplement* this may be readily observed. The navigator observing stars on or near the meridian *below* pole has, of course, to remember that the altitude in this case is decreasing, and the direction of movement in azimuth reversed as compared with similar observations made above pole. Here we may note that in the twilight with a *high* star good results for *longitude* can often be obtained by a short equal altitude observed when the star is only a small distance from the meridian on either side, the mean of the chronometer times of observation affording an opportunity of comparing Greenwich and local times of meridian passage, a correction being made for change of position of the ship in the interval.

Observations of the Moon.—The value of observations of the moon by day or night has not met with that recognition by navigators which we should have expected; no doubt in the form of *lunars* moon observations have ceased to be practical problems, though probably no finer training for the eye can be found than practice at sea in measuring lunar distances, and, aided by considerable experience, it is surprising the accuracy with which some modern observers can determine longitude by such means. Apart, however, from observations of the moon of this character, we think that it would be more often used for the ordinary methods of finding latitude and longitude, but for the idea conveyed in most text-books on navigation of the necessity of the somewhat lengthy calculations involved. The rapidity with which at times the right ascension and declination of the moon change necessitates the accurate correction of *them*, but the absence of correction to the other elements taken from the *Nautical Almanac* would not be found in any circumstances, even the least favourable, to involve practical error at sea.

Lines of Position.—All modern navigators recognize the great value of "lines of position" obtained from the various heavenly bodies, forming as they do a system of celestial cross bearings; indeed, before the wider publicity given to this method by Captain Sumner, under the auspices of the United States Government, it was always known as "cross bearings of the sun." In the original mode of application of this valuable method the lines of position drawn at right angles to the bearing of the sun were laid down on the chart from positions obtained either by calculating the longitude by the ordinary chronometer method, using an assumed latitude, or by computing the latitude by the ex-meridian method from an assumed longitude according to the position in azimuth of the heavenly body observed. In the more modern method originally proposed by M. Marc St Hilaire, a comparison is made between the altitude of a heavenly body as actually *observed* and that *calculated* from the supposed position of the ship. For instance, the position of an observer at the instant of observing a (true) altitude of the sun of 40° 10′ must be somewhere on a portion of the circumference of a circle (usually of such size that the portion considered may be represented on a chart by a straight line) having its centre in latitude equal to the sun's declination, and in longitude equal to the Greenwich apparent time at the instant, the radius of such a circle being equal to the sun's zenith distance of 49° 50′. If at the same time the true altitude of the sun is from the *estimated* position of the ship calculated to be 40° 5′, it is evident that the greater observed altitude must be owing to the ship being nearer to the centre of the circle than was supposed, and a line of position drawn through the estimated position at right angles to the bearing of the sun must be transferred parallel to itself through a distance of 5′ towards the direction of the sun's bearing. The second line of position, obtained when the sun's bearing has altered some 25°, is dealt with in a similar way, and the intersection of the two lines so obtained gives the position of the ship at the time of second observation. This mode of procedure enables all observations, whether near or far from the meridian, to be similarly dealt with; in all cases the altitude the heavenly body *should* have is computed and compared with what it actually *has*. The practice of problems such as the foregoing is greatly facilitated by the extended means of finding at any moment the azimuth or true bearing of a heavenly body. When the azimuth was only required for the determination of compass error, the valuable tables from which the computed results could be obtained by inspection were limited to those cases of most practical importance, but from the ingenious and simple graphical form known as Weir's azimuth diagram azimuths of all heavenly bodies, whose declinations extend from 60° N. to 60° S., can be obtained during the whole time they are above the horizon, thus greatly facilitating the laying down lines of position. (W. R. M*.)

Nawabganj, the name of several towns of British India, the most important of which is the administrative headquarters of Bara Banki district in Oudh; station on the Oudh and Rohilkhand Railway, 17 miles east of Lucknow. Population (1891), 14,478; municipal income (1897–98), Rs.18,940. It has a high school, and there is considerable trade in sugar and cotton. It was the scene of a victory by Sir Hope Grant during the Mutiny.

Nawanagar, or JAMNAGAR, a native state of India, in Kathiawar, within the Gujarat division of Bombay, situated on the south of the Gulf of Cutch. Area, 3393 square miles. Population (1881), 316,417; (1891), 379,611. Estimated gross revenue, Rs.30,83,910, of which Rs.2,44,850 was expended on public works in 1897–98; tribute, Rs.1,20,093. The chief, whose title is Jam, is a Jareja Rajput, of the same clan as the rao of Cutch. K. S. Ranjitsinhji, the cricketer, had been adopted by the late Jam, but the adoption was set aside, with British sanction, in favour of a son by a Mahommedan mother. The state was in 1902 under British administration while this son was being educated at the Rajkumar College at Rajkot. A branch railway, constructed mainly at the expense of this state, was opened in 1898 from Rajkot to Nawanagar town (50 miles).

The town of NAWANAGAR is about five miles from the seaport of Bedi. Population (1881), 39,668; (1891), 48,530. Founded by Jam Rawal in 1540, it is handsomely built of stone, and has special manufactures of silk and gold embroidery, and perfumed oils and red powder for ceremonial purposes. Its water-supply is derived from a reservoir covering 600 acres and an aqueduct 8 miles long. It has a high school, with 383 pupils in 1896–97, and three printing-presses, one of which issues an official gazette.

Nazareth, now *en-Násira*, in Palestine, the chief town of a kaza in the sanjak of Acre. The population consists of 3500 Moslems and 6500 Christians. It is a centre of missionary enterprise. The Roman Catholics have a monastery, nunnery, hospice, schools, and orphanages; the Protestants, a hospital, schools, and orphanage; and the Russians, a seminary, hospice, and schools.

Neamtzu, a town in Rumania, on the left bank of the river of the same name, about half-way between Pascani and Piatra. Population (1900), 8578, of whom about half are Jews. In its vicinity are the extensive ruins of the once famous fortress of Neamtzu, constructed in the 13th century by the Teutonic knights of André II., king of Hungary, in order to repel the incursions of the Kouman Tatars. It was subsequently the scene of many bloody fights. It was here that the mother of Stephen the Great shut the doors of the fortress on her son, when a fugitive from the Turks, and compelled him to return and give battle to his adversaries, whom he defeated with enormous loss. An hour's drive to the west of the town is the famous monastery of the same name, founded in the 14th century, containing two churches and many ancient and interesting relics. Prior to the secularization of the monastic lands it was one of the richest and most important of the Rumanian monasteries, and still contains some curious treasures.

Nebraska, a central state of the American Union. The population in 1880 was 452,402, being an increase during the previous decade of no less than 267·8 per cent. In 1890 the population was 1,058,910, the increase for the decade being 134·1 per cent. In 1900 the population was 1,066,300, an increase of only $\frac{9}{10}$ of 1 per cent. Of the 90 counties of the state, 35 showed a decrease in population from 1890 to 1900. Of the 365 incorporated places in the state, 27 had more than 2000 inhabitants in 1900, 7 had more than 5000, and 3 had more than 25,000. These 3 were—Omaha, with a population in 1890 of 140,452 and in 1900 of 102,555; Lincoln, with 55,154 in 1890 and 40,169 in 1900; South Omaha, with 8062 in 1890 and 26,001 in 1900. The decrease in the population of the state probably occurred in the first half of the decade, and was owing to hard times and the reaction from the boom of earlier years. The hard times in their turn occasioned the realignment of political parties and the free silver movement that for a time swept the state. The total land surface is approximately 76,840 square miles; the average number of persons to the square mile being, in 1890, 13·8, and in 1900, 13·9. Of the total population in 1900, 564,592 were males and 501,708 were females; 888,953 were native-born and 177,347 were foreign-born; 1,056,526 were white and 9774 were coloured (including 6269 negroes, 180 Chinese, 3 Japanese, and 3322 Indians). Out of 301,091 adult males 7388 were illiterate (unable to write), of whom 4720 were foreign-born.

Agriculture and Forestry.—Agriculture is the chief industry, and is the foundation of the manufactures and commerce. There is no mining. From 1869 to 1899 there were only 4 crop failures and 3 short crops. In the same period the State Statistical Bureau recorded 18 good crops, 1 fair crop, and 4 great crops. The yearly production of Indian corn runs from 175 millions to 225 millions of bushels. The crop report for 1898 gives corn, 179,599,596 bushels; oats, 48,522,288 bushels; wheat, 39,177,600 bushels. The report for 1899 gives corn, 196,000,285 bushels; oats, 27,335,490 bushels; wheat, 30,545,880 bushels; rye, 3,141,344 bushels; and barley, 2,395,880 bushels. No state has done more for the forestation of its waste and prairie lands. Arbor Day, which has spread through the Union, was instituted by the Nebraska State Board of Agriculture on 4th January 1872, by the adoption of the following resolution, proposed by J. Sterling Morton:—

Resolved that Wednesday, the 10th day of April 1872, be and the same is hereby especially set apart and consecrated for tree-planting in the state of Nebraska, and the State Board of Agriculture hereby name it Arbor Day.

The 10th of April of the same year was set apart by the governor for tree-planting, and more than three millions of trees and cuttings were set out on that date. Since then Arbor Day has been yearly observed by the public schools throughout the commonwealth. It is estimated that more than 20 billions of trees have been planted on these anniversaries. It is not impossible that before the next fifty years have passed lumber will be shipped from the plains of Nebraska to the eastern states.

Manufactures.—In 1860 there were 107 manufacturing establishments in the state; in 1870 there were 670; in 1880, 1403; and in 1890, 3014. The capital invested in 1890 was $37,569,508. The most prominent manufacturing cities are Omaha, South Omaha, Grand Island, Norfolk, and Nebraska City. At South Omaha the packing interests have reached large proportions. The cash value of cattle and hogs sold in 1900 exceeded 40 millions of dollars, while the value of sheep, horses, and mules sold aggregated at least 2 million dollars more. South Omaha is the third largest packing metropolis in the world. At Nebraska City there is a packing-house with a capacity of 2000 swine per day. At the same place is a canning establishment that puts up millions of cans of corn, tomatoes, peas, and fruits of various kinds each year. During the working season (August–November) it employs between 100 and 200 persons. Starch works, also at Nebraska City, employ between 200 and 300 persons, and have a daily average output of 33 tons. The starch is made from Indian corn. At the same place are cereal mills, which employ between 100 and 200 persons, producing daily 30 tons of oatmeal, and converting 4500 bushels of Indian corn into hominy, grits, and meal. Factories at Grand Island and Norfolk consume the beets from about 10,000 acres of land, and ship large quantities of granulated sugar. At O'Neill, in Holt county, is a chicory factory; and the legislature, which passed an Act making the sale of oleomargarine and other substitutes for butter a penal offence in the state, gave a bounty, to be paid out of the treasury, of 1 cent a pound upon chicory which is used only as an adulterant of, or substitute for, coffee. In 1899 Nebraska shipped more than 85 million pounds of flour and 89 millions of other mill products, together with 714,000 head of cattle and 2,477,243 swine, 50,000 head of mules and horses, and 1,700,000 head of sheep.

Railways.—Within the boundaries of the state are more than 6000 miles of railway. The chief lines, with their mileage and cost to 30th June 1890, are as follows:—

Road.	Miles of Road.	Cost.
Burlington and Missouri River (C. B. & Q. system)	2252	$84,547,628
Fremont, Elkhorn, and Missouri Valley (C. & N. W. system) . . .	985	40,256,515
Union Pacific	943	73,903,339
Chicago, St Paul, Minneapolis, and Omaha (C. & N. W. system) . . .	271	10,779,507
Chicago, Rock Island, and Pacific . .	245	9,016,209
The Missouri Pacific Railway . . .	221	10,823,399

Finances.—The census of 1890 valued the real and personal property at $1,275,685,514. The state has no bonded debt. The rate of taxation for all purposes is from $6\frac{1}{2}$ to $7\frac{1}{2}$ mills; through this levy is obtained a revenue of $1,208,984. There are 400 state banks, with a capital of between 13 and 14 millions of dollars, and 113 national banks, whose aggregate capital amounts, in round numbers, to 10 millions of dollars.

Charity.—The charitable and penal institutions are as follows:—The Asylum for Insane, at Lincoln; the Home for the Friendless, at Lincoln; the State Penitentiary, at Lincoln; the Industrial Home, at Milford; the Soldiers' and Sailors' Home, at Milford; the Girls' Industrial School, at Geneva; the Boys' Industrial Home, at Kearney; the Soldiers' and Sailors' Home, at Grand Island; the Asylum for Chronic Insane, at Hastings; the Asylum for Insane, at Norfolk; the School for Deaf, at Omaha; the School for Feeble-Minded Youth, at Beatrice; the School for Blind, at Nebraska City.

Education.—The rate of illiteracy (1890) was $2\frac{3}{10}$ per cent., the lowest in the Union. The common schools are supported by a general tax, which cannot be less than one-half mill on the entire valuation of the real and personal property. Added to this is the interest on the permanent school fund, derived from the sale of school lands granted by Congress under the Enabling Act of 19th April 1864, which gave the school fund 5 per cent. of the net proceeds derived from the sale of all government lands within the state. This permanent educational fund yields, for semi-annual *per caput* distribution, between $300,000 and $400,000. The number of pupils of school age is over 400,000; the number of teachers, approximately, 10,000; the number of school-houses, 7000. The value of these school-houses and grounds, together with books, apparatus, and fixtures, amounts to more than 8 millions of dollars. The State Normal School at Peru has 500 students and 21 instructors. The university at Lincoln has 2200 students, 110 instructors, and its annual disbursements amount to $248,000.

Politics.—The people have been realigned as to political organizations since 1890. Before that time the Democratic party advocated free trade or a tariff for revenue only, and the Republican party a protective tariff. In 1892, under the leadership of William Jennings Bryan, the Democratic party divided upon the money question, and subsequently amalgamated with the Populist party in the advocacy of the free coinage of silver with gold at the ratio of 16 to 1, forming a party which consisted of Silver Republicans, Democrats, and Populists. The Populists were largely in the majority among the directors of the combination. The Republican party maintained the necessity of the gold standard. In the national election of 1896 the Fusionists (Silver Democrats, Silver Republicans and Populists) polled 115,880 votes, and in 1900, 114,013. The Republicans polled 102,304 in 1896, and 121,835 in 1900. Since 1898 the Populists have named two-thirds or more of the candidates for county and state offices, while Silver Republicans and Democrats acting with them have divided the remainder.

The statement that Bellevue was the first capital of Nebraska is an error: Bellevue was never the capital of either the territory or state. The first capital of the territory was Omaha, and it remained the seat of government until 1867, when by act of the legislature the capital was located at Lincoln, where it remains.

(J. S. M*.)

Nebraska City, a city of Nebraska, U.S.A., capital of Otoe county, on the west bank of the Missouri river, and the Burlington and Missouri River and the Missouri Pacific railways, at an altitude of 961 feet. The city is regularly laid out, is well sewered and lighted, and has a good water supply. It is the site of the state school for the blind. It is in a rich farming region, has considerable manufactures of a varied character, and some commerce in farm products by rail and river. Population (1880), 4183; (1890), 11,494; (1900), 7380, of whom 882 were foreign-born and 142 negroes.

Neckar, a river of Germany, rising between the Black Forest and the Swabian Alb, near Schwenningen, in Würtemberg, at an altitude of 2287 feet. It flows north past Rottweil as far as Horb, thence past Rottenburg, Tübingen, and Nürtingen in a north-easterly direction, then in a generally northerly direction as far as Eberbach, passing on the way Esslingen, Canstatt, and Heilbronn; from Eberbach it pursues a winding west course past Heidelberg, and enters the Rhine (from the right) at Mannheim (295 feet alt.). Its length is 247 miles, and its drainage area 4790 square miles. Its more important tributaries are the Enz (left), and Fils, Rems, Kocher, and Jagst (right). It is navigable for small steamboats up to Heilbronn, for boats up to Canstatt, and for rafts from Rottweil. It is the principal waterway of Würtemberg, and greatly used for floating down timber. From Rottenburg downwards its banks are almost everywhere planted with vineyards. Up to Frankfort it has been deepened and the channel otherwise improved. A committee, chiefly promoted by the Würtemberg government and the Stuttgart Chamber of Commerce, reported in 1901 that it was both desirable and practicable to dredge the river and canalize it, from Esslingen down to Mannheim, and that the cost would probably fall between 2 and $2\frac{1}{2}$ millions sterling.

Neemuch, or Nimach, a town of Central India, with British military cantonment, within the native state of Gwalior, on the border of Rajputana, with a station on the Rajputana Railway, 170 miles north of Mhow. Population (1881), 18,230; (1891), 21,600. Number of police, 69 men; expenditure on public works (1897–98), Rs.3052.

Neenah, a city of Winnebago county, Wisconsin, U.S.A., on the Fox river, at the foot of Winnebago Lake, in the eastern part of the state, at an altitude of 754 feet. The Chicago and North-Western, the Chicago, Milwaukee, and St Paul, and the Wisconsin Central railways intersect at this point. The city has good water-power, and manufactures of lumber, flour, and paper. It has some reputation as a summer resort. It was founded in 1836 as a military post. Population (1880), 4202; (1890), 5083; (1895), 5781; (1900), 5954, of whom 1559 were foreign-born.

Negapatam, a seaport town of British India, in the Tanjore district of Madras, forming one municipality with Nagore, a port 3 miles north at the mouth of the Vettar river. It is the terminus of a branch of the South Indian Railway, which has been extended to Nagore. Population (1881), 53,855; (1891), 59,221; (1901), 56,455; municipal income (1897–98), Rs.75,000. There is a large population of Labbays, Mahommedans of mixed Arab descent, who are keen traders. Jesuit and Wesleyan missions are carried on. In 1897–98 the total sea-borne trade of the district was valued at Rs.1,94,29,666. The chief export is rice to Ceylon. The number of vessels that entered and cleared for foreign trade was 453, with an aggregate burthen of 191,000 tons. The Wesleyan Mission College was closed in 1895. The two aided high schools (Wesleyan and Catholic) had 411 pupils in 1896–97. There are four printing-presses, issuing an English and two vernacular newspapers, besides two large reading-rooms and literary associations.

Negaunee, a city of Marquette county, Michigan, U.S.A., in the Marquette Iron Range, on the Upper Peninsula, 12 miles west of Marquette, and on the Chicago and North-Western, and the Duluth, South Shore, and Atlantic railways, at an altitude of 1564 feet. The city overlies enormous deposits of hæmatite iron ore, and the industries consist in mining and shipping this ore. Population (1880), 3931; (1890), 6078; (1900), 6935, of whom 3270 were foreign-born.

Negligence, in law, is a ground of civil liability, and in criminal law it is an element in several offences, the most conspicuous of which is manslaughter by negligence. In order to establish civil liability on the ground of negligence, three things must be proved,—a duty to take care, the absence of due care, and actual damage caused directly by the absence of due care. Mere carelessness gives no right of action unless the person injured can show that there was a legal duty to take care. The duty may be to the public in general, on the ground that any person who does anything which may involve risk to the public is bound to take due care to avoid the risk. For instance, in the words of Lord Blackburn, "those who go personally or bring property where they know that they or it may come into collision with the persons or property of others have by law a duty cast upon them to use reasonable care and skill to avoid such a collision." Where a special duty to an individual is alleged, the duty must rest on a contract or undertaking or some similar specific ground. Thus, where a surveyor has carelessly given incorrect progress certificates, and a mortgagee who has had no contractual relation with the surveyor has advanced money on the faith of the certificate, the surveyor is not liable to the mortgagee in an action of negligence, because he owed no duty to the mortgagee to be careful. When a duty to take care is established, the degree of care required is now determined by a well-ascertained standard. This standard is the amount of care which would be exercised in the circumstances by an "average reasonable man." This objective standard excludes consideration of the capacity or state of mind of the particular individual. It also gets rid of the old distinctions between "gross," "ordinary," and "slight" negligence, though no doubt the degree of care required varies with the circumstances of the case. The application of such a standard is a task for which a jury is a very appropriate tribunal. In fact the decision of the question whether there has been a want of due care is left almost unreservedly to the jury. There is this amount of control, that if the judge is of opinion that the evidence, if believed, cannot possibly be regarded as showing want of due care, or in technical language that there is "no evidence of negligence," it is his duty to withdraw the case from the jury and give judgment for the defendant. Unless the judge decides that there is no duty to take care, or that there is no evidence of want of care, the question of negligence or no negligence is wholly for the jury.

Ordinarily a man is responsible only for his own negligence and for that of his servants and agents acting within the scope of their authority. For the acts or defaults of the servants of an independent contractor he is not liable. But in certain cases a stricter obligation is imposed on him by law. The occupier of premises is under a duty to all persons who go there on business which concerns him to see that the premises are in a reasonably safe condition so far as reasonable care and skill can make them so. Thus he cannot release himself by employing an independent contractor to maintain or repair the premises. The effect of this doctrine is that the occupier may be liable if it can be shown that the independent contractor or his servant has been guilty of a want of due care. A similar obligation has been enforced in the case of a wreck stranded in a navigable river, and the owner was held liable for damage caused by the carelessness of the servant of an independent contractor who had undertaken to light the wreck. So too any person who undertakes a work likely to cause danger if due care is not taken is liable for damage caused by the carelessness of the servant of an independent contractor, so long as the carelessness is not casual or collateral to the servant's employment.

In an action of negligence a familiar defence is "contributory negligence." This is a rather misleading expression. It is not a sufficient defence to show that the plaintiff was negligent, and that his negligence contributed to the harm complained of. The plaintiff's negligence will not disentitle him to recover unless it is such that without it the misfortune would not have happened, nor if the defendant might by the exercise of reasonable care on his part have avoided the consequences of the plaintiff's negligence. The shortest and plainest way of expressing this rule is, that the plaintiff's negligence is no defence unless it was the proximate or decisive cause of the injury. There was an attempt in recent times to extend this doctrine so as to make the contributory negligence of a third person a defence, in cases where the plaintiff, though not negligent himself, was travelling in a vehicle or vessel managed by the negligent third person, or was otherwise under his control. In such circumstances it was said that the plaintiff was "identified" with the third person. The court went so far in one case as to "identify" a child with its grandmother. But the case of *The Bernina*, decided in 1888, exploded this supposed doctrine, and made it clear that the defence of contributory negligence holds good only when the defendant contends and proves that the plaintiff was injured by his own carelessness. (A. Ll. D.)

Negro.—In recent years the domain of the true African negro, with whom alone we are here concerned (*Ency. Brit.* vol. xvii. p. 316), has been considerably enlarged by the explorations of Dybowski, Crampel, and Clozel about the Congo–Chad water-parting; of Junker and the Belgian officials about the Congo–Nile water-parting; of Lugard, Jackson, Gregory, and others in British East Africa and Uganda; of Baumann and Emin Pasha in German East Africa. The main result is that the ethnical divide between the full-blood Sudanese negro and the Negroid Bantu populations has to be shifted more to the south than had hitherto been supposed. Owing to numerous overlappings and interminglings in some districts it is still often difficult to lay down the frontiers between the two domains with any approach to accuracy. But, speaking generally, the parting line may now be traced across the continent along the fifth parallel from the Rio del Rey in the extreme west to about 20° E., where it roughly coincides with the elevated plateau, which here separates the waters flowing north to Lake Chad and south to the Congo. Farther on it dips considerably to the south-east along the southern borders of the Niam-Niam and Monbuttu (Mangbattu) territories to the Semliki valley between Lakes Albert and Albert Edward, near the equator. From this point the ethnic boundary follows a somewhat irregular course, first north by the east side of Albert Nyanza to and up the Somerset Nile as far as Mruli, and then round the east side of Usoga and Lake Victoria to Kavirondo Bay, where it turns nearly east to and down the Tana river almost to the Indian Ocean. From the Atlantic to Lake Victoria the line thus drawn seems to represent the actual relations with some accuracy; but in Kavirondo it enters a debateable region, where much further research will be needed correctly to determine the respective limits of the various Hamitic negro and Bantu peoples—*Masai*, *Turkana*, *Galla*, *Wakikuyu*, *Shuli*, and others—whose territories here converge from the north, east, and south. Meanwhile, this extension of the Sudanese negro domain has brought within its borders a considerable number of fresh groups, some only discovered in recent years, others hitherto supposed to belong to different ethnical connexions. In Western Sudan also, and especially in the region within the Niger bend, the explorations of the late Col. Ellis and of Col. Binger have not only brought to light many new groups, but have also cleared up some obscure points connected with the inter-relations of the already known peoples. A much wider extension must now be given to the great *Mandingan* family, as well as to that of Upper Guinea, which still lacks a satisfactory collective name, but the various sections of which—*Tshi*, *Ewe*, *Yoruba*, and others—are shown by Ellis to be fundamentally connected in speech, physique, religion, and social usage.

As a consequence of all these discoveries the tentative classification of the Sudanese negro peoples (vol. xvii. p. 319) requires so many readjustments that it will be more convenient to substitute a fresh table harmonizing better with the present state of African ethnology. Here are included the Fulahs, Hausas, and the other historical Negroid nations:—

Wolof Group—Wolofs proper; Jolofs; Serers; between the lower Senegal river and Cape Verde.
Felup Group—Aiamat; Yola; Kabil; Jugut; Fogni; Kaimut; Vaca; Banjiar; Fuluu; Bayot; Casamanza and Cacheo estuaries.
Toucouleur (*Taeuror*)—Kaarta district and Senegal river.
Mandingan (*Mandé*) *Family*—Mandé proper; Bambara; Sarakolé; Kassonké; Jallonké; Suzy; Susu; Vei; Mano; Toma; Landoro; Kabunga; Tene; widespread throughout Senegambia and the Upper Niger basin.
Sonrhay (*Songhay*)—Middle Niger between Lake Debo and Sokoto confluence.
Temné Group—Temné (Timneh) proper; Kissi; Sherbro; Gallina; Kono; Bullom; Solima; Sierra Leone.
Fulah Group—Futa-Jallo; Futa-Toro; Jel; Baa; So; Mabube; Laube; Beri; Senegambia, and sporadically throughout West and Central Sudan.
Liberian Groups—Deh; Gurra; Kru ("Kroo Boys"); Kondo; Pessa; Gollo; Bassa; Kabo; Grebo; Tebo; Webo; Nyambo; Grain Coast.
Upper Guinea Family—Oshin; Agni; Tshi (Ashanti, Fanti, Wassawa, Adansi); Ga (Accra, Krobo, Agotine); Ewe (Awuna, Agbosimi, Togo, Dahoman, Krepe, Fra, Appi); Yoruba (Jebu, Egba, Oworo, Ondo, Ife, Oyo); Ivory, Gold, and Slave Coasts.
Niger-Benue Groups—Benin; Ibo; Nupe; Iju (Akasa); Nempé; Okrika; Qua; Efik; Andoni; Ebe; Kambari; Wuruku; Tangala; Kali; Bele; Akpa; Mitchi; Doma; Niger delta, Oil Rivers, Lower Benue, and Niger.
Adamawa Groups—Batta; Fala; Marga; Holma; Bula; Kilba; Woka; Fani; Longoela, Upper Benue, thence east to Logon.
Niger Bend Groups—Mossi; Gurma; Gonja; Tombo; Gurunga; Sienuf (Sieneret); within the Niger Bend.
Hausa—From the Niger to Bornu; chief nation in Central Sudan.
Lake Chad Groups—Kanembu; Kanuri; Yedina; Kuri; Baghirmi; Logon; Mandara; Mosgu; Gamergu; Kerrikerri; Sara; Babir; Chad Basin (Kanem, Bornu, Baghirmi, Logon, and surrounding districts).
Wadai Groups—Maba; Birkit; Massalit; Korunga; Kondongo; Mubi; Marta; Wadai and East Dar-Fur.
Nuba-Fur Family—Fur; Kunjara; Nuba and Nile Nubians; Kargo; Kulfan; Kolaji; Tumali; Tegele; Dar-Fur, Kordofan, Nubia.
Nilitic Groups—Shuli; Labore; Kirim; Janghey; Falanj; Luri; Madi; Bari; Nuer; Shilluk; Dinka; Mundu; Abaka; Abakaya; Bongo; Rol; Mittu; Krej; Fertit; White Nile; Sobat; northern slopes of Nile-Congo divide.
Welle Groups—Niam-Niam (A-Zandeh); Mangbattu (Mombuttu); Kalaka; A-Baugba; A-Madi; A-Kahle; A-Babua; A-Barambo; Embata; Mangballe; A-Banjia; Mabenge; Nsakkara; A-Ngaddu; Welle river from its source to Mbomu confluence.
Lacustrine Groups—Shefalu; Wa-Kavirondo; Magaya; Wiehwezi; Drugu; Drudu; Wa-Konjo; Wambuba; Wa-Wamba; Wa-Lenga; Wa-Yerra; Wa-Tigawa; Unyoro, Kavirondoland: Victoria Nile; Semliki river; Mpororo and Batumi districts.

(A. H. K.)

Negroes in United States of America.

The first negro slaves in America were brought by the Spaniards to San Domingo, in the island of Hayti, in 1565. There has been much controversy as to the year when the first negroes were landed on the continent of North America; and the number brought in the first shipment has been given as fourteen by some authorities, and as twenty by others. Williams [1] says that fourteen negroes were landed in the colony of Virginia in the month of August 1619 from a Dutch man-of-war, claiming to sail under a commission from the prince of Orange. The negroes were exchanged for provisions, and were forced upon the colony. At that period white servitude was common; women were sold for wives, being sometimes kidnapped in England and sent to the colony. Slavery grew slowly at first. In 1624 there were only twenty-two negroes in the colony of Virginia. In 1648 the white population of the colony was about 15,000, with 300 slaves. Slavery existed from 1619 to 1662 without sanction of law. In 1662 a law was enacted in Virginia that the issue of slave mothers should follow their condition (*Partus sequitur ventrem*). In 1705 a law was passed, by approval of Queen Anne, declaring slaves to be real estate. There is no trustworthy record of slavery in New York under the Dutch between 1609 and 1664, but it undoubtedly existed. When New Netherland became an English colony in 1664, slavery received official recognition. Slaves were introduced into Massachusetts from Barbados in 1637. In 1676 there were 200 slaves in Massachusetts. At the beginning of the Revolution in 1775, there were 501,102 slaves in the American colonies. The last cargo of slaves brought to the United States consisted of thirty full-blooded Dahomeyans landed from the ship *Clothilde* in 1859. Efforts for emancipation were begun as early as 1780 by the Quakers. One of the first organized attempts at "abolition agitation" was that of Benjamin Lundy, begun in 1821. The colony of Liberia, in Africa, was founded by the American Colonization Society as a place of residence for free negroes. The first shipload of emigrants, consisting of 86 negroes, went to the colony in February 1820. In 1861, at the beginning of the Civil War, there were about 4,441,000 negroes in the United States, of whom 11 per cent. were free.

History.

Table A shows the white and coloured population of the United States by decades since 1790. Previous to 1860, Indians and Chinese were included in the census report as "coloured."

[1] *History of the Negro Race in America from 1619 to 1880*, George W. Williams. New York: G. P. Putnam's Sons. The author of this work is himself a negro.

TABLE A.

Year.	White.	Coloured.	Proportion of White.	Proportion of Coloured.
1790	3,172,006	757,208	81·12	18·88
1800	4,306,446	1,002,037	81·13	18·87
1810	5,862,073	1,377,808	80·98	19·02
1820	7,862,166	1,771,656	81·62	18·38
1830	10,537,378	2,328,642	81·90	18·10
1840	14,195,805	2,873,648	83·17	16·83
1850	19,553,068	3,638,808	84·32	15·68
1860	27,001,491	4,441,830	85·88	14·12
1870	33,678,362	4,880,009	87·35	12·65
1880	43,574,990	6,580,793	86·88	13·12
1890	55,152,210	7,470,040	88·07	11·93
1900	66,990,802	8,840,789	88·35	11·65

Table B shows the changes in proportion of coloured to white population in the Southern states.

TABLE B.

	1830.	1860.	1890.	1900.
Maryland	34·88	24·91	20·69	19·79
District of Columbia	30·81	19·07	32·80	31·12
Virginia	42·69	34·39	38·37	35·64
North Carolina	35·93	36·42	34·67	33·07
South Carolina	55·63	58·59	59·85	58·37
Georgia	42·57	44·05	46·74	46·68
Florida	47·06	44·63	42·46	43·69
Kentucky	24·73	20·44	14·42	13·26
Tennessee	21·43	25·50	24·37	23·77
Alabama	38·48	45·40	44·84	45·24
Mississippi	48·44	55·28	57·58	58·60
Louisiana	58·54	49·49	49·99	47·14
Texas	...	30·27	21·84	20·36
Arkansas	15·52	25·55	27·40	27·94

From 1860 to 1900 the negro population of the entire country increased 100 per cent., and the whites about 150 per cent., the whites receiving 14,000,000 by immigration, and the negroes practically none. The natural increase of the two races was about equal. Between 1880 and 1900 the whites increased (excluding immigration) nearly 33 per cent., and the negroes nearly 34 per cent. From 1850 to 1900 a perceptible change in the distribution of the negro population was apparent. In 1850 the proportion of negroes in the Southern states was 94·2 per cent. ; in 1900 it had fallen to 89·9. In the upper Southern states, viz., Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Kentucky, Tennessee, and Missouri, there was a loss of 17 per cent.—from 54·4 to 37·4—and in the lower Southern states an increase of 12·7 per cent.—from 39·8 to 52·5. Alabama alone held its proportion unchanged. From the upper Southern group of states there were two different movements, one to the southward, the other to the north and west. Virginia has afforded the largest migration to the north and west, while South Carolina, North Carolina, Tennessee, and Virginia, in the order given, have contributed most to the lower Southern group of states. There has been a marked increase of the urban negro population, especially in the larger cities of the North and the states bordering on the North (Table C).

TABLE C.—*Negro Population in Twelve Cities having the largest Negro Population.*

	1870.	1880.	1890.	1900.
Washington, D.C.	38,726	52,135	75,572	86,702
Baltimore, Md.	39,558	53,716	67,104	79,258
New Orleans, La.	50,456	57,617	64,491	77,714
Philadelphia, Pa.	22,147	31,699	39,371	62,613
New York, N.Y.	13,072	19,663	33,994	60,666
Memphis, Tenn.	15,471	14,896	28,706	49,910
Louisville, Ky.	14,956	20,905	28,651	39,139
Atlanta, Ga.	9,929	16,330	28,098	35,912
St Louis, Mo.	22,088	22,256	26,865	35,516
Richmond, Va.	23,110	27,832	32,330	32,230
Charleston, S.C.	26,173	27,276	30,970	31,522
Chicago, Ill.	3,691	6,480	14,271	30,150

In the decade 1890–1900 several of the Southern cities made little gain. On the other hand, the four Northern cities, New York, Chicago, Philadelphia, and Pittsburg, show an aggregate increase of 80,973. Four other cities, Washington, Baltimore, New Orleans, and Memphis, show an aggregate increase for the same period of 68,711, but this is much below that of the four Northern cities named.

The relative proportion of the races in the Southern states shows little change, notwithstanding the movements indicated. In the low swampy regions of the Atlantic coast, and in the alluvial regions of the Mississippi valley, 17 per cent. of the total negro population are found, whereas only 4 per cent. of the total population of the country live there. Seventy per cent. of the negroes live below an altitude of 500 feet. The total population of the country live under a mean average temperature of 53° ; the average temperature under which the negro lives is 61°.

Occupation and ownership.

The negro is mainly occupied in agriculture or personal service. Between 1865 and 1890 there was little progress in manufacture, transportation, and trade, but in the last decade of the 19th century there was definite and encouraging progress in those directions. In 1890 the total number of farms in the United States was 4,767,179. Of these the negroes occupied 549,642, or 11·5 per cent. The number of homes, as distinguished from farms, was 7,922,973, and of these the negroes occupied 861,137, or 10·9 per cent. At the same date the proportion of negroes to the total population was 12·2 per cent. Of the farms occupied by negroes in 1890, 120,738, or 22 per cent., were owned by the occupants. The corresponding proportion for whites was 71·7 per cent. In 1890 negroes owned 19 per cent. of the homes occupied by them, whereas the whites owned 39·4 per cent. of their homes. The property owned by the negroes was acquired in the twenty-five years following their freedom. The progress in acquiring farms and homes in the decade from 1890 to 1900 was marked. The report of the State Comptroller of Georgia showed that in 1901 the assessed value (half actual) of negro property in the state was $15,629,811, while negroes owned 1,141,135 acres of land, valued at $4,656,042.

A study of the negro in business, made in 1899 by Professor W. E. B. Du Bois, estimated the capital then invested in negro business enterprises to be $8,784,637. Seventy-nine per cent. of this was in sums of less than $2500. The same study reported 3 monthly magazines, 3 daily papers, 11 school journals, and 136 weekly papers, owned, edited, and published by negroes.

The absolute poverty of the negro after his freedom was responsible for the one-room cabin. Slavery had made family life uncertain or impossible, and this had led to inconstancy, and to a lack of appreciation of the importance of virtue. In these respects there has been a marked improvement. The two-room cabin, making possible separation of the sexes, the ownership of lands, and the general impulse incited in the people for bettering their position, have brought a higher standard of life and morals. The most encouraging result of opportunity and development is the growing differentiation of classes among negroes, even in small communities, and the fact, now clearly defined, that the industrious and property-holding class of the negro population represents the general tendency of the race. "In slavery days marriage or cohabitation was entered upon very early, and the first generation of freemen did the same. The second generation is postponing marriage to better its condition" (Du Bois). In 1890 there were 9 native white prisoners in gaol to every 10,000 of the white population, and 33 negroes to every 10,000 of the negro population ; but as negroes are committed for petty offences in much greater proportion than the whites, the comparison is unfair. It is undoubtedly true, however, that the proportion of negro criminals is in excess of the whites.

Lynching.

Lynching, or the practice of punishment for crimes or offences by unauthorized persons without a legal trial, has been practised against the negro to an alarming extent. A grouping of the lynchings of negroes for five years, with the alleged causes, gives the figures shown in Table D.

TABLE D.

Year.	Murder.	Rape.	Other Causes.	Total.
1896	24	31	31	86
1897	55	22	46	123
1898	47	16	39	102
1899	23	11	56	90
1900	30	16	57	103
Total	179	96	229	504

The lynching may occur from any cause, and any crime by a negro is considered in some communities as an inter-racial crime. The punishment is due to race antipathy and the desire to protect the white race. The rape of the negro by the white, when it occurs, is condoned, and is seldom punished. Throughout the four years of the Civil War, when the negroes were left in charge of the homes of the whites, there is no record of a single murder that could be called an outrage on the part of the negro. The health of the negro race suffered by the free license that followed the restraint in slavery. The introduction of civilized vices into the uncivilized negroes induced excesses, and the lack of self-control brought crime and disease in its path. The birth-rate among the negroes is high, but the death-rate, especially in the cities, is far in excess of that of the whites. This is due to improper food, clothing, excesses, and ignorance of the care of infants.

By Federal constitutional amendment the negro was given the right of franchise. In the former slave states, where the negro predominates, five states—Mississippi, South Carolina, North Carolina, Louisiana, and Alabama—have adopted educational and property qualifications in their constitutions, which practically disfranchise the majority of the negroes. The Constitutional Convention of Virginia (1902) adopted the same qualification. The attitude of the white population varies in proportion to the number of negroes. Where there is no fear of negro domination, as in the North and West, the relationship is simple. But in some Southern states where the negro largely predominates (in some counties in the ratio of 12 to 1), the relations between the negro and the white are very complex. The universal sentiment of the Southern white is that the negro shall neither dominate politically nor shall he have social recognition. He is encouraged, however, to secure a reasonable education, and is respected in proportion to his good citizenship. More trades are open to him in the South than elsewhere, and his labour in agriculture, personal service, and the more laborious trades is appreciated.

Legal disfranchisement.

Statistics of the progress of the negro in education are not complete, but all indicate a wonderfully rapid progress in the elements of education. During slavery it was generally held throughout the South to be a crime to teach negroes to read and write. Schools existed, however, to some extent, for the free negroes, and the U.S. censuses of 1850 and 1860 reported a considerable number of adult "Free Coloured People" in the Southern states who could read and write, 25,490 in 1850, and 29,864 in 1860. The records for literacy and illiteracy among the negroes over ten years of age in eleven of the Southern states since freedom are given in Table E.

Education.

TABLE E.

Year.	Total Negro Population.	Total Number over 10.	Literate Numbers over 10.	Illiterate Numbers over 10.	Percentage of Literates.	Percentage of Illiterates.
1870	3,939,032[1]	2,728,748	295,800	2,432,948	10·8	89·2
1880[2]	5,360,298	3,609,203	837,855	2,771,348	23·2	76·8
1890	6,118,592	4,264,271	1,622,163	2,642,108	38·6	61·4
1900	7,185,617	5,051,828	2,563,090	2,488,738	50·7	49·3

Table F shows the literacy of negro males of voting age (twenty-one years and over) in the United States.

TABLE F.

	Total.	Literate.	Illiterate.	Percentage of Literates.	Percentage of Illiterates.
1870	1,032,475	170,232	862,243	16·5	83·5
1880	1,487,344	465,193	1,022,151[3]	31·3	68·7
1890	1,740,455	714,799	1,025,656[4]	41·1	58·9
1900	2,065,989	1,088,940	977,049	52·7	47·3

Table G shows the variation in different localities.

TABLE G.—*Negro Males of Voting Age in Twelve Cities (1900).*

	Total.	Literate.	Illiterate.	Per Cent. of Illiterate.
Chicago, Ill.	12,414	11,732	682	5·5

East Feliciana, La.	2831	770	2061	72·8
Concordia, La.	3119	690	2429	77·9
St Landry, La.	5101	1038	4063	79·7
St Martin, La.	1695	329	1366	80·6
Lafayette, La.	1739	250	1489	85·6

In New York, Chicago, and Philadelphia few of the negro males of voting age are unable to read and write; in St Louis, Baltimore, and Washington the number increases; in the more southerly cities it becomes upward of a third; and in many of the rural districts the literacy is little greater than under slavery. In some two hundred counties upward of 60 per cent. of the negro males of voting age are recorded as illiterate. The large number that have gone from the South into Northern cities during recent years are evidently of the educated classes who have had the benefit of the schools. Their training seems to have given them an inclination to other pursuits than those which would have made them of greatest use to the more needy people of their own race.

The general disposition of the negro is to educate his children, even at great personal sacrifice. Records of public school expenditure and attendance in the sixteen former slave states and the District of Columbia since 1870 give the following figures:—

TABLE I.

School Year.	Estimated Expenditure for each Race.		Estimated School Population, *i.e.*, Children 5 to 18.		Expenditure per caput.	
	White.	Coloured.	White.	Coloured.	White.	Coloured.
1870–1871	$9,605,158	$780,306	3,236,630	1,578,170	$2·97	$0·49
1880–1881	11,312,573	2,344,241	4,096,800	2,145,990	2·76	1·09
1890–1891	21,245,685	5,444,625	5,230,115	2,551,511	4·06	2·13
1899–1900	28,297,857	7,296,214	6,103,390	2,991,100	4·64	2·44

The total expenditure for the public schools in these states during this time has been $615,074,209, of which $499,119,910 was for white children, and $115,954,299 was for coloured children.

The U.S. Commissioner of Education reported that for the school year 1900–01 there were 180 institutions for the education of the negro in the United States, other than the public schools. 145 of these, reporting to the Commission, gave the following figures:—

Number of students		37,696
Elementary	22,043	
Secondary	13,267	
College grades	2,386	

Of this number 15,683 were receiving industrial training. The aggregate income of the 145 schools was $1,182,365. Of this amount there came from public funds, $212,950; from tuition, $148,506; from productive funds, $142,932; and from private donations, $677,977.

In addition to generous private benefactions, largely from the North, there have been expended for negro education a portion of the income of the Peabody fund, the income of the Slater fund, and large sums contributed through the American Missionary Association and other societies maintained by different churches.

The training given at Hampton Institute, Hampton, Virginia, at the Tuskegee Normal and Industrial Institute, Tuskegee, Alabama, and at similar institutions, has had a marked influence on the education of the negro race. The aim of such schools is to give agricultural or industrial training, together with a practical academic course. The importance of teaching the negro the value of work and how to work is paramount. The need of fitting him for his necessary environment is a responsibility which is gradually being recognized by the whole people.

For a very complete bibliography of the negro, see Appendix "C," p. 419, of *The Philadelphia Negro*, published for the University of Pennsylvania, 1899, Philadelphia, Penn., U.S.A., edited by Prof. W. E. Du Bois. (W. H. B.)

Negro, Rio. See AMAZON.

Nehávend, a small but very fertile and productive province of Persia, situated south-west of Hamadan, west of Maláyir, and north-west of Burújird. It has a population of about 15,000, and pays taxes amounting to about £9000 per annum. The capital is the ancient city of Nehávend, where Yezdigird, the last monarch of the Sassanian dynasty, was finally defeated by the Arabs. It has a population of about 5000, including 700 to 800 Jews; there are fine gardens, and an old citadel on a hill, It is situated at an elevation of 5540 feet, 27 miles from Doletábád (Maláyir), and 25 miles from Burújird.

Neisse, two rivers of Germany, both left-hand tributaries of the Oder. 1. The Glatz Neisse rises on the Schneeberg, at an altitude of 1400 feet, flows north past Glatz, turns east and pierces the Eulengebirge in the Wartha pass, then continues east as far as the town of Neisse, and after that flows north-north-east until it joins (altitude, 453 feet) the Oder between Oppeln and Brieg. It is only used for floating down timber, owing to its torrential character. It abounds in fish. Its total length is 121 miles. 2. The Lausitz or Görlitz Neisse rises near Reichenberg in Bohemia, on the south side of the Riesengebirge, at an altitude of 1130 feet, flows north past Reichenberg, Görlitz, Forst, and Guben, and enters the Oder above Fürstenberg (altitude, 105 feet). Its length is 140 miles, of which less than 10 miles are navigable.

Neisse, a town of Prussia, province of Silesia, 32 miles by rail south-west of Oppeln, on the Neisse. It has a (Renaissance) exchequer (1604; restored in 1890), with frescoes and sculptures on the façade; also a fountain (1686), a museum of antiquities, a military school, an industrial school, a sanatorium (St Rochus); and in the quarter of Friedrichstadt monuments to the poet Eichendorff (who died here in 1857), to the war of 1866, and the war of 1870–71. Population (1885), 21,837; (1900), 24,271.

Nellore, a town and district of India, in the Madras presidency. The town is on the right bank of the Penner river; a station on the East Coast Railway, 109 miles north of Madras city. Population (1881), 27,505; (1891), 29,336; municipal income (1897–98), Rs.44,300. There are United Free Church, American Baptist, and Catholic missions; two high schools, with 558 pupils in 1896–97; five printing-presses, issuing three vernacular periodicals, and four reading-rooms and literary associations.

The district of NELLORE has an area of 8765 square miles; population (1881), 1,220,236; (1891), 1,463,736; (1901), 1,497,796, showing an increase of 20 per cent. after the famine of 1876–77, and of 2·3 per cent. between 1891 and 1901; average density, 171 persons per square mile. The land revenue and rates in 1897–98 were Rs.30,80,873, the incidence of assessment being R.1 : 12 : 5 per acre; cultivated area, 1,094,682 acres, of which 301,932 were irrigated, including 130,762 from Government canals; number of police, 1212; boys at school (1896–97), 24,874, being 22·5 per cent. of the male population of school-going age; registered death-rate (1897), 19·5 per thousand. The principal crops are millet, rice, other food grains, indigo, and oil-seeds. The breed of cattle is celebrated. There are altogether 1223 indigo vats, employing 17,450 hands, with an out-turn valued at Rs.7,65,000 a year; and 32 saltpetre refineries. There are two important irrigation works, the Penner and Sangam systems. On the former the capital expenditure has been Rs.18,99,000. In 1897–98 the irrigated area was 70,464 acres, yielding a profit of 4 per cent. On the latter (not quite finished) the capital outlay has been Rs.38,56,000. In 1897–98 the irrigated area was 76,217 acres, yielding a surplus of Rs.16,234. The East Coast Railway, running through the length of the district, was opened throughout for traffic in 1899. The section of line from Nellore city to Gudur (24 miles), formerly on the metre gauge of the South Indian Railway, has been converted to the standard gauge. Previously the chief means of communication with Madras was by the Buckingham canal. The sea-borne trade is insignificant.

Nelson, a municipal borough (1890) in the Clitheroe parliamentary division of Lancashire, England, 3 miles north of Burnley by rail. Cotton is manufactured. There are a free library, with a largely attended technical school in the same building, and a handsome market hall. Recreation grounds have been opened. Population (1881), 10,381; (1891), 22,754; (1901), 32,816.

Nelson, chief town of the silver-mining localities of West Kootenay, British Columbia. It was one of the earliest mining "camps" in Kootenay, but was incorporated only in 1897. It is situated on the south shore of a branch of Kootenay Lake, and has rail connexion with Rossland, Robson, the terminus of the Arrow Lake steamers, and with the railways of Washington state. It has banks, churches, and schools, as well as large smelting plant for ores. Population, about 6000.

Nelson, a river of Keewatin, Canada, discharging the waters of Lake Winnipeg into Hudson Bay. It drains an area of 360,000 square miles, and, including its great tributary the Saskatchewan, is 1450 miles long. It is unnavigable except for canoes, and has a total fall between the lake and sea of 710 feet. The Saskatchewan rises in the Rocky Mountains in 52° 07′ N. and 117° 06′ W., and flows in a general easterly direction to Lake Winnipeg. It has many large tributaries, including the Clearwater, Brazeau, Battle, Carrot, and the South Saskatchewan, with its affluents, Red Deer, Bow and Belly rivers, and is navigable for shallow-draught steamers from Edmonton to the Grand Rapids at its *débouchement* into Lake Winnipeg, a distance of 820 miles. Other considerable streams discharging into Lake Winnipeg are Berens, Poplar, Winnipeg, Red, with its western branch, the Assiniboine and Dauphin rivers.

Nelsonville, a village of Athens county, Ohio, U.S.A., on the Hocking Valley Railway, in the south-east part of the state. It is in a coal-mining region, and is largely engaged in shipping coal. Population (1890), 4558; (1900), 5421, of whom 328 were foreign-born and 204 negroes.

Nematoda.—Since the date (1884) of the article in the earlier volumes (ninth edition) of this Encyclopædia innumerable details have been added to our knowledge of the minute anatomy and life-history of the Nematoda, but the present article will be mainly confined to the more important additions to our knowledge of the pathological and economic thread-worms. A word or two, however, must be said about certain organs recently brought into prominence—the so-called phagocytic organs. These consist of enormous cells with nuclei so large as to be in some cases just visible to the naked eye. These cells are disposed in pairs, though the members of each pair are not always at the same level. The number of cells is not large (some 2 to 8), and as a rule they lie along the lateral lines. In some species (*Ascaris decipiens*) the giant cell is replaced by an irregular mass of protoplasm containing a number of small nuclei. Such a plasmodium bears, on its periphery, groups of rounded projections of protoplasm termed end-organs. Similarly the giant cells are produced at their periphery into a number of branching processes which bear similar end-organs on their surface and in some cases terminate in them. These end-organs are the active agents in taking up foreign granules, or bacteria, which may have found their way into the fluid of the body-cavity. From the shape and position of the phagocytic organs it is obvious that they form admirable strainers through which the fluid of the body-cavity filters (Figs. 1, 2). (See N. Nassonov, *Arch. Mikr. Anat.*, 1900; *Arch. parasit.*, 1898. Rabot, *Lab. Warsaw*, 1898; *Zool. Anz.*, 1898. L. Jägerskiold, *Centrbl. Bakter.*, 1898. J. Spengel, *Zool. Anz.*, 1897. H. Ehlers, *Arch. Naturg.*, 1899. O. Hamann, *Die Nemathelminthen*, 1895.)

Agriculturists are paying increased attention to the nematodes that destroy their crops. A good example of a fairly typical case is afforded by *Heterodera schachtii*, which attacks the beetroot and causes great loss to the Continental sugar manufacturers. The young larvæ, nourished by the yolk which remains over from the egg and by the remains of the mother which they have taken into their alimentary canal, make their way through the earth, and ultimately coming across the root of a beet, begin to bore into it. This they do by means of a spine which can be protruded from the mouth. Once within the root, they absorb the cell sap of the parenchyma and begin to swell until their body projects from the surface of the root in the form of a tubercle (Fig. 3). The reproductive organs do not begin to appear until the larva has twice cast its skin. After this a marked sexual dimorphism sets in. The female, hitherto indistinguishable from the male, continues to swell until she attains the outlines of a lemon. Doing this she bursts the epidermis of the rootlet, and her body projects into the surrounding earth. The male has a different life-history (Fig. 4). After the second larval moult, he passes through a passive stage comparable to the pupa-stadium of an insect, and during this stage, which occurs inside the root, the reproductive organs are perfected. The male next casts his cuticle, and by means of his spine bores through the tissues of the root and escapes into the earth. Here he seeks a female, pairs, and soon afterwards dies. The eggs of the female give rise to embryos within the body of the mother; her other organs undergo a retrogressive change and serve as food for the young, until the body-wall only of the mother remains as a brown capsule. From this the young escape and make their way through the earth to new roots. The whole life-history extends over a period of some 4–5 weeks (Fig. 4), so that some 6–7 generations are born during the warmer months. The number of descendants which arise from a single pair during one summer are enormous. If we assume that each female produces 300 embryos, and that half of these are females, the number of descendants would be, after six generations, some 22,781 milliards (A. Strubell, *Bibl. Zool.*, 1888–89). Other species which have been recorded in the United Kingdom are *Tylenchus devastatrix* (Kuhn), on oats, rye, and clover roots; *T. tritici*, causing the ear-cockle of wheat; *Cephalobus rigidus* (Schn.),

B. *a*, larvæ boring their way into a root; *b*, larva of the immobile kind surrounded by the old skin, living as an ectoparasite on the outside of the root. (*From Strubell.*)

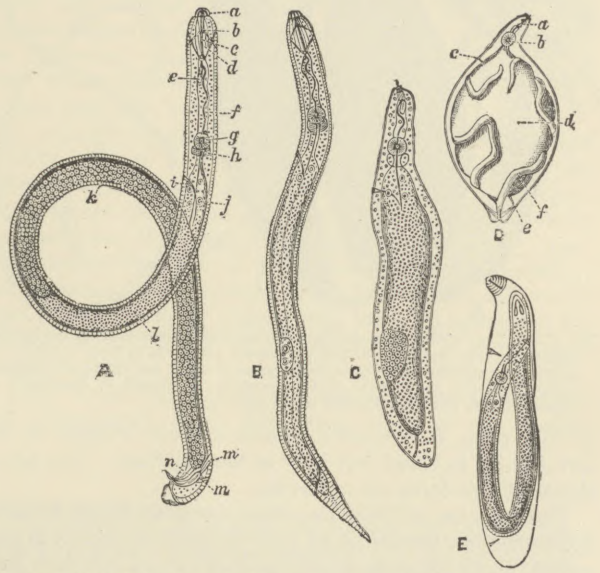

Fig. 4.—A, Male *Heterodera schachtii*, greatly magnified: *a*, head lappets; *b*, mouth cavity; *c*, spine; *d*, muscle of spine; *e*, gland; *f*, œsophagus; *g*, bulb; *h*, nerve-ring; *i*, excretory pore; *j*, œsophagus; *k*, testis; *l*, intestine; *m*, muscles moving spicule; *n*, spicule. B, First motile larva. C, Second immovable parasitic larva casting its skin. D, A female with one half of the body-wall taken away to show the coiling generative organs: *a*, boring apparatus; *b*, œsophageal bulb; *c*, excretory pore; *d*, alimentary canal; *e*, anus; *f*, ovary. E, A male shortly before casting its larval skin.

on oats; *Heterodera radicicola* (Greef) Mull, on the roots of tomatoes, cucumbers, potatoes, turnips, peach-trees, vines, and lettuce and many other plants.

Among recent advances having medical import in our knowledge of the Nematodes, the chief are those dealing with the parasites of the blood. *Filaria sanguinis hominis nocturna* (*F. bancrofti*) is known to live in the lymphatic glands, and its embryos, passing by the thoracic duct, reach the blood-vessels and circulate in the blood. Manson showed, in 1881, that the larvæ were not at all times present in the blood, but that their appearance had a certain periodicity, and that the larvæ of *F. sanguinis hominis nocturna* swarmed in the blood at night-time and disappeared from the circulation during the day. Ten years later Manson discovered a second species whose larvæ live in the blood. They, however, show no periodicity, and are found continuously both by day and by night; hence they are termed *F. sanguinis hominis perstans* (*F. perstans*). The adult stages are thought to be certain Nematodes found in the sub-peritoneal connective tissue.

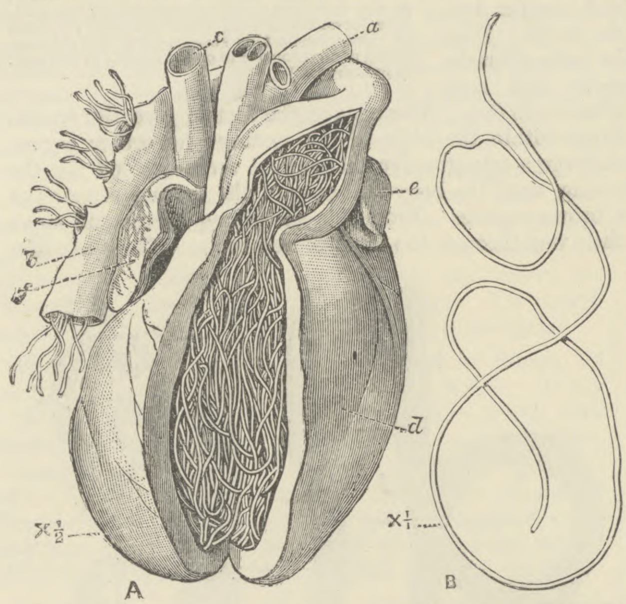

Fig. 5.—A, View of the heart of a dog infested with *Filaria immitis* Leidy; the right ventricle and base of the pulmonary artery have been opened: *a*, aorta; *b*, pulmonary artery; *c*, vena cava; *d*, right ventricle; *e*, appendix of left auricle; *f*, appendix of right auricle. B, Female *F. immitis*, × 1, removed from the heart to show its length.

A third form, *F. sanguinis hominis diurna*, is found in the larval stage in blood, but only in the day-time. The adult stages of this form are unknown.

The presence of these parasites seems at times to have little effect on the host, and men in whose system it is calculated there are some 40–50 million larvæ have shown no signs of disease. In other cases very serious disorders of the lymphatic system are brought about, of which the most marked is perhaps Elephantiasis. Manson and Bancroft suggested that the second host of the parasite is the mosquito or gnat, and for a long time it was thought that they were conveyed to man by the mosquito dying after laying her eggs in water, the larval nematodes escaping from her body and being swallowed by man. It is now held that the parasite enters the blood of man through the piercing mouth-parts at the time of biting. When first sucked up by the insect from an infected man it passes into its stomach, and thence makes its way into the thoracic muscles, and there for some time it grows. Next the larvæ make their way into the connective tissue in the pro-thorax, and ultimately bore a channel into the base of the piercing apparatus and come to rest between the hypopharynx and the labium. Usually two are found in this position lying side by side; it would be interesting to know if these are male and female. From their position in the proboscis the larvæ can easily enter the blood of man the next time the mosquito bites. (Low, *Brit. Med. Journ.*, June 1900; James, *ibid.*, Sept. 1900.) Shortly after Low had published his results, Grassi and Noè issued a paper dealing with the larvæ of *F. immitis*, which is spread by means of the mosquito *Anopheles* (*Centrbl. Bakter.* I. Abth. xxviii., 1900). The larvæ of this parasite develop in the Malpighian tubules of the insect; at a certain stage they cast their cuticle and make their way into the space—part of the hæmocœl—found in the labium. During the act of biting the labium is bent back, and as the piercing stylets enter the skin of the sufferer this bending becomes more and more acute. Grassi and Noè think that if the cavity of the labium be full of the larval nematodes this bending will burst the tissue, and through the rent the larvæ will escape and make their way into the body of the host. Besides *Anopheles*, two species of *Culex*, *C. penicillaris* and *C. pipiens*, are also accused of transmitting the larvæ. A paper by Noè (*Atti Acc. Lincei*, ix., 1900) seems to prove beyond doubt that the larvæ of *F. immitis* are transmitted in the manner indicated. The adult worm is chiefly found in the heart of the dog, and usually in the right side, which may be so packed with the worms as seriously to interfere with the circulation (Fig. 5). The females produce thousands of larvæ, which circulate in the blood, and show a certain periodicity in their appearance, being much more numerous in the blood at night than during the day. (A. E. S.)

Nemertina.—Since the publication of Hubrecht's article on Nemertines in the earlier volumes of this Encyclopædia (ninth edition), the most important event in the history of our knowledge of the group has been the appearance of Bürger's magnificent monograph.[1] As a result of his revision, the author has drawn up a new classification, given below, has added much to our knowledge of the minute histology, and has cleared up many obscure points. There is little to correct in Hubrecht's article, but something to add. In particular, the structure of the excretory system has been elucidated by Bürger, and many naturalists have contributed to our knowledge of the habits and distribution of Nemertines, and many new genera and species have been described.

The curious neuro-glandular pits (Fig. 1), absent in the Mesonemertine and one or two aberrant species, have been shown to possess large glandular cells at their base which secrete a mucus. The development of these organs, which in the Protonemertine are but grooves in the epidermis, not far removed from the similar cephalic slits of many Turbellaria, reaches its height in *Drepanophorus*. Here the pits split into two, one part ending in a sac lined with sensory epithelium, and embedded in nervous tissue, the other projecting backwards as a long, glandular, blind canal. The exit of these organs takes many shapes, of value in systematic work. Their function is still little understood. Two lateral, shallow pits occur on the side of the body about the level of the hinder end of the proboscis in some species of the genus *Carinella*, which are termed side-organs. These are capable of being everted, and are probably sensory in function (Fig. 3, 17).

The vascular system is entirely closed, and its main vessels were described and figured in Hubrecht's article. It contains a colourless fluid, with flat, oval, nucleated corpuscles, as a rule colourless, but in some cases tinged with yellow or red hæmoglobin. Its presence is one of the most distinctive features which separate the Nemertines

[1] "Die Nemertinen," *Fauna und Flora des Golfes von Neapel*, Bd. xix., 1895.

from the Platyhelminthes. In origin the vascular system is due to a fusion of spaces which arise in the mesoblast of the larva. The blood is probably circulated by the general contraction of the whole animal, since it is very doubtful if there are any intrinsic muscles in the vessel-walls. Its function is less that of respiration than of conveying the digested food-products all over the body and the excretory products to the nephridia, and doubtless it serves at times to assist in the extension and retraction of parts of the body. The vessels in the more highly-developed genera seem to be partly lacunæ and partly true vessels with definite walls.

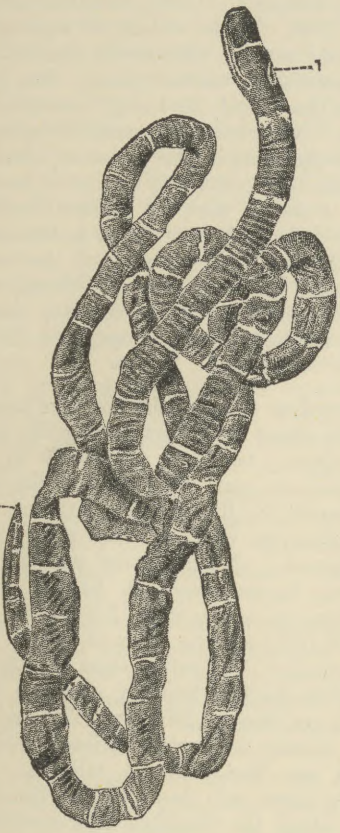

Fig. 1.—*Lineus geniculatus.* × ⅔. (*From Bürger.*) 1, Lateral slits on head; 2, anus.

Closely associated with the lateral blood-vessels are the single pair of nephridia. Each consists of a more or less coiled, ciliated, longitudinal canal, which on its external surface gives origin to one or more transverse canals, which pass to the exterior and open a little way behind the mouth on the sides of the body. On its inner surface the longitudinal canal is adpressed to the lateral blood-vessel, and gives off a number of small, blind cæca or tags, each of which ends in a small clump of cells. These tags indent the blood-vessel. From their inner ends, projecting into the lumen of the tag, hangs a bunch of cilia, which forms the flickering "flame" so well known in the excretory apparatus of the Platyhelminthes and larval Annelids (Fig. 2). There is no communication between the nephridia of one side and the other, but in *Eupolia* there are ducts opening into the alimentary canal as well as to the exterior, a condition of things which recalls what obtains in certain Oligochætes. As a rule these organs only extend a short way along the anterior end of the body, a concentration which we may associate with the development of a vascular system to bring the products of excretion to a fixed spot. In *Stichostemma*, however, Montgomery[1] has described a series of nephridia lying all along the body, and each with a varying number of external pores. The excretory system is epiblastic in its origin.

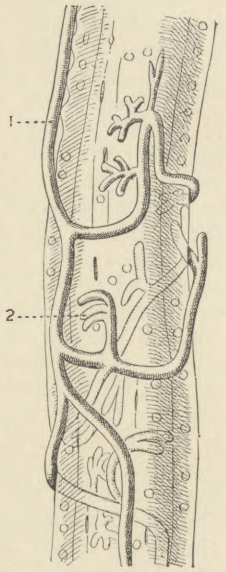

Fig. 2.—Part of the excretory system lying on the lateral vessel of *Drepanophorus spectabilis.* (Magnified about 750.) 1, The longitudinal excretory canal; 2, one of the tags containing the flame-cells.

In the Metanemertini there is a curious diverticulum of the intestine which stretches forward in the median line, ventral to the so-called stomach. It is at times sacculated, but its chief interest is that, as Lebedinsky[2] has shown, the tip of the cæcum in embryonic life opens to the exterior as the blastopore. This subsequently closes up, and the newly-formed œsophagus and stomach open in the intestine above and behind it. It is a curious feature in Nemertines that the alimentary canal seldom contains traces of food, and yet as a class they are voracious. The food must be digested, absorbed, and excreted with great rapidity. There is some evidence that in this group the ectoderm of the œsophagus is chiefly concerned with digestion, whereas the endoderm of the intestine is limited to the absorption of the soluble products.

The armed character of the proboscis of the Metanemertini is dwelt upon by Hubrecht. The median calcareous stylet is supported by usually two, but in *Amphiporus* by as many as twelve lateral stylets secreted in sacs, which Bürger regards as the vacuoles of certain enormous cells. In many forms the epidermis of the proboscis is provided with nematocysts, which differ from those of the Cœlenterata only in that they are found several in one cell. Others secrete rhabdites, recalling similar structures in the Turbellaria. The cavity into which the proboscis is retracted, the rhynchocœlum, is formed by a split which appears in the mesoblast surrounding the epiblastic pit, which is the forerunner of the proboscis. It does not seem to be cœlomic in origin or relations (Fig. 3).

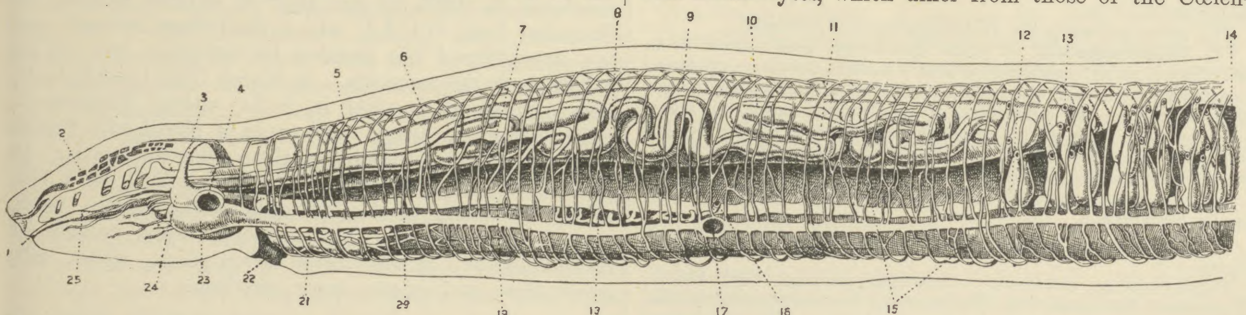

Fig. 3.—Anterior end of a *Carinella*, partly diagrammatic. Magnified. (*From Bürger.*) 1, Opening of proboscis; 2, cephalic glands running to frontal organ; 3, dorsal commissure of brain; 4, cerebral organ; 5, upper dorsal nerve; 6, under dorsal nerve; 7, rhynchocœlic blood-vessel; 8, fore-gut; 9, rhynchocœl; 10, nerve to proboscis; 11, proboscis; 12, genital sac; 13, genital pore; 14, mid-gut; 15, circular nerves; 16, pore of excretory system; 17, lateral organ; 18, excretory canal; 19, lateral vessel; 20, lateral nerve; 21, œsophageal nerve; 22, mouth; 23, ventral ganglion of brain; 24, dorsal ganglion of brain; 25, rhynchodæum.

The reproductive system is of the simplest, strongly contrasting with the complicated arrangements in the Platyhelminthes. A series of sacs lined with an epithelium, the proliferation of which gives rise to the ova or spermatozoa, alternate between the cæca of the intestine.

[1] *Zool. Jahrb. Anat.* x., 1897, p. 265.
[2] *Arch. Mikr. Anat.* xlix., 1897, p. 503.

When mature, each sac pushes out a process to the exterior, and this forms the genital duct. The line of the genital openings is usually dorsal to the lateral nerve. The whole sac, with its epithelial wall and its contained genital cells, arises ultimately from some of the parenchymatous cells of the body. The walls and contents in some forms arise simultaneously; in others the walls are first formed, and their lining then proliferates. It has been pointed out that the cavity of the sacs corresponds in many particulars with the cœlom of higher animals, and in Lebedinsky's observations on the development there is some support to the view that a cœlom exists. Montgomery has also described certain spaces which may be cœlomic lying between the alimentary canal and the inner longitudinal layer of muscles in the Heteronemertini.

The position of the Nemertines in the animal kingdom is now looked upon as more isolated than was formerly thought, and recent writers have been inclined to treat them as a separate phylum. Whether this view be adopted or not, and whether the Turbellaria be regarded as nearly related or only remotely connected, there can be little doubt that the Nemertines resemble the Turbellaria more nearly than they do any other group of animals. Bürger even goes so far as to homologize the proboscis with the Turbellarian pharynx, and he sums up their relationship to the Annelids by the statement that to a certain extent the Nemertines represent Turbellaria, which in the course of time have copied certain features of an Annelid character. The possible relationship to the ancestral forms which must have preceded the Chordata put forward by Hubrecht[1] has met with little recent support, and is not accepted by some of the later writers on the subject.

Bürger classifies Nemertines into four Orders:—

I. **Protonemertini**, in which there are two layers of dermal muscles, external circular and internal longitudinal; the nervous system lies external to the circular muscles; the mouth lies behind the level of the brain; the proboscis has no stylet; there is no cæcum to the intestine. Families, CARINELLIDÆ, HUBRECHTIIDÆ.

II. **Mesonemertini**, in which the nervous system has passed into the dermal muscles, and lies amongst them; other characters as in Protonemertini. Family, CEPHALOTHRICIDÆ.

III. **Metanemertini**, in which the nervous system lies inside the dermal muscles in the parenchyma; the mouth lies in front of the level of the brain; the proboscis as a rule bears stylets; the intestine nearly always has a cæcum. Families, EUNEMERTIDÆ, OTOTYPHLONEMERTIDÆ, PROSORHOCHMIDÆ, AMPHIPORIDÆ, TETRASTEMMATIDÆ, NECTONEMERTIDÆ, PELAGONEMERTIDÆ, MALACOBDELLIDÆ.

This order represents the Hoplonemertini of Hubrecht.

IV. **Heteronemertini**, in which the dermal musculature is in three layers, an external longitudinal, a middle circular, an internal longitudinal; the nervous system lies between the first and second of these layers; the outer layer of longitudinal muscles is a new development; there is no intestinal cæcum; no stylets on the proboscis, and the mouth is behind the level of the brain. Families, EUPOLIIDÆ, LINEIDÆ.

This order represents the Schizonemertini of Hubrecht and the family Eupolidæ.

The following families and genera are represented on the British coasts:—[2]

CARINELLIDÆ, *Carinella*; CEPHALOTHRICIDÆ, *Cephalothrix*, *Carinoma*; EUNEMERTIDÆ, *Eunemertes*; OTOTYPHLONEMERTIDÆ, *Ototyphlonemertes*; AMPHIPORIDÆ, *Amphiporus*, *Drepanophorus*; TETRASTEMMIDÆ, *Tetrastemma*, *Prosorochmus*; MALACOBDELLIDÆ, *Malacobdella*; EUPOLIIDÆ, *Eupolia*, *Valencinia*, *Oxypolia*; LINEIDÆ, *Lineus*, *Euborlasia*, *Micrura*, *Cerebratulus*, *Micrella*.

Nemours, town, arrondissement of Fontainebleau, department of Seine-et-Marne, France, 18 miles in direct line south of Melun, on the railway from Paris to Lyons, and the Loing canal. The church, of which the older parts date from the 13th century, has a handsome wooden spire, and there is a castle of the 13th century. A statue of the mathematician Bézout (d. 1783), a native of the town, was erected in 1885. In the vicinity is a group of fine sandstone rocks, and sand is extensively quarried for the supply of glass factories at various places. The total traffic of the port on the Canal de Loing amounted in 1900 to 174,561 tons. Nemours is supposed to derive its name from the woods (*nemora*) in the midst of which it formerly stood. In the 10th century it was an important lordship, in the 13th it passed into the possession of the kings of Navarre, and in 1425 it was united to the crown of France. From 1528 to 1659 it belonged to the counts of Savoy; it then passed to the house of Orléans, to a branch of which it still gives titular dignity, though possession was lost at the Revolution. Population (1881), 4156; (1901), 4861.

Nepal, an independent state on the northern frontier of India, extending for about 500 miles among the lower ranges of the Himalaya; bounded westwards by the British district of Kumaon, and eastwards by the state of Sikkim. The capital is Khatmandu, situated in a valley of the same name, on the Baghmati river, about 4000 feet above the sea. No accurate statistics are available. The area is estimated at 54,000 square miles; the population at more than 2,000,000; the revenue at Rs.1,50,00,000; and the army at 50,000 men, in a fair state of efficiency. The ruling class of Gurkhas or Gurkhalis, to which the raja belongs, claim to be of Rajput descent, and are devout Hindus. The majority of the inhabitants belong to various tribes of Indo-Chinese origin, and are Buddhists in religion. The present ruling family dates only from 1768. Since the war of 1814–16, in which the Gurkhas after a stubborn resistance were driven from the conquests they had made in the plains of India and the adjoining hill states, the relations of Nepal with the British have been friendly. A Resident is stationed at Khatmandu, but no interference is exercised with the internal administration. The present maharaja, Prithir Bir Bikram, was born in 1875, and succeeded in 1881. But by custom of old standing, he is a *roi fainéant*, all power being vested in the minister. For many years the minister was Jang Bahadur, G.C.B., who established his position by murdering his rivals in 1846, and died in 1877. His son and successor was in his turn murdered in 1885 by the head of a rival faction, Bir Shamsher Jang, G.C.S.I., who is the present minister, and has strengthened his position by marrying two of his daughters to the maharaja. In March 1892 Lord Roberts, then commander-in-chief in India, visited Khatmandu, and reviewed the army. The trade of Nepal with British India is registered at several stations along the frontier. In 1900–01 the total exports were valued at Rs.1,84,78,548, chiefly consisting of rice, oil-seeds, cattle, tobacco, hides, ghee, and timber. The imports were valued at Rs.1,62,26,456, chiefly cotton piece-goods, silver, salt, spices, brass and copper, sugar, and iron.

Nervi, a town and winter resort of the province of Genoa, Liguria, Italy, on the coast, 6 miles east-south-east of Genoa, on the railway to Spezia. It is frequented because of its mild climate and sheltered situation. It produces lemons, oranges, figs, &c., and manufactures macaroni. There is a small harbour. Population, about 3000.

Nesfield, William Eden, British architect, (1835–1888), one of the leaders of the Gothic revival, was born 2nd April 1835. His father, Major Nesfield, a well-known landscape gardener in his day, laid out Regent's Park and St James's Park, and remodelled Kew. Educated at Eton, Nesfield was articled first to Mr Burn, a classicist, and then to his uncle, Mr Anthony Salvin, who took the Gothic side in the "battle of the styles," and had an enthusiastic adherent in his nephew. Having had some practical training, Nesfield travelled for study in France, Italy, and Greece, afterwards publishing a volume, *Sketches from France and Italy* (London, 1862), which by its striking and accurate delineation became one of the text-books of the Gothic revival. In 1859 Nesfield settled down in London. His first important commission was a new wing to Combe Abbey for Lord Craven. In 1862 began a nominal partnership with Norman Shaw, the artistic fruits of which have sometimes been exaggerated; they shared rooms in Argyle Street for some years, but never collaborated in any design. It was in Argyle Street that the principal work of Nesfield's life was conceived—Combe Abbey, Cloverly Hall, and Kinmel Park. Here he showed a mastery of planning and construction, a conscientious regard for detail, an eye for the picturesque, an unfailing regard for quiet dignity, a refusal to strain after effects, which together make his achievements landmarks in the history of his art. His cottages and lodges are more especially characteristic. He built the lodge in Regent's Park (1864) and that in Kew Gardens (1866). Combe Abbey and Cloverly are somewhat "early French" in style, but as Nesfield developed he adopted a purely English manner, and presented his newer ideas in Loughton Hall and Kinmel Park. The gate lodge at Kinmel Park, Abergele, is entirely "English Renaissance"; Cloverly Hall (1864), planned when he was twenty-nine, with its great hall, fine approaches to the staircase, and the staircase itself, is already half English, and Eastlake in his *History of Gothic Revival* praises it on that very ground. "The whole nature of the design, refined and skilful as it is, may be described as the reverse of pretentious. Its graces are of a most unobtrusive kind. The work is homely rather than grandiose, and though it bears evidence of well-directed study, it certainly derives its chief charm from its unmistakably national character." To this period, or a little later, belong some notable farm buildings at Shipley Hall near Derby, and at Croxteth Park near Liverpool. The full development of the revived classic taste in Nesfield came with his addition to Kinmel Park—red brick, stone dressings, grey-green slated roofs—which elevated that originally unpretentious 18th-century building into a small Renaissance palace. The interior is rich in panelling, in plaster work, and in chimney-pieces, the hall fireplace being especially notable. For contrast in style, harmonious as they are in artistic expression, Cloverly and Kinmel are the typical examples of the artist's style. Other works are Farnham Royal House near Slough, Lea Wood, Loughton Hall, and Westcombe Park. His more notable urban works are the bank at Saffron Walden (1873), and the Rose and Crown Hotel; they stand next door to each other and exhibit another contrast, the former being mediæval and the latter what is called "Queen Anne." Though he built no new important church, Nesfield rebuilt the Early Decorated St Mary's, Farnham Royal, near Slough, mainly on the old lines. He restored King's Walden church, Herts (1868), and Radwinter church, Essex, the latter also an enlargement (1871), and Cora church near Whitchurch, Salop. The Grammar School at Newport, Essex, is his, as also is the Boys' School, Romsey, Hants; but no great public building came from him. Nesfield's career was a comparatively short one. He had retired from practice some years before his death at Brighton in 1888. He left behind him a valuable series of sketches and measured drawings, most of which are now in the Library of the Royal Institute of British Architects. (J. M. BY.)

Nestorians.—The Nestorians or East Syrians (*Surayi*) of Turkey and Persia inhabit a district bounded by Lake Urmia, or Urumia, on the east, stretching westwards into Kurdistan, to Mosul on the south, and nearly as far as Van on the north. They are divided into the Persian Nestorians of the plain of Azerbaijan, and the Turkish Nestorians, inhabiting chiefly the sanjak of Hakkiari in the vilayet of Van, who are subdivided into the *Rayat* or subject, and the *Ashiret* or tribal, the latter being semi-independent in their mountain fastnesses. Forming at once a church and a nation, they own allegiance to their hereditary patriarch, Mar Shimun, Catholicos of the East, who resides at Qudshanis, a village about 7000 feet above the sea-level, near the Kurdish town of Julamerk. They are the representatives of the "Church of the East," planted by St Adai, according to tradition one of the Seventy (St Luke x. 1), and St Mari, his disciple, and until the Council of Ephesus (431) in connexion with the patriarchate of Antioch. Separated from the unity of the Catholic Church, the Church of the East assumed large proportions outside the Eastern Empire, and by the 12th century had spread over the whole of Central Asia. Finally ruined by Tamerlane, it shrank to its present dimensions, and in 1552 a disputed succession to the patriarchate caused an internal schism. One-third of the whole body, inhabiting the plain of Mosul, seceded, and with the anti-patriarch, since called the *Patriarch of Babylon*, submitted to Rome in 1778. These "Uniat-Chaldeans" retain their Syriac services and rites in a somewhat modified form. It is only of late years, under the influence of the different missions, that education, ruined by centuries of persecution, has revived amongst the Nestorians; and even now the mountaineers, cut off from the outer world, are as a rule destitute of learning, and greatly resemble their neighbours, the wild and uncivilized Kurds. They are, however, extraordinarily tenacious of their ancient customs, and, almost totally isolated from the rest of Christendom since the 5th century, they afford an interesting study to the ecclesiastical student. Their churches are rude buildings, dimly lighted and destitute of pictures or images, save that of the Cross, which is treated with the deepest veneration. The *qanki*, or sanctuary, is divided from the nave by a solid wall, pierced by a single doorway; it contains the altar, or *madhb'kha* (literally, *the sacrificing place*), and may be entered only by persons in holy orders who are fasting. Here is celebrated the Eucharist (*Qurbana*, or the *offering*; cf. "Corban"), by the priest (*qasha*), attended by his deacon (*shamasha*). Vestments are worn only at the ministration of the sacraments; incense is used invariably at the Eucharist, and frequently at other services. There are three liturgies—of the Holy Apostles, of Theodore, and of Nestorius. The first is quite free from Nestorian taint, dates from some remote period, perhaps prior to 431, and is certainly the most ancient of those now in use in Christendom; the other two, though early, are undoubtedly of later date. The Nestorian canon of Scripture seems never to have been fully determined, nor is the sacramental system rigidly defined. Nestorian writers, however, generally reckon the mysteries as seven, *i.e.*, Priesthood, Oil of Unction, the Offering of the Body and Blood of Christ, Absolution, the Holy Leaven, the Signation of the life-giving Cross. The "Holy Leaven" is reputed to be a part of the original bread of the first Eucharist, brought by Adai and Mari and maintained ever since in the Church; it is used in the confection of the Eucharistic wafers, which are rather thicker than those used in the Western Church. Communion is given in both kinds, as throughout the East; likewise, confirmation is administered directly after baptism. Sacramental confession is enjoined, but has recently become obsolete; prayers for the departed and invocation of saints form part of the services. The primitive restriction on the marriage of priests and deacons was removed by a synod of Seleucia in 499; the bishops, however, are always celibates, and are chosen from episcopal families. The service-books were wholly in MS. until the press of the archbishop of Canterbury's mission at Urmia issued the *Takhsa* (containing the liturgies, baptismal office, &c.) and several other liturgical texts.

The Nestorian Heresy.—The Nestorians commemorate Nestorius as a saint, and invoke the aid of the heresiarch and his companions. They reject the Third Œcumenical Council, and though showing the greatest devotion to the Blessed Virgin, deny her the title of *Theotokos*, *i.e.*, the mother or bearer of God. The heresy of Nestorius consisted, not in *denying* either the divinity or the humanity of Christ, but in so *dividing* the natures as to destroy His "ego" or identity. In other words, Nestorius would not confess a personal union of the Godhead and the Manhood, but only an association between the Eternal Word and the Man born of Mary. He rightly shrank from making the Godhead to originate in Mary, or to be passable on the Cross; but he went farther, and denied that the divine person of Christ could be born or could suffer, *secundum humanitatem;* it was a mere man and not "the everlasting Son of the Father" who did "not abhor the Virgin's womb"; it was but one of the sons of Adam, energized by God the Word, who "overcame the sharpness of death." Nestorius being condemned at the Council of Ephesus in 431, the Church of the East threw in her lot with the excommunicated patriarch. The question remains, How far do the modern Nestorians embrace the teaching of Nestorius? That they are in *formal* heresy there can be, from the foregoing, no doubt, and it would be rash to state, with some writers, that they are free from *actual* heresy. Their theological teaching is misty and perplexing; their earliest writings contain no error, and the hymns of their great St Ephrem, still sung in their services, are positively antagonistic to Nestorianism; their theology dating from the schism is not so satisfactory. They attribute two *Kiani*, two *Qnumi*, and one *Parsopa* in Christ. *Kiani* appears to answer to *Nature*, but the difference between *Qnuma* and *Parsopa*, both apparently meaning *Person*, is not clear to Western scholars. Those who wish to follow this intricate subject may consult Assemanni, a learned but somewhat prejudiced writer, *Bibl. Orient. de Syris Nestorianis*, and various dissertations in the *Quarterly Papers* of the archbishop of Canterbury's Assyrian mission (S.P.C.K.). To say that the modern Nestorians are not definitely and firmly orthodox is perhaps fairer than to charge them with being distinctly heretical.

Missions amongst the Nestorians.—The peculiar circumstances, both ecclesiastical and temporal, of the Nestorians have attracted much attention in Western Christendom, and various missionary enterprises amongst them have resulted.

1. *The Roman Catholic Missions.*—In Turkey these consist of the Dominican mission, established at Mosul during the 18th century, and in Persia of the French Lazarist mission, which sprang out of some schools established by a French layman and scientific traveller, M. Eugène Boré, in 1838. At M. Boré's entreaty the Propaganda sent the first Lazarist father to Persia in 1840. The chief stations of the Lazarists are at Khosrova and Urmia. At the latter place there is an orphanage under the superintendence of the Sisters of St Vincent de Paul. The work of these missions is to extend and consolidate that Catholicized and partly Latinized offshoot of the Nestorians known as the *Uniat-Chaldean Church* (see *ante*).

2. The *American Presbyterian Mission*, established in Persia in 1834–35 by the Rev. Justin Perkins and Dr Grant, comprises large buildings near Urmia, a college, and a hospital. The influence of this mission does not extend much beyond the Turkish frontier, but it is strong in the Persian plains. The original aim was to influence the old Nestorian Church rather than to set up a new religious body, but the wide difference between Presbyterians and an Oriental Church rendered the attempt abortive, and the result of the labours of the Americans has been the establishment since 1862 of a Syrian Protestant community in Persia, with some adherents in Turkey.

3. *The Archbishop of Canterbury's Mission to the Assyrian Christians.*—This Anglican mission was promoted by Archbishop Tait, and finally established by Archbishop Benson in 1886. Its aim is thus officially defined: "To aid an existing Church, . . . not to Anglicanize, . . . not to change any doctrines held by them which are not contrary to that faith which the Holy Spirit, speaking through the Œcumenical Councils of the Undivided Church of Christ, has taught us as necessary to be believed by all Christians, but . . . to strengthen an ancient Church, at the earnest request of the Catholicos, and with the knowledge and blessing of the Catholic patriarch of Antioch, one of the four patriarchs of the Holy Orthodox Eastern Church, and occupant of the Apostolic See from which the Church of the East revolted at the time of Nestorius." This mission has its headquarters at Urmia, with a college for candidates for holy orders and a printing-press. Two mission-priests reside in Turkey, one at Qudshanis with Mar Shimun, the Nestorian Catholicos and Patriarch. The Anglican Church in America co-operates with the mission.

4. *The Russian Mission.*—One of the Nestorian bishops joined the Russian Orthodox Church in 1898, and returned the same year with a small band of missionaries sent by the Holy Synod of Russia. This mission enrolled a very large number of adherents drawn from the old Church, the Protestant Nestorians, and the Uniat-Chaldeans, but it can hardly be said to have commenced any active work, although the Anglican mission withdrew from competition by closing its schools in the dioceses occupied by the Russians.

Netherlands. See HOLLAND.

Nettleship, Henry (1839–1893), English classical scholar, was born on 5th May 1839 at Kettering, being the eldest of a distinguished group of brothers. His career at Oxford was a brilliant one, and he had the good fortune to attract the notice of Conington, who invited his co-operation in his edition of Virgil. After Conington's death in 1869 Nettleship saw the whole work through the press. In 1861 he was elected fellow of Lincoln, and for seven years he held a lectureship there. After visiting Berlin, where he attended the lectures of Moritz Haupt, he went to Harrow as assistant master, his recent marriage having compelled him to resign his fellowship at Lincoln. In 1873 he returned to Oxford, and was elected to a fellowship at Corpus, and in 1878 he was appointed to the professorship of Latin formerly held by Conington. Nettleship had been from the first attracted to the study of Virgil, and a good deal of his time was devoted to his favourite poet. In 1875 he had undertaken to compile a new Latin lexicon for the Clarendon Press, but the work proved more than he could accomplish, and in 1887 he published some of the results of twelve years' labour in a volume entitled *Contributions to Latin Lexicography*, a genuine piece of original work. In conjunction with Dr Sandys, Nettleship revised and edited a new edition of Seyffert's *Dictionary of Classical Antiquities*, and he contributed to a volume entitled *Essays on the Endowment of Research* an article on "The Present Relation between Classical Research and Classical Education in England," in which he pointed out the great value of the professorial lecture in Germany, which gave the student the very latest results of the lecturer's studies. In his views on the research question he was a follower of Mark Pattison, whose essays he edited in 1889 for the Clarendon Press. In *Lectures and Essays on Subjects connected with Latin Literature and Scholarship*, Nettleship revised and republished some of his previous publications. Yet the best of his work was never published, for he reserved this for his lectures, in which he often dealt with some little-known subject, *e.g.*, the study of Latin grammar by the Romans themselves, or the literary criticism of antiquity. He had the rare gift of making each subject live in his exposition, and of inspiring his hearers with his own enthusiasm. He died at Oxford on 10th July 1893.

Nettleship, Richard Lewis (1846–1892), Oxford tutor and lecturer on philosophy, brother of the foregoing, was born 17th December 1846, and was educated at Uppingham under Thring, and subsequently at Balliol, of which college he was a scholar. He had a distinguished university career, winning the Hertford and the Ireland. Nor was he indifferent to athletics, rowing in his college Torpid and Eight. He became a fellow and tutor of his college, and remained in that position until his death on 25th August 1892 from an Alpine accident. His chief work was the editing and preparing for publication of Professor T. H. Green's writings, with a memoir of the author, his friend and master. He left an unfinished work on Plato, part of which was published after his death, together with his lectures on logic and some essays. The tendency of his thought is idealistic and Hegelian. His literary style was clear and agreeable; but though he had considerable influence, rather of a suggestive than of a positive character, on his generation at Oxford, a certain indecisiveness and nebulousness of view marred his actual teaching, and prevented his making any permanent mark in philosophy.

Netze, a river of Prussia, rising in Poland, south-east of Inowrazlaw. It pursues by winding loops a north-westerly direction as far as Nakel (latitude of Bromberg), where it becomes navigable, and where it is connected by the Bromberg canal (17 miles long) with the Vistula. Down to this point its fall, in a distance of 68 miles, has only been about 100 feet. At Nakel it turns westwards, and after a time west-south-westwards, and finally enters the Warthe a little above Landsberg. From Nakel to the confluence, a farther distance of 143 miles, the fall is again about 100 feet. Its lower valley is very fertile. The area of its basin is 5400 square miles.

Neu-Brandenburg, in Platt-Deutsch, Niegen-Bramborg, a town of Germany, in the grand-duchy of Mecklenburg-Strelitz, on the Tollen lake, 58 miles west by north of Stettin by rail. It possesses a bronze statue of Fritz Reuter (1893); monuments to Bismarck (1895) and the war of 1870–71 (1895); a small museum of antiquities and an art collection; and the grand-ducal country-seat of Belvedere. Population (1885), 9134; (1900), 10,560.

Neuchâtel, one of the Swiss cantons, and ranking last in the Confederation save Geneva. Its total area is 311·8 square miles. Of this, 220·9 square miles are reckoned as "productive," forests occupying 86·8 square miles, vineyards 4½ square miles, and arable and pasture land 129½ square miles. Of the "unproductive" 90·9 square miles, no less than 36½ square miles are covered by the waters of that part of the Lake of Neuchâtel that lies within the canton, and 4 square miles by those of the cantonal share of the Lake of Bienne. The asphalte mines in the Val de Travers belong to the state of Neuchâtel, but are worked by an English company. The lace industry is now extinct. Watchmaking is mainly carried on at La Chaux de Fonds and Le Locle. The population (mostly Protestant) of the canton in 1880 was 102,744, while in 1900 it was 126,600. In 1900 the rate of density was 406 inhabitants to each square mile. The Roman Catholics numbered 11,651 in 1880, and 17,778 in 1900; Jews 689 in 1880, and 1032 in 1900. The language of the canton is practically French, though in 1900 there were 17,638 (in 1880, 24,489) German-speaking and 3687 (in 1880, 1346) Italian-speaking persons.

The present cantonal constitution dates from 1858. The legislature is elected (in the proportion of one member per 1000 inhabitants, or fraction over 500), and holds office for three years, while by a law of 1891 the principles of proportional representation obtain in these elections. The five members of the executive are named by the legislature for three years. Three thousand citizens have the right since 1879 of "facultative referendum" as to all legislative projects, and since 1848 of "initiative" as to the revision of the cantonal constitution, and (since 1882) also as to all legislative projects. There are no fewer than three "established and state endowed churches"—the National Evangelical, Roman Catholic, and Old Catholic, while the pastors of the Free Evangelical and Jewish churches are so far recognized as such by the state that they are not required to fulfil their term of military service, like ordinary laymen. The canton is divided into six administrative districts. In 1897 the state revenue was 3,746,417 francs (a rise of over 59¾ per cent. since 1885), and the state expenditure 3,490,171 francs (a rise of 48½ per cent. since 1885), but in 1898 there was a deficit of 93,876 francs. The public debt in 1897 amounted to 16,632,646 francs.

Neuchâtel, the capital of the Swiss canton of the same name, at a height 1434 feet above the sea. Adjoining the castle is the collegiate church of Notre Dame, dating from the 12th and 13th centuries; now a Protestant meeting-house. On the new quay is the Musée des Beaux Arts, in which are the archæological museum, a good collection of modern Swiss pictures, and also various historical curiosities and relics. The Collège Latin contains the natural history collections and the public library. There is an Académie at Neuchâtel (to be raised to the rank of a university), which was attended in the winter of 1898–99 by 102 matriculated students. There is a watchmaking school at Neuchâtel. Population (1880), 15,370; (1900), 21,064. The majority of the inhabitants are Protestants and French-speaking. The railway line to Pontarlier passes through the Val de Travers, and *not* by Yverdon, while in 1900 a new direct line to Bern *viâ* Kerzers (in French, Chiètres) was opened. Two miles south-west of Neuchâtel is Serrières, with M. Suchard's great chocolate manufactory.

Bourgeois. *Neuchâtel et la Politique Prussienne en Franche Comté* (1702–13). Paris, 1887.—Boyve. *Annales Historiques du Comté de N. et de Valangin.* 6 vols. Bern and Neuchâtel, 1855.—Matile. *Monuments de l'Hist. de N.* 3 vols. Neuchâtel, 1844–48; *Musée Neuchâtelois* (published by the Cant. Hist. Soc.) from 1864.

Neufahrwasser. See Danzig.

Neuhaus (Czech, *Hradec Jindřichův*, which signifies "Henry's Castle"), the chief town of a government district in Bohemia, Austria, near the eastern border of the province, at the foot of the Moravian heights. The Gothic parish church and the château of Count Czernin both date from the 13th century. The latter contains valuable archives and a collection of pictures. The industries comprise the manufacture of cloth and woollen goods, paper, dyeing, corn-milling, distilling, and brewing. Population (1890), 8502; (1900), 9316, including garrison of 1066 men, chiefly Czech and Catholic.

Neuilly-sur-Seine, a town in the arrondissement of St Denis, department of Seine, France, 3½ miles west of the centre of Paris, of which it is a suburb, between the fortifications and the Seine. The fine bridge, designed in the 18th century by Perronnet, is noteworthy as the first level bridge constructed in France. The castle of St James, built about 1775 by Claude Baudard, Baron St James, is now occupied as a lunatic asylum. Amongst modern buildings are the large church of St Peter, a Protestant church, and a synagogue. The Galignani Institution, founded by the brothers Galignani for aged booksellers, printers, and others, has accommodation for 100 residents. A steam pump at Neuilly supplies daily to Paris 176,000 cubic feet of water. Population (1881), 23,805; (1901), 36,437.

Neunkirchen, or, more correctly, NEUENKIRCHEN AM STEINFELD, a market-place in Lower Austria, on the Southern Railway, about 8 miles south of Wiener-Neustadt. An important centre of the metal and textile industries. Population (1890), 8795; (1900), 10,831.

Neuquen, a territory in the west centre of the Argentine Republic, bounded on the N. by Mendoza; on the S. by the territory of Rio Negro, from which it is separated by the Rio Limay; on the E. by Pampa; and on the W. by Chile. Official area at the census of 1895, 42,345 square miles; population, 14,517; capital, Chosmalal. The territory is divided into five departments. In 1895 there were 888 farms in the province, with 6778 acres planted in cereals, 1,022,844 head of cattle, 57,015 horses, and 357,429 sheep.

Neuropathology. See PATHOLOGY.

Neu-Ruppin, a town of Prussia, on Lake Ruppin, 37 miles north-north-west of Berlin by rail. The educational establishments include a gymnasium, a normal training college, and a higher grade girls' school. Population (1890), 14,584; (1900), 17,132.

Neusalz, a town of Prussia, province of Silesia, on the Oder, 20 miles by rail north-west of Glogau. It has numerous iron-works, enamelling works, manufacture of flax, papier-mâché, millstones, &c., and tanning. Population (1885), 7716; (1900), 12,586.

Neusandec, or NEU-SANDETZ, the chief town of a district in western Galicia, Austria. Population (1890), 12,722; (1900), 15,724 (estimated at 97 per cent. Polish, 3 per cent. German; 64 per cent. Roman Catholic, 2 per cent. Greek Catholic, 32 per cent. Jewish, and 2 per cent. Protestant). There are large workshops belonging to the Austrian State Railway. A part of the petroleum district lies to the north-west of the town. Population of the adjoining ALTSANDEC (Polish, *Stary Sácz*), 4537 in 1900. It has an important annual fair and a trade in cattle, wine, furs, honey, yarn, and linen.

Neusatz. See UJVIDÉK.

Neutitschein (Czech, *Nový Jičin*), the chief town of a government district in Moravia, Austria. Population (1890), 11,562; (1900), 11,891, chiefly German and Catholic. It has manufactures of agricultural implements and machinery, and is connected by local railways with several of the surrounding districts and with the Northern Railway.

Neutrality.—Neutrality is the most progressive branch of modern International Law. It is also that branch of International Law in which the practice of self-restraint takes the place of the direct sanctions of domestic law most effectively. The rapid changes it is undergoing are in fact bringing the state-system of the modern world nearer to the realization of the dream of many great writers and thinkers, of a community of nations just as much governed by legal methods as any community of civilized men. While the right of war was simply the right of the stronger, there was no room for neutral rights, for, without going back to the time of the ancients, the so-called rights of war and conquest are nothing but survivals of the right of brute strength. No nation or community down to comparatively recent times was treated as having a right to what it could not keep. It is the growth of a law of neutrality, through the modern possibility of concerted action among neutral states, which is bringing about improvement, and, though the signs of our times are not always reassuring, we have taken a long stride forward since Molloy in his *De Jure maritimo et navali* (1680) wrote: "As a neuter neither purchases friends nor frees himself from enemies, so commonly he proves a prey to the victor; hence it is held more advantage to hazard in a conquest with a companion than to remain in a state wherein he is in all probability of being ruined by the one or the other."

It was the great commercial communities, the Hansa in the north and Venice and the Mediterranean maritime republics in the south, which were first able to insist on some sort of regulation of the usages of war for their own protection. With the growth of intercourse among nations a further advance was made, by treaty stipulations entered into in time of peace, to provide rules for their guidance in the event of war, but it is only in our own time that the idea of a substantive neutral right has obtained recognition. To our own time belongs the final acceptance of the principle that the neutral flag protects enemy's goods except contraband, the conception of neutralization of territory, the abolition of fictitious blockades, the practice of declarations of neutrality, the detachment from the high sea and neutralization of the zone called territorial waters, and the Areopagus of nations called the European Concert, in which the right of neutrals is asserted as a brake upon the operation of the still venerated right of conquest. The rights of neutrals have received their most recent affirmation in several of the decisions of the Peace Conference.

International trade and intercourse have become so intricate that war can no longer be waged without causing the most serious loss to neutral nations, which moreover suffer from it without any of the possible contingent benefits it may procure for the immediate parties. So much is it so, that most great Powers have found it necessary for their self-protection to enter into defensive alliances with others, the direct object of which is the preservation of European peace by the threat of making war so gigantic a venture that no State will again embark on it "with a light heart." The next step will probably be alliances between States which, by their nature or by their having reached the limit of their expansion, have nothing further to gain by war with each other, for the purpose of securing perpetual peace as between themselves.

Different attempts have been made to define neutrality, but the word defines itself, so far as a succinct definition serves any purpose. The subject covers too wide and varied an area of matter to be condensed into a short statement of any kind. Neutrality entails right and duties on both the belligerent and the neutral sides. Theoretically, neutrality, to be complete, would require the neutral to abstain from everything which could even remotely be of assistance to either belligerent. To this obligation would theoretically correspond that the belligerent should carry on the war without doing anything which could even remotely disturb or interfere with the neutral State or the free activity of its citizens. Neither the one nor the other is found to be practicable. It is not even easy for the belligerent to observe absolutely the duty of doing no direct injury to

Definition and scope.

neutral territory. A battle may be fought to the very edge of the neutral frontier, and shells may explode in any neutral town within the firing range of modern artillery. The present respect paid by belligerents to territorial waters is a palliative in the case of a seaboard frontier; but even the three-miles limit acknowledged by most countries would permit belligerent vessels with the present range of artillery to fire landwards far into neutral territory. Compensation, it is true, would be due for any damage done, but this does not alter the fact that acts of war can produce direct consequences on neutral territory which have the character of carrying war into a neutral State. The neutral State, moreover, is obliged to incur heavy expenditure to protect its frontier from being traversed by either belligerent, and thus avoid itself being exposed to claims for compensation for an act which it would otherwise be powerless to prevent. In the case of a maritime war, the neutral State is also bound to exercise strict supervision to prevent its ports from being used by either belligerent for the purpose of increasing his military strength. In short, war cannot be carried on without heavy expense and inconvenience to neighbouring neutral States. The inconvenience to the intercourse of neutral citizens is still greater. Their ships are liable to be taken out of their course, and their cargoes to be discharged to the bottom of the hold in search of articles which are contraband according to circumstances over which they have no control, and they may be confiscated without recourse by judges appointed by one of the interested parties. Even their whole trade with specific ports of the one belligerent may be stopped by the ships of the other belligerent without indemnity. On the other hand, a great deal of vital assistance can be given by neutral citizens to the one or the other belligerent in money, or by supplies of arms, ammunition, food, and other commodities, which it is not at present the duty of neutral States to interfere with.

The respective rights and duties of belligerent neutrals in current practice may be subdivided as follows:—

(1) Belligerent duty to respect neutral territory and neutral territorial waters.

(2) Neutral right of official representation, and mediation; of intercourse of neutral citizens with citizens of either belligerent; of convoy, &c.

(3) Belligerent right of blockade, angary, visit and search, capture and confiscation of contraband of war.

(4) Neutral duties: (*absolute*) of abstention from any direct corporate assistance to either belligerent, of enforcement of respect by both belligerents for neutral territory; (*relative*) of prevention of any recruiting for either belligerent, or arming or equipping of vessels for their service; and (*contingent*) of allowing commercial access to the one or other belligerent without distinction, and of granting impartially to one or the other belligerent any rights, advantages, or privileges, which, according to the usages recognized among nations, are not considered as an intervention in the struggle.

This subdivision, we believe, covers the whole ground of neutrality. We shall follow it in this article.

Duty to respect neutral territory.

Belligerent Duty.—It is now universally recognized among European States that a belligerent army must make no use of its strength in the field to carry its operations into neutral territory or into neutral waters. Belligerent forces entering neutral territory are by the practice of nations bound to surrender their arms to the neutral State, and remain *hors de combat* till the close of the war. (See also International Convention, The Hague, 29th July 1899, Art. 57.)

Through territorial waters belligerent vessels are allowed to pass freely as in time of peace. Nor does the usage of nations forbid a belligerent vessel from entering a neutral port. Motives of humanity have sanctioned this distinction between territorial and maritime warfare. The Admiralty Instructions (1893) set out the rights of belligerents as Great Britain views them as follows: "Subject to any limit which the neutral authorities may place upon the number of belligerent cruisers to be admitted into any one of their ports at the same time, the captain, by the comity of nations, may enter a neutral port with his ship for the purpose of taking shelter from the enemy or from the weather, or of obtaining provisions or repairs that may be pressingly necessary (I. section 592).

Access to and duty to respect territorial waters and ports.

He is bound to submit to any regulations which the local authorities may make respecting the place of anchorage, the limitation of the length of stay in the port, the interval to elapse after a hostile cruiser has left the port before his ship may leave in pursuit, &c. (I. section 593). He must abstain from any acts of hostility towards the subjects, cruisers, vessels, or other property of the enemy which he may find in the neutral port (section 594). He must also abstain from increasing the number of his guns, from procuring military stores, and from augmenting his crew even by the enrolment of British subjects" (section 595).

Nor may the commander of a British warship take a capture into a neutral port against the will of the local authorities (Holland, *Manual of Naval Prize Law*, 1888, section 299).

Right of legation.

Neutral Rights.—Neutral Powers have the right to remain, as far as possible, unaffected by the war operations, and therefore continue their diplomatic relations with the belligerent States. The immunities and exterritoriality of their diplomatic agents attach to them as in time of peace, subject only to necessity of war, which may entitle a belligerent to place restrictions on this intercourse. Thus, during the Franco-German war, on the surrounding of Paris, foreign diplomatists in the besieged city were refused by the German authorities all possibility of corresponding with their Governments, except by letters left open for their inspection. Neutral legations may also undertake the representation of private interests of subjects of the one belligerent on the territory of the other. Thus in the Franco-German war of 1871 the Germans in France were placed under the protection of the United States legation, and the French in Germany under that of the British legation; in the war of 1898 between the United States and Spain, American interests in Spain were committed to the care of the British legation, and those of Spaniards in the United States to that of the Austro-Hungarian legation. By legations are understood both diplomatic and consular authorities. The protection granted is in the nature of mere mediation. It confers no rights on the belligerent subjects in question, nor does it give the neutral legation any right to protect a belligerent subject or his property against any ordinary rights of war.

Right of offering good offices and mediation.

Good offices, properly speaking, are a mild form of mediation or tentative mediation, *i.e.*, mediation before it has been accepted by the parties. Article 3 of the Hague Convention of 29th July 1899, however, provides that "Powers, strangers to the dispute, have *the right* to offer good offices or mediation, even during the course of hostilities," and that "the exercise of this right can never be regarded by one or other of the parties in conflict as an unfriendly act" (see Peace Conference). The Hague Convention puts an end to the doubt whether a neutral Power can mediate without involving itself in some way with the one or the other side in the dispute. Mediation had already been provided for in several existing treaties, such as the Treaty of Paris (30th March 1856), which provides that "if any dissension should arise between the Sublime Porte and one or more of the other signatory Powers and threaten the maintenance of their good relations, the Sublime Porte and each of these Powers before resorting to force shall give an opportunity to the other contracting parties in order to prevent such extreme measures" (article 8); the Treaty of Yedo between the United States and Japan (29th July 1858) stipulating that in the case of difference between Japan or any other State, "the President of the United States, at the request of the Japanese Government, will act as a friendly mediator in such matters of difference as may arise between the Government of Japan and any other European Power" (article 2); and the General Act of Berlin relating to West Africa (1885), which provides that "in the case of a serious dissension having arisen on the subject of, or within the territories" in question, between the signatory Powers, they undertake, before taking up arms, to have recourse to the mediation of one or more of the friendly Powers (article 12).

In the Venezuela-Guiana boundary question, the mediation of the United States Government was declined by Great Britain, but its good offices were accepted. In the difficulty which arose between Germany and Spain in connexion with the hoisting of the German flag on one of the Caroline Islands, Spain did not consider arbitration consistent with the sovereign power she claimed to exercise over the island in question, but she accepted the mediation of the Pope, and the matter was settled by protocols, signed at Rome (17th December 1885). These incidents show the uses of variety and graduation in the methods of diplomacy.

Rights of neutral subjects on belligerent soil.

Neutral subjects have the right to carry on trade and intercourse with belligerent subjects in so far as they do not interfere with the operations or necessities of war, and it is no violation of the neutral character that this trade or intercourse is of benefit to either side. This is subject always to the belligerent right to capture and confiscate contraband of war (see below). On the other hand, the property of subjects and citizens of neutral States follows the fortune of the belligerent State within whose territorial jurisdiction it is situated. It is liable to the same charges as that of native subjects and citizens, and in case of military contributions neutral subjects on belligerent soil can claim no protection or exemption (see below, *Angary*). They have also the same rights to all indemnities for loss as are granted to native subjects and citizens.

The rights of neutral public ships and mail steamers.

The position of neutral public ships and the relative assimilation to them of mail steamers has been the subject of some controversy. A public ship is a ship having an official character. It includes not only warships, but also any ships affected to any specific and *exclusive* government purpose. Public ships in this sense are invested with an extra-territorial character, and the State to which they belong is directly responsible for their acts. They are therefore not liable to visit and search for contraband of war, and are exempt from territorial jurisdiction even in belligerent waters. As regards vessels which are engaged partly in private traffic and partly on public service, such as mail steamers and government packets, the position is necessarily different. Under the Japanese Prize Law, adopted in view of the Chino-Japanese campaign, any vessel carrying contraband of war, whose destination is hostile, may be detained, without exception being made for mail steamers. The United States proclamation of April 1898 in connexion with the Spanish war stated that mail steamers would only be stopped in case of grave suspicion of their carrying contraband or of their violating a blockade. This is obviously not an exemption; in practice no belligerent State would stop a mail steamer without grave suspicion.

On the arrest of the German mail steamers *Bundesrath* and *General* during the South African war, the German Government represented to the British Government that "it was highly desirable" that steamers flying the German mail-flag should not be stopped, and the British Government thereupon issued orders not to stop them on suspicion only (*Parliamentary Papers*, Africa, No. 1, 1900). This is a precedent of the greatest importance. It would practically assimilate mail steamers to public ships. Yet the mere circumstance of carrying the mails does not manifestly *per se* change the character of the ship. Both this subject and the position of packets under State ownership, which may carry on trade and may consequently transport contraband, require deliberate adjustment by treaty.[1] In fact, it is one of the most pressing questions of neutrality. The tendency seems to be towards exemption, but in this case there should be official certification that the ships in question carry nothing in the nature of contraband.

Convoy.

Connected with the position of public ships is the question of the right of convoy. Neutral merchant ships travelling under the escort of a warship or warships of their own flag are held by some authorities to be exempt from visit and search. The Japanese Prize Law, which is largely based on English practice, following on this point the recommendations of the Institute of International Law (see *Règlement des prises maritimes*, Annuaire 1888, p. 221), provides that "when the commander of a neutral convoy declares that there is no contraband of war on board the vessels under convoy, and that all the papers are in order in these vessels, the vessels shall not be visited" (article 23).[2] It is believed that Great Britain is, at the present moment (1902), the only Power which does not in one form or another recognize the principle of the protective character of convoy. The United States, in treaties with Mexico, Venezuela (20th January 1836), Peru (6th September 1870), Salvador (6th December 1870), and Italy (26th February 1871), have agreed to accept the commander's declaration as provided in the Japanese Prize Law. Wharton quotes in his *International Law Digest* a passage from a despatch of Mr Secretary Forsyth (18th May 1837) in which he states that "it is an ordinary duty of the naval force of a neutral during either civil or foreign wars to convoy merchant vessels of the nation to which it

[1] The convention between Great Britain and France respecting postal communications (30th August 1890) provides that "in the case of war between the two nations the packets of the two administrations shall continue their navigation, without impediment or molestation, until a notification is made on the part of either of the two Governments of the discontinuance of postal communications, in which case they shall be permitted to return freely to their respective ports" (article 9). The position of either as neutral is not dealt with.

[2] At the outset of the Chino-Japanese war, Vice-Admiral Sir E. R. Fremantle sent a note to the Japanese admiral requesting him to "give orders to the ships under his command not to board, visit, or interfere in any way with British merchant vessels, observing that the British admiral had directed all British ships under his orders to afford protection to such merchant vessels, and not to allow them to be molested in any way." Professor Takahashi, in his *International Law of the Chino-Japanese War*, relates that the Japanese admiral replied that "as the matters demanded by the British admiral belonged to the sphere of international diplomacy, and consequently were outside his official responsibility, they should be communicated directly to the Japanese Department of Foreign Affairs." "The idea of the British admiral," observes Professor Takahashi, "seemed to be not only to claim a right of convoy, which has never been recognized by British prize courts, but also to extend it over all waters of the Far East, where British warships were not actually engaging in convoy. Soon afterwards the matter was settled without any difficulty. On 11th August the Under-Secretary of the Japanese Foreign Office received a letter from the British Minister in Tôkyô stating that there must be some misunderstanding, and that the British Government would never try to interfere with belligerent right."

belongs to the ports of the belligerents. This, however, should not be done in contravention of belligerent rights as defined by the law of nations or by treaty." The Spanish Naval Instructions (24th April 1898) in the war with the United States granted unconditional exemption to convoyed neutral ships (article 11).

A neutral merchant ship, travelling under *enemy's* convoy, places itself, with the assistance of the belligerent force, beyond the application of the belligerent right of visit and search, and thus commits a breach of neutrality.

Blockade.

Belligerent Rights.—Since the declaration of Paris providing that blockades (see article under this heading in ninth edition for general information on the subject) "in order to be binding must be effective, that is to say, must be maintained by a force sufficient really to prevent access to the enemy's coast," the tendency has been to give a precise form to all the obligations of the blockading belligerent. Thus it is now generally agreed that notification to the neutral should be sufficiently detailed to enable neutral vessels to estimate, with practical accuracy, the extent of their risks. French writers consider a general diplomatic notification, though desirable, as insufficient, and hold an individual notification to each neutral ship which presents itself at the line of blockade as requisite. This theory was applied by France in the Franco-German war, and earlier by the Northern States in the American Civil War. The new Japanese Prize Law (1894) does not attempt to prescribe any such notification to each ship, but sets out that notice of blockade to each ship is either actual or constructive. "Actual" it describes as being when the master is shown to have had knowledge of the blockade, in whatever way he may have acquired such knowledge, whether by direct warning from a Japanese warship or from any other source; "constructive," when a notification of its existence has been made to the proper authorities of the State to which the vessel belongs, and sufficient time has elapsed for such authorities to communicate the notification to the subjects of that nation, whether or not they have in fact communicated it. No blockade, however, was attempted by the Japanese Government, and the application of the rules was not put to the test.

In the Spanish war the United States' proclamation of the investment of Cuba stated that an efficient force would be posted, so as to prevent the entrance and exit of vessels from the blockaded ports, and that any neutral vessel approaching or attempting to leave any of them, "without notice or knowledge" of the establishment of the blockade, would be duly warned by the commander of the blockading forces, who would endorse on her register the fact and date of such warning, and where such endorsement was made. The words "without notice or knowledge" were explained fully in the instructions to blockading vessels (20th June 1898). "Neutral vessels," said these instructions, "are entitled to notification of a blockade before they can be made prize for its attempted violation." "The character of this notification is not material. It may be actual, as by a vessel of the blockading force, or constructive, as by a proclamation of the Government maintaining the blockade, or by common notoriety. If a neutral vessel can be shown to have notice of the blockade in any way, she is good prize and should be sent in for adjudication; but should the formal notice not have been given, the rule of constructive knowledge arising from notoriety should be construed in a manner liberal to the neutral." Thus the United States Government abandoned the system of individual notification inserted in the proclamation of 19th April 1861, which was only found practicable in the case of vessels which had presumably sailed without notification. In such cases it was provided by the more recent instructions that they should be boarded by an officer, who should enter the notice in the ship's log, such entry to include the name of the blockading vessel giving notice, the extent of the blockade, and the date and place, verified by his official signature. The vessel was then to be set free, with a warning that, should she again attempt to enter the same or any other blockaded port, she would be good prize.

Angary.

Angary, or *Droit d'Angarie*, is a contingent belligerent right, arising out of necessity of war, to dispose over, use, and destroy, if need be, property belonging to neutral States.[1] During the Franco-German war imminent necessity was pleaded by the German Government, as the justification of using force to seize and sink six British coal-ships in the Seine to prevent French gunboats from running up the river and interfering with the tactics of the German army operating on its banks. The captains of the vessels refused to enter into any agreement with the commanding German general, and the vessels were then sunk by being fired upon. The British Government raised no objection to the exercise of the right, and confined itself to demanding compensation for the owners, which the German Government declared itself ready to pay. Count Bismarck evidently felt the use which might be made against Germany as a neutral Power, of such an extreme measure, and took care in the correspondence with the British Government to emphasize the pressing character of the danger, which could not be otherwise parried.

A case given in the text-books as another one of angary during the same war was the temporary seizure and conversion to war purposes of Swiss and Austrian rolling-stock in Alsace, without any apparent military necessity. Ordinary private neutral property on belligerent soil, it must be remembered, follows the fate of private property generally. The only distinction between the right of angary and the right of assimilating private neutral property to private property generally on belligerent soil which seems based on reason is that, whereas private property of neutrals generally which has remained on belligerent soil is sedentary, or, so to speak, domiciled there, neutral vessels are mere visitors with a distinct external domicile. The writer thinks the assimilation of neutral railway carriages to neutral vessels in this respect not unreasonable.[2]

Contraband.

A neutral State in its corporate capacity, we have seen, must abstain from acts which can be of assistance to either belligerent, and it is bound to exercise reasonable diligence to prevent its territory being used as a base for belligerent operations. The duties of a neutral State as a State go no farther. Commercial acts of its citizens, even the export of arms and munitions of war to a belligerent country, do not, in the present state of international usage, so long as both belligerents are free to profit by such acts alike, involve liability on the part of the neutral State. But relief from the obligation of repressing breaches of neutrality by contraband traffic of subjects has its counterpart in the right granted to belligerent warships of visit and search of neutral merchant vessels, and in the possible condemnation, according to circumstances, of the ship and confiscation of goods held to be contraband.

Contraband is of two kinds—*absolute* contraband, such as arms of all kinds, machinery for manufacturing arms, ammunition, and any materials which are of direct application in naval or military armaments; and *conditional*

---

[1] Angaria (from ἄγγαρος, a messenger), a post station. The French word *hangar* or shed is probably of the same origin.

[2] Treaties between the Zollverein and Spain (30th March 1868) and between Germany and Portugal (2nd March 1872) contain special provisions for the fixing of indemnities in case of any forced utilization by either State of private property of the citizens of the other.

contraband, consisting of articles which *are fit* for, but not necessarily of direct, application to hostile uses. The British Admiralty *Manual of Prize Law* (1888), following this distinction, enumerates as *absolutely contraband:* arms of all kinds and machinery for manufacturing arms; ammunition and materials for ammunition, including lead, sulphate of potash, muriate of potash, chlorate of potash, and nitrate of soda; gunpowder and its materials, saltpetre and brimstone; also guncotton; military equipments and clothing; military stores, naval stores, such as masts, spars, rudders, and ship-timber, hemp and cordage, sail-cloth, pitch and tar, copper fit for sheathing vessels, marine engines and the component parts thereof, including screw propellers, paddle wheels, cylinders, cranks, shafts, boilers, tubes for boilers, boiler plates and fire-bars, marine cement and the material used in the manufacture thereof, blue lias and Portland cements; iron in any of the following forms—anchors, rivet iron, angle iron, round bars of iron of from $\frac{3}{4}$ to $\frac{5}{8}$ of an inch diameter, rivets, strips of iron, sheets, plate iron exceeding $\frac{1}{4}$ of an inch, and Low Moor and Bowling plates;—and as *conditionally contraband:* provisions and liquors fit for the consumption of army or navy, money, telegraphic materials, such as wire, porous cups, platina, sulphuric acid, materials for the construction of a railway, such as iron bars, sleepers, and so forth, coal, hay, horses, rosin, tallow, timber.[1]

Coal. The classing of coal as conditional contraband has given rise to much controversy. Great Britain has consistently held it to be so. During the war of 1870 the French and German warships were only allowed to take at English ports enough to return to a French or German port respectively. In 1885, during the Franco-Chinese campaign, after protest by the Chinese Government, Great Britain applied the same rule at Hong Kong and Singapore. During the Spanish-American war neither belligerent seems to have treated coal as contraband. In the case of the coal ships which were prevented from landing their cargoes at Cuba, the prevention seems to have been connected with the blockade only. At the West African conference of 1884 Russia declared that she would "categorically refuse her consent to any articles in any treaty, convention, or instrument whatever which would imply" the recognition of coal as contraband of war (*Parliamentary Papers*, Africa, No. 4, 1885). Coal, however, is so essential to the prosecution of war that it is impossible to avoid classing it as conditional contraband, so long as such contraband is recognized. The alternative, of course, would be to allow both belligerents freely to supply themselves at neutral ports, and neutral vessels freely to supply belligerent coaling stations.

Food-stuffs. During the Franco-Chinese campaign of 1885 and the South African war, there was controversy as to the legality of treating food-stuffs as conditional contraband. During the former the subject-matter was rice, and the circumstances were exceptional. The hostilities being at the outset reprisals, and not actual war, France at first exercised no right of search over British merchant ships. Great Britain, on her side, for the same reason did not object to French war vessels coaling, victualling, and repairing at British ports. On China protesting against this indulgence to France, Great Britain, as above stated, put in force her practice of treating coal as contraband, and thereupon France exercised her corresponding belligerent right of searching British vessels. The closing of British coaling stations to French warships was a serious inconvenience to France, and she proclaimed "that in the circumstances in which war was being carried on" the cargoes of rice which were being shipped to the northern Chinese ports were contraband. By depriving the Chinese Government of part of the annual tribute sent from the southern provinces in the form of rice she hoped to bring pressure on the Peking Government. This was a manifest stretching of the sense of conditional contraband. Besides, no distinction was made as to destination. The British Government protested, but no cases were brought into the French prize courts, and the legality of the measure has never been judicially examined.

The controversy during the South African war was confined to theory. In practice no stoppage of food-stuffs seems to have taken place, though the fact that the whole able-bodied population of the enemy States formed the fighting force opposed to Great Britain made it clear that the free import of food supplies from abroad helped the farmer-soldiers to carry on warfare without the immediate care of raising food crops.

The two cases cited show the great difficulty of fixing the character of conditional contraband in a way to prevent arbitrary seizures.

Continuous voyages. Trade between neutrals has a *primâ facie* right to go on, in spite of war, without molestation. But if the ultimate destination of goods, though shipped first to a neutral port, is enemy's territory, then, according to the "doctrine of continuous voyages," the goods may be treated as if they had been shipped to the enemy's territory direct. This doctrine, though Anglo-Saxon in its origin and development, has been put in force by an Italian court in the case of the *Doelwijk*, a Dutch vessel which was adjudged good prize on the ground that, although bound for Jibouti, a French colonial port, it was laden with a provision of arms of a model which had gone out of use, and which could only be intended for use by the Abyssinians, with whom Italy was at war. The subject has been fully discussed by the Institute of International Law, by whom the following rule has been adopted: "Destination to the enemy is presumed where the shipment is to one of the enemy's ports, or to a neutral port, if it is unquestionably proved by the facts that the neutral port was only a stage (*étape*) towards the enemy as the final destination of a single commercial operation."[2]

The question of the legality of the doctrine was raised by Chancellor von Bülow during the South African war in connexion with the stopping of German ships bound for Delagoa Bay, a neutral port. He contended that such

[1] The Japanese Prize Law (21st August 1894) makes the following distinction: (1) Arms of all kinds, brimstone, dynamite, nitrate of potash, and all goods fit for the purpose of war exclusively: the above-mentioned goods are contraband when they are on board a vessel which either has a hostile destination or calls at any port of the enemy. (2) Provisions and liquors, money, telegraphic materials, such as wire, platinum, sulphuric acid and zinc, porous cups, materials for the construction of a railway, as iron bars, sleepers, &c., coal, timber, and so forth: the above-mentioned goods are contraband goods when the destination of the vessel is either the enemy's fleet at sea or a hostile port, used exclusively or mainly for naval or military equipment. When it is clearly known that, though goods detailed in the above sections 1 and 2 are found on board a vessel, they are merely for her own use, they cannot be deemed contraband goods.

[2] The only person in that eminent assemblage who raised an objection to the principle of the doctrine was the distinguished French writer on maritime law, M. Desjardins, who declined to acknowledge that any theory of continuous voyages was, or could be, consistently with the existing law of neutrality, juridically known to International Law. He admitted, at the same time, that penalties of contraband would be incurred if the shipping to a neutral port were effected merely in order "to deceive the belligerent as to the real destination of the cargo." This was the French ruling in the *Frau Houwina* case (26th May 1855). He proposed to restrict the operation of the doctrine to this condition, but was opposed by three Italian Professors of International Law, Professors Fusinato, Catellani, and Buzzati, on the ground that it would exclude, as it obviously would do, the contingency of goods shipped to a neutral port, not for the purpose of defrauding the belligerent, but for that of being ultimately delivered to a belligerent not in possession of a seaport. The article as quoted in the text was also supported by the greatest German authority on International Maritime Law, Director Perels of the German Admiralty.

vessels were quite, and at all times, outside belligerent jurisdiction, and that only the authorities of the neutral port were entitled to stop contraband on its way to a belligerent force. He did not, however, press the point, and only reserved the right of raising it at a future date.[1]

The procedure employed to ascertain whether a neutral vessel carries contraband or not is called *Visit and Search*, a belligerent right universally recognized and justified by the considerations that merchant ships of the enemy might evade capture by hoisting a neutral flag, if the belligerent had not the right of ascertaining the real character of the ship, and that private neutral vessels might carry contraband goods and generally help the enemy, if the belligerent had not the right of examining their cargo. All neutral private vessels in time of war are liable to visit by belligerent warships on the high seas and in the territorial waters of the belligerents, but not in the territorial waters of neutral States. Neutral public ships are not liable to visit (see above as to neutral public ships, mail ships, and convoy). Visit and search must be effected at every stage with "as much consideration as possible" (Herr von Bülow, in Reichstag, 19th January 1900). The visiting officer first examines the ship's papers. If satisfied that the vessel is not liable to detention, he immediately quits her. If not so satisfied, he proceeds to search her. If in the course of the search he is satisfied that the vessel is not liable to detention, the search is immediately discontinued. The visiting officer has the right to inspect any lockers, stores, or boxes, and in case of refusal to open them he is justified in using such coercive measure as the case warrants. If after the visit and search the commander has reason to entertain suspicion, he gives the master an opportunity of explanation, and if the explanation is unsatisfactory he detains the vessel. If the seizure turns out after all not to have been justified, the ship and cargo are immediately released, and compensation is due for the loss through the detention. In the case of the stoppage and search of German vessels during the South African war, the German Government proposed the appointment of arbitrators to decide upon the claims for compensation, but this was an innovation to which the British Government did not assent.

Visit and search.

The consequences of carrying contraband are capture, trial by a belligerent prize court, and possible confiscation of the ship and cargo, or of the cargo alone or of a part of the cargo, according to the facts of the case. All are agreed as to articles which are absolute contraband being liable to capture. As regards conditional contraband, British law,[2] in so far, at least, as concerns "naval and victualling stores," is less severe, the Lords of the Admiralty being entitled to purchase such stores without condemnation in a prize court. In practice such purchases are made at the market value of the goods, with an additional 10 per cent. for loss of profit. This proceeding is known in International Law as the right of pre-emption. It is not, however, as yet officially recognized on the continent of Europe, though the need of some palliative for confiscation, in certain cases, is felt, and some continental jurists, moved by the same desire to distinguish unmistakable from so to speak constructive contraband, and protect trade against the vexation of uncertainty, have tried to argue conditional contraband away altogether.

Capture, pre-emption, prize.

The tendency, however, among the majority of continental authorities is seen in the rule drawn up in 1895, after several years of discussion, by the Institute of International Law, a body composed exclusively of international jurists of acknowledged status. The majority which adopted it represents authoritative opinion in Germany, Denmark, Italy, Holland, and France, showing that the old antagonism between the British and continental views on conditional contraband has ceased to exist. To prevent confusion the Institute declares conditional *contraband* abolished, and then adds that "nevertheless, the belligerent has, at his option and on condition of paying an equitable indemnity, *a right of sequestration or preemption* as to articles (*objets*) which, on their way to a port of the enemy, may serve equally for use in war or in peace." The proposed rule goes beyond the directions of the British Prize Act, and it could only come into operation under a verbal alteration of the Declaration of Paris, under which "contraband" alone is excepted from the protection of the neutral flag, a fact which seems to have escaped the notice of the Institute.

British prize law is at present governed by the Prize Act of 1864. The Prize Manual for the guidance of British naval commanders was re-edited by Professor T. E. Holland, and reissued 1888. Both require alteration to bring them into harmony with changes which have resulted from inroads of legislation even since so recent a date as 1888. A Consolidation Prize Bill, drafted, we believe, by Professor Holland, and dealing with the legislative changes which have become necessary, had by 1902 passed through the House of Lords, and was awaiting its turn in the House of Commons. The British Prize Instructions were, at the time of writing this article, also undergoing revision by a committee, appointed by the Government for this purpose, but whose work of course can only be completed after the adoption of the new Act.

Absolute Duties of Neutrals.—For abstention from direct corporate assistance, see INTERNATIONAL LAW, *Ency. Brit.* vol. xii. p. 195 *et seq.*

The duty of neutral States to enforce respect for their territory has become a very serious one. A belligerent cannot be allowed to cross the neutral frontier or carry on war operations in neutral waters, without the same right being granted to the other belligerent. Pursuit of one force by the other would amount to waging war on the neutral territory. It is agreed among nations that the avoidance of such a contingency is in the interest of them all. During the Franco-German war both France and Germany, as belligerents, and Belgium and England, as neutrals, rigorously observed their duties and enforced their rights, and no difficulty occurred. It is, nevertheless, conceivable that, under pressure of military necessity, or on account of an overwhelming interest, a powerful belligerent State would cross the territory of a weak neutral State and leave the consequences to diplomacy. The South African war was exceptional, in that the Portuguese Government exposed itself to no international difficulty through allowing a belligerent, whose final victory was certain, and of necessity entailed total suppression of the conquered belligerent, to cross its colonial territory. At the same time it is an unfortunate precedent of taking advantage of the practical powerlessness of neighbouring neutral States to commit a violation of the law of nations, respect for which it is a primary duty of every self-respecting State to encourage.[3]

Enforcement of respect for neutral territory.

If, by inadvertence or otherwise, belligerent soldiers pass the frontier, they have to be turned back. If they claim the *droit d'asile*, they are arrested, disarmed, and kept in such a manner as to render it impossible for them to take any further part in the

Refugees.

[2] The Naval Prize Act, 1864, sect. 38.

[3] The right of way claimed and acceded to under the Anglo-Portuguese Treaty of 11th June 1891 was a mere right of transit for merchandise, and could not in any way be construed as diminishing the neutral obligation to a belligerent who was no party to the treaty.

hostilities. In the case of territorial waters, as has already been pointed out, the neutral State is not in the same position as on land, all ships without distinction having a right of innocent passage through them. Belligerent ships also have the right to enter neutral ports, but the neutral authority is bound to take precautions to prevent any favour being shown to the one party or the other.[1]

Relative Duties of Neutrals.—Relative duties embrace those duties which citizens are bound to observe and for which States incur a relative responsibility. It was the non-observance of these relative duties that led to difficulties between Great Britain and the United States at the close of the American Civil War and which brought the two countries themselves to the verge of conflict. The Treaty of Washington (8th May 1871) referring these difficulties to arbitration defined the scope of the duties in question for all future purposes between the two peoples (see below, "Proclamations of Neutrality," and International Law, 9th ed.). Under this treaty the parties bind themselves to use "due diligence," where they have "reasonable ground" to believe that any acts have a belligerent character, in "preventing" them. They are bound to prevent—

Foreign enlistment, &c.

(1) Fitting out, arming, or equipping any vessel;

(2) The departure from their jurisdiction of any vessel, having been specially adapted in whole or in part within such jurisdiction to warlike uses;

(3) The making use by a belligerent of their ports or waters as a base of naval operations against the other;

(4) The making use thereof for the purpose of the renewal or augmenting of military supplies or arms;

(5) The making use thereof for the recruitment of men. (See International Law, 9th ed.)

The contracting States undertook to bring the rules they adopted on this subject to the knowledge of other maritime Powers, and to invite them to adopt them also, but thus far, it seems, nothing has been done to get them accepted among other States. Provision had already been made to enable the Government to carry them out in the *Foreign Enlistment Act* (9th August 1870). This Act, which repealed the previous one of 1819 on the same subject, is minute in its provisions to prevent enlisting or recruiting men, or the building or the equipping of vessels, for the military service "of a foreign State at war with a friendly State." Other States, except the United States (which have adopted a similar Act), have not followed the example of Great Britain, but leave it to the Central Government to deal with the cases, when they may arise, as matters of public safety.[2]

There is evident reluctance among foreign States to commit themselves to the obligation of exercising "due diligence." It is clear that the duty of a State to forbear from committing any act which may be of assistance to either belligerent can never be formulated as an absolute one in regard to the acts of private persons, merely within the neutral jurisdiction. In recent times it has certainly become possible for States to exercise a more effective control than formerly over these acts; but at the present moment, though a much greater latitude is left to neutral subjects and citizens than is consistent with the idea of strict neutrality, there is no movement to alter the usages to the disadvantage of neutral interests. That the Geneva Arbitral Tribunal found in favour of the United States in the *Alabama* case in no way implies that International Law has as yet undergone any change. The tribunal was bound by the antecedent fixation of the Washington rules, and laid down no new principle. On the other hand, the magnitude of the Geneva award is not likely to promote change in the direction of increasing neutral duties, except as part of a general regulation of neutral and belligerent rights.

Proclamations of neutrality.

To some extent the difficulty of determining the extent of relative neutral duty is overcome by the issue of proclamations of neutrality; but neutrality and its rights and duties are in no respect dependent on their being proclaimed by the neutral Power. Germany issues no proclamation; at least the German empire has issued none in connexion with the different wars which have taken place since 1870. The Austro-Hungarian Government during the same period only in the case of the war of 1870 itself, and in 1877, issued proclamations, and these probably had objects outside the ordinary purposes of proclamations of neutrality, and its usual practice is the same as that of Germany. France usually issues a short general proclamation, and

[1] The rules laid down on this subject by the British authorities during the Spanish-American war were as follows:—

Rule 1. During the continuance of the present state of war all ships of war of either belligerent are prohibited from making use of any port or roadstead in the United Kingdom, the Isle of Man, or the Channel Islands, or of any of Her Majesty's colonies or foreign possessions or dependencies, or of any waters subject to the territorial jurisdiction of the British crown, as a station or place of resort for any warlike purpose, or for the purpose of obtaining any facilities for warlike equipment; and no ship of war of either belligerent shall hereafter be permitted to leave such port, roadstead, or waters from which any vessel of the other belligerent (whether the same shall be a ship of war or a merchant ship) shall have previously departed until after the expiration of at least twenty-four hours from the departure of such last-mentioned vessel beyond the territorial jurisdiction of Her Majesty.

Rule 2. If there is now in any such port, roadstead, or waters subject to the territorial jurisdiction of the British crown any ship of war of either belligerent, such ship shall leave such port, roadstead, or waters within such time, not less than twenty-four hours, as shall be reasonable, having regard to all the circumstances and the condition of such ship as to repairs, provisions, or things necessary for the subsistence of her crew; and if after the date hereof any ship of war of either belligerent shall enter any such port, roadstead, or waters subject to the territorial jurisdiction of the British crown, such ship shall depart and put to sea within twenty-four hours after her entrance into any such port, roadstead, or waters, except in case of stress of weather, or of her requiring provisions or things necessary for the subsistence of her crew, or repairs; in either of such cases the authorities of the port, or the nearest port (as the case may be), shall require her to put to sea as soon as possible after the expiration of such period of twenty-four hours, without permitting her to take in any supplies beyond what may be necessary for her immediate use; and no such vessel which may have been allowed to remain within British waters for the purpose of repair shall continue in any such port, roadstead, or waters for a longer period than twenty-four hours after her necessary repairs shall have been completed. Provided, nevertheless, that in all cases in which there shall be any vessels (whether ships of war or merchant ships) of both the said belligerent parties in the same port, roadstead, or waters within the territorial jurisdiction of Her Majesty, there shall be an interval of not less than twenty-four hours between the departure therefrom of any such vessel (whether a ship of war or merchant ship) of the one belligerent and the subsequent departure therefrom of any ship of war of the other belligerent; and the time hereby limited for the departure of such ships of war respectively shall always, in case of necessity, be extended so far as may be requisite for giving effect to this proviso, but no further or otherwise.

Rule 3. No ship of war of either belligerent shall hereafter be permitted, while in any such port, roadstead, or waters subject to the territorial jurisdiction of Her Majesty, to take in any supplies, except provisions and such other things as may be requisite for the subsistence of her crew, and except so much coal only as may be sufficient to carry such vessel to the nearest port of her own country or to some nearer destination; and no coal shall again be supplied to any such ship of war in the same or any other port, roadstead, or waters subject to the territorial jurisdiction of Her Majesty, without special permission, until after the expiration of three months from the time when such coal may have been last supplied to her within British waters as aforesaid.

Rule 4. Armed ships of either belligerent are interdicted from carrying prizes made by them into the ports, harbours, roadsteads, or waters of the United Kingdom, the Isle of Man, the Channel Islands, or any of Her Majesty's colonies or possessions abroad.

[2] The French Penal Code, however, contains the following clauses covering the Government's powers in this respect:—

Art. 84. Whoever shall by hostile acts, not approved by the Government, expose the State to a declaration of war, shall be punished by banishment, and should war follow, by deportation.

Art. 85. Whoever shall, by acts not approved by the Government, expose Frenchmen to the risk of reprisals, shall be punished by banishment.

Great Britain a more detailed one, which must be as old as the "ancient custom" of its being publicly read from the steps of the Royal Exchange by the sergeant-at-arms and common crier of the City of London.[1] The British proclamation practically recites the Foreign Enlistment Act, 1870 (an Act to regulate the conduct of His Majesty's subjects during the existence of hostilities between foreign States with which His Majesty is at peace), admonishes all persons entitled to British protection to observe and respect the exercise of those belligerent rights which "We and Our Royal Predecessors have always claimed to exercise," and warns them that any such persons "breaking, or endeavouring to break, any blockade lawfully and actually established" by either belligerent, "or carrying officers, soldiers, despatches, arms, ammunition, military stores, or materials, or article or articles, considered and deemed to be contraband of war, according to the law or modern usages of nations, for the use or service" of either belligerent, "rightfully incur, and are justly liable to, hostile capture and to the penalties denounced by the law of nations in that behalf." During the South African war no proclamation of neutrality was issued by any country.

Proclamations of neutrality may be made to serve the twofold purpose of warning the belligerent of the length to which the neutral Government considers neutral duty to extend, and neutral subjects of the exceptional measures to which a foreign war exposes them. They may also be used to give effect to any modification of neutral right or duty which the neutral State may consider warranted by special or altered circumstances.

Sale of arms and ammunition by neutrals.

No purely mercantile transactions are considered a violation of neutrality. Six years before the American Civil War, President Pierce, in his message to the Thirty-fourth Congress, first session, made the following statement:—"The laws of the United States do not forbid their citizens to sell to either of the belligerent Powers articles of contraband of war, or to take munitions of war or soldiers on board their private ships for transportation; and although in so doing the individual exposes his person or property to some of the hazards of war, his acts do not involve a breach of the national neutrality, nor of themselves implicate the Government." This is as true a statement of international practice to-day as then.

During the Franco-German war there was correspondence between the Prussian diplomatic representatives in London and at Washington and the British and United States foreign secretaries concerning shipments of arms and ammunition to the French armies, in which the Prussian Government contended that it was incompatible with strict neutrality that French agents should be permitted to buy up in the neutral country, under the eyes and with the cognizance of the neutral Government, "many thousands of breech-loaders, revolvers, and pistols, with the requisite ammunition, in order to arm therewith the French people, and make the formation of fresh army corps possible after the regular armies of France had been defeated and surrounded." Nothing, however, was done to prevent the departure of these supplies. Both the British and United States Governments claimed entire liberty for the traffic in question.

Raising of loans on neutral territory.

In the case of loans publicly issued or raised on neutral territory the position is a little different, inasmuch as the neutral State is necessarily cognizant of the fact. No restriction, however, is imposed by international usage, and provided the same rights are granted to both belligerents, either or both can raise money *ad libitum* in neutral countries. Thus neutral States did not prevent the issue on their territory of the Russian war loan of 1876–77. Nor in the recent war between China and Japan was any opposition made by Japan to the raising of the Chinese loan in London.

[1] *The Times*, 28th April 1898.

Proposed Neutrality Reforms.—It has been seen in the course of this article that the rules relating to neutrality need to be made more clearly ascertainable. At the Hague Peace Conference a suggestion was agreed to, without discussion, that a further State conference should be held for the purpose of dealing specially with neutrality. Later, Count von Bülow, the German chancellor, in connexion with German neutrality during the South African war, referred to this proposal. "Attempts at a settlement," he said, "have so far invariably failed, owing to the obstacles created by the divergent views of the different Powers. An endeavour was even made to include this question in the deliberations of the Peace Conference at The Hague. The sole result was that the Conference gave expression to the wish that an attempt should be made, by means of subsequent international conferences, on the one hand to deal with the rights and duties of neutrals, and, on the other, with the question of private property at sea. The German empire would not withhold its concurrence and support, if a prospect were to arise of defining more distinctly than heretofore, in conjunction with other Powers, the lines for an international settlement of the disputed points of maritime law." Both the Institute of International Law and the International Law Association have appointed committees for the examination of the whole subject of neutrality. In fact, there is a distinct movement among the maritime States of the world in favour of revising belligerent rights and neutral duties.

War at the present day cannot be conducted without involving vital interests of neutral states. Germany in the course of the South African war showed great irritation at the stoppage of certain of her merchant vessels, and Great Britain had to consent to a modification of belligerent right under International Law—a modification which, be it said, is a perfectly justifiable one, viz., to restrict the right of search for contraband of war to a specified area. We may be sure that, in future wars, powerful neutral States will show, in similar cases, quite as much irritation as did Germany.[2]

How far States would go in accepting responsibility it is difficult to forecast. It has been said that a State is responsible for acts of infringement of neutrality by those within its jurisdiction, though it may not possess a machinery to repress them. Several States, as a fact, have no enactments specifically to punish infringements of neutrality, and others, like France, deal only with violations of the laws of neutrality as productive of public damage or difficulties. On the other hand, it is not unreasonable to contend that neglect of a State to enforce the laws it possesses entails responsibility for the consequences, and the absence of reciprocity would not be a complete answer to a claim by a State whose laws were less stringent. (T. BA.)

Neuville, Alphonse Marie de (1836–1885), French painter, was born, the son of wealthy parents, at Saint-Omer, France, on 31st May 1836. From school he went to college, where he took his degree of *bachelier ès lettres.* His taste led him to serve in the navy, and in spite of the opposition of his family he entered the naval school at Lorient. It was here, in 1856, that his artistic instincts first declared themselves. He returned to Saint-

[2] Nothing shows more the power of neutral opinion than the fact that the United States and Spain during the war of 1898, though they had refused to be parties to the Declaration of Paris, found themselves obliged to act in accordance with its provisions.

Omer, where his father announced his intention of starting the youth in a public office, but de Neuville obtained his permission to become a painter. After being refused and discouraged by several painters of repute, he was admitted to work in Picot's studio. He did not, however, remain there long, and he was painting by himself when he produced his first picture, "The Fifth Battalion of Chasseurs at the Gervais Battery (Malakoff)." This work won the good opinion of Delacroix. In 1860 de Neuville painted an "Episode of the taking of Naples by Garibaldi" for the Artists' Club in the Rue de Provence, and sent to the Salon in 1861 "The Light Horse Guards in the Trenches of the Mamelon Vert." He also made successful illustrations for *Le Tour du Monde* and for Guizot's *History of France.* At the same time he painted a number of remarkable pictures: "The Attack in the Streets of Magenta by Zouaves and the Light Horse" (1864), "A Zouave Sentinel" (1865), "The Battle of San Lorenzo" (1867), and "Dismounted Cavalry crossing the Tchernaia" (1869). In these he showed peculiar insight into military life, but his full power was not reached till after the war of 1870, in which he had fought with courage. He then aimed at depicting in his works the episodes of that war, and began by representing the "Bivouac before Le Bourget" (1872). His fame spread rapidly, and was increased by "The Last Cartridges" (1873; see Plate), in which it was easy to discern the vast difference between the conventional treatment of military subjects, as practised by Horace Vernet, and that of a man who had lived through the life he painted. In 1874 the "Fight on a Railroad" was not less successful, and was followed by the "Attack on a House at Villersexel" (1875) and the "Railway Bridge at Styring" (1877). In 1878 the painter exhibited (not at the Great Exhibition) "Le Bourget," the "Surprise at Daybreak," "The Intercepted Despatch-bearer," and a considerable number of drawings. He also exhibited in London some episodes of the Zulu war. In 1881 he was awarded the grade of officer of the Legion of Honour for his two pictures "The Cemetery of Saint-Privat" and "The Despatch-bearer." During these years de Neuville was at work with Detaille on an important though less artistic work, "The Panorama of Rézonville." De Neuville died in Paris, 18th May 1885. At the sale of his works after his death the State purchased for the Luxembourg Museum the "Bourget" and the "Attack on a Barricaded House," both in oils, with a water-colour picture, "The Parley," and a drawing of a "Turco in Fighting Trim."

See MONTROSIER. "Les Peintres Militaires," Paris, 1881.—"De Neuville," *La Gazette des Beaux Arts.* Paris, 1885. (H. FR.)

Nevada, one of the most westerly of the United States of America, bounded on the N. by Oregon and Idaho, on the E. by Utah, and on the S. and W. by California. Situated in the arid portion of the country, and with few streams available for irrigation, Nevada can never, under the present climatic conditions, become prominent as an agricultural state. In 1900 the area of land reported as improved and irrigated was 504,204 acres, mainly for grass, alfalfa, and other forage plants. The principal crop in 1898, apart from forage crops, was wheat, in which were planted 36,700 acres, the product being 1,064,271 bushels. The live stock interest was proportionately of greater moment than agriculture proper. In 1898 the state contained 44,305 horses, 1394 mules and asses, 240,386 cattle, 576,994 sheep, and 10,441 hogs. In 1900 there were 922 miles of railway (valued at $8,618,477), but little building had been done in the preceding fifteen years. The production of gold and silver, upon which mainly the state depends for its prosperity, has greatly diminished. In 1900 it was as follows: gold, $2,006,200; silver, coinage value, $1,756,703; giving a total of $3,762,903. Besides this 3388 tons of lead were produced as a by-product. Nevada was never prominent as a manufacturing state. In 1900 there were 133 manufacturing establishments (excluding those classified as hand trades and those having a product of less than $500). They had a total capital of $1,349,109, an average number of 534 wage-earners, and products valued at $1,405,827. At the state capital, Carson, are situated a state prison and an orphan home. A state hospital for the insane is maintained at Reno. The state maintains an excellent system of public schools. Altogether the schools numbered, in 1898, 310, upon which was expended the sum of $317,762. The State University at Reno had in 1898 an income from the state of $32,500, while expenses amounted to $28,297. The number of instructors was 28, and it was attended by 366 students. In the matter of church membership, about two-thirds of the inhabitants are connected with the Roman Catholic Church, the remainder being composed of Episcopalians, Mormons, Methodists, and Presbyterians. In 1898 the total value of real estate, as assessed, was $16,364,656; of personal property, $6,822,555. The net proceeds of mines yielded in taxation the sum of $330,034; the total amount raised by taxation was $583,492. In 1898 the debt was but $682,611, the revenue $297,997, and expenses $355,461. Before 1892, when parties first divided upon the issue of free silver, Nevada was in most elections a Republican state; but since that year the free silver party has carried each election. In the Presidential election of 1896, when silver was adopted by both Democrats and Populists, their party carried the election by a very large majority. The population in 1890 was 45,761, showing a decrease of 16,505, or more than one-fourth, from that in 1880. In 1900 it was 42,335, showing a further decrease. The population in 1900 included 25,603 males and 16,732 females. The foreign-born population numbered 10,093, and the coloured 6930, of whom 134 were negroes, 1352 Chinese, 228 Japanese, and 5216 Indians. Out of 17,710 adult males, 2271 were illiterate (unable to write), of whom 372 were Chinese and 1398 Indians. (H. G*.)

Nevada, a city of Missouri, U.S.A., capital of Vernon county, on the Missouri, Kansas and Texas and the Missouri Pacific railways, in the western part of the state, at an altitude of 860 feet. It has an elevated level site and a regular plan, divided into five wards. It has varied manufactures, including a large smelter for reducing the zinc ores from the adjoining mining district. It is the seat of Christian University and of Cottery Female College. It contains also a state insane asylum. Population (1880), 1913; (1890), 7262; (1900), 7461, of whom 235 were foreign-born and 168 negroes.

Nevis, an island in the Leeward Islands group, British West Indies. Rum, sugar, and molasses are practically the only exports. Other products, chiefly for local consumption, are corn, yams, and sweet potatoes. The island has much declined in prosperity in recent years owing to the decay of sugar production, and it suffered from a severe hurricane in 1899. Population (1881), 11,864; (1891), 13,087; (1900), estimated at 15,305. Primary education is compulsory. Most of the inhabitants are Protestants.

New Albany, a city of Indiana, U.S.A., capital of Floyd county, on the north bank of the Ohio river, opposite Louisville, Kentucky, in the southern part of the state, at an altitude of 442 feet. It has a level site, a regular street plan, and is divided into seven wards. Besides the river, which is open to navigation throughout

(By permission of Goupil and Co., London.)

the year, its ways of commerce include four railways, the Baltimore and Ohio South-Western, the Chicago, Indianapolis and Louisville, the Louisville, Evansville and St Louis, and the Pittsburg, Cincinnati, Chicago and St Louis, bringing the city a large business. Aided by water-power from the falls in the Ohio, New Albany is a manufacturing city of much importance. In 1890 it had 298 manufacturing establishments, with a total capital of $5,342,071. The employés numbered 4506, and the products were valued at $6,631,924. These consisted in great part of glass and iron and steel goods, the former having a value of $1,117,000, and the latter of $1,178,469. Population (1890), 21,059; (1900), 20,628, of whom 1363 were foreign-born and 1905 negroes.

Newark, a municipal borough and market-town in the Newark parliamentary division (since 1885) of Nottinghamshire, England, on the river Trent, 19 miles north-east by east of Nottingham, and on the Midland and Great Northern railways. There are a new public library and public gardens, the latter including the ruins of Newark Castle; and a coffee-palace has been presented by Lady Ossington. Waterworks have been constructed at a cost of £120,000. The manufacturing industries of Newark, especially brewing, malting, and iron-works, have developed considerably of late years. Population (1881), 14,018; (1901), 14,985.

Newark, a city of Essex county, New Jersey, U.S.A., the largest city in the state. It is on the Passaic river, 4 miles from Newark Bay. It is irregularly laid out, with broad streets, less than half of which are paved, mainly with granite blocks and asphalte. Newark is upon five great trunk lines of railway, which connect it with New York, Philadelphia, and other points. These are the Central of New Jersey, the Delaware, Lackawanna and Western, the Erie, the Lehigh Valley, and the Pennsylvania. It contains an excellent public library. Two of its insurance companies have combined assets exceeding $100,000,000, and combined income exceeding, in the year 1899, $34,000,000. In 1900 it contained 3339 manufacturing establishments, with a total capital of $103,191,403. They employed 49,550 hands, and the products were valued at $126,954,049. The manufactures are extremely varied, the chief products being as follows: boots and shoes, $2,530,048; bread, &c., $2,540,245; chemicals, $3,113,095; clothing (men's and women's), $2,682,558; corsets, $1,298,754; fertilizers, $1,426,285; foundry and machine shop products, $5,536,893; hardware, $1,013,409; fur hats, $3,453,619; iron and steel, $1,169,744; jewellery, $7,364,247; leather, $10,857,192; malt liquors, $8,236,468; saddlery and harness, $1,184,178; slaughtering and meat-packing (wholesale), $3,093,396; varnish, $2,401,849. The assessed valuation of real and personal property in 1900 was $150,106,460; the tax rate, $22.40 per $1000, and the net debt was $14,177,641. The actual income of the city in 1900 was $6,080,707, and the total expenditures (exclusive of loans repaid) $7,011,401. The death-rate in 1900 was 18·44 per thousand. Population (1890), 181,830; (1900), 246,070, of whom 71,363 were foreign-born and 6694 negroes.

Newark, a city of Ohio, U.S.A., capital of Licking county, on the Licking river, the Ohio and Erie canal, and the Baltimore and Ohio and the Pittsburg, Cincinnati, Chicago and St Louis railways, in the central part of the state, at an altitude of 868 feet. It is regularly laid out on a level site, and is divided into eight wards. It is in a fertile farming region, a country also underlaid by coal and producing natural gas. The carriage works of the Baltimore and Ohio Railroad are situated here, and there are extensive and varied manufactures. Population (1890), 14,270; (1900), 18,157, of whom 1342 were foreign-born and 300 negroes.

New Bedford, a seaport city of Massachusetts, U.S.A., capital of Bristol county, on the estuary at the mouth of Acushnet river in Buzzard's Bay, in the south eastern part of the state. It has an area of 19 square miles of undulating surface, on which the city is laid out with a regular plan and divided into six wards. It has excellent water-supply and sewer systems. It is on a branch of the New York, New Haven and Hartford Railroad, and has regular steamboat communication with other points of Long Island Sound and the neighbourhood. New Bedford was at one time the headquarters of the American whaling fleet, and with the decline of that industry the city decreased in prominence. In recent years, however, the development of manufactures has revived it. In 1900 the manufacturing establishments numbered 618, the invested capital was $29,073,410, the average number of hands employed was 16,409, and the value of the products was $25,681,671. Of this sum about two-thirds, $16,748,783, represented cotton goods. The assessed valuation of real and personal property in 1900 was $57,884,452, the net debt was $3,175,011, and the rate of taxation $17.60 per $1000. Population (1890), 40,733; (1900), 62,442, of whom 25,529 were foreign-born and 1685 negroes.

Newbern, a city and seaport of North Carolina, U.S.A., capital of Craven county, in the eastern part of the state, at the junction of the Neuse and Trent rivers, at the head of their estuary. It is on the Atlantic and North Carolina and the Atlantic Coast Line railways, and has regular steamboat communication with the principal northern cities. It has a large trade in southern pine lumber, naval stores, tobacco, and cotton. Population (1890), 7843; (1900), 9090, of whom 89 were foreign-born and 5878 negroes.

New Brighton, formerly a village of Richmond county, New York, U.S.A., and since 1st January 1898 a part of the borough of Richmond, one of the five boroughs constituting New York city. Of this borough it forms the first ward. It is situated at the north end of Staten Island, across New York upper harbour from Manhattan borough, with which it is connected by ferry. It has large cotton warehouses and varied manufactures. Population (1880), 12,679; (1890), 16,423; (1900), 21,441 of whom 6575 were foreign-born and 259 negroes.

New Brighton, a borough of Beaver county, Pennsylvania, U.S.A., on the Beaver river and on branches of the Pennsylvania Railroad, in the western part of the state, at an altitude of 748 feet. It is in the coal region, and has varied manufactures. Population (1880), 3653; (1890), 5616; (1900), 6820, of whom 487 were foreign-born and 179 negroes.

New Britain, a town and city of Hartford county, Connecticut, U.S.A., on the New York, New Haven and Hartford Railroad, near the centre of the state, at an altitude of 179 feet. It has extensive and varied manufactures, consisting chiefly of iron and brass goods. In 1900 there were 226 manufacturing establishments, having a capital of $14,115,610, employing an average number of 8438 wage-earners, and turning out products valued at $12,260,782. The site was settled about 1650, and was originally comprised in the towns of Berlin and Framingham. It was incorporated as a town in 1850, and in 1871 the city of New Britain, formerly a part only of the town, was chartered. Population of the town, including the city (1890), 19,007; of the city (1890), 16,519; (1900), 25,998, of whom 9293 were foreign-born and 118 negroes.

New Brunswick, a province of the Dominion of Canada, lying between 45° 2′ and 48° 3′ N. and 63° 46′ and 69° 3′ W. Along the Bay of Fundy, and reaching inland 30 miles, the country is somewhat rugged and broken, and traversed by ridges rising 500 to 1000 feet above sea-level, with occasional summits 300 feet higher. This area is underlain by rocks of the Laurentian, pre-Cambrian, Cambrian, Devonian, and Lower Carboniferous, with considerable masses of intrusive granite. North of this, grey sandstones and conglomerates of Carboniferous age occupy a triangular area, the apex of which is near Oromocto Lake, the south side extending to Nova Scotia and the north-west side to Bathurst. Along the western border this area is 400 to 600 feet high, but near the coast it is low and flat. North-west of the Carboniferous a belt of 40 to 50 miles wide is occupied by Ordovician and pre-Cambrian formations, with large masses of intrusive granite. The Ordovician is composed of schistose, micaceous, and foliated slates and quartzites, in places highly altered and disturbed. The pre-Cambrian rocks consist of very hard cystalline reddish felsite, chloritic quartzites, and felspathic and micaceous schists. The surface of this region is rugged and broken, and traversed by mountain ranges having an elevation of 1500 to 2000 feet, with isolated peaks rising 2500 to 2700 feet above sea-level. The remainder of the province to the north-western boundary is occupied by Silurian rocks, mostly calcareous slates, and shales associated with beds of limestone. The general level of this area varies from 500 to 800 feet, with ridges rising much higher, and in it is found some of the best agricultural land. The whole province has been mantled with ice in the Pleistocene period, and boulder-clay and later modified deposits occupy the surface. Marine clay and sand containing fossil shells are found along the coast.

Climate.—The climate, though subject to extremes, is healthy. The average mean temperature in summer is 60° F., and in winter 19° F. The average rainfall for twenty-seven years (1874 to 1900 inclusive) was 31·9 inches, and the average snowfall for the same period was 99·1 inches.

Game.—Laws for the protection of game have been in force for some years, and moose, caribou, and deer have of late increased rapidly. The hunting grounds, though many miles in the unbroken forest, are readily accessible. In 1902 an Act was passed authorizing the executive to set apart a large area of the highlands at the sources of the Tobique, Nipisiquit, and Miramichi rivers for a national park and game preserve. Much of this district is covered with the primeval forest, and abounds in beautiful lakes and clear sparkling streams. It is the centre of the best hunting grounds in the province, and its selection for a park will preserve many of the fur-bearing animals from total extinction.

Area and Population.—The area of the province is about 27,911 square miles, with a population per square mile of 11·9. The following statistics show the population according to sex, occupation, and race:—

	1871.	1881.	1891.	1901.
Total population .	285,594	321,233	321,263	331,120

In 1901 there were 62,700 families, 168,639 males and 162,481 females.

Occupations of the People in 1891.—Agriculture, fisheries, and mining, 55,705; domestic and personal service, 17,437; manufactures and mechanical industries, 18,707; professional, 3863; trade and transportation, 12,005; non-productive, 1742.

In the census of 1901 the origin of the people is given as follows:—English, 104,701; Irish, 83,385; Scottish, 48,310; Dutch, 3623; French, 79,988; German, 3830; Indian, 1309; negro, 1368, and the remaining 4606 belong to twenty different nationalities. Of the whole population, 329,567 were either born in Canada or are now naturalized citizens.

Constitution and Government.—The province is represented in the Federal Parliament by ten senators, appointed for life, and fourteen members of the House of Commons, elected for a term of five years. Since the abolition of the Legislative Council in 1892 provincial affairs have been managed by a lieutenant-governor and executive council of six paid members, and from one to four without portfolios, and the House of Assembly, composed of forty-six members, elected for a term of four years.

Religion.—In 1901 the principal religious denominations and their adherents were as follows:—Church of England, 41,767; Church of Rome, 125,698; Presbyterians, 39,424; Methodists, 35,973; Baptists, 80,946; Congregationalists, 1033; Disciples of Christ, 1640; Adventists, 1124.

Education.—The total expenditure for schools in 1901 was $600,340, including the Government grant to teachers amounting to $163,952. In 1882, with a population of 321,233, the number of schools was 1411, there were 1445 teachers, and the pupils numbered 52,667. In 1901, with a population of 331,120, there were 1741 schools, 1841 teachers, and 66,760 pupils. There are three chartered institutions which grant academic degrees, viz., the University of New Brunswick, Fredericton; the University of Mount Allison College, Sackville; and St Joseph's College, Memramcook, Westmorland county.

Finance.—The province has increased its revenue by imposing succession duties on estates above a certain value, by levying a tax on banks, insurance companies, telegraph and telephone companies, &c., and by taking a share of the proceeds of liquor licences. The total revenue in 1901 was $1,031,267, including $275,692 received from the Dominion Government on an old railway claim; and the expenditure $910,346, the gross debt $3,476,502, and the assets, not including public buildings, $700,238. Value of public buildings about $370,000. Crown lands, 7,000,000 acres at $1 per acre minimum value.

Defence.—New Brunswick forms the eighth military district in the militia of Canada. The active force is composed of one regiment of cavalry (4 squadrons), two batteries of field artillery and one regiment of garrison artillery, one company of engineers, and five regiments of infantry and rifles, a total of 209 officers and 2359 non-commissioned officers and men, together with a permanent force, one company (Fredericton) of the Royal Canadian Regiment of Infantry, and No. 8 Bearer Company Medical Corps.

Production and Industry.—Although many minerals of economic importance are known to occur in the province, not much progress has yet been made in mining, as the quantity of ore in most cases has been limited. Borings are now being carried on for coal and oil. The mineral production in 1901 was valued at $450,000. The total number of occupiers of land in 1891 was 40,836; of these 37,853 were owners, 2860 tenants, and 123 employés. Much attention has been given to the co-operative manufacture of butter and cheese, and the dairy school at Sussex has done good work in disseminating knowledge regarding these subjects. In 1901 there were 56 factories in operation, which made 1,887,370 pounds of cheese, the value of which was $175,205; there were also 35 factories, which produced 542,626 pounds of butter, valued at $111,043. These amounts are exclusive of large quantities of home-made butter and cheese. The acreage and state of lands occupied is shown as follows:—in 1891 the acres were—total occupied, 4,471,250; total improved, 1,509,790; under crop, 1,018,704; in pasture, 479,607; woodland and forest, 2,961,460; gardens and orchards, 11,479. The largest crops are oats, buckwheat, and potatoes, but barley, wheat, pulse, and rye are also grown. In 1901 there were shipped to transatlantic ports 398,874,725 superficial feet of deal, &c., and 6317 tons of timber. Of the former St John contributed 176,295,257, and the port of Miramichi 125,664,411. The total value of the products of the forest exported in 1899 was $6,148,900. Animals and their products in 1891 were: horses, 59,773; oxen, 7510; milch cows, 106,649; other horned cattle, 90,533; sheep, 182,941; swine, 50,945; domestic fowl, 662,433; cheese, 39,716 ℔; butter, 7,798,268 ℔; wool, 692,898 ℔.

Fisheries.—Provision is made for the distribution of $160,000 annually among fishermen and vessels. Of this amount New Brunswick received $13,563 in 1900, divided among 234 vessels (2969 tons) and 890 men, 670 boats and 1184 men. In the same year the total number of vessels employed in the fisheries was 299 (4058 tons) manned by 1080 men, and 7050 boats manned by 11,559 men. 5440 persons were employed in the lobster canneries. The total value of vessels, boats, nets, lobster canneries, fish-houses, and all other material used in the fisheries was approximately $2,361,087. The value of the fisheries for 1900 was $3,769,742, of which the most important items were herring, $919,619; lobsters, $506,383; sardines, $293,945; cod, $345,618; and salmon, $246,540. Fish products, $223,544.

Manufactures.—Considerable progress has been made in the manufacture of cotton and pulp. In 1891 there were 5 cotton mills, employing 1752 hands, and the value of the finished product was $1,750,000. Four mills for the manufacture of pulp have been erected, 2 at Chatham and 2 near St John, with a total capacity of 140 tons of pulp every 24 hours. As large areas are covered by a heavy growth of spruce, the best wood for making pulp, there is room for great expansion in this industry. In 1891 the number of manufacturing establishments was 5429; capital invested, $15,821,855; hands employed, 26,675; total wages, $5,970,914; total value of raw material, $12,501,453; and the value of the articles produced, $23,849,655. In 1885 the exports amounted to $6,489,293, and the imports to $5,972,836; in 1901 the former reached $14,886,454, and the latter $6,741,848.

Shipping and Navigation.—The registry books for 1900 show that there were 927 sailing vessels and steamers, net tonnage, 78,708; of these 122 were steamers, gross tonnage, 10,247. In the same year 22 new vessels were built and registered; tonnage, 762.

Roads and Railways.—The provincial Government has replaced many wooden highway bridges by permanent structures of masonry and steel. Amongst new railways are the New Brunswick and Prince Edward Island Railway, from Sackville to Cape Tormentine; the Moncton and Buctouche Railway, from Moncton to Buctouche, on Northumberland Strait; the Kent Northern Railway, from the Intercolonial Railway to Richibucto and Palmerston; the Caraquette Railway and Gulf Shore Railway, from the Intercolonial near Bathurst to Tracadie; the Restigouche and Victoria Railway, under construction; the Albert Southern Railway, from Albert to Alma; the Central Railway, from Norton on the Intercolonial to Chipman in Queen's county; the Canada Eastern, connecting Fredericton with Chatham and Loggieville; St John Valley and Rivière du Loup Railway, from Fredericton to Woodstock (6 miles), under construction; York and Carleton Railway, from junction with the Canada Eastern Railway at Cross Creek station to Stanley; and the extension of the Central Railway from Chipman to Fredericton, under construction. The railways west of the St John river and the line on the east side from Fredericton to Andover are owned and worked by the Canadian Pacific Railway Company, except the Shore Line Railway, between St John and St Stephen. In 1901 there were 1444 miles of railway in operation. Telephone lines connect most of the principal places, and are also used in country settlements.

Towns.—The cities and towns are Fredericton, 7117, the capital; St John, 40,711; Moncton, 9026; Chatham, 4868; St Stephen, 2840; Campbelltown, 2652; Sackville, 1875; Woodstock, 2984; Richibucto, 1700; Bathurst, 1550; St Andrews, a favourite summer resort, 1800; St George, the seat of an extensive granite industry, 850; Dalhousie, 1000; Sussex, noted for its dairy products, 1500; Marysville has extensive lumber trade, and one of the largest cotton mills in the Dominion, 1892; Hillsborough, noted for valuable gypsum quarries, 700; Milltown has extensive lumber trade and cotton mills, 2146; Dorchester is the seat of the Maritime Penitentiary, 1000.

W.)

New Brunswick, a city of New Jersey, U.S.A., capital of Middlesex county, on the Raritan river and the Pennsylvania Railroad. It has extensive manufactures, largely of indiarubber and iron and steel goods. Rutgers College, including the state mechanical and agricultural college, now a part of it, in 1899 had 35 instructors and 306 students. Its total income during that year was $67,253. Population (1890), 18,603; (1900), 20,006.

Newburg, a city of Orange county, New York, U.S.A., on the west bank of the Hudson river, 60 miles above New York. It has four railways, the New York, New Haven and Hartford, the New York Central and Hudson River, the Erie, and the West Shore. In 1900 it contained 253 manufacturing establishments, with a total capital of $5,214,536, and employing 3926 hands. The products were valued at $6,497,088, the chief items being clothing, valued at $1,594,475, and foundry and machine-shop products, valued at $543,356. Population (1890), 23,087; (1900), 24,943, of whom 4346 were foreign-born and 558 negroes.

Newbury, municipal borough and market-town in the Newbury parliamentary division of Berkshire, England, on the river Kennet, 17 miles west by south of Reading by rail. Municipal buildings have been erected, and a thorough system of drainage has been laid down. Newbury possesses the right to elect boys and girls to Christ's Hospital. All householders may vote. A very important wool market is held annually in July. There are well-preserved specimens of ancient houses. Population (1881), 10,144; (1901), 11,061.

Newbury, John Strong (1822–1892), American geologist, was born at Windsor, Conn., on 22nd December 1822, and received a medical education. In 1851 he settled in practice at Cleveland, but in 1855 he was appointed surgeon and geologist to an exploring party in northern California, and in 1857 his reports on the geology, botany, and zoology were published. Between then and 1861 he was employed on similar work in the region of the Colorado river, and his researches over a large area of previously unknown country in Colorado, Utah, Arizona, and New Mexico were recognized as of high value. During the Civil War he did important work as a member of the U.S. Sanitary Commission, his organizing capacity being specially marked during the operations in the Mississippi valley. In 1866 he was appointed professor of geology and palæontology at the Columbia School of Mines, where he started a magnificent collection of specimens; in 1869 he was made state geologist of Ohio and director of the Geological Survey there, and in 1884 palæontologist to the U.S. Geological Survey. His work was recognized by his inclusion in most of the learned societies of America and the Old World; he received the Murchison medal of the Geological Society of London in 1888, and was president of the American Association for the Advancement of Science (1867), of the New York Academy of Sciences (1867–91), and of the International Congress of Geologists (1891). He published several volumes dealing with his own subjects. He died at New Haven, Conn., on 7th December 1892.

Newburyport, a city and seaport of Massachusetts, U.S.A., capital of Essex county, on the south side of the Merrimac river, 3 miles above its mouth, and on a line of the Boston and Maine Railroad, in the north-eastern part of the state. Formerly prominent in shipbuilding and as a whale-fishing port, its industries now mainly comprise the manufacture of boots and shoes, cotton goods, &c. It still possesses some commerce and fisheries. Population (1890), 13,947; (1895), 14,552; (1900), 14,478. of whom 2863 were foreign-born and 97 negroes.

New Caledonia, a French island in the Pacific, at the southern extremity of Melanesia, with an area of 5,187,000 acres, or about 8100 square miles. In 1898 the population numbered 52,756, consisting of 5585 colonists, 1714 soldiers, 1762 officials, 31,874 natives, 1829 labourers from the New Hebrides, India, and China, 7477 convicts condemned to short periods of imprisonment, and 2515 freed but restricted as to residence. The centres of population are Nouméa, the capital, with 6968 inhabitants, of whom 4010 are free, Bourail, an agricultural penitentiary (1800), La Foa, in the centre of the coffee plantations, Moindu, St Louis, and St Vincent. Since the great Kanaka insurrection of 1878, order has been maintained without interruption. The colony is administered by a governor, who exercises military power through a marine infantry colonel, and civil power with the assistance of a privy council, a director of the interior, a judicial head, and a director of the penitentiary administration. There is also an elective general council. Nouméa is the seat of a superior tribunal, a tribunal of first instance, and a tribunal of commerce. The island and its dependencies are divided into five arrondissements. Nouméa alone has (since 1879) a municipality, other localities being administered by commissions. The local budget for 1900 balanced at 3,407,876 francs. More than half of the expenditure of France, 6,643,748 francs, is incurred for the penal establishment.

Of the whole area of the colony more than one-half is mountainous: 500 square miles are occupied by forests capable of being worked; 1600 are in pasture-land, and 1600 consist of cultivable lands in alluvial valleys, where coffee, maize, tobacco, sugar-cane, the vine, vegetables, potatoes, and some of the cereals are grown with success. Coffee was introduced about 1870, and so well has it prospered that there are now at least 1,500,000 coffee bushes. Cheap agricultural labour is supplied by the convicts, by the liberated convicts, the Kanakas, and labourers from the New Hebrides. The soil is in three domains: that of the state, for the working of which concessions may be granted under the decree of 1897; that of the penitentiary administration, 400 square miles; and that of the native reserve. Notwithstanding their wealth, the forests are not worked. The colony contains, besides many horses, 130,000 head of cattle and sheep, and the meat-preserving industry has begun. The mineral deposits are abundant. Gold is found in the valley of the Diahot, as well as lead and copper at Balade. Iron is found everywhere. The yearly output of nickel exceeds 20,000 tons; of chrome, 2500 tons; and these minerals, with cobalt, constitute the characteristic wealth of the island. Coal covers more than 450 square miles in five basins, and kaolin is found in places. Gypsum and marble also deserve mention. The industries have not made great progress. The chief industrial establishments are smelting furnaces for cobalt, meat-preserving works at Ouaco, sugar-works and distilleries at Nouméa and La Foa, tobacco, oil, and soap factories at Nouméa. The commerce in 1888 amounted to £480,000, of which £200,000 represented the trade with France. In 1900 the total was £820,000, of which £480,000 was for imports and £340,000 for exports, the share of France in that year having been 45 per cent. of imports and 47 per cent. of exports. The island takes wines, spirits, tissues, clothing, and ironmongery; and sends ores, nickel, cobalt, chrome, copper to the amount annually of £208,000, preserved meats and hides, £20,000 to £24,000, coffee and colonial produce to a like amount. In 1898 the shipments of coffee reached 296 tons. There are as yet only 125 miles of carriage roads, but in the mountainous regions there are many footpaths.

Annexed Islands.—The islands annexed to New Caledonia are: (1) the Isle of Pines, 30 miles south-east, with a population of 600. A decree of 1886 assigned the island as a place for hardened criminals. (2) The Wallis Archipelago, placed under the French protectorate on 5th April 1887, and for administrative purposes connected with New Caledonia by decree of 27th November 1888. There is a French Resident in the islands, which since 1891 have been connected by a regular service with Nouméa. The archipelago, lying to the north-east of Fiji, in about 13° 2′ S. and 176° W., has an area of 40 square miles. The principal islands are Uea, of volcanic formation and surrounded with coral, and Nukuatéa. It was a missionary, Father Bataillon, who in 1837 first brought the influence of France to bear on the natives. These, about 4500 in number, are of Polynesian race and live on yams, and are gentle and industrious. The trade of the islands is mainly with Samoa, whence cottons and iron goods are imported, and to which copra and roots are exported. (3) The Loyalty Islands, 60 miles east of New Caledonia, consist of three large and a multitude of small islands, with a total area of 800 square miles. The population amounts to 14,800. The natives cultivate the banana and yams, and export sandal-wood. (4) The Union Islands, 170 miles north-west of New Caledonia, are almost barren. (5) The islands of Fotuna and Alofa, discovered in 1616, to the south-east of the Wallis Islands, were placed under the French protectorate by decree of 16th February 1888. They have 1500 inhabitants.

The New Hebrides are not classed among the possessions of France, but are under the joint supervision and protectorate of France and Great Britain. The convention of 24th October 1887 entrusted to a mixed commission of naval officers on the British and French stations in the Pacific the duty of protecting life and property. France, having withdrawn her garrisons, engaged not to send her convicts to the archipelago.

Newcastle, the second city of New South Wales, both as regards trade and population, situated at the mouth of the river Hunter, about 62 miles north of Sydney, in 32° 55′ S. and 151° 49′ E. It is the seat of a Church of England bishopric, and there are numerous churches of all denominations. The New South Wales Government has spent very large sums on the construction of breakwaters and training-walls and on dredging and blasting, so that it may now be reckoned in most respects an excellent port, though it is dangerous to enter during east-south-east gales. The amount of silt, sand, and rock removed during 1899 was 2,183,000 tons. Newcastle comprises, besides the city proper, various suburbs: these, with their population in 1901, were Newcastle (city), 12,988; Stockton, 2549; Carrington, 2547; Wickham, 7752; Hamilton, 6124; Merewether, 4547; Adamstown, 2420; Waratah, 3080; New Lambton, 1578; Lambton, 3159; Wallsend, 3820; and Plattsburg, 3177, making the total population of the city and suburbs 53,741. There are 23 coal-mines at Newcastle and in its immediate vicinity, as well as 34 mines in the surrounding district, of which Newcastle is the shipping port. These mines employed, in 1899, 7815 hands, and the quantity of coal raised was 3,259,700 tons, of which about 600,000 tons were sent to Sydney, and 2,478,400 tons exported to places outside New South Wales. There is a growing trade in other articles than coal, and in 1899, out of a total export of £1,630,814, the value of coal was £882,857, and of other goods £747,957; included in this sum was wool valued at £529,876, horses £32,579, cattle £17,289, preserved meat £48,000, silver lead £36,905, and copper ingots £15,674. Biscuit-making is one of the most important manufactures, one establishment employing 500 hands. Newcastle is the fourth port of Australasia, ranking after Sydney, Melbourne, and Adelaide. During 1899, 973 deep-sea vessels, with a tonnage of 1,283,620 tons, entered the port; the majority of these vessels arrived in ballast. In the same year 974 vessels, of 1,283,157 tons, cleared directly from Newcastle, nearly every country of the globe being represented. The Government owns nearly all the wharfage, and has constructed nearly 13,000 feet of frontage. The wharves are equipped with steam and hydraulic cranes capable of shipping 25,000 tons a day.

Newcastle is represented in Parliament by six members, and there are twelve municipalities looking after the local affairs of the city and suburbs, though one would suffice. The total revenue of these municipalities in 1899 was £38,183, of which £24,881 was derived from rates and charges placed directly on assessed properties. The disbursements amounted to £38,815. The capital value of all properties liable to assessment was £5,430,700, and the annual value £316,270. The combined debts of the municipalities amounted to £142,498. There were, in 1899, 10,414 dwellings in these municipalities, and 247 miles of streets, of which only 96 miles were properly macadamized. Newcastle city, Hamilton, Merewether, and Wickham have each twelve aldermen; the other eight municipalities have nine each. The water supply of the Hunter river district, of which the twelve municipalities form part, is pumped direct from the Hunter river, about a mile and a half above West Maitland, and is finally drawn off to six local reservoirs. The capital cost of the works was £519,000. Only a small part of Newcastle and suburbs is regularly drained. In the city proper there were, in 1899, 12½ miles of drainage, constructed at a cost of £18,251. Newcastle and Lambton are supplied with electric light by their respective municipal councils; the local council of Waratah owns its own gas-works, and there are also two private companies supplying the city and suburbs with gas. Communication between the various parts is maintained by tramways and ferry-boats. The Great Northern Railway runs from Newcastle to Wallangarra, on the Queensland border, where it joins the Queensland railway system; at Hamilton the railway from Sydney joins the Northern system, at a point 102 miles distant from Sydney. There is tramway communication with Plattsburg, Tighe's Hill, and Merewether. Steam ferry-boats run at short intervals across the harbour to Stockton and Bullock Island. The Government has established a technical college and museum and 17 public schools, several of which have from 750 to 1100 pupils on their rolls. The Roman Catholic Church has 15 schools, some of which are of considerable size, and there are 11 private undenominational schools and colleges. There is a school of arts or mechanics' institute in the city and in each suburb: the Newcastle School of Arts is a handsome building, with a library of 15,000 volumes, fine reading-room, lecture-hall, and class-rooms. There is a large hospital for the insane, two general hospitals subsidized by the state, and the Wallsend Hospital. There are also several subsidized charitable institutions. The Victoria Theatre was erected in 1891, at a cost of £20,000. The Anglican Cathedral of Christ Church, in course of erection, will cost £20,000. Several of the other churches are handsome buildings. Amongst other prominent public buildings are the Law Courts, the School of Mines and Trades Hall, and the Post and Telegraph Office, all excellently designed. The municipality has provided excellent salt-water swimming-baths in Newcomen Street. The town and harbour are defended by Fort Scratchley, on Allan's Hill. The climate is not unlike that of Sydney, except that it is a little hotter and there is a somewhat smaller rainfall. The mean temperature is 64·6°, the mean summer temperature being 72·4°, and the mean winter 55·5°. The highest recorded temperature over a long series of years was 107·5°, and the lowest 31·3°. The average rainfall is 48 inches per annum, and the number of rainy days 128. (T. A. C.)

Newcastle, a city in the western part of Pennsylvania, U.S.A., capital of Lawrence county, at the junction of the Shenango and Neshannock rivers and at the intersection of five railways; altitude 814 feet. It is in the coal-mining region, and has extensive paper, glass, iron, and steel works, including blast furnaces and machine shops. Population (1890), 11,600; (1900), 28,339, of whom 5324 were foreign-born and 463 negroes.

Newcastle-on-Tyne, a city of Northumberland, England, 273 miles north-north-west of London by rail, on the river Tyne, 8 miles from its mouth, with stations on the North-Eastern Railway and branch lines. The central station has received very extensive additions, and is connected with the south by a new railway bridge, and with the Blyth and Tyne station by an underground line. Population (1881), 146,000; (1891), 186,300; (1901), 214,803; but in 1899 the area was increased largely east and west—following the course of the river—to 5400 acres. The rateable value of the union increased from £715,000 in 1881 to £1,279,713 in 1901. Newcastle is the largest undivided parliamentary constituency in the United Kingdom, returning two members, with 35,983 voters. The government is vested in a mayor, 16 aldermen, and 48 town councillors. In 1899 there were 7780 births, 4887 deaths, and 2280 marriages; the birth-rate was 31·6 per 1000, the death-rate 20·9 per 1000. The water-supply is in the hands of a company. The reservoirs have a water area of 854 acres and a capacity of 5,051,316,362 gallons, providing for 500,000 people. A gas company (rate, 2s. per 1000 cubic feet) and two electric light companies light the town. A system of electric tramcars is in operation. The corporation has organized an excellent police force and fire brigade, and established baths and wash-houses in populous districts. Clubs for working men, of which there are seven, are an interesting social feature. Very few of the old buildings remain. The Castle, Black Gate, and some Elizabethan houses on the Side and Sandhill are all that point to bygone days. Of churches, the cathedral of St Nicholas has been improved at a cost of £20,000; especially fine are the choir-stalls, chancel, and alabaster reredos. St George's, Jesmond, built by the late Mr Charles Mitchell, is a landmark for miles around, and is celebrated for its beautiful interior. Four other new Established churches have been erected, and the Nonconformists have also built many places of worship, especially in Jesmond, now the chief residential quarter. Among scientific institutions may be mentioned the Literary and Philosophical Society, the buildings of which, after being burnt down in 1893, have been restored and extended; the Antiquarian Society; the Mining Institute; the Natural History Museum; and the Tyneside Geographical Society. The Public Library has been in existence since 1880, and two branches have been established in populous suburbs. The total number of volumes, including patents, is over 110,000, with issues to the extent of 4,840,000 a year. In the news-room there were, in 1882, 420,000 readers; in 1899, 1,550,000. Educational work has made great advances. The University of Durham has its colleges of medicine and science here. In the former, degrees in medicine and surgery are granted; in the latter, with which the school of art has been incorporated, degrees in science and literature. Both carry on their work in buildings replete with modern scientific apparatus. The Rutherford College and the Commercial Institute provide excellent technical and commercial education. The Royal Grammar School is being removed to new buildings in Jesmond, where there are also two public day-schools for girls. The school board has accommodation in its 21 schools for 23,036 children. The cost per head is £2, 11s. 7¾d., and the rate 10d., as compared with an average rate of 10¼d. in the country (London included). There are also several voluntary schools, with seating for 15,762. The Royal Infirmary (1751) is being housed in a new building, to the cost of which the public subscribed £100,000, the late Mr John Hall £100,000, and Mr Watson-Armstrong £100,000. The hospital for sick children, Moor Edge, and the eye infirmary are additions to the charities of the town. The Theatre Royal in Grey Street was destroyed by fire in 1899 and the Vaudeville Theatre (the old art gallery) in 1900. Of open spaces there are the Town Moor, Castle Leazes, Nun's Moor, and recreation ground (1269 acres); and six well-laid-out parks. The Elswick Works, founded by Messrs Armstrong in 1847, have been largely extended, particularly since the amalgamation with Mitchell and Co., the shipbuilders; and the construction of ships of all sorts, including the largest ironclads with all their armour and guns, is now carried on. Shipping business is centred in the quayside, where every facility for loading and unloading ships is provided. A large grain warehouse is at the east end of the quay, from which ships run to all parts of the world. The new exchange is in the Guildhall. As regards trade, the vessels that go right up to Newcastle are often claimed at North or South Shields. Any statistics issued for Newcastle alone in this connexion would in consequence be misleading, and the figures given below are therefore those for the Tyne ports—Newcastle and North and South Shields. The shipping returns were as follows:—

Year	Number and Tonnage Vessels registered.		Number and Tonnage of Vessels entered and cleared, with Cargoes.				Quantities of Coal and Coke exported (tons).	
	No.	Tonnage.	No.	Tonnage entered.	No.	Tonnage cleared.	Coastwise.	Foreign.
1880	1030	373,055	6847	1,740,979	16,307	5,860,224	2,974,705	5,159,624
1890	810	390,065	6110	1,780,241	14,740	7,222,145	3,874,955	5,791,802
1898	844	512.799	5485	1,862,992	12,767	7,323,458	5,352,012	6,760,621

The following table gives the value of imports and exports:—

Year.	Total Imports.	Total Exports.	Exports of Coal and Coke.
1880	£8,505,156	£5,110,457	£2,041,175
1890	8,100,031	7,711,649	4,497,002
1898	8,959,906	5,688,769	3,122,006

The figures of the exports and imports of the Tyne for 1899 show a general increase in the trade of the port. Coal exports show an increase of 149,963 tons over the figures of 1898. General exports show an increase of 13,300 tons, most countries showing increases except Italy and the Netherlands. Chemicals, especially sulphate of soda, caustic soda, were exported in larger quantities in 1899 than usually. Pig-iron, iron-work, steel, iron bars and plates, castings and machinery, fire-clay goods, and copper were largely exported. The chief imports are fruits, wheat, maize, oats, barley, iron and steel, petroleum, sulphur ore, timber and wood hoops, iron ore, potatoes. The value of imports in 1899 was £8,139,700. In 1899, 1235 British and 1711 foreign ships entered the port. (H. SH.)

Newcastle-under-Lyme, parliamentary and municipal borough of England, in the county of and 16 miles north-west from the town of Stafford, and 147 miles by rail north-west of London. Within the last few years the town has been greatly improved, the main streets have been rearranged and widened, and several handsome public buildings have been erected, notably the new town hall and the high school. It has industries of brewing and paper-making. Down to 1885 the town returned two members to Parliament, but since that date only one. Population (1891), 18,452; (1901), 19,914.

Newchwang, a treaty port at the head of the Gulf of Pechili, China. It has shown considerable vigour as a port of trade, sharing in the general prosperity of the province of Manchuria, of which it is the outlet. In 1898 the value of the trade was £4,634,470; in 1899, £7,253,650; and in 1900, £3,418,400 (when trade was disorganized by the Boxer rising), as compared with £1,850,000 in 1881. The principal exports (42·7 per cent.) are beans, bean-cake and bean oil, and wild silk. Of imports (57·3 per cent.) the principal are cotton yarn and cotton cloth, most of the latter being drawn from the United States in preference to English-made goods. The population of the town is estimated at about 60,000, and the number of resident foreigners is about 150. Railways connect the port with Tientsin and Peking on the one hand, and with the Russian territories lying to the north on the other. In 1895 Newchwang was occupied by Japanese troops, and the town was included in the cession of territory originally granted by the treaty of peace. By a supplementary convention it was retroceded by the Japanese under pressure of France and Russia. (See also CHINA.)

Newcomb, Simon (1835-——), American astronomer, was born in Wallace, Nova Scotia, on 12th March 1835. He became a resident of the United States in 1853, and graduated at the Lawrence Scientific School of Harvard University in 1858, having paid special attention to mathematics and astronomy. He assisted in the preparation of the American *Nautical Almanac* for 1857. In 1861 he became professor of mathematics in the United States navy, and was put in charge of the great 26-inch equatorial erected at Washington Observatory in 1873. In 1877 he was appointed director of the American *Nautical Almanac*, a post which he held until March 1897. In 1894 he became professor of mathematics and astronomy at the Johns Hopkins University, continuing, however, to reside at Washington. He was also editor of the *American Journal of Mathematics* for many years. In view of the wide extent and importance of his labours, the variety of the subjects of which he treats, and the unity of purpose which has guided him throughout, Simon Newcomb must be considered as one of the most distinguished astronomers of his time. A study of his works reveals an unusual combination of skill and originality in the mathematical treatment of many of the most difficult problems of astronomy, an unfailing patience and sagacity in dealing with immense masses of numerical results, and a talent for observation of the highest order. On assuming the directorship of the *Nautical Almanac* he became very strongly impressed with the diversity existing in the values of the elements and constants of astronomy adopted by different astronomers, and the injurious effect which it exercised on the precision and symmetry of much astronomical work. Accordingly he resolved "to devote all the force which he could spare to the work of deriving improved values of the fundamental elements and embodying them in new tables of the celestial motions." The formation of the tables of a planet has been described by Cayley as "the culminating achievement of astronomy," but the gigantic task which Newcomb laid out for himself, and which he carried on for more than twenty years, was the building up, on an absolutely homogeneous basis, of the theory and tables of the whole planetary system. The results of these investigations have, for the most part, appeared in the *Astronomical Papers of the American Ephemeris*, and have been more or less completely adopted for use in the nautical almanacs of all countries. A valuable summary of a considerable part of this work, containing an account of the methods adopted, the materials employed, and the resulting values of the various quantities involved, was published in 1895 as a supplement to the *American Ephemeris* for 1897, entitled *The Elements of the Four Inner Planets and the Fundamental Constants of Astronomy*. In 1867 Newcomb had published[1] an important memoir on the orbit of Neptune, which was followed in 1874 by a similar investigation of the orbit of Uranus.[2] About twenty-five years later the tables of

[1] *Smithsonian Contributions to Knowledge*, vol. xv.
[2] *Ibid.* vol. xix.

these planets were revised by him in view of all the observations which had accumulated in the meanwhile at Washington, Greenwich, Paris, and Cambridge. In the meantime the theory of Jupiter and Saturn had been thoroughly worked out by G. W. Hill, Newcomb's distinguished collaborator in the *Nautical Almanac* office, and thus was completed one important section of the work projected by Newcomb in 1877.

Among Newcomb's most notable achievements are his researches in connexion with the theory of the moon's motion. His first work on this abstruse subject, entitled *Théorie des Perturbations de la Lune, qui sont dues à l'action des Planètes*,[1] is remarkable for the boldness of its conception, and constitutes an important addition to theoretical dynamics. For some years after the publication of Hansen's tables of the moon it was generally believed that the theory of that body was at last complete, and that its motion could be predicted as accurately as that of the other heavenly bodies. Newcomb showed that this belief was unfounded, and that as a matter of fact the moon was falling rapidly behind the tabular positions. With the view of examining this question, he undertook the reduction of every observation made before 1750 which appeared to be worthy of confidence. In an elaborate memoir[2] he showed that the ancient solar eclipses described by Herodotus, Thucydides, and others, which seemed to require an increased value of the secular acceleration of the moon's mean motion to bring them into line with modern results, might safely be neglected, the ambiguity of the accounts in each case rendering uncertain either the totality of the eclipse or the place from which it was visible. In his investigation he employed the eclipses of the moon recorded in the Almagest, the Arabian eclipses between A.D. 800 and 1004, extracted from Caussin's translation of Ibn Jounis, the eclipses and occultations of Bullialdus, Gassendus, and Hevelius, of the French astronomers at Paris and St Petersburg, and of Flamsteed at Greenwich, and deduced a secular acceleration of $8''\cdot8$, agreeing very well with the theoretical value.

On taking charge of the 26-inch equatorial at the United States Naval Observatory, Newcomb devoted it almost exclusively for the first two years to observations of the satellites of Uranus and Neptune, being of opinion that it was better to do one thing well than many things indifferently. The results of these skilfully conducted observations were published in a memoir on *The Uranian and Neptunian Systems*.[3] From this research it appears that the orbits of all four satellites of Uranus are sensibly circular, and although no special search was made, he concludes that none of Sir William Herschel's supposed outer satellites can have any real existence. From the motion of the satellites he finds that the mass of Uranus is $\frac{1}{22600}$th of that of the sun, while for the planet Neptune he finds a mass equal to $\frac{1}{19380}$th of the sun, agreeing with the value previously found by him from the perturbations of Uranus within $\frac{1}{60}$th of its amount. As early as 1860 Newcomb communicated an important memoir to the American Academy,[4] *On the Secular Variations and Mutual Relation of the Orbits of the Asteroids*, in which he discussed the two principal hypotheses to account for the origin of these bodies—one, that they are the shattered fragments of a single planet (Olber's hypothesis), the other, that they have been formed by the breaking up of a revolving ring of nebulous matter.

In the *Astronomical Papers of the American Ephemeris* will be found a large number of contributions from Newcomb's pen on some fundamental and most important questions of astronomy. Among these are papers on *The Recurrence of Solar Eclipses, A Transformation of Hansen's Lunar Theory, Development of the Perturbative Function and its Derivatives*. His memoir *On the Motion of Hyperion, a New Case in Celestial Mechanics*, is in some respects one of his most original researches. He has discussed the transits of Venus of 1761 and 1769, and those of Mercury from 1677 to 1881. At the international conference, which met at Paris in 1896 for the purpose of elaborating a common system of constants and fundamental stars to be employed in the various national ephemerides, Newcomb took a leading part, and at its suggestion undertook the task of determining a definite value of the constant of precession, and of compiling a new catalogue of standard stars. The results of these investigations were published in 1899,[5] and have been in use since the beginning of 1901. In the intervals of these immense labours, on which his reputation as an astronomer will rest, he has found leisure for works of a lighter character, *e.g.*, his *Popular Astronomy* (1878), and his *Astronomy for Schools and Colleges* (1880), written in conjunction with Professor E. S. Holden. Since his retirement from official life he has published an excellent popular treatise on *The Stars, a Study of the Universe*. He has also written on questions of finance and economics.

He received the honorary degrees of D.C.L., Oxford, and Sc.D., Cambridge and Dublin. In 1872 he was elected an associate of the Royal Astronomical Society, receiving its gold medal in 1874. In 1877 he was elected a foreign member of the Royal Society, which in 1890 awarded him the Copley medal.

New Forest, one of the few woodland regions left in England, covering about 93,000 acres in the south-west of Hampshire, between the Solent, Southampton Water, and the river Avon. About two-thirds of it is Crown property, and is preserved more or less in its natural condition as open woodland interspersed with bogs and heaths. The trees principally represented are oak and beech, with some newer plantations of Scotch fir. The trees were formerly felled for building the ships of the navy, and for feeding the iron furnaces of Sussex and Hampshire. Pigs and a hardy breed of ponies find a good living in the forest; and in spite of an Act in 1851 providing for their extermination or removal, a few red deer still survive. Foxes, squirrels, otters, snakes (smooth snake, grass snake, and adder), butterflies (some of them peculiar to the district), and an occasional badger range the forest freely. The tract derives its name from the extensive afforestation carried through in this region by William the Conqueror in 1089; and the deaths of two of his sons within its confines—Richard killed by a stag, and William Rufus by an arrow—were regarded in their generation as a judgment of Heaven for the cruelty and injustice perpetrated by their father when appropriating the forest. About one-fourth of the area is under cultivation by private owners and tenants. The principal village within the forest is LYNDHURST (population, 2167 in 1901); its church contains a fresco by Lord Leighton; and there is the Verderers' Court, which since 1887 has had charge of the Crown portion of the forest. BROCKENHURST and BEAULIEU, the latter with the ruins of an abbey founded by King John, are the villages next in importance.

See J. R. WISE, *The New Forest* (4th ed. 1883), with over sixty engravings by W. J. Linton and a dozen etchings by H. Sumner; and BLACKMORE, *Cradock Nowell* (1866).

NEWFOUNDLAND.

I. Geography and Statistics.

NEWFOUNDLAND, the oldest British colony, and the nearest part of North America to Europe, occupies very nearly the same geographical position relative to the east coast of the New World which Great Britain does to the west coast of the Old, but lies rather farther south. The area of the island, which has a greatest length from north to south of 350 miles, and an average breadth of about 130 miles, is estimated at 40,200 square miles. The population in 1891 was 197,934; in 1901 it was 216,615. In 1900 the marriage-rate was 8·63, the birth-rate 31·42, and the death-rate 16·78 per 1000. There is a steady flow of emigrants to Canada and the United States. Including 3634 persons in that part of Labrador (120,000 square miles) over which Newfoundland exercises jurisdiction (see Labrador), the total population of the colony in 1901 was 220,249. Of these 76,259 were Roman Catholics, 72,650 Episcopalians, 60,812 Wesleyans, and 10,528 members of other denominations, including 6516 of the Salvation Army. Education is purely denominational, with all the defects of such a system. Each religious body receives its own separate grant and has its own inspector. In 1899 the number of schools of all kinds was: Roman Catholic, 316, with 288 teachers; Church of England, 243, with 240 teachers; Methodist, 206, with 203 teachers. Of these, the total number aided in 1898 was 662, with 28,397 pupils; and the total expenditure, including Government grants, fees, &c., was $176,345, or about £35,260. The attendance at Roman Catholic board schools in 1899 was 12,949; at Church of England, 11,373; at Methodist, 9459; giving a total of 33,781. At the colleges of the Roman Catholic, Church of England, and Methodist bodies there were 244, 199, and 452 students respectively. There is a General Council of Higher Education, on which all the denominations are represented, and which holds examinations, grants prizes, &c. A sum of about £800 is placed at its disposal annually. Much good work has been done by this body.

The administration underwent little change in the last quarter of the 19th century, and is still in the hands of a Governor appointed by the Crown, an Executive Council (increased to 9 members at the end of 1900), a Legislative Council, which must not exceed 15 members, and a House of Assembly, now consisting of 36 members elected, on a manhood franchise, from 18 districts containing (1897) 49,474 electors. The following table shows the revenue and expenditure in various years:—

	1885.	1890.	1895.	1901.
Revenue . .	£207,500	£300,000	£325,721	£402,000
Expenditure .	283,000	410,000	281,809	401,800

Of the revenue in 1899, as much as £322,000 was derived from the customs; loans provided £15,000, and the post office £11,000, these three practically supplying the whole of the revenue. The public debt in 1901 was £3,475,700, and no less than £135,000 of the expenditure went to pay the interest thereon. The other principal items of the expenditure were: public charities, £43,500; the post office, £43,000; education, £31,800; and the administration of justice, £26,800. There is no regularly constituted military organization, but a military police force numbers 150 men.

The mineral resources have been only very partially explored, but important discoveries have been made, and the island is now known to contain considerable deposits of iron, coal, and copper. Iron is distributed all over the island, but exceptionally large beds of ore have been found and are being worked on Bell Island, in Conception Bay on the east coast, and rich deposits have also been discovered on the west coast. Coal of excellent quality is found near St George's Bay and Codroy on the west coast, and in the Grand Lake district. Copper ores are at present the most valuable mineral product. In the eastern part of the island gold-bearing quartz rock and extensive deposits of silver and lead ore have been found. The Government geologist valued the total export of all minerals in the ten years 1888–98 at £1,614,500, in which total copper ore and regulus figures for £1,218,000, and iron pyrites for £314,000. The principal items in the output for 1898 were: copper ore and regulus, 66,798 tons, valued at £56,500; pyrites, 32,835 tons, valued at £33,000; and iron ore, 102,000 tons, valued at £21,000. These and smaller items brought the value of the total output up to £121,000.

The census of 1891 gave the following as the agricultural returns for the island:—

Improved land—acres	64,494	Turnips—barrels .	60,235
In pasture—acres .	20,524	Horses . . .	6,138
Wheat and barley—bushels . .	491	Milch cows . .	10,863
Oats—bushels . .	12,900	Other horned cattle .	12,959
Hay—tons . .	36,032	Sheep . . .	60,841
Potatoes—barrels	481,024	Swine . . .	32,011
		Fowl . .	127,420

Since that date there has been a marked increase in the extent of land farmed: a bonus of $20 per acre for cleared land has been offered by the Government, and the area under cultivation is over 100,000 acres. Compared with the neighbouring colonies, Newfoundland as an agricultural country is in a very backward state; but the soil on the east side of the island, where most of the inhabitants reside, and where the largest amount of cultivation is carried on, is far inferior to the land in the river valleys and on the west coast. Generally speaking, it is simply a thin gravelly loam. With abundance of manure, however, and a moist atmosphere, it produces wonderful crops of hay, oats, barley, potatoes, and turnips. On the west coast, especially in Codroy valley and round St George's Bay, there is excellent land, and a good deal of farming is carried on by settlers of Scottish and French descent coming from Lake Breton. Everywhere in the island considerable tracts of land are reserved for cattle and sheep grazing.

In spite, however, of the development which has taken place in mining and agricultural industries, these are still overshadowed in importance by the *fisheries*. In 1891, 53,502 of the inhabitants were engaged in the fisheries of all kinds and subsidiary industries, using 1242 vessels of about 74,600 tons, and 20,000 boats. The deep sea or Bank fishery is engaged in by American, French, Canadian, and Newfoundland ships, to which two or three Portuguese schooners still add themselves. The American Bank fishery is a rapidly declining industry, though supported by such high protective duties that sea fish is excessively dear in the United States. In 1880 there were 200 American schooners engaged in the Bank fishery; in 1901 the number did not exceed 100, the average annual catch of which may be set down at 150,000 quintals. (A quintal is one-twentieth of a ton.) Many of the American schooners combine halibut fishing with trawling for cod. The French Bank fishery, which once employed over 10,000 men, is also declining, notwithstanding the enormous bounties and prohibitory duties by which the industry is bolstered up. 108 vessels now come from France every year, and 187 from St Pierre, the total number of men employed being something under 5000. In good years the catch may be set down at about 350,000 quintals.

British ships from Canada and Newfoundland at one time prosecuted the Bank fishery to a very large extent, a large bounty being allowed from the Imperial funds. After this bounty was discontinued the industry rapidly declined, and though it revived for a period during 1880–1900, it has again fallen off. The annual Canadian catch on the Banks and off the coast of Labrador is about 100,000 quintals, but only about sixty vessels from Newfoundland, employing 900 men, are engaged on the Banks, and the average catch per schooner is about 1000 quintals. In short, the Bank fishery is not at all in a flourishing condition. Though productive, it is attended by heavy expenses, and the loss of human life is every year very great, the Americans alone losing from seventy to a hundred hands annually. The mainstay of the fisheries is, however, the shore fishery, prosecuted all round the coasts and off the coast of Labrador, for the total quantity of cod-fish caught annually in Newfoundland waters by ships of all nationalities amounts, on an average, to 2,500,000 quintals of the value of from £1,800,000 to £2,000,000, and in this total the Newfoundland catch figures for no less than £1,200,000. Thus, though the total value of the catch of cod-fish has decreased, owing to the decline in the Bank fishery, by about one-third, the value of the Newfoundland catch has remained fairly constant. Statistics for particular years, however, fluctuate greatly, the fisheries being largely affected by wind and weather and ice on the coast. The fish caught round the Newfoundland coast are generally of good quality, but the Labrador cure, owing to the short season, is often very inferior. The winter herring fishery, though quite subsidiary to the cod fishery, is a considerable industry, the principal share in which during the past few years has fallen to Placentia Bay. As soon as caught the fish are frozen and shipped to the United States and Canada. The tinned lobster industry has grown considerably, nearly 3,000,000 pounds weight being exported in 1898, of the value of £127,750, but in 1899 the catch was 50 per cent. short. Since 1880 the question of French rights on the west coast has become one of great importance (see below, *History*). It is only necessary to state here that the French, whose fishery on the west coast is insignificant, are not allowed by the Bait Act of 1888 to obtain bait from Fortune Bay, and that the British, by the *modus vivendi* of 1890, since renewed at intervals, are not allowed to increase the number of their lobster factories on the west side of the island.

SKETCH MAP OF NEWFOUNDLAND.

The artificial hatching of cod and lobster, started by the Government in Trinity Bay, has been a great success as a scientific experiment, but economically a complete failure. Whale fishing, once carried on extensively, has been successfully revived. Seal fishing is now engaged in almost exclusively by steamers. The seasons are regulated by strict laws: no steamer can sail before 10th March; no seals can be killed before 12th March or after 1st May; only one trip is allowed. The catch fluctuates greatly, varying from 297,000 (1895) to 190,262 (1898). The inland salmon fishery, owing to neglect, is only valued at a little over £12,000 annually. More attention is now being paid to this subject, however, and there is already manifest improvement. Sea trout and brook trout abound. Latterly Lochleven and the Californian rainbow trout have been introduced and are flourishing. The principal manufacturing establishments are at St John's. In the island generally there are about half a dozen large lumber mills and fifty smaller ones;

340 lobster factories scattered round the coast; oil factories for making seal oil, cod oil, and cod-liver oil; a large factory for the manufacture of fish guano, and one large pulp factory. The value of these and the fourteen chief establishments in St John's is estimated at over £184,000; their annual production is valued at nearly £300,000. Altogether they give employment to about 6350 persons.

The following table shows the annual value of the imports and exports at various intervals:—

	1885.	1890.	1895.	1901.
Imports .	£1,395,500	£1,313,500	£1,233,233	£1,520,000
Exports .	948,700	1,258,000	1,364,011	1,672,000

The chief imports and exports in 1899 were:—

Imports.		Exports.	
Flour (415,738 brls.) .	£300,472	Dried cod . . .	£913,362
Textiles, apparel .	235,205	Cod oil . . .	53,880
Salt pork . . .	70,298	Seal skins . . .	28,062
Molasses . . .	45,731	Seal oil . . .	51,788
Hardware . . .	52,326	Lobsters (tinned) .	116,170
Tea	32,598	Herring (pickled) .	34,183
Butter . . .	22,411	Copper and ore .	59,974
Leather . . .	32,135	Iron ore and pyrites .	66,302

Of the imports, the value of £397,607 came from Great Britain; £429,060 from Canada; £396,336 from the United States. Of the exports, the value of £296,561 went to Great Britain; £111,313 to Canada; £164,311 to Portugal; £393,055 to Brazil; £127,408 to the United States. The total number of vessels registered at St John's in 1890 was 2207 of 98,619 tons; in 1899 the total number registered in the whole colony was 2441 sailing vessels of 98,742 tons, 37 steamers of 8426 tons; total, 2478 vessels of 107,168 tons. The total tonnage of vessels entered and cleared in 1890 was 634,147 (590,006 British); in 1899 the total was 1,241,490 (1,045,572 British).

There are still only about 750 miles of postal roads and 1700 miles of district roads maintained. Railways have been greatly developed, however, north and west from St John's. A transinsular railway with various branch lines has been completed, and in 1899 there were in all 638 miles of line open. Communication between various points on the coast and between the island and the mainland is maintained by a fleet of eight first-class steamers, each of which connects with some central point on the railway. In 1899 there were 1314 miles of telegraph line open, running north and west from St John's; cables start for Europe from Heart's Content and for Canada and the United States from Placentia. The telegraph lines were given back to the Government in 1902. Throughout the greater part of the year there is regular communication between St John's and Liverpool. By various contracts the Government has made concessions to private enterprise, embracing the working of the Newfoundland Railway; mail contracts for bays, coasts, &c. (with an annual subsidy of £19,150); land grants extending to 5,000,000 acres; the graving dock at St John's; and the electric railway in the streets of St John's. There were in 1902 in St John's a Government savings bank and three Canadian banks, one of which has a branch at Harbour Grace. Before the bank crash of 1894 there were over 5000 depositors and over $2\frac{1}{2}$ millions of dollars in the savings bank; now there are 3000 depositors and about $1\frac{1}{2}$ millions of dollars.

(D. W. P.)

II. HISTORY.

French Shore question.

Since 1884 the island and its affairs have been more prominently before the British public than at any previous period in its history. This prominence has been altogether out of proportion to its population, wealth, or developed resources, being largely concerned with the revival, in a new form, of that ancient dispute with France known as the "French Shore" question. In 1884 a convention which had been arranged between the British and the French Governments was submitted to the colonial administration by its promoters, Sir Clare Ford and Mr E. B. Pennell, C.M.G., but without commanding the support of the Newfoundland Government. In the year following, on a change of ministry in the colony, the Ford-Pennell convention was, in a slightly amended form, again offered to the Newfoundland legislature, but the joint committee of the colonial House of Assembly and the Council absolutely refused to ratify the arrangement unless the French Government would consent either to annul or to amend the system of bounties paid upon French-caught fish in Newfoundland waters. At the same time, to counteract the effect of these bounties, which pressed very hardly upon the British competition, a Bait Act was framed and carried in 1886, empowering the executive to prohibit the capture in Newfoundland waters for exportation or sale of bait fishes, except under special licence to be issued by the colonial Government. The consequence of this measure, were its provisions properly enforced, would be to place an embargo upon the local supply of bait requisite to the French fishermen—the so-called "metropolitan fleet"—on the Grand Banks. Upon being apprised of this enactment, the French Government immediately demanded that Great Britain should deny its sanction to this Newfoundland Bait Act, and pressed their objections with such persistence as to induce Lord Salisbury to disallow the measure. Nevertheless, the despatch of the governor, Sir William Des Voeux, to the colonial secretary, Sir H. Holland, was so entirely in favour of the principle of the Bill that the Newfoundland authorities became imbued with a fixed determination to urge forward the measure for Imperial acceptance.

In 1887, therefore, a delegation consisting of Sir Robert Thorburn, the Premier, and Sir Ambrose Shea visited England at a moment most propitious for obtaining the sympathy and support of the Imperial Government and the press and people of the mother country, it being the jubilee year of Queen Victoria's accession to the throne. A conference of colonial premiers was one of the notable events distinguishing that happy period, and the subject was argued before the conference at considerable length. The claim set up by the senior colony "to control and legislate for her own fisheries" met with general approval, the single dissentient being the representative of Canada, who feared that Canadian fishermen would suffer under the Bill. When an assurance was tendered that Canada's fishermen would be placed upon the same footing with those of Newfoundland, the British Government somewhat reluctantly sanctioned the Bait Act. The stipulation was made, however, that it should not be enforced until the spring following (1888). In the meantime the chagrin of the French Foreign Office at the failure of the Ford-Pennell negotiations, and the hostile attitude taken up by the Newfoundlanders in what they deemed to be the conservation of their interests, induced M. de Freycinet to devise retaliatory measures. Instructions were issued "to seize and confiscate all instruments of fishing belonging to foreigners, resident or otherwise, who shall fish on that part of the coast which is reserved to our use." Lord

Rosebery, then Foreign Secretary, protested to the French ambassador against the spirit of these instructions, which he insisted were in direct contravention of the treaty, inasmuch as they ignored the concurrent as well as those sovereign rights of Great Britain which France solemnly undertook by the treaties never to question or dispute. Nor were other opportunities soon wanting to the French to retort severely upon the Newfoundland authorities for their passage of the Bait Act, as well as to repair in large measure the injury which that Act promised to inflict upon the French industry. About 1874 a Nova Scotian named Rumkey had established the first factory for the canning of lobsters on the west coast. This concern proving profitable, others sprang up, until, at the close of the season of 1887, Captain Campbell, R.N., reported that twenty-six factories were at work, employing about 1100 hands. It was at that time understood that this was an industry which, by the very nature of the process and the permanent shore structures it involved, the French were disqualified from pursuing. So clearly was this recognized that in 1886, when Commander Browne of H.M.S. *Mallard* reported the existence of a French lobster factory at Port-aux-Choix, a substantially-built structure, roofed with corrugated iron, the French authorities conceded that the establishment was in violation of the treaties, and issued orders for its removal. But this conciliatory policy was of brief duration. The year of the Bait Act's first successful application was marked by the stoppage, by order of the French Government, of Messrs Murphy and Andrew's lobster factory, and by their contention that the lobster-canning industry formed a part of the privileges conceded under the treaties to the French, whose participation by the British fishermen would be forcibly resisted.

An exchange of notes took place between Lord Salisbury and M. Waddington, the French ambassador, in which the latter expressed an opinion which evoked a spirited protest on the part of the British Foreign Office. "France," it was then declared, "preserved the exclusive right of fishing she always possessed. This right of France to the coast of Newfoundland reserved to her fishermen is only a part of her ancient sovereignty over the island which she retained in ceding the soil to England, and which she has never weakened or alienated." This claim of the French to an exclusive fishery was held to be wholly untenable, and their classification of the lobster catching and canning industry as amongst the "fishing" privileges granted them by the treaty was denounced as contrary to both letter and spirit of that instrument. Notwithstanding this, the French agents on the Treaty Shore clamoured for the removal of several of the British factories, which (it was declared) interfered with the exclusive fishing rights of the French. The French Government also voted (1888) a special bounty for the establishment of lobster factories by their subjects on the Treaty Coast. Pending a settlement, the British Foreign Office deemed it expedient, in order not to give offence to France, to invest the French claims with a semblance of right by issuing instructions to British naval officers on the North American station to continue to interpret and enforce the treaties with regard to the Newfoundland lobster-canning industry on the same terms as they had done hitherto with regard to the cod-fishery. Acting under a statute passed in the reign of George III. empowering British naval officers to interpret and enforce the treaties, Sir Baldwin Walker and others proceeded to destroy or remove a number of British factories at the request of the French agents. In 1890 the unexpected discovery was made that the Act empowering British naval officers to enforce the provisions of the treaties with France had expired in 1832 and had never been renewed. Consequently all the proceedings of which the colonists had been the victims were illegal. One of them, Mr James Baird, immediately took proceedings against Sir Baldwin Walker in the Supreme Court, which decided in his favour, mulcting the admiral in $5000.

On an appeal to the Privy Council the decision was upheld. But before this incident had taken place, the controversy between London and Paris culminated in the *modus vivendi* of 1890, by which the lobster factories, both British and French, which were in existence on the 1st July 1889, were to continue for the present. Instantly the colony took alarm, and a deputation consisting of the island's leading men was sent to England to protest against both the principle and practice of such an arrangement. On their return they learnt that it was the intention of the Imperial Government to re-enact *verbatim et literatim* the Act for the enforcement of the treaties which had expired fifty-nine years previously. To prevent such an occurrence, delegates from both parties in Newfoundland visited London in April 1891, and, appearing at the bar of the House of Lords, promised that if the measure which was then on the eve of being introduced into that body were withdrawn, a temporary measure would be passed by the Newfoundland legislature which would answer the same purpose of enabling Great Britain to carry out her treaty obligations with France. The hope then generally entertained was that the whole question of French rights in the colony would soon be the subject of definite negotiations looking to their total extinguishment. That hope was, however, not speedily realized. For a number of years the *Modus Vivendi* Act was annually passed by the legislature, each year under protest, the conviction gaining strength in the colony that the Imperial Government was averse from renewing negotiations with France.

In 1898 the Colonial Secretary, Mr Chamberlain, yielding to the urgent requests of the senior colony, despatched a commission consisting of Sir John Bramston and Sir James Erskine, with Lord Westmeath as secretary, on a tour of investigation throughout the Treaty Shore; and the report which the royal commissioners made (though not published) touched all points of the unhappy dispute. Again, in 1901, on a suggestion put forward by the colony, Mr Chamberlain summoned Mr Robert Bond, the Newfoundland Premier, and Hon. E. P. Morris to London, for a new conference on the French Shore question, in which Lord Lansdowne, the Foreign Secretary, participated. Nothing came of this, however. Some months later, on the occasion of the visit of the Prince and Princess of Wales, Mr Bond received the honour of knighthood. In 1902 the Legislative Assembly of the colony again, under protest, passed the *Modus Vivendi* Act.

Another great source of interest in Newfoundland was the Reid contract. This instrument was itself the sequence of a period of ambitious railway development in the colony, which dates from 1880, when a line from St John's to Hall's Bay was projected, and begun in the following year. In 1885 the construction of a line, 27 miles in length, from Whitbourne to Placentia, the old French capital, was begun and finished in 1888. Shortly afterwards it was decided to resume the line northwards from St John's to Hall's Bay, which, owing to the failure of the contractors, had been discontinued, with a view ultimately to a transinsular railway. Tenders were invited; one was accepted from a well-known contractor, Mr R. G. Reid, of Montreal, and the work commenced in October 1890. But before the contractor had proceeded far with the Hall's Bay line a new survey was made, and another route determined for the proposed transinsular railway, westwards from the Valley of the Exploits, which was regarded as much more favourable than the one originally contemplated. It traversed the Exploits and Humber valleys, passing through the most fertile territory in the island, to the Bay of Islands on the west coast; from hence it skirted St George's Bay and the Codroy valley, and terminated at Port-aux-Basques, a commodious harbour 93 miles distant from Sydney, Cape Breton. The new route was chosen, and a contract signed on 16th May 1893, whereby the contractor was to be paid $15,600 per mile in Newfoundland bonds, the whole line to be completed in three years. At the same time, in order to provide for the working of the line, it was agreed between the colonial Government and Mr Reid that the latter should maintain and work it, as well as construct a system of telegraphs, for a period of ten years from the 1st September 1893 at his own expense, in consideration of a "grant in fee simple to the contractor of 5000 acres of land for each one mile of main line or branch railway throughout the entire length of the lines to be operated." Should the line, therefore, be 500 miles in length, the land grant would be 2,500,000 acres, to be situated on each side of the railway in alternate sections of one or two miles in length with the railway, and 8 miles in depth, the colony also retaining an equal amount of land with the contractor along the route. Much hostile criticism was subsequently directed towards this arrangement; but as the land was an undeveloped wilderness, valued even by the Newfoundland Government at only 30 cents an acre, and as Mr Reid announced his willingness to dispose of it in blocks at the same figure, its chief and perhaps its only value must be considered as lying in the possibilities of future development. In any case, the financial disasters which overtook the colony in the following year would probably have rendered the expense of working and maintaining the line a most burdensome one. So far, therefore, the Reid contract, apart from the vast amount of land it placed in the hands of the contractor, presented few extraordinary features. But in 1898 a new proposal was made by Mr Reid, under the terms of which he undertook to work all the railways in the island for a period of fifty years, free of cost to the Government, provided that, at the termination of the said period, the said railways should become his own property. He was also to receive a further concession of land to the extent of 2,500,000 acres on terms similar to those contained in the former contract. Mr Reid agreed to build and run seven steamers, one in each of the large bays, and one to ply in Labrador in summer, to provide an electric street railway for St John's, and also to pave a certain portion of the capital. The colony was to part with the telegraph system to the contractor, who was to acquire at a fixed price the Government dry-dock at St John's. On the other hand, to complete the bargain, $1,000,000 in cash was to be paid by the contractor to the Government within a year after the signing of the contract. This remarkable covenant, which was afterwards characterized by Mr Chamberlain as a transaction "without parallel in the history of any country," was nevertheless ratified by the legislature, and submitted to the governor, Sir Herbert Murray, K.C.B., for his approval. The governor declined to append his signature to the instrument, but upon its being referred to the imperial secretary of state, it was decided that the arrangement was one relating exclusively to the colony, and this being the case, that it would be "an unwarrantable interference with the rights of a self-governing colony" to disallow the measure. The Reid contract was therefore signed by Sir Herbert Murray, who relinquished his post early in 1898. Meanwhile considerable feeling had been manifested in the colony; numerous public meetings in support of the governor's action were held; and several petitions were despatched to England, but it was not until the spring of 1900 that Sir James Winter and his colleagues were forced to resign on account of the opposition which had been engendered. The general election brought a Liberal, Mr Robert Bond, into power; and he had hardly assumed office when the contractor approached the ministry with further proposals to convert his property into a limited liability company with a capital of £5,000,000 sterling, for which proceeding the consent of the legislature was necessary, under the terms of 1898. Mr Bond refused unless a modification of the contract was agreed to. The modifications demanded were: That the telegraphs should go back at once to the Government; that the land grants, which included a large amount of private property, should be readjusted so as to conserve the rights of those whose holdings had been confiscated; also, that it should be optional for the colony to take over the railways at the end of fifty years by paying back the sum of $1,000,000 with interest, the amount paid by Mr Reid to the colony; and a sum to be arrived at by arbitration for all improvements that may have been made on the property within the fifty years. After considerable dispute these terms were substantially agreed to, and the conversion into a company took place.

Reid contract.

The year 1892 was marked by a disastrous conflagration, which, on the 8th and 9th of July, partially destroyed the Newfoundland capital. Eleven thousand of the inhabitants were rendered homeless, and the loss proved to be upwards of $15,000,000, including the destruction of the fine English cathedral, built from designs of Sir Gilbert Scott. Since the fire the city of St John's has been rebuilt on a considerably improved plan. Commerce received a shock, but derived a salutary lesson from the bank failures which occurred in December 1894. The Union and Commercial Banks suspended payment, followed by the suspension of the savings bank, a Government institution. This at once lowered the credit of the colony abroad, and caused the utmost misfortune amongst all classes. There is little doubt but that a principal cause of the disaster was the vicious and dangerous system of credit which had been followed by the merchants in their dealings with the "planters" and commission merchants. The insolvent institutions were speedily replaced by branches of three prominent Canadian banks, and a loan of $1,000,000, procured in London by Mr Bond soon after the *débâcle*, served to tide the senior colony over its financial difficulties. Since that period a new era of prosperity has set in, and there is generally a moderate surplus of revenue over expenditure.

In politics, apart from the matters already alluded to, there occurred in 1893 the filing of petitions under the Corrupt Practices Act to unseat Sir William Whiteway and his colleagues, who had been successful at the general election of that year. The charges created no little interest in England, and the new Government was subjected to much unfair criticism, arising largely from a misapprehension of the political and administrative conditions in the colony. They were examined in detail by the Supreme Court, which finally pronounced them unsustained, and the Whiteway Government resumed office after a brief period of abdication. On the whole, it may be said that Newfoundland has passed the critical stage in her history. Between 1863 and 1900 it has been estimated that $12,000,000 worth of copper ore has been exported, and since 1898, when a discovery of iron ore made at Bell Island, Conception Bay, led to important and valuable results, the belief in the island's mineral resources, long ago entertained by geologists, received practical corroboration. Whether any portion of it will prove profitable for purposes of agriculture is a matter which will be settled when the interior has been inhabited and the capabilities of the soil put to the test on a larger scale than any that has yet been attempted.

In 1900 the British Admiralty, acting upon the repeated suggestions of Sir Charles Dilke and others interested in the manning of the navy, decided to initiate a branch of the Imperial Naval Reserve in the colony. The experiment proved a success; but in 1901 a difficulty arose as to paying the men, owing to the lack of any provision for that purpose in the Imperial Reserves Act under which they were enlisted. The colony was asked to bear the cost; its refusal was followed (1902) by the enactment of special legislation rendering the enrolment and maintenance of the reserves in Newfoundland a special Imperial undertaking. Several efforts have been made to induce Newfoundland to confederate with the Dominion of Canada, but the project has never met with any degree of favour with the electorate, and is not now discussed by either party at the general elections. Much of the disfavour with which confederation is regarded in the colony is said to be due to Sir John Macdonald's opposition on behalf of Canada to the Bond-Blaine commercial treaty, which was negotiated between an emissary from the Government of Newfoundland and Mr Blaine, then Secretary of State of the United States of America, in 1890, but which was subsequently disallowed at his request by the Imperial Government. It is, however, probable that the treaty would never have received the sanction of the American Senate. After the insolvency of the colony in 1894–95, a delegation was sent to Ottawa to see if it were possible to arrange terms of confederation; but Sir Mackenzie Bowell's Government objected to the assumption by the Dominion of the entire amount of Newfoundland's debt ($16,000,000), and the negotiations were abandoned. (B. W*.)

New Granada. See COLOMBIA.

New Guinea, the largest island (excluding Australia) in the world, lying between the equator and 12° S. and 130° 50′ and 154° 30′ E., separated from Australia by Torres Strait, and having the Arafura Sea on the south-west. Since 1884 extensive explorations have been conducted, chiefly in the portion of the country east of the 141st meridian, which have now supplied us with an accurate outline of its coasts and a largely increased knowledge of the geography of the interior. The additions to our information regarding its biology and ethnography have during the same period been perhaps still larger.

Physical Geography.—New Guinea was probably in Miocene times, if not later, united to the northern part of Queensland. The deeply indented shore of the Gulf of Papua forms the boundary of the subsided area between the two countries, and from it the land stretches out for 200 to 300 miles north and west on both sides of the Fly river in vast plains, little elevated above sea-level. From Cape Buru westwards precipitous limestone cliffs, several hundred feet high, face the sea and rise into forest-clad mountains behind. The northern extremity of New Guinea is all but severed from the mainland by the deep Macluer Inlet, running eastwards towards Geelvink Gulf, which deeply indents the northern coast. Southwards from Geelvink Gulf the north-east coast is more regular than the south-western. Off its coast-line, on the parallel of 6° S., lies the vast Bismarck Archipelago, of which Neu Pommern is the most important member; and, on the parallel of 10°, the D'Entrecasteaux Islands, with the Bennett group to their north-east; while stretching out from the south-east promontory of the mainland is the Louisiade Archipelago. The Great Barrier Reef of Australia can be traced more or less continuously round the Papuan Gulf and along the south-east coast to the extremity of the Louisiades. In a general way it may be said that on the west coast of New Guinea, from Cape Buru to the Louisiades, the sea is shallow, while on its steeper eastern side the water close in-shore is often too deep for safe anchorage. The islands on the southern margin of the Louisiade Archipelago are raised coral reefs, but the majority are mountainous, rarely, however, exceeding 3000 feet; all of them are richly forested, but of little agricultural value. The volcanic D'Entrecasteaux Islands are mostly larger, more elevated (the highest being 8000 feet), and stand in deeper water than the Louisiade group. To the east of Kiriwina (Trobriand) lies a small group of uniquely formed islets, each of which is completely surrounded by a steep forest-clad marginal rampart of coral 300 to 400 feet high, concealing a depressed inhabited central plateau.

Starting in the southern extremity of New Guinea from an abrupt face some 3000 feet high, and traversing its centre nearly parallel to both coasts, run high ranges of mountains, which, if not continuous, merge into each other in the same general direction. The Owen Stanley range —its highest summit, named by Huxley in 1850 Mount Owen Stanley, 13,120 feet—the Albert Victor mountains, the Sir Arthur Gordon range, and the Bismarck mountains form a backbone running northwards to unite probably with the westerly-tending Charles Louis range—its main summit 16,000 feet, the loftiest in New Guinea, terminating in a bluff at Cape Buru. Between this backbone and the two seas ramify other ranges, mostly of lower altitude, parallel mainly to the east and west coasts. The most important and best-known rivers are the Amberno, in the north, discharging by a wide delta at Point d'Urville; the Kaiserin Augusta, which, rising in the Charles Louis range, and entering the Pacific near Cape della Torre, is navigable by ocean steamers for 180 miles; the Ottilien, a river of great length, which discharges into the sea a short distance south of the last named; and the Mambare, navigable by steam-launch for 50 miles, which drains the eastern aspect of the Wasigororo mountains and enters the sea near the Anglo-German boundary. Below 8° S. the narrowness of the country precludes the existence of any very important rivers on either coast. The Purari, however, whose delta is 20 miles long by 20 broad, is navigable for 120 miles by steam-launch, while the Fly has been traversed by the same means for 500 and by a whale-boat for over 600 miles. The latter drains an enormous tract of country, which is so little elevated above the sea-level that it can never be of any agricultural or commercial value. West of 141° E. the geographical features of the coast, except in the region of Macluer Inlet and Geelvink Gulf, are very little known, and those of the interior even less.

Geology.—The geology has hardly begun to be seriously investigated. The mountains on the north coast of the northern peninsula are apparently of Tertiary limestones, and the central ranges of sandstones, slates, and volcanic rocks. In the north-west coal deposits occur. To the south of 8° S. we find crystalline volcanic rocks, limestones, and bedded sandstones. Mount Trafalgar is an active volcano. The D'Entrecasteaux, Kiriwina, and Louisiade islands, where they are not of upraised coral, are composed of crystalline volcanic rocks and lavas, micaceous schists, limestones, and slates. Fergusson Island clearly shows remains of extinct craters, and possesses numerous hot springs, saline lakes, and solfataras depositing sulphur and alum. In Murua (Woodlark I.) are quarries of the banded quartzite from which the best stone adzes found throughout south-east New Guinea are made. In Rossel Island (Arova) occur crystalline schistose and volcanic rocks, and in Misima (St Aignan) limestones and lavas in addition. Nearly all the rivers in New Guinea yield "colours" of gold, but only in the Louisiade Archipelago has enough been discovered to constitute the district a goldfield. No auriferous reefs have yet been found. Black magnetic iron sand covers the shore in Milne Bay. In the upper Fly and Purari ranges limestone and sandstones have been observed, with coal in the Purari sandstones. Mount Owen Stanley is composed, according to Sir W. Macgregor, of schist and diorite. In Hall Sound occur Miocene shells identical with those from the same series in Victoria and South Australia. In the Gira river the valuable metal osmiridium has been discovered. Mabadauan hill, on the west of the Fly river, is of granite, which occurs again in the Arfak mountains. No Palæozoic fossils are yet known, and of Mesozoic a few fragments only have been doubtfully assigned to the Upper Oolite or Lower Cretaceous. With these exceptions the oldest fossiliferous beds are of Pliocene age.

Earthquakes are rare on the mainland, but not infrequent in Bismarck and D'Entrecasteaux Archipelagoes.

Climate.—Since the mountains as a rule traverse the island parallel to its coasts, the eastern shores have far less rain than the western. The amount which falls, chiefly at night, varies from 30 inches on some parts of the coast to 130 at others, and to a far greater but unknown amount in the mountains. Throughout the dry or cool season the wind blows steadily and almost uninterruptedly (except for an hour or so forenoon and afternoon) from the south-east. The temperature has an extreme range of from 72° to 95° F., with a mean of about 80°. At an elevation of 3000 feet the climate is pleasantly cool; at 13,000 feet ice forms in the night, but disappears with the heat of the sun. No snow is known certainly to fall, though it is alleged to have been seen from the sea lying on the summits of the Charles Louis range. Fever is very prevalent on the coasts, and even in the interior at 2000 feet above the sea. Though generally of a mild character, it is persistently recurrent, and slowly saps and wears out the constitution; too often it is virulent and rapidly fatal.

Fauna.—New Guinea shares in the poverty in mammals of the Australian sub-region. Monotremes (2 species) and marsupials (4 families and 44 species) predominate, but are not abundant. Among the latter two genera, *Distœchurus* and *Dorcopsis*, are peculiar. A pig (*Sus papuensis*), a dingo, several species of mice (of which *Chiruromys* is a peculiar genus), a few squirrels, and a considerable number of *Chiroptera* (bats) inhabit the country. The island is specially remarkable for the number and beauty of its birds. The most recent lists record over 500 species as found in the Papuan area, and of these between 50 and 60 genera are peculiar to it. The birds of paradise, which are confined to the sub-region, give special celebrity to its fauna. Between 70 and 80 species have already been described, many of them the

New Guinea.

most gorgeously adorned, and others, such as the *Pteridophora albertisi*, the most wonderful of feathered creatures. They are absent from the Louisiades, but species occur in the D'Entrecasteaux Islands which have not been seen on the mainland opposite. The zoology of the Bismarck Archipelago is but little known. The species of birds so far described from it number 178 (referable to 38 families), of which 74 are peculiar to it, though closely allied to Papuan forms. It contains, however, no *Paradiscidœ*. The *Amphibia*, to which the sea is a barrier, are almost exclusively of Australian affinities. Turtles and tortoises are plentiful on the coast. *Ceratochelys insculpta* of the Fly river, a chelonian peculiar to New Guinea, is remarkable in having its nearest affinities (as have the Papuan tortoises) with South American species. Of the lizards, 3 of the 6 species of *Varanidœ*, 16 of the 30 *Scincidœ*, 8 *Geckonidœ*, and 8 out of the 11 *Agamidœ* are peculiar. Salamanders, toads, and frogs are numerous, and crocodiles abound. Only 4 genera and 5 species of snakes are peculiar to New Guinea, many of them poisonous. Butterflies, moths, and bees are very abundant, the former being remarkable for their size and splendid coloration; but these groups have not been exhaustively enough investigated to afford a correct idea of their number or their true affinities. Although the list of *Coleoptera* already known is long, it represents only a fraction of the species remaining to be discovered. The land molluscs show relationship with the Indian and the Malayan sub-regions; but many forms have here their centre, and have spread hence into Australia and the Pacific islands.

Flora.—Most of the foreshores of New Guinea are eucalyptus-dotted grass lands; in the interior dense forests prevail to a height of many thousand feet. Vast tracts of the country have been, however, deforested by fire, and these are covered by the tall ineradicable grass, *Imperata arundinacea*. So far the highest altitudes yet botanically investigated are those of the Owen Stanley range and the mountains in Kaiser Wilhelms Land, but of the flora of the highest range of all—the Charles Louis mountains—nothing is known. The vascular plants already described number about 1500 species. In the low and sub-mountainous lands the flora is a mixture of Malayan, Australian, and Polynesian forms. There are, according to Müller, twice as many palms known from New Guinea as from Australia. The alpine flora, commencing at 6000 feet, is specially characterized by its rhododendrons, pines (*Araucaria* and *Libocedrus*), and palms, by numerous superb species of *Agapetes* (*Ericaceœ*), and on the summits by an extraordinary association of species characteristically European (*Rubus, Ranunculus, Leontodon, Aspidium*), Himalayan, New Zealandian (*Veronica*), Antarctic, and South American (*Drymus, Libocedrus*). Good pasture grasses are numerous, but pasture lands are limited. The usual tropical food plants are cultivated. Tobacco has been found growing in the interior, and may be indigenous, as is in some districts the Kava pepper (*Piper methysticum*). At Dorey a cotton plant (*G. vitifolium*) grows wild, and is also cultivated.

The People.—So large an area of New Guinea remains unexplored that it is impossible, except approximately, to state the number of its inhabitants, but probably 600,000 is under rather than over the mark. The people are broken up into numerous isolated tribes differing greatly in feature, colour, and language. Ethnically they belong as a whole to what should be more correctly designated the Melanian race, whose remaining members are the African negroes, the Australians, and the Melanesians of the Western Pacific. The study of their languages and of their arts and customs—by Mr Ray and Prof. Haddon—has greatly aided in clearing up the tangle of their affinities. The interior would seem to be inhabited by the aborigines, for there is no evidence of there ever having been any other occupiers. Where they are absent from the coast they have been forced inland by various more powerful immigrants, by Melanesians from the western Pacific on the north, north-east, and south-east coasts, and by Malays on the north-west. The Papuan, who is shorter than the European, less well-built than the Polynesian, but taller than the Malay, is smooth-skinned and in colour sooty-brown—deeper than the Melanesian's—or even black. He has long arms, long thin legs, a small dolichocephalous head, prominent nose, high narrow forehead, and dark eyes. His hair is black and frizzled, worn generally in a mop, often of large dimensions, but sometimes worked into plaits with grease or mud. The Melanesian closely resembles him, but is lighter in colour, of stronger build, coarser in feature, and less prognathous. The Papuan scarifies his skin; the Melanesians, especially the women, practise tattooing; ceremonies at the initiation of lads into manhood and symbolic dances are practised among the former, but are unknown to the Melanesians, who, on the other hand, make pottery, a craft of which the Papuans are ignorant. The Melanesians have ousted the Papuans from the coasts of the Port Moresby region, Hood Bay, South Cape, Milne Bay, and East Cape, and occupy as well the Louisiade, D'Entrecasteaux, and Bismarck Archipelagoes. The stream of Melanesian immigration, in Mr Ray's opinion, passes from the westward round the north of New Guinea to the Bismarck Archipelago, the Solomons, and the New Hebrides, whence a reflex wave has stranded some of the people on its south-eastern shores and among its islands. The Papuan languages have nothing in common with the Melanesian; their great peculiarity is their extraordinary diversity—"one language agrees with another neither in grammatical details, in constructive particles, nor in vocabulary." They apparently belong to "separate linguistic stocks," but there is "no evidence connecting them with any others outside the limits of New Guinea, unless there be a connexion with Australia" (Ray). It is not surprising, therefore, that the speech of people of villages only a few miles apart is quite unintelligible to each other. In character and disposition the Papuan and the Melanesian are equally devoid of forethought or ambition; they are rude, boisterous, and full of fun. Though they have no idea of hospitality, and at times practise a species of cannibalism, connected with sympathetic magic, they are less savage, cruel, and treacherous than report makes them. They have really been kindly disposed and friendly, on their first contact, with Europeans; they are not of a quarrelsome disposition among themselves or generally, and they are amenable to discipline; they are affectionate to their children, and not infrequently commit suicide from grief on the death of a relative or friend. The Papuan's decorative art, which has been copied by the Melanesian, is eminently artistic.

The *constitution of society* is everywhere simple. The people live in village communities whose members appear to be more or less inter-related. There are no priests and no hereditary chiefs. Totemistic clans have been observed in Torres Strait, and on the Finsch and west coasts. Throughout the whole island chiefship is quite unrecognized, except on the Keriwina islands. Possessions, such as gardens, houses, pigs, &c., belong to individuals and not to the community, and pass to the owner's heirs, who differ in relationship in different districts. The land within certain boundaries belongs to the tribe, but a member may take possession of any unappropriated portion. There are certain degrees of relationship within which a man may not marry. In some districts he may not marry into his own village, or into his mother's tribe; in others he may select a wife from certain tribes only. Payment, or a present, is always made for a wife to her father, brother, or guardian (who is generally her maternal uncle). Presents are also often made to the bride. Except in the region where is found the communal-house, each family has its own house, or the young people may occasionally share the parent's. Polygamy is practised, but not frequently, and from the wife (or wives) there comes no opposition. The child belongs sometimes to the mother's, sometimes to the father's tribe. The woman is the household drudge, and does the greater part of the outdoor work, but the man assists in clearing new gardens and in digging and planting the soil.

It is impossible to say that there is any idea of *religion* in our sense among the people. They all believe that within them resides an invisible other self, or spirit, which, if it occasionally wanders for a hurried tour from its home in the hours of sleep, goes forth for good at death, to hover for some period at least round the scenes of its embodied life before departing to some lone island or inaccessible summit. This ghost acquires supernatural powers, which at any time it may return to exercise inimically to relations or acquaintances who offend it. Being timid and suspicious, the natives live in constant dread of the darkness of the night, and in traversing the forest depths or volcanic mountains, as at such times and in such places malevolent—never embodied—spirits love to be abroad. These are the spirits which, taking up their abode in a village, cause disease and death; and to escape from such attacks the inhabitants may have to fly the village for good, and, by dwelling scattered in the recesses of the forest for a time before choosing a new site, they hope to throw their enemy off their trail. Spirits of evil, but not of good, therefore require to be propitiated. The powers of nature—thunder, lightning, and storm, all supposed to be caused by evil and angry spirits—are held in the greatest dread. Under the category of religious observances may perhaps come those held previously to the departure of the great trading or *lakatoi* fleet: their tabu-proclaiming customs, their ceremonial and sacred initiation ceremonies for boys and girls on reaching puberty, when masks are worn and the "bull-roarer" swung, as also the harvest festivals, at which great trophies of the produce of field and forest are erected, preparatory to a big feast enlivened with music and dancing. In the north and north-east of New Guinea ancestor-worship is widely practised. Amulets are worn to ensure success in buying, selling, hunting, fishing, and in war, as well as for protection against evil. Circumcision is practised in some regions, although Mahommedanism does not exist.

The more virulent, intractable, and fatal forms of disease are considered the machinations of some evil influence, acting directly, or through the witchcraft of an enemy. The dead are disposed of in various ways. The body is either buried or laid underground for a time, and then disinterred and the bones cleaned and deposited in or near the deceased's dwelling or in some distant cave; or the body is exposed on a platform or dried over a fire, and the mummy kept for a few years. Sometimes the head and portions of the skeleton are preserved as relics. Little houses are frequently erected over the grave as a habitation for the spirit. Soon after death food is offered to the departed, and that he may have no wants, his earthly possessions, after being broken, are laid near his resting-place, so that they also, following their owner, may be ready to his needs. A widow must shave her head, smear her body with black and the exudations of the corpse, and wear mourning for a long time. If ever the dead require to be mentioned, they are referred to by some roundabout phrase, and never by name, for this might have the dangerous result of bringing back the spirit.

In regard to *food*, yams, taro, and sweet potatoes constitute in some districts the main food of the people, while in others sago is the staple of their diet. Flesh, forest fruits, and vegetables also form additions to their food. Maize and rice—which are not indigenous—are eagerly sought after, and are now being rapidly introduced into cultivation. Cooking pots, made at various parts of the coast, form one of the great exchanges for sago; but where such vessels do not reach, food is cooked by the women on the embers, done up in leaves, or in holes in the ground over heated stones. The sexes eat apart. In the interior salt is an article specially craved and appreciated. In the Fly river region, kava, prepared from *Piper methysticum*, is drunk without any ceremonial importance. Tobacco is indigenous in some parts, and is smoked everywhere, except on the north-east coast and on the islands, where its use is quite unknown. In some few districts a species of clay is eaten.

The architectural abilities and taste of the people are seen in their *dwellings* and *bridges*. In the north, the east, and south-west of the island immense communal houses are met with. In some districts the sexes live not apart but together in one of these giant structures, each family having a stall for itself. Communal dwellings on a much smaller scale occur at Meroka, east of the Astrolabe mountains. As a rule, elsewhere each family has its independent dwelling. In some parts of the north-east coast the houses are built on the ground, but oftener they stand on a platform or verandah raised on piles, with the ridge-pole projecting considerably at the gables so that the roof may cover it at each end. Under this shade the inmates spend much of their time; here their meals, which are cooked on the ground beneath the house, are served. In a few districts villages are built at a short distance off the shore, as a protection against raids by the inland tribes. The interior villages are frequently situated on hill crests, or a-top of steep-faced rocks as difficult of access as possible, whence a view clear all round can be had. Where such natural defences are wanting the village is protected by high palisades and by fighting platforms on high trees commanding its approaches. On the north-east coast many of the villages are tastefully kept, their whole area being clean swept, nicely sanded, and planted with ornamental shrubs, and have in their centre little square palaver-places laid with flat stones, each with an erect stone pillar as a back-rest. Excellent suspension bridges span some of the larger rivers, made of interlaced rattan ropes secured to trees on opposite banks, so very similar to those seen in Sumatra as to suggest some Malay influence.

The *arts of war* are more conspicuous than those of peace on one's first acquaintance with the Papuan, for every man carries with him some form of weapon (or at least did so till lately). His armoury consists of the bow and arrow (in the Fly river region, the north, and north-east coasts); a beheading knife of a sharp segment of bamboo; a shafted stone club—rayed, disc-shaped, or ball-headed (in use all over the island); spears of various forms, pointed and barbed; the spear-thrower (on the Finsch coast); and hardwood clubs and shields, widely differing in pattern and ornamentation with the district of their manufacture. In British New Guinea alone is the man-catcher (a rattan loop at the end of a handle with a pith spike projecting into it) met with. In the D'Entrecasteaux Islands the sling is in use. For war actualities the natives smear themselves in grotesque fashion with lime or ochres, and in some parts hold in their teeth against the chin a face-like mask, supposed to strike terror into the foe, against whom they advance warily (if not timidly), yelling and blowing their war-trumpets. The war canoe, which is a long, narrow dug-out outrigger, capable of holding twenty-eight men, is only a transport, for they never fight in it. Victorious warriors wear as insignia of their success large white *ovula* shells, or the beak of a hornbill suspended on their forehead. The conch-shell is the trumpet of alarm and call to arms. The vendetta—resulting, when successful, in the bringing back the head of the slain as a trophy to be set up as a house-ornament—is very widely practised.

The *arts of peace*, on closer knowledge of the people, are after all more conspicuous than those of war. Attention to attire is everywhere observable, notwithstanding that in some districts the men go practically in a state of nudity. Except in one or two localities (on the north-east and west), the women are invariably decently clothed, and they are the most modest and virtuous perhaps of any "savages." The male attire is little more—indeed, often less—than is necessary for our ideas of decency. With this and the head encircled by a coronet of dogs' teeth, and covered by a network cap or a piece of bark cloth, the septum of the nose transfixed by a pencil of bone or shell, and perhaps a shell or fibre armlet or two, the Papuan is in complete everyday attire. On festal occasions he decks his well-forked-out and dyed hair with feathers and flowers, and sticks others in his ear-lobe holes and under his armlets; while a warrior will have *ovula* shells and various bones of his victims dangling from ringlets of his hair, or fixed to his armbands or girdle. The women almost universally wear a longer or shorter petticoat of grass or palm fibre suspended from the waist, the rest of the body, except when in mourning, being uncovered. The adornment of their persons—the tattooing of the skin, and the ornamentation of their belongings by carving, burning, or inlaying (generally of high artistic excellence)—enters largely into the occupation of their lives. The building of canoes is done by all tribes, yet some districts are the seats of professional boat-builders of great skill, the most elegant and most serviceable craft coming from East Cape and the Louisiades. These boats are either plain dug-outs, with or without outriggers, or regularly built by planks tightly laced and well caulked to an excavated keel. The most remarkable, however, of their vessels is the "lakatoi," composed of several capacious dug-outs, each nearly 50 feet long, which are strongly lashed together to a width of some 24 feet, decked, and fitted with two masts, each carrying a huge mat sail picturesquely fashioned. On the deck high crates are built for the reception of some thousands of pieces of pottery for conveyance annually to the Fly river district to exchange for sago. The natives are keen hunters by pursuit and snare. Fishing is done from catamarans mainly, the fish being speared, seined in excellent nets, or driven (by beating the water) into weirs. Music is the great peaceful art of the people, and is diligently extracted from Pan-pipes, a Jew's-harp of the Papuans' own fabrication, and the flute; the music of ceremony and occasion, however, can be evoked only from the drum—always open at one end—tapped by the fingers. To the accompaniment of the drum, dancing—as a rhythmic but stationary movement of the feet or an evolutionary march—almost invariably goes, but rarely singing. All sorts of jingling sounds also are music to the ear, especially the clattering in time of strings of beans in their dry shells, and so these and other rattles are found attached to the drum, leg-bands, and many of the utensils, implements, and weapons. The natives have domesticated no animals except the dog and the pig; they seldom keep cage birds, and still more rarely fowls, unless where they have been influenced by Europeans or Malays.

History.—The surveys and reports of Captain Moresby in 1874 brought home to Queensland (and Australia generally) the dangers possible to her commerce were the coasts opposite to Torres Strait and the entrance to the splendid waterway inside the Barrier Reef to fall into the possession of a foreign power. By authority, therefore, of Queensland, the mainland of New Guinea, opposite her shores east of the 141st meridian, was annexed to that colony in 1883. But this action was disallowed by the British Government, as Yule's (in 1846) and Moresby's (in 1874) had been. Finally, however, in 1884 a British protectorate was authoritatively proclaimed by Commodore Erskine over the region "lying between the 141st meridian eastward as far as East Cape, with the adjacent islands as far as Kosman Island." In 1885, after Germany had established a trading company on the north-east coast, the two countries agreed to fix their boundaries through the then neutral areas of the country. The result of this was the assignation to Great Britain of the portion now known as BRITISH NEW GUINEA, lying between the extreme limits of 5° and 12° S. and 141° and 155° E. To Germany were assigned all the territory and islands to the north of the British boundary under the name of Emperor William's Land (KAISER WILHELMS LAND), while all to the west of the 141st meridian remained under its old flag as DUTCH NEW GUINEA.

BRITISH NEW GUINEA.—The colony as defined above has an area of about 90,000 square miles, and a population estimated at 350,000, of whom only 250 are Europeans.

Government.—The British Protectorate, with its seat of government at Port Moresby, was subsidized by the three Australian colonies of Queensland, New South Wales, and Victoria, and lasted, under the administration of two successive special commissioners (Major-General Sir Peter Scratchley and the Hon. John Douglas), till the 4th September 1888, when it was proclaimed by the first Administrator—afterwards Lieutenant-Governor—Sir William MacGregor, a possession of Queen Victoria. Its constitution is that of a Crown colony in association with Queensland. The Lieutenant-Governor is aided by an executive and a legislative council, and advised by a native regulation board. Justice is administered by petty sessions in the four magisterial districts into which the possession is divided, with a central court at Port Moresby having the jurisdiction of a supreme court, from which in certain cases an appeal lies to the Supreme Court of Queensland. Order is maintained by an armed constabulary force, under a European officer, of over 100 natives from different districts, whose members are found to be very efficient and trustworthy. Queensland guaranteed the colony £15,000 for ten years, but that sum is contributed to by Victoria and New South Wales as well as Queensland, so that all the three states have a voice in its administration. The expenditure has been kept more or less to the limit assigned, and the revenue, mainly derived from customs duties, is rapidly increasing to meet all needs. Only £5110 in 1895, it was in 1899 £11,683.

Commerce and Trade.—The making of mats, fishing-nets, shell ornaments, decorated gourds, and stone implements, and the manufacture of pottery, canoes, and sago, constitute the chief native industries, which are the subject of barter between different regions. European industries include gold mining, in which 500 miners, besides natives, are engaged (chiefly as yet in the Louisiade Archipelago, where, though small quantities of the metal are found alluvially over a wide area, no reefs have been discovered), and the bêche de mer and pearl-shell fisheries, which were formerly more productive than at present. Copra is naturally largely prepared, as cocoa-nut palms are very numerous, and are being every year extensively planted. A small amount of tortoise-shell is collected. The rubber industry is, according to Sir W. MacGregor, "important and promising." Species of *Palaquium*, the genus from which, in the Indian Archipelago, the best gutta-percha is obtained, occur on the hills, and from their cultivation there might in time be obtained a large revenue independently of European labour. Timber of economic value is scarce. Red cedar (*Cedrilla*) abounds in the riverine flats, but the quality is poor and commercially valueless; and oaks are plentiful, but the wood is coarse. Small quantities of ebony and sandal-wood are exported. "There can be no reasonable doubt that the sugar-cane, which is native and present in a great many varieties, sago, cotton, probably also indigenous and of exceptionally fine quality, will eventually be valuable" (MacGregor). The trade of British New Guinea is exclusively with the Australian colonies. Imports were valued at £72,286 in 1899–1900 (an increase of over £20,110 in the year), and exports (including the gold mines) at £56,167 (£68,500 in 1898–99). In foreign trade 112 vessels of 20,733 tons entered and 95 of 19,110 tons cleared; in the coasting trade 528 vessels of 13,221 tons entered and cleared. The postal movement in 1898–99 included 7767 letters, 2120 newspapers, and 640 packets. (H. O. F.)

GERMAN NEW GUINEA.—The German protectorate of New Guinea, so called after the island which contributes the greatest area, comprehends, besides the islands which are now commonly called the Bismarck Archipelago—viz., Neu Pommern, Neu Mecklenburg (New Ireland), with Neu Hannover and the Admiralty Islands (New Britain)—the Solomon Islands (Bougainville and Buka). There are besides nearly 200 smaller islands and islets scattered amongst their greater neighbours. The mainland district is designated Kaiser Wilhelms Land, for the physical geography of which see the introduction to this article.

Annexation.—New Guinea was annexed on the 16th November 1884, when the German flag was raised in Friedrich Wilhelm Hafen.

European Enterprise.—In 1884 New Guinea was absolutely wild, not a single white man living on what is now the German part. On the islands Neu Pommern (New Britain) and Mioko only two trading firms had their establishments; and on Neu Lauenburg (Duke of York) the Wesleyans had a mission station. After the annexation commercial enterprise set in at once, hand in hand with political administration. Now on the mainland and in the islands plantations have been established and tobacco and cotton have been successfully grown. Three German mission societies formed settlements on New Guinea, with a branch one on the Gazelle peninsula. The protectorate is included in the Universal Postal Union; each harbour has its post office, also a leading official with a number of assistants to control the natives and the revenue. It is divided into two districts with separate administrations, New Guinea and the Bismarck Archipelago; over both presides the governor, whose residence is Friedrich Wilhelm Hafen on New Guinea. A small police force of natives has been formed. In each district there is a registry of deeds and a court of law, and in New Guinea a court of appeal, of which the governor is president. A line of steamers plies between New Guinea, the Bismarck Archipelago, and Singapore. A special silver coin of rupee value has been introduced. The area of the protectorate is approximately 91,000 square miles. It is impossible to speak with any precision of the number of the population, but a density of 4 per square mile may not give too high a figure.

Statistics.—The revenue of New Guinea is derived from taxes, dues, and licences, and amounted on the 31st of March 1892 to about £3000; on the same rate, 1901, to £3750. The annual revenue is averaged at £5000, and the expenditure at £4200. The New Guinea Company was to receive £20,000 for transferring proprietorship to Government. The New Guinea Company imported in 1885, £37,145; 1890, £24,722; 1895, £21,915; 1899, £53,000; 1900, £36,600; and exported in 1895, £30,906; in 1899, £46,955; in 1900, £17,500. In 1895 there were 138 Europeans, 7 trading firms; in 1901 there were 301 Europeans, 6 trading firms, with 56 trading stations in various parts of the country.

(J. VON P.)

DUTCH NEW GUINEA comprises all the western portion of the island. The boundary on the east, separating it from British New Guinea and German New Guinea, was finally settled in 1895. Starting from the south coast, it follows 141° 1′ 48″ E. up to the Fly river, which it mounts until 141° 1′ is reached, when it once more follows the meridian up to the north coast. The area of the territory is about 150,000 square miles, and the inhabitants have been conjectured to number some 200,000. A few missionaries have established themselves, but otherwise the Dutch have scarcely occupied their possession, which at present merely forms part of the residency of Ternate in the Moluccas. Dutch New Guinea has, however, better natural advantages than either the British or German possessions in the island, and should eventually prove of real value to the Netherlands.

Recent History.—The treaty concluded in May 1895 between Great Britain and Holland finally settled the new boundaries. Roughly speaking, that partition had allotted about 48·6 per cent. of the superficial area of New Guinea to the Dutch East Indian empire, 28·3 per cent. to Germany, and 23·1 per cent. to Great Britain. Dutch New Guinea now covers the western and, according to some authorities (see, *e.g.,* Guillemard, *The Cruise of the "Marchesa"*), the best half of the whole island. A great deal has been done since Wallace visited it in 1858 and stayed some months at Dorey in the north. At regular intervals the steamers of the Dutch Royal Steam Packet Company now call at Dorey and other points, whilst administrative posts have been established elsewhere in lieu of others previously attempted but abandoned. Nominally the sultan of Tidore (see MOLUCCAS) is still the suzerain of western New Guinea, but his authority is scarcely recognized, except on some few shores and adjacent islands, and practically Dutch New Guinea used to be administered partly from Ternate and partly from Timor, upon more peaceful lines than was the case when the rule of the Dutch in New Guinea largely consisted of the sending of a warship now and again to some distant island or bay to burn a *kampong,* to punish rebellious villagers, and thus assert or reassert Dutch authority, or that of the sultan, who is their vassal. In 1901, however, a more serious effort was made to establish some kind of government in the southern province of Dutch New Guinea, at Merawkay, where a small Dutch-Indian garrison was stationed with the professed object of preventing raids by bands of savages into the British territory near by. Such raids had been rather frequent, the invaders attacking the natives who live under British protection, burning their huts, murdering the men, carrying off the women and children as slaves, and returning scot free to their own haunts laden with booty. There is now also an assistant Resident at Merawkay, whose immediate chief is the Dutch Resident at Ternate, and who is the civil administrator of the province of southern Dutch New Guinea. Assistant Residencies have also been established at Manokvary in northern Dutch New Guinea, which has been formed into a new province, under Ternate, and at Fakfak, in western Dutch New Guinea, likewise created into a new province, also under Ternate. By 1902, therefore, Dutch New Guinea formed a new government, with its headquarters at Ternate, divided into the three provinces aforenamed.

A curious discussion arose in the Dutch States-General when the Government was seeking legislative sanction for the above measures, with a provisional credit to cover the first establishment expenses. It was seriously contended in one part of the House that, as eminent men of geographical and ethnographical science had settled the question, whether New Guinea belongs to Asia or Polynesia, in favour of the latter, a New Guinea colonization scheme could not properly be proposed and decided upon in a section of the Dutch-Indian budget. This budget concerned only the Asiatic possessions of Holland, not the Polynesian ones, and Dutch New Guinea must, consequently, have its own budget. Finally, the majority of the States-General, backed by Government, decided that New Guinea must still be reckoned to belong to Asia.

As the so-called "Wallace line" of demarcation—a name proposed by Professor Huxley and accepted by the scientific world since Dr Alfred Russel Wallace, the famous naturalist, first propounded it (October 1859) in the *Ibis*—has played a *rôle* in these discussions, it is well to point out that this line is entirely a zoological boundary, and does not apply at all to the geographical distribution of man. Wallace's line of demarcation, which runs southwards from the Philippines, separating Borneo from Celebes and Bali from Lombok, was suggested to him, as he explained in a paper written in defence of his scientific boundary against attacks upon it from various quarters, "by his own observations, showing the abrupt and remarkable change in the forms of life that occur in passing from Bali to Lombok and from Borneo to Celebes." The sudden change was, he maintained, "connected with the fact that the sea between those islands suddenly deepens, marking the eastern termination of the great shallow bank which connected the larger Sunda Islands with the Asiatic continent."

The boundary line between the races inhabiting the Malay Archipelago and Australia lies much farther east than Wallace's zoological frontier, the Malays extending to Celebes, the Moluccas, Sumbawa, and Timor, but already meeting and mixing with Papuans on several of the easternmost islands of the Malay Archipelago. Professor Huxley believed that the aborigines of New Guinea, generally called Papuans (but only by the Europeans and their descendants, the name being unknown to any native tribe), were more closely allied to the negroes of Africa than any other race. The hypothesis of some later scientists, who have endeavoured to identify the Papuans with the Negritos of the Philippines and the Semangs of the Malay Peninsula, has met with more success. Dr Alfred Russel Wallace pronounced himself against this hypothesis in an appendix to his *Malay Archipelago* (1883 edition, p. 602), where he observes that "the black, woolly-haired races of the Philippines and the Malay Peninsula . . . have little affinity or resemblance to the Papuans." But Dr A. B. Meyer, who spent several years of scientific travel and exploration in the Malay Archipelago and New Guinea, and who became the director of the Natural History Museum at Dresden after his return, developed a contrary conclusion in his *Die Negritos der Philippinen* (1878). Dr Meyer held, after a special inquiry, that the Negritos and Papuans *are* identical, and that possibly, or even probably, the former are an offshoot of the latter, like some other Polynesian islanders. Professor Haddon (of Cambridge), while discussing, in *Nature* (September 1899), a later paper by Dr A. B. Meyer in English on the same subject (*The Distribution of the Negritos,* Dresden, 1899), practically adopts Meyer's views, after an independent examination of numerous skulls. But Professor Haddon truly remarks that much more needs to be known than is at present available before deciding as to how the Papuans, who are undoubtedly the aborigines of New Guinea, may have peopled other islands surrounding their own and much more distant.

Since 1870 Dutch scientific exploring expeditions have penetrated deeper into many of the unknown parts of Dutch New Guinea than their predecessors, such as Wallace, Beccari, and d'Albertis. Among the more important of such expeditions may be mentioned those of Messrs Van der Crab, Teysmann, Coorengel, Langeveld, Von Hemert, and Swann, undertaken for the Dutch-Indian Government 1871–72, 1875–76 (reports published at The Hague in 1879); of Von Rosenberg in the Geelvink Gulf districts in 1869–70 (report published at The Hague in 1875); of Von Oldenborgh in 1879–81 (published at The Hague); of Monod de Froideville and Boreel in 1882 (published at The Hague), &c. Their reports and the reports of various missionary societies, both Dutch and German, having settlements in western and northern New Guinea, in Netherlands territory, have thrown a great deal of light on the natural history of the island, on its resources, and the islanders. Extensive coal-fields have been discovered near the north-western coast.

New Hampshire, one of the original thirteen states of the American Union, belonging to the New England group, of which it is the third in size. The population is slowly increasing. In 1880 it was 346,991, of whom 170,526 were males and 176,465 females; in 1890 it was 376,530, of whom 186,566 were males and 189,964 females; and in 1900 it was 411,588, of whom 205,379 were males and 206,209 were females. The increase in population from 1880 to 1890 was 8·5 per cent.; from 1890 to 1900, 9·3 per cent. In 1890 the density per square mile was 44·8, and in 1900 it was 45·7. The movement of the population is, as elsewhere, towards the cities. Between 1880 and 1890 three of the four distinctively agricultural counties lost 2528 in population, and from 1890 to 1900 the loss was 2024, while the manufacturing counties steadily gained. The urban population, classing as such all persons living in cities of more than 4000 inhabitants, increased between the census of 1880 and that of 1890 from 26·3 per cent. to 34·2 per cent. of the total population, and at the taking of the census of 1900 it had reached 46·7 per cent. of the total population. There are eleven incorporated cities in the state, each of which has a population of over 5000, and of these the chief manufacturing centres, as Manchester, Nashua, and Laconia, have in particular largely increased in size since 1880. In 1900 the population of Manchester was 56,987; of Nashua, 23,898; of Concord, 19,632; of Dover, 13,207; of Portsmouth, 10,637; and of Laconia, 8042. The gain in population is partly from natural growth and partly from immigration, mainly from Canada. In 1890 there were resident in New Hampshire 46,321 persons born in Canada or Newfoundland, and also 64,016 persons born in other states of the Union, while 124,520 natives of New Hampshire were resident in other states. In 1880, 86·66 per cent. of the population were native-born; in 1890, 80·79 per cent.; and in 1900 only 78·6. The total number of foreign-born inhabitants in 1900 was 88,107. There were only 662 negroes in the state. In 1899 there were for each 1000 of the population 18·53 marriages, 21·56 births, and 17·29 deaths. The size of the family continues to decrease, as it has done since 1850, the average being 4·31 in 1890, against 4·32 in 1880 and 5·15 in 1850. The percentage of births where both parents were foreigners was 38·77 in 1896 and 36·67 in 1899. Divorces have pretty steadily increased; in 1882 there was one divorce to 10·93 marriages, and in 1899 one divorce to 8·90 marriages. Among the causes of mortality consumption held the first place till 1898, although the percentage of deaths from it fell somewhat steadily from 14·01 per cent. of all deaths in 1884 to 9·92 per cent. in 1897, the average being 10·89. Pneumonia came next, varying between 7·06 in 1884 and 9·17 in 1897, averaging 8·67, and now holds the first place, 753 having died from pneumonia in 1899, against 582 from consumption. The ratio of deaths resulting from zymotic diseases during the fourteen years was 13·51 per cent. of the total. The death-rate for the entire state in 1890 was 18·2; in 1900 it was 18·52.

Charitable Institutions.—In 1900 there were 1303 paupers in the various almshouses of the state, of whom 423 were insane. On 1st October of the same year there were 425 insane patients in the state insane asylum. Within the period 1890–1900 there has been an important movement in the establishment of hospitals, with most of which are connected training-schools for nurses. In nearly all the cities hospitals have been opened, partially at the public expense, and in many of the towns "cottage hospitals" have been erected, mainly or wholly by private generosity. The Mary Hitchcock Hospital at Hanover is a model of its kind.

Manufacturing.—Manufacturing is the principal industry, and the amount of capital invested in it, the value of materials employed, and the value of products are steadily advancing, as shown by the comparison of the statistics of 1880, 1890, and 1900:—

	1880.	1890.	1900.
Number of establishments .	3,181	3,229	4,671
Capital	$51,112,263	$79,375,160	$100,929,661
Wage-earners (average number)	48,831	60,111	70,419
Total wages	$14,814,793	$21,927,290	$27,620,247
Value of products . . .	$73,978,628	$85,770,549	$118,669,308

New Hampshire ranks sixth in the Union in the manufacture of cotton goods, fifth in that of woollen, and twenty-fourth in the general value of its manufactures. Its eight chief industries in 1900 were as follows:—

Industries.	Number of Establishments.	Capital.	Wage-earners.		Value of Products.
			Average Number.	Total Wages.	
		$		$	$
Boots and shoes (factory products) . .	67	8,123,481	12,007	4,971,954	23,405,558
Cotton goods . .	23	29,261,835	20,454	6,759,422	22,998,249
Wool manufactures .	45	11,280,295	5,461	2,045,316	10,381,056
Lumber and timber products . . .	553	11,382,114	4,188	1,654,965	9,218,310
Paper and wood pulp .	29	8,163,081	2,391	1,036,856	7,204,733
Foundry and machine-shop products . .	87	2,894,474	1,979	945,154	3,049,334
Leather (tanned, curried, and finished) .	12	1,900,277	552	219,292	2,664,942
Hosiery and knit goods	22	2,525,286	2,492	790,558	2,592,829

Agriculture.—The agricultural products of the state vary but little from year to year, having had an annual value of $13,500,000 to $14,500,000 (in 1890, $13,761,050); but the census of 1900, with a changed method of computing, gave the value of the product for 1899 as $21,929,988. The principal crops in 1899 were as follows:—

	Acreage.	Production.	Value.
Buckwheat .	1,835	43,360 bushels	$19,334
Barley . .	1,596	46,680 ,,	25,189
Indian corn .	25,694	1,080,720 ,,	538,738
Oats . . .	12,589	497,110 ,,	184,025
Potatoes . .	19,422	2,420,668 ,,	1,090,495
Hay and forage .	615,042	654,973 tons	6,336,252

The crop of apples for the same year was 1,978,797 bushels. In 1900 there were 29,324 farms, and their average size was 1231 acres. The total improved acreage was 1,076,879 acres, and the unimproved was 2,532,985. The value of farms, exclusive of stock and implements, was $70,124,360. Sheep-raising, which was formerly a prominent industry, has steadily declined, and horses have taken the place of oxen in farm work, but the introduction of creameries has increased the dairy interest. The value of live stock in 1900 was $10,554,646. The relative proportion of farm stock in various years is shown by the subjoined table:—

	1880.	1890.	1900.
Horses	46,773	52,458	54,866
Dairy cows . . .	90,564	109,423	115,036
Other neat cattle . .	141,831	113,465	111,756
Sheep (not including lambs)	211,825	131,611	65,318
Swine	53,437	58,585	51,211

A fish and game commission has in charge the stocking of the inland waters of the state with fish. There are eleven hatcheries, from which there were distributed in 1900 to the various ponds and brooks 3,256,000 fry, mainly of salmon, salmon trout, brook trout, and lake trout. The principal fresh-water fish are trout, pickerel, black bass, eels, and pout. Under the operation of the game laws there has been a marked increase of the fish throughout the state, and of deer in the forests of the northern part.

Railways.—There was little railway construction during the period 1880–1900, the total mileage in 1901 being only 1189·5 miles, against 1051 in 1880; but there has been a steady movement towards consolidation. The sentiment of the state was formerly very hostile to the absorption, or even the leasing, of one line by another, but the excessive expense of maintenance, and the actual or threatened bankruptcy of many short lines, led in 1883 to the passage of a law, under which, since 1886, when there were thirty-four companies working within the state, one line after another has been leased or absorbed, till now all are merged in three systems—the Boston and Maine, the Maine Central, and the Grand Trunk. The Boston and Maine controls 1037 miles of the state mileage. Up to 1889 the cost of the railways of New Hampshire was about $40,000,000, and since that time about $7,000,000 have been spent in improvements and enlargements. All of the three systems have a large or major part of their mileage out of the state. There is some movement towards the building of electric lines in various parts, but few have been actually constructed.

The ordinary highway roads are very poor, varying according to soil and the knowledge and skill of local supervisors. The question of their improvement has become a public one, and the governor has urged upon the legislature the adoption of measures looking towards the intelligent development of a system of good roads throughout the state. "Good roads" institutes are also held under the direction of the Board of Agriculture.

Education.—The "rural school" has been and still is one of the most difficult problems in New Hampshire, but there has been a gradual tendency to centralize, when possible, and to diminish the number while increasing the efficiency of the schools. In comparison with 1882 the statistics are as follows:—

	Number of Schools.	Graded.	High.	Teachers.
1882	2644	481	56	3075
1900	2198	773	61	2740

	Enrolment.		Expenditures.	Average Length (Weeks).
	Public.	Private.		
1882	64,349	4,275	$584,527·74	22·9
1900	65,668	10,315	1,052,202·36	29·53

The expenditures of 1900 include $113,423.32 for buildings, permanent repairs, and the payment of interest and debt. The enrolment includes all who attended school two weeks or more, the average attendance being 47,276. In 1899 an Act was passed allowing towns to form "supervisory districts for the purpose of employing superintendents of public schools therein." In certain cases a part of the salary of such superintendents is paid by the state, which annually appropriates $25,000 for that purpose. In 1890 the illiterates over ten years of age formed 6·81 per cent. of the population. The Normal School receives an annual appropriation of $10,000 from the state. There are two institutions of higher learning, Dartmouth College at Hanover, and the New Hampshire College of Agriculture and the Mechanic Arts, at Durham. With Dartmouth College, which has classical, literary, and scientific courses, there are connected graduate schools in medicine, civil engineering, and administration and finance. The college has a faculty of 65 members, 768 students, 7164 alumni, and a library of over 85,000 volumes. The College of Agriculture and the Mechanic Arts has a faculty of 23 members, 134 students, 204 graduates, and its library contains about 7000 volumes. In 1891 in connexion with education a law was passed, authorizing the establishment in each town of a free public library, and granting under certain conditions state aid. In 1895 this was changed to a modified requirement, so that in 1898, 15 towns were accumulating a library fund by annual assessment, and 204 towns had free libraries, containing 403,942 volumes, having an annual appropriation of $48,789. There were also 277 other libraries, containing 703,787 volumes. The state library had 48,810 volumes.

Banks.—The banking facilities have undergone little change. On 30th September 1901 there were fifty-two national banks, with a capital of $5,380,000, surplus and undivided profits of $2,329,502, circulation of $4,599,769, deposits of $14,341,009, and loans and discounts of $13,467,698. There were also ten state banks and trust companies, with a capital of $610,000 and deposits of $1,073,318. The savings banks made remarkable progress until 1893, the year of their greatest prosperity. Then hard times seriously affected them, no less than twenty-five having gone into voluntary or forced liquidation. The condition of these banks at successive periods is as follows:—

	Number of Banks.	Depositors.	Average Deposits.	Total Deposits.
1880	67	89,934	$313.61	$28,204,791
1890	72	162,782	411.35	65,727,019
1893	70	174,654	425.85	74,377,278
1900	52	129,135	399.07	51,535,748

In 1893 there were also fourteen trust companies with savings bank departments, having deposits of $4,144,097, so that the total savings deposits of the state for that year were $78,521,376 in solvent companies. In 1900 there were seven such solvent institutions having deposits of $2,510,005, making the total of such deposits $54,045,753, in addition to $8,445,704 in banks in liquidation. In the same year there were seventeen building and loan associations, with assets of $1,863,507.

Finances.—In 1900 the assessed valuation of the state was $208,080,845, and the equalized valuation, including the inventories of the towns, savings banks deposits, and capital of railway and insurance companies, was $287,635,476. The total taxation, including the state tax of $425,000, was $4,728,337, or $11.49 per caput. The net debt of the state was, 1st June 1900, $1,118,798, that of the counties was $683,889, that of the towns was $7,796,145, and of the precincts $1,415,539—a total indebtedness for the state of $11,014,371, or $26.67 per caput. The gross debt was $13,269,286.

Religion.—The statistics of the larger religious denominations of the state for 1899 are given below. Those of the Methodists include a few towns in Massachusetts, and exclude a few in eastern New Hampshire associated with a Maine conference.

	Churches.	Ministers.	Members.	Sunday School Scholars.	Value of Property.
					$
Baptist .	84	96	9,719	10,490	547,200
F. W. Baptist .	101	86	8,240	7,098	416,850
Congregational.	195	212	20,251	21,178	1,500,000[1]
Episcopal. .	46	35	3,894	1.898	443,121
Roman Catholic	77	93	100,000	...	...
Unitarian .	27	23	3,252[1]	...	357,200[1]
Universalist .	34	...	1,250	1,500	260,000

There are also two communities of Shakers, three conferences of Christians, four churches, and ten societies of Christian Scientists in the state.

Politics.—Since 1874, when it elected a Democratic governor, New Hampshire has been a Republican state, though for many years the elections were very close, and in several years the legislature has chosen the governor, no candidate having attained the majority necessary for election. As showing the relation of the two principal parties, the votes for governor and for President of the United States are given below, the vote for 1896 being specially noticeable, as indicating the split in parties brought about by the silver movement.

	Governor.		President.	
	Republican.	Democratic.	Republican.	Democratic.
1880	44,435	40,866	44,852	40,794
1884	42,513	39,637	43,250	39,189
1888	44,904	51,201	46,735	43,457
1892	43,776	41,501	45,543	42,094
1896	48,387	28,383	57,444	21,271
1900	53,891	34,956	54,799	35,489

The mechanism of the state government has undergone no change during the period 1886–1900, except that since 1888, when slight

[1] Figures of 1895.

changes were made in the state constitution, the legislature meets biennially in January instead of June.

In the Spanish-American war New Hampshire furnished under the first call one regiment of 1009 officers and men, which, however, was not called into active service, and was mustered out 12th October 1898. Under the second call 318 volunteers were furnished.

AUTHORITIES.—The statistics of the industries of the states are given in the reports of the United States census and in reports issued by various state commissions annually or biennially.

(J. K. L*.)

Newhaven, a seaport and parish in the Eastbourne parliamentary division of Sussex, England, 8½ miles east by south of Brighton by rail, at the mouth of the river Ouse. There is a daily service of fast steamers to Dieppe. Steamers also leave for Caen, St Nazaire, and Jersey. A new quay has been opened for the Continental service, and two piers and a breakwater (2700 feet long) have been constructed at a cost of £562,000. In 1890 1579 vessels of 349,741 tons entered, and 1582 of 354,005 tons cleared; in 1900, 2471 vessels of 505,009 tons entered, and 2426 of 499,020 tons cleared. Population (1881), 4009; (1901), 6772.

New Haven, a town and the largest city of Connecticut, U.S.A., capital of New Haven county, situated at the head of New Haven Harbour, an inlet from Long Island Sound, in the southern part of the state, and at the intersection of several branches of the New York, New Haven, and Hartford Railway. The plan is irregular, with broad, well-shaded streets, which are paved with brick or granite blocks in the business sections, and in the residence sections are in part macadamized. It is divided into fifteen wards. Its water supply, derived by pumping from Lake Whitney, is in private hands. It is the seat of Yale University. The city has a large commerce by rail and by steamers on Long Island Sound. In 1900 it contained 1236 manufacturing establishments, employing a total capital of $30,463,066. The average number of hands was 20,536, and the products had a value of $40,762,015. These products were very varied; carriages and waggons, and materials for the same, had a value of $2,984,953; hardware, $2,218,032; corsets, $1,893,956; and foundry and machine-shop products, $1,716,028. The assessed valuation of real and personal property in 1900 was $115,698,807; the net debt was $3,690,909, and the rate of taxation, $16.50 per $1000. The receipts, apart from loans, amounted to $1,680,384, and the expenditures, exclusive of loans repaid, to $1,739,946. The death-rate in 1900 was 15·89. Population (1890), of the town, including the city, 86,045; of the city, 81,298; (1900), of the city, 108,027, of whom 30,802 were foreign-born and 2887 negroes.

New Hebrides. See NEW CALEDONIA.

New Iberia, a city of Louisiana, U.S.A., capital of Iberia Parish, on the Bayou Teche and on the Southern Pacific Railway, in the southern part of the state. It is in a lumber region, and its industries consist chiefly in the manufacture of cypress lumber. Sugar, cotton, and rice are raised, with cultivation, in the surrounding country. Population (1890), 3447; (1900), 6815, of whom 234 were foreign-born and 3309 negroes.

New Ireland, now NEU-MECKLENBURG. See NEW GUINEA (GERMAN).

New Jersey, an eastern state of the United States, situated between 41° 21′ 22·6″ N. and 38° 55′ 40″ N., and 73° 53′ 39″ W. and 75° 35′ W. The extreme in length is 166 miles, in breadth 57 miles; its narrowest part is 33½ miles. The total frontier measures 487 miles, of which all but 48 miles is defined by natural boundaries, rivers, bays, and oceans. The highest land has an elevation of 1803 feet. The area is 8,224·44 square miles, or 5,263,641 acres; of this the land surface is 7514·40 square miles, or 4,809,218 acres.

Population.—Notwithstanding its comparatively small area, New Jersey stood with a population in 1890 of 1,444,933, just midway among the states, and in 1900 of 1,883,669, of whom 941,760 were males and 941,909 females, the rate of increase from 1890 to 1900 being 30·4. In density of population for the land area New Jersey was third in rank in 1900, there being at that time to each square mile of land area an average population of 250·3. There were (1900) ten cities, the population of each of which exceeded 25,000, namely:—Newark, 246,070; Jersey City, 206,433; Paterson, 105,171; Camden, 75,935; Trenton, 73,307; Hoboken, 59,896; Elizabeth, 52,130; Bayonne, 32,722; Atlantic City, 27,838; Passaic, 27,777. The percentage of increase of the five largest of these cities during the decade 1890–1900 was as follows:—Newark, 35·5; Jersey City, 26·6; Paterson, 34·2; Camden, 30·2; Trenton, 27·5. The aggregate of population in these ten cities in 1890 was over 900,000, or about half of the total population of the state. In 1900 there were 32 cities or incorporated places, having each a population of more than 2000 and less than 5000, and having an aggregate population of 107,571; and 40 places having more than 5000 inhabitants each, and an aggregate population of 1,232,669. The village and rural population in 1870 was 469,435, in 1895, 514,176, and in 1900, 543,429. For the last generation, therefore, the rural population has remained comparatively stationary, while the population of the cities has increased about threefold. The proportion of foreign residents in 1880 was 3·65 per cent., and in 1890, 3·56. The state seems, therefore, to have received its full share of immigrants, for the total population of New Jersey in the census of 1890 was 2·25 per cent., and its area one-quarter of 1 per cent. of that of the United States. Since 1870, while the increase of native-born residents has nearly kept pace with the increase of foreign-born, much of the native population has sprung from foreign parentage, the census of 1900 showing that over 50 per cent. of the total population have both parents foreign-born. The percentage of the negro population to the total population has increased slightly, being 3·7 per cent. in 1900, and numbering 69,844. Proximity to the coast and a milder climate have given the state a somewhat larger proportion of coloured persons than western states on the same parallel of latitude.

Instruction.—The Constitution provides (1) That the state shall maintain an efficient system of public schools for all children between the ages of five and eighteen; (2) That the legislature shall not pass any private, local, or special law providing for the management and support of the public schools; (3) That no apportionments of any kind shall be made for the support of denominational schools. The state Board of Education prescribes rules for the enforcement of the school law, and appoints county superintendents. The state superintendent, appointed by the governor, apportions the school funds among the counties, and has a general oversight of the schools of the state. County superintendents, holding office for three years, apportion school moneys among the several townships and districts, and examine and license teachers. School trustees, nine in number, hold office for three years; may be women, chosen by voters of the district; employ teachers and fix their salaries; erect and keep in repair school buildings. Cities have separate boards of education and a city superintendent. Under the control of the state Board of Education are—a normal school for the training of teachers, with which are connected a model school, a preparatory school, a school for the deaf, and a manual training and industrial school for coloured youth. The state Board of Education also exercises general control of—(1) graded schools in cities and in a union of school districts; (2) district schools. Each municipality constitutes a school district. The sources of support for schools are—(1) a permanent school fund; (2) annual state school tax; and

(3) special district tax. Acts of the legislature of 1816 and 1817 began the creation of a school fund by the investment for that purpose of certain stock shares, belonging to the state. The Revised Constitution of 1844 guarantees the security and permanence of the funds, and the legislature from time to time has provided for its maintenance and increase by diverting to its purposes state revenues, arising from various sources. From the income of this fund annual apportionments are made. The principal of the school fund in 1901 was $3,773,351, from which the total income was $186,428. A large part of the cost of maintaining the schools is met each year by a school tax on the taxable property at the rate of 2¾ mills on each dollar of ratcables, which in 1901 amounted to $2,287,395. The largest part of the cost of the schools is met by a district tax and city taxes. In 1901 these special taxes aggregated $4,027,575. By the school census of 1900 the children of school age numbered 463,565; of these 322,575 were enrolled in the public schools. The enrolment in the normal school for the year 1901 was 645; in the model school, 536. In the year 1900 there were in the state 1091 children over 10 years of age unable to read, and 7236 under 15 employed in factories, mines, and stores. The total value of school buildings is given as $15,634,471. The number of teachers was, men 998, women 6536. The average monthly salary for men was $86.63; for women, $50.07. In 1900 reports were received from twenty-one communities throughout the state showing an expenditure for that year for manual and industrial training of $88,944. In New Jersey alone of the thirteen original colonies was there, prior to the War of Independence, more than one chartered institution of higher education. Princeton University received its charter in 1746 as the college of New Jersey, and, though it has never had direct relations with the state, has during its career been of inestimable value to the state and nation. At the sesquicentennial celebration in 1896 this college took the name of Princeton University. Rutgers College, founded in 1766 as Queen's College, is situated at New Brunswick. The Rutgers Scientific School was designated under the auspices of the United States Law of 1862 as the State College for the benefit of agriculture and the mechanic arts, and as such maintains courses in agriculture, biology, chemistry, electricity, and engineering, in which students from New Jersey to the number of 290 are, under certain conditions, admitted to free tuition. As a department of this State College, by a law of the United States of 1887, an agricultural experiment station was organized, which, in co-operation with a similar state station established in 1880, has been of great service to the agriculture of New Jersey, and to agricultural science in general.

Charitable Institutions.—There are for the care of the insane two state hospitals and nine county asylums, containing in the aggregate, for 1899, 4063 patients cared for by the state at a cost of $334,342.85. Provision was made in the same year for the blind, feeble-minded, and deaf mutes at a cost of about $120,000. A village for epileptics was opened in 1898. The penal institutions are the state prison at Trenton, with 1119 inmates at the close of the year 1899, whose cost of maintenance, exclusive of salaries and gratuities to discharged prisoners, was $86,756; the reform school for boys at Jamesburg with 405 inmates; the industrial school for girls at Trenton, and the new state reformatory at Rahway.

Religion.—In 1890 the total number of religious organizations in New Jersey was 2085, and of edifices, 2204; the value of church property was $29,490,414; the number of communicants or members was 508,351, being 38·18 per cent. of the total population. Reports for the years named give the following statistics for the various denominations: Methodists in 1900, 577 churches, 439 ministers, 91,027 members, value of church property, $6,425,670; Presbyterians (1900), 328 churches, 452 ministers, 68,278 members, value of church property in 1890, $6,800,000; Baptists (1899), 312 churches, 330 ministers, 52,874 members, value of church property, $4,527,526; Protestant Episcopal (1900), 243 churches, 237 ministers, 40,311 members, and church property in 1890 valued at $3,860,350; the Reformed Church in America (1900), 122 churches, 143 ministers, 26,549 members; the Roman Catholics (1899), 347 priests, 183 churches, the Roman Catholic population in the same year amounting to 329,510.

Agriculture.—In 1900 there were 34,650 farms, containing 2,840,966 acres. The improved land amounted to 1,977,042 acres, and the unimproved to 863,924 acres. The total value of farm property was $189,533,660, and was made up as follows: land improvements and buildings, $162,591,010; implements and machinery, $9,330,030; live stock, $17,612,620. During the preceding year $6,720,030 was expended on labour, and $2,165,320 on fertilizers. Of the total number of farms, 70·1 per cent. were worked by the owners, 15·3 per cent. by cash tenants, and 14·6 per cent. by share tenants. The total value of farm products in 1899 was $43,657,529; the acreages, quantities, and values of the principal crops were as in table following. The three most important orchard fruits are apples, peaches, and pears. The number of trees in 1900 and the quantity of fruit produced the preceding year were: apples,

Crops.	Acres.	Quantity.	Value.
Indian corn	295,258	10,978,800 bushels	$4,533,473
Wheat	132,571	1,902,590 ,,	1,347,650
Oats	75,959	1,601,610 ,,	492,341
Rye	68,967	831,410 ,,	442,446
Hay and forage	444,610	542,796 tons	5,544,970
Potatoes	52,896	4,542,816 bushels	2,192,456
Sweet potatoes	20,588	2,418,641 ,,	1,213,010
Miscellaneous vegetables	76,897	...	4,914,803
Small fruits	25,371	...	1,406,049
Orchard fruits	80,634	6,168,480 bushels	2,594,981
Flowers and plants	614	...	1,953,290
Forest products	...	...	469,005

1,810,793 trees, 4,640,896 bushels; peaches, 2,746,607 trees, 620,928 bushels; and pears, 926,117 trees, 790,818 bushels. The number and value of farm animals in 1900 were as follows: 154,409 dairy cows, $5,840,228; 82,577 other neat cattle, $1,358,879; 94,024 horses, $7,582,274; 4931 mules and asses, $356,492; 26,363 sheep (not including lambs), $118,924; 175,387 swine, $926,179.

Manufacturing.—New Jersey ranks among the chief manufacturing states in the Union. The manufacture of silk goods (included in the following statistics under textiles) is the leading industry, which employed in the year 1900 an average of 24,157 hands, and turned out products valued at $39,966,662. The general statistics of manufacture in 1890 and in 1900 were as follows:—

	1890.	1900.	Increase.
Establishments	9,225	15,481	67·8
Capital	$250,805,745	$502,824,082	100·5
Salaried employés	13,620 [1]	16,283	19·6
Salaries	$13,834,618 [1]	$19,688,946	42·3
Wage-earners	173,778	241,582 [2]	39·0
Total wages	$82,944,118	$110,088,605	32·7
Miscellaneous expenses	$18,458,052	$42,654,076	131·1
Cost of materials used	$189,365,740	$360,945,843	90·6
Value of products	$354,573,571	$611,748,933	72·5

The product of each of fifteen leading industries exceeded $5,000,000. These were—chemical products, $12,207,289; electrical apparatus and supplies, $6,447,154; foundry and machine-shop products, $32,621,229; glass, $5,093,822; iron and steel, $24,381,699; jewellery, $7,379,777; leather, $13,747,155; malt liquors, $14,386,456; lumber, planing-mill products, including sashes, doors, and blinds, $5,107,217; petroleum refining, $29,649,460; pottery, brick, and fire-clay products, $8,940,723; rubber and elastic goods, $8,458,274; sewing machines and attachments, $6,643,348; textiles, $72,921,528; tobacco, $10,435,974.

Railways.—There are 116 railway and canal companies subject to taxation. The total length of railways in 1897 was 2263 miles; of canals, 173 miles. The total trackage was 4590 miles, of which four-fifths was laid with steel rails, the remainder with iron. The number of railway miles to each 100 square miles of area was 29·72, being largely in excess of that of any other state in the Union. There is scarcely a place that is more than 5 miles distant from a railway line. The total value of railway property is very considerable, as the terminals of most of the railways affording transportation to New York City are within New Jersey.

Finance.—In 1899 the total taxable property was valued at $866,030,048. The value of all property, including railway and canal property, exempt property and deductions for debt, was $1,223,815,062. The total assessed valuation, for 1898, of railway and canal property was $222,417,748, and the amount of tax levied thereon in the year 1899 for state uses was $1,112,088; for local uses, $427,019; a total of $1,539,107. The school tax is the only direct state tax levied upon the people. This in 1899 amounted to $2,284,310. The state is without debt. The last of the bonds issued for the Civil War, amounting to $71,000, fell due upon the 1st of January 1902. On 31st October 1901 there was a balance in the treasury of $2,351,683. The disbursements from the state treasury for all purposes for the year ending 31st October 1901 were $3,480,350.

Banking.—On the 1st of January 1900 there were 108 national banks, with an aggregate paid-up capital of $14,795,215; resources, $110,555,252; and with individual deposits amounting to $71,274,754. The 26 savings banks in the state had at the same date total resources of $61,184,322; deposits, $54,713,698; depositors, 191,572; the average amount of each account being $285. The state banks numbered 20, having capital paid up, $1,753,750; total resources, $12,315,993; deposits, $8,826,840.

[1] Includes proprietors and firm members, with their salaries.

[2] Includes 181,879 men, 51,661 women, and 8042 children under sixteen years of age.

The trust companies numbered 25; total capital, $3,657,400; total resources, $43,029,692; deposits, $33,856,403. These three kinds of banks under state control have aggregate resources of $116,530,007; deposits, $97,396,941. There were in New Jersey in 1897, 334 co-operative building and loan associations, whose net assets were $44,842,336; and whose shareholders numbered 116,739; and borrowers, 30,842. The total invested on bond and mortgage was $40,941,291; the aggregate receipts were $19,833,241; and the disbursements, $18,403,551. The number of houses acquired or begun building by borrowers from loan associations during the year was 2381.

National Guard.—In 1899 a commission was appointed with a view to the reorganization of the national guard, and the codification and amendment of the National Guard Law. The national guard, well maintained and highly efficient, consists of 238 officers and 3455 enlisted men, organized into 4 regiments of 12 companies each of infantry, 2 Gatling gun companies, and 2 troops of cavalry. The naval reserve consists of 2 battalions of 2 divisions each. The state expended for the national guard during the year 1899, $277,903; and for the naval reserve, $16,528. New Jersey supplied to the United States forces in the Spanish-American War 4 regiments of national guard volunteer infantry of 12 companies each, numbering 5348 officers and men, and 343 men from the naval reserve.

Legislation.—The State Constitution adopted 2nd July 1776 was maintained as the organic law until 1844, when it was thoroughly revised. In 1875 important amendments were incorporated forbidding the use of public moneys for sectarian purposes; guaranteeing public schools for ever; and forbidding special legislation. In 1893 laws were passed legalizing race-track gambling, which were, however, speedily repealed; and in 1897 the Constitution was amended so as to prohibit the passing of laws authorizing pool-selling, book-making, or gambling of any kind. Legislation permitting the incorporation of so-called trusts has had a vast economic and political importance, but the policy of encouraging by law the massing of capital for the promotion of industries is more than 100 years old in New Jersey. In the first seven months of 1899 there were organized under the laws of New Jersey 1336 corporations, with an aggregate capital of more than $2,000,000,000, and of corporations with a capital of over $10,000,000 there were formed in the same time in New Jersey 61, in all the other states 60. New Jersey was among the very first of the states to pass a law allowing state aid for the improving of public roads. The first State Aid Law of this kind, passed in 1892, appropriated $75,000 annually, to meet equal appropriations on the part of the counties. Later legislation increased this annual appropriation to $300,000. The total outlay for state highways during 1893–1900 was more than $2,150,000, and New Jersey at the end of the 19th century had more miles of improved roads than any state in the Union. Legislation in the interest of labour and laws equalizing taxation and assessing railways and other corporations have been a marked feature.

Political Life.—The population of New Jersey, of mixed origin —Dutch, Swedish, Scotch, Irish, English—embracing early settlements of Quakers, Calvinists, Episcopalians, and other sects, under the successive governments of lords proprietors, royal charters, and republican constitutions, has from the first developed personal independence and democratic ideas. Conservatism has been a marked feature of its history. This is noticeable in the judicial system, for example, the Court of Chancery being retained in New Jersey, though rejected by the other original states of the Union; the judiciary is also appointive and not elective. In recent years the great industrial growth, ready means of quick communication, facilities for easy transportation, a large influx of residents whose business interests are chiefly in the great cities of New York and Philadelphia, have made the state responsive to the influence of forces which dominate in large spheres of action throughout the Union. In twenty of the twenty-nine Presidential elections since the formation of the National Government the vote of New Jersey has been recorded in favour of the successful candidates. Since the Civil War the state has generally favoured the Democratic party. In the Presidential elections of 1896 and 1900, however, the majorities, greater than ever before given by the state, have been in favour of the view of the money question taken by the Republican party. This question and that of racecourse legislation have also in recent years placed the state legislature and administration in the hands of the Republican party. The popularity of the late Vice-President Garret A. Hobart, who was a citizen of New Jersey, contributed to this result. (A. SC.)

New Kensington, a borough of Westmoreland county, Pennsylvania, U.S.A., on the Allegheny river and the Allegheny Valley Railway, 18 miles north-east of Pittsburg, in the western part of the state. It has extensive glass, iron and steel, and white-lead works. It was founded in 1891. Population (1900), 4665, of whom 1042 were foreign-born and 86 negroes.

Newlands, John Alexander Reina (1838–1898), English chemist, was born in 1838. He was one of the first, if not quite the first, to propound the conception of periodicity among the chemical elements. His earliest contribution to the question took the form of a letter published in the *Chemical News* in February 1863. In the succeeding year he showed, in the same journal, that if the elements be arranged in the order of their atomic weights, those having consecutive numbers frequently either belong to the same group, or occupy similar positions in different groups, and he pointed out that each eighth element starting from a given one is in this arrangement a kind of repetition of the first, like the eighth note of an octave in music. The Law of Octaves thus enunciated was at first ignored or treated with ridicule as a fantastic notion unworthy of serious consideration, but it was subsequently elaborated by Mendeléeff and other workers, and as the Periodic Law has taken its place as one of the most important generalizations in modern chemical theory. Newlands, who was of Italian extraction on his mother's side, and fought as a volunteer in the cause of Italian freedom under Garibaldi in 1860, died in London on 29th July 1898. He collected his various papers on the atomicity of the elements in a little volume on the *Discovery of the Periodic Law* published in London in 1884.

New London, a city and seaport of Connecticut, U.S.A., capital of New London county, on the Thames river, a short distance above its mouth, in Long Island Sound, in the south-eastern part of the state. It has an excellent harbour, probably the best on the Sound, and a large commerce, having daily steamboat communication with New York. It has two railways—the New York, New Haven, and Hartford, which passes through it, and the Central Vermont, which has here its southern terminus. In the palmy days of the whale industry, New London was one of the principal home ports of vessels engaged in that industry, but with its decline the city lost in importance. In recent years, owing largely to the introduction of manufactures, it has received a new impetus. It produces silk and woollen goods, and other minor products. In 1900 there were 238 manufacturing establishments, having a total capital of $4,522,003, employing 2658 wage-earners, and turning out products valued at $5,569,615. The inter-collegiate races between Yale and Harvard Universities are commonly rowed on the river at New London. Population (1890), 13,757; (1900), 17,548, of whom 3743 were foreign-born and 378 were negroes.

Newlyn School of Painting. See SCHOOLS OF PAINTING.

Newman, Francis William (1805–1897), English scholar and miscellaneous writer, younger brother of Cardinal Newman, was born in London, 27th June 1805. Like his brother, he was educated at the Rev. Dr Nicholas's school at Ealing, and subsequently at Oxford, where he had a brilliant career, obtaining a double first class in 1826. He was elected fellow of Balliol in the same year. Conscientious scruples respecting the ceremony of infant baptism led him to resign his fellowship in 1830, and he went to Baghdad as assistant in the mission of the Rev. A. N. Groves. In 1833 he returned to England to procure additional support for the mission, but rumours of unsoundness in his views on the doctrine of eternal punishment had preceded him, and finding himself generally looked upon with suspicion, he gave up the vocation of missionary to become classical tutor in an unsectarian college at Bristol. His letters written home during the period of his mission were collected and published in 1856, and form an interesting little volume. Newman's views matured rapidly, and in 1840 he became professor of Latin in Manchester New College, the celebrated Unitarian seminary long established at York, and eventually the parent of Manchester College, Oxford. In 1846 he quitted this appointment to become professor in University College, London, where he remained until 1869. During all this period he was assiduously carrying on his studies in mathematics and Oriental languages, but wrote little until 1848, when he published anonymously a *History of the Hebrew Monarchy*, intended to introduce the results of German investigation in this department of Biblical criticism. In 1849 appeared *The Soul, her Sorrows and Aspirations*, and in 1850, *Phases of Faith, or Passages from the History of my Creed*—the former a tender but searching analysis of the relations of the spirit of man with the Creator; the latter a religious autobiography detailing the author's passage from Calvinism to pure Theism. It is on these two books that Professor Newman's celebrity will principally rest; having in both to describe his personal experience, his intense earnestness has kept him free from the eccentricity which marred most of his other writings, excepting his contributions to mathematical research and Oriental philology. There was, indeed, scarcely a crotchet, except "spiritualism," of which he was not at one time or another the advocate. His versatility was amazing: he wrote on logic, political economy, English reforms, Austrian politics, Roman history, diet, grammar, the most abstruse departments of mathematics, Arabic, the emendation of Greek texts, and languages as out of the way as the Berber, and as obsolete as the dialect of the Iguvine inscriptions. In treating all these subjects he showed signal ability, but, wherever the theme allowed, an incurable crotchetiness; and in his numerous metrical translations from the classics, especially his version of the Iliad, he betrayed an insensibility to the ridiculous which would almost have justified the irreverent criticism of Matthew Arnold, had this been conveyed in more seemly fashion. His miscellaneous essays, some of much value, were collected in several volumes before his death: his last publication, treating of the early life of his celebrated brother, was generally condemned as deficient in fraternal feeling. He was far from possessing his brother's subtlety of reasoning, but he impresses by a transparent sincerity and singleness of mind not always displayed by the more celebrated writer; his style is too individual to be taken as a model, but is admirable for its simplicity and clearness. His character is vividly drawn by Carlyle in his life of Sterling, of whose son Newman was guardian: "a man of fine attainments, of the sharpest-cutting and most restlessly advancing intellect, and of the mildest pious enthusiasm." It was his great misfortune that this enthusiasm should have been correlated, as is not unfrequently the case, with an entire insensibility to the humorous side of things. After his retirement from University College, Professor Newman continued to live for some years in London, subsequently removing to Clifton, and eventually to Weston-super-Mare, where he died on 7th October 1897. He had been blind for five years before his death, but retained his faculties to the last. He was twice married. (R. G.)

Newman, John Henry (1801 – 1890), Cardinal, the most remarkable English ecclesiastic of the 19th century, was born in the City of London, 21st February 1801, the eldest son of Mr John Newman, banker, of the firm of Ramsbottom, Newman, and Co. The family was understood to be of Dutch extraction, and the name itself, spelt "Newmann" in an earlier generation, further suggests Hebrew origin. His mother, Jemima Fourdrinier, was of a Huguenot family, long established in London as engravers and paper manufacturers. John Henry was the eldest of six children. The second son, Charles Robert, a man of ability but of impracticable temper, a professed atheist and a recluse, died in 1884. The youngest son, Francis William, an excellent philologist, was for many years professor of Latin in University College, London. He was a devout theist but a keen critic of orthodox Christianity, and as a humanitarian he gained the reputation of a faddist. He died in 1897. Two of the three daughters, Harriett Elizabeth and Jemima Charlotte, married brothers, Thomas and John Mozley; and Anne Mozley, a daughter of the latter, edited in 1892 Newman's Anglican *Life and Correspondence*, having been entrusted by him in 1885 with an autobiography written in the third person to form the basis of a narrative of the first thirty years of his life. The third daughter, Mary Sophia, died unmarried in 1828.

At the age of seven Newman was sent to a private school conducted by Dr Nicholas at Ealing, where he was distinguished by diligence and good conduct, as also by a certain shyness and aloofness, taking no part in the school games. He speaks of himself as having been "very superstitious" in these early years. He took great delight in reading the Bible, and also the novels of Scott, then in course of publication. At the age of fifteen, during his last year at school, he was "converted," an incident that throughout life remained to him "more certain than that he had hands or feet." It was in the autumn of 1816 that he thus fell under the influence of a definite creed, and received into his intellect impressions of dogma never afterwards effaced. The tone of his mind was at this date evangelical and Calvinistic, and he held that the Pope was anti-Christ. Matriculating at Trinity College, Oxford, 14th December 1816, he went into residence there in June the following year, and in 1818 he gained a scholarship of £60, tenable for nine years. But for this he would have been unable to remain at the university, as in 1819 his father's bank suspended payment. In that year his name was entered at Lincoln's Inn. Anxiety to do well in the final schools produced the opposite result; he broke down in the examination, and so graduated with third-class honours in 1821. Desiring to remain in Oxford, he took private pupils and read for a fellowship at Oriel, then "the acknowledged centre of Oxford intellectualism." To his intense relief and delight he was elected, 12th April 1822. E. B. Pusey was elected a fellow of the same society in 1823.

On Trinity Sunday, 13th June 1824, Newman was ordained, and became, at Pusey's suggestion, curate of St Clement's, Oxford. Here for two years he was busily engaged in parochial work, but he found time to write articles on "Apollonius of Tyana," on "Cicero," and on "Miracles" for the *Encyclopædia Metropolitana*. In 1825, at Whately's request, he became vice-principal of St Alban's Hall, but this post he held for one year only. To his association with Whately at this time he attributed much of his "mental improvement" and a partial conquest of his shyness. He assisted Whately in his popular work on logic, and from him he gained his first definite idea of the Christian Church. He broke with him in 1827 on the occasion of the re-election of Peel for the University, Newman opposing this on personal grounds. In 1826 he became tutor of Oriel, and the same year R. H. Froude, described by Newman as "one of the acutest, cleverest, and deepest men" he ever met, was elected fellow. The two formed a high ideal of the tutorial office as clerical and pastoral rather than secular. In 1827 he was a preacher at Whitehall. The year following Newman supported and secured the election of Hawkins as provost of Oriel in preference to Keble, a choice which he later defended or apologized for as having in effect produced the Oxford

Movement with all its consequences. In the same year he was appointed vicar of St Mary's, to which the chapelry of Littlemore was attached, and Pusey was made regius professor of Hebrew. At this date, though still nominally associated with the Evangelicals, Newman's views were gradually assuming a higher ecclesiastical tone, and while local secretary of the Church Missionary Society he circulated an anonymous letter suggesting a method by which Churchmen might practically oust Nonconformists from all control of the Society. This resulted in his being dismissed from the post, 8th March 1830; and three months later he withdrew from the Bible Society, thus completing his severance from the Low Church party. In 1831–32 he was select preacher before the University. In 1832, his difference with Hawkins as to the "substantially religious nature" of a college tutorship becoming acute, he resigned that post, and in December went with R. H. Froude, on account of the latter's health, for a tour in South Europe. On board the mail steamship *Hermes* they visited Gibraltar, Malta, and the Ionian Islands, and subsequently Sicily, Naples, and Rome, where Newman made the acquaintance of Dr Wiseman. In a letter home he described Rome as "the most wonderful place on earth," but the Roman Catholic religion as "polytheistic, degrading, and idolatrous." It was during the course of this tour that he wrote most of the short poems which a year later were printed in the *Lyra Apostolica*. From Rome Newman returned to Sicily alone, and was dangerously ill with fever at Leonforte, recovering from it with the conviction that he had a work to do in England.

CARDINAL NEWMAN.
(From a photograph by Barraud, London.)

In June 1833 he left Palermo for Marseilles in an orange boat, which was becalmed in the Strait of Bonifacio, and here he wrote the verses, "Lead, kindly Light," which later became popular as a hymn. He was at home again in Oxford, 9th July, and on the 14th Keble preached at St Mary's an assize sermon on "National Apostasy," which Newman afterwards regarded as the inauguration of the Oxford Movement. In the words of Dean Church, it was "Keble who inspired, Froude who gave the impetus, and Newman who took up the work"; but the first organization of it was due to Mr H. J. Rose, editor of the *British Magazine*, who has been styled "the Cambridge originator of the Oxford Movement." It was in his rectory house at Hadleigh, Suffolk, that a meeting of High Church clergymen was held, 25th to 29th July (Newman was not present), at which it was resolved to fight for "the apostolical succession and the integrity of the Prayer-Book." A few weeks later Newman started, apparently on his own initiative, the *Tracts for the Times*, from which the movement was subsequently named "Tractarian." Its aim was to secure for the Church of England a definite basis of doctrine and discipline, in case either of disestablishment or of a determination of High Churchmen to quit the establishment, an eventuality that was thought not impossible in view of the State's recent high-handed dealings with the sister established Church of Ireland. The teaching of the tracts was supplemented by Newman's Sunday afternoon sermons at St Mary's, the influence of which, especially over the junior members of the University, was increasingly marked during a period of eight years. In 1835 Pusey joined the movement, which, so far as concerned ritual observances, was later called "Puseyite"; and in 1836 its supporters secured further coherence by their united opposition to the appointment of Hampden as regius professor of divinity. His Bampton Lectures (in the preparation of which Blanco White had assisted him) were suspected of heresy, and this suspicion was accentuated by a pamphlet put forth by Newman, *Elucidations of Dr Hampden's Theological Statements.* At this date Newman became editor of the *British Critic*, and he also gave courses of lectures in a side-chapel of St Mary's in defence of the *via media* of the Anglican Church as between Romanism and popular Protestantism. His influence in Oxford was supreme about the year 1839, when, however, his study of the monophysite heresy first raised in his mind a doubt as to whether the Anglican position was really tenable on those principles of ecclesiastical authority which he had accepted; and this doubt returned when he read, in Wiseman's article in the *Dublin Review* on "The Anglican Claim," the words of St Augustine against the Donatists, "*securus judicat orbis terrarum*," words which suggested a simpler authoritative rule than that of the teaching of antiquity. He continued his work, however, as a High Anglican controversialist until he had published, in 1841, *Tract 90*, the last of the series, in which he put forth, as a kind of proof charge, to test the tenability of all Catholic doctrine within the Church of England, a detailed examination of the XXXIX. Articles, suggesting that their negations were not directed against the authorized creed of Roman Catholics, but only against popular errors and exaggerations. This theory, though not altogether new, aroused much indignation in Oxford, and A. C. Tait (afterwards archbishop of Canterbury), with three other senior tutors, denounced it as "suggesting and opening a way by which men might violate their solemn engagements to the University." The alarm was shared by the heads of houses and by others in authority; and, at the request of the bishop of Oxford, the publication of the Tracts came to an end. At this date Newman also resigned the editorship of the *British Critic*, and was thenceforth, as he himself later described it, "on his deathbed as regards membership with the Anglican Church." He now recognized that the position of Anglicans was similar to that of the semi-Arians in the Arian controversy; and the arrangement made at this time that an Anglican bishopric should be established in Jerusalem, the appointment to lie alternately with the British and Prussian Governments, was to him further evidence of the non-apostolical character of the Church of England. In 1842 he withdrew to Littlemore, and lived there under monastic conditions with a small band of followers, their life being one of great physical austerity as well as of anxiety and suspense. To his disciples there he assigned the task of writing lives of the English saints, while his own time was largely devoted to the completion of an essay on the development of Christian doctrine, by which principle he sought to reconcile himself to the elaborated creed and the practical system of the Roman Church. In February 1843 he published, as an advertisement in the *Oxford Conservative Journal*, an anonymous but otherwise formal retractation of all the hard things he had said against Rome; and in September, after the secession of one of the inmates of the house, he preached his last Anglican sermon at Littlemore and resigned the living of St Mary's. But still an interval of two years elapsed before he was formally received into the Roman Catholic Church (9th October 1845) by Father Dominic, an Italian Passionist. In February 1846 he left Oxford for Oscott, where Bishop Wiseman, then vicar-apostolic of the Midland district, resided; and in October he proceeded to Rome, where he was ordained priest and was given the degree of D.D. by the Pope. At the close of 1847 he returned to England as an Oratorian, and resided first at Maryvale (near Oscott); then at St Wilfrid's College, Cheadle; then at St Ann's, Alcester Street, Birmingham; and finally at Edgbaston, where spacious premises were built for the community, and where (except for four years in Ireland) he lived a secluded life for nearly forty years. Before the house at Edgbaston was occupied he had established the London Oratory, with Father Faber as its superior, and there (in King William Street, Strand) he delivered a course of lectures on "The Present Position of Catholics in England," in the fifth of which he protested against the anti-Catholic utterances of Dr Achilli, an ex-Dominican friar, whom he accused in detail of numerous acts of immorality. Popular Protestant feeling ran very high at the time, partly in consequence of the recent establishment of a Roman Catholic diocesan hierarchy by Pius IX., and criminal proceedings against Newman for libel resulted in an acknowledged gross miscarriage of justice. He was found guilty, and was sentenced to pay a fine of £100, while his expenses as defendant amounted to about £14,000, a sum that was at once raised by public subscription, a surplus being spent on the purchase of Rednall, a small property picturesquely situated on the Lickey Hills, with a chapel and cemetery, where Newman now lies buried. In 1854, at the request of the Irish bishops, Newman went to Dublin as rector of the newly-established Catholic university there. But practical organization was not among his gifts, and the bishops became jealous of his influence, so that after four years he retired, the best outcome of his stay there being a volume of lectures entitled *Idea of a University*, containing some of his most effective writing. In 1858 he projected a branch house of the Oratory at Oxford; but this was opposed by Manning and others, as likely to induce Catholics to send their sons to that university, and the scheme was abandoned. In 1859 he established, in connexion with the Birmingham Oratory, a school for the education of the sons of gentlemen on lines similar to those of the English public schools, an important work in which he never ceased to take the greatest interest. But all this time (since 1841) Newman had been under a cloud, so far as concerned the great mass of cultivated Englishmen, and he was now awaiting an opportunity to vindicate his career; and in 1862 he began to prepare autobiographical and other memoranda for the purpose. The occasion came when, in January 1864, Charles Kingsley, reviewing Froude's *History of England* in *Macmillan's Magazine*, incidentally asserted that "Father Newman informs us that truth for its own sake need not be, and on the whole ought not to be, a virtue of the Roman clergy." After some preliminary sparring between the two—Newman's pamphlet, "Mr Kingsley and Dr Newman: a Correspondence on the Question whether Dr Newman teaches that Truth is no Virtue," published in 1864 and not reprinted, is unsurpassed in the English language for the vigour of its satire: the anger displayed was later, in a letter to Sir William Cope, admitted to have been largely feigned—Newman published in bi-monthly parts his *Apologia pro Vita Sua*, a religious autobiography of unsurpassed interest, the simple confidential tone of which "revolutionized the popular estimate of its author," establishing the strength and sincerity of the convictions which had led him into the Roman Catholic Church. Kingsley's accusation indeed, in so far as it concerned the Roman clergy generally, was not precisely dealt with; only a passing sentence, in an appendix on lying and equivocation, maintained that English Catholic priests are as truthful as English Catholic laymen; but of the author's own personal rectitude no room for doubt was left.

In 1870 he put forth his *Grammar of Assent*, the most closely reasoned of his works, in which the case for religious belief is maintained by arguments differing somewhat from those commonly used by Roman Catholic theologians; and in 1877, in the republication of his Anglican works, he added to the two volumes containing his defence of the *via media* a long preface and numerous notes in which he criticized and replied to sundry anti-Catholic arguments of his own in the original issues. At the time of the Vatican Council (1869–70) he was known to be opposed to the definition of Papal infallibility, and in a private letter to his bishop (Ullathorne), surreptitiously published, he denounced the "insolent and aggressive faction" that had pushed the matter forward. But he made no sign of disapproval when the doctrine was defined, and subsequently, in a letter nominally addressed to the duke of Norfolk on the occasion of Mr Gladstone's accusing the Roman Church of having "equally repudiated modern thought and ancient history," Newman affirmed that he had always believed the doctrine, and had only feared the deterrent effect of its definition on conversions on account of acknowledged historical difficulties. In this letter, and especially in the postscript to the second edition of it, Newman finally silenced all cavillers as to his not being really at ease within the Roman Church. In 1878 his old college (Trinity), to his great delight, elected him an honorary fellow, and he revisited Oxford after an interval of thirty-two years. At the same date died Pope Pius IX., who had long mistrusted him; and Leo XIII. was encouraged by the duke of Norfolk and other distinguished Roman Catholic laymen to make Newman a cardinal, the distinction being a marked one, because he was a simple priest and not resident in Rome. The offer was made in February 1879, and the announcement of it was received with universal applause throughout the English-speaking world. The "creation" took place on 12th May, with the title of St George in Velabro, Newman taking occasion while in Rome to insist on the lifelong consistency of his opposition to "liberalism in religion." After an illness that excited apprehension he returned to England, and thenceforward resided at the Oratory until his death, 11th August 1890, making occasional visits to London, and chiefly to his old friend, R. W. Church, dean of St Paul's, who as proctor had vetoed the condemnation of *Tract 90* in 1841. As cardinal Newman published nothing beyond a preface to a work by the present writer on the *Anglican Ministry* (1879) and an article on Biblical criticism in the *Nineteenth Century* (February 1884).

Newman's influence as controversialist and preacher (*i.e.*, as reader of his written sermons, for he was never a speaker) has been very great. For the Roman Church his conversion secured great prestige and the dissipation of many prejudices. Within it his influence was mainly in the direction of a broader spirit and of a recognition of the important part played by development both in doctrine and in Church government. And although he never called himself a mystic, he showed that in his judgment spiritual truth is apprehended by direct intuition, as an antecedent necessity to the professedly purely rational basis of the Roman Catholic creed. Within the Anglican Church, and even within the more strictly Protestant Churches, his influence has been greater, but in a different direction, viz., in showing the necessity of dogma and the indispensableness of the austere, ascetic, chastened, and graver side of the Christian religion. If his teaching as to the Church has been less widely followed, it is because of doubts as to the thoroughness of his knowledge of history and as to his freedom from bias as a critic. Some hundreds of clergymen, influenced by the movement of which for ten or twelve years he was the acknowledged leader, made their submission to the Church of Rome; but a very much larger number, who also came under its influence, failed to learn from him that belief in the Church involves belief in the Pope. The natural tendency of his mind is often (and correctly) spoken of as sceptical. He held that, apart from an interior and unreasoned conviction, there is no cogent proof of the existence of God; and in *Tract 85* he dealt with the difficulties of the Creed and of the canon of Scripture, with the apparent implication that they are insurmountable unless overridden by the authority of an infallible Church. In his own case these views did not lead to scepticism, because he had always possessed the necessary interior conviction; and in writing *Tract 85* his only doubt would have been where the true Church is to be found. But, so far as the rest of the world is concerned, his teaching amounts to this: that the man who has not this interior conviction has no choice but to remain an agnostic, while the man who has it is bound sooner or later to become a Roman Catholic.

He was a man of magnetic personality, with an intense belief in the significance of his own career; and his character may be described as feminine, both in its strength and in its weakness. As a poet he had inspiration and genuine power. Some of his short and earlier poems, in spite of a characteristic element of fierceness and intolerance in one or two cases, are described by Mr R. H. Hutton as "unequalled for grandeur of outline, purity of taste, and radiance of total effect"; while his latest and longest, "The Dream of Gerontius," is generally recognized as the happiest effort to represent the unseen world that has been made since the time of Dante. His prose style, especially in his Catholic days, is fresh and vigorous, and is attractive to many who do not sympathize with his conclusions, from the apparent candour with which difficulties are admitted and grappled with, while in his private correspondence there is a charm that places it at the head of that branch of English literature. He was too sensitive and self-conscious to be altogether successful as a leader of men, and too impetuous to take part in public affairs; but he had many of the gifts that go to make a first-rate journalist, for, "with all his love for and his profound study of antiquity, there was something about him that was conspicuously modern." Nevertheless, with the scientific and critical literature of the years 1850–90 he was barely acquainted, and he knew no German. There are a few passages in his writings in which he seems to show some sympathy with a broader theology. Thus he admitted that there was "something true and divinely revealed in every religion." He held that "freedom from symbols and articles is abstractedly the highest state of Christian communion," but was "the peculiar privilege of the primitive Church." And even in 1877 he allowed that "in a religion that embraces large and separate classes of adherents there always is of necessity to a certain extent an exoteric and an esoteric doctrine." These admissions, together with his elucidation of the idea of doctrinal development and his eloquent assertion of the supremacy of conscience, have led some critics to hold that, in spite of all his protests to the contrary, he was himself somewhat of a Liberal. But it is certain that he explained to his own satisfaction and accepted every item of the Roman Catholic creed, even going beyond it, as in holding the Pope to be infallible in canonization; and while expressing his preference for English as compared with Italian devotional forms, he was himself one of the first to introduce such into England, together with the ritual peculiarities of the local Roman Church. The motto that he adopted for use with the arms emblazoned for him as cardinal—*Cor ad cor loquitur*, and that which he directed to be engraved on his memorial tablet at Edgbaston—*Ex umbris et imaginibus in veritatem*—together seem to disclose as much as can be disclosed of the secret of a life which, both to contemporaries and to later students, has been one of almost fascinating interest, at once devout and inquiring, affectionate and yet sternly self-restrained.

There is at Oxford a bust of Newman by Woolner. His portrait by Ouless is at the Birmingham Oratory, and his portrait by Millais is in the possession of the duke of Norfolk, a replica being at the London Oratory. Outside the latter building, and facing the Brompton Road, there is a marble statue of Newman as cardinal.

The chief authorities for Newman's life are his *Apologia*, and the *Letters and Correspondence*, edited by Miss Mozley, above referred to. The letters and memoranda dealing with the years 1845–90, and entrusted by Newman to the Rev. W. Neville as literary executor, have not yet been published. Works by R. W. Church, J. B. Mozley, T. Mozley, and Wilfrid Ward should also be consulted, as well as an appreciation by Mr R. H. Hutton. Adverse criticism will be found in the writings of Dr E. A. Abbott, while some minor traits and foibles were noted by the present writer in the *Expositor*, September, October, and November 1890. (A. W. Hu.)

Newmarket, a market town in the Newmarket parliamentary division of Cambridgeshire, England, partly also in Suffolk, 13 miles east by north of Cambridge by rail. There are generally from 1500 to 2000 horses in training on the downs. Population (1891), 8631; (1901), 10,686. (See also HORSE-RACING.)

New Mexico, a south-western territory of the United States, bounded on the N. by Colorado, on the E. by Oklahoma and Texas, on the S. by Texas and Mexico, and on the W. by Arizona. It has advanced rapidly in all material matters since the advent of the first railway in 1879. The population was 91,874 in 1870, 119,565 in 1880, 153,593 in 1890, and 195,310 in 1900. The rate of increase from 1890 to 1900 was 27·2 per cent., as compared with 28·5 per cent. for the preceding decade, and the average number of persons to the square mile in 1900 was 1·6. The principal cities are Albuquerque (population, 6238), Las Vegas (3552), and Santa Fé (5603). In 1900 the males numbered 104,228, the females 91,082; the native-born 181,685, and the foreign-born 13,625. The negro population was only 1610, and the Indian 13,144. Of the 55,067 males of 21 years and over, 15,585 were illiterate.

Education.—In 1891 a law was enacted establishing an excellent public school system, which has very much increased the facilities for general education. At its head is a board of four members consisting of the governor, superintendent of public instruction, and two college presidents, the executive functions being exercised by the superintendent. The lack of a school fund of any kind has been a serious impediment to educational progress, but in 1899 sections 16 and 36 in each township of the public domain were granted to the territory as school lands, and each of the territorial institutions received a substantial donation of the public lands. The total average daily attendance in 1900 in the common and city schools was 20,505, as against 12,397 in 1891. Of sectarian schools the Roman Catholics had 18, with 1602 pupils; the Presbyterians 25, with 1105 pupils; the Methodists 11, with 462 pupils; and the New West educational commission had 5, with 219 pupils—making in all 59 schools, with 3388 pupils. In 1889 and 1890 the University at Albuquerque, the Agricultural College at Las Cruces, and the School of Mines at Socorro began their work with substantial buildings; soon afterwards a normal school was established at Silver City, and more recently another at Las Vegas. There is also a military institute at Roswell. In 1900 the number of students in the higher institutions was 800. The total amount of money raised for the common and city schools and the territorial institutions was $511,990.

Penal and Charitable Institutions.—The penitentiary at Santa Fé is a substantial stone structure. It contained in 1900 over 200 prisoners, and was admirably conducted. The principal business, brick-making, was very successful. The territorial insane asylum is situated near Las Vegas, and is always full, as its capacity is not equal to the growth of the territory. The number of patients in March 1902 was 109, 56 males and 53 females. Hospitals at Santa Fé and Silver City have been established many years, and are maintained by the territory according to the number of cases treated. The orphan home at Santa Fé has in charge an average of 33 children, and actually received from territorial appropriation about $3300.

Religion.—The prevailing religion is Roman Catholic, as the original settlement was by Spaniards, whose descendants still constitute the great body of the population, but Methodists, Baptists, Episcopalians, Congregationalists, Presbyterians, Jews, and Mormons have congregations in various localities.

Mining.—Mining progresses favourably in almost all parts. The decrease in the value of silver and the increase of that of lead and copper have caused more attention to be given to the mines which contain the latter. The most important of the newer mines are those at Bland, which contain vast bodies of gold ore of moderate grade; those in Taos county, where important copper and gold mines have been put in operation; those in Rio Arriba, with placer dredging on the Chama river and the production of mica near Petaca, and copper in Copper Cañon and near Coyote are progressing; in Doña Aña, where important copper properties are being worked in addition to the older silver-lead mines in the Organ mountains; in Otero county, where extensive deposits of turquoise have been discovered; and in the vicinity of the old mining districts of Grant, Socorro, and Sierra, where renewed activity has added largely to the output. Iron ore is being shipped in large quantities from the Hanover region of Grant county, and also from the vicinity of Glorieta. The total product of coal in the year ending 30th June 1899 was 1,409,038 tons, principally from Gallup, Cerrillos, and Raton.

Agriculture.—Since 1880 the cultivation of alfalfa has very largely increased, and sorghum has been introduced in many localities. Extensive orchards have been planted everywhere, as all the fruits of the temperate zone grow to great perfection both as to size and flavour. The cultivation of the sugar beet is very successful; the percentage of saccharine matter in the roots is found to be larger in New Mexico, and notably in the vicinity of Santa Fé, than elsewhere in the United States, averaging 16 per cent. and frequently exceeding 20 per cent. This high percentage is attributed to the almost perpetual sunshine. A beet sugar factory has been established at Eddy, and successfully run for several years. The average yield per acre was somewhat over 16 tons. In all of its products, mineral, horticultural, agricultural, and of animal industry, New Mexico is showing a steady and healthful progress.

Irrigation.—Extensive irrigation systems of a modern character have greatly enlarged the area of cultivated land. These have been established in the north-west, in the valleys of the San Juan and its tributaries; in the north-east of the great domain of the Maxwell Grant; in the south-east on the Pecos, where the system is in certain respects the largest in the entire country; in the south-west on the Mimbres, and in the central west on the Blue Water. An important improvement is the establishment of a modern low-line ditch in the valley of the Rio Grande from Peña Blanca to Albuquerque.

Manufactures.—The following table shows the manufacturing and mechanical industries in 1890 and 1900:—

	1890.	1900.
Number of establishments	127	420
Capital	$965,938	$2,698,786
Wage-earners, average number	849	2,600
Total wages	$470,361	$1,350,586
Cost of material used	$691,420	$2,914,138
Value of product	$1,516,195	$5,605,295

New Mexico is a mining and stock-raising region, with agriculture ranking next in importance. The most important manufacturing industry is railway repair works, followed by carpentering, lumber, and timber products, and flour and grist mills.

Railways.—The chief railways are the Denver and Rio Grande, the Atchison, Topeka, and Santa Fé, and the Southern Pacific. The total mileage within the territory in 1900 was 1693.

Banks.—There are national banks in all the principal towns, including Santa Fé, Albuquerque, Las Vegas, Raton, Roswell, and Silver City. Banks conducted under the territorial laws, with a capital smaller than that required for national banks, exist in a number of towns, some of the best known being at Taos, Springer, Whiteoaks, Deming, Eddy, Roswell, Hillsboro, and Las Cruces. Several of the large mercantile houses have a banking department which affords most of the facilities provided by regular banks.

Finance.—The financial condition of the territory is good. The assessed valuation has not varied much from $45,000,000 during the decade 1890–1900. The territorial indebtedness began to be paid off in 1891. The rate of interest on parts of the public indebtedness has been reduced to 4 per cent., which speaks well for the credit of the territory.

Land Claims.—The most important official event in the closing years of the 19th century was the establishment by Congress of the United States Court of Private Land Claims, which is adjudicating the titles of all grants of land made by the Spanish and Mexican authorities, and not previously confirmed. For nearly twenty years earnest efforts had been made without success to secure such a tribunal, and it was finally secured by sending a committee of twenty-five leading citizens, headed by the governor, to Washington, in 1890. It has adjudicated nearly all of the unconfirmed land grants in the territory, thus settling the title to many millions of acres, of which the larger proportion has been restored to the public domain.

Legislation.—The judges of the Supreme Court have been increased from three to five, each presiding in the courts of his own district, and the entire bench forming the appellate tribunal of the territory. The Public School Act of 1891 provided for a territorial superintendent of public instruction. With these exceptions, the government remains as it was in 1880, and probably no important change will occur until New Mexico becomes a state.

Politics.—In politics the territory is Republican, especially on the issues of protection, as the principal products of New Mexico, which are wool, coal, lumber, and lead, are all benefited by a tariff. At the election in 1900 the vote for delegate in Congress was, Republican, 21,567; Democratic, 17,857. (L. B. Pr.)

Newmilns, a burgh of barony and police burgh of Ayrshire, Scotland, 7½ miles east by south of Kilmarnock by rail. Muslin and lace curtain-making is the chief industry, and the manufacture of mosquito-nets has been added. There are a town hall, a workmen's institute, a public library, and an endowed school for girls. Population (1881), 2860; (1901), 4466.

New Orleans, the twelfth city of the United States in population, the capital of the state of Louisiana, and the chief seaport of the Mississippi valley. Until the end of the third quarter of the 19th century it owed its growth and importance in the world at large almost wholly to the fact of its being a gate of export for vast agricultural harvests. The close limitation of its business to the handling of raw products, without giving them the larger values of skilled manipulation, tended to keep this great port comparatively unwealthy, and to retard its growth, so that its relative standing among the American cities with which it was obliged to compete was steadily reduced. Its largest shipments were cotton. After 1875, however, while its cotton exports materially increased, another source of power and expansion was found in a growth, proportionately much larger, of its exports of other great staples; and at the same time a number of influences, some welcome, others unwelcome, turned an increasing share of the city's activities into avenues of business more lucrative and even more stimulative of high social conditions than were, or can be, the mere receipt, sale, and reshipment of staple crops. Under these combined influences the population expanded from 216,090 in 1880, and 242,039 in 1890, to 287,104 in 1900. Of the last number 30,325 were foreign-born and 77,714 were negroes. Out of 75,440 adult males, 10,078 (of whom 7125 were negroes) were illiterate (unable to write). The death-rate in 1900, on the basis of the Federal census of that year, was 28·9 per thousand, the highest of any of the large cities of the United States. This high death-rate is often attributed in great part to the large coloured population, among whom the mortality is estimated to be about 90 per cent. higher than among the whites; but it must be remembered that in New Orleans the coloured population largely comprises that labouring element whose faulty provision for health and sickness in every large city swells the death-rate, so that it is an error to explain away the high figure by this means alone.

Manufactures and Commerce.—In 1890 there were 1961 manufacturing establishments with 25,221 employés, a capital of $26,319,277, and products valued at $48,295,449 (or nearly two and one-half times as much as in 1880). In 1900 there were 1525 manufacturing establishments, having a capital of $46,080,061, employing 19,512 hands, and turning out products valued at $63,574,388. The most important industries, and the value of their products, were as follows: bags (other than paper), $3,443,468; men's clothing, $2,036,069; foundry and machine-shop products, $2,199,854; malt liquors, $1,472,062; rice, cleaning and polishing, $2,924,564; sugar and molasses, refining, $22,684,920. The foreign commerce of the port has increased more rapidly than the population. During the year ending 30th June 1900, in the foreign trade, 1220 vessels with a tonnage of 1,675,434 entered the port, and 1187 vessels with a tonnage of 1,720,008 cleared. During the same period the principal exports were as follows: mules, $2,978,884; Indian corn, $11,423,335; wheat, $6,587,218; cotton (unmanufactured), $66,148,722; oil-cake and oil-cake meal, $4,838,024; cotton-seed oil, $3,347,063; tobacco (unmanufactured), $3,115,389. A change calculated to benefit greatly the commerce of the port came into effect 29th May 1901, when the wharves of the city passed from private to municipal control, a marked reduction was made in the port charges from the schedule under the previous lease system, and a number of important improvements were instituted. During the year ending 30th June 1901 the total exports amounted to $152,776,599, and the imports to $20,462,307.

The growth of the city during the last quarter of the 19th century, moreover, was not merely commercial. In the face of grave reverses—floods, widely disastrous frosts, and a revisitation of epidemic yellow fever in 1897 after an immunity of nineteen years, with its accompanying commercial blight of outside quarantine—visible aspects and social conditions have greatly improved. The modern metamorphosis of the world's carrying trade has altered the inland relations of New Orleans from those of a great river port to those of a still greater railway terminus, and has brought in the more alert energies of modern modes of business. Ocean steamers, loaded in large part by elevators, now bear away the exports for which a swarm of sailing-ships of much lighter draught and average freight-room once made long stays at its wharves. Its passenger traffic on the rivers has practically vanished, and its shrunken fleets of river steamers are devoted to the carrying of slow freights and the towing of barges; but railway traffic has grown immensely, and the city is now entered by six trunk lines: the Illinois Central, Louisville and Nashville, Queen and Crescent, Southern Pacific, Texas and Pacific, and Yazoo and Mississippi Valley. The total number of square yards of streets paved in 1899 was 3,649,000, of streets unpaved, 8,800,000. The mileage of paved streets in 1900 was 205¾ miles, or two and a quarter times what it was in 1880. In 1900 the streets were lighted by 1624 arc lights. The immense crowds on gala days and nights are handled with an extraordinary effectiveness on 163 miles of electric street railway.

Public Improvements.—In keeping with this growth and change, unprecedented efforts are in full progress for the establishment of a system of sanitation so complete as to be a guarantee against any return of epidemic fevers, near or remote. This great public improvement was decided upon by a vote of the taxpayers in 1899, and the work of construction is now going forward rapidly. Hitherto the city had been without a sewerage system in the modern sense, open gutters being the only substitute. The main feature of the new system is an underground piping of the entire city that will carry off all sewage, the backwaters of Gulf storms, and the tremendous rainfalls peculiar to the region. A new water system is also projected, the supply for which is to be procured from the Mississippi river, and to be purified by mechanical precipitation and other means. The revenues of the present Sewerage and Water Board are derived from a fixed tax on real and personal estate of two mills on the dollar, the tax being first collected in 1899. To these measures of such vast practical utility are added many æsthetic improvements, conspicuously the embellishment of one or two public parks and several smaller pleasances. Certain drawbacks that remain are of kinds which naturally wait for their removal upon larger changes in manners and customs. The city's political conditions are variable, and popular modes of improving them are still somewhat too fitful and imperious to ensure the best, if even abiding, results; nevertheless some admirable reforms have been effected. The cause of public education enjoys an increased annual outlay ($426,924 in 1900, not including cost of new buildings), but a very grave proportion of the population of school age appears to be making no use of either public or parochial schools. In 1890 there were 71 public school buildings (valued at $1,600,000) and 752 teachers, but only 31,521 enrolled pupils out of 94,606 persons of school age (5 to 20 years inclusive). Tulane University, named after its benefactor, Paul Tulane, was founded in 1884, and in it was merged the former University of Louisiana. It has grown in many directions, notably by the addition of the H. Sophie Newcomb Memorial College for Women (founded in 1886). In 1900 it had in all its departments 77 instructors and 1145 students, and supplies valuable facilities for higher education; but neither the commercial value of an educated working class, nor the unsafety, both political and sanitary, of letting any large element rest in contented ignorance seems as yet to be effectually recognized.

Recent History.—The history of New Orleans during the period 1880–1900 has been marked by no more violations of public order than other American cities equally large; but one outbreak, on account of the international character that it assumed, should perhaps be recorded. In October 1890 the city chief of police was assassinated, declaring as he expired that the deed had been committed by Italians. He had been active in proceedings against certain Italians accused of crime, and it was popularly believed that his death was the work of a *maffia*, or sworn secret society. The following month eleven Sicilians were indicted for his murder. When nine of them were brought to trial in February 1891, six were acquitted, and three escaped conviction on the ground of a mis-trial. On 14th March 1891 a mob broke into the gaol and lynched the entire eleven. The Italian Government demanded that the lynchers should be punished, entered claims for indemnity in the case of those of the lynched Sicilians who had been Italian subjects, and, failing to secure a satisfactory answer from the American Government, withdrew its ambassador from Washington. The dispute was settled the following year by the payment to Italy by the United States of the sum of $25,000.

Among material things probably the leading obstacle to the best advancement of this thriving city is one the removal of which lies within the province of the national Congress, and has suffered an unfortunate delay. The jettied mouth of the Mississippi river, South Pass, has not for several years given a depth of channel sufficient for the steadily-increasing draught of the vessels that must make use of it if New Orleans is either to retain its vast shipments of raw produce, expand its manufactures, or multiply its markets across the waters of the Mexican Gulf, the Spanish Main, and the Pacific Ocean; but at length Congress has settled an improvement of South-West Pass destined to establish a channel 1000 feet wide and 38 feet in depth.

The city is governed under a charter passed by the state legislature in 1896, as amended by the Acts of 1898 and 1900. In 1900 the total assessed valuation of property was $139,230,232, of which $98,809,815 was real estate and $40,420,417 personal property. The rate of taxation per $1000 was $29, of which $22 was for city purposes. In May 1900 the bonded debt was $20,278,917, which was increased by $12,000,000 later in the year by the sale of public improvement bonds for water and sewerage purposes. During the decade from 1891 to 1900 the expenditures for permanent public improvements (including sewerage, lighting, paving, levees, and improvements in connexion with street and steam railways, docks, &c.) amounted to about $30,000,000, and nearly as much more was spent in the erection of private residences, stores, and other buildings. In 1900 the Board of Assessors placed the valuation of the real estate belonging to the city (including engine-houses, schools, public squares, markets, public buildings, &c.) at $4,731,675. In December 1900 arrangements were made to transfer the extensive markets from the lessee system to direct municipal control. In 1900 the city had a total area of 196·25 square miles, and contained 209 churches, 25 hotels, 7 theatres, and 25 public markets. The total vote cast at the election for mayor, 7th November 1899, was 32,559. In 1900 there were 75,440 males 21 years of age and over.

In the comforts and graces of private life New Orleans retains the peculiar attractiveness for which its society has been noted, while such changes as have taken place have been pointedly advantageous. The old Creole or Franco-American element is at length affiliating socially with the Anglo-American, and the gain and the charm of this better homogeneity is felt alike by the resident and the sojourner. The growth of social refinements, visible in many ways, is in no external feature more beautifully indicated than in the improved taste of the domestic architecture, and in the multiplication and high keeping of the innumerable private gardens of this city of perpetual bloom. (G. W. Ca.)

New Philadelphia, a city of Ohio, U.S.A., capital of Tuscarawas county, on the Tuscarawas river and the Ohio Canal, at the intersection of several railway lines, in the north-east part of the state. Population (1890), 4456; (1900), 6213, of whom 554 were foreign-born.

Newport, a municipal borough and market town in the Isle of Wight, Hampshire, England, on the river Medina, navigable to the town quay, which is 7 miles west-south-west from Ryde. A railway line to Freshwater and Yarmouth has been opened. Population (1881), 9357; (1901), 10,911.

Newport, a municipal and county borough, contributory parliamentary borough, seaport, and market town, in the Monmouth parliamentary district of boroughs, Monmouthshire, England, on the Usk, 4 miles from its confluence with the Severn, 145 miles by rail west of London. The town council consists of 10 aldermen and 30 councillors. In 1889 Maindee was incorporated with Newport, and constitutes one of its five wards. With Monmouth and Usk, Newport returns one member to Parliament. The docks have an area of 60 acres. Modern erections are the town hall (1885), the county council offices (1892), the market hall, almost entirely rebuilt in 1889, baths (1890), and museum and art gallery (1895). There are two daily newspapers. The industries include shipbuilding, with dry docks for repair of ships, the making of railway plant, chemical manures, and agricultural implements. In 1888, 112 vessels of 32,146 tons were registered; in 1900, 82 of 23,654 tons. Ships entering port in 1888 numbered 4164 of 1,729,332 tons; clearances, 4135 of 1,718,515 tons. In 1900 entrances numbered 6726 vessels of 2,179,300 tons; clearances, 6717 of 2,166,020 tons. Imports of foreign and colonial produce for 1900 were valued at £1,125,869, against £764,725 for 1888; exports of produce and manufactures of the United Kingdom for 1900 at £3,355,623, against £1,816,647 in 1888. Area of county borough, as extended in 1889, 4924 acres. Population (1881), 38,469; (1891), 54,707; (1901), 67,290.

Newport, a city of Campbell county, Kentucky, U.S.A., on the Ohio river, at the mouth of Licking river, opposite Cincinnati, in the northern part of the state, at an altitude of 515 feet. It is connected with Cincinnati and with Covington, on the other side of Licking river, by railway and waggon bridges. It is on the Chesapeake and Ohio and the Louisville and Nashville railways. The city is well laid out, with six wards, has a water supply owned by the city, and is paved mainly with macadam. It is to a large extent a residential suburb of Cincinnati, but it has also important industries of its own. In 1900 its manufacturing establishments numbered 272, with a total capital of $2,848,435. The average number of wage-earners employed was 2561, and the products were valued at $4,888,169. The principal item was foundry and machine-shop products, which had a value of $922,014. The assessed valuation of real and personal property was, in 1898, $10,373,900; the net debt of the city was $1,303,676, and the rate of taxation $26.35 per $1000. Population (1890), 24,918; (1900), 28,301, of whom 4081 were foreign-born and 424 were negroes.

Newport, a city of Rhode Island, U.S.A., capital of Newport county, and one of the two capitals of the state, at the southern end of Rhode Island in Narragansett Bay. It is the most fashionable seaside resort in the United States, the town proper being surrounded by splendid villas, with beautiful drives in different directions. Its pre-eminence as a seaside resort is due probably to the excellence of its harbour, appreciated by the yachting fraternity, its fine bathing beaches, its accessibility, being connected by rail and daily boat with New York, and its insular climate, which tempers the summer heat. Newport has little commerce. In 1900 there were 290 manufacturing establishments, with products valued at $3,442,998. The harbour is defended by Fort Adams, on a point across the harbour from the city. On Coasters Harbour Island are the Naval War College, torpedo station, and naval training school. Population (1890), 19,457; (1900), 22,034, of whom 5563 were foreign-born and 1613 negroes. These are the figures of the resident population, excluding summer visitors, who come in large numbers in August.

Newport News, a city and seaport of Virginia, U.S.A., on the point to the north of the entrance to James river and on Chesapeake Bay. Though within the limits of Warwick county, it is independent of county government. It has a level site and a regular plan, a water supply, and other municipal improvements. It is the eastern terminus of the Chesapeake and Ohio Railway, and, having a very fine harbour, is rapidly becoming a seaport of great importance, rivalling its much older neighbour, Norfolk. Its imports for the year ending 30th June 1901 amounted to $4,090,451; its exports amounted to $32,567,912, and consisted mainly of bread-stuffs, cattle, cotton, lard, and tobacco. It has a large iron shipbuilding plant, the capacity of which is shown by the fact that several vessels of the U.S. navy have been built there, including two of the largest battleships, which were constructed simultaneously. In 1900 there were 123 manufacturing establishments, having a capital of $14,999,735, employing 5675 hands, and turning out products valued at $6,976,670. Population (1890), 4449; (1900), 19,635, of whom 1614 were foreign-born and 7698 negroes.

Newquay, a popular English watering-place, in the St Austell parliamentary division of Cornwall, 14 miles north of Truro, with a station on a branch of the Great Western Railway. Since 1894 it has been governed by an urban district council. The cliff scenery of the coast is very grand, and there is a fine sandy beach two miles long. The harbour admits vessels of 250 tons. The chief exports are iron and other ores, china-clay, granite, fish, and grain. The imports are coal, salt, and manures. Population of urban district (1891), 1891; (1901), 2935.

New Rochelle, a city of Westchester county, New York, U.S.A., on the shore of Long Island Sound and on the New York, New Haven, and Hartford Railroad, in the south-eastern part of the state. Its site is undulating and its plan fairly regular. It is little more than a residential suburb of New York City, having little commerce or manufactures. Population (1880), 5276; (1890), 9057; (1900), 14,720, of whom 4425 were foreign-born and 777 negroes.

New Ross, a market town and urban sanitary district, county Wexford, Leinster, Ireland, on the left bank of the Barrow, 85 miles south-south-west of Dublin by rail. It ceased to be a parliamentary borough in 1885, and in 1898 the portion situated in Kilkenny was added to Wexford. New quays have been erected. Population (1881), 6626; (1891), 5847; (1901), 5876.

Newry, a maritime town, urban sanitary district, and parliamentary borough (returning one member) in the province of Ulster, Ireland, on the Newry water at the head of Carlingford Lough, 63 miles north of Dublin by rail. In 1898 the portion situated in Armagh was added to Down. The port admits vessels of 2000 tons to Victoria Locks, three miles from the town, but vessels drawing 15 feet can go up the ship canal to the Albert Basin, three miles from the sea. The Newry Navigation have deepened the river at a cost of £53,000. In all, 1522 vessels of 198,661 tons entered in 1900, and 1017 of 153,829 tons cleared. A railway connects the Great Northern system with the deep-water harbour at Greenore, and an electric line has been constructed to Bessbrook. Population (1881), 15,085; (1891), 12,961; (1901), 12,587.

New Siberia Archipelago, a group of islands situated off the Arctic coast of Siberia, from 73° to 76° 6′ N., and 135° 20′ to 148° E. The name is loosely applied either to the northern group only of these islands, for which the name of New Siberia Archipelago, or of Anjou Islands, ought properly to be reserved, or to this northern group as well as to the southern, which ought to maintain its name of Lyakhoff Islands. Some confusion prevails also as to whether the islands Bennett, Henrietta, and Jeannette, discovered by the *Jeannette* expedition, ought to be included in the same archipelago, or described separately as the Jeannette Islands. The first of these three belongs geographically, and probably geologically, to New Siberia Archipelago, from which it is only 97 English miles distant, but for the present it must be counted separate. As to Henrietta and Jeannette Islands, situated 200 English miles north-east of New Siberia Island, under 157° to 159° E., they can hardly be included in New Siberia Archipelago. There seems, moreover, to exist, due north of Kotelnyi Island of New Siberia Archipelago, in 78° N., a land which was sighted first by Sannikoff and described as Sannikoff Land. It has been sighted also by Baron Toll.

The *New Siberia* or *Anjou Islands* consist, beginning from the west, of Kotelnyi, the largest of them (116 miles long, 100 miles wide), having the small island Byelkovskiy near its western shore; Thaddeus (Faddyéevskiy), in the middle; and New Siberia (Novaya Sibir), in the east (90 miles long, 40 miles wide). Kotelnyi is the highest and the most massive of the four, reaching a maximum altitude of 1200 feet in the Malakatyn-tras mountain. Its north-east portion consists of Upper Silurian coral limestones (Llandovery division), containing a rich fossil fauna, and representing a series of folds running north-north-west. The same Silurian deposits are widely spread on the mainland as far as Olenek. The western portion of Kotelnyi is built up of Middle Devonian limestones and slates, folded the same way, of which the fossil fauna is similar to that of the Urals. Triassic slates appear in the south-east. Diabases pierce to Devonian rocks, and Olivine rocks appear as dykes amidst the Triassic deposits. The Malakatyn-tras is also made up of volcanic rocks. The eastern portion of the island, named Bunge's Land, is thickly covered with Post-Tertiary deposits. The geology of Thaddeus Island, which has a long promontory, Anjou, protruding north-westwards, is not yet known.

As to New Siberia Island, it attains altitudes of from 200 to 300 feet in its western portion. A range of hills, composed of Tertiary deposits, and named Hedenström's Mountains, runs along its south-western coast, and the same rocks form a promontory protruding northwards. The so-called Wood Mountains, which were supposed to be accumulations of floating wood, are denudations of Miocene deposits containing layers of brown coal with full stems of trees. These Tertiary deposits are characterized by a rich fauna; fully developed leaves of poplars (*Populus arctica* and *P. Richardsoni*, Heer), numerous fruits of the mammoth tree (*Sequoia Langsdorfii*, Brogt.), needles of several conifers (*Taxites tenuifolia*, Schmidt; *Taxodium distichum miocenum*, Heer), &c., being found in them, thus testifying to a once very much warmer climate. The only representative of tree vegetation now is a dwarf willow one inch high.

The *Lyakhoff Islands* consist of the Bolshoi (Large), or Blizhniy (Nearest), which is separated by Lapteff Strait, 27 miles wide, from Cape Svyatoi of Siberia; Malyi (Small), or Dalniy (Farthest), to the north-west of Blizhniy; and three smaller islands—Stolbovyi (Pillars), Semenovskiy, and Vasilievskiy—to the west of Malyi. Dr Bunge found Large Island consisting of granite protruding from beneath non-fossiliferous deposits; while Svyatoi Nos promontory represents basalt hills 1400 feet high. Along the southern coast of Large Island Baron Toll found immense layers of fossil ice, 70 feet thick, evidently relics from the Ice Age, covered by an upper layer of Post-Tertiary deposits containing numbers of perfectly well-preserved mammoth remains, rhinoceros, *Ovibos*, and bones of the horse, reindeer, American stag, antelope, *saiga*, and even the tiger. The proof that these animals lived and fed in this latitude (73° 20′ N.), at a time when the islands were not yet separated from the continent, is given by the relics of forest vegetation which are found in the same deposits. A stem of *Alnus fruticosa*, 90 feet high, was found with all its roots and even fruits.

Basalts and Tertiary brown coal deposits enter into the composition of the southern extremity of Bennett Island, and the mountains of Sannikoff Land, seen by Toll, have the aspect of basaltic "table mountains."

The climate of these islands is very severe. In 1886 the winter ended only in June, to begin anew in August (21st May, $-21°$; 16th October, $-37°$ Celsius). The highest summer temperature was 10°. Notwithstanding that, flocks of *Larus argentatus*, geese, and *Somateria spectabilis* come to the islands from the north (Bunge and Toll), as also *Tringa islandica* and the gull *Lestris pomarina*, which feeds chiefly on the lemming (*Lemmus obensis*). The lemmings are very numerous, and undertake in certain years migrations to the mainland and back. Reindeer, followed by wolves, come also every year to the islands; the polar fox and the polar bear, both feeding on the lemmings, are numerous. Hunters come in numbers to the Lyakhoffs, which must have been known long since to Arctic hunters. A Yakutsk Cossack, Vaghin, wintered on Large Island in 1712, but it was a merchant, Lyakhoff, who first described the two greater islands of this group in 1770, and three years later reached on sledges the largest island of the New Siberia group, which he named Kotelnyi. The Lyakhoffs were mapped in 1777. J. Sannikoff, with a party of hunters, discovered in 1805–8 Stolbovyi, Thaddeus, and New Siberia Islands, and a merchant, Byelkoff, the Byelkovskiy Islands. He sighted the land in the north of Kotelnyi and the land in the north-east of New Siberia (now Bennett Island). Hedenström, accompanied by Sannikoff, explored the archipelago and published a map of it in 1811. Lieutenant Anjou revisited it in 1821–23. A scientific expedition under Dr Bunge (including Baron Toll) explored these islands in 1885–86. Baron Toll with Lieutenant Shileiko revisited them in 1893, and again in 1900.

NEW SOUTH WALES.

I. GEOGRAPHY AND STATISTICS.

NEW SOUTH WALES, the oldest state of the Australian Commonwealth, lies on the eastern side of the island-continent, and is bounded on the N. by Queensland, on the E. by the Pacific, on the S. by Victoria, and on the W. by South Australia.

Geology.—Exploration has added very materially to our knowledge of the sedimentary formations found in the state. To the Rev. W. B. Clarke is due the credit of making the first systematic classification of these formations; this classification has, however, been somewhat modified, and the rocks as they are now known are classified as follows:—

Cainozoic	Post-Tertiary	Recent.
		Pleistocene.
	Tertiary	Pliocene.
		Miocene.
		Eocene.
Mesozoic	Cretaceous	Upper Cretaceous—Desert Sandstone.
		Lower Cretaceous—Rolling Downs Formation.
	Jurassic.	
	Triassic—Hawkesbury Series	Wianamatta Shales.
		Hawkesbury Sandstones.
		Narrabeen Shales.
Palæozoic	Permo-Carboniferous	Upper Coal Measures.
		Dempsey Beds.
		Middle Coal Measures.
		Upper Marine Series.
		Lower Coal Measures.
		Lower Marine Series.
	Carboniferous.	
	Devonian.	
	Upper Silurian.	
	Lower Silurian.	

Palæozoic rocks extend throughout almost the whole eastern portion of the state, principally on the western watershed of the main dividing range, in the country where the Murrumbidgee, Lachlan, and Abercrombie rivers rise. They appear on the eastern watershed, along part of the coast near Bateman's Bay, and, striking inland, are found in the basin of the Clyde and the upper valley of the Shoalhaven. Slates containing Lower Silurian fossils (graptolites) have been found at three localities in New South Wales, on the border of Victoria, to the south and south-west of Delegate; at Myall Reefs, near Tomingley, and at Cadia, near Orange. The Upper Silurian rocks extend as far north as Mudgee, where they are overlain by the Permo-Carboniferous strata of the Hunter Valley, and by the belt of volcanic rocks extending along the Liverpool range. They reappear farther north, in the upper valley of the Macleay river on the east slope, and in the basin of the Namoi, on the west side of the dividing range. The Silurian rocks consist of sandstone, slate, and limestone, and exhibit evidence of metamorphism, particularly in the country around Bathurst and Hill End. Limestone beds of considerable extent are scattered throughout this formation. These are chiefly composed of crinoids and corals, which outcrop prominently in the Wellington district, near Molong and Gulgong, at Tuena, and also in the Murrumbidgee district. In the limestone formations are found magnificent caves, such as the Wellington, Wombeyan, Jenolan, Bungonia, and Abercrombie, the fame of which has spread even beyond the confines of Australia. The caves at Yarrangobilly, in the Kiandra district, are also very attractive. The Devonian rocks are well seen at Mount Lambie, near Rydal, where the late Mr C. S. Wilkinson measured a section of strata showing a thickness of not less than 10,000 feet. They also occur in the northern, southern, and western districts.

The coal-bearing rocks are of three distinctive systems, the first of which is in all probability of Lower Carboniferous age; but the coal is full of bands, and otherwise too dirty to be of any economic value.

The second system, known as the Permo-Carboniferous, contains many seams of workable coal. Productive Coal Measures occur in this system on three horizons: the first and lowest of these is the Greta (Stony Creek) series, the second the Tomago (East Maitland) series, and the last and uppermost, the Newcastle series. The total thickness of this system and its associated strata at Newcastle is about 11,000 feet, containing a total thickness of about 150 feet of coal, without taking into account seams of less than 3 feet in thickness. Borings at Cremorne, a point on the northern margin of Sydney harbour, as well as at Holt-Sutherland and Liverpool, show the continuous extension of at least the upper or Newcastle series of coal-seams between Newcastle on the north and Bulli on the south.

The third system comprises the Clarence Carboniferous basin, and is of Mesozoic age. Professor David estimates the length of that part of it which contains the principal seams to be about 65 miles from east to west, while its width is about 37 miles from north to south. The most remarkable beds in the Clarence basin are a series of massive whitish sandstones, which were considered by Mr C. S. Wilkinson to be the equivalents of the Hawkesbury sandstones, and were named by him "The Middle Clarence Series," occupying as they do an intermediate position between the upper and lower coal-beds of the basin. None of the seams in this coal-field have as yet been proved to be of commercial value. Professor David estimates the top seam to contain 1 foot 9 inches, out of a total thickness of 5 feet 7½ inches, of coal fit for ordinary consumption, while the second and third seams have not been sufficiently tested to allow of a definite opinion being formed of their value. It is probable, however, that even if the seams prove to be of insufficient thickness and purity to yield coal fit for purposes of export, they may supply coal of fair quality for local requirements.

The Hawkesbury and Wianamatta series, which overlie the Carboniferous formation of that part of the country through which the Hawkesbury and its principal tributaries flow, belong to the Mesozoic period. It is in this series that the wonderful gorges of the Blue Mountains and the beautiful harbours of Port Jackson, Port Hacking, and Broken Bay occur. The rocks consist of grey, purple, and chocolate-coloured shales and yellowish-grey sandstones, and the maximum thickness of the strata is estimated at 1700 feet. The Triassic rocks form the principal store-house of the artesian water-supply of the north-western portion of the state, where they underlie the rolling downs or Lower Cretaceous formation. Most of the deeper bores in this arid region obtain the bulk of their supply of water from the Triassic sandstones. The Wianamatta formation extends round Sydney, and covers a space in the shape of an irregular triangle, the angular points of which rest at Picton on the south, Richmond on the north, and Sydney on the east. The beds are composed of fine sedimentary deposits of argillaceous shales, and are of comparatively little thickness. They appear to have been deposited in hollows worn by denudation out of the sandstone on which they directly rest. Neither the Narrabeen shales, nor the Hawkesbury sandstones, nor the Wianamatta shales, contain any remarkable seams of coal. All three formations are intersected by igneous dykes, which have also intruded the underlying Permo-Carboniferous rocks; and where they have come in contact with the coal-seams, the latter have been converted into coke, sometimes to a thickness of 3 feet or more. Jurassic rocks have been recognized in only one locality in New South Wales, viz., on the Talbragar river, about 20 miles north of Gulgong, where they occupy a denuded hollow in the Hawkesbury sandstones. They are of small extent, and consist of yellowish shales containing numerous fish and plant remains.

The Cretaceous formations occupy the north-western part of the state, extending from the Barwon westwards towards the north-western corner. Water-bearing strata have been reached at depths varying from 89 feet to 2070 feet, and large quantities of water have been obtained, though principally from the underlying Triassic sandstones. The existence of subterranean water throughout this extensive region has been practically demonstrated.

To the Cainozoic period belong the deposits covering the greater portion of the central and western districts of the state. It therefore embraces the valleys of the great western rivers and their chief tributaries. The formation is, however, intersected by a broad broken belt, chiefly of Silurian rocks, extending across its centre, from the Bogan river towards the Great Barrier Range on the farther side of the Darling. Large patches of Devonian rocks are also met with in the same region. Making these deductions, the Post-Tertiary rocks cover more than one-third of the whole state. The vast alluvial plains were formed during the Pliocene and Post-Pliocene periods. The alluvial deposits are of variable thickness, sometimes shallow; but in the great plains, between the main rivers which intersect the country, the deposits are of very great depth.

The area occupied by Igneous and Metamorphic rocks comprises one-eighth of the colony—the principal rocks belonging to the series consisting of varieties of granite, quartz-porphyry and felstone, diorite, basalt, and serpentine. Granite occurs for the most part in the northern and southern masses of the great dividing range, but is found outcropping throughout the Silurian deposits, which cover so large a part of the centre of the state. Diorite and basalt occur principally in the country between the Macleay and Manning rivers, and on both slopes of the Liverpool Range, between the upper waters of the Namoi and Macleay. Serpentine is found scattered in different parts of the state, chiefly at Gundagai, Bingara, Lucknow, Nundle, Yulgilbar on the Clarence river, and Port Macquarie. The granites, quartz-porphyries, and felstones have been recognized as belonging to the Palæozoic age, whilst the volcanic rocks, basalts, and others are chiefly contemporaneous with the Tertiary series. At Kiama there is an immense development of interbedded basalt lavas and tuffs in the Permo-Carboniferous rocks.

Artesian Water.—Before actual boring operations proved that the belief was well founded, it had long been scientifically demonstrated that there was every probability of water being obtained in the Cretaceous formation which underlies the whole of the north-west portion of New South Wales—a region favoured with only a sparse rainfall; and from an examination which has been made of this formation occurring in the western and north-western portions of the state, it is considered probable that the artesian water-bearing basin will be found to extend much farther south than it was previously supposed to do. It may, indeed, be yet found to extend approximately along the course of the Lower Darling. An important discovery has also been made that artesian water is obtainable in other than Cretaceous rocks. This is borne out by palæontological evidence; and some of the most successful bores, such as those at Coonamble, Moree, Gil Gil (Moree to Boggabilla), and Euroka (Walgett to Coonamble), have pierced rocks of Triassic age, corresponding with the Ipswich Coal Measures.

As to the *natural features* and *climate*, nothing need be added to what was said in those respects in the ninth edition of this work (vol. xvii. p. 408), the correctness of which extended observations have served to confirm.

Population.—The population on the 1st January 1901 was 1,359,943, viz., 713,896 males and 646,047 females. The total includes 10,974 Chinese and 7434 aborigines and half-castes. Since 1860 New South Wales has added more largely to its population than any of the other Australian states. In the year named the population was 348,546; in 1890 the number was 1,121,860. From 1890 to 1901 the population increased 238,083, or at the rate of 21·2 per cent. By far the largest part of the increase is due to excess of births over deaths, for out of the increase of over 1,000,000 since 1860, only 350,000 was due to immigration. In 1899 there were 36,461 births and 15,901 deaths; these figures are equal to 27·10 and 11·82 per thousand respectively. The birth-rate has fallen very much, especially during the last ten years of the 19th century. In 1861–65 it was 42·71 per 1000; in 1896–99 it was only 27·92 per thousand. Illegitimacy is increasing in New South Wales, and in 1899 the proportion of illegitimate births was 7·16 per cent. of the total births. In 1871–75 it was 4·09 per cent. of the total births; in 1896–99 it had risen to 6·84 per cent. The marriage-rate for 1899 was 6·89 per thousand, and the persons married 13·78 per thousand. The mean for 20 years was 7·39. The chief cities are Sydney and suburbs, population in 1901, 488,382; Newcastle and suburbs, 54,991; Broken Hill, 27,518; Parramatta, 12,568; Goulburn, 10,610; and Maitland (East and West), 10,085. There are nine other towns with between 5000 and 10,000 inhabitants each.

Administration.—Some important changes have been made in the electoral system. The number of members of the Legislative Assembly has been fixed at 125, and the boundaries of the electoral districts are from time to time adjusted so as to preserve, as far as possible, an equality in the number of electors in every district. The suffrage is extended to all males over twenty-one years of age, with the usual restrictions in regard to the pauper and criminal classes. An elector has only one vote, which is attached to the district in which he resides. Members of the Legislative Assembly are allowed a salary of £300 a year. There were in 1899 about 325,000 electors. Each electoral district returns one member. Local government is confined to the centres of population. There are 189 municipalities, embracing an area of 2824 square miles, which is an insignificant proportion of the whole area of the colony (310,700 square miles). The municipalities, however, contain 815,000 persons, out of a total population of 1,359,943. Rates are levied on the estimated fair annual rental of properties liable for assessment, and in 1900 the assessed value was £7,905,350, representing a capital value of £124,541,800, the value of Sydney and suburbs being £5,069,630 annual and £88,116,600 capital value. The revenues of all the municipalities in 1900 amounted to £806,057. Where water-supply has been provided to municipalities the local bodies control the works. In 1900, 17 municipalities owned their own gasworks and 6 had electric lighting. The various local bodies had outstanding loans to the extent of £2,731,334, of which £1,344,004 had been raised in London, and the balance in Sydney. The municipalities maintained 7500 miles of road, about half this length being formed; the state maintained about 42,000 miles, so that there were nearly 50,000 miles of road communications.

Religion.—The proportions of the leading denominations have not altered to any considerable extent since 1891. The proportions then were:—Church of England, 44·8 per cent.; Roman Catholic, 25·5; Presbyterian, 9·7; Wesleyan and other Methodists, 9·8; Congregationalist, 2·1; Baptist, 1·2; others, 6·9. In 1901, 72·18 per cent. of the population were Protestants and 25·96 per cent. Roman Catholics. Sydney is the seat of Anglican and Roman Catholic archbishoprics; the Anglican archbishop is also primate of Australia and Tasmania.

Education.—The state has in its employ 2755 male and 2308 female teachers, and maintains 2745 schools. The law requires that all children over six years and under fourteen years shall attend school, and in 1900, 250,000 children of these ages, as well as 49,000 others below or beyond the school ages, were receiving instruction, making a total of 299,000. Of this number 239,000 were in state schools and 60,000 in private schools. The majority of the private schools are controlled by one or other of the religious bodies. The Roman Catholic Church has 325 schools, with 1617 teachers and an attendance of 32,000 pupils. The total expenditure of the state on public instruction, science, and art during the year ended 30th June 1900 was £873,824. During the calendar year 1900 a sum of £780,216 was expended on primary instruction. The fees from pupils amounted to £82,494, making the actual cost of primary instruction £697,722. There are a university and a technical college in Sydney.

Finance.—The revenue is derived from three main sources, viz., taxation, sale and lease of lands, railways, tramways, and other services. In 1900 the sums received under these headings were:—From taxation, £2,618,066; from land, £2,116,076; and from services rendered (railways, tramways, posts and telegraphs, &c.), £4,992,521: there were miscellaneous receipts to the extent of £244,014, so that the total revenue was £9,970,677. The direct taxation is represented by a tax of one penny in the pound on the unimproved value of land, sixpence in the pound on the annual income derived in the state from all sources, except the use and occupation of land and improvements thereon. There are also various stamp duties. The land revenue is derived partly from the alienation of the public estate, either absolutely or under conditions, and partly from the occupation of the public lands. There is also a small revenue from mining lands, timber licences, &c. The state still holds 150 million acres out of a total of 198 million acres, having alienated about 48 million acres. The principal heads of expenditure were:—Interest on public debt, £2,310,271; redemption of loans, £264,562; working expenses—railways, £2,025,720; posts and telegraphs, £722,110; public instruction, £769,576; hospitals and charities, £394,637; military and naval, £212,405; other services, £3,189,696, making a total of £9,888,977. The expenditure has been fairly stationary since 1893. The public debt in 1900 was £65,332,993, equal to £48 per inhabitant. The public debt has risen from £14,903,919 since 1880. Of the total debt in 1900 (£65,332,993) the amount of £2,181,584 was unfunded, and £55,060,650 was held in London.

Defence.—The defence force at 30th June 1900, exclusive of Rifle Club reservists to the number of 1500, mustered 9152; of these 824 were permanent troops, 4440 partially paid, 3305 volunteers, and naval volunteer force 583. The annual expenditure upon defence in 1900 was £249,271. Besides the maintenance of the military forces, there is an annual expenditure from loans upon fortifications; this for the year 1900 amounted to £29,427. There is also a small expenditure upon the maintenance of the works at the naval station at Port Jackson, which have been erected at a cost to the state of £312,481.

Production.—Very material changes have taken place since 1882 in the industrial position, due to a variety of causes, chief amongst which were the opening of the Broken Hill silver mines, the extension of agriculture, and the opening up of the central districts, with the substitution of small holdings for the large pastoral areas under which the land was previously held. In 1880 there were 39,918 holdings over one acre in extent, embracing 22,721,603 acres; while in 1900 the separate holdings numbered 68,098, and their area was 45 million acres, in all cases excluding land leased from the Crown. This change in the character of the occupation of the country has had a very natural effect upon all rural industries and on trade generally. The main changes are briefly alluded to hereunder.

Agriculture.—New South Wales is essentially a pastoral country, and the cultivation of the soil has always been secondary to stock-breeding. This circumstance is by no means due to lack of good land, nor can it be ascribed to defects of the climate. But success in tillage in New South Wales is altogether independent of the mere fitness of the soil for cultivation. An irregular rainfall and a want of uniformity in the seasons, which are the chief characteristics of the climate of a large part of the interior, have impeded the advance of agriculture, especially on the great western plains. And to these obstacles there may be added the cost of transport, which, owing to the great distance that produce would have to be carried by land before it can reach a seaport, has told greatly against cultivation for export, which must be the chief hope of the farmers in a country so sparsely populated and affording such a small home market. These reasons will explain how it has happened that for many years such slow progress was made in agriculture. In 1882 the breadth of land under cultivation was 733,582 acres, which is slightly less than one acre per inhabitant; in 1900 the total area under cultivation was 2,440,968 acres, which is equal to 1·86 acres per inhabitant. The area devoted to each of the principal crops was as follows:—Wheat, 1,840,979 acres; maize, 214,697 acres; oats, 134,529 acres; barley, 8623; other cereals, 4885; lucerne and other green crops, 107,880; sugar-cane, 22,517; potatoes, 34,968; oranges, 14,533; vines, 8278; other fruits, 31,716; other crops, 17,363. The total value of all produce harvested in 1900 was £5,582,000. Although the coastal districts are still important, as the crops yielding the largest returns per acre are grown there, as regards total area under crop they are of much less importance compared with the whole state than formerly. For agricultural purposes New South Wales is naturally divided into six zones; these, with the total area under crop in each, are as follows:—Coast districts, 316,403 acres; tablelands, 663,030; western slopes of tableland, 1,004,456; Riverina, 387,710; western plains—east-Darling, 23,303; western plains—trans-Darling, 6066. On the great western plains, comprising an area of 136,896 square miles, less than 30,000 acres are cultivated. The soil of that part of the country is for the most part suitable for cultivation, and there are large areas of rich land, but the rainfall is too light and irregular for the purposes of agriculture.

In 1898 New South Wales for the first time became an exporter of wheat, but a small import was again necessary in 1899. Hay crops and maize rank next in importance to wheat. The cultivation of various kinds of fruit is receiving increased attention, but the growing of sugar-cane and tobacco and the production of wine, until recently so promising, are, if not declining, at least stationary, in spite of the suitability of the soil of many districts for these crops. The progress of agriculture since 1880 will be seen from the fact that in that year the total area cropped was 635,641 acres, and in 1900 it was 2,440,968 acres.

Grazing.—In spite of the great attention now bestowed upon agriculture, the grazing industry still holds the chief place amongst the productive industries. The number of stock depastured in 1900 was, however, much less than in any year since 1886, due solely to the droughts, which during the preceding five years (1895–99) played havoc with the flocks. In 1894 the flocks and herds numbered 518,000 horses, 2,465,000 horned cattle, 57,000,000 sheep, and 273,000 swine; in 1900 the numbers had fallen to 481,417 horses, 1,983,116 horned cattle, 40,020,506 sheep, and 256,577 swine. The vast majority of the sheep are of the merino breed, but there are about a million long-woolled sheep, and between two and three million cross-bred.

There are 68,098 holdings exceeding one acre in extent, and the area occupied is 164,886,804 acres, of which 45,086,209 acres are owned by private persons and 119,800,595 acres by the Crown. About 3 million acres are used for purposes of tillage or are in fallow, and the remainder for grazing and dairying.

Mining.—The mining industry has made great strides. In 1899 there were about 43,000 men engaged in the various mines, besides 3300 employed in smelting. Nearly half this number (19,350) were employed in gold-mining; in coal-mining there were

10,300; silver, 7900; tin, 1500; and copper, 2400. The value of mining machinery may be approximately set down at £2,800,000. The following summary shows the value of the production of the various minerals since their first discovery, as well as the value of minerals won in 1899. It is impossible to separate the values of silver and lead contained in the ore exported from Broken Hill and other fields, but an estimate based upon the best data available gives their approximate values as—silver, £21,559,600, and lead, £6,458,800.

Minerals.	Produced in 1899.	Total Production.
Metallic—		
Gold	£1,751,815	£47,546,013
Silver and lead	2,170,446	28,018,436
Zinc	49,207	112,879
Tin and tin ore	90,482	6,382,538
Copper and regulus	395,451	5,019,480
Iron oxide	846	10,644
Antimony and ore	2,694	190,621
Bismuth	3,355	50,880
Manganese oxide	...	1,331
Chrome iron ore	17,416	70,975
Platinum	1,070	11,425
Non-metallic—		
Coal	1,325,799	35,647,004
Coke (not included with coal)	77,130	371,106
Kerosene shale	40,823	1,908,482
Alunite	2,763	37,958
Cobalt	899	3,380
Diamonds	10,350	49,872
Opals	135,000	376,599
Other	4,970	124,322
Total	£6,080,516	£125,933,945

The value of gold won in 1899 (£1,751,815) was a considerable increase over the production of the previous year and of any year since 1863. As no new fields of importance have been discovered, this increased yield was doubtless due to an improvement in methods. About one-fifth of the gold won is alluvial. The yield of gold from quartz mines was in 1899, 12 dwt. 2 grains per ton, which was somewhat below the average for the previous ten years. The Broken Hill silver lode is the largest as yet discovered; it varies in width from 10 feet to 200 feet, and may be traced for several miles. The Broken Hill Proprietary Company owns the principal mine, and at Port Pirie, in the neighbouring colony of South Australia, has erected a complete smelting plant. From the commencement of mining operations in 1855 to the beginning of June 1900 the company treated 4,594,611 tons of ore, producing 103 million ounces of silver and 419,000 tons of lead, valued at £21,632,000. The production of tin has rapidly declined since 1881, when the value of ore raised was £569,000; in 1899 the production was only £90,000. One cause of this falling-off was the drop in the price of the metal, but the principal cause was the exhaustion of the shallow deposits of stream tin, from which most of the ore was obtained. The high rates ruling in 1899, however, caused an advance in production in 1900, the output being valued at £142,724. The principal deposits of copper are in the central parts between the Macquarie, Bogan, and Darling rivers. The value of the production fell from £473,000 in 1883 to £64,000 eleven years later, but in 1900 had again increased to £425,301. Iron is widely diffused, principally in the form of magnetite, brown hæmatite, limonite, and bog iron. Coal-mining is carried on in three districts. In the northern or Hunter river district there were 57 collieries, employing 8000 men, and the quantity of coal raised was in 1899 about 3,260,000 tons; in the southern district there were 14 collieries, employing 2100 men and raising 1,120,000 tons of coal. The western or mountain collieries were 17 in number, employing 400 men and raising about 218,000 tons. About 70 per cent. of the coal obtained is exported.

Manufacturing Industry.—There are a large number of manufactories, but only 222 employ more than 50 hands. The following is an analysis of the establishments at the close of 1900:—

Establishments with	Number.	Total Hands.
Under 10 hands	1888	10,361
11 to 20 ,,	572	8,449
21 to 50 ,,	395	12,406
51 to 100 ,,	131	8,862
Over 100 ,,	91	20,701
Total	3077	60,779

Of the 60,779 hands employed in 1900, 24,312 may be said to find employment in connexion with industries which come into competition with imported goods, while 36,467 were employed in domestic industries treating perishable produce required for immediate use, or in industries called into existence by the natural resources of the state. About two-thirds of the hands are employed in Sydney and the adjacent district, where the facilities for the establishment of large industries are considerable. The total value of the articles produced in manufactories, and the increased value of materials after undergoing treatment, is approximately £16,300,000, of which about £7,500,000 represents value of material used—£400,000 fuel and £4,750,000 wages. Very fair progress was made in the manufacturing industries up to the year 1892, but in the following year the banking crisis so unsettled affairs that there was a large reduction in the number of hands employed. There was a partial recovery in the following year, and in 1898 the lost ground was fully recovered. Of the hands employed in 1900, 50,516 were males and 10,263 females, making a total of 60,779.

Commerce.—The over-sea trade required in 1900 the services of 3626 vessels; the tonnage entering the ports, excluding the coastal shipping, was 4,094,088 tons. The value of goods imported in 1900 was £27,561,071. Of the imports, £18,270,043 were retained for home consumption and £9,291,028 were re-exported. The average value of imports per inhabitant was, in 1900, £20, 4s. 7d., and of exports, £20, 13s. 5d. Of purely local produce, the value of the exports in 1900 was £18,873,488, or £13, 17s. per inhabitant.

Wool is the staple export, and represents in most years nearly one-half the value of the domestic exports. Gold coin and bullion form one of the principal items in the export list, but only a small portion of the export is of local production, the balance being Queensland and New Zealand gold sent to Sydney for coinage. In 1900 the principal articles of domestic produce, with their value, exported were as follows:—Sheep, £449,633; cattle, £247,663; horses, £366,647; butter, £436,786; coal, £1,273,034; gold coin and bullion, £1,330,249; leather, £420,702; meat, frozen and preserved, £768,245; silver and lead, £2,743,263; skins and hides, £360,713; tallow, £375,855; tin, £171,874; wool, £7,632,213. The total export of coin and bullion was £5,912,710. The course of trade since 1880 has been as follows:—

Year.	Imports.	Exports. Total.	Exports. Domestic Produce.
1880	£14,176,063	£15,682,802	£12,007,931
1885	23,737,461	16,750,107	12,059,280
1890	22,615,004	22,045,937	17,232,725
1895	15,992,415	21,934,785	16,436,210
1900	27,561,071	28,164,516	18,873,488

Railways.—The railways are almost entirely in the hands of the state, for out of 2896 miles open in 1900 the state owned 2812 miles. The capital expended on the state lines open for traffic was £38,477,269, of which sum £5,542,510 was expended on rolling stock and equipment, and £32,934,759 on construction of roads, stations, and permanent ways. The net earnings amounted to £1,394,052, which represents a return of 3·63 per cent. upon the capital invested. The state pays, on an average, 3·62 per cent. for the money borrowed to construct the lines, and there is therefore a slight surplus to the advantage of the revenue.

Postal and Telegraph Service.—The postal business of 1899 was represented by the carriage of 76,742,200 letters and post-cards, 46,807,800 newspapers, and 13,987,000 parcels and books; the telegrams despatched numbered 3,112,000. To transact the postal business of the country, mail conveyances travelled 11,638,000 miles. The income of the postal and telegraph department in 1899 was £789,658, and the expenditure £758,606, but there were some items of expenditure not included in the sum named, such as interest charges, &c.; the total expenditure was approximately £870,000.

Banking.—The banks of issue number thirteen; their paid-up capital amounts to £18,092,428, and the capital and reserves to £22,583,700, but of this sum only about £9,727,000 is used in the state. The coin and bullion in reserve amount to £6,041,444, and the note circulation to £1,241,426. The banks have on deposit £19,679,521 bearing interest, and £12,976,711 not bearing interest, representing a total of £32,656,232. The savings banks had on their books at the close of 1899 about 261,000 depositors, with £10,069,434 to their credit. This represents £7, 8s. 5d. per inhabitant. The total deposits in all banks therefore amounted to £42,725,666. The progress since 1860 has been as follows:—

Year.	Amount on Deposit.	Average per Inhabitant.
1860	£5,721,208	£16 8 3
1870	7,044,464	14 2 6
1880	19,958,880	26 13 8
1890	43,390,141	38 13 6
1899	42,725,666	31 9 11

II. HISTORY.

New South Wales was discovered by Captain Cook on board the *Endeavour*, on 20th April 1770. After he had observed the transit of Venus at Tahiti, he circumnavigated New Zealand and went in search of the eastern coast of the great continent whose western shores had long been known to the Dutch. He sighted the Australian coast at Gippsland, Victoria, near Cape Everard, which he named Point Hicks, and sailed along the east coast of Australia as far north as Botany Bay, where he landed, and took possession of the continent on behalf of his Majesty King George III. He then continued his voyage along the east coast of Australia, and returned to England by way of Torres Strait and the Indian Ocean. The favourable reports made by Captain Cook of the fertility of the country around Botany Bay induced the British Government, which had lost the North American colonies a few years before, to found a penal settlement on the south-eastern part of what was then known as New Holland. An expedition, consisting of H.M.S. *Sirius* of 20 guns, the armed trader *Supply*, three store-ships, and six transports, left England on 17th May 1787, and after touching at Tenerife, Rio de Janeiro, and the Cape of Good Hope, arrived at Botany Bay on 20th January 1788, under the command of Captain Arthur Phillip, R.N., with Captain John Hunter, R.N., as second. The persons on board the fleet included 564 male and 192 female convicts, and a detachment of marines, consisting of Major Ross, commandant, 16 officers, 24 non-commissioned officers, an adjutant and quartermaster, 160 privates, and 40 women. There were in addition five medical men and a few mechanics. The live stock consisted of one bull and four cows, a stallion and three mares, some sheep, goats, pigs, and a large number of fowls. The expedition was well provided with seeds of all descriptions.

Early history.

The shores of Botany Bay were found to be unsuitable for residence or cultivation, and Captain Phillip transferred the people under his command to Port Jackson, half a dozen miles away, near the site of the present city of Sydney. For some years the history of the infant settlement was that of a large gaol; the attempts made to till the soil at Farm Cove near Sydney and near Parramatta were only partially successful, and upon several occasions the residents of the encampment suffered much privation. But by degrees the difficulties inseparable from the foundation of a remote colony were surmounted, several additional convict-ships landed their living freight on the shores of Port Jackson, and in 1793 an emigrant-ship arrived with free settlers, who were furnished with provisions and presented with free grants of land. By the end of the 18th century the inhabitants of Sydney and its neighbourhood numbered 5000. Immediately after the arrival of the first fleet, surveys of the adjacent coast were made; the existence of a strait between Australia and Tasmania was discovered by Surgeon Bass; and before the retirement of Governor King in 1806 Australia had been circumnavigated and the principal features of its coast-line accurately surveyed by Captain Flinders, R.N. The explorations landward were, however, not so successful, and for many years the Blue Mountains, which rise a few miles back from Sydney, formed an impenetrable barrier to the progress of colonization. Penal establishments were formed at Newcastle in New South Wales, at Hobart and Launceston in Tasmania, and an unsuccessful attempt was made to colonize Port Phillip. The most noteworthy incident in the first decade of the 19th century was the forcible deportation by the officers of the New South Wales Corps, a regiment raised in England for service in the colony, of the governor, Captain Bligh, R.N., the naval officer identified with the mutiny of the *Bounty*. For some time the government was administered by the senior officer of the New South Wales Corps, but in 1809 he was succeeded by Captain Macquarie, who retained the governorship for eleven years.

Penal settlement régime.

During the *régime* of this able administrator New South Wales was transformed from a penal settlement to a colony. Prior to the arrival of Macquarie schools and churches had been erected, a newspaper, the *Sydney Gazette and New South Wales Advertiser*, had been started, and attempts had been made to acclimatize the drama. But he was the first governor to open up the country. He constructed permanent buildings at Sydney and Parramatta, formed roads and built bridges in the districts along the coast, and commenced a track across the Blue Mountains, which had been crossed in 1813 by Wentworth and others, thus opening up the rich interior to the inhabitants of Sydney and the settlements in its immediate neighbourhood. It was during Captain Macquarie's administration that the first banking institution, the Bank of New South Wales, was founded. The final fall of Napoleon in 1815 and the cessation of the war, which had lasted with very little intermission since the first establishment of the colony, gave the people of the United Kingdom leisure to think about their possessions at the Antipodes; and in 1817 free settlers commenced to arrive in considerable numbers, attracted by the success of Captain M'Arthur, an officer in the New South Wales Regiment, who had demonstrated that the soil, grass, and climate were well adapted for the growth of merino wool. But although the free settlers enjoyed a considerable amount of material prosperity, and were enabled to purchase land on very easy terms, they were dissatisfied with the administration of justice, which was in the hands of a judge-advocate assisted by military officers, with the absence of a free press and representative institutions, and they demanded permission to occupy the vast plains of the interior with their flocks and herds, without having to obtain by purchase or by grant the fee-simple of the lands upon which their sheep and cattle grazed. These demands were urged with more or less spirit during the governorships of Sir Thomas Brisbane and General Darling; but they were not finally conceded, together with perfect religious equality, until the *régime* of Sir Richard Bourke, which lasted from 1831 to 1837. At the latter date the population had increased to 76,793, of whom 25,254 males and 2557 females were or had been convicts. Settlement had

Captain Macquarie's governorship.

1831 to 1851.

progressed at a rapid rate. Parramatta, Richmond, and Windsor had indeed been founded within the first decade of the colony's existence; Newcastle, Maitland, and Morpeth, near the coast to the north of Sydney, had been begun during the earlier years of the 19th century; but the towns of the interior, Goulburn, Bathurst, and others, were not commenced till about 1835, in which year the site of Melbourne was first occupied by Batman and Fawkner. The explorations which followed the passage of the Blue Mountains opened up a large portion of south-eastern Australia. Van Diemen's Land was declared a separate colony in 1823, West Australia in 1829, South Australia in 1836, and New Zealand in 1839; so that before 1840 the original area of New South Wales, which at first included the mainland of Australia and the islands in the South Pacific, had been greatly reduced. In the last-named year the press was free in every part of Australia, trial by jury had been introduced, and every colony possessed a legislature, although to none of them except to New South Wales had the principle of representation been introduced, and in that colony only to a very limited extent. The policy of granting land without payment, originally in force in New South Wales, had been abandoned in favour of sales of the public lands by auction at the upset price of twenty shillings per acre; and the system of squatting licences, under which colonists were allowed to occupy the waste lands on payment of a small annual licence, had been conceded. In 1851, when separate autonomy was granted to Victoria, New South Wales had a population of 187,243, the annual imports were £2,078,338, the exports £2,399,580, the revenue was £575,794, and the colony contained 132,437 horses, 1,738,965 cattle, and 13,059,324 sheep.

Gold was discovered at Lewis Pond Creek, near Bathurst, in May 1851, by Edward Hammond Hargreaves; and at the end of June the first shipment, valued at £3500, left Sydney. This discovery made an important change in the position of the colony, and transportation, which had been discontinued during the previous year, was finally abolished. The first mail steamer arrived in August 1852, and in 1853 a branch of the Royal Mint was established at Sydney. The New Constitution Bill, passed during the same year by the local legislature, provided for two deliberative chambers, the Assembly to be elected and the Council nominated, and for the responsibility of the executive to the legislature. The Sydney University, founded in 1850, was enlarged in 1854, and the first railway in New South Wales, from Sydney to Parramatta, commenced in 1850, was opened in 1855. In the same year the Imperial Parliament passed the New Constitution Act; and in June 1856 the first responsible government in Australia was formed, during the governorship of Sir William Denison, by Mr Stuart Alexander Donaldson. The first administration lasted only for a few weeks, and the experiment of transporting to the Antipodes responsible government, modelled upon the British plan, was not immediately successful. Ministry succeeded ministry at short intervals, and it was some years before constitutional government worked smoothly. The powers of the new Parliament were utilized for extending representative institutions. Vote by ballot was introduced; the number of members in the Assembly was increased to 80, and the franchise was granted to every adult male after six months' residence in any electoral area. Meanwhile the material progress of the colony was unchecked. A census taken at the end of 1857 showed that the population of Sydney was, including the suburbs, 81,327. Telegraphic communication was established between Sydney, Melbourne, Adelaide, and Tasmania in 1859; and during the same year the Moreton Bay district was separated from New South Wales and was constituted the colony of Queensland.

Responsible government, 1856.

During the *régime* of Sir John Young, afterwards Lord Lisgar, who succeeded Sir William Denison in 1861, several important events occurred. The land policy of previous Governments was entirely revised, and the Land Bill, framed by Sir John Robertson, introduced the principle of deferred payments for the purchase of Crown lands, and made residence and cultivation, rather than a sufficient price, the object to be sought by the Crown in alienating the public estate. This measure, passed with great difficulty and by bringing considerable pressure to bear upon the nominated Council, was the outcome of a lengthened agitation throughout the Australian colonies, and was followed by similar legislation in all of them. It was during the governorship of Sir John Young that the distinction between the descendants of convicts and the descendants of free settlers, hitherto maintained with great strictness, was finally abandoned. In 1862 the agitation against the Chinese assumed importance, and the attitude of the miners at Lambing Flat was so threatening that a large force, military and police, was despatched to that goldfield in order to protect the Chinamen from ill-treatment by the miners. The railways were gradually extended, and the condition of the country roads was improved. The only drawback to the general progress and prosperity of the country was the recrudescence of bushranging, or robbery under arms, in the country districts. This crime, originally confined to runaway convicts, was now committed by young men born in the colony, familiar with its mountains and forests, who were good horsemen and excellent shots. It was not until a large number of lives had been sacrificed, and many bushrangers brought to the scaffold, that the offence was thoroughly stamped out in New South Wales, only to reappear some years afterwards in Victoria under somewhat similar conditions.

Sir John Young's governorship.

The earl of Belmore became governor in 1868, and it was during his first year of office that H.R.H. the duke of Edinburgh visited the colony in command of the *Galatea*. An attempt made upon his life, during a picnic at Clontarf, caused great excitement throughout Australia, and his assailant, a man named O'Farrell, was hanged. A measure which virtually made primary education free, compulsory, and unsectarian came into operation. A census taken in 1871 showed that the population was 503,981; the revenue, £2,908,155; the expenditure, £3,006,576; the imports, £9,609,508; and the exports, £11,245,032. Sir Hercules Robinson, afterwards Lord Rosmead, was sworn in as governor in 1872. During his rule, which lasted till 1879, the Fiji Islands were annexed; telegraphic communication with England and mail communication with the United States were established; and the long series of political struggles, which prevented any administration from remaining in office long enough to develop its policy, was brought to an end by a coalition between Sir Henry Parkes and Sir John Robertson. Lord Augustus Loftus became governor in 1879, in time to inaugurate the first International Exhibition ever held in Australia. The census taken during the following year gave the population of the colony as 751,468, of whom 411,149 were males and 340,319 females. The railway to Melbourne was completed in 1880; and in 1883 valuable deposits of silver were discovered at Broken Hill, near the western frontier of New South Wales, but much nearer to Adelaide than to Sydney. In 1885 the Hon. W. B. Dalley, who was acting Premier during the absence through ill-health of Sir Alexander Stuart, made to the British Government the offer of a contingent of the armed forces of New South Wales to aid the Imperial troops in the Sudan. The offer was accepted; the contingent left Sydney in March 1885, on board the *Iberia* and *Australasian*, and for the first time a British colony sent its armed forces outside its own boundaries to fight on behalf of the mother-country. In July of the same year Dr Moran, the Roman Catholic archbishop of Sydney, became the first Australasian cardinal. Lord Carrington, who was appointed governor in 1888, opened the railway to Queensland, and during the same year the centenary of the colony was celebrated. The agitation against the Chinese, always more or less existent, became intense, and the Government forcibly prevented the Chinese passengers of four ships from landing, and passed laws which practically prohibit the immigration of Chinese.

Sudan contingent, 1885.

In 1889 the Premier, Sir Henry Parkes, gave in his adhesion to the movement for Australasian federation, and New South Wales was represented at the first conference held at Melbourne in the beginning of 1890. Lord Jersey assumed office 15th January 1891, and a few weeks afterwards the conference to consider the question of federating the Australian colonies was held at Sydney, and the great strike, which at one time had threatened to paralyse the trade of the colony, came to an end. A Board of Arbitration and Conciliation to hear and determine labour questions and disputes was formed, and by later legislation its powers have been strengthened. A census taken on 5th April 1891 showed that the population was 1,134,207, of whom the aborigines numbered 7705 and the Chinese 12,781. In 1893 a financial crisis resulted in the suspension of ten banks; but with two exceptions they were reconstructed, and by the following year the effects of the depression had passed away. Federation was not so popular in New South Wales as in the neighbouring colonies, and no progress was made between 1891 and 1894, although Sir Henry Parkes, who was at that time in Opposition, brought the question before the legislature. The Rt. Hon. Sir William Duff, who followed Lord Jersey as governor, died at Sydney in 1895, and was succeeded by Lord Hampden. In 1896 a conference of Australian Premiers was held at Sydney to consider the question of federation. The then Premier, Mr Reid, was rather lukewarm, as he considered that the free-trade policy of New South Wales would be overridden by its protectionist neighbours and its metropolitan position interfered with. But his hand was to a great extent forced by a People's Federation Convention held at Bathurst, and in the early portion of 1897 delegates from New South Wales met those from all the other colonies, except Queensland, at Adelaide, and drafted the constitution, which with some few modifications eventually became law. The visit of the Australian Premiers to England on the occasion of Queen Victoria's Diamond Jubilee gave an additional impetus to federation, and in September 1897 the convention reassembled in Sydney and discussed the modifications in the constitution which had been suggested in the local parliaments. In January 1898 the Bill was finally agreed to and submitted to a popular referendum of the inhabitants of each colony. Those of Victoria, South Australia, and Tasmania agreed to the measure; but the majority in New South Wales, 5458, was not sufficient to carry the Bill. The local parliament subsequently suggested certain amendments, one of them being that Sydney should be the federal capital. The general election returned a majority pledged to federation, and after some opposition to the federal Bill by the Legislative Council it was again referred to the electors of the colony and agreed to by them, 107,420 votes being recorded in its favour, and 82,741 against it. One of the provisions of the Bill as finally carried was that the federal metropolis, although in New South Wales, should be more than 100 miles from Sydney. The Enabling Bill passed through all its stages in the British Parliament during the summer of 1900, all the Australian colonies assenting to its provisions; and on 1st January 1901 Lord Hopetoun, the governor-general of Australia, and the Federal Ministry, of which the Premier, Mr Barton, and Sir William Lyne, Home Secretary, represented New South Wales, were sworn in at Sydney amidst great rejoicings. In the following May the duke and duchess of York visited Sydney. Large contingents of troops from New South Wales were sent to South Africa during 1899 and 1900.

Attitude towards federation.

(G. C. L.)

NEWSPAPERS.

THE great advances of journalism during the latter half of the 19th century, and the ever-spreading influence of the daily paper, have at last created a general interest in newspapers as a class of literature and a subject for bibliographical and statistical inquiry. As a result of this interest it has become possible to differentiate, roughly at all events, between newspapers and periodicals, and in the following statistics an attempt has been made to take into account only such papers as deal with current events, and appear daily or weekly, or with intermediate periodicity. In this connexion it may be stated that the London General Post Office adopts for registration as newspapers the limit of publication within eight days. For convenience the term "weekly, &c." is used to include papers that appear two or three times in the week.

Great Britain and Ireland.

Taking the newspapers of London as fairly representative of the general movement in the great commercial centres, it may be remarked that the ever-increasing activity of life, especially of commercial life, during the last twenty years of the 19th century was reflected in the history of the newspaper press. Not only are many more papers published now than even ten years ago, but the number of copies of individual papers has increased also, especially in the case of so-called evening papers. In these, rather than in the morning papers, the increased "pace" of the present day is more faithfully represented. Such is now the eagerness to be *au courant* of passing events, that some of the "evening" papers are published before eleven o'clock in the morning, and five or six editions, finishing with an "extra special," are successively issued up to 7 P.M., and on occasions even later. Immense numbers of them are hawked about by newspaper-boys, whose parrot-cry of "All the winners!" whether races have taken place or no, might lead the unwary to think that horse-racing is the only subject that interests Londoners. The figures in the following statistics indicate part only of the progress during the period they cover; for in the interval many papers have been started and after a brief existence have come to a premature termination. Among the older papers there have been very few cessations; the most notable, perhaps, being that of the *Edinburgh Courant*. This was founded in 1705, and

Statistics.

after a prosperous career of a hundred and eighty years was amalgamated with the *Glasgow News* after the 6th February 1886, under the new name of the *Scottish News*, the last number of which was published 11th February 1888. On the other hand, the number of "localized" editions—*i.e.*, editions of one paper published at different places with a certain proportion of local news and a local title—grew from 151 provincial papers in 1890 to 260 in 1900. These localized editions sometimes have the inside pages devoted to general news, but in the greater number of cases that portion of their contents which does not consist of local news is printed from stereotype columns supplied by agencies in London to many journals at a time.

The number of sets of British newspapers received at the British Museum under the Copyright Act was as follows:—

	1890.	1900.
England (Provinces), Wales, and Channel Islands	1420	1664
London	647	1226
Ireland	173	222
Scotland	232	288
Total	2472	3400
Single numbers of papers	170,838	220,369

These, however, include fortnightly and monthly papers, which are not comprised in any of the following statistics.

The total number of daily papers published in 1890 was 193; in 1900, 258, showing an increase of 65; the number of weekly papers—*i.e.*, published less than five times a week, and for the most part only once a week—was in 1890, 2246; in 1900, 2644, showing an increase of 398 papers; the grand totals for 1890 and 1900 respectively being 2439 and 2902, showing an increase of 463.

The following tables will show these figures in detail:—

British Papers.	1890.	1900.
England (Provinces)	1390	1666
London	541	669
Wales (in Welsh, 13 in 1890, and 16 in 1900)	86	114
Ireland	181	198
Scotland	218	232
Isle of Man	7	10
Jersey	8	7
Guernsey	8	6
Total	2439	2902

Showing an increase of 463.

London Papers.	1890.	1900.
Daily	29	40
Weekly	488	611
Twice, or more, a week	24	18
Total	541	669

Showing an increase of 128.

Daily Papers.	1890.	1900.
London (morning, 17 in 1890, and 24 in 1900)	29	40
Provincial—England	120	165
Wales	6	7
Ireland	18	22
Scotland	19	19
British Isles	1	5
Total	193	258

Showing an increase of 65.

Daily Papers of the Three Capitals.

	1890.	1900.
London	29	40
Dublin	9	12
Edinburgh	4	3
Total	42	55

Showing an increase of 13.

It would be extremely interesting to ascertain the average number of copies of the leading morning and evening papers issued daily, but it is not considered prudent by newspaper proprietors to disclose the true facts, and the figures sometimes given are not to be absolutely trusted.

The great increase in Roman Catholic papers is due to the issue of a large number of localized editions, principally of the *Catholic Herald*.

Archæology and History.—In 1893, when the conference of the Institute of Journalists was held in London, the British Museum arranged an exhibition of newspapers, and the following is a selection of the most important items. The exhibition was unique of its kind, but no catalogue of it was printed. The names of a few papers already described in vol. xvii. of the *Encyclopædia Britannica* are for convenience repeated.

The *Mercurius Gallobelgicus*, the probable forerunner of newspapers, the full title of which is "Mercurius Gallobelgicus ab anno 1588 . . . usque ad 1594. *Coloniæ Agrip.* 1594," 8vo; the spurious *English Mercurie*, No. 50, of 23rd July 1588; the *Weekly Newes* of 23rd May 1622; No. 1 of the *Intelligencer*, for 31st August 1663, edited by Sir Roger L'Estrange, just appointed "Surveyor of the Imprimery and Printing presses"; the *Mercurius Politicus* of 2nd September 1658, giving the account of the death of Cromwell; the *Mercurius Publicus* of 30th May 1660, reporting the Proclamation of Charles II. as King on 8th May; the *Mercurius Publicus* of 24th–31st January 1661, describing the hanging of the carcases of Cromwell, Ireton, and Bradshaw; No. 1 of the *Oxford Gazette*, 16th November 1665, and No. 1 of the *London Gazette*, which the former became on 1st February 1665/6; No. 85 of the *London Gazette*, 3rd–10th September 1666, giving an account of the Fire of London; the *Intelligencer* of 24th April 1665, giving notice, with reference to touching for the king's evil, "that his Majesty hath declared his positive resolution not to heal any more after the end of this present April until Michaelmas next"; the *Monthly Recorder* of 1681–82, probably the first monthly paper; the *Flying Post* of 17th December 1695, in which notice is given that half the paper is left blank for gentlemen sending the paper away, to write their own news on; No. 1 of the *Daily Courant*, 11th March 1702/3, probably the first daily paper; Nos. 1–272 of the *Tatler*, 1709–11; Nos. 1–623 of the *Spectator*, 1st March 1711–15th December 1714: the numbers for 2nd August 1712 and onwards bear some fine impressions of the newspaper stamp, imposed under the Stamp Act which came into force on the 1st August; the *London Farthing Post* of 15th December 1718, probably the first farthing paper ever issued; No. 14 of the *Morning Post*, 17th November 1772; the *Public Advertiser* of 21st January 1769, containing the first of the Letters of Junius; No. 1 of *The Times*, 1st January 1788, also a copy of the issue of 29th November 1814, being the first paper printed by steam in England; No. 2 of the *Morning Advertiser*, 10th February 1794; *The Times* of 9th September 1798, in which is a report of a trial of the proprietor of a public newspaper-reading-room who was fined £5 for allowing the use of his rooms and papers to one of the public on payment of one penny; the *London Gazette*, 6th November 1805, reporting the battle of Trafalgar on 21st October (time of transmission, sixteen days); *The Times* of 22nd June 1815, reporting the battle of Waterloo on 18th June (time of transmission, four days); *The Times*, of 11th September 1855, reporting the fall of Sebastopol on 9th September (time of transmission, two days); the *Daily News* of 13th September 1882, reporting the battle of Tel-el-Kebir, 13th September (time of transmission, part of day); the *Jacobite Journal*, No. 1, 5th December 1747. By John Trott-Plaid, Esq. [*i.e.*, Henry Fielding]: illustrated heading attributed to Hogarth; a pigeon-post letter, being *The Times* of 27th January 1871, reduced to 2 by 1⅝ inches for transmission into Paris by pigeons during the Franco-German war; the *Pall Mall Gazette* of 30th January 1873, in miniature, reduced to 2⅞ by 4⅝ inches by Dallastype; the *Western Daily Mercury* (Plymouth) of 1884, the largest English newspaper. Early provincial newspapers:—The *Stamford Mercury*, vol. xi., May 1718; the *Cirencester Post*, No. 18, 16th March 1719; *Northampton Mercury*, vol. iii., No. 127, 1st October 1722; *Norwich Gazette*, vol. xix., No. 969, 24th April 1725; the earliest Irish paper, *Pue's Occurrences* (Dublin), 1704–1706; earliest Scottish paper, *Edinburgh Gazette*, No. 4, March 1699; *Le Mercure Anglois*, June 1644–December 1648, probably the earliest French paper published in England; the *Wady Halfa Gazette*, 13th March 1884, published by the Royal Engineers during the Egyptian campaign in the Sudan, for the amusement of the troops.

(G. F. B.; D. E.)

Recent Developments in London Journalism.

The period from 1882, when the article on Newspapers in the earlier volume of this Encyclopædia (ninth edition) was published, up to 1902, covers many important developments, which are associated either with the immense increase in reading, or with the continuous striving on the part of the increasing crowd of journalistic competitors to attain success by providing the "reading public" of all classes with what suits its taste. Some of the new agencies concerned in the production of newspapers, and other allied subjects, are treated elsewhere in these volumes, in the articles on Paper, Advertisement, Copyright, Type-setting Machines, Printing-Presses, Libel, Process, &c. Here we are concerned rather with the changes in the character of the Press than with the mechanical or legal conditions of newspaper production.

Tendencies of modern journalism.

The principal feature in the development of modern newspapers is the greater importance attached to obtaining and displaying "news" of all sorts, and incidentally there has been a considerable change of view as to what sort of news should be given prominence. Sport and finance are treated at greater length and more popularly; and, partly owing to the largely increased number of papers and consequent greater competition, partly to a desire to appeal to a larger public, there has been a tendency to follow the tastes of the vast number of people who can read at all rather than of those to whom reading means literary and intellectual enjoyment. This has involved a more popular form of presenting news, not only in a less literary style and by the presentation of "tit-bits" of information with an appeal to cruder sentiments, but also in a more liberal use of headlines and of similar devices for catching the eye of the reader. "Personal journalism," *i.e.*, paragraphs about the private life or personal appearance of individuals—either men or women—of note or notoriety in society or public affairs, has become far more marked; and in this respect, as in many others, encouragement has been given to a spirit of inquisitiveness, and also to a widespread inclination either to flatter or be oneself flattered—the latter desire being indeed conspicuously prevalent in these "democratic days" even among the classes which once affected to despise such publicity. The more responsible and more serious organs of public opinion have no doubt, in spite of this prevailing spirit, successfully maintained the dignity of British journalism and kept up its high standard and traditions. The great dailies themselves have exhibited, in various directions, the tendency to extend the interest of their "news" columns, without at the same time adopting the clap-trap devices or introducing the personal flavour which during the 'nineties came to be known as "the New Journalism." But *The Times*, or the *Standard*, or the *Spectator*, and journals of their class, while remaining the true representatives of the best sort of British journalism, had an old reputation and traditions to keep up; it is rather the newer journals which have given the characteristic tone to the period with which we are dealing. The modern impulse came partly from America, and its characteristics may be found discussed in the section devoted to American papers below, but it was also the result of new conditions of life in Great Britain, and of the democratic movement produced by the Education Act of 1870 and the Reform Act of 1885. On the whole, while American methods of journalism have largely influenced the Press in Great Britain in these new developments, it may be said that in so far as they were adopted they were very considerably modified in deference to English ideas. In no British paper has anything ever been found approaching the enormous "scare" headlines or inflated language which are common features in the American Press. The most generally adopted American innovation (for, though not unknown before, it was practically a new thing) has been the "interview," which during the early 'nineties was taken up in varying degrees by almost every paper; it was "cheap copy," and could be made both informing and interesting, and "interviewing" caused a large increase in the journalistic profession, notably among women. In later years the "interview" has declined in vogue, in proportion as people of importance have become less ready to talk for publication—or for nothing. In America the interview is notoriously compounded mainly of the journalist's fertile imagination; but the purely fictitious article is not adapted to British consumption. The English public are still attracted by a reported conversation when it contains a trustworthy account of the real opinions or language of the person interviewed, but they pay little attention to the imaginary article, and English editors, besides themselves objecting to such a practice, know that it is of no use.

Increase of news.

From the highest class of paper downwards, however, real news—and especially early news—has been more and more sought after, and all the force of organization both within individual newspaper offices and outside them in the shape of news agencies[1] has been applied to the purpose of obtaining early news and publishing it as quickly as possible. In this matter the Press has certainly been helped most materially not only by the advance in telegraphic facilities, but by all the other new rapid methods of newspaper production which have been the feature of the period. It is boasted by the Post Office that the acquisition of the telegraphs by the State was a great help to newspaper enterprise. It is, of course, only possible to show results, and it must remain doubtful how far such results would have come about in other circumstances, but it is a fact that in the old days only certain newspapers with special contracts enjoyed a reduction from the ordinary rates, and there were also a good many embarrassing restrictions. The reduction in rates for press telegrams under the new régime, while causing some loss to the Post Office, brought about a great increase in the number of such messages. In 1871 the number of words handed in for transmission was 22,000,000, but in 1900 it had risen to 835,000,000. The extent to which Press facilities are utilized may be gauged by the fact that in 1901, on the occasion of the England *v.* Scotland Association football match at the Crystal Palace, no fewer than 61,193 words of Press matter were handed in to the temporary office in the ground; and the increased scale of telegraphic business at race meetings may be indicated by the fact that at the Epsom spring meeting in that year nearly 18,000 telegrams, including 568 Press messages, containing 51,947 words, were dealt with, whereas in 1871 the total number of all kinds on the corresponding occasion was only 1951. The vastly increased amount of telegraphic work now done has perhaps not been all pure gain to the best sort of journalism. It has to some extent weakened the effect of the considered written article, and led to hasty conclusions and precipitate publication, with results that sometimes cannot be compensated for by any later contradiction or modification. In some cases a reaction is inevitable. Take for instance the case of war correspondence. Nothing finer in journalism was ever done than in Russell's letters to *The Times* from the Crimea, or Forbes's work and others in the Franco-Prussian war; but more recently, although first-rate abilities have been forthcoming in such men as Mr Bennet Burleigh, Mr E. F. Knight, and Mr John Stuart, the special war correspondent has not seemed to compensate the great dailies for their large expenses in connexion with him; the news agencies, often favoured by the Press censor, have generally been ahead of the "specials," and the individual work that might have been done for isolated papers has been much hampered by restrictions on separate accounts. This is due partly to the increased competition, and the number of correspondents who have been sent out, partly to military jealousy and officialism; but the result has been to a considerable extent to reduce the value of the "war correspondent" as compared with what was done in the Press in the days of Russell and Forbes. A letter arriving weeks after the telegraphic account, however meagre, is largely shorn of its interest. Given a brilliant foreign correspondent, the form of letters sent home from abroad on general subjects is still, no doubt, very effective. Mr G. W. Steevens's work for the *Daily Mail*, in various parts of the globe, was a good instance of this, as indeed was that of Mr G. A. Sala among an earlier generation for the *Daily Telegraph;* and the great dailies still do some of their best work, though only exceptionally, in this way: Mr Burdett-Coutts's letters to *The Times* concerning hospital administration in the South African war in 1900 had not been anticipated by telegraphic news. But the telegram is necessarily the backbone of the news service of the daily paper. The principal foreign correspondents supply their papers by this means with long articles commenting on the news of the day. Among the foreign correspondents the name of M. de Blowitz (b. 1832), the famous Paris correspondent of *The Times* from 1871, stands supreme; and among others who have made specially high reputations during the period are Mr G. W. Smalley (b. 1833), *Times* correspondent in the United States; Mr W. H. Beatty-Kingston (1837–1900), the *Daily Telegraph* correspondent in Berlin; Mr A. E. Houghton, the *Standard* correspondent in Spain; and Mrs Emily Crawford, Paris correspondent of the *Daily News.* The Press, be it added, is frequently able to acquaint the public with what is going on while the Government itself is still uninformed: Dr Morrison's messages to *The Times* from China in 1900, for instance, showed how much can be done on the spot by an alert and enterprising correspondent. The work of the official and the statesman is admittedly increased and sometimes embarrassed by the new strain imposed upon them in consequence, but the public are on the whole well served by their emancipation from the obscurity of purely official intelligence and by the obligation of straightforward dealing imposed upon governments, which in their nature are apt to be secretive. It is noteworthy, by the way, that while reports of political platform speeches are given in greater profusion in the Press, parliamentary reporting itself is left to a few of the great dailies, *The Times* and *Standard* being almost the only papers to give full reports; and with the exception of "scenes" in the House, it is considered sufficient in most papers to give a few Parliamentary notes or a "descriptive sketch" or summary.

Posters.

Connected with the increased attention given to news is the greater vogue of the newspaper "poster." This is more evident in London in the evening than in the morning papers. The prevailing habit of newspaper readers is to order the same morning paper regularly beforehand and read it at breakfast, while an evening paper is bought at a railway bookstall or in the street, partly no doubt according to some settled preference for one paper in particular, but also to a large extent

[1] The chief news organizations are Reuter's Telegraph Company (1865), the Exchange Telegraph Company, the Central News (1870), and the Press Association (1868). Foreign news is also supplied by Dalziel's and Laffan's Agencies; and there are a number of minor agencies.

according to the attractiveness of the contents-bill or poster which is exhibited. The desire to secure the pennies or halfpennies of the large afternoon public which buys according to the temptation of the poster has given the latter an increasing importance for indicating the possession of the latest news without revealing its whole nature, and the tendency has been to have fewer lines and fewer words in larger type, in order to catch the eye more impressively. Rotary machines for printing these posters enable them to be turned out with great rapidity; and besides those ordinarily prepared for each edition, it is possible at any time during the afternoon, should important news arrive, to issue a new poster and thus secure a large street sale by the insertion of a few words only in the "stop-press" or "fudge" without the necessity of changes in the plates.

Criticism. Apart from the publication of "news" and reports, and occasional original articles of a descriptive and miscellaneous character, the chief function of a newspaper is criticism, whether of politics[1] or other topics of the moment, or of the drama, art, music, books, sport, or finance. Politics is still the staple subject of the newspapers, and any journalist is expected to write about it. A single dramatic critic, art critic, and musical critic, on the other hand, usually do the bulk of the work in each of these departments for some one paper. The dramatic critic has to be at the opening nights of new pieces, and to write a criticism in time for publication in the next issue of the paper. Considering the conditions of such a task, the dramatic criticism in the daily Press reflects great credit on its authors, and they have frequently exercised considerable personal influence on the stage, owing to the wide public interest which is taken in what is written about theatrical affairs. Mr Clement Scott became famous as the dramatic critic for the *Daily Telegraph*, and among other leading critics have been Mr Joseph Knight, the late Mr Nisbet, Mr Spenser Wilkinson, Mr Archer, Mr Walkley, Mr A. E. T. Watson, Mr E. F. Spence, Mr Davenport-Adams, Mr G. Bernard Shaw, and Mr Malcolm Watson. Art criticism has not been in so flourishing a condition; only a few people really care about art, or want to read about it in the Press; and as a rule the art criticism in the newspapers is amateurish and poor. There have been, however, some conspicuous exceptions, notably Mr Humphry Ward, the late Mr R. A. M. Stevenson, Mr F. Wedmore, Mr Claude Phillips, Sir Walter Armstrong, Mr F. G. Stephens, Mr D. S. MacColl, Mr George Moore, Mr Huish, and Mr C. L. Hind. Musical criticism, notwithstanding the wide public interest in music, offers less opportunities for a readable article, and the notices of concerts are usually meagre and of a somewhat stereotyped pattern; but in critics like Mr Fuller Maitland, Mr Jaques, Mr Joseph Bennett, Mr Lionel Monckton, Mr Sutherland Edwards, Mr. J. S. Shedlock, Mr G. Bernard Shaw, Mr R. Hichens, Mr Streatfield, Mr Hervey, Mr J. F. Runciman, Mr Vernon Blackburn, Mr Charles Graves, Mr Barclay Squire, and Mr Robin Legge the Press has had the advantage of undeniable competence and judgment.

Sport. As regards sport, the comments of the various newspapers are mainly descriptive; but a prominent feature has been the attention paid to "tipping" probable winners on the Turf, and the insertion of betting news. The publication of the "odds" some time before a race, and of starting-prices, has undoubtedly helped to foster the increase of this form of gambling, as was pointed out in the report of the Select Committee on Gambling in 1902, but the efforts to induce the newspapers to keep such matter out of their columns have not had much success, though the *Daily News* in 1902 started on a new proprietorship with a declared policy of not referring to horse-racing or betting. Among the daily papers, the notes of "Hotspur" in the *Daily Telegraph* have had a high reputation. The sporting interest (*i.e.*, the desire to know results of racing and cricket, &c.) largely inflates the circulation of some of the London and most of the provincial halfpenny evening papers; and it has caused a notable increase in purely sporting papers, among which, however, the *Sportsman* (1865) and the *Sporting Life* (which, founded in 1859, became a daily in 1883, and in 1886 absorbed *Bell's Life*) are still the principal dailies.

Reviewing. Books are "reviewed" in the Press partly for literary reasons, partly as a *quid pro quo* for publishers' advertisements. The latter reason does not of course affect the great established journals, which have a large assured circulation, to the same extent as those which are more conscious of the struggle for life, but it is not only very generally potent, but has had a bad effect on serious reviewing. Only a limited number of people are really interested in reviews, and in consequence the work is frequently relegated, except in the very highest class of paper, to writers whose function is considered to be fulfilled if they have provided the publishers with "something to quote." The desire for "something to quote," irrespectively of the responsible nature of the criticism, became in the early 'nineties a mania with publishers, who in general appear to have considered that their sales depended upon their catching a public which would be satisfied by seeing in the advertisement that such and such a book was pronounced by such and such a paper to be "indispensable to any gentleman's library." At all events, such a system must be bad for the quality of reviewing, and unfortunately the enormous output of books made it impossible for editors to have them all reviewed, and equally impossible for them to be certain of discriminating properly between those which were really worth reviewing or not. The result has been that the work of book-reviewing in the newspapers has been hastily and poorly or very spasmodically done. There have been some honourable exceptions. *The Times* has always commanded the best literary talent. The *Daily Chronicle* under Mr A. E. Fletcher's editorship started a "literary page" in 1891, which at first was an excellent feature, and it was imitated in varying degrees by a few other papers. Critics of responsibility and eminence contributed signed reviews to the *Daily Chronicle*, and also to the *Daily News*, *Daily Telegraph*, and *Morning Post*, and among the evening papers the weekly "Literary World" (by W. P. James) in the *St James's Gazette* contained for several years a series of brilliant notes. The "Literary Supplement" to *The Times* is the most ambitious attempt yet made by a daily paper to deal seriously with literature. As a form of journalism, however, the review has during our period taken a lower place, partly owing to the cause named, partly to a tendency among reviewers either to indiscriminate praise or to irresponsible irrelevance, partly to a suspicion of "log-rolling"; and to a large extent it has become the practice merely to treat the appearance of new books as so much news, to be chronicled, with or without extracts, according as the subject makes good "copy," like any other event of the day.

[1] It is important to note how the balance of political feeling in the Press has altered since 1880. That year has been described as the high-water mark of Liberal ascendancy on the Press; out of 71 penny morning papers in London and the provinces, 47 were Liberal. In 1902, however, out of 65 only 28 were Liberal. In 1880 the *Scotsman* and *Glasgow Herald* were both Liberal; in 1902 both were Unionist. The *Birmingham Post* in both years supported Mr Chamberlain, but he had changed from an extreme Radical to a colleague of Lord Salisbury.

While the connexion between journalism and contemporary literature is now closer than ever, it must be said that journalism has become less literary and literature more journalistic. Either as reviewers, leader-writers, or editors, most of the principal "men of letters" have worked for longer or shorter periods as writers for some newspaper or other, and much of the published literature of the time has appeared originally in the columns of the newspapers, in the form of essays, poems, short stories, or novels (in serial form). Publication in this shape has many advantages for an author besides that of additional remuneration; it offers an opportunity for a new writer to try his wings, and it helps to introduce him at once to a large public. Moreover, the newspapers read by the educated classes profit by the superior class of journalist represented by writers of a literary turn, though it has frequently happened that the result of a discerning editor's success in establishing a writer's reputation is that the latter can then command higher terms than the paper can afford, and his work is lost to it just when he has become valuable. But the increased popularity of the newspaper, and the close tie between it and the literary world, have on the whole impressed a journalistic stamp upon much of the literature of the day. However popular at the moment a writer may be, the infection with journalistic methods—while rightly employed by journalists, as such, in dealing with contemporary events and for strictly contemporary purposes—is apt to be responsible for something wanting in his work, the loss of which deprives him of the permanent literary or scientific rank to which he might otherwise aspire. It is unnecessary in this matter to go into detail. The literary and scientific abilities, however, of such a writer as Mr Grant Allen, for instance, were so encumbered by journalistic methods, that in spite of the cleverness of his fiction and the temporary interest of his biological work, both nevertheless missed the character of permanent value which would cause his name to be remembered beyond his generation. And much of the output of more distinguished writers, whose best work will undoubtedly survive, is fatally marred by the same fault.

Journalism and literature.

As regards the less literary character of the journalism of the day, the falling-off is mainly noticeable in the more recently established journals, of which the principal halfpenny papers and the multitude of new popular magazines are the type, and also in the gradual decline of those literary features which formerly so markedly distinguished such journals as the old *Saturday Review*, or the *Pall Mall* and *St James's Gazettes* in their earlier days. The new point of departure for the journalism of the period is really to be found in the publication of Sir George (then Mr) Newnes's *Tit-Bits* in 1881. This penny weekly paper, with its appeal to the masses, who liked to read snippets of information brightly put together, opened the eyes of the newspaper world to the enormous profits which were to be made by this style of enterprise; and the multiplication of journals of this description—notably Mr Harmsworth's *Answers* (1888) and Mr Pearson's *Pearson's Weekly* (1890)—had a further influence on public taste, so that even the classes above that which primarily enjoyed these publications were affected in the same direction. A new note was introduced into daily journalism. Whereas before 1885 the notable feature had been the brilliance of the Saturday reviewers and their evening-paper offshoots, the *Pall Mall* and *St James's*, in the early 'nineties came a craze for "actuality." Mr T. P. O'Connor, with his vivid pen (first in the *Star*, then in the *Sunday Sun* and elsewhere), set the pace for a crowd of imitators; the successful establishment of the *Daily Mail* (see "Halfpenny Papers" below) in 1896 by Mr Alfred Harmsworth, with its system of compressing the news of the day briefly and pointedly into short paragraphs, while at the same time catering for all tastes and employing first-rate correspondents and reporters to supply it with special information, gave a distinct shake-up to the older traditions of daily journalism. Even when an attempt was made to provide for a literary public, success came to be generally sought by popular rather than by literary methods. The literary public in the proper sense of the word is inevitably a small one, and the greater part of the Press deals with literature on lines more suited to a larger and less refined *clientèle*. It may be claimed, no doubt, that the best sort of journalism shows a high, and sometimes the highest, literary standard, but the fact remains that the bulk of modern journalism is of a different sort, and that its conductors realize only too well that their business is to appeal to the masses, and to a standard of education which falls far short of anything that can be called intellectual.

The leading article.

It is often said that leading articles have lost their importance, but this is only a half-truth. A leading article in *The Times* has as much weight as ever it had, on any occasion or on any subject when a decisive attitude is required; and the leading articles in the *Standard*, *Daily Telegraph*, *Morning Post*, and some other papers carry great weight with public opinion. Nor is this statement true only of the great dailies, for the articles in such journals as the *Spectator* or *Economist* must not be excluded. Though in the multitude of papers it is probably true to say that in these later years there has been some falling off in quality (which is really more properly to be described as a conforming with a more popular style of speaking) in the writing of "leaders," on the other hand the actual amount of good writing in this department—well-informed, scholarly, and incisive—has been, just as probably, equal to anything done in what are sometimes considered its palmy days.[1] It sometimes suits a minor Cabinet minister or a disappointed politician to sneer at "what the papers say," but the usual experience of the leader-writer is either to find his phrases or arguments repeated some days afterwards by politicians up to the highest ranks as though they were original observations, or else to find the attitude which for the moment is pooh-poohed substantially confirmed or followed within a very short period; and it may be asserted with confidence that in recent years more real political "leading" has been done in the columns of the great newspapers than by any of the professional statesmen. If it is said that the newspaper writer is "inspired" by the statesman, this no doubt is frequently true, though there is nothing analogous in Great Britain to the "Reptile Press" in Germany; but there have been just as many occasions when the statesman, who gets the credit, has really been inspired by the suggestion of some acute journalist, whose very name is most likely unknown to the public. It would be impossible to mention the names of all the best London leader-writers in recent years; and as regards *The Times* anonymity is rigorously observed. But some prominent names may well be recorded. Mr Frederick Greenwood in the original *Pall Mall*, and later in the *St James's Gazette*; Mr Morley and Mr W. T. Stead in the Liberal *Pall Mall* (the latter, up to the time of his "Maiden Tribute" crusade, showing remarkable ability in focussing public attention suggestively on the topics of the day); Mr E. T. Cook in the *Westminster Gazette* and *Daily News*; Mr J. A. Spender in the *Westminster*; Mr Robert Wilson, Mr William

[1] It must be remembered that the style of speeches in Parliament has also altered. Nobody thinks of quoting the classics nowadays in the House of Commons. A more business-like form of speech is adopted in public life, and the Press reflects this change.

Clarke, Mr H. W. Massingham, and Mr Henry Norman in the *Daily Chronicle;* Mr Alfred Austin and Mr Richardson Evans in the *Standard;* Mr Justin McCarthy, Mr Clayden, Mr Herbert Paul, and Mr Whiteing in the *Daily News;* Mr Sidney Low in the *St James's Gazette* and the *Standard;* Mr G. A. Sala, Sir Edwin Arnold, and Mr H. D. Traill in the *Daily Telegraph;* or Mr Spenser Wilkinson in the *Morning Post*—have written as brilliantly and with as much constructive ability as any in a preceding generation. On the other hand, it is undoubtedly the case that in the newer type of newspaper, which appeals rather on the score of its tit-bits of news and rapid readableness to a more casual and less serious public, the whole *raison d'être* of the old-fashioned leading article has disappeared, and its place is taken by a few brief notes, merely indicating the attitude of the paper, and not seeking to discuss any subject comprehensively at all. And though many provincial papers, like the *Manchester Guardian, Yorkshire Post,* or *Scotsman,* employ the leading article almost as effectively as any London paper, the majority are content with quoting and following the lead of others. The halfpenny papers usually recognize that their influence lies in displaying news rather than in imposing views, but even here there are exceptions, notably in the Radical *Star* and *Morning Leader,* while the *Daily Mail* on occasions of importance uses the "leader" with an effect which is none the less because as a rule it does not rely on this weapon. No doubt there are often days on which the stereotyped "leader" in any of the great dailies only represents a marking of time, and the multitude of such articles in the aggregate gives occasion for doubt as to the influence exercisable by this form of journalism at all. But the doubt is founded on a fallacy: *Neque semper arcum tendit Apollo.* The "leader" is to some extent a form of newspaper routine, but on the whole it is a routine which has proved its value by experience. The continuous high standard of the British Press depends more largely than is sometimes realized on the regular industry and skill of those whose business it is to discuss the latest developments of affairs every day or every week in a manner which gives reasonable men something fresh to think about, or interprets for them the thoughts which are only vaguely floating in their minds; and the stability of British public opinion, and consequently of British institutions, is in no small degree the outcome. The liberty of the Press enables every sort of view, right or wrong, to be discussed in this prominent form, and thus every aspect of a question is brought out in public, to be accepted or rejected according to the weight of evidence and of argument.

Correspondence.

The same end is assisted by the devotion of so much space to "letters to the editor." It is sometimes said that *The Times* owes its position largely to the fact that if any individual grievance is felt, it is generally ventilated by a letter to *The Times.* Whatever may be the organization of the Press for reporting the news of the day, the resources of no newspaper staff are great enough to cover an area of information as large as that represented by its readers; and the value of the outlet for opinion and information afforded by the correspondence columns cannot be overstated. Strange, however, as it may appear to the uninitiated, there is a great deal of diffidence on the part of the public in writing letters to the papers; apart from a certain number of habitual letter-writers, it takes a considerable stimulus to bring an ordinary man to commit himself in this way. An important condition of his doing so is that he should have confidence in its being considered the right thing to do. One of the advantages possessed by *The Times* over other papers is that the tradition in its case has long been fixed, and when any definite subject of importance is before the public, it is always certain that the best opinions will be found expressed in its columns in this shape; but the other great dailies are not far behind. Sometimes it has been considered a good device to attract public attention by provoking a wide correspondence, as in the "Is Marriage a Failure?" series and others in the *Daily Telegraph;* but this is really an expedient for attracting readers, rather than a real symptom of popular feeling, though it often results in some interesting conclusions.

Finance.

The increased public interest taken in money matters, and especially in speculative transactions in the stock markets, is responsible both for the establishment of a financial daily press (notably the *Financial News,* 1884, and the *Financial Times,* 1888), and for the increased attention given in the ordinary press to the publication of stock exchange prices and criticism of financial affairs. Another factor which has largely contributed to this result is the importance of financial advertisements, and the pressure exercised by advertisers to have their operations commented upon and their businesses recommended. The company-promoting boom between 1889 and 1893, which brought so much profit to the Press in the shape of advertisements of prospectuses and so forth, had an effect in this direction which was only increased by the subsequent "slump" and the corresponding efforts of advertisement canvassers, anxious for their commissions, and business-managers anxious for revenue, to keep up the advertising income of the papers to which they were attached. It is a legitimate piece of business to insert financial advertisements, and equally legitimate to comment upon financial matters; and the public interest in such things is so great, and public gullibility so persistent, that well-informed comments, honestly made, are both attractive to readers and a valuable form of journalism. The British Press, so far as the principal newspapers are concerned, has kept its reputation for integrity in these matters satisfactorily clean and sound, and it is under no suspicion of being bribed or having its favour bought; and though it has been shown on more than one occasion that certain promoters and financiers (generally with the vaguest notion of whom they were dealing with) have been quite ready to corrupt the Press if they could, the few cases which have been brought home have been in connexion with papers and journalists of no account or influence. The danger, however, is obvious, and can only be met by having in control of the great newspapers, and in charge of this particular department, men who are beyond suspicion both as to their acumen and their impartiality.

The sources of newspaper influence.

While certain financial papers were found guilty of lax methods in this particular in the course of the investigations into Mr E. T. Hooley's affairs (1898–99), and those of one or two other promoters, the leading journals of the United Kingdom have fortunately been owned and edited by men who were too cautious and too wide-awake to fall a prey to such wiles. The history of these great papers, further details of which are given below, is dominated by a succession of proprietors, managers, or editors whose enterprise, insight, and judgment have kept the reputation of the British Press higher than that of any other in the world. Newspapers, like other businesses, are of course conducted with a view to a profit; and the desire to make a profit out of mere popularity, in its effect on both circulation and advertisements, has sometimes led to the exercise of a proprietor's authority in altering the character of a paper against the best interests of high-class journalism; but the Press in the United Kingdom has in the main been fortunate in having behind it, as owners, men who took a personal interest in journalism and had a full sense of their responsibilities in relation both to the guidance of public opinion and to the position of the journalistic profession. It would be impossible to review the period under discussion as regards the London daily press without paying a tribute on this score to the influence among proprietors of such men as Mr Walter of *The Times*, Lord Glenesk (Sir Algernon Borthwick) of the *Morning Post*, Sir Edward Lawson of the *Daily Telegraph*, or Mr Alfred Harmsworth of the *Daily Mail*. Among editors and managers, those who have exercised most influence are Mr G. E. Buckle and Mr Moberly Bell (*The Times*), Mr Mudford and Mr G. Byron Curtis (*Standard*), Sir Edwin Arnold and Mr Le Sage (*Daily Telegraph*), Sir John Robinson (*Daily News*), Mr Massingham (*Daily Chronicle*), Mr J. N. Dunn (*Morning Post*), Mr F. Greenwood (*Pall Mall* and *St James's Gazette*), Sir George Armstrong and Mr W. T. Madge (*Globe*), Mr Sidney Low (*St James's Gazette*), Mr W. T. Stead, Mr H. Cust, and Sir Douglas Straight (*Pall Mall*), Mr E. T. Cook and Mr J. A. Spender (*Westminster Gazette*), Mr T. P. O'Connor and Mr Ernest Parke (*Star*). Whatever may be said of a certain degeneration in journalism as a whole, the fact remains that, though most people read more papers than is compatible with a healthy mental digestion, the Press, as such, has to-day a greater influence than ever; and this is largely due to the reputation maintained by its higher representatives. The reflected glory is shown in the fact that to be an "editor" involves some prestige even in the case of a comparatively feeble journal; and though "medical student" has been supplanted by "journalist" in the "profession or occupation" formula of the police-court, the old Bohemian days of journalism are gone, and it has become a settled profession with as much self-respect as any other. While, individually, the great papers wield considerable influence, due partly to real sagacity and authority, partly to the psychological effect produced by mere print or by reiterated statement, collectively the Press now represents and expresses the Public, and expresses popular opinion more directly than Parliament itself. Nor can the social results of the multiplication of "Press-cutting agencies," or of such publications as *Who's Who* (started by Mr Douglas Sladen in 1897) and similar biographical reference books—all tending to increase the publicity of modern life—be passed over. With other factors they have contributed materially to the pervading influence of journalism in everyday life and the constant dependence of society in most of its manifestations on the activity of the "Fourth Estate."

Weekly papers.

The serious high-class weeklies have developed no specially important new features of their own. To the *Spectator* and *Saturday Review* have been added the Radical *Speaker* (1890), edited by Mr J. L. Hammond, the *Outlook* (1898), edited by Mr Percy Hurd, and the *Pilot* (1900), edited by Mr Lathbury; and several new weekly papers, *e.g.*, the *Realm* (edited by Mr Earl Hodgson), the *British Review* (edited by Mr Mallock), the *Review of the Week* (edited by Mr Harold Gorst), came and passed away after showing promise of good things. On the whole, the weekly press has declined in proportion as the daily papers and the monthly magazines have grown. The *Spectator* alone, among the serious weekly papers, has kept or increased its vogue. Under Mr Hutton and Mr Meredith Townsend the *Spectator* became an institution, as a thoughtful organ of criticism; and after it passed into the hands of Mr J. St Loe Strachey in 1897 its old characteristics were still maintained. The palmy days of the *Saturday Review*, on the other hand, had already gone when in 1894 Mr W. H. Pollock retired from the editorship and Mr Saintsbury, Mr David Hannay, and the other brilliant members of its old staff ceased to write for it. Under Mr Frank Harris the *Saturday* failed to regain its position. In 1899 it was acquired by Lord Hardwicke, and under the editorship of Mr Harold Hodge it remained the chief Conservative weekly. The most important decease has been that of the *National* (at first the *Scots*) *Observer*, which under Mr W. E. Henley's editorship (1888–93) had a considerable literary success. Mr Henley gathered about him a staff of young literary men who formed to all intents and purposes a school. It had some mannerisms and preciousnesses, but it was essentially clever and often brilliant. In 1894 Mr Henley ceased to be editor, and Mr J. E. Vincent edited the paper with conspicuous ability till in 1897 the *National Observer* came to an end. Among weekly illustrated papers, *Black and White* (1891) and the *Sketch* (1892), for the immediate success of which Mr Clement Shorter (then editor of the *Illustrated London News*) was responsible, *Country Life Illustrated* (1897), edited by Mr J. E. Vincent, and the *Sphere* (1901), started under Mr Shorter when he left the *Illustrated London News*, have prospered without affecting the popularity of the *Graphic* and *Illustrated London News*. The "Society" papers, *Truth* (1877), *Vanity Fair* (1868), and the *World* (1874), have well maintained their interest. Mr Edmund Yates's (*q.v.*) success with the *World* contributed largely to the increase of the personal style which he did so much to introduce. *Truth* made Mr Labouchere, its proprietor, one of the most prominent men of the day, not so much on account of his cynical Radicalism, as for its vigorous exposure of all sorts of public humbug and charlatanry. *Vanity Fair's* leading feature is its cartoon (see CARICATURE), the weekly interest of which has been ably maintained under Mr Oliver Fry's editorship. Sunday papers have not multiplied as much as might have been expected. The *People* (conducted by Mr Madge, of the *Globe*) was started in 1881; the *Sunday* (afterwards *Weekly*) *Sun* (1891) began brilliantly under Mr T. P. O'Connor, but after his connexion ceased it gravitated to a more commonplace type: these, with *Lloyd's* (edited after 1884 by Mr T. Catling), now appeal to an uncritical public. The *Sunday Special* (1897) has been added to the small list of high-class Sunday papers (its competitors being the *Sunday Times* and the *Observer*, the latter of which has reduced its price to twopence); the *Referee* too (1877) has a sporting and theatrical character of its own, and in "Dagonet" (Mr G. R. Sims) has had a paragraphist of original humour. But British feeling is against Sunday journalism, and in 1899, when a *Sunday Daily Mail* and *Sunday Daily Telegraph* simultaneously appeared, the vociferous objections raised by the public—added to the fact that they showed no sign of paying their way—led to their simultaneous withdrawal.

The old "literary weeklies," the *Athenæum* (1828) and *Academy* (1869), still hold the field. The former continued to be ably edited by Mr Norman MacColl till 1901, when he was succeeded by Mr Vernon Rendall. The *Academy*, which was bought in 1894 by Mr Morgan Richards and put under the editorship of Mr Lewis Hind, altered some of its methods and lost a good deal of the academic character it had enjoyed under the editorship of Mr J. S. Cotton; in 1901 its proprietor bought *Literature* from *The Times* (*q.v.*) and amalgamated it with the *Academy*. The *Guardian* (1846) reduced its price to threepence, and maintained its high character; in 1900, for reasons connected with the ritualistic crisis in the Church, Mr Lathbury ceased to be its editor, and was succeeded by the Rev. Walter Hobhouse. In the *Economist* (1843) and *Statist* (1878) the world of political economy and finance continued to find admirable critical articles; and the *Field*

(1853) has encountered no real rival in the world of sport. *Punch* (an excellent *History* of which was published by Mr M. H. Spielmann in 1895) remained easily first among humorous journals, being supported by a number of such talented writers as Sir F. C. Burnand, Mr Anstey Guthrie, Mr E. J. Milliken, Mr Arthur à Beckett (an all-round journalist who, besides editing the *Sunday Times* (1891–95), became president of the Newspaper Society, 1893, and chairman of the Institute of Journalists, 1901), Mr H. W. Lucy ("Toby, M.P."), and Mr Owen Seaman; but though *Fun* (1860) died in 1901, and *Lika Joko* (started by Mr Harry Furniss in 1894) only lived a few months, *Judy* (1867), *Moonshine* (1879), and *Pick-me-up* (1888), served to cater to a wider and rather less discriminating public. Mention must also be made here of the technical and professional journals, which have been produced in increasing numbers; many of them are admirably conducted, and are models of what such publications should be. The Religious Press has developed considerably, and among its most notable representatives besides the *Guardian* may be named the *Record* (1828), edited by the Rev. A. R. Buckland, the *Church Times* (1863), *Tablet* (1868), *Weekly Register* (1849), *Christian World* (1857), *Methodist Times* (1885).

Though Magazines and Reviews are dealt with properly under PERIODICALS, some reference may be made to them here. The place of the two old Quarterlies in public interest has really been taken by the modern half-crown monthly reviews, of which the type is the *Nineteenth Century, and After* (1877), founded and edited by Mr James Knowles. These high-class monthlies enable the best writers to deal more at length with the subjects of the day than is possible in a daily or weekly paper. The *Fortnightly Review* (1865), edited successively by Mr John Morley, Mr T. H. S. Escott, Mr Frank Harris, Mr Oswald Crawfurd, and Mr W. L. Courtney; the Conservative *National Review* (1883), edited successively by Mr Alfred Austin, Mr Earl Hodgson, and Mr Leo Maxse; the Liberal Nonconformist *Contemporary Review* (1866), edited during this period by Mr Percy Bunting; and *Blackwood's Magazine*, which has maintained its old standard, are conducted from slightly different standpoints on somewhat similar lines; and the *Monthly Review* (1900), edited by Mr Henry Newbolt, stands in the same class. These are all serious reviews of an intellectual type; and in *Longman's Magazine* (1882, distinguished by Mr Andrew Lang's *causeries*), *Macmillan's*, and *Cornhill* a diversity of reading matter of good quality is provided at a lower price. In addition to these there have gradually come upon the scene a number of popular sixpenny and still lower-priced magazines, the first of which, Sir G. Newnes's *Strand Magazine* (1891), set the fashion; including miscellaneous articles, copiously illustrated, they appeal to the general public, and are intended solely to entertain. The *English Illustrated* (1883), and, later, the *Pall Mall Magazine* (1893), at a shilling, were attempts to carry out the same idea on a somewhat higher plane. A characteristic development of the period has been the foundation by Mr W. T. Stead, whose personality has been very prominent in the journalism of the time, of the *Review of Reviews* (1890), containing extracts from and comments on all the most interesting articles in the periodicals of the month, together with original features of its own. Among the monthly reviews devoted to special subjects, a high type of journalism is represented by, in sport, the *Badminton Magazine*, and in art, the *Art Journal* (1839), *Magazine of Art* (1878), *Studio* (1893), *Connoisseur* (1901); and the *Bookman* (1886) has managed with some success to combine both popular and literary qualities.

Magazines and Reviews.

The introduction of women into journalism is one of the new departures of our period. It was indeed no new thing for women to write for the Press. Harriet Martineau was one of the principal members of the *Daily News* staff, and Miss Frances Power Cobbe (b. 1822), the advocate of anti-vivisectionism, was an active woman journalist in her day. But these were exceptional cases, in which something in the nature of a personal mission and a peculiar aptitude gave the impulse. It was not till later that journalism as a profession was resorted to by women, in consequence of the immense increase in women readers and the immensely increased publicity given to matters of primarily feminine interest. In 1880 the only "ladies' paper" of any importance was the *Queen*, a weekly which, dating from 1861, remains a valuable property. But since then a considerable number of new weeklies have entered the field and become popular: notably the *Lady's Pictorial* (1880), the *Lady* (1885), *Woman* (1889), the *Gentlewoman* (1890), which owed its success to the ability of Mr J. S. Wood, *Madame* (1895), and the *Ladies' Field* (1898). New monthlies have also appeared, in the *Englishwoman*, the *Ladies' Realm*, and the *Woman at Home*. The sphere of action of the lady journalist has been by no means confined to the "ladies' papers," or to writing columns on dress or cookery for other journals which found it useful to cultivate feminine readers; women have invaded every other field of journalism, especially the large new field of fashionable gossip, and though on the whole their success has been very limited, there have been some striking exceptions. Notably is this the case with Miss Flora Shaw (Lady Lugard), whose able colonial articles in *The Times* made her work for that paper up to 1899 one of its most interesting features. Mrs Crawford, the Paris correspondent of the *Daily News*, Mrs Meynell in articles for the *Pall Mall Gazette*, and Mrs Humphry Ward have shown what first-rate work can be done by women writers in the press. Lady Randolph Churchill, in connexion with the sumptuous *Anglo-Saxon Review*, and Lady Jeune, Mrs Alec Tweedie, Mrs Isabella Bishop, and Miss Betham-Edwards have taken a considerable part in the journalism of the day. The names of Miss H. Friederichs, Mrs Humphry, Miss Drew, Mrs Aria, Mrs Harcourt Williamson, Lady Colin Campbell, Miss Christabel Coleridge, Miss Blackburne, Miss M. F. Billington, Miss E. N. Hepworth Dixon, Mrs Ballin, Miss M. Bateson, Mrs Belloc-Lowndes, Miss Clo Graves, Mrs Howarth, and Annie S. Swan have also been prominent as regular workers on various papers.

Women journalists.

THE LONDON DAILY PRESS.

The Times since 1880 has fully maintained the position it acquired at the beginning of the 19th century as the leading paper not only of the British empire, but of the world. No paper can be said to compete with it, or even to attempt competition with it, either in position or influence. Other papers have a larger circulation, may even be sometimes in advance of it with their news, but no other paper can be said to speak with a tenth part of its authority. If it errs, the greater part of the Press follows it in its error; and the influence of the Press on public opinion is the influence primarily of *The Times*, either directly or through its giving a cue to the other papers. Unattached to any party, it gave a general support to Lord Beaconsfield's cabinet in the crisis of the Eastern Question, while warning them as early as 1876 that their Egyptian policy would inevitably lead the nation into more active intervention in that country. It distrusted Mr Gladstone's Midlothian campaign of 1880, but when that resulted in his return to power, it

The Times.

endeavoured to strengthen his policy in Ireland, and, in particular, it heartily endorsed his denunciation of the leaders of the Home Rule movement. While protesting against the weakness of his Egyptian policy, it supported him in the military occupation which was the inevitable result of it, but commented with just severity on the vacillation of his treatment of General Gordon. On the conversion of Mr Gladstone to Home Rule, *The Times* was instrumental in forming the Liberal-Unionist party, and by its opposition may claim to have largely contributed to the defeat of the two Home Rule Bills. In the course of its vigorous campaign it published as part of its case a series of articles on "Parnellism and Crime," including the celebrated "Parnell letters" which proved to be forgeries of Pigott. With the exception of those letters, *The Times* substantiated almost the whole of its charges; but public opinion had so fastened on that portion of them that the services rendered by *The Times* to the country were in some measure overlooked. The revelations and the judgment of the Parnell Commission, by exposing the conspiracy, gave a death-blow to Home Rule; the nation reaped the benefit, and *The Times* paid the whole cost. After the change produced in English politics by the adoption of Home Rule by the Liberal party, *The Times* gave a decided but discriminating support to Lord Salisbury and his colleagues; but, during the brief periods of office enjoyed by the Liberals, it encouraged Lord Rosebery, as Foreign Minister, in his patriotic and largely successful policy of preserving continuity in regard to foreign affairs. In like manner it encouraged the section of Liberals brought into prominence by the South African war, who desired the vigorous prosecution of hostilities, and were anxious to drop the alliance with the Irish Nationalists. In the Turco-Greek war *The Times* supported Lord Salisbury's Government in its refusal to interfere. It advocated the advance into the Sudan, and the necessity of action in South Africa. During the progress of the Boer war it remained, along with the nation, steadfast in insisting that hostilities should only end in the absolute incorporation of the two Boer States in the British Empire; and, while refraining from much comment on mistakes in the field, expressed itself with severity on the blunders of omission and commission of officials at home. Kept admirably informed by its Peking Correspondent, *The Times* demanded, for some time in vain, more vigour in the China policy of the Government, and it advocated the treaty with Japan. For a long time it was almost alone in giving prominence to news from the outlying portions of the empire, and it was imperialist before Mr Chamberlain became Colonial Secretary. *The Times* bore an honourable part in the efforts which were made from time to time to improve the defences of the country. The great increase of the Navy could hardly have been carried through without its persistent advocacy; and, so far as the nation is awakened to the defects of its Army and War Office and the right methods of amending them, it is largely due to the well-known letters of "Vetus," and the numerous other series of articles in *The Times* on the subject. In other domestic matters *The Times* has recognized that it is no longer organic changes of ancient institutions, but rather modest social reforms that are demanded by the people. It has endeavoured with some success to curb the inordinate pretensions of trade-unions, and to combat the insidious advances of Socialism.

In the earlier volumes of this Encyclopædia the personal history of *The Times* concluded with an incidental mention of the retirement in 1877 of John Thadeus Delane (*q.v.*), for thirty-six years chief editor of the paper. He was succeeded by Thomas Chenery (*q.v.*), sometime Lord Almoner's professor of Arabic at Oxford. Chenery died after a short illness in February 1884, and was succeeded by George Earle Buckle. Mr John Walter (*q.v.*), who since 1847 had been the chief proprietor and manager of the paper, died in 1894, and was succeeded by his eldest son Mr Arthur Fraser Walter. *The Times* has always maintained the principle of anonymity in relation not only to the occasional contributors to its columns, but also to the permanent members of its staff. It is sufficient to say that there are few well-known men who have not in one form or another contributed to its pages.

The bulk and business of the paper greatly increased after 1880. It was stated in the earlier article in vol. xvii. that on one occasion a number of the paper had contained 67 columns of advertisements. This was even then much below the mark. As far back as 1861 a single issue had contained 105 columns of advertisements, and another 98. Prior to 1884 the paper had only on two occasions consisted of 24 pages in a single issue. Between that year and 1902 more than 80 separate issues of this size were published, many of them containing over 80 columns of advertisements. Of the two issues, one containing the news of the death and the other the account of the funeral of Queen Victoria, 140,000 copies were printed.

The increasing circulation of *The Times* between the years 1840 and 1850 made an improvement in the printing-presses necessary, as sometimes the publication could not be completed before the afternoon. To meet this want the Applegath vertical press was introduced in 1848. This press, instead of having a flat printing surface, by which only one sheet could be printed at each movement, had an upright revolving cylinder on which the pages of type were fixed. This cylinder revolved at a speed which enabled eight sheets to be laid on by eight men, and taken off by the same number, thus printing very much faster than the flat press. But it still had the drawback of printing only one side of the paper. To improve upon this machine the American Hoe ten-feeder press was introduced in 1858. This machine required ten "layers-on," but no "takers-off," and also printed at a faster speed than the Applegath. Meanwhile the idea of stereotyping from the movable types had been making steady progress, but it had many drawbacks in consequence of the "plaster" process being continued. About the year 1856, however, a Swiss named Dellagana introduced to *The Times* Kroning's idea of casting from papier-mâché instead of plaster, and was allowed to experiment in the *Times* office. After a time the invention was so much improved that matrices of pages could be taken, and the stereotype plates fixed bodily on the printing machine in place of the movable type. This cleared the way for the introduction of the Walter press. Hitherto only one set of "formes" could be used, as the type was set up once only—one side of the paper being worked on one machine, and the sheets then taken to another machine to be "perfected." Stereotyping enabled the formes to be multiplied to any extent, as several plates could be cast from one matrix. Mr MacDonald of *The Times* had devoted himself for several years to the production of a press which could print papers on both sides in one operation from a large reel of paper, the web of paper being cut into the required size after printing, instead of each sheet being "laid on" by a man, and then printed. After years of experiment the Walter press was introduced into the *Times* machine-room in 1869, and the question of printing great numbers in a short time was solved. Each press turned out 12,000 sheets per hour, and it was therefore only a question of multiplying the stereo plates and presses to obtain any number of printed papers by a certain time. Meanwhile Messrs Hoe and Company had not been idle, but had set about producing something even quicker and better than the Walter press. They succeeded in accomplishing this by multiplying the reels of paper on each press, and also adding folders and stitchers. The result was the production of over 36,000 sheets per hour from each machine, all folded, and, if required, stitched with wire. These presses were adopted by *The Times* in 1895, and were still in use in 1902.

In 1868 the question of composing machines for the quicker setting-up of type was taken up by *The Times.* A German named Kastenbein had an invention which he brought to the notice of *The Times,* and arrangements were made for him to continue his experiments in the *Times* office. In a couple of years a machine was made, which was worked and improved until in 1874 several machines were ready to set up a portion of the paper; but it was not until 1879 that the arrangements were sufficiently advanced to make certain that they could do all that was wanted from them. The introduction of composing machines, and the necessary alterations in the office arrangements which followed, led to some trouble among the compositors, which in 1880 culminated in a partial strike; but a part of the staff remaining loyal, the printer was able by extra effort to produce the paper at the proper time on the morning following the strike. In the course of a few days the places of the strikers were filled, and the business of the paper went on as before. From this time the composing machines took their place as the chief producers of the work. Various improvements were made, until one machine was able to set up as many as 298 lines of *The Times* in one hour, equal to 16,688 separate types, the compositor being dictated to at the *Times* office by telephone directly from the House of Commons. This system of telephone dictation was commenced in 1885, and was continued until the House of Commons decided to rise at midnight, which very much reduced the pressure of work, and enabled the more economical method of composing direct from the "copy" to be resumed. In connexion with the telephoning it may be mentioned that a special helmet was made for each compositor's head, with a receiver at each ear, and as fast as the reader at the House of Commons dictated, the compositor set up the matter at the *Times* office. Ever since the introduction of the composing machines they had been much hampered by the question of "distribution"—that is, the breaking-up and sorting of the types after use. Kastenbein had invented a distributing machine to accompany his composing machine, but it proved to be unsatisfactory. Various systems were tried at the *Times* office, but for many years the work of the composing machines was to some extent crippled by the distribution difficulty. This had been recognized by Mr Wicks, the inventor of the Wicks Rotary Type-casting Machine, who for many years had been working at a machine which would cast new type so quickly and so cheaply as to do away with the old system of distribution and substitute new type every day. In 1899 his machine was practically perfect, and *The Times* entered into a contract with him to supply any quantity of new type every day. Since that time the average weekly delivery to *The Times* has exceeded 5,000,000 types. The difficult question of distribution was thus surmounted, and composition by machines placed on a satisfactory basis. To sum up, we find that during the last half of the 19th century *The Times* continued to take the lead in new inventions relating to the printing of a newspaper, just as it had in the fifty years preceding. The three most important advances during the later period were practically worked out at the *Times* office—namely, fast-printing presses, stereotyping, and machine composing, and without these it is safe to say that the cheap newspaper of the present day could not exist.

The growth of *The Times* is shown in a statement published in the issue of 7th January 1901, from which it appears that the total news, exclusive of advertisements, supplied to the public by *The Times* during the year 1800 amounted to about 2,700,000 words, while during the year 1900 it is estimated to have consisted of over 35,000,000 words. "To pursue the comparison, *The Times* for the year 1900 contained, always exclusive of advertisements, nearly 20 per cent. more reading matter than the *Encyclopædia Britannica,* more than 240 quarterly volumes (60 years) of the *Edinburgh Review,* and more than five times as much as all Macaulay's works, Grote's *History of Greece,* and Gibbon's *Decline and Fall* added together."

In addition to this colossal daily issue, *The Times* is the parent of several other newspapers. *The Mail,* published three times a week at the price of 2d. per number, has 8 pages, and gives a convenient summary of two days' issue of *The Times. The Times Weekly Edition* (begun in 1877) is published every Friday, and for 2d. gives a carefully condensed but necessarily brief epitome of *The Times* for the six days. It includes also a serial story, the character of which is always irreproachable, and a popular chess column. The circulation of *The Times Weekly Edition,* chiefly in the colonies, almost trebled between 1890 and 1900. The *Law Reports* (begun in 1884) are conducted by the large staff of *Times* law reporters, all of them barristers of at least five years' standing, under the direction of Mr William Frederick Barry of the Inner Temple, and they have acquired a recognized position in the legal world. *Commercial Cases,* edited by Mr T. E. Aldous of the Inner Temple, deals with cases of a commercial nature. *Issues* is a useful half-yearly compilation of all the company announcements and demands for new capital, taken from the advertisement columns of *The Times.*

In 1897 the increasing demand of the public for information of a literary character encouraged the conductors of *The Times* to issue a weekly literary organ under the title of *Literature.* This at first was issued entirely independently of *The Times,* under the editorship of the late Dr H. D. Traill, but after his death it was in 1901 deemed advisable to issue in its place a weekly literary supplement to *The Times,* and *Literature* passed into the hands of the proprietor of the *Academy,* with which paper it was incorporated as *The Academy and Literature.* The "Literary Supplement" appears each Friday, is printed in a different form, and separately paged.

Moreover, the publishing department of *The Times* has of late years invaded several new fields of enterprise. *The Times Atlas* was first published in 1895, and successive editions, revised, enlarged, and continuously brought up to date, have been published at frequent intervals, and about 50,000 copies were sold up to 1902. By an arrangement with Messrs Longmans, this publication was supplemented by that of *The Times Gazetteer.* A much larger and more important venture was the issue in 1898 of a reprint of the ninth edition of the *Encyclopædia Britannica.* That work was then out of print. The original publishers, Messrs A. and C. Black, had printed 10,000 copies, and in the fourteen years of its publication, and in the nine years following its completion, had sold little more than 9000. It was recognized by *The Times* that this small sale of an invaluable work was due to the high price at which it was issued. Messrs Black had assumed that as the sale would be small the price must be high. *The Times* recognized that the sale was small *because* the price was high, and by an arrangement with Messrs Black they issued their reprint at less than half the original price, and on a new system of terms that enabled the purchaser to receive the whole work at once and to pay for it by a series of equal monthly payments. In the first year 18,000 copies were sold, the gross proceeds of sales amounting to almost exactly £365,000. Subsequent sales in the United Kingdom alone up to 1902 amounted to nearly another 18,000, apart from considerable sales in India and the colonies. The new method of sale introduced into the United Kingdom by *The Times* found several imitators, and was repeated by that journal itself in the case of the *Century Dictionary* and of a reprint of the first fifty years of *Punch*. The new volumes of the *Encyclopædia Britannica*, supplementing the ninth edition and forming with it the tenth edition, were issued in 1902 on similar terms at brief intervals. Within three weeks of publication of the first volume more than 10,000 complete sets were subscribed for.

In the year 1895 *The Times*, through its Vienna correspondent, purchased from the late Dr Busch the MS. and entire copyright of his journals, containing a very minute record of his intimate relations with Bismarck. It was stipulated in the contract that these were not to be published until after the death of the prince. That event occurred on the 30th July 1898, and on the 12th September of the same year *The Times* published through Messrs Macmillan (in 3 vols.) *Bismarck: Some Secret Pages of his History*, by Dr Moritz Busch. The work created an immense sensation, was translated into many languages, and remains the most authentic record of much of the secret history of the period with which it deals (1870–90).

The Times History of the War in South Africa arose out of a desire to preserve in a more readable form the excellent work done by the numerous *Times* correspondents in South Africa. When originally projected in the early days of 1900 it was hoped that the war would be of short duration, and that the history of it could be rapidly completed. The length of the war naturally upset all these calculations, and the large number of subscribers at the very low price which had originally been deemed sufficient compelled *The Times* to decide between a mere re-editing of its original despatches and a more complete and permanent record of the whole event. The fact that numerous short histories had already been produced decided *The Times* to adopt the latter more costly and more laborious alternative. Mr L. S. Amery, fellow of All Souls, who during the war had not only served for a short time as its special correspondent in the Boer camp, but had ultimately had the direction of the nineteen correspondents representing *The Times*, was selected as the editor. Two volumes had been published by August 1902, and met with general approval. The comments made in the second volume had the result of causing at length the official publication of the much-disputed Buller heliogram.

The Standard. The *Standard* was established as an evening paper in the Tory interest in 1827, its first editor being Stanley Lees Giffard, father of the first earl of Halsbury, who had Alaric Watts and Dr William Maginn, famous as one of the originators of *Fraser's Magazine*, as his chief helpers. In the course of two or three years it became a pecuniary, as it had from the first been a political, success, and gradually ousted the *Courier*, which was for a time conducted by William Mudford, whose son half a century later became the most distinguished editor of the *Standard*. In course of time the latter became the property of Mr Charles Baldwin, whose father was proprietor of the *Morning Herald*, and when the father died the son found himself in possession of both a morning and an evening journal. In his hands neither of them prospered, although the *Standard* retained a large circulation and constantly printed early and accurate political information. At length, midway in the 'fifties, both papers were purchased by Mr James Johnstone, Mr John Maxwell, the publisher, being for a time associated with him in the ownership. Mr Johnstone realized that he had before him a great opportunity, and at once set to work to grasp it. He brought out the *Standard* as a morning paper (29th June 1857), increased its size from four to eight pages, and reduced the price from fourpence to twopence. One of the most curious features of the early numbers was a novel by William Howard Russell. The evening edition was continued. In February 1858 Mr Johnstone again reduced the price, this time to a penny. When that step was taken the *Standard* announced that its politics were "enlightened amelioration and progress," but that it was "bound to no party"; and to those independent lines it in the main adhered. In the course of four or five years it became a financial success, and then began to attract to itself many brilliant pens, one of its contributors in the 'sixties, Lord Robert Cecil, being destined to become illustrious as marquess of Salisbury. Lord Robert was an occasional leader-writer, whose contributions were confined almost entirely to political subjects. It was at this time that the *Standard* laid the foundation of the great reputation for early and detailed foreign news which it has ever since enjoyed. During the American Civil War it obtained the services of a representative signing himself "Manhattan," whose vivid and forcible letters from the battlefield arrested attention from the beginning. As the campaign progressed, these full, picturesque, and accurate accounts of the most terrible struggle of modern times were looked for with eager interest. There were no "special cables" to discount the poignant curiosity of the reader, and the paper reached a circulation far beyond anything hitherto known. The distinction thus acquired was maintained during the Prussian-Austrian war of 1866, and greatly increased by the letters and telegrams describing the triumphs and disasters of the campaign of 1870. In the early 'sixties the staff had been reinforced by the engagement of Mr William Heseltine Mudford. In the midst of his work as a Parliamentary reporter, he was sent as special correspondent to Jamaica in 1865 to report upon the troubles which involved the recall of Governor Eyre; a further period in the gallery of the House of Commons followed, and in 1873 Mr Mudford became business manager. Mr Johnstone's first editor was Captain Hamber, who afterwards seceded to the short-lived *Hour*, with whom had been associated Mr David Morier Evans as manager. He was succeeded by the owner's eldest son, to whom Mr (afterwards Sir) John Gorst was joined in a consultative capacity. In 1876 Mr Mudford became editor, still, however, retaining managerial control. Mr Johnstone, the proprietor to whose energy and perspicacity the paper owed so much, died in 1878, and under his will Mr Mudford was appointed editor and manager for life, or until resignation. Already a great property, the *Standard* in Mr Mudford's hands entered upon a very brilliant period. Sturdy independence was the note of his editorship—mere party factiousness did not enter into his ideas. The relations between the paper and the Conservative party were still intimate, but they were very different from those which obtained in the old days when a *Punch* cartoon had represented Lord Derby and Mr Disraeli as followed in the street by an old woman in a "Gamp" bonnet—since it was as Sairey Gamp that the *Standard* was invariably referred to by its weekly contemporary. "Throw her a penny," says Mr Disraeli, "or people will think she belongs to us." No man, however brilliant, is capable of successfully editing a great daily newspaper, with its heavy weight of labour and responsibility, without an able and trustworthy second in command, and in that respect Mr Mudford was fortunate throughout. He had for his first assistant-editor Mr Gilbert Venables, who was succeeded after a short term by Mr George Byron Curtis, previously one of the leader-writers, who thus held the position through nearly the whole of Mr Mudford's long editorship. The staff at this time comprised many men, and some women, whose names are distinguished in letters as well as in journalism. Mr Alfred Austin, Mr T. H. S. Escott, Miss Frances Power Cobbe, and the late Professor Palmer were all writing for the paper at the same time. To them must be added, among others, Mr E. D. J. Wilson, the brilliant political leader-writer (afterwards of *The Times*), Mr Percy Greg, son of "Cassandra" Greg, Mr T. E. Kebbel, and the late Dr Robert Brown, who wrote copiously upon scientific and miscellaneous subjects. Throughout these years the *Standard* was exceptionally well served by a series of war correspondents who to enterprise and resource added unusual literary ability. Foremost among them were Mr G. A. Henty, who represented the paper on many a stricken field; Mr John A. Cameron, who was killed at Abu Klea; and Mr William Maxwell, who added appreciably to the brilliant tradition he inherited. In January 1900 Mr Mudford retired, and was succeeded in the editorship by Mr Byron Curtis, Mr S. H. Jeyes, the biographer of Lord Salisbury and Mr Chamberlain, whose connexion with the paper had begun in 1891, becoming assistant-editor. Under Mr Curtis's control the *Standard* is said to have increased in circulation, while maintaining its unique position as the exponent of progressive and independent Conservatism. Among the members of his literary staff in 1902 were, in addition to some of those whose names have been mentioned, Mr Sidney Low, Mr Richardson Evans, Mr David Hannay, the Rev. Professor Bonney, and Mr J. Penderel-Brodhurst. Mr A. E. T. Watson and Mr Sutherland Edwards wrote on the theatre, and Mr Frederick Wedmore on art.

Daily Telegraph.

The first number of the *Daily Telegraph* was published on 29th June 1855, as a twopenny newspaper. Its proprietor was Colonel Sleigh. This gentleman soon found himself in pecuniary straits, and in satisfaction of the debt for the printing of the paper it was transferred to Mr Joseph Moses Levy in the following September. On 17th September Mr Levy published it as a four-paged penny journal, the first penny newspaper produced in London. His son, afterwards Sir Edward Lawson (b. 1833), immediately entered the office, and after a short time became editor, a post which he only abandoned in 1885, when he became the managing proprietor and sole director. From the outset Mr Levy gathered round him a staff of high literary skill and reputation. Among the first were Mr Thornton Hunt, who acted in collaboration with Sir Edward Lawson, Mr Geoffrey Prowse, Mr George Hooper, and Sir Edwin Arnold (*q.v.*), as leader-writers. Sir Edwin returned from public service in India immediately after the Mutiny, and became a member of the staff of the *Daily Telegraph* in response to an advertisement. Mr E. L. Blanchard was among the earliest of the dramatic critics, and Mr Alexander Harper the City editor. Later there came Mr George Augustus Sala (*q.v.*), then one of Charles Dickens's young men; Mr Clement Scott (b. 1841), at one time a clerk in the War Office; and Mr Edward Dicey (b. 1832), then fresh from Cambridge. The Hon. Frank Lawley turned to journalism from official life; and among the most remarkable of the early contributors to the paper was Mr J. P. Benjamin, Q.C., the great American lawyer, who wrote a number of articles, principally on financial and legal subjects, when he took refuge in England in 1866. A distinguished man of letters, who was on the staff for well-nigh a quarter of a century, was Dr H. D. Traill (*q.v.*). The active list of the staff in 1902 included Mr J. M. Le Sage, the managing editor, who had been connected with the paper over thirty-five years; Mr W. L. Courtney, editor of the *Fortnightly Review*; Mr E. J. Iwan-Muller, Mr J. B. Firth, and Mr J. L. Garvin; Mr Joseph Bennett and Mr Lionel Monckton being the musical critics, Mr T. M. Rendle dramatic critic, Mr H. W. Lucy principal Parliamentary reporter, and Mr Bennet Burleigh the principal war correspondent. The *Daily Telegraph* is famous for its "special correspondents," Mr John Ellerthorpe and Dr E. J. Dillon having been conspicuous in this capacity; and Lord Dunraven, the late Lord Russell of Killowen, and Mr Winston Churchill, M.P., have also been on special missions for the paper. Among the regular correspondents in foreign capitals have been Mr Felix Whitehurst in Paris, Mr W. H. Beatty-Kingston (1837–1900) in Berlin, Mr Lavino in Vienna, and Sir Campbell Clarke (1835–1902) in Paris. After 1890 Mr Harry Lawson assisted his father in the general control of the paper.

Sir Edward Lawson, with the influence of the paper at his back, took a leading part in the agitation for the abolition of the stamp duties upon newspapers in 1861. On his initiative the *Daily Telegraph* organized many expeditions for scientific and exploring purposes. In June 1873 it despatched Mr George Smith to carry out a series of archæological researches in Nineveh, which resulted in the discovery of the missing fragments of the cuneiform account of the Deluge, and many other inscriptions. In co-operation with the *New York Herald* it equipped Mr (afterwards Sir) Henry Stanley's second great expedition to Central Africa (1875–77), described in his work *Through the Dark Continent*. During this journey Stanley surveyed Lakes Victoria and Tanganyika, and identified the Lualaba with the Congo. Another geographical feat with which the name of the *Daily Telegraph* is associated was the exploration of Kilimanjaro (1884–85) by Mr (afterwards Sir) Harry Johnston, whose account of his work appeared in the *Daily Telegraph* during 1885. And Mr Lionel Decle's march from the Cape to Cairo, in 1899 and 1900, was also undertaken under the auspices of the paper.

The *Daily Telegraph* has raised many large funds, which Sir Edward Lawson has himself organized and managed free of charge. Almost the first was the subscription for the relief of the sufferers by the cotton famine in Lancashire, in the winter of 1862–63; the fund in aid of the starving and impoverished people of Paris at the close of the siege in 1871; the prince of Wales's Hospital Fund in commemoration of the Jubilee of 1897, which was collected in the end of that year and the beginning of 1898; and the *Daily Telegraph* Shilling Fund for the soldiers' widows and orphans in connexion with the Boer war. It is interesting to note that while the cotton famine list resulted in a total subscription of £6300, that in aid of the Hospitals realized £37,840, and the widows and orphans' fund in May 1900 stood at £253,000. An undertaking of a more festive kind was the fête given to 30,000 London school children in Hyde Park on the occasion of Queen Victoria's Jubilee in 1887.

In politics the *Daily Telegraph* was consistently Liberal up to 1878, when it opposed Mr Gladstone's foreign policy as explained in his Midlothian speeches. After 1886 it represented Unionist opinions. Among special feats of which it can boast was the first news brought to England of the conclusion of peace after the Franco-German war.

Prior to 1874 the *Daily Telegraph* was printed by eight- and ten-feeder machines, through which every sheet had to be passed twice to complete the impression. Under these conditions it was necessary to start printing one side of the paper as early as ten or eleven o'clock. The handicap which this imposed on the satisfactory production of a newspaper was removed by the introduction of Hoe's web machines at the end of 1874. No further change took place until 1891, when they were superseded by others built by the same makers capable of printing a 12-page paper at the rate of about 24,000 an hour, cut, folded, delivered, and counted in quires. In 1896 they were modified so as to be suitable for turning out an 8-, 10-, 12-, 14-, or 16-page paper. Up to 1894 the setting of type had been done entirely by hand, but in that year the linotype, after an experimental trial, was introduced on a large scale, the *Daily Telegraph* being the first of the great London dailies to make the change. There are 36 of these machines at work, and with only a few exceptions the whole of the setting is entrusted to them. The difference between the scale of operations in earlier days and present practice may be illustrated by a few figures. The volume which contains the issue of the *Daily Telegraph* for July to December 1856—the beginning of the second year of its existence—consists of 632 pages; the three volumes required for the same period of 1900 are made up of 2080 (for the first half of that year the total is 2192). In the second half of 1856 the issue numbered 3792 columns, while in July to December 1900 the aggregate was 14,560. This, however, does not indicate the whole addition to the size of the paper. The page is now deeper from top to bottom, with the result that it would take 16,640 of the columns of 1856 to represent the output of the latter half of 1900. Another example of the volume of work done by the mechanical departments is afforded in the fact that while in 1860 there were printed 5000 columns of advertisements, the total in 1900 was over 16,000. Here, again, for purposes of comparison the latter figure may be taken as equal to 18,300. Mr Levy acquired the *Daily Telegraph* paper-mills at Dartford Creek in 1867, and the whole of the material used for the daily issue of the paper is manufactured at these mills, which are as fully equipped with machinery as the offices in Peterborough Court.

Morning Post.

During the first three quarters of the 19th century the *Morning Post* fairly held its own against the constantly increasing pressure of competition, but without making any great headway. Amongst its editors were Mr Peter Borthwick, M.P.; his son, Algernon Borthwick (b. 1830), under whom it acquired great political influence as the official organ of Lord Palmerston's Government; and Sir William Hardman, for many years chairman of the Surrey sessions, and recorder of Kingston. For a time the paper passed into the hands of Messrs J. and T. B. Crompton, one of the largest firms of paper manufacturers; but upon the death of Mr Rideout, the principal surviving partner, Mr Algernon Borthwick (who was knighted in 1880, made a baronet in 1887, and raised to the peerage as Lord Glenesk in 1895) acquired the sole proprietorship. One of his first acts (on 27th June 1881) was to reduce the price of the *Morning Post* from threepence, at which it had so long stood, to one penny —an experiment which many experts predicted would be fatal to the existence of a journal which hitherto had been regarded as merely the organ of the fashionable world. The result exceeded his most sanguine anticipations. The circulation increased in the course of a few months more than tenfold, and with expanding circulation came a corresponding increase of advertisements. Under the later editorships of Mr Moore, Mr Algernon Locker (1895–97), and Mr James Nicol Dunn, who became editor in 1897, the *Morning Post* fully maintained its position. It claims to have been the first paper to announce the conclusion of the Anglo-Russian agreement in regard to China in April 1899, to have been the only newspaper in which the text of the award in the Delagoa Bay Railway Arbitration was published on the day after it was made, and the first to announce the duke of Connaught's renunciation of the Saxe-Coburg succession. Its list of contributors includes such well-known names as those of Andrew Lang, W. E. Henley, George Meredith, Thomas Hardy, Spenser Wilkinson, Professor York Powell, E. F. Knight, and Mr Winston Spencer Churchill, M.P.—the last-named as the special correspondent in Lord Kitchener's campaign against the Khalifa and the war in the Transvaal. Mr Spenser Wilkinson's trenchant criticisms of the military operations in South Africa in 1899 and 1900 were a notable feature of the *Morning Post* during that period. Of recent years considerable attention has been devoted to social questions. A short series of articles on the outcasts who frequented the Thames Embankment at night led the readers to provide funds for the *Morning Post* Embankment Homes, where homeless wanderers are provided with temporary shelter and are afterwards assisted to permanent employment. The readers of the paper likewise presented Lord Kitchener with money enough to erect a bronze statue of General Gordon, by Mr Onslow Ford, R.A., in Khartum. Moreover, it is claimed the articles in the *Morning Post* induced the Government to open throughout the United Kingdom convalescent homes for soldiers, and to erect a monument in memory of the many nameless heroes among the Chelsea Pensioners buried in Brompton Cemetery.

Daily News.

The history of the *Daily News* has been told by Mr Justin McCarthy and Sir John R. Robinson in a volume (Sampson Low, Marston and Co.) of "political and social retrospect" published in 1896 on the occasion of its jubilee. It could boast of having continuously been the champion of Liberal ideas and principles—of what (so long as Mr Gladstone lived) might be called official Liberalism at home and of liberty abroad. Its only rival in the history of Liberal journalism in London for many years was the short-lived (1856–70) *Morning Star*, which in 1870 it absorbed. Notably, it led British public opinion in foreign affairs as champion of the North in the American Civil War, of the cause of Italy, of the emancipation of Bulgaria from the Turk, and of Armenia. Its early editors were Charles Dickens (21st January–March 1846), John Forster (March–October 1846), E. E. Crowe (1847–51), F. K. Hunt (1851–54), W. Weir (1854–58), T. Walker (1858–69). In 1868 the paper was reduced in price to a penny, and came under the management of Mr (after Sir) John R. Robinson (b. 1828), who only retired in 1901. Its later editors have included (1868–86) Mr F. H. Hill (the brilliant author of *Political Portraits*), and subsequently Sir John R. Robinson, as managing editor, in conjunction with Mr P. W. Clayden (b. 1827; d. 1902), the author of *Life of Samuel Rogers*, *England under the Coalition*, and other able works, as political and literary editor, down to 1896, and Mr E. T. Cook from 1896 to 1901. Mr Cook, during the negotiations with the Boer Government in 1899, strongly supported Sir Alfred Milner; and under him the *Daily News*, as an exponent of Liberal Imperialism, gave no countenance to the pro-Boer views of some of the more active members of the Liberal party. In 1901, however, the proprietary changed, and Mr E. T. Cook, whose views on the Boer war were not shared by the new proprietors, retired; the journal then becoming an organ of the anti-imperialist section of the Liberal party. After other editorial changes, Mr Gardiner became editor in 1902.

Throughout its career the *Daily News* has been famous for its war correspondents, among whom may be named Archibald Forbes (Franco-German and Russo-Turkish wars), E. H. Vizetelly (Italy), O'Donovan (of Merv), MacGahan (Bulgaria), and A. G. Hales (Boer war). Among its other principal writers have been Harriet Martineau, Professor Minto, William Black, Justin McCarthy, E. F. S. Pigott, Sir R. Giffen (City editor), Professor Elliot Cairnes, Grenville Murray, John Hollingshead, Richard Whiteing, Andrew Lang, Herbert Paul, and (Parliamentary sketch) H. W. Lucy.

Daily Chronicle.

The *Daily Chronicle* arose out of the *Clerkenwell News*, the latter paper having been purchased by the late Mr Edward Lloyd in 1877, and converted into "an Imperial morning paper" on independent Liberal lines. Under the editorship of Mr R. Whelan Boyle the *Daily Chronicle* soon took rank among the other London daily journals, the only traces of its original character being shown in the attention paid to metropolitan affairs and the appearance of numerous small advertisements. The independent tone of the journal was conspicuous in its treatment of the Home Rule question. At first deprecating the system of combined agitation and outrage with which the term was synonymous, the *Daily Chronicle*, under the editorship of Mr A. E. Fletcher (1890–95), ceased to be a Unionist journal, and supported Mr Gladstone's Bill of 1893. Another instance was afforded in the course of the Boer war. During the negotiations and the early stages of the campaign, the *Daily Chronicle*, which was then edited by Mr H. W. Massingham, strove for peace by supporting the Boer side against the diplomacy of Mr Chamberlain. Mr Massingham's policy was, however, not to the liking of the proprietors, and he retired from the editorship towards the end of 1899, Mr W. J. Fisher, whose knowledge of international affairs had singled him out for the post, succeeding him as editor. Mr Massingham during his editorship, ably seconded by Mr Henry Norman, had largely increased the interest of the paper, particularly on its literary side. A new impetus had been given in this direction in 1891, when a "literary page" was started, conducted at first by Mr J. A. Manson, and after 1892 by Mr Massingham, when he became assistant-editor under Mr Fletcher. The journal can claim to have taken a leading part in many public movements since 1877. It was conspicuous in its advocacy of the cause of the men in the London dock strike of 1889; and in the great mining dispute for a "living wage," which was brought to a close by Lord Rosebery in November 1893, raised over £13,000 for the relief committees. Much attention was given to the theosophical discussion of 1891, and to the exposure of the adventurer "De Rougemont" after he had appeared before the British Association at Bristol in 1898. The *Daily Chronicle* took an active part in the negotiations which led to the Venezuelan Arbitration Treaty of 1897, it energetically pleaded the cause of the Armenians and Cretans during the massacres of 1896, and it encouraged the Greeks in the war with Turkey in 1897. Its foreign policy was, however, more distinguished by goodwill than by discretion—and notably in the latter instance. The *Daily Chronicle* also worked strenuously for the Progressive cause in London in regard to the County Council, Borough Councils, and the School Board. Of late years it has devoted a portion of its space daily to "the Churches." Its news successes included the first announcement of the revolution in eastern Rumelia (1885); the first circumstantial account of the death of Prince Rudolph (1889); Nansen's own narrative of his expedition towards the North Pole; and Sir Martin Conway's journey across Spitsbergen in 1896, and the first ascent of Aconcagua in the following year. Among its more frequent contributors—past and present—may be mentioned the late Robert Wilson, B. F. C. Costelloe, Sir Walter Besant, William Clarke, and Lewis Sergeant; Mr William Archer, Mr Edmund Gosse, Mr E. T. Cook (whose association with the paper after 1901 confirmed its adoption of Liberal Imperialistic views), Mr Joseph Pennell, Dr Jessopp, Mr Lionel Johnson, Mr Henry Norman, M.P., Mr L. F. Austin, Mr Edward Clodd, the Hon. R. C. Drummond, Mr Egerton Castle, Sir Martin Conway, Major Martin Hume, Mr Henry Harland, Mr Francis Thompson, Mr Arthur Waugh, and the Rev. Dr R. F. Horton.

Morning Advertiser and Daily Graphic.

The only other important morning papers, other than those of the halfpenny press (see below), are the *Morning Advertiser*, the organ of the licensed victuallers, which is devoted largely to the interests of "the Trade," and was reduced in price from threepence to a penny in 1891 (one of its conspicuous features up to 1902 being an alliterative contents bill); and the *Daily Graphic*, founded in 1890 by Mr W. L. Thomas (1830–1901) as an offshoot from the *Graphic*, and edited by Mr Hammond Hall, assisted by Mr Lucien Wolf. The combination of clear arrangement of news, well-informed comments, and plentiful illustration of the topics of the moment, rapidly made the *Daily Graphic* a popular addition to London journalism. In 1896 Sir G. Newnes started a new type of penny morning daily in the shape of *The Courier*, edited by Mr Earl Hodgson; but it only survived for a short time.

The Pall Mall Gazette.

We pass now to the London penny evening papers. The first number of the *Pall Mall Gazette* issued on 7th February 1865 from Salisbury Street, Strand. Mr George Smith, of the publishing firm of Smith and Elder, was its first proprietor; Mr Frederick Greenwood (b. 1830), its first editor, took the *Anti-Jacobin* for his model; the paper was intended to realize Thackeray's picture of one "written by gentlemen for gentlemen." In spite, however, of brilliant supporters such as Fitzjames Stephen as writer of leading articles (replaced to a certain extent, after 1869, by Sir Henry Maine), R. H. Hutton, Matthew James Higgins ("Jacob Omnium"), James Hannay, and George Henry Lewes, with George Eliot, Anthony Trollope, Charles Reade, and Thomas Hughes as occasional contributors, the paper failed to attract until, in the following year, Mr Greenwood's brother, James, furnished it with three articles on "A Night in a Workhouse: by an Amateur Casual." A morning edition had already been tried and dropped, and so was a distinct morning paper, attempted in 1870. In 1867 new premises were taken in Northumberland Street, Strand. Three years later the *Pall Mall Gazette* was the first to announce the surrender of Napoleon III. at Sedan. Matthew Arnold was represented in it by "Friendship's Garland" in 1871, and Richard Jefferies by "The Gamekeeper at Home" in 1876 and onwards. Mr Greenwood made the paper unflinchingly Conservative and strongly adherent to Lord Beaconsfield's foreign policy. In 1880 Mr Smith handed over the *Pall Mall Gazette* to his son-in-law, Mr Henry Yates Thompson, who turned it into a Liberal journal. Mr Greenwood retired from the editorship shortly afterwards and started the *St James's Gazette*; and Mr John Morley became editor of the *Pall Mall*, with Mr W. T. Stead (b. 1849) as assistant-editor. The price was reduced in 1882 from twopence to one penny. Many of the old contributors remained, and they were reinforced by Robert Louis Stevenson, who wrote some "Letters from Davos," Professor Tyndall, Professor Freeman, James Payn, and Mrs Humphry Ward. Mr Morley exchanged journalism for politics in 1883, and was succeeded by Mr Stead, with Mr Milner, afterwards Lord Milner, as his assistant. Adopting an adventurous policy, Mr Stead imported the "interview" from America, and a report of General Gordon's opinions was believed to have been the cause of his ill-fated mission to Khartum. A series of articles called "The Truth about the Navy" (1884) forced the Admiralty to lay down more ships next year. "The Maiden Tribute of Modern Babylon," purporting to further the Criminal Law Amendment Bill, consigned Mr Stead to three months' imprisonment in Holloway Gaol. Mr Stead made a feature of reprints called "extras"; and, edited by Mr Charles Morley, the *Pall Mall Budget* became an illustrated weekly. Mr Stead was replaced in 1889 by Mr E. T. Cook, who had become assistant-editor in succession to Mr Milner. The *Pall Mall Gazette* was now steadily Liberal and a strong advocate of Home Rule. On its staff were Mr Edmund Garrett, Mr F. C. Gould the caricaturist, and Mr Alfred Spender. Mr Cook resigned in 1892, on the sale of the paper to Mr William Waldorf Astor, the American multi-millionaire, who turned it again into a Conservative organ, and also changed its shape, abandoning the old small pages for a larger sheet. Mr Henry Cust, M.P., was appointed editor, with Mr E. B. Iwan-Muller as assistant-editor, and a staff including Mr H. B. Marriott-Watson, Mr G. W. Steevens, Mr John Stuart, Mr Charles Hands, Mr Nicol Dunn (afterwards editor of the *Morning Post*), Mr Duguid as City editor, the late R. A. M. Stevenson as art critic, and Mr Vernon Blackburn as musical critic. Among the fairly regular contributors may be mentioned Mr H. G. Wells, Mrs Meynell, Miss Violet Hunt, Mr G. S. Street, and Sir Herbert Maxwell. Being unstinted from a financial point of view, Mr Cust, who came fresh to editorship with enthusiasms as to what a newspaper could do acquired from his experiences in Parliament and in Society, made the columns of the *Pall Mall* very lively for the next couple of years. It became well known for its "booms," and its "smartness" generally; also for the punning head-lines which frequently adorned its leading articles. Some papers contributed to it by Sir Charles Dilke and Mr Spenser Wilkinson resulted in the establishment of the Navy League in 1894. The paper had, too, the first news of Mr Gladstone's resignation and the appointment of Lord Rosebery to succeed him. But though the *Pall Mall* under Mr Cust had outshone all its competitors, its independence of those business considerations which ultimately appeal to most proprietors hardly represented a durable state of affairs; and eventually the relations between proprietor and editor became strained. In February 1896 Mr Cust and Mr Iwan-Muller parted company with the *Pall Mall Gazette*, and were succeeded in their appointments by Sir Douglas Straight and Mr Lloyd Sanders, the latter of whom retired in 1902. A more moderate policy was now pursued. The *Pall Mall* was the first London paper to announce the critical character of Mr Gladstone's last illness; while its denunciation of the use of water-tube boilers in the Royal Navy produced a Parliamentary Committee of Inquiry. The *Pall Mall* published its 10,000th number on 14th April 1897.

The St James's Gazette.

Founded in 1880 by Mr H. Hucks Gibbs (afterwards Lord Aldenham), with Mr Frederick Greenwood as editor, the *St James's Gazette* represented the more intellectual and literary side of Tory journalism in opposition to the new Liberalism of the changed *Pall Mall Gazette;* it was in fact meant to carry on the idea of the original *Pall Mall* as Mr Greenwood had conceived it, and was more of a daily review than a chronicle of news. In 1888, the paper having then been sold to Mr E. Steinkopff, Mr Greenwood retired and was succeeded as editor by Mr Sidney Low (1888–97), who had as his chief assistant-editors Mr S. H. Jeyes (till 1891) and Mr Hugh Chisholm (1892–97), the latter succeeding him as editor (1897–1900). The paper was for many years conspicuous for its literary character and for the number of distinguished literary men who wrote for it, some of whom first became known to the public by means of its columns. Among its contributors were Sir J. Fitzjames Stephen, Sir Henry Maine, Mr H. D. Traill, Mr Edmund Gosse, Mr Coventry Patmore, Mr J. M. Barrie, Mr Rudyard Kipling, Mr (afterwards Sir) Gilbert Parker, Mr Anthony Hope, Mr F. S. Pulling, Mr David Hannay, Mr T. E. Kebbel, Sir Walter Armstrong, Mr J. K. Stephen, Mr Sutherland Edwards, Mr Marcus B. Huish, Mr J. R. Fisher, Mr Walter Low, Mr Pett Ridge, Mr Harold Boulton, Mr H. A. Kennedy, Mr W. B. Woodgate, Dr A. Shadwell, Mr Henry Newbolt, and Mr W. P. James. In 1895 *Truth*, not prejudiced in favour of a Conservative journal, described the *St James's* as the best-edited paper in London. It was one of the earliest supporters of the Imperialist movement, and between 1895 and 1899 was the chief advocate in the Press of resistance to the foreign bounties on sugar which were ruining the West Indies. In 1899 the course taken by Sir Michael Hicks-Beach in reducing the fixed charge on the national debt had previously been advocated in its columns alone. In 1898 the sum of £1000 was raised through the medium of the *St James's* for endowing a cot in the Great Ormond Street Children's Hospital in memory of Lewis Carroll. It may be recalled that under Mr Low's editorship a protest was made on behalf of *boni mores* by the omission of any report in the columns of the *St James's* of the Oscar Wilde trial in 1895. This action obtained commendation in responsible circles, and notably from Lord Chancellor Halsbury, but in practice the circulation returns indicated that, while verbally approving the course taken, people bought other papers which contained an account; and the suggestion which was made that judges should in such cases order no report to be published failed to obtain much support. During the years immediately following 1892, when the *Pall Mall Gazette* again became Conservative, and the competition between Conservative evening papers became acute, it was increasingly difficult to carry on the *St James's* on its old lines so as to secure a profit to the proprietor; and by degrees modifications were made in the general character of the paper, with a view to its containing more news and less purely literary matter. But it retained its original shape, with sixteen (after 1897, twenty) small pages, a form which the *Pall Mall* abandoned in 1892. In 1900 Mr Theodore Cook, who had been assistant-editor since 1898, became editor for a brief period, and subsequently Mr Ronald MacNeill acted in this capacity, with Mr W. D. Ross as manager. The *St James's Budget*, which up to 1893 had been a weekly edition of the *Gazette*, was then turned into an independent illustrated weekly, edited from the same office by Mr J. Penderel-Brodhurst, who had been on the editorial staff since 1888; and it continued to be published till 1899, when Mr Brodhurst retired and the *Budget* was converted back into its earlier form.

The Globe.

The *Globe* (printed on pink paper), founded in 1803, is in the later period associated with the name of Mr George Armstrong, who, first joining its staff in 1872, became editor and proprietor, and in 1892 was created a baronet. In 1895 his son, Lieutenant G. E. Armstrong, became editor. No London paper changed its character in later years less than the *Globe*, both in policy and in methods. Aggressively Conservative since 1866 in politics, it maintained its reputation for straightforward criticism and well-digested news. One of its regular features was its "turnover," a miscellaneous article always appearing on the last column of the front page and turning over on the second; another was its "By the way" column, containing smart paragraphs and *bon mots;* and in recent years its articles on naval topics were consistently well informed. Among those connected with the paper, the most prominent has been Mr W. T. Madge, the manager, who also started and edited the *People* (1881), a popular Sunday journal for the masses.

The Westminster Gazette.

When the *Pall Mall Gazette* was sold to Mr Astor in 1892 and converted into a Conservative organ, Mr E. T. Cook, the editor, and most of his staff, resigned, and in 1893 they came together again on the *Westminster Gazette*, newly started for the purpose by Sir G. Newnes as a penny Liberal evening paper. It was printed on green paper, but the novelty of this soon wore off. The paper was conducted on the lines of the old *Pall Mall*, and it had the advantage of a brilliant political cartoonist in Mr F. Carruthers Gould. In 1895 Mr Cook was appointed editor of the *Daily News*, and his place was ably filled by Mr J. Alfred Spender, who had been his assistant-editor. Apart from Mr Gould's cartoons, the *Westminster* became conspicuous in London evening journalism for the admirable tone of its leading articles, and for Mr C. Duguid's excellent City notes. One of its greatest successes was the original publication of Mr Anthony Hope's "Dolly Dialogues."

The *Evening Standard*, founded as we have seen in 1827 as the *Standard*, has long been the evening edition of the morning paper. It is distinguished by the peculiarly full and detailed character of its reports of the day's news. (H. CH.)

The Halfpenny Press.

One of the problems and surprises that have resulted from the cheapening of telegraphy, of mechanical methods of production, and of the desire to read, is the modern halfpenny newspaper. It is, however, by no means so new as may appear. For its origin we must go back to the middle of the 16th century, when the Government of Venice sent out occasional bulletins of information on political and public affairs. These leaflets were called *Fogli di Avvisi*, and were sold at the price of one gazzetta, a coin worth a fraction over a halfpenny. Thus arose the use of the word "gazette" as a common term for a newspaper, and it is noteworthy that it originally meant what we now know as a halfpenny. In England we find the first mention of inexpensive news-sheets towards the close of the 17th century, when a number of halfpenny and farthing *Posts* sprang into existence, and appeared at more or less irregular intervals. These consisted of small leaflets, containing a few items of news—sometimes accompanied by advertisements—and were commonly sold in the streets by hawkers. The increase of these newspapers, and especially the growing practice of inserting advertisements, led the Legislature to contemplate a stamp tax of a penny per sheet on all news publications. As a protest, a curious pamphlet—of which a copy is preserved in the British Museum—was issued in 1701, and sheds an interesting light upon this early phase of cheap journalism. The pamphlet is entitled, "*Reasons humbly offered to the Parliament on behalf of several persons concerned in the paper-making, printing, and publishing of the halfpenny newspapers.*" It states that five master printers were engaged in the trade, which used 20,000 reams of paper per annum. The journals are described in the following terms: "The said newspapers have been always a whole sheet and a half, and sold for one halfpenny to the poorer sort of people, who are purchasers of it by reason of its cheapness, to divert themselves, and also to allure herewith their young children and entice them to reading; and should a duty of three halfpence be laid on these mean newspapers (which, by reason of the coarseness of the paper, the generality of gentlemen are above conversing with), it would utterly extinguish and suppress the same." The pamphlet goes on to say that hundreds of families, including a considerable number of blind people, were supported by selling the halfpenny journals in the streets.

Origins of the halfpenny Press.

In 1712 a tax of a halfpenny per sheet was imposed, and the cheap newspapers at once ceased to exist. This tax on the press was increased from time to time, till in 1815 it stood at fourpence per sheet. The usual price of newspapers was then sevenpence a copy. From these facts it seems highly probable that, had not the stamp tax been imposed, the halfpenny paper would soon have become the normal type, and would have continued so to this day. In 1724 a committee of the House of Commons sat to consider the action of certain printers who were evading the stamp tax by publishing cheap newspapers under the guise of pamphlets. They found that there were then two *Halfpenny Posts* published in London, one by Read of Whitefriars, and the other by Parker of Salisbury Street. There were also three weekly papers issued at a halfpenny a copy. The tax, after several reductions, was finally repealed on 15th June 1855, and a rush of cheap papers immediately followed.

Modern London halfpenny papers.

The first modern English newspaper to be issued at a halfpenny was the *London Evening News*—afterwards known as the *Day*. It was started in 1855, but soon failed to meet expenses, and disappeared from the scene. Between twenty and thirty local papers were at once started in London, of which the following were issued at a halfpenny:—*Clerkenwell News*, *Time o' Day for Hoxton*, *Islington Gazette*, *Islington Times*, *Lambeth Observer*, *North London Record*, *St Luke's News*, *Shoreditch Observer*, *South London Times*, and *Westminster News*. Of these it is interesting to note that the *Clerkenwell News* became the *Daily Chronicle*, while the *Islington Gazette* still survived in 1902, though not as a daily newspaper. The times, however, were not then ripe for fresh ventures in halfpenny journalism. The high price of paper, the slowness of production, the limited income from advertisements, and inadequate means of distribution, were all against these cheap journals, and one by one they had to raise their price or die. Not infrequently they did both. In 1868 appeared the *Echo*, the first of present-day evening papers to be issued at a halfpenny. It was published by Messrs Cassell, Petter, and Galpin, and had for its first editor, until 1875, Mr (afterwards Sir) Arthur Arnold (1833–1902), who afterwards became M.P. for Salford (1880–1886), and chairman of the London County Council (1895–96), and was well known both as a writer and traveller, and as founder of the Free Land League (1885). Baron Albert Grant (1830–1899), the pioneer of modern mammoth company-promoting,[1] afterwards took it in

---

[1] Albert Grant, who took that name though his father's was Gottheimer, was given the title of Baron by King Victor Emmanuel of Italy in 1868 for his services in connexion with the Milan picture gallery. He made a large fortune by company-promoting, and in 1865 became M.P. for Kidderminster. He became a prominent public character in London. In 1873 he built Kensington House, a vast mansion close to Kensington Palace, which in 1883 was demolished and the site seized by his creditors. In 1874 he bought up Leicester Square, converted it into a public garden, and presented it to the Metropolitan Board of Works. But soon afterwards he failed, and from 1876 to his death he constantly figured in the law-courts at the suit of his creditors.

hand and wasted a fortune over it. After passing through troublous days, it was finally put upon a sound basis and turned into a commercial success by the shrewd judgment and untiring energy of Mr Passmore Edwards. In the following year appeared at Darlington the *Northern Echo*, which claims to be the first halfpenny morning daily ever issued in any land, though it is on record that the one-cent morning journal is of older origin in the United States. Next came the *Evening News*, which was begun at a halfpenny in 1881 as a Liberal organ, but was shortly afterwards bought by a Conservative syndicate. It saw stormy times, and at the end of thirteen years it had absorbed £298,000 and was heavily in debt. Its shares could then be purchased for threepence or fourpence each. In August 1894 it was purchased by Messrs Harmsworth for £25,000, and entered upon a career of prosperity. On 17th January 1888 the first number of the *Star* appeared, under the editorship of Mr T. P. O'Connor (b. 1848), as a halfpenny evening newspaper in support of Mr Gladstone's policy. When Mr O'Connor left the paper, Mr H. W. Massingham became its editor, and subsequently Mr Ernest Parke. From the first it warmly espoused the cause of the working classes. In 1893 Mr T. P. O'Connor founded the *Sun*, which eventually passed first into the hands of Mr H. H. Marks and then into those of Mr Bottomley.

Two morning papers at the popular price of a halfpenny appeared in the spring of 1892, the *Morning* and the *Morning Leader*. They raced for priority of publication, the former winning by a day. The *Morning Leader*, under the same management as the *Star*, was still flourishing in 1902, but the *Morning* had but a brief career. The *Daily Mail*, which was originated by Mr Alfred Charles Harmsworth (b. 1865) and appeared in 1896, was the first halfpenny morning newspaper to place at the disposal of its readers a news service competing with that of any of the higher-priced newspapers. It claimed by 1902 a regular circulation of about a million copies daily (and had occasionally sold as many as 1,500,000 copies of a single issue), and it was produced simultaneously in London and Manchester, the whole of the contents being telegraphed nightly. The *Daily Express*, founded by Mr Cyril Arthur Pearson (b. 1866), first appeared in 1900, and won a large *clientèle* by its eminently readable qualities.

British provincial halfpenny papers.

The British provincial press, which had its origin in 1690, when the *Worcester Postman*—now known as *Berrow's Worcester Journal*—was started, advanced by leaps and bounds during the latter half of the 19th century (see also below). Increased facilities for the distribution of news resulted in the establishment of daily newspapers in all the principal towns, and a large proportion of them were in 1902 sold at the popular price of one halfpenny, practically all the evening journals being issued at this price. A list compiled at the commencement of 1902 gave the names of eighty-seven halfpenny daily newspapers published in English provincial towns, a considerable number of these being morning journals. Of these, sixty-two had been issued since 1870, those bearing earlier dates of origin being in most cases sheets which formerly were issued at a penny or more, but had subsequently reduced their prices. An example of this may be seen in the *Leeds Mercury*, which was issued in 1718 at three-halfpence. Owing to the imposition of the stamp tax its price gradually increased, until in 1797 it stood at sixpence, when its circulation was only 800 copies. With the removal of the tax its price was reduced and it became one of the most popular of Yorkshire penny newspapers. In 1901 its price was lowered to a halfpenny and at the same time its news service was greatly improved, with the result that its circulation grew rapidly, and it proved more profitable at a halfpenny than it had been at a penny. Of halfpenny morning newspapers existing in 1902, the first to be published at that price was, as has been stated above, the *Northern Echo*, which was issued at Darlington in 1869. It may be interesting to note that of the eighty-seven halfpenny dailies issued in England in 1902, twenty-nine claimed to be Liberal in politics, twenty-three Conservative or Unionist, and nineteen independent, while the rest did not indicate their tendency. Of the sixty-two that were issued since 1870, twenty-seven appeared between 1871 and 1882, nineteen between 1882 and 1892, and sixteen between 1892 and 1902. Scotland at the close of 1901 had eleven halfpenny dailies, three being morning papers; Ireland had seven, and Wales four.

Conditions of production.

The growth of the halfpenny newspaper has been practically a simultaneous one throughout the civilized world. This has been notably the case in the United States, France, and Great Britain. The general tendency in newspaper production, as in all other branches of industry, has been towards the lowering of prices while maintaining excellence of quality, experience having proved the advantage of large sales with a small margin of profit over a limited circulation with a higher rate of profit. The development—and indeed the possibility—of the halfpenny daily paper was due to a number of causes operating together during the latter half of the 19th century. Among these, the first place must undoubtedly be given to the cheapening of paper, through the introduction of wood pulp and the perfecting of the machinery used in the manufacture. From 1875 to 1885 paper cheapened rapidly, and it has been estimated that the introduction of wood pulp trebled the circulation of newspapers in England. Keen competition in the paper trade also did much to lower prices. At the same time the prime cost of newspaper production was increased by the introduction of improved machinery into the printing office. The growth of advertisements must also be taken into account in considering the evolution of the halfpenny journal. The income from this source alone made it possible to embark upon journalistic enterprises which would otherwise have been simply to court disaster. At the same time, a properly managed halfpenny paper should show a substantial profit, altogether apart from the income that it derives from advertisements.

Special characteristics.

The popular journal of the present day does not, however, owe its existence and success merely to questions of diminished cost and improved methods of production. Its favourable reception points to a change that has come over the public mind. The modern reader demands news rather than opinions, and he likes his news in a brief, handy form, so that he can see at a glance the main facts without the task of reading through wordy articles. This is especially the case with the man of business, who desires to master the news of the past twenty-four hours as he travels to his office in the morning. It is to economize time rather than money that the modern reader would often prefer a halfpenny paper; while the man of leisure, who likes to peruse leading articles and full descriptive accounts—often written by most able thinkers and skilled *littérateurs*—finds what he needs in the more highly priced journals. It is not, then, to the people who cannot afford a penny that the halfpenny paper makes its appeal. To say that it is read by "the man in the street" is after all not to disparage it, for it is "the man in the street" who goes to the poll and governs his country. The growth of education must also be borne in mind when endeavouring to account for the halfpenny paper. It is happily a very rare thing now to find a young man or woman who cannot read, and every person who can read wants to know the news. Even the poorest person does not hesitate much over the expenditure of a halfpenny when an interesting line on the contents-bill arrests his attention and awakens his curiosity. The halfpenny paper in England has not had to contend with the opposition that the penny newspaper met from its threepenny contemporaries in the 'fifties and 'sixties. This is largely due to the fact that in most cases the contributors, paper, printing, and general arrangement of the cheaper journal do not leave much room for criticism. Mr G. A. Sala's famous complaint that the reporters of the older sheets objected to work side by side with him when he represented the first penny morning newspaper, through fear of losing caste, does not apply, for in the United Kingdom, France, and the United States the cheap journals, owing to their vast circulation, are able to offer the best rates of remuneration, and can thus command the services of the best men in all the various departments of journalism.

Foreign Press.

Turning now to the growth of the cheap press abroad, the first French newspaper ever published may be fairly called a halfpenny one. The *Gazette de Paris* was established by Theophrastus Renaudot—the founder of the Mont de Piété, or pawnshop—in the year 1631, at the price of one parisis or six centimes. At first the *Gazette* consisted of four small pages, increased in the following year to eight and sometimes to ten. It still existed in 1902 as an organ of the Legitimist party, though its circulation was presumably very small and its price had been advanced. *Le Petit Journal* was founded in 1863, and may be regarded as the modern pioneer of the French halfpenny press. It claims to have attained on occasion a circulation of 1,012,050 copies, and dispenses almost entirely with advertisements. *Le Petit Journal* has a close rival in *Le Petit Parisien* and in *Le Journal.* The sou was in 1902 the recognized price of Parisian newspapers, of which there were about sixty, comparatively few being dearer. French journalism showed a slow but sure change, the feuilleton giving way to news. *Le Matin*, which in 1902 was in its nineteenth year, claimed that it was the only French journal receiving by special wires the latest news of the whole world, and it had an advantage in having arranged to obtain the news service of the London *Times.* In many respects it offered remarkable value for the money. Of a very different type are *L'Intransigéant*, edited by M. Henri Rochefort, and *La Libre Parole*, conducted by M. E. Drumont, both affording reading matter of the most flamboyant type at the popular price.

To enumerate all the other Parisian newspapers at five centimes would be a lengthy task, but the following are a few of the best known:—*L'Écho de Paris*, an excellent newspaper, in its nineteenth year in 1902, and *L'Éclair*, a typical news-sheet. *La Fronde*, in its sixth year in 1902, enjoyed the unique distinction of being managed, edited, and written by women only, the *directrice* being Madame Marguerite Durand. *La République* represented the progressive Republican party since 1872, and *La Petite République* had expounded the views of the Socialists since 1875. *La Lanterne* in 1902 had seen a quarter of a century, and *Le Journal*, which claimed to be the only French journal appearing every day with six pages at least, was eleven years old. It may be mentioned that six pages is a favourite size for a French halfpenny paper. *Le Radical* was in its twenty-second year, and *L'Autorité*, under the political direction of M. Paul de Cassagnac, in its seventeenth.

In *Belgium* the halfpenny paper is decidedly popular and well established. Among others may be noted *La Chronique*, which in 1902 was in its thirty-fifth year; *L'Étoile Belge* (founded 1869), an eight-page paper, one-half of which consists of advertisements; and *La Gazette*, a year younger. *Le Petit Bleu* makes free and effective use of illustrations, and in 1902 was in its ninth year. *Le Soir*, *Le National Bruxellois*, and *La Réforme*, which last is often illustrated, are sold at the remarkably low price of two centimes (one-fifth of a penny) per copy. These claim to be the cheapest journals in the world. Each is a four-page paper, well edited, and possessing a very fair news service. The first was in 1902 sixteen years old, and the last nineteen.

In *Italy* all the papers, with a very few exceptions, were in 1902 sold at five centesimi. Among others may be mentioned *La Tribuna*, which enjoys an excellent news service, and gives very complete accounts of the debates in the Italian Parliament. Published at Rome, it was in its twentieth year. *Il Secolo*, which in 1902 was thirty-seven years old, and the *Corriere della Sera*, which was twenty-seven, are both issued from Milan; while *La Stampa*, a new Piedmontese gazette, has its publishing offices at Turin. Italy has also its halfpenny illustrated press, of which a good example is seen in *Il Secolo Illustrato*, fourteen years old in 1902, which is admirably produced.

The tendency towards extreme cheapness had not yet, in 1902, influenced the *German* press to so great an extent as in some other European countries, though it is decidedly leaning in that direction. *Der Lokal-Anzeiger* was founded at Berlin by August Scherl, who had gained his journalistic experience in America, and was prepared to introduce entirely novel methods into the Fatherland. The new journal was published on Sunday mornings, and delivered free for two and a half pfennigs per copy, a sum about equal to one farthing. It was subsequently converted into a daily paper, and the price was considerably advanced. A typical German halfpenny newspaper is seen in *Das Kleine Journal*, published in Berlin at five pfennigs. It is occupied mainly with finance and trade announcements. An attempt was made at Vienna in 1902 to establish a paper, the *Neue Zeitung*, at one kreuzer (one-fifth of a penny), but it lived only two months.

In *Switzerland*, *La Tribune de Genève*, founded 1878, is published at five centimes, and is a leading paper of its class. *Spain* is represented by *El Correo*, founded 1879, which is published in Madrid at five centimos. It has an ingenious arrangement by which the inevitable feuilleton is so printed that it may be cut off and folded into book form. In *Russia* a cheap paper has not much encouragement, but the *Swet* contrives to flourish at the equivalent of a halfpenny. *Pesti Hirlap* is a *Hungarian* paper, published at Budapest. It contains twenty-four pages—of which six are advertisements—and costs eight pfennigs. Though this is more than a halfpenny, it is less than a penny, and the *Pesti Hirlap* is certainly a low-priced newspaper.

American Press.

Down to the year 1833 there were no cheap newspapers in *America*. The usual price was six cents, and no journal had a sale of over 5000 copies. On 1st January 1833 the *Morning Post* was started in New York at two cents per copy. This was quickly reduced to one cent, but the paper lived only three weeks. On the 3rd September following, the New York *Sun* was founded by Benjamin H. Day. It sold at one cent until the outbreak of the war, when the general rise in prices sent it up to two cents, where it remained. The first issue of the *Morning Herald* of New York, owned by James Gordon Bennett and Company, appeared on 6th May 1853 at the price of one cent. It consisted of four pages, measuring 30 inches by 24, with four columns to the page. Vigorous competition followed, and the rival one-cent papers adopted tactics which were as ingenious as they were novel in the newspaper world. The *Herald*, *Sun*, *Tribune*, *Times*, and *World* of New York all started at one cent. There were in 1902 an immense number of one-cent journals published in various parts of the United States, and fresh ones are continually appearing. As an example of the enterprise with which they are conducted, mention may be made of the *Journal* and *World* of New York, and the *Press* of Philadelphia. These and many others often give fourteen or sixteen big pages in return for the purchaser's cent. (A. C. H*.)

British Provincial Newspapers.

The London newspaper zone extends eastwards to Ipswich and Norwich, northwards to Leicester, and westwards to Bristol. In 1870 its northern limits were Nottingham and Birmingham. Important daily newspapers had then been established in every great centre of intellectual, industrial, and mercantile activity. The abolition of the duty on advertisements in 1853, of the stamp duty in 1855, and of the paper duty in 1861, opened the way for a cheap press, and within ten years of the abolition of the paper duty penny morning newspapers had taken up commanding positions in Edinburgh, Glasgow, Dundee, and Aberdeen; in Liverpool, Manchester, Leeds, Bradford, Newcastle, and Sheffield; in Birmingham and Nottingham; in Bristol, Cardiff, and Plymouth; and across St George's Channel in Dublin, Cork, Belfast, and Waterford. Halfpenny morning newspapers (see above) had also come into existence. In 1859 the *Dundee Courier* was started. At Exeter two old papers published twice a week—the *Daily Gazette* in 1863 and the *Western Times* in 1866—began to issue halfpenny morning editions on four days in the week. At Brighton in 1868 the *Sussex Daily News* was started as a halfpenny morning paper, but has since been advanced to a penny. Evening newspapers, too, had come into existence. The most successful were the *Manchester Evening News* and the *Glasgow Citizen*; but there were also prosperous evening papers at Birmingham, Shields, Exeter, Bolton, Bradford, Leeds, and Brighton. Practically, however, provincial newspapers at the close of the 'sixties consisted of the penny morning newspapers and the old county weeklies, with a few weekly papers of more recent creation in great towns. Since then there has been an enormous increase in the number of evening newspapers, a smaller addition to the number of both penny and halfpenny morning papers, and some increase also in the weekly press; but the great change effected in provincial journalism during the last thirty years of the 19th century is in the character rather than in the number of the newspapers produced.

So far as the increase in the number of morning newspapers is concerned, politics have been a powerful influence. Dissensions amongst Irish Nationalists led in 1891 to the establishment of the *Dublin Daily Independent* and its evening ally the *Evening Herald* as Independent Nationalist newspapers, in opposition to the *Freeman's Journal* and its evening paper the *Evening Telegraph*; and in 1897 the *Nation*, a powerful Irish weekly in the days of "Young Ireland" and while it was owned and edited by the Sullivans, was brought out as a daily newspaper. In Newcastle-on-Tyne the adhesion of the *Newcastle Chronicle* to Unionism opened the way for the *Newcastle Daily Leader* in 1885 as a Liberal paper; and this journal, with evening and weekly paper attached, is amongst the few new morning newspapers that have in recent years been begun with success. Other places in which morning penny newspapers have been successfully started, as a rule to supply a political want, are Aberdeen, York, Huddersfield, Manchester, Ipswich, Norwich, Cardiff, and Swansea. Halfpenny morning newspapers have increased in number to almost as large an extent as their penny contemporaries. At Darlington in 1871 the *Northern Echo* was started; and a few years later, when Mr W. T. Stead became its editor, the very advanced views that it advocated goaded the Conservatives of the district into the production of a rival paper, the *North Star*. Brighton was again given a halfpenny morning paper in 1896; and the close of the century was signalized by an eruption of morning halfpenny newspapers in Middlesbrough, Newcastle, Shields, and Sunderland, all the outcome of a labour dispute in the office of the *Newcastle Leader*, and all issued from Newcastle by the same publisher. A still more recent development, the ultimate results of which remain to be seen, is the creation in provincial centres of halfpenny morning newspapers in connexion with London halfpenny morning journals. This movement has been inaugurated by Messrs Harmsworth and Messrs C. Arthur Pearson and Co., who have invaded Birmingham, Liverpool, Manchester, Leeds, Newcastle, and Glasgow with halfpenny morning papers that reproduce in the provinces the leading characteristics of the *Daily Mail* and the *Daily Express*.

Except in special cases, provincial newspapers began as strictly local journals. Manchester held an exceptional position. Commercially the centre of a trade that extended over the whole of Lancashire and part of Cheshire, and politically the headquarters of advanced views on social and economic reform, the Manchester press from its earliest days regarded current events from a national point of view, and influenced opinion throughout Lancashire, Cheshire, and northwards to Carlisle. The *Leeds Mercury* from its inception was given a character of its own by its founder and first editor, Mr Edward Baines, whose family have left an impress not only upon journalism but upon literature in the north of England. For many years the *Leeds Mercury* admitted neither racing news nor notices of theatres to its columns, but it was a powerful influence both in morals and politics in the northern districts of Lancashire and Yorkshire. In Northumberland and Durham the *Newcastle Chronicle* had some influence outside its strictly local sphere. It was in Scotland, however, that localism was first thoroughly broken down. The *Scotsman*, under the managership of Mr Law and the editorship of Mr Alexander Russel, led the way. It collected news from the whole of Scotland, opened an office in London, made special arrangements for securing home and foreign news, made liberal use of the telegraphs, reviewed books, discussed general as well as local topics, supplied full parliamentary reports, and in fact realized the present ideal of a morning newspaper. On the business side, means were taken to circulate the paper all over Scotland by the early morning trains. Glasgow is a better centre than Edinburgh for distribution in the west of Scotland; a publishing office was therefore opened in Glasgow, and a special train engaged to take the *Scotsman* to it for distribution over the west of Scotland. The same policy was adopted at Perth for the north of Scotland. The *Glasgow Herald* met this action by arranging for simultaneous publication in Edinburgh, and it and the *Dundee Advertiser* were equally active in improving their news supply and perfecting their London arrangements. The Dublin and Belfast newspapers being more distinctly severed from Great Britain and from British influence than the Scottish press, naturally organized themselves on Irish lines, the Dublin becoming national and the Belfast more distinctly Ulster organs of public opinion. But London connexions were indispensable, and the leading Irish newspapers were carried along in the stream of general advance. For a time the English press rather lagged behind. Even

Manchester did not move forward so resolutely as Scotland. A remarkable result of the *Scotsman's* energetic policy and lavish expenditure, under the editorship after 1876 of Mr Charles A. Cooper (b. 1829), has been that it has killed every other morning newspaper in Edinburgh. The *Daily Review*, once the organ of the Free Church, and the *Edinburgh Courant*, the oldest Conservative newspaper in Scotland, have both disappeared. They could not stand the *Scotsman's* pace. A courageous attempt was made by the Liberal party, after the *Scotsman* became Unionist in 1886, to run the *Scottish Leader*. To compete with the *Scotsman*, with its more than princely revenue, its splendid organization for news supply, and its perfect publishing arrangements, required a very long purse. The *Scottish Leader* did not succeed. In Manchester the *Guardian* has shown enterprise on the Scottish lines. It has perfected its news supply, and promotes circulation by chartering special early trains to Crewe for Wales and the south, Leeds for the Yorkshire district, and Wigan for the north of England. The *Manchester Examiner*, once the leading Liberal paper in the north of England, did not show similar enterprise, and when it abandoned its traditional advanced Liberalism for Liberal Unionism it forfeited whatever remained of its old popularity, and died. The tendency is for one great newspaper to dominate a district, and success falls to the most enterprising and most intelligently conducted. In 1871 the *Liverpool Weekly Albion* brought out a *Daily Albion* under the editorship of Mr William Hind, whose experience in daily journalism was gained on the *Scotsman* and the *Dundee Advertiser*. The new daily was edited on the most advanced lines. It presented both local and general news, reviews of books, special articles on both general and local topics, had special London arrangements, was exceptionally strong in commercial news, and discussed general more than local affairs. It failed through defective business management; but through its three or four years of existence it had given an immense stimulus to the other Liverpool dailies; and when it was converted into an evening paper in 1874, preliminary to its decease in 1887, its disappearance chiefly benefited the *Liverpool Daily Post*, which most closely resembled it in character, and through Sir Edward Russell (b. 1834), who became editor in 1869, enjoyed political and social connexions and influence, and a reputation for cultured criticism in art, music, the drama, and literature, that placed it above its local contemporaries and in the front rank of provincial journalism.

General causes were now beginning to influence the whole provincial press. While the leading journals were content with a merely local circulation, and did not strive very vigorously to push into new and distant ground, the personality and influence of the editor was a factor of first importance. How profoundly the guiding mind of the editor might influence the public usefulness of a newspaper had been shown by Mr (afterwards Sir William) Leng, when in 1867 and 1868, at the peril of his life, he denounced in the *Sheffield Telegraph* the iniquities of "rattening" and the trade-union terrorism of the saw-grinder Broadhead. How powerful the personality of the editor still is, and ever must be, was shown by the strongly "pro-Boer" attitude maintained by the *Manchester Guardian*, under the guidance of Mr C. P. Scott, M.P., from 1899 onwards. But even in 1870 it was beginning to be universally perceived that though the influence of a newspaper depends upon the sagacity, sound judgment, and courage of the editor, its success as a business enterprise rests mainly with the business manager. Managers demanded less localism, a wider range of news, prompter and fuller reports of all important events, longer Parliamentary reports, Parliamentary sketches, verbatim reports of speeches by statesmen of the first rank. In the early 'seventies such a thing as a full telegraphic report in a provincial morning newspaper of Parliamentary proceedings, or of a speech by a leading statesman, was almost unheard of. The Press Association had been in existence a short time, but had not then covered the country with its organization. Reuter's foreign news service very briefly reported important events. Leading articles were written during the day. Between 1870 and 1880 a complete revolution was effected, as the result of social and educational changes that have already been traced. Leader-writers began to discuss the latest topics. Newspapers that had been content to fill their columns with local news and clippings from London and distant provincial papers put such matter aside. Telegraphic news crushed it out. In February 1870 the Government took over the telegraph system. The advantage of the change was immediately felt by newspapers and their readers. Leading English and Irish newspapers, following Scotland's lead, began to open offices in London. Soon Fleet Street began to be an open directory to the provincial press—English, Scottish, and Irish. The Scottish and the leading Irish newspapers of necessity, the wealthiest and most enterprising English papers for convenience and advantage, engaged special wires. Others that were near enough to London to do so secured London news and advertisements by railway, and completed their news supply by a liberal use of the telegraph. Commercial news, both home and foreign, especially American, was expanded. The Press Association spread its news-collecting organization over the whole country, and was stimulated to activity by the rising opposition of the Central News. All this energy had its counterpart in the business side of the press. Rapid "perfecting" printing machines were introduced, and newspaper managers found themselves in possession of newspapers full of the latest news, and procurable in practically unlimited quantities. By the use of special trains and other organizations, circulation increased apace. The development of news agencies, and their universal employment, tended to produce sameness in the provincial press. From this fate the more enterprising journals saved themselves by special London letters, Parliamentary sketches, and other special contributions. In 1881 the reporters' gallery in the House of Commons was opened to some provincial newspapers, and these accordingly enjoyed new facilities for special effort and distinction. A more important matter, however, was the bombardment of Alexandria and the subsequent Egyptian war. The leading provincial newspapers had already emancipated themselves from localism, and in general news and criticism had risen almost, if not quite, to the average level of the first-class London journals. Now they were to step abroad into the field of war. Singly or in syndicates, or by arrangement with London journals, the leading provincial newspapers sent out war correspondents, and were able to record the history of events as promptly and fully as the metropolitan press. The first syndicate to send out war correspondents was formed by the *Glasgow News*, the *Liverpool Daily Post*, *Manchester Courier*, *Birmingham Gazette*, and *Western Morning News*. By this combination two very able correspondents were sent to Egypt, and the new departure was attended with complete success. The Central News also sent out war correspondents to Egypt and the Sudan. During the South African war the Press Association, in conjunction with Reuter's Agency, employed correspondents, as well as the Central News. The leading provincial newspapers, however, all formed syndicates amongst themselves to secure war telegrams, and in many cases made arrangements for the simultaneous publication of the letters and telegrams of leading London journals. The result was that in these provincial journals during the early and most exciting period of the war there was a fuller and better supply of war news than in the London press. This system of securing simultaneous publication, in provincial newspapers, of special contributions to London morning newspapers was afterwards still further extended, and articles of exceptional interest that have been specially prepared for London journals may now be found on the same day in some of the leading provincial newspapers.

By the beginning of 1880 the country had fallen upon a period of low prices, and extra expenditure upon war telegrams and on an improved supply of general news was to a considerable extent balanced by the reduced cost of paper. Under the stimulus of cheapness the news-sheet was enlarged. More advertisements, more news, more varied contributions, filled up the additional space. The cost of composition increased, and, though circulation and revenue increased also, there was some danger to the margin of profit. Again invention came to the rescue. Type-setting machines had been invented even before web-printing machines came into use, but had not been turned to practical service. The experimental was now to pass into the practical stage. In the 'eighties some of the leading provincial newspapers began to use type-setting machines. In this forward step the provinces were far ahead of the London papers excepting *The Times*. The *Southport Daily News*—since dead—led the way by introducing six Hattersley machines. These instruments subsequently passed into the hands of two northern newspapers, and shortly afterwards the *Liverpool Courier* and the *Liverpool Daily Post* adopted the Hattersley machines on a large scale. The Linotype, however, was destined to supersede this invention, and now all the leading provincial journals are supplied with type-setting instruments of this pattern. The immediate results of composition by machinery were important. Fewer compositors were required, the earnings of those employed upon machines were greatly increased, and the employers' wages bill was reduced. But the public were given most of the benefit, for with the enlargement of newspapers and an increase in their number, the composing staffs soon rose to their former numbers, or even beyond them, and increased circulation had to meet the increased cost of production. Another development of newspaper enterprise was the introduction of illustrations into the daily press. So long ago as the first Egyptian war the *Liverpool Daily Post*, under the energetic management of Mr A. G. Jeans, introduced maps and diagrams to illustrate the progress of events. Some other English provincial newspapers have advanced in this direction, but not to any great extent. The displayed advertisements which are now so much in evidence, and have found their way into all English and into some Scottish newspapers, are of American origin. The leading Scottish newspapers, more conservative in their habits and stronger financially than the majority of their English contemporaries, still resist very large type and unusual display. The English newspapers, however, find whole-page and double-column and other display advertisements remunerative, and relax their general rules "for a consideration."

In the general amplification of news in morning newspapers, the enlargement of ideas on sport has been an especially remarkable feature. In 1870 sporting meant horse-racing and little more. Now it embraces athleticism in all its branches, and progressive newspapers are looked to for information on football, hockey, golf, cricket, lawn-tennis, yachting, boating, cycling, wrestling, coursing, hunting, polo, running, bowls, billiards, chess, &c., quite as much as for notices of musical and dramatic performances, and of other forms of recreation and amusement. No newspaper objects on principle to the publication of athletic news, but some have striven against the publication of betting and other gambling accompaniments of horse-racing. Amongst these the *Leeds Mercury* was the most conspicuous; but Yorkshire is a great sporting county, and though the *Yorkshire Post*, under Mr Pebody's management, catered well for all classes, the Leeds Daily News Company found it possible in 1895 to start the *Yorkshire Sporting Pink*. In Manchester so long ago as 1871 a *Sporting Chronicle* was successfully started, the proprietors of which in 1885 began also a *Sunday Chronicle*, and in 1897 an *Evening Chronicle*. Liverpool has a *Football Echo* and a *Football Express*, published on Saturdays; Sheffield a *Football World*, published on Mondays; the *Potteries Sporting News* is published daily at Hanley; the *Midland Sporting Gazette* at Nottingham; and Newcastle-on-Tyne, Bristol, and Newmarket each has a *Sporting News*.

Some provincial towns with special characteristics present journalistic opportunities of their own. Liverpool with its large shipping interest supports a *Journal of Commerce*, issued daily, which Mr Charles Birchall, its proprietor and manager, afterwards published also in Manchester. Since 1877 the *Swansea Gazette*, issued daily, has catered for the shipping trade of South Wales. Liverpool has an exceptionally large Roman Catholic population, which is provided with a weekly *Catholic Times*. Leeds, with an exceptionally large Jewish quarter, supports a weekly *Jewish Express*, established in 1894.

Neither in connexion with sport nor other matters has there been any addition to the number of newspapers in Scotland comparable to English experience, probably because the remarkable completeness of the Scottish morning papers leaves no opening for competitors. Ireland has exhibited more variety, and new journalistic adventures in Dublin speak of increased Irish prosperity. The Freeman's Journal Company in 1881 issued *Sport* as a weekly, and in 1890 added a daily *Sporting News*; in 1885 the *Irish Cyclist* appeared as a weekly, and in 1888 the *Farming World* and the *Social Review*.

Despite the many changes in provincial journalism resulting from the phenomenal energy that has been brought to bear upon morning newspapers, the most conspicuous feature in newspaper evolution during the period under review was the development of the evening newspaper. For a long time proprietors of morning newspapers held aloof. They feared that the evening paper would damage the circulation of the morning journal and give them only a halfpenny for a penny. The idea, as has been discovered by experience, was utterly fallacious, but it was strongly held. Even in Scotland, where every morning newspaper now publishes an evening paper, the proprietors of the morning newspapers were almost forced into the new enterprise. In Glasgow, under a new proprietary, the *Glasgow Evening News* was brought out in 1870, in opposition to the *Citizen*. The *Edinburgh Evening News* was started in 1873, and in Paisley an evening *Daily Express* was issued in 1874. The *Glasgow Herald* brought out its *Evening Times* in 1876. In the following year the *Dundee Advertiser* issued its *Evening Telegraph*. Two years later the *Aberdeen Journal*, and again after a two years' interval the *Aberdeen Free Press*, joined in the movement. Not till 1885 did the *Scotsman* publish an evening paper. In this matter Ireland moved more quickly than Scotland, for the *Freeman's Journal* brought out its *Evening Telegraph* in 1870. In Belfast a new proprietary was left to introduce in the same year an *Evening Telegraph*, and a few years later the *Ulster Echo* was started under independent auspices. But beyond the duplication of evening papers in Dublin through Nationalist dissensions, and the establishment of an evening paper at Waterford, little success has attended evening journalism in Ireland.

It is in England that the evening press has flourished most, though, as in Scotland, the morning newspapers were slow to move. The *Liverpool Courier* and the *Birmingham Daily Post* were first in the field, and in 1870 issued respectively the *Liverpool Evening Express* and the *Birmingham Daily Mail.* The latter paper soon became a great success, and within three or four years of its commencement had a circulation of from 50,000 to 70,000. Other morning papers that during the 'seventies brought out evening newspapers were the *Manchester Courier* and the *Leicester Post* in 1874, the *Western Daily Press* in 1877, the *Nottingham Daily Guardian* in 1878, and the *Liverpool Daily Post* in 1879. This was not striking evidence of appreciation of the value of evening newspapers, during a period in which morning papers were entirely transformed by a widened news supply, and printing power was multiplied by the introduction of web-printing machines. Nor did the Egyptian war, and cheaper paper, and type-setting machines greatly stimulate the issue of evening papers by old dailies.

Between 1880 and 1890 evening newspapers were started by the *Sussex Daily News*, the *York Herald*, the *Eastern Daily Press*, the *South Wales Daily News*, the *Nottingham Daily Express*, the *Newcastle Chronicle*, the *Western Mail*, and the *Sheffield Daily Telegraph.* Since then the *Yorkshire Post*, *Western Daily Mercury*, *Manchester Chronicle*, *Newcastle Daily Leader*, *Bristol Mercury*, and *Western Morning News* have done so. But there are still a few prominent morning newspapers that have not entered into evening journalism. Amongst these are the *Liverpool Mercury*, *Leeds Mercury*, *Sheffield Independent*, *Birmingham Daily Gazette*, and *Bristol Times*.

Comparatively few additions have been made to weekly newspapers since 1870. The most notable new weeklies have been the *Liverpool Weekly Post*, the *Birmingham Weekly Mercury* (issued from the *Birmingham Gazette* office), the *Newcastle Weekly Leader*, the *Western Weekly Mercury* (published at Plymouth), and the *Manchester Sunday Chronicle* and the late Sir W. Leng's Sunday paper, the *Sunday Telegraph.* The old county papers have held their ground, and in many county towns new weeklies have been started; but the prompt publication of news of all kinds by morning and evening newspapers and their circulation throughout the whole country have compelled weekly newspapers to modify their character and to give attractiveness to their columns by publishing serial stories, notes on gardening, agriculture, &c., notes and queries, and other special contributions.

Taking a general survey of the progress that has been made, evidence is found on every hand of remarkable energy, resourcefulness, and prosperity. The progress of education, the greater use of telegraphs, the organization of news agencies, the introduction of the telephone, and the growth of industry, commerce, and population have been the main influences that have led to a revolution in the supply of news. The improved printing machines, type-setting machines, and cheapness of paper have resulted in cheapening the production of newspapers, and have encouraged their owners to increase their size. At the same time, the multiplication and enlargement of newspapers, notwithstanding the temporary reduction of staffs through the improvement of machinery, have provided employment for a greatly increased number of compositors at higher wages, and the rapid distribution of evening newspapers has utilized the services of an immense army of men and boys and horses. The low price of paper has enabled many new journals to come into existence and prosper on a comparatively slender income. But the keenness of competition has carried expenditure upwards. It is only the great newspapers that are indisputably in the front that can feel secure of their position, and those only by a combination of prudence and enterprise and energy in management that do not always coexist. In the financial prosperity and strength of newspapers the public have a very direct interest. Wealthy and flourishing newspapers can resist with impunity all temptations to venality, and perform their functions as vigilant critics and watchful guardians of public interests with fearless independence. The provincial press has gained and maintained a high reputation for integrity of purpose and superiority to all corrupt influences. It ranges itself on the side of public morality and decency and sobriety, and upholds purity in political and social life and in the administration of both local and national affairs. (W. WE*.)

ILLUSTRATED JOURNALISM.

Illustrated journalism is the name given to that form of newspaper enterprise which treats of illustration of current news and the events of the passing hour. The great development in this direction in recent years makes it desirable to trace its origins more in detail than was attempted in the earlier volumes of this work. The earliest attempts at popular illustration of news events took the form of broadsides. One broadside dated 1587 recounted the *Valiant Exploits of Sir Francis Drake;* another dated 1607 gave an account of *A wonderful flood in Somersetshire and Norfolk.* The series of murder broadsides which lasted almost to our own time commenced in 1613 with one that gave an account of the murder of Mr William Storre, a clergyman of Market Rasen, in Lincolnshire, by Francis Cartwright. Early in the reign of Charles I. there appeared a broadside which described a fall of meteors in Berkshire. A little later—in 1683—the *Weekly News* came out with the picture of an island which was supposed to have risen from the sea on the French coast. The execution of Strafford in 1641 was made the subject of a picture pamphlet that is to be seen in the British Museum, and in 1642 the first attempt to portray the House of Commons appeared in *A Perfect Diurnall of the Passages in Parliament.* In 1643 a pamphlet was published, called *The Bloody Prince; or a Declaration of the Most Cruel Practices of Prince Rupert and the rest of the Cavaliers in fighting against God and the True Ministers of His Church.* This contains a woodcut representation of Prince Rupert on his charger, one of the first attempts at providing the public with a portrait of a contemporary celebrity.

Soon after this there appeared a journal, entitled *Mercurius Civicus*, which frequently gave illustrations, and, allowing for the *Weekly News* with its one attempt at an illustration above mentioned, must be counted the first illustrated paper. *Mercurius Civicus*, however, only gave portraits; it published Charles I. and his queen, Prince Rupert, Sir Thomas Fairfax, and all the leading men on both sides in the Civil War. Perhaps the most interesting illustration of the next four years was that contained in a tract intended to evoke sympathy for the conquered and captured king. It represented Charles in Carisbrooke Castle in 1648. There were many later attempts to depict the tragedy of Charles I.'s execution, and several woodcuts present to us also the execution of the regicides after Charles II. came to the throne. A broadside of the reign of the second Charles shows the Frost Fair on the Thames in 1683, and with a broadside describing *Great Britain's Lamentations, or the Funeral Obsequies of that most incomparable Protestant Princess*—Queen Mary, the wife of William III., in 1695—we close the illustrated journalism of the 17th century.

Curiously enough, the 18th century, so rich in journalistic enterprise and initiation so far as the printed page was concerned, did less than the previous century to illustrate news. In 1731, however, in the *Grub Street Journal*, there appeared the first illustration of the Lord Mayor's procession. In 1740 another journal, the *Daily Post*, gave an illustration of Admiral Vernon's attack on Portobello. The narrative was introduced by the editor with the information that the letter that he is printing is from a friend who witnessed the conflict between the English and the Spaniards. The writer of the letter, who must be put on record as the father of war correspondents, signed himself "William Richardson."

There were some interesting efforts to illustrate magazines about this time. In the *Gentleman's Magazine* for 1746 there was a lengthy account of the famous rising of 1745, and a map was given of the country round Carlisle, showing the route of the Scottish rebels; and in the same volume there was a portrait of the duke of Cumberland. In 1747 the *Gentleman's* gave a bird's-eye view of the city of Genoa, illustrating the account of the insurrection there, and so on year by year there were further pictures. In 1751 an obituary notice was illustrated by a portrait of a certain Edward Bright of Malden, Essex. Mr Bright died at the age of thirty, and his interest to the public was that he weighed 42½ stones. There were a number of other magazines besides the *Gentleman's* that came out about this time and continued well into the next century. In the *Thespian Magazine* for 1793, for example, there is an illustration of a new theatre at Birmingham. Then there were the *English Magazine*, the *Macaroni Magazine*, the *Monstrous Magazine*. Every one of these contained illustrations on copper, more or less topical.

William Clement, the proprietor of the *Observer*, the first number of which was published in 1791, was the first real pioneer of illustrated journalism, although his ideals fell short in this particular, that he was never prepared to face the illustration of news systematically; he only attempted to illustrate events when there was a great crisis in public affairs. In 1818 Abraham Thornton, who was tried for murder, appealed to the wager of battle, which after long arguments before judges was proved to be still in accordance with statute law, and he escaped hanging in consequence. Thornton's portrait appeared in the *Observer*. Clement owned for some time *Bell's Life* and the *Morning Chronicle*. All his journals contained occasional topical illustrations. The *Observer's* illustration of the house where the Cato Street conspirators met is really sufficiently elaborate for a journal of to-day, and in 1820 it gave its readers "A Faithful Reproduction of the Interior of the House of Lords as prepared for the Trial of Her Most Gracious Majesty Queen Caroline." In 1821 it published an interior of the House of Commons with the members in their places. The *Observer* of 22nd July 1821—the Coronation number—contained four engravings. Of the George IV. Coronation number Mr Clement sold 60,000 copies, but even that was nothing to the popularity that this journal secured by its illustrations of the once famous murder of Mr Weare and the trial of the murderer Thurtell. The *Observer* in 1838 gave a picture of the Coronation of Queen Victoria. In 1841 there was a fire at the Tower of London, when the armoury was destroyed. The *Observer* published three illustrations of the fire; it further published an emblematic engraving on the birth of the prince of Wales, and issued a large page engraving of the christening ceremony in the following January. Thus it had in it all the elements of pictorial journalism as we know it to-day.

The *Illustrated London News* was, however, the first illustrated newspaper by virtue of its regularity. It was the first illustrated paper, because all the illustrations to which we have referred as appearing in the *Observer* and other publications were irregular. They came at intervals; they were quite subordinate to the letterpress of the paper; they were given only occasionally in times of excitement, with a view to promoting some little extra sale. That they did not really achieve the result hoped for to any great extent may be gauged by the fact that from 1842 to 1847 the *Observer* published scarcely any illustrations at all, and in the meantime the *Illustrated London News* had taken an assured place as a journal devoted mainly to the illustration of news week by week. That is why its first publication marked an epoch in journalism. The casual illustration of other journals still went on: the *Weekly Chronicle*, for example, still published a number of pictures; the *Sunday Times*, also a very old paper, illustrated in these early days many topical subjects. In 1834, indeed, it pictured the ruins of the House of Commons, when that building was burned down. A paper started in 1837 called the *Magnet* gave illustrations, one of them of the removal from St Helena and delivery of the remains of the Emperor Napoleon to the prince de Joinville in 1840.

The first number of the *Illustrated London News* appeared on 14th May 1842. Its founder was Herbert Ingram (1811–1860), who was born in Boston, Lincolnshire, and started life amid the most humble surroundings, what education he ever received having been secured at the free school of his native town. Apprenticed at fourteen to a printer in Hull, he later settled in Nottingham as a printer and newsagent in a small way. It was during his career as a newsvendor at Nottingham that he was seized with the belief that it was possible to produce a paper entirely devoted to illustration of news. In the first number of the *Illustrated London News*, however, there was not a single picture that was drawn from actual sight, the factor which is the most essential element of the illustrated journalism of to-day. Sir John Gilbert (1817–1897), the artist, has stated that not one of the events depicted by him—a State ball at which the Queen and the Prince Consort appeared, the Queen with the young prince of Wales in her arms, and other incidental illustrations—was taken from life.

The *Illustrated London News* had not been long in existence before there were many imitators, in America *Harper's Weekly*, in France *L'Illustration*, and in Germany *Über Land und Meer*, and from that day there has been constant development, although in 1902 in the United Kingdom only three other newspapers existed on lines akin to the *Illustrated London News*, namely the *Graphic*, *Black and White*, and the *Sphere*. Development has taken place, however, in many directions. The photograph has in some measure dethroned the artist; colour-printing has been taken up vigorously, more particularly in France; wood-engraving has given way to mechanical processes that are much more expeditious; daily journalism has largely taken up with illustration, and the *Daily Graphic* has systematically illustrated news. Recent illustrated journalism has also expressed itself in a division of subject. Women's interests are catered for in the *Queen*, the *Gentlewoman*, and many similar journals, the interests of the stage in the *Sketch* and the *Tatler*, while all kinds of interests—golf, motoring, field-sports, for example—have each a separate illustrated organ. Further developments of illustrated journalism will probably be in the direction of more complex machinery and quicker production.

(C. K. S.)

THE UNITED STATES.

The changes in the newspaper press of the United States in the last fifteen years of the 19th century were little short of revolutionary. It was noted in the ninth edition of the *Encyclopædia Britannica* that "only one daily illustrated paper is published in America." Now it would be easier to enumerate those not illustrated. It was noted then that most of the new papers were of the four-page class, springing from a reaction against large sheets; that they "aimed at great condensation of routine news," but with "special prominence for sensations," and were coming to be sold for two cents. Now the papers are far larger than ever before, extending in the great cities not infrequently, on special occasions or on Sundays, to sixty pages, and from that to 100, and often ranging from twelve to twenty-four for ordinary week-day issues. Routine news is no longer so rigidly condensed, and far more of it is collected, while sensational news is apt to be expanded beyond all precedent. There has been a great increase in the number of large one-cent papers and in their circulation, while simultaneously different reading habits have appeared among the people, and there has been a distinct diminution in the authority of the press. Several circumstances have combined to promote such changes in the condition and character of American newspapers:—(1) Paper has been enormously cheapened. Before and during the Civil War it cost large New York newspapers at times 22 cents per ℔ for even a poor quality. In 1864 it cost 16 cents in February, and ran up a cent every month till in midsummer it touched 21 and 22 cents. As late as 1873 it was still sold at from 12 to 13 cents. As new materials were found and machinery was improved, the price slowly declined. When the manufacture from wood-pulp was made commercially successful, the profits tempted great investments of new capital; bigger mills were built, competition became keen, and new inventions cheapened the various processes. Thus in New York in 1875 the average price for the year for fair "news" paper was 8·53 cents per ℔; in 1880, 6·92; in 1885, 5·16; and in 1890, 3·38. At last, about 1897, large contracts for a good average quality, delivered at the press-room, were made in New York at as low a figure as 1·5 cents per ℔. Since then advances in raw materials, one or two dry seasons which curtailed the water-power, and combinations resulting from over-competition, have caused some reaction. Yet it could still be said in 1900 that prudent publishers could buy for $1 as much paper as would have cost them $3 twenty years earlier, or $10 about 1875. (2) Printing machinery for great newspaper offices has been transformed. Instead of the old cylinder presses fed by hand, with the product then folded and counted by hand, machines now in common use print, fold, cut, paste, and count and deliver in bundles, ready either for the carrier or the mail, at rates of speed formerly not dreamed of. The size of the paper may be increased or diminished at will, as late news may require, within an hour of the time when it must be in the hands of its readers. Instead of cutting down other news to make room for something late and important, more pages are added, and this steadily increases the tendency to larger papers. Devices have also been found for printing the same sheet in different colours at the same rate of speed; and in this way startling headlines are made more startling in red ink, or a piece of news for which special attention is desired is made so glaring that no one can help seeing it. (3) Hand-setting (for great newspapers) has been practically abolished. Instead of the slow gathering of single types by hand which prevailed since Gutenberg's invention, separate lines are now produced and cast by machines, capable when pushed to their utmost capacity of doing each the work of five average compositors. Various circumstances generally prevent anything like this speed in ordinary use; but in spite of opposition these machines now reduce the cost of composition in well-organized offices at least to one-half the former figure, while helping to advance wages.

Thus between 1880 and 1900 there were reductions in the cost—(1) of the raw material for the manufacture of newspapers from two-thirds to three-fourths; (2) of printing, at least as much; and (3) of composition one-half, while the facilities in each department for a greater product within a given time were enormously increased. The obvious business tendency of these changes was either a reduction in price or an increase of size, or both.

Electricity became the only news-carrier. New ocean cables broke down the high rates charged at the outset. The American news appetite, growing by what it fed on, soon demanded far fuller cablegrams of European news; and the wars in which Great Britain and the United States were involved accelerated the movement. The establishment of a strong telegraph company, capable of efficient competition with the one which practically controlled the inland service in 1880, likewise cheapened domestic news by telegraph and increased its volume. The companies presently recognized their interest in encouraging rival news associations, and so getting double work for the wires, while promoting the establishment of new papers. Wild competition between news agencies was thus encouraged (even in the cases of some already known to be bankrupt) to the extent of credits of a quarter or half a million dollars on telegraphic tolls. The rapid spread of long-distance telephone lines further contributed to this tendency to make the whole continent a whispering gallery for the press. Every great paper now has both telegraph and telephone wires run directly into its newsroom.

Photography and etching were added to the office equipment. Various "process" methods were found, by which the popular desire for a picture to make the news clearer could be gratified. Drawings were reproduced successfully in stereotype plates for the fastest rotary presses. The field of political caricature had heretofore belonged exclusively to the weekly papers, but the great dailies now seized upon it, and commanded the service of the cleverest caricaturists. Newspapers found a way to put the "half-tone" etching of a photograph, such as had heretofore been printed only on slow flat presses, bodily into the stereotype plate for the great quadruple and octuple presses; and thereafter portraits and photographs of important groups on notable occasions began to appear, embodied in the text describing the occurrences, a few hours after the camera had been turned on them, in papers printed at the rate of thirty and forty thousand an hour.

News agencies multiplied and gave cheaper service. The New York Associated Press had been the chief agency for the whole country. It admitted new customers with great caution, and its refusal to admit was almost prohibitory, while its withdrawal of news from established papers was practically fatal. It was owned by the leading New York journals. Their disagreements led to the success of a rival, the United Press. The New York Associated Press finally dissolved, most of the New York members became connected with the United Press, and many of their Western and Southern clients organized the Associated Press of Illinois, more nearly on a mutual plan. The United Press finally failed, and most of its New York members went into the Associated Press of Illinois, which in turn was forced into plans for reorganization by decisions of Illinois courts against its rules for confining its services to its own members. One result of these successive changes has been to encourage new papers by making it easy for them to secure a comprehensive news service, and thus to threaten the value of the old papers. Another has been the struggle to increase the volume of the service, leading to reports of multitudes of occurrences formerly left without notice in the great news centres, an extension of agencies into the remotest hamlets, and less scrupulous care in the consideration and preparation of the reports filed at many points for transmission. News syndicates for special purposes also developed, as well as small news associations, sometimes with a service sufficient for the wants of many papers. The species of almost official authenticity which the public formerly attached to an Associated Press despatch is measurably dissipated; and the dailies have at once more difficulty in sifting and deciding upon the news that comes to them, and more individual responsibility for what they print.

The great accumulation of private fortunes has also changed the newspapers. Millionaires have occasionally come to think it advantageous to own newspapers, openly or secretly, which can be conducted without reference to direct profits, for the sake primarily of political, social, or business considerations. To secure large circulations for such enterprises they have been willing to sell the paper for long periods at much below the cost of manufacture, and to spend money for news and writers more lavishly than the legitimate business of established journals would allow. Great business corporations seeking for favourable or fearing adverse legislation sometimes make secret newspaper investments for the same purpose. Ambitious politicians, men who want newspaper favour to get into politics, or speculators who want it for private schemes, men with suddenly increased incomes who can readily spare a few thousand dollars to promote some end without much certainty of direct return on the investment, are often found ready subscribers for the scheme of any plausible young person with some newspaper experience to start a new paper or buy up and revolutionize an old one, and are not much deterred by occasionally seeing newspaper capital thus raised disappear entirely in a receivership or a bankruptcy.

These various new conditions, affecting the newspaper press of the United States with ever-increasing force since 1885, are changing the average character of the papers and their effect upon their readers. A craze for great circulation obtains—circulation among intelligent and moral classes, if convenient, but at any rate a great circulation, no matter among what classes—as the only evidence of success and the only way to make the sale of a newspaper below cost ultimately a source of profit. A disposition to lower the character in order to catch the largest audience naturally follows. Criminal news is reported more fully than formerly, with more piquant details. Competitors outdo each other in the effort to treat all news with unprecedented sensationalism. The lowest possible price is regarded as essential to the largest possible circulation, and so a favourite price even for large newspapers is one cent to the public, and consequently only half a cent to the publishers, whose business is practically all at wholesale with dealers and news companies. The feeling that the most must be given for the money prompts also the great increase in size, only made possible by the reductions in paper, composition, presswork, &c., already noted. Yet mere quantity and mere sensation after a time palled on the jaded appetite, and the spice of intense personality became necessary. As most people like to see their names in print, and can bear criticism of their neighbours with composure, these two chords of human nature were played upon incessantly. The appetite thus created soon craved yet greater supplies, so that the average American publisher is now right when he pleads that in practically taking the roof off the house of everybody of any note, and filling his paper with inane "social" or other mention of people of no note, he does not even yet satisfy the interest in personalities which possesses large classes of the community.

The habits of readers have also undergone great changes. In the villages and smaller towns few took more than one daily paper a generation ago, and many were content with weeklies. Even in large cities the average well-to-do householder was apt to be satisfied with one daily, or at the most one morning and one evening paper. Now few content themselves with less than one of each at the home, and another (preferably of different politics) on the street car or at the office. Orders from prosperous New Yorkers to serve six or seven dailies are so common as to attract no notice; even the children and the servants have their favourite journals provided. It would not be exact to say that the influence of the press at large has declined in proportion as its circulation has increased and people have acquired the habit of reading both sides. When the papers show reasonable agreement on any new question, they still carry the community with them almost unanimously. The most corrupt and most powerful combination cannot long stand, even yet, against a united press. But when papers differ on any great question, people give less serious thought to what any of them say, and often less to the question itself. In the multitude of contradictory voices one neutralizes another, and the reader thinks of something else. Meanwhile the influence of the press, as measured by the outward appearance of actual subservience to it, has been enhanced, though this is accompanied by a latent distrust, which is becoming general, and by a dislike, often more openly expressed than formerly. The libel laws, unhappily, are resorted to less by people who have character to protect than by those who are tempted by lawyers to speculate on inadvertent errors. The possibility of repressive measures, social or legal, for false news and unwarranted personality is sometimes discussed, but not often seriously approached. It would not be just to omit saying that, while these changes have been increasingly manifest in American newspapers, there has been marked improvement in other directions. Though their flippancy

world with their correspondents; cultivate the fields of art, literature, and science; and present accounts of discoveries, letters of adventure, details of political, business, educational, reformatory, charitable, and religious movements, especially in the Sunday issues, in a profusion, variety, and popular attractiveness never before approached. There has been an extraordinary increase in the attention given to the interests of women, and also in the space surrendered, even in the soberest of journals, to sport. All kinds of special interests find constant and copious notice: cycling, chess, bridge, motoring, spelling reform, amateur photography, &c. In fact, the great American daily has become a good deal like the great "department store"—a sort of universal provider.

In 1880 the number of newspapers and periodicals printed in foreign languages in the United States was 799, and in 1900, 1032. Newspapers and periodicals were printed in the United States in fifteen different languages in 1880, in thirty in 1890, and in twenty-five in 1900. In 1900 the newspapers and periodicals reported 122,183 employés receiving $77,348,842 in wages. The total cost of material used in publication of newspapers and periodicals was reported at $50,214,904. The amounts received from advertising and subscriptions and sales were reported at $175,789,610, of which the advertising was a larger part than the subscriptions and sales.

The statistics of circulation, capital invested, profit, and the like are notoriously untrustworthy. The Government adhered to its effort to collect them in 1890, and such results of that census as seem valuable are given together with those of the census of 1900. In spite of the universal newspaper-reading habit in America, none of its papers yet attains regularly the vast circulations attributed to two or three papers in London and Paris. The reasons are obvious. Each of these is a national capital, situated in the midst of a dense population of between thirty and forty millions, of whom from one-half to three-fourths can be readily reached by the London or Paris paper during daylight on the day of publication. In the greatest American cities the population to be reached within the same time is smaller; the papers lack the authority of the capital, and are often met, two or three hours after issue, by the papers from other large cities with the same general news service. Thus a New York paper meets the papers of Philadelphia in an hour and a half, and those of Boston in two and a half, while Chicago and St Louis eat into each other's field in the same way. But it is probably true that two or three morning and evening papers in New York pass ordinarily above 200,000 and at times above 300,000 with the combined circulation of their two editions; and that the best of the high-priced papers range from 20,000 to 80,000. It is not believed that in the case of the larger morning papers the publication at one cent has proved generally and permanently profitable. Those in Chicago, after trying it for several years, finally agreed among themselves and doubled the price. One-cent evening newspapers are produced more cheaply and fare better.

The total number of newspapers and periodicals published in the United States in 1900 was, according to the census returns, 21,272. Of these, however, 3046, or 14 per cent., made no report to the Census Bureau, and as these were the least important, they have been omitted from the tables given (I. to IV.). (W. R.)

FRANCE.

The number of newspapers, as distinguished from periodicals, published in France during 1900 was in round numbers 2400. Of these, about 240 appeared in Paris and 2160 in 540 provincial towns. The increase in the Paris newspapers from 160 in 1890 to 240 in 1900 may be taken to fairly represent the general increase throughout the country for the same period; and as there were about 120 in 1880, it appears that the newspapers of Paris, and similarly of France, have doubled their number between 1880 and 1900.

Of the 146 dailies published in 1900, 81 were political. But in order to have an accurate idea of the balance of parties as represented by the Parisian political press, to the 81 dailies must be added 83 periodicals, and it is then found that, of the 146 political organs, 68 are Moderate Republican, 30 Radical and Socialist, 16 Conservative, 8 Nationalist or anti-Semitic, and 42 independent or nondescript. In the provinces the proportion of Radical to Moderate papers is smaller by one-half, for whereas the numbers in Paris are respectively 30 and 68, in the provinces they stand in the proportion of 223 to 880.

Journalism in France.

In the following table is shown the proportion of dailies to weeklies in Paris and four of the largest provincial towns:—

	1890. Population.	Dailies.	Weeklies, &c.	1900. Population.	Dailies.	Weeklies, &c.
Paris	2,250,000	92	68	2,500,000	146	94
Bordeaux	221,000	6	4	257,000	6	8
Lyons	377,000	7	4	466,000	10	5
Marseilles	360,000	5	3	442,000	7	7
Toulouse	140,000	4	1	150,000	5	2

The history of the French press during the last twenty years of the 19th century follows very closely that of the country itself, Boulangist and anti-Boulangist, Dreyfusist or anti-Dreyfusist, Republican or Nationalist; finally it became either Moderate Republican or Radical-Socialist with a sprinkling of Nationalist organs and a small minority of Royalist and Bonapartist sheets.

At the head of the Moderate Republican organs are *Le Temps* and *Le Journal des Débats* among the evening papers, and *Le Figaro*, *Le Journal*, *Le Siècle*, *Le Petit Parisien*, and *Le Petit Journal* among the morning dailies. *Le Temps* and *Le Journal des Débats* have been edited respectively by M. Adrien Hébrard and M. E. de Nalèche. *Le Figaro* was until 1901 under the editorship of M. F. de Rodays, and the brilliant articles of M. J. Cornély were one of the features of the paper; but a dispute among the proprietors in 1901 resulted in the dismissal of M. Cornély and the retirement of M. de Rodays. M. Jean Dupuy (a member of the Waldeck-Rousseau Government) is the proprietor and editor of *Le Petit Parisien*, a popular organ rivalling *Le Petit Journal*; the circulation of the latter, however, has now reached over one million and a quarter copies daily.

Le Matin and *L'Éclair*, among the Moderate Republican organs, give less attention to the discussion of political questions from the party point of view than to the collection of news, and they have been followed by the *Écho de Paris*. *Le Matin*, which dates from 1884, has from its origin been essentially what is called in France a *journal d'informations*, and publishes every morning a mass of telegraphic news from all countries. By an arrangement with the London *Times*, it is in a position to give every day a translation of most of the telegrams published in the latter newspaper. But *Le Matin* contains also very able articles on current topics signed by M. Harduin and

M. Henri des Houx and a number of distinguished contributors.

In April 1901 the proprietorship of *Le Siècle* was changed, in consequence of the lack of support given by Parisian readers to that journal as edited by M. Yves Guyot (formerly Minister of Public Works). The latter was a staunch free-trader, a courageous defender of Captain Dreyfus, and an eloquent advocate of a good understanding between France and England; he emphatically endorsed the British policy in South Africa, and tried to explain it to his countrymen. The paper was, however, bought in by a number of friends of M. Yves Guyot, who remained as editor.

The greatest opponent of M. Yves Guyot from the economic point of view has been M. Jules Méline, also a former minister, whose paper, *La République*, is the recognized organ of Protectionism.

The Radical and Socialist ideas which in latter years have made such progress in France are very ably advocated by several newspapers whose influence has been steadily growing. Such are *L'Aurore*, edited by M. Vaughan, *La Lanterne*, to which have contributed, besides M. Viviani, who is the editor, men like M. Millerand and M. Baudin (both members of the Waldeck-Rousseau Cabinet), M. Camille Pelletan and M. Rouanet.

It is difficult to assign a proper place to *L'Intransigéant*, which really belongs neither to a well-defined party nor even to a group. It may be said to be simply the organ of M. Henri Rochefort, whose personal influence over a large number of readers is still great. Equally difficult is it to speak of M. Clémenceau's organ, *Le Bloc*, as a newspaper, and yet on account of the writer's ability and political influence, *Le Bloc*, which belongs to that class of one-man political periodical sheets of which M. Rochefort's *La Lanterne* is the best-known type, cannot be ignored. In this periodical M. Clémenceau advocates the practical application of all of the revolutionary republican principles, pure and unadulterated, which form a whole (*bloc*), no part of which can or ought to be sacrificed to temporary political necessities.

As an intermediate link between the Republican organs of all shades and the various Monarchist newspapers, comes the so-called Nationalist press, an offshoot of or successor to the Boulangist press of the preceding decade. As were the Boulangists, so are the Nationalists, a sort of *syndicat des mécontents*. Their chief organs are *La Patrie*, edited by M. Millevoye, and *La Cocarde*, and these papers represent the views of those who have vague hankerings after a different *régime* and a decided hostility towards the republican form of government.

There has been a considerable diminution of influence in the Monarchist press. *Le Soleil*, however, has a large circle of readers among the Conservative *bourgeoisie* with Orleanist leanings, and still keeps up the tradition left to it by the late M. Édouard Hervé. *Le Gaulois* remains a Royalist paper of somewhat doubtful tendencies, since the editor, M. Arthur Meyer, seems to have incurred the displeasure of the Pretender whose cause he defended. Of the old Legitimist press there remains the old *Gazette de France*, which was founded in 1631 and has still a diminishing band of faithful readers whose fidelity to their principles compels respect.

It is impossible to close this rapid review of the existing French newspapers without mentioning the organ of the religious (Roman Catholic) associations in France, namely, *La Croix*, founded in 1880. The name of the editor (now M. Feron-Vrau) matters little; what is important is the fact that *La Croix* represents the views of the French religious associations, and discusses all questions from the point of view of Catholic interests. *La Croix* is published in Paris, but there are in the provinces one hundred and four local weekly supplements to the Paris edition, each one taking its name from the parent journal and adding to it the name of the department or locality in which it is printed, such as *La Croix de l'Allier*, *La Croix de Lyon*. The circulation of *La Croix* is supposed to be about 200,000 copies daily. It is needless to add that the tendencies of this journal are anti-Republican.

To whatever parties the French papers belong, most of them have in recent years taken greater interest in foreign matters, and have much improved their organization for collecting news. Some of them, in fact, were almost exclusively news-sheets as distinguished from ordinary newspapers, and the *journal d'informations*—*Le Matin* or *L'Éclair*, for instance—took its place beside the *journal* properly so called more perhaps as a rival than as a complement. The natural result followed, and the ordinary newspapers took steps to provide their readers with news as well as with leading articles, current and literary topics, society gossip, dramatic criticism, and law reports. The most remarkable as well as perhaps the earliest attempt to enlarge the scope of Parisian newspapers was made in 1893 by the late M. Georges Patinot, one of the ablest French editors, who was editing the *Journal des Débats*. Instead of one edition, that newspaper published two entirely distinct editions, a morning one and an evening one. After some time the plucky attempt had to be given up, and the *Journal des Débats* became an evening paper. Before that an interesting event had taken place in 1889, when that renowned organ celebrated its hundredth anniversary by the publication of a most valuable record of its distinguished career in the shape of a splendid volume, *Le Livre du Centenaire du Journal des Débats*. The bold experiment made by the *Journal des Débats* led the other newspapers to find a happy mean between a four-page paper published twice a day and an eight-page paper on the pattern of English newspapers, and the result was that now most great daily papers in Paris have six pages: the *Figaro* gave the lead, and the others followed suit.

Another fact to be noted is that as French newspapers increased in size they reduced their price, and the time is fast approaching when all daily political papers will be sold at 5 centimes ($\frac{1}{2}$d.). Already most six-page newspapers, with the exception of *Le Figaro*, are sold at 5 centimes, and the price of 15 centimes, which used to be the rule, is now the exception. At the present time 60 Paris papers (daily and weekly) are sold at 5 centimes, and 51 at 10 centimes, whilst only 11 cost 15 centimes. In 1880 only 23 were 5-centime papers and 24 were 10-centime papers.

At one time the American style of journalism was in vogue in Paris, and "interviews" were frequent; they are much more scarce now, and the general tendency of Parisian editors is towards the English rather than the American or sensational methods of journalism. Most of the important Parisian newspapers now have special correspondents in the great capitals of Europe, London, Berlin, St Petersburg, Vienna, and Rome, and print every day telegraphic reports from their representatives; and if they do not make use of the telegraph to the same extent as their English and American *confrères*, at least their use of it has become regular and of everyday occurrence. This in itself is a great and remarkable change, and nothing perhaps has been so striking since 1890 as the demand of the French public for foreign and colonial news, or the readiness of the papers to supply it by means of special representatives who make them independent of the news agencies.

In home matters the French press has made greater progress still in the rapid and accurate collection of news, and in this respect the provincial press has shown more enterprise and more ability than that of Paris. Its development has been remarkable, for whereas in 1880 the inhabitants of the departments had to await the arrival of the Parisian papers for their news, they now have the advantage of being supplied every morning with local newspapers inferior to none of the best organs of Paris. The provincial press is extremely well-informed, its news is accurate, and its leading articles are well thought out and well written. Among the best provincial papers may be mentioned *La Gironde* and *La Petite Gironde* of Bordeaux, *La Dépêche* of Toulouse (215,000), *Le Lyon Républicain*, *L'Écho du Nord* of Lille, *Le Journal de Rouen*, all of which have a staff in Paris engaged in collecting news, reporting parliamentary proceedings and law cases, the whole of which is telegraphed or telephoned during the night and published early the next morning in their respective localities. Although, in addition to their regular contributors, these papers frequently engage leading Parisian journalists or literary men to give them special articles, they are nevertheless perfectly independent of purely Parisian opinion or even bias, and the decentralization of the French provincial press may be said to be complete.

The influence of the press of the departments is great, for the newspapers of the large towns circulate not only in the city in which they are printed but throughout the region of which it is the centre. Thus the *Dépêche* of Toulouse, with its twelve editions daily, is read in the whole of the departments extending from the Lot to the Pyrenees, whilst the *Petite Gironde* is found in all south-western France.

It may be said here, however, that in the provinces, as in Paris, there prevails an idea that the press is becoming too powerful, and there is a growing feeling against its omnipotence, as M. Avenel says in his book on the French press.[1] The power of the newspaper in France differs from that of the English newspaper, in that it seems to act more on the Government and the Parliament than on public opinion; and it is needless to insist on the danger of such a state of things, which gives undue power and prominence to individuals and groups of individuals, and may enable them to prevail against a real current of opinion. It is against this system that there exists the feeling to which M. Avenel refers. The French newspapers have taken upon themselves, in many cases, functions which belong more properly to the legislative or to the judicial power than to the press, and the result has not always been successful. The cause of this is that too many men of talent with political ambition look upon journalism as "leading to everything, provided one gets out of it," and use it alternately as an antechamber of Parliament or of the Cabinet, and a lounge during their parliamentary or ministerial eclipses. The remedy will be found ultimately in making the press in France what it once was—a profession which men will be proud to enter, and in which it will be their ambition to remain and to make their mark.

Since 1880 the French press has undergone marked changes which can be summed up in a few words. It has become less exclusive, and has given greater and more intelligent, if at times prejudiced, attention to what goes on beyond the frontiers of France; it has developed its organization for the collection of information, and, without in any way renouncing its literary traditions, it has given to political and current topics of general interest, and to "news" properly so called, a more conspicuous and important place in its columns than before. As a consequence it has been found necessary to increase the size of newspapers and to reduce their price. All these changes are in the right direction, and will probably lead to more important ones in the near future, the tendencies of the French press being now more progressive than at any time during the 19th century. (P. V*.)

[1] *La Presse française au vingtième siècle*, par Henri Avenel. Paris, 1901.

Germany.

In their main characteristics German newspapers are similar to those of Great Britain, but do not approach them in vastness of circulation. There are 3278 newspapers altogether in the empire. Berlin in 1890, with a population of 1,300,000, had 18 dailies and 36 weeklies, &c., while in 1900, with 1,660,000 inhabitants, it was credited with 45 dailies and 48 weeklies, &c. Among its leading papers are the *Vossische Zeitung*, which still retains its position and character; the *National Zeitung*, the organ of the Liberal party; the *Deutsche Allgemeine Zeitung*, the official organ, chiefly inspired by the Foreign Office; the *Berliner Tageblatt*, progressist; and *Germania*, the organ of the Catholic centre.

For the provinces the following table will show the movement during the last decade of the 19th century:—

	1890.			1900.		
	Population.	Dailies.	Weeklies, &c.	Population.	Dailies.	Weeklies, &c.
Leipzig .	170,000	3	10	220,000	8	9
Munich .	200,000	9	4	292,000	12	11
Hamburg .	470,000	6	4	519,000	11	11
Stuttgart .	126,000	3	8	126,000	8	10
Strasburg .	110,000	3	12	124,000	6	6

At the beginning of the 20th century the position and influence of the German press may be described as passing through a period of change. There can be no doubt that the Germans have become a newspaper-reading people. Indeed, with the remarkable growth of the commercial spirit in Germany there has simultaneously been a change in the intellectual attitude and habits of the mass of the nation. The German of what is commonly called "the great period" of recent German history, which had its high-water marks in the years 1866 and 1870, derived his knowledge of his own and other countries to a very great extent from the more or less intelligent study of books, pamphlets, and magazines. The busy German of the opening years of the 20th century is almost as much the slave of his newspaper as the average American. He takes the information which it daily places before him as authoritative, not because he has any general faith in the accuracy of German journalism, but because he has no time to investigate the truth of what he reads. In the domains both of home and of foreign politics the result is often a chaos of crude opinions and impulses, the strata of which are only differentiated by certain permanent tendencies of German political thought based upon tradition, class feeling, material interests, or distinctions of religious creed. In these circumstances it is still possible for the Government, as in the days of Prince Bismarck and Dr Moritz Busch, to bring its superior knowledge to bear upon the anarchy of public sentiment through the medium of the inspired press. It is true that this operation must now be performed with greater delicacy and skill. The press has begun to feel its power, though it is still to some extent incapable of wielding it. It is at least able to drive a bargain with those who would officially control it, and it is conscious in its relations with the authorities that the advantage is no longer exclusively on the side of the latter. It would be instructive to compare, with the aid of Dr Busch's "Secret Pages" of the history of Prince Bismarck, the methods by which the first Chancellor used to create and control a movement of public opinion with the devices by which, for instance, count von

Bülow and his subordinates have endeavoured to manage the press of a later day. The journalists who placed themselves at the disposal of Prince Bismarck were mostly treated as his menials; as he himself said, "Decent people do not write for me." Count von Bülow's methods, and to a certain extent those of his predecessor, Prince Hohenlohe, might be said to move on somewhat different lines. These methods might be characterized as the psychological treatment of the individual journalist, the endeavour to appeal to his personal vanity or to his legitimate ambition, and only in a minor degree to his fear of the *dossier*, the public prosecutor, and the official boycott. There has also been a further development of Prince Bismarck's system of acknowledging the existence of political and social movements the origin of which is wholly or partially independent. As in Bismarck's time, the tendencies of these movements are carefully observed, and they are turned to account where they seem capable of subserving the main objects of State policy. Thus the pro-Boer and agrarian movements were both employed in support of German foreign and colonial policy, and of an elaborate scheme of naval construction; while the growth of the commercial spirit on the one hand and the awakening of the lower middle classes on the other have been pressed into the service of *Welt-politik* and of its auxiliary—a system of protective tariffs. It must have required no small skill to bring into line and to hold together the various classes and interests which are from time to time arrayed in the press in support of German foreign policy. The organs of the Government in the press are the sheep-dogs which hold the flock together.

The German journals of which English newspapers hear most belong with few exceptions to the daily press of Berlin. There are, however, one or two provincial or non-Prussian newspapers which from time to time enjoy more careful inspiration from the Government offices than any of their Berlin contemporaries. There is, for example, the *Cologne Gazette* (*Kölnische Zeitung*), of which Prince Bismarck once said that it was "worth an army corps on the Rhine." It is difficult to trace all the channels by which information is conveyed to an organ of this kind, but there have undoubtedly been times when leading articles and *entre-filets* in the Rhenish organ were virtually or actually written in the German Foreign Office. It does not by any means follow that, because an article or a semi-official announcement is inspired or dictated from official quarters, it precisely represents the views of the Government or the facts of the situation. It is often in the interest of German policy that a hypothetical case should be stated or an alternative course of action suggested, in order that public opinion and even the governments of the different German states should be prepared for all eventualities, or should be influenced in favour of the ultimate decisions of the central authority by being led to contrast them with other possible courses of action. Indeed, the methods of the institution which has been called the "Press Bureau," but which in the realm of foreign policy at least represents no concrete organization, are so numerous and varied that it is hopeless for any one except the most practised observer to trace their manifestations. The advantage of a semi-official press, if it could be manipulated with unvarying success, is that it can easily be disavowed when the suggestions, overtures, or menaces of which it has been the exponent have served their turn or have become inexpedient. Thus during the blockade of Manila the *Cologne Gazette* gave all the prominence of its first column and of leaded type to an article taken from the *Marine Politische Korrespondenz*, which practically warned the United States of the intention of Germany to have a share in the Pacific possessions of Spain if these should eventually change hands. Some ten days later the authority of this menace was explicitly disavowed by the *North German Gazette*, which announced that the *Marine Politische Korrespondenz* had never possessed a semi-official character. The *Cologne Gazette* continues in the west of Germany to serve the German Government much as it did in the time of Prince Bismarck, although for prudential reasons its inspiration is on the whole more intermittent than it was in the days of the first Chancellor. The *Hamburgischer Correspondent*, now the leading Hamburg journal, plays a minor rôle of the same nature in the chief Hanseatic port, while the *Hamburger Nachrichten*, celebrated especially during the exile of Prince Bismarck and the closing years of his life at Friedrichsruh as the receptacle of indiscreet revelations and violent attacks upon his successors, has almost lost all significance except as a local organ of violent Anglophobia. The *Allgemeine Zeitung* of Munich, once famous throughout Europe as the *Augsburger Allgemeine Zeitung* before its transference to the Bavarian capital, has become in the hands of new proprietors practically an organ of the imperial Chancellor. In Prince Bismarck's days the press bureau of the Prussian Ministry of the Interior, and a similar organization in the Imperial Home Office, used to furnish hundreds of petty local newspapers known as *Kreis-blätter* with whole articles gratis, so that the policy of the Government might be advocated in every nook and corner of the country. The numerous journals in which these communications used to appear simultaneously and in an identical form were the Government organs to which the Radical and Socialist opposition more particularly applied the term "Reptile Press." Latterly this practice of wholesale inspiration appears to have been abandoned, but there are still many channels, public and private, through which almost every department of the Government can communicate information and guidance to newspapers in all parts of Germany. The Prussian Ministry of the Interior distributes to all and sundry a news-letter known as the *Berliner Korrespondenz*, which professes only to give statistics and information and to correct erroneous statements; but it also frequently contains articles which advocate some proposal of the Government or combat the arguments of its opponents. The *Sud-Deutsche Reichs-Korrespondenz* is an institution of a similar character, and in 1902 served as an exponent of the policy and tactics of the imperial Chancellor, count von Bülow.

The number of "news-letters"—which seems the only English term by which the German word *Korrespondenz* can be approximately rendered—is very great. Almost every one of the political parties has its *Korrespondenz*, which, it ought to be noted, supplies views rather than news. These circular letters deal, in fact, with the policy of the party with which they are associated, although they occasionally also embody information which the party leaders in the Reichstag or in the Prussian Diet have received from representatives of the Government for their own guidance. They form the means of holding the parties together, and of inspiring them with common aims, as they are reproduced throughout the country by all the party organs.

It is in the press of Berlin that the greatest changes have taken place in recent years. During the régime of Prince Bismarck the *North German Gazette*, and occasionally the *Post*, used to keep Europe in a state of nervous tension by fulminant *communiqués* which the great Chancellor himself often dictated, or by what he used to call "jets of cold water" (*Kaltwasserstrahl*), which were mostly directed against France or Russia.

So far as France and Russia are concerned, a much more pacific tone prevailed in Berlin after the conclusion of the Dual Alliance, and it was upon England that the press mainly concentrated its attacks. The *North German Gazette*, which was originally established by a private individual, in order "to place a blank sheet of paper at the disposal of Prince Bismarck," has become, on the whole, a mere record of home news and a summary of foreign intelligence bearing the semi-official stamp of Wolff's Telegraph Agency. It had doubtless been found that the constant employment of an organ so distinctly official as the *Norddeutsche Allgemeine* as a medium of expression for the views of the Government was apt to lead to indiscretions which committed the authorities too deeply. Indeed, immediately before Prince Bismarck's fall he had actually employed this journal in order to attack the labour policy of the Emperor. At the present day *communiqués* dealing with foreign affairs still appear at rare intervals in the columns of the *North German Gazette*, but they are mostly characterized by a vagueness and awkwardness of style which is in striking contrast to the force and point of Prince Bismarck's polemics. The *Imperial Gazette* (*Reichsanzeiger*), corresponding to the *London Gazette*, is purely a record of official intelligence, though on rare occasions it publishes in the section marked *Nicht Amtlich* (non-official), some *démenti*, some statement of policy, or some official document—a proceeding which always requires the express sanction of the Emperor.

The journals which in 1880 were most widely read in Berlin, and which were best known abroad as the exponents of Berlin opinion, were the Liberal or Radical *Vossische Zeitung* and *Berliner Tageblatt*, and the National Liberal *National Zeitung*. These journals still survived in 1902 in a more or less flourishing condition, and the *Vossische Zeitung*, the oldest of all the Berlin newspapers, was still written with a degree of literary ability which justified its real title, *Königlich priviligierte Berlinische Zeitung für Staats- und Gelehrten Sachen*. The *National Zeitung* is also ably written, and represents those vestiges of old German Liberalism which still survive in the National Liberal party. The *Kreuz Zeitung* continues to represent the "small but mighty party" of the reactionary Conservatives and Agrarians in the State, and of the orthodox (Lutheran) Protestants in the Church. In its surveys of foreign affairs it occasionally contains an important reflection of the views of foreign policy which have been acquired by leading Conservatives in their intercourse with members of the Government. It is the favourite journal of officers in the army, of the Conservative gentry (*Junker*), as well as the medium through which people of social standing prefer to announce births, marriages, and deaths. The *Post* continues to be subsidized by a small number of industrial and rural magnates in the interests of the *Reichspartei*, or Free Conservative party, which for the most part subordinates its views to those of the Government. In matters of foreign policy this journal reflects the views entertained in official quarters. The *Berliner Neueste Nachrichten*, like the *Post*, is a consistent advocate of the development of the German navy and of a vigorous *Welt-politik*. It enjoys an intermittent official inspiration. The *Boersen Zeitung* and the *Börsen-Courier* are organs of the Berlin Stock Exchange; the one is of a National Liberal colour, and the other expresses the views of the Moderate Radicals (*Freisinnige Vereingung*) and of opponents of extreme protection. The *Vörwarts* is the central organ of the German Social-Democrats, who have established a considerable number of other journals throughout Germany. The clericals or Centre party are represented by the *Germania*, the importance of which is not, however, so great as that of the other leading organ of the Roman Catholic "governing party," the *Kölnische Volks-zeitung*. The *Deutsche Tageszeitung* has recently made itself a name by its advocacy of the agrarian movement, while the *Freisinnige Zeitung* (founded, and to a great extent edited by the Radical leader Herr Eugen Richter) gives a very full yet concise summary of the news of the day, upon which it comments in luminous editorial articles and notes, written from the Radical point of view. Among the provincial papers the *Frankfurter Zeitung* (Radical) is distinguished by the excellence of its news, especially on commercial subjects. The *Schlesische Zeitung*, a leading Conservative organ, has continued to appear in Breslau since the days of Frederick the Great. The *Magdeburger Zeitung* and the *Hannoversche Courier* give an independent or National Liberal support to the Government. The *Weser Zeitung*, published at Bremen, is an exponent of the Liberalism of the commercial classes, while the *Strasburger Post* is one of the journals which enjoy Government inspiration, and helps to maintain *die Wacht am Rhein*. A considerable number of journals, published in the Polish language, advocate the Polish cause in the eastern provinces of Prussia.

Great success has attended a new departure in German journalism, represented by newspapers like the Berlin *Lokal-Anzeiger*, which describe themselves as non-political. Their political philosophy is that of Dr Pangloss, for they generally find that all is done for the best by the best of governments. The *Lokal-Anzeiger* has a circulation in Germany which is comparable with that of the *Petit Journal* in France, while its news is superior in quantity and in freshness to that of any of its German contemporaries. It has become a power with which the Government has to reckon, since it is read "in the palace and in the hovel." It is often asserted that journals of this kind are read for their news, and have no political influence. It has already been pointed out, however, that the average modern German is too busy to correct by study and reflection the impressions which he derives from the hurried perusal of his newspaper. The *Lokal-Anzeiger* undoubtedly exercises a very marked influence upon public opinion in Berlin, and there is plenty of evidence that both in Government and in Court circles it has frequently been used in order to shape the views of its readers.

The external form and arrangement of German newspapers is often puzzling at first sight to an English reader. There is an absence of the striking headlines, which in English journals direct attention to news of importance, and which in America almost swamp the text. The outside page generally contains the editorial articles and the news of most importance, while the intelligence received immediately before going to press is placed in the last column of the last sheet. The bulk of the paper can apparently be increased indefinitely in accordance with the supply of news or literary matter, or with the number of advertisements. The *Vossische Zeitung* on a Sunday morning assumes, with its numerous supplementary sheets, the dimensions of a thick Blue-book. The quantity of extraneous matter, such as articles on literary, social, and technical subjects, is enormous, and even the most serious political journals invariably publish a novel in serial form, as well as numerous novelettes and sketches. The local news in Berlin and other large cities is written with the minuteness and the familiarity of style of a village chronicle, and gives the impression that every one is occupied in observing the doings of his neighbour. The signed article is very much in vogue, and most writers and salaried correspondents have at least a cypher or initial by which they are distinguished. The greatest licence prevails in reporting and discussing the affairs of other countries, combined with the keenest sensitiveness to foreign criticism of anything that concerns Germany. The example of the Government is followed in advertising the products of German industry, while those of foreigners are studiously depreciated. (X.)

Austria.

In the period from 1880 to 1888 the only notable paper founded in Austria was the *Wiener Allgemeine Zeitung* (1880). It appeared three times daily, and attempted to compete with the large dailies already established, but in spite of the impetus communicated to its start by the well-known "Freilands" Apostle Theodor Hertzka, it soon fell away, and now only appears as a late evening paper; it is known as the *6 Uhr Abendblatt*, and enjoys a large local circulation. It was with the rise of the anti-Semitic and Socialistic movements of 1888 onwards that the Vienna daily press first began a fresh increase. The *Deutsche Volksblatt* (anti-Semitic) was founded in 1888, the *Ostdeutsch Rundschau* (Radical) in 1893, and the *Reichspost* (the organ of the Catholic section of the Christian Socialist party) in 1894. The Labour movement led to the development of the *Arbeiterzeitung* from a weekly, when it succeeded the *Gleichheit* in 1889, to a daily in 1895. It is therefore the first Social Democratic daily of Austria. In 1893 the *Neues Wiener Journal* was founded as a political neutral, and the old *Presse* at last disappeared in 1894, its place being filled by the weekly *Reichswehr* (military), established in 1888. Since May 1899 the French in Vienna have once more a daily paper in their language, *Le Petit Journal de Vienne*. There are now nineteen political dailies published in Vienna, but owing to the various nations included in the Austrian empire, the political press of the provinces has more than usual importance. Of the German provincial press the most highly developed is in the German towns of Bohemia and in Prague, and the foundation of the *Deutsche Volkszeitung* at Reichenberg in 1885 marks the date of separation of the *Deutschfortschrittliche* and *Deutschvolkliche* parties, while the Radical party, which has so greatly increased in Bohemia of late years, was first represented by the weekly *Deutscher Volksbote* at Prague, and also in 1897 by the *Unverfälschte deutsche Worte*, now edited by Iro at Eger. A peculiar feature is the existence of German organs of the Czech national movement, of which the representative is the Prague daily *Politik*, which has appeared since 1862. In Silesia the anti-Semitic *Freie Schlesische Presse* was founded in 1881 at Troppau, and when it changed sides in 1889 it was speedily replaced, 1891, by the *Deutsche Wehr*. In Moravia the representative papers of the Czech Conservatives and Radicals are the *Mir* and the *Pozar* respectively. The newspapers in Galicia, which have been growing steadily since 1870, are both numerous and important. The leading ones are the *Slovo Polskie* in Lemberg and the *Glos Naroda* in Cracow. There are 161 newspapers in Polish, as against 10 in 1848 and 50 in 1873.

Of the lesser Slavic nations, the Slovenians have advanced the most, and their latest political newspaper is the *Slovenski List*, commenced at the end of 1896.

In Illyrian journalism the chief newspapers founded since 1880 are the *Crvena Hrvatska*, 1891, and the *Hrvatska Kruna*, 1893. An attempt at unity amongst the Ruthenian factions in 1885 to 1887 produced the *Mir*, while the *Ruslan*, published daily at Lemberg since 1896, advocates joint action by Poles and Ruthenians. The *Bukowyna*, established in 1885, has developed into the organ of "Young Ruthenia," and the *Bukowinska Widomosty*, established in 1895, represents the Old Ruthenians.

The Italian press in Austria is now represented chiefly by the very popular daily *Piccolo*, published at Trieste; it had a formidable rival in the *Mattino*, which commenced in 1885, but only lasted to the end of 1898. The *Fede e Lavoro*, published at Roveredo, is the organ of the Catholic Labour party, and *L'Avvenire del Lavoro*, at Bozen, that of the Socialists. In Dalmatia the *Corriere Nazionale*, founded in 1896 at Zara and now published at Trieste, is the organ of the autonomist Italians, while *Il Dalmata* continues to represent the National Liberals.

The Rumanian press is limited to a few papers in Czernowitz. The oldest is the anti-Semitic *Dutepazza*, founded in 1883; but the real representative of the autonomist Rumanians is the *Patria*, founded in 1897. Economics and social science, in which subject journalism in Austria is of very recent growth, is chiefly represented by the *Zeitschrift für Volkswirtschaft, Socialpolitik und Verwaltung*, a paper which deals exclusively with its own subject.

The technical journals of Austria are very numerous and most highly developed, consisting of 154 agricultural, 263 trade, 25 military and marine, 92 medical and scientific, 50 legal, 88 religious, 130 educational, 52 geographical, statistical, and historical, 189 theatrical, musical, sporting, &c., 169 humorous and literary, 289 economic, and 16 for women. Most of these, however, are not newspapers, but magazines.

In 1890 Vienna, with a population of 1,100,000, had 8 dailies and 44 papers published less frequently but at least weekly. In 1900, with a population of 1,526,000, it had 14 dailies and 36 weeklies, &c. Prague, notwithstanding a large increase in population, had about the same number of papers in 1900 as in 1890, namely, 11 dailies and 2 weeklies, while Trieste, which in 1890, with a population of 144,000, had 5 dailies, had 9 in 1900, with an increase of only 16,000 inhabitants. In the smaller provincial towns there were in 1900, 321 newspapers of various periodicity, but not exceeding a week, which are published in 168 towns.

ZENKER. *Geschichte der Journalistik in Osterreich.* Vienna, 1900.—HAASENSTEIN and VOGLER. *Notizkalendar*, 1901, &c.

Hungary.

Budapest in 1890, with a population of 360,000, had 14 dailies and 10 weeklies, &c. In 1900, with 470,000 inhabitants, it had 21 dailies and 3 weeklies, &c., and 147 papers, mostly weeklies, were published in eighty-nine other towns. The leading papers are the official *Budapesti Közlöny*, the Liberal *Pester Lloyd*, and the *Budapesti Hirlap*. From the Hungarian returns of 1899 (*A Magyar Hirlapirodalom Id. Szinnyei J.*) it would appear that 764 newspapers were published in that year, but those returns include a large number of official bulletins and journals that are more correctly described as periodicals. It may be noted here that seven papers in Hungarian are published in America and one in Vienna.

Belgium.

In 1890 Brussels published 34 papers of various periodicity, among which the *Moniteur Belge* held the lead with a circulation of 90,000, while *Le National* (founded in 1885) and *L'Étoile* circulated 21,000 and 5000 respectively. In 1900 there were 18 dailies and 14 weeklies, &c. The other large towns compare as follows:—

	1890.			1900.		
	Population.	Dailies.	Weeklies, &c.	Population.	Dailies.	Weeklies, &c.
Antwerp .	191,000	7	2	186,780	7	4
Ghent .	140,000	7	3	140,000	6	3
Liége .	133,000	6	5	140,300	5	3

In 1890 there were 112 papers published in 90 other towns, and in 1900, 230 papers in 124 other towns. These were mostly weekly, but the towns with upwards of 20,000 inhabitants have usually one or more daily papers. *Le Soir*, a Brussels paper, is distributed gratis, and subsists entirely upon its advertisements. Totals:—

	1890.	1900.
Brussels	34	32
Provinces	142	258
Belgium	176	290

Holland.

Amsterdam in 1890 had 10 dailies and 15 weeklies, &c.; and in 1900 the number had increased to 12 dailies (*Algemeen Handelsblad*, *Nieuws van den Dag*, &c.), and 26 weeklies, &c. In 1900 The Hague had 6 dailies (*Dagblad*, *Vaderland*, &c.) and 5 weeklies, &c.; and Rotterdam had 5 dailies (*Nieuwe Rotterdammer Courant*, &c.) and 8 weeklies. In addition to these, about 250 papers, mostly weeklies, were published in 128 other towns. The *Haarlemsche Courant*, founded in 1656, still appears. The totals for Holland are:—Amsterdam, 38; provinces, 274; kingdom, 312.

Luxemburg.

In the Grand Duchy there were 12 newspapers in 1900—3 dailies (*Luxemburger Zeitung*, &c.), and 9 that appear twice or thrice a week. All the dailies and three others are published in the capital.

Sweden.

In 1890 Stockholm, with a population of 205,000, had 5 dailies and 12 weeklies, &c.; in 1900, with an increase of 50,000 inhabitants, it had 11 dailies and 4 weeklies, &c., while 93 provincial towns published 197 papers, mostly weeklies, &c. In the period 1890–94 a large number of newspapers appeared at Stockholm, but their duration was in general very short, often only a few months (Lundstadt, *Sveriges Periodiska Literatur*, ii. 1896). A newspaper in Finnish is published at Haparanda.

Denmark.

In 1890 Copenhagen, with 286,000 inhabitants, produced 8 dailies and 6 weeklies, &c. In 1900, with a population of 410,000, it had 12 dailies and 2 weeklies, while 121 papers appeared in sixty-eight provincial towns.

Iceland.

Reykjavik published two weekly papers in 1890, and the same number in 1900 (*Thiódólfr* and *Isafold*).

Faroe Islands.

A weekly paper called the *Dimmalaeting* was published at Thorshavn in 1890, and continued to appear in 1900.

Norway.

In 1890 Christiania, with a population of 128,000, published 12 papers, of which only three appeared daily; in 1900, although the population increased to 151,000, only 10 papers were produced, but 8 of them were dailies. The *Morgenbladet* still holds its rank, and the *Aftenposten* has a large circulation. In the provinces in 1900 there were 122 papers published in fifty-two towns.

Russia.

In 1890 St Petersburg had 6 dailies and 14 weeklies, &c.; and in 1900 there were 16 dailies and 22 weeklies, &c. (the *St Petersburgskaya Viedomosti*, notably anti-British since 1895, the *Novoya Vremja*, the *Journal de St Pétersbourg*, &c.). Moscow increased its papers from 5 dailies and 6 weeklies, &c., to 8 dailies and 11 weeklies, &c. (the *Moskowskaya Viedomosti*, &c.). The rest of Russia proper produced about 100 newspapers, of which one-third were dailies. In Russian Poland about 11 papers, one-half being dailies, were published at Warsaw in 1900 (*Kurier Warsawski*, *Gazeta Polska*, &c.), and about 18 in the other towns. The Baltic provinces produced 11 dailies and 9 weeklies, &c.; Siberia, 1 daily and 23 weeklies, &c.; the Caucasus, 5 dailies and 4 weeklies, &c.; and Finland, 12 dailies and 29 weeklies. Seven weekly newspapers in Esthonian were published at Reval, Dorpat, and Pernau in 1900. The totals for Russia are therefore—St Petersburg and Moscow, 57; provinces, 230; the Russian empire, 287.

Throughout the empire, but especially in Russia proper, Siberia, and the Caucasus, a number both of daily and weekly papers are so intermittent in their publication that they have not been included in the above statistics.

A large number of newspapers in the Russian language are published, chiefly for political reasons, outside Russia, and most of the papers of the non-Russian nations living under Muscovite rule are similarly published outside the empire.

In all the large provincial towns there is a Government newspaper published daily, or at least twice a week, but apart from this but few of the periodicals can justly be considered as newspapers. The provincial press labours under great difficulties, for whereas in St Petersburg or Moscow the editors may publish at their own risk, subject to warnings, every paper that appears in the provinces must duly pass the censor. The more important section of the Russian press tends to develop on the lines of British newspapers, *i.e.*, large papers well filled with advertisements, but no new papers of importance were founded during the period under review. The popular press in the French fashion has largely developed, and there is a system of giving bonuses to subscribers in the form of books published as supplements.

Italy.

In 1890 Rome, with a population of 278,000, published 13 dailies and 1 tri-weekly, and in 1900, with 376,000, 10 dailies and 5 weeklies, &c. The leading Roman papers are—the *Fanfulla*, representing the Court and Government; the *Tribuna*, a Liberal paper founded in 1883, which has the largest circulation (150,000); the organ of the Vatican, *L'Osservatore Romano*; and the popular *Messagero*. The number of papers published in the chief towns between 1880 and 1900 was as follows:—

	Population.	Dailies.	Weeklies, &c.
Florence . . .	170,000	4	...
Milan . . .	375,900	6	5
Naples . . .	463,000	9	...
Turin . . .	253,000	5	3
Venice . . .	130,000	4	...

In addition to these, about 200 papers, one-third being dailies, were published in 123 of the smaller towns, making the totals—Rome, 15; provinces, 236; Italy, 251.

Malta in 1890 had 3 dailies and 3 weeklies, and in 1900, 8 dailies (*Malta Chronicle*, *Il Risorgimento*, &c.) and 5 weeklies. Two were in English, one in Maltese, and the rest in Italian.

Spain.

In 1890 Madrid published 38 papers, of which 15 were dailies; but by 1900 they declined to 28, of which 19 were dailies. Barcelona published only 4 dailies in 1890, the remaining 17 being weekly, &c.; in 1900 the dailies increased to 15, while the weeklies, &c., decreased to 4, a state of things very consonant with the increased commercial activity of the town. The leading Spanish papers are—*El Correo*, Monarchico-Liberal; *La Epoca*, Conservative; *El Imparcial*, Independent Liberal; *La Justicia*, an evening Republican paper; *El Liberal*, which numbers among its contributors the best writers without distinction of party; and *El Pais*, the organ of the Progressives. The provincial press is very active, but extremely short-lived. In Badajoz, a typical ordinary provincial town, about 30 newspapers sprang into existence during the twenty years 1881–1900, besides a still larger number of periodicals (Gomez Villafranca, *Historia y Bibliografia de la Prensa de Badajoz*, 1901). In 1900 there were 287 papers published in 118 provincial towns, thus making the totals—Madrid, 28; provinces, 306; Spain, 334.

Majorca.—In 1900 there were 4 daily papers published at Palma de Mallorca.

Portugal.

In 1890 Lisbon, with 246,000 inhabitants, published 18 papers, of which 11 were dailies; and in 1900, with a population of 261,000, 21 papers, of which 19 were dailies. The other towns show very little movement since 1880, about 58 papers being published in 30 provincial towns. The totals may be roughly taken as—Lisbon, 21; provinces, 58; Portugal, 79.

Switzerland.

This is one of the countries remarkable for the number of its newspapers in proportion to its size. Among the more important may be mentioned the *Journal de Genève* and the *Gazette de Lausanne*, both Moderate Liberal, and the Catholic *Courrier de Genève*. The following table shows the increase in the three largest towns:—

	1890.		1900.	
	Dailies.	Weeklies.	Dailies.	Weeklies.
Geneva . .	3	...	5	4
Basel . .	2	1	5	1
Zurich . .	2	3	4	15

In 1895, 587 papers were published in 192 towns, about 270 being weeklies and about 100 dailies. Nearly two-thirds are in German, the remainder being chiefly French, with a few in Italian, in Romansch, and in English. The number of papers founded in the decade ending 1890 showed an increase of 30 per cent. on the previous one. In 1872 only 3 papers were credited with a circulation exceeding 20,000, but there were in 1896 at least 16. The Swiss continue to preserve with jealous care the freedom of the press, and in 1895 they rejected an alteration in their criminal code which appeared likely to interfere with it.

Greece.

Athens, with 85,000 inhabitants in 1890, published 9 dailies and 4 weeklies, &c., and in 1900, with 114,000 inhabitants, 10 dailies and 2 weeklies. The chief papers, the *Asty* and the *Acropolis*, are mainly political and on the Liberal side, as indeed are nearly all the Athenian papers. In the smaller towns the number increased from 20 in 1890 to 35 in 1900, most of them being published weekly.

Rumania.

Bucharest, with a population of about half a million, had 7 dailies and 1 weekly in 1890, and 14 dailies (the *Romanul*, &c.) and 3 weeklies in 1900, when about 30 papers, mostly dailies, were published in the provinces.

Servia.

Belgrade has a large number of papers in proportion to its population of 36,000, but shows no movement in recent years. It had 6 dailies and 8 weeklies, &c., in 1900. The official paper is the *Serbske Noviny*, and the leading Liberal organ the *Videlo*. Five smaller towns published one or two papers apiece, appearing twice or thrice in the week.

Bulgaria.

In 1890 only 3 newspapers were published in Bulgaria, namely, 2 at Sofia and 1 at Rustchuk. In 1900 Sofia, with a population of 48,000, had 1 daily, the *Swoboda*, and 3 on alternate days; while Philippopolis and five smaller towns produced 11 papers, mostly weeklies.

Montenegro.

Cettigne, with 1500 inhabitants, published 2 weeklies (the *Glas Crnagorca* and the *Political*) in 1900.

Turkey.

In 1890, with a population of 873,000, there were 19 papers, in various languages, published at Constantinople, most of them dailies; and in 1900, with a decrease in population estimated at 1000, the number of papers decreased to 18. They appeared in the following languages: the *Stamboul* and 4 others in French, 3 in

Turkish, 1 in Turkish and Greek, 3 in Greek, 2 in Armenian, 1 in English and French, and 1 each in Arabic, English, Italian, and Persian. Smyrna, with 200,000 inhabitants, published 8 papers, mostly weeklies, in 1890, and the same number in 1900. Owing to the number of fasts and feasts observed by the Mahommedans, during which Turkish newspapers are not published, they are somewhat irregular in their appearance. Two papers are published at Adrianople and 2 at Salonica (1 being in Hebrew). Cyprus had 6 weeklies in 1900, the chief being the *Owl* at Nicosia and the *Times of Cyprus* at Larnaca.

Persia.

Tehran, with 200,000 inhabitants, published 2 newspapers in 1890 and 3 in 1900. The *Irán* is the leading paper, but the papers of Persia, like those of Turkey, appear somewhat irregularly.

Syria.

At Beyrout were published in 1900, 1 daily (the French *Journal*), and 5 weeklies (1 in Turkish and 4 in Arabic).

China.

With the exception of the *Peking Gazette*, which is the official organ of the Chinese Government, it may be said that all the newspapers published in China, including those in the vernacular, are due to foreign influence, and are under European management. The leading papers of the British colony are the *North China Daily News* and *Shanghai Mercury* at Shanghai, and the *Hong Kong Daily Press* and *China Mail* at Hong Kong. In addition to these may be mentioned the *Journal* at Peking, the *Gazette* at Amoy, the *Herald* and *Daily Echo* at Foochow, the *Chinese Times* at Tientsin, the *Deutsch-Asiatische Warte* at Tsintau, and a few Portuguese papers at Macao. Of the few papers in Chinese, the *Shun-pao* and *Hu-pao* of Shanghai have a very large circulation, and there are four Chinese dailies at Hong Kong and two at Canton. Several newspapers are published by the missionaries in various parts, but they are more of the nature of religious or scientific journals with a few items of news thrown in (J. D. Ball, *Things Chinese*, 1893). The total number of newspapers published in China in 1900 may be reckoned at 40, about two-thirds being dailies.

Siam.

Bangkok, with 255,000 inhabitants in 1890, had 3 dailies and 1 weekly, while in 1900, with a population of 400,000, it had an additional weekly. The leading papers are the *Times* and the *Siam Free Press*.

Straits Settlements.

There are about a dozen papers, half of them dailies, published in the Straits Settlements. The chief are the *Straits Times* and the *Government Gazette* at Singapore, the *Penang Gazette*, &c.

Cochin China.

Two papers, the *Courrier* and the *Mekong*, are published at Saigon. Tongking has the *Courrier* published at Haiphong, and *L'Avenir* at Hanoï.

Japan.

Rapid growth of journalism has been one of the marked features of Japan's modern career. As early as the beginning of the 17th century, a sheet called the *Reading for Sale* (*Yomi-uri*) was hawked about the streets of Yedo by a vendor who cried his wares in the familiar European style of later times. This embryo journal was in manuscript. It contained accounts of natural calamities, conflagrations, fights, vendettas, and other striking events. Another more aristocratic sheet, called the *Official Intelligence* (*Go-sata-gaki*), was compiled by the chief of the tea-cult in the shogun's palace and sold privately. Its contents were taken chiefly from the archives of the Government secretariat, and consisted of appointments and dismissals of officials, copies of administrative ordinances, and notes on current events. Neither of these publications attained permanent vogue or suggested any expansion of the enterprise. Not until 1863 did a real newspaper make its appearance. Its publisher, Fukuda Meiga, was inspired by the hope that if fuller knowledge of foreign countries were disseminated among the people, the policy of national exclusion might become distasteful. He therefore made translations of the *Batavia News*, and published them in the form of a journal printed from wood blocks. The following year (1864) Joseph Hiko—a Japanese who had just returned from the United States, where he had lived since boyhood, having been rescued from a sinking junk and carried to San Francisco by an American ship—combined with two of his countrymen to publish a periodical which they called *Shimbunshi* (newspaper), a term destined to become permanent in the language. As yet movable types were not employed. But that innovation followed quickly on the establishment of English journals for the foreign community in Yokohama, and during the stirring times of the fall of feudalism a demand for news became so keen that one journal after another made its appearance. At first the tone of these sheets reflected the anti-foreign, anti-progressive spirit of the conservative section of the nation, and their influence seemed so pernicious that the Government prohibited their publication and treated the editors as malefactors. But the incongruity of such a policy being quickly perceived, the veto was revoked in 1869, and journalistic enterprise received official sanction within certain limitations. All discussion of religious questions, of politics, and of legal problems was interdicted; a general injunction forbade the publication of matter prejudicial to public peace or good morals; official permission had to be obtained before issuing a journal, and the power of fining or imprisoning editors, publishers, and printers, as well as that of suspending or suppressing a newspaper, was vested in administrative officials without any recourse to courts of law. It might have been foreseen that the young journalists of Japan, whose ideas of press liberty were derived from European theories, would not readily submit to these restrictions. A bitter struggle commenced between, on the one hand, irresponsible editors who were influenced partly by honest faith in the value of free speech, but partly by a desire to embarrass the Government, and, on the other, responsible officials who either believed that Japanese society was not yet ripe for the full enfranchisement of newspapers, or were unwilling to place in the hands of their political opponents a weapon which threatened to prove inconveniently effective against themselves. The public, of course, sympathized with the editors, and each sentence of imprisonment or fine pronounced against them brought a fresh access of popular support. Devices, often unscrupulous and sometimes ingenious, were employed by the editors to gain popularity or to bring the Government into ridicule. On one occasion they organized imposing funeral rites in honour of journals that had been suppressed by ministerial order. The defunct sheets, placed in a coffin, were borne in solemn procession to the temple of the Goddess of Mercy, where Buddhist priests chanted litanies for the dead, journalists and political agitators read threnodies or burned incense, and all the pomp, parade, and ceremony proper to aristocratic obsequies were observed. The story of this struggle for liberty reads strangely in the context of such a history as that of Japan under the Tokugawa shogunate. Although scarcely a month passed that did not see an editor fined or imprisoned, a newspaper suspended or suppressed, the representatives of the press grew constantly more defiant, the demand for journals more urgent. The first daily paper, the *Mainichi*

Shimbun (*Daily News*), was published in 1871, and in 1879, despite the severity of the law, there were 192 journals and periodicals, with a total annual circulation of over 11,000,000. In 1897 a law, passed by both Houses and confirmed by the emperor, removed all restrictions on freedom of speech, except in cases of *lèse-majesté*. In 1900 there were 829 journals and periodicals, with an annual circulation of 463 million copies. (See also JAPAN.)

The more important newspapers appearing in the capital are the official *Kwampo*, the Conservative *Nihon*, the Progressive *Yomiuri* and *Mainichi*, and the *Kokumin Shimbun* (established in 1890), one of the best specimens of Japanese journalism, and remarkable for its liberal spirit, and for having an article in English to facilitate the exchange of views between Japanese and foreigners.

East Indies.

Philippines.—In the Philippines, where the periodical press has now been established for upwards of three-quarters of a century, the first newspaper printed outside Manila was *El Eco de Vigan*, 1884, which lasted for about a year. In Manila itself a considerable number of newspapers have been started since 1880, but few have lasted long; many, indeed, only a few months. The *Diario*, *Occania Español*, and *Comercio* are the dailies (Retana, *El Periodismo Filipino*, Madrid, 1895).

Java.—The newspapers of Java show but little movement. In 1900 there were 6 dailies and 1 weekly published in Batavia, and about 20 papers, half of them dailies, in other parts of the island.

Sumatra.—In 1890, 3 papers were published in Sumatra, and double that number in 1900; they appear, at most, three times in the week.

Celebes.—The number of papers published at Macassar in 1900 was 3, published once or twice in the week.

West Africa.

In Gambia in 1900 the *Gambia Intelligencer* was published weekly at Bathurst.

At Accra, in the Gold Coast Colony, there were 2 weekly papers, the *Gold Coast Chronicle* and the *Gold Coast Independent*.

In Sierra Leone, Freetown, with a population of 39,000, had 3 weekly papers (the *Weekly News*, *Weekly Times*, and *West African Reporter*).

Lagos, with 32,500 inhabitants, published the *Lagos Times* daily and 3 weekly papers.

East Africa.

Mauritius.—In 1900 the *Merchant and Planter's Gazette* and the *Vrai Mauricien* were published daily at St Louis, the only other paper being the *Weekly News*.

Congo Free State.

St Paul de Loanda published *O Mercantil* daily and 2 weekly papers.

Liberia Republic.

At Monrovia the *Observer* and the *Liberia Gazette* were published weekly.

Morocco.

In this territory were published in 1900 the *Times of Morocco*, a newspaper in Arabic, one in French, and one in Spanish; their periodicity varies.

German East Africa.

The *Deutsch-Östafrikanische Zeitung* was published weekly at Dar-es-Salam.

Algeria.

In 1890 there were 11 newspapers published in Algeria. In 1900 Algiers, with a population of 154,000, published 6 dailies (*L'Akhbar*, *La Dépêche Algérienne*, &c.) and 4 weeklies, and seventeen smaller towns had 25 papers, in most cases weeklies or semi-weeklies.

Tunis.

Two daily papers, the *Journal Officiel* and the *Petit Tunisien*, and 4 weeklies were published at the capital in 1900, while *Le Courrier* appeared weekly at Bizerta, *La Dépêche Sfaxienne* daily at Sfax, and *L'Avenir* weekly at Sonese.

Senegal.

In 1900 the *Moniteur* was published weekly at St Louis.

Réunion.

The *Journal Officiel* was published twice a week, the *Nouveau Salazien* weekly at St Denis.

Madagascar.

Le Progrès, *Le Madagascar*, and *La Cloche*, nominally weeklies, appeared at irregular intervals.

Angra Pequeña.

The *Deutsche Colonial Zeitung* was published weekly.

Canary Islands.

In 1900 the *Diario* was published at Las Palmas, and the *Diario* and the *Liberal* at Santa Cruz and Tenerife, but at very irregular intervals.

Madeira.

The *Diario de Noticias* was published daily, and *O Direito* twice weekly at Funchal.

St Helena.

In 1900 the *Guardian* was published weekly.

Egypt.

In 1900 Alexandria, with 230,000 inhabitants, published 10 dailies (*Le Phare d'Alexandria*, the *Egyptian Gazette*, &c.) and 1 weekly; Cairo, with 380,000, had 8 dailies (*Journal Egyptien*, *Le Progrès*, &c.) and 3 weeklies; and Port Said 2 dailies, the *Phare* and the *Telegrafo*. These are exclusive of Arab newspapers.

Portuguese East Africa.

In 1900 *O Futuro* was published at Delagoa Bay, the *Boletim Oficial* and *Africa Oriental* at Mozambique, and *O Africano* at Quilimane. These are all weeklies.

Azores.

There were two papers apiece published weekly in Terceira, Fayal, and San Miguel in 1900.

Central America.

In the republics of Central America there has been little or no variation in the number of newspapers, save in Nicaragua, which in 1900 had 4 dailies (*El Diario*) &c., and 5 weeklies, against 4 weeklies in 1890. The *Diaro del Centro de America* is the chief paper of the 3 published in Guatemala; the *Diario Oficial* and *El Siglo XX.* were published at San Salvador; the *Correo Español*, *La Republica*, and *El Heraldo* at Costa Rica; and *La Paz* and *La Regeneración* at Honduras.

British Honduras in 1900 had 1 daily paper, *El Sol*, published at Belize.

West Indies.

Cuba.—In 1890, 6 dailies and 1 weekly appeared in Cuba. In 1900 there were 9 dailies and 2 weeklies, the *Diario de la Marina* and 4 other dailies being published at Havana. Seven papers were published in other towns of the island.

Porto Rico.—Three newspapers, 1 daily (*La Avispa*) and 2 tri-weeklies, have appeared in Porto Rico since 1890, to which is now added the *Democracia*, published daily.

Hayti in 1900 had 5 dailies and 3 weeklies, being an increase of 2 papers since 1890.

Jamaica in 1900 maintained its number, 5 dailies and 4 weeklies; the leading papers are the *Jamaica Daily Telegraph*, *Evening Express*, *Gleaner*, and *Government Gazette*.

Barbados published 6 papers, mostly bi-weekly (*West Indian*, *Barbados Herald*, &c.), at Bridgetown in 1900.

Trinidad, with 5 weeklies in 1890, had 2 dailies (*Daily News* and *Times*) and 4 weeklies (*Royal Gazette*, &c.) in 1900.

Dominica had 2 weeklies, the *Dominican* and the *Guardian*, in 1900.

Grenada, which had only 1 paper in 1890, had 3 (*St George's Chronicle*, &c.) in 1900.

St Vincent had 2 weekly papers (*Sentinel*, &c.), and St Lucia the same number (*The Voice*, &c.), in 1900.

Antigua had 3 weeklies (*Leeward Isles Budget*, &c.).

Bahamas.—In 1900 the *Guardian* was published twice weekly at Nassau.

Bermudas.—In 1900 the *Royal Gazette* was published at Hamilton, and the *Colonist* at St George, both weekly.

St Christopher (St Kitts), which had only 1 paper in 1890, had the *Daily Express* and 2 weeklies in 1900.

Tobago had the *Gazette* and *News*, both weekly.

Turks Island.—The *Royal Standard*, weekly.

St Thomas.—The *St Thomæ Tidende* appeared twice weekly in 1900.

Martinique.—Three papers, *Les Antilles*, *Les Colonies*, and *El Porvenir*, were published at St Pierre in 1900, and were still being published up to 8th May 1902, when the town was destroyed (see MARTINIQUE).

Guadeloupe.—The *Courrier* was published twice weekly.

Mexico.

In 1890, 5 dailies and 2 weeklies were published in the capital, with 316,000 inhabitants, and 2 dailies and 1 weekly in other parts of the territory. In 1900 there were 10 dailies (*El Diario Oficial*, *El Nacional*, &c.) published in the capital, which has increased its population by 16,000; and 20 papers, about half being dailies, appeared in fifteen smaller towns.

Colombia.

Panama, with 35,000 inhabitants, had 3 dailies in 1890, and 3 dailies (*La Estrella*, &c.) and 1 weekly in 1900. Bogotá, with a population of 100,000, had 3 dailies and 3 weeklies in 1890, and 9 dailies and 23 weeklies in 1900. In the other towns of the republic there were only 3 weeklies in 1890, while there were 17 newspapers, mostly weekly, published in seven towns in 1900.

Venezuela.

Caracas, with a population of 70,500, published only 2 dailies in 1890, but in 1900, with 80,000 inhabitants, it had 5 dailies (*El Correo*, &c.) and 6 weeklies. The returns from smaller towns were 1 daily and 6 weeklies in 1890, while in seven towns in 1900 there were 10 papers, about half of them appearing daily.

British Guiana.

There has been very little movement in the number of papers. In 1900 the *Daily Chronicle* and 5 weeklies appeared at Georgetown, and the *Berbice Gazette*, a bi-weekly, at New Amsterdam.

Dutch Guiana.

In 1900, 5 weeklies (the *Suriname*, *West Indier*, &c.) were published at Paramaribo, 1 daily and 6 weeklies at Curaçoa, and 1 weekly at Nickerie.

French Guiana.

Two weeklies, the *Moniteur* and the *Reveil*, were published at Cayenne in 1900.

Ecuador.

In 1890 there were only 3 papers, all weeklies, published in Ecuador. In 1900 Quito, with 80,000 inhabitants, had 1 daily (*El Comercio*) and 2 weeklies; Guayaquil had 3 dailies and 1 bi-weekly; and Cuenca 1 weekly.

Brazil.

In 1890 Rio, with 350,000 inhabitants, had 4 dailies and 1 weekly, while 7 dailies and 2 weeklies were published in other towns. In 1900 Rio had 10 dailies (*Diario de Noticias*, *Diario Oficial*, &c.) and 1 weekly, while 33 papers, nearly all dailies, were published in eighteen other towns.

Peru.

In 1890 there were only 2 dailies published at Lima, with 101,400 inhabitants. In 1900, however, with a population of 135,000, it had 8 dailies (*El Comercio*, *El Nacional*, &c.) and 11 weeklies, while 18 newspapers, mostly weeklies, were published in seven other towns.

Bolivia.

In 1900, 6 dailies (*El Comercio*, *El Nacional*, &c.) were published at La Paz, 3 dailies (*El Dia*, &c.) and 3 weeklies at Sucre, and 10 papers in six smaller towns.

Chile.

In 1890 Santiago, with 200,000 inhabitants, published 2 dailies and 1 weekly; Valparaiso, with 95,000, had the same number, and 1 daily paper appeared in Iquique. In 1900 Santiago published 10 dailies (*El Chileno*, *El Constitucional*, &c.); Valparaiso, with 110,000 inhabitants, had 5 dailies (*El Imparcial*, *La Union*, &c.) and 1 bi-weekly; while twelve smaller towns had 13 papers, mostly dailies.

Argentine Republic.

Buenos Aires in 1890, with 398,500 inhabitants, published 18 dailies and 1 weekly, of which 3 were in French and 3 in English; Rosario, with 80,000, had 7 dailies and 2 weeklies, of which 2 were in English; and 8 dailies and 1 weekly appeared in the smaller towns. In 1900 Buenos Aires, with its population increased by 150,000, had 18 dailies (*La Nacion*, *Buenos Aires Herald*, &c.) and 8 weeklies, which appear in the following languages: 11 in Spanish, 4 in English, 3 in Italian, 3 in German, and 2 in French; Rosario, with 90,000 inhabitants, had 6 dailies (*El Mensagero*, &c.) and 2 weeklies; and ten smaller towns produced 14 papers, nearly all dailies.

Paraguay.

In 1900, 5 dailies (*Diario Oficial*, *La Republica*, &c.) and 1 weekly were published at Asunción, with a population of 30,000; and a weekly paper, the *Eco de la Campaña*, appeared at Villa Concepcion.

Uruguay.

The press has made great strides in this republic during 1880–1900, and especially during the second decade. Montevideo, which in 1890 had 7 dailies, all in Spanish, in 1900 had 10 in Spanish, mostly political, 2 in French, and 1 apiece in English and Italian. The chief are *El Telegrafo Marítimo*, founded in 1880, *El Siglo*, *La Razón*, and *El Día*. The reduction of the price of *El Día* to one-half (2 centesimos) in 1890 was a reform which gave the notable recent impulse to the popular press. Among the more important papers in the departments may be mentioned *El Pueblo* and *La Paz* of San José, *El Día* of Paysandú, and *La Prensa* of El Salto. The only available statistics for the newspapers of the entire republic include periodicals: it appears that, in addition to the above-mentioned daily papers, 42 reviews and periodicals were published in Montevideo in 1900, and about 80 newspapers and periodicals in the provinces, giving a total for the republic of about 136. (Fernández y Medina, *La Imprenta y la Prensa en el Uruguay*, Montevideo, 1900.)

India.

It appears from the official tables that there are about 600 newspapers, so called, published in the Indian empire, of which about one-third, mostly dailies, are in the Indian vernaculars. The numbers, however, are very fluctuating, and in the following statistics of 1900 only the chief and more permanent papers are included:—

	Population.	Dailies.	Weeklies.
Calcutta .	843,487	15 (*Calcutta Englishman*, &c.)	40
Bombay .	821,704	2 (*Bombay Gazette*, &c.)	14
Madras .	452,518	4 (*Madras Mail*, &c.)	9
Rangoon .	180,000	3 (*Rangoon Times*, &c.)	3
Allahabad	175,240	2 (*Pioneer*, &c.)	3
Lahore .	176,800	2 (*Civil and Military Gazette*, &c.)	3

Chandernagore has a weekly paper, *Le Petit Bengali*, and Pondichéry *Le Progrès* and the *Journal Officiel*.

Goa has the *Boletin Official* and *A Voz do Povo*, which appear at irregular intervals.

Ceylon.

In 1900 Colombo, with a population of 125,000, published four dailies (*Ceylon Independent*, *Times*, &c.), and six weeklies. These are all in English, and there are several in the native dialects. Also three weeklies were published at Jaffna.

Canada.

Ontario.—In 1890 Toronto, with 181,220 inhabitants, had 6 dailies and 26 weeklies; Ottawa, with 30,000 inhabitants, had 2 dailies and 2 bi-weeklies; while five smaller towns published 12 dailies and 17 weeklies. In 1900 Toronto had 6 dailies (*Evening News*, *Globe*, *Mail*, *Merchant*, &c.) and 70 weeklies; Ottawa had 4 dailies (*Citizen*, *Free Press*, *Le Canada*, &c.) and 11 weeklies; while 203 smaller towns issued 341 papers, mostly weeklies. The *Citizen*, a Conservative daily paper, is the *doyen* of Ottawa journals; it was founded as the *Packet* in 1844, and changed its title in February 1851. (Audet, *Historique des Journaux d'Ottawa*.)

Quebec.—Quebec, with 65,000 inhabitants, had 7 dailies and 5 weeklies in 1890; Montreal, with 250,000, had 9 dailies and 18 weeklies. In 1900 Quebec had 6 dailies and 8 weeklies, 6 of the papers being in English and 8 in

French (*Mercury*, *Telegraph*, *Le Courrier du Canada*, &c.); Montreal had 8 dailies and 48 weeklies, 29 papers being in English and 27 in French (*Gazette*, *Herald*, *La Minerve*, &c.); while in twenty-seven smaller towns 44 papers were published, mostly weeklies.

New Brunswick.—In the whole of this territory only 4 dailies and 9 weeklies were published in 1890, whereas in 1900 Fredericton had 1 daily and 5 weeklies, St John 5 dailies (*Gazette*, *Globe*, &c.) and 4 weeklies; and 20 other papers, mostly weeklies, appeared in thirteen smaller towns.

Nova Scotia.—In 1890, 5 dailies and 8 weeklies were published in Halifax. In 1900 the same number appeared in Halifax, while 47 other papers appeared in thirty of the smaller towns.

Prince Edward Island.—In 1890 the 120,000 inhabitants of this territory had 2 dailies and 6 weeklies. In 1900 there were 3 dailies and 10 weeklies, most of which were published at Charlottetown.

Manitoba.—In 1890 only 2 dailies and 2 weeklies were published at Winnipeg, which in 1900 had 3 dailies (*Manitoba Morning Free Press*, &c.) and 17 weeklies; while 26 other papers, mostly weeklies, appeared in nineteen smaller towns.

North-West Territories.—These territories had only 3 newspapers in 1890. In 1900 there were 2 weeklies (*Leader* and *Standard*) published at Regina; and 16 other papers, mostly weeklies, appeared in thirteen smaller towns.

British Columbia.—In 1890 there appear to have been 6 papers published in this territory. In 1900 there were 20, mostly weeklies; 2 dailies (*Colonist* and *Times*) and 2 weeklies were published at Victoria, and 2 dailies (*News Advertiser*, &c.) and 3 weeklies at Vancouver.

Newfoundland.

In 1890, 3 daily papers were published at St John's, which in 1900 had 2 dailies (*Evening Herald*, &c.), while Harbor and Twillingate had a weekly paper apiece.

South Africa.

Cape Colony.—In 1890 Cape Town, with 45,000 inhabitants, published 13 newspapers of various periodicity. In 1900, with the same population, there were 16 newspapers, of which 3 were dailies and 5 were in Dutch. The leading papers were the *Cape Argus*, *Cape Times*, *South African Review*, *Ons Land*, &c. Port Elizabeth, which published 6 newspapers of various periodicity in 1890, published only 3 in 1900; but Kimberley increased from 2 to 3 in the decade. The number published in other towns of the colony remained stationary at about 32.

Natal.—In 1890 Durban and Pietermaritzburg published 3 newspapers each, of various periodicity, but in 1900 the former, with 16,600 inhabitants, published 2 dailies, the *Natal Advertiser* and *Natal Mercury*, and the latter, with a population of 14,400, published 2 dailies and 2 weeklies, the *Natal Witness*, &c.; the *Herald*, a weekly paper, is published at Newcastle.

Rhodesia.—In 1900 Bulawayo published 2 dailies (*Chronicle*, &c.) and 1 weekly, while 5 other newspapers, mostly weeklies, were published in three smaller towns.

Orange River Colony.—In 1890 only 2 newspapers were published at Bloemfontein, but in 1900 these had increased to 5—2 dailies (*Daily Express*, *Government Gazette*) and 3 weeklies.

Transvaal Colony.—In 1890, 6 newspapers of various periodicity were published at Pretoria, 7 at Johannesburg, 3 at Barberton, and 1 apiece at Lydenburg and Potchefstroom. In 1900 Pretoria published 2 dailies, the *Advertiser* in English, and the *Press* in Dutch and English; and 1 daily, the *Volksstem*, and 2 weeklies, the *Staatscourant* and *Land en Volk*, in Dutch. At Johannesburg 8 appeared—4 daily (the *Standard and Digger's News*, *Daily News*, *Eastern Star*, and *Times*), and 4 weekly (the *Mining Journal*, &c.) Barberton published only the *Gold Fields News*, weekly, but Lydenburg issued the *Transvaal* and the *Lydenburger* weekly; Potchefstroom the *Budget*, *Potchefstroomer*, *Vryheid*, and *Nieuwe Republieken* weekly; while Klerksdorp published the *Mining Record* twice a week; Krugersdorp, the *Times* and *Ons Volk* weekly; and Middelburg the *Courant* and the *District Advertiser* also weekly.

Australasia.

The first newspaper established in Australasia was the *Sydney Gazette and New South Wales Advertiser.* It began 5th March 1803, and continued to 23rd December 1843. The *Derwent Star*, the first paper in Van Diemen's Land, started 8th January 1810. The *Sydney Morning Herald* began as a weekly in 1831, became bi-weekly in 1832, tri-weekly in 1838, and daily in 1840. The *Melbourne Argus* began 2nd January 1846, the *Age* 17th October 1854, and the *Leader* in 1856. Characteristic of the newspapers of Australasia is the large number of advertisements; in fact, there is a keener appreciation of the value of advertising than in England, and consequently a newspaper is first of all an advertising medium. As a natural consequence, except in the case of the great metropolitan dailies, the press does not lead public opinion, but follows it; for in small colonial communities an editor's first care is to avoid alienating any influential section of advertisers. (Grattan Grey, *Australasia*, London, 1900.)

New South Wales.—Sydney, with a population of 332,000, in 1890 had 21 newspapers, about half being dailies; but in 1900, while the total increased nearly threefold (59), there were only 5 published daily. The largest paper is the *Morning Herald*, which may be considered the leader of Conservative journalism in Australasia. Its contemporary on the opposite side is the *Daily Telegraph*, which is run upon similar lines to the Melbourne *Age*. The *Bulletin*, however, is said to have the widest circulation throughout the whole of the Australasian colonies, but it temporarily lost ground through its strenuous opposition to the South African war. The two leading weeklies are *Town and Country* and the *Sydney Mail*, to which must be added the Radical and Republican *Truth*. (Grattan Grey, *Australasia*, London, 1901.)

In the provinces in 1890 there were 78 papers in 51 towns, mostly dailies, whereas in 1900, 168 papers were published in 118 towns, and the same tendency is shown in favour of weeklies, which, with but few exceptions, is characteristic of Australia.

Queensland.—Brisbane in 1890, with 60,000 inhabitants, had 26 papers, 8 of them being dailies, and in thirty-five other towns there were 61 papers, for the most part dailies. In 1900 the capital, with a population of 101,000, had 3 dailies (*Courier*, *Evening Observer*, &c.) and 20 weeklies, while 86 papers, mostly weeklies, were published in forty-one other towns.

South Australia.—Adelaide in 1890, with a population of 45,000, seems to have had 24 papers, 10 being dailies; and 18 papers, mostly dailies, appeared in sixteen of the smaller towns. In 1900 Adelaide had 130,000 inhabitants, but only 4 daily papers (*Register*, *Advertiser*, *Express and Telegraph*, and *Evening Journal*) and 13 weeklies (*Observer*, *Australische Zeitung*, &c.); and 27 papers, mostly weeklies, appeared in twenty-two other towns.

Victoria.—Melbourne, with a population of 400,000 in

1890, had 46 town papers, nearly half of them daily, and 21 suburban papers, mostly weekly; and 82 papers, most of them dailies, appeared in seventy smaller towns. In 1900 Melbourne had a population of 491,800, and out of 131 town and suburban papers had only 4 dailies (*Argus*, *Age*, *Standard*, *Shipping Gazette*). The struggle for the lead between the *Argus* and the *Age* has resulted in the victory of the latter, which both in position and influence has eclipsed its senior contemporary. The *Argus*, however, is intimately connected with the earliest associations of colonists in Victoria, and maintains a high standard of literary excellence, and the decline in its circulation is due solely to its conservatism. The two leading Melbourne weeklies are the *Australasian* and the *Leader*, issued respectively from the *Argus* and the *Age* offices. Both have an extensive intercolonial circulation. The popular evening paper is the *Herald*, which enjoys an extensive circulation, but is said to display occasionally a tendency towards "yellow" journalism. (Grattan Grey, *Australasia*, London, 1901.) 179 papers, mostly weeklies, were published in 122 smaller towns, Ballarat having 9, Geelong 5, and Bendigo 4.

West Australia.—Perth in 1890, with 10,000 inhabitants, had 2 dailies and 3 weeklies; and 1 weekly, the *Herald*, was published at Fremantle. In 1900 Perth had 3 dailies and 3 weeklies, and 12 papers, mostly weeklies, were published in nine smaller towns.

Tasmania.—In 1890 Hobart, with 29,000 inhabitants, had 4 dailies and 6 weeklies; Launceston had 2 dailies and 3 weeklies, and La Trobe had 1 daily. In 1900 Hobart had 2 dailies (the *Hobart Mercury*, &c.) and 7 weeklies, Launceston 2 dailies (the *Launceston Examiner*, &c.) and 5 weeklies, and Burnie and Devonport West 1 weekly apiece.

New Zealand.—Taking its size and population into account, no country in the world has been so productive of newspapers as New Zealand. The newspapers of the country districts are extremely numerous, and in general successful.

Otago.—Dunedin in 1890 had 3 dailies and 11 weeklies, and in 1900, with a population of 24,300, it had 2 dailies (*Otago Daily Times*, &c.) and 5 weeklies (*Witness*, &c.). In 1890 there were 12 papers, mostly dailies, published in eleven of the smaller towns, and in 1900, 21 papers, mostly weeklies, in sixteen towns. A notable exception to the vogue of the weekly paper is Invercargill, which has 3 dailies and 1 weekly.

Wellington had in 1900 the same number of papers as in 1890, *i.e.*, 3 dailies and 3 weeklies; but 23 papers, mostly weeklies, appeared in seventeen of the smaller towns, as against 14 papers, mostly dailies, in ten smaller towns in 1890.

Auckland, the capital, which had 3 dailies and 6 weeklies in 1890, had in 1900 only 2 dailies (*New Zealand Herald*, &c.) and 3 weeklies (*Weekly Herald*, &c.); but whereas in 1890 there were only 8 other papers, mostly dailies, published in six of the smaller towns, there were in 1900 12 papers, mostly weeklies, published in eleven towns.

Napier in 1890 had 2 dailies and 1 weekly, and nine smaller towns published 12 papers, mostly dailies. In 1900 Napier had 3 dailies (*Telegraph*, &c.) and 1 weekly, while 7 papers, mostly weeklies, were published in five other towns.

Christchurch, which had 4 dailies and 5 weeklies in 1890, had 5 dailies (*Press*, &c.) and 6 weeklies (*Weekly Press*, &c.) in 1900, while the numbers in the provinces remained the same, namely, 12 papers in nine towns, but they were mostly dailies in 1890 and mostly weeklies in 1900.

Nelson.—In 1890, 2 daily papers were published in the capital. In 1900, 3 dailies appeared in the capital, and 2 weeklies in the smaller towns.

Marlborough.—In 1900, 2 dailies and 2 weeklies were published at Blenheim, being double the number that appeared in 1890, and 2 weeklies were published in the smaller towns.

Taranaki.—In 1900, 2 dailies and 2 weeklies were published at New Plymouth, being double as many as appeared in 1890; and 2 dailies and 6 weeklies were published in five smaller towns.

Westland Province.—In 1900, 6 dailies and 7 weeklies were published in seven towns of this province, as against 7 papers, mostly dailies, in 1890.

Totals of Newspapers, 1900.

AUTHORITIES.—*Press Directories*, Mitchell's, Sell's, and Willing's. —FOX-BOURNE (H. R.). *English Newspapers*, 2 vols., London, 1877. —*Returns of the Newspapers in the British Museum.*—*Progress of British Newspapers in the Nineteenth Century*, illustrated, 1901. Simpkin Marshall and Co. (G. F. B.; D. E.)

Newton, a city of Kansas, U.S.A., capital of Harvey county, on the Atchison, Topeka, and Santa Fé and the Missouri Pacific railways, at an altitude of 1447 feet. Its site is level, its plan regular, and it is divided into four wards. The surrounding country is a fertile agricultural region, for which Newton serves as a supply and distributing point. Population (1900), 6208, of whom 756 were foreign-born and 251 negroes.

Newton, a city of Middlesex county, Massachusetts, U.S.A., on the right bank of the Charles river, and on the Boston and Albany Railway, in the eastern part of the state. Including an area of 18 square miles, it formerly contained several villages, which have extended until they have finally merged into one another, and at present the entire area is covered with urban settlement. Most of the inhabitants have their business interests in Boston. Population (1900), 33,587, of whom 10,068 were foreign-born and 505 negroes.

Newton, Alfred (1829–——), English zoologist, was born at Geneva on 11th June 1829. In 1854 he was elected travelling fellow of Magdalene College, Cambridge, of which he had been an undergraduate, and subsequently visited many parts of the world, including Lapland, Iceland, Spitsbergen, the West Indies, and North America. In 1866 he became the first occupant of the chair of zoology and comparative anatomy at Cambridge. He is especially known as an authority on ornithology, and his services to ornithology and zoogeography were recognized by the Royal Society in 1900, when it awarded him a Royal medal. He is the author of many books, including *Zoology of Ancient Europe* (1862), *Ootheca Wolleyana* (1864), *Zoology* (1874), and a *Dictionary of Birds* (1893–96), the last being an acknowledged standard work. The articles on BIRDS (in great part) and ORNITHOLOGY in the ninth edition of this Encyclopædia came from his pen, and he also wrote some of the smaller ones on ornithological subjects. He contributed many memoirs to scientific societies, and edited *The Ibis* (1865–70), the *Zoological Record* (1870–1872), and *Yarrell's British Birds* (1871–82).

Newton, Sir Charles Thomas (1816–1894), English archæologist, was born on 16th September 1816 at Bredwardine in Herefordshire, and educated at Shrewsbury and Christ Church, Oxford. His tastes were rather for classical art than for philology; he only obtained a second class in the schools, and he entered the British Museum in 1840 as an assistant in the Antiquities Department. All manner of antiquities, classical, Oriental, and mediæval, as well as ethnography, were then lumped together under one administration; and although the department possessed officers of great distinction as Egyptologists and numismatists, it had not, at the time of Newton's appointment, a single distinguished classical archæologist. The twelve years which he spent in it were years of assiduous self-instruction. In 1852 he quitted the Museum for a time to become vice-consul at Mitylene, with the object of exploring the coasts and islands of Asia Minor for antiquities. Aided by funds supplied by Lord Stratford de Redcliffe, then British ambassador at Constantinople, he made in 1852 and 1855 important discoveries of inscriptions at the island of Calymnos, off the coast of Caria; and in 1856–57 achieved the great archæological exploit of his life by the discovery of the remains of the famous mausoleum of Halicarnassus, one of the "seven wonders" of the ancient world. He was greatly assisted by Murdoch Smith, afterwards celebrated in connexion with Persian telegraphs. The results were described by Newton in his *History of Discoveries at Halicarnassus* (1862–63), written in conjunction with Mr R. P. Pullan, and in his *Travels and Discoveries in the Levant* (1865). These works included particulars of other important discoveries, especially at Branchidae, where he disinterred the statues which had anciently lined the Sacred Way, and at Cnidos, where Mr Pullan, acting under his direction, found the colossal lion now in the British Museum.

In 1855 the regius professorship of Greek at Oxford was offered to Newton, but he declined it. In 1860 he was made British consul at Rome, but had scarcely entered upon the post when an opportunity presented itself of reorganizing the amorphous department of antiquities at the British Museum, which was divided into three and ultimately four branches. The Greek and Roman section naturally fell to Newton, who returned as Keeper, and held the office until 1885, declining the offer of the principal librarianship made to him in 1878. The Mausoleum Room, to accommodate the treasures he had found in Asia Minor, was built under his supervision, but the most brilliant episode of his administration was the acquisition of the Blacas and Castellani gems and sculptures. The Farnese and Pourtalès collections were also acquired by him. He maintained an intimate connexion with the important excavations carried on during his term of office in Asia Minor and other regions of the ancient world, and took a leading part in the foundation of the Society for the Promotion of Hellenic Studies, the British School at Athens, and the Egypt Exploration Fund. He was Yates professor of classical archæology at University College, London, from 1880 to 1888. When, on his retirement from the Museum, his bust by Boehm, now placed in one of the sculpture galleries, was presented to him as a testimonial, he desired the unexpended balance to be given to the school at Athens. After his retirement he was for long much occupied with the publication of the Greek inscriptions in the British Museum, but his health failed greatly in the latter years of his life. He died at Margate on 28th November 1894. He had married in 1861 the daughter of his successor in the consulate at Rome, the painter Severn, herself a distinguished artist. She died after a short illness in 1866. Newton was knighted for his services to classical archæology. His narrative of his own explorations is somewhat dry, but there is much entertaining as well as instructive reading in his collected *Essays on Art and Archæology* (1886), especially those on the Mycenæan, Cyprian, Olympian, and other epoch-making discoveries. (R. G.)

Newton, John (1823–1895), American soldier, was born in Norfolk, Va., 24th August 1823, and after graduating at the U.S. Military Academy in 1842, was engaged on engineering duties. During the Civil War he was detailed upon the defences of Washington, and fought in the great battles of 1862 in the east. Promoted from brigadier-general (September 1861) to major-general of volunteers (March 1863), he commanded the corps of General Reynolds at Gettysburg after the death of that officer. In the west, in 1864, he took part in Sherman's invasion of Georgia. Returning to regular engineer duty once more in 1866, he enlarged and improved New York harbour and the Hudson and East rivers (1866–85), removing the dangerous rocks at Hell Gate, and solving new problems with great success. Appointed chief of engineers in March 1884, with the rank of brigadier-general, he retired from active service in August 1886. In 1887–88 he served as commissioner of public works in New York City, where he died 1st May 1895.

Newton-Stewart, a police burgh of Wigtownshire, Scotland, on the river Cree, 49¾ miles west by south of Dumfries. A tweed mill, an agricultural implement factory, and tanneries are the chief industrial features. There are two secondary schools—one for girls and one for boys. Population (1901), 2204.

Newtownards, a market town and urban sanitary district in the county of Down, Ireland, 9½ miles east of Belfast by rail. There are a weaving factory and a hosiery factory. A new market occupying 3½ acres has been erected. Population (1881), 8676; (1901), 9110.

New Ulm, a city of Minnesota, U.S.A., capital of Brown county, on the south bank of the Minnesota river, and on a line of the Chicago and North-Western Railway, in the southern part of the state. It was founded in 1854, destroyed in 1862 by Indians, but rebuilt. Population (1890), 3741; (1900), 5403, of whom 1924 were foreign-born.

New Westminster, a town on the north bank of the Fraser river, British Columbia, 15 miles from the mouth. It was founded in 1859, and was the capital of British Columbia when the British possessions on the Pacific coast formed two colonies—that is, British Columbia (the mainland portion) and Vancouver Island. The city is accessible to ocean-going ships of 16 feet draught. It is the chief centre of the farming country of the lower Fraser, and has one or two factories, but its chief trade is in connexion with the salmon canneries of the Fraser river. It has a small export lumber trade. In 1898 the greater portion of the business part of the city was destroyed by fire, and though much of it was rebuilt the establishment of the city of Vancouver, only eight miles distant, seriously affected New Westminster's prospects of rapid growth. It is connected with Vancouver by an electric railway. Population, about 6000.

New Whatcom, a city of Washington, U.S.A., capital of Whatcom county, at the head of Bellingham Bay, an arm of Puget Sound, and on a branch of the Great Northern Railway, in the north-western part of the state.

It is in the heavily forested region of the north-west, and its industries are chiefly related to lumber and its manufacture. It contains many saw and shingle mills, and ships large quantities of fir timber to southern parts. Population (1890), 4059; (1900), 6834, of whom 1425 were foreign-born.

NEW YORK.

NEW YORK, one of the original thirteen United States of America, and, from its pre-eminence in population, wealth, commerce, and industry, popularly known as the Empire State, is situated between 40° 29′ 40″ and 45° 0′ 42″ N., and 71° 51′ and 79° 45′ 54·4″ W. Its total land area is 47,620 square miles, or 30,476,800 acres. The climate of New York is in a general sense typical of that of the northern United States, hot in summer and cold in winter, yet healthful and stimulating. Apart from elevation, the important sources of local variation are the ocean, the Great Lakes, and certain marked irregularities of land surface which modify the direction and force of the winds. The effect of the ocean is greatly limited by the general eastwardly drift of the atmosphere. The population in 1880 was 5,082,871; in 1890, 5,997,853, exclusive of 5321 specially enumerated; in 1900, 7,268,894. The total increase in the last ten years of the 19th century (1,265,720, including those specially enumerated) was greater than in any former decade, while the percentage of increase (21·1) was greater than at any census since 1860. Since 1820 New York has been the most populous state in the Union. Of 160 cities in the United States (excluding Honolulu, in Hawaii) in 1900 having a population of 25,000 or more, 12 are in New York, namely, Greater New York, 3,437,202; Buffalo, 352,387; Rochester, 162,608; Syracuse, 108,374; Albany, 94,151; Troy, 60,651; Utica, 56,383; Yonkers, 47,931; Binghamton, 39,647; Elmira, 35,672; Schenectady, 31,682; Auburn, 30,345. The average population per square mile increased from 106·74 in 1880 to 126·1 in 1890, and 152·6 in 1900. New York has always been distinguished for a diversity of races. Out of 10,039,217 immigrants who arrived at the port of New York between 1st January 1856 and 30th June 1898, the declared destination of 3,930,857, or 39·2 per cent., was New York state, Germans, Irish, and English largely predominating. In 1900, 1,900,425 of the population were foreign-born and 99,232 were negroes. Of the native whites, those of foreign parentage numbered 2,415,845. Of the total population, 3,614,780 were males and 3,654,114 were females.

Recent History.—The state, owing to its size and its reflection of changes in political sentiment, has been an important factor in national politics. Since 1864 its electoral vote, which was then cast a second time for Abraham Lincoln, has regularly alternated between the Democratic and Republican candidates, till 1900, when it was cast the second time for William McKinley, the Republican candidate; and in each instance, except in 1868, when it went to Horatio Seymour, the Democrat candidate, and 1876, when the national contest was determined by the Electoral Commission, the candidate receiving the electoral vote of New York became President. The popular vote of the state in the Presidential contest of 1896 was: Republican, 819,838; Democratic, 551,369; National Democratic, 18,950; Prohibitionist, 16,052; Socialist-Labour, 17,667—a Republican plurality of 268,469; in the Presidential contest of 1900 the vote stood: Republican, 822,013; Democratic, 678,462; Socialist-Labour, 12,621; Prohibitionist, 22,077; Social Democratic, 12,869—a Republican plurality of 143,551. The pluralities of 1896 and 1900 are to be ascribed largely to the overwhelming sentiment in favour of the maintenance of the gold standard. Party preponderance in the state's delegation in the national House of Representatives has often shifted. Since 1860 only three of the United States senators from New York have been Democrats. Democratic governors were elected in 1874, 1876, 1882, 1885, 1888, and 1891; Republican governors, in 1879, 1894, 1896, 1898, and 1900. Local causes have sometimes produced marked results in gubernatorial contests, as when Cleveland (Democrat) received in 1882 a plurality of 192,854, and Morton (Republican) received in 1894 a plurality of 156,108. Since 1876 the control of the legislature has rested about four-fifths of the time with the Republicans, and since 1894 inclusive continuously.

During the war with Spain, New York furnished 20,870 men to state volunteer organizations, 3400 (estimated) to the United States navy, 2000 (estimated) to United States volunteer organizations, and 3000 (estimated) to the regular army, making a total of 29,270. The volunteer organizations included 210 cavalry and 325 artillery.

Constitution.—The present constitution was adopted 6th November 1894, and came into force 1st January 1895. Its main features are:—Separation of city from state and national elections; safeguards against abuses in legislative procedure, and against abuse of the elective franchise; provisions for the preservation of the forests; prohibitions of gambling; abolition of the statutory limitation of the right of recovery for injuries causing death to $5000; a new apportionment of senate and assembly districts, under which (1) no county may have more than three senators unless it shall have a full ratio for each senator, although smaller counties may receive a senator, or an additional senator, on a major fraction of a ratio, and (2) no county shall have more than one-third of all the senators, and New York and Kings counties together not more than one-half of all; the strengthening of civil service reform; the prohibition of the contract-labour system as to convicts; authority to improve the canals; provisions for free public schools, and prohibition of use of public money in aid of sectarian schools; the revision of the judiciary system; provision that there shall be a naval as well as a land force of militia, and that the militia shall not be reduced below 10,000 men. Suffrage is extended to every male citizen, 21 years old, who has fulfilled certain conditions of residence and who is not legally disqualified. Legislative power is vested in the Senate and Assembly, the former consisting of 50 members, chosen for two years, and the latter of 150, chosen for one year. Each member of the legislature is allowed a salary of $1500 a year, and a limited amount for travelling expenses. Restrictions are placed on private or local legislation, and on the debt-incurring power. The legislature meets every year on the first Wednesday in January. The executive power is vested in a Governor, who holds office for two years. A Lieutenant-Governor must be chosen at the same time and for the same term. The Governor is commander-in-chief of the military and naval forces of the state; has the right of appointment, with the advice and consent of the Senate, of different officials; has the right of removal, generally after hearing, of various state and local officers; and has power to fill vacancies. He has also extensive pardoning power. He is required to send an annual message to the legislature, may convene the legislature in extraordinary session, and possesses a limited veto in legislation. He receives $10,000 a year and a furnished residence. The Lieutenant-Governor, except when he becomes Governor, is president of the Senate, but has only a casting vote. The constitution provides for the election of a Secretary of State, Comptroller, Treasurer, Attorney-General, and State Engineer and Surveyor. The Superintendent of Public Works, the Superintendent of State Prisons, the State Board of Charities, the Prison Commission, and the Lunacy Commission are appointed by the Governor, with the advice and consent of the Senate. Appointments and promotions in the civil service are, by the constitution of the state, required to be made according to merit and fitness—to be ascertained, so far as practicable, by competitive examinations; but a preference in appointment and promotion, without regard to their standing in the list, is given to honourably-discharged soldiers and sailors of the Civil War. In 1900, 3190 persons were examined in the competitive merit class.

Judiciary.—The state is divided into four judicial departments, in each of which there is an Appellate Division of the Supreme Court. The justices composing the Appellate Division in each department are designated by the Governor from all the justices elected to the Supreme Court, but a majority of them must be residents of the department, as must the presiding justice, who is designated by the Governor. By the constitution of 1894, the Superior Court of the city of New York, the Court of Common Pleas for the city and county of New York, the Superior Court of Buffalo, and the City Court of Brooklyn, were abolished, and their jurisdiction, original and appellate, transferred to the Supreme Court and its appellate divisions. The justices of the Supreme Court are chosen at the general elections for terms of fourteen years. Circuit courts, and courts of oyer and terminer, were abolished, and their jurisdiction vested in the Supreme Court. The Supreme Court has general jurisdiction in law and equity. The Court of Appeals was continued. It consists of the chief judge and six associates, all chosen by the electors of the state for fourteen years. Five constitute a quorum, and the concurrence of four is necessary to a decision. Jurisdiction, except where judgment is of death, is limited to the review of questions of law. The legislature may restrict the jurisdiction of the court, but cannot make the right to appeal depend upon the amount involved. The existing county courts were continued. Courts of Sessions, except in the county of New York, were abolished from and after 31st December 1895, and their jurisdiction was transferred to the county courts. The Surrogates courts were continued. The electors of the several towns elect justices of the peace. Inferior local courts not of record, with civil and criminal jurisdiction, may be established by the legislature.

Local Government.—The state is divided into 61 counties, in each of which, unless it be coextensive with a city, there is a board of supervisors. The constitution provides for the election of the sheriffs, clerks of counties, district attorneys, and registrars by the electors of the respective counties; but any of them may be removed by the Governor after giving to such officer a copy of the charges against him, and an opportunity of being heard in his defence. All county, city, town, and village officers, whose election or appointment is not provided for by the constitution, are, at the discretion of the legislature, to be chosen by the electors of the various divisions, or appointed by such authorities thereof as the legislature shall designate. No county or city is, as a rule, allowed to become indebted to an amount exceeding 10 per cent. of the assessed valuation of its taxable real estate. The cities are classified as follows:—1st class, those having 250,000 or more inhabitants; 2nd class, 50,000 to 250,000; 3rd class, all other cities. By the census of 1900, Greater New York and Buffalo come within the 1st class; Rochester, Syracuse, Albany, Troy, and Utica within the 2nd; and the rest in the 3rd. By a law of 16th July 1898 the counties of New York, Kings, Queens, Richmond, and Westchester were constituted a Metropolitan Elections District, at the head of which was placed a superintendent, whose duty it is to prevent violations of the laws relating to elections.

Militia.—This includes all able-bodied male citizens between the ages of 18 and 45, who are residents of the state, subject to any exemptions created by federal or state law. By the constitution, there shall be maintained at all times a force of not less than 10,000 enlisted men, fully uniformed, armed, equipped, disciplined, and ready for active service. Under the Act of 2nd April 1898, the militia of the state consists of two parts—the active, comprising the organized and uniform forces known as the National Guard and Naval Militia, and the reserve, consisting of the rest of the militia. In times of peace the National Guard shall be not less than 10,000 and not more than 18,000 enlisted men. On 31st December 1901, 41 armouries were owned by the state, 16 by counties, 1 by the 7th regiment, and the United States was furnishing the use of two ships for the 1st and 2nd Naval Battalions. There was one state arsenal, in New York City.

Correction.—By the constitution the legislature is required to provide for the occupation and employment of prisoners sentenced to the state prisons, penitentiaries, gaols, and reformatories, but the products of this labour may be disposed of only to the state or a political division thereof, or to or for public institutions of the state. The penal institutions of the state include the state prisons at Sing Sing, Auburn, and Clinton, the Elmira Reformatory, the Eastern Reformatory at Napanoch, the reformatory for women at Bedford, the houses of refuge for women at Albion and Hudson, the six penitentiaries situated at New York, Brooklyn, Albany, Syracuse, Rochester, and Buffalo, the county gaols, the state industrial school at Rochester, the house of refuge for juvenile delinquents at New York, and the state hospitals for insane convicts at Matteawan and Dannemora. In the fiscal year ending 30th September 1901 the daily average number of convicts in the three state prisons was 3492, as against 3468 in 1900. On 1st October 1901 the number of inmates of the various penal institutions was: three state prisons, 3323; Elmira Reformatory, 1276; Eastern Reformatory, 234; houses of refuge for women, 359; six penitentiaries, 2206—total 7398, a decrease of 2453 since 1895. Including gaols and workhouses, the total prison population was 11,157, a decrease of 1504 since 1st October 1895. For the year ending 30th September 1901 the cost of care and maintenance of the three state prisons was $483,644; the net earnings of the convicts amounted to $45,441. At the Elmira Reformatory instruction is given in trades, manual training, physical training, military organization, letters, and religious exercises. Three characteristics of the system there employed are (1) the indeterminate sentence, (2) the parole or conditional release, (3) the grades and marking system. The results have been highly satisfactory. The condition of the county gaols and of the penitentiaries in 1898 was pronounced by the Prison Commission to be very bad. The Commission's report for 1901 states that "marked progress has been made during the year in the work of gaol improvements."

Sanitation.—The health of the state is cared for by the Board of Health and the Board of Commissioners of Quarantine. During 1900 there were 130,268 deaths reported for the state, making a death-rate of 17·9 per thousand of the reporting population, as against 19·6 in 1890.

Care of the Insane.—The whole number of committed insane in the state, 30th September 1900, was 23,778, an increase of 755 over the previous year. Of these, the whole number in state hospitals, including the Matteawan state hospital for insane criminals (752 patients), was 22,840; on 1st October 1899 there were 21,435 inmates of the state hospitals; on 1st October 1900, 22,088. There are 11 state hospitals, besides that at Matteawan, situated at Utica, Willard, Poughkeepsie, Middletown, Buffalo, Binghamton, Ogdensburg, Rochester, Long Island, New York, and Gowanda. In 1900, of those discharged, 1029 had recovered, 1249 were handed over to the custody of friends or public officials, and 49 were adjudged not insane. The expenditures for the year ending 30th September 1900 for the support of the state hospitals were $3,594,873, or $164.79 per inmate.

Charities.—By the constitution the legislature is required to provide for a State Board of Charities, which shall visit and inspect, with certain exceptions, all institutions, state, county, or municipal, which are of a charitable, eleemosynary, correctional, or reformatory character, and institutions for epileptics or idiots. There are 14 state institutions subject to the authority of the Board, situated at Rochester, Syracuse, Batavia, Newark, Bath, Iroquois, Albion, Bedford, Rome, Sonyea, Oxford, Hudson, and Tarrytown, and in the Adirondacks. The receipts of these institutions for the fiscal year ending 30th September 1900 amounted to $1,345,720; their expenditures to $1,254,223, $837,670 being for maintenance and $380,000 for improvements, while $36,553 were returned to the state treasurer. The number of their beneficiaries was 7056. Besides these, there are ten other institutions, mainly supported by state appropriations, but under private management. The receipts of these institutions for the fiscal year ending 30th September 1900 were: from cash in hand, $63,925; from public sources, $612,471; from private sources, $307,699; their expenditures aggregated $940,189. The total number of their beneficiaries was 3273. Provision is made for the separate care of idiotic and feeble-minded persons. Besides state institutions, the Board also has under its control over 1000 other institutions, societies, and associations under private control, including hospitals, homes, dispensaries, orphan and other asylums, reformatories, day nurseries, general and special relief societies, and other charitable organizations. The almshouses are county, city, and town institutions. Their inspection in 1900 showed general improvement. The number of inmates of the county almshouses on 1st October 1899 was 5496; on 1st October 1900, 5472. Of the latter, 754 were able-bodied; 3603 sick or infirm; 35 insane; 621 feeble-minded or idiotic; 152 epileptic; 154 blind; 75 deaf; 78 minors. The total number of persons supported during the year was 15,780. Of these, 8172 were native, 7608 foreign. The total expenditures in direct connexion with the almshouses were $762,572. In the city and town almshouse institutions, on 1st October 1899, there were 7476 inmates; on 1st October 1900, 7364. The total supported during the year was 70,409. Of these, 30,915 were native, 39,494 foreign. The total expenditures in direct connexion with these almshouses were $1,495,519. The number of persons receiving temporary relief during the year was 209,092, and the total expenditures were $1,120,876. The number and classification of beneficiaries in institutions subject to the supervision of the Board, on 1st October 1900, was as follows:—Aged and friendless persons, 3368; almshouse inmates, 10,794; blind, 641; deaf, 1672; dependent children, 26,998; disabled soldiers and sailors, 1969; epileptics in almshouses, 357; epileptics in Craig Colony, 612; hospital patients, 6217; idiotic and feeble-minded in almshouses, 1257; idiotic and feeble-minded in state institutions, 1312; juvenile offenders, 3658; inmates of reformatories, 1800; total, 60,655. During the year ended 30th September 1900 the institutions under the supervision of the Board had an income of $17,312,302. They expended $16,107,496, and owned real and personal property conservatively estimated to be worth $66,805,054.

Education.—By the constitution the legislature is required to maintain a system of free common schools, wherein all the children of the state may be educated. The use of public money in aid of sectarian schools is forbidden. The public schools are under the supervision of a State Superintendent of Public Instruction, and of local commissioners and superintendents. Besides the state normal college at Albany, there are state normal and training schools at Brockport, Buffalo, Cortland, Fredonia, Geneseo, Jamaica, New Paltz, Oneonta, Oswego, Plattsburg, and Pottsdam. On 31st July 1900 there were in the state 11,740 school districts. The number of licensed teachers employed for the legal term of 160 days during the preceding year was 31,768. The number of children of school age was 505,018 in the towns and 1,064,635 in the cities—a total in the state of 1,569,653. The number of children attending school some portion of the year was in the towns 454,215 and in the cities 755,359—making a total of 1,209,574 for the state. The average daily attendance in the towns was 305,800 and in the cities 551,688, showing an average attendance for the entire state of 857,488. The amount paid for teachers' salaries was $19,218,892, and the average annual salary was $604. The sum of $1,030,393 was expended for buildings, sites, and repairs in the towns, and $7,518,250 in the cities. The total reported value of the schoolhouses and sites was $81,768,495. The total expenditures for the public schools were $33,421,491, an increase over the previous year of $5,368,500. The total expenditures for public educational interests directly connected with the department were $34,513,455. The University of the state of New York, incorporated 1st May 1784, and made a constitutional body 1st January 1895, is a supervisory and administrative, not a teaching institution. Its powers are exercised by nineteen elective regents, and by the Governor, Lieutenant-Governor, Secretary of State, and Superintendent of Public Instruction, who are *ex officio* regents. Regents are elected in the same way as United States senators, and are the only public officers in New York state chosen for life. They are unsalaried. The regents have power to incorporate, and to alter or revoke the charters of universities, colleges, academies, libraries, museums, or other educational institutions; to distribute to them funds granted by the state for their use; to inspect their workings, and require annual reports under oath of their presiding officers; to establish examinations as to attainments in learning, and confer on successful candidates suitable certificates, diplomas, and degrees. On 30th June 1900 the institutions in the University included 34 colleges, 76 professional and technical schools, 140 academies, 565 high schools, and 175 libraries. During the fiscal year ending 30th September 1900 there was expended for academies $2,018,953, for high schools $4,077,420, for colleges and for professional and technical schools, $7,663,037.

Churches.—By the census of 1890 there were in the state 8237 religious organizations, 7942 church edifices, church property of the value of $140,123,008, and 2,171,822 church members or communicants. Membership and property were distributed as follows:—

Denomination.	Membership.	Property.
Baptist	142,736	$13,625,588
Catholic	1,153,650	25,769,478
Congregationalist	45,686	5,175,262
Friends	7,078	767,450
Jewish	45,807	4,315,200
Lutheran	89,046	4,693,375
Methodist	265,551	18,305,200
Presbyterian	168,564	22,727,192
Protestant Episcopal	127,961	31,142,613
Reformed	55,973	7,698,280
Unitarian	4,470	1,717,500
Universalist	8,526	1,798,250

Wealth.—By the census of 1890, New York stood easily first in the valuation of real estate and improvements, gold and silver, coin and bullion, machinery of mills and product on hand (raw and manufactured), railways and equipments, telegraphs, telephones, shipping, canals and improvements, and miscellaneous property. She stood third in the value of live stock on farms, farm implements, and machinery; and ninth in the value of her mines and quarries, including the product on hand. The following table shows the proportionate valuations of real and personal property for the purposes of taxation from 1875–1900:—

Year.	Assessed Valuation, Real Property.	Assessed Valuation, Personal Property.	Total Assessed Valuation, Real and Personal Property.	Percentage, Real Property.	Percentage, Personal Property.
	$	$	$		
1875	1,960,352,703	407,427,399	2,367,780,102	82·8	17·2
1880	2,315,400,526	322,468,712	2,637,869,238	87·8	12·2
1885	2,762,348,218	332,383,239	3,094,731,457	89·3	10·7
1890	3,298,323,931	385,329,131	3,683,653,062	89·5	10·5
1895	3,841,582,748	450,499,419	4,292,082,167	89·5	10·5
1900	4,811,593,059	649,709,693	5,461,302,752	88·1	11·9

The extreme undervaluation, of personal property especially, is evident.

Finances.—The debt of the state, 30th September 1901, was $10,075,660. The capital of the several trust funds belonging to the state was: Common School Fund, $4,573,140; Literature Fund, $284,201; United States Deposit Fund (1837), $4,014,520; Military Record Fund, $39,121—total $8,910,982. The balance in the treasury, 1st October 1900, was $7,289,802; receipts from all sources during the fiscal year, $30,544,694—total, receipts and balances, $37,834,496. The total receipts, however, include temporary loans, transfers to and from various funds, and transactions on account of trust funds. Deducting these, the receipts would amount to $27,704,817, practically representing the product of taxation. The payments for all purposes amounted to $28,045,146, leaving in the treasury, 30th September 1901, $9,789,350. The general property tax, at the rate (1900) of $1\frac{26}{100}$ mills on the dollar, amounted to $10,704,153. The receipts from indirect taxes were $15,565,890. Of the latter, the tax on corporations yielded $4,966,680; on transfers of property, $4,084,606; licences for the sale of liquors, $4,197,858. The appropriations for the year were: for General Fund, $11,814,481; for Canal Fund, $1,760,921; for School Fund, $4,225,500; for the insane, $4,506,705—total, $22,307,607. The liquor-tax law of 1896, since amended, divided licence taxes into six grades: for cities of 1,500,000 or more, $800; of 500,000 or more, $650; of 50,000 or more, $500; of 10,000 or more, $350; of 5000 or more, $300; of 1200 or more, $200. In any other place the tax is $100. There are different rates for places where liquors are not to be drunk on the premises. In the law there were also local option provisions. For the fiscal year ended 30th September 1901 the net receipts from liquor licences, fines, and penalties were $12,415,046. Of this the state received $4,198,377; towns and cities, $8,216,669. The number of licences issued during the last year of the old law, 1895–96, was, in the cities, 22,937; outside cities, 10,320—total, 33,257. The number of certificates (saloon, hotel, and club) in force, 30th April 1901, was 26,835.

Banking.—On 12th September 1901 there were 195 banks of deposit and discount in the state system, having capital stock, $28,245,700; surplus funds and undivided profits, $29,176,768. The total resources of such banks, 12th September 1901, were $403,477,311; of savings banks, 1st July 1901, $1,105,076,764; of trust companies, $966,528,398; of safe deposit companies, $5,475,091; of foreign mortgage companies, 1st January 1901, $5,690,620; of building and loan associations, $59,653,737—total, $2,545,901,921, an increase of $283,899,506 over the previous year. On corresponding dates in 1900 the total resources of the same classes of institutions amounted to $2,185,433,300, an increase of $121,116,072 over the previous year. On 30th September 1901 there were 341 national banks in operation in the state, with an aggregate capital of $104,828,290 and a combined surplus and undivided profits of $107,792,289. There has been a large increase in the organization and business of trust companies with banking functions. The reports of these institutions, 31st December 1900, showed, among total resources of $797,983,512, loans on collateral, $387,911,415; on personal securities, $39,840,066; in stock investments, $196,852,583; bonds and mortgages, $40,730,576; cash on deposit with other banks, $96,337,243; while they showed, among liabilities, general deposits of $392,753,744; deposits in trust, $245,367,996; surplus funds, $76,123,784; capital stock, $47,150,000. These figures show an increase, as compared with the year before, of $59,700,000 in loans on collateral security, of $25,700,000 in cash on deposit with other banks, of $28,600,000 in stock and bond investments, of $31,800,000 in trust deposits, and of $82,700,000 in general deposits. The reports of trust companies, 1st July 1901, showed total resources of $966,528,398; deposits, $802,518,096; aggregate capital, $47,450,000; surplus and undivided profits, $98,391,728; earnings for six months, $22,159,857; expenses, including interest and taxes, $11,828,393. In 1890 building and loan associations were placed under the supervision of the Superintendent of Banks. The whole number on the official list, 31st December 1898, was 373, of which 360 were building and loan associations and 13 building lot associations. About 1888 there sprang up in New York state a new type called "national," whose loaning territory is not limited, and who have soliciting agents. There were 48 of these on the list. The assets of the "nationals" were $17,729,057; of locals, $30,905,857—total, $48,634,914.

Insurance.—During the year ending 30th September 1900 the total receipts of the insurance department were $297,944; total expenditure, $183,752. The gross receipts of life and casualty companies doing business in the state were $392,358,740. The disbursements were $261,467,238, as follows: $120,945,587, paid in claims; $22,190,804, lapsed and suspended policies; $22,568,260, dividends to policy-holders; $980,562, dividends to stockholders; $45,223,551, commissions; $23,458,090, salaries and medical examiners' fees; $26,100,380, miscellaneous purposes. The business done in the state during 1900, including "industrial" business, was as follows: policies in force, 3,320,149, insuring $1,476,150,662; issued during 1900, 898,073, insuring $332,173,010; premiums received, $54,775,074; claims incurred, $21,896,164; claims paid, $21,921,741. For the fire and marine companies the receipts during the year were $158,934,378, the disbursements, $155,803,510, being less than the receipts by $3,130,868. In business done in the state the fire premiums received were $22,867,152; fire losses incurred, $16,377,644; fire losses paid, $16,040,452; estimated expenses of business, $7,622,383; showing, on the whole, an apparent net excess of fire losses incurred and estimated expenses over fire premiums received of $1,132,875. The receipts of fraternal organizations were $41,178,094, and disbursements $38,549,276. The receipts of co-operative associations were $10,222,172; payments for claims, $6,613,074; and for expenses, $2,589,763. The following table gives other important statistics:—

Number of Companies.	Assets.	Liabilities except Capital.	Capital.	Surplus.	Risks in Force.
	$	$	$	$	$
Fire (169) .	313,875,420	148,200,737	79,259,239	107,034,939	22,423,334,216
Marine (13) .	17,407,568	4,612,549	200,000	12,595,019	621,263,991
Life (40) .	1,723,737,723	1,565,459,781	10,340,500	158,277,942	8,345,379,153
Casualty (31)	47,326,359	18,865,766	14,894,000	13,566,592	4,416,101,854
Totals (253)	2,102,347,070	1,737,138,833	104,693,739	291,474,492	35,806,079,214

Transportation.—The state canal system comprises the Erie, Oswego, Champlain, Cayuga and Seneca, and Black river canals, having a total length of 638 miles. The privately-owned Delaware and Hudson canal, from Rondout to the Pennsylvania state line, has been almost entirely abandoned. The Erie canal, extending across the state and forming a low-level route to the west, largely contributed to the commercial supremacy of city and state. Lately its relative importance has rapidly declined. In 1890 the value of property transported on all the state canals was $145,761,068, including $112,470,461 on the Erie; in 1900 it was only $84,123,772, including $66,903,696 on the Erie. In 1890 there went from tide-water, by the canals, 1,304,274 tons; in 1900, 834,481 tons. In 1890 there arrived at tide-water, by the canals, 2,846,930 tons; in 1900, 1,340,631, comprising, by way of the Erie, 596,246 tons from western states and 341,001 from New York, and by the Champlain canal, 134,798 tons from Vermont and Canada and 268,586 from New York. In 1868, 44 per cent. of the tonnage across the state was canal-borne; in 1898, 5 per cent. A committee of experts in 1900 recommended the enlargement of the Erie canal at a cost of $58,894,668, so as to admit 1000-ton boats. The railway facilities of the state show steady improvement. On 30th June 1901 the length of steam railways (not including second track, sidings or turnouts) in operation was 8143 miles. Of elevated railways (all in Greater New York) there were 73 miles. Of surface lines there were 1545. Only 70 miles of surface lines were worked by horses. The expenses of the steam railways per mile worked, for the year ending 30th June 1901, were, for maintenance of way and structure, $2045; for maintenance of equipment, $2100; for conducting transportation, $6345; for general expenses, $375; total, $10,865. For all the railways doing business in New York the entire passenger train mileage was 79,129,682; the freight mileage, 80,794,862; all other mileage, 31,563,264; the number of passengers carried, 199,358,549; the tons of freight carried, 197,041,867. The passenger profit per mile worked was $1040; the freight profit, $3886; the gross earnings, $15,793; the net earnings, $4926. In 1900 the state appropriated $150,000 for good roads, and in consequence 23 roads, covering 53·8 miles, were constructed at a cost of $377,594, one-half being paid by the localities.

Commerce.—The value of the foreign imports into the port of New York was, of dutiable goods, in 1900, $304,855,071; 1899, $294,505,183; of free goods in 1900, $221,251,710; 1899, $224,290,748; of specie and bullion in 1900, $29,039,486; 1899, $31,191,223. The value of exports to foreign ports was, of domestic exports in 1900, $526,153,270; 1899, $467,554,122; of foreign exports in 1900, $12,090,402; 1899, $9,059,156; of specie and bullion in 1900, $102,933,991; 1899, $84,729,255. The total foreign imports were valued at, in 1900, $555,146,267; 1899, $549,987,154; the total exports in 1900, $641,177,663; 1899, $561,342,533. For the fiscal year ended 30th June 1900 the value of the imports and exports of the port of New York was $1,168,785,559, of which $140,638,207 was carried in American vessels, $1,024,613,977 in foreign vessels, and $3,533,375 in land vehicles. Of the entire $233,164,871 received from duties at all the ports of the United States in the year ended 3rd June 1900, $152,333,877 was received at the port of New York. Of 34,014 vessels, with a tonnage of 28,163,005, which entered all United States ports in the same year, 12,287, aggregating 10,169,040 tons, entered the ports of the state of New York. Of 23,333 vessels with a tonnage of 5,164,839, registered, enrolled, and licensed in the United States, 30th June 1900, 4988, aggregating 1,354,444 tons, belonged to New York ports.

Manufactures.—By the census of 1900 New York stood first in manufactures. Out of a total production of $13,040,013,638 for the whole Union, that of New York was $2,175,766,900. The number of establishments reporting was 78,659; capital value, $1,679,906,515; wage-earners, 849,092; wages, $408,864,952; salaried officials, 74,482; salaries, $82,077,648. In 1890 the number of establishments was 65,840; capital value, $1,130,161,195; value of product, $1,711,577,671; wage-earners, 752,066; wages, $370,380,559; salaried officials, 98,018; salaries, $96,466,083. Out of the 369 industries specified in the census of 1890, New York, in value of product, was first in 164, second in 60, third in 36, fourth in 13, and of importance in almost all. Industries whose product was valued at $20,000,000 or more were baking (bread, &c.), carpentering, chemicals, men's clothing (factory-made), women's clothing (factory-made), roasting and grinding of coffee and spices, flour and grist mills, foundries and machine shops, furniture, hosiery and knitted goods, leather, malt liquors, lumber, masonry, plumbing and gas-fitting, printing and publishing (book and job), printing and publishing (newspapers and periodicals), and tobacco, cigars, and cigarettes.

Labour.—In 1901 the Bureau of Labour Statistics, the State Factory Inspector's Department, and the Board of Mediation and Arbitration were superseded by a Department of Labour. A free public employment bureau was opened in New York City in 1896. On 30th September 1901 there were 1881 labour organizations in the state, with a membership of 276,141 persons—261,523 men, 14,618 women. The whole number of wage-workers was estimated in 1898 at 1,755,000. The general average of wages for organized labour for seven quarters (four in 1897 and three in 1898), per quarter, was $167 for men and $80 for women. In 1898, as compared with 1897, there was a general increase in the earnings of men, but an opposite tendency in those of women; the average quarterly earnings of men approximated, in 1899, \$187; 1900, \$179; 1901, \$189. Children under 14 are forbidden to be employed in factories. Children between 14 and 16 may be so employed on the certificate of a health officer.

Agriculture.—By the census of 1890 New York stood third in the number and in the valuation of farms, second in the value of farm products, and seventh in the number of improved acres. The number of farms was 226,223; their valuation, including implements, machinery, and live stock on hand, \$1,139,310,716; the value of their product, \$161,593,009. The live stock included 664,430 horses, 4386 mules, 37,293 working oxen, 1,440,230 milch cows, 653,869 other cattle, 843,342 swine, and 1,528,979 sheep, not including spring lambs. The product of wool was 6,715,686 ℔. Dairy products, in which New York stood easily first, embraced 663,917,240 gallons of milk, 98,241,813 ℔ of butter, and 4,324,028 ℔ of cheese. The state also stood first in buckwheat, 4,675,735 bushels; Irish potatoes, 24,616,736 bushels; maple syrup, 457,658 gallons; hops, 20,063 ℔; pears, 588,767 bushels; grapes for the table, 60,687 tons: second in hay, 6,675,658 tons; maple sugar, 10,485,623 ℔; grapes for wine, 15,172 tons, making 2,528,250 gallons of wine: third in honey, 4,281,964 ℔; rye, 3,065,623 bushels: fourth in wax, 66,654 ℔; barley, 8,220,242 bushels; apples, 8,493,846 bushels: seventh in plums and prunes, 73,411 bushels: ninth in oats, 38,896,479 bushels: tenth in tobacco, 9,316,135 ℔: seventeenth in wheat, 8,304,539 bushels: twenty-first in Indian corn, 15,109,969 bushels. In market-garden products, including small fruits, she stood first, with a valuation of \$3,400,172. The production of cereals, hay, and potatoes was as follows in 1900: barley, 3,751,942 bushels; buckwheat, 3,280,158 bushels; Indian corn, 17,236,032 bushels; oats, 44,538,974 bushels; rye, 3,189,165 bushels; wheat, 6,496,166 bushels; hay, 3,351,991 tons; potatoes, 27,481,356 bushels.

Forestry.—On 30th September 1899 the state owned, in the Forest Preserve, 1,200,673 acres. On 15th November 1900 the aggregate was 1,327,315 acres, of which 1,250,803 were in the "Adirondack Preserve" and 76,512 in the "Catskill Preserve." Of the increase, 125,478 acres were purchased at a cost of \$381,320, an average of \$3 an acre. The purchases for the Catskill Preserve, in the year ended 30th September 1900, amounted to 18,126 acres and cost \$42,817, an average of over \$2 an acre. On 30th September 1901 the aggregate owned by the state was 1,408,181 acres, of which 1,325,851 were in the Adirondack Preserve and 82,330 in the Catskill Preserve. Purchases in the Catskill region during 1901 amounted to 5605 acres, at an average of over \$2 per acre. The Adirondack Park was increased by 36,458 acres, at nearly \$4 per acre. Of this park, comprising 3,226,144 acres, the state owns 1,163,414 acres. The assessed valuation of the state lands in the Forest Preserve counties in 1901 was \$2,459,223. The New York State College of Forestry, which constitutes a department of Cornell University, has the use of a large tract in the Adirondack Preserve.

Fisheries.—By the census of 1890 New York stood fourth in fisheries products, with a valuation of \$3,798,815, as against \$4,380,565 in 1880. In the Menhaden fisheries she still stood first, although in 1880 the value of their product was \$1,114,158, and in 1890 only \$628,212. In the oyster fisheries she stood third, with a valuation of \$1,765,088, as against \$1,577,050 in 1880. She stood fifth in her general fisheries, the value of their product being \$1,396,767, as against \$1,689,357 in 1880. In 1889 the number of persons employed was 9321; in 1880, 7266. In 1889 the capital employed was \$5,125,361; in 1880, \$2,629,585. In 1889 the number of vessels employed was 809, net tonnage 9770, value, \$1,052,192; in 1880, the number of vessels was 541, tonnage, 11,582; value, \$777,600. In the value of inland fisheries New York by the census of 1890 stood sixth, with a valuation of \$82,412; in the products of the Great Lake fisheries she stood fifth, with a valuation of \$165,116. The Fisheries, Game and Forest Commission is charged with the duty of stocking the waters of the state.

Mineral Resources.—According to the census of 1890, New York in 1889 stood sixth among the states in the value of her mineral productions, which embraced iron ores, petroleum, natural gas, stone, gypsum, graphite, corundum, salt, and mineral waters, and were valued at \$24,156,206 out of a total of \$587,230,662. In 1898 she stood fifth in clay products, including various kinds of brick, tile, sewer pipes, ornamental terra-cotta, fire-proofing, and pottery, valued at \$6,448,989. In 1899 she stood fifth in limestone, valued at \$1,545,669; fourth in marble, valued at \$338,816; second in sandstone, valued at \$1,218,053; and first in mineral waters, with a value of \$809,056. Slate for roofing and other purposes is obtained in abundance in the slate belt in eastern New York and western Vermont, and the only cherry-red slate found in the world is in New York. The production of fibrous talc in the United States is carried on exclusively in St Lawrence county. Colourless tourmaline is found at Dekalb. The granite product decreased from \$516,847 in 1898 to \$306,711 in 1899; natural gas increased from \$229,078 to \$294,593; petroleum, from 1,205,250 brls. to 1,320,909 brls., while the price rose from 91½ cents per brl. to \$1.29⅝. In 1899 New York stood sixth in the value of iron ore production, the total product being 443,790 long tons, valued at \$1,241,985, including 344,159 long tons of magnetite, 45,503 tons of red and 31,975 of brown hæmatite, and 22,153 tons of carbonate. The increase of total product over 1898 was 263,839, or nearly 150 per cent. In 1880, 1890, and 1900 New York and Michigan produced more than half the salt mined in the United States.

New York City, the largest city of the state of New York, U.S.A., and of the United States. According to the United States census of June 1900, the city of New York contained a population of 3,437,202. Its population by the census of 1890 was 1,515,301. The immense growth of the decade, as shown by this comparison, was due largely to a change of boundary lines in the year 1897, by virtue of which there was annexed to the city of New York the populous city of Brooklyn, which in 1890 had a population of 806,343 (or, including suburbs annexed soon afterwards, 838,547), and which, at the time of its absorption into the metropolis, had a population of over 1,000,000. The original town, named by its Dutch founders New Amsterdam, had been situated at the extreme south end of Manhattan Island, and its growth had been gradually northwards, involving the absorption of several villages, until at length the boundaries of the city had become coterminous with those of the island and of the county of New York. Manhattan Island is 13½ miles long, and has an average width of 1¾ miles. Its total area is 21 square miles. By an enactment of May 1873, which came into effect on 1st January 1874, there was added what for some time afterwards was known as the Annexed District, this being an area somewhat less in extent than Manhattan Island, directly to the north, between the Hudson river on the west and Long Island Sound on the east. Some slight further additions were made in 1895 in rectification of the boundaries of this Annexed District, and thus the total area in 1897, before the larger consolidation was effected, was 40·22 square miles. The area of the enlarged city, by virtue of the Act which came into effect on 1st January 1898, is 307⅓ square miles. The great extent of this area is due to the inclusion of (1) a large part of the suburban county of Queens, adjacent to the city of Brooklyn, comprising about 123·98 square miles; and (2) Staten Island, which had constituted Richmond county, and which lies between the Upper Bay of New York and the ocean, with an area of 57·19 square miles and a comparatively small population.

Population and area.

As constituted by this important enactment, the area and jurisdiction of the city of New York include all that pertains in the strict sense to the metropolis and the greater part of what may be regarded as the suburban belt—in so far as the state of New York is concerned. It happens, however, that the Hudson river, which forms the western boundary line of Manhattan Island, separates the state of New York from the state of New Jersey; and on the New Jersey side of the Hudson river very important residential and manufacturing suburbs have grown

Walker & Cockerell sc.

up, which would have been included as a part of the new metropolitan aggregation but for the practical impossibility of uniting in a single municipal corporation the populations and territories of urban districts which, though adjacent and belonging in the commercial sense to one community, are nevertheless in different states. But for this difficulty an area including Jersey City, Hoboken, Newark, Paterson, and many smaller New Jersey towns and cities would have been comprised in the consolidation, and the metropolis would thus at the opening of the 20th century have had an area of approximately 500 square miles and a population of approximately 4,500,000. This New Jersey population, of which, by the census of 1900, more than 1,000,000 lived within 20 miles of the New York City Hall, belongs in the commercial sense to the great community quite as essentially as any other portions of the so-called Greater New York. As actually constituted, the city of New York has an extreme length north and south of about 33 miles, and an extreme width east and west of about 18 miles. The consolidation was brought about by a law bearing the following title: "An Act to unite into one municipality under the corporate name of the city of New York the various communities lying in and about New York Harbour, including the city and county of New York, the city of Brooklyn and the county of Kings, the county of Richmond, and a part of the county of Queens, and to provide for the government thereof." This enactment for purposes of administration divided the city of New York as thus constituted into five boroughs, designated respectively Manhattan, the Bronx, Brooklyn, Queens, and Richmond. Manhattan perpetuates the earlier boundary line of New York City, in that it includes Manhattan Island, together with a few minute adjacent islands lying in the harbour and the East river, which latter separates Manhattan Island from Long Island, which lies to the eastward. The borough of the Bronx includes what had been known as the Annexed District lying beyond the Harlem river (which forms the northern boundary of Manhattan Island), and comprises territory extending from the Hudson river on the west to the East river and Long Island Sound on the east. The borough of Brooklyn comprises what had formerly been the city of Brooklyn. The borough of Queens (which includes Long Island City, Flushing, College Point, Jamaica, Lawrence, Far Rockaway, &c.) consists of that part of Queens county lying on Long Island beyond the limits of the city of Brooklyn, which was included in the consolidation. The borough of Richmond comprises what had been Richmond county, and what is still locally known as Staten Island. The two boroughs of Manhattan and Brooklyn, while much smaller in extent than the other three, include the great bulk of the population. The following table shows the areas of these five boroughs, together with their population in 1880, 1890, and 1900:—

Area and Population of New York City by Boroughs.

	Area, sq. miles.	Population.			Increase from 1890 to 1900.		Increase from 1880 to 1890.	
		1900.	1890.	1880.	Number.	Per cent.	Number.	Per cent.
New York City . . .	307·34	3,437,202	2,492,591	1,901,345	944,611	37·8	591,246	31·0
Manhattan Borough .	21·07	1,850,093	1,515,301	1,206,299	535,299	35·3	309,002	25·6
Bronx ,, .	39·33	200,507						
Brooklyn ,, .	65·77	1,166,582	838,547	599,495	328,035	39·1	239,052	39·8
Richmond ,, .	57·19	67,021	51,693	38,991	15,328	29·6	12,702	32·5
Queens ,, .	123·98	152,999	87,050	56,560	65,949	75·7	30,490	53·9

As shown by the above summary, the boroughs of Manhattan and Bronx, or what was formerly New York City, increased 35·3 per cent. from 1890 to 1900, as against an increase of 25·6 per cent. from 1880 to 1890. The percentage of increase in Brooklyn borough was substantially the same from 1890 to 1900 as in the ten years preceding, being 39·1 per cent. and 39·8 per cent. respectively, while Richmond borough increased 29·6 per cent. from 1890 to 1900, and 32·5 per cent. from 1880 to 1890. The largest percentage of increase is shown in Queens borough, which increased 75·7 per cent. from 1890 to 1900, as against 53·9 per cent. from 1880 to 1890. The rapid development of well-considered plans for the improvement of transit facilities to the suburbs in all directions has made it certain that the census of 1910 will show an unprecedented growth of population in the outer zones.

Not to pause here for review of the earlier history or growth of the city, it may be recalled that in the period immediately before and after the Civil War a great majority of the population was either of foreign birth or of foreign-born parentage; and of the alien elements, the Irish and the Germans greatly preponderated over all others. The state census of 1875 showed that the population had passed 1,000,000. The numbers for 1880 had grown to 1,206,299; and in that year the American-born were 727,629 and the foreign-born 478,670, of whom almost 200,000 were from Ireland and more than 153,000 from Germany. Many of the American-born were, of course, children of foreign-born parents.

In view of the profound changes in the origin of the more recent immigration to the United States, it is important to note the fact that in 1880 there were in the city of New York only 12,233 persons born in Italy, and only 4551 born in the Russian empire. The census of 1890 gave New York City a population of 1,513,501. By this time the density of the population in the more closely inhabited parts of Manhattan Island had reached a point much in excess of that of any other city in the world. The actual growth of the metropolis is in no manner truly indicated by the apparent gain of 300,000 people in the decade, inasmuch as a very large portion of the actual increase had overflown from Manhattan Island into the outer metropolitan zones on Long Island, in New Jersey, or northwards in Westchester county. The analysed returns for 1890 showed a foreign-born population of 875,358, of whom about 150,000 had come from Russia, Austria-Hungary, and Italy. Previous to 1870 the immigration from southern and eastern Europe had been insignificant. It had fairly begun before 1880, and had taken on importance in the following decade. Scarcely any one had come to America from Austria-Hungary before 1870; but about 350,000 had come in the decade ending in 1890, and in the last decade of the 19th century there came 597,047. Similarly there had set in a large stream from the Russian empire, chiefly Jews; and in the last years of the 19th century the persecution of that race in Russia multiplied the number of pilgrims to America. In the years from 1890 to 1900 the number that came from Russia was 507,089. From Italy there had come to the United States about 70,000 people in the sixty years from 1820 to 1880, and more than 307,000 in the next ten years. From 1890 to 1900 the Italian immigration was 655,694. Thus the Italian immigrants alone at the end of the century were as numerous as the Irish, Scottish, English, German, and Scandinavian all put together.

Every succeeding wave of immigration which spread across the North American continent had left some residue in New York City, and in the last years of the 19th century the establishment of large and distinct elements of Italians and Polish Jews was as marked a fact in the city's social and industrial situation as the influx of Irishmen and Germans had been in the period from 1850 to 1870. Newspapers in the Yiddish dialect of the Hebrew language, and Yiddish theatres, marked the advent of hundreds of thousands of Jews.

In 1900 the composition of the population by sex, general nativity, and colour is shown by the following table. The class "negro" includes all persons of negro descent; the class "coloured" includes negroes, and also Chinese, Japanese, and Indians.

Borough.	Males.	Females.	Native-born.	Foreign-born.	White.	Coloured.	Negro.
Bronx	101,756	98,751	138,965	61,542	197,923	2,584	2,370
Brooklyn	573,733	592,849	810,885	355,697	1,146,909	19,673	18,367
Manhattan	918,259	931,834	1,060,751	789,342	1,808,968	41,125	36,246
Queens	77,547	75,452	108,187	44,812	150,235	2,764	2,611
Richmond	34,410	32,611	48,334	18,687	65,863	1,158	1,072
Total	1,705,705	1,731,497	2,167,122	1,270,080	3,369,898	67,304	60,666

Out of 1,007,670 males of voting age (21 years and over) in the entire city in 1900, 460,445 were native-born and 547,225 foreign-born. Of the latter number, 300,660 were naturalized, 45,235 had filed their first naturalization papers, 152,782 were aliens, and the citizenship of 48,548 was returned by the U.S. census enumerators as unknown. Of the total 1,007,670 males of voting age, 65,556 were illiterate (unable to write), of whom 62,528 were foreign-born.

The topographical conditions undoubtedly afford the principal explanation of the unexampled density of the population on Manhattan Island. Practically the entire working-class population of what was New York City proper before the annexation of Brooklyn and the suburbs is lodged in tenement houses of an average height of five or six storeys. The width of the streets being greater than that in most of the Old World centres of dense population, there is comparatively free opportunity for the circulation of air and the admission of light. Reforms have from time to time been instituted by law in the construction and arrangement of New York tenement houses, especially as a result of an expert commission appointed in the year 1900 to advise the Governor and Legislature of the state. From the year 1895 to the end of the decade there was so great an advance as to constitute a transformation in the paving of New York, especially in the congested population areas—smooth asphalt being substituted for the former pavements of uneven stone. This movement for asphalt paving was accompanied by a complete change in the method and policy of public cleansing; so that from the position of a city of unfavourable repute as respects cleanliness of streets and the disposal of waste, New York had become before the year 1900 famous throughout America and of good reputation among municipal and sanitary experts in Europe by reason of the excellence of its street cleansing and its removal and disposal of domestic waste. The importance of perfect paving and of such cleansing as to keep the streets clear of dust can scarcely be over-estimated where, as in some parts of New York, from 3000 to 5000 people live in the tall tenement houses of single blocks as constituted by the intersections of the rectangular street system.

While in the older portion of New York, at the southern end of Manhattan Island, there is some degree of irregularity in the character of the network of the streets, the system for most of the city is regular in the highest degree. It consists of broad avenues running north and south on parallel lines about $\frac{1}{4}$th of a mile apart, intersected at right angles by cross streets extending from one river to the other $\frac{1}{20}$th of a mile apart. Business establishments have more and more tended to concentration at the lower end of Manhattan Island, and the consequence has been an ever-increasing pressure upon facilities for transit and communication up and down the avenues. The chief problem of local transit has been the devising of means by which to bring an ever-growing multitude of people southwards in the morning and then to send them northwards in the latter part of the afternoon.

Rapid transit.

The transit system in the earlier days consisted of omnibuses and horse tramways. The first great innovation was the elevated railways, which were constructed in parallel lines on several avenues in the period between 1877 and 1880, and which almost immediately found their capacity overtaxed. Surface street railways on all of the important avenues, with one exception (Fifth Avenue), were developed to such an extent as was possible with animal power, and later several of them were changed to the cable system. There was delay in the adoption of the electric trolley through the refusal of the authorities to permit the use of overhead wires. Subsequently, however, the lines were absorbed by one great company (the Metropolitan Street Railway Co.), which entered upon a comprehensive plan of substituting the underground electric trolley for horses and cables. At the end of the year 1900 this change had proceeded so far that, of the several hundred million passengers transported annually by this company, the great majority were patrons of electrical lines.

The demand being still unsatisfied, the municipal authorities, after careful consideration, decided in 1899 upon the construction of a great underground trunk-line railway with four tracks, to begin at a point near the lower end of the city and proceed northwards some 13 or 14 miles. At its northern end this trunk line will eventually serve several branches, and in like manner there will in all probability be connecting underground railways passing at two or three different points to Brooklyn on the east, and in due time, it may be hoped, more than one passing under the great Hudson (or North river, as it is locally called) to the New Jersey suburbs. Actual work on the construction of this great underground railway began in 1900. The capital for the construction of the main line was advanced by the municipal corporation itself, to the extent of $35,000,000, to a constructing and operating lessee, who was obliged to provide full interest and sinking-fund payments, and at the end of fifty years to deliver the railway itself (free of all financial encumbrance and of all costs, direct or indirect) to the municipal corporation as public property. This great undertaking in electrical transit was to be completed and in operation by the year 1904. It must have a profound influence upon the development of the northern suburbs.

In addition to this underground transit scheme which marked the end of the 19th century are to be noted the advanced plans for several additional great bridges, as well as various tunnels, to connect Manhattan Island with New Jersey on the west and with Brooklyn and the great expanse of Long Island on the east. The first great bridge, built jointly by the cities of New York and Brooklyn, was regarded as one of the engineering wonders of the world. It was begun in 1870, and opened to traffic in 1883. Some modifications and improvements introduced from time to time brought its total cost up to about $22,000,000 in 1900.

Bridges.

The more recent modifications had consisted of very important changes at both terminals, by virtue of which not only the surface electrical railway cars of the Brooklyn transit system were brought across to the New York terminus at the City Hall Park, but also the cars of the Brooklyn system of elevated railways. This arrangement, completed in 1899, added vastly to the practical capacity of the bridge as a means by which the hundreds of thousands of people living in Brooklyn and on Long Island were enabled to reach Manhattan Island for daily purposes of business. It is estimated that about 140,000 trolley cars cross the bridge each month.

The convergence, however, of enormous systems of local transit at either end of this one bridge had made the congestion at certain hours, morning and evening, almost indescribable. The great necessity for additional bridges had long been perceived, and a second one, also a suspension bridge, was begun in 1897, and was expected to be completed in 1903, the total cost, including approaches, being $12,000,000. The bridge spans the river at a clear height above the water-line of 135 feet. Its cables are suspended from towers of skeleton steel construction 335 feet high. Its width of 118 feet will permit—besides carriage-ways, foot and bicycle paths—six railway tracks, four for surface electric cars and two for the elevated system. One other suspension bridge and one cantilever bridge to cross the East river to the Brooklyn and Long Island portions of the metropolis had also entered the initial stages of construction in or prior to 1901.

The general tendency of great cities at the end of the 19th century towards the concentration of business and trade in the central districts, with the distribution of population through widening suburban zones, was strikingly illustrated in New York. Two American inventions, the results of which are better seen in New York than elsewhere, have lent themselves particularly to the new concentration of business offices and mercantile establishments. These inventions are the steel frame for high buildings, and the elevator or "lift." The distinctive movement toward the construction of high buildings, popularly known in America as "sky-scrapers," began earlier in Chicago than in New York, where it was scarcely seen in 1890. Its progress in New York, however, was amazingly rapid, so that by the end of the year 1900 the entire aspect of the city, especially from the bay or the rivers, had undergone a most startling transformation. Where there had been buildings of an average height of from four to five storeys, with six as the maximum and seven as a rare extreme, with church spires here and there breaking the monotony of the skyline, there began to appear buildings first of eight or ten storeys, then of fourteen or sixteen, and at length of twenty to twenty-three, twenty-four, and even twenty-nine storeys in height, their upper rows of windows being far above the tops of neighbouring church spires. These buildings were run up as steel skeletons filled in with fireproof materials, and were like portions of streets raised to a vertical position. Some of the largest of these buildings have fully 5000 tenants. The elevators, which in some of the great buildings are numerous and well-operated, are in fact an important part of the passenger traffic system of the city. As a part of the same remarkable movement differentiating central business areas from outlying residential districts must be remarked the rapid growth of vast general stores or magazines known in America as "department stores," situated at points of special convenience for customers using the various traffic lines, and tending to the extinction of thousands of small retail establishments.

High buildings.

With these profound changes working towards a redistribution of the population is to be noted a general improvement in the public health. In spite of the very rapid influx of a comparatively insanitary population from eastern Europe, with its tendency to overcrowding in congested quarters, there has been a steady reduction of the death-rate of New York, and all conditions would appear favourable for a further reduction in the first quarter of the 20th century. Thus the death-rate for the year 1900 was only 20·4 per thousand of population, whereas in 1895 it was nearly 22, in 1890 about 26·5, and in the years preceding and following 1880 it was nearly 30.

Health, water, and sewerage.

New York has long been fortunate, as compared with many population centres, in its possession of a wholesome and adequate supply of water. The original Croton Aqueduct, opened in 1842, was in its day the most important municipal water-supply undertaking in the world. This conduit, about 40 miles long, had a capacity of some 75,000,000 gallons per day. The subsequent growth of the city made it necessary to construct another and very much larger aqueduct from the same general source of supply, and this New Croton Aqueduct, so-called, was opened in 1890. Its cost was $25,000,000, and its daily capacity is considerably in excess of 300,000,000 gallons. Meanwhile, vast improvements were undertaken in the Croton watershed, where, by means of a series of dams, the drainage area has been increased to such an extent that with the completion of the system the storage capacity will in 1905 be about 75,000,000,000 gallons. The supply is of a pure and wholesome quality. Brooklyn has a separate supply derived from various streams, ponds, and wells on Long Island. With proper care and foresight the existing sources can be made adequate for the supply of the city for perhaps the first three decades of the 20th century. Supplementary supplies for future needs must be obtained by drawing upon more distant sources.

The outward flow of the vast volume of the Hudson river—taken in conjunction with certain peculiarly fortunate movements of the tides through the channel that connects Long Island Sound with the harbour and separates Manhattan from Brooklyn—has always availed to sweep sewage out to sea, and New York has thus been spared the difficult problem of sewage disposal. As compared with other cities of metropolitan rank, New York has for a number of years been exceptionally free from epidemic diseases. The public health department exercises great watchfulness over the crowded tenement-house districts, and through the co-operation of various public and private agencies there has been a marked improvement of general conditions. There is a comparatively small percentage of sordid and chronic pauperism in New York, and in periods of normal business activity the exhibition of poverty is small as compared with that in European cities. Even among the Polish Jews, who at the beginning of the 20th century formed the most notable new factor of the population, the abject conditions of overcrowding and sweat-shop labour were not so discouraging as they might have seemed; for this population was rapidly improving its economic condition, and its lot in New York was much better than in the towns of Russia and Poland whence it had come. The clothing trades, which had become highly specialized in New York, and had in the aggregate assumed enormous proportions, had in the course of a few years passed very rapidly into the hands of these Jewish newcomers, who by the year 1900 held something like a monopoly of the labour in that class of manufactures.

Until 1896 the administration of public charity was connected with that of correctional institutions, but in that year the administration of charity was placed in the hands of a separate department. Various hospital dispensary facilities are available, and there was appropriated in the municipal budget for the year 1900, and again for the year 1901, a sum of money falling little short of $2,000,000 for charitable relief, besides which a still greater amount of public money was distributed in form of subsidies to a great number of hospitals, infirmaries, orphanages, and other establishments of an eleemosynary character. It is stated that at ordinary times not more than one family in 200 in New York seeks relief from established charitable sources, whether public or private. So great is the development of manufactures and commerce in and about New York that it is only in periods of exceptional business depression that there is suffering through lack of employment. The standard of living among the working classes is high when compared with other metropolitan populations; and the thrift of the people is to some extent indicated by the statistics of the savings banks. There is no postal or municipal system for the receipt and custody of the savings of working people, but there were in New York in 1901 49 banks for savings organized and conducted as private enterprises in conformity with carefully devised laws of the state of New York, and subject to constant state inspection. The deposits in these banks for the year ending 1st January 1902 reached a total of $191,417,073, the number of individual depositors being 1,476,809. This in a total population of 3,437,202 would indicate an average of about two depositors to each family of the population, with an average of perhaps $275 deposited for each family in a single year. The total resources of savings banks were $795,876,362, just $230 for each inhabitant, or $1150 for each family of five persons. Large and constant remittances to Ireland and Germany, and those portions of eastern Europe whence the newer elements of the population have come, give further indication of the relatively high prosperity of the working class.

Charities and Savings.

The situation of New York affords unusually picturesque areas for public parks and places of resort, and while in the earlier period of the city's development there was far too little provision made for open spaces, the closing years of the 19th century disclosed a very earnest and comprehensive movement for the creation at no slight expense of a number of small parks and playgrounds accessible to the inhabitants of the tenement-house districts, together with recreation piers and free bathing facilities at convenient intervals along the extensive water frontage. The best-known recreation ground is Central Park, a beautiful tract conveniently situated in the heart of Manhattan Island, containing 862 acres. The principal park of Brooklyn is Prospect Park, with 516 acres. In the newer portion of New York City north of the Harlem river, and comparatively remote from the present mass of population, are three great tracts of park land, namely, Bronx Park, of 662 acres, in which were opened in 1899–1900 very extensive botanical and zoological collections; Pelham Bay Park, of 1756 acres, lying at the north-east end of the municipal area, with an irregular frontage on Long Island Sound; and Van Cortlandt Park, of 1132 acres, lying 5 miles west of Pelham Bay Park. These three great parks are connected by broad parkways. One of the most attractive bits of park area in America is the strip of high east bank along the Hudson river, known as Riverside Park, or Drive, which has been considerably extended northwards to connect with a system of new drives and parkways and so become part of the general park system. One of the noteworthy accomplishments of 1901 was that of a park to embrace

Parks.

the wonderful Palisades of the Hudson river, stretching for nearly 20 miles along the river's west bank. The new Ocean Park in the vicinity of the famous suburban seaside resorts known as Coney Island and Manhattan Beach will prove a great boon to the teeming millions of the metropolis. The total area of parks and open spaces under the care of the Park Commissioners of New York in 1901 was 6766 acres.

Not only the direct activities of the municipal government, but also to some extent the conditions and character of the city in general, may be better appreciated by a glance at the yearly budget of the corporation. The total amount of money appropriated by the fiscal authorities in the budget for 1900 was, in round figures, $90,779,000, and for the year 1901 it was $98,100,000. Nearly $7,000,000 of this aggregate was payable to the state government at Albany for the city's share of state taxes, the remaining $91,000,000 being for local purposes. The greatest item in this huge budget was that for the municipal debt. The total gross funded debt outstanding on 1st January 1900 was $358,104,307. This, however, was offset by the municipal stocks and bonds held as investments by the sinking fund to the total amount of $105,435,871, leaving a net funded debt of $252,668,436. The consolidation of New York, Brooklyn, and other areas involved the assumption of all outstanding indebtedness by the enlarged municipality. The budget for 1901 included in round figures $12,100,000 for interest on the city debt and $10,332,000 for debt redemption, being a total of more than $22,000,000.

The budget.

The next largest item of public expenditure was for education, the amount appropriated in the budget of 1900 being $14,619,111, while in the budget of 1901 there was a marked increase to $18,512,817. The number of schools under the control of the Board of Education was 507, and the total enrolment of pupils in July 1900 was 418,951, the average daily attendance being 378,211, and the number of teachers 8844. According to the U.S. census of 1900, the number of persons of school age (5 to 20 years inclusive) was 1,028,069. A special effort was made in the period from 1895 to 1900 to improve the system of elementary education and adapt it to the practical requirements of the population. Many of the large schools of the tenement-house districts are composed almost entirely of children whose parents are of foreign birth, and who speak languages other than the English in their homes. Public schools perform an inestimable service in teaching such children the English language, and in training them for citizenship. Evening schools are provided for children who have left the day school to earn their living, and for such older persons as may choose to attend. Under the compulsory education statute the attendance of children at some suitable school, or their equivalent instruction, is required between the ages of eight and fourteen years. Provision is made for more advanced instruction in ten high schools and in two institutions of still higher grade—one for young women, known as the Normal College, and the other for young men, known as the College of the City of New York. Many of the young women who graduate at the Normal College are subsequently employed as teachers in the various elementary schools. The College of the City of New York in 1901 had 2126 students and 80 instructors. Provision had been made for the erection of a new building for this institution, at an estimated cost of more than a million dollars. Besides the children receiving instruction in the schools under control of the Board of Education, 70,061 children were registered, at the beginning of the year 1900, in Roman Catholic parochial schools, and there were many thousands of children and youths in other schools under ecclesiastical or private control.

Education and police.

The items of expenditure in the budget of 1900 and 1901 that followed in magnitude the item of education are the police department, costing approximately $12,000,000 a year, and the departments of fire and street cleaning, the cost of each of which was about $5,000,000. There are eighty police precincts, each with its fully-equipped station-house containing quarters for policemen as well as for prisoners, and temporary accommodation for homeless and unfortunate persons. In all that pertains to their ordinary duties as guardians of the public peace, the 7000 policemen of New York are a very efficient and admirable body of men. The fire department is more elaborately equipped than that of any other city in the world, and probably possesses the highest average efficiency. The number of fire companies in the metropolitan area approximates 300, with a total force exceeding 3000 men. The statistics of 1899 showed fire losses in New York of $10,000,000, the total number of fires considerably exceeding 7000, and the buildings attacked by flames being of such value as to carry aggregate insurance approaching $200,000,000.

The total assessed valuation of real and personal property liable to taxation for general city purposes was $3,787,970,873 in 1901, and the tax rate for such purposes was about 2·3 per cent. This rate would produce $75,687,894 (after deducting $1,513,757 for estimated deficiencies in collection). In addition to the above, the rate of taxation for local county purposes, which varied with the different boroughs, was estimated to produce altogether $3,661,531. The discrepancy between the sum of these two amounts, $79,349,425, and the total budget for city and county purposes, was covered by estimated revenues from the so-called general fund, such as the tax on stockholders of banks, interest on taxes, school money from the state, licences, fees, proceeds of excise taxes, unexpended balance of previous year, &c.

The following table shows by boroughs the assessed valuation of real estate and personal property liable to taxation for city purposes:—

Boroughs.	Real Estate.	Personal.	Total.
	$	$	$
Manhattan and the Bronx . .	2,428,997,016	440,468,558	2,869,465,574
Brooklyn . .	658,962,119	89,241,624	748,203,743
Queens . . .	107,179,620	10,826,810	118,006,430
Richmond . .	42,639,506	9,655,620	52,295,126
Grand total .	3,237,778,261	550,192,612	3,787,970,873

The municipal charters granted by the legislature of the state of New York, under which the city has exercised the functions of a municipal corporation, had been amended and altered many times by successive enactments prior to the great enactment of 1897, which provided an extremely elaborate framework of municipal government and special code of laws for the government of the consolidated metropolis. This new charter came into force on 1st January 1898. It provided for a mayor, elected for a four-years' term, with very extensive executive and appointing powers; an elective chief financial officer, called a comptroller; and a municipal assembly composed of two branches, one of them called the council, and consisting of twenty-nine members, and the other a board of aldermen of sixty members. The twenty-ninth member of the council, who served as its president, acted also as vice-mayor, and was elected, like the comptroller and the mayor, by the voters of the entire city for a term of four years. The other municipal officers were appointed by the mayor, and after the first six months of his term they could be removed only upon the presentment of formal charges. The municipal assembly had no such authority as the London County Council, and incomparably less than the municipal councils of British, French, and German cities under the respective municipal codes of these countries. The real administrative work was performed by a series of boards, the most important of which was known as the board of estimate and apportionment, consisting of the mayor, comptroller, and the president of the council, all of whom were elected by the people, and the corporation counsel and the president of the department of taxes and assessments, who were both nominees of the mayor. This board was the actual budgetary authority, deciding both upon the total amounts to be raised by taxation and the distribution of the revenues to the various departments. The body that exercised authority over the policy of the metropolis in respect of public improvements, constituting an authority somewhat analogous to the old Metropolitan Board of Works of London, was entitled the board of public improvements, and consisted of the heads of six important departments, namely, water supply, highways, street cleaning, sewers, public buildings, and bridges. A single commissioner appointed by the mayor was at the head of each of these departments; and when they met as a metropolitan board, they were presided over by the mayor himself, or by a president of the board appointed by him. The police board had formerly consisted of four commissioners, but after 1901 of one commissioner appointed by the mayor and exercising a wide range of authority, which at first included also that of the supervision of all elections held within the metropolitan district. This power was taken away, however, by the state legislature in 1898, and vested in a separate bureau of elections, at the head of which was an official appointed by the governor of the state. The board of health consisted of two commissioners, with whom acted as *ex-officio* members the police commissioner and the president of the health office of the port of New York. There was a park board, consisting of three commissioners, a board of public charities, and a board in charge of the department of public buildings, each of which had three members. At the head of the fire department was a single commissioner, as was also the case in the department of correction. The board of taxes and assessments consisted of a president and three additional commissioners. The board of education had nineteen members, made up of representatives of the school boards of the several boroughs into which the metropolis was divided. There was also a board of docks, made up of three commissioners. In practical administration these boards had extensive power and responsibility, and also very potent influence in the shaping of the general policy to be pursued as respects their departments.

Government.

Experience in the working of the charter of 1897 soon showed the need of numerous amendments, some of them important and fundamental, others merely matters of minor detail. An able commission appointed by Governor Roosevelt to recommend charter changes made a report the recommendations of which were for the most part accepted by the legislature of the state in 1901, so that the revised charter came into effect with the new city administration at the beginning of the year 1902. One of these changes abolished the council and increased the number of members of the board of aldermen, thus providing a single instead of a double chamber. The powers of the board of aldermen were also to some extent increased. An unfortunate change reduced the term of the mayor from four years to two. It had been found necessary to give a more distinct administrative character to the several boroughs into which the metropolis is divided, and the elective borough presidents became, under the revised charter, officials of very considerable importance, having large authority with respect to public improvements, and becoming members of the board of estimate and apportionment, the membership of which was otherwise modified. A considerable number of small local-improvement districts were created for the better care of such matters as street-paving and the like. The Health Department was placed under the control of a single commissioner. An important new branch of the municipal government was created in the so-called Tenement House Department, with wide authority, under a new and greatly reformed building code, to supervise the structure of tenement houses and their occupancy in the interest of health and the general welfare. The educational system of the city on the administrative side was also changed in the charter amendments, so that the board of education in 1902 consisted of forty-six members appointed by the mayor.

The efficiency of the municipal government is to be tested by an examination of the work of the principal departments. These are to such an extent independent of one another that it is conceivable at any given time that the department of education, for example, should meet the demands made upon it with an admirable intelligence and an almost perfect system, while the police department might be relatively inefficient or corrupt. The ultimate authority to which appeal is constantly made is the legislature of the state of New York, which meets annually at Albany. Hundreds of Bills are introduced at each legislative session relating specifically to the affairs of the metropolis.

Higher education, libraries, art, and music.

Two important American universities are situated in New York City, namely, Columbia University and the University of New York. Columbia, which was chartered as King's College in 1754, and incorporated as Columbia College in 1784, was removed in 1857 from its old site in Church Street, near the lower end of Manhattan Island, to more spacious buildings in Madison Avenue, between 49th and 50th Streets. In 1896 the name "University" was adopted, the institution having outgrown the original school of arts, which still retains within the university the name of Columbia College. In the following year the university moved to a group of magnificent buildings which had been erected on a commanding site, a little more than three miles north of the old one, known as Morningside Heights. In 1902 Professor Nicholas Murray Butler was made president of Columbia, to succeed Seth Low, who had become mayor of New York. The university has seven departments, and in 1902 the total number of professors and instructors was nearly 500, and the total number of students about 4000. Affiliated with Columbia University is Barnard College for women and the Teachers' College, both of which also have admirable buildings on Morningside Heights, adjoining the grounds of the university, and the foregoing statistics of teachers and students include these.

The New York University, which, like Columbia University, is a chartered institution under the control of an independent corporation, began its career in 1839, and was housed in Washington Square from that time until 1894, when it was removed to its present site, known as University Heights, a little more than four miles north of the site of Columbia University. Like its neighbour, the New York University also occupies an admirable new group of buildings. In all departments it had, in the year 1901, 1824 students and 186 instructors.

Besides the public school system, Brooklyn has several notable educational institutions, among which may be mentioned Adelphi College, an excellent local institution for both sexes, with power to confer degrees; the Pratt Institute, a well-endowed school for technical training and instruction in the applied arts, with many well-conducted departments; the Packer Institute for young women; the Brooklyn Institute, which maintains a great variety of popular lecture courses and classes, with museums and other educational facilities. In the borough of Manhattan a great centre of popular instruction has long been the Cooper Institute, founded by the distinguished philanthropist Peter Cooper, which maintains practical trade classes and a great variety of instruction in evening classes, besides an important art school and several lecture courses in the great assembly hall. The Carnegie Music Hall in Manhattan borough is also to be noted as a centre of popular culture. The Roman Catholic Church maintains several large institutions for advanced education, and the Hebrews, recognizing the needs of a great influx of Jewish population, support some admirable centres for industrial and practical training.

Among important enterprises of a popular educational character is the New York public library, formed by the consolidation of two important existing reference libraries, the Astor and the Lenox, with the fund left by the will of Samuel J. Tilden, and known as the Tilden Trust for the Establishment of a Free Circulating Library. The headquarters of the New York public library are to be in a monumental building, of white marble, the construction of which was begun in the year 1900 by the municipal corporation on the site of an abandoned reservoir extending from 40th to 42nd Streets on Fifth Avenue. This building, the capacity of which can easily be extended in the future, will have shelving space for perhaps a million and a half volumes. A number of libraries under separate control, but receiving large annual subsidies from the municipal treasury, are, according to plans formed in 1900, to be consolidated with the New York public library, which is to use their numerous buildings and branches as sub-stations. In addition to this, Mr Andrew Carnegie gave to the city of New York in 1901 the sum of $5,200,000 for the erection of sixty-five more branch library buildings in different parts of the city.

An important educational agency is the American Museum of Natural History, with great collections constantly growing, and housed in a vast edifice built by the municipal corporation. The municipality has also provided a structure, greatly extended at the end of the 19th century, for the collection of paintings, statuary, and other works of art, belonging to the Metropolitan Museum of Art. The Museum of Natural History is situated in a small park annexed to the Central Park on the west side, and the Metropolitan Museum of Art is within the enclosure of Central Park near Fifth Avenue.

The architectural transformation of New York at the end of the 19th century was notable chiefly from the point of view of its daring and skilful use of iron and steel, and its marvellous adaptation to the new conditions of industry and commerce, but it had also many specimens to show of buildings of merit from the standpoint of architecture as a fine art. No great metropolis, however, had done so little as New York to produce those notable effects in architecture that are derived from the symmetrical and balanced placing of buildings of a public character with reference to each other, with suitable approaches and with open spaces about them; and no other great and rich city of any period of the world's history, perhaps, was so lacking in the embellishment of great public fountains, heroic monuments, and groups of statuary. Nevertheless, the wealth of the city was so enormous, and its structures, both public and private, in their infinite architectural variety were so costly and substantial, as to create the general impression of a magnificent city. And this impression was enhanced by the marvellous purity of the atmosphere and clearness of the sky, due not merely to a favourable climate, but also to the exclusion of smoke-producing bituminous coal.

Among other highly-marked tendencies at the end of the century was the development of New York as a musical centre, where grand opera, without Government subsidy, was produced on a more elaborate scale than elsewhere, while various musical interests, fostered in considerable measure by the large population of German origin, were prosperous to an encouraging degree. There was also to be noted the extremely rapid multiplication of theatres and kindred places of popular entertainment and resort. These had more than doubled in number since 1880; and of theatres and music halls alone there were not fewer than seventy-five. This development of New York as the chief centre of America for purposes of entertainment had, in the last years of the 19th century, brought about a wholly unprecedented influx of well-to-do visitors from other parts of the country; and this influx in turn had made it profitable to build a series of enormous and magnificent hotels for the accommodation of the ever-increasing multitude of prosperous strangers. In these regards New York had begun to bear a strong resemblance to London. In earlier periods New York had not, in any such sense as London or Paris, been a great national metropolis. Boston, Philadelphia, and Baltimore in the east, and other cities of the south and west, were centres which before 1880, or even 1890, would not for a moment have acknowledged themselves provincial with reference to New York as a metropolis. And their pretensions would have been fully justified, for in many respects their position as local centres was analogous to that of such German cities as Hamburg, Frankfort, Munich, and Dresden in their relation to Berlin. But as the aggregation of all kinds of German interests at Berlin in the last twenty years of the 19th century was at a far higher rate relatively than the development of other German cities, so the progress of New York in the same period, and especially in the closing years of the last decade of the century, was tending to make for the position

New York as the metropolis of the country.

not merely of primacy among American cities, but for that of unquestioned metropolitan rank and position as a centre of national and international transportation, trade, and commerce.

Previous to 1880 New York was not recognized in any unqualified sense as the metropolitan centre of the country in respect of such enterprises as the publication of books and periodicals, but the publishing trade has steadily tended to concentrate. The growth of New York has been especially marked as the chief centre of North America for the issue of all kinds of periodical literature. While the daily newspapers have a larger circulation and a wider influence than those of other American cities, there is in America no such distinction as in England between the metropolitan and the provincial press. Boston, Philadelphia, Baltimore, Chicago, St Louis, San Francisco, New Orleans, and other American cities are for their own localities important centres of newspaper publishing.

Banks.

The progress of New York as a great banking and financial centre had been also especially rapid in the closing years of the 19th century, its banking houses and financial institutions having multiplied in number, and having developed even more in the extent of their capital and the volume of their transactions. Thus the banks of deposit in the metropolis numbered considerably more than 100, with capital and surplus exceeding $150,000,000 ; and about 40 trust companies, having a banking character, had an aggregate capital of more than $110,000,000. Besides those institutions were the savings banks, 49 in number, with total resources of nearly $700,000,000. The position of New York as the banking, financial, and general commercial centre of the United States is indicated in the statistics of the New York Clearing-House Association, when compared with the clearings of other cities. All the considerable cities of the United States, to the extent of nearly a hundred, maintain bank clearing-houses, yet in most weeks the clearings of the New York association aggregate more than three-fourths of the total clearings of the entire country. For the calendar year 1901 the average daily clearings of the New York Clearing-House were, in round figures, $262,000,000, and the total for the year was $79,420,418,435. Previous to September 1897, the London clearings had generally been considerably larger than those of New York, but in the years 1898, 1899, 1900, and 1901 the New York clearings were greatly in excess of those of the British metropolis. Thus the London clearings for 1901 were $46,529,000,000, while those for New York were $79,420,000,000.

The amalgamation of the capital engaged in various branches of industry, which had been brought about with great rapidity in the period from 1896 to 1899, had enhanced the tendency towards the concentration of banking and financial operations ; and this tendency had in turn increased the financial importance of New York as compared with other American cities. The central offices of numerous vast enterprises were, in the closing years of the 19th century, brought to New York, and the metropolis became the home of a rapidly increasing number of individuals of great wealth. Thus New York was fast becoming a centre of luxury, display, and entertainment, and an agreeable place of resort at all times of the year—but especially in the winter months—for thousands of people of refined or luxurious taste from the south, the west, and all portions of the country.

Commerce.

For the fiscal year ending with June 1901 the port of New York handled almost exactly 47 per cent. of the total value of the import and export trade of the United States. Twenty years earlier New York had been credited with about 57 per cent. of this total trade. The proportion had gradually declined with the development of other ports, notably those of the Gulf of Mexico and the Pacific coast. The actual value of New York's foreign trade, however, had increased enormously, even if the relative proportion had declined. For a few years following 1870 the total foreign trade of the United States was about $1,000,000,000. The period from 1880 to 1890 had averaged about $1,500,000,000. It gradually increased until for 1900 it exceeded $2,533,800,000, of which amount the exports of merchandise reached nearly $1,500,000,000, while the imports of merchandise were valued at $829,000,000. Of this total importation, $526,100,000 came to the port of New York. Of the total exports of merchandise, somewhat more than $538,000,000 was shipped from New York ; and if one includes the imports and exports of the precious metals, the total foreign commerce of the port of New York for 1900 exceeded $1,196,000,000.

Political history.

Some authorities on the political history of New York have expressed the opinion that the frauds of the Tweed Ring, which were exposed in 1871–72, amounted, in the period from 1865 to 1871, including issues of fraudulent bonds, to a total of $200,000,000. This vast sum represented, in the main, a direct theft of public property. It was supposed at the time of the Tweed exposure that Tammany Hall was hopelessly discredited. The charter of the Tammany Society ought to have been annulled ; but the organization, within a surprisingly short time, had regained its control of municipal affairs. A shrewd local politician named John Kelly became the dominating personality in the Tammany Society; and the first move to mislead the public was the selection, as Tammany "sachems," of some of the most sincere and most conspicuous of the Democrats who had exposed and overthrown the Tweed *régime*. Tammany now posed as a reform body, with the objectionable elements all excluded. In these circumstances Tammany actually came near winning the mayoralty election of 1872, and in 1874 it was victorious. There had been much industrial distress, and by its superior system of minute neighbourhood organization Tammany distributed aid to the poor, promised public work to all the unemployed, and built up a strong support. By this time the more obscure members of the old Ring were reasserting themselves in Tammany, and the liquor interests were becoming dominant in the district and ward politics of the organizations. The dictatorship of John Kelly lasted from 1874 to 1886. He bore the sobriquet "Honest John Kelly," but his political character was far from that of a man of scrupulous views. There was no repetition of the extravagant crimes of the Tweed *régime*, but for the most part municipal government was on an exceedingly low and corrupt plane. During a part of this time Tammany yielded to public opinion to the extent of permitting men of upright personal character and excellent intentions to fill the office of mayor, but under the charter as it then was the power of the mayor was comparatively limited. From time to time there arose local organizations, which affiliated with the Democratic party in national politics, and which disputed the right of Tammany Hall to stand as the sole local representative of that great party. But Tammany was generally able to overcome and absorb such dissentient bodies. In 1884 there occurred a transaction of a particularly scandalous nature, the men chiefly guilty being known as the "boodle aldermen." To the aldermanic board there had now been restored a considerable measure of authority which at a former period had been withdrawn. Rival companies were seeking to obtain a franchise for working a street railway on Broadway, the main thoroughfare of the city. This privilege was so valuable that the city could have sold it for several millions of dollars. It was given away by the aldermen, and it was afterwards proved that a large number of them had accepted equal portions of a cash bribe of $500,000. Some of them were subsequently punished, but Tammany's power was not seriously impaired. John Kelly died in 1886, holding up to the date of his death an undisputed dictatorship in Tammany Hall, and this was equivalent during much of the time to an autocratic direction of all the affairs of the city. After Kelly's death it was announced that Tammany would henceforth acknowledge no single "boss," and for a time a group of three or four leaders jointly managed the affairs of the organization. But one of these, Richard Croker, gradually strengthened his hold upon the twenty-four district leaders who were officially the governing committee ; and Kelly had not been dead more than two years before Croker's authority came to be generally recognized. This remarkable politician was born near Cork, Ireland, in 1843, and was brought to New York in early childhood. As a youth he worked as a mechanic, but early became active in the politics of his ward, and in 1868 was elected alderman. In 1873, and again in 1876, he was elected coroner. In 1883 he was made a fire commissioner. His great political skill was shown in the campaign of 1886, when Henry

George, who was extremely popular, was an independent candidate for mayor, while Theodore Roosevelt was the Republican candidate. The better element of Democrats chose Abram S. Hewitt, and Mr Croker and the Tammany organization, appreciating the nature of the contest, endorsed and accepted Mr Hewitt, and secured his election. Though possessing the highest qualifications and the purest motives, Mr Hewitt's policy as mayor was largely rendered futile by the antagonism of Tammany Hall. At the next election, in 1888, Tammany did not hesitate to bring forward one of its own chiefs as its candidate, Mr Hewitt running as an independent candidate, and the Republicans having a strong nominee in Mr Erhardt. Tammany succeeded through the division of the opposing voters. An investigation of Tammany's government of the city was made by the Republican legislature of the state in 1890. Much evidence was secured illustrating the manifold improprieties of the Tammany system, but nothing of overwhelming importance was brought to light. There followed, however, an unusually earnest attempt on the part of good citizens, through the so-called People's Municipal League, to defeat Tammany in the election of 1890. This movement failed, however, and in 1892 Tammany not only won again, but by an overwhelming majority. Again the administration became more carelessly and more scandalously corrupt; and the state senate again, in 1894, made an investigation. This inquiry brought to light some of the facts respecting an elaborate system of blackmail which had grown up under the joint protection of Tammany Hall and the city government. Under this system large sums were paid for appointments to office and for promotions, and an elaborate method had been devised for collecting money regularly from the keepers of gambling-houses, houses of ill-fame, and other disorderly resorts, and from liquor-sellers for permission to violate certain details of the excise laws, such as midnight and Sunday closing. There followed a great outcry against Tammany Hall, and at length the so-called Independents were able to unite forces with the Republicans in a campaign which elected William L. Strong, a reputable and prominent merchant, as mayor. Under the Strong administration Colonel George E. Waring, junior, as head of the street cleaning department, quite revolutionized New York as respects its cleanliness. Theodore Roosevelt, as president of the police board, rendered efficient service, the public school system was vastly improved, and in numerous ways the administration of the city was greatly improved. In 1897, unfortunately, the opponents of Tammany failed to unite. The Citizens' Union nominated the Hon. Seth Low, president of Columbia University, who, though a prominent Republican, was not endorsed by the so-called Republican machine. Although Mr Low polled a much larger number of votes than the Republican candidate, the Tammany candidate, Robert A. Van Wyck, was successful, and Mr Richard Croker more than ever before was in control. Another legislative inquiry, under the chairmanship of Mr Mazet, was made in 1899, with the usual result of many disclosures that threw light upon the objectionable methods of Tammany rule. Mr Croker's power could not be understood without some knowledge of the relation between the great municipality and the government of the state of New York. Mr Croker was practically in control of the votes of a large portion of the members of the state legislature. The rapid development of vast business interests had made it increasingly important for many companies and individuals to ward off unfavourable legislation, or at times to seek the active favour of the law-making body. Instead of dealing directly with the members of the legislature through old-fashioned lobbies, so-called, these private interests found it more prudent and more effective to cultivate the favour of Tammany Hall on the one hand and of the Republican organization on the other. The receipt of large funds for political expenditure would naturally increase the authority of the men having charge of the disbursement of such funds, and render it more difficult to dislodge them. On the popular side the strength of Tammany Hall was largely due to the fact that it united in a compact body a great number of men whose livelihoods were directly affected, and whose rewards were made proportionate to their usefulness to the organization.

An awakened public opinion, and many determined and zealous efforts for municipal reform, while generally unsuccessful in the election of reform candidates for municipal offices, have nevertheless had beneficial effects of the most marked character upon the methods and results of departmental work. Thus, in spite of a world-wide impression that New York is habitually misgoverned, there was during the last ten years of the 19th century a very remarkable progress made in almost every department of local administration, in response to an exacting public opinion that demanded good streets, vigilant protection of the public health, an ample supply of good schools, and other municipal facilities such as progressive communities elsewhere had learned to value. Elections in New York had become honest and free from scandal, while the collection and disbursement of a vast public revenue had become relatively free from charges of peculation or fraud. The principal scandals of recent years had risen out of a sharp discrepancy between the habits and customs of a metropolitan population of diverse origin and certain rigid state laws relating to public morals which it had been made a part of the duty of the police to enforce. These laws, among other things, prohibit the existence of gambling places and other resorts of a so-called "disorderly" nature, and require the closing of drink-shops and various other establishments on Sunday. The existence of such laws, and the extreme difficulty of their enforcement, rendered possible a system of connivances and sale of indulgences that made the police department, and certain influential politicians who controlled it, the partners in a system of blackmail that permitted the conduct of a vast number of illegal establishments, and the paid protectors of Sunday opening and various other violations of law. While such connivances are demoralizing to the tone of a police department, it is obvious that they may exist without radical impairment of the efficiency of many other branches of the municipal administration.

The Citizens' Union and the various reform groups succeeded in the autumn of 1901 in forming a campaign union with the Republicans for the overthrow of Tammany rule and Croker domination. This fusion movement agreed upon Seth Low as candidate for mayor. The Tammany party, appreciating the danger of defeat, nominated a Democratic lawyer of the highest repute, Mr Edward M. Shepard, who had never been a member of the Tammany organization. Mr Low was elected by a substantial majority, and entered upon his two years' administration on the 1st of January 1902. His administration was marked by excellent appointments to the various administrative posts, and by honest, enlightened, and efficient methods throughout. Under Mayor Low, New York assumed its rightful position as one of the best governed of the world's great municipalities.

Thus the 20th century had opened for New York City in a period of colossal material development, of great projects, and of great expectations apparently well founded. (A. Sw.)

NEW ZEALAND.

Geography and Statistics.

THE British colony of New Zealand consists of a group of islands lying between 35° and 48° S. in the south Pacific Ocean. It is situated eastward of Tasmania and south-eastern Australia, and Wellington, its most central seaport, is 1204 miles from Sydney. Its area is 104,471 square miles, of which its two main islands, called North and South, contain 44,468 and 58,525 respectively, and Stewart Island 621. These three form a broken chain divided by Cook Strait, 16 miles wide, separating the first two islands, and Foveaux Strait, which separates Stewart Island from South Island. Outlying groups of islets, included in the colony, are the Chathams, 536 miles eastward of Lyttelton in South Island, which are settled, and carry sheep well; the Aucklands, three degrees south of Stewart Island, also useful for grazing; several uninhabited islets farther south; and the Kermadecs, a volcanic cluster about 500 miles north-east of North Island. Of these last, Raoul or Sunday Island, the largest, is fertile. North Island is 515 miles long, and varies in breadth from 6 to 200 miles. The length of South Island is 535 miles, and its greatest breadth 180. From the south-west corner of South Island to the Bay of Plenty in North Island run parallel mountain chains which are the chief physical feature of New Zealand. Some remarkable peaks, however, rise apart from these. Such are the active volcanoes Ruapehu (9008 feet), Ngauruhoe (7515 feet), and Tongariro, in the centre of North Island. West of these the extinct cone Egmont (8260 feet) curves up from the sea-shore, almost rivalling Fusi-yama in its solitary and symmetrical beauty. On the north-east coast of South Island the Kaikouras are high parallel ranges, among which Tapuae-nuku reaches 9462 feet. In North Island the rivers Waikato, Waihou, Wanganui, and Manawatu are navigable for small steamers, the first for about 100 miles, the others for about 50. The chief river of South Island, the Clutha, which is 154 miles long, can be ascended by small craft for about 30 miles. Of the harbours which are commercially important, Auckland and Wellington are naturally the finest; Lyttelton has been made very commodious, and Port Chalmers, Greymouth, and Westport have been greatly improved. The two last-named are the chief outlets for the coal of the west coast. Less successful have been the attempts to improve Napier, New Plymouth, and Gisborne, all ports of rich and productive districts. The famous fiords or sounds of the extreme south-west afford perfect shelter, but are cut off from the inhabited districts by precipitous mountains. They are regularly visited in summer by tourist steamers. The Sutherland waterfall near Milford Sound is 1904 feet high. The southern Alps and the lakes and glaciers on their eastern side have also become noted amongst climbers and travellers. The most beautiful of the lakes is Manapouri. On the west side of the Alps glaciers descend into the forest belt as low as 700 feet above the sea. But the largest glaciers are to the east of the watershed. Their names and extent are as follows :—

Name of Glacier.	Area.	Length.	Greatest Width.	Average Width.
	Acres.	Miles. ch.	Miles. ch.	Miles. ch.
Tasman	13,664	18 0	2 14	1 15
Murchison	5,800	10 70	1 5	0 66
Godley	5,312	8 0	1 55	1 3
Mueller	3,200	8 0	0 61	0 50
Hooker	2,416	7 25	0 54	0 41

The region of the thermal springs in North Island covers 660 square miles, and stretches from Mount Ruapehu to White Island, an ever-active volcanic cone in the Bay of Plenty. The most striking natural feature of the district, the Pink and White Terraces, was overwhelmed in the eruption of Mount Tarawera in 1886, when for great distances the country was buried beneath mud and dust. Fine lakes and waterfalls, innumerable pools, in temperature from boiling-point to cold, geysers, solfataras, fumaroles, and mud volcanoes still attract tourists in large numbers. The healing virtue of many of the springs, too, becomes more widely known every year. The Government maintains a sanatorium at Lake Rotorua, and there are private bathing establishments in several other places, notably near Lake Taupo. In South Island there are hot pools and a State sanatorium at Hanmer Plains. Experience shows that the most remarkable cures effected by the hot waters are in cases of gout, rheumatism, diseases of the larynx, and in skin disorders.

Climate. The healthiness of the climate is attested by the death-rate, which, varying (1896–1900) from 9 to 10 per thousand, is the lightest in the world. In 1896 it was as low as 9·10, and since 1886 it has not exceeded 10·35. Even in the boroughs the average is below 13. The rainfall in most of the settled districts ranges from 30 to 50 inches a year. There is, however, a drier strip nearly 200 miles long along the middle portion of the eastern coast of South Island. The rainfall at Christchurch is 26 inches. Nearly all the cereals produced are grown on the east coast.

Maori. In 1896 the Maori were reckoned at 42,113, including 5762 half-castes. In 1901 the number was 46,518. It is probable that the numbers for 1896 were slightly under-estimated. Half-castes have increased by 1327 since 1881. Pulmonary consumption is the chief scourge of the race. About 4600 Maori children are taught in schools, about 3000 of them in schools specially maintained for Maori. The tribes still own 5,000,000 acres of land, and draw considerable sums in rent from Europeans, to whom they lease about 2,000,000 acres. They cultivate the soil, and own cattle, sheep, and horses, but seldom work for wages, and do not engage in trade.

Population. In 1901 the population, excluding the Maori, numbered 772,455, of whom 406,161 were males and 366,294 females. It was distributed thus :—North Island, 390,373; South Island, 381,617; Stewart Island, 253; Chathams, 204; Kermadecs, 8. The Chinese amounted to 2792. The last-named numbered 3711 at the census of 1896. The decrease of the Chinese, who in 1881 numbered 5004, has been caused by a landing tax of £10 a head, increased to £100 in 1896. The colony lost 20,000 by white emigration in the seven years 1885–91. In the worst year, 1888, the departures exceeded the arrivals by 9000; while in 1893 the gain from outside was 10,412, and in every subsequent year there has been at least a slight gain, which in 1901 rose to 6522. A noteworthy feature of the vital statistics has been the fall in the birth-rate from 37·97 in 1881 to 25·31 in 1901. This is significant, as the colony has been prosperous since 1894, and the marriage-rate has risen from 5·70 in 1894 to 7·67 in 1900. Only the very low death-rate preserves an excess of births over deaths, which range from 11,500 to 13,500 annually. Males still exceed females by 10 per cent. Illegitimate births ranged from 3·20 in the 100 in 1885 to 4·63 in 1900. The population is now 8 to the square mile.

Population.

Year.	Population (exclusive of Maori) on the 31st December.
1880	486,029
1885	575,172
1890	625,508
1895	698,706
1900	770,682
1901	772,455

The increase from 1891 to 1901 in the four chief towns is thus shown :—

	Census, 1891.	Census, 1901.
Auckland and suburbs	51,287	67,226
Wellington and suburbs	34,190	49,344
Christchurch and suburbs	47,846	57,041
Dunedin and suburbs	45,869	52,390

A fifth college—the Victoria College, Wellington—was added in 1899 to the four previously affiliated to the New Zealand University. The number of undergraduates is about 2000, of whom 880 were keeping terms in 1899. The proportion of male to female students is about 2 to 1. Excluding Maori schools, the following summary shows the number of schools, teachers, and scholars in 1900:—

Education.

Description of Schools.	Number of Schools.	Teachers.	Scholars.
Public (Government) schools (scholars other than Maoris)	1674	3586	130,724
Colleges, grammar and high schools (aided or endowed)	26	195	2665
Private schools	304	831	15,555
Industrial schools and orphanages	7	...	1668
Native village schools, European children attending	85	151	3109
Private native boarding-schools, European children attending	4	...	72
School for deaf-mutes	1	...	50
Jubilee Institute for Blind	1	...	28
Totals	2102	4763	153,871

The proportion of persons unable to read or write sank from 21·19 in 1886 to 15·27 in 1901. There are eight schools of art, attendance 3000; schools of mines, attendance 300; a school of engineering, attendance 106; an agricultural college, attendance 34.

Crime.

The number of convicts in gaol was 508 at the end of 1899 (633 at the end of 1887). From 1888 to 1897 the annual number of convicted persons fell steadily till the decline amounted to 26 per cent. In the two years following 1897 there was a rise of 2·49 per cent. In 1896 New Zealand-born persons (whites) over fifteen years old formed 44 per cent. of the population, but only supplied 25 per cent. of the convictions. Persons imprisoned for drunkenness fell in number from 1200 in 1885 to 610 in 1899. The proportion of lunatics rose from 1 in 393 for 1896 to 1 in 288 for 1900.

Finance.

The public finances, embarrassed between 1884 and 1889, have since then yielded annual surpluses of from £100,000 to £500,000, which have been chiefly spent upon public works. The public debt is roundly £51,000,000. Two thousand two hundred miles of State railways pay somewhat over 3 per cent. on the cost of construction. Telephones as well as telegraphs are a State monopoly. The revenue from lands was £270,203 in 1901. The mainstay of the Treasury is customs revenue, which now exceeds £2,250,000 a year.

Commerce.

External trade has risen from £12,853,736 in 1886 to £24,697,881 in 1901.

Year.	Imports (excluding Specie).	Exports (excluding Specie).	Excess of Exports over Imports (excluding Specie).
1886	£6,319,223	£6,534,513	£215,290
1888	5,430,050	7,403,206	1,972,156
1890	5,928,895	9,569,316	3,640,421
1892	6,742,544	9,490,920	2,748,376
1894	5,990,177	9,221,550	3,231,373
1895	6,115,953	8,518,119	2,402,166
1896	7,035,379	9,299,907	2,264,528
1897	7,994,201	9,741,222	1,747,021
1899	8,739,633	11,938,335	3,198,702
1900	10,207,326	13,246,161	3,038,835

The re-export trade is extremely small. Trade with the United States has grown from £877,000 in 1891 to £1,520,000 in 1900. Trade with India and Ceylon reached £391,300 in 1900; that with Fiji and other Pacific islands was £622,000 in 1900. With these exceptions, New Zealand trade is almost all done with Australia and the United Kingdom; the latter's share in 1900 was 70·16 per cent. of the whole.

Industrial progress was checked from 1884 to 1895 by the low prices for wool, wheat, and meat, and by the after-effects of land and other speculation in the 'seventies. During these years, however, two new industries of great importance were developed, the export of butter and cheese and frozen meat. The character of the soil and the moist cool climate enable English grasses to be sown almost everywhere, and nearly eleven million acres are now laid down with these. The result is seen in the price obtained for New Zealand sheep in Smithfield Market, which is from ½d. to 1d. per lb higher than that given for frozen mutton from other countries. The figures below show the growth of the trade:—

Export of Frozen Mutton

Year.	lb	Year.	lb
1882	1,707,328	1896	123,576,544
1886	38,758,160	1900	192,074,451
1891	110,199,082	1901	212,208,968

In 1901 New Zealand sent a little over two million frozen sheep and a million and a quarter lambs to London, thus about equalling in quantity the mutton imported into England from South America. In the market for frozen lambs the colony remains at present without a rival. Frozen beef is also sent to England. The export of butter and cheese has risen in value from £207,687 in 1890, till in 1901 it amounted to £1,199,000. In London, New Zealand cheese fetches as high a price as Canadian. Though not ranking in importance with wool or frozen meat, dairy-farming is almost entirely carried on by small farmers and their families, who supply milk to factories. Most of these are co-operative, their shareholders being the farmers themselves. The profits of the industry are thus widely distributed among the producers. The development of dairy-farming has led to the spread of settlement, especially in the west of North Island, where large tracts of fertile soil formerly covered with forest have now been cleared and converted into dairy-farms.

Live Stock.

Year.	Horses.	Cattle.	Sheep.	Pigs.
1881	161,736	698,637	12,985,085	200,083

1896–97	249,813	1,138,067	19,138,493	209,834
1900–01	266,245	1,256,680	20,233,099	250,975

Mining.

In 1895 gold-mining, after being long at a standstill, began again to make headway. For many years the surface alluvial mining in South Island became less and less profitable. As in other countries, however, the working of quartz reefs compensated for this. The cyanide process of gold extraction, and the returns obtained by its means from the Waiki mine in the Upper Thames, caused an outbreak of gold fever, which led to the opening up of a few good and a great many worthless quartz-mines. In South Island the river-beds of Otago province have been successfully worked by means of ingeniously constructed dredges, and good returns secured. In 1901 the gold exported was 455,560 oz., valued at £1,753,784. The total value of the gold exported from New Zealand from the discovery of the metal in 1857 to 1901 was slightly over £58,000,000. Kauri gum still holds its place as an export, about £500,000 worth being dug up annually. The number of Istrians and Dalmatians who came from the Adriatic to dig for kauri gum led to the passing of restrictive laws.

The progressive output of coal from 1880 to 1900 is shown below. The output in 1901 was 1,227,198 tons:—

Year.	Raised in the Colony.	Imported.	Exported (excluding Coal for Fuel by Ocean Steamers).
	Tons.	Tons.	Tons.
1880	299,923	123,298	7,021
1885	511,063	130,202	2,371
1890	637,397	110,939	33,404
1895	726,654	108,198	26,151
1900	1,093,990	124,033	36,699

Land under cultivation increased from 8,489,000 acres in 1891 to 12,679,000 in 1901. The following table shows the comparison of the official assessments of the value of landed properties in 1888 and 1898 :—

	1888.	1898.	Increase, 1888-98.	
			Amount.	Rate per cent.
Unimproved value .	£75,497,379	£84,401,244	£8,903,865	11·79
Value of improvements	35,640,335	54,190,103	18,549,768	52·05
Total . . .	£111,137,714	£138,591,347	£27,453,633	24·70

Wool remains at the head of the list of exports. In the eleven years ending 1898 the wool-clip increased 65·14 per cent. But the description changes; there is much less merino, and more of the coarser and longer cross-bred. The number of sheep has increased from 16,564,000 in 1886 to 20,233,000 in 1901, though the increase has been almost all in North Island. The number of the flocks grows, and the average size diminishes even more rapidly. There were 9149 flocks in 1886; in 1901 the number had risen to 19,000—average size of each flock about 1050. The smaller size of the flocks and the breeding of sheep for meat rather than for wool, the cultivation of English grasses and of extensive crops of turnips and other roots on which to fatten sheep and lambs, all tend to change sheep-farming from the mere grazing of huge mobs on wide, unimproved runs held by pastoral licences. The "squatters" still occupy eleven million acres, but even these are more closely subdivided than in former days. How much more extensive is grazing—of the more scientific order—than agriculture, is seen at once from the figures of the amount of land broken up, for crops or other purposes, and the amount under sown grasses. There were 1,646,000 acres of ploughed land and over eleven millions sown with artificial grasses in 1899. This is exclusive of the vast area of native-grass land. It may be noted here that the area now occupied and utilized by whites is about 39,000,000 acres.

Sheep-farming.

Acreage and actual yield in principal corn-crops, 1901—Wheat: acres, 206,465; yield per acre, in bushels, 31·61; total bushels, 6,527,154. Oats: acres, 449,534; yield per acre, in bushels, 42·45; total bushels, 19,085,837. Barley: acres, 30,831; yield per acre, in bushels, 33·33; total bushels, 1,027,621. Rye: acres, 1388; yield per acre, in bushels, 22·45; total bushels, 52,214. Maize: acres, 14,232; yield per acre, in bushels, 36; total bushels, 502,697. This was the largest yield for seven years, except that of 1899, when the figures were: wheat, 13,073,416 bushels; oats, 16,511,388 bushels; barley, 1,677,908 bushels. The export of cereals has greatly diminished of recent years. Nearly 300,000 tons of potatoes were grown in 1899.

The manufactures have made steady progress. The figures of the census taken in March 1896, and given in the following table, showed a lower rate of increase for the preceding five years than ruled from 1886 to 1891. This is explained, firstly by the collapse of the native hemp industry between 1891 and 1896, and, secondly, by the financial depression of 1893 and 1894, caused by low prices and the Australian bank panic. The estimated private wealth of colonists fell from £236 per head in 1890 to £219 in 1895. It rose in 1900 to £296.

Since 1896 progress has been much faster. The returns of trade and the income-tax, the briskness of the building trade in the towns, the almost entire disappearance of unemployed workmen, are admitted on all hands. The figures of the census of 1901 support this contention. The best proof of advance is perhaps found in the official returns of hands employed in the registered factories and workshops :—

Year.	Hands.	Increase.
1895 . . .	29,879	4028
1896 . . .	32,387	2508
1897 . . .	36,918	4531
1898 . . .	39,672	2754
1899 . . .	45,305	5633
1900 . . .	48,938	3633
1901 . . .	53,460	4522

The chief factory industries come under the following heads:—meat-freezing and tallow; tanning and wool-scouring; saw-mills and grain-mills; boots and shoes; woollen and clothing; butter and cheese; breweries; printing houses; foundries; agricultural implement and machine shops; soap and candle works; coach-building and furniture; gasworks. Except in meat-freezing, wool-scouring, butter- and cheese-making, and timber-sawing, manufacturing is almost entirely for consumption within the colony.

HISTORY, 1882–1902.

Between 1882 and 1902 five governors represented the Crown in New Zealand. Of these Sir Arthur Gordon quitted the colony in June 1882. His successor, Sir William Drummond Jervois, arrived in January 1883, and held office until March 1889. The earl of Onslow, who followed, landed in June 1889, and resigned in February 1892. The next governor, the earl of Glasgow, remained in the colony from June 1892 to February 1897, and was succeeded in August of the last-mentioned year by the earl of Ranfurly. The cabinets which administered the affairs of the colony during these years were those of Sir Frederick Whitaker, Sir Harry Atkinson (3), Sir Robert Stout (2), Mr Ballance, and Mr Seddon. Except in one disturbed month, August 1884, when there were three changes of ministry in eighteen days, executives were more stable than in the colony's earlier years. The party headed by Mr Ballance and Mr Seddon held office without a break for more than eleven years, a result mainly due to the general support given to its agrarian and labour policy by the smaller farmers and the working classes.

The industrial history of New Zealand during these two decades may be divided into two unequal periods. Thirteen lean years—marked, some of them, by great depression—were followed by seven years of prosperity. The colony, which in 1882 was under a cloud, has not often been busier and more self-confident than in 1902. A division into two periods also marks the political history of the same time; but here the dividing line is drawn in a different year. Up to December 1890 the Conservative forces which overthrew Sir George Grey in 1879 controlled Parliament in effect, though not always in name; and for ten years progressive legislation was confined to a mild experiment in offering Crown lands on perpetual lease, with a right of purchase (1882), and a still milder instalment of local option (1881). In September 1889, however, Sir George Grey succeeded in getting Parliament to abolish the last remnant of plural voting. Finance otherwise absorbed attention; the task of successive ministries was to make the colony's accounts balance, and search for some means of restoring prosperity. The years 1884, 1887, and 1888 were notable for heavy deficits in the treasury. Taxation, direct and indirect, had to be increased, and as a means of gaining support for this in 1888 Sir Harry Atkinson, who was responsible for the year's budget, gave the customs tariff a distinctly protectionist complexion. In the previous year Atkinson had reduced the scale of public expenditure, retrenching the salaries of public servants, from those of the governor and ministers to those of clerks drawing £125 a year, but leaving wages untouched. The number of members of the House of Representatives was cut down from 95 to 74, and their pay from £205 to £150. The cost of government was reduced in other ways, and the amount of State employment diminished. Public borrowing between 1882 and 1895, if not abandoned, was on a more modest scale. Private economy was also generally practised, and the colony made a resolute effort to live within its means. The commercial revival, however, came but slowly. The heavy borrowing and feverish speculation of the seven years 1872–79 must in any case have been paid for by reaction. The failure of the City of Glasgow Bank in 1879 precipitated this, and the almost continuous fall in the price of wool and wheat, together with the dwindling of the output of alluvial gold, postponed recovery. Landholders and cultivators were almost always mortgaged, and paid heavy rates of interest, usually from 6 to 9 per cent. An excessive amount of the better land was held in large estates, carrying but little population. The banks and other money-lending institutions virtually owned wide tracts, which were unsaleable at profitable prices. The principal local bank—the Bank of New Zealand—was in an unsound condition, and until in 1895 it was taken under control and guaranteed by the colony, the fear of its collapse overshadowed the community. The financial and commercial improvement which began in 1895 was doubtless to some extent connected with this venturesome but apparently successful stroke of policy. The revival, however, is mainly attributable to the steady conversion of the colony's waste lands into pasture, the development of two new and really great exports—frozen meat and dairy produce; the continuous increase of the output of coal; the invention of gold-dredging; the exploiting of the deposits of kauri gum; the reduction in the rates of interest on mortgage money; a general rise in wages, obtained without strikes, and partially secured by law, which has increased the spending power of the working classes. Undoubtedly also commercial activity has been stimulated by considerable public loans, while the systems of taxation and rating on land values, adopted in 1891 and 1896, have contributed to check land speculation.

During the years 1882–90 the leading political personage was Sir Harry Atkinson. He, however, withdrew from party politics when, in December 1890, he was overthrown by the Progressives under John Ballance. Atkinson's party never rallied from this defeat, and a striking change came over public life, though Ballance, until his death in April 1893, continued the prudent financial policy of his predecessor. The change was emphasized by the active intervention in politics of the trade unions. These bodies, impelled by a socialistic movement felt throughout Australia and New Zealand, decided in 1889 and 1890 to exert their influence in returning workmen to Parliament, and where this was impossible, to secure pledges from middle-class candidates. This plan was first put into execution at the general election of 1890, which was held during the industrial excitement aroused by the Australasian maritime strike of that year. It is therefore usually, but wrongly, attributed to the feeling caused by that great conflict of labour and capital. It had, however, been fully arranged before the conflict broke out. The number of labour members thus elected to the General Assembly was small, never more than six, and no independent labour party was formed. But the influence of labour in the Progressive or, as it preferred to be called, Liberal party, was considerable, and the legislative results noteworthy. Ballance at once raised the pay of members from £150 to £240 a year, but otherwise directed his energies to constitutional reforms and social experiments. These did not interfere with the general lines of Atkinson's strong and cautious finance, though the first of them was the abolition of his direct tax upon all property, personal as well as real, and the substitution therefor of a graduated tax upon unimproved land values, and an income-tax also graduated, though less elaborately. The land-tax, which is still levied, rises from nothing at all upon the small holdings of peasant farmers to 3d. in the £ upon the capital value of the largest estates—those worth £210,000 and upwards. It must be remembered that buildings, improvements, and live stock are exempted. In the case of mortgaged estates, part of the tax is paid by the mortgagee. In 1896 municipal and rural local bodies were allowed to levy rates upon unimproved land values if authorized to do so by a vote of their electors, and by the end of 1901 some sixty bodies, amongst them the city of Wellington, had made use of this permission. The income-tax is not levied on incomes drawn from land. In 1891 the tenure of members of the Legislative Council or nominated Upper House, which had hitherto been for life, was altered to seven years. In 1892 a new form of land tenure was introduced, under which large areas of Crown lands have since been leased for 999 years, at an unchanging rent of 4 per cent. on the prairie value. Crown tenants under this system have no right of purchase. In the same year a law was also passed authorizing Government to repurchase private land for closer settlement. At first the owner's consent to the sale was necessary, but in 1894 power was taken to buy land compulsorily. So energetically was the law administered by John Mackenzie, minister of lands from 1891 to 1900, that in March 1901 more than a million acres had been repurchased and subdivided, and over 6000 souls were living thereon. (These figures include the Cheviot estate, 84,000 acres, bought under another law.) Out of about one hundred estates bought, only four have been taken compulsorily.

On Ballance's sudden death his place was taken by Richard Seddon, minister of mines in the Ballance cabinet, whose first task was to pass the electoral Bill of his predecessor, which provided for granting the franchise to all adult women. This was adopted in September 1893, though the majority for it in the Upper House was but two votes. At three general elections after the date mentioned women voted in large and increasing numbers, though without affecting the strength or policy of parties. In 1893 was also enacted the Alcoholic Liquor Control Act, greatly extending local option. Under it all male and female electors have the right to vote triennially for the reduction or total refusal of licences in their districts. No compensation is paid. Up to 1902 prohibition had been carried in one rural district (Clutha) only, though the number of licences had been somewhat diminished since 1893; there was one licensed house to every 502 persons in the colony. In the Clutha district prohibition was followed by a diminution of drunkenness and minor police offences. In the colony generally drunkenness and petty crime have increased with the years of prosperity. [Summary convictions in 1895, 13,067; in 1900, 18,800. Serious crime, however, decreased.] In 1894 the Advances to Settlers Act authorized State loans on mortgage to farmers at 5 per cent., and about £2,500,000 has been lent in this way, causing a general decline in the rate of interest. The same year also saw the climax of a series of laws passed by the Progressives affecting the relations of employers and workmen. These laws deal with truck, employers' liability, contractors' workmen, the recovery of workmen's wages, the hours of closing in shops and merchants' offices, conspiracy amongst trade unionists, and with factories, mines, shipping, and seamen. In 1895 a law controlling servants' registry offices was added.

Meanwhile the keystone of the regulative system had been laid by the passing of the Industrial Conciliation and Arbitration Act, under which disputes between employers and unions of workers are compulsorily settled by State tribunals; strikes and lock-outs are virtually prohibited in the case of organized work-people, and the conditions of employment in industries may be, and in many cases are, regulated by the awards of public boards and courts. The Arbitration Act, consolidated and extended in 1900, was soon in constant use. In 1895 the chief question before parliament was the reconstruction of the Bank of New Zealand. Under a Government guarantee fresh capital was provided for the bank, its creditors and depositors were secured against loss, and the gradual liquidation of its assets was arranged for, subject to governmental audit and supervision. Up to 1902 this process was steadily carried out, and the bank's business increased. In 1896 the landing-tax on Chinese immigrants, which had been £10 since 1881, was raised to £100, resulting in a rapid diminution of the Chinese in the colony: 1896, 1897, and 1898 were marked by struggles over the Old Age Pensions Bill, which became law in November 1898; by 1902 it had become the means of conferring a free pension of £18 a year, or less, upon 12,300 men and women of 65 years of age and upwards whose private income was less than £1 a week. About 1000 of these pensioners were Maori. The total cost to the colony was about £205,000 annually. Complaints were made of certain evasions of the pensions law, and in 1901 an amending Act was adopted to check these. In 1898 the divorce law was amended on the lines of the Stephen Act of New South Wales, and the municipal franchise, hitherto confined to ratepayers, was greatly widened; in 1900 the English system of compensation to workmen for accidents suffered in their trade was adopted with some changes. In 1895 borrowing on a larger scale was begun, and in seven years as many millions were added to the public debt. Before this the Ballance ministry had organized two new departments, those of Labour and Agriculture. The former supervises the labour laws, and endeavours to deal with unemployment; the latter has done much practical teaching and inspecting work, manages experimental farms, and is active in stamping out diseases of live stock, noxious weeds, and adulteration. Butter, cheese, and New Zealand hemp are by law graded and branded by departmental inspectors before export.

The outbreak of the Boer war in October 1899 was followed in New Zealand by a prompt display of general and persistent warlike enthusiasm: politics ceased to be the chief topic of interest; the general election of 1899 was the most languid held for fifteen years. The desire of New Zealanders to strike a blow for the Mother Country took the practical shape of despatching to South Africa ten successive contingents—in all 6000 men and horses. As soldiers the New Zealand riflemen won from their Imperial commanders high praise for courage, intelligence, and discipline.

Noteworthy incidents of the period were the establishment in 1883 of direct steam service with London; a proposal to annex Samoa, vetoed by the Imperial Government in 1885; the volcanic eruptions of 1886, in which the Pink and White Terraces were overwhelmed and 101 lives lost; the payment of the first annual contribution to the Australasian Naval Squadron under an Act of 1887; the annexation of the Kermadec Islands in the same year; the maritime strike of 1890; the establishment of Victoria College in Wellington in 1899; the adoption of universal penny postage on New Year's Day, 1900; the addition to the colony of the Cook Islands, Savage Islands, and other Polynesian islets in 1901. In the year last mentioned a Royal Commission reported exhaustively against the expediency of New Zealand entering the Australian Commonwealth. In 1902 the progress of the Pacific cable brought the colony into telegraphic communication with Norfolk Island and Fiji. (W. P. R.)

Ngami, the central point of an inland water system of South Africa, once forming a small lake 20 miles long and 10 wide, but now dry and consisting merely of an expanse of reeds growing in a soft treacherous soil, below which brackish water is found at a depth of 20 feet. It is cut by $20\frac{1}{2}°$ S. and 23° E. The former feeder of the lake was the Tioghe or Taukhe river, which entered at the north-west end, but which now sends a portion at least of its waters by a channel north of the Ngami into the Botletli or Zuga river, by which the overflow of the lake was formerly carried off eastwards at the time of high water. The lowest 20 miles of the Taukhe are said to have been dry since about 1890, the districts intersected by the old river beds now growing corn in great plenty. The cessation of the river's flow was caused, according to native report, by a blocking of the channel by thousands of rafts on which the Makoba natives brought down their yearly tribute of corn. The Upper Taukhe is known successively as the Kubango and Okavango, the most remote source lying in about $12\frac{1}{2}°$ S. and $16\frac{1}{2}°$ E., on the high plateau of Bihe. The Kubango flows first south, then south-east and east, but its course is still imperfectly known. In about 18° S. and $20\frac{1}{2}°$ E. it is joined on the north bank by the Kwito, a large navigable stream rising almost as far north as the Kubango, and possibly containing more water. Its general course is south-east, but between 15° and 17° S. it flows south and even south-west. Below the Kwito the Okavango is a rapid stream with an average breadth of over 100 yards, and generally navigable as far as the Popa falls, in 21° 50′ E. In the dry season the water-level is from 4 to 20 feet below the banks, but these are overflowed during the rains. At this period some of the surplus water finds its way (in about 19° S.) by the Magwekwana to the Kwando or Linyanti (Zambezi system), to which, in Major Gibbons's opinion, the whole body of water may have once flowed. Below this point the river (now known as the Taukhe) enters a wide swamp-plain, and is broken up into various branches. The only channel by which its waters now reach the Botletli is the Tamalakane, which joins the latter in about $23\frac{1}{2}°$ E., the Botletli above this point being merely a succession of pools. Below the junction the river when visited by Dr Passarge in 1896, at the close of the dry season, had a breadth of 30 to 50 yards, though its bed reached 150 to 200 yards. The banks are 25 to 30 feet high, and form steep white walls of sand compacted with lime, behind which the dark green forest rises. The stream is fringed with reeds harbouring countless water-fowl, but the game which formerly abounded on its banks was largely destroyed by the rinderpest. The Botletli loses itself in a system of salt-pans—round or oval basins of varying size sunk to a depth of 30 to 45 feet in the sandstone, and often bounded by steep banks. The outer pans are dry for a large part of the year, the whole system being filled only at the height of the flood-season in August. (E. HE.)

Niagara, a river of North America, running northwards from Lake Erie to Lake Ontario, and carrying the discharge of all the Laurentian or Great Lakes, except Lake Ontario (see articles NIAGARA and ST LAWRENCE in the ninth edition of this work). It is navigable from its head to Chippewa, 16 miles, and from Queenston to its mouth, 6 miles. The intervening 9 miles include a series of rapids and the celebrated Falls of Niagara, where the water makes a sheer leap of 160 feet. On the right bank are Buffalo, Tonawanda, Niagara Falls, Lewiston, and Youngstown, of the state of New York; on the left bank, Chippewa, Niagara Falls, Queenston, and Niagara-on-the-Lake, of the province of Ontario. At mean stage the flow of water is 222,000 cubic feet per second, at low stage 176,000. The theoretic average

water power at the Falls equals five million horse-power, the minimum four million. Some 85,000 horse-power is already utilized, and there are extensive plans for future development. The chief part is transferred by electric methods to manufacturers and other consumers in the cities of Niagara Falls and Buffalo.

The gorge and its origin.

The river has no valley. The belt of land it crosses consists of two plains separated by a high cliff or escarpment facing towards Lake Ontario. The stream runs half its length on the upper plain, drops at the Falls into a narrow gorge through which it courses seven miles to the escarpment, and then traverses the lower plain in a deep channel. Under the lower plain are soft shales. The crest of the escarpment is a bed of limestone, nearly level, and this bed is visible in both walls of the gorge to the falls, where it is 60 feet thick. From this firm brink the cataract plunges down into a deep pool or basin hollowed from the soft shale, and the resulting agitation causes further wear of the shale and the continual undermining of the limestone, which breaks away in blocks. Thus the site of the cataract retreats up stream and the gorge is lengthened; the average rate, measured from 1842 to 1890, being between 4 and 5 feet a year. It is evident that the whole gorge has been dug out by the river, and many attempts have been made to determine the time consumed in the work.

Problem of the River's Age.—This problem is of much interest to geologists, because its solution would aid in establishing a relation between the periods and ages of geologic time and the centuries of human chronology. The great Canadian glacier, which in the Glacial period alternately crowded forward over the Great Lakes region and melted back again, so modified the face of the land by erosion and by the deposit of drift that the waters afterwards had to find new courses. The Niagara river came into existence when the waning of the glacier laid bare the western part of the Ontario basin, and the making of the gorge was then begun. If it were supposable that the lengthening of the gorge proceeded at a uniform rate, the computation of the time would be easy, but there are various modifying conditions. (1) The limestone is not equally thick all along the gorge; in one place it is 90 feet, and in several places as little as 35 feet. (2) The height of the cataract has varied from 160 feet to more than 300 feet. (3) For a short distance at the whirlpool the limestone and shale were replaced by softer material, sand, and clay. The river here touched a more ancient gorge, which had previously been concealed by drift except at the escarpment. The diagram shows the breach in the escarpment directed towards the sharp turn of the river gorge at the whirlpool. (4) The size of the river has varied. While the glacier was gradually melting the lakes underwent a complicated series of metamorphoses, and there were two separate epochs when the discharge from all the basins beyond Lake Erie followed other routes, and, during these, the Niagara drained only one-eighth of its present territory. The last mentioned is the most important of the modifying conditions, and at the same time least amenable to computation.

The parts of the gorge eroded by the full river are now marked by deep pools, the powerful cataract having dug far down into the shale. The parts eroded by the depleted river are comparatively narrow and shallow, the weaker cataract having been unable to clear away the fallen blocks of limestone. The work of the full river is illustrated by the main division of the present cataract, called the Horseshoe Fall, which wore its cliff back 220 feet in 48 years. The work of the depleted river is less adequately represented by the narrower and shallower American Fall, where 70 years of observation have discovered no change. In making two-thirds of the gorge the full river probably consumed between 5000 and 15,000 years. If the depleted river worked one-tenth as fast, the period required for the remaining third was five times as long; but the relative rate is wholly conjectural, and the ratio of one-tenth is no more plausible than one of one-hundredth. A weighing of the evidence now available indicates 25,000 years as a lower limit for plausible estimates of the age of the river, but yields no suggestion of an upper limit.

(G. K. G.)

Niagara Falls (formerly Clifton or Suspension Bridge), a town, port of entry, and railway station of Welland county, Ontario, Canada, 40 miles south-south-east of Toronto, on the left bank of the Niagara river and opposite the falls. It is a station on the Grand Trunk, Michigan Central, and St Catharines and Niagara Central railways, and has electric railway communication with Niagara, Lewiston, and Buffalo. There are two famous bridges, viz., the Grand Trunk, the largest single-arch railway bridge extant—span 550 feet—and the road bridge, resting on the greatest steel arch in the world—840 feet span. Population (1891), 3349; (1901), 4244.

Niagara Falls, a city of Niagara county, New York, U.S.A., on the east side of the Niagara river at the falls, in the north-western part of the state, at an altitude of 571 feet. The present city was formed by the consolidation in 1892 of the former villages of Niagara Falls and Suspension Bridge. It extends along the level summit of the cliffs, from above the falls to some three miles below. The city is regularly laid out on a level site, is entered by five large railways, and is divided into four wards. The river is here crossed by three bridges, the steel arch bridge built (1897–98) on the site of the former suspension bridge near the falls, and two railway bridges about two miles farther down the river, viz., the cantilever bridge of the Michigan Central Railway and the single steel arch bridge of the Grand Trunk Railway. The first named of the three is crossed by double carriage-ways and footpaths, and by an electric tramway. Population (1890), 5502; (1892, of the present city), 12,638; (1900), 19,457.

Niam-Niam.—Former estimates of the dominant position held by the Niam-Niam, or Zandeh people, as they call themselves (*Ency. Brit.* vol. xvii. p. 473), have been more than confirmed by the researches of Junker, Casati, Bohndorff, and the Belgian and French officials in south-east Sudan. Their political ascendancy, already weakened by the incessant attacks of the Arabo-Nubian slave-hunters before the rise of the Mahdi, was no doubt broken, perhaps for ever, by the forces of the Congo Free State advancing from the Ubangi into the Welle, and thence across the Nile–Congo divide into the Bahr-el-Ghazal zeriba lands. But by these very political developments the boundaries of their ethnical domain have been greatly enlarged, and the Zandehs proper, with the kindred peoples, are now found to stretch, with interruptions, from the White Nile above the Sobat confluence to the Shari affluent of Lake Chad, and from the Bahr-el-Arab, about 10° N., nearly to the equator.

In this widespread Negroid family are now provisionally grouped the *Makarakas*, intermingled with the *Mundas*, the *Bari*, and the *Babukurs* in the north-east (Bahr-el-Ghazal); the *Krej*, *Bandas*, and *N'Sakkaras* in the north-west (Dar-Fertit, and thence to the Upper Shari); the *Bandzisi*, *Ndris*, *Togbos*, *Langwasi*, *Dakoas*, *Ngapus*, *Wia-Wias*, *Manjas*, *Awakas*, *Akungas*, and others visited by the French explorers—Crampel, Dybowski, Maister—about both slopes of the Congo–Chad water-parting. These last, who give such an enormous westward extension to the family, present much the same physical characters as the Zandehs proper, and speak dialects of the widely-diffused Ndris language, which is not Bantu, but appears to show affinities with Zandeh.

In this great division some French ethnologists are even disposed to include the Fulahs of west and central Sudan, and to substitute for the now exploded "Nuba-Fulah" a "Zandeh-Fulah" family, resulting from various secular interminglings between the true negroes and the Hamites of North Africa. Such crossings have undoubtedly been in progress since prehistoric times over an enormous area south of the Sahara (Africa: *Ethnology*), and are almost everywhere marked by certain constant characters, such as long ringletty or kinky black hair, coppery, reddish, or bronze shades of complexion, brachycephalous (round) head, often highly pronounced, and indicated outwardly by an unusually wide space between the orbits, and generally by somewhat softened negro features. But, owing to the different environments and to the different initial ratios of intermixture, the transitional forms are almost endless, so that it becomes difficult to constitute distinct ethnical groups without calling in the aid of language. Where type and speech correspond, as to a large extent is the case with most of the above-mentioned tribes, even strict systematists will be disposed to constitute separate ethnical groups, at least as working hypotheses, always allowing for the somewhat untrustworthy nature of the linguistic factor. But in the case under consideration Fulah has no kind of connexion with Zandeh speech, both forming, as far as yet known, two absolutely independent negro stock languages. Hence, at least for the present, the newly-formed Zandeh–Fulah must share the fate of Fr. Müller's Nuba–Fulah division of the Hamito-Negroid races.

Besides their speech and the above indicated physical traits, the Zandehs differ in some other respects—temperament and social usages—from the surrounding Mangbattu, Momfu, A-Barambo, A-Babua, and other Negroid peoples. The Makaraka branch especially is described by Junker as amongst the most trustworthy, industrious, and intelligent people of the Bahr-el-Ghazal, where they are very numerous in the district west of Lado. Their strength and staying-power are extraordinary, and they will carry loads of 75 ℔ poised on the head for long marches with only one or two halts during the day. They came originally from the country of the *Kibas*, north of the Welle, who are typical Niam-Niams, distinguished by their elaborate head-dresses and peculiar tattoo markings—square patterns on forehead, temples, or cheeks, an X-shaped figure in a cartouche below the chest, and various zigzag, straight, or dotted lines on the upper arm and breast. Most of the Zandeh file the incisors, the better, as they explain, to seize the foe in battle or in wrestling. From the malted grain of a species of eleusine they brew the best beer in Africa, of a sparkling brown or reddish colour, and pleasant bitter taste, derived from the stalk of the same cereal.

By tribal custom the men are all hunters; the women, who are treated with great kindness and even affection, all tillers of their fertile soil, which with little toil yields abundant crops of cereals—yams, manioc, colocasia, and Virginian tobacco (*gundli*). They are great smokers, and also passionately fond of music, gathering for hours at the concerts, at which fantastically-dressed strolling minstrels accompany their songs with stringed instruments of the guitar and mandoline types. Of the ox, horse, ass, or camel they have no knowledge, the only domestic animals being poultry, and a remarkable breed of dogs, like small wolf-hounds, with smooth red hair, twisted tail like a porker's, large ears, pointed nose, and four-clawed hind feet. These curious little "greyhounds" join in the chase with small wooden bells round the neck, and are thus soon found when lost in the woods.

At present the dismembered Zandeh empire and dependent principalities are divided up between France, which claims the "sultanates" of Rafai, Dinda, Zemio, and Tambura in the Mbomu valley, with all the peoples in Fertit and the Shari basin; the Congo State, which administers the eastern section between the Mbomu and the Upper Welle; and Great Britain, to whose share have fallen the Bari, Makarakas, and other Niam-Niam groups of the Bahr-el-Ghazal region.

See Dr W. Junker. *Travels in Africa.* English ed., vol. i., 1890.—Fr. Bohndorff. *Reisen in Central Afrika*, 1885.—G. Casati. *Ten Years in Equatoria.* English ed., 1891.

(A. H. K.)

Nicaragua, a country of Central America, lying between 10° 41′ and 15° N. and 83° 15′ and 87° 40′ W. The demarcation of the boundary towards Costa Rica was determined by arbitration under treaties of 1858 and 1896 (see Costa Rica). The climate, healthy on the uplands, is malarial on the coast and plains. The rainy season on the Pacific slope is from the middle of May to the middle of November; on the eastern coast, from June to December. The fever which prevails on the low-lying regions appears to be of a mild character, yielding to simple remedies. Observations made at San Juan (Greytown) in 1890 showed the extremes of temperature to be 89° Fahr. in September for the maximum, and 70° Fahr. in January for the minimum; the rainfall for the whole year amounted to 297 inches, the rainiest month having been July (52·5 inches), and the driest, May (4·9 inches). Earthquakes are felt at times on the Pacific slope, but in Nicaragua they are never violent, as in the neighbouring countries. The area of Nicaragua is estimated at about 49,000 square miles; the population in 1897 was 428,000. The country is for political purposes divided into twelve departments and two comarcas (or territories). The departments with their population in 1896 are given as follows:—Managua, 42,460; Masaya, 33,869; Granada, 18,938; Carazo, 18,545; Rivas, 25,883; Leon, 87,772; Chinandega, 34,614; Chontales, 40,387; Matagalpa, 29,895; Jinotega, 37 653; Nueva Segovia, 32,642; and Zelaya, 14,541. The Mosquito Reserve was, by desire of the Indian population, constituted as the department of Zelaya on 20th November 1894. The mass of the population of Nicaragua is very mixed, comprising negroes, mulattoes, *zambos*, *mestizos*, and other coloured inhabitants. The Europeans and descendants of Europeans are estimated at about 1200; the uncivilized Indians at about 30,000. The more important towns are Managua, the capital, with 27,000 inhabitants; Leon, the old capital, 45,000; Granada, 21,000; Masaya, 15,000; Chinandega, 10,000; Jinotega, 10,000; Estelí, 8500; Rivas, 6000; Bluefields, 5000; Corinto, 2500; and San Juan del Norte (Greytown), 1200. Within the republic there are altogether 110 municipalities.

Government.—Under the constitution of 11th July 1894, the Legislative Chamber consists of twenty-four members, two from each department, elected for four years by universal suffrage. The

President of the republic, chosen in a similar manner for four years, is assisted by a cabinet of five ministers, heads of Government departments. Justice is administered by a Supreme Court in two sections, one at Leon, the other at Granada, and by subordinate tribunals throughout the country.

Instruction.—Public instruction is under the care of Government, but is in a very backward condition. In 1894 there were said to be 1020 schools, with altogether 20,000 pupils. An official report of 1895, however, stated that in Leon and Granada, the most advanced of the towns, only 30 per cent. of the children were enrolled, and of these only about half learned anything, while of the whole population of school age only about 3 per cent. learned anything. There are two intermediate schools, one for boys, the other for girls, with together 51 teachers and 1441 pupils (724 boys and 717 girls). The universities for teaching law and medicine at Leon and Granada have been united. A library at Managua is supported by Government. For the year 1901 the cost of instruction was put at 491,192 pesos, or £32,740.

Defence.—Military service is obligatory. To the active army belong all citizens from eighteen to thirty-five years of age; to the reserve, those from thirty-six to forty-five; to the national guard, those from forty-six to sixty-five. The number actually serving is from 2000 to 3500. A few steamers used for police purposes are stationed on Lake Managua.

Finance.—The revenue of the republic is derived mainly from customs duties, liquor, tobacco, and slaughter taxes, railways and steamers, the postal and telegraph services, and the gunpowder monopoly. The principal spending departments are those of war and marine, internal development, and finance. The published accounts, however, present no continuous or clear view of the national receipts and disbursements. For the year 1899 the receipts amounted to 4,475,827 pesos, or (at fifteen pesos to the £) £298,388; and the expenditure to 4,577,794 pesos, or £305,186; deficit, £6798. These receipts, however, are exclusive of the proceeds of the coffee export tax mentioned below, and the expenditure is exclusive of external and various internal debt charges. For the year 1901 the revenue was estimated at £384,060, £317,480 being from taxation, and £66,580 from railways and other national services; while the expenditure was put at £383,928, of which £123,002 was for finance, £78,640 for internal development, and £66,256 for war and marine. In 1886 the republic contracted an external loan to the amount of £285,000 at 6 per cent. interest, and in 1894 the interest fell into default. In 1895 an arrangement was made for the reduction of interest, the commencement of amortization, and the creation of "coffee warrants" to be used in the payment of export duties on coffee assigned for the service of the debt. In the four years 1897-1900 the sales of these warrants amounted to 1,028,990 gold pesos, or (at 23d.) £98,610. In July 1901 the outstanding amount of the debt was £273,900. At the end of 1899 the internal debt amounted to 8,064,935 pesos, or (at fifteen to the £) £537,662.

Production.—The principal agricultural product is coffee, the yield of which increased from 4,528,300 ℔ in 1880 to 11,382,000 ℔ in 1890, 19,800,000 ℔ in 1899, and 26,400,000 ℔ in 1900. Coffee is grown principally in the Matagalpa region, on the uplands of the interior. On the Caribbean coast bananas are cultivated, and largely exported to the United States. Sugar is grown and exported in considerable quantities (1800 tons in 1901). The cocoa export is small; tobacco is grown for local use, as are also rice, beans, and other crops. Rubber is collected in the forests, and plantations have been formed from which good results are expected. The quantity of rubber exported in the year 1900 amounted to 1,097,600 ℔. Dyewoods and indigo are still shipped, but the demand for vegetable dyes has decreased. Cattle rearing is successfully pursued, live cattle and hides being important articles of export. There are about 400,000 head of cattle in the republic. In 1899 the Government sold about 52,000 acres of public land lying about 18 miles to the east of Lake Nicaragua for the purpose of colonization. The purchaser undertakes to introduce settlers from northern Europe, to import cattle for the improvement of the Nicaraguan breed, to plant rubber and vanilla trees, and to provide schools for agricultural instruction. Gold-mining is carried on in the Bluefields region, but, though the discovery of rich deposits is announced from time to time, there is no great enterprise in progress. In 1898 the gold dust and bar exports from Bluefields were of the value of £25,760; in 1899, £47,830; in 1900, £62,000.

Commerce.—The imports consist of cotton and woollen goods, wines and spirits, flour, earthenware, and provisions; the exports consist of the products already mentioned. Complete returns of the trade are not available. In 1900 the total imports amounted to the value of £703,490, and the exports to £792,203. The chief imports were cotton goods of the value of £321,000; flour, £35,000; wines and spirits, £32,000; woollen goods, £19,500; hardware, £18,300; provisions, £15,260. The chief exports were coffee, of the value of £400,000; gold and silver bullion, £74,000; rubber, £69,600; gold ore, £80,690; cattle, £45,000; mahogany, £44,000; hides, £31,500; sugar, £7343. The largest trade is with the United Kingdom, both in imports and exports; then follow, in order of value, the United States, Germany, and France. The largest and most numerous commercial firms are German, but there are also French, British, and even Chinese establishments. The immigration of Chinese is prohibited by law.

Shipping and Communications.—At Corinto, the principal port of the republic, there entered, in 1900, 200 ocean-going vessels with an aggregate tonnage of 328,622 tons. The railways, with the exception of a few short lines for local purposes, belong to the Government. Their total length in 1899 was 136 miles. The main system, connected and supplemented by steamboats on Lakes Managua and Nicaragua and the San Juan river, provides communication between Corinto on the Pacific and San Juan del Norte (Greytown) on the Atlantic. The railway is year by year extending, and several new lines are now contracted for or projected.

Nicaragua Canal.—For the construction of an interoceanic canal across Nicaragua a company obtained a concession which was ratified 15th April 1887. For the carrying out of this project the Maritime Canal Company was organized in May 1899, and incorporated by charter granted by the United States Congress. In the following year a construction company was incorporated. The proposed route of the canal begins at San Juan (Greytown), and, passing across the low coast-land to the San Juan river, follows (with the help of 3½ miles of short cuttings) the course of the river as far as Lake Nicaragua. Issuing from the west side of the lake, it passes along the valleys of the river Las Lajas and the Rio Grande to Brito, the port on the Pacific. The total length of projected waterway is 170 miles, of which 27 miles would be excavated canal. The ascent from the sea-level at each end would be made by three locks, and the summit level would have a length of 154 miles. The question whether the interoceanic canal would be constructed by this route or by the Panama route was still undecided in September 1902. (See also CANALS.)

Posts and Telegraphs.—Nicaragua joined the Postal Union in 1882. In 1896 the republic had 119 post offices; during that year 1,376,366 pieces of mail were received and 1,242,876 were delivered. The telegraph lines in 1897 had a length of 1752 miles, and were served by 83 telegraph offices.

Money and Credit.—There is one bank of issue, the London Bank of Central America, but in 1898 a concession was granted for the formation of another bank. There is, besides, an agricultural bank. The monetary unit is the silver peso, but no Nicaraguan silver pesos are coined. The current coin (of which there is little in the country) consists of Mexican and Central and South American dollars. The currency is mostly paper, notes being issued directly by the Treasury and by the bank. The outstanding Treasury notes at the beginning of 1899 amounted to 2,379,642 pesos. For their amortization there is a fund to which in 1900 the sum of 390,000 pesos, or £26,000, was paid. The notes issued by the bank must be covered to the extent of 40 per cent. by gold and silver; the actual bank reserve is stated to be from 65 to 100 per cent. of the notes issued. The metric system of weights and measures was legalized in January 1893.

History.—Few events in the recent history of Nicaragua, beyond those already noticed, require to be mentioned here. Under the administration of Chamorro, who became president in 1875, a difficulty with Germany occurred. The German Government asserted that one of its consuls had been insulted, and demanded an indemnity of $30,000 (about £2800), a demand to which Nicaragua only submitted after all her principal ports had been blockaded. The successor of President Chamorro was General Zavala, whose administration brought Nicaragua to a higher degree of prosperity than she had ever known. He was succeeded in 1883 by Dr Cárdenas, during whose presidency the attempt of General Barrios to unite the five Central American states was a cause of war between Guatemala and Honduras on one side, and Salvador, Nicaragua, and Costa Rica on the other. Cárdenas had taken command of the united Nicaraguan and Costa Rican army when Barrios died, and on 11th April 1885 a treaty of peace was signed. Don Evaristo Carazo succeeded Dr Cárdenas as president of the republic in 1887, but died when he had served a little over two years, and was succeeded by Dr Roberto Sacasa. Under Carazo's administration the boundary question between Nicaragua and Costa Rica had been settled by arbitration, the President of the United States acting as arbitrator. While Dr Sacasa was president of Nicaragua, the republics of Honduras, Salvador, and Guatemala signed a treaty, under which the United States of Central America were to be formed. The president of Nicaragua adhered to this treaty, but the National Congress refused to ratify it. President Sacasa was overthrown by a revolution in 1893, and was succeeded by a provisional government, which in its turn was deposed soon after by another uprising, at the head of which was General Zelaya. His position was regularized by the constitution of 1894, and he was re-elected president in 1898 for another term of four years. Under his government the incorporation of the Mosquito Reserve into the territory of Nicaragua took place. In 1895 occurred the Hatch incident, which led to the occupation of the port of Corinto by a British fleet. Mr Hatch, British pro-vice-consul at Bluefields, being accused of conspiracy against the Nicaraguan Government, was arrested, along with other British subjects, and expelled the country. For this action Nicaragua was required to pay an indemnity of $15,000. A serious attempt to overthrow Zelaya by force of arms was made in February 1896, but although it developed rapidly into a formidable revolution, it was crushed after several months of severe fighting. There were occasional disturbances subsequently, but none sufficient (up to September 1902) to overturn President Zelaya.

For the formation and dissolution of the Greater Republic of Central America, composed of Nicaragua, Salvador, and Honduras, see CENTRAL AMERICA.

(W. W. R.; I. P. A. R.; C. E. A.)

Nice, capital of the department of Alpes-Maritimes, France, a winter health resort and seaport on the Mediterranean, 640 miles from Paris by rail. Its population is continually increasing, and every year fresh districts are built over. Nice now joins on the north-east the ancient episcopal town of Cimiez, in which are situated the largest and most elegantly appointed mansions (the Regina and Riviera Palace), frequented by British Royalties and rich foreigners. From east to west the town is surrounded by a girdle of beautiful towns—Carabacel, St Etienne, St Philippe, and the Beaumettes. On the east of the port lie Montboron, Riquier, and St Roch, the last partly occupied by barracks. The entrances to the port of Nice have been improved; that of the outer port is 300 feet wide, and that of the inner 220 feet. The area of the port is about 15 acres, the length of quayage available 3380 feet, the depth of water 20 feet, its trade, mostly coastal, being shared principally between French and Italian vessels, the arrivals being about 300 vessels of some 100,000 tons annually. Nice, under the command of a governor-general, is the pivot of defence of the Alpes-Maritimes; hence its girdle of forts. The French Mediterranean squadron is frequently stationed in the deep bays of Villefranche. In 1891 a monument was erected in Nice to the memory of Garibaldi, who was born here, followed in 1896 by one commemorating the union of Nice with France a century before, though the final cession did not take place till 1860 (see NICE, ninth edition of this work). The Palais de Justice was completed in 1891, the Gothic church of Notre Dame in 1890. The trade in flowers and fruit (oranges and lemons) increases in importance as the means of transit improve. In winter the railway carries them daily by the waggon-load. Population (1886), 61,484; (1896), 106,246; (1901), 125,099.

Nichol, John (1833–1894), Scottish man of letters, son of the astronomer J. P. Nichol (1804–1859), was born 8th September 1883, and educated at Glasgow and Balliol College, Oxford, where he had a brilliant career. After taking his first-class in classics, he remained at Oxford as a coach, but in 1862 he was made professor of English literature at Glasgow. He had already made a reputation as a spirited writer of both verse and prose, an acute critic, and a successful lecturer, and his influence at Glasgow was very marked. He was a frequent visitor to the United States, and in 1882 he wrote the article on American literature for the ninth edition of the *Encyclopædia Britannica*—an article which is a good example of his pungent (sometimes unduly pungent) style. He left Glasgow for London in 1889, and continued to be very active with his pen until his death on 11th October 1894, a few months after that of his wife, whom he had married in 1861. Among his best works were his drama *Hannibal* (1873), his *Byron* in the "English Men of Letters" series (1880), his *Robert Burns* (1882), and *Carlyle* (1892). A *Memoir* of Nichol, by Professor Knight, was published in 1896.

Nicholas (1841– ——), PRINCE OF MONTENEGRO AND THE BERDA, was born at the village of Niegush, the ancient home of the reigning family of Petrovitch-Niegush, on the 25th September 1841. His father, Mirko Petrovitch, a celebrated Montenegrin warrior, was elder brother to Danilo II., who left no male offspring. Since 1696, when the dignity of *vladika*, or prince-bishop, became hereditary in the Petrovitch family, the sovereign power has descended from uncle to nephew, the vladikas belonging to the order of the "black clergy" who are forbidden to marry. A change was introduced by Danilo II., who declined the episcopal office, married, and declared the principality hereditary in the direct male line. Mirko Petrovitch having resigned his claim to the throne, his son was nominated heir, and the old system of succession was thus accidentally continued. Prince Nicholas, who had been trained from infancy in martial and athletic exercises, spent a portion of his early boyhood at Trieste in the household of the Kuetitch family, to which his aunt, the Princess Darinka, wife of Danilo II., belonged. The princess was an ardent advocate of French culture, and at her suggestion the young heir of the vladikas was sent to the academy of Louis le Grand in Paris. Unlike his contemporary, King Milan of Servia, Prince Nicholas was little influenced in his tastes and habits by his Parisian education: the young mountaineer, whose keen patriotism, capability for leadership, and poetic talents early displayed themselves, showed no inclination for the pleasures of the French capital, and eagerly looked forward to returning to his native land. He was still in Paris when, in consequence of the assassination of his uncle, he was called to the throne (13th August 1860). In 1862 Montenegro was engaged in an unfortunate struggle with Turkey: the prince distinguished himself during the campaign, and on one occasion narrowly escaped with his life. In the period of peace which followed he carried out a series of military, administrative, and educational reforms. In 1867 he met the Emperor Napoleon III. at Paris, and in 1868 he undertook a journey to Russia, where he received an affectionate welcome from the Tsar, Alexander II. He afterwards visited the courts of Berlin and Vienna. His efforts to enlist the sympathies of the Russian imperial family were productive of important results for Montenegro; considerable subventions were granted by the Tsar and Tsaritsa for educational and other purposes, and supplies of arms and ammunition were sent to Cettigne. In 1871 Prince Dolgorouki arrived in Montenegro on a special mission from the Tsar, and distributed large sums of money among the people. In 1869 Prince Nicholas, whose authority was now firmly established, succeeded in preventing the impetuous mountaineers from aiding the Krivoshians in their revolt against the Austrian Government; more recently, in 1897, he checked the martial excitement caused by the outbreak of the Greco-Turkish war. In 1876 he declared war against Turkey: his military reputation was enhanced by the ensuing campaign, and still more by that of 1877–78, during which he captured Nikshitch, Antivari, and Dulcigno. The war resulted in a considerable extension of the Montenegrin frontier and the acquisition of a seaboard on the Adriatic. In 1883 Prince Nicholas visited the Sultan, with whom he has latterly maintained the most cordial relations; in 1896 he celebrated the bicentenary of the Petrovitch dynasty, and in the same year he attended the coronation of the Tsar Nicholas II., from whom in 1898 he received a gift of 30,000 rifles and 30 million cartridges; in May 1898 he visited Queen Victoria at Windsor. In 1901 he assumed the title of "Royal Highness." The descendant of a long line of warriors, gifted with a fine physique and a commanding presence, a successful military leader and a graceful poet, Prince Nicholas possesses many characteristics which awake the enthusiasm of the impressionable Servian race, while his merits as a statesman, diplomatist, administrator, and reformer have received general recognition. His system of government, which may be described as a benevolent despotism, is perhaps that which is best suited to the character of his subjects. He has done much to establish security of life and property in his dominions, to put down the vendetta and other barbarous usages, to further the progress of education, and to improve the material condition of the people. His historical dramas, poems, and ballads hold a recognized place in contemporary Slavonic literature; among them are—*Balkanska Tzaritza* and *Kniaz Arvaniti* (dramas); *Haïdana, Potini Abenserage* and *Pesnik i Vila* (poems); *Skupliene Pesme* and *Nova Kola* (miscellaneous songs). In November 1860 Prince Nicholas married Milena, daughter of the *voievode* Petar Vukotitch. Of his three sons, the eldest, Prince Danilo, married (27th July 1899) Duchess Jutta (now Militza) of Mecklenburg-Strelitz; of his six surviving daughters, Princess Militza is married to the Grand Duke Peter Nikolaievitch, Princess Stana to Duke George of Leuchtenberg, Princess Helena to King Victor Emmanuel III. of Italy, and Princess Anka to Prince Francis Joseph of Battenberg. (For the political and military history of Montenegro under Prince Nicholas see MONTENEGRO and the more recent authorities there enumerated.)

Nicholas II., EMPEROR OF RUSSIA (1868-——), eldest son and successor of Alexander III., was born at St Petersburg on the 18th of May 1868, and received the ordinary education of Russian grand dukes, under the direction of General Danilovitch, assisted by M. Pobêdonostsef and other eminent professors. Among these was an Englishman, the late Mr Charles Heath, for whom he had great respect and affection. By the death of his grandfather, Alexander II., in 1881, he became heir-apparent (Cesarevitch). Though he received, like all the heirs-apparent to the Russian throne, a certain amount of military training, his personal tastes did not lie in that direction, nor did he show any inclination for the boisterous amusements of the *jeunesse dorée* of St Petersburg. Like his father, he was nowhere happier than in the family circle, and he was particularly attached to his sister, the Grand Duchess Xenia, who was seven years younger than himself. In 1890–91 he made a tour in Greece, Egypt, India, Ceylon, and Japan, where he narrowly escaped assassination at the hands of a Japanese fanatic. On the return journey by Siberia, at Vladivostok, he turned the first sod of the eastern section of the Siberian railway, and two years afterwards (1893) he was appointed president of the imperial committee for that great undertaking. By the death of his father on 1st November 1894 he

THE TSAR NICHOLAS II.
(*From a photograph by W. and D. Downey, London.*)

became emperor, and on the 26th of that month he married Princess Alix of Hesse (a grand-daughter of Queen Victoria) to whom he had been betrothed in the presence of his father during the latter's last illness. Eighteen months later the coronation took place at Moscow with great pomp, but a gloom was thrown over the festivities by the unfortunate incident of the Khodinskoe Polye, a great open space near the city, where a popular fête had been prepared and where, from defective police arrangements, a large number of men, women, and children, roughly estimated at 2000, were crushed and trampled to death. As a rule, Nicholas II. followed in the footsteps of his father, seeking to preserve peace in foreign relations, and continuing in home affairs, though in a much milder form, the policy of centralization and Russification which had characterized the previous reign. His pacific tendencies were shown by his systematic opposition to all bellicose excitement, by his maintaining M. de Giers in the post of minister of foreign affairs, by his offering the post, on the death of that statesman, to M. de Staal, by his restraining France from dangerous adventures, by his supporting M. de Witte in his efforts to establish close commercial relations with Great Britain, and by initiating the so-called Peace Conference at The Hague. To these ought perhaps to be added the transformation of the Franco-Russian *entente cordiale* into a formal alliance, since the alliance in question might be regarded as favourable to the preservation of the *status quo* in Europe. In the internal administration he introduced by his personal influence, and without any great change in the laws, a more humane spirit towards those of his subjects who did not belong by language and tradition to the dominant nationality, and who were not members of the Eastern Orthodox Church; but he disappointed the men of liberal views by giving it to be clearly understood that he had no intention of circumscribing and weakening the autocratic power by constitutional guarantees or parliamentary institutions.

Nicholson, John (1822–1857), British colonel and brigadier-general, eldest son of Alexander Nicholson, a physician of Dublin, was born at Lisburn, Antrim, on 11th December 1822. Educated at Dungannon College, he entered the Bengal Infantry as ensign in 1839. He served in the Afghan war of 1839–42, distinguished himself in the defence of Ghazni (1842), and on its capitulation and the subsequent treachery was made a prisoner and badly treated until removed to Bamian. He escaped with the other prisoners in September 1842, on the occupation of Kabul by Sir George Pollock (medal). He served in the Sutlej campaign, and was present at the battle of Firozshah in 1845 (medal). He was then sent to Kashmir to instruct the maharaja's troops, and in 1847 was given the charge of the Sind Sagar district. On the seizure of Multan by Mulraj, Nicholson rendered great service in securing the country from Attock and in putting down rebellion. He distinguished himself at the Margalla Pass, where he was wounded. In the Punjab campaign of 1848–49 his services were invaluable in furnishing supplies and boats, and in obtaining information of the movements of the enemy, and for these and his gallantry at Chilianwala, Gujrat, and the pursuit of the Sikhs he was mentioned in despatches (medal and clasp and brevet-majority). He was appointed a deputy-commissioner of the annexed Punjab, under Sir Henry Lawrence. His frontier work was most remarkable. At Bannu, among an ignorant and bloodthirsty people, he evolved, in the course of five years, such order and respect for law that murder and highway robbery, previously rife, were unknown in the district. He so impressed his personality on the natives that he became to them a demi-god, and in Hazara a brotherhood of fakirs in 1848 instituted a religious cult for the worship of "Nikal-Seyn," which continued to flourish in spite of Nicholson's efforts to suppress it by punishment. Promoted lieutenant-colonel in 1854, he was deputy-commissioner at Peshawar when the Indian Mutiny began in 1857. He disarmed the sepoy regiment there, and pursued the Mardan mutineers to the borders of Swat. He succeeded Sir Neville Chamberlain in the command of the Punjab force, defeated the rebels at Trimmu Ghat and on the Ravi river, and joined the Delhi field force. He gained a great victory over the rebels at Najafgarh, capturing thirteen guns, and was a tower of strength during the siege and at the assault of Delhi. He led the main storming party, and, having carried the breach, fell mortally wounded in the street while leading on his men. He died a few days later, 23rd September 1857, and was buried in front of the Kashmir gate. (R. H. V.)

Nicobar Islands, a British group, consisting of twelve inhabited and seven uninhabited islands, lying in the Bay of Bengal, between Sumatra and the Andaman Islands, to which latter they are administratively appended. They have an aggregate area of about 635 square miles, Great Nicobar (*Loöng*), the largest and southernmost of any size, covering 333 square miles. Six others range in area from about 20 square miles to 62 square miles; the rest are mere islets. A careful census of the natives, taken by Mr E. H. Man in 1901, gave a total population of some 6700, at about which figure the estimates of the number of inhabitants have always stood. Car Nicobar (*Pu*), the most northerly island, with an area of 49 square miles, was by far the most densely populated, and had 3500 inhabitants, Great Nicobar containing only 450. The marine surveys of these islands are still meagre and unsatisfactory, but the whole of the Nicobars and outlying islands were surveyed topographically by the Indian Survey Department in 1886–87, when a number of maps on the scale of two inches to the mile were produced, giving an accurate coast-line. Some of the islands have mere flat, coral-covered surfaces; others, again, are hilly, the Great Nicobar rising to 2105 feet. On that island there are considerable and beautiful streams, but the others generally are badly off for fresh surface water. There is one good harbour, a magnificent land-locked shelter called Nancowry Harbour, formed by the islands of Camorta and Nancowry (both known to natives as *Nankauri*).

Geology. The Nicobars form part of a great submarine chain, of which the Andamans are a continuation. Elaborate geological reports were issued by a Danish scientific expedition in 1846 and an Austrian expedition in 1858. Dr Rink of the former found no trace of true volcanic rocks, though the chain as a whole is known for its volcanic activity, but features were not wanting to indicate considerable upheavals in the most recent periods. He considered that the islands belonged to the Tertiary age. Von Hochstetter of the Austrian expedition classified the most important formations thus: eruptive, serpentine, and gabbro; marine deposits, probably late Tertiary, consisting of sandstones, slates, clay, marls, and plastic clay; recent corals. He considered the whole group connected geologically with the great islands of the Malay Archipelago farther south. The vexed question of the presence of coal and tin in the Nicobars has so far received no decided scientific support. The white clay marls of Camorta and Nancowry have become famous as being true polycistinan marls like those of Barbados. Earthquakes of great violence were recorded in 1847 and 1881 (with tidal wave), and mild shocks were experienced in December 1899. ***Meteorology.*** It has always been held to be important to maintain a meteorological station on the Nicobars, for the purpose of supplementing the information obtained from the Andamans regarding cyclones in the Bay of Bengal. From 1869 to 1888 an observatory was properly maintained in Nancowry harbour, but after the latter year observations were recorded only in a more or less desultory way until 1897, when the station was removed to Mus in Car Nicobar. The climate is unhealthy for Europeans. The islands are exposed to both monsoons, and smooth weather is only experienced from February to April, and in October. Rain falls throughout the year, generally in sharp, heavy showers. During the five years ending 1888 the annual rainfall varied from 91 inches to 133 inches, and the number of wet days per annum from 148 to 222. The highest temperature in the shade was 98·2° F., and the lowest 64° F. ***Flora and fauna.*** Although the vegetation of the Nicobars has received much desultory attention from scientific observers, it has not been subjected to a systematic examination by the Indian Forest Department like that of the Andamans, and indeed the forests are quite inferior in economic value to those of the more northerly group; besides fruit trees—such as the cocoanut (*Cocos nucifera*), the betel-nut (*Areca catechu*), and the mellori (*Pandanus leeram*)—a thatching palm (*Nipa fruticans*) and various timber trees have some commercial value, but only one timber tree (*Myristica irya*) would be considered first-class in the Andamans. The palms of the Nicobars are, however, exceedingly graceful. Instances of the introduction of foreign economic plants are frequently mentioned in the old missionary records, and nowadays a number of familiar Asiatic fruit-trees are carefully and successfully cultivated. As with the geology and the flora, certain phases of the fauna of the islands have been extensively reported. The mammals are not numerous. In the southernmost islands are a small monkey, rats and mice, tree-shrews (*Cladobates nic.*), bats, and flying-foxes, but it is doubtful if the "wild" pig is indigenous; cattle, when introduced and left, have speedily become "wild." There are many kinds of birds, notably the megapod (*Megapodius nic.*), the edible-nest-building swift (*Collocalia nidifica*), the hackled and pied pigeons (*Calœnas nic.* and *Carpophaga bicolor*), a paroquet (*Palæornis caniceps*), and an oriole (*Oriolus macrourus*). Fowls, snipe, and teal thrive after importation or migration. Reptiles—snakes, lizards, and chameleons, crocodiles, turtles, and an enormous variant of the edible Indian crab—are numerous; butterflies and insects, the latter very troublesome, have not yet been systematically collected. The fresh-water fish are reported to be of the types found in Sumatra.

Natives. The Nicobarese may be best described as a Far Eastern race, having generally the characteristics of the less civilized tribes of the Malay Peninsula and the south-eastern portion of the Asiatic continent, and speaking varieties of the Mon-Annam group of languages, though the several dialects that prevail are mutually unintelligible. Their figure is not graceful, and, owing to their habit of dilating the lips by betel-chewing, the adults of both sexes are often repulsive in appearance. Though short according to our standards (average height, man, 5 feet 3¾ inches; woman, 5 feet), the Nicobarese are a fine, well-developed race, and live to 70 or 80 years of age. Their mental capacity is considerable, though there is a great difference between the sluggish inhabitant of Great Nicobar and the keen trader of Car Nicobar. The religion is an undisguised animism, and all their very frequent and elaborate ceremonies and festivals are aimed at exorcising and scaring spirits. It has so far proved ineradicable. Though for a very long time they were callous wreckers and pirates, and then very cruel, and though they show great want of feeling in the "devil murders"—ceremonial murders of one of themselves for grave offences against the community, which are now being gradually put down—still on the whole the Nicobarese are a quiet, inoffensive people, friendly to each other, and not quarrelsome, and by inclination friendly towards and not dangerous to foreigners. The old charge of cannibalism may be generally said to be quite untrue. Tribes can hardly be distinguished, but there are distinctions, chiefly territorial. All the differences observed in the several kinds of Nicobarese may with some confidence be referred to habitat and the physical difficulties of communication. Such government as there is, is by the village; but the village chiefs have not usually much power, though such authority as they have has always been maintained by the foreign Powers who have possessed the islands. The clothing, when not a caricature of European dress, is of the scantiest, and the waggling tags in which the loin-cloths are tied behind early gave rise to fanciful stories that the inhabitants were naked and tailed. The houses are good, and often of considerable size. The natives are skilful with their lands, and though they never cultivate cereals, exercise some care and knowledge over the cocoanut and tobacco, and have had much success with the foreign fruits and vegetables introduced by the missionaries. The staple article of trade has always been the ubiquitous cocoanut, of which it is computed that 15 million are produced annually, 10 million being taken by the people, and 5 million exported about equally from Car Nicobar and the rest of the islands. The usual cheap European goods are imported, the foreign trade being carried on with the native traders of the neighbouring Asiatic countries. There is an old-established internal trade, chiefly between the other islands and Chowra for pots (which are only made there) and racing and other canoes.

History. The situation of the Nicobars along the line of a very ancient trade route has caused them to be reported by traders and seafarers through all historical times. In the 17th century the islands began to attract the attention of missionaries. At various times France, Denmark, Austria, and Great Britain all had more or less shadowy rights to the islands, the Danes being the most persistent in their efforts to occupy the group, until in 1869 they relinquished their claims in favour of the British, who at once began to put down the piracies of the islanders, and established a penal settlement, numbering in all about 350 persons, in Nancowry harbour. The health of the convicts was always bad, though it improved with length of residence and the adoption of better sanitary measures; and an attempt to found a Chinese colony having failed in 1884 through mismanagement, the settlement was withdrawn in 1888. At present there are maintained native agencies at Nancowry Harbour and on Car Nicobar, both of which places are gazetted ports. At the latter is a Church of England mission station (the only one the missioners connected with which have not led a miserable existence) under a native Indian catechist attached to the diocese of Rangoon.

Nicosia, the capital of Cyprus. Its earliest name was Ledra, but Leucos, son of Ptolemy Soter (280 B.C.), is said to have restored it and changed its name to Leuteon, Leucotheon, or Levcosia. One mile south-west of the town lies the very large Bronze-Age necropolis known as Hagia Paraskevi, which has been repeatedly explored with valuable results. Population in 1881, 11,536 (Moslem, 5393; Christian, 6143); in 1901, 14,752 (Moslem, 6013; Christian, 8739). The circuit of the city was reduced in 1567, under the direction of the Venetian engineer G. Savorgnano, from nine miles to three; eighty churches and a number of fine houses were sacrificed. The new walls were given a circular shape, with eleven bastions and three gates. Water is supplied by two aqueducts. Government House, the residence of the High Commissioner, the Government offices, hospital, central prison, and the new English church are without the walls. The fosse has been planted, and part of it used as an experimental garden. Carriage roads have been completed to Kyrenia, Kythraia, Famagusta, Larnaca, Limasol, and Morphou. Within the city something has been done towards widening and repairing the streets. The principal monuments of the Lusignan period are the fine cathedral church of St Sophia, an edifice of French Gothic, at once solid and elegant (the towers were never completed); the church of St Catherine, "a perfect and finished type of southern Gothic architecture of the last years of the 14th century" (both these are now mosques); and the church of St Nicolas of the English (now a grain store), built for the order of the Knights of St Thomas of Acre (Bp. Stubbs, *Lectures on Mediæval and Modern History*, Lect. viii. p. 182, Oxford, 1886). A gateway of no great importance is nearly all that remains of the palace last used by the Venetian *proveditori.* It dates from the end of the 15th century. There is a museum, with a valuable catalogue. The chief industries are tanning and hand weaving, both silk and cotton.

Nicotera, Giovanni (1828–1894), Italian patriot and politician, was born at San Biagio on 9th September 1828. Early affiliated to the Giovane Italia, he was among the combatants at Naples in May 1848, and at San Pancrazio with Garibaldi during the defence of Rome. After the fall of Rome he fled to Piedmont, where he organized the expedition of Sapri in 1857, but shortly after landing was defeated and severely wounded by the Bourbon troops. Condemned to death, but reprieved through the intervention of the British minister, he remained a prisoner at Favignana until 1860, when he joined Garibaldi at Palermo. Sent by Garibaldi to Tuscany, he attempted to invade the Papal States with a volunteer brigade, but his followers were disarmed and disbanded by Ricasoli and Cavour. In 1862 he was with Garibaldi at Aspromonte; in 1866 he commanded a volunteer brigade against Austria; in 1867 he invaded the Papal States from the south, but the defeat of Garibaldi at Mentana put an end to his enterprise. His parliamentary career dated from 1860. During the first ten years he engaged in violent opposition, but from 1870 onwards joined in supporting the military reforms of Ricotti. Upon the advent of the Left in 1876, Nicotera assumed the portfolio of the Interior, and governed with remarkable firmness. Obliged to resign in December 1877, he joined Crispi, Cairoli, Zanardelli, and Baccarini in forming the "Pentarchy" in opposition to Depretis, but only returned to power, thirteen years later, as Minister of the Interior in the Rudini cabinet of 1891. On this occasion he restored the system of uninominal constituencies, resisted the Socialist May Day agitation, and pressed, though in vain, for the adoption of drastic measures against the false bank-notes put in circulation by the Roman Bank. He fell with the Rudini cabinet in May 1892, and died at Vico Equense on 13th June 1894. (H. W. S.)

Niemes (Czech, *Mimoň*), a town in the government district of Böhmisch-Leipa, North Bohemia, Austria, on the Polzen river. There are manufactures of cloth, linen, and cotton stuffs, bentwood furniture, chemicals, and pyroligneous vinegar. Population (1890), 5598; (1900), 6024.

Nietzsche, Friedrich Wilhelm (1844–1900), German philosopher, was the son of the pastor at Röcken, near Leipzig, where he was born on 15th October 1844. He was educated at Schulpforta, and studied the classics at the universities of Bonn and Leipzig. In 1869, while still an undergraduate, he was, on F. W. Ritschl's recommendation, appointed to an extraordinary professorship of classical philology in the University of Basel, and rapidly promoted to an ordinary professorship. Here he almost immediately began a brilliant literary activity, which gradually assumed a more and more philosophical character. In 1876 eye (and brain) trouble caused him to obtain sick leave, and finally, in 1879, to be pensioned. For the next ten years he lived in various health resorts, in considerable suffering (he declares that the year contained for him 200 days of pure pain), but dashing off, at high pressure, the brilliant essays on which his fame rests. Towards the end of 1888, after recovering from an earlier attack, he was pronounced hopelessly insane, and in this condition he remained until he died on 25th August 1900. Nietzsche's writings must be understood in their relation to these circumstances of his life, and as the outcome of a violent revolt against them on the part of an intensely emotional and nervous temperament. His philosophy, consequently, is neither systematic in itself nor expounded in systematic form. It is made up of a number of points of view which successively appeared acceptable to a personality whose self-appreciation verges more and more upon the insane, and exhibits neither consecutiveness nor consistency. Its natural form is the aphorism, and to this and to its epigrammatic brilliance, vigour, and uncompromising revolt against all conventions in science and conduct it owes its persuasiveness. Revolt against the whole civilized environment in which he was brought up is the keynote of Nietzsche's literary career. His revolt against Christian faith and morals turns him into a proudly atheistic "free-thinker," and preacher of a new "master" morality, which transposes the current valuations, deposes the "Christian virtues," and incites the "over-man" ruthlessly to trample under foot the servile herd of the weak, degenerate, and poor in spirit. His revolt against the theory of State supremacy turns him into an anarchist and individualist; his revolt against modern democracy into an aristocrat. His revolt against conventional culture leads him to attack D. F. Strauss as the typical "Philistine of culture"; his revolt against the fashion of pessimism to demand a new and more robust affirmation of life, not merely *although*, but *because*, it is painful. Indeed, his very love of life may itself be regarded as an indignant revolt against the toils that were inexorably closing in around him. He directs this spirit of revolt also against the sources of his own inspiration; he turns bitterly against Wagner, whose intimate friend and enthusiastic admirer he had been, and denounces him as the musician of decadent emotionalism; he rejects his "educator" Schopenhauer's pessimism, and transforms his will to live into a "Will to Power." Nevertheless his reaction does not in this case really carry him beyond the ground of Schopenhauerian philosophy, and his own may perhaps be most truly regarded as the paradoxical development of an inverted Schopenhauerism. Other influences which may be traced in his writings are those of modern naturalism and of a somewhat misinterpreted Darwinism ("strength" is generally interpreted as physical endowment, but it has sometimes to be reluctantly acknowledged that the physically feeble, by their combination and cunning, prove stronger than the "strong"). His writings in their chronological order are as follows, those so far translated into English being marked with an asterisk:—*Die Geburt der Tragödie aus dem Geiste der Musik*, 1872; *Unzeitgemässe Betrachtungen*, 1873–76 (*Strauss—Vom Nutzen u. Nachtheil der Historie für das Leben—Schopenhauer als Erzieher—Richard Wagner in Bayreuth*); *Menschliches, Allzumenschliches*, 1876–80; *Morgenröthe*, 1881; *D. fröhliche Wissenschaft*, 1882; **Also sprach Zarathustra*, 1883–84; *Jenseits von Gut u. Böse*, 1886; **Zur Genealogie der Moral*, 1887; **Der Fall Wagner*, 1888; **Götzendämmerung*, 1888; **Nietzsche contra Wagner*, **Der Antichrist*, and **Poems* first appeared in the complete edition of his works, which also contains the notes for *Wille zur Macht*, in which Nietzsche had intended to give a more systematic account of his doctrine (1895–1901). His biography, by his sister, Elizabeth Förster-Nietzsche, is in course of publication (vol. i., 1895). (F. C. S. S.)

Nièvre, a department in the centre of France, traversed by the mountains of Morvan and watered by the Loire, the Allier, the Nièvre, and the Yonne.

Area, 2659 square miles. The population, 347,576 in 1881, had decreased to 319,506 in 1901. Births in 1899, 5921, of which 279 were illegitimate; deaths, 6473; marriages, 2380. There were in 1896, 702 schools, with 53,000 pupils, and 5 per cent. of the population was illiterate. The area under cultivation in 1896 measured 1,593,150 square miles, of which 795,340 acres were plough-land and 27,170 acres vineyards. The land in wheat in 1899 yielded the value of £1,008,000; barley, £96,000; oats, £433,000; vines, £132,000; potatoes, £304,000; mangold-wurzel, £123,000; green crops (trefoil, lucern, and sainfoin), £309,000; natural pastures and grass lands, £957,000. In 1899 there were in the department 26,230 horses, 195,369 cattle, 147,790 sheep, and 76,570 pigs. In 1898 Nièvre mined 192,000 metric tons of coal, valued at £92,000. It has also some iron mines. The arrondissement of Nevers (Decize, &c.) has important industries in metals, producing in 1898, 5800 metric tons of iron and 19,200 tons of steel, of the total value of £245,000. There is a brisk industry in pottery. Distillation produced (1899) only some 28,000 gallons of alcohol. Nevers, the capital, had 25,116 inhabitants in 1901.

Nigdeh, the chief town of a sanjak of the same name in the Konia vilayet of Asia Minor, situated on the Kaisaríeh–Karaman road. It is remarkable for the beauty of its buildings, dating from the Seljúk period. The population of 20,000 includes large Greek and small Armenian communities.

Niger, a great river of West Africa, inferior only to the Congo and Nile among the rivers of the continent. Rising within 150 miles of the sea in the outer mountainous zone of the western limb of Africa, it traverses the interior plateaux in a vast curve, flowing north-east, east, and south-east, until it finally enters the Gulf of Guinea through an immense delta. About 250 miles from its mouth it is joined by its great tributary, the Benue, coming from the east from the mountainous region of Adamawa. The source of the Niger, as fixed by the Anglo-French boundary commission in 1896, lies in 9′ 5° N. and 10′ 46° W., and the most northerly point of the great bend in about 17° N., this part of the river's course having been shifted considerably to the south as a result of recent surveys. The area of the Niger basin, excluding the arid regions with a slope towards the stream, has been calculated by Dr Bludau at 584,000 square miles.

The additions to our knowledge of the Niger during the last two decades of the 19th century were largely the work of French officers engaged in the extension of French influence throughout the western Sudan. From 1880 onwards Colonel (afterwards General) Gallieni took a leading part in the operations on the upper river, where in 1883 a small gunboat, the *Niger*, was launched for the protection of the newly-established French posts. In 1885 a first voyage was made by Captain Delanneau past the ruins of Sansandig, as far as Diafarabe, at the junction of the backwater which flows past the town of Jenne. Below Sansandig the stream was found to be split up into a number of channels, while beyond Diafarabe the banks became swampy and treeless. In 1887 the gunboat made a more extended voyage, reaching the port of Timbuktu, and correcting the mapping of the river down to that point. After the occupation of Timbuktu in 1893–94, surveys made in the surrounding region revealed the existence of a series of lakes and backwaters, chiefly on the left of the main stream, with which they are connected by channels conveying the water in one direction or the other according to the season. At high water most of these are united into one general inundation. The largest lake, Faguibini, is nearly 70 miles long, has high shores, and reaches a considerable depth. In 1894–95 attention was directed to the middle and lower Niger, to which several expeditions started from the coast of Guinea, the result being the survey of the portion of the river below Say never before visited by Europeans. Say was reached early in 1895 by Captain Decœur (French), coming from Dahomey, and by Dr Gruner (German), coming from Togoland, the latter afterwards following the course of the stream down to its mouth. In the same year Captain Toutée (French) ascended the river past the Bussa rapids (the scene of Mungo Park's death) and Say, to a point within the radius of influence of Timbuktu. During the subsequent descent the rapids at Bussa were only passed with the greatest difficulty. A still more important expedition was that of Lieutenant Hourst, who, starting from Timbuktu in January 1896, navigated the whole course of the Niger from that point to its mouth, executing a careful survey of the river and the various obstructions to navigation. These were found to occur in two principal sections—the one commencing at Ansongo, in the territory of the Kel-es-Suk Tuareg, and extending almost to Say, the other beginning below the town of Bussa. In both of these sections the river flows through several rocky passes, the current attaining a tremendous velocity. Rapids do not entirely cease until a little above Rabba. A voyage made in 1897 by Lieutenant de Chevigné showed that at low water the section between Timbuktu and Ansongo presents great difficulties, but the voyage from Timbuktu to Say was again successfully accomplished in 1899 by Captain Granderye. In 1901 Captain Leufaut ascended the river with a flotilla from its mouth to Say, experiencing great difficulties in the passage of the rapids.

The delta of the Niger, though still imperfectly known, has been partially surveyed since it became British territory by various ship captains, officials of the Royal Niger Company, and others, including Sir Harry Johnston, formerly British consul for the Oil Rivers. East of the Nun, or the main mouth of the Niger, the estuaries known as the Brass, Sombrero, New Calabar, Bonny, Opobo, &c. (with the exception, perhaps, of the first-named), seem to derive most of their water from independent streams such as the Orashi, rising in about 6° N., which is, however, linked with the Niger by the Onita creek in 5½° N. Behind the town of Okrika, some 30 miles up the Bonny river, the swampy ground gives place to firm land, partially forest-clad. West of the Nun all the estuaries up to the Forcados, and possibly the next beyond, the Escravos, seem to be true mouths of the great river, while the Benin river, though linked to the others by transverse channels, may be more properly regarded as an independent stream. In this direction the largest mouth is the Forcados, the main outlet of the Wari branch of the Niger, a noble stream with a safe and relatively deep bar. The other western mouths, most of which are still very imperfectly known, have as a rule shallow and difficult bars.

In addition to the main stream, almost the whole of the Niger basin has been made known by recent exploration. The journeys of the German traveller G. A. Krause (north from the Gold Coast, 1886–87) and the French Captain Binger (Senegal to Ivory Coast, 1887–89) first defined its southern limits by revealing the unexpected northward extension of the basins of the Guinea coast streams, especially the Volta and Komoe, a fact which explained the absence of important tributaries within the Niger bend. This was crossed for the first time, in its fullest extent, by Monteil (French) in 1890–91, but has since been traversed in all directions by French and other travellers. At the eastern end of the basin much light has been thrown on the system of the Benue, the only really important tributary, apart from the right-bank affluents of the upper Niger. The region of the Benue sources was first explored by E. R. Flegel (1882–84), who traversed the whole southern basin of the river and reached the important town of Ngaundere. Other German travellers—Zintgraff, Morgen, Uechtritz and Passarge, &c., —added to our knowledge of the southern tributaries, the Tarabba, Donga, and others, which in the rains bring down a large body of water from the highlands of southern Adamawa. British travellers who have done work in the same region are Messrs Wallace, Moseley, and Hewby. The Benue itself was ascended to 13½° E., and its tributary the Kebbi to the Bifara marshes, by Colonel (afterwards Sir Claude) Macdonald in 1889, further progress towards the Tuburi marsh, by which a connexion with the Shari system is supposed to exist, being prevented by the shallowness of the water. The upper basin of the Benue was also traversed by the French expeditions of Mizon (1892) and Maistre (1892–93), the latter passing to the south of the Tuburi marsh, without, however, definitely settling the hydrographical question connected with it. Above the Kebbi a considerable stretch of the Benue has not been visited. At this part the stream flows in a curve from the south-west, its source lying in the latter direction, in about 7° 40′ N. and 13° 15′ E. The Benue, though exceptionally free from obstruction by rapids, falls very low in the dry season, and for seven to eight months is almost useless for navigation.

Politically, the main stream of the Niger is divided between Great Britain and France, the former holding, in the protectorate of Nigeria (see below), the lower course of the river as far as a point just above Ilo, in about 11° 40′ N., and the latter the whole middle and upper course. The Benue falls within British territory up to a point three miles below the mouth of the Faro, in about 13° 8′ E., the head streams beyond that point lying within the German territory of Cameroon.

Nigeria, a British protectorate occupying the whole lower basin of the Niger, with adjoining territories up to Lake Chad.

History. The coast-line had long been a field of British commerce, but no British political rights were asserted anywhere in Nigeria until 1884, when the annexation of Cameroon by Germany drew the attention of the Government to the complete insecurity of British interests in those regions. Early in 1884 the first political treaties with native chiefs on the banks of the Niger were concluded by a British company which had foreseen and prepared for the coming general rush for the partition of the continent. It had been founded for this work by Captain Goldie Taubman (afterwards the Right Hon. Sir George Taubman Goldie, K.C.M.G.) as early as 1879, under the name of the United African Company. Finding its capital too small to obtain the desired royal charter, it had expanded in 1882 into the National African Company, with a capital of £1,000,000 sterling. Just before the West African Conference at Berlin in 1884, it had completed the purchase of all French interests in the basin of the lower Niger, enabling the British ambassador to declare that the British flag was alone represented in those regions. In 1886 it at last received a royal charter, which recognized the sovereign and other administrative rights it had obtained (or might obtain) by treaties with native sultans, emirs, and chiefs. Its name was then changed to "The Royal Niger Company." The total number of these political treaties exceeded 400, and covered territory extending from the Gulf of Guinea to the Sahara. Of the coast-line of Nigeria, about one-half only was within the Royal Niger Company's jurisdiction. The remaining half—at the chief ports of which treaties had been made by Consul Hewitt in 1884 for the Imperial Government—was administered by Imperial authorities, first as the "Oil Rivers Protectorate," and after May 1893 as the "Niger Coast Protectorate." After many years of struggle between the Niger Company and German agents, final recognition of British rights was obtained from Germany by the agreement of 1893, which defined the south-east frontier, running roughly north-east from the Rio del Rey to Lake Chad. An agreement with France in 1890 fixed the northern frontier of the company as a line running from Say on the Niger to Barua on Lake Chad, but left undecided the frontier west of the Niger. This was keenly contested between the Niger Company and the French colonial agents, until the agreement of 1898, which fixed the frontier on the right bank of the Niger near Ilo, the northern frontier of the company being also modified so as to give to France the left bank below Say, and also a rectangular block, including the important town of Zinder. Two small enclaves on the lower river were also assigned to France—the one on the south bank of the Forcados estuary, the other on the right bank of the Niger in about $9\frac{1}{2}°$ N. They were occupied in 1901. The sovereign rights of the Niger Company were transferred to the British Crown on 1st January 1900, and the whole territory, including the coast protectorate, became the protectorate of Nigeria, divided into a northern and southern government, each of which is administered by a high commissioner appointed by the Colonial Office. (See also CHARTERED COMPANIES.)

Physical features. Physically, Nigeria consists of a series of zones parallel to the coast-line. The swampy delta region, traversed by innumerable interlacing creeks and broad placid channels fringed with monotonous mangrove forest, gives place some 40 miles from the coast to an undulating forest-clad country, which in turn yields near the confluence of the Niger and Benue to a zone of hills, bare in parts, marking the outer margin of the interior plateau. This, which extends north with generally similar features through the remainder of British territory, broken only by the valleys of the two great rivers, does not attain an elevation approaching that of the plateaux of the southern half of the continent, the culminating point (apart from particular mountain districts), situated in about 10° N., reaching a height of 2500 feet only. The valleys of the Niger and Benue, especially the latter, are very much lower, the town of Yola on the Benue, some 750 miles from the sea, lying at an altitude of little over 600 feet. The surface is generally undulating, with isolated hills of granite and sandstone often rising abruptly from the plain. It is clothed largely with thin forest, but becomes more open to the north until the arid steppes bordering the Sahara are reached. The most mountainous districts are northern Bauchi (a little north of 10°), where heights of 6000 to 7000 feet occur; parts of Muri, along the north bank of the Benue; and the southern border of the Benue basin, where the hills (consisting of ironstone, quartz, and granite) appear rich in minerals.

The climate of the coast-lands is moist and hot, and extremely unhealthy, malarial fevers being unusually prevalent and deadly. Inland the mean temperature of the year is high, and at the time when the "harmattan" blows from the northern deserts, noon temperatures considerably over 100° Fahr. are recorded. A great part of the year (eight months in parts) is dry, the rains being limited to the late summer. Though unfavourable for the permanent residence of white men, the interior is much less deadly than the coast-lands. In the latter, as far inland as $6\frac{1}{2}°–7\frac{1}{2}°$ N., the oil-palm (*Elæis guineensis*) is the most noteworthy tree; bananas are largely grown, and, with yams, &c., form an important article of food. Rubber, with many kinds of valuable timber, occurs throughout the inland forest zone. The Benue valley and the plains of northern Nigeria are largely cultivated, producing abundance of guinea corn (millet), maize, wheat, cassava, rice, onions, cotton, indigo, peas and beans, sweet potatoes, ground nuts, &c. Various economic trees, including the shea-butter tree (*Bassia Parkii*), the locust-tree, gambier (used in tanning), tamarind, &c., are allowed to grow in the fields. The last-named supports silk-worms in large quantities, the silk being much valued.

Population. The inhabitants of Nigeria are distributed in accordance with the physical features, the forest-clad coast-lands being peopled by pure negroes, some of the tribes being given, at least in the past, to cannibalism and other revolting practices, while others are harmless and peaceable. The interior possesses a mixed population, a negro substratum having been modified by contact with the northern races of the continent, and by them converted to Islam, which forms, however, but a thin veneer. The most important race in northern Nigeria is that of the Hausas, who have been called the Parsees of West Africa for their enterprise and industry. They are keen traders, their caravans ranging from the Mediterranean to the Gulf of Guinea. They are physically well developed, capable of great endurance, and make excellent soldiers. The ruling race of the Hausa States, however, is the Fulah or Fulani, which forms a separate caste of cattle-rearers, but constitutes probably less than a sixth of the total population, the pure-blooded Hausas making up a third, while the remainder consists of slaves chiefly recruited from the pagan races to the south-east. Towns of 10,000 to 30,000 inhabitants are met with about every 50 miles in some parts, and occasional cities of 60,000 to 100,000. The total population of the Hausa States alone has been estimated at from 15 to 20 millions. The nominal sovereign of the Fulah empire is the Sultan of Sokoto, whose power has, however, much declined of late years, many of the subordinate sultans having become almost independent.

The capital is now *Wurnu*, some 25 miles north-east of *Sokoto*, the former capital, which has been abandoned for political reasons. Wurnu is a small town of 6000 inhabitants, not to be compared with the other great cities of the empire. Of these the most important is *Kano*, the great emporium of trade for the central Sudan, where Tuareg and Arab from the north meet merchants from the Niger, Lake Chad, and the far southern regions. The average daily attendance at the market has been estimated at 25,000 to 30,000. Kano produces an immense amount of cotton cloth, and is the great centre of the trade in kola nuts, which are imported from behind the Gold

Coast. Other important towns, more or less independent of the central authority, are *Katsena*, *Zaria*, *Bauchi* or *Yakoba* (population, 50,000), *Nasarawa*, *Muri*, and *Yola* on the Benue, the last the chief centre of the province of Adamawa. In the extreme east, between the Benue and Lake Chad, the state of *Belda* has acquired importance of late years under Hayatu, a Moslem propagandist of the ruling family of Sokoto. Several of the mountainous districts, especially south of the Benue, are inhabited by pagan negro tribes. Immediately east of the Niger is the semi-subordinate kingdom of *Gandu*, with the chief town of the same name, and south of it the small states of Yauri and Nupe. Nupe extends south across the Niger, between 8° and 9° N. Its capital is Bida, a large walled town of much importance as a centre of trade and of the manufacture of leather goods and glass. It was taken by the Niger Company's forces in 1897. West of the Niger lies the negro kingdom of *Borgu* (under the king of Bussa), where, however, the Fulahs have gained a footing at *Gomba*. The bulk of the inhabitants are known as Baribas. Farther south on this side Nigeria includes the northern part of the Yoruba countries, with the important town of *Ilorin*, captured by the Niger Company's forces in 1897. *Bornu*, west of Lake Chad, inhabited by the Kanuri, another mixed race, though likewise part of British Nigeria, has for some time been in an unsettled state, firstly through the invasion of the ex-slave Rabah (*q.v.*), and since 1899 through the French military operations against Rabah and his son Fadel Allah, both of whom lost their lives in battle.

Administration.

Since its transfer to the British Crown Nigeria has been divided for administrative purposes into the two governments of northern and southern Nigeria, the dividing line running east and west in about 7° 10′ N., crossing the Niger a little above Idda. Southern Nigeria thus includes an area many times larger than the old Niger Coast Protectorate. The administrative centre is at *Asaba*, above the head of the delta, which was the old civil capital of the whole territory under the Niger Company. It is the seat of the supreme court, and has various public buildings, including the central gaol. On the opposite bank of the Niger is *Onitsha*, where are both Protestant and Roman Catholic mission stations. The principal port of entry for the Niger is *Akassa*, on the main mouth of the river, which under the former régime formed part of the Company's territory. It possesses a slip for the repairing of ships and important engineering workshops. Other trading ports of importance are *Old Calabar*, *Opobo*, *Bonny*, *New Calabar*, and *Brass* to the east; and *Warri*, *Burutti*, *Sapele*, and *Benin* to the west, of the main Niger mouth. Old Calabar, known also as Duke Town (population about 40,000), lies at the head of a broad tidal estuary unconnected with the Niger system, but carrying off the water of the Old Calabar or Cross river, which rises in German territory in about 10½° E. The chief exports from all these ports are palm-oil and kernels. Rubber, ebony, cacao, and coffee also figure in small quantities among the exports from the coast region, and those of the interior which pass out by the Niger mouth include ivory, indigo, gums, camwood, and hides. The total exports of southern Nigeria were valued at £774,648 in 1898–99, and the imports (in which the principal item was cotton goods) at £732,640. The Church Missionary Society has long been active on the Lower Niger, and has stations at most of the chief centres; while two other British Protestant societies and two French Roman Catholic societies are also at work.

In northern Nigeria the chief British stations are *Lokoja* (military centre under the Royal Niger Company), *Egga*, *Rabba*, and *Bussa*, all on the Niger; and *Loko* (port of Nasarawa) and *Ibi* on the Benue, the latter the company's military headquarters on that river. Under the administration of Sir F. Lugard good progress has been made in the pacification of the country, and British influence has been established at several of the Hausa towns; while Yola, the capital of Adamawa, was taken by a force under Colonel Morland in 1901. A site for the headquarters of the Government has been chosen near the left bank of the Kaduna river, 9 miles from Wushishi, the limit of navigation, with which it has been connected by a steam tramway. The portion of the territory brought under British control had in May 1901 been formed into nine provinces, each under a Resident, while others were about to be established. Northern Nigeria, especially the Hausa States, is an unusually promising field for commercial enterprise, the principal products being indigo, gum-arabic, kola-nuts, ivory (brought from the south by caravans from the marts of Tibati and Ngaundere, and from the shores of Lake Chad), kino, hides, gutta-percha, and rice. The military force of northern Nigeria consists of about 2500 native infantry, with artillery, engineers, and other details, officered by British officers; the military force of southern Nigeria consists of about 800 native infantry, also under British officers. In 1898–99 the total revenue of southern Nigeria (then the Niger Coast Protectorate) was £169,568, and expenditure £146,752.

Nightingale, Florence (1820–——), younger daughter of William Edward Nightingale of Embley Park, Hampshire, and Lea Hurst, Derbyshire, was born at Florence, 15th May 1820, and named after that city, but her childhood was spent in England, chiefly in Derbyshire.

FLORENCE NIGHTINGALE.
(From a photograph by the London Stereoscopic Co.)

From her earliest years her strong love of nature and animals manifested itself. Her games, too, were characteristic, for her great delight was to nurse and bandage her dolls. Her first living patient was a shepherd's dog. From tending animals she passed to human beings, and wherever there was sorrow or suffering she was sure to be found. Her most ardent desire was to use her talents for the benefit of humanity. She had a natural shrinking from society; and though her social position necessitated her presentation at Court, her first season in town was spent in examining into the working of hospitals, reformatories, and other charitable institutions. This was followed by a tour of inspection of foreign hospitals. At that time England was sadly behind-hand in matters of nursing and sanitation, and Miss Nightingale, who desired to obtain the best possible teaching for herself, went through a course of training in the Institute of Protestant Deaconesses at Kaiserswerth. She remained there six months, learning every detail of hospital management with a thoroughness rarely equalled. Miss Nightingale neglected nothing that could make her proficient in her self-chosen task. From Kaiserswerth she went to Paris, where she studied the system of nursing and management in the hospitals under the charge of the sisters of St Vincent de Paul. After her return to England she devoted herself to reorganizing the Governesses' Sanatorium in Harley Street (now the Home for Gentlewomen during Temporary Illness), which was at that time badly managed and in great need of funds. Miss Nightingale grudged neither time nor money to this work, and she had the satisfaction of placing it on a thoroughly satisfactory basis.

In the year 1854 England was stirred to its depths by the report of the sufferings of the sick and wounded in the Crimea. There was an utter absence of the commonest preparations to carry out the first and simplest demands in a place set apart to receive the sick and wounded of a large army. The condition of the large barrack-hospital at Scutari was deplorable. A Royal Commission of Inquiry was appointed, a Patriotic Fund opened, and money flowed in fast. To Miss Nightingale this proved the trumpet-call of duty. She wrote to Sidney Herbert, Secretary at War, and offered her services. Her letter crossed with one from him inviting her to proceed to the Crimea. She set out on the 24th October with a staff of thirty-seven nurses, partly volunteers, partly professionals trained in hospitals. They reached Scutari on 4th November, in time to receive the Balaclava wounded. A day or two later these were joined by 600 from Inkerman. The story of Miss Nightingale's labours at Scutari is one of the brightest pages in English annals. She gave herself, body and soul, to the work. She would stand for twenty hours at a stretch to see the wounded accommodated. She regularly took her place in the operation-room, to hearten the sufferers by her presence and sympathy, and at night she would make her solitary round of the wards, lamp in hand, stopping here and there to speak a kindly word to some patient. Soon she had 10,000 men under her charge, and the general superintendence of all the hospitals on the Bosphorus. Gradually the effects of the measures adopted were seen in a lowered death-rate. In February 1855 it was as high as 42 per cent., before many months it had sunk to 2. For a time Miss Nightingale was herself prostrated with fever, but she refused to leave her post, and remained at Scutari till Turkey was evacuated by the British in July 1856. The enthusiasm aroused in England by Miss Nightingale's labours was indescribable. A man-of-war was ordered to bring her home, and London prepared to give her a triumphant reception; but she returned quietly in a French ship, crossed to England, and escaped to her country home before the news of her return could leak out. The experiences of those terrible months permanently affected Miss Nightingale's health, but the quiet life she afterwards led was full of usefulness. With the £50,000 raised in recognition of her services she founded the Nightingale Home for training nurses at St Thomas's and King's College Hospitals. She also turned her attention to the question of army sanitary reform and army hospitals, and to the work of the Army Medical College at Chatham. In 1858 she published her *Notes on Nursing*, which gave an enormous stimulus to the study of this subject in England. According to Miss Nightingale, nursing ought to signify the proper use of fresh air, light, warmth, cleanliness, quiet, and the selection and administration of diet—all at the least expense of vital force to the patient.

Miss Nightingale followed with interest all the later improvements in sanitation, and was frequently consulted about hospital plans both at home and abroad. She has written on sanitation in India, children's hospitals, lying-in hospitals, and other cognate subjects. With the help of the County Council Technical Instruction Committee she organized in 1892 a health crusade in Buckinghamshire. Teachers were sent round among the cottagers to give practical advice on such points as ventilation, drainage, disinfectants, cleanliness, &c., a plan which, if widely carried out, would bring the most valuable knowledge to every home in England. She is understood to have drawn up a confidential report for the Government on the working of the Army Medical Corps in the Crimea, and to have been officially consulted during the American Civil War and the Franco-German war. She is the subject of a beautiful poem by Longfellow, "Santa Filomena," and the popular estimate of her character and mission was summed up in a particularly felicitous anagram, *Flit on, cheering angel.*

Nigra, Costantino (1827——), Count, Italian diplomatist and knight of the Annunziata, was born at Villa Castelnuovo in the province of Ivrea on 12th June 1827. During the war of 1848 he interrupted his studies to take up arms against Austria, and on the conclusion of peace entered the Piedmontese Foreign Office. He accompanied Victor Emmanuel and Cavour to London in 1855, and a year later was chosen by Cavour as secretary in the negotiations for the Franco-Italian alliance of 1859. During the war of that year Nigra was attached to the French headquarters, and after the peace of Villafranca was sent as minister plenipotentiary to Paris. Except for a brief period in 1860–61, when the Piedmontese occupation of the Marches and Umbria caused a breach in Franco-Italian relations, Nigra remained Italian representative in Paris until the fall of the Right in 1876. During this long period the influence possessed by him at the Imperial Court enabled him to render invaluable service to his country, especially in regard to the September Convention, the Italo-Prussian alliance against Austria in 1866, and the French expedition to Rome in 1867. During the Franco-Prussian war Nigra was of material assistance to the French imperial family, but nevertheless succeeded in maintaining, in his dealings with the Republican Government, the same influence as he had wielded under the Empire. Upon the advent of the Left in 1876, he was transferred to St Petersburg, and in 1882 to London, where he actively seconded the Anglophil policy of Mancini. Upon the fall of Mancini he was appointed ambassador at Vienna in succession to Count di Robilant, the duties of which difficult post he discharged with great tact and skill, the exceptional value of his diplomatic services being recognized even by former political opponents. In 1882 he was created count by King Humbert, and in December 1890 was appointed a member of the Italian Senate.

Nihilism may be roughly defined as the Russian form of revolutionary Socialism, which had at first an academical character, and rapidly developed into an anarchist revolutionary movement. It originated in the early years of the reign of Alexander II., and the term was first used by Turguenief in his celebrated novel, *Fathers and Children*, published in 1862. Among the students of the universities and the higher technical schools Turguenief had noticed a new and strikingly original type—young men and women in slovenly attire, who called in question and ridiculed the generally received convictions and respectable conventionalities of social life, and who talked of reorganizing society on strictly scientific principles. They reversed the traditional order of things even in trivial matters of external appearance, the males allowing the hair to grow long and the female adepts cutting it short, and adding sometimes the additional badge of blue spectacles. Their appearance, manners, and conversation were apt to shock ordinary people, but to this they were profoundly indifferent, for they had raised themselves above the level of so-called public opinion, despised Philistine respectability, and rather liked to scandalize people still under the influence of what they considered antiquated prejudices. For æsthetic culture, sentimentalism, and refinement of every kind they had a profound and undisguised contempt. Professing extreme utilitarianism and delighting in paradox, they were ready to declare that a shoemaker who distinguished himself in his craft was a greater man than a Shakespeare or a Goethe, because humanity had more need of shoes than of poetry. Thanks to Turguenief, these young persons came to be known in common parlance as "Nihilists," though they never ceased to protest against the term as a calumnious nickname. According to their own account, they were simply earnest students who desired reasonable reforms, and the peculiarities in their appearance and manner arose simply from an excusable neglect of trivialities in view of graver interests. In reality, whatever name we may apply to them, they were the extreme representatives of a curious moral awakening and an important intellectual movement among the Russian educated classes (see the article ALEXANDER II., vol. xxv. p. 258). In material and moral progress Russia had remained behind the other European nations, and the educated classes felt, after the humiliation of the Crimean war, that the reactionary régime of the Emperor Nicholas must be replaced by a series of drastic reforms. With the impulsiveness of youth and the recklessness of inexperience, the students went in this direction much farther than their elders, and their reforming zeal naturally took an academic, pseudo-scientific form. Having learned the rudiments of positivism, they conceived the idea that Russia had outlived the religious and metaphysical stages of human development, and was ready to enter on the positivist stage. She ought, therefore, to throw aside all religious and metaphysical conceptions, and to regulate her intellectual, social, and political life by the pure light of natural science. Among the antiquated institutions which had to be abolished as obstructions to real progress were religion, family life, private property, and centralized administration. Religion was to be replaced by the exact sciences, family life by free love, private property by collectivism, and centralized administration by a federation of independent communes. Such doctrines could not, of course, be preached openly under a paternal, despotic government, but the press censure had become so permeated with the prevailing spirit of enthusiastic liberalism, that they could be artfully disseminated under the disguise of literary criticism and fiction, and the public very soon learned the art of reading between the lines. The work which had perhaps the greatest influence in popularizing the doctrines was a novel called *Shto Dyelati?* (What is to be done?), written in prison by Tchernishefski, one of the academic leaders of the movement, and published with the sanction of the authorities!

Since the time of Peter the Great, Russia had been subjected to a wonderful series of administrative and social transformations, and it seemed to many people quite natural that another great transformation might be effected with the consent and co-operation of the autocratic power. The doctrines spread, therefore, with marvellous rapidity. In the winter of 1861–62 a high official wrote to a friend who had been absent from Russia for a few months: "If you returned now you would be astonished at the progress which the opposition—one might say, the revolutionary party—has made. . . . The revolutionary ideas have taken possession of all classes, all ages, all professions, and they are publicly expressed in the streets, in the barracks, and in the Government offices. I believe the police itself is carried away by them." Certainly the Government was under the influence of the prevailing enthusiasm for reform, for it liberated all the serfs, endowed them liberally with arable land, and made their democratic communal institutions independent of the landed proprietors; and it was preparing other important reforms in a similar spirit, including the extension of self-government in the rural districts and the towns, and the reorganization of the antiquated judicial system and procedure according to the modern principles adopted in western Europe.

The programme of the Government was extensive enough and liberal enough to satisfy, for the moment at least, all reasonable reformers, but the well-intentioned, self-confident young people to whom the term Nihilists was applied were not reasonable. They wanted an immediate, thorough-going transformation of the existing order of things according to the most advanced socialistic principles, and in their youthful, reckless impatience they determined to undertake the work themselves, independently of and in opposition to the Government. As they had no means of seizing the central power, they adopted the method of endeavouring to bring about the desired political, social, and economic changes by converting the masses to their views. They began, therefore, a propaganda among the working population of the towns and the rural population in the villages. The propagandists were recruited chiefly from the faculty of physical science in the universities, from the Technological Institute, and from the medical schools, and a female contingent was supplied by the midwifery classes of the Medico-Surgical Academy. Those of each locality were personally known to each other, but there was no attempt to establish among them hierarchical distinctions or discipline. Each individual had entire freedom as to the kind and means of propaganda to be employed. Some disguised themselves as artisans or ordinary labourers, and sought to convert their uneducated fellow-workmen in the industrial centres, whilst others settled in the villages as school-teachers, and endeavoured to stir up disaffection among the recently emancipated peasantry by telling them that the Tsar intended they should have all the land, and that his benevolent intentions had been frustrated by the selfish landed proprietors and the dishonest officials. Landed proprietors and officials, it was suggested, should be got rid of, and then the peasants would have arable, pastoral, and forest land in abundance, and would not require to pay any taxes. To persons of a certain education the agitators sought to prove that the general economic situation was desperate, that it was the duty of every conscientious citizen to help the people in such a dilemma, and that the first step towards the attainment of this devoutly to be wished consummation was the limitation or destruction of the uncontrolled supreme power. On the whole the agitators had very little success, and not a few of them fell into the hands of the police, several of them being denounced to the authorities by the persons in whose interest they professed to be acting; but the great majority of them were so obstinate and so ready to make any personal sacrifices, that the arrest and punishment of some of their number did not deter others from continuing the work. Between 1861 and 1864 there were no less than twenty political trials, with the result that most of the accused were condemned to imprisonment, or to compulsory residence in small provincial towns under police supervision.

The activity of the police naturally produced an ever-increasing hostility to the Government, and in 1866 this feeling took a practical form in an attempt on the part of an obscure individual called Karakozof to assassinate the emperor. The attempt failed, and the judicial inquiry proved that it was the work of merely a few individuals, but it showed the dangerous character of the movement, and it induced the authorities to take more energetic measures. For the next four years there was an apparent lull, during which only one political trial took place, but it was subsequently proved that the Nihilists during this time were by no means inactive. An energetic agitator called Netchaief organized in 1869 a secret association under the title of the Society for the Liberation of the People, and when he suspected of treachery one of the members he caused him to be assassinated. This crime led to the arrest of some members of the society, but their punishment had very little deterrent effect on the Nihilists in general, for during the next few years there was a recrudescence of the propaganda among the labouring classes. Independent circles were created and provided with secret printing-presses in many of the leading provincial towns—notably in Moscow, Nijni-Novgorod, Penza, Samara, Saratof, Kharkof, Kief, Odessa, Rostof-on-the-Don, and Taganrog; and closer relations were established with the revolutionary Socialists in western Europe, especially with the followers of Bakounine, who considered that a great popular rising should be brought about in Russia as soon as possible. Bakounine's views did not, it is true, obtain unanimous acceptance. Some of the Nihilists maintained that things were not yet ripe for a rising of the masses, that the pacific propaganda must be continued for a considerable time, and that before attempting to overthrow the existing social organization some idea should be formed as to the order of things which should take its place. The majority, however, were too impatient for action to listen to such counsels of prudence, and when they encountered opposition on the part of the Government they urged the necessity of retaliating by acts of terrorism. In a brochure issued in 1874 one of the most influential leaders (Tkatchef) explained that the object of the revolutionary party should be, not the preparation of revolution in general, but the realization of it at the earliest possible moment, that it was a mistake to attach great importance to questions of future social organization, and that all the energies of the party should be devoted to "a struggle with the Government and the established order of things, a struggle to the last drop of blood and to the last breath." In accordance with the fashionable doctrine of evolution, the reconstruction of society on the *tabula rasa* might be left, it was thought, to the spontaneous action of natural forces, or, to use a Baconian phrase, to *natura naturans*.

To this and similar declarations of irreconcilable hostility the Government replied by numerous arrests, and in the winter of 1877–78 no less than 193 agitators, selected from 2000 arrested on suspicion, were tried publicly in St Petersburg by a tribunal specially constituted for the purpose. Nearly all of them were condemned to imprisonment or exile, and the revolutionary organization in the northern provinces was thereby momentarily paralysed, but a few energetic leaders who had escaped arrest reorganized their scattered forces and began the work anew. They constituted themselves into a secret executive committee, which endeavoured to keep in touch with, and partially direct, the independent groups in the provincial towns. Though they never succeeded in creating an efficient centralized administration, they contrived to give to the movement the appearance of united action by assuming the responsibility for terrorist crimes committed by persons who were in reality not acting under their orders. During the years 1878, 1879, and 1880 these terrorist crimes were of frequent occurrence. General Trepof, prefect of St Petersburg, was shot by Vera Zasulitch under pretence of presenting a petition to him; General Mezentsof, chief of the political police, was assassinated in broad daylight in one of the principal streets of St Petersburg, and an attempt was afterwards made on the life of his successor, General Drenteln; Prince Krapotkin, governor of the province of Kharkof, was assassinated for having introduced stricter prison discipline with regard to political prisoners; a murderous attack was made on the emperor in front of the Winter Palace by an ex-student called Solovieff; repeated attempts were made to blow up the train conveying the Imperial family from the Crimea to St Petersburg; and a dynamite explosion, by which ten people were killed and thirty-four wounded, took place in the Winter Palace, the Imperial family owing their escape to the accident of not sitting down to dinner punctually at the usual hour. Assassination was used also by the agitators against confederates suspected of giving information to the police, and a number of gendarmes were murdered when effecting arrests. After each of these crimes a proclamation was issued by the executive committee explaining the motives and accepting the responsibility.

When repressive measures and the efforts of the police were found insufficient to cope with the evil, Alexander II. determined to try a new system. Count Loris Melikof was entrusted with semi-dictatorial powers, relaxed the severity of the police régime, and endeavoured to obtain the support of all loyal Liberals by holding out the prospect of a series of reforms in a liberal sense. His conciliatory methods failed signally, and were repaid by an attack on his life. A semblance of parliamentary institutions was not what the Anarchists wanted. They simply redoubled their activity, and hatched a plot for the assassination of the emperor. In March 1881 the plot was successful. Alexander II., when driving in St Petersburg, was mortally wounded by the explosion of small bombs, and died almost as soon as he had reached the Winter Palace. On the following day the executive committee issued a bombastic proclamation, in which it declared triumphantly that the Tsar had been condemned to death by a secret tribunal on 26th August 1879, and that two years of effort and painful losses had at last been crowned with success.

These facts put an end to the policy of killing Anarchism by kindness, and one of the first acts of the new reign was a manifesto in which Alexander III. announced very plainly that he had no intention of limiting the autocratic power, or making concessions of any kind to the revolutionary party. The subsequent history of the movement presents little that is interesting or original, merely a continual but gradually subsiding effort to provoke local disturbances with a view to bringing about sooner or later a general rising of the masses and the overthrow not only of the Government, but also of the existing social and economic régime. A serious manifestation on the part of the terrorists took the shape of a plot to assassinate the emperor by bombs in the streets of St Petersburg in March 1887. It was the work of a very small group, the members of which were being watched by the police, and were all arrested on the day when the crime was to be perpetrated. The movement afterwards showed occasionally signs of revival. In 1901, for example, there were troubles in the universities, and in 1902 there were serious disturbances among the peasantry in some of the central rural districts; and the assassination of M. Sipiaguine, the Minister of the Interior, was a disquieting incident; but the revolutionary aspirations no longer received sympathy and support from any large section of the educated classes. The illusions and enthusiasm which produced Nihilism in the young generation during the early years of the reign of Alexander II. had been shattered and dispelled by experience, and many of those who formerly dreamed of bringing about at once by revolutionary methods a social millenium became quiet, respectable members of society in the various spheres of ordinary practical life.

The following criminal statistics of the movement during six and a half years of its greatest activity (from 1st July 1881 to 1st January 1888) are taken from unpublished official records:—

Number of affairs examined in the police department	1500
Number of persons punished	3046

These 3046 punishments may be divided into the following categories:—

Death	20
Penal servitude	128
Exile in Siberia	681
Exile under police supervision in European Russia	1500
Lesser punishments	717
	3046

From the beginning of the movement up to 1902 the number of Anarchists condemned to death and executed was forty-eight, and the number of persons assassinated by the Anarchists was thirty-nine. There is no reason to suspect the accuracy of these statistics, for they were not intended for publication. They are taken from a confidential memorandum presented to the emperor. (D. M. W.)

Niigata, capital of the province of Echigo, Japan, with a population of 53,366, as against 46,393 in 1889. It was originally chosen as one of the five open ports —Nagasaki, Kobe, Yokohama, Niigata, and Hakodate —but it failed, chiefly owing to a bar which prevents the entry of vessels of any size. The town has been brought within the railway circuit, and it is possible that it may become important, as Echigo promises to yield large quantities of kerosene, and efforts are in progress to develop that enterprise. The foreign trade is entirely in the hands of Japanese merchants, and amounted to only £13,459 in 1899, namely, exports £12,743, and imports £716.

Nijar, a town of Spain, in the province of Almeria. It lies in a plain well watered by small streams, and fertile, that produces abundantly wheat, olives, almonds, esparto grass, and fruit. There are lead, iron, manganese, and phosphorite beds in the neighbourhood, and in the town manufactures of fine porcelain and woollen and cotton stuffs are carried on. The streets are regular, and in general contain modern houses, but there are no public buildings worth notice except the massive parish church. The population was 11,568 in 1897.

Nijni-Novgorod, a province of middle Russia, bounded on the W. by Vladimir, on the N. by Kostroma and Vyatka, on the E. by Kazañ and Simbirsk, and on the S. by Penza and Tamboff. It is intersected by the Volga and the Oka, at the junction of which the town of Nijni-Novgorod has grown up. The area of the province is 19,797 square miles. Besides the Carboniferous, Permian, and Triassic deposits ("variegated marls"), Jurassic deposits are found in patches, chiefly in the south-east, as also in the south-west and north. They are covered with Cretaceous black clays and sandstones. Thick layers of Tertiary sands, containing petrified wood, are found in the Ardatoff district, and the whole is overlain with Glacial deposits, sandy gravels, and clays.

The soil has been carefully investigated by Prof. Dokuchaeff. Black earth, known as the "black earth of the plateau," prevails on the high plains between the river valleys in the south-east; the "valley black earth," even more fertile than the former, covers the gently-sloping portions of the territory, also in the south-east. More or less sandy clays are met with elsewhere, and there are also large patches of sand. Forests cover all the territory to the north of the Volga and the Oka, as also in the west and along the Alatyr river in the south. Iron ores (brown and spherosideritic), alabaster, limestone, sand (used for glass), and phosphorites are the chief useful minerals. There are also extensive deposits of peat. The population increased from 1,376,000 in 1880 to 1,600,304 in 1897; of these 841,245 were women, and 140,347 lived in towns. The population was thus distributed in 1896:—10,875 nobles, 14,920 clergy, 6368 merchants, 53,585 artisans, 1,430,165 peasants, and 141,433 military. Of the total number 1,525,735 were Orthodox or Old Believers, 75,848 Raskolniks (Nonconformists), 1115 Catholics, 723 Protestants, 51,236 Mussulmans, and 3388 Jews. Both the birth-rate (53 in 1000) and the death-rate (42 in 1000) are high. A little over 92 per cent. of the area is available for agriculture, and of this 59 per cent. is owned by noblemen and 16 per cent. only by the peasantry, the remainder being owned by merchants and others. Of the cultivable land owned by the peasantry 55 per cent. is under crops, but of similar land owned by noblemen only 30 per cent. is cultivated. The annual average yield of the principal crops in 1894-99 was—wheat, 7,643,000 cwt.; rye, 7,871,000 cwt.; oats, 2,369,600 cwt. In some years the crops are quite insufficient for the population. The *zemstvo* of Nijni-Novgorod supports an agricultural school, an experimental farm, and an agency for the purchase of improved seeds and machinery. There is good gardening in some of the towns, but the cattle-breeding is inferior, as many as 41 per cent. of the peasant families having no horses, and 24 per cent. no cows. In 1896 there were 215,120 horses, 281,180 cattle, and 259,860 sheep in the province. The domestic trades are widely practised, 70 per cent. of the male working population among the peasants earning their livelihood in this way (122,570 persons), as well as by shipping (95,760). The last named represents a very large industry; no fewer than 9311 vessels (565,000 tons, valued at 17 million roubles) were loaded, and 8690 vessels (1,360,000 tons, 30 million roubles) unloaded in 1896. To these must be added 1800 rafts. The factories are steadily developing: iron, machinery, and crockery works, tanneries, shipbuilding yards, saw-mills, and distilleries are the chief of them, but their aggregate production is only worth £2,206,500 annually, and they employ only some 18,000 persons. Education, owing to the efforts of the *zemstvo*, is in a better condition than in many other provinces. There are 29 schools for secondary education (gymnasia, technical schools), and the total number of schools in 1895 was 1044, with an attendance of 38,104 boys and 9440 girls. A society for primary education supplies the village schools with libraries (330,000 copies distributed in ten years), and organizes lectures in the villages. The chief towns of the 11 districts into which the government is divided are: Nijni-Novgorod (95,124), Ardatoff (3538), Arzamas (10,591), Balakhna (5037), Gorbatoff (3950), Knyaghinin (2962), Lukoyanoff (2113), Makarieff (1443), Semenoff (3748), Sergach (1726), and Vasilsursk (3729). Other towns of importance are Pavlovo (7414) and Vorsma (3413), centres of cutlery manufacture, and Pochinki (9894). (P. A. K.)

Nijni-Novgorod, or simply Nijniy, capital of the above government, 276 miles by rail east of Moscow, at the confluence of the Oka with the Volga. It is a city of steadily growing importance both as a commercial centre for Russia and as an intellectual centre for east Russia. Population (1897), 95,124, increasing to nearly 200,000 during the great annual fair. Nijni-Novgorod has 14 secondary schools (gymnasia, technical and professional schools, cadet schools, &c.) and 36 primary schools, in which an aggregate of about 7000 pupils are taught; 15 libraries, mostly free, one (municipal) being of special value; several museums, historical, art, archæological, natural sciences; and a number of philanthropic institutions. The fair is still a prominent factor in the internal trade of the empire. Several buildings have been erected for the purposes of the fair—the house of the committee, with "passages" lined with shops; banks, a theatre, a circus, a new semicircular canal and a second floating bridge, underground galleries, a water-supply, an electrical tramway, temperance tea-shops and restaurants kept by the Society of Tradesmen, and so on. The value of goods brought to the fair has, however, steadily declined from 246,000,000 roubles in 1881 to 176,557,573 in 1896; but the amount of trade operations concluded at the fair greatly exceeds these figures. The total amount of business done was put at 416,000,000 roubles in 1894, of which 161,000,000 only represented the value of goods sold, while 254,000,000 was the return of four banks, excluding, however, the principal bank (the State Bank) and one private bank. It is, however, certain that the facilities offered to Siberian merchants, by the Siberian Railway, for dealing directly with Moscow, will lead to a further decrease of business at the fair.

Authorities.—Excellent guides to Nijni-Novgorod and its fair were published in connexion with the Exhibition of 1896. See also the *Pamyatnaya Knizhka* of the Government, published every year. Excellent works dealing with the province have been published by A. Gatsissky (*Nizhegorodskiy Sbornik*, 10 vols.); the Committee of Archives (*Trudy*, 16 vols.); the *Zemstvo* (*Materialy*, for the valuation of the lands; Natural History part, 14 vols.; Economical part, 6 vols.); V. Vinogradoff's *Nizhegorodskiy Kalendar*, illustrated. (P. A. K.)

Nikolaeff, a seaport and the chief naval station of Russia on the Black Sea, at the head of the estuary of the Bug, 41 miles north-west of Kherson. Its population, which was 35,000 in 1881 and 77,210 in 1891, reached 92,060 in 1897, and its importance both as an industrial centre and as a commercial port has been steadily growing. Since 1893 it has been the chief port for the Russian voluntary fleet, which transports to Vladivostok all the materials necessary for the Usuri and the Manchurian railways. Its steam flour-mills, iron and machinery works, saw-mills, soap, tobacco, vinegar, carriage and agricultural machinery works show yearly returns of approximately £4,000,000, to which the Admiralty works must be added. Every year no less than 3,000,000 tons of goods are brought by rail, and 100,000 tons by the coasting trade. The port is visited annually by an average of 160 vessels engaged in foreign trade and 750 coasting vessels. The foreign exports amount to from 1,150,000 tons, chiefly of grain (815,000 tons), flour, linseed, hempseed, and sugar (16,200 tons) to 1,450,000 tons (grain, 1,170,000 tons). The foreign imports are small (25,000 tons), and consist chiefly of coal, metals, and some machinery. Navigation is maintained during the whole winter by the aid of a powerful ice-breaker.

Nikolaistad. See Vasa.

Nikolsburg (Czech, *Mikulov*), the chief town of a government district in southern Moravia, at the foot of the Polau Mountains near the border of Upper Austria. It is best known from the preliminary treaty of peace concluded there on the 26th July 1866 between the Prussians and Austrians. The château of the Dietrichstein family contains an extensive library, with some valuable MSS. and block-books. The Heiliger Berg, in the immediate vicinity, has sixteen chapels, and a church in the Byzantine style. The principal resources of the inhabitants (in 1890, 8210; in 1900, 8091) are viticulture, the manufacture of cloth, and trade in lime and limestone.

Nile, the longest river of Africa, and second in length of all the rivers of the globe, draining a vast area in north-east Africa, from the East African lake plateau to the shores of the Mediterranean. Although probably falling short of the length of the Mississippi-Missouri (4194 miles according to the estimate of General Tillo), when the windings of the stream are taken into account the Nile is at the head of all rivers as regards the length of its basin, which extends through 35 degrees of latitude, or 2450 miles in a direct line; while measured along its major curves its course has a similar pre-eminence. The length along the minor windings has not yet been accurately determined, but a moderate estimate puts it at 4000 miles.

Area.

The area of the Nile basin is reckoned by Dr A. Bludau at 1,082,000 square miles, on the assumption, since shown to be fairly correct, that the southern branches of the Sobat extend to the neighbourhood of Lake Rudolf. This falls considerably short of the area of the Congo basin (1,425,000 square miles), the lesser extent being due to the fact that, though of so great a length, the Nile basin is reduced to a minimum width during the passage of the river across the Sahara. The limits of the basin can now be laid down with an approximation to accuracy. The most southerly extremity has been found to be south-west, not south, of Victoria Nyanza, the streams draining the steppes in the latter direction, between 3½° and 5° S., having been proved to enter an independent lake, and to form no part of the Nile basin. No streams of any importance enter the south side of Lake Victoria, and the country drained to it by temporary water-courses does not extend farther than about 3½°. Farther west, however, the southernmost feeders of the Kagera river rise as far south as 3° 50′ and 30° E. From this point northwards the western limit of the basin runs first in the close vicinity of the eastern wall of the great central rift valley, where it is formed by considerable ranges of mountains; then crossing that valley by the line of the Kirunga volcanoes, it follows the western wall of the valley to a point near the north end of Albert Nyanza. It then turns north-west, embracing the wide area watered by the Bahr-el-Ghazal and its tributaries, until about 9° N. and 23° E., whence it runs north and north-east till it approaches the Nile itself on the southern verge of the Sahara. It is a matter of uncertainty whether the Wadi Melk, which in its upper course carries down water at certain seasons from the highlands of Darfur, should be ascribed to the Nile basin or not.

East of Victoria Nyanza the limit of the Nile basin runs along the high plateaux (8000–9000 feet) west of the East African rift valley, until on reaching 1° N. it veers somewhat to the west towards Mount Elgon, which on the north-east sends its waters towards Lake Rudolf. North of Mount Elgon it probably runs between 34½° and 36° E. to 9° N., where it veers suddenly eastwards to enclose the greater part of the Abyssinian highlands. Beyond 15° N. it keeps generally near the west shore of the Red Sea, except where diverted to the west by the basin of the Khor Baraka.

The Nile basin includes a variety of zones succeeding each other from south to north, and differing in elevation, climate, and natural productions. The southernmost zone, ending in about 2°–4° N., belongs to the elevated lake plateau of eastern Africa, and here the altitude is generally over 3500 feet, while extensive areas in the east and west exceed 5000 feet. The most sudden fall northwards occurs about 2° N., and beyond 4° the central valley is generally below 1500 feet, though to the east the Abyssinian highlands form another very elevated region. It is the high lake plateau which supplies the chief volume of water to the White Nile, just as the highlands of Abyssinia are the source of the supply of the Blue Nile. Coming in part, however, from this same elevated region, the Sobat contributes an appreciable amount to the total volume of the Nile. Within the Nile basin the most rainy portions of the lake plateau (where alone a rainfall occurs comparable to that of the West African basin—60 inches and over) lie along the eastern edge of the central rift valley, and to the east and north-east of Victoria Nyanza. Through the Kagera and Semliki the former region affords the greater part of the water-supply of the great lakes, while the rainy region to the east, especially that around Mount Elgon, also helps to feed Victoria Nyanza through the Nzoia river. Elsewhere on the lake plateau and along the southern watershed of the Bahr-el-Ghazal the rainfall probably reaches 40 inches a year, gradually diminishing, however, apart from isolated districts to the north-east of a line running from Mount Elgon to the western extremity of the Bahr-el-Ghazal system.

Source and feeders.

The controversy as to the true source of the Nile has continued to engage the attention of travellers and writers, some holding that nothing but Victoria Nyanza, the gathering-ground of the rain and rivers of three-fourths of the upper basin, can be considered the source of the Nile proper, while others seek to bestow the honour on some one ultimate streamlet. If the source be considered—somewhat unscientifically, but in accordance with general usage—to signify the most remote headstream (measured by the windings of the river) there is no doubt that the distinction belongs to one of the upper branches of the Kagera. Among the feeders of Victoria

Nyanza this is by far the most important, both for length of course and volume of water carried, coming as it does from the region of greatest rainfall round Lake Victoria. Three chief branches unite to form the Kagera, and of these the most important for the volume of water carried is said to be the Nyavarongo, explored by the German traveller Dr Kandt in 1898. Its sources appear to lie in about 2° 30′ S., at an elevation of some 7000 feet, in a picturesque and bracing mountain region immediately east of the central rift valley. It first flows north to about 1° 40′ S., then turning in a sharp bend east and south, and on again reaching 2° 30′ joining the Akanyaru in a swamp or small lake in 30° 30′ E. The Akanyaru, which comes from the south-west, has been sometimes considered the larger stream, but in Dr Kandt's opinion it carries decidedly less water, while its course is shorter than that of the Nyavarongo. The combined stream retains the direction of the Akanyaru, flowing in a swampy valley and joining a little west of 31° E. the third branch of the Kagera, the Ruvuvu, coming from the south. The source of this river was placed by Baumann (1892) in about 3° S., but according to Dècle (1900) it derives its main water-supply from a range running east from the vicinity of Lake Tanganyika in about 3° 50′ S. The combined stream of the Kagera flows north and north-west in a level valley strewn with small lakes until almost 1° S., when it turns east, and finally empties itself into Victoria Nyanza just north of 1°, the mouth forming a small projecting delta. Its lower course would be navigable for small steamers. All the other feeders of Victoria Nyanza are small rivers, many carrying water at one time of the year only, the largest being probably the Nzoia, which enters on the north-east from the plateaux south of Mount Elgon.

After leaving the lake at Ripon Falls, the Nile enters a smaller lake of irregular outline, running mainly east and west in 1½° N., and known as Choga (formerly Kioja or Ibrahim). Eastwards the lake breaks up into several long arms, which appear to receive the waters of other lakes lying on the plain west of Mount Elgon. One of these, which has been named Lake Salisbury, lies in 1° 40′ N. and 34° E.; another, Mpologoma, south-south-east of the first. Lake Choga also receives a broad lacustrine river, the Seziwa, from the south, while still another lake is said to be connected with it in the north. The altitude of Choga is given as 3320 feet, so that between its western end and Albert Nyanza—a distance of 130 miles—the Nile falls over 1200 feet, chiefly during the second half of the distance, which is occupied by the Karuma Rapids and Murchison Falls. At Mruli, a little below Choga, the river is 900 yards wide, and at Foweira, at the head of the rapids, 500 yards.

Albert and Albert Edward Nyanzas, lying in the central rift valley, form the western source-reservoirs of the Nile, the latter fed mainly by streams descending the eastern slopes of the Ruwenzori range, in the rainy district of Toru. The two lakes are united by the Semliki river (known also as Isango and Itiri), which traverses the level plain—in part forested, in part swampy—between them, receiving countless streams from the western slopes of Ruwenzori. These streams are so charged with sediment that the deposits from the Semliki have filled up a large part of the south end of Lake Albert. The Semliki is a rapid stream running in a winding course between high banks of alluvium, and falling about 1000 feet in a distance of 130 miles. In its upper course the Semliki is 60 yards wide and 1½ to 3 feet deep, but at 30 miles from its mouth it has become a deep stream 100 yards wide. Besides the Semliki, Albert Nyanza has no important feeder.

Between its exit from Albert Nyanza (2100 feet above the sea) and the swamp region which begins in about 6° 20′ N., at an altitude of 1450 feet, the Nile receives no important tributary but the Asua, which joins from the east in 3° 50′ N., and even this has little water in the dry season. Its source-region, first explored by the Macdonald expedition in 1898, lies on the western versant of the Karamojo plateau, and among the mountain ranges which run off from that plateau to the north-west, the most remote head-stream running originally due south, and forming, with others, the small Lake Kirkpatrick in 2° 20′ S. and 34° E. The total length of the Asua is over 300 miles. Just below the old Egyptian fort of Bor in 6° 20′ N., an arm was found by Mr Grogan (1899) to diverge from the Bahr-el-Jebel, running more or less parallel with the latter on the eastern edge of the swamps, among which it seems to lose itself near the lower junction of the Bahr-el-Zaraf. Near the Bahr-el-Zaraf divergence a considerable stream enters from the east, but its course is unknown. Owing to the renewed obstruction of the Nile by "sudd" (*q.v.*), which, during the time that this region was closed to Europeans in 1884 by the Mahdist revolt, acquired an unusual density, the Nile water seems to have spread over an unusually large area, the channel being therefore less defined. In 1899 the Bahr-el-Jebel was totally obstructed, and only after weeks of laborious labour was navigation opened by Major Peake in May 1900. The whole channel of the White Nile was finally cleared of sudd in 1901.

Recent additions to our knowledge of the Bahr-el-Ghazal system, west of the Bahr-el-Jebel, have been mainly of the character of filling in of details respecting streams previously known. The valuable results of Dr Junker's surveys, published in Germany in 1889, still supply our most complete account of the system. Later surveys have been made by French travellers arriving from the Congo basin, especially by Major Marchand, who during his journey across the continent explored the course of the Swe or Jur, and threw light on the relationship of the Bahr-el-Homr and Bahr-el-Arab with the rest of the system. The system of the Sobat, the next important Nile tributary, was, on the contrary, first brought to light within the last decade of the 19th century by the explorations of Bottego, de Bonchamps, Michel, Wellby, Austin, and others. The most important upper branch is the Baro, which, with its many tributaries, descends the western slopes of the Abyssinian highlands, flowing in a course slightly north of west. Rising in about 36° 10′ E. and 7° 50′ N., at an altitude of 6000 to 7000 feet, the Baro has first the character of a torrent descending the plateau escarpment between rocky walls, with a drop of 3000 feet in 45 miles. Some 25 miles after reaching the plains its course becomes free from rocks, and the river is navigable to its mouth, being barred at one spot only at extreme low water. In 32° 40′ E. the Baro is joined by the Pibor or Ajubba, formed by the junction of various streams coming from the south and south-east, and having their sources on the western slopes of the Kaffa plateau. The whole region of the lower Pibor and Baro is one of swamps, almost impassable even in the dry season. At its junction with the Baro to form the Sobat the Pibor is over 100 yards wide, with a depth of 8 feet and a speed of 2·3 feet per second. The Blue Nile and the Atbara tributaries are described under ABYSSINIA.

On the main stream of the Nile the most valuable results are to be expected from the trigonometrical surveys inaugurated by Colonel Talbot. The telegraphic determination of the longitude of Omdurman (32° 29′ 42″ E.), and of other points, both on the White and Blue rivers, has supplied for the first time a trustworthy basis for the mapping of the upper river, showing that previously accepted positions require considerable shifting. On the Lower Nile a most important work is the construction of the great dam at Assuan, which will raise the level of the Nile for 140 miles above the First Cataract, and enormously increase the water-supply available for irrigation in Egypt. Schemes have been set on foot for the improvement of the White Nile channel by means of embankments, and for the storage of its water-supply, and that of the Blue Nile, in reservoirs (see Sir W. Garstin's Report, "Egypt," No. 2, 1901). A measure of scientific interest, but also of some practical importance, is the execution of a fish-survey of the waters of the Nile, chiefly due to the advocacy of the late Dr John Anderson.

Political relations.

The political relations in the Nile valley have of late years been subject to many vicissitudes. After the abandonment, in 1888, of the old Equatorial Province administered by Emin Pasha, the whole course of the river from the frontiers of Egypt to the neighbourhood of Albert Nyanza was for a time dominated by the Dervish power. After the establishment of a British protectorate in Uganda, British posts were pushed down the stream from the great lakes, while the Belgians also established themselves on the west bank in the territory leased to King Leopold in 1894 by Great Britain, from Lake Albert to 5° 30′ N. British posts exist at Mruli, Foweira, and Fajau, between Lake Choga and Albert Nyanza, and at Wadelai, Afuddu, and Fort Berkeley, between the latter lake and 50° N. Of these, Wadelai, the only healthy station in the river valley, is opposite the old Egyptian station of the same name which lay on the west bank. Afuddu lies nearly opposite the old Egyptian post of Dufile (now in Belgian territory), on a spot originally chosen by Sir S. Baker as the site of the capital of the Upper Nile province; while Fort Berkeley occupies the site of the old Bedden. The chief Belgian posts are at Old Wadelai, Dufile, Labore, Rejaf, Lado, and at Kero, on the frontier of the leased territory in 5° 30′ N. Lado, in Gordon's time the capital of the Equatorial Province, has sometimes given its name to the whole Belgian territory on the Upper Nile. For the Anglo-Egyptian stations established on the Nile above Khartum since the overthrow of the Dervish power, see SUDAN.

Niles, a city of Trumbull county, Ohio, U.S.A., on the Mahoning river and several railway lines, in the north-eastern part of the state. Population (1890), 4289; (1900), 7468.

Nilgiris, The, or Neelgherries (=Blue Mountains), a range of hills in southern India, which gives its name to a district of the Madras Presidency. The Nilgiris are really a plateau rather than a range, rising abruptly from the plains on most sides, with a general elevation of about 6500 feet above the sea.

The district of the Nilgiris is by far the smallest in Madras. Area, 957 square miles. Population (1881), 91,034; (1891), 99,797; (1901), 111,449, showing an increase of nearly 10 per cent. between 1881 and 1891, and of 11·7 per cent. between 1891 and 1901; average density, 116 persons per square mile, being the lowest in the Presidency. Of the total population in 1891 Europeans numbered 1790, Eurasians, 1236, and native Christians, 8600. The land revenue and rates in 1897–98 were Rs.1,73,347, the incidence of assessment being 11 annas per acre; number of police, 186; boys at school (1896–97), 3402, being 40 per cent. of the male population of school-going age; girls at school, 925, being 14 per cent. Registered death-rate (1897), 25·5 per thousand. In 1897–98, out of a cultivated area of 69,956 acres, food crops covered only 26,343, while 26,520 were under coffee, 6867 under tea, and 5097 under cinchona. The Government cinchona factory turned out 5092 ℔ of quinine and 6389 ℔ of febrifuge. The export of tea from Madras in 1897–98, practically all of which came from the Nilgiris, was 3.441,840 ℔, valued at Rs.25,77,800. The approach from the plains is by the branch of the Madras Railway from Podanur to Mettupalaiyam, whence a metre-gauge line on the rack principle has been constructed to Coonoor (17 miles), which it is proposed to extend to Ootacamund. Unfortunately, this Nilgiri railway, when ready for traffic in October 1898, was damaged by a storm which caused serious landslips, and the opening has been indefinitely postponed. There are three printing-presses in the district, one of which issues an English newspaper, and a library and reading-room, with an income of Rs.7660. The chief educational institution is the Lawrence Asylum at Ootacamund, with 304 boys and 71 girls, maintained by Government at a cost of Rs.45,685. There are three breweries, with a total out-turn of 341,000 gallons. The military quarters are at Wellington.

Nilsson, Christine [Countess de Miranda] (1843——), Swedish singer, was born at Wederslöff, near Wexiö, Sweden, on 3rd August 1843. Her father was a poor working man, and she used as a girl to sing and perform on the violin at popular gatherings. In 1857 a wealthy man, M. Tornérhjelm, perceiving the unusual beauty of her voice, provided the means for giving her a proper musical education, and in 1860 she made her first appearance in opera at Paris with great success. Between that date and 1872, when she married M. Auguste Rouzaud, she was the leading prima donna. Her first appearance in London was at Her Majesty's in 1867, and she visited the United States in 1870. After her marriage she only appeared in public at rare intervals. M. Rouzaud died in 1882, and five years afterwards Madame Nilsson married Count A. de Miranda.

Nimar, a district of British India, in the Nerbudda division of the Central Provinces. The administrative headquarters are at Khandwa; but the capital in Mahommedan times was Burhanpur, and, yet earlier, the hill fort of Asirgarh.

Area, 3357 square miles. Population (1881), 231,341; (1891), 285,944; (1901), 327,042, showing an increase of 24 per cent. between 1881 and 1891, and of 14·4 per cent. between 1891 and 1901; average density, 97 persons per square mile, being little more than half of that for the province generally. The land revenue and rates are Rs.3,13,478, the incidence of assessment being R.0 : 3 : 10 per acre. The cultivated area in 1897–98 was 562,069 acres, of which 13,752 were irrigated from wells. The number of police is 437. Boys at school (1896–97), 5726, being 30 per cent. of the male population of school-going age, the highest proportion for any rural district in the province. Registered death-rate (1897), 66 per thousand. The Great Indian Peninsula Railway runs through the district for 112 miles, with six stations, and a branch of the Rajputana line from Indore joins it at Khandwa. There are seven factories for ginning and pressing cotton at Khandwa, and manufacture of gold-embroidered cloth at Burhanpur. There is one printing-press, issuing a weekly newspaper in Marathi.

Nimburg, an old town on the right bank of the Elbe, in the government district of Podiebrad, in Bohemia, Austria. It has an interesting Gothic church (1282–1305), and portions of its old wall and gates. It has a sugar-refining factory, the works of the North-Western Railway, cattle and horse fairs, and a considerable trade in corn, timber, and live stock. Population (1890), 6659; (1900), 7843.

Nimeguen, or Nijmegen, a town of the Netherlands, province Gelderland, on the south bank of the Waal, 11 miles by rail south of Arnhem. Like this town and Cleves (17 miles by rail to the south-east), it is very pleasantly situated amongst wooded hills. The former town walls were taken down and the site converted into a boulevard in 1877–84, and since then a new quarter has grown up on the south. In addition to the Valkhof, there are now three other parks—the Huner Park on the east, near the Valkhof; the Emperor Charles's Plain, in the new quarter; and Kronenburg Park on the west. The town-hall has been restored, also the town weigh-house and meat market. An iron bridge has been thrown across from the Valkhof Park to the Belvedere, at the eastern extremity of the old town. Berg en Dal, about 3 miles to the south-east, is a favourite summer resort. Pale ale, Prussian blue, leather, tin, pottery, and cigars are the principal industrial products. About 75 per cent. of the inhabitants are Roman Catholics. Population (1900), 42,756.

Nîmes, or Nismes, chief town of department of Gard, France, 450 miles south-south-east of Paris by rail. It is the seat of a Calvinist consistory, and has a Protestant normal school for females, schools of design, music, manufactures, chemistry and physics as applied to the arts, and a school of artillery. Since 1894 the museums and the public library (80,000 volumes) have been installed in the old Jesuit College, formerly occupied by the lycée, to which an elegant façade adorned with statues of Painting and Music by Max Raphael was added in 1894. The collection of paintings occupies a separate building. Population (1881), 55,828; (1891), 63,625; (1901), 72,479.

Ningpo, a treaty port in the province of Chekiang, China. It is simply a local distributing centre subordinate to Shanghai, from which it is 100 miles distant, and the volume of trade shows little tendency to grow. The population is estimated at 255,000. The foreign residents are very few. There are, however, a great number of missionaries engaged in various parts in the interior of the province (Chekiang). The Church Missionary Society, the China Inland Mission, and the American Baptist and Presbyterian Societies are most strongly represented. The value of the trade passing through the custom house in 1900 was H. taels 15,414,191 (£2,312,000), as compared with H. taels 12,384,000 (£3,405,000) in 1880. Cotton and tea are the principal exports, and opium, shirtings, and sugar the chief imports.

Niort, chief town of the department of Deux-Sèvres, France, 258 miles south-west of Paris, and an important railway junction. The prefecture was rebuilt in 1893; the school of design is installed in a handsome new structure, and behind it is the library, containing 45,000 volumes, while the museum of antiquities is now lodged in the Elénore Palace. Population (1891), 20,082; (1901), 20,738.

Nipigon, Neepigon, or Nepigon, a lake of Thunder Bay district, Ontario, Canada, situated 30 miles north of the bay of the same name on Lake Superior, at an altitude of 850 feet above the sea. It is 70 miles long and 50 miles wide; contains over 1000 islands, is very deep, and has a much-indented shore-line measuring upwards of 580 miles. The Nipigon river, which discharges its waters, is the largest stream flowing into Lake Superior. It affords the finest trout-fishing in North America.

Nipissing, a lake of the district of the same name in Ontario, Canada, situated nearly midway between Lake Huron and the Ottawa river, at an altitude of 642 feet above the sea. It is 50 miles long; greatest breadth, 35 miles; discharges its waters by French river into Lake Huron, and is separated from the waters of Mattawa river by a low watershed. It has been proposed as the summit level of the projected Ottawa and Georgian Bay canal. With the Ottawa, Mattawa, and French, it formed the old *voyageur* route from Montreal to the Great Lakes.

Nish (written generally *Nisch*), after Belgrade the most important town of the kingdom of Servia, situated in a plain on the left shore of the Nishava, a tributary of the Morava. It is of great strategical and commercial importance, lying at the junction of several of the most important roads of the Balkan Peninsula. The great international railway lines, Vienna–Belgrade–Constantinople and Vienna–Belgrade–Salonica, bifurcate at Nish. There is a project to connect the Rumanian railways with the Servian through the Timok valley to Nish, and it is also intended to carry the line which is to connect the Adriatic with the centre of the peninsula to Nish, through the Toplitza valley. The town has a small obsolete fortress on the right bank of the Nishava, believed to have been erected on the site of the ancient Roman castle Naissus. The surrounding hills (Vinik, Goritza, Kamenitza) have, since 1886, been fortified by modern earthworks. Since it has ceased to be Turkish, Nish has made much progress, and is becoming a modern European town. The king and the Government reside for at least three months in the year in Nish, where also the National Assembly, before the new constitution of 1901, was regularly held. It is the see of a bishop, the seat of the district prefecture and a tribunal, and the headquarters of the territorial militia corps, having besides a large number of regular troops in garrison. The administration of the Servian railways has its principal store of material there, and also a factory for repairing engines. On the whole, Nish, with its population of 21,600 (1895), is one of the most prosperous towns in Servia. It is known also for the many picturesque and interesting places in its immediate neighbourhood (Yelashnitza, Sityevo, Mramor).

The ancient Roman city Naissus was mentioned as an already important place by Ptolemy of Alexandria. Under its walls was fought in A.D. 269 the great battle in which Emperor Claudius destroyed the army of the Goths. It was at Naissus that Constantine the Great was born. Though the Emperor Julian improved its defences, the town was destroyed by the Huns under Attila, but the Emperor Justinian did his best to restore it. In the 9th century the Bulgarians became masters of Naissus, but had to cede it to the Hungarians in the 11th century, from whom the Byzantine Emperor Emmanuel reconquered it in 1173. Towards the end of the 12th century the town was in the hands of the Servian Prince Stephen Nemanya, who there received hospitably the German Emperor Frederic Barbarossa and his Crusaders. In 1375 the Turks captured Naissus for the first time from the Servians. In 1443 the allied armies of the Hungarians under Hunyadi, and the Servians under George Brankovich, retook it from the Turks, but in 1456 it again came under Turkish dominion, and remained for more than 300 years the most important Turkish military station on the road between Hungary and Constantinople. In the frequent wars between Austria and Turkey during the 17th and 18th centuries the Austrians captured Naissus twice (in 1689 and 1737), but were not able to retain it long. The Servians having, in the beginning of the 19th century, successfully cleared Servia of Turks, were emboldened to attack Nish in 1809, but were repulsed with great loss. One of the Servian commanders, Singyelich, died a heroic death on that occasion by blowing up the gunpowder stores of the redoubt of which he found himself the only defender. The Turks raised a gruesome monument of their victory—a high tower composed entirely of the heads of the Servians slain in the battle of Nish. The remnants of this monument are still kept up. It stands half a mile to the east from Nish, and is called to this day by the Turkish name "Tyele-Koula," "the Tower of Skulls." In the Russo-Turkish war the Servian army, under the personal command of King Milan, besieged Nish, and forced it to capitulate on the 10th January 1878. The Berlin Congress decided that it should remain with Servia. (C. MI.)

Nishápúr, a province of Persia, situated between Mashad and Sabzvár, in northern Khorassan. It has a population of from 130,000 to 140,000, is divided into twelve districts, and pays a yearly revenue of about £12,000. It produces much grain and cotton, and is considered one of the most fertile districts of Persia. One of its subdivisions is that of Bár-i-Mâdan, with chief town Mâdan (situated 32 miles north-west of the city of Nishápúr, at an elevation of 5100 feet, in 36° 28′ N., 58° 20′ E.), where the famous mines are which have supplied the world with turquoises for at least 2000 years. (For description of mines, *vide* A. Houtum-Schindler, *Turquoise Mines of Nishápúr*, Diplomatic and Consular Reports, part ii., 1884.) The province used to be one of the administrative divisions of Khorassan, but is now a separate province, with a governor appointed by the Shah.

Nishápúr, the capital of the above province, situated at an elevation of 3920 feet, in 36° 12′ N. and 58° 40′ E., about 49 miles west of Mashad. It was once one of the four great cities of Khorassan, rivalling Rai (Rhages), "the mother of cities," in importance and population, but is now a small and comparatively unimportant place, with a population of barely 15,000. It has post and telegraph offices, and does a lively trade in wool, cotton, and dry fruits (almonds, pistachios). Eastwards of the present city, amongst the mounds and remains of the old town, in a ruined mosque, is the tomb of Omar Khayyám, who was also born here—an unsightly mass of plaster, without inscription.

Niué (Savage Island), or NIUÉ-FEKAI, as the natives prefer to call it, an island 14 miles long by 10 miles wide, situated in 19° 10′ S. and 169° 47′ W., in the South Pacific. The entire island is an old coral reef upheaved 200 feet, honeycombed with caves and seamed with fissures. The soil, though thin, is, as in other limestone islands, very rich, and cocoanuts, tara, yams, and bananas thrive. There is an abundant rainfall, but owing to the porous nature of the soil the water percolates into deep caves which have communication with the sea, and becomes brackish. The natives, a branch of the Malayo-Polynesians, with what seems to be an admixture of Micronesian blood, are the most industrious in the Pacific, and about 500 of the young men are generally absent as labourers in other islands. The consequent minority of men has been very destructive to the sexual morality of the women, which formerly stood high. The natives are keen traders, and though uncouth in manners when compared with their nearest neighbours, the Tongans and Samoans, are very friendly to Europeans. Their hostility to Captain Cook, which earned for them the name of "Savage Islanders," was due to their fear of foreign disease, a fear that has since been justified. The population, about 4400, is slightly decreasing. The natives are all Christians, and the majority have learned to read and write, and to speak a little English, under the tuition of the London Missionary Society. They wear European clothes. The island became a British protectorate on 20th April 1900, and was made a dependency of New Zealand in October 1900, the native government, of an elected "king" and a council of headmen, being maintained for the present. In 1900 there were thirteen Europeans on the island. The exports are copra (£6000), fungus (8 tons), and straw hats, which the women plait very cleverly.

HOOD. *Notes of a Cruise in H.M.S. "Fawn."* Edinburgh, 1863.—THOMSON. *Savage Island.* London, 1902. (B. H. T.)

Nivelles, a town of Belgium, in the province of Brabant, 19 miles south of Brussels. Vegetable parchment is one of the numerous manufactures of the arrondissement, and the railway workshops employ large numbers of men. Population (1890), 10,642; (1900), 11,645.

Nizhneudinsk, a growing district town of East Siberia, government of, and 351 miles by rail west-north-west of Irkutsk, on the Siberian Railway, and on the Uda river. It is a centre for the Biryusa gold mines, and in winter the head of a line of communication with the Lena and Bratskiy Ostrog. Population (1896), 6016.

Noakhali, a town and district of British India, in the Chittagong division of Bengal. The town, also known as Sudharam, is on a small river channel 10 miles from the sea. Population (1881), 5124; (1891), 5479. The high school had 269 pupils in 1897–98.

The district of NOAKHALI has an area of 1645 square miles. Population (1881), 820,772; (1891), 1,009,693; (1901), 1,141,817, showing an increase of 23 per cent. after the storm-wave, and of 13 per cent. between 1891 and 1901. Average density, 695 persons per square mile. Classified according to religion, Mahommedans in 1891 numbered 760,929; Hindus, 248,123; Christians, 641, of whom 10 were Europeans. The land revenue and rates in 1897–98 were Rs.7,27,354; number of police, 281; boys at school (1896–97), 39,764, being 51 per cent. of the male population of school-going age, compared with 28 per cent. for the province generally. Registered death-rate (1897), 37 per thousand. Besides rice, an important crop is areca-nut. A portion of the district is traversed by the railway from Chittagong towards Assam.

Nobel, Alfred (1833–1896), Swedish chemist and engineer, was born in 1833 at Stockholm. After studying at St Petersburg, he began to assist in the conduct of his father's engineering works, but it was not long before he took up the study of explosives. Previously to 1864 many attempts had been made to utilize nitro-glycerine as an explosive for practical purposes, but little success was attained until that year, when Nobel took out his patent for dynamite. He found that by incorporating nitro-glycerine with some porous substance, such as powdered charcoal or silica (usually kieselguhr), he obtained it in an altered condition, such that it ceased to be sensitive to shocks and could even be burned in a fire without explosion. He next combined nitro-glycerine with another high explosive, nitro-cotton, into a form that could be safely employed for blasting. Taking about 8 parts of the latter, he dissolved them by the aid of moderate heat in 92 of nitro-glycerine, and thus obtained a transparent, jelly-like substance that was a still more powerful explosive than dynamite. Blasting gelatin, as it was called, was patented in 1875, and was followed by a host of similar combinations, prepared in much the same way, but modified by the addition of nitrate of potash, wood-pulp, and various other substances. Some thirteen years later Nobel produced ballistite, one of the earliest of the nitro-glycerine smokeless powders, which contained in its latest forms about equal parts of gun-cotton and nitro-glycerine. This powder was a precursor of cordite, and Nobel's claim that his patent covered the latter was the occasion of vigorously-contested law-suits between him and the British Government in 1894 and 1895. Cordite also consists of nitro-glycerine and gun-cotton, but the form of the latter which its inventors wished to use was the most highly nitrated variety, which is not soluble in mixtures of ether and alcohol, whereas Nobel contemplated using a less nitrated form, which is soluble in such mixtures. The question was complicated by the fact that it is in practice impossible to prepare either of these two forms without admixture of the other, but eventually the courts decided against him, having come to the conclusion that he meant to employ the soluble variety, not the insoluble one, the method of using the latter being indeed not known at the date of his patent. From the manufacture of dynamite and other explosives, which were produced on a very large scale at the Nobel works at Ardeer, Ayrshire, and from the exploitation of the Baku oil-fields, in the development of which he and his brothers took a leading part, he amassed an immense fortune; and at his death, which occurred on 10th December 1896, at San Remo, he left the bulk of it in trust for the establishment of five prizes, to be awarded annually without distinction of nationality. The first three of these prizes are for the most important discovery or invention in physical science, in chemistry, and in medical science or physiology; the fourth is for the most remarkable literary work *dans le sens d'idéalisme*; and the fifth is to be given to the person who renders the greatest service to the cause of international brotherhood, in the suppression or reduction of standing armies, or in the establishment or furtherance of peace congresses.

Noble, Sir Andrew (1832–——), British physicist and artillerist, was born at Greenock on 15th September 1832, and was educated at Edinburgh Academy and at the Royal Military Academy, Woolwich. In 1849 he entered the Royal Artillery, attaining the rank of captain in 1855, and in 1857 he became secretary to the Royal Artillery Institution. About this time the question of the supersession of the old smooth-bores by rifled guns was coming to the fore, and on the appointment of the Select Committee on Rifled Cannon in 1858 to report on the matter, he was chosen its secretary, a capacity in which he devised an ingenious method for comparing the probable accuracy of the shooting attainable with each type of gun. In 1859 he was appointed Assistant-Inspector of Artillery, and in the following year he became a member of the Ordnance Select Committee and of the Committee on Explosives, serving on the latter for twenty years, until its dissolution. About the same time he was prevailed upon by Sir William, afterwards Lord, Armstrong, to leave the public service and take up a post at Elswick, where beyond doubt the facilities offered for experimental research enabled him to do more for his country in the way of improving guns and munitions of war than would have been possible under the cramping regulations of an official department. At Elswick, in the first instance, he was put in charge of the ordnance department, but it was not long before his organizing and administrative ability and scientific attainments enlarged the sphere of his influence, and he has probably done more than any other single man to develop Elswick to the commanding position it now enjoys among the arsenals of the world. Immediately on his appointment he began a systematic investigation of the phenomena which occur when a gun is fired, some of his first experiments being designed to discover with accuracy the pressures attained in the largest guns of that time. About 1862 he invented his chronoscope for the measurement of exceedingly small intervals of time, and began to apply it in ballistic experiments for ascertaining the velocity with which the shot moves along the barrel of a gun with different powders and different charges. Then he joined Sir Frederick Abel in a classical research on "Fired Gunpowder," the experimental work being largely carried on at Elswick, and the conclusions they arrived at had a great effect on the progress of gunnery, for they showed how increased muzzle velocities were to be attained without increased pressures in the gun. These inquiries, in fact, enabled Elswick in 1877 to turn out the

6-inch and 8-inch guns, with velocities of over 2000 feet per second, that obliged the British Government finally to give up the antiquated muzzle-loaders to which it had so obstinately adhered. Later, when the era of nitro or "smokeless" powders had begun, Captain Noble was an early advocate of their advantages, and when at length the British Government awoke to the necessity of selecting a powder of that character for the naval and military services of Great Britain, Elswick extended its hospitality to the committee that invented cordite, and gave the members facilities, which were not offered by the Government, for the necessary experimental work. Even after the powder was invented and the committee dissolved, inquiries—which it was nobody's official business to make, and which therefore were not made—were continued at Elswick to ascertain how by suitable modifications in form, composition, &c., cordite might the better perform the varied duties required of it. Noble became a member of the committee appointed in 1900 by Lord Lansdowne to consider, among other things, the excessive erosion alleged by some of the powder's critics to be produced by it in the barrels of the guns in which it is used. He was made C.B. in 1881, promoted to be K.C.B. in 1893, and was created a baronet among the Coronation honours in 1902; he was also the recipient of many foreign decorations and scientific honours, including a Royal medal from the Royal Society in 1880.

Noblesville, a city of Indiana, U.S.A., capital of Hamilton county, on the White river and the Chicago and South-Eastern and the Lake Erie and Western railways, in the central part of the state, at an altitude of 772 feet. It is in a rich agricultural region, and has natural gas. Population (1890), 3054; (1900), 4792.

Nocera Umbria, a town and bishop's see of the province of Perugia, Umbria, Italy, 12 miles by rail north by east of Foligno. It has mineral springs (known since 1510), with a hydropathic, situated 1969 feet above sea-level, on the west slope of Mount Pennino. There are a cathedral and other churches, in one of which good frescoes, dated 1434, were discovered in 1877. Cement is quarried. The town is the ancient Umbrian *Nuceria*. Population, about 5000.

Nogent-le-Rotrou, chief town of arrondissement, department of Eure-et-Loir, 38 miles west-south-west of Chartres by rail. It is of great antiquarian interest, and in the early part of the 17th century the overlordship was acquired by Sully, Henri Quatre's great minister of finance. There are statues of him and his wife, of General St Pol, killed at Sebastopol, and of the poet Remy-Belleau, a native of the town (1897); also, a departmental school for deaf mutes. An important industry is the manufacture of hats, employing about 700 persons. Population (1891), 6934; (1901), 7620.

Nogent-sur-Marne, a town in the arrondissement of Sceaux, department of Seine, France, 5 miles east of Paris on the railway to Belfort, which here crosses the Marne valley by a magnificent viaduct of 34 arches, at a height of 100 feet, and with a total length of 870 yards. A belfry dates from the 11th century, with 12th-century spire. A monument was erected in 1865 to Watteau, who died here in 1721. A large town hall was completed in 1884. The principal manufactures are chemicals and toys. The commune of Perreux was detached from Nogent in 1887. Total port traffic on the Marne, 1900, 24,123 tons. Population (1881), 7596; (1891), 8047; (1901), 10,391.

Nöldeke, Theodor (1836-——), German Orientalist, was born at Harburg on 2nd March 1836, and studied at Göttingen, Vienna, Leyden, and Berlin. In 1859 his history of the Koran won for him the prize of the French Académie des Inscriptions, and in the following year he rewrote it in German and published it with additions at Göttingen. In 1861 he began to lecture at this university, and three years later was appointed assistant professor there. In 1868 he became regular professor at Kiel, and in 1872 was appointed to the chair of Oriental languages at Strasburg. His range of studies is wide and varied, but in the main his work has followed the two lines already indicated by his prize essay, *i.e.*, Semitic languages, and the history and civilization of Islam. The Semitic religion he regards as simple, not favourable to a complicated mythology, and at the same time violent, exclusive, and fanatical. Professor Nöldeke is a prolific writer, and while a great deal of his work (*e.g.*, his *Neusyrische Grammatik*, his *Mandäische Grammatik*, and his translations from Tabarî) is meant for specialists, many of his books are of interest to the general reader as well. Several of his essays first appeared in the *Encyclopædia Britannica*, and the article on the Koran (MOHAMMEDANISM, *Ency. Brit.* vol. xvi.), with some others, was republished in a volume called *Oriental Sketches*. The articles dealing with Persia were republished in a German volume, *Aufsätze zur persischen Geschichte*. Among his best-known works are: *Das Leben Mohammeds*, *Beiträge zur Kenntnis der Poesie der alten Araber*, *Die alttestamentliche Litteratur*, *Untersuchungen zur Kritik des alten Testaments*. He has been a frequent contributor to the *Zeitschrift der deutsch-morgenländischen Gesellschaft*, the *Göttinger Gelehrtenanzeiger*, and the *Expositor*.

Norcia, a town and bishop's see of the province of Perugia, Umbria, Italy, 29 miles north-east of Terni, on the south-west foot-slopes of the Sibylline Mountains, still surrounded by old walls. There are a cathedral; the church of St Benedict, with a Romanesque façade; the town hall; and the prefecture, with Romanesque arcades. Norcia (the ancient *Nursia*) was the birthplace of Sertorius (slain 72 B.C.), of Vespasia, mother of the Emperor Vespasian, of Plotina, the wife of the Emperor Trajan, and of St Benedict, founder of the Benedictine order, and of his sister Scholastica. The town is famous for its pork and its cloth, and makes bricks and terra-cotta. Population (1899), about 5000.

Nord, a department of the farthest north-east of France, washed by the North Sea and bordering on Belgium.

Area, 2229 square miles. The population, 1,603,259 in 1881, had increased to 1,877,647 in 1901. In respect of population, therefore, Nord stands second among the departments of France. Births in 1899, 51,466, of which 6128 were illegitimate; deaths, 37,158; marriages, 15,858. In 1896 there were 2001 schools, with 292,000 pupils, more than 6 per cent. of the population being illiterate. The area under cultivation in 1896 measured 1,296,750 acres; 839,800 acres arable, 24,700 acres in gardens, 419,900 acres in woods and grass. One of the greatest wheat-growing departments, Nord produced in 1899 wheat valued at £2,122,000; rye, £100,000; barley, £118,000; oats, £948,000; potatoes, £544,000; mangold-wurzel, £244,000; flax, in harl and in seed, £45,000; tobacco, £44,000; hops, £72,000. In the production of beetroot Nord holds the first rank among the departments, producing in 1899 £1,420,000 worth. Its live stock in 1899 included 81,800 horses, 286,540 cattle, 84,200 sheep, 82,920 pigs, and 15,910 goats. The milk produced in 1899 was valued at £3,000,200. The industries dependent on agriculture have made enormous strides. The manufacture of sugar amounted in 1898 to 3,110,000 cwts., and the alcohol produced in 1898 was 18,100,000 gallons. Mining in 1898 produced 5,500,000 metric tons of fuel, valued at £2,120,000 sterling, while the industry in metals yielded 294,000 metric tons of cast-iron, 295,000 tons of iron, and 204,000 tons of steel, which, with the industries in other metals added, represented a value of £4,080,000. The textile industry is particularly active around Lille, Roubaix, and Tourcoing, which spin and weave cotton and wool, as also around Fourmies, which is specially a weaving town.

The cotton industry is carried on by 3000 looms and 1,300,000 spindles, distributed among 170 establishments. The woollen industry disposes of 20,000 looms and 1,760,000 spindles among 300 factories. Nord possesses one-seventh of the total steam-power of France. The chief towns of this department are Lille, with 215,431 inhabitants in 1901; Roubaix, 124,660; Tourcoing, 79,468; Cambrai, 26,586; Douai, 33,918; and Dunkerque, 40,329.

Norden, a town of Prussia, province of Hanover, 4 miles from the North Sea, and 20 by rail north of Emden. It has a 16th-century town hall, and its parish church was built in 1445. There are various industries—gin, sugar, chocolate, yeast, tobacco, and machinery; also a school of agriculture. Norddeich, a small port 4 miles to the north-west, is the shipping place for passengers bound for Norderney. Population (1900), 7048.

Nordenskiöld, Nils Adolf Erik, Baron (1832–1901), geographer and Arctic explorer, was the son of Nils Gustav Nordenskiöld, and was born at Helsingfors, 18th November 1832. His ancestors came originally from Sweden, but for several generations had been settled in Finland, where several members of the family were distinguished by their enthusiasm for scientific research. His father was both an able mineralogist and a considerable traveller, and to his influence may be ascribed that early devotion to geological investigation which laid the basis of Baron Nordenskiöld's career. After a few years at the gymnasium of Borgo, young Nordenskiöld entered the University of Helsingfors in 1849, where he applied himself specially to chemistry and mineralogy by spending his holidays in personal investigations of the chief mineral deposits in Finland. In 1853 he accompanied his father to the Ural Mountains, and studied with particular interest the iron and copper mines at Tagilsk. On his return to Helsingfors he received minor appointments both at the university and the mining office, but an unguarded speech at a convivial entertainment in November 1855 drew attention to his political views, and led to dismissal from his posts. He then visited Berlin, continuing his mineralogical studies, and returned to Helsingfors in 1856, where he obtained the Alexander travelling stipend at the university, and proposed to expend it in studying the geology of Siberia and Kamchatka. But before starting he took his master's and doctor's degrees at the promotion festival in 1857, and again, as in 1855, aroused the suspicion of the authorities during the entertainments to the deputation from Upsala and Lund. Russian officials, always jealous in all that regarded Swedish influence in Finland, again took the matter seriously, and this time Nordenskiöld's departure for Sweden was accompanied by deprivation of the right of ever holding office in the University of Helsingfors. Settling at Stockholm in 1857, he thenceforward became practically a Swedish citizen, for until 1862 he was refused permission even to visit Finland, and his friends had much difficulty in preventing a decree of permanent exile. The far north always had a great fascination for Nordenskiöld, and he had been only a few months in Stockholm when he met Otto Torell the geologist, who was making preparations for his first expedition to Spitsbergen, and offered to take Nordenskiöld with him. The result was most satisfactory, for to the remarkable observations of Torell on glacial phenomena Nordenskiöld added the valuable discovery at Bell Sound of remains of Tertiary plants, which has led to such important conclusions respecting the climates of those regions in former epochs. In 1861 Nordenskiöld took part in Torell's second Spitsbergen expedition, which yielded even more important results as regards the geological history of the islands. Its main object, however, was to take steps for the measurement of an arc of the meridian, and when a further expedition to the same quarter was promoted by the Swedish Academy in 1864, Nordenskiöld accepted the post of leader in the place of Dr Chydenius. But on this occasion the attempt to reach a high northern latitude was frustrated by the necessity of rescuing a party of shipwrecked walrus-hunters. Three years later, however, chiefly through the support of the Swedish Government and Mr Oscar Dickson, who contributed so largely towards the later expeditions of 1872 and 1875, Nordenskiöld headed a well-organized expedition in the *Sofia*, and reached the highest northern latitude attained up to that date in the eastern hemisphere. Arctic exploration had now become his all-absorbing object, and in 1870, with three young naturalists, he visited the vast inland ice-sheet of Greenland. His next expedition in 1872 did not answer expectation, for the tenders were caught in the ice, and the crews of the three vessels were forced to winter in Spitsbergen. In 1875–76, however, a successful voyage eastwards, including the ascent of the Yenisei, led Nordenskiöld to attempt the exploration of the "North-East passage." This led to the celebrated voyage of the *Vega*, in which Nordenskiöld navigated for the first time the northern coasts of Europe and Asia. Starting from Karlskrona on 22nd June 1878, the *Vega* doubled Cape Cheluiskin in the following August, and, after being frozen in at the end of September near Bering Strait, completed the voyage successfully in the following summer. This brought him conspicuously before the world, and, even if the discovery of the long-sought North-East passage has but little direct value, the indirect and scientific results are very far-reaching. The monumental record edited by Nordenskiöld, in five closely printed octavos, throws a flood of light on the past and present conditions of life on the north coast of Siberia, while the more popular account in two volumes, written by Nordenskiöld himself, is a model of lucid description and a perfect summary of the history of the subject. On his return to Sweden Nordenskiöld received a most enthusiastic welcome, and in April 1880 was made a baron and a commander of the Nordstjerne Order. In 1883 he again visited the east coast of Greenland, and succeeded in taking his ship through the great ice barrier, a feat that had been attempted in vain during upwards of three centuries. In addition to his heroic work as an explorer, Baron Nordenskiöld made a notable reputation in the field of historical geography by his monumental publications, the *Facsimile Atlas*, 1889, and the *Periplus*, 1897. The former contains reproductions of the most important geographical documents printed during the 15th and 16th centuries, and the latter, a work of far greater research, deals with the history of early cartography and the sailing charts in use among mariners during the Middle Ages. Baron Nordenskiöld died at Stockholm on the 12th of August 1901. (G. F. B.)

Norderney, an island of Prussia, province of Hanover, off the north coast of East Friesland. It is one of the most popular seaside resorts in all Germany, the summer visitors reaching the total of 24,000 annually. The village is situated at the western extremity of the island, and near it are a military convalescent home and the Empress Frederick's Children's Home. In 1898 the island was cleared by 2806 vessels of 213,340 tons. Norderney is immortalized by its association with Heine's *Nordseebilder*. Population (1900), 4018.

Nordhausen, a town of Prussia, province of Saxony, 60 miles by rail west of Halle. It possesses a museum of antiquities. In the corn market is a fountain by Rietschel (1825), and in the market-place another to Luther (1888). Population (1885), 27,083; (1900), 28,500.

Norfolk, an eastern county of England, bounded on the N. and E. by the North Sea, on the S. by Suffolk, and on the W. by Lincolnshire and Cambridgeshire.

Area and Population.—In 1901 the area of the ancient (geographical) county was 1,308,440 acres, and the population numbered 454,516 in 1891 and 460,040 in 1901, showing an increase of 9767 between 1881 and 1891, or at the rate of 2·2 per cent. during the ten years, and of 5524, or at the rate of 1·2, between 1891 and 1901, as compared with an increase at the rate of 1·4 per cent. during the ten years 1871–81. The 1901 returns give 0·35 persons to an acre, and 2·84 acres to a person. In 1891 the area of the registration county was 1,291,170 acres, and the population 460,362, of whom 221,688 were males and 238,674 females, and in 1901, 467,614. Particulars of birth-rate, death-rate, and the number of persons married per thousand inhabitants, as well as the illegitimacy-rate per thousand births, are given in the following table:—

	1871–80.	1881–90.	1889–98.	1899.
Birth-rate . .	30·8	30·7	28·1	26·9
Death-rate . .	19·8	18·3	17·4	16·6
Marriage-rate .	14·5	13·7	13·6	14·6
Illegitimacy-rate .	84	63	66	61

In 1891 the county contained 952 persons born in Scotland, 1152 born in Ireland, and 619 foreigners. At the same time there were 448 blind persons, 226 deaf and dumb, and 1856 insane.

Government, &c.—For parliamentary purposes the ancient county is divided into six divisions (North-Western, South-Western, Northern, Eastern, Mid, and Southern), and also includes the parliamentary boroughs of King's Lynn and Norwich, and part of the parliamentary borough of Great Yarmouth; each returning one member, except the city of Norwich, which returns two members. The administrative county includes the municipal boroughs of King's Lynn and Thetford. Norwich and Great Yarmouth form county and municipal boroughs. There are two courts of quarter sessions, and 25 petty sessional divisions. Each of the four municipal boroughs has a separate commission of the peace and a separate court of quarter sessions. The administrative county contains 692, the county borough of Norwich 1, and the county borough of Great Yarmouth 2, entire civil parishes; there are also 3 civil parishes which are partly in other administrative counties, and one which is partly in the administrative county of Norfolk and partly in the county borough of Great Yarmouth. The ancient county contains 595 entire ecclesiastical parishes and districts, and parts of 13 others. It is situated partly in the dioceses of Ely, Lincoln, and Norwich.

Education.—At Norwich there are the Norwich and Ely Diocesan Training College for Schoolmistresses (founded in 1853, the building dating from 1892) and an institution for the blind, and there are a deaf school and a blind school at Great Yarmouth. On 31st August 1900 there were in the county 501 elementary schools, of which 156 were board schools and 345 voluntary schools, the latter including 331 National Church of England schools, 4 Roman Catholic, and 10 British and other. The average attendance during the year was 47,686, out of a total of 57,682 on the register. The total receipts of the board schools during the year were £127,259, of which £4763 were earnings under the Agricultural Rates Act, and £385 earnings under the Technical Instruction Act.

Agriculture.—For the ten years following 1885 there was a general tendency towards an increase in the areas of pasture land and of meadows, but the latter decreased again after 1895. In 1889 a total of 882,432 acres were farmed by tenants and 212,698 acres by the owners, the corresponding figures in 1895 being 890,773 and 186,840 acres, and in 1900, 896,933 and 170,424 acres.

The following table shows the areas under the different kinds of crops at the periods named:—

Year.	Area in Cultivation.	Area under Corn Crops.	Area under Green Crops.	Area of Bare Fallow.	Area under Permanent Grass.
1880	1,083,737	444,476	202,992	11,002	...
1885	1,090,967	438,252	207,295	10,977	271,717
1890	1,093,395	427,039	195,951	13,392	286,651
1895	1,077,613	404,289	191,378	11,480	296,959
1900	1,067,357	409,632	195,950	6,177	289,189

The next table shows the numbers of the live stock at the periods named:—

Year.	Cows and Heifers.	Other Cattle.	Total Cattle.	Horses.	Sheep.	Pigs.
1880	27,937	80,341	108,278	63,840	638,791	85,483
1890	32,457	104,558	137,015	64,481	595,014	105,007
1900	35,635	98,892	134,527	66,602	547,245	100,712

Industries.—The total number of persons employed in factories and workshops in the county during the year 1897 was 29,997, of whom 9111 were employed in the clothing industries, 3593 in the making of machinery, implements, tools, &c., 3286 in the preparation of food, 2221 in the paper and printing trades, 1801 in the manufacture of silk, 1732 in brewing, &c., and 1655 in the wood industries.

The *Norfolk Broads*, which have attracted the attention of tourists, lie within a triangle which has for its angular points Happisburgh (on the coast), Norwich, and Lowestoft. They consist of shallow lakes or marshes, mostly fringed with reeds, and frequently of a picturesque appearance, and abound in fish and waterfowl. For the most part they belong to the lower basins of the rivers Bure, Yare, and Wavency, which converge upon Yarmouth. In the Bure basin are Wroxham, Hoveton, Hickling, Horsey, Martham, Heigham, Ormesby, Filby, Barton, Somerton, and Whitelsea; in the Yare basin, Rockland and Surlingham; and in the Waveney basin, Oulton.

(J. T. BE.)

Norfolk, a city of Madison county, Nebraska, U.S.A., on the Elkhorn river and the Fremont, Elkhorn, and Missouri Valley, the Union Pacific, and the Chicago, St Paul, Minneapolis and Omaha railways, in the north-eastern part of the state, at an altitude of 1523 feet. It is a railway centre of some importance, and a distributing point for a large region of fertile farming country. Population (1880), 547; (1890), 3038; (1900), 3883, of whom 622 were foreign-born.

Norfolk, a city and seaport of Norfolk county, Virginia, U.S.A., on Norfolk Harbour, at the mouth of the Elizabeth river, in the south-eastern part of the state. Its site is level, it is divided into six wards, and its plan is irregular. It has an excellent water-supply and thorough sewerage, but its streets are ill-paved. It has a good harbour, accessible to vessels of great draught, and it has considerable export trade, consisting mainly of bread-stuffs, cotton, and lard. For the year ending 30th June 1901 the exports (including those of the smaller adjacent city of Portsmouth) amounted to $10,308,489. Regular steamship lines connect the city with New York, Boston, and southern ports. In 1900 it had 445 manufacturing establishments, with a total capital of $6,425,099, an average number of 4334 hands, and products valued at $9,397,355. The industries were varied, consisting of the roasting and grinding of coffee and the grinding of spice, and the production of clothing, fertilizers, flour, foundry and machine-shop products, and hosiery and knitted goods, the coffee and spice industry being of the most importance. The assessed valuation of real and personal property in 1900, on a basis of about three-fourths of the full value, was $26,175,980, the net debt $4,177,305, and the rate of taxation $22 per $1000. Population (1890), 34,871; (1900), 46,624—1705 foreign-born and 20,230 negroes.

Norfolk Island, in the Pacific Ocean, about 800 miles east of New South Wales, containing 8528 acres, of which about one-fourth remains unalienated. The fertility of the island is very great. Oranges, grapes, passion fruit, figs, pine-apples, and other fruits grow abundantly; while potatoes, onions, maize, and arrowroot can be largely produced. The inhabitants, however, have by no means made use of their opportunities. Since its constitution as a separate settlement in 1856 its condition has gone from bad to worse. The administration of justice in the hands of an elected magistrate was unsatisfactory. Crime was rarely punished, and debts were not recoverable. A lack of energy was everywhere apparent. Owing to intermarrying there has been steady deterioration of the race. The population was, in 1895, 882. The total trade barely exceeds £5500 annually. An attempt has been made to remedy matters by an improvement in the government. Although not actually annexed to New South Wales, the island is now more directly under the jurisdiction of the Governor of New South Wales, who has the power of legislation until the New South Wales legislature provides otherwise. A chief magistrate, appointed by the Governor, has taken the place of the elected magistrate, and an elected council of elders, consisting of twelve members, has superseded the general gathering of the adult population.

Parliamentary Paper C. 8358, *Correspondence relating to the Transfer of Norfolk Island to the Government of New South Wales*, 1897. (H. E. Eg.)

Norman, Sir Henry Wylie (1826——), English field-marshal and colonial governor, was born 2nd December 1826, and entered the army at the age of seventeen, his first appointment being to the 31st Native Infantry. Until 1840 the Norman family was entirely unconnected with India. In that year Sir Henry's father, who had been for many years a merchant in Cuba, became a partner in a mercantile house in Calcutta, where he was joined by his son in 1842. In 1844 the latter obtained a cadetship, and so began his career without social or professional influence to help him. Young Norman went through the second Sikh campaign with the 31st Native Infantry, and having attracted the favourable notice of Sir Colin Campbell, was selected by him to accompany an expedition against the Kohat Pass Afridis in 1850 as officiating brigade-major. The subaltern of twenty-four was given a substantive appointment in this capacity for a splendid deed of gallantry, which is recorded by Sir Charles Napier in the following terms: "In the pass of Kohat a sepoy picket, descending a precipitous mountain under fire and the rolling of large stones, had some men killed and wounded. Four of the latter, dreadfully hurt, crept under some rocks for shelter. They were not missed until the picket reached the bottom, but were then discovered by our glasses, high up and helpless. Fortunately the enemy did not see them, and some sepoys volunteered a rescue, headed by Norman of the 31st Native Infantry and Ensign Murray of the 70th Native Infantry. These brave men—would that the names of all were known to me for record!—ascended the rocks in defiance of the enemy, and brought the wounded men down." Norman served in numerous frontier expeditions between 1850 and 1854, and in the suppression of the Sonthal rebellion of 1855–56. In the Mutiny campaign he was constantly engaged, being present at the siege of Delhi, the relief of Lucknow, and a number of other affairs. Altogether he was mentioned twenty-five times in despatches. He afterwards became assistant military secretary for Indian affairs at the Horse Guards, military secretary to the Government of India, military member of the Viceroy's Council, and member of the Secretary of State for India's Council. It is generally understood that the Indian Staff Corps owed its origin to Sir Henry Norman, several members of whose family have won distinction in it. In 1883 Sir Henry began his colonial career as Governor of Jamaica, an appointment from which he was transferred in 1888 to the governorship of Queensland. Here he remained until 1895, when he came home to act as Agent-General for the colony in London. In 1893 he was offered the Viceroyalty of India, but, after first accepting, declined it. In 1897 he was chairman of the Royal Commission of Inquiry into the condition of the West Indies, a position for which his experience in Jamaica eminently fitted him. In April 1901 he was appointed Governor of the Royal Hospital, Chelsea, in succession to Field-marshal Sir Donald Stewart. In 1902 he was made a field-marshal.

Norristown, a borough of Pennsylvania, U.S.A., capital of Montgomery county, on the Schuylkill river, 16 miles from Philadelphia, in the south-eastern part of the state. It has a fairly regular plan, with ten wards, and a good water-supply from Schuylkill river. It has three railways, the Pennsylvania, the Philadelphia and Reading, and the Stony Creek. Though a residential suburb of Philadelphia, it has considerable manufactures, the products of which in 1900 were valued at $4,821,745, and consisted of cotton and woollen goods, carpets, hosiery and knitted goods, flour, iron and steel goods, &c. Population (1890), 19,791; (1900), 22,265, of whom 3048 were foreign-born and 728 negroes.

Norrköping, a town and port in the province of Östergötland, Sweden, on the river Motala, just before it enters Bråvik, an inlet of the Baltic, 113 miles south-west of Stockholm by the main line to Malmö. The falls in the river afford motive power to the cloth and cotton mills (spinning and weaving)—the staple industries—and to factories for sugar, paper, lithography, tobacco, and carpets, joinery works, and breweries. There are also shipbuilding yards and docks. Fine granite is quarried at Grafversfors, 7½ miles to the north. The inlet of Bråvik affords excellent harbour accommodation, there being from 33 feet to 17½ feet of water below the bridges in the town. In 1896 the port was entered and cleared by 4972 vessels of 605,137 tons. The chief new building is St Matthew's church (1892). Population (1880), 26,735; (1890), 32,826; (1900), 41,008.

Norrland, the most northerly of the three territorial divisions of Sweden, embraces the counties of Norrbotten, Vesterbotten, Vesternorrland, Jämtland, and Gefleborg, that is to say, the river basins of the Torneå, Kalix, Luleå, Piteå, Skellefteå, Umeå, Ångerman, and Indal, corresponding to the old districts of Gestrikland, Helsingland, Medelpad, Ångermanland, Herjeådal, Jämtland, Vesterbotten, and Lappmark. Its area is 98,771 square miles, or 57·8 per cent. of the whole area of Sweden. In 1900, however, notwithstanding the very rapid increase of the population, Norrland had only 16·6 per cent. of the total population of the kingdom. Population (1880), 628,742; (1890), 743,704; (1900), 860,254.

North Adams, a city of Berkshire county, Massachusetts, U.S.A., at the junction of the north and south branches of the Hoosac river, and the Fitchburg (at the western terminus of the Hoosac Tunnel) and the Boston and Albany railways, in the north-western part of the state, at an altitude of 704 feet. The village of North Adams, the principal population centre of the town, is a thriving manufacturing place. In 1900 there were in the town 231 manufacturing establishments, with a total capital of $14,563,492. They employed an average number of 6796 hands, and turned out products valued at $11,682,663. The most important industries were the manufacture of cotton and woollen goods, and of boots and shoes. Population (1890), 16,074; (1900), 24,200, of whom 6821 were foreign-born and 90 negroes.

Northampton.—One of the south midland counties of England, bounded on the N. by Lincoln, Rutland, and Leicester, on the W. by Warwick and Oxford, on the S. by Oxford and Buckingham, and on the E. by Bedford, Huntingdon, and Cambridge.

Area and Population.—In 1901 the area of the ancient (geographical) county was 641,992 acres, and the population 302,183, of whom 149,759 were males and 152,424 were females, showing an increase of 29,628 since 1881, or at the rate of 10·8 per cent.

during the ten years, as compared with an increase at the rate of 11·7 per cent. for the ten years 1871–81. In 1901 the population was 338,064, an increase of 35,881, or at the rate of 11·8 per cent. between 1891 and 1901. These last returns give 0·53 persons to an acre, and 1·89 acres to a person. In the year 1891 the area of the registration county was 641,925 acres, and the population 308,072, of whom 152,918 were males and 155,154 females, and in 1901, 348,924. Particulars of birth-rate, death-rate, and the number of persons married per thousand inhabitants, as well as the number of illegitimate births per thousand births, are given in the annexed table :—

	1871–80.	1881–90.	1889–98.	1899.
Birth-rate . .	34·8	31·8	29·8	29·3
Death-rate . .	19·6	17·1	16·2	15·5
Marriage-rate .	15·0	14·1	15·1	16·3
Illegitimacy-rate .	47	45	40	41

In 1891 the county contained 869 natives of Scotland, 1095 natives of Ireland, and 378 foreigners. At the same date there were 228 blind persons, 115 deaf and dumb, and 1452 insane.

Government, &c.—For parliamentary purposes the ancient county is divided into four divisions (Northern, Eastern, Mid, and Southern), the parliamentary borough of Northampton, and part of the parliamentary borough of Peterborough, each returning one member, except the borough of Northampton, which returns two members. The administrative counties of Northampton and the soke of Peterborough include four municipal boroughs, namely, Brackley, Daventry, Higham Ferrers, and Peterborough, together with the municipal and county borough of Northampton. There are one court of quarter sessions and nine petty sessional divisions. The county borough of Northampton and the liberty of the soke of Peterborough have each a separate court of quarter sessions and a separate commission of the peace. The administrative county contains 301 entire civil parishes and parts of seven others ; the soke of Peterborough contains twenty-nine entire civil parishes and parts of three others ; and the county borough of Northampton contains five entire civil parishes. The ancient county contains 288 entire ecclesiastical parishes or districts, with parts of ten others, most of them being in the diocese of Peterborough.

Education.—There is a diocesan training college for schoolmasters at Peterborough. On 31st August 1900 the county, inclusive of the soke of Peterborough, possessed 306 elementary schools, namely, 51 board schools and 255 voluntary schools, the latter including 238 National Church of England schools, three Wesleyan, three Roman Catholic, and 11 British and other. The average attendance during the year was 43,139, out of a total of 51,841 on the register. The school board receipts amounted during the year to £76,769, inclusive of £40 earned under the Technical Instruction Act and £1812 earned under the Agricultural Rates Act.

Agriculture.—Since 1880 there has been a very considerable decrease in the area devoted to corn crops and in the fallow land, and a slight decrease in the area planted with green crops. On the other hand, there has been an increase in the permanent grass and meadow-land since 1885. In 1889, 455,039 acres were farmed by tenants, 463,082 acres in 1895, and 478,343 acres in 1900 ; whilst in the same three years 104,602, 95,512, and 82,441 acres respectively were farmed by their owners.

The following table shows the areas under the different kinds of crops at the periods named :—

Year.	Area in Cultivation.	Area under Corn Crops.	Area under Green Crops.	Area of Bare Fallow.	Area under Permanent Grass.
1880	559,117	169,759	38,090	25,393	...
1885	559,325	153,365	40,419	15,775	309,730
1890	560,305	140,615	37,080	13,928	333,800
1895	558,594	127,985	36,703	13,513	343,787
1900	560,784	128,281	35,153	8,462	354,912

The next table shows the numbers of the live stock for the periods named :—

Year.	Cows and Heifers.	Other Cattle.	Total Cattle.	Horses.	Sheep.	Pigs.
1880	24,997	88,038	113,035	21,998	457,412	29,595
1885	29,457	100,452	129,909	21,953	452,638	32,713
1890	30,797	99,265	130,062	21,701	429,050	37,502
1895	27,352	92,350	119,702	22,357	409,043	39,576
1900	32,404	93,937	126,341	22,880	403,434	28,340

Industries.—The total number of hands employed in the factories and workshops of the county during 1897 was 42,795 ; and of these by far the greater portion, namely, 31,922, or 75 per cent. of the whole, was employed in the clothing (boots and shoes) industries. Next in importance came the making of machinery, implements, and tools, giving employment to 3008 persons ; the paper and printing trades, with 1185 hands ; the metal industries, with 1183 ; leather, with 1128 ; and wood, with 1073. Iron ore is extracted at various places in the middle of the county, *e.g.*, Kettering near Northampton, Wellingborough, Thrapston, and near Stamford ; and there are thirteen blast furnaces at the four places named. In 1900, 1,622,539 tons of ironstone were extracted and 247,908 tons of pig-iron were made. Further, in the same year 168,628 tons of limestone, 303,520 tons of clay, and 53,231 tons of gravel were produced. Altogether 1769 persons were employed in the mines and quarries, the total value of the products of which amounted to £191,941.

See C. A. MARKHAM. *The Church Plate of the County of Northampton.* London, 1894.—T. L. POWYS. *Notes on the Birds of Northamptonshire,* 2 vols. London, 1895. (J. T. BE.)

Northampton, a parliamentary, county, and municipal borough of England, capital of Northamptonshire, on the river Nene, 70 miles north-north-west of London by rail. The churches of St Peter and the Holy Sepulchre have been restored since 1883. St Crispin's chapel-of-ease was built in 1884. There are nine other ecclesiastical parishes, some with new churches since 1882, *e.g.*, St Mary's at Far Cotton, in the Early English Gothic ; St Paul's, Decorated ; St Matthew's, Gothic ; and St Michael's and All Angels'. Besides the cathedral, the Roman Catholics have the church of St John. The town hall was enlarged in 1892. The public buildings erected since 1883 embrace the county council room, the Masonic Hall, the museum and free library (1884), the Friendly Societies' Medical Institute, and the opera-house. The town also possesses a Roman Catholic convent, with schools, the Northampton and county modern and technical schools (opened in 1894), and half a dozen clubs. The water-supply of the town was increased by the construction of a new reservoir of 100 acres at Teeton in 1888. The parliamentary borough (area, 1972 acres ; population, 23,671 in 1891) returns two members to the House of Commons. The population of the municipal and county borough in 1891, on the then area (1311 acres), was 61,012. In 1898 the area was 1342 acres, and the population on this in 1891 was 75,075 ; in 1901, 87,021.

See *Records of the Borough of Northampton,* edited by C. A. MARKHAM and Rev. J. C. COX, 2 vols. Norwich, 1898.

Northampton, a city of Massachusetts, U.S.A., capital of Hampshire county, on the west bank of the Connecticut river, towards the western part of the state. It comprises an area of 37 square miles, mainly in the level Connecticut valley, is divided into seven wards, and includes, besides Northampton proper, the villages of Leeds and Florence. Northampton is irregularly planned, is on branches of the New York, New Haven and Hartford, and the Boston and Maine railways, and has extensive and varied manufactures. Northampton is the site of Smith College, one of the foremost of the colleges for women in the country. It is non-sectarian, was opened in 1875, and in 1899 had 68 instructors and was attended by 1074 students. Its library contained 7500 volumes, its property was valued at $1,566,252, and its income was $182,128. Besides the college library, there is in Northampton the public library with over 30,000, and the Forbes library with over 75,000 volumes. Population (1890), 14,990 ; (1900), 18,643, of whom 4498 were foreign-born and 108 negroes.

North Attleboro, a town of Bristol county, Massachusetts, U.S.A., in the south-eastern part of the state, and on a line of the New York, New Haven, and Hartford Railroad. It has an area of 20 square miles of rolling surface. The principal village, of the same name as the town, is regularly laid out. It is well known for its manufacture of jewellery. Population (1890), 6727; (1900), 7253, of whom 1786 were foreign-born and 59 negroes.

North Berwick, a royal burgh and watering-place of Haddingtonshire, Scotland, at the south corner of the mouth of the Firth of Forth. It has fine sands and famous golf-links. There is a town house, a library and reading-room, a hospital for infectious diseases, and a fishermen's hall. Little trade is done at the harbour, which is not easy of access. There is steamer communication in summer with Leith and Fife. The High School is one of the leading secondary schools in the county. Population (1891), 2376; (1901), 2784.

North Bierley, an extensive township in the Shipley parliamentary division of Yorkshire, England, 2 miles south-south-east of Bradford, on the Lancashire and Yorkshire Railway. Ironworks at Low Moor (in the township), established in 1790, provide employment for 3000 to 4000 people. In 1899 it was incorporated with Bradford. Population of sub-district, including townships of North Bierley and Wyke (1901), 22,151 (North Bierley, 16,266; Wyke, 5885).
